- For API details, see [DescribeOrderableReplicationInstances](https://docs.aws.amazon.com/cli/latest/reference/dmscli/describe-orderable-replication-instances.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/dmscli/).
**describe-refresh-schemas-status**

The following code example shows how to use `describe-refresh-schemas-status`.

**AWS CLI**

**To list the refresh status for an endpoint**

The following `describe-refresh-schemas-status` example returns the status of a previous refresh request.

```bash
aws dms describe-refresh-schemas-status \
```

Output:

```json
{
    "RefreshSchemasStatus": {
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5N2LCVZF7JPGJRNUE",
        "Status": "successful",
        "LastRefreshDate": 1590786544.605
    }
}
```

- For API details, see [DescribeRefreshSchemasStatus](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-refresh-schemas-status.html) in *AWS CLI Command Reference*.

**describe-replication-instances**

The following code example shows how to use `describe-replication-instances`.

**AWS CLI**

**To describe replication instances**

The following `describe-replication-instances` example lists the replication instances in your AWS account.

```bash
aws dms describe-replication-instances
```
Output:

```json
{
    "ReplicationInstances": [
        {
            "ReplicationInstanceIdentifier": "my-repl-instance",
            "ReplicationInstanceClass": "dms.t2.micro",
            "ReplicationInstanceStatus": "available",
            "AllocatedStorage": 5,
            "InstanceCreateTime": 1590011235.952,
            "VpcSecurityGroups": [
                {
                    "VpcSecurityGroupId": "sg-f839b688",
                    "Status": "active"
                }
            ],
            "AvailabilityZone": "us-east-1e",
            "ReplicationSubnetGroup": {
                "ReplicationSubnetGroupIdentifier": "default",
                "ReplicationSubnetGroupDescription": "default",

For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationInstances in AWS CLI Command Reference.

**describe-replication-subnet-groups**

The following code example shows how to use describe-replication-subnet-groups.

**AWS CLI**

To display the available subnet groups

The following describe-replication-subnet-groups example lists the available subnet groups.

```bash
aws dms describe-replication-subnet-groups \ 
   --filter "Name=replication-subnet-group-id,Values=my-subnet-group"
```

Output:

```json
{
   "ReplicationSubnetGroups": [
      {
         "ReplicationSubnetGroupIdentifier": "my-subnet-group",
         "ReplicationSubnetGroupDescription": "my subnet group",
         "VpcId": "vpc-136a4c6a",
         "SubnetGroupStatus": "Complete",
         "Subnets": [
            {
               "SubnetIdentifier": "subnet-da327bf6",
               "SubnetAvailabilityZone": { "Name": "us-east-1a"
            },
            "SubnetStatus": "Active"
         },
         {
            "SubnetIdentifier": "subnet-bac383e0",
```
For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationSubnetGroups in AWS CLI Command Reference.

**describe-replication-task-assessment-results**

The following code example shows how to use describe-replication-task-assessment-results.

**AWS CLI**

**To list the results of replication task assessment**

The following describe-replication-task-assessment-results example lists the results of a prior task assessment.

```
aws dms describe-replication-task-assessment-results
```

**Output:**

```json
{
   "ReplicationTaskAssessmentResults": [
   {
   }
   ]
}
```
describe-replication-tasks

The following code example shows how to use describe-replication-tasks.

AWS CLI

To describe a replication task

The following describe-replication-tasks example describes current replication tasks.

aws dms describe-replication-tasks

Output:

```json
{
   "ReplicationTasks": [
      {
         "ReplicationTaskIdentifier": "moveit2",
         "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCEYHZBFAGZT3QEC5U",
         "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF73PGJRNUE",
         "MigrationType": "full-load",
         "TableMappings": "...output omitted...",
         "AssessmentStatus": "No issues found",
         "AssessmentResultsFile": "moveit2/2020-05-29-22-10"
      }
   ]
}
```
"ReplicationTaskSettings": ...output omitted...,

    "TablesErrored": 0,
    "FreshStartDate": 1590619811.528,
    "StartDate": 1590619811.528,
    "StopDate": 1590619842.068
}
]

describe-schemas

The following code example shows how to use describe-schemas.

**AWS CLI**

To describe database schemas

The following describe-schemas example lists the available tables at an endpoint.

```bash
aws dms describe-schemas \
```

Output:
For more information, see This is the topic title in the AWS Database Migration Service User Guide.

- For API details, see DescribeSchemas in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list the tags for a resource

The following list-tags-for-resource example lists the tags for a replication instance.

```
aws dms list-tags-for-resource \
   --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPJRNUE
```

Output:

```
{
   "TagList": [
   {
      "Key": "Project",
      "Value": "dbMigration"
   },
   {
      "Key": "Environment",
      "Value": "PROD"
   }
   ]
}
```

For more information, see Tagging Resources in the AWS Database Migration Service User Guide.
For API details, see `ListTagsForResource` in *AWS CLI Command Reference*.

**modify-endpoint**

The following code example shows how to use `modify-endpoint`.

**AWS CLI**

**To modify an endpoint**

The following `modify-endpoint` example adds an extra connection attribute to an endpoint.

```
aws dms modify-endpoint \
    --endpoint-arn "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U" \
    --extra-connection-attributes "compressionType=GZIP"
```

Output:

```
{
    "Endpoint": {
        "EndpointIdentifier": "src-endpoint",
        "EndpointType": "SOURCE",
        "EngineName": "s3",
        "EngineDisplayName": "Amazon S3",
        "ExtraConnectionAttributes": "compressionType=GZIP;csvDelimiter=,;csvRowDelimiter=\n;",
        "Status": "active",
        "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U",
        "SslMode": "none",
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
        "S3Settings": {
            "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
            "CsvRowDelimiter": "\n",
            "CsvDelimiter": ",",
            "BucketFolder": "",
            "BucketName": "",
            "CompressionType": "GZIP",
            "EnableStatistics": true
        }
    }
}
```
modify-event-subscription

The following code example shows how to use modify-event-subscription.

AWS CLI

To modify an event subscription

The following modify-event-subscription example changes the source type of an event subscription.

```
aws dms modify-event-subscription \\
   --subscription-name "my-dms-events" \\
   --source-type replication-task
```

Output:

```json
{
   "EventSubscription": {
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "my-dms-events",
      "Status": "modifying",
      "SubscriptionCreationTime": "2020-05-29 17:04:40.262",
      "SourceType": "replication-task",
      "Enabled": true
   }
}
```

For more information, see Working with Events and Notifications in the AWS Database Migration Service User Guide.
modify-replication-instance

The following code example shows how to use `modify-replication-instance`.

AWS CLI

To modify a replication instance

The following `modify-replication-instance` example modifies a replication instance so that it uses a Multi-AZ deployment.

```bash
aws dms modify-replication-instance \
    --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZ7PGJRNUE \
    --multi-az
```

Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "available",
        "AllocatedStorage": 5,
        "InstanceCreateTime": 1590011235.952,
        ...output omitted...

        "PendingModifiedValues": {
            "MultiAZ": true
        },
        "MultiAZ": false,
        "EngineVersion": "3.3.2",
        "AutoMinorVersionUpgrade": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/f7bc0f8e-1a3a-4ace-9fae-e8494fa3921a",
        ...output omitted...
    }
}
```
For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see ModifyReplicationInstance in AWS CLI Command Reference.

modify-replication-subnet-group

The following code example shows how to use modify-replication-subnet-group.

AWS CLI

To modify a subnet group

The following modify-replication-subnet-group example changes the lists of subnets associated with a subnet group.

```
aws dms modify-replication-subnet-group \
    --replication-subnet-group-identifier my-subnet-group \
    --subnet-id subnet-da327bf6 subnet-bac383e0
```

Output:

```
{
    "ReplicationSubnetGroup": {
        "ReplicationSubnetGroupIdentifier": "my-subnet-group",
        "ReplicationSubnetGroupDescription": "my subnet group",
        "VpcId": "vpc-136a4c6a",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-da327bf6",
                "SubnetAvailabilityZone": {
                    "Name": "us-east-1a"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-bac383e0",
                "SubnetAvailabilityZone": {
                    "Name": "us-east-1c"
                }
            }
        ]
    }
}
```
For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see ModifyReplicationSubnetGroup in AWS CLI Command Reference.

modify-replication-task

The following code example shows how to use modify-replication-task.

AWS CLI

To modify a replication task

The following modify-replication-task example changes the table mappings for a task.

```bash
aws dms modify-replication-task \
   --replication-task-arn "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
   --table-mappings file://table-mappings.json
```

Contents of table-mappings.json:

```json
{
   "rules": [
      {
         "rule-type": "selection",
         "rule-id": "1",
         "rule-name": "1",
         "object-locator": {
            "schema-name": "prodrep",
            "table-name": "ACCT_%"
         },
         "rule-action": "include",
         "filters": []
      }
   ]
}
Output:

```json
{
    "ReplicationTask": {
        "ReplicationTaskIdentifier": "moveit2",
        "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKZ7EZM6ZCE7R37QEC5U",
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNU",
        "MigrationType": "full-load",
        "TableMappings": ...output omitted...
        "ReplicationTaskSettings": ...output omitted...
        "Status": "modifying",
        "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
        "ReplicationTaskCreationDate": 1590524772.505,
        "ReplicationTaskStartDate": 1590789424.653,
        "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZZIINA45FII"
    }
}
```

For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyReplicationTask](#) in *AWS CLI Command Reference*.

**reboot-replication-instance**

The following code example shows how to use `reboot-replication-instance`.

**AWS CLI**

**To reboot a replication instance**

The following `reboot-replication-instance` example reboots a replication instance.

```bash
aws dms reboot-replication-instance
```
Output:

```
{
    "ReplicationInstance": {
        "ReplicationInstanceIdentifier": "my-repl-instance",
        "ReplicationInstanceClass": "dms.t2.micro",
        "ReplicationInstanceStatus": "rebooting",
        "AllocatedStorage": 5,
        "InstanceCreateTime": 1590011235.952,
        ... output omitted ...
    }
}
```

For more information, see [Working with an AWS DMS Replication Instance](https://docs.aws.amazon.com/AmazonDMS/latest/UserGuide/WorkingWithDMSReplicationInstances.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [RebootReplicationInstance](https://docs.aws.amazon.com/cli/latest/reference/dms/reboot-replication-instance.html) in *AWS CLI Command Reference*.

**refresh-schemas**

The following code example shows how to use `refresh-schemas`.

### AWS CLI

**To refresh database schemas**

The following `refresh-schemas` example requests that AWS DMS refresh the list of schemas at an endpoint.

```bash
aws dms refresh-schemas \
    --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T30M70UB5NM2LCVZF73PGJRNUE \
```

Output:

```
{
    "RefreshSchemasStatus": {
        ... output omitted ...
    }
}
```
"ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T30M70UB5NM2LCVZF7PGJRNUE",
"Status": "refreshing",
"LastRefreshDate": 1590019949.103
}
}

- For API details, see RefreshSchemas in AWS CLI Command Reference.

**reload-tables**

The following code example shows how to use reload-tables.

**AWS CLI**

**To refresh the list of tables available at an endpoint**

The following reload-tables example reloads the list of available tables at an endpoint.

```bash
aws dms reload-tables \
   --replication-task-arn "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
   --tables-to-reload "SchemaName=prodrep,TableName=ACCT_BAL"
```

**Output:**

```json
{
   "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
}
```

- For API details, see ReloadTables in AWS CLI Command Reference.

**remove-tags-from-resource**

The following code example shows how to use remove-tags-from-resource.

**AWS CLI**

**To remove tags from a replication instance**
The following `remove-tags-from-resource` example removes tags from a replication instance.

```bash
aws dms remove-tags-from-resource \
   --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
   --tag-keys Environment Project
```

This command produces no output.

For more information, see [Tagging Resources](#) in the [AWS Database Migration Service User Guide](#).

- For API details, see [RemoveTagsFromResource](#) in [AWS CLI Command Reference](#).

### start-replication-task-assessment

The following code example shows how to use `start-replication-task-assessment`.

**AWS CLI**

**To start a task assessment**

The following `start-replication-task-assessment` example starts a replication task assessment.

```bash
aws dms start-replication-task-assessment \
   --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FI
```

Output:

```json
{
   "ReplicationTask": {
      "ReplicationTaskIdentifier": "moveit2",
      "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCZELYH7BFGAGZT3QEC5U",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
      "MigrationType": "full-load",
   }
}```
For more information, see [Creating a Task Assessment Report](#) in the [AWS Database Migration Service User Guide](#).

- For API details, see [StartReplicationTaskAssessment](#) in [AWS CLI Command Reference](#).

**start-replication-task**

The following code example shows how to use `start-replication-task`.

**AWS CLI**

To start a replication task

The following command-name example lists the available widgets in your AWS account.

```
aws dms start-replication-task \
  --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII \
  --start-replication-task-type reload-target
```

Output:

```
{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCZEYHZBFAGZT3QEC5U",

  }
}
```
For more information, see Working with AWS DMS Tasks in the AWS Database Migration Service User Guide.

- For API details, see StartReplicationTask in AWS CLI Command Reference.

stop-replication-task

The following code example shows how to use stop-replication-task.

AWS CLI

To stop a task

The following stop-replication-task example stops a task.

```
aws dms stop-replication-task \
   --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
   "ReplicationTask": {
      "ReplicationTaskIdentifier": "moveit2",
      "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SKCZEYHZBFAGGT3QEC5U",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCV7FJGJRNU", "MigrationType": "full-load",
```

Actions and scenarios 1791
For more information, see Working with AWS DMS Tasks in the AWS Database Migration Service User Guide.

- For API details, see StopReplicationTask in AWS CLI Command Reference.

**test-connection**

The following code example shows how to use test-connection.

**AWS CLI**

**To test a connection to an endpoint**

The following test-connection example tests whether an endpoint can be accessed from a replication instance.

```
aws dms test-connection \
    --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE \
```

**Output:**

```
{
    "Connection": {
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
        "Status": "testing",
    
```
For more information, see Creating source and target endpoints in the AWS Database Migration Service User Guide.

- For API details, see TestConnection in AWS CLI Command Reference.

Amazon DocumentDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon DocumentDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

add-tags-to-resource

The following code example shows how to use add-tags-to-resource.

AWS CLI

To add one or more tags to a specified resource

The following add-tags-to-resource example adds three tags to sample-cluster. One tag (CropB) has a key name but no value.
aws docdb add-tags-to-resource \
  --tags Key="CropA",Value="Apple" Key="CropB" Key="CropC",Value="Corn"

This command produces no output.

For more information, see Tagging Amazon DocumentDB Resources in the Amazon DocumentDB Developer Guide.

- For API details, see AddTagsToResource in AWS CLI Command Reference.

apply-pending-maintenance-action

The following code example shows how to use apply-pending-maintenance-action.

AWS CLI

To have pending maintenance actions take place during the next maintenance window

The following apply-pending-maintenance-action example causes all system-update actions to be performed during the next scheduled maintenance window.

aws docdb apply-pending-maintenance-action \
  --apply-action system-update \
  --opt-in-type next-maintenance

This command produces no output.

For more information, see Applying Amazon DocumentDB Updates in the Amazon DocumentDB Developer Guide.

- For API details, see ApplyPendingMaintenanceAction in AWS CLI Command Reference.

copy-db-cluster-parameter-group

The following code example shows how to use copy-db-cluster-parameter-group.

AWS CLI

To duplicate an existing DB cluster parameter group
The following copy-db-cluster-parameter-group example makes a copy of the parameter group custom-docdb3-6 named custom-docdb3-6-copy. When making the copy it adds tags to the new parameter group.

```bash
aws docdb copy-db-cluster-parameter-group \
  --source-db-cluster-parameter-group-identifier custom-docdb3-6 \
  --target-db-cluster-parameter-group-identifier custom-docdb3-6-copy \
  --target-db-cluster-parameter-group-description "Copy of custom-docdb3-6" \
  --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBParameterGroupFamily": "docdb3.6",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:12345678901:cluster-pg:custom-docdb3-6-copy",
        "DBClusterParameterGroupName": "custom-docdb3-6-copy",
        "Description": "Copy of custom-docdb3-6"
    }
}
```

For more information, see Copying an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see CopyDbClusterParameterGroup in AWS CLI Command Reference.

**copy-db-cluster-snapshot**

The following code example shows how to use copy-db-cluster-snapshot.

**AWS CLI**

**To create a copy of a snapshot**

The following copy-db-cluster-snapshot example makes a copy of sample-cluster-snapshot named sample-cluster-snapshot-copy. The copy has all the tags of the original plus a new tag with the key name CopyNumber.

```bash
aws docdb copy-db-cluster-snapshot \
  --source-db-cluster-snapshot-identifier sample-cluster-snapshot \
```
--target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \
--copy-tags \
--tags Key="CopyNumber",Value="1"

This command produces no output.

For more information, see Copying a Cluster Snapshot in the Amazon DocumentDB Developer Guide.

- For API details, see CopyDbClusterSnapshot in AWS CLI Command Reference.

create-db-cluster-parameter-group

The following code example shows how to use create-db-cluster-parameter-group.

AWS CLI

To create an Amazon DocumentDB cluster parameter group

The following create-db-cluster-parameter-group example creates the DB cluster parameter group sample-parameter-group using the docdb3.6 family.

aws docdb create-db-cluster-parameter-group \ 
   --db-cluster-parameter-group-name sample-parameter-group \ 
   --db-parameter-group-family docdb3.6 \ 
   --description "Sample parameter group based on docdb3.6"

Output:

{  
   "DBClusterParameterGroup": {  
      "Description": "Sample parameter group based on docdb3.6",  
      "DBParameterGroupFamily": "docdb3.6",  
      "DBClusterParameterGroupName": "sample-parameter-group"  
   }  
}

For more information, see Creating an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.
create-db-cluster-snapshot

The following code example shows how to use create-db-cluster-snapshot.

AWS CLI

To create a manual Amazon DocumentDB cluster snapshot

The following create-db-cluster-snapshot example creates an Amazon DB cluster snapshot named sample-cluster-snapshot.

```bash
aws docdb create-db-cluster-snapshot \
  --db-cluster-identifier sample-cluster \
  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```json
{
  "DBClusterSnapshot": {
    "MasterUsername": "master-user",
    "AvailabilityZones": ["us-west-2a", "us-west-2b", "us-west-2c", "us-west-2d", "us-west-2e", "us-west-2f"],
    "SnapshotType": "manual",
    "EngineVersion": "3.6.0",
    "PercentProgress": 0,
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
    "Engine": "docdb",
    "DBClusterIdentifier": "sample-cluster",
    "Status": "creating",
    "Port": 0,
  }
}
```
For more information, see Creating a Manual Cluster Snapshot in the Amazon DocumentDB Developer Guide.

- For API details, see CreateDbClusterSnapshot in AWS CLI Command Reference.

**create-db-cluster**

The following code example shows how to use create-db-cluster.

**AWS CLI**

**To create an Amazon DocumentDB cluster**

The following create-db-cluster example creates an Amazon DocumentDB cluster named sample-cluster with the preferred maintenance window on Sundays between 20:30 and 11:00.

```bash
aws docdb create-db-cluster \
   --db-cluster-identifier sample-cluster \
   --engine docdb \
   --master-username master-user \
   --master-user-password password \
   --preferred-maintenance-window Sun:20:30-Sun:21:00
```

Output:

```
{
   "DBCluster": {
      "DBClusterParameterGroup": "default.docdb3.6",
      "AssociatedRoles": [],
      "DBSubnetGroup": "default",
      "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
      "Status": "creating",
      "Port": 27017,
      "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
      "HostedZoneId": "ZNKXH85TT8WVW",
      "DBClusterMembers": []
   }
}
```
"Engine": "docdb",
"DBClusterIdentifier": "sample-cluster",
"PreferredBackupWindow": "10:12-10:42",
"AvailabilityZones": [
  "us-west-2d",
  "us-west-2f",
  "us-west-2e"
],
"MasterUsername": "master-user",
"BackupRetentionPeriod": 1,
"ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",

  {
    "VpcSecurityGroupId": "sg-77186e0d",
    "Status": "active"
  }
],
"StorageEncrypted": false,
"DbClusterResourceId": "cluster-L3R4YR5BUYDP4GLMTJ2WF5GH5Q",
"MultiAZ": false,
"Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
"EngineVersion": "3.6.0"
}

For more information, see Creating an Amazon DocumentDB Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see CreateDbCluster in AWS CLI Command Reference.

**create-db-instance**

The following code example shows how to use create-db-instance.

**AWS CLI**

To create an Amazon DocumentDB cluster instance

The following create-db-instance example code creates the instance sample-cluster-instance-2 in the Amazon DocumentDB cluster sample-cluster.
aws docdb create-db-instance \
--db-cluster-identifier sample-cluster \
--db-instance-class db.r4.xlarge \
--db-instance-identifier sample-cluster-instance-2 \
--engine docdb

Output:

{
    "DBInstance": {
        "DBInstanceStatus": "creating",
        "PendingModifiedValues": {
            "PendingCloudwatchLogsExports": {
                "LogTypesToEnable": [
                    "audit"
                ]
            }
        },
        "PubliclyAccessible": false,
        "PreferredBackupWindow": "00:00-00:30",
        "PromotionTier": 1,
        "EngineVersion": "3.6.0",
        "BackupRetentionPeriod": 3,
        "DBInstanceIdentifier": "sample-cluster-instance-2",
        "PreferredMaintenanceWindow": "tue:10:28-tue:10:58",
        "StorageEncrypted": false,
        "Engine": "docdb",
        "DBClusterIdentifier": "sample-cluster",
        "DBSubnetGroup": {
            "Subnets": [
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-4e26d263"
                },
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    },
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-afc329f4"
                }
            ]
        }
    }
}
{
    "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
    },
    "SubnetStatus": "Active",
    "SubnetIdentifier": "subnet-53ab3636"
},
{
    "SubnetAvailabilityZone": {

    {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
    }
],
"DbiResourceId": "db-XEKJLEMGRV5ZKCARUVA4H03ITE"
}

For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see CreateDbInstance in AWS CLI Command Reference.

**create-db-subnet-group**

The following code example shows how to use create-db-subnet-group.
AWS CLI

To create an Amazon DocumentDB subnet group

The following create-db-subnet-group example creates an Amazon DocumentDB subnet group named sample-subnet-group.

```
aws docdb create-db-subnet-group \
  --db-subnet-group-description "a sample subnet group" \
  --db-subnet-group-name sample-subnet-group \
  --subnet-ids "subnet-29ab1025" "subnet-991cb8d0" "subnet-53ab3636"
```

Output:

```
{
  "DBSubnetGroup": {
    "SubnetGroupStatus": "Complete",
    "DBSubnetGroupName": "sample-subnet-group",
    "DBSubnetGroupDescription": "a sample subnet group",
    "VpcId": "vpc-91280df6",
    "Subnets": [
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-53ab3636",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2d"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-991cb8d0",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2b"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-29ab1025",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2c"
        }
      }
    ]
  }
}
```
For more information, see [Creating an Amazon DocumentDB Subnet Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbSubnetGroup](#) in *AWS CLI Command Reference*.

delete-db-cluster-parameter-group

The following code example shows how to use delete-db-cluster-parameter-group.

**AWS CLI**

**To delete an Amazon DocumentDB cluster parameter group**

The following delete-db-cluster-parameter-group example deletes the Amazon DocumentDB parameter group sample-parameter-group.

```bash
aws docdb delete-db-cluster-parameter-group \
--db-cluster-parameter-group-name sample-parameter-group
```

This command produces no output.

For more information, see [Deleting an Amazon DocumentDB Cluster Parameter Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DeleteDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

delete-db-cluster-snapshot

The following code example shows how to use delete-db-cluster-snapshot.

**AWS CLI**

**To delete an Amazon DocumentDB cluster snapshot**

The following delete-db-cluster-snapshot example deletes the Amazon DocumentDB cluster snapshot sample-cluster-snapshot.

```bash
aws docdb delete-db-cluster-snapshot \
```

Actions and scenarios
Output:

```
{
    "DBClusterSnapshot": {
        "DBClusterIdentifier": "sample-cluster",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c",
            "us-west-2d"
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
        "VpcId": "vpc-91280df6",
        "EngineVersion": "3.6.0",
        "Engine": "docdb",
        "Status": "available",
        "MasterUsername": "master-user",
        "PercentProgress": 100,
        "StorageEncrypted": false,
        "SnapshotType": "manual",
        "Port": 0
    }
}
```

For more information, see [Deleting a Cluster Snapshot](https://docs.aws.amazon.com/documentdb/latest/developerguide/howto-backup-cluster.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DeleteDbClusterSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/delete-db-cluster-snapshot.html) in *AWS CLI Command Reference*.

**delete-db-cluster**

The following code example shows how to use `delete-db-cluster`.

**AWS CLI**

To delete an Amazon DocumentDB cluster
The following `delete-db-cluster` example deletes the Amazon DocumentDB cluster `sample-cluster`. No backup of the cluster is made prior to deleting it. NOTE: You must delete all instances associated with the cluster before you can delete it.

```
aws docdb delete-db-cluster \
  --db-cluster-identifier sample-cluster \
  --skip-final-snapshot
```

Output:

```
{
  "DBCluster": {
    "DBClusterIdentifier": "sample-cluster",
    "DBSubnetGroup": "default",
    "EngineVersion": "3.6.0",
    "Engine": "docdb",

    "DbClusterResourceId": "cluster-L3R4YRSBUYDP4GLMTJ2WF5GH5Q",
    "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
  }
}
```
For more information, see Deleting an Amazon DocumentDB Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbCluster in AWS CLI Command Reference.

**delete-db-instance**

The following code example shows how to use delete-db-instance.

**AWS CLI**

**To delete an Amazon DocumentDB instance**

The following delete-db-instance example deletes the Amazon DocumentDB instance sample-cluster-instance-2.

```bash
aws docdb delete-db-instance \
    --db-instance-identifier sample-cluster-instance-2
```

**Output:**

```json
{
    "DBInstance": {
        "DBSubnetGroup": {
            "Subnets": [
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-4e26d263"
                },
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    }
                }
            }
        }
    }
}
```

"Port": 27017
For more information, see Deleting an Amazon DocumentDB Instance in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbInstance in AWS CLI Command Reference.

**delete-db-subnet-group**

The following code example shows how to use delete-db-subnet-group.

**AWS CLI**

**To delete an Amazon DocumentDB subnet group**

The following delete-db-subnet-group example deletes the Amazon DocumentDB subnet group sample-subnet-group.

```
aws docdb delete-db-subnet-group 
--db-subnet-group-name sample-subnet-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Subnet Group in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbSubnetGroup in AWS CLI Command Reference.
describe-db-cluster-parameter-groups

The following code example shows how to use describe-db-cluster-parameter-groups.

AWS CLI

To see the details of one or more Amazon DocumentDB cluster parameter groups

The following describe-db-cluster-parameter-groups example displays details for the Amazon DocumentDB cluster parameter group custom3-6-param-grp.

```bash
aws docdb describe-db-cluster-parameter-groups \
   --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```json
{
    "DBClusterParameterGroups": [
        {
            "DBParameterGroupFamily": "docdb3.6",
            "Description": "Custom docdb3.6 parameter group",
            "DBClusterParameterGroupName": "custom3-6-param-grp"
        }
    ]
}
```

For more information, see Viewing Amazon DocumentDB Cluster Parameter Groups in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbClusterParameterGroups in AWS CLI Command Reference.

describe-db-cluster-parameters

The following code example shows how to use describe-db-cluster-parameters.

AWS CLI

To view the detailed parameter list for an Amazon DocumentDB cluster parameter group.

The following describe-db-cluster-parameters example lists the parameters for the Amazon DocumentDB parameter group custom3-6-param-grp.
aws docdb describe-db-cluster-parameters \
   --db-cluster-parameter-group-name custom3-6-param-grp

Output:

```json
{
   "Parameters": [
   {
   "DataType": "string",
   "ParameterName": "audit_logs",
   "IsModifiable": true,
   "ApplyMethod": "pending-reboot",
   "Source": "system",
   "ApplyType": "dynamic",
   "AllowedValues": "enabled,disabled",
   "Description": "Enables auditing on cluster.",
   "ParameterValue": "disabled"
   },
   {
   "DataType": "string",
   "ParameterName": "tls",
   "IsModifiable": true,
   "ApplyMethod": "pending-reboot",
   "Source": "system",
   "ApplyType": "static",
   "AllowedValues": "disabled,enabled",
   "Description": "Config to enable/disable TLS",
   "ParameterValue": "enabled"
   },
   {
   "DataType": "string",
   "ParameterName": "ttl_monitor",
   "IsModifiable": true,
   "ApplyMethod": "pending-reboot",
   "Source": "user",
   "ApplyType": "dynamic",
   "AllowedValues": "disabled,enabled",
   "Description": "Enables TTL Monitoring",
   "ParameterValue": "enabled"
   }
   ]
}
```
For more information, see Viewing Amazon DocumentDB Cluster Parameters in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbClusterParameters in AWS CLI Command Reference.

**describe-db-cluster-snapshot-attributes**

The following code example shows how to use describe-db-cluster-snapshot-attributes.

**AWS CLI**

To list an Amazon DocumentDB snapshot attribute names and values

The following describe-db-cluster-snapshot-attributes example lists the attribute names and values for the Amazon DocumentDB snapshot sample-cluster-snapshot.

.aws docdb describe-db-cluster-snapshot-attributes \ 
--db-cluster-snapshot-identifier sample-cluster-snapshot

Output:

```json
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": []
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
}
```

For more information, see DescribeDBClusterSnapshotAttributes in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbClusterSnapshotAttributes in AWS CLI Command Reference.

**describe-db-cluster-snapshots**

The following code example shows how to use describe-db-cluster-snapshots.
**AWS CLI**

**To describe Amazon DocumentDB snapshots**

The following `describe-db-cluster-snapshots` example displays details for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```
aws docdb describe-db-cluster-snapshots \
  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
   "DBClusterSnapshots": [
      {
         "AvailabilityZones": ["us-west-2a", "us-west-2b", "us-west-2c", "us-west-2d"],
         "Status": "available",
         "SnapshotType": "manual",
         "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
         "DBClusterIdentifier": "sample-cluster",
         "MasterUsername": "master-user",
         "StorageEncrypted": false,
         "VpcId": "vpc-91280df6",
         "EngineVersion": "3.6.0",
         "PercentProgress": 100,
         "Port": 0,
         "Engine": "docdb",
         "ClusterCreateTime": "2019-03-15T20:29:58.836Z"
      }
   ]
}
```

For more information, see [DescribeDBClusterSnapshots](#) in the [Amazon DocumentDB Developer Guide](#).
describe-db-clusters

The following code example shows how to use describe-db-clusters.

AWS CLI

To get detailed information about one or more Amazon DocumentDB clusters.

The following describe-db-clusters example displays details for the Amazon DocumentDB cluster sample-cluster. By omitting the --db-cluster-identifier parameter you can get information of up to 100 clusters.

```bash
aws docdb describe-db-clusters
   --db-cluster-identifier sample-cluster
```

Output:

```json
{
   "DBClusters": [
       {
           "DBClusterParameterGroup": "default.docdb3.6",
           "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
           "PreferredBackupWindow": "00:00-00:30",
           "DBClusterIdentifier": "sample-cluster",
           "LatestRestorableTime": "2019-03-18T20:28:03.239Z",
           "MasterUsername": "master-user",
           "DBClusterMembers": [
               {
                   "PromotionTier": 1,
                   "DBClusterParameterGroupStatus": "in-sync",
                   "IsClusterWriter": false,
                   "DBInstanceIdentifier": "sample-cluster"
               },
               {
                   "PromotionTier": 1,
                   "DBClusterParameterGroupStatus": "in-sync",
                   "IsClusterWriter": true,
                   "DBInstanceIdentifier": "sample-cluster2"
               }
           ]
       }
   ]
}
```

```
{

    "Port": 27017,
    "Status": "available"
}
```

For more information, see [Describing Amazon DocumentDB Clusters](https://docs.aws.amazon.com/documentdb/latest/developer-guide) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeDbClusters](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-clusters.html) in AWS CLI Command Reference.
describe-db-engine-versions

The following code example shows how to use describe-db-engine-versions.

AWS CLI

To list available Amazon DocumentDB engine versions

The following describe-db-engine-versions example lists all available Amazon DocumentDB engine versions.

```bash
aws docdb describe-db-engine-versions \
   --engine docdb
```

Output:

```
{
   "DBEngineVersions": [
   {
      "DBEngineVersionDescription": "DocDB version 1.0.200837",
      "DBParameterGroupFamily": "docdb3.6",
      "EngineVersion": "3.6.0",
      "ValidUpgradeTarget": [],
      "DBEngineDescription": "Amazon DocumentDB (with MongoDB compatibility)",
      "SupportsLogExportsToCloudwatchLogs": true,
      "Engine": "docdb",
      "ExportableLogTypes": [
         "audit"
      ],
      "EngineMetadata": {
      },
      "CreateTime": "2020-08-31T00:00:00.000Z"
   }
   ]
}
```

For more information, see DescribeDBEngineVersions in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbEngineVersions in AWS CLI Command Reference.

describe-db-instances

The following code example shows how to use describe-db-instances.
AWS CLI

To find information about provisioned Amazon DocumentDB instances

The following `describe-db-instances` example displays details for about the Amazon DocumentDB instance `sample-cluster-instance`. By omitting the `--db-instance-identifier` parameter you get information on up to 100 instances.

```
aws docdb describe-db-instances \
  --db-instance-identifier sample-cluster-instance
```

Output:

```
{
  "DBInstances": [
    {
      "Endpoint": {
        "HostedZoneId": "ZNKXH85TT8WVW",
        "Address": "sample-cluster-instance.corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Port": 27017
      },
      "PreferredBackupWindow": "00:00-00:30",
      "DBInstanceStatus": "available",
      "DBInstanceClass": "db.r4.large",
      "EnabledCloudwatchLogsExports": [
        "audit"
      ],
      "DBInstanceIdentifier": "sample-cluster-instance",
      "DBSubnetGroup": {
        "Subnets": [
          {
            "SubnetStatus": "Active",

For more information, see [Describing Amazon DocumentDB Instances](https://docs.aws.amazon.com/documentdb/latest/developerguide/about.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbInstances](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-db-instances.html) in *AWS CLI Command Reference*.

### describe-db-subnet-groups

The following code example shows how to use `describe-db-subnet-groups`.

**AWS CLI**

#### To retrieve a list of Amazon DocumentDB subnet descriptions

The following `describe-db-subnet-groups` example describes details for the Amazon DocumentDB subnet named `default`.

```
aws docdb describe-db-subnet-groups \
  --db-subnet-group-name default
```

**Output:**

```
{
  "DBSubnetGroups": [
    {
      "VpcId": "vpc-91280df6",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-4e26d263",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2a"
          }
        },
        {
          "SubnetIdentifier": "subnet-afc329f4",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
```
For more information, see Describing Subnet Groups in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbSubnetGroups in AWS CLI Command Reference.

**describe-engine-default-cluster-parameters**

The following code example shows how to use describe-engine-default-cluster-parameters.

**AWS CLI**

To describe the default engine and system parameter information for Amazon DocumentDB

The following describe-engine-default-cluster-parameters example displays details for the default engine and system parameter information for the Amazon DocumentDB parameter group docdb3.6.
aws docdb describe-engine-default-cluster-parameters
--db-parameter-group-family docdb3.6

Output:

```
{
   "EngineDefaults": {
      "DBParameterGroupFamily": "docdb3.6",
      "Parameters": [
         {
            "ApplyType": "dynamic",
            "ParameterValue": "disabled",
            "Description": "Enables auditing on cluster.",
            "Source": "system",
            "DataType": "string",
            "MinimumEngineVersion": "3.6.0",
            "AllowedValues": "enabled,disabled",
            "ParameterName": "audit_logs",
            "IsModifiable": true
         },
         {
            "ApplyType": "static",
            "ParameterValue": "enabled",
            "Description": "Config to enable/disable TLS",
            "Source": "system",
            "DataType": "string",
            "MinimumEngineVersion": "3.6.0",
            "AllowedValues": "disabled,enabled",
            "ParameterName": "tls",
            "IsModifiable": true
         },
         {
            "ApplyType": "dynamic",
            "ParameterValue": "enabled",
            "Description": "Enables TTL Monitoring",
            "Source": "system",
            "DataType": "string",
            "MinimumEngineVersion": "3.6.0",
            "AllowedValues": "disabled,enabled",
            "ParameterName": "ttl_monitor",
            "IsModifiable": true
         }
      ]
   }
```

Actions and scenarios
For more information, see `DescribeEngineDefaultClusterParameters` in the *Amazon DocumentDB Developer Guide*.

- For API details, see `DescribeEngineDefaultClusterParameters` in *AWS CLI Command Reference*.

**describe-event-categories**

The following code example shows how to use `describe-event-categories`.

**AWS CLI**

**To describe all Amazon DocumentDB event categories**

The following `describe-event-categories` example lists all categories for the Amazon DocumentDB event source type `db-instance`.

```bash/aws docdb describe-event-categories \
   --source-type db-cluster
```

**Output:**

```json
{
   "EventCategoriesMapList": [
   {
      "SourceType": "db-cluster",
      "EventCategories": [
         "failover",
         "maintenance",
         "notification",
         "failure"
      ]
   }
   ]
}
```

For more information, see *Viewing Event Categories* in the *Amazon DocumentDB Developer Guide*.

- For API details, see `DescribeEventCategories` in *AWS CLI Command Reference*. 

Actions and scenarios
describe-events

The following code example shows how to use describe-events.

AWS CLI

To list Amazon DocumentDB events

The following describe-events example list all the Amazon DocumentDB events for the last 24 hours (1440 minutes).

```bash
aws docdb describe-events \
    --duration 1440
```

This command produces no output. Output:

```json
{
    "Events": [
        {
            "EventCategories": [
                "failover"
            ],
            "Message": "Started cross AZ failover to DB instance: sample-cluster",
            "Date": "2019-03-18T21:36:29.807Z",

}
For more information, see Viewing Amazon DocumentDB Events in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeEvents in AWS CLI Command Reference.

describe-orderable-db-instance-options

The following code example shows how to use describe-orderable-db-instance-options.

AWS CLI

To find the Amazon DocumentDB instance options you can order
The following describe-orderable-db-instance-options example lists all instance options for Amazon DocumentDB for a region.

```
aws docdb describe-orderable-db-instance-options \
   --engine docdb \
   --region us-east-1
```

Output:

```
{
   "OrderableDBInstanceOptions": [
    {
       "Vpc": true,
       "AvailabilityZones": [
         {
           "Name": "us-east-1a"
         },
         {
           "Name": "us-east-1b"
         },
         {
           "Name": "us-east-1c"
         },
         {
           "Name": "us-east-1d"
         }
       ],
       "EngineVersion": "3.6.0",
       "DBInstanceClass": "db.r4.16xlarge",
       "LicenseModel": "na",
       "Engine": "docdb"
    },
    {
       "Vpc": true,
       "AvailabilityZones": [
         {
           "Name": "us-east-1a"
         },

describe-pending-maintenance-actions

The following code example shows how to use `describe-pending-maintenance-actions`.

**AWS CLI**

To list your pending Amazon DocumentDB maintenance actions

The following `describe-pending-maintenance-actions` example lists all your pending Amazon DocumentDB maintenance actions.

```bash
aws docdb describe-pending-maintenance-actions
```

Output:

```json
{
   "PendingMaintenanceActions": []
}
```

For more information, see [Maintaining Amazon DocumentDB](https://docs.aws.amazon.com/documentdb/latest/developerguide/maintenance.html) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribePendingMaintenanceActions](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-pending-maintenance-actions.html) in AWS CLI Command Reference.

failover-db-cluster

The following code example shows how to use `failover-db-cluster`.

```bash
docdb failover-db-cluster
```

For more information, see [Adding an Amazon DocumentDB Instance to a Cluster](https://docs.aws.amazon.com/documentdb/latest/developerguide/cluster.html) in the Amazon DocumentDB Developer Guide.

- For API details, see [FailoverDBCluster](https://docs.aws.amazon.com/cli/latest/reference/docdb/failover-db-cluster.html) in AWS CLI Command Reference.
AWS CLI

To force an Amazon DocumentDB cluster to failover to a replica

The following `failover-db-cluster` example causes the primary instance in the Amazon DocumentDB cluster `sample-cluster` to failover to a replica.

```bash
aws docdb failover-db-cluster
  --db-cluster-identifier sample-cluster
```

Output:

```
{
  "DBCluster": {
    "AssociatedRoles": [],
    "DBClusterIdentifier": "sample-cluster",
    "EngineVersion": "3.6.0",
    "DBSubnetGroup": "default",

}

For more information, see Amazon DocumentDB Failover in the Amazon DocumentDB Developer Guide.

- For API details, see FailoverDbCluster in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list all the tags on an Amazon DocumentDB resource

The following list-tags-for-resource example lists all tags on the Amazon DocumentDB cluster sample-cluster.

```bash
aws docdb list-tags-for-resource \
```
Output:

```json
{
   "TagList": [
   {
      "Key": "A",
      "Value": "ALPHA"
   },
   {
      "Key": "B",
      "Value": ""
   },
   {
      "Key": "C",
      "Value": "CHARLIE"
   }
   ]
}
```

For more information, see [Listing Tags on an Amazon DocumentDB Resource](https://docs.aws.amazon.com/documentdb/latest/developerguide/list-tags-on-resource.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/docdb/list-tags-on-resource.html) in [AWS CLI Command Reference](https://awscli.amazonaws.comeworthy.com/).  

modify-db-cluster-parameter-group

The following code example shows how to use `modify-db-cluster-parameter-group`.

**AWS CLI**

To modify an Amazon DocumentDB DB cluster parameter group

The following modify-db-cluster-parameter-group example modifies the Amazon DocumentDB cluster parameter group `custom3-6-param-grp` by setting the two parameters `audit_logs` and `ttl_monitor` to enabled. The changes are applied at the next reboot.

```bash
aws docdb modify-db-cluster-parameter-group \  --db-cluster-parameter-group-name custom3-6-param-grp \  --parameters ParameterName=audit_logs,ParameterValue=enabled,ApplyMethod=pending-reboot 
```
**ParameterName=ttl_monitor,ParameterValue=enabled,ApplyMethod=pending-reboot**

Output:

```
{
   "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see [Modifying an Amazon DocumentDB Cluster Parameter Group](https://docs.aws.amazon.com/documentdb/userguide/CHAP_ModifyingClusterParameterGroups.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbClusterParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/docdb/modify-db-cluster-parameter-group.html) in *AWS CLI Command Reference*.

**modify-db-cluster-snapshot-attribute**

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

**AWS CLI**

**Example 1: To add an attribute to an Amazon DocumentDB snapshot**

The following `modify-db-cluster-snapshot-attribute` example adds four attribute values to an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
   --db-cluster-snapshot-identifier sample-cluster-snapshot \
   --attribute-name restore \
   --values-to-add all 123456789011 123456789012 123456789013
```

Output:

```
{
   "DBClusterSnapshotAttributesResult": {
      "DBClusterSnapshotAttributes": [
         {
            "AttributeName": "restore",
            "AttributeValues": [
               "all",
               "123456789011",
               "123456789012",
               "123456789013"
            ]
         }
      ]
   }
}
```
Example 2: To remove attributes from an Amazon DocumentDB snapshot

The following modify-db-cluster-snapshot-attribute example removes two attribute values from an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
    --db-cluster-snapshot-identifier sample-cluster-snapshot \
    --attribute-name restore \
    --values-to-remove 123456789012 all
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789011",
                    "123456789013"
                ]
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
}
```

For more information, see [ModifyDBClusterSnapshotAttribute](#) in the Amazon DocumentDB Developer Guide.

- For API details, see [ModifyDbClusterSnapshotAttribute](#) in AWS CLI Command Reference.

modify-db-cluster

The following code example shows how to use modify-db-cluster.
To modify an Amazon DocumentDB cluster

The following `modify-db-cluster` example modifies the Amazon DocumentDB cluster `sample-cluster` by making the retention period for automatic backups 7 days, and changing the preferred windows for both backups and maintenance. All changes are applied at the next maintenance window.

```bash
grep -A 2 output aws docdb modify-db-cluster
--db-cluster-identifier sample-cluster
--no-apply-immediately
--backup-retention-period 7
--preferred-backup-window 18:00-18:30
--preferred-maintenance-window sun:20:00-sun:20:30
```

Output:

```json
{
    "DBCluster": {
        "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "DBClusterMembers": [
            {
                "DBClusterParameterGroupStatus": "in-sync",
                "DBInstanceIdentifier": "sample-cluster",
                "IsClusterWriter": true,
                "PromotionTier": 1
            },
            {
                "DBClusterParameterGroupStatus": "in-sync",
                "DBInstanceIdentifier": "sample-cluster2",
                "IsClusterWriter": false,
                "PromotionTier": 2
            }
        ],
        "HostedZoneId": "ZNKXH85TT8WVW",
        "StorageEncrypted": false,
        "PreferredBackupWindow": "18:00-18:30",
        "MultiAZ": true,
        "EngineVersion": "3.6.0",
        "MasterUsername": "master-user"
    }
}
```
For more information, see Modifying an Amazon DocumentDB Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see ModifyDbCluster in AWS CLI Command Reference.

modify-db-instance

The following code example shows how to use modify-db-instance.
AWS CLI

To modify an Amazon DocumentDB instance

The following modify-db-instance example modifies the Amazon DocumentDB instance sample-cluster2 by changing its instance class to db.r4.4xlarge and its promotion tier to 5. The changes are applied immediately but can only be seen after the instances status is available.

```
aws docdb modify-db-instance \
    --db-instance-identifier sample-cluster2 \
    --apply-immediately \
    --db-instance-class db.r4.4xlarge \
    --promotion-tier 5
```

Output:

```
{
    "DBInstance": {
        "EngineVersion": "3.6.0",
        "StorageEncrypted": false,
        "DBInstanceClass": "db.r4.large",

    "DBInstanceClass": "db.r4.4xlarge"}
modify-db-subnet-group

The following code example shows how to use modify-db-subnet-group.

AWS CLI

To modify an Amazon DocumentDB subnet group

The following modify-db-subnet-group example modifies the subnet group sample-subnet-group by adding the specified subnets and a new description.

```bash
aws docdb modify-db-subnet-group \
  --db-subnet-group-name sample-subnet-group \
  --subnet-ids subnet-b3806e8f subnet-53ab3636 subnet-991cb8d0 \
  --db-subnet-group-description "New subnet description"
```

Output:

```json
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "sample-subnet-group",
        "SubnetGroupStatus": "Complete",
        "VpcId": "vpc-91280df6",
        "DBSubnetGroupDescription": "New subnet description",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-b3806e8f",
                "SubnetStatus": "Active",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                }
            }
        ]
    }
}
```

For more information, see [Modifying an Amazon DocumentDB Instance](http://example.com) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbInstance](http://example.com) in *AWS CLI Command Reference*.
For more information, see Modifying an Amazon DocumentDB Subnet Group in the Amazon DocumentDB Developer Guide.

- For API details, see ModifyDbSubnetGroup in AWS CLI Command Reference.

**reboot-db-instance**

The following code example shows how to use reboot-db-instance.

**AWS CLI**

**To reboot an Amazon DocumentDB instance**

The following reboot-db-instance example reboots the Amazon DocumentDB instance sample-cluster2.

```bash
aws docdb reboot-db-instance \
    --db-instance-identifier sample-cluster2
```

This command produces no output. Output:

```json
{
    "DBInstance": {
        "PreferredBackupWindow": "18:00-18:30",
```
"DBInstanceIdentifier": "sample-cluster2",
"VpcSecurityGroups": [
    {
      "Status": "active",
      "VpcSecurityGroupId": "sg-77186e0d"
    }
  ],
"DBSubnetGroup": {
  "VpcId": "vpc-91280df6",
  "Subnets": [
    {
      "SubnetStatus": "Active",
      "SubnetAvailabilityZone": {
        "Name": "us-west-2a"
      },
      "SubnetIdentifier": "subnet-4e26d263"
    },
    {
      "SubnetStatus": "Active",
      "SubnetAvailabilityZone": {
        "Name": "us-west-2c"
      },
      "SubnetIdentifier": "subnet-afc329f4"
    },
    {
      "SubnetStatus": "Active",
      "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
      },
      "SubnetIdentifier": "subnet-53ab3636"
    },
    {

      "SubnetAvailabilityZone": {
        "Name": "us-west-2b"
      },
      "SubnetIdentifier": "subnet-991cb8d0"
    }
  ],
  "SubnetGroupStatus": "Complete",
  "DBSubnetGroupName": "default",
  "DBSubnetGroupDescription": "default"
  }
},
"PendingModifiedValues": {}}
For more information, see [Rebooting an Amazon DocumentDB Instance](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RebootDbInstance](#) in *AWS CLI Command Reference*.

### remove-tags-from-resource

The following code example shows how to use `remove-tags-from-resource`.

**AWS CLI**

**To remove tags from an Amazon DocumentDB resource**

The following `remove-tags-from-resource` example removes the tag with the key named `B` from the Amazon DocumentDB cluster `sample-cluster`.

```bash
aws docdb remove-tags-from-resource \
```
This command produces no output.

For more information, see Removing Tags from an Amazon DocumentDBResource in the Amazon DocumentDB Developer Guide.

- For API details, see RemoveTagsFromResource in AWS CLI Command Reference.

reset-db-cluster-parameter-group

The following code example shows how to use reset-db-cluster-parameter-group.

AWS CLI

To reset the specified parameter value to its defaults in an Amazon DocumentDB parameter group

The following reset-db-cluster-parameter-group example resets the parameter ttl_monitor in the Amazon DocumentDB parameter group custom3-6-param-grp to its default value.

```
aws docdb reset-db-cluster-parameter-group \
   --db-cluster-parameter-group-name custom3-6-param-grp \
   --parameters ParameterName=ttl_monitor,ApplyMethod=immediate
```

Output:

```
{
   "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see title in the Amazon DocumentDB Developer Guide.

To reset specified or all parameter values to their defaults in an Amazon DocumentDB parameter group

The following reset-db-cluster-parameter-group example resets all parameters in the Amazon DocumentDB parameter group custom3-6-param-grp to their default value.

```
aws docdb reset-db-cluster-parameter-group \
```
The following code example shows how to use restore-db-cluster-from-snapshot.

AWS CLI

To restore an Amazon DocumentDB cluster from an automatic or manual snapshot

The following restore-db-cluster-from-snapshot example creates a new Amazon DocumentDB cluster named sample-cluster-2019-03-16-00-01-restored from the snapshot rds:sample-cluster-2019-03-16-00-01.

```
aws docdb restore-db-cluster-from-snapshot \
    --db-cluster-identifier sample-cluster-2019-03-16-00-01-restored \
    --engine docdb \
    --snapshot-identifier rds:sample-cluster-2019-03-16-00-01
```

Output:

```
{
    "DBCluster": {
        "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "Engine": "docdb",
        "DBClusterMembers": [],
        "MultiAZ": false,
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
            "us-west-2c"
        ]
    }
}
```
For more information, see Restoring from a Cluster Snapshot in the Amazon DocumentDB Developer Guide.

- For API details, see RestoreDbClusterFromSnapshot in AWS CLI Command Reference.

`restore-db-cluster-to-point-in-time`

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

**AWS CLI**

To restore an Amazon DocumentDB cluster to a point-in-time from a manual snapshot
The following `restore-db-cluster-to-point-in-time` example uses the `sample-cluster-snapshot` to create a new Amazon DocumentDB cluster, `sample-cluster-pit`, using the latest restorable time.

```bash
aws docdb restore-db-cluster-to-point-in-time \
  --db-cluster-identifier sample-cluster-pit \
  --use-latest-restorable-time
```

Output:

```
{
  "DBCluster": {
    "StorageEncrypted": false,
    "BackupRetentionPeriod": 3,
    "MasterUsername": "master-user",
    "HostedZoneId": "ZNKXH85TT8WVW",
    "PreferredBackupWindow": "00:00-00:30",
    "MultiAZ": false,
    "DBClusterIdentifier": "sample-cluster-pit",
    "DBSubnetGroup": "default",
    "AssociatedRoles": [],
    "DBClusterParameterGroup": "default.docdb3.6",
    "DBClusterMembers": [],
    "Status": "creating",
    "AvailabilityZones": [
      "us-west-2a",
      "us-west-2d",
      "us-west-2b"
    ],
    "ReaderEndpoint": "sample-cluster-pit.cluster-ro-corcjorzr1sfc.us-west-2.docdb.amazonaws.com",
    "Port": 27017,
    "Engine": "docdb",
    "EngineVersion": "3.6.0",
    "VpcSecurityGroups": [
      {
        "VpcSecurityGroupId": "sg-77186e0d",
        "Status": "active"
      }
    ],
  }
}
```
"PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
"Endpoint": "sample-cluster-pit.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
"DbClusterResourceId": "cluster-NLCABBXOSE2QPQ4GOLZIFWEPLM",
}
}

For more information, see [Restoring a Snapshot to a Point in Time](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RestoreDbClusterToPointInTime](#) in *AWS CLI Command Reference*.

### start-db-cluster

The following code example shows how to use `start-db-cluster`.

**AWS CLI**

**To start a stopped Amazon DocumentDB cluster**

The following `start-db-cluster` example starts the specified Amazon DocumentDB cluster.

```bash
aws docdb start-db-cluster \
--db-cluster-identifier sample-cluster
```

**Output:**

```json
{
"DBCluster": {
  "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
  "HostedZoneId": "ZNKXH85TT8WVW",
  "Engine": "docdb",

**stop-db-cluster**

The following code example shows how to use `stop-db-cluster`.

**AWS CLI**

**To stop a running Amazon DocumentDB cluster**

The following `stop-db-cluster` example stops the specified Amazon DocumentDB cluster.

```bash
aws docdb stop-db-cluster \
```

---

For more information, see **Stopping and Starting an Amazon DocumentDB Cluster** in the *Amazon DocumentDB Developer Guide*.

- For API details, see [StartDbCluster](#) in *AWS CLI Command Reference*.

**stop-db-cluster**

The following code example shows how to use `stop-db-cluster`.

**AWS CLI**

**To stop a running Amazon DocumentDB cluster**

The following `stop-db-cluster` example stops the specified Amazon DocumentDB cluster.

```bash
aws docdb stop-db-cluster \
```
--db-cluster-identifier sample-cluster

Output:

```json

DynamoDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

batch-get-item

The following code example shows how to use batch-get-item.

AWS CLI

To retrieve multiple items from a table

The following batch-get-items example reads multiple items from the MusicCollection table using a batch of three GetItem requests, and requests the number of read capacity units consumed by the operation. The command returns only the AlbumTitle attribute.

```
aws dynamodb batch-get-item \
    --request-items file://request-items.json \
    --return-consumed-capacity TOTAL
```
Contents of request-items.json:

```
{
    "MusicCollection": {
        "Keys": [
            {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"}
            },
            {
                "Artist": {"S": "Acme Band"},
                "SongTitle": {"S": "Happy Day"}
            },
            {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Scared of My Shadow"}
            }
        ],
        "ProjectionExpression":"AlbumTitle"
    }
}
```

Output:

```
{
    "Responses": {
        "MusicCollection": [
            {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                }
            },
            {
                "AlbumTitle": {
                    "S": "Blue Sky Blues"
                }
            },
            {
                "AlbumTitle": {
                    "S": "Louder Than Ever"
                }
            }
        ]
    }
}
```
For more information, see [Batch Operations](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/BatchOperations.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [BatchGetItem](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/batch-get-item.html) in *AWS CLI Command Reference*.

**batch-write-item**

The following code example shows how to use `batch-write-item`.

**AWS CLI**

**To add multiple items to a table**

The following `batch-write-item` example adds three new items to the `MusicCollection` table using a batch of three `PutItem` requests. It also requests information about the number of write capacity units consumed by the operation and any item collections modified by the operation.

```bash
aws dynamodb batch-write-item \\
   --request-items file://request-items.json \\
   --return-consumed-capacity INDEXES \\
   --return-item-collection-metrics SIZE
```

**Contents of request-items.json:**

```json
{
   "MusicCollection": [
      {
         "PutRequest": {
            "Item": {
                "Artist": {"S": "No One You Know"},
                "SongTitle": {"S": "Call Me Today"},
                "AlbumTitle": {"S": "Somewhat Famous"}
            }
         }
      }
   ]
}
```
Output:

```json
{
  "UnprocessedItems": {},
  "ItemCollectionMetrics": {
    "MusicCollection": [
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "No One You Know"
          }
        },
        "SizeEstimateRangeGB": [0.0, 1.0]
      }
    ]
  }
}
```
create-backup

The following code example shows how to use create-backup.

AWS CLI

To create a backup for an existing DynamoDB table

The following create-backup example creates a backup of the MusicCollection table.

```bash
aws dynamodb create-backup
--table-name MusicCollection
```
--backup-name MusicCollectionBackup

Output:

```json
{
   "BackupDetails": {
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
      "BackupName": "MusicCollectionBackup",
      "BackupSizeBytes": 0,
      "BackupStatus": "CREATING",
      "BackupType": "USER",
      "BackupCreationDateTime": 1576616366.715
   }
}
```

For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/DynamoDB-Backup.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateBackup](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/create-backup.html) in *AWS CLI Command Reference*.

**create-global-table**

The following code example shows how to use `create-global-table`.

**AWS CLI**

**To create a global table**

The following `create-global-table` example creates a global table from two identical tables in the specified, separate AWS Regions.

```bash
aws dynamodb create-global-table \
   --global-table-name MusicCollection \
   --replication-group RegionName=us-east-2 RegionName=us-east-1 \
   --region us-east-2
```

Output:

```json
{
}
```
"GlobalTableDescription": {  
  "ReplicationGroup": [   
    {   
      "RegionName": "us-east-2"   
    },   
    {   
      "RegionName": "us-east-1"   
    }  
  ],  
  "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",  
  "CreationDateTime": 1576625818.532,  
  "GlobalTableStatus": "CREATING",  
  "GlobalTableName": "MusicCollection"  
}

For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amAZondB/2018-07-25/dynamodb-global-tables.html) in the *Amazon DynamoDB Developer Guide*.  

- For API details, see [CreateGlobalTable](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/create-globaTable.html) in *AWS CLI Command Reference*.

**create-table**

The following code example shows how to use `create-table`.

**AWS CLI**

**Example 1: To create a table with tags**

The following `create-table` example uses the specified attributes and key schema to create a table named `MusicCollection`. This table uses provisioned throughput and is encrypted at rest using the default AWS owned CMK. The command also applies a tag to the table, with a key of `Owner` and a value of `blueTeam`.

```
aws dynamodb create-table \   
  --table-name MusicCollection \   
  --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S \   
  --key-schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \   
  --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \   
  --tags Key=Owner,Value=blueTeam
```

**Actions and scenarios**
For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

**Example 2: To create a table in On-Demand Mode**
The following example creates a table called MusicCollection using on-demand mode, rather than provisioned throughput mode. This is useful for tables with unpredictable workloads.

```bash
aws dynamodb create-table
   --table-name MusicCollection
   --attribute-definitions AttributeName=Artist,AttributeType=S
   AttributeName=SongTitle,AttributeType=S
   --key-schema AttributeName=Artist,KeyType=HASH
   AttributeName=SongTitle,KeyType=RANGE
   --billing-mode PAY_PER_REQUEST
```

Output:

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "Artist",
            "AttributeType": "S"
         },
         {
            "AttributeName": "SongTitle",
            "AttributeType": "S"
         }
      ],
      "TableName": "MusicCollection",
      "KeySchema": [
         {
            "AttributeName": "Artist",
            "KeyType": "HASH"
         },
         {
            "AttributeName": "SongTitle",
            "KeyType": "RANGE"
         }
      ],
      "TableStatus": "CREATING",
      "CreationDateTime": "2020-05-27T11:44:10.807000-07:00",
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "ReadCapacityUnits": 0,
         "WriteCapacityUnits": 0
      }
   }
}
```
For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

Example 3: To create a table and encrypt it with a Customer Managed CMK

The following example creates a table named MusicCollection and encrypts it using a customer managed CMK.

```bash
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
  --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=abcd1234-abcd-1234-a123-ab1234a1b234
```

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "BillingModeSummary": {
      "BillingMode": "PAY_PER_REQUEST"
    }
  }
}
```
Example 4: To create a table with a Local Secondary Index

The following example uses the specified attributes and key schema to create a table named MusicCollection with a Local Secondary Index named AlbumTitleIndex.

```
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S AttributeName=AlbumTitle,AttributeType=S 
```
--key-schema AttributeName=Artist,KeyType=HASH
AttributeName=SongTitle,KeyType=RANGE \
--provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
--local-secondary-indexes \
"[
  {
    "IndexName": "AlbumTitleIndex",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "AlbumTitle",
        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "INCLUDE",
      "NonKeyAttributes": ["Genre", "Year"]
    }
  }
]"

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
```

]
Example 5: To create a table with a Global Secondary Index

The following example creates a table named GameScores with a Global Secondary Index called GameTitleIndex. The base table has a partition key of UserId and a sort key of GameTitle, allowing you to find an individual user's best score for a specific game efficiently, whereas the GSI has a partition key of GameTitle and a sort key of TopScore, allowing you to quickly find the overall highest score for a particular game.

```
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N \n  --key-schema AttributeName=UserId,KeyType=HASH \n  AttributeName=GameTitle,KeyType=HASH \n  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \n  --global-secondary-indexes \n  "[ 
   {"IndexName": "GameTitleIndex", "KeySchema": [ 
     {"AttributeName": "GameTitle", "KeyType": "HASH"}, 
     {"AttributeName": "TopScore", "KeyType": "RANGE"}
   ], "Projection": { 
     "ProjectionType": "INCLUDE", 
     "NonKeyAttributes": ["UserId"]
   }, "ProvisionedThroughput": { 
     "ReadCapacityUnits": 10, 
     "WriteCapacityUnits": 5
   }
   ]"
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
```
{
    "AttributeName": "GameTitle",
    "AttributeType": "S"
},
{
    "AttributeName": "TopScore",
    "AttributeType": "N"
},
{
    "AttributeName": "UserId",
    "AttributeType": "S"
}
],
"TableName": "GameScores",
"KeySchema": [
    {
        "AttributeName": "UserId",
        "KeyType": "HASH"
    },
    {
        "AttributeName": "GameTitle",
        "KeyType": "RANGE"
    }
],
"TableStatus": "CREATING",
"CreationDateTime": "2020-05-26T17:28:15.602000-07:00",
"ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "ReadCapacityUnits": 10,
    "WriteCapacityUnits": 5
},
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"GlobalSecondaryIndexes": [
    {
        "IndexName": "GameTitleIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            }
        ],
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        }
    }
]
Example 6: To create a table with multiple Global Secondary Indexes at once

The following example creates a table named GameScores with two Global Secondary Indexes. The GSI schemas are passed via a file, rather than on the command line.

```
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N AttributeName=Date,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --global-secondary-indexes file://gsi.json
```
Contents of gsi.json:

```json
[
    {
        "IndexName": "GameTitleIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "TopScore",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "ALL"
        },
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        }
    },
    {
        "IndexName": "GameDateIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "Date",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "ALL"
        },
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        }
    }
]
```
Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Date",
                "AttributeType": "S"
            },
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "TopScore",
                "AttributeType": "N"
            },
            {
                "AttributeName": "UserId",

        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "ALL"
    }
  }
]
Example 7: To create a table with Streams enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Both new and old images of each item will be written to the stream.

```
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-definitions AttributeName=UserId,AttributeType=S  \
    AttributeName=GameTitle,AttributeType=S \
    --key-schema AttributeName=UserId,KeyType=HASH  \
    AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --stream-specification StreamEnabled=TRUE,StreamViewType=NEW_AND_OLD_IMAGES
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [ 
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            }  
        ]
    }
}
```
Example 8: To create a table with Keys-Only Stream enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Only the key attributes of modified items are written to the stream.
aws dynamodb create-table
   --table-name GameScores
   --attribute-definitions AttributeName=UserId,AttributeType=S
   AttributeName=GameTitle,AttributeType=S
   --key-schema AttributeName=UserId,KeyType=HASH
   AttributeName=GameTitle,KeyType=RANGE
   --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5
   --stream-specification StreamEnabled=TRUE,StreamViewType=KEYS_ONLY

Output:

{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "GameTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "UserId",
            "AttributeType": "S"
         }
      ],
      "TableName": "GameScores",
      "KeySchema": [
         {
            "AttributeName": "UserId",
            "KeyType": "HASH"
         },
         {
            "AttributeName": "GameTitle",
            "KeyType": "RANGE"
         }
      ],
      "TableStatus": "CREATING",
      "CreationDateTime": "2023-05-25T18:45:34.140000+00:00",
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "ReadCapacityUnits": 10,
         "WriteCapacityUnits": 5
      },
      "TableSizeBytes": 0,
      "ItemCount": 0
   }
}
For more information, see Change data capture for DynamoDB Streams in the Amazon DynamoDB Developer Guide.

**Example 9: To create a table with the Standard Infrequent Access class**

The following example creates a table called GameScores and assigns the Standard-Infrequent Access (DynamoDB Standard-IA) table class. This table class is optimized for storage being the dominant cost.

```
aws dynamodb create-table
   --table-name GameScores
   --attribute-definitions AttributeName=UserId,AttributeType=S
          AttributeName=GameTitle,AttributeType=S
   --key-schema AttributeName=UserId,KeyType=HASH
          AttributeName=GameTitle,KeyType=RANGE
   --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5
   --table-class STANDARD_INFREQUENT_ACCESS
```

Output:

```
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "GameTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "UserId",
            "AttributeType": "S"
         }
      ],
      "StreamSpecification": {
         "StreamEnabled": true,
         "StreamViewType": "KEYS_ONLY"
      },
      "LatestStreamLabel": "2023-05-25T18:45:34.140",
      "DeletionProtectionEnabled": false
   }
}
```
Example 10: To Create a table with Delete Protection enabled

The following example creates a table called GameScores and enables deletion protection.

```bash
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S \
  AttributeName=GameTitle,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH \
  AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
```

For more information, see Table classes in the Amazon DynamoDB Developer Guide.
For more information, see Using deletion protection in the Amazon DynamoDB Developer Guide.
delete-backup

The following code example shows how to use delete-backup.

**AWS CLI**

To delete an existing DynamoDB backup

The following delete-backup example deletes the specified existing backup.

```bash
aws dynamodb delete-backup \
backup/01576616366715-b4e58d3a
```

Output:

```json
{
   "BackupDescription": {
      "BackupDetails": {
MusicCollection/backup/01576616366715-b4e58d3a",
         "BackupName": "MusicCollectionBackup",
         "BackupSizeBytes": 0,
         "BackupStatus": "DELETED",
         "BackupType": "USER",
         "BackupCreationDateTime": 1576616366.715
      },
      "SourceTableDetails": {
         "TableName": "MusicCollection",
         "TableId": "b0c04b2c-309b-4352-b2ae-9088af169fe2",
         "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
         "TableSizeBytes": 0,
         "KeySchema": [
            {
               "AttributeType": "Artist",
               "KeyType": "HASH"
            },
            {
               "AttributeName": "SongTitle",
               "KeyType": "RANGE"
            }
         ]
      }
   }
}
```
For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DeleteBackup in AWS CLI Command Reference.

**delete-item**

The following code example shows how to use delete-item.

**AWS CLI**

**Example 1: To delete an item**

The following delete-item example deletes an item from the MusicCollection table and requests details about the item that was deleted and the capacity used by the request.

```bash
avs dynamodb delete-item \  --table-name MusicCollection \  --key file://key.json \  --return-values ALL_OLD \  --return-consumed-capacity TOTAL \  --return-item-collection-metrics SIZE
```

Contents of key.json:

```json
{
    "Artist": {"S": "No One You Know"},
```
Example 2: To delete an item conditionally

The following example deletes an item from the ProductCatalog table only if its ProductCategory is either Sporting Goods or Gardening Supplies and its price is between 500 and 600. It returns details about the item that was deleted.

aws dynamodb delete-item \
--table-name ProductCatalog \
--key '{"Id":{"N":"456"}}' \
--condition-expression "((ProductCategory IN (:cat1, :cat2)) and (#P between :lo and :hi))" \
--expression-attribute-names file://names.json \
--expression-attribute-values file://values.json \
--return-values ALL_OLD

Contents of names.json:

{
  "#P": "Price"
}

Contents of values.json:

{
  ":cat1": {"S": "Sporting Goods"},
  ":cat2": {"S": "Gardening Supplies"},
  ":lo": {"N": "500"},
  ":hi": {"N": "600"}
}

Output:

{
  "Attributes": {
    "Id": {
      "N": "456"
    },
    "Price": {
      "N": "550"
    },
    "ProductCategory": {
      "S": "Sporting Goods"
    }
  }
}

For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.

- For API details, see DeleteItem in AWS CLI Command Reference.
delete-table

The following code example shows how to use delete-table.

AWS CLI

To delete a table

The following delete-table example deletes the MusicCollection table.

```bash
aws dynamodb delete-table \
--table-name MusicCollection
```

Output:

```json
{
   "TableDescription": {
      "TableStatus": "DELETING",
      "TableSizeBytes": 0,
      "ItemCount": 0,
      "TableName": "MusicCollection",
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "WriteCapacityUnits": 5,
         "ReadCapacityUnits": 5
      }
   }
}
```

For more information, see Deleting a Table in the Amazon DynamoDB Developer Guide.

- For API details, see DeleteTable in AWS CLI Command Reference.

describe-backup

The following code example shows how to use describe-backup.

AWS CLI

To get information about an existing backup of a table

The following describe-backup example displays information about the specified existing backup.
aws dynamodb describe-backup \
    --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a

Output:

```json
{
    "BackupDescription": {
        "BackupDetails": {
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
            "BackupName": "MusicCollectionBackup",
            "BackupSizeBytes": 0,
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupCreationDateTime": 1576616366.715
        },
        "SourceTableDetails": {
            "TableName": "MusicCollection",
            "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "TableSizeBytes": 0,
            "KeySchema": [
                {
                    "AttributeName": "Artist",
                    "KeyType": "HASH"
                },
                {
                    "AttributeName": "SongTitle",
                    "KeyType": "RANGE"
                }
            ],
            "TableCreationDateTime": 1576615228.571,
            "ProvisionedThroughput": {
                "ReadCapacityUnits": 5,
                "WriteCapacityUnits": 5
            },
            "ItemCount": 0,
            "BillingMode": "PROVISIONED"
        },
        "SourceTableFeatureDetails": {}
    }
}
```
For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeBackup in AWS CLI Command Reference.

**describe-continuous-backups**

The following code example shows how to use describe-continuous-backups.

**AWS CLI**

**To get information about continuous backups for a DynamoDB table**

The following describe-continuous-backups example displays details about the continuous backup settings for the MusicCollection table.

```
aws dynamodb describe-continuous-backups \
   --table-name MusicCollection
```

**Output:**

```
{
   "ContinuousBackupsDescription": {
      "ContinuousBackupsStatus": "ENABLED",
      "PointInTimeRecoveryDescription": {
         "PointInTimeRecoveryStatus": "DISABLED"
      }
   }
}
```

For more information, see Point-in-Time Recovery for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeContinuousBackups in AWS CLI Command Reference.

**describe-contributor-insights**

The following code example shows how to use describe-contributor-insights.
AWS CLI

To view Contributor Insights settings for a DynamoDB table

The following describe-contributor-insights example displays the Contributor Insights settings for the MusicCollection table and the AlbumTitle-index global secondary index.

```bash
aws dynamodb describe-contributor-insights \
  --table-name MusicCollection \
  --index-name AlbumTitle-index
```

Output:

```
{
  "TableName": "MusicCollection",
  "IndexName": "AlbumTitle-index",
  "ContributorInsightsRuleList": [
    "DynamoDBContributorInsights-PKC-MusicCollection-1576629651520",
    "DynamoDBContributorInsights-SKC-MusicCollection-1576629651520",
    "DynamoDBContributorInsights-PKT-MusicCollection-1576629651520",
    "DynamoDBContributorInsights-SKT-MusicCollection-1576629651520"
  ],
  "ContributorInsightsStatus": "ENABLED",
  "LastUpdateDateTime": 1576629654.78
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeContributorInsights in AWS CLI Command Reference.

describe-endpoints

The following code example shows how to use describe-endpoints.

AWS CLI

To view regional endpoint information

The following describe-endpoints example displays details about the endpoints for the current AWS Region.
aws dynamodb describe-endpoints

Output:

```
{
    "Endpoints": [
        {
            "Address": "dynamodb.us-west-2.amazonaws.com",
            "CachePeriodInMinutes": 1440
        }
    ]
}
```

For more information, see Amazon DynamoDB Endpoints and Quotas in the AWS General Reference.

- For API details, see DescribeEndpoints in AWS CLI Command Reference.

describe-global-table-settings

The following code example shows how to use describe-global-table-settings.

AWS CLI

**To get information about a DynamoDB global table's settings**

The following describe-global-table-settings example displays the settings for the MusicCollection global table.

```
aws dynamodb describe-global-table-settings \
    --global-table-name MusicCollection
```

Output:

```
{
    "GlobalTableName": "MusicCollection",
    "ReplicaSettings": [
        {
            "RegionName": "us-east-1",
            "ReplicaStatus": "ACTIVE",
            "ReplicaProvisionedReadCapacityUnits": 10,
            "ReplicaProvisionedReadCapacityAutoScalingSettings": {
```
For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeGlobalTableSettings in AWS CLI Command Reference.

describe-global-table

The following code example shows how to use describe-global-table.

AWS CLI

To display information about a DynamoDB global table

The following describe-global-table example displays details about the MusicCollection global table.

```bash/aws dynamodb describe-global-table \   --global-table-name MusicCollection
```

Output:

```json
{
```

Actions and scenarios

1884
"GlobalTableDescription": {
    "ReplicationGroup": [
        {
            "RegionName": "us-east-2"
        },
        {
            "RegionName": "us-east-1"
        }
    ],
    "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",
    "CreationDateTime": 1576625818.532,
    "GlobalTableStatus": "ACTIVE",
    "GlobalTableName": "MusicCollection"
}
}

For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/DynamoDBGlobalTables.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeGlobalTable](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-limits.html) in *AWS CLI Command Reference*.

### describe-limits

The following code example shows how to use describe-limits.

**AWS CLI**

**To view provisioned-capacity limits**

The following `describe-limits` example displays provisioned-capacity limits for your account in the current AWS Region.

```bash
aws dynamodb describe-limits
```

**Output:**

```json
{
    "AccountMaxReadCapacityUnits": 80000,
    "AccountMaxWriteCapacityUnits": 80000,
    "TableMaxReadCapacityUnits": 40000,
    "TableMaxWriteCapacityUnits": 40000
}
```
For more information, see Limits in DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeLimits in AWS CLI Command Reference.

describe-table-replica-auto-scaling

The following code example shows how to use describe-table-replica-auto-scaling.

AWS CLI

To view auto scaling settings across replicas of a global table

The following describe-table-replica-auto-scaling example displays auto scaling settings across replicas of the MusicCollection global table.

```bash
aws dynamodb describe-table-replica-auto-scaling \
   --table-name MusicCollection
```

Output:

```json
{
    "TableAutoScalingDescription": {
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "Replicas": [

        }
    }
],
"ReplicaStatus": "ACTIVE"
}

For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeTableReplicaAutoScaling in AWS CLI Command Reference.

describe-table

The following code example shows how to use describe-table.

AWS CLI

To describe a table

The following describe-table example describes the MusicCollection table.

```bash
aws dynamodb describe-table \
  --table-name MusicCollection
```

Output:

```json
{
  "Table": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      }
    ]
  }
}
```
```json
"AttributeName": "SongTitle",
"AttributeType": "S"
],
"ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "WriteCapacityUnits": 5,
    "ReadCapacityUnits": 5
},
"TableSizeBytes": 0,
"TableName": "MusicCollection",
"TableStatus": "ACTIVE",
"KeySchema": [
    {
        "KeyType": "HASH",
        "AttributeName": "Artist"
    },
    {
        "KeyType": "RANGE",
        "AttributeName": "SongTitle"
    }
],
"ItemCount": 0,
"CreationDateTime": 1421866952.062
}```

For more information, see [Describing a Table](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeTable](#) in *AWS CLI Command Reference*.

**describe-time-to-live**

The following code example shows how to use describe-time-to-live.

**AWS CLI**

To view Time to Live settings for a table

The following `describe-time-to-live` example displays Time to Live settings for the `MusicCollection` table.

```bash
aws dynamodb describe-time-to-live
```
--table-name MusicCollection

Output:

```
{
    "TimeToLiveDescription": {
        "TimeToLiveStatus": "ENABLED",
        "AttributeName": "ttl"
    }
}
```

For more information, see Time to Live in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeTimeToLive in AWS CLI Command Reference.

get-item

The following code example shows how to use get-item.

AWS CLI

**Example 1: To read an item in a table**

The following get-item example retrieves an item from the MusicCollection table. The table has a hash-and-range primary key (Artist and SongTitle), so you must specify both of these attributes. The command also requests information about the read capacity consumed by the operation.

```
aws dynamodb get-item \
  --table-name MusicCollection \
  --key file://key.json \
  --return-consumed-capacity TOTAL
```

Contents of key.json:

```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:
For more information, see Reading an Item in the Amazon DynamoDB Developer Guide.

**Example 2: To read an item using a consistent read**

The following example retrieves an item from the MusicCollection table using strongly consistent reads.

```bash
aws dynamodb get-item \
    --table-name MusicCollection \
    --key file://key.json \
    --consistent-read \
    --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```json
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:

```json
{
```
For more information, see [Reading an Item](#) in the Amazon DynamoDB Developer Guide.

**Example 3: To retrieve specific attributes of an item**

The following example uses a projection expression to retrieve only three attributes of the desired item.

```bash
aws dynamodb get-item \
  --table-name ProductCatalog \
  --key '{"Id": {"N": "102"}}' \
  --projection-expression "#T, #C, #P" \
  --expression-attribute-names file://names.json
```

Contents of `names.json`:

```json
{
  "#T": "Title",
  "#C": "ProductCategory",
  "#P": "Price"
}
```

Output:

```json
{
  "Item": {
```
For more information, see Reading an Item in the Amazon DynamoDB Developer Guide.
- For API details, see GetItem in AWS CLI Command Reference.

### list-backups

The following code example shows how to use list-backups.

**AWS CLI**

**Example 1: To list all existing DynamoDB backups**

The following list-backups example lists all of your existing backups.

```
aws dynamodb list-backups
```

**Output:**

```json
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
        }
    ]
}
```
For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/dynamodb/latest/developerguide/dynamodb-backups.html) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To list user-created backups in a specific time range**

The following example lists only backups of the `MusicCollection` table that were created by the user (not those automatically created by DynamoDB) with a creation date between January 1, 2020 and March 1, 2020.

```bash
aws dynamodb list-backups \
  --table-name MusicCollection \ 
  --time-range-lower-bound 1577836800 \ 
  --time-range-upper-bound 1583020800 \ 
  --backup-type USER
```

**Output:**

```
{
   "BackupSummaries": [
   {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "BackupName": "MusicCollectionBackup2",
      "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 400
   }
   ]
}
```
For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 3: To limit page size**

The following example returns a list of all existing backups, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-backups \
    --page-size 1
```

Output:

```
{
    "BackupSummaries": [
    {
        "TableName": "MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
        "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
        "BackupName": "MusicCollectionBackup1",
        "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
        "BackupStatus": "AVAILABLE",
        "BackupType": "USER",
        "BackupSizeBytes": 170
    },
    ]
}
```
"TableName": "MusicCollection",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
"BackupName": "MusicCollectionBackup2",
"BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
"BackupStatus": "AVAILABLE",
"BackupType": "USER",
"BackupSizeBytes": 400
}
]
}

For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/backup-restore-index.html) in the *Amazon DynamoDB Developer Guide*.

**Example 4: To limit the number of items returned**

The following example limits the number of items returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```bash
aws dynamodb list-backups \
  --max-items 1
```

**Output:**

```json
{
  "BackupSummaries": [ 
    {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
      "BackupName": "MusicCollectionBackup1",
      "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 170
    }
  ]
}
```
Example 5: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-backups` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```bash
aws dynamodb list-backups
   --starting-token
   abCDeGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output

```json
{
   "BackupSummaries": [
   {
    "TableName": "MusicCollection",
    "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
    "BackupName": "MusicCollectionBackup2",
    "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
    "BackupStatus": "AVAILABLE",
    "BackupType": "USER",
    "BackupSizeBytes": 400
   }
   }
}
```

For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/AmazonDynamoDB/latest/developerguide/On-DemandBackup.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListBackups](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/list-backups.html) in *AWS CLI Command Reference*. 

Actions and scenarios

1897
list-contributor-insights

The following code example shows how to use list-contributor-insights.

AWS CLI

Example 1: To view a list of Contributor Insights summaries

The following list-contributor-insights example displays a list of Contributor Insights summaries.

```
aws dynamodb list-contributor-insights
```

Output:

```
{
    "ContributorInsightsSummaries": [
    {
        "TableName": "MusicCollection",
        "IndexName": "AlbumTitle-index",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "ProductCatalog",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "Forum",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "Reply",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "Thread",
        "ContributorInsightsStatus": "ENABLED"
    }
    ]
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.
Example 2: To limit the number of items returned

The following example limits the number of items returned to 4. The response includes a NextToken value with which to retrieve the next page of results.

```
aws dynamodb list-contributor-insights \
  --max-results 4
```

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "MusicCollection",
            "IndexName": "AlbumTitle-index",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "ProductCatalog",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Forum",
            "ContributorInsightsStatus": "ENABLED"
        }
    ],
    "NextToken": "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/CloudWatchContributorInsights.html) in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve the next page of results

The following command uses the NextToken value from a previous call to the `list-contributor-insights` command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```
aws dynamodb list-contributor-insights \
  --max-results 4 \n```

Output:

```
{
  "ContributorInsightsSummaries": [
    {
      "TableName": "Reply",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "Thread",
      "ContributorInsightsStatus": "ENABLED"
    }
  ]
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the Amazon DynamoDB Developer Guide.

- For API details, see [ListContributorInsights](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/list-contributor-insights.html) in AWS CLI Command Reference.

**list-global-tables**

The following code example shows how to use `list-global-tables`.

**AWS CLI**

**To list existing DynamoDB global tables**

The following `list-global-tables` example lists all of your existing global tables.

```
aws dynamodb list-global-tables
```

Output:

```
{
  "GlobalTables": [
    {
      "GlobalTableName": "MusicCollection",
      "ReplicationGroup": ["replication_group_1"]
    }
  ]
}
```
For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see ListGlobalTables in AWS CLI Command Reference.

list-tables

The following code example shows how to use list-tables.

AWS CLI

Example 1: To list tables

The following list-tables example lists all of the tables associated with the current AWS account and Region.

```bash
aws dynamodb list-tables
```

Output:

```json
{
    "TableNames": [  
        "Forum",  
        "ProductCatalog",  
        "Reply",  
        "Thread"
    ]
}
```

For more information, see Listing Table Names in the Amazon DynamoDB Developer Guide.

Example 2: To limit page size
The following example returns a list of all existing tables, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-tables \
   --page-size 1
```

Output:

```
{
   "TableNames": [
      "Forum",
      "ProductCatalog",
      "Reply",
      "Thread"
   ]
}
```

For more information, see [Listing Table Names](#) in the *Amazon DynamoDB Developer Guide*.

**Example 3: To limit the number of items returned**

The following example limits the number of items returned to 2. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-tables \
   --max-items 2
```

Output:

```
{
   "TableNames": [  
      "Forum",
      "ProductCatalog"
   ],
   "NextToken":
      "abCDeFghiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFghI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Listing Table Names](#) in the *Amazon DynamoDB Developer Guide*. 
Example 4: To retrieve the next page of results

The following command uses the NextToken value from a previous call to the list-tables command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```
aws dynamodb list-tables \
   --starting-token
   abCDeFghiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
   "TableNames": [
      "Reply",
      "Thread"
   ]
}
```

For more information, see Listing Table Names in the Amazon DynamoDB Developer Guide.

- For API details, see ListTables in AWS CLI Command Reference.

list-tags-of-resource

The following code example shows how to use list-tags-of-resource.

AWS CLI

Example 1: To list tags of a DynamoDB resource

The following list-tags-of-resource example displays tags for the MusicCollection table.

```
aws dynamodb list-tags-of-resource \
```

Output:

```
{
   "Tags": [
```
For more information, see [Tagging for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/Tagging.html) in the *Amazon DynamoDB Developer Guide*.

### Example 2: To limit the number of tags returned

The following example limits the number of tags returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```bash
aws dynamodb list-tags-of-resource \
  --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
  --max-items 1
```

**Output:**

```
{
   "Tags": [
      {
         "Key": "Owner",
         "Value": "blueTeam"
      }
   ],
   "NextToken": "abCDeFGhiJKlmnOPqrSTuvwxyZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Tagging for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/Tagging.html) in the *Amazon DynamoDB Developer Guide*.

### Example 3: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-tags-of-resource` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.
aws dynamodb list-tags-of-resource \
   --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
   --starting-token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghiK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9

Output:

```json
{
   "Tags": [
   {
      "Key": "Environment",
      "Value": "Production"
   }
   ]
}
```

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see ListTagsOfResource in AWS CLI Command Reference.

### put-item

The following code example shows how to use put-item.

**AWS CLI**

**Example 1: To add an item to a table**

The following put-item example adds a new item to the MusicCollection table.

```bash
aws dynamodb put-item \
   --table-name MusicCollection \
   --item file://item.json \
   --return-consumed-capacity TOTAL \
   --return-item-collection-metrics SIZE
```

Contents of item.json:

```json
{
   "Artist": {"S": "No One You Know"},
   "SongTitle": {"S": "Call Me Today"},
   ...
}
```
Example 2: To conditionally overwrite an item in a table

The following `put-item` example overwrites an existing item in the `MusicCollection` table only if that existing item has an `AlbumTitle` attribute with a value of `Greatest Hits`. The command returns the previous value of the item.

```bash
aws dynamodb put-item
   --table-name MusicCollection
   --item file://item.json
   --condition-expression "#A = :A"
   --expression-attribute-names file://names.json
   --expression-attribute-values file://values.json
   --return-values ALL_OLD
```

Contents of `item.json`:

```json
{
"AlbumTitle": {"S": "Greatest Hits"}
}
```

Output:

```json
{
   "ConsumedCapacity": {
      "TableName": "MusicCollection",
      "CapacityUnits": 1.0
   },
   "ItemCollectionMetrics": {
      "ItemCollectionKey": {
         "Artist": {
            "S": "No One You Know"
         }
      },
      "SizeEstimateRangeGB": [
         0.0,
         1.0
      ]
   }
}
```

For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.
Contents of names.json:

```json
{
    "#A": "AlbumTitle"
}
```

Contents of values.json:

```json
{
    "A": {"S": "Greatest Hits"}
}
```

Output:

```json
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Greatest Hits"
        },
        "Artist": {
            "S": "No One You Know"
        },
        "SongTitle": {
            "S": "Call Me Today"
        }
    }
}
```

If the key already exists, you should see the following output:

```
A client error (ConditionalCheckFailedException) occurred when calling the PutItem operation: The conditional request failed.
```

For more information, see [Writing an Item](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [PutItem](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/put-item.html) in *AWS CLI Command Reference*. 

query

The following code example shows how to use `query`.

AWS CLI

**Example 1: To query a table**

The following query example queries items in the `MusicCollection` table. The table has a hash-and-range primary key (Artist and SongTitle), but this query only specifies the hash key value. It returns song titles by the artist named "No One You Know".

```
aws dynamodb query \
  --table-name MusicCollection \
  --projection-expression "SongTitle" \
  --key-condition-expression "Artist = :v1" \
  --expression-attribute-values file://expression-attributes.json \
  --return-consumed-capacity TOTAL
```

Contents of `expression-attributes.json`:

```json
{
  ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
  "Items": [
    {
      "SongTitle": {
        "S": "Call Me Today"
      },
      "SongTitle": {
        "S": "Scared of My Shadow"
      }
    }
  ],
  "Count": 2,
  "ScannedCount": 2,
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
```

Actions and scenarios 1908
"CapacityUnits": 0.5
}
}

For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

Example 2: To query a table using strongly consistent reads and traverse the index in descending order

The following example performs the same query as the first example, but returns results in reverse order and uses strongly consistent reads.

```
aws dynamodb query \\
   --table-name MusicCollection \\
   --projection-expression "SongTitle" \\
   --key-condition-expression "Artist = :v1" \\
   --expression-attribute-values file://expression-attributes.json \\
   --consistent-read \\
   --no-scan-index-forward \\
   --return-consumed-capacity TOTAL
```

Contents of expression-attributes.json:

```
{
   "v1": {"S": "No One You Know"}
}
```

Output:

```
{
   "Items": [
   {
      "SongTitle": {
         "S": "Scared of My Shadow"
      }
   },
   {
      "SongTitle": {
         "S": "Call Me Today"
      }
   }
   ]
}
```
Example 3: To filter out specific results

The following example queries the MusicCollection but excludes results with specific values in the AlbumTitle attribute. Note that this does not affect the ScannedCount or ConsumedCapacity, because the filter is applied after the items have been read.

```bash
aws dynamodb query \
  --table-name MusicCollection \
  --key-condition-expression "#n1 = :v1" \
  --filter-expression "NOT (#n2 IN (:v2, :v3))" \
  --expression-attribute-names file://names.json \n  --expression-attribute-values file://values.json \n  --return-consumed-capacity TOTAL
```

Contents of `values.json`:

```json
{
  "":v1": {"S": "No One You Know"},
  "":v2": {"S": "Blue Sky Blues"},
  "":v3": {"S": "Greatest Hits"}
}
```

Contents of `names.json`:

```json
{
  "#n1": "Artist",
  "#n2": "AlbumTitle"
}
```

Output:
For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

Example 4: To retrieve only an item count

The following example retrieves a count of items matching the query, but does not retrieve any of the items themselves.

```
aws dynamodb query \
   --table-name MusicCollection \
   --select COUNT \
   --key-condition-expression "Artist = :v1" \
   --expression-attribute-values file://expression-attributes.json
```

Contents of expression-attributes.json:

```
{
   "v1": {"S": "No One You Know"}
}
```
Example 5: To query an index

The following example queries the local secondary index AlbumTitleIndex. The query returns all attributes from the base table that have been projected into the local secondary index. Note that when querying a local secondary index or global secondary index, you must also provide the name of the base table using the `table-name` parameter.

```
aws dynamodb query \
    --table-name MusicCollection \
    --index-name AlbumTitleIndex \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
    --select ALL_PROJECTED_ATTRIBUTES \
    --return-consumed-capacity INDEXES
```

Contents of `expression-attributes.json`:

```
{
    ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Items": [
        {
            "AlbumTitle": {
                "S": "Blue Sky Blues"
            }
        }
    ]
}
```
For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see Query in AWS CLI Command Reference.

**restore-table-from-backup**

The following code example shows how to use `restore-table-from-backup`.
AWS CLI

To restore a DynamoDB table from an existing backup

The following `restore-table-from-backup` example restores the specified table from an existing backup.

```bash
aws dynamodb restore-table-from-backup
   --target-table-name MusicCollection
   backup/01576616366715-b4e58d3a
```

Output:

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "Artist",
            "AttributeType": "S"
         },
         {
            "AttributeName": "SongTitle",
            "AttributeType": "S"
         }
      ],
      "TableName": "MusicCollection2",
      "KeySchema": [
         {
            "AttributeName": "Artist",
            "KeyType": "HASH"
         },
         {
            "AttributeName": "SongTitle",
            "KeyType": "RANGE"
         }
      ],
      "TableStatus": "CREATING",
      "CreationDateTime": 1576616274.326,
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "ReadCapacityUnits": 5,
         "WriteCapacityUnits": 5
      }
   }
}
```
For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see RestoreTableFromBackup in AWS CLI Command Reference.

**restore-table-to-point-in-time**

The following code example shows how to use `restore-table-to-point-in-time`.

**AWS CLI**

To restore a DynamoDB table to a point in time

The following `restore-table-to-point-in-time` example restores the MusicCollection table to the specified point in time.

```
aws dynamodb restore-table-to-point-in-time \
  --source-table-name MusicCollection \
  --target-table-name MusicCollectionRestore \
  --restore-date-time 1576622404.0
```

Output:
```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ],
        "TableName": "MusicCollectionRestore",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": 1576623311.86,
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollectionRestore",
        "TableId": "befd9e0e-1843-4dc6-a147-d6d00e85cb1f",
        "BillingModeSummary": {
            "BillingMode": "PROVISIONED"
        },
        "RestoreSummary": {
            "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "RestoreDateTime": 1576622404.0,
            "RestoreInProgress": true
        }
    }
}
```
For more information, see [Point-in-Time Recovery for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [RestoreTableToPointInTime](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/restore-table-to-point-in-time.html) in *AWS CLI Command Reference*.

### scan

The following code example shows how to use `scan`.

#### AWS CLI

**To scan a table**

The following `scan` example scans the entire `MusicCollection` table, and then narrows the results to songs by the artist "No One You Know". For each item, only the album title and song title are returned.

```bash
aws dynamodb scan
    --table-name MusicCollection
    --filter-expression "Artist = :a"
    --projection-expression "#ST, #AT"
    --expression-attribute-names file://expression-attribute-names.json
    --expression-attribute-values file://expression-attribute-values.json
```

**Contents of expression-attribute-names.json:**

```json
{
    "#ST": "SongTitle",
    "#AT": "AlbumTitle"
}
```

**Contents of expression-attribute-values.json:**

```json
{
    "a": {"S": "No One You Know"}
}
```
Output:

```
{
    "Count": 2,
    "Items": [
        {
            "SongTitle": {
                "S": "Call Me Today"
            },
            "AlbumTitle": {
                "S": "Somewhat Famous"
            }
        },
        {
            "SongTitle": {
                "S": "Scared of My Shadow"
            },
            "AlbumTitle": {
                "S": "Blue Sky Blues"
            }
        }
    ],
    "ScannedCount": 3,
    "ConsumedCapacity": null
}
```

For more information, see [Working with Scans in DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/working-with-scans.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [Scan](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/scan.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To add tags to a DynamoDB resource**

The following `tag-resource` example adds a tag key/value pair to the MusicCollection table.

```
aws dynamodb tag-resource \
```
This command produces no output.

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

transact-get-items

The following code example shows how to use transact-get-items.

AWS CLI

To retrieve multiple items atomically from one or more tables

The following transact-get-items example retrieves multiple items atomically.

```
aws dynamodb transact-get-items \
--transact-items file://transact-items.json \
--return-consumed-capacity TOTAL
```

Contents of transact-items.json:

```
[
  {
    "Get": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "TableName": "MusicCollection"
    }
  },
  {
    "Get": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection"
    }
  }
]
```
Output:

```
{
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 4.0,
            "ReadCapacityUnits": 4.0
        }
    ],
    "Responses": [
        {
            "Item": {
                "AlbumTitle": {
                    "S": "Songs About Life"
                },
                "Artist": {
                    "S": "Acme Band"
                },
                "SongTitle": {
                    "S": "Happy Day"
                }
            }
        },
        {
            "Item": {
                "AlbumTitle": {
                    "S": "Somewhat Famous"
                },
                "Artist": {
                    "S": "No One You Know"
                },
                "SongTitle": {
                    "S": "Call Me Today"
                }
            }
        }
    ]
}
```
For more information, see Managing Complex Workflows with DynamoDB Transactions in the Amazon DynamoDB Developer Guide.

- For API details, see TransactGetItems in AWS CLI Command Reference.

**transact-write-items**

The following code example shows how to use transact-write-items.

**AWS CLI**

**Example 1: To write items atomically to one or more tables**

The following transact-write-items example updates one item and deletes another. The operation fails if either operation fails, or if either item contains a Rating attribute.

```bash
aws dynamodb transact-write-items \
   --transact-items file://transact-items.json \
   --return-consumed-capacity TOTAL \
   --return-item-collection-metrics SIZE
```

Contents of the transact-items.json file:

```json
[
  {
    "Update": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "UpdateExpression": "SET AlbumTitle = :newval",
      "ExpressionAttributeValues": {
        ":newval": {"S": "Updated Album Title"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  },
  {
    "Delete": {
      "Key": {
        "Artist": {"S": "No One You Know"},
```
Output:

```json
{
  "ConsumedCapacity": [
    {
      "TableName": "MusicCollection",
      "CapacityUnits": 10.0,
      "WriteCapacityUnits": 10.0
    }
  ],
  "ItemCollectionMetrics": {
    "MusicCollection": [
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "No One You Know"
          }
        },
        "SizeEstimateRangeGB": [0.0, 1.0]
      },
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "Acme Band"
          }
        },
        "SizeEstimateRangeGB": [0.0, 1.0]
      }
    ]
  }
}
```
For more information, see Managing Complex Workflows with DynamoDB Transactions in the Amazon DynamoDB Developer Guide.

Example 2: To write items atomically using a client request token

The following command uses a client request token to make the call to transact-write-items idempotent, meaning that multiple calls have the same effect as one single call.

```
aws dynamodb transact-write-items \
   --transact-items file://transact-items.json \
   --client-request-token abc123
```

Contents of the transact-items.json file:

```
[
  {
    "Update": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "UpdateExpression": "SET AlbumTitle = :newval",
      "ExpressionAttributeValues": {
        ":newval": {"S": "Updated Album Title"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  },
  {
    "Delete": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  }
]
This command produces no output.

For more information, see Managing Complex Workflows with DynamoDB Transactions in the Amazon DynamoDB Developer Guide.

- For API details, see TransactWriteItems in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a DynamoDB resource

The following untag-resource example removes the tag with the key Owner from the MusicCollection table.

```
aws dynamodb untag-resource \
   --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \ 
   --tag-keys Owner
```

This command produces no output.

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-continuous-backups

The following code example shows how to use update-continuous-backups.

AWS CLI

To update continuous backup settings for a DynamoDB table

The following update-continuous-backups example enables point-in-time recovery for the MusicCollection table.

```
aws dynamodb update-continuous-backups \
```
For more information, see [Point-in-Time Recovery for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/pti.html) in the [Amazon DynamoDB Developer Guide](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/).

**update-contributor-insights**

The following code example shows how to use `update-contributor-insights`.

**AWS CLI**

**To enable Contributor Insights on a table**

The following `update-contributor-insights` example enables Contributor Insights on the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```bash
aws dynamodb update-contributor-insights \   --table-name MusicCollection \   --index-name AlbumTitle-index \   --contributor-insights-action ENABLE
```

Output:

```json
{
    "TableName": "MusicCollection",
```
For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateContributorInsights in AWS CLI Command Reference.

update-global-table-settings

The following code example shows how to use update-global-table-settings.

AWS CLI

To update provisioned write capacity settings on a DynamoDB global table

The following update-global-table-settings example sets the provisioned write capacity of the MusicCollection global table to 15.

```bash
aws dynamodb update-global-table-settings \
  --global-table-name MusicCollection \
  --global-table-provisioned-write-capacity-units 15
```

Output:

```json
{
  "GlobalTableName": "MusicCollection",
  "ReplicaSettings": [
    {
      "RegionName": "eu-west-1",
      "ReplicaStatus": "UPDATING",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      },
      "ReplicaProvisionedWriteCapacityUnits": 10,
      "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      }
    },
    {
      
    },
  ]
}
```
For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateGlobalTableSettings in AWS CLI Command Reference.

**update-global-table**

The following code example shows how to use update-global-table.

**AWS CLI**

To update a DynamoDB global table

The following update-global-table example adds a replica in the specified Region to the MusicCollection global table.

```bash
aws dynamodb update-global-table \
    --global-table-name MusicCollection \
```
Output:

```
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "eu-west-1"
            },
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "ACTIVE",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/dynamodb/latest/developerguide/gtg-tut-dynamodb-create-table-global-view.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateGlobalTable](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/update-global-table.html) in *AWS CLI Command Reference*.

### update-item

The following code example shows how to use `update-item`.

**AWS CLI**

**Example 1: To update an item in a table**

The following `update-item` example updates an item in the `MusicCollection` table. It adds a new attribute (`Year`) and modifies the `AlbumTitle` attribute. All of the attributes in the item, as they appear after the update, are returned in the response.

```
aws dynamodb update-item \
```
## Contents of key.json:

```json
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

## Contents of expression-attribute-names.json:

```json
{
    "#Y": "Year",
    "#AT": "AlbumTitle"
}
```

## Contents of expression-attribute-values.json:

```json
{
    ":y": {"N": "2015"},
    ":t": {"S": "Louder Than Ever"}
}
```

## Output:

```json
{
    "Attributes": {
        "AlbumTitle": {
            "S": "Louder Than Ever"
        },
        "Awards": {
            "N": "10"
        },
        "Artist": {
            "S": "Acme Band"
        }
    }
}
```
For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To update an item conditionally**

The following example updates an item in the `MusicCollection` table, but only if the existing item does not already have a `Year` attribute.

```bash
aws dynamodb update-item
  --table-name MusicCollection
  --key file://key.json
  --update-expression "SET #Y = :y, #AT = :t"
  --expression-attribute-names file://expression-attribute-names.json
  --expression-attribute-values file://expression-attribute-values.json
  --condition-expression "attribute_not_exists(#Y)"
```

Contents of `key.json`:

```json
{

"Year": {
  "N": "2015"
},
"SongTitle": {
  "S": "Happy Day"
},
"ConsumedCapacity": {
  "TableName": "MusicCollection",
  "CapacityUnits": 3.0
},
"ItemCollectionMetrics": {
  "ItemCollectionKey": {
    "Artist": {
      "S": "Acme Band"
    }
  },
  "SizeEstimateRangeGB": [
    0.0,
    1.0
  ]
}
}
Contents of expression-attribute-names.json:

```json
{
    "#Y": "Year",
    "#AT": "AlbumTitle"
}
```

Contents of expression-attribute-values.json:

```json
{
    ":y": {"N": "2015"},
    ":t": {"S": "Louder Than Ever"}
}
```

If the item already has a Year attribute, DynamoDB returns the following output.

An error occurred (ConditionalCheckFailedException) when calling the UpdateItem operation: The conditional request failed

For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.
- For API details, see UpdateItem in AWS CLI Command Reference.

**update-table-replica-auto-scaling**

The following code example shows how to use update-table-replica-auto-scaling.

**AWS CLI**

**To update auto scaling settings across replicas of a global table**

The following update-table-replica-auto-scaling example updates write capacity auto scaling settings across replicas of the specified global table.

```bash
aws dynamodb update-table-replica-auto-scaling \
--table-name MusicCollection \
--provisioned-write-capacity-auto-scaling-update file://auto-scaling-policy.json
```
Contents of `auto-scaling-policy.json`:

```
{
    "MinimumUnits": 10,
    "MaximumUnits": 100,
    "AutoScalingDisabled": false,
    "ScalingPolicyUpdate": {
        "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",

For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateTableReplicaAutoScaling in AWS CLI Command Reference.

update-table

The following code example shows how to use update-table.

**AWS CLI**

**Example 1: To modify a table's billing mode**

The following update-table example increases the provisioned read and write capacity on the MusicCollection table.

```bash
aws dynamodb update-table \
  --table-name MusicCollection \
  --billing-mode PROVISIONED \ 
  --provisioned-throughput ReadCapacityUnits=15,WriteCapacityUnits=10
```

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [ 
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ]
  }
}
```
For more information, see Updating a Table in the Amazon DynamoDB Developer Guide.

**Example 2: To create a global secondary index**

The following example adds a global secondary index to the MusicCollection table.

```bash
aws dynamodb update-table \
    --table-name MusicCollection \
    --attribute-definitions AttributeName=AlbumTitle,AttributeType=S \
    --global-secondary-index-updates file://gsi-updates.json
```

**Contents of gsi-updates.json:**

```json
{
    "TableName": "MusicCollection",
    "KeySchema": [
        {
            "AttributeName": "Artist",
            "KeyType": "HASH"
        },
        {
            "AttributeName": "SongTitle",
            "KeyType": "RANGE"
        }
    ],

For more information, see [Updating a Table](#) in the Amazon DynamoDB Developer Guide.

**Example 3: To enable DynamoDB Streams on a table**

The following command enables DynamoDB Streams on the MusicCollection table.

```bash
aws dynamodb update-table \
  --table-name MusicCollection \
  --stream-specification StreamEnabled=true,StreamViewType=NEW_IMAGE
```

**Output:**

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "SongTitle",
        "KeyType": "HASH"
      }
    ]
  }
}
```

For more information, see [Updating a Table](https://docs.aws.amazon.com/AmazonDynamoDB/latest/DeveloperGuide/Using-the-Management-GUI.html) in the *Amazon DynamoDB Developer Guide*.

**Example 4: To enable server-side encryption**

The following example enables server-side encryption on the MusicCollection table.

```
aws dynamodb update-table \
  --table-name MusicCollection \
```

Output:

```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "AlbumTitle",

    }}
The following code example shows how to use `update-time-to-live`.

**AWS CLI**

To update Time to Live settings on a table

The following update-time-to-live example enables Time to Live on the specified table.

```bash
aws dynamodb update-time-to-live \
  --table-name MusicCollection \
  --time-to-live-specification Enabled=true,AttributeName=ttl
```

Output:
For more information, see Time to Live in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateTimeToLive in AWS CLI Command Reference.

**DynamoDB Streams examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB Streams.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**describe-stream**

The following code example shows how to use describe-stream.

**AWS CLI**

To get information about a DynamoDB stream

The following describe-stream command displays information about the specific DynamoDB stream.

```json
{
    "TimeToLiveSpecification": {
        "Enabled": true,
        "AttributeName": "ttl"
    }
}
```
aws dynamodbstreams describe-stream \

Output:

```json
{
    "StreamDescription": {
        "StreamLabel": "2019-10-22T18:02:01.576",
        "StreamStatus": "ENABLED",
        "StreamViewType": "NEW_AND_OLD_IMAGES",
        "CreationDateTime": 1571767321.571,
        "TableName": "Music",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "SongTitle",
                "KeyType": "RANGE"
            }
        ],
        "Shards": [
            {
                "ShardId": "shardId-00000001571767321804-697ce3d2",
                "SequenceNumberRange": {
                    "StartingSequenceNumber": "4000000000000642977831",
                    "EndingSequenceNumber": "4000000000000642977831"
                }
            },
            {
                "ShardId": "shardId-00000001571780995058-40810d86",
                "ParentShardId": "shardId-00000001571767321804-697ce3d2"
            }
        ]
    }
}
```
For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeStream in AWS CLI Command Reference.

get-records

The following code example shows how to use get-records.

AWS CLI

To get records from a Dynamodb stream

The following get-records command retrieves records using the specified Amazon DynamoDB shard iterator.

```sh
aws dynamodbstreams get-records \
    stream/2019-10-22T18:02:01.576|1|

For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see GetRecords in AWS CLI Command Reference.

**get-shard-iterator**

The following code example shows how to use get-shard-iterator.
AWS CLI

To get a shard iterator

The following get-shard-iterator command retrieves a shard iterator for the specified shard.

```
aws dynamodbstreams get-shard-iterator \
   stream/2019-10-22T18:02:01.576 \
   --shard-id shardId-0000001571780995058-40810d86 \
   --shard-iterator-type LATEST
```

Output:

```
{
   stream/2019/10-22T18:02:01.576|1|

```

For more information, see [Capturing Table Activity with DynamoDB Streams](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/streams.html) in the *Amazon DynamoDB Developer Guide*.

list-streams

The following code example shows how to use list-streams.

AWS CLI

To list DynamoDB streams

The following list-streams command lists all existing Amazon DynamoDB streams within the default AWS Region.
aws dynamodbstreams list-streams

Output:

```
{
    "Streams": [ 
        {
            "TableName": "Music",
            "StreamLabel": "2019-10-22T18:02:01.576"
        }
    ]
}
```

For more information, see [Capturing Table Activity with DynamoDB Streams](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/streams.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListStreams](https://docs.aws.amazon.com/cli/latest/reference/dynamodbstreams/list-streams.html) in *AWS CLI Command Reference*.

### Amazon EC2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)
Actions

accept-address-transfer

The following code example shows how to use accept-address-transfer.

AWS CLI

To accept an Elastic IP address transferred to your account

The following accept-address-transfer example accepts the transfer of the specified Elastic IP address to your account.

```bash
aws ec2 accept-address-transfer \\ --address 100.21.184.216
```

Output:

```
{
   "AddressTransfer": {
      "PublicIp": "100.21.184.216",
      "AllocationId": "eipalloc-09ad461b0d03f6aaf",
      "TransferAccountId": "123456789012",
      "TransferOfferExpirationTimestamp": "2023-02-22T20:51:10.000Z",
      "TransferOfferAcceptedTimestamp": "2023-02-22T22:52:54.000Z",
      "AddressTransferStatus": "accepted"
   }
}
```

For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

- For API details, see AcceptAddressTransfer in AWS CLI Command Reference.

accept-reserved-instances-exchange-quote

The following code example shows how to use accept-reserved-instances-exchange-quote.

AWS CLI

To perform a Convertible Reserved Instance exchange

This example performs an exchange of the specified Convertible Reserved Instances.
Command:

```
aws ec2 accept-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=b747b472-423c-48f3-8cee-679bcexample
```

Output:

```
{
  "ExchangeId": "riex-e68ed3c1-8bc8-4c17-af77-811afexample"
}
```

- For API details, see [AcceptReservedInstancesExchangeQuote](#) in [AWS CLI Command Reference](#).

**accept-transit-gateway-peering-attachment**

The following code example shows how to use `accept-transit-gateway-peering-attachment`.

**AWS CLI**

**To accept a transit gateway peering attachment**

The following `accept-transit-gateway-peering-attachment` example accepts the specified transit gateway peering attachment. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 accept-transit-gateway-peering-attachment \
  --transit-gateway-attachment-id tgw-attach-4455667788aabbcccd \
  --region us-east-2
```

Output:

```
{
  "TransitGatewayPeeringAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
    "RequesterTgwInfo": {
      "TransitGatewayId": "tgw-123abc05e04123abc",
      "OwnerId": "123456789012",
      "Region": "us-west-2"
    },
```

Actions and scenarios
For more information, see [Transit Gateway Peering Attachments](#) in the *Transit Gateways Guide*.

- For API details, see [AcceptTransitGatewayPeeringAttachment](#) in *AWS CLI Command Reference*.

### accept-transit-gateway-vpc-attachment

The following code example shows how to use `accept-transit-gateway-vpc-attachment`.

**AWS CLI**

**To accept a request to attach a VPC to a transit gateway.**

The following `accept-transit-gateway-vpc-attachment` example accepts the request for the specified attachment.

```bash
aws ec2 accept-transit-gateway-vpc-attachment \\
  --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

**Output:**

```json
{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8ffdd50fEXAMPLE",
    "VpcOwnerId": "123456789012",
    "State": "pending",
    "SubnetIds": [
      "subnet-0752213d59EXAMPLE"
    ],
    "CreationTime": "2019-07-10T17:33:46.000Z",
    "Options": {
      "DnsSupport": "enable",
    }
  }
}
```
For more information, see Transit Gateway Attachments to a VPC in the Transit Gateways Guide.

- For API details, see AcceptTransitGatewayVpcAttachment in AWS CLI Command Reference.

accept-vpc-endpoint-connections

The following code example shows how to use accept-vpc-endpoint-connections.

AWS CLI

To accept an interface endpoint connection request

This example accepts the specified endpoint connection request for the specified endpoint service.

Command:

```
aws ec2 accept-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```
{
   "Unsuccessful": []
}
```

- For API details, see AcceptVpcEndpointConnections in AWS CLI Command Reference.

accept-vpc-peering-connection

The following code example shows how to use accept-vpc-peering-connection.

AWS CLI

To accept a VPC peering connection

This example accepts the specified VPC peering connection request.
Command:

```bash
aws ec2 accept-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```json
{
  "VpcPeeringConnection": {
    "Status": {
      "Message": "Provisioning",
      "Code": "provisioning"
    },
    "Tags": [],
    "AccepterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-4445556666",
      "CidrBlock": "10.0.1.0/28"
    },
    "VpcPeeringConnectionId": "pcx-1a2b3c4d",
    "RequesterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-111abc45",
      "CidrBlock": "10.0.0.0/28"
    }
  }
}
```

- For API details, see [AcceptVpcPeeringConnection](#) in *AWS CLI Command Reference*.

## advertise-byoip-cidr

The following code example shows how to use `advertise-byoip-cidr`.

### AWS CLI

#### To advertise an address range

The following `advertise-byoip-cidr` example advertises the specified public IPv4 address range.

```bash
aws ec2 advertise-byoip-cidr \
```
--cidr 203.0.113.25/24

Output:

```json
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
      "State": "provisioned"
   }
}
```

- For API details, see `AdvertiseByoipCidr` in `AWS CLI Command Reference`.

**allocate-address**

The following code example shows how to use `allocate-address`.

**AWS CLI**

**Example 1: To allocate an Elastic IP address from Amazon's address pool**

The following `allocate-address` example allocates an Elastic IP address. Amazon EC2 selects the address from Amazon's address pool.

```
aws ec2 allocate-address
```

Output:

```json
{
   "PublicIp": "70.224.234.241",
   "AllocationId": "eipalloc-01435ba59eEXAMPLE",
   "PublicIpv4Pool": "amazon",
   "NetworkBorderGroup": "us-west-2",
   "Domain": "vpc"
}
```

For more information, see [Elastic IP addresses](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/ElasticIP.html) in the Amazon EC2 User Guide.

**Example 2: To allocate an Elastic IP address and associate it with a network border group**
The following `allocate-address` example allocates an Elastic IP address and associates it with the specified network border group.

```bash
aws ec2 allocate-address \
   --network-border-group us-west-2-lax-1
```

Output:

```
{
   "PublicIp": "70.224.234.241",
   "AllocationId": "eipalloc-e03dd489ceEXAMPLE",
   "PublicIpv4Pool": "amazon",
   "NetworkBorderGroup": "us-west-2-lax-1",
   "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the Amazon EC2 User Guide.

**Example 3: To allocate an Elastic IP address from an address pool that you own**

The following `allocate-address` example allocates an Elastic IP address from an address pool that you have brought to your Amazon Web Services account. Amazon EC2 selects the address from the address pool.

```bash
aws ec2 allocate-address \
   --public-ipv4-pool ipv4pool-ec2-1234567890abcdef0
```

Output:

```
{
   "AllocationId": "eipalloc-02463d08ceEXAMPLE",
   "NetworkBorderGroup": "us-west-2",
   "CustomerOwnedIp": "18.218.95.81",
   "CustomerOwnedIpv4Pool": "ipv4pool-ec2-1234567890abcdef0",
   "Domain": "vpc"
   "NetworkBorderGroup": "us-west-2",
}
```

For more information, see Elastic IP addresses in the Amazon EC2 User Guide.

- For API details, see AllocateAddress in AWS CLI Command Reference.
allocate-hosts

The following code example shows how to use allocate-hosts.

AWS CLI

Example 1: To allocate a Dedicated Host

The following allocate-hosts example allocates a single Dedicated Host in the eu-west-1a Availability Zone, onto which you can launch m5.large instances. By default, the Dedicated Host accepts only target instance launches, and does not support host recovery.

```bash
aws ec2 allocate-hosts \
   --instance-type m5.large \
   --availability-zone eu-west-1a \
   --quantity 1
```

Output:

```json
{
   "HostIds": [
       "h-07879acf49EXAMPLE"
   ]
}
```

Example 2: To allocate a Dedicated Host with auto-placement and host recovery enabled

The following allocate-hosts example allocates a single Dedicated Host in the eu-west-1a Availability Zone with auto-placement and host recovery enabled.

```bash
aws ec2 allocate-hosts \
   --instance-type m5.large \
   --availability-zone eu-west-1a \
   --auto-placement on \
   --host-recovery on \
   --quantity 1
```

Output:

```json
{
   "HostIds": [

   ]
}
```
Example 3: To allocate a Dedicated Host with tags

The following `allocate-hosts` example allocates a single Dedicated Host and applies a tag with a key named `purpose` and a value of `production`.

```bash
aws ec2 allocate-hosts \
    --instance-type m5.large \
    --availability-zone eu-west-1a \
    --quantity 1 \
    --tag-specifications 'ResourceType=dedicated-host,Tags={Key=purpose,Value=production}'
```

Output:

```json
{
    "HostIds": [
        "h-07879acf49EXAMPLE"
    ]
}
```

For more information, see [Allocating Dedicated Hosts](http://example.com) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [AllocateHosts](http://example.com) in *AWS CLI Command Reference*.

---

**allocate-ipam-pool-cidr**

The following code example shows how to use `allocate-ipam-pool-cidr`.

**AWS CLI**

To allocate a CIDR from an IPAM pool

The following `allocate-ipam-pool-cidr` example allocates a CIDR from an IPAM pool.

(Linux):

```bash
aws ec2 allocate-ipam-pool-cidr \
```
```bash
--ipam-pool-id ipam-pool-0533048da7d823723 \ 
--netmask-length 24
```

(Windows):

```bash
aws ec2 allocate-ipam-pool-cidr ^
--ipam-pool-id ipam-pool-0533048da7d823723 ^
--netmask-length 24
```

Output:

```json
{
   "IpamPoolAllocation": {
      "Cidr": "10.0.0.0/24",
      "IpamPoolAllocationId": "ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd",
      "ResourceType": "custom",
      "ResourceOwner": "123456789012"
   }
}
```

For more information, see [Manually allocate a CIDR to a pool to reserve IP address space](https://docs.aws.amazon.com/vpcipam/latest/userguide/ipam-manually-allocate-cidr.html) in the [Amazon VPC IPAM User Guide](https://docs.aws.amazon.com/vpcipam/latest/userguide/).  

---

**apply-security-groups-to-client-vpn-target-network**

The following code example shows how to use `apply-security-groups-to-client-vpn-target-network`.

**AWS CLI**

**To apply security groups to a target network for a Client VPN endpoint**

The following `apply-security-groups-to-client-vpn-target-network` example applies security group `sg-01f6e627a89f4db32` to the association between the specified target network and Client VPN endpoint.

```bash
aws ec2 apply-security-groups-to-client-vpn-target-network \ 
--security-group-ids sg-01f6e627a89f4db32 \ 
--vpc-id vpc-0e2110c2f324332e0 \
```

---

Actions and scenarios 1962
Output:

```
{
   "SecurityGroupIds": [
      "sg-01f6e627a89f4db32"
   ]
}
```

For more information, see [Target Networks](#) in the [AWS Client VPN Administrator Guide](#).

- For API details, see [ApplySecurityGroupsToClientVpnTargetNetwork](#) in [AWS CLI Command Reference](#).

### assign-ipv6-addresses

The following code example shows how to use `assign-ipv6-addresses`.

**AWS CLI**

**To assign specific IPv6 addresses to a network interface**

This example assigns the specified IPv6 addresses to the specified network interface.

**Command:**

```
```

**Output:**

```
{
   "AssignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071",
      "2001:db8:1234:1a00:9691:9503:25ad:1761"
   ],
   "NetworkInterfaceId": "eni-38664473"
}
```

**To assign IPv6 addresses that Amazon selects to a network interface**
This example assigns two IPv6 addresses to the specified network interface. Amazon automatically assigns these IPv6 addresses from the available IPv6 addresses in the IPv6 CIDR block range of the subnet.

Command:

```
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473 --ipv6-address-count 2
```

Output:

```
{
   "AssignedIpv6Addresses": [ 
   "2001:db8:1234:1a00:3304:8879:34cf:4071",
   "2001:db8:1234:1a00:9691:9503:25ad:1761"
   ],
   "NetworkInterfaceId": "eni-38664473"
}
```

- For API details, see AssignIpv6Addresses in AWS CLI Command Reference.

**assign-private-ip-addresses**

The following code example shows how to use assign-private-ip-addresses.

**AWS CLI**

**To assign a specific secondary private IP address a network interface**

This example assigns the specified secondary private IP address to the specified network interface. If the command succeeds, no output is returned.

Command:

```
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```

**To assign secondary private IP addresses that Amazon EC2 selects to a network interface**

This example assigns two secondary private IP addresses to the specified network interface. Amazon EC2 automatically assigns these IP addresses from the available IP addresses in the
CIDR block range of the subnet the network interface is associated with. If the command succeeds, no output is returned.

Command:

```
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --secondary-private-ip-address-count 2
```

- For API details, see AssignPrivateIpAddresses in AWS CLI Command Reference.

**assign-private-nat-gateway-address**

The following code example shows how to use assign-private-nat-gateway-address.

**AWS CLI**

**To assign private IP addresses to your private NAT gateway**

The following assign-private-nat-gateway-address example assigns two private IP addresses to the specified private NAT gateway.

```
aws ec2 assign-private-nat-gateway-address \
   --nat-gateway-id nat-1234567890abcdef0 \
   --private-ip-address-count 2
```

Output:

```
{
   "NatGatewayId": "nat-1234567890abcdef0",
   "NatGatewayAddresses": [
   {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "IsPrimary": false,
      "Status": "assigning"
   },
   {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "IsPrimary": false,
      "Status": "assigning"
   }
   ]
}```
For more information, see [NAT gateways](https://docs.aws.amazon.com/vpc/latest/userguide/NAT-Gateway.html) in the Amazon VPC User Guide.

## associate-address

The following code example shows how to use `associate-address`.

### AWS CLI

**To associate an Elastic IP addresses in EC2-Classic**

This example associates an Elastic IP address with an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 associate-address --instance-id i-07ffe74c7330ebf53 --public-ip 198.51.100.0
```

**To associate an Elastic IP address in EC2-VPC**

This example associates an Elastic IP address with an instance in a VPC.

Command:

```
aws ec2 associate-address --instance-id i-0b263919b6498b123 --allocation-id eipalloc-64d5890a
```

Output:

```json
{
  "AssociationId": "eipassoc-2bebb745"
}
```

This example associates an Elastic IP address with a network interface.

Command:

```
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d
```
This example associates an Elastic IP with a private IP address that's associated with a network interface.

**Command:**

```
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d --private-ip-address 10.0.0.85
```

- For API details, see [AssociateAddress](#) in *AWS CLI Command Reference*.

### associate-client-vpn-target-network

The following code example shows how to use `associate-client-vpn-target-network`.

**AWS CLI**

**To associate a target network with a Client VPN endpoint**

The following `associate-client-vpn-target-network` example associates a subnet with the specified Client VPN endpoint.

```
aws ec2 associate-client-vpn-target-network \
--subnet-id subnet-0123456789abcabca \
--client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

**Output:**

```
{
    "AssociationId": "cvpn-assoc-12312312312312312",
    "Status": {
        "Code": "associating"
    }
}
```

For more information, see [Target Networks](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [AssociateClientVpnTargetNetwork](#) in *AWS CLI Command Reference*.

### associate-dhcp-options

The following code example shows how to use `associate-dhcp-options`.

Actions and scenarios
**AWS CLI**

**To associate a DHCP options set with your VPC**

This example associates the specified DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 associate-dhcp-options --dhcp-options-id dopt-d9070ebb --vpc-id vpc-a01106c2
```

**To associate the default DHCP options set with your VPC**

This example associates the default DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 associate-dhcp-options --dhcp-options-id default --vpc-id vpc-a01106c2
```

- For API details, see [AssociateDhcpOptions](https://aws.amazon.com/sdk-for-python/#AssociateDhcpOptions) in *AWS CLI Command Reference*.

**associate-iam-instance-profile**

The following code example shows how to use `associate-iam-instance-profile`.

**AWS CLI**

**To associate an IAM instance profile with an instance**

This example associates an IAM instance profile named `admin-role` with instance `i-123456789abcde123`.

Command:

```bash
aws ec2 associate-iam-instance-profile --instance-id i-123456789abcde123 --iam-instance-profile Name=admin-role
```

Output:

```json
{}
```
For API details, see [AssociateIamInstanceProfile](#) in *AWS CLI Command Reference.*

### associate-instance-event-window

The following code example shows how to use `associate-instance-event-window`.

**AWS CLI**

**Example 1: To associate one or more instances with an event window**

The following `associate-instance-event-window` example associates one or more instances with an event window.

```bash
aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

**Output:**

```json
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [
        "i-1234567890abcdef0",
        "i-0598c7d356eba48d7"
      ],
      "Tags": []
    }
  }
}
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To associate instance tags with an event window**

The following associate-instance-event-window example associates instance tags with an event window. Enter an instance-event-window-id parameter to specify the event window. To associate instance tags, specify the association-target parameter, and for the parameter value, specify one or more tags.

```
aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

**Output:**

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [
        {
          "Key": "k2",
          "Value": "v2"
        },
        {
          "Key": "k1",
          "Value": "v1"
        }
      ],
      "DedicatedHostIds": []
    }
  }
}
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 3: To associate a Dedicated Host with an event window**

The following `associate-instance-event-window` example associates a Dedicated Host with an event window. Enter an `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one of more Dedicated Host IDs.

```bash
aws ec2 associate-instance-event-window \\
--region us-east-1 \\
--instance-event-window-id iew-0abcdef1234567890 \\
--association-target "DedicatedHostIds=h-029fa35a02b99801d"
```

Output:

```json
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": [
                "h-029fa35a02b99801d"
            ],
            "State": "creating"
        }
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see AssociateInstanceEventWindow in AWS CLI Command Reference.
associate-nat-gateway-address

The following code example shows how to use associate-nat-gateway-address.

AWS CLI

To associate an Elastic IP address with a public NAT gateway

The following associate-nat-gateway-address example associates the specified Elastic IP address with the specified public NAT gateway. AWS automatically assigns a secondary private IPv4 address.

```bash
aws ec2 associate-nat-gateway-address \
   --nat-gateway-id nat-1234567890abcdef0 \ 
   --allocation-ids eipalloc-0be6ecac95EXAMPLE
```

Output:

```json
{
   "NatGatewayId": "nat-1234567890abcdef0",
   "NatGatewayAddresses": [
      {
         "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
         "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
         "IsPrimary": false,
         "Status": "associating"
      }
   ]
}
```

For more information, see [NAT gateways](https://docs.aws.amazon.com/vpc/latest/userguide/NAT-gateway.html) in the *Amazon VPC User Guide*.

- For API details, see [AssociateNatGatewayAddress](https://docs.aws.amazon.com/cli/latest/reference/ec2/associate-nat-gateway-address.html) in *AWS CLI Command Reference*.

associate-route-table

The following code example shows how to use associate-route-table.

AWS CLI

To associate a route table with a subnet
This example associates the specified route table with the specified subnet.

Command:

```
aws ec2 associate-route-table --route-table-id rtb-22574640 --subnet-id subnet-9d4a7b6c
```

Output:

```
{
    "AssociationId": "rtbassoc-781d0d1a"
}
```

- For API details, see `AssociateRouteTable` in `AWS CLI Command Reference`.

**associate-subnet-cidr-block**

The following code example shows how to use `associate-subnet-cidr-block`.

**AWS CLI**

**To associate an IPv6 CIDR block with a subnet**

This example associates an IPv6 CIDR block with the specified subnet.

Command:

```
aws ec2 associate-subnet-cidr-block --subnet-id subnet-5f46ec3b --ipv6-cidr-block 2001:db8:1234:1a00::/64
```

Output:

```
{
    "SubnetId": "subnet-5f46ec3b",
    "Ipv6CidrBlockAssociation": {
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
        "AssociationId": "subnet-cidr-assoc-3aa54053",
        "Ipv6CidrBlockState": {
            "State": "associating"
        }
    }
}
For API details, see AssociateSubnetCidrBlock in AWS CLI Command Reference.

associate-transit-gateway-multicast-domain

The following code example shows how to use associate-transit-gateway-multicast-domain.

**AWS CLI**

To associate a transit gateway with a multicast domain

The following associate-transit-gateway-multicast-domain example associates the specified subnet and attachment with the specified multicast domain.

```
aws ec2 associate-transit-gateway-multicast-domain \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --transit-gateway-attachment-id tgw-attach-028c1dd0f8f5cbe8e \
  --subnet-ids subnet-000de86e3b49c932a \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
  "Associations": [
    {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
      "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8f5cbe8e",
      "ResourceId": "vpc-01128d2c240c09bd5",
      "ResourceType": "vpc",
      "Subnets": [
        {
          "SubnetId": "subnet-000de86e3b49c932a",
          "State": "associating"
        }
      ]
    }
  ]
}
```

For more information, see Managing multicast domains in the Transit Gateways Guide.
associate-transit-gateway-route-table

The following code example shows how to use `associate-transit-gateway-route-table`.

AWS CLI

To associate a transit gateway route table with a transit gateway attachment

The following example associates the specified transit gateway route table with the specified VPC attachment.

```
aws ec2 associate-transit-gateway-route-table
   --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
   --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```
{
   "Association": {
      "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
      "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
      "ResourceId": "vpc-0065acced4EXAMPLE",
      "ResourceType": "vpc",
      "State": "associating"
   }
}
```

For more information, see [Associate a Transit Gateway Route Table](https://docs.aws.amazon.com/TransitGateways/latest/userguide/associate-route-table.html) in the *AWS Transit Gateways Guide*.

- For API details, see [AssociateTransitGatewayMulticastDomain](https://docs.aws.amazon.com/cli/latest/reference/ec2/associate-transit-gateway-route-table.html) in *AWS CLI Command Reference*.

associate-vpc-cidr-block

The following code example shows how to use `associate-vpc-cidr-block`.

AWS CLI

**Example 1: To associate an Amazon-provided IPv6 CIDR block with a VPC**
The following `associate-vpc-cidr-block` example associates an IPv6 CIDR block with the specified VPC:

```bash
aws ec2 associate-vpc-cidr-block \
  --amazon-provided-ipv6-cidr-block \
  --ipv6-cidr-block-network-border-group us-west-2-lax-1 \
  --vpc-id vpc-8EXAMPLE
```

Output:

```
{
  "Ipv6CidrBlockAssociation": {
    "AssociationId": "vpc-cidr-assoc-0838ce7d9dEXAMPLE",
    "Ipv6CidrBlockState": {
      "State": "associating"
    },
    "NetworkBorderGroup": "us-west-2-lax-1"
  },
  "VpcId": "vpc-8EXAMPLE"
}
```

**Example 2:** To associate an additional IPv4 CIDR block with a VPC

The following `associate-vpc-cidr-block` example associates the IPv4 CIDR block `10.2.0.0/16` with the specified VPC.

```bash
aws ec2 associate-vpc-cidr-block \
  --vpc-id vpc-1EXAMPLE \
  --cidr-block 10.2.0.0/16
```

Output:

```
{
  "CidrBlockAssociation": {
    "AssociationId": "vpc-cidr-assoc-2EXAMPLE",
    "CidrBlock": "10.2.0.0/16",
    "CidrBlockState": {
      "State": "associating"
    }
  },
  "VpcId": "vpc-1EXAMPLE"
}
```
attach-classic-link-vpc

The following code example shows how to use `attach-classic-link-vpc`.

**AWS CLI**

**To link (attach) an EC2-Classic instance to a VPC**

This example links instance i-1234567890abcdef0 to VPC vpc-88888888 through the VPC security group sg-12312312.

Command:

```
aws ec2 attach-classic-link-vpc --instance-id i-1234567890abcdef0 --vpc-id vpc-88888888 --groups sg-12312312
```

Output:

```
{
   "Return": true
}
```

• For API details, see [AttachClassicLinkVpc](#) in *AWS CLI Command Reference*.

attach-internet-gateway

The following code example shows how to use `attach-internet-gateway`.

**AWS CLI**

**To attach an internet gateway to your VPC**

The following `attach-internet-gateway` example attaches the specified internet gateway to the specific VPC.

```
aws ec2 attach-internet-gateway \
```

• For API details, see [AttachInternetGateway](#) in *AWS CLI Command Reference*. 
--internet-gateway-id igw-0d0fb496b3EXAMPLE \
--vpc-id vpc-0a60eb65b4EXAMPLE

This command produces no output.

For more information, see Internet gateways in the Amazon VPC User Guide.
• For API details, see AttachInternetGateway in AWS CLI Command Reference.

attach-network-interface

The following code example shows how to use attach-network-interface.

AWS CLI

Example 1: To attach a network interface to an instance

The following attach-network-interface example attaches the specified network interface to the specified instance.

aws ec2 attach-network-interface \
    --network-interface-id eni-0dc56a8d4640ad10a \
    --instance-id i-1234567890abcdef0 \
    --device-index 1

Output:

{
    "AttachmentId": "eni-attach-01a8fc87363f07cf9"
}

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

Example 2: To attach a network interface to an instance with multiple network cards

The following attach-network-interface example attaches the specified network interface to the specified instance and network card.

aws ec2 attach-network-interface \
    --network-interface-id eni-07483b1897541ad83 \
    --instance-id i-01234567890abcdef \

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

- For API details, see AttachNetworkInterface in AWS CLI Command Reference.

**attach-verified-access-trust-provider**

The following code example shows how to use attach-verified-access-trust-provider.

**AWS CLI**

**To attach a trust provider to an instance**

The following attach-verified-access-trust-provider example attaches the specified Verified Access trust provider to the specified Verified Access instance.

```
aws ec2 attach-verified-access-trust-provider \
   --verified-access-instance-id vai-0ce000c0b7643abea \
   --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

**Output:**

```
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T19:00:38",
      "LastUpdatedTime": "2023-08-25T19:00:38"
   },
   "VerifiedAccessInstance": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
```
```
For more information, see [Verified Access instances](#) in the [*AWS Verified Access User Guide*](#).

- For API details, see [AttachVerifiedAccessTrustProvider](#) in [*AWS CLI Command Reference*](#).

**attach-volume**

The following code example shows how to use `attach-volume`.

**AWS CLI**

**To attach a volume to an instance**

This example command attaches a volume (vol-1234567890abcdef0) to an instance (i-01474ef662b89480) as /dev/sdf.

**Command:**

```
aws ec2 attach-volume --volume-id vol-1234567890abcdef0 --instance-id i-01474ef662b89480 --device /dev/sdf
```

**Output:**

```
{
   "AttachTime": "YYYY-MM-DDTHH:MM:SS.000Z",
   "InstanceId": "i-01474ef662b89480",
   "VolumeId": "vol-1234567890abcdef0",
   "State": "attaching",
   "Device": "/dev/sdf"
}
```
The following code example shows how to use `attach-vpn-gateway`.

**AWS CLI**

To attach a virtual private gateway to your VPC

The following `attach-vpn-gateway` example attaches the specified virtual private gateway to the specified VPC.

```bash
aws ec2 attach-vpn-gateway \
    --vpn-gateway-id vgw-9a4cacf3 \
    --vpc-id vpc-a01106c2
```

Output:

```json
{
    "VpcAttachment": {
        "State": "attaching",
        "VpcId": "vpc-a01106c2"
    }
}
```

The following code example shows how to use `authorize-client-vpn-ingress`.

**AWS CLI**

To add an authorization rule for a Client VPN endpoint

The following `authorize-client-vpn-ingress` example adds an ingress authorization rule that permits all clients to access the internet (0.0.0.0/0).

```bash
aws ec2 authorize-client-vpn-ingress \
```

For API details, see [AttachVolume](https://docs.aws.amazon.com/cli/latest/reference/ec2/attach-volume) in *AWS CLI Command Reference*.

For API details, see [AttachVpnGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/attach-vpn-gateway) in *AWS CLI Command Reference*.
The following code example shows how to use `authorize-security-group-egress`.

**AWS CLI**

**To add a rule that allows outbound traffic to a specific address range**

This example command adds a rule that grants access to the specified address ranges on TCP port 80.

Command (Linux):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
    IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges='[[CidrIp=10.0.0.0/16]]'
```

Command (Windows):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
    IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]
```

**To add a rule that allows outbound traffic to a specific security group**

This example command adds a rule that grants access to the specified security group on TCP port 80.
**Command (Linux):**

```bash
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
    IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs='[GroupId=sg-4b51a32f]'
```

**Command (Windows):**

```bash
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
    IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs=[{GroupId=sg-4b51a32f}]
```

- For API details, see [AuthorizeSecurityGroupEgress](#) in *AWS CLI Command Reference*.

---

**authorize-security-group-ingress**

The following code example shows how to use `authorize-security-group-ingress`.

**AWS CLI**

**Example 1: To add a rule that allows inbound SSH traffic**

The following `authorize-security-group-ingress` example adds a rule that allows inbound traffic on TCP port 22 (SSH).

```bash
aws ec2 authorize-security-group-ingress \
    --group-id sg-1234567890abcdef0 \
    --protocol tcp \
    --port 22 \
    --cidr 203.0.113.0/24
```

**Output:**

```json
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-01afa97ef3e1bedfc",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
            "IpRanges": [
                {
                    "CidrIp": "203.0.113.0/24",
                    "Description": "Allow inbound SSH traffic"
                }
            ]
        }
    ]
}
```
Example 2: To add a rule that allows inbound HTTP traffic from another security group

The following authorize-security-group-ingress example adds a rule that allows inbound access on TCP port 80 from the source security group sg-1a2b3c4d. The source group must be in the same VPC or in a peer VPC (requires a VPC peering connection). Incoming traffic is allowed based on the private IP addresses of instances that are associated with the source security group (not the public IP address or Elastic IP address).

```
aws ec2 authorize-security-group-ingress \
  --group-id sg-1234567890abcdef0 \n  --protocol tcp \n  --port 80 \n  --source-group sg-1a2b3c4d
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupId": "sg-090f4be99120f638a7",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 80,
      "ToPort": 80,
      "ReferencedGroupInfo": {
        "GroupId": "sg-1a2b3c4d",
        "UserId": "123456789012"
      }
    }
  ]
}
```

Example 3: To add multiple rules in the same call
The following authorize-security-group-ingress example uses the ip-permissions parameter to add two inbound rules, one that enables inbound access on TCP port 3389 (RDP) and the other that enables ping/ICMP.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="[{CidrIp=172.31.0.0/16}]" IpProtocol=icmp,FromPort=-1,ToPort=-1,IpRanges="[{CidrIp=172.31.0.0/16}]"
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-00e06e5d3690f29f3",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "CidrIpv4": "172.31.0.0/16"
    },
    {
      "SecurityGroupRuleId": "sgr-0a133dd4493944b87",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv4": "172.31.0.0/16"
    }
  ]
}
```

**Example 4: To add a rule for ICMP traffic**

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows the ICMP message Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4) from anywhere.
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges="[\{CidrIp=0.0.0.0/0\}]"

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0de3811019069b787",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmp",
            "FromPort": 3,
            "ToPort": 4,
            "CidrIpv4": "0.0.0.0/0"
        }
    ]
}
```

**Example 5: To add a rule for IPv6 traffic**

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows SSH access (port 22) from the IPv6 range 2001:db8:1234:1a00::/64.

aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=22,ToPort=22,Ipv6Ranges="[\{CidrIpv6=2001:db8:1234:1a00::/64\}]"

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-0455bc68b60805563",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
            "CidrIpv6": "2001:db8:1234:1a00::/64"
        }
    ]
}
```
Example 6: To add a rule for ICMPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows ICMPv6 traffic from anywhere.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmpv6,Ipv6Ranges="["CidrIpv6=::/0"]"
```

Output:

```json
{
   "Return": true,
   "SecurityGroupRules": [
       {
           "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
           "GroupId": "sg-1234567890abcdef0",
           "GroupOwnerId": "123456789012",
           "IsEgress": false,
           "IpProtocol": "icmpv6",
           "FromPort": -1,
           "ToPort": -1,
           "CidrIpv6": "::/0"
       }
   ]
}
```

Example 7: Add a rule with a description

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows RDP traffic from the specified IPv4 address range. The rule includes a description to help you identify it later.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="["CidrIp=203.0.113.0/24,Description='RDP access from NY office']"
```

Output:

```json
{
   "Return": true,
   "SecurityGroupRules": [
       {
           "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
           "GroupId": "sg-1234567890abcdef0",
           "GroupOwnerId": "123456789012",
           "IsEgress": false,
           "IpProtocol": "tcp",
           "FromPort": 3389,
           "ToPort": 3389,
           "CidrIp": "203.0.113.0/24",
           "Description": "RDP access from NY office"
       }
   ]
}
```
Example 8: To add an inbound rule that uses a prefix list

The following authorize-security-group-ingress example uses the ip-permissions parameter to add an inbound rule that allows all traffic for the CIDR ranges in the specified prefix list.

```
aws ec2 authorize-security-group-ingress --group-id sg-04a351bfe432d4e71 --ip-permissions IpProtocol=all,PrefixListIds="[{PrefixListId=pl-002dc3ec097de1514}]"
```

Output:

```json
{
   "Return": true,
   "SecurityGroupRules": [
      {
         "SecurityGroupRuleId": "sgr-09c74b32f677c6c7c",
         "GroupId": "sg-1234567890abcdef0",
         "GroupOwnerId": "123456789012",
         "IsEgress": false,
         "IpProtocol": "-1",
         "FromPort": -1,
         "ToPort": -1,
         "PrefixListId": "pl-0721453c7ac4ec009"
      }
   ]
}
```
For more information, see Security groups in the Amazon VPC User Guide.

- For API details, see AuthorizeSecurityGroupIngress in AWS CLI Command Reference.

bundle-instance

The following code example shows how to use bundle-instance.

**AWS CLI**

**To bundle an instance**

This example bundles instance i-1234567890abcdef0 to a bucket called bundletasks. Before you specify values for your access key IDs, review and follow the guidance in Best Practices for Managing AWS Access Keys.

Command:

```bash
aws ec2 bundle-instance --instance-id i-1234567890abcdef0 --bucket bundletasks --prefix winami --owner-akid AK12AJEXAMPLE --owner-sak example123example
```

Output:

```json
{
   "BundleTask": {
      "UpdateTime": "2015-09-15T13:30:35.000Z",
      "InstanceId": "i-1234567890abcdef0",
      "Storage": {
         "S3": {
            "Prefix": "winami",
            "Bucket": "bundletasks"
         }
      },
      "State": "pending",
      "StartTime": "2015-09-15T13:30:35.000Z",
      "BundleId": "bun-294e041f"
   }
}
```

- For API details, see BundleInstance in AWS CLI Command Reference.

Actions and scenarios 1989
cancel-bundle-task

The following code example shows how to use cancel-bundle-task.

AWS CLI

To cancel a bundle task

This example cancels bundle task bun-2a4e041c.

Command:

```bash
aws ec2 cancel-bundle-task --bundle-id bun-2a4e041c
```

Output:

```json
{
    "BundleTask": {
        "UpdateTime": "2015-09-15T13:27:40.000Z",
        "InstanceId": "i-1234567890abcdef0",
        "Storage": {
            "S3": {
                "Prefix": "winami",
                "Bucket": "bundletasks"
            }
        },
        "State": "cancelling",
        "StartTime": "2015-09-15T13:24:35.000Z",
        "BundleId": "bun-2a4e041c"
    }
}
```

• For API details, see CancelBundleTask in AWS CLI Command Reference.

cancel-capacity-reservation-fleets

The following code example shows how to use cancel-capacity-reservation-fleets.

AWS CLI

To cancel a Capacity Reservation Fleet
The following `cancel-capacity-reservation-fleets` example cancels the specified Capacity Reservation Fleet and the capacity it reserves. When you cancel a Fleet, its status changes to cancelled, and it can no longer create new Capacity Reservations. Additionally, all of the individual Capacity Reservations in the Fleet are cancelled, and the instances that were previously running in the reserved capacity continue to run normally in shared capacity.

```bash
aws ec2 cancel-capacity-reservation-fleets \
    --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```json
{
    "SuccessfulFleetCancellations": [ 
        {
            "CurrentFleetState": "cancelling",
            "PreviousFleetState": "active",
            "CapacityReservationFleetId": "crf-abcdef01234567890"
        }
    ],
    "FailedFleetCancellations": []
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/capacity-reservation-fleet.html) in the Amazon EC2 User Guide.

- For API details, see [CancelCapacityReservationFleets](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_CancelCapacityReservationFleets.html) in AWS CLI Command Reference.

### cancel-capacity-reservation

The following code example shows how to use `cancel-capacity-reservation`.

#### AWS CLI

**To cancel a capacity reservation**

The following `cancel-capacity-reservation` example cancels the specified capacity reservation.

```bash
aws ec2 cancel-capacity-reservation \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```
Output:

```json
{
   "Return": true
}
```

For more information, see [Canceling a Capacity Reservation](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/canceling-a-capacity-reservation.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CancelCapacityReservation](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-capacity-reservation.html) in *AWS CLI Command Reference*.

**cancel-conversion-task**

The following code example shows how to use `cancel-conversion-task`.

**AWS CLI**

To cancel an active conversion of an instance or a volume

This example cancels the upload associated with the task ID `import-i-fh95npoc`. If the command succeeds, no output is returned.

Command:

```
aws ec2 cancel-conversion-task --conversion-task-id import-i-fh95npoc
```

- For API details, see [CancelConversionTask](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-conversion-task.html) in *AWS CLI Command Reference*.

**cancel-export-task**

The following code example shows how to use `cancel-export-task`.

**AWS CLI**

To cancel an active export task

This example cancels an active export task with the task ID `export-i-fgelt0i7`. If the command succeeds, no output is returned.

Command:

```
aws ec2 cancel-export-task --export-task-id export-i-fgelt0i7
```
cancel-image-launch-permission

The following code example shows how to use cancel-image-launch-permission.

AWS CLI

To cancel having an AMI shared with your Amazon Web Services account

The following cancel-image-launch-permission example removes your account from the specified AMI's launch permissions.

```bash
aws ec2 cancel-image-launch-permission \
    --image-id ami-0123456789example \
    --region us-east-1
```

Output:

```json
{
    "Return": true
}
```

For more information, see Cancel having an AMI shared with your Amazon Web Services account in the Amazon EC2 User Guide.

- For API details, see CancelImageLaunchPermission in AWS CLI Command Reference.

cancel-import-task

The following code example shows how to use cancel-import-task.

AWS CLI

To cancel an import task

The following cancel-import-task example cancels the specified import image task.

```bash
aws ec2 cancel-import-task \
    --import-task-id import-ami-1234567890abcdef0
```
Output:

```json
{
    "ImportTaskId": "import-ami-1234567890abcdef0",
    "PreviousState": "active",
    "State": "deleting"
}
```

- For API details, see [CancelImportTask](#) in AWS CLI Command Reference.

### cancel-reserved-instances-listing

The following code example shows how to use `cancel-reserved-instances-listing`.

**AWS CLI**

**To cancel a Reserved Instance listing**

The following `cancel-reserved-instances-listing` example cancels the specified Reserved Instance listing.

```bash
aws ec2 cancel-reserved-instances-listing \
    --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

- For API details, see [CancelReservedInstancesListing](#) in AWS CLI Command Reference.

### cancel-spot-fleet-requests

The following code example shows how to use `cancel-spot-fleet-requests`.

**AWS CLI**

**Example 1: To cancel a Spot fleet request and terminate the associated instances**

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request and terminates the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --terminate-instances
```
Output:

```json
{
   "SuccessfulFleetRequests": [
      {
         "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
         "CurrentSpotFleetRequestState": "cancelled_terminating",
         "PreviousSpotFleetRequestState": "active"
      }
   ],
   "UnsuccessfulFleetRequests": []
}
```

For more information, see Cancel a Spot Fleet request in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

**Example 2: To cancel a Spot fleet request without terminating the associated instances**

The following cancel-spot-fleet-requests example cancels a Spot Fleet request without terminating the associated On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
   --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
   --no-terminate-instances
```

Output:

```json
{
   "SuccessfulFleetRequests": [
      {
         "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
         "CurrentSpotFleetRequestState": "cancelled_running",
         "PreviousSpotFleetRequestState": "active"
      }
   ],
   "UnsuccessfulFleetRequests": []
}
```

For more information, see Cancel a Spot Fleet request in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see CancelSpotFleetRequests in AWS CLI Command Reference.
cancel-spot-instance-requests

The following code example shows how to use cancel-spot-instance-requests.

AWS CLI

To cancel Spot Instance requests

This example command cancels a Spot Instance request.

Command:

```
aws ec2 cancel-spot-instance-requests --spot-instance-request-ids sir-08b93456
```

Output:

```
{
   "CancelledSpotInstanceRequests": [
      {
         "State": "cancelled",
         "SpotInstanceRequestId": "sir-08b93456"
      }
   ]
}
```

- For API details, see CancelSpotInstanceRequests in AWS CLI Command Reference.

confirm-product-instance

The following code example shows how to use confirm-product-instance.

AWS CLI

To confirm the product instance

This example determines whether the specified product code is associated with the specified instance.

Command:

```
aws ec2 confirm-product-instance --product-code 774F4FF8 --instance-id i-1234567890abcdef0
```
copy-fpga-image

The following code example shows how to use copy-fpga-image.

AWS CLI

To copy an Amazon FPGA image

This example copies the specified AFI from the us-east-1 region to the current region (eu-west-1).

Command:

```
aws ec2 copy-fpga-image --name copy-afi --source-fpga-image-id afi-0d123e123bfc85abc --source-region us-east-1 --region eu-west-1
```

Output:

```
{
   "FpgaImageId": "afi-06b12350a123fbabc"
}
```

- For API details, see [CopyFpgaImage](#) in *AWS CLI Command Reference*.

copy-image

The following code example shows how to use copy-image.

AWS CLI

Example 1: To copy an AMI to another Region
The following `copy-image` example command copies the specified AMI from the `us-west-2` Region to the `us-east-1` Region and adds a short description.

```bash
aws ec2 copy-image \
   --region us-east-1 \
   --name ami-name \
   --source-region us-west-2 \
   --source-image-id ami-066877671789bd71b \
   --description "This is my copied image."
```

Output:

```json
{
   "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see [Copy an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/copy-ami.html) in the *Amazon EC2 User Guide*.

**Example 2: To copy an AMI to another Region and encrypt the backing snapshot**

The following `copy-image` command copies the specified AMI from the `us-west-2` Region to the current Region and encrypts the backing snapshot using the specified KMS key.

```bash
aws ec2 copy-image \
   --source-region us-west-2 \
   --name ami-name \
   --source-image-id ami-066877671789bd71b \
   --encrypted \
   --kms-key-id alias/my-kms-key
```

Output:

```json
{
   "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see [Copy an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/copy-ami.html) in the *Amazon EC2 User Guide*.

**Example 3: To include your user-defined AMI tags when copying an AMI**

The following `copy-image` command uses the `--copy-image-tags` parameter to copy your user-defined AMI tags when copying the AMI.
aws ec2 copy-image \
   --region us-east-1 \
   --name ami-name \
   --source-region us-west-2 \
   --source-image-id ami-066877671789bd71b \
   --description "This is my copied image." \
   --copy-image-tags

Output:

{
   "ImageId": "ami-0123456789abcdefg"
}

For more information, see Copy an AMI in the Amazon EC2 User Guide.

- For API details, see CopyImage in AWS CLI Command Reference.

**copy-snapshot**

The following code example shows how to use copy-snapshot.

**AWS CLI**

**Example 1: To copy a snapshot to another Region**

The following copy-snapshot example command copies the specified snapshot from the us-west-2 Region to the us-east-1 Region and adds a short description.

aws ec2 copy-snapshot \
   --region us-east-1 \
   --source-region us-west-2 \
   --source-snapshot-id snap-066877671789bd71b \
   --description "This is my copied snapshot."

Output:

{
   "SnapshotId": "snap-066877671789bd71b"
}
Example 2: To copy an unencrypted snapshot and encrypt the new snapshot

The following copy-snapshot command copies the specified unencrypted snapshot from the us-west-2 Region to the current Region and encrypts the new snapshot using the specified KMS key.

```
aws ec2 copy-snapshot \
   --source-region us-west-2 \
   --source-snapshot-id snap-066877671789bd71b \
   --encrypted \n   --kms-key-id alias/my-kms-key
```

Output:

```
{
   "SnapshotId": "snap-066877671789bd71b"
}
```

create-capacity-reservation-fleet

The following code example shows how to use create-capacity-reservation-fleet.

AWS CLI

To create a Capacity Reservation Fleet

The following create-capacity-reservation-fleet example creates a Capacity Reservation Fleet for the instance type specified in the request, up to the specified total target capacity. The number of instances for which the Capacity Reservation Fleet reserves capacity depends on the total target capacity and instance type weights that you specify in the request. Specify the instance types to use and a priority for each of the designated instance types.

```
aws ec2 create-capacity-reservation-fleet \n   --total-target-capacity 24 \n   --allocation-strategy prioritized \
```
--instance-match-criteria open \ 
--tenancy default \ 
--end-date 2022-12-31T23:59:59.000Z \ 
--instance-type-specifications file://instanceTypeSpecification.json

Contents of instanceTypeSpecification.json:

```
[
  {
    "InstanceType": "m5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "Weight": 3.0,
    "AvailabilityZone": "us-east-1a",
    "EbsOptimized": true,
    "Priority": 1
  }
]
```

Output:

```
{
  "Status": "submitted",
  "TotalFulfilledCapacity": 0.0,
  "CapacityReservationFleetId": "crf-abcdef01234567890",
  "TotalTargetCapacity": 24
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](#) in the [Amazon EC2 User Guide](#).

For more information about instance type weight and total target capacity, see [Instance type weight](#) and [Total target capacity](#) in the [Amazon EC2 User Guide](#).

For more information about designating priority for specified instance types, see [Allocation strategy](#) and [Instance type priority](#) in the [Amazon EC2 User Guide](#).

- For API details, see [CreateCapacityReservationFleet](#) in [AWS CLI Command Reference](#).

**create-capacity-reservation**

The following code example shows how to use create-capacity-reservation.
Example 1: To create a Capacity Reservation

The following `create-capacity-reservation` example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three t2.medium instances running a Linux/Unix operating system. By default, the capacity reservation is created with open instance matching criteria and no support for ephemeral storage, and it remains active until you manually cancel it.

```
aws ec2 create-capacity-reservation \\
    --availability-zone eu-west-1a \\
    --instance-type t2.medium \\
    --instance-platform Linux/UNIX \\
    --instance-count 3
```

Output:

```
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "eu-west-1a",
        "InstanceMatchCriteria": "open",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T09:27:35.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "t2.medium"
    }
}
```

Example 2: To create a Capacity Reservation that automatically ends at a specified date/time

The following `create-capacity-reservation` example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three m5.large instances running a
Linux/Unix operating system. This capacity reservation automatically ends on 08/31/2019 at 23:59:59.

```
aws ec2 create-capacity-reservation \
  --availability-zone eu-west-1a \
  --instance-type m5.large \
  --instance-platform Linux/UNIX \
  --instance-count 3 \
  --end-date-type limited \
  --end-date 2019-08-31T23:59:59Z
```

Output:

```
{
  "CapacityReservation": {
    "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
    "EndDateType": "limited",
    "AvailabilityZone": "eu-west-1a",
    "EndDate": "2019-08-31T23:59:59.000Z",
    "InstanceMatchCriteria": "open",
    "EphemeralStorage": false,
    "CreateDate": "2019-08-16T10:15:53.000Z",
    "AvailableInstanceCount": 3,
    "InstancePlatform": "Linux/UNIX",
    "TotalInstanceCount": 3,
    "State": "active",
    "Tenancy": "default",
    "EbsOptimized": false,
    "InstanceType": "m5.large"
  }
}
```

**Example 3: To create a Capacity Reservation that accepts only targeted instance launches**

The following `create-capacity-reservation` example creates a capacity reservation that accepts only targeted instance launches.

```
aws ec2 create-capacity-reservation \
  --availability-zone eu-west-1a \
  --instance-type m5.large \
  --instance-platform Linux/UNIX \
  --instance-count 3 \
```
**--instance-match-criteria targeted**

**Output:**

```json
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "eu-west-1a",
        "InstanceMatchCriteria": "targeted",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T10:21:57.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

- For API details, see [CreateCapacityReservation](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-carrier-gateway.html) in *AWS CLI Command Reference*.

**create-carrier-gateway**

The following code example shows how to use `create-carrier-gateway`.

**AWS CLI**

**To create a carrier gateway**

The following `create-carrier-gateway` example creates a carrier gateway for the specified VPC.

```bash
aws ec2 create-carrier-gateway \
  --vpc-id vpc-0c529aEXAMPLE1111
```

**Output:**
For more information, see Carrier gateways in the AWS Wavelength User Guide.

- For API details, see CreateCarrierGateway in AWS CLI Command Reference.

create-client-vpn-endpoint

The following code example shows how to use create-client-vpn-endpoint.

AWS CLI

To create a Client VPN endpoint

The following create-client-vpn-endpoint example creates a Client VPN endpoint that uses mutual authentication and specifies a value for the client CIDR block.

```
aws ec2 create-client-vpn-endpoint \
  --client-cidr-block "172.31.0.0/16" \
  --server-certificate-arn arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
  --authentication-options Type=certificate-authentication,MutualAuthentication={ClientRootCertificateChainArn=arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE} \
  --connection-log-options Enabled=false
```

Output:

```
{
  "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
  "Status": {
    "Code": "pending-associate"
  },
  "DnsName": "cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-south-1.amazonaws.com"
}
```
For more information, see [Client VPN Endpoints](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [CreateClientVpnEndpoint](#) in *AWS CLI Command Reference*.

**create-client-vpn-route**

The following code example shows how to use `create-client-vpn-route`.

**AWS CLI**

**To create a route for a Client VPN endpoint**

The following `create-client-vpn-route` example adds a route to the internet \((0.0.0.0/0)\) for the specified subnet of the Client VPN endpoint.

```bash
aws ec2 create-client-vpn-route \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
   --destination-cidr-block 0.0.0.0/0 \
   --target-vpc-subnet-id subnet-0123456789abcabca
```

**Output:**

```json
{
   "Status": {
      "Code": "creating"
   }
}
```

For more information, see [Routes](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [CreateClientVpnRoute](#) in *AWS CLI Command Reference*.

**create-coip-cidr**

The following code example shows how to use `create-coip-cidr`.

**AWS CLI**

**To create a range of customer-owned IP (CoIP) addresses**
The following `create-coip-cidr` example creates the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 create-coip-cidr \
   --cidr 15.0.0.0/24 \
   --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
   "CoipCidr": {
      "Cidr": "15.0.0.0/24",
      "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
   }
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see `CreateCoipCidr` in AWS CLI Command Reference.

**create-coip-pool**

The following code example shows how to use `create-coip-pool`.

**AWS CLI**

**To create a pool of customer-owned IP (CoIP) addresses**

The following `create-coip-pool` example creates a CoIP pool for CoIP addresses in the specified local gateway route table.

```
aws ec2 create-coip-pool \
   --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
   "CoipPool": {
      "PoolId": "ipv4pool-coip-1234567890abcdefg",
   }
}
```
"LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
}
}

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see CreateCoipPool in AWS CLI Command Reference.

create-customer-gateway

The following code example shows how to use create-customer-gateway.

**AWS CLI**

**To create a customer gateway**

This example creates a customer gateway with the specified IP address for its outside interface.

Command:

```
aws ec2 create-customer-gateway --type ipsec.1 --public-ip 12.1.2.3 --bgp-asn 65534
```

Output:

```
{
    "CustomerGateway": {
        "CustomerGatewayId": "cgw-0e11f167",
        "IpAddress": "12.1.2.3",
        "State": "available",
        "Type": "ipsec.1",
        "BgpAsn": "65534"
    }
}
```

- For API details, see CreateCustomerGateway in AWS CLI Command Reference.

create-default-subnet

The following code example shows how to use create-default-subnet.
To create a default subnet

This example creates a default subnet in Availability Zone us-east-2a.

Command:

```bash
aws ec2 create-default-subnet --availability-zone us-east-2a
```

```json
{
    "Subnet": {
        "AvailabilityZone": "us-east-2a",
        "Tags": [],
        "AvailableIpAddressCount": 4091,
        "DefaultForAz": true,
        "Ipv6CidrBlockAssociationSet": [],
        "VpcId": "vpc-1a2b3c4d",
        "State": "available",
        "MapPublicIpOnLaunch": true,
        "SubnetId": "subnet-1122aabb",
        "CidrBlock": "172.31.32.0/20",
        "AssignIpv6AddressOnCreation": false
    }
}
```

- For API details, see [CreateDefaultSubnet](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_CreateDefaultSubnet.html) in *AWS CLI Command Reference*.

create-default-vpc

The following code example shows how to use create-default-vpc.

AWS CLI

To create a default VPC

This example creates a default VPC.

Command:

```bash
aws ec2 create-default-vpc
```
For API details, see `CreateDefaultVpc` in *AWS CLI Command Reference*.

**create-dhcp-options**

The following code example shows how to use `create-dhcp-options`.

**AWS CLI**

**To create a set of DHCP options**

The following `create-dhcp-options` example creates a set of DHCP options that specifies the domain name, the domain name servers, and the NetBIOS node type.

```bash
aws ec2 create-dhcp-options \
  --dhcp-configuration \
    "Key=domain-name-servers,Values=10.2.5.1,10.2.5.2" \
    "Key=domain-name,Values=example.com" \
    "Key=netbios-node-type,Values=2"
```

**Output:**

```json
{
  "DhcpOptions": {
    "DhcpConfigurations": [
      {
        "Key": "domain-name",
      }
    ]
  }
}
```
create-egress-only-internet-gateway

The following code example shows how to use create-egress-only-internet-gateway.

AWS CLI

To create an egress-only Internet gateway

This example creates an egress-only Internet gateway for the specified VPC.

Command:
aws ec2 create-egress-only-internet-gateway --vpc-id vpc-0c62a468

Output:

```
{
  "EgressOnlyInternetGateway": {
    "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
    "Attachments": [
      {
        "State": "attached",
        "VpcId": "vpc-0c62a468"
      }
    ]
  }
}
```

- For API details, see [CreateEgressOnlyInternetGateway](#) in [AWS CLI Command Reference](#).

**create-fleet**

The following code example shows how to use `create-fleet`.

**AWS CLI**

**Example 1: To create an EC2 Fleet that launches Spot Instances as the default purchasing model**

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `spot`, which results in the fleet launching 2 Spot Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

Contents of file_name.json:
Example 2: To create an EC2 Fleet that launches On-Demand Instances as the default purchasing model

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is on-demand, which results in the fleet launching 2 On-Demand Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

Contents of file_name.json:

```
{
  "LaunchTemplateConfigs": [ 
  {
    "LaunchTemplateSpecification": {
      "LaunchTemplateId": "lt-0e8c754449b27161c",
      "Version": "1"
    }
  },
  "TargetCapacitySpecification": {
    "TotalTargetCapacity": 2,
    "DefaultTargetCapacityType": "spot"
  }
}
```
Example 3: To create an EC2 Fleet that launches On-Demand Instances as the primary capacity

The following `create-fleet` example creates an EC2 Fleet that specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing model is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfil the total target capacity. The purchasing model for the difference is calculated as `TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType`, which results in the fleet launching 1 Spot Instance.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \n   --cli-input-json file://file_name.json
```

Contents of file_name.json:

```json
{
   "LaunchTemplateConfigs": [ 
   
   ]
}
```
"LaunchTemplateSpecification": {  
"LaunchTemplateId": "lt-0e8c754449b27161c",
"Version": "1"
}
]
,"TargetCapacitySpecification": {  
"TotalTargetCapacity": 2,
"OnDemandTargetCapacity": 1,
"DefaultTargetCapacityType": "spot"
}
}

Output:

{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}

Example 4: To create an EC2 Fleet that launches Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is lowest-price, is used. The following create-fleet example creates an EC2 Fleet using the lowest-price allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing model is spot. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```bash
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

Contents of file_name.json:

```json
{
  "LaunchTemplateConfigs": [  
  {
    "LaunchTemplateSpecification": {  
      "LaunchTemplateId": "lt-0e8c754449b27161c",
      "Version": "1"
    }
  }
  ]
}
```
"Version": "1"
},
"Overrides": [
{
   "InstanceType": "c4.large",
   "WeightedCapacity": 1,
   "SubnetId": "subnet-a4f6c5d3"
},
{
   "InstanceType": "c3.large",
   "WeightedCapacity": 1,
   "SubnetId": "subnet-a4f6c5d3"
},
{
   "InstanceType": "c5.large",
   "WeightedCapacity": 1,
   "SubnetId": "subnet-a4f6c5d3"
}
]
},
"TargetCapacitySpecification": {
   "TotalTargetCapacity": 2,
   "DefaultTargetCapacityType": "spot"
}
}

Output:

{
   "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}

• For API details, see CreateFleet in AWS CLI Command Reference.

create-flow-logs

The following code example shows how to use create-flow-logs.

AWS CLI

Example 1: To create a flow log
The following `create-flow-logs` example creates a flow log that captures all rejected traffic for the specified network interface. The flow logs are delivered to a log group in CloudWatch Logs using the permissions in the specified IAM role.

```
aws ec2 create-flow-logs \
  --resource-type NetworkInterface \
  --resource-ids eni-11223344556677889 \
  --traffic-type REJECT \
  --log-group-name my-flow-logs \
  --deliver-logs-permission-arn arn:aws:iam::123456789101:role/publishFlowLogs
```

Output:

```
{
  "ClientToken": "so0eNA2uSHUNlHI0S2cJ305GuIX1CezaRdGtexample",
  "FlowLogIds": [
    "fl-12345678901234567"
  ],
  "Unsuccessful": []
}
```

For more information, see [VPC Flow Logs](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_FlowLogs.html) in the *Amazon VPC User Guide*.

**Example 2: To create a flow log with a custom format**

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--log-format` parameter specifies a custom format for the flow log records. To run this command on Windows, change the single quotes (') to double quotes (").

```
aws ec2 create-flow-logs \
  --resource-type VPC \
  --resource-ids vpc-00112233344556677 \
  --traffic-type ALL \
  --log-destination-type s3 \
  --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \
  --log-format '${version} ${vpc-id} ${subnet-id} ${instance-id} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${protocol} ${tcp-flags} ${type} ${pkt-srcaddr} ${pkt-dstaddr}'
```

For more information, see [VPC Flow Logs](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_FlowLogs.html) in the *Amazon VPC User Guide*.
Example 3: To create a flow log with a one-minute maximum aggregation interval

The following create-flow-logs example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The --max-aggregation-interval parameter specifies a maximum aggregation interval of 60 seconds (1 minute).

```bash
aws ec2 create-flow-logs \
  --resource-type VPC \
  --resource-ids vpc-00112233344556677 \
  --traffic-type ALL \
  --log-destination-type s3 \
  --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \
  --max-aggregation-interval 60
```

For more information, see VPC Flow Logs in the Amazon VPC User Guide.

- For API details, see CreateFlowLogs in AWS CLI Command Reference.

create-fpga-image

The following code example shows how to use create-fpga-image.

AWS CLI

To create an Amazon FPGA image

This example creates an AFI from the specified tarball in the specified bucket.

Command:

```bash
aws ec2 create-fpga-image --name my-afi --description test-afi --input-storage-location Bucket=my-fpga-bucket,Key=dcp/17_12_22-103226.Developer_CL.tar --logs-storage-location Bucket=my-fpga-bucket,Key=logs
```

Output:

```
{
  "FpgaImageId": "afi-0d123e123bfc85abc",
  "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc"
}
```
- For API details, see `CreateFpgaImage` in *AWS CLI Command Reference*.

**create-image**

The following code example shows how to use `create-image`.

**AWS CLI**

**Example 1: To create an AMI from an Amazon EBS-backed instance**

The following `create-image` example creates an AMI from the specified instance.

```bash
aws ec2 create-image \
  --instance-id i-1234567890abcdef0 \
  --name "My server" \
  --description "An AMI for my server"
```

Output:

```json
{
   "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see [Specifying a block device mapping for an AMI](#) in the *Amazon EC2 User Guide*.

**Example 2: To create an AMI from an Amazon EBS-backed instance without reboot**

The following `create-image` example creates an AMI and sets the `--no-reboot` parameter, so that the instance is not rebooted before the image is created.

```bash
aws ec2 create-image \
  --instance-id i-1234567890abcdef0 \
  --name "My server" \
  --no-reboot
```

Output:

```json
{
   "ImageId": "ami-abcdef01234567890"
}
```
For more information about specifying a block device mapping for your AMI, see [Specifying a block device mapping for an AMI](#) in the *Amazon EC2 User Guide*.

### Example 3: To tag an AMI and snapshots on creation

The following `create-image` example creates an AMI, and tags the AMI and the snapshots with the same tag `cost-center=cc123`

```bash
aws ec2 create-image \
  --instance-id i-1234567890abcdef0 \
  --name "My server" \
  --tag-specifications "ResourceType=image,Tags=[{Key=cost-center,Value=cc123}]" "ResourceType=snapshot,Tags=[{Key=cost-center,Value=cc123}]"
```

**Output:**

```json
{
   "ImageId": "ami-abcdef01234567890"
}
```

For more information about tagging your resources on creation, see [Add tags on resource creation](#) in the *Amazon EC2 User Guide*.

- For API details, see [CreateImage](#) in *AWS CLI Command Reference*.

### create-instance-connect-endpoint

The following code example shows how to use `create-instance-connect-endpoint`.

**AWS CLI**

#### To create an EC2 Instance Connect Endpoint

The following `create-instance-connect-endpoint` example creates an EC2 Instance Connect Endpoint in the specified subnet.

```bash
aws ec2 create-instance-connect-endpoint \
  --region us-east-1 \
  --subnet-id subnet-0123456789example
```

**Output:**

-
For more information, see [Create an EC2 Instance Connect Endpoint](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-connect-endpoint.html) in the *Amazon EC2 User Guide*.

### create-instance-event-window

The following code example shows how to use `create-instance-event-window`.

**AWS CLI**

**Example 1: To create an event window with a time range**

The following `create-instance-event-window` example creates an event window with a time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 create-instance-event-window
```
--region us-east-1 \
--time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
--tag-specifications "ResourceType=instance-event-window,Tags=([{Key=K1,Value=V1}]"

Output:

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "TimeRanges": [
        {
          "StartWeekDay": "monday",
          "StartHour": 2,
          "EndWeekDay": "wednesday",
          "EndHour": 8
        }
      ],
      "Name": "myEventWindowName",
      "State": "creating",
      "Tags": [
        {
          "Key": "K1",
          "Value": "V1"
        }
      ]
   }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To create an event window with a cron expression**

The following create-instance-event-window example creates an event window with a cron expression. You can't also specify the time-range parameter.

```
aws ec2 create-instance-event-window \
   --region us-east-1 \
   --cron-expression "* 21-23 * * 2,3" \
   --tag-specifications "ResourceType=instance-event-window,Tags=([{Key=K1,Value=V1}]"
```
-name myEventWindowName

Output:

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "State": "creating",
      "Tags": [
         {
            "Key": "K1",
            "Value": "V1"
         }
      ]
   }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see CreateInstanceEventWindow in AWS CLI Command Reference.

create-instance-export-task

The following code example shows how to use create-instance-export-task.

AWS CLI

To export an instance

This example command creates a task to export the instance i-1234567890abcdef0 to the Amazon S3 bucket myexportbucket.

Command:

```
aws ec2 create-instance-export-task --description "RHEL5 instance" --instance-id i-1234567890abcdef0 --target-environment vmware --export-to-s3-task DiskImageFormat=vmdk,ContainerFormat=ova,S3Bucket=myexportbucket,S3Prefix=RHEL5
```

Output:
AWS Command Line Interface

For API details, see [CreateInstanceExportTask](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-instance-export-task.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/)

**create-internet-gateway**

The following code example shows how to use `create-internet-gateway`.

**AWS CLI**

**To create an internet gateway**

The following `create-internet-gateway` example creates an internet gateway with the tag `Name=my-igw`.

```bash
aws ec2 create-internet-gateway \
    --tag-specifications ResourceType=internet-gateway,Tags=[{Key=Name,Value=my-igw}]
```

**Output:**

```json
{
    "InternetGateway": {
        "Attachments": [],
        "InternetGatewayId": "igw-0d0fb496b3994d755",

```
For more information, see Internet gateways in the Amazon VPC User Guide.

- For API details, see CreateInternetGateway in AWS CLI Command Reference.

create-ipam-pool

The following code example shows how to use create-ipam-pool.

AWS CLI

To create an IPAM pool

The following create-ipam-pool example creates an IPAM pool.

(Linux):

```
aws ec2 create-ipam-pool \\
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \\
   --address-family ipv4 \\
   --auto-import \\
   --allocation-min-netmask-length 16 \\
   --allocation-max-netmask-length 26 \\
   --allocation-default-netmask-length 24 \\
   --allocation-resource-tags "Key=Environment,Value=Preprod" \\
   --tag-specifications 'ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod pool"}]
```

(Windows):

```
aws ec2 create-ipam-pool ^
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
   --address-family ipv4 ^
--auto-import ^
--allocation-min-netmask-length 16 ^

    }
}
```
For more information, see Plan for IP address provisioning in the Amazon VPC IPAM User Guide.

- For API details, see CreateIpamPool in AWS CLI Command Reference.

**create-ipam-scope**

The following code example shows how to use create-ipam-scope.

**AWS CLI**

**To create an IPAM scope**

The following create-ipam-scope example creates an IPAM scope.

*(Linux):*

```
aws ec2 create-ipam-scope \
  --ipam-id ipam-08440e7a3acde3908 \
  --description "Example description" \
  --tag-specifications 'ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name value"}]'
```

*(Windows):*

```
aws ec2 create-ipam-scope ^
  --ipam-id ipam-08440e7a3acde3908 ^
  --description "Example description" ^
  --tag-specifications ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name value"}]`
```

**Output:**

```json
{
  "IpamScope": {
    "OwnerId": "123456789012",
    "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-01c1ebab2b63bd7e4",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "IpamScopeType": "private",
    "IsDefault": false,
  }
}```
"Description": "Example description",
"PoolCount": 0,
"State": "create-in-progress",
"Tags": [
  {
    "Key": "Name",
    "Value": "Example name value"
  }
]
}

For more information, see [Create additional scopes](#) in the Amazon VPC IPAM User Guide.

- For API details, see [CreateIpamScope](#) in AWS CLI Command Reference.

**create-ipam**

The following code example shows how to use create-ipam.

**AWS CLI**

**To create an IPAM**

The following create-ipam example creates an IPAM.

(Windows):

```
aws ec2 create-ipam ^
   --description "Example description" ^
   --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^
   --tag-specifications ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

(Windows):

```
aws ec2 create-ipam ^
   --description "Example description" ^
   --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^
   --tag-specifications ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

Output:
```json
{
   "Ipam": {
      "OwnerId": "123456789012",
      "IpamId": "ipam-036486dfa6af58ee0",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
      "IpamRegion": "us-east-1",
      "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
      "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
      "OperatingRegions": [
         {
            "RegionName": "us-east-2"
         },
         {
            "RegionName": "us-west-1"
         },
         {
            "RegionName": "us-east-1"
         }
      ],
      "State": "create-in-progress",
      "Tags": [
         {
            "Key": "Name",
            "Value": "ExampleIPAM"
         }
      ]
   }
}
```

For more information, see [Create an IPAM](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [CreateIpam](#) in *AWS CLI Command Reference*.

**create-key-pair**

The following code example shows how to use `create-key-pair`.

**AWS CLI**

**To create a key pair**

This example creates a key pair named `MyKeyPair`.
Command:

```
aws ec2 create-key-pair --key-name MyKeyPair
```

The output is an ASCII version of the private key and key fingerprint. You need to save the key to a file.

For more information, see Using Key Pairs in the *AWS Command Line Interface User Guide*.

- For API details, see [CreateKeyPair](aws CLI Command Reference) in *AWS CLI Command Reference*.

---

**create-launch-template-version**

The following code example shows how to use `create-launch-template-version`.

**AWS CLI**

To create a launch template version

This example creates a new launch template version based on version 1 of the launch template and specifies a different AMI ID.

Command:

```
aws ec2 create-launch-template-version --launch-template-id lt-0abcd290751193123 --version-description WebVersion2 --source-version 1 --launch-template-data 
'{"ImageId":"ami-c998b6b2"}'
```

Output:

```
{
   "LaunchTemplateVersion": {
      "VersionDescription": "WebVersion2",
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "WebServers",
      "VersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "LaunchTemplateData": {
         "ImageId": "ami-c998b6b2",
         "InstanceType": "t2.micro",
         "NetworkInterfaces": [  
```
create-launch-template

The following code example shows how to use create-launch-template.

AWS CLI

Example 1: To create a launch template

The following create-launch-template example creates a launch template that specifies the subnet in which to launch the instance, assigns a public IP address and an IPv6 address to the instance, and creates a tag for the instance.

```
aws ec2 create-launch-template \
  --launch-template-name TemplateForWebServer \
  --version-description WebVersion1 \
  --launch-template-data '{"NetworkInterfaces": [{"AssociatePublicIpAddress":true,"DeviceIndex":0,"Ipv6AddressCount":1,"SubnetId":"subnet-7b16de0c"}, {"ResourceType":"instance","Tags": [{"Key":"purpose","Value":"webserver"}]}]}'
```

Output:

```
{
  "LaunchTemplate": {

  }
}
```
For more information, see Launching an Instance from a Launch Template in the *Amazon Elastic Compute Cloud User Guide*. For information about quoting JSON-formatted parameters, see Quoting Strings in the *AWS Command Line Interface User Guide*.

**Example 2: To create a launch template for Amazon EC2 Auto Scaling**

The following `create-launch-template` example creates a launch template with multiple tags and a block device mapping to specify an additional EBS volume when an instance launches. Specify a value for `Groups` that corresponds to security groups for the VPC that your Auto Scaling group will launch instances into. Specify the VPC and subnets as properties of the Auto Scaling group.

```bash
aws ec2 create-launch-template \
   --launch-template-name TemplateForAutoScaling \ 
   --version-description AutoScalingVersion1 \ 
   --launch-template-data '{"NetworkInterfaces": ["DeviceIndex":0,"AssociatePublicIpAddress":true,"Groups": ["sg-7c227019,sg-903004f8"],"DeleteOnTermination":true}],"ImageId":"ami-b42209de","InstanceType":"m4.large","TagSpecifications": [{"ResourceType":"instance","Tags": ["Key":"environment","Value":"production"],"Key":"purpose","Value":"webserver"}],["ResourceType":"volume","Tags": [{"Key":"environment","Value":"production"},{"Key":"cost-center","Value":"cc123"}]],"BlockDeviceMappings": [{"DeviceName":"/dev/sda1","Ebs": {"VolumeSize":100}}]}' --region us-east-1
```

Output:

```json
{
   "LaunchTemplate": {
      "LatestVersionNumber": 1,
      "LaunchTemplateId": "lt-0123c79c33a54e0abc",
      "LaunchTemplateName": "TemplateForAutoScaling",
      "DefaultVersionNumber": 1,
      "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
      "CreateTime": "2019-01-27T09:13:24.000Z"
   }
}
```
For more information, see Creating a Launch Template for an Auto Scaling Group in the *Amazon EC2 Auto Scaling User Guide*. For information about quoting JSON-formatted parameters, see Quoting Strings in the *AWS Command Line Interface User Guide*.

**Example 3: To create a launch template that specifies encryption of EBS volumes**

The following `create-launch-template` example creates a launch template that includes encrypted EBS volumes created from an unencrypted snapshot. It also tags the volumes during creation. If encryption by default is disabled, you must specify the "Encrypted" option as shown in the following example. If you use the "KmsKeyId" option to specify a customer managed CMK, you also must specify the "Encrypted" option even if encryption by default is enabled.

```
aws ec2 create-launch-template \
  --launch-template-name TemplateForEncryption \
  --launch-template-data file://config.json
```

**Contents of config.json:**

```
{
  "BlockDeviceMappings":[
    {
      "DeviceName":"/dev/sda1",
      "Ebs":{
        "VolumeType":"gp2",
        "DeleteOnTermination":true,
        "SnapshotId":"snap-066877671789bd71b",
        "Encrypted":true,
        "KmsKeyId":"arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef"
      }
    }
  ],
  "ImageId":"ami-00068cd7555f543d5",
  "InstanceType":"c5.large",
  "TagSpecifications":[
```
Output:

```json
{
  "LaunchTemplate": {
    "LatestVersionNumber": 1,
    "LaunchTemplateId": "lt-0d5bd51b658530abc",
    "LaunchTemplateName": "TemplateForEncryption",
    "DefaultVersionNumber": 1,
    "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
    "CreateTime": "2020-01-07T19:08:36.000Z"
  }
}
```

For more information, see Restoring an Amazon EBS Volume from a Snapshot and Encryption by Default in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [CreateLaunchTemplate](#) in *AWS CLI Command Reference*.

**create-local-gateway-route-table-virtual-interface-group-association**

The following code example shows how to use `create-local-gateway-route-table-virtual-interface-group-association`.

**AWS CLI**

**To associate a local gateway route table with a virtual interfaces (VIFs) group**

The following `create-local-gateway-route-table-virtual-interface-group-association` example creates an association between the specified local gateway route table and VIF group.
aws ec2 create-local-gateway-route-table-virtual-interface-group-association \   --local-gateway-route-table-id lgw-rtb-exampleidabcd1234 \   --local-gateway-virtual-interface-group-id lgw-vif-grp-exampleid0123abcd

Output:

```
{
   "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
      "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-exampleid12345678",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
      "LocalGatewayId": "lgw-exampleid11223344",
      "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
      "OwnerId": "111122223333",
      "State": "pending",
      "Tags": []
   }
}
```

For more information, see [VIF group associations](https://docs.aws.amazon.com/Outposts/latest/userguide/VIF-group-associations.html) in the *AWS Outposts User Guide*.

- For API details, see [CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-local-gateway-route-table-virtual-interface-group-association.html) in *AWS CLI Command Reference*.

### create-local-gateway-route-table-vpc-association

The following code example shows how to use `create-local-gateway-route-table-vpc-association`.

#### AWS CLI

**To associate a VPC with a route table**

The following `create-local-gateway-route-table-vpc-association` example associates the specified VPC with the specified local gateway route table.

```bash
aws ec2 create-local-gateway-route-table-vpc-association \   --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \   --vpc-id vpc-07ef66ac71EXAMPLE
```
Output:

```json
{
   "LocalGatewayRouteTableVpcAssociation": {
      "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0ee765bccaEXAMPLE",
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
      "LocalGatewayId": "lgw-09b493ca7cEXAMPLE",
      "VpcId": "vpc-07ef66ac71EXAMPLE",
      "State": "associated"
   }
}
```

- For API details, see [CreateLocalGatewayRouteTableVpcAssociation](#) in [AWS CLI Command Reference](#).

**create-local-gateway-route-table**

The following code example shows how to use `create-local-gateway-route-table`.

### AWS CLI

**To create a local gateway route table**

The following `create-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```bash
aws ec2 create-local-gateway-route-table \
   --local-gateway-id lgw-1a2b3c4d5e6f7g8h9 \
   --mode direct-vpc-routing
```

Output:

```json
{
   "LocalGatewayRouteTable": {
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
      "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
      "OwnerId": "111122223333",
      "State": "pending",
```

Actions and scenarios
"Tags": [],
"Mode": "direct-vpc-routing"
}
}

For more information, see Local gateway route tables in the AWS Outposts User Guide.

- For API details, see CreateLocalGatewayRouteTable in AWS CLI Command Reference.

create-local-gateway-route

The following code example shows how to use create-local-gateway-route.

AWS CLI

**To create a static route for a local gateway route table**

The following create-local-gateway-route example creates the specified route in the specified local gateway route table.

```
aws ec2 create-local-gateway-route \
   --destination-cidr-block 0.0.0.0/0 \ 
   --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
   "Route": {
      "DestinationCidrBlock": "0.0.0.0/0",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif.grp-07145b276bEXAMPLE",
      "Type": "static",
      "State": "deleted",
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
   }
}
```

- For API details, see CreateLocalGatewayRoute in AWS CLI Command Reference.

create-managed-prefix-list

The following code example shows how to use create-managed-prefix-list.

Actions and scenarios
AWS CLI

To create a prefix list

The following create-managed-prefix-list example creates an IPv4 prefix list with a maximum of 10 entries, and creates 2 entries in the prefix list.

```bash
aws ec2 create-managed-prefix-list \
   --address-family IPv4 \
   --max-entries 10 \
   --entries Cidr=10.0.0.0/16,Description=vpc-a Cidr=10.2.0.0/16,Description=vpc-b \
   --prefix-list-name vpc-cidrs
```

Output:

```
{
   "PrefixList": {
      "PrefixListId": "pl-0123456ababcabc1",
      "AddressFamily": "IPv4",
      "State": "create-in-progress",
      "PrefixListName": "vpc-cidrs",
      "MaxEntries": 10,
      "Version": 1,
      "Tags": [],
      "OwnerId": "123456789012"
   }
}
```

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see CreateManagedPrefixList in AWS CLI Command Reference.

create-nat-gateway

The following code example shows how to use create-nat-gateway.

AWS CLI

Example 1: To create a public NAT gateway
The following `create-nat-gateway` example creates a public NAT gateway in the specified subnet and associates the Elastic IP address with the specified allocation ID. When you create a public NAT gateway, you must associate an Elastic IP address.

```
aws ec2 create-nat-gateway \
   --subnet-id subnet-0250c25a1fEXAMPLE \
   --allocation-id eipalloc-09ad461b0dEXAMPLE
```

Output:

```
{
   "NatGateway": {
      "CreateTime": "2021-12-01T22:22:38.000Z",
      "NatGatewayAddresses": [
         {
            "AllocationId": "eipalloc-09ad461b0dEXAMPLE"
         }
      ],
      "NatGatewayId": "nat-0c61bf8a12EXAMPLE",
      "State": "pending",
      "SubnetId": "subnet-0250c25a1fEXAMPLE",
      "VpcId": "vpc-0a60eb65b4EXAMPLE",
      "ConnectivityType": "public"
   }
}
```

For more information, see [NAT gateways](amazon_vpc_user_guide) in the *Amazon VPC User Guide*.

**Example 2: To create a private NAT gateway**

The following `create-nat-gateway` example creates a private NAT gateway in the specified subnet. A private NAT gateway does not have an associated Elastic IP address.

```
aws ec2 create-nat-gateway \
   --subnet-id subnet-0250c25a1fEXAMPLE \
   --connectivity-type private
```

Output:

```
{
   "NatGateway": {
      "State": "pending",
      "SubnetId": "subnet-0250c25a1fEXAMPLE",
      "VpcId": "vpc-0a60eb65b4EXAMPLE",
      "ConnectivityType": "private"
   }
}
```
"CreateTime": "2021-12-01T22:26:00.000Z",
 "NatGatewayAddresses": [
   
  
  ],
 "NatGatewayId": "nat-011b568379EXAMPLE",
 "State": "pending",
 "SubnetId": "subnet-0250c25a1fEXAMPLE",
 "VpcId": "vpc-0a60eb65b4EXAMPLE",
 "ConnectivityType": "private"
}

For more information, see [NAT gateways](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/NatGateways.html) in the Amazon VPC User Guide.

- For API details, see [CreateNatGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-nat-gateway.html) in AWS CLI Command Reference.

### create-network-acl-entry

The following code example shows how to use `create-network-acl-entry`.

**AWS CLI**

**To create a network ACL entry**

This example creates an entry for the specified network ACL. The rule allows ingress traffic from any IPv4 address (0.0.0.0/0) on UDP port 53 (DNS) into any associated subnet. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 0.0.0.0/0 --rule-action allow
```

This example creates a rule for the specified network ACL that allows ingress traffic from any IPv6 address (::/0) on TCP port 80 (HTTP).

Command:

```bash
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 120 --protocol tcp --port-range From=80,To=80 --ipv6-cidr-block ::/0 --rule-action allow
```
create-network-acl

The following code example shows how to use create-network-acl.

**AWS CLI**

**To create a network ACL**

This example creates a network ACL for the specified VPC.

**Command:**

```bash
aws ec2 create-network-acl --vpc-id vpc-a01106c2
```

**Output:**

```json
{
   "NetworkAcl": {
      "Associations": [],
      "NetworkAclId": "acl-5fb85d36",
      "VpcId": "vpc-a01106c2",
      "Tags": [],
      "Entries": [
         {
            "CidrBlock": "0.0.0.0/0",
            "RuleNumber": 32767,
            "Protocol": "-1",
            "Egress": true,
            "RuleAction": "deny"
         },
         {
            "CidrBlock": "0.0.0.0/0",
            "RuleNumber": 32767,
            "Protocol": "-1",
            "Egress": false,
            "RuleAction": "deny"
         }
      ],
      "IsDefault": false
   }
}
```
create-network-insights-access-scope

The following code example shows how to use create-network-insights-access-scope.

AWS CLI

To create a Network Access Scope

The following create-network-insights-access-scope example creates a Network Access Scope.

```
aws ec2 create-network-insights-access-scope \
  --cli-input-json file://access-scope-file.json
```

Contents of access-scope-file.json:

```
{
  "MatchPaths": [
    {
      "Source": {
        "ResourceStatement": {
          "Resources": [
            "vpc-abcd12e3"
          ]
        }
      }
    },
    "ExcludePaths": [
      {
        "Source": {
          "ResourceStatement": {
            "ResourceTypes": [
              "AWS::EC2::InternetGateway"
            ]
          }
        }
      }
    ]
}
```
For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.
create-network-insights-path

The following code example shows how to use create-network-insights-path.

**AWS CLI**

**To create a path**

The following create-network-insights-path example creates a path. The source is the specified internet gateway and the destination is the specified EC2 instance. To determine whether the destination is reachable using the specified protocol and port, analyze the path using the start-network-insights-analysis command.

```bash
aws ec2 create-network-insights-path \
  --source igw-0797ccdc9d73b0e5 \ 
  --destination i-0495d385ad28331c7 \ 
  --destination-port 22 \ 
  --protocol TCP
```

Output:

```
{
  "NetworkInsightsPaths": {
    "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
    "CreatedDate": "2021-01-20T22:43:46.933Z",
    "Source": "igw-0797ccdc9d73b0e5",
    "Destination": "i-0495d385ad28331c7",
    "Protocol": "tcp"
  }
}
```

For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/userguide/getting-started.html) in the **Reachability Analyzer Guide**.

- For API details, see [CreateNetworkInsightsAccessScope](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-network-insights-access-scope.html) in **AWS CLI Command Reference**.

create-network-interface-permission

The following code example shows how to use create-network-interface-permission.

- For API details, see [CreateNetworkInsightsAccessScope](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-network-insights-access-scope.html) in **AWS CLI Command Reference**.
AWS CLI

To create a network interface permission

This example grants permission to account 123456789012 to attach network interface eni-1a2b3c4d to an instance.

Command:

```
aws ec2 create-network-interface-permission --network-interface-id eni-1a2b3c4d --aws-account-id 123456789012 --permission INSTANCE-ATTACH
```

Output:

```
{
    "InterfacePermission": {
        "PermissionState": {
            "State": "GRANTED"
        },
        "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
        "NetworkInterfaceId": "eni-1a2b3c4d",
        "Permission": "INSTANCE-ATTACH",
        "AwsAccountId": "123456789012"
    }
}
```

- For API details, see CreateNetworkInterfacePermission in AWS CLI Command Reference.

create-network-interface

The following code example shows how to use create-network-interface.

AWS CLI

Example 1: To specify an IPv4 address for a network interface

The following create-network-interface example creates a network interface for the specified subnet with the specified primary IPv4 address.

```
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67acf6333 \
    --description "my network interface"
```
--groups sg-09dfba7ed20cda78b \
--private-ip-address 10.0.8.17

Output:

```json
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my network interface",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-09dfba7ed20cda78b"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "06:6a:0f:9a:49:37",
        "NetworkInterfaceId": "eni-0492b355f0cf3b3f8",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.17",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-17.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.17"
            }
        ],
        "RequesterId": "AIDA4Z3Y76SXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": [],
        "VpcId": "vpc-02723a0f6eeeb9d57b"
    }
}
```

Example 2: To create a network interface with an IPv4 address and an IPv6 address

The following `create-network-interface` example creates a network interface for the specified subnet with an IPv4 address and an IPv6 address that are selected by Amazon EC2.
```bash
aws ec2 create-network-interface \
    --subnet-id subnet-00a24d0d67acf6333 \
    --description "my dual stack network interface" \
    --ipv6-address-count 1 \
    --groups sg-09dfba7ed20cda78b
```

Output:

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my dual stack network interface",
        "Groups": [
            {
                "GroupName": "my-security-group",
                "GroupId": "sg-09dfba7ed20cda78b"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [
            {
                "Ipv6Address": "2600:1f13:cfe:3650:a1dc:237c:393a:4ba7",
                "IsPrimaryIpv6": false
            }
        ],
        "MacAddress": "06:b8:68:d2:b2:2d",
        "NetworkInterfaceId": "eni-05da417453f9a84bf",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.18",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
                "PrivateIpAddress": "10.0.8.18"
            }
        ],
        "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-00a24d0d67acf6333",
        "TagSet": []
    }
}
```
Example 3: To create a network interface with connection tracking configuration options

The following create-network-interface example creates a network interface and configures the idle connection tracking timeouts.

```bash
aws ec2 create-network-interface \
   --subnet-id subnet-00a24d0d67acf6333 \
   --groups sg-02e57dbcfe0331c1b \
   --connection-tracking-specification TcpEstablishedTimeout=86400,UdpTimeout=60
```

Output:

```
{
   "NetworkInterface": {
      "AvailabilityZone": "us-west-2a",
      "ConnectionTrackingConfiguration": {
         "TcpEstablishedTimeout": 86400,
         "UdpTimeout": 60
      },
      "Description": "",
      "Groups": [
         {
            "GroupName": "my-security-group",
            "GroupId": "sg-02e57dbcfe0331c1b"
         }
      ],
      "InterfaceType": "interface",
      "Ipv6Addresses": [],
      "MacAddress": "06:4c:53:de:6d:91",
      "NetworkInterfaceId": "eni-0c133586e08903d0b",
      "OwnerId": "123456789012",
      "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
      "PrivateIpAddress": "10.0.8.94",
      "PrivateIpAddresses": [
         {
            "Primary": true,
            "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",
            "PrivateIpAddress": "10.0.8.94"
         }
      ]
   }
}
```
Example 4: To create an Elastic Fabric Adapter

The following `create-network-interface` example creates an EFA.

```bash
aws ec2 create-network-interface \
  --interface-type efa \
  --subnet-id subnet-00a24d0d67acf6333 \
  --description "my efa" \
  --groups sg-02e57dbcf0331c1b
```

Output:

```json
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "my efa",
        "Groups": [
            {
                "GroupName": "my-efa-sg",
                "GroupId": "sg-02e57dbcf0331c1b"
            }
        ],
        "InterfaceType": "efa",
        "Ipv6Addresses": [],
        "MacAddress": "06:d7:a4:f7:4d:57",
        "NetworkInterfaceId": "eni-034acc2885e862b65",
        "OwnerId": "123456789012",
        "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.180",
        "PrivateIpAddresses": [
            
```
For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

- For API details, see CreateNetworkInterface in AWS CLI Command Reference.

**create-placement-group**

The following code example shows how to use create-placement-group.

**AWS CLI**

**To create a placement group**

This example command creates a placement group with the specified name.

Command:

```bash
aws ec2 create-placement-group --group-name my-cluster --strategy cluster
```

**To create a partition placement group**

This example command creates a partition placement group named HDFS-Group-A with five partitions.

Command:

```bash
aws ec2 create-placement-group --group-name HDFS-Group-A --strategy partition --partition-count 5
```
create-replace-root-volume-task

The following code example shows how to use create-replace-root-volume-task.

AWS CLI

Example 1: To restore a root volume to its initial launch state

The following create-replace-root-volume-task example restores the root volume of instance i-0123456789abcdefa to its initial launch state.

```
aws ec2 create-replace-root-volume-task \
   --instance-id i-0123456789abcdefa
```

Output:

```
{
  "ReplaceRootVolumeTask":
   {
    "InstanceId": "i-0123456789abcdefa",
    "ReplaceRootVolumeTaskId": "replacevol-011122223333abced",
    "TaskState": "pending",
    "StartTime": "2022-03-14T15:06:38Z",
    "Tags": []
   }
}
```

For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

Example 2: To restore a root volume to a specific snapshot

The following create-replace-root-volume-task example restores the root volume of instance i-0123456789abcdefa to snapshot snap-0abcdef1234567890.

```
aws ec2 create-replace-root-volume-task \
   --instance-id i-0123456789abcdefa \
   --snapshot-id snap-0abcdef1234567890
```
Output:

```
{
    "ReplaceRootVolumeTask":
    {
        "InstanceId": "i-0123456789abcdefa",
        "ReplaceRootVolumeTaskId": "replacevol-0555566667777abcd",
        "TaskState": "pending",
        "StartTime": "2022-03-14T15:16:28Z",
        "Tags": []
    }
}
```

For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

- For API details, see CreateReplaceRootVolumeTask in AWS CLI Command Reference.

create-reserved-instances-listing

The following code example shows how to use create-reserved-instances-listing.

AWS CLI

To list a Reserved Instance in the Reserved Instance Marketplace

The following create-reserved-instances-listing example creates a listing for the specified Reserved Instance in the Reserved Instance Marketplace.

```
aws ec2 create-reserved-instances-listing \
    --reserved-instances-id 5ec28771-05ff-4b9b-aa31-9e57dexample \  
    --instance-count 3 \  
    --price-schedules CurrencyCode=USD,Price=25.50  
    --client-token 550e8400-e29b-41d4-a716-446655440000
```

- For API details, see CreateReservedInstancesListing in AWS CLI Command Reference.

create-restore-image-task

The following code example shows how to use create-restore-image-task.
AWS CLI

To restore an AMI from an S3 bucket

The following create-restore-image-task example restores an AMI from an S3 bucket. Use the values for S3ObjectKey `object-key` and `Bucket` from the describe-store-image-tasks output, specify the object key of the AMI and the name of the S3 bucket to which the AMI was copied, and specify the name for the restored AMI. The name must be unique for AMIs in the Region for this account. The restored AMI will receive a new AMI ID.

```
aws ec2 create-restore-image-task \
   --object-key ami-1234567890abcdef0.bin \
   --bucket my-ami-bucket \
   --name "New AMI Name"
```

Output:

```
{
   "ImageId": "ami-0eab20fe36f83e1a8"
}
```

- For API details, see CreateRestoreImageTask in AWS CLI Command Reference.

create-route-table

The following code example shows how to use create-route-table.

AWS CLI

To create a route table

This example creates a route table for the specified VPC.

Command:

```
aws ec2 create-route-table --vpc-id vpc-a01106c2
```
Output:

```json
{
   "RouteTable": {
      "Associations": [],
      "RouteTableId": "rtb-22574640",
      "VpcId": "vpc-a01106c2",
      "PropagatingVgws": [],
      "Tags": [],
      "Routes": [
         {
            "GatewayId": "local",
            "DestinationCidrBlock": "10.0.0.0/16",
            "State": "active"
         }
      ]
   }
}
```

- For API details, see `CreateRouteTable` in *AWS CLI Command Reference*.

**create-route**

The following code example shows how to use `create-route`.

**AWS CLI**

**To create a route**

This example creates a route for the specified route table. The route matches all IPv4 traffic (0.0.0.0/0) and routes it to the specified Internet gateway. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 create-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0 --gateway-id igw-c0a643a9
```

This example command creates a route in route table rtb-g8ff4ea2. The route matches traffic for the IPv4 CIDR block 10.0.0.0/16 and routes it to VPC peering connection, pcx-111aaa22. This route enables traffic to be directed to the peer VPC in the VPC peering connection. If the command succeeds, no output is returned.
**Command:**

```
aws ec2 create-route --route-table-id rtb-g8ff4ea2 --destination-cidr-block 10.0.0.0/16 --vpc-peering-connection-id pcx-1a2b3c4d
```

This example creates a route in the specified route table that matches all IPv6 traffic (::/0) and routes it to the specified egress-only Internet gateway.

**Command:**

```
aws ec2 create-route --route-table-id rtb-dce620b8 --destination-ipv6-cidr-block ::/0 --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

- For API details, see [CreateRoute](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-route.html) in *AWS CLI Command Reference*.

### create-security-group

The following code example shows how to use `create-security-group`.

#### AWS CLI

**To create a security group for EC2-Classic**

This example creates a security group named `MySecurityGroup`.

**Command:**

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group"
```

**Output:**

```json
{
  "GroupId": "sg-903004f8"
}
```

**To create a security group for EC2-VPC**

This example creates a security group named `MySecurityGroup` for the specified VPC.
Command:

```bash
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group" --vpc-id vpc-1a2b3c4d
```

Output:

```json
{
   "GroupId": "sg-903004f8"
}
```

For more information, see Using Security Groups in the *AWS Command Line Interface User Guide*.

- For API details, see [CreateSecurityGroup](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-security-group.html) in *AWS CLI Command Reference*.

**create-snapshot**

The following code example shows how to use `create-snapshot`.

**AWS CLI**

**To create a snapshot**

This example command creates a snapshot of the volume with a volume ID of `vol-1234567890abcdef0` and a short description to identify the snapshot.

Command:

```bash
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description "This is my root volume snapshot"
```

Output:

```json
{
   "Description": "This is my root volume snapshot",
   "Tags": [],
   "Encrypted": false,
   "VolumeId": "vol-1234567890abcdef0",
   "State": "pending",
   "VolumeSize": 8,
```
To create a snapshot with tags

This example command creates a snapshot and applies two tags: purpose=prod and costcenter=123.

Command:

```bash
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description 'Prod backup' --tag-specifications 'ResourceType=snapshot,Tags=[{Key=purpose,Value=prod},{Key=costcenter,Value=123}]'
```

Output:

```json
{
   "Description": "Prod backup",
   "Tags": [
      {
         "Value": "prod",
         "Key": "purpose"
      },
      {
         "Value": "123",
         "Key": "costcenter"
      }
   ],
   "Encrypted": false,
   "VolumeId": "vol-1234567890abcdef0",
   "State": "pending",
   "VolumeSize": 8,
   "StartTime": "2018-02-28T21:06:06.000Z",
   "Progress": "",
   "OwnerId": "012345678910",
   "SnapshotId": "snap-09ed24a70bc19bbe4"
}
```

- For API details, see [CreateSnapshot](#) in [AWS CLI Command Reference](#).
create-snapshots

The following code example shows how to use create-snapshots.

AWS CLI

Example 1: To create a multi-volume snapshot

The following create-snapshots example creates snapshots of all volumes attached to the specified instance.

```bash
aws ec2 create-snapshots
  --instance-specification InstanceId=i-1234567890abcdef0
  --description "This is snapshot of a volume from my-instance"
```

Output:

```json
{
  "Snapshots": [
    {
      "Description": "This is a snapshot of a volume from my-instance",
      "Tags": [],
      "Encrypted": false,
      "VolumeId": "vol-0a01d2d5a34697479",
      "State": "pending",
      "VolumeSize": 16,
      "StartTime": "2019-08-05T16:58:19.000Z",
      "Progress": "",
      "OwnerId": "123456789012",
      "SnapshotId": "snap-07f30e3909aa0045e"
    },
    {
      "Description": "This is a snapshot of a volume from my-instance",
      "Tags": [],
      "Encrypted": false,
      "VolumeId": "vol-02d0d4947008cb1a2",
      "State": "pending",
      "VolumeSize": 20,
      "StartTime": "2019-08-05T16:58:19.000Z",
      "Progress": "",
      "OwnerId": "123456789012",
      "SnapshotId": "snap-0ec20b602264aad48"
    }
  ]
}
```
Example 2: To create a multi-volume snapshot with tags from the source volume

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and copies the tags from each volume to its corresponding snapshot.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \    
    --copy-tags-from-source volume \    
    --description "This is snapshot of a volume from my-instance"
```

Output:

```
{
   "Snapshots": [
    {
        "Description": "This is a snapshot of a volume from my-instance",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-volume"
            }
        ],
        "Encrypted": false,
        "VolumeId": "vol-02d0d4947008cb1a2",
        "State": "pending",
        "VolumeSize": 20,
        "StartTime": "2019-08-05T16:53:04.000Z",
        "Progress": ",",
        "OwnerId": "123456789012",
        "SnapshotId": "snap-053bfaeb821a458dd"
    }
    ...
    ]
}
```

Example 3: To create a multi-volume snapshot not including the root volume
The following create-snapshots example creates a snapshot of all volumes attached to the specified instance except for the root volume.

```
aws ec2 create-snapshots \
   --instance-specification InstanceId=i-1234567890abcdef0,ExcludeBootVolume=true
```

See example 1 for sample output.

**Example 4: To create a multi-volume snapshot and add tags**

The following create-snapshots example creates snapshots of all volumes attached to the specified instance and adds two tags to each snapshot.

```
aws ec2 create-snapshots \
   --instance-specification InstanceId=i-1234567890abcdef0 \
   --tag-specifications 'ResourceType=snapshot,Tags=[[Key=Name,Value=backup],\n   {Key=costcenter,Value=123}]
```

See example 1 for sample output.

- For API details, see [CreateSnapshots](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-snapshots.html) in *AWS CLI Command Reference*.

### create-spot-datafeed-subscription

The following code example shows how to use create-spot-datafeed-subscription.

**AWS CLI**

**To create a Spot Instance data feed**

The following create-spot-datafeed-subscription example creates a Spot Instance data feed.

```
aws ec2 create-spot-datafeed-subscription \
   --bucket my-bucket \
   --prefix spot-data-feed
```

Output:

```json
{
   "SpotDatafeedSubscription": {
```
The data feed is stored in the Amazon S3 bucket that you specified. The file names for this data feed have the following format.

```
my-bucket.s3.amazonaws.com/spot-data-feed/123456789012.YYYY-MM-DD-HH.n.abcd1234.gz
```

For more information, see [Spot Instance data feed](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/Spot-AMIs.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CreateSpotDatafeedSubscription](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-spot-datafeed-subscription.html) in *AWS CLI Command Reference*.

---

### create-store-image-task

The following code example shows how to use `create-store-image-task`.

**AWS CLI**

**To store an AMI in an S3 bucket**

The following `create-store-image-task` example stores an AMI in an S3 bucket. Specify the ID of the AMI and the name of the S3 bucket in which to store the AMI.

```
aws ec2 create-store-image-task \
  --image-id ami-1234567890abcdef0 \
  --bucket my-ami-bucket
```

**Output:**

```
{
  "ObjectKey": "ami-1234567890abcdef0.bin"
}
```

For more information, see [Store and restore an AMI using S3](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/StoreAMIOnS3.html) in the *Amazon EC2 User Guide*.

- For API details, see [CreateStoreImageTask](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-store-image-task.html) in *AWS CLI Command Reference*. 

---

```
"Bucket": "my-bucket",
"OwnerId": "123456789012",
"Prefix": "spot-data-feed",
"State": "Active"

```
create-subnet-cidr-reservation

The following code example shows how to use create-subnet-cidr-reservation.

AWS CLI

To create a subnet CIDR reservation

The following create-subnet-cidr-reservation example creates a subnet CIDR reservation for the specified subnet and CIDR range.

```
aws ec2 create-subnet-cidr-reservation \
   --subnet-id subnet-03c51e2eEXAMPLE \
   --reservation-type prefix \
   --cidr 10.1.0.20/26
```

Output:

```
{
   "SubnetCidrReservation": {
      "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
      "SubnetId": "subnet-03c51e2e6cEXAMPLE",
      "Cidr": "10.1.0.16/28",
      "ReservationType": "prefix",
      "OwnerId": "123456789012"
   }
}
```

For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.

- For API details, see CreateSubnetCidrReservation in AWS CLI Command Reference.

create-subnet

The following code example shows how to use create-subnet.

AWS CLI

Example 1: To create a subnet with an IPv4 CIDR block only

The following create-subnet example creates a subnet in the specified VPC with the specified IPv4 CIDR block.
aws ec2 create-subnet \
   --vpc-id vpc-081ec835f3EXAMPLE \
   --cidr-block 10.0.0.0/24 \
   --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-only-subnet}]

Output:

```json
{
   "Subnet": {
      "AvailabilityZone": "us-west-2a",
      "AvailabilityZoneId": "usw2-az2",
      "AvailableIpAddressCount": 251,
      "CidrBlock": "10.0.0.0/24",
      "DefaultForAz": false,
      "MapPublicIpOnLaunch": false,
      "State": "available",
      "SubnetId": "subnet-0e99b93155EXAMPLE",
      "VpcId": "vpc-081ec835f3EXAMPLE",
      "OwnerId": "123456789012",
      "AssignIpv6AddressOnCreation": false,
      "Ipv6CidrBlockAssociationSet": [],
      "Tags": [
         {
            "Key": "Name",
            "Value": "my-ipv4-only-subnet"
         }
      ],
      "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0e99b93155EXAMPLE"
   }
}
```

Example 2: To create a subnet with both IPv4 and IPv6 CIDR blocks

The following create-subnet example creates a subnet in the specified VPC with the specified IPv4 and IPv6 CIDR blocks.

aws ec2 create-subnet \
   --vpc-id vpc-081ec835f3EXAMPLE \
   --cidr-block 10.0.0.0/24 \
   --ipv6-cidr-block 2600:1f16:cfe:3660::/64 \

Example 3: To create a subnet with an IPv6 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv6 CIDR block.

---

```
--tag-specifications ResourceType=subnet,Tags=[[Key=Name,Value=my-ipv4-ipv6-subnet]]
```

Output:

```
{
  "Subnet": {
    "AvailabilityZone": "us-west-2a",
    "AvailabilityZoneId": "usw2-az2",
    "AvailableIpAddressCount": 251,
    "CidrBlock": "10.0.0.0/24",
    "DefaultForAz": false,
    "MapPublicIpOnLaunch": false,
    "State": "available",
    "SubnetId": "subnet-0736441d38EXAMPLE",
    "VpcId": "vpc-081ec835f3EXAMPLE",
    "OwnerId": "123456789012",
    "AssignIpv6AddressOnCreation": false,
    "Ipv6CidrBlockAssociationSet": [
      {
        "AssociationId": "subnet-cidr-assoc-06c5f904499fcc623",
        "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
        "Ipv6CidrBlockState": {
          "State": "associating"
        }
      }
    ],
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-ipv4-ipv6-subnet"
      }
    ],
  }
}
```
aws ec2 create-subnet \
  --vpc-id vpc-081ec835f3EXAMPLE \ 
  --ipv6-native \ 
  --ipv6-cidr-block 2600:1f16:115:200::/64 \ 
  --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv6-only-subnet}]

Output:

```json
{
  "Subnet": {
    "AvailabilityZone": "us-west-2a",
    "AvailabilityZoneId": "usw2-az2",
    "AvailableIpAddressCount": 0,
    "DefaultForAz": false,
    "MapPublicIpOnLaunch": false,
    "State": "available",
    "SubnetId": "subnet-03f720e7deEXAMPLE",
    "VpcId": "vpc-081ec835f3EXAMPLE",
    "OwnerId": "123456789012",
    "AssignIpv6AddressOnCreation": true,
    "Ipv6CidrBlockAssociationSet": [
      {
        "AssociationId": "subnet-cidr-assoc-01ef639edde556709",
        "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
        "Ipv6CidrBlockState": {
          "State": "associating"
        }
      }
    ],
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-ipv6-only-subnet"
      }
    ],
    "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-03f720e7deEXAMPLE"
  }
}
```

For more information, see [VPCs and subnets](https://docs.aws.amazon.com/vpc/latest/userguide/what-is-vpc.html) in the *Amazon VPC User Guide*. 
create-tags

The following code example shows how to use create-tags.

AWS CLI

Example 1: To add a tag to a resource

The following create-tags example adds the tag Stack=production to the specified image, or overwrites an existing tag for the AMI where the tag key is Stack.

```bash
aws ec2 create-tags \
    --resources ami-1234567890abcdef0 \
    --tags Key=Stack,Value=production
```

For more information, see This is the topic title in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

Example 2: To add tags to multiple resources

The following create-tags example adds (or overwrites) two tags for an AMI and an instance. One of the tags has a key (webserver) but no value (value is set to an empty string). The other tag has a key (stack) and a value (Production).

```bash
aws ec2 create-tags \
    --resources ami-1a2b3c4d i-1234567890abcdef0 \
    --tags Key=webserver,Value=   Key=stack,Value=Production
```

For more information, see This is the topic title in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

Example 3: To add tags containing special characters

The following create-tags example adds the tag [Group]=test for an instance. The square brackets ([ and ]) are special characters, and must be escaped. The following examples also use the line continuation character appropriate for each environment.

If you are using Windows, surround the element that has special characters with double quotes ("), and then precede each double quote character with a backslash (\) as follows:
aws ec2 create-tags ^
   --resources i-1234567890abcdef0 ^
   --tags Key="[Group]\",Value=test

If you are using Windows PowerShell, surround the element the value that has special characters with double quotes ("), precede each double quote character with a backslash (\), and then surround the entire key and value structure with single quotes (’) as follows:

aws ec2 create-tags `
   --resources i-1234567890abcdef0 `
   --tags 'Key="[Group]\",Value=test'

If you are using Linux or OS X, surround the element that has special characters with double quotes ("), and then surround the entire key and value structure with single quotes (’) as follows:

aws ec2 create-tags `
   --resources i-1234567890abcdef0 `
   --tags 'Key="[Group]\",Value=test'

For more information, see This is the topic title in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see CreateTags in AWS CLI Command Reference.

create-traffic-mirror-filter-rule

The following code example shows how to use create-traffic-mirror-filter-rule.

AWS CLI

To create a filter rule for incoming TCP traffic

The following create-traffic-mirror-filter-rule example creates a rule that you can use to mirror all incoming TCP traffic. Before you run this command, use create-traffic-mirror-filter to create the Traffic Mirror filter.

```bash
aws ec2 create-traffic-mirror-filter-rule \
   --description "TCP Rule" \
   --destination-cidr-block 0.0.0.0/0 \
   --protocol 6 \
```
create-traffic-mirror-filter

The following code example shows how to use create-traffic-mirror-filter.

AWS CLI

To create a Traffic Mirror Filter

The following create-traffic-mirror-filter example creates a Traffic Mirror filter. After you create the filter, use create-traffic-mirror-filter-rule to add rules to the filter.

```bash
cmd
aws ec2 create-traffic-mirror-filter \
   --description "TCP Filter"
```

Output:

```json
{
    "TrafficMirrorFilterRule": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "TrafficMirrorFilterId": "tmf-04812ff784b25ae67",
        "TrafficMirrorFilterRuleId": "tmfr-02d20d996673f3732",
        "SourceCidrBlock": "0.0.0.0/0",
        "TrafficDirection": "ingress",
        "Description": "TCP Rule",
        "RuleNumber": 1,
        "RuleAction": "accept",
        "Protocol": 6
    },
    "ClientToken": "4752b573-40a6-4eac-a8a4-a72058761219"
}
```

For more information, see Create a Traffic Mirror Filter in the AWS Traffic Mirroring Guide.

- For API details, see CreateTrafficMirrorFilterRule in AWS CLI Command Reference.
For more information, see [Create a Traffic Mirror Filter](#) in the AWS Traffic Mirroring Guide.

- For API details, see [CreateTrafficMirrorFilter](#) in AWS CLI Command Reference.

**create-traffic-mirror-session**

The following code example shows how to use `create-traffic-mirror-session`.

**AWS CLI**

**To create a Traffic Mirror Session**

The following `create-traffic-mirror-session` command creates a traffic mirror sessions for the specified source and target for 25 bytes of the packet.

```bash
aws ec2 create-traffic-mirror-session \
  --description "example session" \
  --traffic-mirror-target-id tmt-07f75d8feeEXAMPLE \
  --network-interface-id eni-070203f901EXAMPLE \
  --session-number 1 \n  --packet-length 25 \n  --traffic-mirror-filter-id tmf-04812ff784EXAMPLE
```

**Output:**

```json
{
  "TrafficMirrorSession": {
    "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
    "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
  }
}
```
For more information, see [Create a Traffic Mirror Session](https://docs.aws.amazon.com/traffic-mirroring/latest/userguide/create-traffic-mirror-session.html) in the AWS Traffic Mirroring Guide.

- For API details, see [CreateTrafficMirrorSession](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-traffic-mirror-session.html) in AWS CLI Command Reference.

### create-traffic-mirror-target

The following code example shows how to use `create-traffic-mirror-target`.

**AWS CLI**

**To create a Network Load Balancer Traffic Mirror target**

The following `create-traffic-mirror-target` example creates a Network Load Balancer Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target \
  --description "Example Network Load Balancer Target" \
```

**Output:**

```
{
  "TrafficMirrorTarget": {
    "Type": "network-load-balancer",
    "Tags": [],
    "Description": "Example Network Load Balancer Target",
    "OwnerId": "111122223333",
    "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:724145273726:loadbalancer/net/NLB/7cdec873EXAMPLe",
  }
}
```
To create a network Traffic Mirror target

The following create-traffic-mirror-target example creates a network interface Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target --description "Network interface target" --network-interface-id eni-eni-01f6f631eEXAMPLE
```

Output:

```
{
   "ClientToken": "5289a345-0358-4e62-93d5-47ef3061d65e",
   "TrafficMirrorTarget": {
      "Description": "Network interface target",
      "NetworkInterfaceId": "eni-01f6f631eEXAMPLE",
      "TrafficMirrorTargetId": "tmt-02dcdb2abEXAMPLE",
      "OwnerId": "1112222253",
      "Type": "network-interface",
      "Tags": []
   }
}
```

For more information, see Create a Traffic Mirror Target in the AWS Traffic Mirroring Guide.

- For API details, see CreateTrafficMirrorTarget in AWS CLI Command Reference.

create-transit-gateway-connect-peer

The following code example shows how to use create-transit-gateway-connect-peer.

AWS CLI

To create a Transit Gateway Connect peer

The following create-transit-gateway-connect-peer example creates a Connect peer.

```
aws ec2 create-transit-gateway-connect-peer
```
```
--transit-gateway-attachment-id tgw-attach-0f0927767cEXAMPLE \
--peer-address 172.31.1.11 \
--inside-cidr-blocks 169.254.6.0/29
```

Output:

```json
{
   "TransitGatewayConnectPeer": {
      "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
      "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
      "State": "pending",
      "CreationTime": "2021-10-13T03:35:17.000Z",
      "ConnectPeerConfiguration": {
         "TransitGatewayAddress": "10.0.0.234",
         "PeerAddress": "172.31.1.11",
         "InsideCidrBlocks": [
            "169.254.6.0/29"
         ],
         "Protocol": "gre",
         "BgpConfigurations": [
            {
               "TransitGatewayAsn": 64512,
               "PeerAsn": 64512,
               "TransitGatewayAddress": "169.254.6.2",
               "PeerAddress": "169.254.6.1",
               "BgpStatus": "down"
            },
            {
               "TransitGatewayAsn": 64512,
               "PeerAsn": 64512,
               "TransitGatewayAddress": "169.254.6.3",
               "PeerAddress": "169.254.6.1",
               "BgpStatus": "down"
            }
         ]
      }
   }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayConnectPeer in AWS CLI Command Reference.
create-transit-gateway-connect

The following code example shows how to use create-transit-gateway-connect.

AWS CLI

To create a transit gateway Connect attachment

The following create-transit-gateway-connect example creates a Connect attachment, with the "gre" protocol, for the specified attachment.

```shell
aws ec2 create-transit-gateway-connect \
  --transport-transit-gateway-attachment-id tgw-attach-0a89069f57EXAMPLE \
  --options "Protocol=gre"
```

Output:

```json
{
  "TransitGatewayConnect": {
    "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
    "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "State": "pending",
    "CreationTime": "2021-03-09T19:59:17+00:00",
    "Options": {
      "Protocol": "gre"
    }
  }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayConnect in AWS CLI Command Reference.

create-transit-gateway-multicast-domain

The following code example shows how to use create-transit-gateway-multicast-domain.

AWS CLI

Example 1: To create an IGMP multicast domain
The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources disabled, any instances in subnets associated with the multicast domain can send multicast traffic. If at least one member uses the IGMP protocol, you must enable IGMPv2 support.

```
aws ec2 create-transit-gateway-multicast-domain \
   --transit-gateway-id tgw-0bf0bffefafEXAMPLE \n   --options StaticSourcesSupport=disable,Igmpv2Support=enable
```

Output:

```
{
   "TransitGatewayMulticastDomain": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c9e29e2a7EXAMPLE",
      "TransitGatewayId": "tgw-0bf0bffefafEXAMPLE",
      "OwnerIds": "123456789012",
      "Options": {
         "Igmpv2Support": "enable",
         "StaticSourcesSupport": "disable",
         "AutoAcceptSharedAssociations": "disable"
      },
      "State": "pending",
      "CreationTime": "2021-09-29T22:17:13.000Z"
   }
}
```

**Example 2: To create a static multicast domain**

The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources enabled, you must statically add sources.

```
aws ec2 create-transit-gateway-multicast-domain \
   --transit-gateway-id tgw-0bf0bffefafEXAMPLE \n   --options StaticSourcesSupport=enable,Igmpv2Support=disable
```

Output:
{  
  "TransitGatewayMulticastDomain": {  
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",  
    "TransitGatewayId": "tgw-0bf0bffe08EXAMPLE",  
    "OwnerId": "123456789012",  
    "Options": {  
      "Igmpv2Support": "disable",  
      "StaticSourcesSupport": "enable",  
      "AutoAcceptSharedAssociations": "disable"  
    },  
    "State": "pending",  
    "CreationTime": "2021-09-29T22:20:19.000Z"
  }
}

For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayMulticastDomain in AWS CLI Command Reference.

create-transit-gateway-peering-attachment

The following code example shows how to use create-transit-gateway-peering-attachment.

AWS CLI

To create a transit gateway peering attachment

The following create-transit-gateway-peering-attachment example creates a peering attachment request between the two specified transit gateways.

```bash
aws ec2 create-transit-gateway-peering-attachment \
  --transit-gateway-id tgw-123abc05e04123abc \
  --peer-transit-gateway-id tgw-11223344aabbcc112 \
  --peer-account-id 123456789012 \
  --peer-region us-east-2
```

Output:
For more information, see Transit Gateway Peering Attachments in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayPeeringAttachment in AWS CLI Command Reference.

create-transit-gateway-policy-table

The following code example shows how to use create-transit-gateway-policy-table.

AWS CLI

To create a transit gateway policy table

The following create-transit-gateway-policy-table example creates a transit gateway policy table for the specified transit gateway.

```
aws ec2 create-transit-gateway-policy-table \
  --transit-gateway-id tgw-067f8505c18f0bd6e
```

Output:

```
{
  "TransitGatewayPolicyTable": {
    "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
    "TransitGatewayId": "tgw-067f8505c18f0bd6e",
  }
}
```
For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see CreateTransitGatewayPolicyTable in AWS CLI Command Reference.

create-transit-gateway-prefix-list-reference

The following code example shows how to use create-transit-gateway-prefix-list-reference.

**AWS CLI**

**To create a reference to a prefix list**

The following create-transit-gateway-prefix-list-reference example creates a reference to the specified prefix list in the specified transit gateway route table.

```bash
aws ec2 create-transit-gateway-prefix-list-reference \\
  --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \\
  --prefix-list-id pl-111112222222333 \\
  --transit-gateway-attachment-id tgw-attach-aaaaaabbbbbb11111
```

Output:

```json
{
  "TransitGatewayPrefixListReference": {
    "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
    "PrefixListId": "pl-1111122222222333",
    "PrefixListOwnerId": "123456789012",
    "State": "pending",
    "Blackhole": false,
    "TransitGatewayAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-aaaaaabbbbbb11111",
      "ResourceType": "vpc",
      "ResourceId": "vpc-112233445566aabbad"
    }
  }
}
```
create-transit-gateway-route-table

The following code example shows how to use `create-transit-gateway-route-table`.

**AWS CLI**

**To create a Transit Gateway Route Table**

The following `create-transit-gateway-route-table` example creates a route table for the specified transit gateway.

```bash
aws ec2 create-transit-gateway-route-table \
   --transit-gateway-id tgw-0262a0e521EXAMPLE
```

**Output:**

```json
{
   "TransitGatewayRouteTable": {
      "TransitGatewayRouteTableId": "tgw-rtb-0960981be7EXAMPLE",
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
      "State": "pending",
      "DefaultAssociationRouteTable": false,
      "DefaultPropagationRouteTable": false,
      "CreationTime": "2019-07-10T19:01:46.000Z"
   }
}
```

For more information, see [Create a transit gateway route table](https://docs.aws.amazon.com/TransitGateways/latest/APIReference/API_CreateTransitGatewayRouteTable.html) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-transit-gateway-route-table.html) in *AWS CLI Command Reference*.

create-transit-gateway-route

The following code example shows how to use `create-transit-gateway-route`.

**AWS CLI**

**To create a transit gateway route**

```bash
aws ec2 create-transit-gateway-route \
   --transit-gateway-id tgw-0262a0e521EXAMPLE \
   --route target-route-id rtb-0321EXAMPLE
```

**Output:**

```json
{
   "TransitGatewayRoute": {
      "TransitGatewayRouteId": "rtb-0321EXAMPLE",
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
      "DestinationCidrBlock": "10.10.10.0/24",
      "Type": "direct",
      "State": "pending",
      "CreationTime": "2019-07-10T19:01:46.000Z"
   }
}
```

For more information, see [Create a transit gateway route](https://docs.aws.amazon.com/TransitGateways/latest/APIReference/API_CreateTransitGatewayRoute.html) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayRoute](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-transit-gateway-route.html) in *AWS CLI Command Reference*. 
The following `create-transit-gateway-route` example creates a route, with the specified destination, for the specified route table.

```bash/aws ec2 create-transit-gateway-route \
   --destination-cidr-block 10.0.2.0/24 \
   --transit-gateway-route-table-id tgw-rtb-0b6f6aa01EXAMPLE \
   --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```json
{
   "Route": {
      "DestinationCidrBlock": "10.0.2.0/24",
      "TransitGatewayAttachments": [
         {
            "ResourceId": "vpc-0065acced4EXAMPLE",
            "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
            "ResourceType": "vpc"
         }
      ],
      "Type": "static",
      "State": "active"
   }
}
```

`create-transit-gateway-vpc-attachment`

The following code example shows how to use `create-transit-gateway-vpc-attachment`.

**AWS CLI**

**Example 1: To associate a transit gateway with a VPC**

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC.

```bash/aws ec2 create-transit-gateway-vpc-attachment \
```
Output:

```json
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8ffd50fEXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Create a transit gateway attachment to a VPC in the Transit Gateways Guide.

**Example 2: To associate a transit gateway with multiple subnets in a VPC**

The following create-transit-gateway-vpc-attachment example creates a transit gateway attachment to the specified VPC and subnets.

```bash
aws ec2 create-transit-gateway-vpc-attachment \
    --transit-gateway-id tgw-02f776b1a7EXAMPLE \
    --vpc-id vpc-3EXAMPLE \
    --subnet-ids "subnet-dEXAMPLE" "subnet-6EXAMPLE"
```

Output:

```json
{
    "TransitGatewayVpcAttachment": {
```
For more information, see Create a transit gateway attachment to a VPC in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayVpcAttachment in AWS CLI Command Reference.

create-transit-gateway

The following code example shows how to use create-transit-gateway.

AWS CLI

To create a transit gateway

The following create-transit-gateway example creates a transit gateway.

```bash
aws ec2 create-transit-gateway
   --description MyTGW
   --options
       AmazonSideAsn=64516,AutoAcceptSharedAttachments=enable,DefaultRouteTableAssociation=enable,
       DefaultRouteTablePropagation=enable,VpnEcmpSupport=enable,DnsSupport=enable
```

Output:

```json
{
   "TransitGateway": {
       "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
   }
}
```
For more information, see Create a transit gateway in the Transit Gateways Guide.

- For API details, see CreateTransitGateway in AWS CLI Command Reference.

create-verified-access-endpoint

The following code example shows how to use create-verified-access-endpoint.

AWS CLI

To create a Verified Access endpoint

The following create-verified-access-endpoint example creates a Verified Access endpoint for the specified Verified Access group. The specified network interface and security group must belong to the same VPC.

```bash
aws ec2 create-verified-access-endpoint \
  --verified-access-group-id vagr-0dbe967baf14b7235 \
  --endpoint-type network-interface \
  --attachment-type vpc \
  --domain-certificate-arn arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE \
  --application-domain example.com \
  --endpoint-domain-prefix my-ava-app 
```
Output:

```json
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
        "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
        "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
        ],
        "NetworkInterfaceOptions": {
            "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
        },
        "Status": {
            "Code": "pending"
        },
        "Description": "",
        "CreationTime": "2023-08-25T20:54:43",
        "LastUpdatedTime": "2023-08-25T20:54:43",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-endpoint"
            }
        ]
    }
}
```
For more information, see [Verified Access endpoints](#) in the [AWS Verified Access User Guide](#).

- For API details, see [CreateVerifiedAccessEndpoint](#) in [AWS CLI Command Reference](#).

**create-verified-access-group**

The following code example shows how to use `create-verified-access-group`.

**AWS CLI**

**To create a Verified Access group**

The following `create-verified-access-group` example creates a Verified Access group for the specified Verified Access instance.

```bash
aws ec2 create-verified-access-group \
  --verified-access-instance-id vai-0ce000c0b7643abea \
  --tag-specifications ResourceType=verified-access-group,Tags=([{Key=Name,Value=my-va-group}]
```

Output:

```json
{
  "VerifiedAccessGroup": {
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "Description": "",
    "Owner": "123456789012",
    "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
    "CreationTime": "2023-08-25T19:55:19",
    "LastUpdatedTime": "2023-08-25T19:55:19",
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-va-group"
      }
    ]
  }
}
```

For more information, see [Verified Access groups](#) in the [AWS Verified Access User Guide](#).
create-verified-access-instance

The following code example shows how to use create-verified-access-instance.

AWS CLI

To create a Verified Access instance

The following create-verified-access-instance example creates a Verified Access instance with a Name tag.

```bash
aws ec2 create-verified-access-instance \
    --tag-specifications ResourceType=verified-access-instance,Tags=[{Key=Name,Value=my-va-instance}]
```

Output:

```
{
    "VerifiedAccessInstance": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "",
        "VerifiedAccessTrustProviders": [],
        "CreationTime": "2023-08-25T18:27:56",
        "LastUpdatedTime": "2023-08-25T18:27:56",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-va-instance"
            }
        ]
    }
}
```

For more information, see Verified Access instances in the AWS Verified Access User Guide.

create-verified-access-trust-provider

The following code example shows how to use create-verified-access-trust-provider.
AWS CLI

**To create a Verified Access trust provider**

The following `create-verified-access-trust-provider` example sets up a Verified Access trust provider using AWS Identity Center.

```
aws ec2 create-verified-access-trust-provider \
   --trust-provider-type user \
   --user-trust-provider-type iam-identity-center \
   --policy-reference-name idc \
   --tag-specifications ResourceType=verified-access-trust-provider,Tags=([[Key=Name,Value=my-va-trust-provider]]
```

Output:

```
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T18:40:36",
      "LastUpdatedTime": "2023-08-25T18:40:36",
      "Tags": [
         {
            "Key": "Name",
            "Value": "my-va-trust-provider"
         }
      ]
   }
}
```

For more information, see Trust providers for Verified Access in the *AWS Verified Access User Guide*.

- For API details, see CreateVerifiedAccessTrustProvider in *AWS CLI Command Reference*.

**create-volume**

The following code example shows how to use `create-volume`.

To create an empty General Purpose SSD (gp2) volume

The following `create-volume` example creates an 80 GiB General Purpose SSD (gp2) volume in the specified Availability Zone. Note that the current Region must be `us-east-1`, or you can add the `--region` parameter to specify the Region for the command.

```bash
aws ec2 create-volume 
   --volume-type gp2 
   --size 80 
   --availability-zone us-east-1a
```

Output:

```
{
   "AvailabilityZone": "us-east-1a",
   "Tags": [],
   "Encrypted": false,
   "VolumeType": "gp2",
   "VolumeId": "vol-1234567890abcdef0",
   "State": "creating",
   "Iops": 240,
   "SnapshotId": "",
   "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
   "Size": 80
}
```

If you do not specify a volume type, the default volume type is gp2.

```bash
aws ec2 create-volume 
   --size 80 
   --availability-zone us-east-1a
```

Example 2: To create a Provisioned IOPS SSD (io1) volume from a snapshot

The following `create-volume` example creates a Provisioned IOPS SSD (io1) volume with 1000 provisioned IOPS in the specified Availability Zone using the specified snapshot.

```bash
aws ec2 create-volume 
   --volume-type io1 
```
--iops 1000 \ 
--snapshot-id snap-066877671789bd71b \ 
--availability-zone us-east-1a

Output:

```
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": false,
    "VolumeType": "io1",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 1000,
    "SnapshotId": "snap-066877671789bd71b",
    "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "Size": 500
}
```

**Example 3: To create an encrypted volume**

The following `create-volume` example creates an encrypted volume using the default CMK for EBS encryption. If encryption by default is disabled, you must specify the `--encrypted` parameter as follows.

```
aws ec2 create-volume \
    --size 80 \
    --encrypted \
    --availability-zone us-east-1a
```

Output:

```
{
    "AvailabilityZone": "us-east-1a",
    "Tags": [],
    "Encrypted": true,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "creating",
    "Iops": 240,
    "SnapshotId": "",
    "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
```
If encryption by default is enabled, the following example command creates an encrypted volume, even without the `--encrypted` parameter.

```bash
aws ec2 create-volume \
  --size 80 \
  --availability-zone us-east-1a
```

If you use the `--kms-key-id` parameter to specify a customer managed CMK, you must specify the `--encrypted` parameter even if encryption by default is enabled.

```bash
aws ec2 create-volume \
  --volume-type gp2 \
  --size 80 \
  --encrypted \n  --kms-key-id 0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE \
  --availability-zone us-east-1a
```

**Example 4: To create a volume with tags**

The following `create-volume` example creates a volume and adds two tags.

```bash
aws ec2 create-volume \
  --availability-zone us-east-1a \
  --volume-type gp2 \
  --size 80 \
  --tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production}, \n  {Key=cost-center,Value=cc123}]
```

- For API details, see [CreateVolume](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-volume.html) in AWS CLI Command Reference.

**create-vpc-endpoint-connection-notification**

The following code example shows how to use `create-vpc-endpoint-connection-notification`.

**AWS CLI**

To create an endpoint connection notification
This example creates a notification for a specific endpoint service that alerts you when interface endpoints have connected to your service and when endpoints have been accepted for your service.

**Command:**

```bash
```

**Output:**

```json
{
    "ConnectionNotification": {
        "ConnectionNotificationState": "Enabled",
        "ConnectionNotificationType": "Topic",
        "ServiceId": "vpc-svc-1237881c0d25a3abc",
        "ConnectionEvents": [
            "Accept",
            "Connect"
        ],
        "ConnectionNotificationId": "vpce-nfn-008776de7e03f5abc",
    }
}
```

- For API details, see [CreateVpcEndpointConnectionNotification](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-vpc-endpoint-connection-notification.html) in *AWS CLI Command Reference*.

**create-vpc-endpoint-service-configuration**

The following code example shows how to use `create-vpc-endpoint-service-configuration`.

**AWS CLI**

**Example 1: To create an endpoint service configuration for an interface endpoint**

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Network Load Balancer `nlb-vpce`. This example
also specifies that requests to connect to the service through an interface endpoint must be accepted.

```bash
aws ec2 create-vpc-endpoint-service-configuration \
   --network-load-balancer-arns arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532 \
   --acceptance-required
```

Output:

```
{
   "ServiceConfiguration": {
      "ServiceType": [
         {
            "ServiceType": "Interface"
         }
      ],
      "NetworkLoadBalancerArns": [
         "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532"
      ],
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-03d5ebb7d9579a2b3",
      "ServiceState": "Available",
      "ServiceId": "vpce-svc-03d5ebb7d9579a2b3",
      "AcceptanceRequired": true,
      "AvailabilityZones": [
         "us-east-1d"
      ],
      "BaseEndpointDnsNames": [
         "vpce-svc-03d5ebb7d9579a2b3.us-east-1.vpce.amazonaws.com"
      ]
   }
}
```

**Example 2: To create an endpoint service configuration for a Gateway Load Balancer endpoint**

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Gateway Load Balancer GWLBService. Requests to connect to the service through a Gateway Load Balancer endpoint are automatically accepted.

```bash
aws ec2 create-vpc-endpoint-service-configuration \
   --network-load-balancer-arns arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/glb-vpce/e94221227f1ba532 \
   --acceptance-required
```
--gateway-load-balancer-arns arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/GWLBService/123123123123abcc \  
--no-acceptance-required

Output:

```json
{
   "ServiceConfiguration": {
      "ServiceType": [
         {
            "ServiceType": "GatewayLoadBalancer"
         }
      ],
      "ServiceId": "vpce-svc-123123a1c43abc123",
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
      "ServiceState": "Available",
      "AvailabilityZones": [
         "us-east-1d"
      ],
      "AcceptanceRequired": false,
      "ManagesVpcEndpoints": false,
      "GatewayLoadBalancerArns": [
         "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/GWLBService/123123123123abcc"
      ]
   }
}
```

For more information, see [VPC endpoint services](https://docs.aws.amazon.com/vpc/latest/userguide/vpc-endpoint-service.html) in the *Amazon VPC User Guide*.

- For API details, see [CreateVpcEndpointServiceConfiguration](https://docs.aws.amazon.com/cli/latest/reference/vpc-endpoint-service/create-vpc-endpoint-service-configuration.html) in *AWS CLI Command Reference*.

**create-vpc-endpoint**

The following code example shows how to use `create-vpc-endpoint`.

**AWS CLI**

**Example 1: To create a gateway endpoint**

The following create-vpc-endpoint example creates a gateway VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-east-1` region, and associates route table `rtb-11aa22bb` with the endpoint.
aws ec2 create-vpc-endpoint \
   --vpc-id vpc-1a2b3c4d \
   --service-name com.amazonaws.us-east-1.s3 \
   --route-table-ids rtb-11aa22bb

Output:

```
{
   "VpcEndpoint": {
      "PolicyDocument": "{\"Version\":"2008-10-17","Statement":[{"\"Sid\":"","\"Effect\":"Allow","\"Principal\":"*","\"Action\":"*","\"Resource\":"*"}]}",
      "VpcId": "vpc-1a2b3c4d",
      "State": "available",
      "ServiceName": "com.amazonaws.us-east-1.s3",
      "RouteTableIds": [
         "rtb-11aa22bb"
      ],
      "VpcEndpointId": "vpc-1a2b3c4d",
      "CreationTimestamp": "2015-05-15T09:40:50Z"
   }
}
```

For more information, see [Creating a gateway endpoint](#) in the [AWS PrivateLink Guide](#).

**Example 2: To create an interface endpoint**

The following `create-vpc-endpoint` example creates an interface VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-east-1` region. The command creates the endpoint in subnet `subnet-1a2b3c4d`, associates it with security group `sg-1a2b3c4d`, and adds a tag with a key of "Service" and a Value of "S3".

aws ec2 create-vpc-endpoint \
   --vpc-id vpc-1a2b3c4d \
   --vpc-endpoint-type Interface \
   --service-name com.amazonaws.us-east-1.s3 \
   --subnet-ids subnet-7b16de0c \
   --security-group-id sg-1a2b3c4d \
   --tag-specifications ResourceType=vpc-endpoint,Tags=[{Key=service,Value=S3}]

Output:

```
{
```

Actions and scenarios
"VpcEndpoint": {
    "VpcEndpointId": "vpce-1a2b3c4d5e6f1a2b3",
    "VpcEndpointType": "Interface",
    "VpcId": "vpc-1a2b3c4d",
    "ServiceName": "com.amazonaws.us-east-1.s3",
    "State": "pending",
    "RouteTableIds": [],
    "SubnetIds": [
        "subnet-1a2b3c4d"
    ],

For more information, see Creating an interface endpoint in the User Guide for AWSPrivateLink.

Example 3: To create a Gateway Load Balancer endpoint

The following create-vpc-endpoint example creates a Gateway Load Balancer endpoint between VPC vpc-111122223333aabbc and and a service that is configured using a Gateway Load Balancer.

```
aws ec2 create-vpc-endpoint \
   --service-name com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123 \
   --vpc-endpoint-type GatewayLoadBalancer \
   --vpc-id vpc-111122223333aabbc \
   --subnet-ids subnet-0011aabbcc2233445
```

Output:

```
{
   "VpcEndpoint": {
      "VpcEndpointId": "vpce-aabbaabbaabbaab",
      "VpcEndpointType": "GatewayLoadBalancer",
      "VpcId": "vpc-111122223333aabbc",
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
      "State": "pending",
      "SubnetIds": [
         "subnet-0011aabbcc2233445"
      ],
      "RequesterManaged": false,
      "NetworkInterfaceIds": [
         "eni-01010120203030405"
      ],

      "OwnerId": "123456789012"
   }
}
```

For more information, see Gateway Load Balancer endpoints in the User Guide for AWSPrivateLink.

- For API details, see CreateVpcEndpoint in AWS CLI Command Reference.
create-vpc-peering-connection

The following code example shows how to use create-vpc-peering-connection.

AWS CLI

To create a VPC peering connection between your VPCs

This example requests a peering connection between your VPCs vpc-1a2b3c4d and vpc-11122233.

Command:

```bash
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233
```

Output:

```json
{
    "VpcPeeringConnection": {
        "Status": {
            "Message": "Initiating Request to 444455556666",
            "Code": "initiating-request"
        },
        "Tags": [],
        "RequesterVpcInfo": {
            "OwnerId": "444455556666",
            "VpcId": "vpc-1a2b3c4d",
            "CidrBlock": "10.0.0.0/28"
        },
        "VpcPeeringConnectionId": "pcx-111aaa111",
        "ExpirationTime": "2014-04-02T16:13:36.000Z",
        "AccepterVpcInfo": {
            "OwnerId": "444455556666",
            "VpcId": "vpc-11122233"
        }
    }
}
```

To create a VPC peering connection with a VPC in another account

This example requests a peering connection between your VPC (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012.
Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-owner-id 123456789012
```

To create a VPC peering connection with a VPC in a different region

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) in your account in the us-west-2 region.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-region us-west-2
```

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012 that's in the us-west-2 region.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-owner-id 123456789012 --peer-region us-west-2
```

- For API details, see CreateVpcPeeringConnection in AWS CLI Command Reference.

create-vpc

The following code example shows how to use create-vpc.

AWS CLI

Example 1: To create a VPC

The following create-vpc example creates a VPC with the specified IPv4 CIDR block and a Name tag.

```
aws ec2 create-vpc \
   --cidr-block 10.0.0.0/16 \
   --tag-specification ResourceType=vpc,Tags=([[Key=Name,Value=MyVpc]])
```
Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-5EXAMPLE",
        "State": "pending",
        "VpcId": "vpc-0a60eb65b4EXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-07501b79ecEXAMPLE",
                "CidrBlock": "10.0.0.0/16",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false,
        "Tags": [
            {
                "Key": "Name",
                "Value": "MyVpc"
            }
        ]
    }
}
```

**Example 2: To create a VPC with dedicated tenancy**

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and dedicated tenancy.

```
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \
    --instance-tenancy dedicated
```

Output:

```
{
```
Example 3: To create a VPC with an IPv6 CIDR block

The following `create-vpc` example creates a VPC with an Amazon-provided IPv6 CIDR block.

```
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \n    --amazon-provided-ipv6-cidr-block
```

Output:

```
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-dEXAMPLE",
        "State": "pending",
        "VpcId": "vpc-0fc5e3406bEXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-068432c60bEXAMPLE",
                "Ipv6CidrBlock": "",
                "Ipv6CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false
    }
}
```
Example 4: To create a VPC with a CIDR from an IPAM pool

The following `create-vpc` example creates a VPC with a CIDR from an Amazon VPC IP Address Manager (IPAM) pool.

Linux and macOS:

```sh
aws ec2 create-vpc \
   --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 \
   --tag-specifications ResourceType=vpc,Tags='[[Key=Environment,Value="Preprod"],
   {Key=Owner,Value="Build Team"}]'
```

Windows:

```sh
aws ec2 create-vpc ^
   --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 ^
   --tag-specifications ResourceType=vpc,Tags='[[Key=Environment,Value="Preprod"],
   {Key=Owner,Value="Build Team"}]'
```

Output:

```json
{
```
"Vpc": {
  "CidrBlock": "10.0.1.0/24",
  "DhcpOptionsId": "dopt-2afccf50",
  "State": "pending",
  "VpcId": "vpc-010e1791024eb0af9",
  "OwnerId": "123456789012",
  "InstanceTenancy": "default",
  "Ipv6CidrBlockAssociationSet": [],
  "CidrBlockAssociationSet": [
    {
      "AssociationId": "vpc-cidr-assoc-0a77de1d803226d4b",
      "CidrBlock": "10.0.1.0/24",
      "CidrBlockState": {
        "State": "associated"
      }
    }
  ],
  "IsDefault": false,
  "Tags": [
    {
      "Key": "Environment",
      "Value": "Preprod"
    },
    {
      "Key": "Owner",
      "Value": "Build Team"
    }
  ]
}

For more information, see Create a VPC that uses an IPAM pool CIDR in the Amazon VPC IPAM User Guide.

- For API details, see CreateVpc in AWS CLI Command Reference.

create-vpn-connection-route

The following code example shows how to use create-vpn-connection-route.

AWS CLI

To create a static route for a VPN connection
This example creates a static route for the specified VPN connection. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 create-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

- For API details, see [CreateVpnConnectionRoute](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-vpn-connection-route.html) in *AWS CLI Command Reference*.

**create-vpn-connection**

The following code example shows how to use `create-vpn-connection`.

### AWS CLI

**Example 1: To create a VPN connection with dynamic routing**

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway, and applies tags to the VPN connection. The output includes the configuration information for your customer gateway device, in XML format.

```bash
aws ec2 create-vpn-connection \
   --type ipsec.1 \
   --customer-gateway-id cgw-001122334455aabbc \
   --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
   --tag-specification 'ResourceType=vpn-connection,Tags=[{Key=Name,Value=BGP-VPN}]'
```

Output:

```json
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-001122334455aabbc",
      "Category": "VPN",
      "State": "pending",
      "VpnConnectionId": "vpn-123123123123abcab",
      "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
   }
}
```
"Options": {
    "EnableAcceleration": false,
    "StaticRoutesOnly": false,
    "LocalIpv4NetworkCidr": "0.0.0.0/0",
    "RemoteIpv4NetworkCidr": "0.0.0.0/0",
    "TunnelInsideIpVersion": "ipv4",
    "TunnelOptions": [
        {},
        {}
    ],
    "Routes": [],
    "Tags": [
        {
            "Key": "Name",
            "Value": "BGP-VPN"
        }
    ]
}

For more information, see [How AWS Site-to-Site VPN works](https://aws.amazon.com) in the *AWS Site-to-Site VPN User Guide*.

**Example 2: To create a VPN connection with static routing**

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The options specify static routing. The output includes the configuration information for your customer gateway device, in XML format.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --customer-gateway-id cgw-001122334455aabbc \
    --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
    --options "{"StaticRoutesOnly":true}"
```

**Output:**

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "..configuration information...",
    }
}
```
"CustomerGatewayId": "cgw-001122334455aabbcc",
"Category": "VPN",
"State": "pending",
"VpnConnectionId": "vpn-123123123123abcab",
"VpnGatewayId": "vgw-1a1a1a1a1a2b2b2",
"Options": {
    "EnableAcceleration": false,
    "StaticRoutesOnly": true,
    "LocalIpv4NetworkCidr": "0.0.0.0/0",
    "RemoteIpv4NetworkCidr": "0.0.0.0/0",
    "TunnelInsideIpVersion": "ipv4",
    "TunnelOptions": [
        {},
        {}
    ],
    "Routes": [],
    "Tags": []
}

For more information, see How AWS Site-to-Site VPN works in the AWS Site-to-Site VPN User Guide.

**Example 3: To create a VPN connection and specify your own inside CIDR and pre-shared key**

The following create-vpn-connection example creates a VPN connection and specifies the inside IP address CIDR block and a custom pre-shared key for each tunnel. The specified values are returned in the CustomerGatewayConfiguration information.

```bash
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --customer-gateway-id cgw-001122334455aabbcc \
    --vpn-gateway-id vgw-1a1a1a1a1a2b2b2 \
    --options
    TunnelOptions='[{
        TunnelInsideCidr=169.254.12.0/30,
        PreSharedKey=ExamplePreSharedKey1},
    {
        TunnelInsideCidr=169.254.13.0/30,
        PreSharedKey=ExamplePreSharedKey2}]'
```

**Output:**

```json
{
    "VpnConnection": {
```
"CustomerGatewayConfiguration": "..configuration information...",
"CustomerGatewayId": "cgw-001122334455aabbc",
"Category": "VPN",
"State": "pending",
"VpnConnectionId": "vpn-123123123123abcab",
"VpnGatewayId": "vgw-1a1a1a1a1a2b2b2",
"Options": {
    "EnableAcceleration": false,
    "StaticRoutesOnly": false,
    "LocalIpv4NetworkCidr": "0.0.0.0/0",
    "RemoteIpv4NetworkCidr": "0.0.0.0/0",
    "TunnelInsideIpVersion": "ipv4",
    "TunnelOptions": [
        {
            "OutsideIpAddress": "203.0.113.3",
            "TunnelInsideCidr": "169.254.12.0/30",
            "PreSharedKey": "ExamplePreSharedKey1"
        },
        {
            "OutsideIpAddress": "203.0.113.5",
            "TunnelInsideCidr": "169.254.13.0/30",
            "PreSharedKey": "ExamplePreSharedKey2"
        }
    ]
},
"Routes": [],
"Tags": []
}

For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpc/userguide/vpc-site-site-vpn.html) in the [AWS Site-to-Site VPN User Guide](https://docs.aws.amazon.com/vpc/userguide/vpc-site-site-vpn.html).

**Example 4: To create a VPN connection that supports IPv6 traffic**

The following `create-vpn-connection` example creates a VPN connection that supports IPv6 traffic between the specified transit gateway and specified customer gateway. The tunnel options for both tunnels specify that AWS must initiate the IKE negotiation.

```
aws ec2 create-vpn-connection
    --type ipsec.1
    --transit-gateway-id tgw-12312312312312312
    --customer-gateway-id cgw-001122334455aabbc
```
--options TunnelInsideIpVersion=ipv6,TunnelOptions=[[StartupAction=start], {StartupAction=start}]

Output:

```
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-00123456789abbc",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-12345678901234567",
        "TransitGatewayId": "tgw-12345678901234567",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": false,
            "LocalIpv6NetworkCidr": "::/0",
            "RemoteIpv6NetworkCidr": "::/0",
            "TunnelInsideIpVersion": "ipv6",
            "TunnelOptions": [
                {
                    "OutsideIpAddress": "203.0.113.3",
                    "StartupAction": "start"
                },
                {
                    "OutsideIpAddress": "203.0.113.5",
                    "StartupAction": "start"
                }
            ]
        },
        "Routes": [],
        "Tags": []
    }
}
```

For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpn/latest/userguide/how-vpn-works.html) in the [AWS Site-to-Site VPN User Guide](https://docs.aws.amazon.com/vpn/latest/userguide/).

**create-vpn-gateway**

The following code example shows how to use `create-vpn-gateway`. 
AWS CLI

To create a virtual private gateway

This example creates a virtual private gateway.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1
```

Output:

```
{
   "VpnGateway": {
      "AmazonSideAsn": 64512,
      "State": "available",
      "Type": "ipsec.1",
      "VpnGatewayId": "vgw-9a4cacf3",
      "VpcAttachments": []
   }
}
```

To create a virtual private gateway with a specific Amazon-side ASN

This example creates a virtual private gateway and specifies the Autonomous System Number (ASN) for the Amazon side of the BGP session.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1 --amazon-side-asn 65001
```

Output:

```
{
   "VpnGateway": {
      "AmazonSideAsn": 65001,
      "State": "available",
      "Type": "ipsec.1",
      "VpnGatewayId": "vgw-9a4cacf3",
      "VpcAttachments": []
   }
}
```
delete-carrier-gateway

The following code example shows how to use delete-carrier-gateway.

AWS CLI

To delete your carrier gateway

The following delete-carrier-gateway example deletes the specified carrier gateway.

```
aws ec2 delete-carrier-gateway \
   --carrier-gateway-id cagw-0465cdEXAMPLE1111
```

Output:

```
{
   "CarrierGateway": {
      "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
      "VpcId": "vpc-0c529aEXAMPLE1111",
      "State": "deleting",
      "OwnerId": "123456789012"
   }
}
```

For more information, see Carrier gateways in the Amazon Virtual Private Cloud User Guide.

For API details, see CreateVpnGateway in AWS CLI Command Reference.

delete-client-vpn-endpoint

The following code example shows how to use delete-client-vpn-endpoint.

AWS CLI

To delete a Client VPN endpoint
The following delete-client-vpn-endpoint example deletes the specified Client VPN endpoint.

```bash
aws ec2 delete-client-vpn-endpoint \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
   "Status": {
      "Code": "deleting"
   }
}
```

For more information, see Client VPN Endpoints in the AWS Client VPN Administrator Guide.

- For API details, see DeleteClientVpnEndpoint in AWS CLI Command Reference.

**delete-client-vpn-route**

The following code example shows how to use delete-client-vpn-route.

**AWS CLI**

**To delete a route for a Client VPN endpoint**

The following delete-client-vpn-route example deletes the 0.0.0.0/0 route for the specified subnet of a Client VPN endpoint.

```bash
aws ec2 delete-client-vpn-route \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \ 
   --destination-cidr-block 0.0.0.0/0 \ 
   --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
   "Status": {
      "Code": "deleting"
   }
}
```
delete-coip-cidr

The following code example shows how to use delete-coip-cidr.

AWS CLI

To delete a range of customer-owned IP (CoIP) addresses

The following delete-coip-cidr example deletes the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 delete-coip-cidr \
  --cidr 14.0.0.0/24 \
  --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
  "CoipCidr": {
    "Cidr": "14.0.0.0/24",
    "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
  }
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DeleteCoipCidr in AWS CLI Command Reference.

delete-coip-pool

The following code example shows how to use delete-coip-pool.

AWS CLI

To delete a pool of customer-owned IP (CoIP) addresses
The following delete-coip-pool example deletes a CoIP pool of CoIP addresses.

```bash
aws ec2 delete-coip-pool \
    --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```json
{
    "CoipPool": {
        "PoolId": "ipv4pool-coip-1234567890abcdefg",
        "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    }
}
```

**delete-customer-gateway**

The following code example shows how to use delete-customer-gateway.

**AWS CLI**

**To delete a customer gateway**

This example deletes the specified customer gateway. If the command succeeds, no output is returned.

**Command:**

```bash
aws ec2 delete-customer-gateway --customer-gateway-id cgw-0e11f167
```

**delete-dhcp-options**

The following code example shows how to use delete-dhcp-options.
AWS CLI

To delete a DHCP options set

This example deletes the specified DHCP options set. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-dhcp-options --dhcp-options-id dopt-d9070ebb
```

• For API details, see [DeleteDhcpOptions](https://awscli.amazonaws.com/v2/documentation/api-reference/) in *AWS CLI Command Reference*.

delete-egress-only-internet-gateway

The following code example shows how to use delete-egress-only-internet-gateway.

AWS CLI

To delete an egress-only Internet gateway

This example deletes the specified egress-only Internet gateway.

Command:

```bash
aws ec2 delete-egress-only-internet-gateway --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

Output:

```json
{
   "ReturnCode": true
}
```

• For API details, see [DeleteEgressOnlyInternetGateway](https://awscli.amazonaws.com/v2/documentation/api-reference/) in *AWS CLI Command Reference*.

delete-fleets

The following code example shows how to use delete-fleets.
Example 1: To delete an EC2 Fleet and terminate the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet and terminates the associated On-Demand Instances and Spot Instances.

```
aws ec2 delete-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --terminate-instances
```

Output:

```
{
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_terminating",
            "PreviousFleetState": "active",
            "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
        }
    ],
    "UnsuccessfulFleetDeletions": []
}
```

For more information, see Delete an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

Example 2: To delete an EC2 Fleet without terminating the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet without terminating the associated On-Demand Instances and Spot Instances.

```
aws ec2 delete-fleets \
    --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --no-terminate-instances
```

Output:

```
{
    "SuccessfulFleetDeletions": [
```
{
    "CurrentFleetState": "deleted_running",
    "PreviousFleetState": "active",
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
"UnsuccessfulFleetDeletions": []
}

For more information, see [Delete an EC2 Fleet](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/AmazonElasticComputeCloud.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DeleteFleets](https://docs.aws.amazon.com/AWSCLI/latest/userguide/cli-aws-cmdref.html) in *AWS CLI Command Reference*.

### delete-flow-logs

The following code example shows how to use `delete-flow-logs`.

**AWS CLI**

**To delete a flow log**

The following `delete-flow-logs` example deletes the specified flow log.

```bash
aws ec2 delete-flow-logs --flow-log-id fl-1122344556677889
```

Output:

```json
{
    "Unsuccessful": []
}
```

- For API details, see [DeleteFlowLogs](https://docs.aws.amazon.com/AWSCLI/latest/userguide/cli-aws-cmdref.html) in *AWS CLI Command Reference*.

### delete-fpga-image

The following code example shows how to use `delete-fpga-image`.

**AWS CLI**

**To delete an Amazon FPGA image**
This example deletes the specified AFI.

Command:

```
aws ec2 delete-fpga-image --fpga-image-id afi-06b12350a123fbabc
```

Output:

```
{
  "Return": true
}
```

- For API details, see `DeleteFpgImage` in *AWS CLI Command Reference*.

**delete-instance-connect-endpoint**

The following code example shows how to use `delete-instance-connect-endpoint`.

**AWS CLI**

**To delete an EC2 Instance Connect Endpoint**

The following `delete-instance-connect-endpoint` example deletes the specified EC2 Instance Connect Endpoint.

```
aws ec2 delete-instance-connect-endpoint \
  --instance-connect-endpoint-id eice-03f5e49b83924bbc7
```

Output:

```
{
  "InstanceConnectEndpoint": {
    "OwnerId": "111111111111",
    "InstanceConnectEndpointId": "eice-0123456789example",
    "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
    "State": "delete-in-progress",
    "StateMessage": "",
    "NetworkInterfaceIds": [],
    "VpcId": "vpc-0123abcd",
```
For more information, see Remove EC2 Instance Connect Endpoint in the Amazon EC2 User Guide.

- For API details, see DeleteInstanceConnectEndpoint in AWS CLI Command Reference.

**delete-instance-event-window**

The following code example shows how to use delete-instance-event-window.

**AWS CLI**

**Example 1: To delete an event window**

The following delete-instance-event-window example deletes an event window.

```bash
aws ec2 delete-instance-event-window
   --region us-east-1
   --instance-event-window-id iew-0abcdef1234567890
```

Output:

```json
{
   "InstanceEventWindowState": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "State": "deleting"
   }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To force delete an event window**

The following delete-instance-event-window example force deletes an event window if the event window is currently associated with targets.
aws ec2 delete-instance-event-window
   --region us-east-1
   --instance-event-window-id iew-0abcdef1234567890
   --force-delete

Output:

```
{
   "InstanceEventWindowState": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "State": "deleting"
   }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

- For API details, see [DeleteInstanceEventWindow](#) in [AWS CLI Command Reference](#).

### delete-internet-gateway

The following code example shows how to use `delete-internet-gateway`.

**AWS CLI**

**To delete an internet gateway**

The following `delete-internet-gateway` example deletes the specified internet gateway.

```
aws ec2 delete-internet-gateway
   --internet-gateway-id igw-0d0fb496b3EXAMPLE
```

This command produces no output.

For more information, see [Internet gateways](#) in the [Amazon VPC User Guide](#).

- For API details, see [DeleteInternetGateway](#) in [AWS CLI Command Reference](#).

### delete-ipam-scope

The following code example shows how to use `delete-ipam-scope`.

---

*Actions and scenarios*
AWS CLI

To delete an IPAM scope

The following delete-ipam-scope example deletes an IPAM.

```bash
aws ec2 delete-ipam-scope \
  --ipam-scope-id ipam-scope-01c1ebab2b63bd7e4
```

Output:

```
{
  "IpamScope": {
    "OwnerId": "123456789012",
    "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-01c1ebab2b63bd7e4",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "IpamScopeType": "private",
    "IsDefault": false,
    "Description": "Example description",
    "PoolCount": 0,
    "State": "delete-in-progress"
  }
}
```

For more information, see Delete a scope in the Amazon VPC IPAM User Guide.

- For API details, see DeletIpamScope in AWS CLI Command Reference.

delete-ipam

The following code example shows how to use delete-ipam.

AWS CLI

To delete an IPAM

The following delete-ipam example deletes an IPAM.

```bash
aws ec2 delete-ipam \
```
Output:

```json
{
"Ipam": {
"OwnerId": "123456789012",
"IpamId": "ipam-036486dfa6af58ee0",
"IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
"IpamRegion": "us-east-1",
"PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
"PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
"ScopeCount": 2,
"OperatingRegions": [
{
"RegionName": "us-east-1"
},
{
"RegionName": "us-east-2"
},
{
"RegionName": "us-west-1"
}
],
"State": "delete-in-progress"
}
}
```

For more information, see [Delete an IPAM](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DeleteIpam](#) in *AWS CLI Command Reference*.

### delete-key-pair

The following code example shows how to use `delete-key-pair`.

**AWS CLI**

**To delete a key pair**

The following `delete-key-pair` example deletes the specified key pair.

```bash
aws ec2 delete-key-pair \
```
Output:

```
{
    "Return": true,
    "KeyPairId": "key-03c8d3aceb53b507"
}
```

For more information, see [Create and delete key pairs](#) in the *AWS Command Line Interface User Guide*.

- For API details, see [DeleteKeyPair](#) in *AWS CLI Command Reference*.

---

### delete-launch-template-versions

The following code example shows how to use `delete-launch-template-versions`.

**AWS CLI**

**To delete a launch template version**

This example deletes the specified launch template version.

Command:

```
aws ec2 delete-launch-template-versions --launch-template-id lt-0abcd290751193123 --versions 1
```

Output:

```
{
    "UnsuccessfullyDeletedLaunchTemplateVersions": [],
    "SuccessfullyDeletedLaunchTemplateVersions": [
        {
            "LaunchTemplateName": "TestVersion",
            "VersionNumber": 1,
            "LaunchTemplateId": "lt-0abcd290751193123"
        }
    ]
}
delete-launch-template

The following code example shows how to use delete-launch-template.

AWS CLI

To delete a launch template

This example deletes the specified launch template.

Command:

```
aws ec2 delete-launch-template --launch-template-id lt-0abcd290751193123
```

Output:

```
{
   "LaunchTemplate": {
      "LatestVersionNumber": 2,
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "TestTemplate",
      "DefaultVersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "CreateTime": "2017-11-23T16:46:25.000Z"
   }
}
```

For API details, see DeleteLaunchTemplate in AWS CLI Command Reference.

delete-local-gateway-route-table-virtual-interface-group-association

The following code example shows how to use delete-local-gateway-route-table-virtual-interface-group-association.

AWS CLI

To disassociate a local gateway route table from a virtual interfaces (VIFs) group
The following `delete-local-gateway-route-table-virtual-interface-group-association` example deletes the association between the specified local gateway route table and VIF group.

```
aws ec2 delete-local-gateway-route-table-virtual-interface-group-association 
   --local-gateway-route-table-virtual-interface-group-association-id lgw-vif-grp-assoc-exampleid12345678
```

Output:

```
{
   "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
      "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-exampleid12345678",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
      "LocalGatewayId": "lgw-exampleid11223344",
      "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
      "OwnerId": "111122223333",
      "State": "disassociating",
      "Tags": []
   }
}
```

For more information, see [VIF group associations](https://docs.aws.amazon.com/AWSEncryption/latest/UserGuide/) in the *AWS Outposts User Guide*.

- For API details, see [DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-local-gateway-route-table-virtual-interface-group-association.html) in *AWS CLI Command Reference*.

**delete-local-gateway-route-table-vpc-association**

The following code example shows how to use `delete-local-gateway-route-table-vpc-association`.

**AWS CLI**

**To disassociate a local gateway route table from a VPC**

The following `delete-local-gateway-route-table-vpc-association` example deletes the association between the specified local gateway route table and VPC.
aws ec2 delete-local-gateway-route-table-vpc-association \
   --local-gateway-route-table-vpc-association-id vpc-example0123456789

Output:

{
   "LocalGatewayRouteTableVpcAssociation": {
      "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-abcd1234wxyz56789",
      "LocalGatewayRouteTableId": "lgw-rtb-abcddefg1234567890",
      "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:555555555555:local-gateway-route-table/lgw-rtb-abcddefg1234567890",
      "LocalGatewayId": "lgw-exampleid01234567",
      "VpcId": "vpc-example0123456789",
      "OwnerId": "555555555555",
      "State": "disassociating"
   }
}

For more information, see VPC associations in the AWS Outposts User Guide.

- For API details, see DeleteLocalGatewayRouteTableVpcAssociation in AWS CLI Command Reference.

del**ete-local-gateway-route-table**

The following code example shows how to use delete-local-gateway-route-table.

**AWS CLI**

**To delete a local gateway route table**

The following delete-local-gateway-route-table example creates a local gateway route table with the direct VPC routing mode.

aws ec2 delete-local-gateway-route-table \
   --local-gateway-route-table-id lgw-rtb-abcddefg1234567890

Output:

{

Actions and scenarios 2123
"LocalGatewayRouteTable": {
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
    "OwnerId": "111122223333",
    "State": "deleting",
    "Tags": []
    "Mode": "direct-vpc-routing"
}
}

For more information, see Local gateway route tables in the AWS Outposts User Guide.

- For API details, see DeleteLocalGatewayRouteTable in AWS CLI Command Reference.

delete-local-gateway-route

The following code example shows how to use delete-local-gateway-route.

AWS CLI

To delete a route from a local gateway route table

The following delete-local-gateway-route example deletes the specified route from the specified local gateway route table.

aws ec2 delete-local-gateway-route \
    --destination-cidr-block 0.0.0.0/0 \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE

Output:

{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
For API details, see DeleteLocalGatewayRoute in AWS CLI Command Reference.

**delete-managed-prefix-list**

The following code example shows how to use delete-managed-prefix-list.

**AWS CLI**

**To delete a prefix list**

The following delete-managed-prefix-list example deletes the specified prefix list.

```
aws ec2 delete-managed-prefix-list \
--prefix-list-id pl-0123456abcabcabc1
```

Output:

```json
{
   "PrefixList": {
      "PrefixListId": "pl-0123456abcabcabc1",
      "AddressFamily": "IPv4",
      "State": "delete-in-progress",
      "PrefixListName": "test",
      "MaxEntries": 10,
      "Version": 1,
      "OwnerId": "123456789012"
   }
}
```

For more information, see Managed prefix lists in the Amazon VPC User Guide.

For API details, see DeleteManagedPrefixList in AWS CLI Command Reference.

**delete-nat-gateway**

The following code example shows how to use delete-nat-gateway.
AWS CLI

To delete a NAT gateway

This example deletes NAT gateway nat-04ae55e711cec5680.

Command:

```bash
aws ec2 delete-nat-gateway --nat-gateway-id nat-04ae55e711cec5680
```

Output:

```json
{
   "NatGatewayId": "nat-04ae55e711cec5680"
}
```

- For API details, see [DeleteNatGateway](#) in *AWS CLI Command Reference*.

delete-network-acl-entry

The following code example shows how to use delete-network-acl-entry.

AWS CLI

To delete a network ACL entry

This example deletes ingress rule number 100 from the specified network ACL. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100
```

- For API details, see [DeleteNetworkAclEntry](#) in *AWS CLI Command Reference*.

delete-network-acl

The following code example shows how to use delete-network-acl.
AWS CLI

To delete a network ACL

This example deletes the specified network ACL. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-network-acl --network-acl-id acl-5fb85d36
```

- For API details, see `DeleteNetworkAcl` in `AWS CLI Command Reference`.

**delete-network-insights-access-scope-analysis**

The following code example shows how to use `delete-network-insights-access-scope-analysis`.

AWS CLI

To delete a Network Access Scope analysis

The following `delete-network-insights-access-scope-analysis` example deletes the specified Network Access Scope analysis.

```bash
aws ec2 delete-network-insights-access-scope-analysis \\
--network-insights-access-scope-analysis-id nisa-01234567891abcdef
```

Output:

```json
{
   "NetworkInsightsAccessScopeAnalysisId": "nisa-01234567891abcdef"
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/networkaccess/latest/ug/analyzer-getting-started-cli.html) in the *Network Access Analyzer Guide*.

- For API details, see `DeleteNetworkInsightsAccessScopeAnalysis` in `AWS CLI Command Reference`.

Actions and scenarios
delete-network-insights-access-scope

The following code example shows how to use delete-network-insights-access-scope.

AWS CLI

To delete a Network Access Scope

The following delete-network-insights-access-scope example deletes the specified Network Access Scope.

```
aws ec2 delete-network-insights-access-scope \
--network-insights-access-scope-id nis-123456789abc01234
```

Output:

```
{
   "NetworkInsightsAccessScopeId": "nis-123456789abc01234"
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see DeleteNetworkInsightsAccessScope in AWS CLI Command Reference.

delete-network-insights-analysis

The following code example shows how to use delete-network-insights-analysis.

AWS CLI

To delete a path analysis

The following delete-network-insights-analysis example deletes the specified analysis.

```
aws ec2 delete-network-insights-analysis \
--network-insights-analysis-id nia-02207aa13eb480c7a
```

Output:

```
{
```
```
For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.

- For API details, see DeleteNetworkInsightsAnalysis in AWS CLI Command Reference.

**delete-network-insights-path**

The following code example shows how to use delete-network-insights-path.

**AWS CLI**

**To delete a path**

The following delete-network-insights-path example deletes the specified path. Before you can delete a path, you must delete all its analyses using the delete-network-insights-analysis command.

```bash
aws ec2 delete-network-insights-path \
   --network-insights-path-id nip-0b26f224f1d131fa8
```

**Output:**

```
{
   "NetworkInsightsPathId": "nip-0b26f224f1d131fa8"
}
```

For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.

- For API details, see DeleteNetworkInsightsPath in AWS CLI Command Reference.

**delete-network-interface-permission**

The following code example shows how to use delete-network-interface-permission.

**AWS CLI**

**To delete a network interface permission**

This example deletes the specified network interface permission.
Command:

aws ec2 delete-network-interface-permission --network-interface-permission-id eni-perm-06fd19020ede149ea

Output:

```json
{
   "Return": true
}
```

**delete-network-interface**

The following code example shows how to use `delete-network-interface`.

**AWS CLI**

**To delete a network interface**

This example deletes the specified network interface. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-network-interface --network-interface-id eni-e5aa89a3
```

**delete-placement-group**

The following code example shows how to use `delete-placement-group`.

**AWS CLI**

**To delete a placement group**

This example command deletes the specified placement group.

Command:
aws ec2 delete-placement-group --group-name my-cluster

- For API details, see DeletePlacementGroup in AWS CLI Command Reference.

delete-queued-reserved-instances

The following code example shows how to use delete-queued-reserved-instances.

AWS CLI

To delete a queued purchase

The following delete-queued-reserved-instances example deletes the specified Reserved Instance, which was queued for purchase.

```
aws ec2 delete-queued-reserved-instances \\
   --reserved-instances-ids af9f760e-6f91-4559-85f7-4980eexample
```

Output:

```
{
   "SuccessfulQueuedPurchaseDeletions": [ 
      { 
         "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"
      }
   ],
   "FailedQueuedPurchaseDeletions": []
}
```

- For API details, see DeleteQueuedReservedInstances in AWS CLI Command Reference.

delete-route-table

The following code example shows how to use delete-route-table.

AWS CLI

To delete a route table

This example deletes the specified route table. If the command succeeds, no output is returned.
Command:

```bash
aws ec2 delete-route-table --route-table-id rtb-22574640
```

- For API details, see [DeleteRouteTable](https://docs.aws.amazon.com/AWSCommandLineReference/latest/clireference/api/amazon-ec2-delete-route-table.html) in *AWS CLI Command Reference*.

### delete-route

The following code example shows how to use `delete-route`.

**AWS CLI**

**To delete a route**

This example deletes the specified route from the specified route table. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0
```

- For API details, see [DeleteRoute](https://docs.aws.amazon.com/AWSCommandLineReference/latest/clireference/api/amazon-ec2-delete-route.html) in *AWS CLI Command Reference*.

### delete-security-group

The following code example shows how to use `delete-security-group`.

**AWS CLI**

**[EC2-Classic] To delete a security group**

This example deletes the security group named `MySecurityGroup`. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-security-group --group-name MySecurityGroup
```

**[EC2-VPC] To delete a security group**
This example deletes the security group with the ID sg-903004f8. Note that you can't reference a security group for EC2-VPC by name. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-security-group --group-id sg-903004f8
```

For more information, see Using Security Groups in the AWS Command Line Interface User Guide.

- For API details, see DeleteSecurityGroup in AWS CLI Command Reference.

**delete-snapshot**

The following code example shows how to use delete-snapshot.

**AWS CLI**

**To delete a snapshot**

This example command deletes a snapshot with the snapshot ID of snap-1234567890abcdef0. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-snapshot --snapshot-id snap-1234567890abcdef0
```

- For API details, see DeleteSnapshot in AWS CLI Command Reference.

**delete-spot-datafeed-subscription**

The following code example shows how to use delete-spot-datafeed-subscription.

**AWS CLI**

**To cancel a Spot Instance data feed subscription**

This example command deletes a Spot data feed subscription for the account. If the command succeeds, no output is returned.

Command:
aws ec2 delete-spot-datafeed-subscription

- For API details, see `DeleteSpotDatafeedSubscription` in `AWS CLI Command Reference`.

**delete-subnet-cidr-reservation**

The following code example shows how to use `delete-subnet-cidr-reservation`.

**AWS CLI**

**To delete a subnet CIDR reservation**

The following `delete-subnet-cidr-reservation` example deletes the specified subnet CIDR reservation.

```
aws ec2 delete-subnet-cidr-reservation \
   --subnet-cidr-reservation-id scr-044f977c4eEXAMPLE
```

**Output:**

```
{
   "DeletedSubnetCidrReservation": {
      "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
      "SubnetId": "subnet-03c51e2e6cEXAMPLE",
      "Cidr": "10.1.0.16/28",
      "ReservationType": "prefix",
      "OwnerId": "123456789012"
   }
}
```

For more information, see `Subnet CIDR reservations` in the `Amazon VPC User Guide`.

- For API details, see `DeleteSubnetCidrReservation` in `AWS CLI Command Reference`.

**delete-subnet**

The following code example shows how to use `delete-subnet`.

**AWS CLI**

**To delete a subnet**
This example deletes the specified subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-subnet --subnet-id subnet-9d4a7b6c
```

- For API details, see `DeleteSubnet` in `AWS CLI Command Reference`.

delete-tags

The following code example shows how to use delete-tags.

**AWS CLI**

**Example 1: To delete a tag from a resource**

The following delete-tags example deletes the tag `Stack=Test` from the specified image. When you specify both a value and a key name, the tag is deleted only if the tag's value matches the specified value.

```
aws ec2 delete-tags \
   --resources ami-1234567890abcdef0 \
   --tags Key=Stack,Value=Test
```

It's optional to specify the value for a tag. The following delete-tags example deletes the tag with the key name `purpose` from the specified instance, regardless of the tag value for the tag.

```
aws ec2 delete-tags \
   --resources i-1234567890abcdef0 \
   --tags Key=purpose
```

If you specify the empty string as the tag value, the tag is deleted only if the tag's value is the empty string. The following delete-tags example specifies the empty string as the tag value for the tag to delete.

```
aws ec2 delete-tags \
   --resources i-1234567890abcdef0 \
   --tags Key=Name,Value=
```
Example 2: To delete a tag from multiple resources

The following delete-tags example deletes the tag `Purpose=Test` from both an instance and an AMI. As shown in the previous example, you can omit the tag value from the command.

```
aws ec2 delete-tags \
   --resources i-1234567890abcdef0 ami-1234567890abcdef0 \
   --tags Key=Purpose
```

- For API details, see [DeleteTags](aws:cli:delete-tags) in [AWS CLI Command Reference](aws:cli:delete-tags).

**delete-traffic-mirror-filter-rule**

The following code example shows how to use delete-traffic-mirror-filter-rule.

**AWS CLI**

**To delete a traffic mirror filter rule**

The following delete-traffic-mirror-filter-rule example deletes the specified traffic mirror filter rule.

```
aws ec2 delete-traffic-mirror-filter-rule \
   --traffic-mirror-filter-rule-id tmfr-081f71283bEXAMPLE
```

Output:

```
{
   "TrafficMirrorFilterRuleId": "tmfr-081f71283bEXAMPLE"
}
```

For more information, see [Modify Your Traffic Mirror Filter Rules](aws:traffic-mirroring:traffic-mirror) in the [AWS Traffic Mirroring Guide](aws:traffic-mirroring:traffic-mirror).

- For API details, see [DeleteTrafficMirrorFilterRule](aws:cli:delete-traffic-mirror-filter-rule) in [AWS CLI Command Reference](aws:cli:delete-traffic-mirror-filter-rule).

**delete-traffic-mirror-filter**

The following code example shows how to use delete-traffic-mirror-filter.
AWS CLI

To delete a traffic mirror filter

The following `delete-traffic-mirror-filter` example deletes the specified traffic mirror filter.

```bash
aws ec2 delete-traffic-mirror-filter \
   --traffic-mirror-filter-id tmf-0be0b25fcdEXAMPLE
```

Output:

```json
{
   "TrafficMirrorFilterId": "tmf-0be0b25fcdEXAMPLE"
}
```

For more information, see [Delete a Traffic Mirror Filter](#) in the *[AWS Traffic Mirroring Guide](#)*.

- For API details, see [DeleteTrafficMirrorFilter](#) in [AWS CLI Command Reference](#).

delete-traffic-mirror-session

The following code example shows how to use `delete-traffic-mirror-session`.

AWS CLI

To delete a traffic mirror session

The following `delete-traffic-mirror-session` example deletes the specified traffic mirror-session.

```bash
aws ec2 delete-traffic-mirror-session \
   --traffic-mirror-session-id tms-0af3141ce5EXAMPLE
```

Output:

```json
{
   "TrafficMirrorSessionId": "tms-0af3141ce5EXAMPLE"
}
```
For more information, see Delete a Traffic Mirror Session in the AWS Traffic Mirroring Guide.

- For API details, see DeleteTrafficMirrorSession in AWS CLI Command Reference.

delelete-traffic-mirror-target

The following code example shows how to use delete-traffic-mirror-target.

AWS CLI

To delete a traffic mirror target

The following delete-traffic-mirror-target example deletes the specified traffic mirror target.

```
aws ec2 delete-traffic-mirror-target \
   --traffic-mirror-target-id tmt-060f48ce9EXAMPLE
```

Output:

```
{
   "TrafficMirrorTargetId": "tmt-060f48ce9EXAMPLE"
}
```

For more information, see Delete a Traffic Mirror Target in the AWS Traffic Mirroring Guide.

- For API details, see DeleteTrafficMirrorTarget in AWS CLI Command Reference.

delete-transit-gateway-connect-peer

The following code example shows how to use delete-transit-gateway-connect-peer.

AWS CLI

To delete a Transit Gateway Connect peer

The following delete-transit-gateway-connect-peer example deletes the specified Connect peer.

```
aws ec2 delete-transit-gateway-connect-peer \
   --transit-gateway-connect-peer-id tgw-connect-peer-0666adbac4EXAMPLE
```
Output:

```json
{
    "TransitGatewayConnectPeer": {
        "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
        "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
        "State": "deleting",
        "CreationTime": "2021-10-13T03:35:17.000Z",
        "ConnectPeerConfiguration": {
            "TransitGatewayAddress": "10.0.0.234",
            "PeerAddress": "172.31.1.11",
            "InsideCidrBlocks": [
                "169.254.6.0/29"
            ],
            "Protocol": "gre",
            "BgpConfigurations": [
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.2",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                },
                {
                    "TransitGatewayAsn": 64512,
                    "PeerAsn": 64512,
                    "TransitGatewayAddress": "169.254.6.3",
                    "PeerAddress": "169.254.6.1",
                    "BgpStatus": "down"
                }
            ]
        }
    }
}
```

**delete-transit-gateway-connect**

The following code example shows how to use delete-transit-gateway-connect.
AWS CLI

To delete a transit gateway Connect attachment

The following `delete-transit-gateway-connect` example deletes the specified Connect attachment.

```
aws ec2 delete-transit-gateway-connect \
  --transit-gateway-attachment-id tgw-attach-037012e5dcEXAMPLE
```

Output:

```
{
  "TransitGatewayConnect": {
    "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
    "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "State": "deleting",
    "CreationTime": "2021-03-09T19:59:17+00:00",
    "Options": {
      "Protocol": "gre"
    }
  }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayConnect in AWS CLI Command Reference.

delete-transit-gateway-multicast-domain

The following code example shows how to use `delete-transit-gateway-multicast-domain`.

AWS CLI

To delete a transit gateway multicast domain

The following `delete-transit-gateway-multicast-domain` example deletes the specified multicast domain.

```
aws ec2 delete-transit-gateway-multicast-domain \
```
For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayMulticastDomain in AWS CLI Command Reference.

**delete-transit-gateway-peering-attachment**

The following code example shows how to use delete-transit-gateway-peering-attachment.

**AWS CLI**

**To delete a transit gateway peering attachment**

The following delete-transit-gateway-peering-attachment example deletes the specified transit gateway peering attachment.

```
aws ec2 delete-transit-gateway-peering-attachment \
   --transit-gateway-attachment-id tgw-attach-4455667788aabbccd
```

Output:

```
{
   "TransitGatewayPeeringAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
      "RequesterTgwInfo": {
         "TransitGatewayId": "tgw-123abc05e04123abc",
         "OwnerId": "123456789012",
      }
   }
}
```
"Region": "us-west-2",
"AccepterTgwInfo": {
    "TransitGatewayId": "tgw-11223344aabbcc112",
    "OwnerId": "123456789012",
    "Region": "us-east-2"
},
"State": "deleting",
"CreationTime": "2019-12-09T11:38:31.000Z"
}

For more information, see [Transit Gateway Peering Attachments](https://docs.aws.amazon.com/TransitGateways/latest/userguide/) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayPeeringAttachment](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-transit-gateway-peering-attachment.html) in *AWS CLI Command Reference*.

**delete-transit-gateway-policy-table**

The following code example shows how to use `delete-transit-gateway-policy-table`.

**AWS CLI**

To delete a transit gateway policy table

The following `delete-transit-gateway-policy-table` example deletes the specified transit gateway policy table.

```bash
aws ec2 delete-transit-gateway-policy-table \
    --transit-gateway-policy-table-id tgw-ptb-0a16f134b78668a81
```

Output:

```json
{
    "TransitGatewayPolicyTables": [
        {
            "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
            "TransitGatewayId": "tgw-067f8505c18f0bd6e",
            "State": "deleting",
            "CreationTime": "2023-11-28T16:36:43+00:00",
            "Tags": []
        }
    ]
}
```
For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see DeleteTransitGatewayPolicyTable in AWS CLI Command Reference.

**delete-transit-gateway-prefix-list-reference**

The following code example shows how to use delete-transit-gateway-prefix-list-reference.

**AWS CLI**

To delete a prefix list reference

The following delete-transit-gateway-prefix-list-reference example deletes the specified prefix list reference.

```
aws ec2 delete-transit-gateway-prefix-list-reference \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --prefix-list-id pl-1111122222222333
```

Output:

```
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
        "PrefixListId": "pl-1111122222222333",
        "PrefixListOwnerId": "123456789012",
        "State": "deleting",
        "Blackhole": false,
        "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aabbccdaabbcaab",
            "ResourceType": "vpc",
            "ResourceId": "vpc-112233445566aabb"
        }
    }
}
```

For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayPrefixListReference in AWS CLI Command Reference.
delete-transit-gateway-route-table

The following code example shows how to use delete-transit-gateway-route-table.

AWS CLI

To delete a transit gateway route table

The following delete-transit-gateway-route-table example deletes the specified transit gateway route table.

```
aws ec2 delete-transit-gateway-route-table \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTable": {
        "TransitGatewayRouteTableId": "tgw-rtb-0b6f6aaa01EXAMPLE",
        "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
        "State": "deleting",
        "DefaultAssociationRouteTable": false,
        "DefaultPropagationRouteTable": false,
        "CreationTime": "2019-07-17T20:27:26.000Z"
    }
}
```

For more information, see Delete a transit gateway route table in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayRouteTable in AWS CLI Command Reference.

delete-transit-gateway-route

The following code example shows how to use delete-transit-gateway-route.

AWS CLI

To delete a CIDR block from a route table

The following delete-transit-gateway-route example deletes the CIDR block from the specified transit gateway route table.
```
aws ec2 delete-transit-gateway-route \
  --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
  --destination-cidr-block 10.0.2.0/24
```

Output:

```
{
  "Route": {
    "DestinationCidrBlock": "10.0.2.0/24",
    "TransitGatewayAttachments": [
      {
        "ResourceId": "vpc-0065acced4EXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
        "ResourceType": "vpc"
      }
    ],
    "Type": "static",
    "State": "deleted"
  }
}
```

For more information, see [Delete a static route](#) in the [Transit Gateways Guide](#).

- For API details, see [DeleteTransitGatewayRoute](#) in [AWS CLI Command Reference](#).

---

**delete-transit-gateway-vpc-attachment**

The following code example shows how to use `delete-transit-gateway-vpc-attachment`.

**AWS CLI**

To delete a transit gateway VPC attachment

The following `delete-transit-gateway-vpc-attachment` example deletes the specified VPC attachment.

```
aws ec2 delete-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-0d2c54bdbEXAMPLE
```

Output:

```
{
```
```
"TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0d2c54b6db3EXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "VpcId": "vpc-0065acced4f61c651",
    "VpcOwnerId": "111122223333",
    "State": "deleting",
    "CreationTime": "2019-07-17T16:04:27.000Z"
}

For more information, see [Delete a VPC attachment](#) in the [Transit Gateways Guide](#).

- For API details, see [DeleteTransitGatewayVpcAttachment](#) in [AWS CLI Command Reference](#).

**delete-transit-gateway**

The following code example shows how to use `delete-transit-gateway`.

**AWS CLI**

**To delete a transit gateway**

The following `delete-transit-gateway` example deletes the specified transit gateway.

```bash
aws ec2 delete-transit-gateway \
    --transit-gateway-id tgw-01f04542b2EXAMPLE
```

Output:

```json
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-01f04542b2EXAMPLE",
        "State": "deleting",
        "OwnerId": "123456789012",
        "Description": "Example Transit Gateway",
        "CreationTime": "2019-08-27T15:04:35.000Z",
        "Options": {
            "AmazonSideAsn": 64515,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-0ce7a6948fEXAMPLE",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-0ce7a6948fEXAMPLE",
```
For more information, see Delete a transit gateway in the Transit Gateways Guide.

- For API details, see DeleteTransitGateway in AWS CLI Command Reference.

**delete-verified-access-endpoint**

The following code example shows how to use delete-verified-access-endpoint.

**AWS CLI**

**To delete a Verified Access endpoint**

The following delete-verified-access-endpoint example deletes the specified Verified Access endpoint.

```
aws ec2 delete-verified-access-endpoint \
    --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
    "VerifiedAccessEndpoint": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
        "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
        "SecurityGroupIds": [
            "sg-004915970c4c8f13a"
        ]
    }
}
```
"NetworkInterfaceOptions": {
  "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
  "Protocol": "https",
  "Port": 443
},
"Status": {
  "Code": "deleting"
},
"Description": "Testing Verified Access",
"CreationTime": "2023-08-25T20:54:43",
"LastUpdatedTime": "2023-08-25T22:46:32"
}
}

For more information, see [Verified Access endpoints](https://docs.aws.amazon.com/verified-access/latest/APIReference/endpoint.html) in the [AWS Verified Access User Guide](https://docs.aws.amazon.com/verified-access/latest/APIReference/).

**delete-verified-access-group**

The following code example shows how to use `delete-verified-access-group`.

### AWS CLI

**To delete a Verified Access group**

The following `delete-verified-access-group` example deletes the specified Verified Access group.

```
aws ec2 delete-verified-access-group \
  --verified-access-group-id vagr-0dbe967baf14b7235
```

**Output:**

```
{
  "VerifiedAccessGroup": {
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessInstanceId": "vai-0ce000c07643abea",
    "Description": "Testing Verified Access",
    "Owner": "123456789012",
    "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
    "CreationTime": "2023-08-25T19:55:19",
  }
}
```
For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-groups.html) in the AWS Verified Access User Guide.

**delete-verified-access-instance**

The following code example shows how to use `delete-verified-access-instance`.

**AWS CLI**

**To delete a Verified Access instance**

The following `delete-verified-access-instance` example deletes the specified Verified Access instance.

```
aws ec2 delete-verified-access-instance \ 
   --verified-access-instance-id vai-0ce000c0b7643abea
```

**Output:**

```
{
   "VerifiedAccessInstance": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "VerifiedAccessTrustProviders": [],
      "CreationTime": "2023-08-25T18:27:56",
      "LastUpdatedTime": "2023-08-26T01:00:18"
   }
}
```

For more information, see [Verified Access instances](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-instances.html) in the AWS Verified Access User Guide.

- For API details, see [DeleteVerifiedAccessInstance](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-verified-access-instance.html) in AWS CLI Command Reference.

**delete-verified-access-trust-provider**

The following code example shows how to use `delete-verified-access-trust-provider`.

```
AWS CLI

To delete a Verified Access trust provider

The following `delete-verified-access-trust-provider` example deletes the specified Verified Access trust provider.

```
aws ec2 delete-verified-access-trust-provider \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "Testing Verified Access",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T18:40:36",
      "LastUpdatedTime": "2023-08-25T18:40:36"
   }
}
```

For more information, see Trust providers for Verified Access in the AWS Verified Access User Guide.

- For API details, see DeleteVerifiedAccessTrustProvider in AWS CLI Command Reference.

delete-volume

The following code example shows how to use `delete-volume`.

AWS CLI

To delete a volume

This example command deletes an available volume with the volume ID of `vol-049df61146c44d7901`. If the command succeeds, no output is returned.

Command:
aws ec2 delete-volume --volume-id vol-049df61146c4d7901

- For API details, see DeleteVolume in AWS CLI Command Reference.

delete-vpc-endpoint-connection-notifications

The following code example shows how to use delete-vpc-endpoint-connection-notifications.

AWS CLI

To delete an endpoint connection notification

This example deletes the specified endpoint connection notification.

Command:

```bash
aws ec2 delete-vpc-endpoint-connection-notifications --connection-notification-ids vpce-nfn-008776de7e03f5abc
```

Output:

```json
{
  "Unsuccessful": []
}
```

- For API details, see DeleteVpcEndpointConnectionNotifications in AWS CLI Command Reference.

delete-vpc-endpoint-service-configurations

The following code example shows how to use delete-vpc-endpoint-service-configurations.

AWS CLI

To delete an endpoint service configuration

This example deletes the specified endpoint service configuration.
**Command:**

```
aws ec2 delete-vpc-endpoint-service-configurations --service-ids vpce-svc-03d5ebb7d9579a2b3
```

**Output:**

```
{
   "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpointServiceConfigurations](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-vpc-endpoint-service-configurations.html) in *AWS CLI Command Reference*.

---

**delete-vpc-endpoints**

The following code example shows how to use `delete-vpc-endpoints`.

**AWS CLI**

**To delete an endpoint**

This example deletes endpoints `vpce-aa22bb33` and `vpce-1a2b3c4d`. If the command is partially successful or unsuccessful, a list of unsuccessful items is returned. If the command succeeds, the returned list is empty.

**Command:**

```
aws ec2 delete-vpc-endpoints --vpc-endpoint-ids vpce-aa22bb33 vpce-1a2b3c4d
```

**Output:**

```
{
   "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpoints](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-vpc-endpoints.html) in *AWS CLI Command Reference*.

---

**delete-vpc-peering-connection**

The following code example shows how to use `delete-vpc-peering-connection`.

---

**Actions and scenarios**

2152
AWS CLI

To delete a VPC peering connection

This example deletes the specified VPC peering connection.

Command:

`aws ec2 delete-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d`

Output:

```
{
    "Return": true
}
```

- For API details, see [DeleteVpcPeeringConnection](#) in [AWS CLI Command Reference](#).

delete-vpc

The following code example shows how to use `delete-vpc`.

AWS CLI

To delete a VPC

This example deletes the specified VPC. If the command succeeds, no output is returned.

Command:

`aws ec2 delete-vpc --vpc-id vpc-a01106c2`

- For API details, see [DeleteVpc](#) in [AWS CLI Command Reference](#).

delete-vpn-connection-route

The following code example shows how to use `delete-vpn-connection-route`.

AWS CLI

To delete a static route from a VPN connection
This example deletes the specified static route from the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

- For API details, see `DeleteVpnConnectionRoute` in `AWS CLI Command Reference`.

### delete-vpn-connection

The following code example shows how to use `delete-vpn-connection`.

**AWS CLI**

**To delete a VPN connection**

This example deletes the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-connection --vpn-connection-id vpn-40f41529
```

- For API details, see `DeleteVpnConnection` in `AWS CLI Command Reference`.

### delete-vpn-gateway

The following code example shows how to use `delete-vpn-gateway`.

**AWS CLI**

**To delete a virtual private gateway**

This example deletes the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-gateway --vpn-gateway-id vgw-9a4cacf3
```
deprovision-byoip-cidr

The following code example shows how to use deprovision-byoip-cidr.

**AWS CLI**

To remove an IP address range from use

The following example removes the specified address range from use with AWS.

```
aws ec2 deprovision-byoip-cidr \
   --cidr 203.0.113.25/24
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "State": "pending-deprovision"
   }
}
```

For API details, see [DeprovisionByoipCidr](#) in *AWS CLI Command Reference*.

deprovision-ipam-pool-cidr

The following code example shows how to use deprovision-ipam-pool-cidr.

**AWS CLI**

To deprovision an IPAM pool CIDR

The following deprovision-ipam-pool-cidr example deprovisions a CIDR provisioned to an IPAM pool.

(Linux):

```
aws ec2 deprovision-ipam-pool-cidr \
   --ipam-pool-id ipam-pool-02ec043a19bbe5d08 \
```

For API details, see [DeleteVpnGateway](#) in *AWS CLI Command Reference*. 
--cidr 11.0.0.0/16

(Windows):

aws ec2 deprovision-ipam-pool-cidr ^
   --ipam-pool-id ipam-pool-02ec043a19bbe5d08 ^
   --cidr 11.0.0.0/16

Output:

```
{
   "IpamPoolCidr": {
      "Cidr": "11.0.0.0/16",
      "State": "pending-deprovision"
   }
}
```

For more information, see [Deprovision pool CIDRs](https://docs.aws.amazon.com/vpc/ipam/userguide/amazon-vpc-ipam-deprovisioning.html) in the Amazon VPC IPAM User Guide.

**deregister-image**

The following code example shows how to use deregister-image.

**AWS CLI**

**To deregister an AMI**

This example deregisters the specified AMI. If the command succeeds, no output is returned.

Command:

```
aws ec2 deregister-image --image-id ami-4fa54026
```

- For API details, see [DeregisterImage](https://docs.aws.amazon.com/cli/latest/reference/ec2/deregister-image.html) in AWS CLI Command Reference.

**deregister-instance-event-notification-attributes**

The following code example shows how to use deregister-instance-event-notification-attributes.
Example 1: To remove all tags from event notifications

The following `deregister-instance-event-notification-attributes` example removes `IncludeAllTagsOfInstance=true`, which has the effect of setting `IncludeAllTagsOfInstance` to false.

```
aws ec2 deregister-instance-event-notification-attributes \ 
  --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{   "InstanceTagAttribute": {       "InstanceTagKeys": [],       "IncludeAllTagsOfInstance": true   }
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To remove specific tags from event notifications

The following `deregister-instance-event-notification-attributes` example removes the specified tag from the tags included in event notifications. To describe the remaining tags included in event notifications, use `describe-instance-event-notification-attributes`.

```
aws ec2 deregister-instance-event-notification-attributes \ 
  --instance-tag-attribute InstanceTagKeys="tag-key2"
```

Output:

```
{   "InstanceTagAttribute": {       "InstanceTagKeys": [       "tag-key2"     ],     "IncludeAllTagsOfInstance": false   }
}````
For more information, see [Scheduled events for your instances](https://aws.amazon.com/about-aws/whats-new/) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DeregisterInstanceEventNotificationAttributes](https://docs.aws.amazon.com/cli/latest/reference/ec2/deregister-instance-event-notification-attributes.html) in *AWS CLI Command Reference*.

---

**deregister-transit-gateway-multicast-group-members**

The following code example shows how to use `deregister-transit-gateway-multicast-group-members`.

**AWS CLI**

**To deregister group members from a multicast group**

This example deregisters the specified network interface group member from the transit gateway multicast group.

```bash
aws ec2 deregister-transit-gateway-multicast-group-members \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-0e246d3269EXAMPLE
```

**Output:**

```json
{
    "DeregisteredMulticastGroupMembers": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
        "RegisteredNetworkInterfaceIds": [
            "eni-0e246d3269EXAMPLE"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```

For more information, see [Deregister Members from a Multicast Group](https://docs.aws.amazon.com/transit-gateways/latest/userguide/deregister-members.html) in the *AWS Transit Gateways Users Guide*.

- For API details, see [DeregisterTransitGatewayMulticastGroupMembers](https://docs.aws.amazon.com/cli/latest/reference/ec2/deregister-transit-gateway-multicast-group-members.html) in *AWS CLI Command Reference*. 

---

Actions and scenarios 2158
**deregister-transit-gateway-multicast-group-source**

The following code example shows how to use `deregister-transit-gateway-multicast-group-source`.

**AWS CLI**

**To deregister a source from the transit gateway multicast group**

This example deregisters the specified network interface group source from the multicast group.

```bash
aws ec2 register-transit-gateway-multicast-group-sources \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
   --group-ip-address 224.0.1.0 \
   --network-interface-ids eni-07f290fc3c090cbe
```

Output:

```json
{
   "DeregisteredMulticastGroupSources": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
      "DeregisteredNetworkInterfaceIds": [
         "eni-07f290fc3c090cbe"
      ],
      "GroupIpAddress": "224.0.1.0"
   }
}
```

For more information, see [Deregister Sources from a Multicast Group](https://docs.aws.amazon.com/transit-gateways/latest/userguide/deregister-sources.html) in the *AWS Transit Gateways User Guide*.

- For API details, see [DeregisterTransitGatewayMulticastGroupSource](https://docs.aws.amazon.com/cli/latest/reference/ec2/deregister-transit-gateway-multicast-group-sources.html) in *AWS CLI Command Reference*.

**describe-account-attributes**

The following code example shows how to use `describe-account-attributes`.

**AWS CLI**

**To describe all the attributes for your AWS account**

```bash
aws ec2 describe-account-attributes
```
This example describes the attributes for your AWS account.

Command:

```bash
aws ec2 describe-account-attributes
```

Output:

```json
{
   "AccountAttributes": [
   {
      "AttributeName": "vpc-max-security-groups-per-interface",
      "AttributeValues": [
         {
            "AttributeValue": "5"
         }
      ]
   },
   {
      "AttributeName": "max-instances",
      "AttributeValues": [
         {
            "AttributeValue": "20"
         }
      ]
   },
   {
      "AttributeName": "supported-platforms",
      "AttributeValues": [
         {
            "AttributeValue": "EC2"
         },
         {
            "AttributeValue": "VPC"
         }
      ]
   },
   {
      "AttributeName": "default-vpc",
      "AttributeValues": [
         {
            "AttributeValue": "none"
         }
      ]
   }
  ]
}```
To describe a single attribute for your AWS account

This example describes the supported-platforms attribute for your AWS account.

Command:

```bash
aws ec2 describe-account-attributes --attribute-names supported-platforms
```

Output:

```json
{
  "AccountAttributes": [
    {
      "AttributeName": "supported-platforms",
      "AttributeValues": [
        {}
      ]
    }
  ]
}
```
describe-address-transfers

The following code example shows how to use describe-address-transfers.

**AWS CLI**

To describe an Elastic IP address transfer

The following describe-address-transfers example describes the Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 describe-address-transfers \
  --allocation-ids eipalloc-09ad461b0d03f6aaf
```

Output:

```
{
  "AddressTransfers": [
    {
      "PublicIp": "100.21.184.216",
      "AllocationId": "eipalloc-09ad461b0d03f6aaf",
      "TransferAccountid": "123456789012",
      "TransferOfferExpirationTimestamp": "2023-02-22T22:51:01.000Z",
      "AddressTransferStatus": "pending"
    }
  ]
}
```

For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

• For API details, see DescribeAddressTransfers in AWS CLI Command Reference.

describe-addresses-attribute

The following code example shows how to use describe-addresses-attribute.
AWS CLI

**To view the attributes of the domain name associated with an elastic IP address**

The following describe-addresses-attribute examples return the attributes of the domain name associated with the elastic IP address.

Linux:

```
aws ec2 describe-addresses-attribute \
    --allocation-ids eipalloc-abcdef01234567890 \
    --attribute domain-name
```

Windows:

```
aws ec2 describe-addresses-attribute ^
    --allocation-ids eipalloc-abcdef01234567890 ^
    --attribute domain-name
```

Output:

```
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.com."
        }
    ]
}
```

To view the attributes of an elastic IP address, you must have first associated a domain name with the elastic IP address. For more information, see [Use reverse DNS for email applications](#) in the [Amazon EC2 User Guide](#) or [modify-address-attribute](#) in the [AWS CLI Command Reference](#).

- For API details, see [DescribeAddressesAttribute](#) in *AWS CLI Command Reference*.

**describe-addresses**

The following code example shows how to use describe-addresses.
**AWS CLI**

**Example 1: To retrieve details about all of your Elastic IP addresses**

The following `describe-addresses` example displays details about your Elastic IP addresses.

```
aws ec2 describe-addresses
```

**Output:**

```json
{
   "Addresses": [
   {
       "InstanceId": "i-1234567890abcdef0",
       "PublicIp": "198.51.100.0",
       "PublicIpv4Pool": "amazon",
       "Domain": "standard"
   },
   {
       "Domain": "vpc",
       "PublicIpv4Pool": "amazon",
       "InstanceId": "i-1234567890abcdef0",
       "NetworkInterfaceId": "eni-12345678",
       "AssociationId": "eipassoc-12345678",
       "NetworkInterfaceOwnerId": "123456789012",
       "PublicIp": "203.0.113.0",
       "AllocationId": "eipalloc-12345678",
       "PrivateIpAddress": "10.0.1.241"
   }
   ]
}
```

**Example 2: To retrieve details your Elastic IP addresses for EC2-VPC**

The following `describe-addresses` example displays details about your Elastic IP addresses for use with instances in a VPC.

```
aws ec2 describe-addresses \
  --filters "Name=domain,Values=vpc"
```

**Output:**

Example 3: To retrieve details about an Elastic IP address specified by allocation ID

The following `describe-addresses` example displays details about the Elastic IP address with the specified allocation ID, which is associated with an instance in EC2-VPC.

```
aws ec2 describe-addresses \
   --allocation-ids eipalloc-282d9641
```

Output:

```
{
   "Addresses": [
      {
         "Domain": "vpc",
         "PublicIpv4Pool": "amazon",
         "InstanceId": "i-1234567890abcdef0",
         "NetworkInterfaceId": "eni-12345678",
         "AssociationId": "eipassoc-12345678",
         "NetworkInterfaceOwnerId": "123456789012",
         "PublicIp": "203.0.113.25",
         "AllocationId": "eipalloc-12345678",
         "PrivateIpAddress": "10.251.50.12"
      }
   ]
}
```
Example 4: To retrieve details about an Elastic IP address specified by its VPC private IP address

The following `describe-addresses` example displays details about the Elastic IP address associated with a particular private IP address in EC2-VPC.

```bash
aws ec2 describe-addresses \
    --filters "Name=private-ip-address,Values=10.251.50.12"
```

Example 5: To retrieve details about Elastic IP addresses in EC2-Classic

The following `describe-addresses` example displays details about your Elastic IP addresses for use in EC2-Classic.

```bash
aws ec2 describe-addresses \
    --filters "Name=domain,Values=standard"
```

Output:

```
{
  "Addresses": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "PublicIp": "203.0.110.25",
      "PublicIpv4Pool": "amazon",
      "Domain": "standard"
    }
  ]
}
```

Example 6: To retrieve details about an Elastic IP addresses specified by its public IP address

The following `describe-addresses` example displays details about the Elastic IP address with the value `203.0.110.25`, which is associated with an instance in EC2-Classic.

```bash
aws ec2 describe-addresses \
    --public-ips 203.0.110.25
```

Output:

```
{
```

Actions and scenarios
"Addresses": [
  {
    "InstanceId": "i-1234567890abcdef0",
    "PublicIp": "203.0.110.25",
    "PublicIpv4Pool": "amazon",
    "Domain": "standard"
  }
]

- For API details, see DescribeAddresses in AWS CLI Command Reference.

**describe-aggregate-id-format**

The following code example shows how to use describe-aggregate-id-format.

**AWS CLI**

To describe the longer ID format settings for all resource types in a Region

The following describe-aggregate-id-format example describes the overall long ID format status for the current Region. The Deadline value indicates that the deadlines for these resources to permanently switch from the short ID format to the long ID format expired. The UseLongIdsAggregated value indicates that all IAM users and IAM roles are configured to use long ID format for all resource types.

```
aws ec2 describe-aggregate-id-format
```

Output:

```
{
  "UseLongIdsAggregated": true,
  "Statuses": [
    {
      "Deadline": "2018-08-13T02:00:00.000Z",
      "Resource": "network-interface-attachment",
      "UseLongIds": true
    },
    {
      "Deadline": "2016-12-13T02:00:00.000Z",
      "Resource": "instance",
```
For API details, see DescribeAggregatedIdFormat in AWS CLI Command Reference.

describe-availability-zones

The following code example shows how to use describe-availability-zones.

AWS CLI

To describe your Availability Zones

The following example describe-availability-zones displays details for the Availability Zones that are available to you. The response includes Availability Zones only for the current Region. In this example, it uses the profiles default us-west-2 (Oregon) Region.

aws ec2 describe-availability-zones

Output:

```json
{
   "AvailabilityZones": [
      {
         "State": "available",
         "OptInStatus": "opt-in-not-required",
         "Messages": [],
         "RegionName": "us-west-2",
         "ZoneName": "us-west-2a",
         "ZoneId": "usw2-az1",
         "GroupName": "us-west-2",
         "NetworkBorderGroup": "us-west-2"
      }
   ]
}
```
The following code example shows how to use `describe-aws-network-performance-metric-subscription`.

**AWS CLI**

**To describe your metric subscriptions**

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

**Output:**

```
{
   "Subscriptions": [
       {
           "Source": "us-east-1",
           "Destination": "eu-west-1",
           "Metric": "aggregate-latency",
           "Statistic": "p50",
           "Period": "five-minutes"
       }
   ]
}
```

For more information, see [Manage subscriptions](#) in the *Infrastructure Performance User Guide*.

- For API details, see [DescribeAwsNetworkPerformanceMetricSubscription](#) in *AWS CLI Command Reference*.

The following code example shows how to use `describe-aws-network-performance-metric-subscriptions`.

**AWS CLI**

**To describe your metric subscriptions**
The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Source": "us-east-1",
            "Destination": "eu-west-1",
            "Metric": "aggregate-latency",
            "Statistic": "p50",
            "Period": "five-minutes"
        }
    ]
}
```

For more information, see [Manage subscriptions](#) in the *Infrastructure Performance User Guide*.

- For API details, see [DescribeAwsNetworkPerformanceMetricSubscriptions](#) in *AWS CLI Command Reference*.

**describe-bundle-tasks**

The following code example shows how to use `describe-bundle-tasks`.

**AWS CLI**

To describe your bundle tasks

This example describes all of your bundle tasks.

Command:

```
aws ec2 describe-bundle-tasks
```

Output:

```
{
```
"BundleTasks": [
    {
        "UpdateTime": "2015-09-15T13:26:54.000Z",
        "InstanceId": "i-1234567890abcdef0",
        "Storage": {
            "S3": {
                "Prefix": "winami",
                "Bucket": "bundletasks"
            }
        },
        "State": "bundling",
        "StartTime": "2015-09-15T13:24:35.000Z",
        "Progress": "3%",
        "BundleId": "bun-2a4e041c"
    }
],
}

- For API details, see [DescribeBundleTasks](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-bundle-tasks.html) in *AWS CLI Command Reference*.

**describe-byoip-cidrs**

The following code example shows how to use describe-byoip-cidrs.

**AWS CLI**

To describe your provisioned address ranges

The following describe-byoip-cidrs example displays details about the public IPv4 address ranges that you provisioned for use by AWS.

```
aws ec2 describe-byoip-cidrs
```

Output:

```
{
    "ByoipCidrs": [
    {
        "Cidr": "203.0.113.25/24",
        "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
        "State": "provisioned"
    }
]
```
describe-capacity-reservation-fleets

The following code example shows how to use describe-capacity-reservation-fleets.

AWS CLI

To view a Capacity Reservation Fleet

The following describe-capacity-reservation-fleets example lists configuration and capacity information for the specified Capacity Reservation Fleet. It also lists details about the individual Capacity Reservations that are inside the Fleet:

```
aws ec2 describe-capacity-reservation-fleets \
    --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```
{
    "CapacityReservationFleets": [
        {
            "Status": "active",
            "EndDate": "2022-12-31T23:59:59.000Z",

**describe-capacity-reservations**

The following code example shows how to use describe-capacity-reservations.

**AWS CLI**

**Example 1: To describe one or more of your capacity reservations**

The following describe-capacity-reservations example displays details about all of your capacity reservations in the current AWS Region.

```
aws ec2 describe-capacity-reservations
```

Output:

```json
{
   "CapacityReservations": [
   {
      "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
      "EndDateType": "unlimited",
      "AvailabilityZone": "eu-west-1a",
      "InstanceMatchCriteria": "open",
      "Tags": [],
      "EphemeralStorage": false,
      "CreateDate": "2019-08-16T09:03:18.000Z",
      "AvailableInstanceCount": 1,
      "InstanceId": "i-abcd567890EXAMPLE ",
      "State": "available",
      "StateReason": "",
      "StateChangeCode": 0,
      "StateChangeReason": "",
      "TotalTargetCapacity": 5,
      "TotalFulfilledCapacity": 5.0,
      "CreateTime": "2022-07-02T08:34:33.397Z",
      "AllocationStrategy": "prioritized"
   }
   ]
}
```
Example 2: To describe one or more of your capacity reservations

The following describe-capacity-reservations example displays details about the specified capacity reservation.

```
aws ec2 describe-capacity-reservations \\
   --capacity-reservation-ids cr-1234abcd56EXAMPLE
```

Output:

```
{
   "CapacityReservations": [
   {
      "CapacityReservationId": "cr-1234abcd56EXAMPLE",
      "EndDateType": "unlimited",
      "AvailabilityZone": "eu-west-1a",
      "InstanceMatchCriteria": "open",
      "CreateDate": "2019-08-07T11:34:19.000Z",
      "AvailableInstanceCount": 3,
      "InstancePlatform": "Linux/UNIX",
      "TotalInstanceCount": 3,
      "State": "cancelled",
      "Tenancy": "default",
      "EbsOptimized": true,
      "InstanceType": "m5.large"
   }
   ]
}
```
For more information, see [Viewing a Capacity Reservation](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/view-capacity-reservation.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeCapacityReservations](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-capacity-reservations.html) in *AWS CLI Command Reference*.

### describe-carrier-gateways

The following code example shows how to use `describe-carrier-gateways`.

**AWS CLI**

To describe all carrier gateways

The following `describe-carrier-gateways` example lists all your carrier gateways.

```bash
aws ec2 describe-carrier-gateways
```

Output:

```json
{
   "CarrierGateways": [
   {
      "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
      "VpcId": "vpc-0c529aEXAMPLE",
      "State": "available",
      "OwnerId": "123456789012",
      "Tags": [
      {
      }]
   }]
}
```
describe-classic-link-instances

The following code example shows how to use describe-classic-link-instances.

AWS CLI

To describe linked EC2-Classic instances

This example lists all of your linked EC2-Classic instances.

Command:

```bash
aws ec2 describe-classic-link-instances
```

Output:

```json
{
    "Instances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "VpcId": "vpc-88888888",
            "Groups": [
                {
                    "GroupId": "sg-11122233"
                }
            ],
            "Tags": [
                {
                    "Value": "ClassicInstance",
                    "Key": "Name"
                }
            ]
        }
    ]
}
```
This example lists all of your linked EC2-Classic instances, and filters the response to include only instances that are linked to VPC vpc-88888888.

Command:

```bash
aws ec2 describe-classic-link-instances --filter "Name=vpc-id,Values=vpc-88888888"
```

Output:

```json
{
  "Instances": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "VpcId": "vpc-88888888",
      "Groups": [
        {
          "GroupId": "sg-11122233"
        }
      ],
      "Tags": [
        {
          "Value": "ClassicInstance",
          "Key": "Name"
        }
      ]
    }
  ]
}
```
For API details, see DescribeClassicLinkInstances in AWS CLI Command Reference.

describe-client-vpn-authorization-rules

The following code example shows how to use describe-client-vpn-authorization-rules.

AWS CLI

To describe the authorization rules for a Client VPN endpoint

The following describe-client-vpn-authorization-rules example displays details about the authorization rules for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-authorization-rules \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "AuthorizationRules": [
    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "GroupId": "",
      "AccessAll": true,
      "DestinationCidr": "0.0.0.0/0",
      "Status": {
        "Code": "active"
      }
    }
  ]
}
```

For more information, see Authorization Rules in the AWS Client VPN Administrator Guide.

For API details, see DescribeClientVpnAuthorizationRules in AWS CLI Command Reference.
describe-client-vpn-connections

The following code example shows how to use describe-client-vpn-connections.

AWS CLI

To describe the connections to a Client VPN endpoint

The following describe-client-vpn-connections example displays details about the client connections to the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-connections \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
  "Connections": [
    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "Timestamp": "2019-08-12 07:58:34",
      "ConnectionId": "cvpn-connection-0e03eb24267165acd",
      "ConnectionEstablishedTime": "2019-08-12 07:57:14",
      "IngressBytes": "32302",
      "EgressBytes": "5696",
      "IngressPackets": "332",
      "EgressPackets": "67",
      "ClientIp": "172.31.0.225",
      "CommonName": "client1.domain.tld",
      "Status": {
        "Code": "terminated"
      },
      "ConnectionEndTime": "2019-08-12 07:58:34"
    },
    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "Timestamp": "2019-08-12 08:02:54",
      "ConnectionId": "cvpn-connection-00668867a40f18253",
      "ConnectionEstablishedTime": "2019-08-12 08:02:53",
      "IngressBytes": "2951",
      "EgressBytes": "2611",
      "IngressPackets": "9",
      "EgressPackets": "6",
    }
  ]
}
```
For more information, see Client Connections in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClientVpnConnections in AWS CLI Command Reference.

describe-client-vpn-endpoints

The following code example shows how to use describe-client-vpn-endpoints.

AWS CLI

To describe your Client VPN endpoints

The following describe-client-vpn-endpoints example displays details about all of your Client VPN endpoints.

```
aws ec2 describe-client-vpn-endpoints
```

Output:

```
{
    "ClientVpnEndpoints": [
        {
            "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
            "Description": "Endpoint for Admin access",
            "Status": {
                "Code": "available"
            },

  "Enabled": false
}
]}

For more information, see [Client VPN Endpoints](https://aws.amazon.com) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnEndpoints](https://aws.amazon.com) in *AWS CLI Command Reference*. 

Actions and scenarios 2182
**describe-client-vpn-routes**

The following code example shows how to use `describe-client-vpn-routes`.

**AWS CLI**

To describe the routes for a Client VPN endpoint

The following `describe-client-vpn-routes` example displays details about the routes for the specified Client VPN endpoint.

```bash
aws ec2 describe-client-vpn-routes \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
    "Routes": [
    {
        "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
        "DestinationCidr": "10.0.0.0/16",
        "TargetSubnet": "subnet-0123456789abcdef",
        "Type": "Nat",
        "Origin": "associate",
        "Status": {
            "Code": "active"
        },
        "Description": "Default Route"
    },
    {
        "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
        "DestinationCidr": "0.0.0.0/0",
        "TargetSubnet": "subnet-0123456789abcdef",
        "Type": "Nat",
        "Origin": "add-route",
        "Status": {
            "Code": "active"
        }
    }
    ]
}
```

For more information, see [Routes](#) in the *AWS Client VPN Administrator Guide*. 
• For API details, see `DescribeClientVpnRoutes` in *AWS CLI Command Reference*.

**describe-client-vpn-target-networks**

The following code example shows how to use `describe-client-vpn-target-networks`.

**AWS CLI**

**To describe the target networks for a Client VPN endpoint**

The following `describe-client-vpn-target-networks` example displays details about the target networks for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-target-networks \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "ClientVpnTargetNetworks": [
    {
        "AssociationId": "cvpn-assoc-012e837060753dc3d",
        "VpcId": "vpc-1111222222333333",
        "TargetNetworkId": "subnet-0123456789abcabca",
        "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
        "Status": {
            "Code": "associating"
        },
        "SecurityGroups": [
            "sg-012345678910abcab"
        ]
    }
    ]
}
```

For more information, see [Target Networks](#) in the *AWS Client VPN Administrator Guide*.

• For API details, see `DescribeClientVpnTargetNetworks` in *AWS CLI Command Reference*.

**describe-coip-pools**

The following code example shows how to use `describe-coip-pools`.
AWS CLI

To describe customer-owned IP address pools

The following describe-coip-pools example describes the customer-owned IP address pools in your AWS account.

```
aws ec2 describe-coip-pools
```

Output:

```
{
    "CoipPools": [
    {
        "PoolId": "ipv4pool-coip-123a45678bEXAMPLE",
        "PoolCidrs": [
            "0.0.0.0/0"
        ],
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
    }
    ]
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DescribeCoipPools in AWS CLI Command Reference.

describe-conversion-tasks

The following code example shows how to use describe-conversion-tasks.

AWS CLI

To view the status of a conversion task

This example returns the status of a conversion task with the ID import-i-ffvko9js.

Command:

```
aws ec2 describe-conversion-tasks --conversion-task-ids import-i-ffvko9js
```
Output:

```json
{
    "ConversionTasks": [
        {
            "ConversionTaskId": "import-i-ffvko9js",
            "ImportInstance": {
                "InstanceId": "i-1234567890abcdef0",
                "Volumes": [
                    {
                        "Volume": {
                            "Id": "vol-049df61146c4d7901",
                            "Size": 16
                        },
                        "Status": "completed",
                        "Image": {
                            "Size": 1300687360,
                            "ImportManifestUrl": "https://s3.amazonaws.com/myimportbucket/411443cd-d620-4f1c-9d66-13144EXAMPLE/RHEL5.vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=140EXAMPLE&Signature=XYNhznHNgCqsjDxL9wRL%2FJvEXAMPLE",
                            "Format": "VMDK"
                        },
                        "BytesConverted": 1300682960,
                        "AvailabilityZone": "us-east-1d"
                    }
                ],
                "State": "completed"
            }
        }
    ]
}
```

- For API details, see `DescribeConversionTasks` in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/cli/).
This example describes your customer gateways.

Command:

```
aws ec2 describe-customer-gateways
```

Output:

```json
{
    "CustomerGateways": [
        {
            "CustomerGatewayId": "cgw-b4dc3961",
            "IpAddress": "203.0.113.12",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65000"
        },
        {
            "CustomerGatewayId": "cgw-0e11f167",
            "IpAddress": "12.1.2.3",
            "State": "available",
            "Type": "ipsec.1",
            "BgpAsn": "65534"
        }
    ]
}
```

To describe a specific customer gateway

This example describes the specified customer gateway.

Command:

```
aws ec2 describe-customer-gateways --customer-gateway-ids cgw-0e11f167
```

Output:

```json
{
    "CustomerGateways": [
        {
            "CustomerGatewayId": "cgw-0e11f167",
            "IpAddress": "12.1.2.3",
```
For API details, see [DescribeCustomerGateways](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-customer-gateways) in *AWS CLI Command Reference*.

**describe-dhcp-options**

The following code example shows how to use describe-dhcp-options.

**AWS CLI**

**Example 1: To describe your DHCP options**

The following `describe-dhcp-options` example retrieves details about your DHCP options.

```bash
code
aws ec2 describe-dhcp-options
```

Output:

```json
{
   "DhcpOptions": [
      {
         "DhcpConfigurations": [
            {
               "Key": "domain-name",
               "Values": [
                  {
                     "Value": "us-east-2.compute.internal"
                  }
               ]
            },
            {
               "Key": "domain-name-servers",
               "Values": [
                  {
                     "Value": "AmazonProvidedDNS"
                  }
               ]
            }
         ]
      }
   ]
}
```
For more information, see Working with DHCP Option Sets in the AWS VPC User Guide.

Example 2: To describe your DHCP options and filter the output

The following describe-dhcp-options example describes your DHCP options and uses a filter to return only DHCP options that have example.com for the domain name server. The example uses the --query parameter to display only the configuration information and ID in the output.

```bash
aws ec2 describe-dhcp-options \
   --filters Name=key,Values=domain-name-servers Name=value,Values=example.com \
   --query "DhcpOptions[*].[DhcpConfigurations,DhcpOptionsId]"
```

Output:
[{
    "Key": "domain-name",
    "Values": [
    {
        "Value": "example.com"
    }
    ],
},
{
    "Key": "domain-name-servers",
    "Values": [
    {
        "Value": "172.16.16.16"
    }
    ]
    },
    "dopt-001122334455667ab"
}
]

For more information, see [Working with DHCP Option Sets](aws-vpc-user-guide) in the *AWS VPC User Guide*.

- For API details, see [DescribeDhcpOptions](aws-cli-command-reference) in *AWS CLI Command Reference*.

describe-egress-only-internet-gateways

The following code example shows how to use `describe-egress-only-internet-gateways`

**AWS CLI**

To describe your egress-only Internet gateways

This example describes your egress-only Internet gateways.

Command:

```
aws ec2 describe-egress-only-internet-gateways
```

Output:
{  
  "EgressOnlyInternetGateways": [  
    {  
      "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",  
      "Attachments": [  
        {  
          "State": "attached",  
          "VpcId": "vpc-0c62a468"  
        }  
      ]  
    }  
  ]  
}

- For API details, see [DescribeEgressOnlyInternetGateways](#) in *AWS CLI Command Reference*.

**describe-elastic-gpus**

The following code example shows how to use describe-elastic-gpus.

**AWS CLI**

**To describe an Elastic GPU**

Command:

```
aws ec2 describe-elastic-gpus --elastic-gpu-ids
egpu-12345678901234567890abcdefghijkl
```

- For API details, see [DescribeElasticGpus](#) in *AWS CLI Command Reference*.

**describe-export-image-tasks**

The following code example shows how to use describe-export-image-tasks.

**AWS CLI**

**To monitor an export image task**

The following describe-export-image-tasks example checks the status of the specified export image task. The resulting image file in Amazon S3 is `my-export-bucket/exports/export-ami-1234567890abcdef0.vmdk`.

Actions and scenarios
The following code example shows how to use describe-export-tasks.

describe-export-tasks

The following code example shows how to use describe-export-tasks.

For more information, see Export a VM from an AMI in the VM Import/Export User Guide.

- For API details, see DescribeExportImageTasks in AWS CLI Command Reference.
**AWS CLI**

**To list details about an instance export task**

This example describes the export task with ID export-i-fh8sjjsq.

Command:

```
aws ec2 describe-export-tasks --export-task-ids export-i-fh8sjjsq
```

Output:

```json
{
    "ExportTasks": [
    {
        "State": "active",
        "InstanceExportDetails": {
            "InstanceId": "i-1234567890abcdef0",
            "TargetEnvironment": "vmware"
        },
        "ExportToS3Task": {
            "S3Bucket": "myexportbucket",
            "S3Key": "RHEL5export-i-fh8sjjsq.ova",
            "DiskImageFormat": "vmdk",
            "ContainerFormat": "ova"
        },
        "Description": "RHEL5 instance",
        "ExportTaskId": "export-i-fh8sjjsq"
    }
    ]
}
```

- For API details, see [DescribeExportTasks](#) in *AWS CLI Command Reference*.

**describe-fast-launch-images**

The following code example shows how to use `describe-fast-launch-images`.

**AWS CLI**

**To describe the details for Windows AMIs that are configured for faster launching**
The following describe-fast-launch-images example describes the details for each of the AMIs in your account that are configured for faster launching, including the resource type, the snapshot configuration, the launch template details, the maximum number of parallel launches, the AMI owner ID, the state of the fast launch configuration, the reason the state was changed, and the time that the state change occurred.

```bash
aws ec2 describe-fast-launch-images
```

Output:

```json
{
    "FastLaunchImages": [
        {
            "ImageId": "ami-01234567890abcedf",
            "ResourceType": "snapshot",
            "SnapshotConfiguration": {},
            "LaunchTemplate": {
                "LaunchTemplateId": "lt-01234567890abcedf",
                "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-a8c6215d-94e6-441b-9272-dbd1f87b07e2",
                "Version": "1"
            },
            "MaxParallelLaunches": 6,
            "OwnerId": "0123456789123",
            "State": "enabled",
            "StateTransitionReason": "Client.UserInitiated",
            "StateTransitionTime": "2022-01-27T22:20:06.552000+00:00"
        }
    ]
}
```

For more information about configuring a Windows AMI for faster launching, see [Configure your AMI for faster launching](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/configure-windows-ami-fast-launch.html) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeLaunchImages](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-launch-images.html) in *AWS CLI Command Reference*.

### describe-fast-snapshot-restores

The following code example shows how to use describe-fast-snapshot-restores.
### AWS CLI

**To describe fast snapshot restores**

The following `describe-fast-snapshot-restores` example displays details for all fast snapshot restores with a state of disabled.

```bash
aws ec2 describe-fast-snapshot-restores --filters Name=state,Values=disabled
```

**Output:**

```json
{
   "FastSnapshotRestores": [
      {
         "SnapshotId": "snap-1234567890abcdef0",
         "AvailabilityZone": "us-west-2c",
         "State": "disabled",
         "StateTransitionReason": "Client.UserInitiated - Lifecycle state transition",
         "OwnerId": "123456789012",
         "EnablingTime": "2020-01-25T23:57:49.596Z",
         "OptimizingTime": "2020-01-25T23:58:25.573Z",
         "DisablingTime": "2020-01-26T00:40:56.069Z",
         "DisabledTime": "2020-01-26T00:41:27.390Z"
      }
   ]
}
```

The following `describe-fast-snapshot-restores` example describes all fast snapshot restores.

```bash
aws ec2 describe-fast-snapshot-restores
```

- For API details, see [DescribeFastSnapshotRestores](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-fast-snapshot-restores.html) in *AWS CLI Command Reference*.

### describe-fleet-history

The following code example shows how to use `describe-fleet-history`.

---

*Actions and scenarios*
AWS CLI

**To describe EC2 Fleet history**

The following `describe-fleet-history` example returns the history for the specified EC2 Fleet starting at the specified time. The output is for an EC2 Fleet with two running instances.

```bash
aws ec2 describe-fleet-history \
    --fleet-id fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
    --start-time 2020-09-01T00:00:00Z
```

Output:

```json
{
    "HistoryRecords": [
        {
            "EventInformation": {
                "EventSubType": "submitted"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:05.000Z"
        },
        {
            "EventInformation": {
                "EventSubType": "active"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:15.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "t2.small, ami-07c8bc5c1ce9598c3, ...",
                "EventSubType": "progress"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        },
        {
            "EventInformation": {
                "InstanceId": "i-083a1c446e66085d2"
            },
            "EventSubType": "launched"
        }
    ]
}
```
For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeFleetHistory in AWS CLI Command Reference.

**describe-fleet-instances**

The following code example shows how to use describe-fleet-instances.

**AWS CLI**

To describe the running instances for an EC2 Fleet

The following describe-fleet-instances example describes the running instances for the specified EC2 Fleet.

```
aws ec2 describe-fleet-instances 
   --fleet-id 12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```
{
   "ActiveInstances": [
      {
```

```
For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeFleetInstances in AWS CLI Command Reference.

describe-fleets

The following code example shows how to use describe-fleets.

AWS CLI

To describe an EC2 Fleet

The following describe-fleets example describes the specified EC2 Fleet.

```bash
aws ec2 describe-fleets \
  --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```json
{
  "Fleets": [
    {
      "ActivityStatus": "pending_fulfillment",
      "CreateTime": "2020-09-01T18:26:05.000Z",
      "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
      "FleetState": "active",
      "ExcessCapacityTerminationPolicy": "termination",
```
"FulfilledCapacity": 0.0,
"FulfilledOnDemandCapacity": 0.0,
"LaunchTemplateConfigs": [
  {
    "LaunchTemplateSpecification": {
      "LaunchTemplateId": "lt-0e632f2855a979cd5",
      "Version": "1"
    }
  }
],
"TargetCapacitySpecification": {
  "TotalTargetCapacity": 2,
  "OnDemandTargetCapacity": 0,
  "SpotTargetCapacity": 2,
  "DefaultTargetCapacityType": "spot"
},
"TerminateInstancesWithExpiration": false,
"Type": "maintain",
"ReplaceUnhealthyInstances": false,
"SpotOptions": {
  "AllocationStrategy": "lowestPrice",
  "InstanceInterruptionBehavior": "terminate",
  "InstancePoolsToUseCount": 1
},
"OnDemandOptions": {
  "AllocationStrategy": "lowestPrice"
}
]

For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeFleets in AWS CLI Command Reference.

describe-flow-logs

The following code example shows how to use describe-flow-logs.

AWS CLI

Example 1: To describe all of your flow logs
The following describe-flow-logs example displays details for all of your flow logs.

```bash
aws ec2 describe-flow-logs
```

Output:

```json
{
   "FlowLogs": [
   {
      "DeliverLogsPermissionArn": "arn:aws:iam::123456789012:role/flow-logs-role",
      "DeliverLogsStatus": "SUCCESS",
      "FlowLogId": "fl-aabbccdd112233445",
      "MaxAggregationInterval": 600,
      "FlowLogStatus": "ACTIVE",
      "LogGroupName": "FlowLogGroup",
      "ResourceId": "subnet-12345678901234567",
      "TrafficType": "ALL",
      "LogDestinationType": "cloud-watch-logs",
      "LogFormat": "${version} ${account-id} ${interface-id} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${protocol} ${packets} ${bytes} ${start} ${end} ${action} ${log-status}"
   },
   {
      "CreationTime": "2020-02-04T15:22:29.986Z",
      "DeliverLogsStatus": "SUCCESS",
      "FlowLogId": "fl-01234567890123456",
      "MaxAggregationInterval": 60,
      "FlowLogStatus": "ACTIVE",
      "ResourceId": "vpc-00112233445566778",
      "TrafficType": "ACCEPT",
      "LogDestinationType": "s3",
      "LogDestination": "arn:aws:s3:::my-flow-log-bucket/custom",
      "LogFormat": "${version} ${vpc-id} ${subnet-id} ${instance-id} ${interface-id} ${account-id} ${type} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${pkt-srcaddr} ${pkt-dstaddr} ${protocol} ${bytes} ${packets} ${start} ${end} ${action} ${tcp-flags} ${log-status}"
   }
   ]
}
```

Example 2: To describe a subset of your flow logs
The following `describe-flow-logs` example uses a filter to display details for only those flow logs that are in the specified log group in Amazon CloudWatch Logs.

```sh
aws ec2 describe-flow-logs 
   --filter "Name=log-group-name,Values=MyFlowLogs"
```

- For API details, see `DescribeFlowLogs` in *AWS CLI Command Reference*.

### describe-fpga-image-attribute

The following code example shows how to use `describe-fpga-image-attribute`.

**AWS CLI**

**To describe the attributes of an Amazon FPGA image**

This example describes the load permissions for the specified AFI.

Command:

```
aws ec2 describe-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --attribute loadPermission
```

Output:

```
{
   "FpgaImageAttribute": {
       "FpgaImageId": "afi-0d123e123bfc85abc",
       "LoadPermissions": [
           {
               "UserId": "123456789012"
           }
       ]
   }
}
```

- For API details, see `DescribeFpgaImageAttribute` in *AWS CLI Command Reference*.

### describe-fpga-images

The following code example shows how to use `describe-fpga-images`.

**Actions and scenarios**
AWS CLI

To describe Amazon FPGA images

This example describes AFIs that are owned by account 123456789012.

Command:

```bash
aws ec2 describe-fpga-images --filters Name=owner-id,Values=123456789012
```

Output:

```json
{
  "FpgaImages": [
    {
      "UpdateTime": "2017-12-22T12:09:14.000Z",
      "Name": "my-afi",
      "PciId": {
        "SubsystemVendorId": "0xfedd",
        "VendorId": "0x1d0f",
        "DeviceId": "0xf000",
        "SubsystemId": "0x1d51"
      },
      "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc",
      "Public": false,
      "State": {
        "Code": "available"
      },
      "ShellVersion": "0x071417d3",
      "OwnerId": "123456789012",
      "FpgaImageId": "afi-0d123e123bfc85abc",
      "CreateTime": "2017-12-22T11:43:33.000Z",
      "Description": "my-afi"
    }
  ]
}
```

For API details, see [DescribeFpgaImages](#) in AWS CLI Command Reference.

describe-host-reservation-offerings

The following code example shows how to use describe-host-reservation-offerings.
AWS CLI

To describe Dedicated Host Reservation offerings

This example describes the Dedicated Host Reservations for the M4 instance family that are available to purchase.

Command:

```
aws ec2 describe-host-reservation-offerings --filter Name=instance-family,Values=m4
```

Output:

```
{
    "OfferingSet": [
        {
            "HourlyPrice": "1.499",
            "OfferingId": "hro-03f707bf363b6b324",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        },
        {
            "HourlyPrice": "1.045",
            "OfferingId": "hro-0ef9181cabdef7a02",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "UpfrontPrice": "0.000",
            "Duration": 94608000
        },
        {
            "HourlyPrice": "0.714",
            "OfferingId": "hro-04567a15500b92a51",
            "InstanceFamily": "m4",
            "PaymentOption": "PartialUpfront",
            "UpfrontPrice": "6254.000",
            "Duration": 31536000
        },
        {
            "HourlyPrice": "0.484",
            "OfferingId": "hro-0d5d7a9d23ed7fbfe",
            "InstanceFamily": "m4",
        }
    ]
}
```
For API details, see DescribeHostReservationOfferings in AWS CLI Command Reference.

describe-host-reservations

The following code example shows how to use describe-host-reservations.

AWS CLI

To describe Dedicated Host Reservations in your account

This example describes the Dedicated Host Reservations in your account.

Command:

```
aws ec2 describe-host-reservations
```

Output:

```
{
   "HostReservationSet": [
```
For API details, see `DescribeHostReservations` in *AWS CLI Command Reference*.

**describe-hosts**

The following code example shows how to use `describe-hosts`.

**AWS CLI**

To view details about Dedicated Hosts

The following `describe-hosts` example displays details for the available Dedicated Hosts in your AWS account.

```bash
aws ec2 describe-hosts --filter "Name=state,Values=available"
```

Output:

```json
{
    "Hosts": [
        {
            "HostId": "h-07879acf49EXAMPLE",
            "Tags": [
                {
                    ...
```
For more information, see Viewing Dedicated Hosts in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeHosts in AWS CLI Command Reference.

describe-iam-instance-profile-associations

The following code example shows how to use describe-iam-instance-profile-associations.

AWS CLI

To describe IAM instance profile associations
This example describes all of your IAM instance profile associations.

Command:

```bash
aws ec2 describe-iam-instance-profile-associations
```

Output:

```json
{
   "IamInstanceProfileAssociations": [
      {
         "InstanceId": "i-09eb09efa73ec1dee",
         "State": "associated",
         "AssociationId": "iip-assoc-0db249b1f25fa24b8",
         "IamInstanceProfile": {
            "Id": "AIPAJVQN4F5WVLGCJDRGM",
            "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
         }
      },
      {
         "InstanceId": "i-0402909a2f4dffd14",
         "State": "associating",
         "AssociationId": "iip-assoc-0d1ec06278d29f44a",
         "IamInstanceProfile": {
            "Id": "AGJAJVQN4F5WVLGCJABC",
            "Arn": "arn:aws:iam::123456789012:instance-profile/user1-role"
         }
      }
   ]
}
```

- For API details, see [DescribeIamInstanceProfileAssociations](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-iam-instance-profile-associations.html) in *AWS CLI Command Reference*.

**describe-id-format**

The following code example shows how to use `describe-id-format`.

**AWS CLI**

**Example 1: To describe the ID format of a resource**

The following `describe-id-format` example describes the ID format for security groups.
In the following example output, the Deadline value indicates that the deadline for this resource type to permanently switch from the short ID format to the long ID format expired at 00:00 UTC on August 15, 2018.

```
{
   "Statuses": [
      {
         "Deadline": "2018-08-15T00:00:00.000Z",
         "Resource": "security-group",
         "UseLongIds": true
      }
   ]
}
```

Example 2: To describe the ID format for all resources

The following describe-id-format example describes the ID format for all resource types. All resource types that supported the short ID format were switched to use the long ID format.

```
aws ec2 describe-id-format
```

- For API details, see DescribeIdFormat in AWS CLI Command Reference.

**describe-identity-id-format**

The following code example shows how to use describe-identity-id-format.

**AWS CLI**

To describe the ID format for an IAM role

The following describe-identity-id-format example describes the ID format received by instances created by the IAM role EC2Role in your AWS account.

```
aws ec2 describe-identity-id-format \
   --principal-arn arn:aws:iam::123456789012:role/my-iam-role \
   --resource instance
```
The following output indicates that instances created by this role receive IDs in long ID format.

```json
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00Z",
            "Resource": "instance",
            "UseLongIds": true
        }
    ]
}
```

**To describe the ID format for an IAM user**

The following describe-identity-id-format example describes the ID format received by snapshots created by the IAM user `AdminUser` in your AWS account.

```
aws ec2 describe-identity-id-format \\
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \\
    --resource snapshot
```

The output indicates that snapshots created by this user receive IDs in long ID format.

```json
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00Z",
            "Resource": "snapshot",
            "UseLongIds": true
        }
    ]
}
```

- For API details, see [DescribeIdentityIdFormat](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-identity-id-format.html) in *AWS CLI Command Reference*.

**describe-image-attribute**

The following code example shows how to use describe-image-attribute.

**AWS CLI**

**To describe the launch permissions for an AMI**
This example describes the launch permissions for the specified AMI.

Command:

```
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute launchPermission
```

Output:

```
{
   "LaunchPermissions": [
   {
      "UserId": "123456789012"
   }
   ],
   "ImageId": "ami-5731123e",
}
```

To describe the product codes for an AMI

This example describes the product codes for the specified AMI. Note that this AMI has no product codes.

Command:

```
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute productCodes
```

Output:

```
{
   "ProductCodes": [],
   "ImageId": "ami-5731123e",
}
```

**describe-images**

The following code example shows how to use describe-images.
AWS CLI

Example 1: To describe an AMI

The following `describe-images` example describes the specified AMI in the specified Region.

```bash
aws ec2 describe-images \
--region us-east-1 \
--image-ids ami-1234567890EXAMPLE
```

Output:

```json
{
   "Images": [ 
      {
         "VirtualizationType": "hvm",
         "Description": "Provided by Red Hat, Inc.",
         "PlatformDetails": "Red Hat Enterprise Linux",
         "EnaSupport": true,
         "Hypervisor": "xen",
         "State": "available",
         "SriovNetSupport": "simple",

]
}

For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

Example 2: To describe AMIs based on filters

The following describe-images example describes Windows AMIs provided by Amazon that are backed by Amazon EBS.

```
aws ec2 describe-images \
  --owners amazon \
  --filters "Name=platform,Values=windows" "Name=root-device-type,Values=ebs"
```

For an example of the output for describe-images, see Example 1.

For additional examples using filters, see Listing and filtering your resources in the Amazon EC2 User Guide.

Example 3: To describe AMIs based on tags

The following describe-images example describes all AMIs that have the tag Type=Custom. The example uses the --query parameter to display only the AMI IDs.

```
aws ec2 describe-images \
  --filters "Name=tag:Type,Values=Custom" \
  --query 'Images[*].[ImageId]' \
  --output text
```

Output:

```
ami-1234567890EXAMPLE
ami-0abcdef1234567890
```

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribelImages in AWS CLI Command Reference.
describe-import-image-tasks

The following code example shows how to use describe-import-image-tasks.

AWS CLI

To monitor an import image task

The following describe-import-image-tasks example checks the status of the specified import image task.

```bash
aws ec2 describe-import-image-tasks \
   --import-task-ids import-ami-1234567890abcdef0
```

Output for an import image task that is in progress.

```json
{
   "ImportImageTasks": [
      {
         "ImportTaskId": "import-ami-1234567890abcdef0",
         "Progress": "28",
         "SnapshotDetails": [
            {
               "DiskImageSize": 705638400.0,
               "Format": "ova",
               "Status": "completed",
               "UserBucket": {
                  "S3Bucket": "my-import-bucket",
                  "S3Key": "vms/my-server-vm.ova"
               }
            }
         ],
         "Status": "active",
         "StatusMessage": "converting"
      }
   ]
}
```

Output for an import image task that is completed. The ID of the resulting AMI is provided by ImageId.

```json
{
}
```
"ImportImageTasks": [
  {
    "ImportTaskId": "import-ami-1234567890abcdef0",
    "ImageId": "ami-1234567890abcdef0",
    "SnapshotDetails": [
      {
        "DiskImageSize": 705638400.0,
        "Format": "ova",
        "SnapshotId": "snap-1234567890abcdef0",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "my-import-bucket",
          "S3Key": "vms/my-server-vm.ova"
        }
      }
    ],
    "Status": "completed"
  }
]

- For API details, see [DescribeImportImageTasks](#) in *AWS CLI Command Reference*.

describe-import-snapshot-tasks

The following code example shows how to use `describe-import-snapshot-tasks`.

**AWS CLI**

To monitor an import snapshot task

The following `describe-import-snapshot-tasks` example checks the status of the specified import snapshot task.

```bash
aws ec2 describe-import-snapshot-tasks \
  --import-task-ids import-snap-1234567890abcdef0
```

Output for an import snapshot task that is in progress:

```json
{
  "ImportSnapshotTasks": [
  ]
}
```
Output for an import snapshot task that is completed. The ID of the resulting snapshot is provided by SnapshotId.

```json
{
   "ImportSnapshotTasks": [
      {
         "Description": "My server VMDK",
         "ImportTaskId": "import-snap-1234567890abcdef0",
         "SnapshotTaskDetail": {
            "Description": "My server VMDK",
            "DiskImageSize": "705638400.0",
            "Format": "VMDK",
            "Progress": "42",
            "Status": "active",
            "StatusMessage": "downloading/converting",
            "UserBucket": {
               "S3Bucket": "my-import-bucket",
               "S3Key": "vms/my-server-vm.vmdk"
            }
         }
      }
   ]
}
```

---

Actions and scenarios 2215
describe-instance-attribute

The following code example shows how to use describe-instance-attribute.

AWS CLI

To describe the instance type

This example describes the instance type of the specified instance.

Command:

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute instanceType
```

Output:

```
{
   "InstanceId": "i-1234567890abcdef0"
   "InstanceType": {
   "Value": "t1.micro"
    }
}
```

To describe the disableApiTermination attribute

This example describes the disableApiTermination attribute of the specified instance.

Command:

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute disableApiTermination
```

Output:

```
{
   "InstanceId": "i-1234567890abcdef0"
   "DisableApiTermination": { 
   "Value": "false"
    }
}
```

To describe the block device mapping for an instance
This example describes the blockDeviceMapping attribute of the specified instance.

Command:

```bash
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute blockDeviceMapping
```

Output:

```json
{
   "InstanceId": "i-1234567890abcdef0",
   "BlockDeviceMappings": [
   {
      "DeviceName": "/dev/sda1",
      "Ebs": {
         "Status": "attached",
         "DeleteOnTermination": true,
         "VolumeId": "vol-049df61146c4d7901",
         "AttachTime": "2013-05-17T22:42:34.000Z"
      }
   },
   {
      "DeviceName": "/dev/sdf",
      "Ebs": {
         "Status": "attached",
         "DeleteOnTermination": false,
         "VolumeId": "vol-049df61146c4d7901",
         "AttachTime": "2013-09-10T23:07:00.000Z"
      }
   }
   ],
}
```

- For API details, see [DescribeInstanceAttribute](#) in *AWS CLI Command Reference*.

**describe-instance-connect-endpoints**

The following code example shows how to use describe-instance-connect-endpoints.

**AWS CLI**

To describe an EC2 Instance Connect Endpoint
The following `describe-instance-connect-endpoints` example describes the specified EC2 Instance Connect Endpoint.

```bash
aws ec2 describe-instance-connect-endpoints \
  --region us-east-1 \
  --instance-connect-endpoint-ids eice-0123456789example
```

Output:

```json
{
   "InstanceConnectEndpoints": [
      {
         "OwnerId": "111111111111",
         "InstanceConnectEndpointId": "eice-0123456789example",
         "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
         "State": "create-complete",
         "StateMessage": ",",
         "DnsName": "eice-0123456789example.b67b86ba.ec2-instance-connect-endpoint.us-east-1.amazonaws.com",
         "NetworkInterfaceIds": ["eni-0123456789example"],
         "VpcId": "vpc-0123abcd",
         "AvailabilityZone": "us-east-1",
         "CreatedAt": "2023-02-07T12:05:37+00:00",
         "SubnetId": "subnet-0123abcd",
         "Tags": []
      }
   ]
}
```

For more information, see [Create an EC2 Instance Connect Endpoint](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/CreateInstanceConnectEndpoint.html) in the [Amazon EC2 User Guide](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/).  

- For API details, see [DescribeInstanceConnectEndpoints](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-connect-endpoints.html) in [AWS CLI Command Reference](https://awscli.amazonaws.com/v2/documentation/api/).  

**describe-instance-credit-specifications**

The following code example shows how to use `describe-instance-credit-specifications`.  

---

**Actions and scenarios**  

2218
**AWS CLI**

**To describe the credit option for CPU usage of one or more instances**

The following `describe-instance-credit-specifications` example describes the CPU credit option for the specified instance.

```
aws ec2 describe-instance-credit-specifications
   --instance-ids i-1234567890abcdef0
```

Output:

```
{
   "InstanceCreditSpecifications": [
       {
           "InstanceId": "i-1234567890abcdef0",
           "CpuCredits": "unlimited"
       }
   ]
}
```

- For API details, see [DescribeInstanceCreditSpecifications](https://docs.aws.amazon.com/AWS CLI Command Reference/latest/the command reference/index.html#ec2:DescribeInstanceCreditSpecifications) in *AWS CLI Command Reference*.

**describe-instance-event-notification-attributes**

The following code example shows how to use `describe-instance-event-notification-attributes`.

**AWS CLI**

**To describe the tags for scheduled event notifications**

The following `describe-instance-event-notification-attributes` example describes the tags to appear in scheduled event notifications.

```
aws ec2 describe-instance-event-notification-attributes
```

Output:
describe-instance-event-windows

The following code example shows how to use describe-instance-event-windows.

AWS CLI

**Example 1: To describe all event windows**

The following describe-instance-event-windows example describes all event windows in the specified Region.

```bash
aws ec2 describe-instance-event-windows \
  --region us-east-1
```

Output:

```json
{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
        "InstanceIds": [
          "i-1234567890abcdef0",
          "i-0598c7d356eba48d7"
        ],
        "Tags": [],
        "DedicatedHostIds": []
      }
    }
  ]
}
```

For more information, see [Scheduled events for your instances](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/scheduled-events.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeInstanceEventNotificationAttributes](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-event-notification-attributes.html) in *AWS CLI Command Reference*.
Example 2: To describe a specific event window

The following `describe-instance-event-windows` example describes a specific event by using the `instance-event-window` parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \
    --region us-east-1 \
    --instance-event-window-ids iew-0abcdef1234567890
```

Output:

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0abcdef1234567890",
            "Name": "myEventWindowName",
            "CronExpression": "* 21-23 * * 2,3",
            "AssociationTarget": {
                "InstanceIds": [
                    "i-1234567890abcdef0",
                    "i-0598c7d356eba48d7"
                ],
                "Tags": [],
                "DedicatedHostIds": []
            },
            "State": "active",
            "Tags": []
        }
    ]
}
```

Example 3: To describe event windows that match one or more filters
The following `describe-instance-event-windows` example describes event windows that match one or more filters using the `filter` parameter. The `instance-id` filter is used to describe all of the event windows that are associated with the specified instance. When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the tags of the instance or Dedicated Host ID (if the instance is a Dedicated Host).

```
aws ec2 describe-instance-event-windows \
   --region us-east-1 \
   --filters Name=instance-id,Values=i-1234567890abcdef0 \
   --max-results 100 \ 
   --next-token <next-token-value>
```

Output:

```
{
   "InstanceEventWindows": [
   {
      "InstanceEventWindowId": "iew-0dbc0adb66f235982",
      "TimeRanges": [
      {
         "StartWeekDay": "sunday",
         "StartHour": 2,
         "EndWeekDay": "sunday",
         "EndHour": 8
      }
      ],
      "Name": "myEventWindowName",
      "AssociationTarget": {
         "InstanceIds": [],
         "Tags": [],
         "DedicatedHostIds": [
            "h-0140d9a7ecbd102dd"
         ]
      },
      "State": "active",
      "Tags": []
   }
   ]
}
```
In the example output, the instance is on a Dedicated Host, which is associated with the event window.

For event window constraints, see Considerations in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceEventWindows in AWS CLI Command Reference.

describe-instance-status

The following code example shows how to use describe-instance-status.

AWS CLI

To describe the status of an instance

The following describe-instance-status example describes the current status of the specified instance.

```
aws ec2 describe-instance-status \
--instance-ids i-1234567890abcdef0
```

Output:

```
{
   "InstanceStatuses": [
   {
      "InstanceId": "i-1234567890abcdef0",
      "InstanceState": {
         "Code": 16,
         "Name": "running"
      },
      "AvailabilityZone": "us-east-1d",
      "SystemStatus": {
         "Status": "ok",
         "Details": [
            {
               "Status": "passed",
               "Name": "reachability"
            }
         ]
      },
      "InstanceStatus": {
         "Status": "ok",
         "Reason": "instance running",
         "Code": 16,
         "Name": "running"
      }
   }
]}
```
For more information, see Monitor the status of your instances in the Amazon EC2 User Guide.

- For API details, see DescribleInstanceStatus in AWS CLI Command Reference.

**describe-instance-topology**

The following code example shows how to use describe-instance-topology.

**AWS CLI**

**To describe the instance topology of all your instances**

The following describe-instance-topology example describes the topology of all your instances that match the supported instance types for this command.

```
aws ec2 describe-instance-topology \
   --region us-west-2
```

Output:

```json
{
   "Instances": [
   {
      "InstanceId": "i-1111111111example",
      "InstanceType": "p4d.24xlarge",
      "GroupName": "my-ml-cpg",
      "NetworkNodes": [
      "nn-1111111111example",
      "nn-2222222222example",
      "nn-3333333333example"
      ],
   }]
}
```
For more information, including more examples, see Amazon EC2 instance topology in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceTopology in AWS CLI Command Reference.
**describe-instance-type-offerings**

The following code example shows how to use `describe-instance-type-offerings`.

**AWS CLI**

**Example 1: To list the instance types offered in a Region**

The following `describe-instance-type-offerings` example lists the instance types offered in the Region configured as the default Region for the AWS CLI.

```
aws ec2 describe-instance-type-offerings
```

To list the instance types offered in a different Region, specify the Region using the `--region` parameter.

```
aws ec2 describe-instance-type-offerings \
    --region us-east-2
```

**Output:**

```
{
    "InstanceTypeOfferings": [
        {
            "InstanceType": "m5.2xlarge",
            "LocationType": "region",
            "Location": "us-east-2"
        },
        {
            "InstanceType": "t3.micro",
            "LocationType": "region",
            "Location": "us-east-2"
        },
        ...
    ]
}
```

**Example 2: To list the instance types offered in an Availability Zone**

The following `describe-instance-type-offerings` example lists the instance types offered in the specified Availability Zone. The Availability Zone must be in the specified Region.
Example 3: To check whether an instance type is supported

The following `describe-instance-type-offerings` command indicates whether the `c5.xlarge` instance type is supported in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \\   --filters Name=instance-type,Values=c5.xlarge \\   --region us-east-2
```

The following `describe-instance-type-offerings` example lists all C5 instance types that are supported in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \\   --filters Name=instance-type,Values=c5* \\   --query "InstanceTypeOfferings[].InstanceType" \\   --region us-east-2
```

Output:

```json
[
  "c5d.12xlarge",
  "c5d.9xlarge",
  "c5n.xlarge",
  "c5.xlarge",
  "c5d.metal",
  "c5n.metal",
  "c5.large",
  "c5d.2xlarge",
  "c5n.4xlarge",
  "c5.2xlarge",
  "c5n.large",
  "c5n.9xlarge",
  "c5d.large",
  "c5.18xlarge",
  "c5d.18xlarge",
  "c5.12xlarge",
  "c5n.18xlarge",
]```
describe-instance-types

The following code example shows how to use describe-instance-types.

AWS CLI

Example 1: To describe an instance type

The following describe-instance-types example displays details for the specified instance type.

```bash
aws ec2 describe-instance-types \
--instance-types t2.micro
```

Output:

```json
{
    "InstanceTypes": [
        {
            "InstanceType": "t2.micro",
            "CurrentGeneration": true,
            "FreeTierEligible": true,
            "SupportedUsageClasses": [
                "on-demand",
                "spot"
            ],
            "SupportedRootDeviceTypes": [
                "ebs"
            ],
            "BareMetal": false,
        }
    ]
}
```

- For API details, see [DescribeInstanceTypeOfferings](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-type-offerings.html) in *AWS CLI Command Reference*.

For more information, see Instance Types in Amazon Elastic Compute Cloud User Guide for Linux Instances.

**Example 2: To filter the available instance types**

You can specify a filter to scope the results to instance types that have a specific characteristic. The following describe-instance-types example lists the instance types that support hibernation.

```bash
aws ec2 describe-instance-types \
   --filters Name=hibernation-supported,Values=true --query
'InstanceTypes[*].InstanceType'
```

Output:

```json
[

```

For more information, see Instance Types in Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeInstanceTypes in AWS CLI Command Reference.
**describe-instances**

The following code example shows how to use describe-instances.

**AWS CLI**

**Example 1: To describe an instance**

The following `describe-instances` example describes the specified instance.

```bash
aws ec2 describe-instances \
  --instance-ids i-1234567890abcdef0
```

Output:

```json
{
  "Reservations": [
    {
      "Groups": [],
      "Instances": [
        {
          "AmiLaunchIndex": 0,
          "ImageId": "ami-0abcdef1234567890",

Example 2: To filter for instances with the specified type

The following describe-instances example uses filters to scope the results to instances of the specified type.

```bash
aws ec2 describe-instances \
   --filters Name=instance-type,Values=m5.large
```

For example output, see Example 1.

For more information, see List and filter using the CLI in the Amazon EC2 User Guide.

Example 3: To filter for instances with the specified type and Availability Zone

The following describe-instances example uses multiple filters to scope the results to instances with the specified type that are also in the specified Availability Zone.

```bash
aws ec2 describe-instances \
   --filters Name=instance-type,Values=t2.micro,t3.micro Name=availability-zone,Values=us-east-2c
```

For example output, see Example 1.

Example 4: To filter for instances with the specified type and Availability Zone using a JSON file

The following describe-instances example uses a JSON input file to perform the same filtering as the previous example. When filters get more complicated, they can be easier to specify in a JSON file.

```bash
aws ec2 describe-instances \
    --filters file://filters.json
```

Contents of filters.json:

```
[
    {
        "Name": "instance-type",
        "Values": ["t2.micro", "t3.micro"]
    },
    {
        "Name": "availability-zone",
```
For example output, see Example 1.

**Example 5: To filter for instances with the specified Owner tag**

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag key (Owner), regardless of the tag value.

```
aws ec2 describe-instances \
  --filters "Name=tag-key,Values=Owner"
```

For example output, see Example 1.

**Example 6: To filter for instances with the specified my-team tag value**

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag value (my-team), regardless of the tag key.

```
aws ec2 describe-instances \
  --filters "Name=tag-value,Values=my-team"
```

For example output, see Example 1.

**Example 7: To filter for instances with the specified Owner tag and my-team value**

The following `describe-instances` example uses tag filters to scope the results to instances that have the specified tag (Owner=my-team).

```
aws ec2 describe-instances \
  --filters "Name=tag:Owner,Values=my-team"
```

For example output, see Example 1.

**Example 8: To display only instance and subnet IDs for all instances**

The following `describe-instances` examples use the `--query` parameter to display only the instance and subnet IDs for all instances, in JSON format.

**Linux and macOS:**
aws ec2 describe-instances \
   --query 'Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}' \
   --output json

Windows:

aws ec2 describe-instances ^
   --query "Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}" ^
   --output json

Output:

```
[
  {
    "Instance": "i-057750d42936e468a",
    "Subnet": "subnet-069beee9b12030077"
  },
  {
    "Instance": "i-001efd250faaa6ffa",
    "Subnet": "subnet-0b715c6b7db68927a"
  },
  {
    "Instance": "i-027552a73f021f3bd",
    "Subnet": "subnet-0250c25a1f4e15235"
  }
  ...
]
```

**Example 9: To filter instances of the specified type and only display their instance IDs**

The following describe-instances example uses filters to scope the results to instances of the specified type and the --query parameter to display only the instance IDs.

```bash
aws ec2 describe-instances \
   --filters "Name=instance-type,Values=t2.micro" \
   --query "Reservations[*].Instances[*].{InstanceId}" \
   --output text
```

Output:

```
i-031c0dc19de2fb70c
```
Example 10: To filter instances of the specified type and only display their instance IDs, Availability Zone, and the specified tag value

The following `describe-instances` examples display the instance ID, Availability Zone, and the value of the Name tag for instances that have a tag with the name `tag-key`, in table format.

**Linux and macOS:**

```
aws ec2 describe-instances \
   --filters Name=tag-key,Values=Name \n   --query 'Reservations[*].Instances[*].\n   {Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key==`Name`][\0].Value}' \n   --output table
```

**Windows:**

```
aws ec2 describe-instances ^
   --filters Name=tag-key,Values=Name ^
   --query "Reservations[*].Instances[*].\n   {Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key=='Name'][\0].Value}" ^
   --output table
```

**Output:**

```
<table>
<thead>
<tr>
<th>DescribeInstances</th>
</tr>
</thead>
<tbody>
<tr>
<td>+----------+-----------------------+--------------------+</td>
</tr>
<tr>
<td>AZ</td>
</tr>
<tr>
<td>+----------+-----------------------+--------------------+</td>
</tr>
<tr>
<td>us-east-2b</td>
</tr>
<tr>
<td>us-east-2a</td>
</tr>
<tr>
<td>us-east-2a</td>
</tr>
</tbody>
</table>
```
Example 11: To describe instances in a partition placement group

The following describe-instances example describes the specified instance. The output includes the placement information for the instance, which contains the placement group name and the partition number for the instance.

```bash
aws ec2 describe-instances \
   --instance-ids i-0123a456700123456 \
   --query "Reservations[*].Instances[*].Placement"
```

Output:

```json
[
  [
    {
      "AvailabilityZone": "us-east-1c",
      "GroupName": "HDFS-Group-A",
      "PartitionNumber": 3,
      "Tenancy": "default"
    }
  ]
]
```

For more information, see [Describing instances in a placement group](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-placement-groups-describe.html) in the *Amazon EC2 User Guide*.

Example 12: To filter to instances with the specified placement group and partition number

The following describe-instances example filters the results to only those instances with the specified placement group and partition number.

```bash
aws ec2 describe-instances \
   --filters "Name=placement-group-name,Values=HDFS-Group-A" "Name=placement-partition-number,Values=7"
```

The following shows only the relevant information from the output.

```json
"Instances": [
  {
    "InstanceId": "i-0123a456700123456",
  }
]```
"InstanceType": "r4.large",
"Placement": {
   "AvailabilityZone": "us-east-1c",
   "GroupName": "HDFS-Group-A",
   "PartitionNumber": 7,
   "Tenancy": "default"
}
},
{
   "InstanceId": "i-9876a543210987654",
   "InstanceType": "r4.large",
   "Placement": {
      "AvailabilityZone": "us-east-1c",
      "GroupName": "HDFS-Group-A",
      "PartitionNumber": 7,
      "Tenancy": "default"
   }
}
],

For more information, see [Describing instances in a placement group](#) in the *Amazon EC2 User Guide*.

**Example 13: To filter to instances that are configured to allow access to tags from instance metadata**

The following describe-instances example filters the results to only those instances that are configured to allow access to instance tags from instance metadata.

```
aws ec2 describe-instances \
   --filters "Name=metadata-options.instance-metadata-tags,Values=enabled" \
   --query "Reservations[*].Instances[*].InstanceId" \
   --output text
```

The following shows the expected output.

```
i-1234567890abcdefg
i-abcdefg1234567890
i-11111111aaaaaaa
i-aaaaaaaa111111111
```

For more information, see [Work with instance tags in instance metadata](#) in the *Amazon EC2 User Guide*. 
describe-internet-gateways

The following code example shows how to use describe-internet-gateways.

AWS CLI

To describe an internet gateway

The following describe-internet-gateways example describes the specified internet gateway.

```
aws ec2 describe-internet-gateways \
  --internet-gateway-ids igw-0d0fb496b3EXAMPLE
```

Output:

```
{
  "InternetGateways": [
    {
      "Attachments": [
        {
          "State": "available",
          "VpcId": "vpc-0a60eb65b4EXAMPLE"
        }
      ],
      "InternetGatewayId": "igw-0d0fb496b3EXAMPLE",
      "OwnerId": "123456789012",
      "Tags": [
        {
          "Key": "Name",
          "Value": "my-igw"
        }
      ]
    }
  ]
}
```

For more information, see Internet gateways in the Amazon VPC User Guide.

• For API details, see DescribeInternetGateways in AWS CLI Command Reference.
describe-ipam-pools

The following code example shows how to use describe-ipam-pools.

**AWS CLI**

To view the details for an IPAM pool

The following describe-ipam-pools example shows the details for pools.

(Linux):

```
aws ec2 describe-ipam-pools \
  --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-
  scope-02fc38cd4c48e7d38
```

(Windows):

```
aws ec2 describe-ipam-pools ^
  --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-
  scope-02fc38cd4c48e7d38
```

Output:

```
{
  "IpamPools": [
    {
      "OwnerId": "123456789012",
      "IpamPoolId": "ipam-pool-02ec043a19bbe5d08",
      "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
        pool-02ec043a19bbe5d08",
      "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
        scope-02fc38cd4c48e7d38",
      "IpamScopeType": "private",
      "IpamArn": "arn:aws:ec2::123456789012:ipam-ipam-08440e7a3acde3908",
      "IpamRegion": "us-east-1",
      "Locale": "None",
      "PoolDepth": 1,
      "State": "create-complete",
      "AutoImport": true,
      "AddressFamily": "ipv4",
      "AllocationMinNetmaskLength": 16,
      "AllocationMaxNetmaskLength": 26,
    }
  ]
}
```
"AllocationDefaultNetmaskLength": 24,
"AllocationResourceTags": [
  {
    "Key": "Environment",
    "Value": "Preprod"
  }
],
"Tags": [
  {
    "Key": "Name",
    "Value": "Preprod pool"
  }
]
]
]
]
]
]

For API details, see DescribeIpamPools in AWS CLI Command Reference.

describe-ipam-scopes

The following code example shows how to use describe-ipam-scopes.

AWS CLI

To view the details for an IPAM scope

The following describe-ipam-scopes example shows the details for scopes.

```
aws ec2 describe-ipam-scopes \
  --filters Name=owner-id,Values=123456789012 Name=ipam-id,Values=ipam-08440e7a3acde3908
```

Output:

```
{
  "IpamScopes": [
    {
      "OwnerId": "123456789012",
      "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
      "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
    }
  ]
}
```
describe-ipams

The following code example shows how to use describe-ipams.

AWS CLI

To view the details for an IPAM

The following describe-ipams example shows the details of an IPAM.

```bash
aws ec2 describe-ipams \
    --filters Name=owner-id,Values=123456789012
```

Output:

```
{
    "Ipams": [
        {
            "OwnerId": "123456789012",
            "IpamId": "ipam-08440e7a3acde3908",
            "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
            "IpamRegion": "us-east-1",
            "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
            "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "ScopeCount": 3,
            "OperatingRegions": [
                {
                    "RegionName": "us-east-1"
                },
                {
                    "RegionName": "us-east-2"
                },
                {
                    "RegionName": "us-west-1"
                }
            ],
            "State": "create-complete",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "ExampleIPAM"
                }
            ]
        }
    ]
}
```
describe-ipv6-pools

The following code example shows how to use describe-ipv6-pools.

**AWS CLI**

To describe your IPv6 address pools

The following describe-ipv6-pools example displays details for all of your IPv6 address pools.

```
aws ec2 describe-ipv6-pools
```

Output:

```
{
    "Ipv6Pools": [
        {
            "PoolId": "ipv6pool-ec2-012345abc12345abc",
            "PoolCidrBlocks": [
                {
                    "Cidr": "2001:db8:123::/48"
                }
            ],
            "Tags": [
                {
                    "Key": "pool-1",
                    "Value": "public"
                }
            ]
        }
    ]
}
```

For API details, see DescribeIpv6Pools in AWS CLI Command Reference.
describe-key-pairs

The following code example shows how to use describe-key-pairs.

AWS CLI

To display a key pair

The following describe-key-pairs example displays information about the specified key pair.

```bash
aws ec2 describe-key-pairs
--key-names my-key-pair
```

Output:

```json
{
  "KeyPairs": [
    {
      "KeyPairId": "key-0b94643da6EXAMPLE",
      "KeyName": "my-key-pair",
      "KeyType": "rsa",
      "Tags": [],
    }
  ]
}
```

For more information, see Describe public keys in the Amazon EC2 User Guide.

- For API details, see DescribeKeyPairs in AWS CLI Command Reference.

describe-launch-template-versions

The following code example shows how to use describe-launch-template-versions.

AWS CLI

To describe launch template versions

This example describes the versions of the specified launch template.
Command:

```
aws ec2 describe-launch-template-versions --launch-template-id lt-068f72b72934aff71
```

Output:

```
{
  "LaunchTemplateVersions": [
    {
      "LaunchTemplateId": "lt-068f72b72934aff71",
      "LaunchTemplateName": "Webservers",
      "VersionNumber": 3,
      "CreatedBy": "arn:aws:iam::123456789102:root",
      "LaunchTemplateData": {
        "KeyName": "kp-us-east",
        "ImageId": "ami-6057e21a",
        "InstanceType": "t2.small",
        "NetworkInterfaces": [
          {
            "SubnetId": "subnet-7b16de0c",

describe-launch-templates

The following code example shows how to use `describe-launch-templates`.
AWS CLI

To describe launch templates

This example describes your launch templates.

Command:

```bash
aws ec2 describe-launch-templates
```

Output:

```json
{
  "LaunchTemplates": [
    {
      "LatestVersionNumber": 2,
      "LaunchTemplateId": "lt-0e06d290751193123",
      "LaunchTemplateName": "TemplateForWebServer",

      "LaunchTemplateName": "testingtemplate2",
      "DefaultVersionNumber": 1,
    }
  ]
}```
describe-local-gateway-route-table-virtual-interface-group-associations

The following code example shows how to use describe-local-gateway-route-table-virtual-interface-group-associations.

AWS CLI

To describe associations between virtual interface groups and local gateway route tables

The following describe-local-gateway-route-table-virtual-interface-group-associations example describes the associations between virtual interface groups and local gateway route tables in your AWS account.

```
aws ec2 describe-local-gateway-route-table-virtual-interface-group-associations
```

Output:

```
{
   "LocalGatewayRouteTableVirtualInterfaceGroupAssociations": [
      {
         "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-07145b276bEXAMPLE",
         "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
         "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
         "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
         "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-gateway-route-table/lgw-rtb-059615ef7dEXAMPLE",
         "OwnerId": "123456789012",
         "State": "associated",
         "Tags": []
      }
   ]
}
```
For more information, see [Working with local gateways](https://docs.aws.amazon.com/awsoutposts/latest/userguide/working-local-gateways.html) in the *AWS Outposts User Guide*.

- For API details, see [DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-local-gateway-route-table-virtual-interface-groupassociations.html) in *AWS CLI Command Reference*.

### describe-local-gateway-route-table-vpc-associations

The following code example shows how to use describe-local-gateway-route-table-vpc-associations.

**AWS CLI**

To describe the associations between VPCs and local gateway route tables

The following `describe-local-gateway-route-table-vpc-associations` example displays information about the specified association between VPCs and local gateway route tables.

```
aws ec2 describe-local-gateway-route-table-vpc-associations \\
    --local-gateway-route-table-vpc-association-ids lgw-vpc-assoc-0e0f27af15EXAMPLE
```

**Output:**

```
{
    "LocalGatewayRouteTableVpcAssociation": {
        "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0e0f27af1EXAMPLE",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
        "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
        "VpcId": "vpc-0efe9bde08EXAMPLE",
        "State": "associated"
    }
}
```

For more information, see [Local gateway route tables](https://docs.aws.amazon.com/awsoutposts/latest/userguide/local-gateway-route-tables.html) in the *Outposts User Guide*.

- For API details, see [DescribeLocalGatewayRouteTableVpcAssociations](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-local-gateway-route-table-vpc-associations.html) in *AWS CLI Command Reference*.  

Actions and scenarios
describe-local-gateway-route-tables

The following code example shows how to use `describe-local-gateway-route-tables`.

**AWS CLI**

To describe your Local Gateway Route Tables

The following `describe-local-gateway-route-tables` example displays details about the local gateway route tables.

```
aws ec2 describe-local-gateway-route-tables
```

Output:

```
{
   "LocalGatewayRouteTables": [
      {
         "LocalGatewayRouteTableId": "lgw-rtb-059615ef7deEXAMPLE",
         "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
         "State": "available"
      }
   ]
}
```

- For API details, see [DescribeLocalGatewayRouteTables](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-local-gateway-route-tables.html) in *AWS CLI Command Reference*.

describe-local-gateway-virtual-interface-groups

The following code example shows how to use `describe-local-gateway-virtual-interface-groups`.

**AWS CLI**

To describe local gateway virtual interface groups

The following `describe-local-gateway-virtual-interface-groups` example describes the local gateway virtual interface groups in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interface-groups
```
For more information, see Working with local gateways in the AWS Outposts User Guide.

- For API details, see DescribeLocalGatewayVirtualInterfaceGroups in AWS CLI Command Reference.

describe-local-gateway-virtual-interfaces

The following code example shows how to use describe-local-gateway-virtual-interfaces.

AWS CLI

To describe local gateway virtual interfaces

The following describe-local-gateway-virtual-interfaces example describes the local gateway virtual interfaces in your AWS account.

aws ec2 describe-local-gateway-virtual-interfaces

Output:

```json
{
    "LocalGatewayVirtualInterfaces": [
        {
            "LocalGatewayVirtualInterfaceId": "lgw-vif-01a23bc4d5EXAMPLE",
            "Tags": []
        }
    ]
}
```
For more information, see [Working with local gateways](aws-outposts-user-guide) in the *AWS Outposts User Guide*.

- For API details, see [DescribeLocalGatewayVirtualInterfaces](aws-cli-command-reference) in *AWS CLI Command Reference*.

### describe-local-gateways

The following code example shows how to use `describe-local-gateways`.

#### AWS CLI

**To describe your Local Gateways**

The following `describe-local-gateways` example displays details for the local gateways that are available to you.

```bash
aws ec2 describe-local-gateways
```

**Output:**

```json
{
  ...
}
```
For API details, see DescribeLocalGateways in AWS CLI Command Reference.

describe-managed-prefix-lists

The following code example shows how to use describe-managed-prefix-lists.

AWS CLI

To describe managed prefix lists

The following describe-managed-prefix-lists example describes the prefix lists owned by AWS account 123456789012.

```
aws ec2 describe-managed-prefix-lists \
   --filters Name=owner-id,Values=123456789012
```

Output:

```
{
"PrefixLists": [
{
   "PrefixListId": "pl-11223344556677aab",
   "AddressFamily": "IPv6",
   "State": "create-complete",
   "PrefixListName": "vpc-ipv6-cidrs",
   "MaxEntries": 25,
   "Version": 1,
   "Tags": [],
   "OwnerId": "123456789012"
}
]
}```
For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see DescribeManagedPrefixLists in AWS CLI Command Reference.

describe-moving-addresses

The following code example shows how to use describe-moving-addresses.

AWS CLI

To describe your moving addresses

This example describes all of your moving Elastic IP addresses.

Command:

```bash
aws ec2 describe-moving-addresses
```

Output:

```json
{
    "MovingAddressStatuses": [
        {
            "PublicIp": "198.51.100.0",
            "MoveStatus": "MovingToVpc"
        }
    ]
}
```
This example describes all addresses that are moving to the EC2-VPC platform.

Command:

```bash
aws ec2 describe-moving-addresses --filters Name=moving-status,Values=MovingToVpc
```

- For API details, see [DescribeMovingAddresses](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-moving-addresses.html) in [AWS CLI Command Reference](https).

`describe-nat-gateways`

The following code example shows how to use `describe-nat-gateways`.

**AWS CLI**

**Example 1: To describe a public NAT gateway**

The following `describe-nat-gateways` example describes the specified public NAT gateway.

```bash
aws ec2 describe-nat-gateways \
   --nat-gateway-id nat-01234567890abcdef
```

**Output:**

```
{
   "NatGateways": [
      {
         "CreateTime": "2023-08-25T01:56:51.000Z",
         "NatGatewayAddresses": [
            {
               "AllocationId": "eipalloc-0790180cd2EXAMPLE",
               "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
               "PrivateIp": "10.0.0.211",
               "PublicIp": "54.85.121.213",
               "AssociationId": "eipassoc-04d295cc9b8815b24",
               "IsPrimary": true,
               "Status": "succeeded"
            },
            {
               "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
               "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
               "PrivateIp": "10.0.0.212",
               "PublicIp": "54.85.121.214",
               "AssociationId": "eipassoc-04d295cc9b8815b25",
               "IsPrimary": true,
               "Status": "succeeded"
            }
         ]
      }
   ]
}
```
Example 2: To describe a private NAT gateway

The following describe-nat-gateways example describes the specified private NAT gateway.

```
aws ec2 describe-nat-gateways \
  --nat-gateway-id nat-1234567890abcdef0
```

Output:

```
{
  "NatGateways": [
  {
    "CreateTime": "2023-08-25T00:50:05.000Z",
    "NatGatewayAddresses": [
    {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "PrivateIp": "10.0.20.240",
      "IsPrimary": true,
      "Status": "succeeded"
    },
    {
      "NetworkInterfaceId": "eni-0066a61b324d1897b",
      "PrivateIp": "10.0.20.241",
      "IsPrimary": false,
      "Status": "succeeded"
    }
    ],
    "NatGatewayId": "nat-01234567890abcdef",
    "State": "available",
    "SubnetId": "subnet-655eab5f08EXAMPLE",
    "VpcId": "vpc-098eb5ef58EXAMPLE",
    "Tags": [
    {
      "Key": "Name",
      "Value": "private-nat"
    }
    ],
    "ConnectivityType": "public"
  }
  ]
}
```
For more information, see [NAT gateways](https://docs.aws.amazon.com/vpc/latest/userguide/nat-gateway.html) in the [Amazon VPC User Guide](https://docs.aws.amazon.com/vpc/latest/userguide/).  

### describe-network-acls

The following code example shows how to use `describe-network-acls`.

**AWS CLI**

To describe your network ACLs

The following `describe-network-acls` example retrieves details about your network ACLs.

```
aws ec2 describe-network-acls
```
Output:

```json
{
    "NetworkAcls": [
        {
            "Associations": [
                {
                    "NetworkAclAssociationId": "aclassoc-0c1679dc41EXAMPLE",
                    "NetworkAclId": "acl-0ea1f54ca7EXAMPLE",
                    "SubnetId": "subnet-0931fc2fa5EXAMPLE"
                }
            ],
            "Entries": [
                {
                    "CidrBlock": "0.0.0.0/0",
                    "Egress": true,
                    "Protocol": "-1",
                    "RuleAction": "allow",
                    "RuleNumber": 100
                },
                {
                    "CidrBlock": "0.0.0.0/0",
                    "Egress": true,
                    "Protocol": "-1",
                    "RuleAction": "deny",
                    "RuleNumber": 32767
                },
                {
                    "CidrBlock": "0.0.0.0/0",
                    "Egress": false,
                    "Protocol": "-1",
                    "RuleAction": "allow",
                    "RuleNumber": 100
                },
                {
                    "CidrBlock": "0.0.0.0/0",
                    "Egress": false,
                    "Protocol": "-1",
                    "RuleAction": "deny",
                    "RuleNumber": 32767
                }
            ],
            "IsDefault": true,
            "NetworkAclId": "acl-0ea1f54ca7EXAMPLE"
        }
    ]
}
```
"Tags": [],
"VpcId": "vpc-06e4ab6c6cEXAMPLE",
"OwnerId": "111122223333"
},
{
  "Associations": [],
  "Entries": [
    {
      "CidrBlock": "0.0.0.0/0",
      "Egress": true,

    },
    {
      "CidrBlock": "0.0.0.0/0",
      "Egress": false,
      "Protocol": "-1",
      "RuleAction": "allow",
      "RuleNumber": 100
    },
    {
      "Egress": false,
For more information, see [Network ACLs](https://docs.aws.amazon.com/vpc/latest/userguide/vpc-network-acls.html) in the *AWS VPC User Guide*.

- For API details, see [DescribeNetworkAcls](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-network-acls.html) in *AWS CLI Command Reference*.

**describe-network-insights-access-scope-analyses**

The following code example shows how to use `describe-network-insights-access-scope-analyses`.

**AWS CLI**

To describe Network Insights access scope analyses
The following `describe-network-insights-access-scope-analyses` example describes the access scope analysis in your AWS account.

```bash
aws ec2 describe-network-insights-access-scope-analyses \
   --region us-east-1
```

Output:

```
{
   "NetworkInsightsAccessScopeAnalyses": [ 
       {
           "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111",
           "NetworkInsightsAccessScopeId": "nis-123456789222",
           "Status": "succeeded",
           "StartDate": "2022-01-25T19:45:36.842000+00:00",
           "FindingsFound": "true",
           "Tags": []
       }
   ]
}
```

---

**describe-network-insights-access-scopes**

The following code example shows how to use `describe-network-insights-access-scopes`.

**AWS CLI**

**To describe Network Insights access scopes**

The following `describe-network-insights-access-scopes` example describes the access-scope analyses in your AWS account.

```bash
aws ec2 describe-network-insights-access-scopes \
```
--region us-east-1

Output:

```json
{
    "NetworkInsightsAccessScopes": [
        {
            "NetworkInsightsAccessScopeId": "nis-123456789111",
            "CreateDate": "2021-11-29T21:12:41.416000+00:00",
            "UpdateDate": "2021-11-29T21:12:41.416000+00:00",
            "Tags": []
        }
    ]
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/AmazonVpc/latest/UserGuide/network-access-analyzer-getting-started.html) in the *Network Access Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsAccessScopes](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-network-insights-access-scopes.html) in *AWS CLI Command Reference*.

### describe-network-insights-analyses

The following code example shows how to use `describe-network-insights-analyses`.

**AWS CLI**

**To view the results of a path analysis**

The following `describe-network-insights-analyses` example describes the specified analysis. In this example, the source is an internet gateway, the destination is an EC2 instance, and the protocol is TCP. The analysis succeeded (Status is succeeded) and the path is not reachable (NetworkPathFound is false). The explanation code `ENI_SG_RULES_MISMATCH` indicates that the security group for the instance does not contain a rule that allows traffic on the destination port.

```bash
aws ec2 describe-network-insights-analyses \
    --network-insights-analysis-ids nia-02207aa13eb480c7a
```

Output:
{
    "NetworkInsightsAnalyses": [
    {
        "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
        "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",

**describe-network-insights-paths**

The following code example shows how to use `describe-network-insights-paths`.

**AWS CLI**

**To describe a path**

The following `describe-network-insights-paths` example describes the specified path.

```
aws ec2 describe-network-insights-paths \
    --network-insights-path-ids nip-0b26f224f1d131fa8
```

**Output:**

```
{
    "NetworkInsightsPaths": [
        {
            "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
            "CreatedDate": "2021-01-20T22:43:46.933Z",
            "Source": "igw-0797cccde22d73b0e5",
            "Destination": "i-0495d385ad28331c7",
            "Protocol": "tcp"
        }
    ]
}
```

For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/userguide/cli-configure-download.html) in the *Reachability Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsPaths](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-network-insights-paths.html) in *AWS CLI Command Reference*.

**describe-network-interface-attribute**

The following code example shows how to use `describe-network-interface-attribute`.

```
AWS CLI

To describe the attachment attribute of a network interface

This example command describes the attachment attribute of the specified network interface.

Command:
```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute attachment
```

Output:
```
{
    "NetworkInterfaceId": "eni-686ea200",
    "Attachment": {
        "Status": "attached",
        "DeviceIndex": 0,
        "AttachTime": "2015-05-21T20:02:20.000Z",
        "InstanceId": "i-1234567890abcdef0",
        "DeleteOnTermination": true,
        "AttachmentId": "eni-attach-43348162",
        "InstanceOwnerId": "123456789012"
    }
}
```

To describe the description attribute of a network interface

This example command describes the description attribute of the specified network interface.

Command:
```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute description
```

Output:
```
{
    "NetworkInterfaceId": "eni-686ea200",
    "Description": {
        "Value": "My description"
    }
}
To describe the groupSet attribute of a network interface

This example command describes the groupSet attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute groupSet
```

Output:

```
{
    "NetworkInterfaceId": "eni-686ea200",
    "Groups": [
        {
            "GroupName": "my-security-group",
            "GroupId": "sg-903004f8"
        }
    ]
}
```

To describe the sourceDestCheck attribute of a network interface

This example command describes the sourceDestCheck attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute sourceDestCheck
```

Output:

```
{
    "NetworkInterfaceId": "eni-686ea200",
    "SourceDestCheck": {
        "Value": true
    }
}
```
describe-network-interface-permissions

The following code example shows how to use describe-network-interface-permissions.

AWS CLI

To describe your network interface permissions

This example describes all of your network interface permissions.

Command:

```
aws ec2 describe-network-interface-permissions
```

Output:

```
{
    "NetworkInterfacePermissions": [
        {
            "PermissionState": {
                "State": "GRANTED"
            },
            "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
            "NetworkInterfaceId": "eni-b909511a",
            "Permission": "INSTANCE-ATTACH",
            "AwsAccountId": "123456789012"
        }
    ]
}
```

For API details, see DescribeNetworkInterfacePermissions in AWS CLI Command Reference.

describe-network-interfaces

The following code example shows how to use describe-network-interfaces.

AWS CLI

To describe your network interfaces
This example describes all your network interfaces.

Command:

```bash
aws ec2 describe-network-interfaces
```

Output:

```json
{
  "NetworkInterfaces": [
    {
      "Status": "in-use",
      "MacAddress": "02:2f:8f:b0:cf:75",
      "SourceDestCheck": true,
      "VpcId": "vpc-a01106c2",
      "Description": "my network interface",

"PrivateIpAddress": "10.0.1.17"
},
{
  "Status": "in-use",
  "MacAddress": "02:58:f5:ef:4b:06",
  "SourceDestCheck": true,
  "VpcId": "vpc-a01106c2",
  "Description": "Primary network interface",
  "Association": {
    "PublicIp": "198.51.100.0",
    "IpOwnerId": "amazon"
  },
  "NetworkInterfaceId": "eni-f9ba99bf",
  "PrivateIpAddresses": [  {
      "Association": {
        "PublicIp": "198.51.100.0",
        "IpOwnerId": "amazon"
      },
      "Primary": true,
      "PrivateIpAddress": "10.0.1.149"
    }
  ],
  "RequesterManaged": false,
  "Ipv6Addresses": [],
  "AvailabilityZone": "us-east-1d",
  "Attachment": {
    "Status": "attached",
    "DeviceIndex": 0,
This example describes network interfaces that have a tag with the key `Purpose` and the value `Prod`.

**Command:**

```
aws ec2 describe-network-interfaces --filters Name=tag:Purpose,Values=Prod
```

**Output:**

```json
{
    "NetworkInterfaces": [
        {
            "Status": "available",
            "MacAddress": "12:2c:bd:f9:bf:17",
            "SourceDestCheck": true,
            "VpcId": "vpc-8941ebec",
            "Description": "ProdENI",
            "NetworkInterfaceId": "eni-b9a5ac93",
            "PrivateIpAddresses": [
                {
                    "PrivateDnsName": "ip-10-0-1-55.ec2.internal",
                    "Primary": true,
                    "PrivateIpAddress": "10.0.1.55"
                }
            ]
        }
    ]
}
```
For API details, see DescribeNetworkInterfaces in AWS CLI Command Reference.

describe-placement-groups

The following code example shows how to use describe-placement-groups.

AWS CLI

To describe your placement groups

This example command describes all of your placement groups.

Command:
aws ec2 describe-placement-groups

Output:

```
{
   "PlacementGroups": [
   {
      "GroupName": "my-cluster",
      "State": "available",
      "Strategy": "cluster"
   },
   ...
   ]
}
```

- For API details, see [DescribePlacementGroups](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-placement-groups.html) in AWS CLI Command Reference.

**describe-prefix-lists**

The following code example shows how to use describe-prefix-lists.

**AWS CLI**

**To describe prefix lists**

This example lists all available prefix lists for the region.

Command:

```
aws ec2 describe-prefix-lists
```

Output:

```
{
   "PrefixLists": [
   {
      "PrefixListName": "com.amazonaws.us-east-1.s3",
      "Cidrs": [
         "54.231.0.0/17"
      ],
      "PrefixListId": "pl-63a5400a"
   }
```

Actions and scenarios 2275
describe-principal-id-format

The following code example shows how to use describe-principal-id-format.

AWS CLI

To describe the ID format for IAM users and roles with long ID format enabled

The following describe-principal-id-format example describes the ID format for the root user, all IAM roles, and all IAM users with long ID format enabled.

```
aws ec2 describe-principal-id-format \
   --resource instance
```

Output:

```json
{
   "Principals": [
      {
         "Arn": "arn:aws:iam::123456789012:root",
         "Statuses": [
            {
               "Deadline": "2016-12-15T00:00:00Z",
               "Resource": "reservation",
               "UseLongIds": true
            },
            {
               "Deadline": "2016-12-15T00:00:00Z",
               "Resource": "instance",
               "UseLongIds": true
            },
            {
               "Deadline": "2016-12-15T00:00:00Z",
               "Resource": "volume",
               "UseLongIds": true
            }
         ]
      }
   ]
}```
describe-public-ipv4-pools

The following code example shows how to use describe-public-ipv4-pools.

AWS CLI

To describe your public IPv4 address pools

The following describe-public-ipv4-pools example displays details about the address pools that were created when you provisioned public IPv4 address ranges using Bring Your Own IP Addresses (BYOIP).

```
aws ec2 describe-public-ipv4-pools
```

Output:

```
{
   "PublicIpv4Pools": [
      {
         "PoolId": "ipv4pool-ec2-1234567890abcdef0",
         "PoolAddressRanges": [
            {
               "FirstAddress": "203.0.113.0",
               "LastAddress": "203.0.113.255",
               "AddressCount": 256,
               "AvailableAddressCount": 256
            }
         ],
         "TotalAddressCount": 256,
         "TotalAvailableAddressCount": 256
      }
   ]
}
```

• For API details, see DescribePrincipalIdFormat in AWS CLI Command Reference.
describe-regions

The following code example shows how to use `describe-regions`.

**AWS CLI**

**Example 1: To describe all of your enabled Regions**

The following `describe-regions` example describes all of the Regions that are enabled for your account.

```bash
aws ec2 describe-regions
```

**Output:**

```json
{
  "Regions": [
    {
      "Endpoint": "ec2.eu-north-1.amazonaws.com",
      "RegionName": "eu-north-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.ap-south-1.amazonaws.com",
      "RegionName": "ap-south-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-3.amazonaws.com",
      "RegionName": "eu-west-3",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-2.amazonaws.com",
      "RegionName": "eu-west-2",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-1.amazonaws.com",
      "RegionName": "eu-west-1",
      "OptInStatus": "opt-in-not-required"
    }
  ]
}
```
"Endpoint": "ec2.ap-northeast-3.amazonaws.com",
"RegionName": "ap-northeast-3",
"OptInStatus": "opt-in-not-required"
},
{
"Endpoint": "ec2.ap-northeast-2.amazonaws.com",
"RegionName": "ap-northeast-2",
"OptInStatus": "opt-in-not-required"
},
{
"Endpoint": "ec2.ap-northeast-1.amazonaws.com",
"RegionName": "ap-northeast-1",
"OptInStatus": "opt-in-not-required"
},
{
"Endpoint": "ec2.sa-east-1.amazonaws.com",
"RegionName": "sa-east-1",
"OptInStatus": "opt-in-not-required"
},
{
"Endpoint": "ec2.ca-central-1.amazonaws.com",
"RegionName": "ca-central-1",
"OptInStatus": "opt-in-not-required"
},
{
"Endpoint": "ec2.ap-southeast-1.amazonaws.com",
"RegionName": "ap-southeast-1",
"OptInStatus": "opt-in-not-required"
},
{
"Endpoint": "ec2.ap-southeast-2.amazonaws.com",
"RegionName": "ap-southeast-2",
"OptInStatus": "opt-in-not-required"
},
{
"Endpoint": "ec2.eu-central-1.amazonaws.com",
"RegionName": "eu-central-1",
"OptInStatus": "opt-in-not-required"
},
{
"Endpoint": "ec2.us-east-1.amazonaws.com",
"RegionName": "us-east-1",
"OptInStatus": "opt-in-not-required"
},
Example 2: To describe enabled Regions with an endpoint whose name contains a specific string

The following describe-regions example describes all Regions that you have enabled that have the string "us" in the endpoint.

```
aws ec2 describe-regions \
   --filters "Name=endpoint,Values=*us*"
```

Output:

```
{
    "Regions": [
        {
            "Endpoint": "ec2.us-east-1.amazonaws.com",
            "RegionName": "us-east-1"
        },
        {
            "Endpoint": "ec2.us-east-2.amazonaws.com",
            "RegionName": "us-east-2"
        },
        {
            "Endpoint": "ec2.us-west-1.amazonaws.com",
            "RegionName": "us-west-1"
        }
    ]
}
```
For more information, see Regions and Zones in the Amazon EC2 User Guide.

Example 3: To describe all Regions

The following describe-regions example describes all available Regions, including Regions that are disabled.

```bash
aws ec2 describe-regions \
   --all-regions
```

Output:

```json
{
    "Regions": [
        {
            "Endpoint": "ec2.eu-north-1.amazonaws.com",
            "RegionName": "eu-north-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.ap-south-1.amazonaws.com",
            "RegionName": "ap-south-1",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-3.amazonaws.com",
            "RegionName": "eu-west-3",
            "OptInStatus": "opt-in-not-required"
        },
        {
            "Endpoint": "ec2.eu-west-2.amazonaws.com",
            "RegionName": "eu-west-2",
            "OptInStatus": "opt-in-not-required"
        }
    ]
}
```
For more information, see Regions and Zones in the Amazon EC2 User Guide.

Example 4: To list the Region names only

The following describe-regions example uses the --query parameter to filter the output and return only the names of the Regions as text.

```bash
aws ec2 describe-regions \
   --all-regions \
```
Output:

eu-north-1
ap-south-1
eu-west-3
eu-west-2
eu-west-1
ap-northeast-3
ap-northeast-2
me-south-1
ap-northeast-1
sa-east-1
can-central-1
ap-east-1
ap-southeast-1
ap-southeast-2
eu-central-1
us-east-1
us-east-2
us-west-1
us-west-2

For more information, see Regions and Zones in the Amazon EC2 User Guide.

- For API details, see DescribeRegions in AWS CLI Command Reference.

describe-replace-root-volume-tasks

The following code example shows how to use describe-replace-root-volume-tasks.

AWS CLI

**Example 1: To view information about a specific root volume replacement task**

The following describe-replace-root-volume-tasks example describes root volume replacement task replacevol-0111122223333abcd.

```bash
aws ec2 describe-replace-root-volume-tasks \
  --replace-root-volume-task-ids replacevol-0111122223333abcd
```
Output:

```json
{
    "ReplaceRootVolumeTasks": [
        {
            "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
            "Tags": [],
            "InstanceId": "i-0123456789abcdefa",
            "TaskState": "succeeded",
            "StartTime": "2022-03-14T15:16:28Z",
            "CompleteTime": "2022-03-14T15:16:52Z"
        }
    ]
}
```

For more information, see [Replace a root volume](#) in the *Amazon Elastic Compute Cloud User Guide*.

**Example 2: To view information about all root volume replacement tasks for a specific instance**

The following `describe-replace-root-volume-tasks` example describes all of the root volume replacement tasks for instance `i-0123456789abcdefa`.

```bash
aws ec2 describe-replace-root-volume-tasks \
    --filters Name=instance-id,Values=i-0123456789abcdefa
```

Output:

```json
{
    "ReplaceRootVolumeTasks": [
        {
            "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
            "Tags": [],
            "InstanceId": "i-0123456789abcdefa",
            "TaskState": "succeeded",
            "StartTime": "2022-03-14T15:06:38Z",
            "CompleteTime": "2022-03-14T15:07:03Z"
        },
        {
            "ReplaceRootVolumeTaskId": "replacevol-0444455555555abcd",
            "Tags": [],
```

---

**Actions and scenarios**

2285
For more information, see **Replace a root volume** in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see **DescribeReplaceRootVolumeTasks** in *AWS CLI Command Reference*.

**describe-reserved-instances-listings**

The following code example shows how to use `describe-reserved-instances-listings`.

**AWS CLI**

To describe a Reserved Instance listing

The following `describe-reserved-instances-listings` example retrieves information about the specified Reserved Instance listing.

```
aws ec2 describe-reserved-instances-listings \
  --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

This command produces no output.

- For API details, see **DescribeReservedInstancesListings** in *AWS CLI Command Reference*.

**describe-reserved-instances-modifications**

The following code example shows how to use `describe-reserved-instances-modifications`.

**AWS CLI**

To describe Reserved Instances modifications

This example command describes all the Reserved Instances modification requests that have been submitted for your account.
Command:

aws ec2 describe-reserved-instances-modifications

Output:

```json
{
   "ReservedInstancesModifications": [
      {
         "Status": "fulfilled",
         "ModificationResults": [
            {
               "ReservedInstancesId": "93bba2-62f1-4d9d-b225-16bada29e6c7",
               "TargetConfiguration": {
                  "AvailabilityZone": "us-east-1b",
                  "InstanceType": "m1.large",
                  "InstanceCount": 3
               }
            },
            {
               "ReservedInstancesId": "1ba8e2e3-aabb-46c3-bcf5-3fe2f922e6",
               "TargetConfiguration": {
                  "AvailabilityZone": "us-east-1d",
                  "InstanceType": "m1.xlarge",
                  "InstanceCount": 1
               }
            }
         ]
      },
      {
         "EffectiveDate": "2015-08-12T17:00:00.000Z",

         "UpdateDate": "2015-08-12T18:08:06.698Z",
         "ClientToken": "c9adb218-3222-4889-8216-0cf0e52dc37e",
         "ReservedInstancesModificationId": "rimod-d3ed4335-81d3-44e6-ab31-0f13aa46687",
         "ReservedInstancesIds": [
            {
               "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342f5bd7c02"
            }]
      }
   ]
}
```
For API details, see `DescribeReservedInstancesModifications` in *AWS CLI Command Reference*.

**describe-reserved-instances-offerings**

The following code example shows how to use `describe-reserved-instances-offerings`.

**AWS CLI**

To describe Reserved Instances offerings

This example command describes all Reserved Instances available for purchase in the region.

Command:

```sh
aws ec2 describe-reserved-instances-offerings
```

Output:

```json
{
  "ReservedInstancesOfferings": [ 
    {
      "OfferingType": "Partial Upfront",
      "AvailabilityZone": "us-east-1b",
      "InstanceTenancy": "default",
      "PricingDetails": [],
      "ProductDescription": "Red Hat Enterprise Linux",
      "UsagePrice": 0.0,
      "RecurringCharges": [ 
        {
          "Amount": 0.088,
          "Frequency": "Hourly"
        }
      ],
      "Marketplace": false,
      "CurrencyCode": "USD",
      "FixedPrice": 631.0,
      "Duration": 94608000,
      "ReservedInstancesOfferingId": "9a06095a-bdc6-47fe-a94a-2a382f016040",
      "InstanceType": "c1.medium"
    },
    {
      "OfferingType": "PartialUpfront",
```
To describe your Reserved Instances offerings using options

This example lists Reserved Instances offered by AWS with the following specifications: t1.micro instance types, Windows (Amazon VPC) product, and Heavy Utilization offerings.

Command:

```
aws ec2 describe-reserved-instances-offerings --no-include-marketplace --instance-type "t1.micro" --product-description "Windows (Amazon VPC)" --offering-type "no upfront"
```

Output:

```json
{
   "ReservedInstancesOfferings": [
      {
         "OfferingType": "No Upfront",
         "AvailabilityZone": "us-east-1b",
         "InstanceTenancy": "default",
         "PricingDetails": [],
         "ProductDescription": "Windows",
         "UsagePrice": 0.0,
         "RecurringCharges": [
            {
               "Amount": 0.028,
               "Frequency": "Hourly"
            }
         ],
         "Marketplace": false,
         "CurrencyCode": "USD",
         "FixedPrice": 631.0,
         "Duration": 94608000,
         "ReservedInstancesOfferingId": "bfbefc6c-0d10-418d-b144-7258578d329d",
         "InstanceType": "c1.medium"
      }
   ]
}
```
For API details, see DescribeReservedInstancesOfferings in AWS CLI Command Reference.

describe-reserved-instances

The following code example shows how to use describe-reserved-instances.
AWS CLI

To describe your Reserved Instances

This example command describes the Reserved Instances that you own.

Command:

```
aws ec2 describe-reserved-instances
```

Output:

```
{
   "ReservedInstances": [
   {
      "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342fexample",
      "OfferingType": "No Upfront",
      "AvailabilityZone": "us-west-1c",
      "End": "2016-08-14T21:34:34.000Z",
      "ProductDescription": "Linux/UNIX",
      "UsagePrice": 0.00,
      "RecurringCharges": [
         {
            "Amount": 0.104,
            "Frequency": "Hourly"
         }
      ],
      "Start": "2015-08-15T21:34:35.086Z",
      "State": "active",
      "FixedPrice": 0.0,
      "CurrencyCode": "USD",
      "Duration": 31536000,
      "InstanceTenancy": "default",
      "InstanceType": "m3.medium",
      "InstanceCount": 2
   },
   ...
   ]
}
```

To describe your Reserved Instances using filters
This example filters the response to include only three-year, t2.micro Linux/UNIX Reserved Instances in us-west-1c.

Command:

```bash
aws ec2 describe-reserved-instances --filters Name=duration,Values=94608000 Name=instance-type,Values=t2.micro Name=product-description,Values=Linux/UNIX Name=availability-zone,Values=us-east-1e
```

Output:

```json
{
   "ReservedInstances": [
      {
         "ReservedInstancesId": "f127bd27-edb7-44c9-a0eb-0d7e09259af0",
         "OfferingType": "All Upfront",
         "AvailabilityZone": "us-east-1e",
         "End": "2018-03-26T21:34:34.000Z",
         "ProductDescription": "Linux/UNIX",
         "UsagePrice": 0.00,
         "RecurringCharges": [],
         "Start": "2015-03-27T21:34:35.848Z",
         "State": "active",
         "FixedPrice": 151.0,
         "CurrencyCode": "USD",
         "Duration": 94608000,
         "InstanceTenancy": "default",
         "InstanceType": "t2.micro",
         "InstanceCount": 1
      }
   ]
}
```

For more information, see Using Amazon EC2 Instances in the *AWS Command Line Interface User Guide*.

- For API details, see `DescribeReservedInstances` in *AWS CLI Command Reference*.

**describe-route-tables**

The following code example shows how to use describe-route-tables.
To describe your route tables

The following `describe-route-tables` example retrieves the details about your route tables:

```
aws ec2 describe-route-tables
```

Output:

```
{
   "RouteTables": [
   {
      "Associations": [
      {
         "Main": true,
         "RouteTableAssociationId": "rtbassoc-0df3f54e06EXAMPLE",
         "RouteTableId": "rtb-09ba434c1bEXAMPLE"
      }
      ],
      "PropagatingVgws": [],
      "RouteTableId": "rtb-09ba434c1bEXAMPLE",
      "Routes": [
      {
         "DestinationCidrBlock": "10.0.0.0/16",

         "Origin": "CreateRouteTable",
         "State": "active"
      },
      {
         "DestinationCidrBlock": "0.0.0.0/0",
         "NatGatewayId": "nat-06c018cbd8EXAMPLE",
         "Origin": "CreateRoute",
         "State": "blackhole"
      }
      ],
      "Tags": [],
      "VpcId": "vpc-0065acced4EXAMPLE",
      "OwnerId": "111122223333"
   },
   {
      "Associations": [
      
      
      ]
   }
   
}
```
"Main": true,
"RouteTableAssociationId": "rtbassoc-9EXAMPLE",
"RouteTableId": "rtb-a1eec7de"
]
],
"PropagatingVgws": [],
"RouteTableId": "rtb-a1eec7de",
"Routes": [
{
"DestinationCidrBlock": "172.31.0.0/16",
"GatewayId": "local",
"Origin": "CreateRouteTable",
"State": "active"
},
{
"DestinationCidrBlock": "0.0.0.0/0",
"GatewayId": "igw-fEXAMPLE",
"Origin": "CreateRoute",
"State": "active"
}
],
"Tags": [],
"VpcId": "vpc-3EXAMPLE",
"OwnerId": "111122223333"
],
{
"Associations": [
{
"Main": false,
"RouteTableAssociationId": "rtbassoc-0b100c28b2EXAMPLE",
"RouteTableId": "rtb-07a98f76e5EXAMPLE",
"SubnetId": "subnet-0d3d002af8EXAMPLE"
}
],
"PropagatingVgws": [],
"RouteTableId": "rtb-07a98f76e5EXAMPLE",
"Routes": [
{
"DestinationCidrBlock": "10.0.0.0/16",
"GatewayId": "local",
"Origin": "CreateRouteTable",
"State": "active"
},

For more information, see [Working with Route Tables](https://docs.aws.amazon.com/vpc/latest/userguide/working-with-route-tables.html) in the *AWS VPC User Guide*.

- For API details, see [DescribeRouteTables](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-route-tables.html) in *AWS CLI Command Reference*.

### describe-scheduled-instance-availability

The following code example shows how to use `describe-scheduled-instance-availability`.

**AWS CLI**

**To describe an available schedule**

This example describes a schedule that occurs every week on Sunday, starting on the specified date.

**Command:**

```bash
aws ec2 describe-scheduled-instance-availability --recurrence Frequency=Weekly,Interval=1,OccurrenceDays=[1] --first-slot-start-time-range EarliestTime=2016-01-31T00:00:00Z,LatestTime=2016-01-31T04:00:00Z
```

**Output:**

```json
{
   "ScheduledInstanceAvailabilitySet": [
      {
         "AvailabilityZone": "us-west-2b",
         "TotalScheduledInstanceHours": 1219,
         "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...
      }
   ]
}
```
To narrow the results, you can add filters that specify the operating system, network, and instance type.

Command:

--filters Name=platform,Values=Linux/UNIX Name=network-platform,Values=EC2-VPC Name=instance-type,Values=c4.large

- For API details, see `DescribeScheduledInstanceAvailability` in AWS CLI Command Reference.

describe-scheduled-instances

The following code example shows how to use describe-scheduled-instances.

AWS CLI

To describe your Scheduled Instances

This example describes the specified Scheduled Instance.

Command:
aws ec2 describe-scheduled-instances --scheduled-instance-ids
sci-1234-1234-1234-1234-123456789012

Output:

{
  "ScheduledInstanceSet": [
    {
      "AvailabilityZone": "us-west-2b",
      "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
      "HourlyPrice": "0.095",
      "CreateDate": "2016-01-25T21:43:38.612Z",
      "Recurrence": {
        "OccurrenceDaySet": [
          1
        ],
        "Interval": 1,
        "Frequency": "Weekly",
        "OccurrenceRelativeToEnd": false,
        "OccurrenceUnit": ""
      },
      "Platform": "Linux/UNIX",
      "TermEndDate": "2017-01-31T09:00:00Z",
      "InstanceCount": 1,
      "SlotDurationInHours": 32,
      "TermStartDate": "2016-01-31T09:00:00Z",
      "NetworkPlatform": "EC2-VPC",
      "TotalScheduledInstanceHours": 1696,
      "NextSlotStartTime": "2016-01-31T09:00:00Z",
      "InstanceType": "c4.large"
    }
  ]
}

This example describes all your Scheduled Instances.

Command:

aws ec2 describe-scheduled-instances

• For API details, see DescribeScheduledInstances in AWS CLI Command Reference.
**describe-security-group-references**

The following code example shows how to use `describe-security-group-references`.

**AWS CLI**

**To describe security group references**

This example describes the security group references for sg-bbb2222. The response indicates that security group sg-bbb2222 is being referenced by a security group in VPC vpc-aaaaaaaa.

Command:

```
aws ec2 describe-security-group-references --group-id sg-bbb2222
```

Output:

```
{
   "SecurityGroupsReferenceSet": [
      {
         "ReferencingVpcId": "vpc-aaaaaaaa",
         "GroupId": "sg-bbb2222",
         "VpcPeeringConnectionId": "pcx-b04deed9"
      }
   ]
}
```

- For API details, see [DescribeSecurityGroupReferences](#) in [AWS CLI Command Reference](#).

**describe-security-group-rules**

The following code example shows how to use `describe-security-group-rules`.

**AWS CLI**

**Example 1: To describe the security group rules for a security group**

The following `describe-security-group-rules` example describes the security group rules of a specified security group. Use the `filters` option to scope the results to a specific security group.
aws ec2 describe-security-group-rules \
   --filters Name="group-id",Values="sg-1234567890abcdef0"

Output:

{
   "SecurityGroupRules": [
   {
      "SecurityGroupRuleId": "sgr-abcdef01234567890",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "111122223333",
      "IsEgress": false,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "ReferencedGroupInfo": {
         "GroupId": "sg-1234567890abcdef0",
         "UserId": "111122223333"
      },
      "Tags": []
   },
   {
      "SecurityGroupRuleId": "sgr-bcdef01234567890a",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "111122223333",
      "IsEgress": true,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv6": "::/0",
      "Tags": []
   },
   {
      "SecurityGroupRuleId": "sgr-cdef01234567890ab",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "111122223333",
      "IsEgress": true,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv4": "0.0.0.0/0",
      "Tags": []
   }
}
Example 2: To describe a security group rule

The following describe-security-group-rules example describes the specified security group rule.

```aws
aws ec2 describe-security-group-rules \
   --security-group-rule-ids sgr-cdef01234567890ab
```

Output:

```json
{
   "SecurityGroupRules": [
      {
         "SecurityGroupRuleId": "sgr-cdef01234567890ab",
         "GroupId": "sg-1234567890abcdef0",
         "GroupOwnerId": "111122223333",
         "IsEgress": true,
         "IpProtocol": "-1",
         "FromPort": -1,
         "ToPort": -1,
         "CidrIpv4": "0.0.0.0/0",
         "Tags": []
      }
   ]
}
```

For more information, see [Security group rules](https://docs.aws.amazon.com/vpc/latest/userguide/security-group-rules.html) in the Amazon VPC User Guide.

describe-security-groups

The following code example shows how to use describe-security-groups.

AWS CLI

Example 1: To describe a security group

The following describe-security-groups example describes the specified security group.
aws ec2 describe-security-groups \
--group-ids sg-903004f8

Output:

{
   "SecurityGroups": [
      {
         "IpPermissionsEgress": [
            {
               "IpProtocol": "-1",
               "IpRanges": [
                  {
                     "CidrIp": "0.0.0.0/0"
                  }
               ],
               "UserIdGroupPairs": [],
               "PrefixListIds": []
            }
         ],
         "Description": "My security group",
         "Tags": [
            {
               "Value": "SG1",
               "Key": "Name"
            }
         ],
         "IpPermissions": [
            {
               "IpProtocol": "-1",
               "IpRanges": [],
               "UserIdGroupPairs": [
                  {
                     "UserId": "123456789012",
                     "GroupId": "sg-903004f8"
                  }
               ],
               "PrefixListIds": []
            },
            {
               "PrefixListIds": [],
               "FromPort": 22,
               "IpRanges": [
               
            }
         ]
      }
   ]
}
Example 2: To describe security groups that have specific rules

The following `describe-security-groups` example uses filters to scope the results to security groups that have a rule that allows SSH traffic (port 22) and a rule that allows traffic from all addresses (0.0.0.0/0). The example uses the `--query` parameter to display only the names of the security groups. Security groups must match all filters to be returned in the results; however, a single rule does not have to match all filters. For example, the output returns a security group with a rule that allows SSH traffic from a specific IP address and another rule that allows HTTP traffic from all addresses.

```
aws ec2 describe-security-groups \
  --filters Name=ip-permission.from-port,Values=22 Name=ip-permission.to-port,Values=22 Name=ip-permission.cidr,Values='0.0.0.0/0' \
  --query "SecurityGroups[*].[GroupName]" \
  --output text
```

Output:

```
default
my-security-group
web-servers
launch-wizard-1
```
Example 3: To describe security groups based on tags

The following `describe-security-groups` example uses filters to scope the results to security groups that include test in the security group name, and that have the tag Test=To-delete. The example uses the `--query` parameter to display only the names and IDs of the security groups.

```bash
aws ec2 describe-security-groups \
   --filters Name=group-name,Values=*test* Name=tag:Test,Values=To-delete \n   --query "SecurityGroups[*].{Name:GroupName,ID:GroupId}"
```

Output:

```
[
   {
      "Name": "testfornewinstance",
      "ID": "sg-33bb22aa"
   },
   {
      "Name": "newgrouptest",
      "ID": "sg-1a2b3c4d"
   }
]
```

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeSecurityGroups in AWS CLI Command Reference.

describe-snapshot-attribute

The following code example shows how to use `describe-snapshot-attribute`.

**AWS CLI**

To describe the snapshot attributes for a snapshot

The following `describe-snapshot-attribute` example lists the accounts with which a snapshot is shared.

```bash
aws ec2 describe-snapshot-attribute \
   --snapshot-id snap-01234567890abcedf \
```
Output:

```json
{
    "SnapshotId": "snap-01234567890abcedf",
    "CreateVolumePermissions": [
        {
            "UserId": "123456789012"
        }
    ]
}
```

For more information, see [Share an Amazon EBS snapshot](https://docs.aws.amazon.com/AmazonEBS/latest/UserGuide/share-amazon-ebs-snapshot.html) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [DescribeSnapshotAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-snapshot-attribute.html) in *AWS CLI Command Reference*.

---

describe-snapshot-tier-status

The following code example shows how to use `describe-snapshot-tier-status`.

**AWS CLI**

**To view archival information about an archived snapshot**

The following `describe-snapshot-tier-status` example provides archival information about an archived snapshot.

```bash
aws ec2 describe-snapshot-tier-status \
   --filters "Name=snapshot-id, Values=snap-01234567890abcedf"
```

Output:

```json
{
    "SnapshotTierStatuses": [
        {
            "Status": "completed",
            "ArchivalCompleteTime": "2021-09-15T17:33:16.147Z",
            "LastTieringProgress": 100,
            "Tags": [],
            "VolumeId": "vol-01234567890abcedf",
        }
    ]
}
```
"LastTieringOperationState": "archival-completed",
"StorageTier": "archive",
"OwnerId": "123456789012",
"SnapshotId": "snap-01234567890abcdef",
"LastTieringStartTime": "2021-09-15T16:44:37.574Z"
] } ]
}

For more information, see View archived snapshots in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshotTierStatus in AWS CLI Command Reference.

describe-snapshots

The following code example shows how to use describe-snapshots.

AWS CLI

Example 1: To describe a snapshot

The following describe-snapshots example describes the specified snapshot.

```bash
aws ec2 describe-snapshots \
  --snapshot-ids snap-1234567890abcdef0
```

Output:

```json
{
  "Snapshots": [
    {
      "Description": "This is my snapshot",
      "Encrypted": false,
      "VolumeId": "vol-049df61146c4d7901",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2019-02-28T21:28:32.000Z",
      "Progress": "100%",
      "OwnerId": "012345678910",
      "SnapshotId": "snap-01234567890abcdef",
      "Tags": [""
```
For more information, see Amazon EBS snapshots in the Amazon EC2 User Guide.

Example 2: To describe snapshots based on filters

The following describe-snapshots example uses filters to scope the results to snapshots owned by your AWS account that are in the pending state. The example uses the --query parameter to display only the snapshot IDs and the time the snapshot was started.

```bash
aws ec2 describe-snapshots \
  --owner-ids self \
  --filters Name=status,Values=pending \
  --query "Snapshots[*].{ID:SnapshotId,Time:StartTime}"
```

Output:

```
[
  {
    "ID": "snap-1234567890abcdef0",
    "Time": "2019-08-04T12:48:18.000Z"
  },
  {
    "ID": "snap-066877671789bd71b",
    "Time": "2019-08-04T02:45:16.000Z"
  },
  ...
]
```

The following describe-snapshots example uses filters to scope the results to snapshots created from the specified volume. The example uses the --query parameter to display only the snapshot IDs.

```bash
aws ec2 describe-snapshots \
  --filters Name=volume-id,Values=049df61146c4d7901 \
  --query "Snapshots[*].[SnapshotId]"
```
Output:

```
snap-1234567890abcdef0
snap-08637175a712c3fb9
...
```

For additional examples using filters, see [Listing and filtering your resources](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/listing-and-filtering-resources.html) in the *Amazon EC2 User Guide*.

**Example 3: To describe snapshots based on tags**

The following `describe-snapshots` example uses tag filters to scope the results to snapshots that have the tag Stack=Prod.

```
aws ec2 describe-snapshots \
  --filters Name=tag:Stack,Values=prod
```

For an example of the output for `describe-snapshots`, see Example 1.

**Example 4: To describe snapshots based on age**

The following `describe-snapshots` example uses JMESPath expressions to describe all snapshots created by your AWS account before the specified date. It displays only the snapshot IDs.

```
aws ec2 describe-snapshots \
  --owner-ids 012345678910 \
  --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]"
```

For additional examples using filters, see [Listing and filtering your resources](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/listing-and-filtering-resources.html) in the *Amazon EC2 User Guide*.

**Example 5: To view only archived snapshots**

The following `describe-snapshots` example lists only snapshots that are stored in the archive tier.

```
aws ec2 describe-snapshots \
```

**Actions and scenarios**
--filters "Name=storage-tier,Values=archive"

Output:

```
{
    "Snapshots": [
    {
        "Description": "Snap A",
        "Encrypted": false,
        "VolumeId": "vol-01234567890aaaaa",
        "State": "completed",
        "VolumeSize": 8,
        "StartTime": "2021-09-07T21:00:00.000Z",
        "Progress": "100%",
        "OwnerId": "123456789012",
        "SnapshotId": "snap-01234567890aaaaa",
        "StorageTier": "archive",
        "Tags": []
    },
    ]
}
```

For more information, see [View archived snapshots](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/view-snapshots.html) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [DescribeSnapshots](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-snapshots.html) in *AWS CLI Command Reference*.

### describe-spot-datafeed-subscription

The following code example shows how to use `describe-spot-datafeed-subscription`.

#### AWS CLI

**To describe Spot Instance datafeed subscription for an account**

This example command describes the data feed for the account.

**Command:**

```
aws ec2 describe-spot-datafeed-subscription
```

**Output:**
• For API details, see DescribeSpotDatafeedSubscription in AWS CLI Command Reference.

describe-spot-fleet-instances

The following code example shows how to use describe-spot-fleet-instances.

AWS CLI

To describe the Spot Instances associated with a Spot fleet

This example command lists the Spot instances associated with the specified Spot fleet.

Command:

```bash
aws ec2 describe-spot-fleet-instances --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```json
{
    "ActiveInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "InstanceType": "m3.medium",
            "SpotInstanceRequestId": "sir-08b93456"
        },
        ...
    ],
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

• For API details, see DescribeSpotFleetInstances in AWS CLI Command Reference.
describe-spot-fleet-request-history

The following code example shows how to use describe-spot-fleet-request-history.

AWS CLI

To describe Spot fleet history

This example command returns the history for the specified Spot fleet starting at the specified time.

Command:

```
aws ec2 describe-spot-fleet-request-history --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE --start-time 2015-05-26T00:00:00Z
```

The following example output shows the successful launches of two Spot Instances for the Spot fleet.

Output:

```
{
   "HistoryRecords": [
      {
         "EventInformation": {
            "EventSubType": "submitted"
         },
         "EventType": "fleetRequestChange"
      },
      {
         "EventInformation": {
            "EventSubType": "active"
         },
         "EventType": "fleetRequestChange"
      },
      {
         "EventInformation": {
            "InstanceId": "i-1234567890abcdef0",
            "EventSubType": "launched"
         },
         "EventType": "fleetRequestChange"
      }
   ]
}
```
For API details, see DescribeSpotFleetRequestHistory in AWS CLI Command Reference.

describe-spot-fleet-requests

The following code example shows how to use describe-spot-fleet-requests.

AWS CLI

To describe your Spot fleet requests

This example describes all of your Spot fleet requests.

Command:

```
aws ec2 describe-spot-fleet-requests
```

Output:

```
{
    "SpotFleetRequestConfigs": [
    {
        "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
        "SpotFleetRequestConfig": {
            "TargetCapacity": 20,
            "LaunchSpecifications": [ ...
```
{
  "EbsOptimized": false,
  "NetworkInterfaces": [
    {
      "SubnetId": "subnet-a61dafcf",
      "DeviceIndex": 0,
      "DeleteOnTermination": false,
      "AssociatePublicIpAddress": true,
      "SecondaryPrivateIpAddressCount": 0
    }
  ],
  "InstanceType": "cc2.8xlarge",
  "ImageId": "ami-1a2b3c4d"
},
{
  "EbsOptimized": false,
  "NetworkInterfaces": [
    {
      "SubnetId": "subnet-a61dafcf",
      "DeviceIndex": 0,
      "DeleteOnTermination": false,
      "AssociatePublicIpAddress": true,
      "SecondaryPrivateIpAddressCount": 0
    }

"IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role"
},
"SpotFleetRequestState": "active"
]
}]

• For API details, see DescribeSpotFleetRequests in AWS CLI Command Reference.

describe-spot-instance-requests

The following code example shows how to use describe-spot-instance-requests.

AWS CLI

Example 1: To describe a Spot Instance request

The following describe-spot-instance-requests example describes the specified Spot Instance request.
aws ec2 describe-spot-instance-requests
  --spot-instance-request-ids slr-08b93456

Output:

{
  "SpotInstanceRequests": [
    {
      "CreateTime": "2018-04-30T18:14:55.000Z",
      "InstanceId": "i-1234567890abcdef1",
      "LaunchSpecification": {
        "InstanceType": "t2.micro",
        "ImageId": "ami-003634241a8fcdec0",
        "KeyName": "my-key-pair",
        "SecurityGroups": [
          {
            "GroupName": "default",
            "GroupId": "sg-e38f24a7"
          }
        ],
        "BlockDeviceMappings": [
          {
            "DeviceName": "/dev/sda1",
            "Ebs": {
              "DeleteOnTermination": true,
              "SnapshotId": "snap-0e54a519c999adbbd",
              "VolumeSize": 8,
              "VolumeType": "standard",
              "Encrypted": false
            }
          }
        ],
        "NetworkInterfaces": [
          {
            "DeleteOnTermination": true,
            "DeviceIndex": 0,
            "SubnetId": "subnet-049df61146c4d7901"
          }
        ],
        "Placement": {
          "AvailabilityZone": "us-east-2b",
          "Tenancy": "default"
        }
      }
    }
  ]
}
Example 2: To describe Spot Instance requests based on filters

The following describe-spot-instance-requests example uses filters to scope the results to Spot Instance requests with the specified instance type in the specified Availability Zone. The example uses the --query parameter to display only the instance IDs.

```bash
aws ec2 describe-spot-instance-requests \\
    --filters Name=launch.instance-type,Values=m3.medium Name=launched-availability-zone,Values=us-east-2a \\
    --query "SpotInstanceRequests[*].[InstanceId]" \\
    --output text
```

Output:

```
i-057750d42936e468a
i-001efd250f0a66fa
i-027552a73f021f3bd
...```

For additional examples using filters, see Listing and filtering your resources in the Amazon Elastic Compute Cloud User Guide.
Example 3: To describe Spot Instance requests based on tags

The following `describe-spot-instance-requests` example uses tag filters to scope the results to Spot Instance requests that have the tag `cost-center=cc123`.

```
aws ec2 describe-spot-instance-requests \
   --filters Name=tag:cost-center,Values=cc123
```

For an example of the output for `describe-spot-instance-requests`, see Example 1.

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeSpotInstanceRequests in AWS CLI Command Reference.

describe-spot-price-history

The following code example shows how to use `describe-spot-price-history`.

AWS CLI

To describe Spot price history

This example command returns the Spot Price history for m1.xlarge instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --start-time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```

Output:

```
{
   "SpotPriceHistory": [
      {
         "Timestamp": "2014-01-06T07:10:55.000Z",
         "ProductDescription": "SUSE Linux",
         "InstanceType": "m1.xlarge",
         "SpotPrice": "0.087000",
         "AvailabilityZone": "us-west-1b"
      },
      {
      }
```
To describe Spot price history for Linux/UNIX Amazon VPC

This example command returns the Spot Price history for m1.xlarge, Linux/UNIX Amazon VPC instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --product-description "Linux/UNIX (Amazon VPC)" --start-time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```

Output:

```
{
  "SpotPriceHistory": [
    {
      "Timestamp": "2014-01-06T07:10:55.000Z",
      "ProductDescription": "SUSE Linux",
      "InstanceType": "m1.xlarge",
      "SpotPrice": "0.087000",
      "AvailabilityZone": "us-west-1c"
    },
    {
      "Timestamp": "2014-01-06T05:42:36.000Z",
      "ProductDescription": "SUSE Linux (Amazon VPC)",
      "InstanceType": "m1.xlarge",
      "SpotPrice": "0.087000",
      "AvailabilityZone": "us-west-1a"
    },
    ...
  ]
}```
For API details, see DescribeSpotPriceHistory in AWS CLI Command Reference.

describe-stale-security-groups

The following code example shows how to use describe-stale-security-groups.

AWS CLI

To describe stale security groups

This example describes stale security group rules for vpc-11223344. The response shows that sg-5fa68d3a in your account has a stale ingress SSH rule that references sg-279ab042 in the peer VPC, and that sg-fe6fba9a in your account has a stale egress SSH rule that references sg-ef6fba8b in the peer VPC.

Command:

```
aws ec2 describe-stale-security-groups --vpc-id vpc-11223344
```

Output:

```
{
  "StaleSecurityGroupSet": [
    {
      "VpcId": "vpc-11223344",
      "StaleIpPermissionsEgress": [
        {
          "ToPort": 22,
          "FromPort": 22,
          "UserIdGroupPairs": [
            {
              "VpcId": "vpc-7a20e51f",
              "GroupId": "sg-ef6fba8b",
              "VpcPeeringConnectionId": "pcx-b04deed9",
              "PeeringStatus": "active"
            }
          ]
        }
      ]
    }
  ]
}
```
For API details, see `DescribeStaleSecurityGroups` in *AWS CLI Command Reference*.

**describe-store-image-tasks**

The following code example shows how to use `describe-store-image-tasks`.

**AWS CLI**

To describe the progress of an AMI store task
The following `describe-store-image-tasks` example describes the progress of an AMI store task.

```
aws ec2 describe-store-image-tasks
```

Output:

```
{
   "AmiId": "ami-1234567890abcdef0",
   "Bucket": "my-ami-bucket",
   "ProgressPercentage": 17,
   "S3ObjectKey": "ami-1234567890abcdef0.bin",
   "StoreTaskState": "InProgress",
   "StoreTaskFailureReason": null,
   "TaskStartTime": "2022-01-01T01:01:01.001Z"
}
```

For more information about storing and restoring an AMI using S3, see [Store and restore an AMI using S3](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-store-restore.html) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeStoreImageTasks](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-store-restore.html) in *AWS CLI Command Reference*.

**describe-subnets**

The following code example shows how to use `describe-subnets`.

**AWS CLI**

**Example 1: To describe all your subnets**

The following `describe-subnets` example displays the details of your subnets.

```
aws ec2 describe-subnets
```

Output:

```
{
   "Subnets": [
      {
         "AvailabilityZone": "us-east-1d",
         "AvailabilityZoneId": "use1-az2",
      }
   ]
}
```
"AvailableIpAddressCount": 4089,
"CidrBlock": "172.31.80.0/20",
"DefaultForAz": true,
"MapPublicIpOnLaunch": false,
"MapCustomerOwnedIpOnLaunch": true,
"State": "available",
"SubnetId": "subnet-0bb1c79de3EXAMPLE",
"VpcId": "vpc-0ee975135dEXAMPLE",
"OwnerId": "111122223333",
"AssignIpv6AddressOnCreation": false,
"Ipv6CidrBlockAssociationSet": [],

}

For more information, see [Working with VPCs and Subnets](https://docs.aws.amazon.com/vpc/latest/userguide/) in the AWS VPC User Guide.

**Example 2: To describe the subnets of a specific VPC**

The following `describe-subnets` example uses a filter to retrieve details for the subnets of the specified VPC.

```bash
aws ec2 describe-subnets \
  --filters "Name=vpc-id,Values=vpc-3EXAMPLE"
```

**Output:**

```
{
  "Subnets": [
    {
      "AvailabilityZone": "us-east-1d",
      "AvailabilityZoneId": "use1-az2",
      "AvailableIpAddressCount": 4089,
      "CidrBlock": "172.31.80.0/20",
      "DefaultForAz": true,
      "MapPublicIpOnLaunch": true,
      "MapCustomerOwnedIpOnLaunch": false,
      "State": "available",
      "SubnetId": "subnet-8EXAMPLE",
      "VpcId": "vpc-3EXAMPLE",
      "OwnerId": "1111222233333",
      "AssignIpv6AddressOnCreation": false,
      "Ipv6CidrBlockAssociationSet": [],
      "Tags": [
        {
          "Key": "Name",
          "Value": "MySubnet"
```
For more information, see [Working with VPCs and Subnets](https://docs.aws.amazon.com/vpc/latest/userguide/) in the *AWS VPC User Guide*.

### Example 3: To describe the subnets with a specific tag

The following `describe-subnets` example uses a filter to retrieve the details of those subnets with the tag `CostCenter=123` and the `--query` parameter to display the subnet IDs of the subnets with this tag.

```
aws ec2 describe-subnets \
  --filters "Name=tag:CostCenter,Values=123" \
  --query "Subnets[0].SubnetId" \ 
  --output text
```

**Output:**

```
subnet-0987a87c8b37348ef
subnet-02a95061c45f372ee
subnet-03f720e7de2788d73
```

For more information, see [Working with VPCs and Subnets](https://docs.aws.amazon.com/vpc/latest/userguide/) in the *Amazon VPC User Guide*.

- For API details, see [DescribeSubnets](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-subnets.html) in *AWS CLI Command Reference*.

### describe-tags

The following code example shows how to use `describe-tags`.

```
Example 1: To describe all tags for a single resource

The following `describe-tags` example describes the tags for the specified instance.

```
aws ec2 describe-tags \
--filters "Name=resource-id,Values=i-1234567890abcdef8"
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Test",
            "Key": "Stack"
        },
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Beta Server",
            "Key": "Name"
        }
    ]
}
```

Example 2: To describe all tags for a resource type

The following `describe-tags` example describes the tags for your volumes.

```
aws ec2 describe-tags \
--filters "Name=resource-type,Values=volume"
```

Output:

```
{
    "Tags": [
        {
            "ResourceType": "volume",
            "ResourceId": "vol-1234567890abcdef0",
            "Value": "Project1",
```

Actions and scenarios 2325
Example 3: To describe all your tags

The following `describe-tags` example describes the tags for all your resources.

```
aws ec2 describe-tags
```

Example 4: To describe the tags for your resources based on a tag key

The following `describe-tags` example describes the tags for your resources that have a tag with the key `Stack`.

```
aws ec2 describe-tags
  --filters Name=key,Values=Stack
```

Output:

```
{
  "Tags": [
    {
      "ResourceType": "volume",
      "ResourceId": "vol-027552a73f021f3b",
      "Value": "Production",
      "Key": "Stack"
    },
    {
      "ResourceType": "instance",
      "ResourceId": "i-1234567890abcdef8",
      "Value": "Test",
      "Key": "Stack"
    }
  ]
}
```
Example 5: To describe the tags for your resources based on a tag key and tag value

The following describe-tags example describes the tags for your resources that have the tag Stack=Test.

```
aws ec2 describe-tags \
   --filters Name=key,Values=Stack Name=value,Values=Test
```

Output:

```
{
   "Tags": [
   {
     "ResourceType": "image",
     "ResourceId": "ami-3ac336533f021f3bd",
     "Value": "Test",
     "Key": "Stack"
   },
   {
     "ResourceType": "instance",
     "ResourceId": "i-1234567890abcdef8",
     "Value": "Test",
     "Key": "Stack"
   }
   ]
}
```

The following describe-tags example uses alternate syntax to describe resources with the tag Stack=Test.

```
aws ec2 describe-tags \
   --filters "Name=tag:Stack,Values=Test"
```

The following describe-tags example describes the tags for all your instances that have a tag with the key Purpose and no value.

```
aws ec2 describe-tags \
   --filters "Name=resource-type,Values=instance" "Name=key,Values=Purpose"
   "Name=value,Values="
Output:

```json
{
    "Tags": [
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef5",
            "Value": null,
            "Key": "Purpose"
        }
    ]
}
```

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

### describe-traffic-mirror-filters

The following code example shows how to use `describe-traffic-mirror-filters`.

**AWS CLI**

**To view your traffic mirror filters**

The following `describe-traffic-mirror-filters` example displays details for all of your traffic mirror filters.

```
aws ec2 describe-traffic-mirror-filters
```

Output:

```json
{
    "TrafficMirrorFilters": [
        {
            "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
            "IngressFilterRules": [
                {
                    "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
                    "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
                    "TrafficDirection": "ingress",
                    "RuleNumber": 100,
                    "RuleAction": "accept",
                    "Protocol": 6,
                }
            ],
```

---

**Actions and scenarios**

2328
For more information, see View your traffic mirror filters in the Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorFilters in AWS CLI Command Reference.

### describe-traffic-mirror-sessions

The following code example shows how to use describe-traffic-mirror-sessions.

#### AWS CLI

**To describe a Traffic Mirror Session**

The following describe-traffic-mirror-sessions example displays details of the your Traffic Mirror sessions.

```bash
aws ec2 describe-traffic-mirror-sessions
```

**Output:**

```json
{
   "TrafficMirrorSessions": [
      {
         "Tags": [],
         "VirtualNetworkId": 42,
         "OwnerId": "111122223333",
         "Description": "TCP Session",
         "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
         "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
         "TrafficMirrorFilterId": "tmf-083e18f985EXAMPLE",
         "PacketLength": 20,
      }
   ]
}
```
For more information, see View Traffic Mirror Session Details in the AWS Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorSessions in AWS CLI Command Reference.

describe-traffic-mirror-targets

The following code example shows how to use describe-traffic-mirror-targets.

AWS CLI

To describe a traffic mirror target

The following describe-traffic-mirror-targets example displays information about the specified traffic mirror target.

```
aws ec2 describe-traffic-mirror-targets \ 
    --traffic-mirror-target-ids tmt-0dabe9b0a6EXAMPLE
```

Output:

```json
{
```

Actions and scenarios
"TrafficMirrorTargets": [
    {
      "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
      "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:111122223333:loadbalancer/net/NLB/7cdec873fEXAMPLE",
      "Type": "network-load-balancer",
      "Description": "Example Network Load Balancer target",
      "OwnerId": "111122223333",
      "Tags": []
    }
  ]
}

For more information, see Traffic mirror targets in the Amazon VPC Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorTargets in AWS CLI Command Reference.

describe-transit-gateway-attachments

The following code example shows how to use describe-transit-gateway-attachments.

AWS CLI

To view your transit gateway attachments

The following describe-transit-gateway-attachments example displays details for your transit gateway attachments.

aws ec2 describe-transit-gateway-attachments

Output:

{
  "TransitGatewayAttachments": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",

"Tags": []
}
For more information, see [Work with transit gateways](#) in the *Transit Gateways Guide*.
- For API details, see [DescribeTransitGatewayAttachments](#) in *AWS CLI Command Reference*.

**describe-transit-gateway-connect-peers**

The following code example shows how to use `describe-transit-gateway-connect-peers`.

**AWS CLI**

**To describe a Transit Gateway Connect peer**

The following `describe-transit-gateway-connect-peers` example describes the specified Connect peer.

```
aws ec2 describe-transit-gateway-connect-peers \
    --transit-gateway-connect-peer-ids tgw-connect-peer-0666adbac4EXAMPLE
```

**Output:**

```
{
    "TransitGatewayConnectPeers": [
    {
        "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
        "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
        "State": "available",
        "CreationTime": "2021-10-13T03:35:17.000Z",
        "ConnectPeerConfiguration": {
```
For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayConnectPeers in AWS CLI Command Reference.

**describe-transit-gateway-connects**

The following code example shows how to use describe-transit-gateway-connects.

**AWS CLI**

**To describe a transit gateway Connect attachment**

The following describe-transit-gateway-connects example describes the specified Connect attachment.
aws ec2 describe-transit-gateway-connects \
   --transit-gateway-attachment-ids tgw-attach-037012e5dcEXAMPLE

Output:

```
{
   "TransitGatewayConnects": [
   {
      "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
      "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
      "State": "available",
      "CreationTime": "2021-03-09T19:59:17+00:00",
      "Options": {
         "Protocol": "gre"
      },
      "Tags": []
   }
   ]
}
```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers](#) in the Transit Gateways Guide.

- For API details, see [DescribeTransitGatewayConnects](#) in AWS CLI Command Reference.

### describe-transit-gateway-multicast-domains

The following code example shows how to use `describe-transit-gateway-multicast-domains`.

**AWS CLI**

**To describe your transit gateway multicast domains**

The following `describe-transit-gateway-multicast-domains` example displays details for all of your transit gateway multicast domains.

```bash
aws ec2 describe-transit-gateway-multicast-domains
```

Output:
For more information, see [Managing multicast domains](https://docs.aws.amazon.com/AmazonVPC/latest/userguide/transit-gateways-managing-domain.html) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayMulticastDomains](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-transit-gateway-multicast-domains.html) in *AWS CLI Command Reference*.

**describe-transit-gateway-peering-attachments**

The following code example shows how to use `describe-transit-gateway-peering-attachments`.

**AWS CLI**

**To describe your transit gateway peering attachments**

The following `describe-transit-gateway-peering-attachments` example displays details for all of your transit gateway peering attachments.
aws ec2 describe-transit-gateway-peering-attachments

Output:

```
{
   "TransitGatewayPeeringAttachments": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
         "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
         },
         "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
         },
         "State": "pendingAcceptance",
         "CreationTime": "2019-12-09T11:38:05.000Z",
         "Tags": []
      }
   ]
}
```

- For API details, see [DescribeTransitGatewayPeeringAttachments](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-transit-gateway-peering-attachments.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/).

**describe-transit-gateway-policy-tables**

The following code example shows how to use `describe-transit-gateway-policy-tables`.

**AWS CLI**

**To describe a transit gateway policy table**

The following `describe-transit-gateway-policy-tables` example describes the specified transit gateway policy table.

```
aws ec2 describe-transit-gateway-policy-tables \
```
Output:

```json
{
    "TransitGatewayPolicyTables": [
        {
            "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
            "TransitGatewayId": "tgw-067f8505c18f0bd6e",
            "State": "available",
            "CreationTime": "2023-11-28T16:36:43+00:00",
            "Tags": []
        }
    ]
}
```

For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see DescribeTransitGatewayPolicyTables in AWS CLI Command Reference.

**describe-transit-gateway-route-tables**

The following code example shows how to use describe-transit-gateway-route-tables.

**AWS CLI**

To describe your transit gateway route tables

The following describe-transit-gateway-route-tables example displays details for your transit gateway route tables.

```bash
aws ec2 describe-transit-gateway-route-tables
```

Output:

```json
{
    "TransitGatewayRouteTables": [
        {
            "TransitGatewayRouteTableId": "tgw-rtb-0ca78a549EXAMPLE",
            "TransitGatewayId": "tgw-0bc994abffEXAMPLE",
            "State": "available",
            "DefaultAssociationRouteTable": true,
            "Tags": []
        }
    ]
}
```
"DefaultPropagationRouteTable": true,
"CreationTime": "2018-11-28T14:24:49.000Z",
"Tags": []
},
{
  "TransitGatewayRouteTableId": "tgw-rtb-0e8f48f148EXAMPLE",
  "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
  "State": "available",
  "DefaultAssociationRouteTable": true,
  "DefaultPropagationRouteTable": true,
  "CreationTime": "2018-11-28T14:24:00.000Z",
  "Tags": []
}
}
}

For more information, see View transit gateway route tables in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayRouteTables in AWS CLI Command Reference.

describe-transit-gateway-vpc-attachments

The following code example shows how to use describe-transit-gateway-vpc-attachments.

AWS CLI

To describe your transit gateway VPC attachments

The following describe-transit-gateway-vpc-attachments example displays details for your transit gateway VPC attachments.

aws ec2 describe-transit-gateway-vpc-attachments

Output:

{
  "TransitGatewayVpcAttachments": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-0a08e88308EXAMPLE",
      "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
      "VpcId": "vpc-0f501f7ee8EXAMPLE",
      "VpcOwnerId": "111122223333",
      "State": "available",
      "CreationTime": "2018-11-28T14:24:00.000Z",
      "Tags": []
    }
  ]
}
For more information, see View your VPC attachments in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayVpcAttachments in AWS CLI Command Reference.

describe-transit-gateways

The following code example shows how to use describe-transit-gateways.

AWS CLI

To describe your transit gateways

The following describe-transit-gateways example retrieves details about your transit gateways.

```
aws ec2 describe-transit-gateways
```

Output:

```json
{
   "TransitGateways": [
      {
         "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
         "State": "available",

describe-verified-access-endpoints

The following code example shows how to use describe-verified-access-endpoints.

AWS CLI

To describe a Verified Access endpoint

The following delete-verified-access-endpoints example describes the specified Verified Access endpoint.

```bash
aws ec2 describe-verified-access-endpoints \
   --verified-access-endpoint-ids vae-066fac616d4d546f2
```

Output:

```json
{
   "VerifiedAccessEndpoints": [
      {
         "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
         "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
         "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
         "ApplicationDomain": "example.com",
         "EndpointType": "network-interface",
         "AttachmentType": "vpc",
         "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",

            "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
            "Protocol": "https",
            "Port": 443
         }
      }
   ]
}
```
For more information, see [Verified Access endpoints](#) in the AWS Verified Access User Guide.

- For API details, see [DescribeVerifiedAccessEndpoints](#) in AWS CLI Command Reference.

### describe-verified-access-groups

The following code example shows how to use `describe-verified-access-groups`.

**AWS CLI**

**To describe a Verified Access group**

The following `describe-verified-access-groups` example describes the specified Verified Access group.

```
aws ec2 describe-verified-access-groups \\
    --verified-access-group-ids vagr-0dbe967baf14b7235
```

**Output:**

```
{
    "VerifiedAccessGroups": [{
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
    }
    ]
}
```
For more information, see [Verified Access groups](https://docs.aws.amazon.com/awsverifiedaccess/latest/userguide/) in the AWS Verified Access User Guide.

### describe-verified-access-instance-logging-configurations

The following code example shows how to use `describe-verified-access-instance-logging-configurations`.

**AWS CLI**

To describe the logging configuration for a Verified Access instance

The following `describe-verified-access-instance-logging-configurations` example describes the logging configuration for the specified Verified Access instance.

```bash
aws ec2 describe-verified-access-instance-logging-configurations \
   --verified-access-instance-ids vai-0ce000b7643abea
```

**Output:**

```json
{
   "LoggingConfigurations": [
   {
      "VerifiedAccessInstanceId": "vai-0ce000b7643abea",
      "AccessLogs": {
         "S3": {
```
For more information, see [Verified Access logs](#) in the AWS Verified Access User Guide.

- For API details, see [DescribeVerifiedAccessInstanceLoggingConfigurations](#) in AWS CLI Command Reference.

### describe-verified-access-instances

The following code example shows how to use `describe-verified-access-instances`.

**AWS CLI**

**To describe a Verified Access instance**

The following `describe-verified-access-instances` example describes the specified Verified Access instance.

```bash
aws ec2 describe-verified-access-instances \
   --verified-access-instance-ids vai-0ce000c0b7643abea
```

**Output:**

```json
{
   "VerifiedAccessInstances": [

   ]
}
```
For more information, see [Verified Access instances](#) in the [AWS Verified Access User Guide](#).

- For API details, see [DescribeVerifiedAccessInstances](#) in [AWS CLI Command Reference](#).

**describe-verified-access-trust-providers**

The following code example shows how to use describe-verified-access-trust-providers.

**AWS CLI**

**To describe a Verified Access trust provider**

The following describe-verified-access-trust-providers example describes the specified Verified Access trust provider.

```bash
aws ec2 describe-verified-access-trust-providers \ 
       --verified-access-trust-provider-ids vatp-0bb32de759a3e19e7
```

**Output:**

```json
{
   "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
   "Description": "Testing Verified Access",
   "VerifiedAccessTrustProviders": [
      {
         "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
         "TrustProviderType": "user",
         "UserTrustProviderType": "iam-identity-center"
      }
   ],
   "CreationTime": "2023-08-25T18:27:56",
   "LastUpdatedTime": "2023-08-25T19:03:32",
   "Tags": [
      {
         "Key": "Name",
         "Value": "my-ava-instance"
      }
   ]
}
```
For more information, see [Trust providers for Verified Access](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-trust-providers.html) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessTrustProviders](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-verified-access-trust-providers.html) in *AWS CLI Command Reference*.

### describe-volume-attribute

The following code example shows how to use `describe-volume-attribute`.

**AWS CLI**

**To describe a volume attribute**

This example command describes the `autoEnableIo` attribute of the volume with the ID `vol-049df61146c4d7901`.

**Command:**

```
aws ec2 describe-volume-attribute --volume-id vol-049df61146c4d7901 --attribute autoEnableIo
```

**Output:**
{  
    "AutoEnableIO": {  
        "Value": false  
    },  
    "VolumeId": "vol-049df61146c4d7901"
}

- For API details, see `DescribeVolumeAttribute` in AWS CLI Command Reference.

**describe-volume-status**

The following code example shows how to use `describe-volume-status`.

**AWS CLI**

**To describe the status of a single volume**

This example command describes the status for the volume `vol-1234567890abcdef0`.

Command:

```
aws ec2 describe-volume-status --volume-ids vol-1234567890abcdef0
```

Output:

```json
{
    "VolumeStatuses": [
        {
            "VolumeStatus": {
                "Status": "ok",
                "Details": [
                    {
                        "Status": "passed",
                        "Name": "io-enabled"
                    },
                    {
                        "Status": "not-applicable",
                        "Name": "io-performance"
                    }
                ]
            },
            "AvailabilityZone": "us-east-1a",
            "Value": false
        },
        "VolumeId": "vol-049df61146c4d7901"
    ]
}
```
To describe the status of impaired volumes

This example command describes the status for all volumes that are impaired. In this example output, there are no impaired volumes.

Command:

```
aws ec2 describe-volume-status --filters Name=volume-status.status,Values=impaired
```

Output:

```
{
   "VolumeStatuses": []
}
```

If you have a volume with a failed status check (status is impaired), see Working with an Impaired Volume in the Amazon EC2 User Guide.

- For API details, see DescribeVolumeStatus in AWS CLI Command Reference.

describe-volumes-modifications

The following code example shows how to use describe-volumes-modifications.

AWS CLI

To describe the modification status for a volume

The following describe-volumes-modifications example describes the volume modification status of the specified volume.

```
aws ec2 describe-volumes-modifications \
   --volume-ids vol-1234567890abcdef0
```
### Output:

```
{
    "VolumeModification": {
        "TargetSize": 150,
        "TargetVolumeType": "io1",
        "ModificationState": "optimizing",
        "VolumeId": "vol-1234567890abcdef0",
        "TargetIops": 100,
        "StartTime": "2019-05-17T11:27:19.000Z",
        "Progress": 70,
        "OriginalVolumeType": "io1",
        "OriginalIops": 100,
        "OriginalSize": 100
    }
}
```

- For API details, see [DescribeVolumesModifications](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-volumes-modifications.html) in *AWS CLI Command Reference*.

### describe-volumes

The following code example shows how to use `describe-volumes`.

#### AWS CLI

**Example 1: To describe a volume**

The following `describe-volumes` example describes the specified volumes in the current Region.

```bash
aws ec2 describe-volumes \
    --volume-ids vol-049df61146c4d7901 vol-1234567890abcdef0
```

**Output:**

```
{
    "Volumes": [
        {
            "AvailabilityZone": "us-east-1a",
            "Attachments": [
                
```
Example 2: To describe volumes that are attached to a specific instance

The following `describe-volumes` example describes all volumes that are both attached to the specified instance and set to delete when the instance terminates.

```
aws ec2 describe-volumes \
  --region us-east-1 \
  --filters Name=attachment.instance-id,Values=i-1234567890abcdef0 \
  Name=attachment.delete-on-termination,Values=true
```
For an example of the output for `describe-volumes`, see Example 1.

**Example 3: To describe available volumes in a specific Availability Zone**

The following `describe-volumes` example describes all volumes that have a status of `available` and are in the specified Availability Zone.

```bash/aws ec2 describe-volumes \  --filters Name=status,Values=available Name=availability-zone,Values=us-east-1a```

For an example of the output for `describe-volumes`, see Example 1.

**Example 4: To describe volumes based on tags**

The following `describe-volumes` example describes all volumes that have the tag key `Name` and a value that begins with `Test`. The output is then filtered with a query that displays only the tags and IDs of the volumes.

```bash/aws ec2 describe-volumes \  --filters Name=tag:Name,Values=Test* \  --query "Volumes[*].{ID:VolumeId,Tag:Tags}"```

**Output:**

```json
[
  {
    "Tag": [
      {
        "Value": "Test2",
        "Key": "Name"
      }
    ],
    "ID": "vol-1234567890abcdef0"
  },
  {
    "Tag": [
      {
        "Value": "Test1",
        "Key": "Name"
      }
    ],
  }
]```
For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeVolumes in AWS CLI Command Reference.

**describe-vpc-attribute**

The following code example shows how to use describe-vpc-attribute.

**AWS CLI**

**To describe the enableDnsSupport attribute**

This example describes the enableDnsSupport attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is true, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

Command:

```bash
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsSupport
```

Output:

```json
{
    "VpcId": "vpc-a01106c2",
    "EnableDnsSupport": {
        "Value": true
    }
}
```

**To describe the enableDnsHostnames attribute**

This example describes the enableDnsHostnames attribute. This attribute indicates whether the instances launched in the VPC get DNS hostnames. If this attribute is true, instances in the VPC get DNS hostnames; otherwise, they do not.

Command:
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsHostnames

Output:

```
{
  "VpcId": "vpc-a01106c2",
  "EnableDnsHostnames": {
    "Value": true
  }
}
```

- For API details, see [DescribeVpcAttribute](#) in AWS CLI Command Reference.

**describe-vpc-classic-link-dns-support**

The following code example shows how to use `describe-vpc-classic-link-dns-support`.

**AWS CLI**

To describe ClassicLink DNS support for your VPCs

This example describes the ClassicLink DNS support status of all of your VPCs.

Command:

```
aws ec2 describe-vpc-classic-link-dns-support
```

Output:

```
{
  "Vpcs": [
    {
      "VpcId": "vpc-88888888",
      "ClassicLinkDnsSupported": true
    },
    {
      "VpcId": "vpc-1a2b3c4d",
      "ClassicLinkDnsSupported": false
    }
  ]
}
```
describe-vpc-classic-link

The following code example shows how to use describe-vpc-classic-link.

AWS CLI

To describe the ClassicLink status of your VPCs

This example lists the ClassicLink status of vpc-88888888.

Command:

```bash
aws ec2 describe-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
   "Vpcs": [
      {
         "ClassicLinkEnabled": true,
         "VpcId": "vpc-88888888",
         "Tags": [
            {
               "Value": "classiclinkvpc",
               "Key": "Name"
            }
         ]
      }
   ]
}
```

This example lists only VPCs that are enabled for Classiclink (the filter value of is-classic-link-enabled is set to true).

Command:

```bash
aws ec2 describe-vpc-classic-link --filter "Name=is-classic-link-enabled,Values=true"
```

For API details, see `DescribeVpcClassicLink` in `AWS CLI Command Reference`.  

For API details, see `DescribeVpcClassicLinkDnsSupport` in `AWS CLI Command Reference`.

describe-vpc-endpoint-connection-notifications

The following code example shows how to use describe-vpc-endpoint-connection-notifications.

AWS CLI

To describe endpoint connection notifications

The following describe-vpc-endpoint-connection-notifications example describes all of your endpoint connection notifications.

```
aws ec2 describe-vpc-endpoint-connection-notifications
```

Output:

```json
{
  "ConnectionNotificationSet": [
    {
      "ConnectionNotificationState": "Enabled",
      "ConnectionNotificationType": "Topic",
      "ConnectionEvents": [
        "Accept",
        "Reject",
        "Delete",
        "Connect"
      ],
      "ConnectionNotificationId": "vpce-nfn-04bcb952bc8af7abc",
      "ConnectionNotificationArn": "arn:aws:sns:us-east-1:123456789012:VpceNotification",
      "VpcEndpointId": "vpce-0324151a02f327123"
    }
  ]
}
```

- For API details, see [DescribeVpcEndpointConnectionNotifications](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpc-endpoint-connection-notifications.html) in *AWS CLI Command Reference*.

describe-vpc-endpoint-connections

The following code example shows how to use describe-vpc-endpoint-connections.
AWS CLI

To describe VPC endpoint connections

This example describes the interface endpoint connections to your endpoint service and filters the results to display endpoints that are PendingAcceptance.

Command:

```
aws ec2 describe-vpc-endpoint-connections --filters Name=vpc-endpoint-state,Values=pendingAcceptance
```

Output:

```
{
   "VpcEndpointConnections": [
      {
         "VpcEndpointId": "vpce-0abed31004e618123",
         "ServiceId": "vpce-svc-0abced088d20def56",
         "CreationTimestamp": "2017-11-30T10:00:24.350Z",
         "VpcEndpointState": "pendingAcceptance",
         "VpcEndpointOwner": "123456789012"
      }
   ]
}
```

- For API details, see [DescribeVpcEndpointConnections](#) in [AWS CLI Command Reference](#).

describe-vpc-endpoint-service-configurations

The following code example shows how to use describe-vpc-endpoint-service-configurations.

AWS CLI

To describe endpoint service configurations

The following describe-vpc-endpoint-service-configurations example describes your endpoint service configurations.

```
aws ec2 describe-vpc-endpoint-service-configurations
```
Output:

```json
{
  "ServiceConfigurations": [
    {
      "ServiceType": [
        {
          "ServiceType": "GatewayLoadBalancer"
        }
      ],
      "ServiceId": "vpce-svc-012d33a1c4321cabc",
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-012d33a1c4321cabc",
      "ServiceState": "Available",
      "AvailabilityZones": [
        "us-east-1d"
      ],
      "AcceptanceRequired": false,
      "ManagesVpcEndpoints": false,
      "GatewayLoadBalancerArns": [
        "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/GWLBService/123210844e429123"
      ],
      "Tags": []
    },
    {
      "ServiceType": [
        {
          "ServiceType": "Interface"
        }
      ],
      "ServiceId": "vpce-svc-123cabc125efa123",
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123cabc125efa123",
      "ServiceState": "Available",
      "AvailabilityZones": [
        "us-east-1a"
      ],
      "AcceptanceRequired": true,
      "ManagesVpcEndpoints": false,
      "NetworkLoadBalancerArns": [
        "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/NLBforService/1238753950b25123"
      ],
      "BaseEndpointDnsNames": [
    ```
"vpce-svc-123cabc125efa123.us-east-1.vpce.amazonaws.com",

},
"Tags": []
]
}

For more information, see VPC endpoint services in the Amazon VPC User Guide.

- For API details, see DescribeVpcEndpointServiceConfigurations in AWS CLI Command Reference.

**describe-vpc-endpoint-service-permissions**

The following code example shows how to use describe-vpc-endpoint-service-permissions.

**AWS CLI**

To describe endpoint service permissions

This example describes the permissions for the specified endpoint service.

Command:

```bash
aws ec2 describe-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3
```

Output:

```json
{
  "AllowedPrincipals": [
    {
      "PrincipalType": "Account",
      "Principal": "arn:aws:iam::123456789012:root"
    }
  ]
}
```
describe-vpc-endpoint-services

The following code example shows how to use describe-vpc-endpoint-services.

**AWS CLI**

**Example 1: To describe all VPC endpoint services**

The following "describe-vpc-endpoint-services" example lists all VPC endpoint services for an AWS Region.

```
aws ec2 describe-vpc-endpoint-services
```

Output:

```json
{
  "ServiceDetails": [
    {
      "ServiceType": [
        {
          "ServiceType": "Gateway"
        }
      ],
      "AcceptanceRequired": false,
      "ServiceName": "com.amazonaws.us-east-1.dynamodb",
      "VpcEndpointPolicySupported": true,
      "Owner": "amazon",
      "AvailabilityZones": [
        "us-east-1a",
        "us-east-1b",
        "us-east-1c",
        "us-east-1d",
        "us-east-1e",
        "us-east-1f"
      ],
      "BaseEndpointDnsNames": [
        "dynamodb.us-east-1.amazonaws.com"
      ]
    }
  ]
}
```
Actions and scenarios
For more information, see [View available AWS service names](#) in the User Guide for AWSPrivateLink.

**Example 2: To describe the details about an endpoint service**

The following "describe-vpc-endpoint-services" example lists the details of the Amazon S3 interface endpoint service:

```bash
aws ec2 describe-vpc-endpoint-services
    --filter "Name=service-type,Values=Interface" Name=service-name,Values=com.amazonaws.us-east-1.s3
```

**Output:**

```json
{
    "ServiceDetails": [
        {
            "ServiceName": "com.amazonaws.us-east-1.s3",
            "ServiceId": "vpce-svc-081d84efcdEXAMPLE",
            "ServiceType": [
                {
                    "ServiceType": "Interface"
                }
            ],
            "AvailabilityZones": [
                "us-east-1a",
                "us-east-1b",
                "us-east-1c",
            ]
        }
    ]
}
```
For more information, see View available AWS service names in the User Guide for AWSPrivateLink.

- For API details, see DescribeVpcEndpointServices in AWS CLI Command Reference.

describe-vpc-endpoints

The following code example shows how to use describe-vpc-endpoints.

AWS CLI

To describe your VPC endpoints

The following describe-vpc-endpoints example displays details for all of your VPC endpoints.

aws ec2 describe-vpc-endpoints

Output:

```json
{
   "VpcEndpoints": [
      {
```
"PolicyDocument": "{\"Version\":\"2008-10-17\",\"Statement\":\[\{\"Effect\":\"Allow\",\"Principal\":\"*\",\"Action\":\"*\",\"Resource\":\"*\"\}\]\},
"VpcId": "vpc-aabb1122",
"NetworkInterfaceIds": [],
"SubnetIds": [],
"PrivateDnsEnabled": true,
"State": "available",
"ServiceName": "com.amazonaws.us-east-1.dynamodb",

For more information, see VPC endpoints in the Amazon VPC User Guide.

- For API details, see DescribeVpcEndpoints in AWS CLI Command Reference.
describe-vpc-peering-connections

The following code example shows how to use describe-vpc-peering-connections.

AWS CLI

To describe your VPC peering connections

This example describes all of your VPC peering connections.

Command:

```
aws ec2 describe-vpc-peering-connections
```

Output:

```
{
   "VpcPeeringConnections": [
   {
      "Status": {
         "Message": "Active",
         "Code": "active"
      },
      "Tags": [
      {
         "Value": "Peering-1",
         "Key": "Name"
      }
      ],
      "AccepterVpcInfo": {
         "OwnerId": "111122223333",
         "VpcId": "vpc-1a2b3c4d",
         "CidrBlock": "10.0.1.0/28"
      },
      "VpcPeeringConnectionId": "pcx-11122233",
      "RequesterVpcInfo": {
         "PeeringOptions": {
            "AllowEgressFromLocalVpcToRemoteClassicLink": false,
            "AllowEgressFromLocalClassicLinkToRemoteVpc": false
         },
         "OwnerId": "444455556666",
         "VpcId": "vpc-123abc45",
         "CidrBlock": "192.168.0.0/16"
      }
   }
]
```
To describe specific VPC peering connections

This example describes all of your VPC peering connections that are in the pending-acceptance state.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=status-code,Values=pending-acceptance
```

This example describes all of your VPC peering connections that have the tag Owner=Finance.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=tag:Owner,Values=Finance
```
This example describes all of the VPC peering connections you requested for the specified VPC, vpc-1a2b3c4d.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=requester-vpc-info.vpc-id,Values=vpc-1a2b3c4d
```

- For API details, see DescribeVpcPeeringConnections in AWS CLI Command Reference.

describe-vpcs

The following code example shows how to use describe-vpcs.

AWS CLI

Example 1: To describe all of your VPCs

The following describe-vpcs example retrieves details about your VPCs.

```
aws ec2 describe-vpcs
```

Output:

```
{
  "Vpcs": [
    {
      "CidrBlock": "30.1.0.0/16",
      "DhcpOptionsId": "dopt-19edf471",
      "State": "available",
      "VpcId": "vpc-0e9801d129EXAMPLE",
      "OwnerId": "111122223333",
      "InstanceTenancy": "default",
      "CidrBlockAssociationSet": [
        {
          "AssociationId": "vpc-cidr-assoc-062c64cfaEXAMPLE",
          "CidrBlock": "30.1.0.0/16",
          "CidrBlockState": {
            "State": "associated"
          }
        }
      ]
    }
  ]
}
```
Example 2: To describe a specified VPC

The following describe-vpcs example retrieves details for the specified VPC.

```
aws ec2 describe-vpcs \
    --vpc-ids vpc-06e4ab6c6cEXAMPLE
```

Output:
For API details, see `DescribeVpcs` in *AWS CLI Command Reference.*

**describe-vpn-connections**

The following code example shows how to use `describe-vpn-connections`.

**AWS CLI**

**Example 1: To describe your VPN connections**

The following `describe-vpn-connections` example describes all of your Site-to-Site VPN connections.
aws ec2 describe-vpn-connections

Output:

```json
{
    "VpnConnections": [
        {
            "CustomerGatewayConfiguration": "...configuration information...",
            "CustomerGatewayId": "cgw-01234567abcde1234",
            "Category": "VPN",
            "State": "available",
            "Type": "ipsec.1",
            "VpnConnectionId": "vpn-1122334455aabbccd",
            "TransitGatewayId": "tgw-00112233445566aab",
            "Options": {
                "EnableAcceleration": false,
                "StaticRoutesOnly": true,
                "LocalIpv4NetworkCidr": "0.0.0.0/0",
                "RemoteIpv4NetworkCidr": "0.0.0.0/0",
                "TunnelInsideIpVersion": "ipv4"
            },
            "Routes": [],
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "CanadaVPN"
                }
            ],
            "VgwTelemetry": [
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2020-07-29T10:35:11.000Z",
                    "OutsideIpAddress": "203.0.113.3",
                    "Status": "DOWN",
                    "StatusMessage": ""
                },
                {
                    "AcceptedRouteCount": 0,
                    "LastStatusChange": "2020-09-02T09:09:33.000Z",
                    "OutsideIpAddress": "203.0.113.5",
                    "Status": "UP",
                    "StatusMessage": ""
                }
            ]
        }
    ]
}
```
Example 2: To describe your available VPN connections

The following describe-vpn-connections example describes your Site-to-Site VPN connections with a state of available.

```
aws ec2 describe-vpn-connections \
   --filters "Name=state,Values=available"
```

For more information, see How AWS Site-to-Site VPN works in the AWS Site-to-Site VPN User Guide.

- For API details, see DescribeVpnConnections in AWS CLI Command Reference.

**describe-vpn-gateways**

The following code example shows how to use describe-vpn-gateways.

**AWS CLI**

To describe your virtual private gateways

This example describes your virtual private gateways.

Command:

```
aws ec2 describe-vpn-gateways
```

Output:

```
{
   "VpnGateways": [
   {
      "State": "available",
      "Type": "ipsec.1",
```
For API details, see DescribeVpnGateways in AWS CLI Command Reference.

detach-classic-link-vpc

The following code example shows how to use detach-classic-link-vpc.

AWS CLI

To unlink (detach) an EC2-Classic instance from a VPC

This example unlinks instance i-0598c7d356eba48d7 from VPC vpc-88888888.

Command:

```
aws ec2 detach-classic-link-vpc --instance-id i-0598c7d356eba48d7 --vpc-id vpc-88888888
```

Output:

```
{
```
• For API details, see `DetachClassicLinkVpc` in *AWS CLI Command Reference*.

**detach-internet-gateway**

The following code example shows how to use `detach-internet-gateway`.

**AWS CLI**

**To detach an internet gateway from your VPC**

The following `detach-internet-gateway` example detaches the specified internet gateway from the specific VPC.

```bash
aws ec2 detach-internet-gateway \
   --internet-gateway-id igw-0d0fb496b3EXAMPLE \
   --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see `Internet gateways` in the *Amazon VPC User Guide*.

• For API details, see `DetachInternetGateway` in *AWS CLI Command Reference*.

**detach-network-interface**

The following code example shows how to use `detach-network-interface`.

**AWS CLI**

**To detach a network interface from your instance**

This example detaches the specified network interface from the specified instance. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 detach-network-interface --attachment-id eni-attach-66c4350a
```

• For API details, see `DetachNetworkInterface` in *AWS CLI Command Reference*. 
**detach-verified-access-trust-provider**

The following code example shows how to use `detach-verified-access-trust-provider`.

**AWS CLI**

To detach a trust provider from an instance

The following `detach-verified-access-trust-provider` example detaches the specified Verified Access trust provider from the specified Verified Access instance.

```bash
aws ec2 detach-verified-access-trust-provider \
  --verified-access-instance-id vai-0ce000c0b7643abea \
  --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```json
{
  "VerifiedAccessTrustProvider": {
    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
    "Description": "Testing Verified Access",
    "TrustProviderType": "user",
    "UserTrustProviderType": "iam-identity-center",
    "PolicyReferenceName": "idc",
    "CreationTime": "2023-08-25T19:00:38",
    "LastUpdatedTime": "2023-08-25T19:00:38"
  },
  "VerifiedAccessInstance": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "Description": "Testing Verified Access",
    "VerifiedAccessTrustProviders": [],
    "CreationTime": "2023-08-25T18:27:56",
    "LastUpdatedTime": "2023-08-25T18:27:56"
  }
}
```

For more information, see [Verified Access instances](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-index.html) in the *AWS Verified Access User Guide*.

- For API details, see [DetachVerifiedAccessTrustProvider](https://docs.aws.amazon.com/cli/latest/reference/ec2/detach-verified-access-trust-provider.html) in *AWS CLI Command Reference*.

**detach-volume**

The following code example shows how to use `detach-volume`.

---

**Actions and scenarios**
**AWS CLI**

**To detach a volume from an instance**

This example command detaches the volume (vol-049df61146c4d7901) from the instance it is attached to.

Command:

```
aws ec2 detach-volume --volume-id vol-1234567890abcdef0
```

Output:

```
{
    "AttachTime": "2014-02-27T19:23:06.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "VolumeId": "vol-049df61146c4d7901",
    "State": "detaching",
    "Device": "/dev/sdb"
}
```

- For API details, see **DetachVolume** in *AWS CLI Command Reference*.

**detach-vpn-gateway**

The following code example shows how to use `detach-vpn-gateway`.

**AWS CLI**

**To detach a virtual private gateway from your VPC**

This example detaches the specified virtual private gateway from the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 detach-vpn-gateway --vpn-gateway-id vgw-9a4cacf3 --vpc-id vpc-a01106c2
```

- For API details, see **DetachVpnGateway** in *AWS CLI Command Reference*. 
disable-address-transfer

The following code example shows how to use disable-address-transfer.

AWS CLI

To disable an Elastic IP address transfer

The following disable-address-transfer example disables Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 disable-address-transfer \
   --allocation-id eipalloc-09ad461b0d03f6aaf
```

Output:

```
{
   "AddressTransfer": {
      "PublicIp": "100.21.184.216",
      "AllocationId": "eipalloc-09ad461b0d03f6aaf",
      "AddressTransferStatus": "disabled"
   }
}
```

For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

• For API details, see DisableAddressTransfer in AWS CLI Command Reference.

disable-aws-network-performance-metric-subscription

The following code example shows how to use disable-aws-network-performance-metric-subscription.

AWS CLI

To disable a metric subscription

The following disable-aws-network-performance-metric-subscription example disables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 disable-aws-network-performance-metric-subscription \
```
--source us-east-1  
--destination eu-west-1  
--metric aggregate-latency  
--statistic p50

**Output:**

```json
{
  "Output": true
}
```

For more information, see [Manage subscriptions](#) in the *Infrastructure Performance User Guide*.

- For API details, see [DisableAwsNetworkPerformanceMetricSubscription](#) in *AWS CLI Command Reference*.

---

### disable-ebs-encryption-by-default

The following code example shows how to use `disable-ebs-encryption-by-default`.

**AWS CLI**

**To disable EBS encryption by default**

The following `disable-ebs-encryption-by-default` example disables EBS encryption by default for your AWS account in the current Region.

```bash
aws ec2 disable-ebs-encryption-by-default
```

**Output:**

```json
{
  "EbsEncryptionByDefault": false
}
```

- For API details, see [DisableEbsEncryptionByDefault](#) in *AWS CLI Command Reference*.

---

### disable-fast-launch

The following code example shows how to use `disable-fast-launch`.

---

**Actions and scenarios**

2378
AWS CLI

To discontinue fast launching for an image

The following disable-fast-launch example discontinues fast launching on the specified AMI, and cleans up existing pre-provisioned snapshots.

/aws ec2 disable-fast-launch \
--image-id ami-01234567890abcedf

Output:

```json
{
  "ImageId": "ami-01234567890abcedf",
  "ResourceType": "snapshot",
  "SnapshotConfiguration": {},
  "LaunchTemplate": {
    "LaunchTemplateId": "lt-01234567890abcedf",
    "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-a8c6215d-94e6-441b-9272-dbd1f87b07e2",
    "Version": "1"
  },
  "MaxParallelLaunches": 6,
  "OwnerId": "0123456789123",
  "State": "disabling",
  "StateTransitionReason": "Client.UserInitiated",
  "StateTransitionTime": "2022-01-27T22:47:29.265000+00:00"
}
```

For more information about configuring a Windows AMI for faster launching, see Configure your AMI for faster launching in the Amazon EC2 User Guide.

- For API details, see DisableFastLaunch in AWS CLI Command Reference.

disable-fast-snapshot-restores

The following code example shows how to use disable-fast-snapshot-restores.

AWS CLI

To disable fast snapshot restore
The following `disable-fast-snapshot-restores` example disables fast snapshot restore for the specified snapshot in the specified Availability Zone.

```
aws ec2 disable-fast-snapshot-restores \
   --availability-zones us-east-2a \
   --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
   "Successful": [
      {
         "SnapshotId": "snap-1234567890abcdef0",
         "AvailabilityZone": "us-east-2a",
         "State": "disabling",
         "StateTransitionReason": "Client.UserInitiated",
         "OwnerId": "123456789012",
         "EnablingTime": "2020-01-25T23:57:49.602Z"
      }
   ],
   "Unsuccessful": []
}
```

- For API details, see [DisableFastSnapshotRestores](https://awscli.amazonaws.com/v2/documentation/api/index.html#awscli.command.ec2_disable_fast_snapshot_restores) in [AWS CLI Command Reference](https).

**disable-image-block-public-access**

The following code example shows how to use `disable-image-block-public-access`.

**AWS CLI**

**To disable block public access for AMIs in the specified Region**

The following `disable-image-block-public-access` example disables block public access for AMIs at the account level in the specified Region.

```
aws ec2 disable-image-block-public-access \
   --region us-east-1
```

Output:
For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.  
• For API details, see DisableImageBlockPublicAccess in *AWS CLI Command Reference*.

disable-image-deprecation

The following code example shows how to use disable-image-deprecation.

**AWS CLI**

**To cancel the deprecation of an AMI**

The following disable-image-deprecation example cancels the deprecation of an AMI, which removes the DeprecationTime field from the describe-images output. You must be the AMI owner to perform this procedure.

```
aws ec2 disable-image-deprecation \
   --image-id ami-1234567890abcdef0
```

**Output:**

```
{
   "RequestID": "11aabb229-4eac-35bd-99ed-be587EXAMPLE",
   "Return": "true"
}
```

For more information, see Deprecate an AMI <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami> in the *Amazon EC2 User Guide*.  
• For API details, see DisableImageDeprecation in *AWS CLI Command Reference*.

disable-image

The following code example shows how to use disable-image.

**AWS CLI**

**To disable an AMI**
The following `disable-image` example disables the specified AMI.

```bash
aws ec2 disable-image \
   --image-id ami-1234567890abcdef0
```

Output:

```json
{
   "Return": "true"
}
```

For more information, see [Disable an AMI](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/ami-disable.html) in the *Amazon EC2 User Guide*.

- For API details, see [DisableImage](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-image.html) in *AWS CLI Command Reference*.

---

disable-serial-console-access

The following code example shows how to use `disable-serial-console-access`.

AWS CLI

**To disable access to the EC2 serial console for your account**

The following `disable-serial-console-access` example disables account access to the serial console.

```bash
aws ec2 disable-serial-console-access
```

Output:

```json
{
   "SerialConsoleAccessEnabled": false
}
```

For more information, see [EC2 Serial Console](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/serial-console.html) in the *Amazon EC2 User Guide*.

- For API details, see [DisableSerialConsoleAccess](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-serial-console-access.html) in *AWS CLI Command Reference*.
disable-transit-gateway-route-table-propagation

The following code example shows how to use disable-transit-gateway-route-table-propagation.

AWS CLI

To disable a transit gateway attachment to propagate routes to the specified propagation route table

The following disable-transit-gateway-route-table-propagation example disables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 disable-transit-gateway-route-table-propagation \\
--transit-gateway-route-table-id tgw-rtb-0a823edbbeEXAMPLE \\
--transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{
    "Propagation": {
        "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
        "ResourceId": "vpc-4d7de228",
        "ResourceType": "vpc",
        "TransitGatewayRouteTableId": "tgw-rtb-0a823edbbeEXAMPLE",
        "State": "disabled"
    }
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/TransitGateways/latest/APIReference/index.html) in the *Transit Gateways Guide*.

- For API details, see [DisableTransitGatewayRouteTablePropagation](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-transit-gateway-route-table-propagation.html) in *AWS CLI Command Reference*.

disable-vgw-route-propagation

The following code example shows how to use disable-vgw-route-propagation.

AWS CLI

To disable route propagation
This example disables the specified virtual private gateway from propagating static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 disable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

- For API details, see [DisableVgwRoutePropagation](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-vgw-route-propagation.html) in *AWS CLI Command Reference*.

**disable-vpc-classic-link-dns-support**

The following code example shows how to use `disable-vpc-classic-link-dns-support`.

**AWS CLI**

**To disable ClassicLink DNS support for a VPC**

This example disables ClassicLink DNS support for `vpc-88888888`.

Command:

```
aws ec2 disable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```
{
   "Return": true
}
```

- For API details, see [DisableVpcClassicLinkDnsSupport](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-vpc-classic-link-dns-support.html) in *AWS CLI Command Reference*.

**disable-vpc-classic-link**

The following code example shows how to use `disable-vpc-classic-link`.

**AWS CLI**

**To disable ClassicLink for a VPC**

---

**Actions and scenarios**

---
This example disables ClassicLink for vpc-8888888.

Command:

```
aws ec2 disable-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
   "Return": true
}
```

- For API details, see [DisableVpcClassicLink](#) in AWS CLI Command Reference.

**disassociate-address**

The following code example shows how to use disassociate-address.

**AWS CLI**

**To disassociate an Elastic IP addresses in EC2-Classic**

This example disassociates an Elastic IP address from an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-address --public-ip 198.51.100.0
```

**To disassociate an Elastic IP address in EC2-VPC**

This example disassociates an Elastic IP address from an instance in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-address --association-id eipassoc-2bebb745
```

- For API details, see [DisassociateAddress](#) in AWS CLI Command Reference.
disassociate-client-vpn-target-network

The following code example shows how to use disassociate-client-vpn-target-network.

**AWS CLI**

**To disassociate a network from a Client VPN endpoint**

The following disassociate-client-vpn-target-network example disassociates the target network that's associated with the cvpn-assoc-12312312312312312 association ID for the specified Client VPN endpoint.

```
aws ec2 disassociate-client-vpn-target-network \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --association-id cvpn-assoc-12312312312312312
```

**Output:**

```
{
    "AssociationId": "cvpn-assoc-12312312312312312",
    "Status": {
        "Code": "disassociating"
    }
}
```

For more information, see [Target Networks](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DisassociateClientVpnTargetNetwork](#) in *AWS CLI Command Reference*.

disassociate-iam-instance-profile

The following code example shows how to use disassociate-iam-instance-profile.

**AWS CLI**

**To disassociate an IAM instance profile**

This example disassociates an IAM instance profile with the association ID iip-assoc-05020b59952902f5f.

**Command:**

```
aws ec2 disassociate-iam-instance-profile --association-id iip-assoc-05020b59952902f5f

Output:

```
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-123456789abcdef0",
        "State": "disassociating",
        "AssociationId": "iip-assoc-05020b59952902f5f",
        "IamInstanceProfile": {
            "Id": "AIPAI5IVIHMFFYY2DKV5Y",
            "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
        }
    }
}
```

- For API details, see [DisassociateIamInstanceProfile](https://docs.aws.amazon.com/cli/latest/manual/aws-ec2.html#aws-ec2-command) in *AWS CLI Command Reference*.

### disassociate-instance-event-window

The following code example shows how to use `disassociate-instance-event-window`.

**AWS CLI**

**Example 1: To disassociate one or more instances from an event window**

The following `disassociate-instance-event-window` example disassociates one or more instances from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate instances, specify the `association-target` parameter, and for the parameter values, specify one or more instance IDs.

```bash
aws ec2 disassociate-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Output:

```
{
```
```
"InstanceEventWindow": {
   "InstanceEventWindowId": "iew-0abcdef1234567890",
   "Name": "myEventWindowName",
   "CronExpression": "* 21-23 * * 2,3",
   "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
   },
   "State": "creating"
}

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 2: To disassociate instance tags from an event window**

The following disassociate-instance-event-window example disassociates instance tags from an event window. Specify the instance-event-window-id parameter to specify the event window. To disassociate instance tags, specify the association-target parameter, and for the parameter values, specify one or more tags.

```
aws ec2 disassociate-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --association-target "InstanceTags=[[Key=k2,Value=v2],[Key=k1,Value=v1]]"
```

**Output:**

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
         "InstanceIds": [],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating"
   }
}
```

Example 3: To disassociate a Dedicated Host from an event window

The following disassociate-instance-event-window example disassociates a Dedicated Host from an event window. Specify the instance-event-window-id parameter to specify the event window. To disassociate a Dedicated Host, specify the association-target parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --association-target DedicatedHostIds=h-029fa35a02b99801d
```

Output:

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
         "InstanceIds": [],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating"
   }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see DisassociateInstanceEventWindow in AWS CLI Command Reference.

disassociate-nat-gateway-address

The following code example shows how to use disassociate-nat-gateway-address.
AWS CLI

To disassociate an Elastic IP address from a public NAT gateway

The following disassociate-nat-gateway-address example disassociates the specified Elastic IP address from the specified public NAT gateway.

```
aws ec2 disassociate-nat-gateway-address \
  --nat-gateway-id nat-1234567890abcdef0 \
  --association-ids eipassoc-0f96bdca17EXAMPLE
```

Output:

```
{
  "NatGatewayId": "nat-1234567890abcdef0",
  "NatGatewayAddresses": [
    {
      "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
      "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
      "PrivateIp": "10.0.0.74",
      "PublicIp": "3.211.231.218",
      "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
      "IsPrimary": false,
      "Status": "disassociating"
    }
  ]
}
```

For more information, see [NAT gateways](https://docs.aws.amazon.com/vpc/latest/userguide/NAT-instances.html) in the *Amazon VPC User Guide*.

- For API details, see [DisassociateNatGatewayAddress](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-nat-gateway-address.html) in *AWS CLI Command Reference*.

**disassociate-route-table**

The following code example shows how to use disassociate-route-table.

AWS CLI

To disassociate a route table

This example disassociates the specified route table from the specified subnet. If the command succeeds, no output is returned.
Command:

```bash
aws ec2 disassociate-route-table --association-id rtbassoc-781d0d1a
```

- For API details, see [DisassociateRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-route-table.html) in *AWS CLI Command Reference*.

### disassociate-subnet-cidr-block

The following code example shows how to use disassociate-subnet-cidr-block.

**AWS CLI**

**To disassociate an IPv6 CIDR block from a subnet**

This example disassociates an IPv6 CIDR block from a subnet using the association ID for the CIDR block.

Command:

```bash
aws ec2 disassociate-subnet-cidr-block --association-id subnet-cidr-assoc-3aa54053
```

Output:

```json
{
    "SubnetId": "subnet-5f46ec3b",
    "Ipv6CidrBlockAssociation": {
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
        "AssociationId": "subnet-cidr-assoc-3aa54053",
        "Ipv6CidrBlockState": {
            "State": "disassociating"
        }
    }
}
```

- For API details, see [DisassociateSubnetCidrBlock](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-subnet-cidr-block.html) in *AWS CLI Command Reference*.

### disassociate-transit-gateway-multicast-domain

The following code example shows how to use disassociate-transit-gateway-multicast-domain.
AWS CLI

To disassociate subnets from a multicast domain

The following disassociate-transit-gateway-multicast-domain example disassociates a subnet from the specified multicast domain.

```
aws ec2 disassociate-transit-gateway-multicast-domain \
  --transit-gateway-attachment-id tgw-attach-070e571cd1EXAMPLE \ 
  --subnet-id subnet-000de86e3bEXAMPLE \ 
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
  "Associations": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
    "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
    "ResourceId": "vpc-7EXAMPLE",
    "ResourceType": "vpc",
    "Subnets": [
      {
        "SubnetId": "subnet-000de86e3bEXAMPLE",
        "State": "disassociating"
      }
    ]
  }
}
```

For more information, see Working with multicast in the Transit Gateways Guide.

- For API details, see DisassociateTransitGatewayMulticastDomain in AWS CLI Command Reference.

disassociate-transit-gateway-route-table

The following code example shows how to use disassociate-transit-gateway-route-table.

AWS CLI

To disassociate a transit gateway route table from a resource attachment
The following `disassociate-transit-gateway-route-table` example disassociates the specified attachment from the transit gateway route table.

```bash
aws ec2 disassociate-transit-gateway-route-table \
   --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
   --transit-gateway-attachment-id tgw-attach-08e0bc912cEXAMPLE
```

Output:

```
{
   "Association": {
      "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
      "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
      "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
      "ResourceType": "direct-connect-gateway",
      "State": "disassociating"
   }
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/transit-gateway-route-tables.html) in the *Transit Gateways Guide*.

- For API details, see [DisassociateTransitGatewayRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-transit-gateway-route-table.html) in *AWS CLI Command Reference*.

### disassociate-vpc-cidr-block

The following code example shows how to use `disassociate-vpc-cidr-block`.

**AWS CLI**

**To disassociate an IPv6 CIDR block from a VPC**

This example disassociates an IPv6 CIDR block from a VPC using the association ID for the CIDR block.

**Command:**

```bash
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-eca54085
```

**Output:**

```
{
   "Ipv6CidrBlockAssociation": {
      "AssociationId": "vpc-cidr-assoc-eca54085",
      "Ipv6CidrBlock": "::/64",
      "State": "disassociated"
   }
}
```
To disassociate an IPv4 CIDR block from a VPC

This example disassociates an IPv4 CIDR block from a VPC.

Command:

```bash
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-0287ac6b
```

Output:

```json
{
   "CidrBlockAssociation": {
      "AssociationId": "vpc-cidr-assoc-0287ac6b",
      "CidrBlock": "172.18.0.0/16",
      "CidrBlockState": {
         "State": "disassociating"
      }
   },
   "VpcId": "vpc-27621243"
}
```

- For API details, see [DisassociateVpcCidrBlock](#) in AWS CLI Command Reference.

enable-address-transfer

The following code example shows how to use enable-address-transfer.

**AWS CLI**

To enable an Elastic IP address transfer

The following enable-address-transfer example enables Elastic IP address transfer for the specified Elastic IP address to the specified account.
aws ec2 enable-address-transfer \
  --allocation-id eipalloc-09ad461b0d03f6aaf \
  --transfer-account-id 123456789012

Output:

```json
{
  "AddressTransfer": {
    "PublicIp": "100.21.184.216",
    "AllocationId": "eipalloc-09ad461b0d03f6aaf",
    "TransferAccountId": "123456789012",
    "TransferOfferExpirationTimestamp": "2023-02-22T20:51:01.000Z",
    "AddressTransferStatus": "pending"
  }
}
```

For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

- For API details, see EnableAddressTransfer in AWS CLI Command Reference.

### enable-aws-network-performance-metric-subscription

The following code example shows how to use enable-aws-network-performance-metric-subscription.

**AWS CLI**

**To enable a metric subscription**

The following enable-aws-network-performance-metric-subscription example enables the monitoring of aggregate network latency between the specified source and destination Regions.

```bash
aws ec2 enable-aws-network-performance-metric-subscription \
  --source us-east-1 \
  --destination eu-west-1 \
  --metric aggregate-latency \
  --statistic p50
```

Output:
For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see EnableAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

**enable-ebs-encryption-by-default**

The following code example shows how to use enable-ebs-encryption-by-default.

**AWS CLI**

**To enable EBS encryption by default**

The following enable-ebs-encryption-by-default example enables EBS encryption by default for your AWS account in the current Region.

```
aws ec2 enable-ebs-encryption-by-default
```

Output:

```
{
   "EbsEncryptionByDefault": true
}
```

- For API details, see EnableEbsEncryptionByDefault in AWS CLI Command Reference.

**enable-fast-launch**

The following code example shows how to use enable-fast-launch.

**AWS CLI**

**To start fast launching for an image**

The following enable-fast-launch example starts fast launching on the specified AMI and sets the maximum number of parallel instances to launch to 6. The type of resource to use to pre-provision the AMI is set to snapshot, which is also the default value.
aws ec2 enable-fast-launch \
  --image-id ami-01234567890abcedf \
  --max-parallel-launches 6 \
  --resource-type snapshot

Output:

```json
{
  "ImageId": "ami-01234567890abcedf",
  "ResourceType": "snapshot",
  "SnapshotConfiguration": {
    "TargetResourceCount": 10
  },
  "LaunchTemplate": {},
  "MaxParallelLaunches": 6,
  "OwnerId": "0123456789123",
  "State": "enabling",
  "StateTransitionReason": "Client.UserInitiated",
  "StateTransitionTime": "2022-01-27T22:16:03.199000+00:00"
}
```

For more information about configuring a Windows AMI for faster launching, see [Configure your AMI for faster launching](#) in the Amazon EC2 User Guide.

- For API details, see [EnableFastLaunch](#) in AWS CLI Command Reference.

**enable-fast-snapshot-restores**

The following code example shows how to use `enable-fast-snapshot-restores`.

### AWS CLI

**To enable fast snapshot restore**

The following `enable-fast-snapshot-restores` example enables fast snapshot restore for the specified snapshot in the specified Availability Zones.

aws ec2 enable-fast-snapshot-restores \
  --availability-zones us-east-2a us-east-2b \
  --source-snapshot-ids snap-1234567890abcdef0
Output:

```json
{
    "Successful": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-east-2a",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.602Z"
        },
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-east-2b",
            "State": "enabling",
            "StateTransitionReason": "Client.UserInitiated",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.596Z"
        }
    ],
    "Unsuccessful": []
}
```

- For API details, see [EnableFastSnapshotRestores](#) in AWS CLI Command Reference.

### enable-image-block-public-access

The following code example shows how to use `enable-image-block-public-access`.

**AWS CLI**

**To enable block public access for AMIs in the specified Region**

The following `enable-image-block-public-access` example enables block public access for AMIs at the account level in the specified Region.

```bash
aws ec2 enable-image-block-public-access \
    --region us-east-1 \
    --image-block-public-access-state block-new-sharing
```

**Output:**
For more information, see Block public access to your AMIs in the Amazon EC2 User Guide.

- For API details, see EnableImageBlockPublicAccess in AWS CLI Command Reference.

enable-image-deprecation

The following code example shows how to use enable-image-deprecation.

AWS CLI

**Example 1: To deprecate an AMI**

The following enable-image-deprecation example deprecates an AMI on a specific date and time. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute. You must be the AMI owner to perform this procedure.

```
aws ec2 enable-image-deprecation \
   --image-id ami-1234567890abcdef0 \
   --deprecate-at "2022-10-15T13:17:12.000Z"
```

Output:

```
{
   "RequestId": "59dbff89-35bd-4eac-99ed-be587EXAMPLE",
   "Return": "true"
}
```

For more information, see Deprecate an AMI <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami> in the Amazon EC2 User Guide.

- For API details, see EnableImageDeprecation in AWS CLI Command Reference.

enable-image

The following code example shows how to use enable-image.
AWS CLI

**To enable an AMI**

The following `enable-image` example enables the specified AMI.

```bash
aws ec2 enable-image \
    --image-id ami-1234567890abcdef0
```

Output:

```json
{
   "Return": "true"
}
```

For more information, see [Disable an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/enable-image.html) in the *Amazon EC2 User Guide*.

- For API details, see [EnableImage](https://docs.aws.amazon.com/AWS CLI Command Reference/latest/CLI-Reference/index.html) in *AWS CLI Command Reference*.

**enable-ipam-organization-admin-account**

The following code example shows how to use `enable-ipam-organization-admin-account`.

AWS CLI

**To integrate with AWS Organizations and delegate a member account as the IPAM account**

The following `enable-ipam-organization-admin-account` example integrates IPAM with AWS Organizations and delegates a member account as the IPAM account.

```bash
aws ec2 enable-ipam-organization-admin-account \
    --delegated-admin-account-id 320805250157
```

Output:

```json
{
   "Success": true
}
```

For more information, see [Integrate IPAM with AWS Organizations](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/about-creating-an-ipam.html) in the *Amazon VPC IPAM User Guide*. 

enable-reachability-analyzer-organization-sharing

The following code example shows how to use enable-reachability-analyzer-organization-sharing.

**AWS CLI**

**To enable trusted access for Reachability Analyzer**

The following enable-reachability-analyzer-organization-sharing example enables trusted access for Reachability Analyzer.

```bash
aws ec2 enable-reachability-analyzer-organization-sharing
```

This command produces no output.

For more information, see [Cross-account analyses](#) in the [Reachability Analyzer User Guide](#).

**enable-serial-console-access**

The following code example shows how to use enable-serial-console-access.

**AWS CLI**

**To enable access to the serial console for your account**

The following enable-serial-console-access example enables account access to the serial console.

```bash
aws ec2 enable-serial-console-access
```

Output:

```json
{
   "SerialConsoleAccessEnabled": true
}
```
enable-transit-gateway-route-table-propagation

The following code example shows how to use `enable-transit-gateway-route-table-propagation`.

**AWS CLI**

To enable a transit gateway attachment to propagate routes to the specified propagation route table

The following `enable-transit-gateway-route-table-propagation` example enables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 enable-transit-gateway-route-table-propagation \
    --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{
    "Propagation": {
        "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
        "ResourceId": "vpc-4d7de228",
        "ResourceType": "vpc",
        "TransitGatewayRouteTableId": "tgw-rtb-0a823edbeEXAMPLE",
        "State": "disabled"
    }
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/transit-gateway-route-tables.html) in the *Transit Gateways Guide*.

- For API details, see [EnableTransitGatewayRouteTablePropagation](https://docs.aws.amazon.com/AWS CLI Command Reference) in *AWS CLI Command Reference*.

enable-vgw-route-propagation

The following code example shows how to use `enable-vgw-route-propagation`.
AWS CLI

To enable route propagation

This example enables the specified virtual private gateway to propagate static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 enable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

- For API details, see EnableVgwRoutePropagation in AWS CLI Command Reference.

enable-volume-io

The following code example shows how to use enable-volume-io.

AWS CLI

To enable I/O for a volume

This example enables I/O on volume vol-1234567890abcdef0.

Command:

```bash
aws ec2 enable-volume-io --volume-id vol-1234567890abcdef0
```

Output:

```json
{
  "Return": true
}
```

- For API details, see EnableVolumeIo in AWS CLI Command Reference.

enable-vpc-classic-link-dns-support

The following code example shows how to use enable-vpc-classic-link-dns-support.
AWS CLI

**To enable ClassicLink DNS support for a VPC**

This example enables ClassicLink DNS support for vpc-88888888.

Command:

```bash
aws ec2 enable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```json
{
   "Return": true
}
```

- For API details, see [EnableVpcClassicLinkDnsSupport](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-vpc-classic-link-dns-support.html) in ***AWS CLI Command Reference***.

**enable-vpc-classic-link**

The following code example shows how to use `enable-vpc-classic-link`.

**AWS CLI**

**To enable a VPC for ClassicLink**

This example enables vpc-8888888 for ClassicLink.

Command:

```bash
aws ec2 enable-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```json
{
   "Return": true
}
```

- For API details, see [EnableVpcClassicLink](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-vpc-classic-link.html) in ***AWS CLI Command Reference***.
export-client-vpn-client-certificate-revocation-list

The following code example shows how to use export-client-vpn-client-certificate-revocation-list.

AWS CLI

To export a client certificate revocation list

The following export-client-vpn-client-certificate-revocation-list example exports the client certificate revocation list for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```bash
aws ec2 export-client-vpn-client-certificate-revocation-list \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --output text
```

Output:

```
-----BEGIN X509 CRL-----
MIICiTCCAf ICCDQ6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMC
VVMxCzAJBgNVBAgTBGFzaGluZ3MxMSQxJjAlBgNVBAMTBGFzaGluZ3MxMSQxJjAl
BgNVBAMTBGFzaGluZ3MxMSQxJjAlBgNVBAMTBGFzaGluZ3MxMSQxJjAlBgNVBAMT
---END X509 CRL-----
```

For more information, see Client Certificate Revocation Lists in the AWS Client VPN Administrator Guide.

- For API details, see ExportClientVpnClientCertificateRevocationList in AWS CLI Command Reference.
export-client-vpn-client-configuration

The following code example shows how to use `export-client-vpn-client-configuration`.

**AWS CLI**

**To export the client configuration**

The following `export-client-vpn-client-configuration` example exports the client configuration for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-configuration \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --output text
```

**Output:**

```
client
dev tun
proto udp
remote cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-south-1.amazonaws.com 443
remote-random-hostname

```

Actions and scenarios 2406
For more information, see `Client VPN Endpoints` in the `AWS Client VPN Administrator Guide`.

- For API details, see `ExportClientVpnClientConfiguration` in `AWS CLI Command Reference`.

### `export-image`

The following code example shows how to use `export-image`.

#### AWS CLI

**To export a VM from an AMI**

The following `export-image` example exports the specified AMI to the specified bucket in the specified format.

```bash
aws ec2 export-image \
  --image-id ami-1234567890abcdef0 \
  --disk-image-format VMDK \
  --s3-export-location S3Bucket=my-export-bucket,S3Prefix=exports/
```

**Output:**

```
{
    "DiskImageFormat": "vmdk",
    "ExportImageTaskId": "export-ami-1234567890abcdef0",
    "ImageId": "ami-1234567890abcdef0",
    "RoleName": "vmimport",
    "Progress": "0",
    "S3ExportLocation": {
        "S3Bucket": "my-export-bucket",
        "S3Prefix": "exports/"
    },
    "Status": "active",
    "StatusMessage": "validating"
}
```
get-associated-ipv6-pool-cidrs

The following code example shows how to use get-associated-ipv6-pool-cidrs.

AWS CLI

To get the associations for an IPv6 address pool

The following get-associated-ipv6-pool-cidrs example gets the associations for the specified IPv6 address pool.

```bash
aws ec2 get-associated-ipv6-pool-cidrs \
    --pool-id ipv6pool-ec2-012345abc12345abc
```

Output:

```json
{
    "Ipv6CidrAssociations": [
    {
        "Ipv6Cidr": "2001:db8:1234:1a00::/56",
        "AssociatedResource": "vpc-111111222222333ab"
    }
    ]
}
```

• For API details, see GetAssociatedIpv6PoolCidrs in AWS CLI Command Reference.

get-aws-network-performance-data

The following code example shows how to use get-aws-network-performance-data.

AWS CLI

To get network performance data

The following get-aws-network-performance-data example retrieves data about the network performance between the specified Regions in the specified time period.
aws ec2 get-aws-network-performance-data \
   --start-time 2022-10-26T12:00:00.000Z \
   --end-time 2022-10-26T12:30:00.000Z \
   --data-queries Id=my-query,Source=us-east-1,Destination=eu-west-1,Metric=aggregate-latency,Statistic=p50,Period=five-minutes

Output:

```json
{
    "DataResponses": [
    {
        "Id": "my-query",
        "Source": "us-east-1",
        "Destination": "eu-west-1",
        "Metric": "aggregate-latency",
        "Statistic": "p50",
        "Period": "five-minutes",
        "MetricPoints": [
            {
                "StartDate": "2022-10-26T12:00:00+00:00",
                "EndDate": "2022-10-26T12:05:00+00:00",
                "Value": 62.44349,
                "Status": "OK"
            },
            {
                "StartDate": "2022-10-26T12:05:00+00:00",
                "EndDate": "2022-10-26T12:10:00+00:00",
                "Value": 62.483498,
                "Status": "OK"
            },
            {
                "StartDate": "2022-10-26T12:10:00+00:00",
                "EndDate": "2022-10-26T12:15:00+00:00",
                "Value": 62.51248,
                "Status": "OK"
            },
            {
                "StartDate": "2022-10-26T12:15:00+00:00",
                "EndDate": "2022-10-26T12:20:00+00:00",
                "Value": 62.635475,
                "Status": "OK"
            }
        ]
    }
}
```
For more information, see Monitor network performance in the Infrastructure Performance User Guide.

- For API details, see GetAwsNetworkPerformanceData in AWS CLI Command Reference.

get-capacity-reservation-usage

The following code example shows how to use get-capacity-reservation-usage.

AWS CLI

To view capacity reservation usage across AWS accounts

The following get-capacity-reservation-usage example displays usage information for the specified capacity reservation.

aws ec2 get-capacity-reservation-usage \
   --capacity-reservation-id cr-1234abcd56EXAMPLE

Output:
{  
  "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
  "InstanceUsages": [  
    {  
      "UsedInstanceCount": 1,
      "AccountId": "123456789012"
    }  
  ],
  "AvailableInstanceCount": 4,
  "TotalInstanceCount": 5,
  "State": "active",
  "InstanceType": "t2.medium"
}

For more information, see Viewing Shared Capacity Reservation Usage in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see GetCapacityReservationUsage in AWS CLI Command Reference.

get-coip-pool-usage

The following code example shows how to use get-coip-pool-usage.

AWS CLI

To get customer-owned IP address pool usage

The following get-coip-pool-usage example gets the usage details for the specified customer-owned IP address pool.

aws ec2 get-coip-pool-usage \
  --pool-id ipv4pool-coip-123a45678bEXAMPLE

Output:

{  
  "CoipPoolId": "ipv4pool-coip-123a45678bEXAMPLE",
  "CoipAddressUsages": [  
    {  
      "CoIp": "0.0.0.0"
    },
  ]
}
For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see GetCoipPoolUsage in AWS CLI Command Reference.

get-console-output

The following code example shows how to use get-console-output.

AWS CLI

Example 1: To get the console output

The following get-console-output example gets the console output for the specified Linux instance.

```bash
aws ec2 get-console-output \
   --instance-id i-1234567890abcdef0
```

Output:

```json
{
   "InstanceId": "i-1234567890abcdef0",
   "Output": "..."
}
```

For more information, see Instance console output in the Amazon EC2 User Guide.
Example 2: To get the latest console output

The following `get-console-output` example gets the latest console output for the specified Linux instance.

```bash
aws ec2 get-console-output \
    --instance-id i-1234567890abcdef0 \
    --latest \n    --output text
```

Output:

```
i-1234567890abcdef0 [    0.000000] Command line: root=LABEL=/ console=tty1
    console=ttyS0  selinux=0  nvme_core.io_timeout=4294967295
[    0.000000] x86/fpu: Supporting XSAVE feature 0x001: 'x87 floating point registers'

```

For more information, see [Instance console output](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-console-output.html) in the *Amazon EC2 User Guide*.

- For API details, see [GetConsoleOutput](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-console-output.html) in *AWS CLI Command Reference*.

**get-console-screenshot**

The following code example shows how to use `get-console-screenshot`.

AWS CLI

To retrieve a screenshot of a running instance

The following `get-console-screenshot` example retrieves a screenshot of the specified instance in .jpg format. The screenshot is returned as a Base64-encoded string.

```bash
aws ec2 get-console-screenshot \
    --instance-id i-1234567890abcdef0
```
Output:

```json
{
   "ImageData": "997987/8kgj49ikjhekwwe0008084EXAMPLE",
   "InstanceId": "i-1234567890abcdef0"
}
```

- For API details, see [GetConsoleScreenshot](#) in *AWS CLI Command Reference*.

### get-default-credit-specification

The following code example shows how to use `get-default-credit-specification`.

**AWS CLI**

**To describe the default credit option**

The following `get-default-credit-specification` example describes the default credit option for T2 instances.

```
aws ec2 get-default-credit-specification \
   --instance-family t2
```

Output:

```json
{
   "InstanceFamilyCreditSpecification": {
      "InstanceFamily": "t2",
      "CpuCredits": "standard"
   }
}
```

- For API details, see [GetDefaultCreditSpecification](#) in *AWS CLI Command Reference*.

### get-ebs-default-kms-key-id

The following code example shows how to use `get-ebs-default-kms-key-id`.

**AWS CLI**

**To describe your default CMK for EBS encryption**
The following `get-ebs-default-kms-key-id` example describes the default CMK for EBS encryption for your AWS account.

```bash/aws ec2 get-ebs-default-kms-key-id
```

The output shows the default CMK for EBS encryption, which is an AWS managed CMK with the alias `alias/aws/ebs`.

```
{  "KmsKeyId": "alias/aws/ebs"
}
```

The following output shows a custom CMK for EBS encryption.

```
{  "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see [GetEbsDefaultKmsKeyId](#) in [AWS CLI Command Reference](#).

**get-ebs-encryption-by-default**

The following code example shows how to use `get-ebs-encryption-by-default`.

**AWS CLI**

**To describe whether EBS encryption by default is enabled**

The following `get-ebs-encryption-by-default` example indicates whether EBS encryption by default is enabled for your AWS account in the current Region.

```bash
/aws ec2 get-ebs-encryption-by-default
```

The following output indicates that EBS encryption by default is disabled.

```
{  "EbsEncryptionByDefault": false
}
```
The following output indicates that EBS encryption by default is enabled.

```json
{
   "EbsEncryptionByDefault": true
}
```

- For API details, see `GetEbsEncryptionByDefault` in `AWS CLI Command Reference`.

**get-flow-logs-integration-template**

The following code example shows how to use `get-flow-logs-integration-template`.

**AWS CLI**

**To create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena**

The following `get-flow-logs-integration-template` examples create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena.

**Linux:**

```bash
aws ec2 get-flow-logs-integration-template \
   --flow-log-id fl-1234567890abcdef0 \
   --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET \
   --integrate-services
   AthenaIntegrations='[{
   IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET,
   PartitionLoadFrequency=none,
   PartitionStartDate=2021-07-21T00:40:00,
   PartitionEndDate=2021-07-21T00:42:00}
   ]'
```

**Windows:**

```bash
aws ec2 get-flow-logs-integration-template ^
   --flow-log-id fl-1234567890abcdef0 ^
   --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET ^
   --integrate-services
   AthenaIntegrations='[{
   IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-BUCKET,
   PartitionLoadFrequency=none,
   PartitionStartDate=2021-07-21T00:40:00,
   PartitionEndDate=2021-07-21T00:42:00}
   ]'
```

**Actions and scenarios**
For information on using CloudFormation templates, see [Working with AWS CloudFormation templates](#) in the [AWS CloudFormation User Guide](#).

For information on using Amazon Athena and flow logs, see [Query flow logs using Amazon Athena](#) in the [Amazon Virtual Private Cloud User Guide](#).

- For API details, see [GetFlowLogsIntegrationTemplate](#) in [AWS CLI Command Reference](#).

### get-groups-for-capacity-reservation

The following code example shows how to use `get-groups-for-capacity-reservation`.

**AWS CLI**

**To list the resource groups with a Capacity Reservation**

The following `get-groups-for-capacity-reservation` example lists the resource groups to which the specified Capacity Reservation was added.

```
aws ec2 get-groups-for-capacity-reservation \
  --capacity-reservation-id cr-1234abcd56EXAMPLE
```

**Output:**

```
{
    "CapacityReservationsGroup": [
        {
            "OwnerId": "123456789012"
        }
    ]
}
```
For more information, see Working with Capacity Reservations in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see GetGroupsForCapacityReservation in AWS CLI Command Reference.

get-host-reservation-purchase-preview

The following code example shows how to use get-host-reservation-purchase-preview.

AWS CLI

To get a purchase preview for a Dedicated Host Reservation

This example provides a preview of the costs for a specified Dedicated Host Reservation for the specified Dedicated Host in your account.

Command:

```bash
aws ec2 get-host-reservation-purchase-preview --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```json
{
   "TotalHourlyPrice": "1.499",
   "Purchase": [
      {
         "HourlyPrice": "1.499",
         "InstanceFamily": "m4",
         "PaymentOption": "NoUpfront",
         "HostIdSet": [
            "h-013abcd2a00cbd123"
         ],
         "UpfrontPrice": "0.000",
         "Duration": 31536000
      }
   ],
   "TotalUpfrontPrice": "0.000"
}
```

- For API details, see GetHostReservationPurchasePreview in AWS CLI Command Reference.
get-image-block-public-access-state

The following code example shows how to use get-image-block-public-access-state.

**AWS CLI**

*To get the block public access state for AMIs in the specified Region*

The following get-image-block-public-access-state example gets the block public access state for AMIs at the account level in the specified Region.

```bash
aws ec2 get-image-block-public-access-state \
  --region us-east-1
```

Output:

```json
{
   "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see [Block public access to your AMIs](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/block-public-access.html) in the *Amazon EC2 User Guide*.

get-instance-types-from-instance-requirements

The following code example shows how to use get-instance-types-from-instance-requirements.

**AWS CLI**

*To preview the instance types that match specified attributes*

The following get-instance-types-from-instance-requirements example first generates a list of all of the possible attributes that can be specified using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to customize the attributes for which to preview matched instance types.

To generate all possible attributes and save the output directly to a JSON file, use the following command.
aws ec2 get-instance-types-from-instance-requirements \
--region us-east-1 \
--generate-cli-skeleton input > attributes.json

Output:

```json
{
    "DryRun": true,
    "ArchitectureTypes": [
        "x86_64_mac"
    ],
    "VirtualizationTypes": [
        "paravirtual"
    ],
    "InstanceRequirements": {
        "VcpuCount": {
            "Min": 0,
            "Max": 0
        },
        "MemoryMiB": {
            "Min": 0,
            "Max": 0
        },
        "CpuManufacturers": [
            "intel"
        ],
        "MemoryGiBPerVcpu": {
            "Min": 0.0,
            "Max": 0.0
        },
        "ExcludedInstanceTypes": [
        ""
    ],
    "InstanceGenerations": [
        "current"
    ],
    "SpotMaxPricePercentageOverLowestPrice": 0,
    "OnDemandMaxPricePercentageOverLowestPrice": 0,
    "BareMetal": "included",
    "BurstablePerformance": "excluded",
    "RequireHibernateSupport": true,
    "NetworkInterfaceCount": {
        "Min": 0,
```
Configure the JSON file. You must provide values for ArchitectureTypes, VirtualizationTypes, VCPUCount, and MemoryMiB. You can omit the other attributes. When omitted, default values are used. For a description of each attribute and their default values, see get-instance-types-from-instance-requirements <https://docs.aws.amazon.com/cli/latest/reference/ec2/get-instance-types-from-instance-requirements.html>.
Preview the instance types that have the attributes specified in attributes.json. Specify the name and path to your JSON file by using the --cli-input-json parameter. In the following request, the output is formatted as a table.

```
aws ec2 get-instance-types-from-instance-requirements
   --cli-input-json file://attributes.json
   --output table
```

Contents of attributes.json file:

```
{
   "ArchitectureTypes": [
      "x86_64"
   ],
   "VirtualizationTypes": [
      "hvm"
   ],
   "InstanceRequirements": {
      "VcpuCount": {
         "Min": 4,
         "Max": 6
      },
      "MemoryMiB": {
         "Min": 2048
      },
      "InstanceGenerations": ["current"
   ]
}
```

Output:

```
------------------------------------------
|GetInstanceTypesFromInstanceRequirements|
+----------------------------------------+
|| InstanceTypes                        ||
|+---------------------------------------+
|| InstanceType                          ||
|+---------------------------------------+
|| c4.xlarge                             ||
```
For more information about attribute-based instance type selection, see How attribute-based instance type selection works in the Amazon EC2 User Guide.

- For API details, see GetInstanceTypesFromInstanceRequirements in AWS CLI Command Reference.

get-instance-uefi-data

The following code example shows how to use get-instance-uefi-data.

AWS CLI

To retrieve UEFI data from an instance

The following get-instance-uefi-data example retrieves UEFI data from an instance. If the output is empty, the instance does not contain UEFI data.

```
aws ec2 get-instance-uefi-data \\
   --instance-id i-0123456789example
```

Output:

```
{
   "InstanceId": "i-0123456789example",
   "UefiData": "QU1aTlVFRkkf+uLXAAAAAHj5a7fZ9+3dBzxXb/.
   <snipped>
   AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAD4L/J/A0Dshho="
}
```

For more information, see UEFI Secure Boot in the Amazon EC2 User Guide.

- For API details, see GetInstanceUefiData in AWS CLI Command Reference.
get-ipam-address-history

The following code example shows how to use get-ipam-address-history.

AWS CLI

To get the history of a CIDR

The following get-ipam-address-history example gets the history of a CIDR.

(Windows):

```
aws ec2 get-ipam-address-history ^
   --cidr 10.0.0.0/16 ^
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
   --start-time 2021-12-08T01:00:00.000Z ^
   --end-time 2021-12-10T01:00:00.000Z
```

Output:

```
{
   "HistoryRecords": [
      {
         "ResourceOwnerId": "123456789012",
         "ResourceRegion": "us-west-1",
         "ResourceType": "vpc",
         "ResourceId": "vpc-06cbefa9ee907e1c0",
         "ResourceCidr": "10.0.0.0/16",
         "ResourceName": "Demo",
         "ResourceComplianceStatus": "unmanaged",
         "ResourceOverlapStatus": "overlapping",
         "VpcId": "vpc-06cbefa9ee907e1c0",
         "SampledStartTime": "2021-12-08T19:54:57.675000+00:00"
      }
   ]
}
```
For more information, see View the history of IP addresses in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamAddressHistory in AWS CLI Command Reference.

get-ipam-pool-allocations

The following code example shows how to use get-ipam-pool-allocations.

AWS CLI

To get the CIDRs allocated from an IPAM pool

The following get-ipam-pool-allocations example gets the CIDRs allocated from an IPAM pool.

(Linux):
aws ec2 get-ipam-pool-allocations \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --filters Name=ipam-pool-allocation-id,Values=ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220

(Windows):

aws ec2 get-ipam-pool-allocations ^ 
   --ipam-pool-id ipam-pool-0533048da7d823723 ^ 
   --filters Name=ipam-pool-allocation-id,Values=ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220

Output:

```json
{
   "IpamPoolAllocations": [
      {
         "Cidr": "10.0.0.0/16",
         "IpamPoolAllocationId": "ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220",
         "ResourceType": "custom",
         "ResourceOwner": "123456789012"
      }
   ]
}
```

**get-ipam-pool-cidrs**

The following code example shows how to use `get-ipam-pool-cidrs`.

**AWS CLI**

To get the CIDRs provisioned to an IPAM pool

The following `get-ipam-pool-cidrs` example gets the CIDRs provisioned to an IPAM pool.

(Windows):

```
aws ec2 get-ipam-pool-cidrs \
```
--ipam-pool-id ipam-pool-0533048da7d823723 \    --filters 'Name=cidr,Values=10.*'

(Windows):

aws ec2 get-ipam-pool-cidrs ^    
  --ipam-pool-id ipam-pool-0533048da7d823723 ^    
  --filters Name=cidr,Values=10.*

Output:

{    "IpamPoolCidr": {    "Cidr": "10.0.0.0/24",    "State": "provisioned"    }}

• For API details, see GetIpamPoolCidrs in AWS CLI Command Reference.

going-get-ipam-resource-cidrs

The following code example shows how to use get-ipam-resource-cidrs.

AWS CLI

To get the CIDRs allocated to a resource

The following get-ipam-resource-cidrs example gets the CIDRs allocated to a resource.

(Windows):

aws ec2 get-ipam-resource-cidrs ^    
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^    
  --filters Name=management-state,Values=unmanaged

Actions and scenarios 2427
Output:

```json
{
   "IpamResourceCidrs": [
      {
         "IpamId": "ipam-08440e7a3acde3908",
         "IpamScopeId": "ipam-scope-02fc38cd4c4e7d38",
         "ResourceRegion": "us-east-2",
         "ResourceOwnerId": "123456789012",
         "ResourceId": "vpc-621b8709",
         "ResourceName": "Default AWS VPC",
         "ResourceCidr": "172.33.0.0/16",
         "ResourceType": "vpc",
         "ResourceTags": ["Key": "Environment", "Value": "Test"],
         "Key": "Name",
         "Value": "Default AWS VPC"
      },
      "IpUsage": 0.0039,
      "ComplianceStatus": "unmanaged",
      "ManagementState": "unmanaged",
      "OverlapStatus": "nonoverlapping",
      "VpcId": "vpc-621b8709"
   }
}
```

For more information, see [Monitor CIDR usage by resource](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [GetIpamResourceCidrs](#) in *AWS CLI Command Reference*.

**get-launch-template-data**

The following code example shows how to use get-launch-template-data.

**AWS CLI**

To get instance data for a launch template
This example gets data about the specified instance and uses the --query option to return the contents in LaunchTemplateData. You can use the output as a base to create a new launch template or launch template version.

Command:

```bash
aws ec2 get-launch-template-data --instance-id i-0123d646e8048babc --query 'LaunchTemplateData'
```

Output:

```json
{
    "Monitoring": {},
    "ImageId": "ami-8c1be5f6",
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/xvda",
            "Ebs": {
                "DeleteOnTermination": true
            }
        }
    ],
    "EbsOptimized": false,
    "Placement": {
        "Tenancy": "default",
        "GroupName": "",
        "AvailabilityZone": "us-east-1a"
    },
    "InstanceType": "t2.micro",
    "NetworkInterfaces": [
        {
            "Description": ",
            "NetworkInterfaceId": "eni-35306abc",
            "PrivateIpAddresses": [
                {
                    "Primary": true,
                    "PrivateIpAddress": "10.0.0.72"
                }
            ],
            "SubnetId": "subnet-7b16de0c",
            "Groups": [
                "sg-7c227019"
            ]
        }
    ]
}
```
"Ipv6Addresses": [
  {
    "Ipv6Address": "2001:db8:1234:1a00::123"
  }
],
"PrivateIpAddress": "10.0.0.72"
}

- For API details, see GetLaunchTemplateData in AWS CLI Command Reference.

get-managed-prefix-list-associations

The following code example shows how to use get-managed-prefix-list-associations.

AWS CLI

To get prefix list associations

The following get-managed-prefix-list-associations example gets the resources that are associated with the specified prefix list.

```bash
aws ec2 get-managed-prefix-list-associations \
  --prefix-list-id pl-0123456abcabcabc1
```

Output:

```json
{
  "PrefixListAssociations": [
    {
      "ResourceId": "sg-0abc123456abc12345",
      "ResourceOwner": "123456789012"
    }
  ]
}
```

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see GetManagedPrefixListAssociations in AWS CLI Command Reference.
get-managed-prefix-list-entries

The following code example shows how to use get-managed-prefix-list-entries.

AWS CLI

To get the entries for a prefix list

The following get-managed-prefix-list-entries gets the entries for the specified prefix list.

```
aws ec2 get-managed-prefix-list-entries \
  --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
   "Entries": [
      {
         "Cidr": "10.0.0.0/16",
         "Description": "vpc-a"
      },
      {
         "Cidr": "10.2.0.0/16",
         "Description": "vpc-b"
      }
   ]
}
```

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see GetManagedPrefixListEntries in AWS CLI Command Reference.

get-network-insights-access-scope-analysis-findings

The following code example shows how to use get-network-insights-access-scope-analysis-findings.

AWS CLI

To get the findings of Network Insights access scope analysis
The following `get-network-insights-access-scope-analysis-findings` example gets the selected scope analysis findings in your AWS account.

```
aws ec2 get-network-insights-access-scope-analysis-findings 
  --region us-east-1 
  --network-insights-access-scope-analysis-id nis 
  --nis-123456789111
```

Output:

```
{
    "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
    "AnalysisFindings": [
        {
            "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
            "NetworkInsightsAccessScopeId": "nis-123456789111",
            "FindingComponents": [
                {
                    "SequenceNumber": 1,
                    "Component": {
                        "Id": "eni-02e3d42d5ccec67d",
                        "Arn": "arn:aws:ec2:us-east-1:936459623503:network-interface/eni-02e3d32d9ccec617d"
                    },
                    "OutboundHeader": {
                        "DestinationAddresses": [
                            "0.0.0.0/5",
                            "11.0.0.0/8",
                            "12.0.0.0/6",
                            "128.0.0.0/3",
                            "16.0.0.0/4",
                            "160.0.0.0/5",
                            "168.0.0.0/6",
                            "172.0.0.0/12",
                            "8.0.0.0/7"
                        ],
                        "DestinationPortRanges": [
                            {
                                "From": 0,
                                "To": 65535
                            }
                        ],
                        "Protocol": "6",
```
For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the [Network Access Analyzer Guide](#).

- For API details, see [GetNetworkInsightsAccessScopeAnalysisFindings](#) in [AWS CLI Command Reference](#).

get-network-insights-access-scope-content

The following code example shows how to use `get-network-insights-access-scope-content`.

**AWS CLI**

To get Network Insights access scope content

The following `get-network-insights-access-scope-content` example gets the content of the selected scope analysis ID in your AWS account.

```
aws ec2 get-network-insights-access-scope-content \
  --region us-east-1 \
  --network-insights-access-scope-id nis-123456789222
```

Output:

```
{
  "NetworkInsightsAccessScopeContent": {
    "SourceAddresses": [
      "10.0.2.253/32"
    ],
    "SourcePortRanges": [
      {
        "From": 0,
        "To": 65535
      }
    ], [etc]
  }
}
```
"NetworkInsightsAccessScopeId": "nis-123456789222",
"MatchPaths": [
  {
    "Source": {
      "ResourceStatement": {
        "ResourceTypes": [
          "AWS::EC2::NetworkInterface"
        ]
      }
    },
    "Destination": {
      "ResourceStatement": {
        "ResourceTypes": [
          "AWS::EC2::InternetGateway"
        ]
      }
    }
  }
]
}

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see GetNetworkInsightsAccessScopeContent in AWS CLI Command Reference.

get-password-data

The following code example shows how to use get-password-data.

AWS CLI

To get the encrypted password

This example gets the encrypted password.

Command:

```
aws ec2 get-password-data --instance-id i-1234567890abcdef0
```

Output:
To get the decrypted password

This example gets the decrypted password.

Command:

```
aws ec2 get-password-data --instance-id i-1234567890abcdef0 --priv-launch-key C:\Keys\MyKeyPair.pem
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-08-30T23:18:05.000Z",
    "PasswordData": "&ViJ652e*u"
}
```

- For API details, see `GetPasswordData` in AWS CLI Command Reference.

get-reserved-instances-exchange-quote

The following code example shows how to use `get-reserved-instances-exchange-quote`.

AWS CLI

To get a quote for exchanging a Convertible Reserved Instance

This example gets the exchange information for the specified Convertible Reserved Instances.

Command:
aws ec2 get-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=6fea5434-b379-434c-b07b-a7abexample

Output:

```json
{
    "CurrencyCode": "USD",
    "ReservedInstanceValueSet": [
        {
            "ReservedInstanceId": "7b8750c3-397e-4da4-bbcb-a45ebexample",
            "ReservationValue": {
                "RemainingUpfrontValue": "0.000000",
                "HourlyPrice": "0.027800",
                "RemainingTotalValue": "730.556200"
            }
        }
    ],
    "PaymentDue": "424.983828",
    "TargetConfigurationValueSet": [
        {
            "TargetConfiguration": {
                "InstanceCount": 5,
                "OfferingId": "6fea5434-b379-434c-b07b-a7abexample"
            },
            "ReservationValue": {
                "RemainingUpfrontValue": "424.983828",
                "HourlyPrice": "0.016000",
                "RemainingTotalValue": "845.447828"
            }
        }
    ],
    "IsValidExchange": true,
    "OutputReservedInstancesWillExpireAt": "2020-10-01T13:03:39Z",
    "ReservedInstanceValueRollup": {
        "RemainingUpfrontValue": "0.000000",
        "HourlyPrice": "0.027800",
        "RemainingTotalValue": "730.556200"
    },
    "TargetConfigurationValueRollup": {
        "RemainingUpfrontValue": "424.983828",
        "HourlyPrice": "0.016000",
        "RemainingTotalValue": "845.447828"
    }
}
```
get-serial-console-access-status

The following code example shows how to use get-serial-console-access-status.

AWS CLI

To view the status of account access to the serial console

The following get-serial-console-access-status example determines whether serial console access is enabled for your account.

```bash
aws ec2 get-serial-console-access-status
```

Output:

```json
{
   "SerialConsoleAccessEnabled": true
}
```

For more information, see EC2 Serial Console in the Amazon EC2 User Guide.

get-spot-placement-scores

The following code example shows how to use get-spot-placement-scores.

AWS CLI

To calculate the Spot placement score for specified requirements

The following get-spot-placement-scores example first generates a list of all of the possible parameters that can be specified for the Spot placement score configuration using the --generate-cli-skeleton parameter, and saves the list to a JSON file. Then, the JSON file is used to configure the requirements to use to calculate the Spot placement score.
To generate all possible parameters that can be specified for the Spot placement score configuration, and save the output directly to a JSON file.

```
aws ec2 get-spot-placement-scores \
  --region us-east-1 \
  --generate-cli-skeleton input > attributes.json
```

Output:

```
{
  "InstanceTypes": ["
  
  ],
  "TargetCapacity": 0,
  "TargetCapacityUnitType": "vcpu",
  "SingleAvailabilityZone": true,
  "RegionNames": ["
  
  ],
  "InstanceRequirementsWithMetadata": {

  "Min": 0,
  "Max": 0
},
"LocalStorage": "included",
"LocalStorageTypes": [ "hdd" ],
"TotalLocalStorageGB": {
  "Min": 0.0,
  "Max": 0.0
},
"BaselineEbsBandwidthMbps": {
  "Min": 0,
  "Max": 0
},
"AcceleratorTypes": [ "fpga" ],
"AcceleratorCount": {
  "Min": 0,
  "Max": 0
},
"AcceleratorManufacturers": [ "amd" ],
"AcceleratorNames": [ "vu9p" ],
"AcceleratorTotalMemoryMiB": {
  "Min": 0,
  "Max": 0
}
Configure the JSON file. You must provide a value for TargetCapacity. For a description of each parameter and their default values, see Calculate the Spot placement score (AWS CLI) <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-placement-score.html#calculate-sps-cli>.

Calculate the Spot placement score for the requirements specified in attributes.json. Specify the name and path to your JSON file by using the --cli-input-json parameter.

```
aws ec2 get-spot-placement-scores \
   --region us-east-1 \
   --cli-input-json file://attributes.json
```

Output if SingleAvailabilityZone is set to false or omitted (if omitted, it defaults to false). A scored list of Regions is returned.

```
"Recommendation": [
  {
    "Region": "us-east-1",
    "Score": 7
  },
  {
    "Region": "us-west-1",
    "Score": 5
  },
  ...
```

Output if SingleAvailabilityZone is set to true. A scored list of SingleAvailability Zones is returned.

```
"Recommendation": [
  {
    "Region": "us-east-1",
    "AvailabilityZoneId": "use1-az1",
    "Score": 8
  },
```
For more information about calculating a Spot placement score, and for example configurations, see Calculate a Spot placement score in the Amazon EC2 User Guide.

- For API details, see GetSpotPlacementScores in AWS CLI Command Reference.

get-subnet-cidr-reservations

The following code example shows how to use get-subnet-cidr-reservations.

AWS CLI

To get information about a subnet CIDR reservation

The following get-subnet-cidr-reservations example displays information about the specified subnet CIDR reservation.

```
aws ec2 get-subnet-cidr-reservations \
   --subnet-id subnet-03c51e2e6cEXAMPLE
```

Output:

```
{
   "SubnetIpv4CidrReservations": [
      {
         "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
         "SubnetId": "subnet-03c51e2e6cEXAMPLE",
         "Cidr": "10.1.0.16/28",
         "ReservationType": "prefix",
         "OwnerId": "123456789012"
      }
   ],
   "SubnetIpv6CidrReservations": []
}
```

For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.
For API details, see `GetSubnetCidrReservations` in AWS CLI Command Reference.

get-transit-gateway-attachment-propagations

The following code example shows how to use `get-transit-gateway-attachment-propagations`.

**AWS CLI**

To list the route tables to which the specified resource attachment propagates routes

The following `get-transit-gateway-attachment-propagations` example lists the route table to which the specified resource attachment propagates routes.

```bash
aws ec2 get-transit-gateway-attachment-propagations
  --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE
```

Output:

```json
{
  "TransitGatewayAttachmentPropagations": [
    {
      "TransitGatewayRouteTableId": "tgw-rtb-0882c61b97EXAMPLE",
      "State": "enabled"
    }
  ]
}
```

For more information, see Transit gateway route tables in the Transit Gateways Guide.

For API details, see `GetTransitGatewayAttachmentPropagations` in AWS CLI Command Reference.

get-transit-gateway-multicast-domain-associations

The following code example shows how to use `get-transit-gateway-multicast-domain-associations`.

**AWS CLI**

To view the information about the transit gateway multicast domain associations
The following `get-transit-gateway-multicast-domain-associations` example returns the associations for the specified multicast domain.

```
aws ec2 get-transit-gateway-multicast-domain-associations
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
    "MulticastDomainAssociations": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8EXAMPLE",
            "ResourceId": "vpc-01128d2c24EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
                "SubnetId": "subnet-000de86e3bEXAMPLE",
                "State": "associated"
            }
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
            "ResourceId": "vpc-7EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
                "SubnetId": "subnet-4EXAMPLE",
                "State": "associated"
            }
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
            "ResourceId": "vpc-7EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
                "SubnetId": "subnet-5EXAMPLE",
                "State": "associated"
            }
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
            "ResourceId": "vpc-7EXAMPLE",
            "ResourceType": "vpc",
            "Subnet": {
                "SubnetId": "subnet-aEXAMPLE",
            }
        }
    ]
}
```
For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see GetTransitGatewayMulticastDomainAssociations in AWS CLI Command Reference.

get-transit-gateway-prefix-list-references

The following code example shows how to use get-transit-gateway-prefix-list-references.

**AWS CLI**

To get prefix list references in a transit gateway route table

The following get-transit-gateway-prefix-list-references example gets the prefix list references for the specified transit gateway route table, and filters by the ID of a specific prefix list.

```sh
aws ec2 get-transit-gateway-prefix-list-references \
    --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
    --filters Name=prefix-list-id,Values=pl-11111222222333
```

Output:

```json
{
    "TransitGatewayPrefixListReferences": [
```
For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see GetTransitGatewayPrefixListReferences in AWS CLI Command Reference.

### get-transit-gateway-route-table-associations

The following code example shows how to use get-transit-gateway-route-table-associations.

**AWS CLI**

**To get information about the associations for the specified transit gateway route table**

The following get-transit-gateway-route-table-associations example displays information about the associations for the specified transit gateway route table.

```bash
aws ec2 get-transit-gateway-route-table-associations \
   --transit-gateway-route-table-id tgw-rtb-0a823edbe
```

Output:

```json
{
   "Associations": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
         "ResourceId": "vpc-4d7de228",
         "ResourceType": "vpc"
      }
   ]
}
```
For more information, see `Transit gateway route tables` in the `Transit Gateways Guide`.

- For API details, see `GetTransitGatewayRouteTableAssociations` in `AWS CLI Command Reference`.

get-transit-gateway-route-table-propagations

The following code example shows how to use get-transit-gateway-route-table-propagations.

**AWS CLI**

To display information about the route table propagations for the specified transit gateway route table

The following get-transit-gateway-route-table-propagations example returns the route table propagations for the specified route table.

```
aws ec2 get-transit-gateway-route-table-propagations \
    --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
```

Output:

```
{
    "TransitGatewayRouteTablePropagations": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
            "ResourceId": "vpc-3EXAMPLE",
            "ResourceType": "vpc",
            "State": "enabled"
        },
        {
            "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
            "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
            "ResourceType": "direct-connect-gateway",
            "State": "enabled"
        }
    ]
}
```
For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [GetTransitGatewayRouteTablePropagations](#) in *AWS CLI Command Reference*.

### get-verified-access-endpoint-policy

The following code example shows how to use **get-verified-access-endpoint-policy**.

**AWS CLI**

**To get the Verified Access policy of an endpoint**

The following get-verified-access-endpoint-policy example gets the Verified Access policy of the specified endpoint.

```bash
aws ec2 get-verified-access-endpoint-policy \
    --verified-access-endpoint-id vae-066fac616d4d546f2
```

**Output:**

```json
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true\\n};"
}
```

For more information, see [Verified Access policies](#) in the *AWS Verified Access User Guide*.

- For API details, see [GetVerifiedAccessEndpointPolicy](#) in *AWS CLI Command Reference*.
get-verified-access-group-policy

The following code example shows how to use `get-verified-access-group-policy`.

**AWS CLI**

**To get the Verified Access policy of a group**

The following `get-verified-access-group-policy` example gets the Verified Access policy of the specified group.

```bash
aws ec2 get-verified-access-group-policy \
   --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```
{
   "PolicyEnabled": true,
   "PolicyDocument": "permit(principal,action,resource)\nwhen
{\n    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true\n};"
}
```

For more information, see [Verified Access groups](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/verified-access.html) in the *AWS Verified Access User Guide*.

- For API details, see [GetVerifiedAccessGroupPolicy](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-verified-access-group-policy.html) in *AWS CLI Command Reference*.

get-vpn-connection-device-sample-configuration

The following code example shows how to use `get-vpn-connection-device-sample-configuration`.

**AWS CLI**

**To download a sample configuration file**

The following `get-vpn-connection-device-sample-configuration` example downloads the specified sample configuration file. To list the gateway devices with a sample configuration file, call the `get-vpn-connection-device-types` command.

```bash
aws ec2 get-vpn-connection-device-sample-configuration \
   --vpn-connection-id vpn-123456789abc01234 \
```
Output:

```json
{
    "VpnConnectionDeviceSampleConfiguration": "contents-of-the-sample-configuration-file"
}
```

For more information, see [Download the configuration file](https://aws.amazon.com/sslvpn/userguide/) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [GetVpnConnectionDeviceSampleConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-vpn-connection-device-types.html) in *AWS CLI Command Reference*.

### get-vpn-connection-device-types

The following code example shows how to use `get-vpn-connection-device-types`.

**AWS CLI**

**To list gateway devices with a sample configuration file**

The following `get-vpn-connection-device-types` example lists the gateway devices from Palo Alto Networks that have sample configuration files.

```bash
aws ec2 get-vpn-connection-device-types \
    --query "VpnConnectionDeviceTypes[?Vendor=='Palo Alto Networks']"
```

Output:

```json
[
    {
        "VpnConnectionDeviceTypeId": "754a6372",
        "Vendor": "Palo Alto Networks",
        "Platform": "PA Series",
        "Software": "PANOS 4.1.2+"
    },
    {
        "VpnConnectionDeviceTypeId": "9612cbed",
        "Vendor": "Palo Alto Networks",
```
import-client-vpn-client-certificate-revocation-list

The following code example shows how to use import-client-vpn-client-certificate-revocation-list.

**AWS CLI**

**To import a client certificate revocation list**

The following import-client-vpn-client-certificate-revocation-list example imports a client certificate revocation list to the Client VPN endpoint by specifying the location of the file on the local computer.

```
aws ec2 import-client-vpn-client-certificate-revocation-list \
  --certificate-revocation-list file:///path/to/crl.pem \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "Return": true
}
```

For more information, see [Client Certificate Revocation Lists](https://docs.aws.amazon.com/AmazonVPC/latest/APIReference/#!/creating-client-certificates-import-client-certificate-revocation-list) in the *AWS Client VPN Administrator Guide*.
• For API details, see ImportClientVpnClientCertificateRevocationList in AWS CLI Command Reference.

import-image

The following code example shows how to use import-image.

AWS CLI

To import a VM image file as an AMI

The following import-image example imports the specified OVA.

```
aws ec2 import-image \
   --disk-containers Format=ova,UserBucket="{S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.ova}"
```

Output:

```
{
   "ImportTaskId": "import-ami-1234567890abcdef0",
   "Progress": "2",
   "SnapshotDetails": [
      {
         "DiskImageSize": 0.0,
         "Format": "ova",
         "UserBucket": {
            "S3Bucket": "my-import-bucket",
            "S3Key": "vms/my-server-vm.ova"
         }
      }
   ],
   "Status": "active",
   "StatusMessage": "pending"
}
```

• For API details, see ImportImage in AWS CLI Command Reference.

import-key-pair

The following code example shows how to use import-key-pair.
AWS CLI

To import a public key

First, generate a key pair with the tool of your choice. For example, use this ssh-keygen command:

Command:

```
ssh-keygen -t rsa -C "my-key" -f ~/.ssh/my-key
```

Output:

```
Generating public/private rsa key pair.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/ec2-user/.ssh/my-key.
Your public key has been saved in /home/ec2-user/.ssh/my-key.pub.
...
```

This example command imports the specified public key.

Command:

```
aws ec2 import-key-pair --key-name "my-key" --public-key-material fileb://~/.ssh/my-key.pub
```

Output:

```
{
    "KeyName": "my-key",
}
```

- For API details, see `ImportKeyPair` in AWS CLI Command Reference.

import-snapshot

The following code example shows how to use import-snapshot.
AWS CLI

To import a snapshot

The following import-snapshot example imports the specified disk as a snapshot.

```
aws ec2 import-snapshot
    --description "My server VMDK"
    --disk-container Format=VMDK,UserBucket={S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.vmdk}
```

Output:

```
{
    "Description": "My server VMDK",
    "ImportTaskId": "import-snap-1234567890abcdef0",
    "SnapshotTaskDetail": {
        "Description": "My server VMDK",
        "DiskImageSize": "0.0",
        "Format": "VMDK",
        "Progress": "3",
        "Status": "active",
        "StatusMessage": "pending"
    },
    "UserBucket": {
        "S3Bucket": "my-import-bucket",
        "S3Key": "vms/my-server-vm.vmdk"
    }
}
```

- For API details, see ImportSnapshot in AWS CLI Command Reference.

list-images-in-recycle-bin

The following code example shows how to use list-images-in-recycle-bin.

AWS CLI

To list the images in the Recycle Bin

The following list-images-in-recycle-bin example lists all of the images that are currently retained in the Recycle Bin.
aws ec2 list-images-in-recycle-bin

Output:

```
{
   "Images": [
   {
      "RecycleBinEnterTime": "2022-03-14T15:35:08.000Z",
      "Description": "Monthly AMI One",
      "RecycleBinExitTime": "2022-03-15T15:35:08.000Z",
      "Name": "AMI_01",
      "ImageId": "ami-0111222333444abcd"
   }
   ]
}
```

For more information, see [Recover AMIs from the Recycle Bin](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/be-manage-images.html) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [ListImagesInRecycleBin](https://docs.aws.amazon.com/cli/latest/reference/ec2/list-images-in-recycle-bin.html) in *AWS CLI Command Reference*.

### list-snapshots-in-recycle-bin

The following code example shows how to use `list-snapshots-in-recycle-bin`.

**AWS CLI**

**To view snapshots in the Recycle Bin**

The following `list-snapshots-in-recycle-bin` example lists information about snapshots in the Recycle Bin, including the snapshot ID, a description of the snapshot, The ID of the volume from which the snapshot was created, the date and time when the snapshot was deleted and it entered the Recycle Bin, and the date and time when the retention period expires.

```
aws ec2 list-snapshots-in-recycle-bin \ 
   --snapshot-id snap-01234567890abcdef
```

Output:

```
{
```
"SnapshotRecycleBinInfo": [ 
{
   "Description": "Monthly data backup snapshot",
   "RecycleBinEnterTime": "2022-12-01T13:00:00.000Z",
   "RecycleBinExitTime": "2022-12-15T13:00:00.000Z",
   "VolumeId": "vol-abcdef09876543210",
   "SnapshotId": "snap-01234567890abcdef"
}
]

For more information about Recycle Bin for Amazon EBS, see Recover snapshots from the Recycle Bin in the Amazon EC2 User Guide.

- For API details, see ListSnapshotsInRecycleBin in AWS CLI Command Reference.

**modify-address-attribute**

The following code example shows how to use modify-address-attribute.

**AWS CLI**

**To modify the domain name attribute associated with an elastic IP address**

The following modify-address-attribute examples modify the domain name attribute of an elastic IP address.

Linux:

```bash
aws ec2 modify-address-attribute \
   --allocation-id eipalloc-abcdef01234567890 \
   --domain-name example.com
```

Windows:

```bash
aws ec2 modify-address-attribute ^
   --allocation-id eipalloc-abcdef01234567890 ^
   --domain-name example.com
```

**Output:**

```json
{
}
```
To monitor the pending change and to view the modified attributes of an elastic IP address, see `describe-addresses-attribute` in the AWS CLI Command Reference.

- For API details, see `ModifyAddressAttribute` in AWS CLI Command Reference.

modify-availability-zone-group

The following code example shows how to use modify-availability-zone-group.

AWS CLI

To enable a zone group

The following modify-availability-zone-group example enables the specified zone group.

```
aws ec2 modify-availability-zone-group \
  --group-name us-west-2-lax-1 \
  --opt-in-status opted-in
```

Output:

```
{
  "Return": true
}
```

For more information, see Regions and Zones in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see `ModifyAvailabilityZoneGroup` in AWS CLI Command Reference.
modify-capacity-reservation-fleet

The following code example shows how to use `modify-capacity-reservation-fleet`.

**AWS CLI**

**Example 1: To modify the total target capacity of a Capacity Reservation Fleet**

The following `modify-capacity-reservation-fleet` example modifies the total target capacity of the specified Capacity Reservation Fleet. When you modify the total target capacity of a Capacity Reservation Fleet, the Fleet automatically creates new Capacity Reservations, or modifies or cancels existing Capacity Reservations in the Fleet to meet the new total target capacity. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```bash
aws ec2 modify-capacity-reservation-fleet \
    --capacity-reservation-fleet-id crf-01234567890abcdedf \
    --total-target-capacity 160
```

Output:

```json
{
   "Return": true
}
```

**Example 2: To modify the end date of a Capacity Reservation Fleet**

The following `modify-capacity-reservation-fleet` example modifies the end date of the specified Capacity Reservation Fleet. When you modify the end date for the Fleet, the end dates for all of the individual Capacity Reservations are updated accordingly. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```bash
aws ec2 modify-capacity-reservation-fleet \
    --capacity-reservation-fleet-id crf-01234567890abcdedf \
    --end-date 2022-07-04T23:59:59.000Z
```

Output:

```json
{
   "Return": true
}
```
modify-capacity-reservation

The following code example shows how to use modify-capacity-reservation.

AWS CLI

**Example 1: To change the number of instances reserved by an existing capacity reservation**

The following modify-capacity-reservation example changes the number of instances for which the capacity reservation reserves capacity.

```bash
aws ec2 modify-capacity-reservation
--capacity-reservation-id cr-1234abcd56EXAMPLE
--instance-count 5
```

Output:

```json
{
   "Return": true
}
```

**Example 2: To change the end date and time for an existing capacity reservation**

The following modify-capacity-reservation example modifies an existing capacity reservation to end at the specified date and time.

```bash
aws ec2 modify-capacity-reservation
--capacity-reservation-id cr-1234abcd56EXAMPLE
--end-date-type limited
--end-date 2019-08-31T23:59:59Z
```

For more information, see [Modifying a Capacity Reservation](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*. 

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](#) in the *Amazon EC2 User Guide*.

- For API details, see [ModifyCapacityReservationFleet](#) in *AWS CLI Command Reference*.  

```json
} 
```
modify-client-vpn-endpoint

The following code example shows how to use modify-client-vpn-endpoint.

**AWS CLI**

To modify a Client VPN endpoint

The following modify-client-vpn-endpoint example enables client connection logging for the specified Client VPN endpoint.

```bash
aws ec2 modify-client-vpn-endpoint \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
    --connection-log-options Enabled=true,CloudwatchLogGroup=ClientVPNLogs
```

Output:

```json
{
    "Return": true
}
```

For more information, see [Client VPN Endpoints](https://docs.aws.amazon.com/vpc/latest/clientvpn/administer-client-vpn-endpoints.html) in the *AWS Client VPN Administrator Guide*.

**modify-default-credit-specification**

The following code example shows how to use modify-default-credit-specification.

**AWS CLI**

To modify the default credit option

The following modify-default-credit-specification example modifies the default credit option for T2 instances.

```bash
aws ec2 modify-default-credit-specification \
    --instance-family t2 \
    --cpu-credits unlimited
```
Output:

```json
{
   "InstanceFamilyCreditSpecification": {
      "InstanceFamily": "t2",
      "CpuCredits": "unlimited"
   }
}
```

- For API details, see [ModifyDefaultCreditSpecification](#) in *AWS CLI Command Reference*.

modify-ebs-default-kms-key-id

The following code example shows how to use `modify-ebs-default-kms-key-id`.

**AWS CLI**

To set your default CMK for EBS encryption

The following modify-ebs-default-kms-key-id example sets the specified CMK as the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 modify-ebs-default-kms-key-id \
   --kms-key-id alias/my-cmk
```

Output:

```json
{
   "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see [ModifyEbsDefaultKmsKeyId](#) in *AWS CLI Command Reference*.

modify-fleet

The following code example shows how to use `modify-fleet`.

**AWS CLI**

To scale an EC2 Fleet
The following `modify-fleet` example modifies the target capacity of the specified EC2 Fleet. If the specified value is greater than the current capacity, the EC2 Fleet launches additional instances. If the specified value is less than the current capacity, the EC2 Fleet cancels any open requests and if the termination policy is `terminate`, the EC2 fleet terminates any instances that exceed the new target capacity.

```
aws ec2 modify-fleet \
   --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
   --target-capacity-specification TotalTargetCapacity=5
```

Output:

```
{
   "Return": true
}
```

For more information, see [Managing an EC2 Fleet](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/ecs-manage-fleets.html) in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see [ModifyFleet](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-fleet.html) in AWS CLI Command Reference.

### modify-fpga-image-attribute

The following code example shows how to use `modify-fpga-image-attribute`.

**AWS CLI**

**To modify the attributes of an Amazon FPGA image**

This example adds load permissions for account ID 123456789012 for the specified AFI.

Command:

```
aws ec2 modify-fpga-image-attribute --attribute loadPermission --fpga-image-id afi-0d123e123bfc85abc --load-permission Add=[{UserId=123456789012}]
```

Output:

```
{
   "FpgaImageAttribute": {
      "FpgaImageId": "afi-0d123e123bfc85abc",
```
modify-hosts

The following code example shows how to use `modify-hosts`.

**AWS CLI**

**Example 1: To enable auto-placement for a Dedicated Host**

The following `modify-hosts` example enables auto-placement for a Dedicated Host so that it accepts any untargeted instance launches that match its instance type configuration.

```
aws ec2 modify-hosts \
    --host-id h-06c2f189b4EXAMPLE \
    --auto-placement on
```

Output:

```
{
    "Successful": [
        "h-06c2f189b4EXAMPLE"
    ],
    "Unsuccessful": []
}
```

**Example 2: To enable host recovery for a Dedicated Host**

The following `modify-hosts` example enables host recovery for the specified Dedicated Host.

```
aws ec2 modify-hosts \
    --host-id h-06c2f189b4EXAMPLE \
    --host-recovery on
```
Output:

```json
{
   "Successful": [
      "h-06c2f189b4EXAMPLE"
   ],
   "Unsuccessful": []
}
```

For more information, see Modifying Dedicated Host Auto-Placement in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see ModifyHosts in AWS CLI Command Reference.

**modify-id-format**

The following code example shows how to use modify-id-format.

**AWS CLI**

**To enable the longer ID format for a resource**

The following modify-id-format example enables the longer ID format for the instance resource type.

```
aws ec2 modify-id-format \\n   --resource instance \\n   --use-long-ids
```

**To disable the longer ID format for a resource**

The following modify-id-format example disables the longer ID format for the instance resource type.

```
aws ec2 modify-id-format \\n   --resource instance \\n   --no-use-long-ids
```

The following modify-id-format example enables the longer ID format for all supported resource types that are within their opt-in period.
aws ec2 modify-id-format \
    --resource all-current \
    --use-long-ids

- For API details, see ModifyIdFormat in AWS CLI Command Reference.

modify-identity-id-format

The following code example shows how to use modify-identity-id-format.

AWS CLI

To enable an IAM role to use longer IDs for a resource

The following modify-identity-id-format example enables the IAM role EC2Role in your AWS account to use long ID format for the instance resource type.

aws ec2 modify-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:role/EC2Role \
    --resource instance \
    --use-long-ids

To enable an IAM user to use longer IDs for a resource

The following modify-identity-id-format example enables the IAM user AdminUser in your AWS account to use the longer ID format for the volume resource type.

aws ec2 modify-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
    --resource volume \
    --use-long-ids

The following modify-identity-id-format example enables the IAM user AdminUser in your AWS account to use the longer ID format for all supported resource types that are within their opt-in period.

aws ec2 modify-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
    --resource all-current \
    --use-long-ids
modify-image-attribute

The following code example shows how to use modify-image-attribute.

**AWS CLI**

**Example 1: To make an AMI public**

The following modify-instance-attribute example makes the specified AMI public.

```bash
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{Group=all}]"
```

This command produces no output.

**Example 2: To make an AMI private**

The following modify-instance-attribute example makes the specified AMI private.

```bash
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Remove=[{Group=all}]"
```

This command produces no output.

**Example 3: To grant launch permission to an AWS account**

The following modify-instance-attribute example grants launch permissions to the specified AWS account.

```bash
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{UserId=123456789012}]"
```

This command produces no output.
Example 4: To remove launch permission from an AWS account

The following modify-instance-attribute example removes launch permissions from the specified AWS account.

```bash
aws ec2 modify-image-attribute 
   --image-id ami-5731123e 
   --launch-permission "Remove=[{UserId=123456789012}]"
```

- For API details, see [ModifyImageAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-image-attribute.html) in *AWS CLI Command Reference*.

modify-instance-attribute

The following code example shows how to use modify-instance-attribute.

**AWS CLI**

Example 1: To modify the instance type

The following modify-instance-attribute example modifies the instance type of the specified instance. The instance must be in the stopped state.

```bash
aws ec2 modify-instance-attribute 
   --instance-id i-1234567890abcdef0 
   --instance-type 
   "{"Value": "m1.small"}"
```

This command produces no output.

Example 2: To enable enhanced networking on an instance

The following modify-instance-attribute example enables enhanced networking for the specified instance. The instance must be in the stopped state.

```bash
aws ec2 modify-instance-attribute 
   --instance-id i-1234567890abcdef0 
   --sriov-net-support simple
```

This command produces no output.

Example 3: To modify the sourceDestCheck attribute
The following `modify-instance-attribute` example sets the `sourceDestCheck` attribute of the specified instance to `true`. The instance must be in a VPC.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --source-dest-check 
  "{\"Value\": true}"
```

This command produces no output.

**Example 4: To modify the `deleteOnTermination` attribute of the root volume**

The following `modify-instance-attribute` example sets the `deleteOnTermination` attribute for the root volume of the specified Amazon EBS-backed instance to `false`. By default, this attribute is `true` for the root volume.

**Command:**

```
aws ec2 modify-instance-attribute 
  --instance-id i-1234567890abcdef0 
  --block-device-mappings 
  "[\{"DeviceName": "/dev/sda1",\"Ebs\": 
    \"DeleteOnTermination\":false\}]]"
```

This command produces no output.

**Example 5: To modify the user data attached to an instance**

The following `modify-instance-attribute` example adds the contents of the file `UserData.txt` as the `UserData` for the specified instance.

**Contents of original file `UserData.txt`:**

```
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

The contents of the file must be base64 encoded. The first command converts the text file to base64 and saves it as a new file.

**Linux/macOS version of the command:**

```
base64 UserData.txt > UserData.base64.txt
```
This command produces no output.

Windows version of the command:

```bash
certutil -encode UserData.txt tmp.b64 && findstr /v /c:- tmp.b64 > UserData.base64.txt
```

Output:

```
Input Length = 67
Output Length = 152
CertUtil: -encode command completed successfully.
```

Now you can reference that file in the CLI command that follows:

```bash
aws ec2 modify-instance-attribute \
    --instance-id=i-09b5a14dbca622e76 \
    --attribute userData --value file://UserData.base64.txt
```

This command produces no output.

For more information, see User Data and the AWS CLI in the EC2 User Guide.

- For API details, see ModifyInstanceAttribute in AWS CLI Command Reference.

modify-instance-capacity-reservation-attributes

The following code example shows how to use modify-instance-capacity-reservation-attributes.

AWS CLI

**Example 1: To modify an instance's capacity reservation targeting settings**

The following modify-instance-capacity-reservation-attributes example modifies a stopped instance to target a specific capacity reservation.

```bash
aws ec2 modify-instance-capacity-reservation-attributes \
    --instance-id i-EXAMPLE8765abcd4e \
    --capacity-reservation-specification
    'CapacityReservationTarget={CapacityReservationId= cr-1234abcd56EXAMPLE }'
```
Example 2: To modify an instance's capacity reservation targeting settings

The following modify-instance-capacity-reservation-attributes example modifies a stopped instance that targets the specified capacity reservation to launch in any capacity reservation that has matching attributes (instance type, platform, Availability Zone) and that has open instance matching criteria.

```bash
aws ec2 modify-instance-capacity-reservation-attributes \
   --instance-id i-EXAMPLE8765abcd4e \
   --capacity-reservation-specification 'CapacityReservationPreference=open'
```

Output:

```
{
   "Return": true
}
```

For more information, see [Modifying an Instance's Capacity Reservation Settings](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyInstanceCapacityReservationAttributes](#) in *AWS CLI Command Reference*.

**modify-instance-credit-specification**

The following code example shows how to use modify-instance-credit-specification.

**AWS CLI**

**To modify the credit option for CPU usage of an instance**

This example modifies the credit option for CPU usage of the specified instance in the specified region to "unlimited". Valid credit options are "standard" and "unlimited".

Command:
aws ec2 modify-instance-credit-specification --instance-credit-specification
"InstanceId=i-1234567890abcdef0,CpuCredits=unlimited"

Output:

```json
{
   "SuccessfulInstanceCreditSpecifications": [
      {
         "InstanceId": "i-1234567890abcdef0"
      }
   ],
   "UnsuccessfulInstanceCreditSpecifications": []
}
```

- For API details, see [ModifyInstanceCreditSpecification](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-credit-specification.html) in *AWS CLI Command Reference*.

modify-instance-event-start-time

The following code example shows how to use `modify-instance-event-start-time`.

**AWS CLI**

**To modify the event start time for an instance**

The following `modify-instance-event-start-time` command shows how to modify the event start time for the specified instance. Specify the event ID by using the `--instance-event-id` parameter. Specify the new date and time by using the `--not-before` parameter.

```bash
aws ec2 modify-instance-event-start-time --instance-id i-1234567890abcdef0
   --instance-event-id instance-event-0abcdef1234567890 --not-before
   2019-03-25T10:00:00.000
```

Output:

```json
"Event": {
   "InstanceEventId": "instance-event-0abcdef1234567890",
   "Code": "system-reboot",
   "Description": "scheduled reboot",
   "NotAfter": "2019-03-25T12:00:00.000Z",
   "NotBefore": "2019-03-25T10:00:00.000Z",
```
For more information, see Working with Instances Scheduled for Reboot in the *Amazon Elastic Compute Cloud User Guide*

- For API details, see [ModifyInstanceEventStartTime](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-event-start-time.html) in *AWS CLI Command Reference*.

**modify-instance-event-window**

The following code example shows how to use `modify-instance-event-window`.

**AWS CLI**

**Example 1: To modify the time range of an event window**

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 modify-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

**Output:**

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "TimeRanges": [
         {
            "StartWeekDay": "monday",
            "StartHour": 2,
            "EndWeekDay": "wednesday",
            "EndHour": 8
         }
      ],
      "Name": "myEventWindowName",
      "AssociationTarget": {
         "InstanceId": [

```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

Example 2: To modify a set of time ranges for an event window

The following modify-instance-event-window example modifies the time range of an event window. Specify the time-range parameter to modify the time range. You can't also specify the cron-expression parameter.

```
aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --time-range '[{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay": "wednesday", "EndHour": 8}, 
  {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday", "EndHour": 8}]'
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 3: To modify the cron expression of an event window**

The following modify-instance-event-window example modifies the cron expression of an event window. Specify the cron-expression parameter to modify the cron expression. You can't also specify the time-range parameter.

```
aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --cron-expression "* 21-23 * * 2,3"
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see ModifyInstanceEventWindow in AWS CLI Command Reference.

modify-instance-maintenance-options

The following code example shows how to use modify-instance-maintenance-options.

AWS CLI

Example 1: To disable the recovery behavior of an instance

The following modify-instance-maintenance-options example disables simplified automatic recovery for a running or stopped instance.

```
aws ec2 modify-instance-maintenance-options
   --instance-id i-0abcdef1234567890
```
--auto-recovery disabled

Output:

```
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "disabled"
}
```

For more information, see Recover your instance in the Amazon EC2 User Guide for Linux Instances.

**Example 2: To set the recovery behavior of an instance to default**

The following modify-instance-maintenance-options example sets the automatic recovery behavior to default which enables simplified automatic recovery for supported instance types.

```
aws ec2 modify-instance-maintenance-options \\
    --instance-id i-0abcdef1234567890 \\
    --auto-recovery default
```

Output:

```
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "default"
}
```

For more information, see Recover your instance in the Amazon EC2 User Guide for Linux Instances.

- For API details, see ModifyInstanceMaintenanceOptions in AWS CLI Command Reference.

**modify-instance-metadata-options**

The following code example shows how to use modify-instance-metadata-options.

**AWS CLI**

**Example 1: To enable IMDSv2**
The following modify-instance-metadata-options example configures the use of IMDSv2 on the specified instance.

```bash
aws ec2 modify-instance-metadata-options \
  --instance-id i-1234567898abcdef0 \
  --http-tokens required \
  --http-endpoint enabled
```

Output:

```
{
  "InstanceId": "i-1234567898abcdef0",
  "InstanceMetadataOptions": {
    "State": "pending",
    "HttpTokens": "required",
    "HttpPutResponseHopLimit": 1,
    "HttpEndpoint": "enabled"
  }
}
```

For more information, see Instance metadata and user data in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

**Example 2: To disable instance metadata**

The following modify-instance-metadata-options example disables the use of all versions of instance metadata on the specified instance.

```bash
aws ec2 modify-instance-metadata-options \
  --instance-id i-1234567898abcdef0 \
  --http-endpoint disabled
```

Output:

```
{
  "InstanceId": "i-1234567898abcdef0",
  "InstanceMetadataOptions": {
    "State": "pending",
    "HttpTokens": "required",
    "HttpPutResponseHopLimit": 1,
    "HttpEndpoint": "disabled"
  }
}
```
Example 3: To enable instance metadata IPv6 endpoint for your instance

The following `modify-instance-metadata-options` example shows you how to turn on the IPv6 endpoint for the instance metadata service.

```bash
aws ec2 modify-instance-metadata-options \
  --instance-id i-1234567898abcdef0 \
  --http-protocol-ipv6 enabled \
  --http-endpoint enabled
```

Output:

```json
{
  "InstanceId": "i-1234567898abcdef0",
  "InstanceMetadataOptions": {
    "State": "pending",
    "HttpTokens": "required",
    "HttpPutResponseHopLimit": 1,
    "HttpEndpoint": "enabled",
    "HttpProtocolIpv6": "enabled"
  }
}
```

By default, the IPv6 endpoint is disabled. This is true even if you have launched an instance into an IPv6-only subnet. The IPv6 endpoint for IMDS is only accessible on instances built on the Nitro System. For more information, see Instance metadata and user data in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see `ModifyInstanceMetadataOptions` in AWS CLI Command Reference.

modify-instance-placement

The following code example shows how to use `modify-instance-placement`.

AWS CLI

Example 1: To remove an instance's affinity with a Dedicated Host
The following `modify-instance-placement` example removes an instance's affinity with a Dedicated Host and enables it to launch on any available Dedicated Host in your account that supports its instance type.

```
aws ec2 modify-instance-placement \
   --instance-id i-0e6ddf6187EXAMPLE \
   --affinity default
```

Output:

```
{
   "Return": true
}
```

**Example 2: To establish affinity between an instance and the specified Dedicated Host**

The following `modify-instance-placement` example establishes a launch relationship between an instance and a Dedicated Host. The instance is only able to run on the specified Dedicated Host.

```
aws ec2 modify-instance-placement \
   --instance-id i-0e6ddf6187EXAMPLE \
   --affinity host \
   --host-id i-0e6ddf6187EXAMPLE
```

Output:

```
{
   "Return": true
}
```

**Example 3: To move an instance to a placement group**

The following `modify-instance-placement` example moves an instance to a placement group, stop the instance, modify the instance placement, and then restart the instance.

```
aws ec2 stop-instances \
```
--instance-ids i-0123a456700123456

aws ec2 modify-instance-placement
   --instance-id i-0123a456700123456
   --group-name MySpreadGroup

aws ec2 start-instances
   --instance-ids i-0123a456700123456

For more information, see Changing the Placement Group for an Instance in the Amazon Elastic Compute Cloud Users Guide.

Example 4: To remove an instance from a placement group

The following modify-instance-placement example removes an instance from a placement group by stopping the instance, modifying the instance placement, and then restarting the instance. The following example specifies an empty string (""") for the placement group name to indicate that the instance is not to be located in a placement group.

Stop the instance:

aws ec2 stop-instances
   --instance-ids i-0123a456700123456

Modify the placement (Windows Command Prompt, Linux, and macOS):

aws ec2 modify-instance-placement
   --instance-id i-0123a456700123456
   --group-name ""

Modify the placement (Windows PowerShell):

aws ec2 modify-instance-placement`
   --instance-id i-0123a456700123456`
   --group-name """"

Restart the instance:

aws ec2 start-instances`
   --instance-ids i-0123a456700123456`
Output:

```json
{
  "Return": true
}
```

For more information, see Modifying Instance Tenancy and Affinity in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see ModifyInstancePlacement in AWS CLI Command Reference.

modify-ipam-pool

The following code example shows how to use modify-ipam-pool.

**AWS CLI**

**To modify an IPAM pool**

The following modify-ipam-pool example modifies an IPAM pool.

(Linux):

```bash
aws ec2 modify-ipam-pool \
  --ipam-pool-id ipam-pool-0533048da7d823723 \
  --add-allocation-resource-tags "Key=Owner,Value=Build Team" \
  --clear-allocation-default-netmask-length \
  --allocation-min-netmask-length 14
```

(Windows):

```bash
aws ec2 modify-ipam-pool ^
  --ipam-pool-id ipam-pool-0533048da7d823723 ^
  --add-allocation-resource-tags "Key=Owner,Value=Build Team" ^
  --clear-allocation-default-netmask-length ^
  --allocation-min-netmask-length 14
```

Output:

```json
{
}
```
"IpamPool": {
    "OwnerId": "123456789012",
    "IpamPoolId": "ipam-pool-0533048da7d823723",
    "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-pool-0533048da7d823723",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
    "IpamScopeType": "private",
    "IpamArn": "arn:aws:ec2::123456789012:ipam-ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "Locale": "None",
    "PoolDepth": 1,
    "State": "modify-complete",
    "AutoImport": true,
    "AddressFamily": "ipv4",
    "AllocationMinNetmaskLength": 14,
    "AllocationMaxNetmaskLength": 26,
    "AllocationResourceTags": [
        {
            "Key": "Environment",
            "Value": "Preprod"
        },
        {
            "Key": "Owner",
            "Value": "Build Team"
        }
    ]
}

For more information, see [Edit a pool](#) in the [Amazon VPC IPAM User Guide](#).

- For API details, see [ModifyIpamPool](#) in [AWS CLI Command Reference](#).

**modify-ipam-resource-cidr**

The following code example shows how to use `modify-ipam-resource-cidr`.

**AWS CLI**

**To modify the CIDR allocated to a resource**

The following `modify-ipam-resource-cidr` example modifies a resource CIDR.
(Linux):

```
aws ec2 modify-ipam-resource-cidr \
  --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
  --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 \
  --resource-id vpc-010e1791024eb0af9 \
  --resource-cidr 10.0.1.0/24 \
  --resource-region us-east-1 \
  --monitored
```

(Windows):

```
aws ec2 modify-ipam-resource-cidr ^
  --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
  --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 ^
  --resource-id vpc-010e1791024eb0af9 ^
  --resource-cidr 10.0.1.0/24 ^
  --resource-region us-east-1 ^
  --monitored
```

Output:

```
{
   "IpamResourceCidr": {
      "IpamId": "ipam-08440e7a3acde3908",
      "IpamScopeId": "ipam-scope-0da34c61fd189a141",
      "IpamPoolId": "ipam-pool-0533048da7d823723",
      "ResourceRegion": "us-east-1",
      "ResourceOwnerId": "123456789012",
      "ResourceId": "vpc-010e1791024eb0af9",
      "ResourceCidr": "10.0.1.0/24",
      "ResourceType": "vpc",
      "ResourceTags": [
         {
            "Key": "Environment",
            "Value": "Preprod"
         },
         {
            "Key": "Owner",
            "Value": "Build Team"
         }
      ],
   }
}
```
For more information on moving resources, see Move resource CIDRs between scopes in the Amazon VPC IPAM User Guide.

For more information on changing monitoring states, see Change the monitoring state of resource CIDRs in the Amazon VPC IPAM User Guide.

- For API details, see ModifyIpamResourceCidr in AWS CLI Command Reference.

modify-ipam

The following code example shows how to use modify-ipam.

AWS CLI

To modify an IPAM

The following modify-ipam example modifies an IPAM by adding an Operating Region.

(Linux):

```bash
aws ec2 modify-ipam \
  --ipam-id ipam-08440e7a3acde3908 \
  --add-operating-regions RegionName=us-west-2
```

(Windows):

```bash
aws ec2 modify-ipam ^
  --ipam-id ipam-08440e7a3acde3908 ^
  --add-operating-regions RegionName=us-west-2
```

Output:

```json
{
  "IpUsage": 0.0,
  "ComplianceStatus": "noncompliant",
  "ManagementState": "managed",
  "OverlapStatus": "overlapping",
  "VpcId": "vpc-010e1791024eb0af9"
}
```
"Ipam": {
    "OwnerId": "123456789012",
    "IpamId": "ipam-08440e7a3acde3908",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
    "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
    "ScopeCount": 3,
    "OperatingRegions": [
        {
            "RegionName": "us-east-1"
        },
        {
            "RegionName": "us-east-2"
        },
        {
            "RegionName": "us-west-1"
        },
        {
            "RegionName": "us-west-2"
        }
    ],
    "State": "modify-in-progress"
}

- For API details, see ModifyIpam in AWS CLI Command Reference.

**modify-launch-template**

The following code example shows how to use modify-launch-template.

**AWS CLI**

**To change the default launch template version**

This example specifies version 2 of the specified launch template as the default version.

**Command:**

```bash
aws ec2 modify-launch-template --launch-template-id lt-0abcd290751193123 --default-version 2
```
Output:

```
{
    "LaunchTemplate": {
        "LatestVersionNumber": 2,
        "LaunchTemplateId": "lt-0abcd290751193123",
        "LaunchTemplateName": "WebServers",
        "DefaultVersionNumber": 2,
        "CreatedBy": "arn:aws:iam::123456789012:root",
        "CreateTime": "2017-12-01T13:35:46.000Z"
    }
}
```

- For API details, see [ModifyLaunchTemplate](aws-cli-modify-managed-prefix-list) in [AWS CLI Command Reference](aws-cli-modify-managed-prefix-list).

**modify-managed-prefix-list**

The following code example shows how to use `modify-managed-prefix-list`.

**AWS CLI**

**To modify a prefix list**

The following `modify-managed-prefix-list` example adds an entry to the specified prefix list.

```
aws ec2 modify-managed-prefix-list \
    --prefix-list-id pl-0123456abcabcabc1 \
    --add-entries Cidr=10.1.0.0/16,Description=vpc-c \
    --current-version 1
```

**Output:**

```
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "modify-in-progress",
        "PrefixListName": "vpc-cidrs",
    }
}
```
For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see ModifyManagedPrefixList in AWS CLI Command Reference.

modify-network-interface-attribute

The following code example shows how to use modify-network-interface-attribute.

AWS CLI

To modify the attachment attribute of a network interface

This example command modifies the attachment attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --attachment AttachmentId=eni-attach-43348162,DeleteOnTermination=false
```

To modify the description attribute of a network interface

This example command modifies the description attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --description "My description"
```

To modify the groupSet attribute of a network interface

This example command modifies the groupSet attribute of the specified network interface.

Command:
To modify the sourceDestCheck attribute of a network interface

This example command modifies the sourceDestCheck attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --groups sg-903004f8 sg-1a2b3c4d
```

For API details, see `ModifyNetworkInterfaceAttribute` in AWS CLI Command Reference.

modify-private-dns-name-options

The following code example shows how to use modify-private-dns-name-options.

AWS CLI

To modify the options for instance hostnames

The following modify-private-dns-name-options example disables the option to respond to DNS queries for instance hostnames with DNS A records.

```
aws ec2 modify-private-dns-name-options \\
   --instance-id i-1234567890abcdef0 \\
   --no-enable-resource-name-dns-a-record
```

Output:

```
{
   "Return": true
}
```

For more information, see Amazon EC2 instance hostname types in the Amazon EC2 User Guide.

For API details, see `ModifyPrivateDnsNameOptions` in AWS CLI Command Reference.
modify-reserved-instances

The following code example shows how to use modify-reserved-instances.

AWS CLI

To modify Reserved Instances

This example command moves a Reserved Instance to another Availability Zone in the same region.

Command:

aws ec2 modify-reserved-instances --reserved-instances-ids b847fa93-e282-4f55-b59a-1342f5bd7c02 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Class,InstanceCount=10

Output:

{  "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687" }

To modify the network platform of Reserved Instances

This example command converts EC2-Class Reserved Instances to EC2-VPC.

Command:

aws ec2 modify-reserved-instances --reserved-instances-ids f127bd27-edb7-44c9-a0eb-0d7e09259af0 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-VPC,InstanceCount=5

Output:

{  "ReservedInstancesModificationId": "rimod-82fa9020-668f-4fb6-945d-61537009d291" }

For more information, see Modifying Your Reserved Instances in the Amazon EC2 User Guide.
To modify the instance size of Reserved Instances

This example command modifies a Reserved Instance that has 10 m1.small Linux/UNIX instances in us-west-1c so that 8 m1.small instances become 2 m1.large instances, and the remaining 2 m1.small become 1 m1.medium instance in the same Availability Zone. Command:

```bash
aws ec2 modify-reserved-instances --reserved-instances-ids 1ba8e2e3-3556-4264-949e-63ee671405a9 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=2,InstanceType=m1.large AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=1,InstanceType=m1.medium
```

Output:

```json
{
    "ReservedInstancesModificationId": "rimod-acc5f240-080d-4717-b3e3-1c6b11fa00b6"
}
```

For more information, see Modifying the Instance Size of Your Reservations in the Amazon EC2 User Guide.

- For API details, see ModifyReservedInstances in AWS CLI Command Reference.

modify-security-group-rules

The following code example shows how to use modify-security-group-rules.

AWS CLI

To modify a security group rules to update the rule description, the IP protocol, and the CidrIpv4 address range

The following modify-security-group-rules example updates the description, the IP protocol, and the IPV4 CIDR range of a specified security group rule. Use the security-group-rules parameter to enter the updates for the specified security group rules. -1 specifies all protocols.

```bash
aws ec2 modify-security-group-rules \
    --group-id sg-1234567890abcdef0 \
    --security-group-rules SecurityGroupRuleId=sgr-abcdef01234567890,SecurityGroupRule='{
            "Description": "test",
            "IpProtocol": -1,
            "CidrIpv4": "0.0.0.0/0"
        }'
```
Output:

```json
{
   "Return": true
}
```

For more information about security group rules, see [Security group rules](#) in the *Amazon EC2 User Guide*.

- For API details, see [ModifySecurityGroupRules](#) in *AWS CLI Command Reference*.

**modify-snapshot-attribute**

The following code example shows how to use `modify-snapshot-attribute`.

**AWS CLI**

**Example 1: To modify a snapshot attribute**

The following `modify-snapshot-attribute` example updates the `createVolumePermission` attribute for the specified snapshot, removing volume permissions for the specified user.

```bash
aws ec2 modify-snapshot-attribute \
   --snapshot-id snap-1234567890abcdef0 \
   --attribute createVolumePermission \
   --operation-type remove \
   --user-ids 123456789012
```

**Example 2: To make a snapshot public**

The following `modify-snapshot-attribute` example makes the specified snapshot public.

```bash
aws ec2 modify-snapshot-attribute \
   --snapshot-id snap-1234567890abcdef0 \
   --attribute createVolumePermission \
   --operation-type add \
   --group-names all
```

- For API details, see [ModifySnapshotAttribute](#) in *AWS CLI Command Reference*. 
modify-snapshot-tier

The following code example shows how to use modify-snapshot-tier.

AWS CLI

Example 1: To archive a snapshot

The following modify-snapshot-tier example archives the specified snapshot.

```
aws ec2 modify-snapshot-tier \
  --snapshot-id snap-01234567890abcedf \
  --storage-tier archive
```

Output:

```
{
  "SnapshotId": "snap-01234567890abcedf",
  "TieringStartTime": "2021-09-15T16:44:37.574Z"
}
```

The TieringStartTime response parameter indicates the date and time at which the archive process was started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

For more information about snapshot archiving, see Archive Amazon EBS snapshots in the Amazon EC2 User Guide.

- For API details, see ModifySnapshotTier in AWS CLI Command Reference.

modify-spot-fleet-request

The following code example shows how to use modify-spot-fleet-request.

AWS CLI

To modify a Spot fleet request

This example command updates the target capacity of the specified Spot fleet request.

Command:

```
aws ec2 modify-spot-fleet-request --target-capacity 20 --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```
This example command decreases the target capacity of the specified Spot fleet request without terminating any Spot Instances as a result.

**Command:**

```
aws ec2 modify-spot-fleet-request --target-capacity 10 --excess-capacity-termination-policy NoTermination --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

**Output:**

```
{
   "Return": true
}
```

- For API details, see [ModifySpotFleetRequest](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-spot-fleet-request.html) in *AWS CLI Command Reference*.

### modify-subnet-attribute

The following code example shows how to use `modify-subnet-attribute`.

**AWS CLI**

**To change a subnet's public IPv4 addressing behavior**

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned a public IPv4 address. If the command succeeds, no output is returned.

**Command:**

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --map-public-ip-on-launch
```

**To change a subnet's IPv6 addressing behavior**
This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned an IPv6 address from the range of the subnet.

Command:

```bash
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --assign-ipv6-address-on-creation
```

For more information, see IP Addressing in Your VPC in the *AWS Virtual Private Cloud User Guide*.

- For API details, see [ModifySubnetAttribute](#) in *AWS CLI Command Reference*.

### modify-traffic-mirror-filter-network-services

The following code example shows how to use `modify-traffic-mirror-filter-network-services`.

**AWS CLI**

**To add network services to a Traffic Mirror filter**

The following `modify-traffic-mirror-filter-network-services` example adds the Amazon DNS network services to the specified filter.

```bash
aws ec2 modify-traffic-mirror-filter-network-services \
--traffic-mirror-filter-id tmf-04812ff784EXAMPLE \
--add-network-service amazon-dns
```

Output:

```json
{
   "TrafficMirrorFilter": {
      "Tags": [
         {
            "Key": "Name",
            "Value": "Production"
         }
      ],
      "EgressFilterRules": [],
      "NetworkServices": [
```
With the `modify-traffic-mirror-filter-rule` command, you can update the description of a specified traffic mirror filter rule. The following example demonstrates this:

```bash
aws ec2 modify-traffic-mirror-filter-rule \
  --traffic-mirror-filter-rule-id tmfr-0ca76e008EXAMPLE \
  --description "TCP Rule"
```

Upon execution, you will see an output indicating the successful modification of the traffic mirror filter rule, including the updated description.

This command allows for fine-grained control over traffic mirror rules directly from the AWS CLI, enabling efficient network management without needing to navigate through the AWS Management Console.

For more information, consult the `Modify Traffic Mirror Filter Network Services` section in the AWS Traffic Mirroring Guide. Additionally, the `ModifyTrafficMirrorFilterNetworkServices` documentation is available in the `AWS CLI Command Reference`.
"TrafficMirrorFilterRule": {
    "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
    "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
    "TrafficDirection": "ingress",
    "RuleNumber": 100,
    "RuleAction": "accept",
    "Protocol": 6,
    "DestinationCidrBlock": "10.0.0.0/24",
    "SourceCidrBlock": "10.0.0.0/24",
    "Description": "TCP Rule"
}

For more information, see Modify Your Traffic Mirror Filter Rules in the AWS Traffic Mirroring Guide.

- For API details, see ModifyTrafficMirrorFilterRule in AWS CLI Command Reference.

modify-traffic-mirror-session

The following code example shows how to use modify-traffic-mirror-session.

AWS CLI

To modify a traffic mirror session

The following modify-traffic-mirror-session example changes the traffic mirror session description and the number of packets to mirror.

aws ec2 modify-traffic-mirror-session \
    --description "Change packet length" \
    --traffic-mirror-session-id tms-08a33b1214EXAMPLE \
    --remove-fields "packet-length"

Output:

{
    "TrafficMirrorSession": {
        "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
        "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "NetworkInterfaceId": "eni-070203f901EXAMPLE",
        "Description": "TCP Rule"
    }
}
modify-transit-gateway-prefix-list-reference

The following code example shows how to use modify-transit-gateway-prefix-list-reference.

AWS CLI

To modify a reference to a prefix list

The following modify-transit-gateway-prefix-list-reference example modifies the prefix list reference in the specified route table by changing the attachment to which traffic is routed.

```
aws ec2 modify-transit-gateway-prefix-list-reference \
  --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
  --prefix-list-id pl-11111122222222333 \
  --transit-gateway-attachment-id tgw-attach-aabbccdaabbcaab
```

Output:

```
{
  "TransitGatewayPrefixListReference": {
    "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
    "PrefixListId": "pl-11111122222222333",
    "PrefixListOwnerId": "123456789012",
    "State": "modifying",
    "Blackhole": false,
    "TransitGatewayAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-aabbccdaabbcaab",
      "ResourceType": "vpc",
```
modify-transit-gateway-vpc-attachment

The following code example shows how to use modify-transit-gateway-vpc-attachment.

**AWS CLI**

To modify a transit gateway VPC attachment

The following modify-transit-gateway-vpc-attachment example adds a subnet to the specified transit gateway VPC attachment.

```bash
aws ec2 modify-transit-gateway-vpc-attachment \
   --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE \
   --add-subnet-ids subnet-0e51f45802EXAMPLE
```

Output:

```json
{
   "TransitGatewayVpcAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-09fbd47ddfEXAMPLE",
      "TransitGatewayId": "tgw-0560315ccfEXAMPLE",
      "VpcId": "vpc-5ecc927",
      "VpcOwnerId": "111122223333",
      "State": "modifying",
      "SubnetIds": ["subnet-0e51f45802EXAMPLE",
                     "subnet-1EXAMPLE"
      ],
      "CreationTime": "2019-08-08T16:47:38.000Z",
      "Options": {
                     "DnsSupport": "enable",
                     "Ipv6Support": "disable"
      }
   }
}
```
modify-transit-gateway

The following code example shows how to use `modify-transit-gateway`.

**AWS CLI**

**To modify a transit gateway**

The following `modify-transit-gateway` example modifies the specified transit gateway by enabling ECMP support for VPN attachments.

```
aws ec2 modify-transit-gateway \\n    --transit-gateway-id tgw-111111222222aaaaa \\n    --options VpnEcmpSupport=enable
```

Output:

```
{
    "TransitGateway": {
        "TransitGatewayId": "tgw-111111222222aaaaa",
        "TransitGatewayArn": "64512",
        "State": "modifying",
        "OwnerId": "123456789012",
        "CreationTime": "2020-04-30T08:41:37.000Z",
        "Options": {
            "AmazonSideAsn": 64512,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-0123456789abcd123",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-0123456789abcd123",
            "VpnEcmpSupport": "enable",
            "DnsSupport": "enable"
        }
    }
}
```
modify-verified-access-endpoint-policy

The following code example shows how to use modify-verified-access-endpoint-policy.

AWS CLI

To configure the Verified Access policy for an endpoint

The following modify-verified-access-endpoint-policy example adds the specified Verified Access policy to the specified Verified Access endpoint.

```
aws ec2 modify-verified-access-endpoint-policy \
  --verified-access-endpoint-id vae-066fac616d4d546f2 \
  --policy-enabled \ 
  --policy-document file://policy.txt
```

Contents of policy.txt:

```
permit(principal,action,resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true
};
```

Output:

```
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true\n};"
}
```

For more information, see Verified Access policies in the AWS Verified Access User Guide.

• For API details, see ModifyVerifiedAccessEndpointPolicy in AWS CLI Command Reference.
modify-verified-access-endpoint

The following code example shows how to use modify-verified-access-endpoint.

AWS CLI

To modify the configuration of a Verified Access endpoint

The following modify-verified-access-endpoint example adds the specified description to the specified Verified Access endpoint.

```bash
aws ec2 modify-verified-access-endpoint \
   --verified-access-endpoint-id vae-066fac616d4d546f2 \
   --description "Testing Verified Access"
```

Output:

```json
{
   "VerifiedAccessEndpoint": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
      "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
      "ApplicationDomain": "example.com",
      "EndpointType": "network-interface",
      "AttachmentType": "vpc",
      "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
      "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
      "SecurityGroupIds": ["sg-004915970c4c8f13a"],
      "NetworkInterfaceOptions": {
         "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
         "Protocol": "https",
         "Port": 443
      },
      "Status": {
         "Code": "updating"
      },
      "Description": "Testing Verified Access",
      "CreationTime": "2023-08-25T20:54:43",
```

Actions and scenarios
For more information, see [Verified Access endpoints](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessEndpoint](#) in *AWS CLI Command Reference*.

**modify-verified-access-group-policy**

The following code example shows how to use `modify-verified-access-group-policy`.

**AWS CLI**

**To configure a Verified Access policy for a group**

The following `modify-verified-access-group-policy` example adds the specified Verified Access policy to the specified Verified Access group.

```bash
aws ec2 modify-verified-access-group-policy \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --policy-enabled \
    --policy-document file://policy.txt
```

**Contents of policy.txt:**

```acl
permit(principal,action,resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true
};
```

**Output:**

```json
{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true
};"
}
```
modify-verified-access-group

The following code example shows how to use modify-verified-access-group.

AWS CLI

To modify the configuration of a Verified Access group

The following modify-verified-access-group example adds the specified description to the specified Verified Access group.

```bash
aws ec2 modify-verified-access-group \
   --verified-access-group-id vagr-0dbe967baf14b7235 \
   --description "Testing Verified Access"
```

Output:

```json
{
   "VerifiedAccessGroup": {
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "Owner": "123456789012",
      "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
      "CreationTime": "2023-08-25T19:55:19",
      "LastUpdatedTime": "2023-08-25T22:17:25"
   }
}
```

modify-verified-access-instance-logging-configuration

The following code example shows how to use modify-verified-access-instance-logging-configuration.

For more information, see Verified Access groups in the AWS Verified Access User Guide.

- For API details, see ModifyVerifiedAccessGroupPolicy in AWS CLI Command Reference.

modify-verified-access-instance-logging-configuration

The following code example shows how to use modify-verified-access-instance-logging-configuration.

For more information, see Verified Access groups in the AWS Verified Access User Guide.

- For API details, see ModifyVerifiedAccessGroup in AWS CLI Command Reference.
To enable logging for a Verified Access instance

The following modify-verified-access-instance-logging-configuration example enables access logging for the specified Verified Access instance. The logs will be delivered to the specified CloudWatch Logs log group.

```
aws ec2 modify-verified-access-instance-logging-configuration \
    --verified-access-instance-id vai-0ce000c0b7643abea \
    --access-logs CloudWatchLogs={Enabled=true,LogGroup=my-log-group}
```

Output:

```
{
    "LoggingConfiguration": {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "AccessLogs": {
            "S3": {  
                "Enabled": false
            },
            "CloudWatchLogs": {
                "Enabled": true,
                "DeliveryStatus": {
                    "Code": "success"
                },
                "LogGroup": "my-log-group"
            },
            "KinesisDataFirehose": {
                "Enabled": false
            },
            "LogVersion": "ocsf-1.0.0-rc.2",
            "IncludeTrustContext": false
        }
    }
}
```

For more information, see [Verified Access logs](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-logs.html) in the [AWS Verified Access User Guide](https://docs.aws.amazon.com/verified-access/latest/userguide/).

modify-verified-access-instance

The following code example shows how to use modify-verified-access-instance.

**AWS CLI**

To modify the configuration of a Verified Access instance

The following modify-verified-access-instance example adds the specified description to the specified Verified Access instance.

```bash
aws ec2 modify-verified-access-instance \
  --verified-access-instance-id vai-0ce000c0b7643abea \
  --description "Testing Verified Access"
```

Output:

```json
{
  "VerifiedAccessInstance": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "Description": "Testing Verified Access",
    "VerifiedAccessTrustProviders": [
      {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center"
      }
    ],
    "CreationTime": "2023-08-25T18:27:56",
    "LastUpdatedTime": "2023-08-25T22:41:04"
  }
}
```

For more information, see [Verified Access instances](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-instances.html) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessInstance](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-verified-access-instance.html) in *AWS CLI Command Reference*.

modify-verified-access-trust-provider

The following code example shows how to use modify-verified-access-trust-provider.
AWS CLI

To modify the configuration of a Verified Access trust provider

The following modify-verified-access-trust-provider example adds the specified description to the specified Verified Access trust provider.

```bash
aws ec2 modify-verified-access-trust-provider \
    --verified-access-trust-provider-id vatp-0bb32de759a3e19e7 \
    --description "Testing Verified Access"
```

Output:

```
{
    "VerifiedAccessTrustProvider": {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "Description": "Testing Verified Access",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center",
        "PolicyReferenceName": "idc",
        "CreationTime": "2023-08-25T19:00:38",
        "LastUpdatedTime": "2023-08-25T19:18:21"
    }
}
```

For more information, see [Trust providers for Verified Access](https://docs.aws.amazon.com/verified-access/latest/userguide/trust-providers.html) in the AWS Verified Access User Guide.

modify-volume-attribute

The following code example shows how to use modify-volume-attribute.

AWS CLI

To modify a volume attribute

This example sets the autoEnableIo attribute of the volume with the ID `vol-1234567890abcdef0` to `true`. If the command succeeds, no output is returned.

Command:
aws ec2 modify-volume-attribute --volume-id vol-1234567890abcdef0 --auto-enable-io

- For API details, see ModifyVolumeAttribute in AWS CLI Command Reference.

modify-volume

The following code example shows how to use modify-volume.

AWS CLI

Example 1: To modify a volume by changing its size

The following modify-volume example changes the size of the specified volume to 150GB.

Command:

```bash
aws ec2 modify-volume --size 150 --volume-id vol-1234567890abcdef0
```

Output:

```json
{
   "VolumeModification": {
      "TargetSize": 150,
      "TargetVolumeType": "io1",
      "ModificationState": "modifying",
      "VolumeId": "vol-1234567890abcdef0",
      "TargetIops": 100,
      "StartTime": "2019-05-17T11:27:19.000Z",
      "Progress": 0,
      "OriginalVolumeType": "io1",
      "OriginalIops": 100,
      "OriginalSize": 100
   }
}
```

Example 2: To modify a volume by changing its type, size, and IOPS value

The following modify-volume example changes the volume type to Provisioned IOPS SSD, sets the target IOPS rate to 10000, and sets the volume size to 350GB.

```bash
aws ec2 modify-volume \
   --volume-type io1 \
```
modify-vpc-attribute

The following code example shows how to use modify-vpc-attribute.

AWS CLI

**To modify the enableDnsSupport attribute**

This example modifies the enableDnsSupport attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is true, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not. If the command succeeds, no output is returned.

Command:

```bash/aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-support "{"Value":false}"
```

**To modify the enableDnsHostnames attribute**
This example modifies the enableDnsHostnames attribute. This attribute indicates whether instances launched in the VPC get DNS hostnames. If this attribute is true, instances in the VPC get DNS hostnames; otherwise, they do not. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-hostnames "{"Value ":false}"
```

- For API details, see ModifyVpcAttribute in AWS CLI Command Reference.

modify-vpc-endpoint-connection-notification

The following code example shows how to use modify-vpc-endpoint-connection-notification.

AWS CLI

To modify an endpoint connection notification

This example changes the SNS topic for the specified endpoint connection notification.

Command:

```bash
```

Output:

```json
{
   "ReturnValue": true
}
```

- For API details, see ModifyVpcEndpointConnectionNotification in AWS CLI Command Reference.

modify-vpc-endpoint-service-configuration

The following code example shows how to use modify-vpc-endpoint-service-configuration.
To modify an endpoint service configuration

This example changes the acceptance requirement for the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-configuration --service-id vpce-svc-09222513e6e77dc86 --no-acceptance-required
```

Output:

```
{
   "ReturnValue": true
}
```

- For API details, see [ModifyVpcEndpointServiceConfiguration](#) in *AWS CLI Command Reference*.

modify-vpc-endpoint-service-payer-responsibility

The following code example shows how to use `modify-vpc-endpoint-service-payer-responsibility`.

AWS CLI

To modify the payer responsibility

The following `modify-vpc-endpoint-service-payer-responsibility` example modifies the payer responsibility of the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-payer-responsibility \
   --service-id vpce-svc-071afff70666e61e0 \
   --payer-responsibility ServiceOwner
```

This command produces no output.

- For API details, see [ModifyVpcEndpointServicePayerResponsibility](#) in *AWS CLI Command Reference*. 
modify-vpc-endpoint-service-permissions

The following code example shows how to use modify-vpc-endpoint-service-permissions.

AWS CLI

To modify endpoint service permissions

This example adds permission for an AWS account to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals "["arn:aws:iam::123456789012:root"]"
```

Output:

```
{
   "ReturnValue": true
}
```

This example adds permission for a specific IAM user (admin) to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals "["arn:aws:iam::123456789012:user/admin"]"
```

- For API details, see ModifyVpcEndpointServicePermissions in AWS CLI Command Reference.

modify-vpc-endpoint

The following code example shows how to use modify-vpc-endpoint.

AWS CLI

To modify a gateway endpoint

This example modifies gateway endpoint vpce-1a2b3c4d by associating route table rtb-aaa222bb with the endpoint, and resetting the policy document.
Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-1a2b3c4d --add-route-table-ids rtb-aaa222bb --reset-policy
```

Output:

```
{
  "Return": true
}
```

To modify an interface endpoint

This example modifies interface endpoint `vpce-0fe5b17a0707d6fa5` by adding subnet `subnet-d6fcaa8d` to the endpoint.

Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-0fe5b17a0707d6fa5 --add-subnet-id subnet-d6fcaa8d
```

Output:

```
{
  "Return": true
}
```

- For API details, see [ModifyVpcEndpoint](#) in [AWS CLI Command Reference](#).

**modify-vpc-peering-connection-options**

The following code example shows how to use `modify-vpc-peering-connection-options`.

**AWS CLI**

To enable communication over a VPC peering connection from your local ClassicLink connection

In this example, for peering connection `pcx-aaaabbb`, the owner of the requester VPC modifies the VPC peering connection options to enable a local ClassicLink connection to communicate with the peer VPC.
Command:
```bash
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --requester-peering-connection-options AllowEgressFromLocalClassicLinkToRemoteVpc=true
```

Output:
```json
{
   "RequesterPeeringConnectionOptions": {
      "AllowEgressFromLocalClassicLinkToRemoteVpc": true
   }
}
```

**To enable communication over a VPC peering connection from your local VPC to a remote ClassicLink connection**

In this example, the owner of the accepter VPC modifies the VPC peering connection options to enable the local VPC to communicate with the ClassicLink connection in the peer VPC.

Command:
```bash
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --accepter-peering-connection-options AllowEgressFromLocalVpcToRemoteClassicLink=true
```

Output:
```json
{
   "AccepterPeeringConnectionOptions": {
      "AllowEgressFromLocalVpcToRemoteClassicLink": true
   }
}
```

**To enable DNS resolution support for the VPC peering connection**

In this example, the owner of the requester VPC modifies the VPC peering connection options for `pcx-aaaabbbb` to enable the local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.
Command:

```
```

Output:

```
{
   "RequesterPeeringConnectionOptions": {
      "AllowDnsResolutionFromRemoteVpc": true
   }
}
```

- For API details, see [ModifyVpcPeeringConnectionOptions](#) in *AWS CLI Command Reference*.

### modify-vpc-tenancy

The following code example shows how to use `modify-vpc-tenancy`.

**AWS CLI**

**To modify the tenancy of a VPC**

This example modifies the tenancy of VPC `vpc-1a2b3c4d` to `default`.

Command:

```
aws ec2 modify-vpc-tenancy --vpc-id vpc-1a2b3c4d --instance-tenancy default
```

Output:

```
{
   "Return": true
}
```

- For API details, see [ModifyVpcTenancy](#) in *AWS CLI Command Reference*.

### modify-vpn-connection-options

The following code example shows how to use `modify-vpn-connection-options`.

Actions and scenarios
AWS CLI

**To modify your VPN connection options**

The following `modify-vpn-connection-options` example modifies the local IPv4 CIDR on the customer gateway side of the specified VPN connection.

```bash
code
aws ec2 modify-vpn-connection-options \
   --vpn-connection-id vpn-1122334455aabbccd \
   --local-ipv4-network-cidr 10.0.0.0/16
```

**Output:**

```json
{
   "VpnConnections": [
      {
         "CustomerGatewayConfiguration": "...configuration information...",
         "CustomerGatewayId": "cgw-01234567abcde1234",
         "Category": "VPN",
         "State": "modifying",
         "Type": "ipsec.1",
         "VpnConnectionId": "vpn-1122334455aabbccd",
         "TransitGatewayId": "tgw-00112233445566aab",
         "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": true,
            "LocalIpv4NetworkCidr": "10.0.0.0/16",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4"
         },
         "Routes": [],
         "Tags": [
            {
               "Key": "Name",
               "Value": "CanadaVPN"
            }
         ],
         "VgwTelemetry": [
            {
               "AcceptedRouteCount": 0,
               "LastStatusChange": "2020-07-29T10:35:11.000Z",
               "OutsideIpAddress": "203.0.113.3",
               "Status": "DOWN"
            }
         ]
      }
   ]
}
```
AWS Command Line Interface

For more information, see [Modifying Site-to-Site VPN connection options](https://docs.aws.amazon.com/AWSEC2/latest/userguide/site-to-site-vpn.html) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [ModifyVpnConnectionOptions](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-vpn-connection.html) in *AWS CLI Command Reference*.

### modify-vpn-connection

The following code example shows how to use `modify-vpn-connection`.

**AWS CLI**

**To modify a VPN connection**

The following `modify-vpn-connection` example changes the target gateway for VPN connection `vpn-12345678901234567` to virtual private gateway `vgw-11223344556677889`:

```bash
aws ec2 modify-vpn-connection \
    --vpn-connection-id vpn-12345678901234567 \
    --vpn-gateway-id vgw-11223344556677889
```

**Output:**

```json
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbcddddee1122334",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "Status": "UP",
        "StatusMessage": ""
    }
}
```
modify-vpn-tunnel-certificate

The following code example shows how to use modify-vpn-tunnel-certificate.

AWS CLI

To rotate a VPN tunnel certificate

The following modify-vpn-tunnel-certificate example rotates the certificate for the specified tunnel for a VPN connection

aws ec2 modify-vpn-tunnel-certificate \
    --vpn-tunnel-outside-ip-address 203.0.113.17 \
    --vpn-connection-id vpn-12345678901234567

Output:

```json
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbccddeel122334",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-1123344556677889",
        "Options": {
            "StaticRoutesOnly": false
        },
        "VgwTelemetry": [
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-09-11T17:27:14.000Z",
                "OutsideIpAddress": "203.0.113.17",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN",
                "CertificateArn": "arn:aws:acm:us-east-1:123456789101:certificate/c544d8ce-20b8-4fff-98b0-example"
            },
            {
                "AcceptedRouteCount": 0,
                "LastStatusChange": "2019-09-11T17:26:47.000Z",
                "OutsideIpAddress": "203.0.114.18",
                "Status": "DOWN",
                "StatusMessage": "IPSEC IS DOWN",
                "CertificateArn": "arn:aws:acm:us-east-1:123456789101:certificate/5ab64566-761b-4ad3-b259-example"
            }
        ]
    }
}
```

- For API details, see [ModifyVpnTunnelCertificate](#) in *AWS CLI Command Reference*.

**modify-vpn-tunnel-options**

The following code example shows how to use `modify-vpn-tunnel-options`.  

AWS CLI

To modify the tunnel options for a VPN connection

The following modify-vpn-tunnel-options example updates the Diffie-Hellman groups that are permitted for the specified tunnel and VPN connection.

```bash
aws ec2 modify-vpn-tunnel-options \
  --vpn-connection-id vpn-12345678901234567 \n  --vpn-tunnel-outside-ip-address 203.0.113.17 \n  --tunnel-options Phase1DHGroupNumbers=[[Value=14],[Value=15],[Value=16], \n  {Value=17},{Value=18}],Phase2DHGroupNumbers=[[Value=14],[Value=15],[Value=16], \n  {Value=17},{Value=18]]
```

Output:

```json
{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "...configuration information...",
    "CustomerGatewayId": "cgw-aabbccddee1122334",
    "Category": "VPN",
    "State": "available",
    "Type": "ipsec.1",
    "VpnConnectionId": "vpn-12345678901234567",
    "VpnGatewayId": "vgw-11223344556677889",
    "Options": {
      "StaticRoutesOnly": false,
      "TunnelOptions": [
        {
          "OutsideIpAddress": "203.0.113.17",
          "Phase1DHGroupNumbers": [
            { "Value": 14 },
            { "Value": 15 },
            { "Value": 16 },
            { "Value": 17 },
            { "Value": 18 }
          ]
        }
      ]
    }
  }
}
```

```json
{
    "Value": 18
}
],
"Phase2DHGroupNumbers": [
    {
        "Value": 14
    },
    {
        "Value": 15
    },
    {
        "Value": 16
    },
    {
        "Value": 17
    },
    {
        "Value": 18
    }
],
"OutsideIpAddress": "203.0.114.19"
},
"VgwTelemetry": [
    {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2019-09-10T21:56:54.000Z",
        "OutsideIpAddress": "203.0.113.17",
        "Status": "DOWN",
        "StatusMessage": "IPSEC IS DOWN"
    },
    {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2019-09-10T21:56:43.000Z",
        "OutsideIpAddress": "203.0.114.19",
        "Status": "DOWN",
        "StatusMessage": "IPSEC IS DOWN"
    }
]
}```
• For API details, see ModifyVpnTunnelOptions in AWS CLI Command Reference.

monitor-instances

The following code example shows how to use monitor-instances.

AWS CLI

To enable detailed monitoring for an instance

This example command enables detailed monitoring for the specified instance.

Command:

```
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
    "InstanceMonitorings": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "Monitoring": {
                "State": "pending"
            }
        }
    ]
}
```

• For API details, see MonitorInstances in AWS CLI Command Reference.

move-address-to-vpc

The following code example shows how to use move-address-to-vpc.

AWS CLI

To move an address to EC2-VPC

Actions and scenarios
This example moves Elastic IP address 54.123.4.56 to the EC2-VPC platform.

Command:

```
aws ec2 move-address-to-vpc --public-ip 54.123.4.56
```

Output:

```
{
  "Status": "MoveInProgress"
}
```

- For API details, see [MoveAddressToVpc](https://docs.aws.amazon.com/cli/latest/reference/ec2/move-address-to-vpc.html) in *AWS CLI Command Reference*.

**move-byoip-cidr-to-ipam**

The following code example shows how to use move-byoip-cidr-to-ipam.

**AWS CLI**

**To transfer a BYOIP CIDR to IPAM**

The following move-byoip-cidr-to-ipam example transfers a BYOIP CIDR to IPAM.

(Linux):

```
aws ec2 move-byoip-cidr-to-ipam \
  --region us-west-2 \
  --ipam-pool-id ipam-pool-0a03d430ca3f5c035 \
  --ipam-pool-owner 111111111111 \
  --cidr 130.137.249.0/24
```

(Windows):

```
aws ec2 move-byoip-cidr-to-ipam ^
  --region us-west-2 ^
  --ipam-pool-id ipam-pool-0a03d430ca3f5c035 ^
  --ipam-pool-owner 111111111111 ^
  --cidr 130.137.249.0/24
```

Output:
For more information, see Tutorial: Transfer an existing BYOIP IPv4 CIDR to IPAM in the Amazon VPC IPAM User Guide.

- For API details, see MoveByoipCidrToIpam in AWS CLI Command Reference.

network-insights-access-scope

The following code example shows how to use network-insights-access-scope.

AWS CLI

To create Network Insights access scopes

The following create-network-insights-access-scope example creates a network insights access scope in your AWS account.

```bash
aws ec2 create-network-insights-access-scope \
  --cli-input-json file://access-scope-file.json
```

Contents of access-scope-file.json:

```json
{
  "ByoipCidr": {
    "Cidr": "130.137.249.0/24",
    "State": "pending-transfer"
  }
}
```

For actions and scenarios, see Tutorial: Transfer an existing BYOIP IPv4 CIDR to IPAM in the Amazon VPC IPAM User Guide.
Output:

```json
{
    "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111",
    "NetworkInsightsAccessScope": {
        "NetworkInsightsAccessScopeId": "nis-123456789222",
        "CreatedDate": "2022-01-25T19:20:28.796000+00:00",
        "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"
    },
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-04c0c0fbca737c404",
        "MatchPaths": [{
            "Source": {
                "ResourceStatement": {
                    "Resources": [
                        "vpc-abcd12e3"
                    ]
                }
            }
        }],
        "ExcludePaths": [
            { 
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```
provision-byoip-cidr

The following code example shows how to use provision-byoip-cidr.

AWS CLI

To provision an address range

The following provision-byoip-cidr example provisions a public IP address range for use with AWS.

```bash
aws ec2 provision-byoip-cidr \
   --cidr 203.0.113.25/24 \
   --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```json
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "State": "pending-provision"
   }
}
```

For more information about creating the messages strings for the authorization context, see Bring Your Own IP Addresses in the Amazon EC2 User Guide.

- For API details, see ProvisionByoipCidr in AWS CLI Command Reference.
provision-ipam-pool-cidr

The following code example shows how to use `provision-ipam-pool-cidr`.

**AWS CLI**

**To provision a CIDR to an IPAM pool**

The following `provision-ipam-pool-cidr` example provisions a CIDR to an IPAM pool.

( Linux):  
```bash
aws ec2 provision-ipam-pool-cidr 
  --ipam-pool-id ipam-pool-0533048da7d823723 
  --cidr 10.0.0.0/24
```

( Windows):  
```bash
aws ec2 provision-ipam-pool-cidr ^
  --ipam-pool-id ipam-pool-0533048da7d823723 ^
  --cidr 10.0.0.0/24
```

Output:

```json
{
   "IpamPoolCidr": {
      "Cidr": "10.0.0.0/24",
      "State": "pending-provision"
   }
}
```

For more information, see [Provision CIDRs to a pool](https://docs.aws.amazon.com/AmazonVPCIPAM/latest/UserGuide/provision-cidr.html) in the *Amazon VPC IPAM User Guide*.

- For API details, see [ProvisionIpamPoolCidr](https://docs.aws.amazon.com/cli/latest/reference/ec2/provision-ipam-pool-cidr.html) in *AWS CLI Command Reference*.

purchase-host-reservation

The following code example shows how to use `purchase-host-reservation`.

**AWS CLI**

**To purchase a Dedicated Host Reservation**
This example purchases the specified Dedicated Host Reservation offering for the specified Dedicated Host in your account.

Command:

```bash
aws ec2 purchase-host-reservation --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```json
{
  "TotalHourlyPrice": "1.499",
  "Purchase": [
    {
      "HourlyPrice": "1.499",
      "InstanceFamily": "m4",
      "PaymentOption": "NoUpfront",
      "HostIdSet": [
        "h-013abcd2a00cbd123"
      ],
      "HostReservationId": "hr-0d418a3a4ff669ae",
      "UpfrontPrice": "0.000",
      "Duration": 31536000
    }
  ],
  "TotalUpfrontPrice": "0.000"
}
```

- For API details, see [PurchaseHostReservation](https://docs.aws.amazon.com/cli/latest/reference/ec2/purchase-host-reservation.html) in *AWS CLI Command Reference*.

**purchase-reserved-instances-offering**

The following code example shows how to use `purchase-reserved-instances-offering`.

**AWS CLI**

**To purchase a Reserved Instance offering**

This example command illustrates a purchase of a Reserved Instances offering, specifying an offering ID and instance count.

Command:
aws ec2 purchase-reserved-instances-offering --reserved-instances-offering-id ec06327e-dd07-46ee-9398-75b5fexample --instance-count 3

Output:

{
   "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"
}

- For API details, see [PurchaseReservedInstancesOffering](#) in [AWS CLI Command Reference](#).

### purchase-scheduled-instances

The following code example shows how to use `purchase-scheduled-instances`.

**AWS CLI**

**To purchase a Scheduled Instance**

This example purchases a Scheduled Instance.

**Command:**

```bash
aws ec2 purchase-scheduled-instances --purchase-requests file://purchase-request.json
```

**Purchase-request.json:**

```json
[
   {
      "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
      "InstanceCount": 1
   }
]
```

**Output:**

```json
{
   "ScheduledInstanceSet": [
```

---

Actions and scenarios 2527
For API details, see PurchaseScheduledInstances in AWS CLI Command Reference.

reboot-instances

The following code example shows how to use reboot-instances.

**AWS CLI**

To reboot an Amazon EC2 instance

This example reboots the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 reboot-instances --instance-ids i-1234567890abcdef5
```
register-image

The following code example shows how to use register-image.

AWS CLI

Example 1: To register an AMI using a manifest file

The following register-image example registers an AMI using the specified manifest file in Amazon S3.

```bash
aws ec2 register-image \
   --name my-image \
   --image-location my-s3-bucket/myimage/image.manifest.xml
```

Output:

```
{
   "ImageId": "ami-1234567890EXAMPLE"
}
```

For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

Example 2: To register an AMI using a snapshot of a root device

The following register-image example registers an AMI using the specified snapshot of an EBS root volume as device /dev/xvda. The block device mapping also includes an empty 100 GiB EBS volume as device /dev/xvdf.

```bash
aws ec2 register-image \
   --name my-image \
   --root-device-name /dev/xvda \
   --block-device-mappings DeviceName=/dev/xvda,Ebs={SnapshotId=snap-0db2cf683925d191f} DeviceName=/dev/xvdf,Ebs={VolumeSize=100}
```

Output:

```bash
{
   "ImageId": "ami-1234567890EXAMPLE"
}
```
For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

- For API details, see RegisterImage in AWS CLI Command Reference.

register-instance-event-notification-attributes

The following code example shows how to use register-instance-event-notification-attributes.

AWS CLI

Example 1: To include all tags in event notifications

The following register-instance-event-notification-attributes example includes all tags in event notifications.

```
aws ec2 register-instance-event-notification-attributes \
--instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{
  "InstanceTagAttribute": {
    "InstanceTagKeys": [],
    "IncludeAllTagsOfInstance": true
  }
}
```

For more information, see Scheduled events for your instances in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

Example 2: To include specific tags in event notifications

The following register-instance-event-notification-attributes example includes the specified tags in event notifications. You cannot specify tags if IncludeAllTagsOfInstance is true.
aws ec2 register-instance-event-notification-attributes \
   --instance-tag-attribute InstanceTagKeys="tag-key1","tag-key2"

Output:

{
   "InstanceTagAttribute": {
      "InstanceTagKeys": [
         "tag-key1",
         "tag-key2"
      ],
      "IncludeAllTagsOfInstance": false
   }
}

For more information, see Scheduled events for your instances in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see RegisterInstanceEventNotificationAttributes in AWS CLI Command Reference.

**register-transit-gateway-multicast-group-sources**

The following code example shows how to use register-transit-gateway-multicast-group-sources.

**AWS CLI**

To register a source with a transit gateway multicast group.

The following register-transit-gateway-multicast-group-sources example registers the specified network interface group source with a multicast group.

aws ec2 register-transit-gateway-multicast-group-sources \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
   --group-ip-address 224.0.1.0 \
   --network-interface-ids eni-07f290fc3c090cbae

Output:

{

"RegisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "RegisteredNetworkInterfaceIds": [
        "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
}
}

For more information, see Register Sources with a Multicast Group in the AWS Transit Gateways User Guide.

- For API details, see RegisterTransitGatewayMulticaseGroupSources in AWS CLI Command Reference.

**register-transit-gateway-multicast-group-members**

The following code example shows how to use register-transit-gateway-multicast-group-members.

**AWS CLI**

**To view the information about the transit gateway multicast domain associations**

The following register-transit-gateway-multicast-group-members example returns the associations for the specified multicast domain.

```
aws ec2 register-transit-gateway-multicast-group-members \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-0e246d32695012e81
```

Output:

```
{
    "RegisteredMulticastGroupMembers": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "RegisteredNetworkInterfaceIds": [
            "eni-0e246d32695012e81"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```
register-transit-gateway-multicast-group-sources

The following code example shows how to use register-transit-gateway-multicast-group-sources.

AWS CLI

To register a source with a transit gateway multicast group.

The following register-transit-gateway-multicast-group-sources example registers the specified network interface group source with a multicast group.

```bash
aws ec2 register-transit-gateway-multicast-group-sources \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
   --group-ip-address 224.0.1.0 \
   --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```json
{
   "RegisteredMulticastGroupSources": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
      "RegisteredNetworkInterfaceIds": [
         "eni-07f290fc3c090cbae"
      ],
      "GroupIpAddress": "224.0.1.0"
   }
}
```

For more information, see Managing multicast domains in the Transit Gateways User Guide.

- For API details, see RegisterTransitGatewayMulticastGroupMembers in AWS CLI Command Reference.
reject-transit-gateway-peering-attachment

The following code example shows how to use reject-transit-gateway-peering-attachment.

AWS CLI

To reject a transit gateway peering attachment

The following reject-transit-gateway-peering-attachment example rejects the specified transit gateway peering attachment request. The --region parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 reject-transit-gateway-peering-attachment \
   --transit-gateway-attachment-id tgw-attach-4455667788aabbccd \
   --region us-east-2
```

Output:

```
{
   "TransitGatewayPeeringAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
      "RequesterTgwInfo": {
         "TransitGatewayId": "tgw-123abc05e04123abc",
         "OwnerId": "123456789012",
         "Region": "us-west-2"
      },
      "AccepterTgwInfo": {
         "TransitGatewayId": "tgw-11223344aabbcc112",
         "OwnerId": "123456789012",
         "Region": "us-east-2"
      },
      "State": "rejecting",
      "CreationTime": "2019-12-09T11:50:31.000Z"
   }
}
```

For more information, see Transit Gateway Peering Attachments in the Transit Gateways Guide. For API details, see RejectTransitGatewayPeeringAttachment in AWS CLI Command Reference.
reject-transit-gateway-vpc-attachment

The following code example shows how to use reject-transit-gateway-vpc-attachment.

AWS CLI

To reject a transit gateway VPC attachment

The following reject-transit-gateway-vpc-attachment example rejects the specified transit gateway VPC attachment.

```bash
aws ec2 reject-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```json
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8f9d50fEXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": ["subnet-0752213d59EXAMPLE"],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see Transit gateway attachments to a VPC in the Transit Gateways Guide.

- For API details, see RejectTransitGatewayVpcAttachment in AWS CLI Command Reference.

reject-transit-gateway-vpc-attachments

The following code example shows how to use reject-transit-gateway-vpc-attachments.
AWS CLI

To reject a transit gateway VPC attachment

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```
aws ec2 reject-transit-gateway-vpc-attachment
--transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8fffd50fEXAMPLE",
        "VpcOwnerId": "111122223333",
        "State": "pending",
        "SubnetIds": [
            "subnet-0752213d59EXAMPLE"
        ],
        "CreationTime": "2019-07-10T17:33:46.000Z",
        "Options": {
            "DnsSupport": "enable",
            "Ipv6Support": "disable"
        }
    }
}
```

For more information, see [Transit gateway attachments to a VPC](transit-gateways-guide) in the [Transit Gateways Guide](transit-gateways-guide).

- For API details, see [RejectTransitGatewayVpcAttachments](aws-cli-command-reference) in [AWS CLI Command Reference](aws-cli-command-reference).

**reject-vpc-endpoint-connections**

The following code example shows how to use `reject-vpc-endpoint-connections`.

AWS CLI

To reject an interface endpoint connection request
This example rejects the specified endpoint connection request for the specified endpoint service.

Command:

```bash
aws ec2 reject-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```json
{
    "Unsuccessful": []
}
```

- For API details, see [RejectVpcEndpointConnections](https://awscli.amazonaws.com/v2/documentation/api/2019-09-24/index.html) in *AWS CLI Command Reference*.

**reject-vpc-peering-connection**

The following code example shows how to use `reject-vpc-peering-connection`.

**AWS CLI**

**To reject a VPC peering connection**

This example rejects the specified VPC peering connection request.

Command:

```bash
aws ec2 reject-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```json
{
    "Return": true
}
```

- For API details, see [RejectVpcPeeringConnection](https://awscli.amazonaws.com/v2/documentation/api/2019-09-24/index.html) in *AWS CLI Command Reference*.

**release-address**

The following code example shows how to use `release-address`.
AWS CLI

**To release an Elastic IP addresses for EC2-Classic**

This example releases an Elastic IP address for use with instances in EC2-Classic. If the command succeeds, no output is returned.

Command:

```bash/aws ec2 release-address --public-ip 198.51.100.0
```

**To release an Elastic IP address for EC2-VPC**

This example releases an Elastic IP address for use with instances in a VPC. If the command succeeds, no output is returned.

Command:

```bash/aws ec2 release-address --allocation-id eipalloc-64d5890a
```

- For API details, see [ReleaseAddress](https://awscli.amazonaws.com/v2/documentation/api-reference) in *AWS CLI Command Reference*.

**release-hosts**

The following code example shows how to use `release-hosts`.

AWS CLI

**To release a Dedicated host from your account**

To release a Dedicated host from your account. Instances that are on the host must be stopped or terminated before the host can be released.

Command:

```bash/aws ec2 release-hosts --host-id=h-0029d6e3cacf1b3da
```

Output:

```
{  }  
```
The following code example shows how to use replace-iam-instance-profile-association.

**AWS CLI**

**To replace an IAM instance profile for an instance**

This example replaces the IAM instance profile represented by the association iip-assoc-060bae234aac2e7fa with the IAM instance profile named AdminRole.

```
aws ec2 replace-iam-instance-profile-association \
   --iam-instance-profile Name=AdminRole \
   --association-id iip-assoc-060bae234aac2e7fa
```

**Output:**

```
{
   "IamInstanceProfileAssociation": {
      "InstanceId": "i-087711ddaf98f9489",
      "State": "associating",
      "AssociationId": "iip-assoc-0b215292f9b192820",
      "IamInstanceProfile": {
         "Id": "AIPAJLNLFX3AMYZNYYAY",
         "Arn": "arn:aws:iam::123456789012:instance-profile/AdminRole"
      }
   }
}
```

- For API details, see [ReleaseHosts](https://docs.aws.amazon.com/cli/latest/reference/ec2/release-hosts.html) in *AWS CLI Command Reference*.

- For API details, see [ReplaceIamInstanceProfileAssociation](https://docs.aws.amazon.com/cli/latest/reference/ec2/replace-iam-instance-profile-association.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**
**replace-network-acl-association**

The following code example shows how to use replace-network-acl-association.

**AWS CLI**

To replace the network ACL associated with a subnet

This example associates the specified network ACL with the subnet for the specified network ACL association.

Command:

```bash
aws ec2 replace-network-acl-association --association-id aclassoc-e5b95c8c --network-acl-id acl-5fb85d36
```

Output:

```json
{
   "NewAssociationId": "aclassoc-3999875b"
}
```

- For API details, see ReplaceNetworkAclAssociation in AWS CLI Command Reference.

**replace-network-acl-entry**

The following code example shows how to use replace-network-acl-entry.

**AWS CLI**

To replace a network ACL entry

This example replaces an entry for the specified network ACL. The new rule 100 allows ingress traffic from 203.0.113.12/24 on UDP port 53 (DNS) into any associated subnet.

Command:

```bash
aws ec2 replace-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 203.0.113.12/24 --rule-action allow
```

- For API details, see ReplaceNetworkAclEntry in AWS CLI Command Reference.
**replace-route-table-association**

The following code example shows how to use `replace-route-table-association`.

**AWS CLI**

**To replace the route table associated with a subnet**

This example associates the specified route table with the subnet for the specified route table association.

Command:

```
aws ec2 replace-route-table-association --association-id rtbassoc-781d0d1a --route-table-id rtb-22574640
```

Output:

```
{
  "NewAssociationId": "rtbassoc-3a1f0f58"
}
```

- For API details, see [ReplaceRouteTableAssociation](#) in [AWS CLI Command Reference](#).

**replace-route**

The following code example shows how to use `replace-route`.

**AWS CLI**

**To replace a route**

This example replaces the specified route in the specified route table. The new route matches the specified CIDR and sends the traffic to the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 replace-route --route-table-id rtb-22574640 --destination-cidr-block 10.0.0.0/16 --gateway-id vgw-9a4cacf3
```
For API details, see ReplaceRoute in AWS CLI Command Reference.

replace-transit-gateway-route

The following code example shows how to use replace-transit-gateway-route.

AWS CLI

To replace the specified route in the specified transit gateway route table

The following replace-transit-gateway-route example replaces the route in the specified transit gateway route table.

```bash
aws ec2 replace-transit-gateway-route \
    --destination-cidr-block 10.0.2.0/24 \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE \
    --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAMPLE
```

Output:

```json
{
    "Route": {
        "DestinationCidrBlock": "10.0.2.0/24",
        "TransitGatewayAttachments": [
            {
                "ResourceId": "vpc-4EXAMPLE",
                "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                "ResourceType": "vpc"
            }
        ],
        "Type": "static",
        "State": "active"
    }
}
```

For more information, see Transit gateway route tables in the Transit Gateways Guide.

For API details, see ReplaceTransitGatewayRoute in AWS CLI Command Reference.

report-instance-status

The following code example shows how to use report-instance-status.
AWS CLI

To report status feedback for an instance

This example command reports status feedback for the specified instance.

Command:

```bash
aws ec2 report-instance-status --instances i-1234567890abcdef0 --status impaired --reason-codes unresponsive
```

- For API details, see [ReportInstanceStatus](https://docs.aws.amazon.com/cli/latest/reference/ec2/report-instance-status.html) in **AWS CLI Command Reference**.

request-spot-fleet

The following code example shows how to use `request-spot-fleet`.

AWS CLI

To request a Spot fleet in the subnet with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by subnet. The Spot fleet launches the instances in the specified subnet with the lowest price. If the instances are launched in a default VPC, they receive a public IP address by default. If the instances are launched in a nondefault VPC, they do not receive a public IP address by default.

Note that you can't specify different subnets from the same Availability Zone in a Spot fleet request.

Command:

```bash
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```json
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
```
To request a Spot fleet in the Availability Zone with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by Availability Zone. The Spot fleet launches the instances in the specified Availability Zone with the lowest price. If your account supports EC2-VPC only, Amazon EC2 launches the Spot instances in the default subnet of the Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the Availability Zone.

Command:

```bash
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```json
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        
```
To launch Spot instances in a subnet and assign them public IP addresses

This example command assigns public addresses to instances launched in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```bash
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```json
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "InstanceType": "m3.medium",
            "NetworkInterfaces": [
                {
                    "DeviceIndex": 0,
                }
            ],
        }
    ]
}
```
To request a Spot fleet using the diversified allocation strategy

This example command creates a Spot fleet request that launches 30 instances using the diversified allocation strategy. The launch specifications differ by instance type. The Spot fleet distributes the instances across the launch specifications such that there are 10 instances of each type.

Command:

aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json

Config.json:

```json
{
   "SpotPrice": "0.70",
   "TargetCapacity": 30,
   "AllocationStrategy": "diversified",
   "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
   "LaunchSpecifications": [
      {
         "ImageId": "ami-1a2b3c4d",
         "InstanceType": "c4.2xlarge",
         "SubnetId": "subnet-1a2b3c4d"
      },
      {
         "ImageId": "ami-1a2b3c4d",
         "InstanceType": "m3.2xlarge",
         "SubnetId": "subnet-1a2b3c4d"
      },
      {
         "ImageId": "ami-1a2b3c4d",
         "InstanceType": "c4.2xlarge",
         "SubnetId": "subnet-1a2b3c4d"
      }
   ]
}
```
For more information, see Spot Fleet Requests in the Amazon Elastic Compute Cloud User Guide.

- For API details, see RequestSpotFleet in AWS CLI Command Reference.

request-spot-instances

The following code example shows how to use request-spot-instances.

AWS CLI

To request Spot Instances

This example command creates a one-time Spot Instance request for five instances in the specified Availability Zone. If your account supports EC2-VPC only, Amazon EC2 launches the instances in the default subnet of the specified Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the specified Availability Zone.

Command:

```
aws ec2 request-spot-instances --spot-price "0.03" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
  "ImageId": "ami-1a2b3c4d",
  "KeyName": "my-key-pair",
  "SecurityGroupIds": [ "sg-1a2b3c4d" ],
  "InstanceType": "m3.medium",
  "Placement": {
    "AvailabilityZone": "us-west-2a"
  },
  "IamInstanceProfile": {
    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  }
}
```
Output:

```json
{
    "SpotInstanceRequests": [
        {
            "Status": {
                "UpdateTime": "2014-03-25T20:54:21.000Z",
                "Code": "pending-evaluation",
                "Message": "Your Spot request has been submitted for review, and is pending evaluation."
            },
            "ProductDescription": "Linux/UNIX",
            "SpotInstanceRequestId": "sir-df6f405d",
            "State": "open",
            "LaunchSpecification": {
                "Placement": {
                    "AvailabilityZone": "us-west-2a"
                },
                "ImageId": "ami-1a2b3c4d",
                "KeyName": "my-key-pair",
                "SecurityGroups": [
                    {
                        "GroupName": "my-security-group",
                        "GroupId": "sg-1a2b3c4d"
                    }
                ],
                "Monitoring": {
                    "Enabled": false
                },
                "IamInstanceProfile": {
                    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
                },
                "InstanceType": "m3.medium"
            },
            "Type": "one-time",
            "CreateTime": "2014-03-25T20:54:20.000Z",
            "SpotPrice": "0.050000"
        }
    ]
}
```
This example command creates a one-time Spot Instance request for five instances in the specified subnet. Amazon EC2 launches the instances in the specified subnet. If the VPC is a nondefault VPC, the instances do not receive a public IP address by default.

Command:

```bash
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```json
{
   "ImageId": "ami-1a2b3c4d",
   "SecurityGroupIds": [ "sg-1a2b3c4d" ],
   "InstanceType": "m3.medium",
   "SubnetId": "subnet-1a2b3c4d",
   "IamInstanceProfile": {
      "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
   }
}
```

Output:

```json
{
   "SpotInstanceRequests": [
      {
         "Status": {
            "UpdateTime": "2014-03-25T22:21:58.000Z",
            "Code": "pending-evaluation",
            "Message": "Your Spot request has been submitted for review, and is pending evaluation."
         },
         "ProductDescription": "Linux/UNIX",
         "SpotInstanceRequestId": "sir-df6f405d",
         "State": "open",
         "LaunchSpecification": {
            "Placement": {
               "AvailabilityZone": "us-west-2a"
            }
         },
         "ImageId": "ami-1a2b3c4d",
         "SecurityGroups": [ ]
      }
   ]
}
```
This example assigns a public IP address to the Spot Instances that you launch in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```bash
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 1 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```json
{
   "ImageId": "ami-1a2b3c4d",
   "KeyName": "my-key-pair",
   "InstanceType": "m3.medium",
   "NetworkInterfaces": [
      {
         "DeviceIndex": 0,
         "SubnetId": "subnet-1a2b3c4d",
         "Groups": [ "sg-1a2b3c4d" ],
         "AssociatePublicIpAddress": true
      }
   ]
}
```
For API details, see [RequestSpotInstances](#) in AWS CLI Command Reference.

**reset-address-attribute**

The following code example shows how to use `reset-address-attribute`.

**AWS CLI**

**To reset the domain name attribute associated with an elastic IP address**

The following `reset-address-attribute` examples reset the domain name attribute of an elastic IP address.

**Linux:**

```bash
aws ec2 reset-address-attribute \
   --allocation-id eipalloc-abcdef01234567890 \
   --attribute domain-name
```

**Windows:**

```bash
aws ec2 reset-address-attribute ^ \
   --allocation-id eipalloc-abcdef01234567890 ^ \
   --attribute domain-name
```

**Output:**

```json
{
   "Addresses": [
      {
         "PublicIp": "192.0.2.0",
         "AllocationId": "eipalloc-abcdef01234567890",
         "PtrRecord": "example.com."
      },
      {
         "Value": "example.net.",
         "Status": "PENDING"
      }
   ]
}
```
To monitor the pending change, see `describe-addresses-attribute` in the *AWS CLI Command Reference*.

- For API details, see `ResetAddressAttribute` in *AWS CLI Command Reference*.

**reset-ebs-default-kms-key-id**

The following code example shows how to use `reset-ebs-default-kms-key-id`.

**AWS CLI**

**To reset your default CMK for EBS encryption**

The following `reset-ebs-default-kms-key-id` example resets the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 reset-ebs-default-kms-key-id
```

**Output:**

```
{
   "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513eEXAMPLE"
}
```

- For API details, see `ResetEbsDefaultKmsKeyId` in *AWS CLI Command Reference*.

**reset-fpga-image-attribute**

The following code example shows how to use `reset-fpga-image-attribute`.

**AWS CLI**

**To reset the attributes of an Amazon FPGA image**

This example resets the load permissions for the specified AFI.

```
aws ec2 reset-fpga-image-attribute
```

**Command:**
The following code example shows how to use `reset-image-attribute`.

**AWS CLI**

**To reset the launchPermission attribute**

This example resets the `launchPermission` attribute for the specified AMI to its default value. By default, AMIs are private. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-image-attribute --image-id ami-5731123e --attribute launchPermission
```

For API details, see [ResetImageAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/reset-image-attribute.html) in **AWS CLI Command Reference**.

The following code example shows how to use `reset-instance-attribute`.

**AWS CLI**

**To reset the sourceDestCheck attribute**

This example resets the `sourceDestCheck` attribute of the specified instance. The instance must be in a VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef --attribute sourceDestCheck
```

For API details, see [ResetInstanceAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/reset-instance-attribute.html) in **AWS CLI Command Reference**.
To reset the kernel attribute

This example resets the kernel attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute kernel
```

To reset the ramdisk attribute

This example resets the ramdisk attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute ramdisk
```

- For API details, see ResetInstanceAttribute in AWS CLI Command Reference.

reset-network-interface-attribute

The following code example shows how to use reset-network-interface-attribute.

AWS CLI

To reset a network interface attribute

The following reset-network-interface-attribute example resets the value of the source/destination checking attribute to true.

```
aws ec2 reset-network-interface-attribute \\
    --network-interface-id eni-686ea200 \\
    --source-dest-check
```

This command produces no output.
For API details, see `ResetNetworkInterfaceAttribute` in *AWS CLI Command Reference*.

**reset-snapshot-attribute**

The following code example shows how to use `reset-snapshot-attribute`.

**AWS CLI**

To reset a snapshot attribute

This example resets the create volume permissions for snapshot `snap-1234567890abcdef0`. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-snapshot-attribute --snapshot-id snap-1234567890abcdef0 --attribute createVolumePermission
```

For API details, see `ResetSnapshotAttribute` in *AWS CLI Command Reference*.

**restore-address-to-classic**

The following code example shows how to use `restore-address-to-classic`.

**AWS CLI**

To restore an address to EC2-Classic

This example restores Elastic IP address `198.51.100.0` to the EC2-Classic platform.

Command:

```bash
aws ec2 restore-address-to-classic --public-ip 198.51.100.0
```

Output:

```json
{
  "Status": "MoveInProgress",
  "PublicIp": "198.51.100.0"
}
```

For API details, see `RestoreAddressToClassic` in *AWS CLI Command Reference*. 
**restore-image-from-recycle-bin**

The following code example shows how to use `restore-image-from-recycle-bin`.

**AWS CLI**

To restore an image from the Recycle Bin

The following `restore-image-from-recycle-bin` example restores AMI `ami-011222333444abcd` from the Recycle Bin.

```
aws ec2 restore-image-from-recycle-bin 
    --image-id ami-011222333444abcd
```

Output:

```
{
    "Return": true
}
```

For more information, see [Recover AMIs from the Recycle Bin](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [RestoreImageFromRecycleBin](#) in *AWS CLI Command Reference*.

**restore-managed-prefix-list-version**

The following code example shows how to use `restore-managed-prefix-list-version`.

**AWS CLI**

us-west-2**To restore a prefix list version**

The following `restore-managed-prefix-list-version` restores the entries from version 1 of the specified prefix list.

```
aws ec2 restore-managed-prefix-list-version 
    --prefix-list-id pl-0123456abcabcabc1 
    --current-version 2 
    --previous-version 1
```
Output:

```json
{
  "PrefixList": {
    "PrefixListId": "pl-0123456abcabcabc1",
    "AddressFamily": "IPv4",
    "State": "restore-in-progress",
    "PrefixListName": "vpc-cidrs",
    "MaxEntries": 10,
    "Version": 2,
    "OwnerId": "123456789012"
  }
}
```

For more information, see [Managed prefix lists](https://docs.aws.amazon.com/vpc/latest/userguide/managed-prefix-lists.html) in the *Amazon VPC User Guide*.

- For API details, see [RestoreManagedPrefixListVersion](https://docs.aws.amazon.com/cli/latest/reference/ec2/restore-managed-prefix-list-version.html) in *AWS CLI Command Reference*.

**restore-snapshot-from-recycle-bin**

The following code example shows how to use `restore-snapshot-from-recycle-bin`.

**AWS CLI**

To restore snapshots from the Recycle Bin

The following `restore-snapshot-from-recycle-bin` example restores a snapshot from the Recycle Bin. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

```
aws ec2 restore-snapshot-from-recycle-bin \
  --snapshot-id snap-01234567890abcdef
```

This command produces no output.

For more information about Recycle Bin for Amazon EBS, see [Recover snapshots from the Recycle Bin](https://docs.aws.amazon.com/elasticbeaststore/latest/ec2-userguide/recycle-bin.html) in the *Amazon EC2 User Guide*.

- For API details, see [RestoreSnapshotFromRecycleBin](https://docs.aws.amazon.com/cli/latest/reference/ec2/restore-snapshot-from-recycle-bin.html) in *AWS CLI Command Reference*. 

---

Actions and scenarios 2557
**restore-snapshot-tier**

The following code example shows how to use `restore-snapshot-tier`.

**AWS CLI**

**Example 1: To permanently restore an archived snapshot**

The following `restore-snapshot-tier` example permanently restores the specified snapshot. Specify the `--snapshot-id` and include the `permanent-restore` option.

```bash
aws ec2 restore-snapshot-tier \\
   --snapshot-id snap-01234567890abcedf \\
   --permanent-restore
```

Output:

```json
{
   "SnapshotId": "snap-01234567890abcedf",
   "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the *Amazon EC2 User Guide*.

**Example 2: To temporarily restore an archived snapshot**

The following `restore-snapshot-tier` example temporarily restores the specified snapshot. Omit the `--permanent-restore` option. Specify the `--snapshot-id` and, for `temporary-restore-days`, specify the number of days for which to restore the snapshot. `temporary-restore-days` must be specified in days. The allowed range is 1 to 180. If you do not specify a value, it defaults to 1 day.

```bash
aws ec2 restore-snapshot-tier \\
   --snapshot-id snap-01234567890abcedf \\
   --temporary-restore-days 5
```

Output:

```json
{
}
```
"SnapshotId": "snap-01234567890abcedf",
"RestoreDuration": 5,
"IsPermanentRestore": false
}

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

Example 3: To modify the restore period

The following `restore-snapshot-tier` example changes the restore period for the specified snapshot to 10 days.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --temporary-restore-days 10
```

Output:

```
{
    "SnapshotId": "snap-01234567890abcedf",
    "RestoreDuration": 10,
    "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

Example 4: To modify the restore type

The following `restore-snapshot-tier` example changes the restore type for the specified snapshot from temporary to permanent.

```
aws ec2 restore-snapshot-tier \
    --snapshot-id snap-01234567890abcedf \
    --permanent-restore
```

Output:
For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

- For API details, see RestoreSnapshotTier in AWS CLI Command Reference.

**revoke-client-vpn-ingress**

The following code example shows how to use revoke-client-vpn-ingress.

**AWS CLI**

**To revoke an authorization rule for a Client VPN endpoint**

The following revoke-client-vpn-ingress example revokes a rule for internet access (0.0.0.0/0) for all groups.

```bash
aws ec2 revoke-client-vpn-ingress \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
   --target-network-cidr 0.0.0.0/0 --revoke-all-groups
```

**Output:**

```json
{
   "Status": {
      "Code": "revoking"
   }
}
```

For more information, see Authorization Rules in the AWS Client VPN Administrator Guide.

- For API details, see RevokeClientVpnIngress in AWS CLI Command Reference.

**revoke-security-group-egress**

The following code example shows how to use revoke-security-group-egress.
AWS CLI

Example 1: To remove the rule that allows outbound traffic to a specific address range

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified address ranges on TCP port 80.

```bash
aws ec2 revoke-security-group-egress \
  --group-id sg-026c12253ce15eff7 \
  --ip-permissions
  [IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]
```

This command produces no output.

For more information, see [Security groups](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/sect_security-group-rules.html) in the *Amazon EC2 User Guide*.

Example 2: To remove the rule that allows outbound traffic to a specific security group

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified security group on TCP port 80.

```bash
aws ec2 revoke-security-group-egress \
  --group-id sg-026c12253ce15eff7 \
  --ip-permissions '[["IpProtocol": "tcp", "FromPort": 443, "ToPort": 443,"UserIdGroupPairs": [{"GroupId": "sg-06df23a01ff2df86d"}]]]
```

This command produces no output.

For more information, see [Security groups](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/sect_security-group-rules.html) in the *Amazon EC2 User Guide*.

- For API details, see [RevokeSecurityGroupEgress](https://docs.aws.amazon.com/cli/latest/reference/ec2/revoke-security-group-egress.html) in *AWS CLI Command Reference*.

`revoke-security-group-ingress`

The following code example shows how to use `revoke-security-group-ingress`.

AWS CLI

Example 1: To remove a rule from a security group

The following `revoke-security-group-ingress` example removes TCP port 22 access for the 203.0.113.0/24 address range from the specified security group for a default VPC.
aws ec2 revoke-security-group-ingress \
   --group-name mySecurityGroup \
   --protocol tcp \
   --port 22 \
   --cidr 203.0.113.0/24

This command produces no output if it succeeds.

For more information, see Security groups in the Amazon EC2 User Guide.

**Example 2: To remove a rule using the IP permissions set**

The following revoke-security-group-ingress example uses the ip-permissions parameter to remove an inbound rule that allows the ICMP message Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4).

aws ec2 revoke-security-group-ingress \
   --group-id sg-026c12253ce15eff7 \
   --ip-permissions 
   IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[{CidrIp=0.0.0.0/0}]

This command produces no output if it succeeds.

For more information, see Security groups in the Amazon EC2 User Guide.

- For API details, see RevokeSecurityGroupIngress in AWS CLI Command Reference.

**run-instances**

The following code example shows how to use run-instances.

**AWS CLI**

**Example 1: To launch an instance into a default subnet**

The following run-instances example launches a single instance of type t2.micro into the default subnet for the current Region and associates it with the default subnet for the default VPC for the Region. The key pair is optional if you do not plan to connect to your instance using SSH (Linux) or RDP (Windows).
aws ec2 run-instances \
   --image-id ami-0abcdef1234567890 \
   --instance-type t2.micro \
   --key-name MyKeyPair

Output:

```json
{
   "Instances": [
      {
         "AmiLaunchIndex": 0,
         "ImageId": "ami-0abcdef1234567890",
         "InstanceId": "i-1231231230abcdef0",
         "InstanceType": "t2.micro",
         "KeyName": "MyKeyPair",
         "LaunchTime": "2018-05-10T08:05:20.000Z",
         "Monitoring": {
            "State": "disabled"
         },
         "Placement": {
            "AvailabilityZone": "us-east-2a",
            "GroupName": "",
            "Tenancy": "default"
         },
         "PrivateDnsName": "ip-10-0-0-157.us-east-2.compute.internal",
         "PrivateIpAddress": "10.0.0.157",
         "ProductCodes": [],
         "PublicDnsName": "",
         "State": {
            "Code": 0,
            "Name": "pending"
         },
         "StateTransitionReason": "",
         "SubnetId": "subnet-04a636d18e83cfacb",
         "VpcId": "vpc-1234567890abcdef0",
         "Architecture": "x86_64",
         "BlockDeviceMappings": [],
         "ClientToken": "",
         "EbsOptimized": false,
         "Hypervisor": "xen",
         "NetworkInterfaces": [
            {
               "Attachment": {
```
Example 2: To launch an instance into a non-default subnet and add a public IP address

The following `run-instances` example requests a public IP address for an instance that you're launching into a nondefault subnet. The instance is associated with the specified security group.

```bash
aws ec2 run-instances \
  --image-id ami-0abcdef1234567890 \n  --instance-type t2.micro \n  --subnet-id subnet-08fc749671b2d077c \n  --security-group-ids sg-0b0384b66d7d692f9 \n  --associate-public-ip-address \n  --key-name MyKeyPair
```

For an example of the output for `run-instances`, see Example 1.

Example 3: To launch an instance with additional volumes
The following `run-instances` example uses a block device mapping, specified in `mapping.json`, to attach additional volumes at launch. A block device mapping can specify EBS volumes, instance store volumes, or both EBS volumes and instance store volumes.

```
aws ec2 run-instances \
   --image-id ami-0abcdef1234567890 \
   --instance-type t2.micro \
   --subnet-id subnet-08fc749671b2d077c \
   --security-group-ids sg-0b0384b66d7d692f9 \
   --key-name MyKeyPair \
   --block-device-mappings file://mapping.json
```

Contents of `mapping.json`. This example adds `/dev/sdh` an empty EBS volume with a size of 100 GiB.

```
[
  {
    "DeviceName": "/dev/sdh",
    "Ebs": {
      "VolumeSize": 100
    }
  }
]
```

Contents of `mapping.json`. This example adds `ephemeral1` as an instance store volume.

```
[
  {
    "DeviceName": "/dev/sdc",
    "VirtualName": "ephemeral1"
  }
]
```

For an example of the output for `run-instances`, see Example 1.

For more information about block device mappings, see [Block device mapping](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/block-device-mapping.html) in the Amazon EC2 User Guide.

**Example 4: To launch an instance and add tags on creation**
The following `run-instances` example adds a tag with a key of `webserver` and value of `production` to the instance. The command also applies a tag with a key of `cost-center` and a value of `cc123` to any EBS volume that's created (in this case, the root volume).

```bash
aws ec2 run-instances \
  --image-id ami-0abcdef1234567890 \
  --instance-type t2.micro \
  --count 1 \
  --subnet-id subnet-08fc749671b2d077c \
  --key-name MyKeyPair \
  --security-group-ids sg-0b0384b66d7d692f9 \
  --tag-specifications
    'ResourceType=instance,Tags=[{Key=webserver,Value=production}]'
    'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

For an example of the output for `run-instances`, see Example 1.

**Example 5: To launch an instance with user data**

The following `run-instances` example passes user data in a file called `my_script.txt` that contains a configuration script for your instance. The script runs at launch.

```bash
aws ec2 run-instances \
  --image-id ami-0abcdef1234567890 \
  --instance-type t2.micro \
  --count 1 \
  --subnet-id subnet-08fc749671b2d077c \
  --key-name MyKeyPair \
  --security-group-ids sg-0b0384b66d7d692f9 \
  --user-data file://my_script.txt
```

For an example of the output for `run-instances`, see Example 1.

For more information about instance user data, see [Working with instance user data](amazon-ec2-user-guide) in the *Amazon EC2 User Guide*.

**Example 6: To launch a burstable performance instance**

The following `run-instances` example launches a t2.micro instance with the unlimited credit option. When you launch a T2 instance, if you do not specify `--credit-specification`, the default is the standard credit option. When you launch a T3 instance, the default is the unlimited credit option.
aws ec2 run-instances \\ 
   --image-id ami-0abcdef1234567890 \\ 
   --instance-type t2.micro \\ 
   --count 1 \\ 
   --subnet-id subnet-08fc749671b2d077c \\ 
   --key-name MyKeyPair \\ 
   --security-group-ids sg-0b0384b66d7d692f9 \\ 
   --credit-specification CpuCredits=unlimited

For an example of the output for run-instances, see Example 1.

For more information about burstable performance instances, see Burstable performance instances in the Amazon EC2 User Guide.

- For API details, see RunInstances in AWS CLI Command Reference.

run-scheduled-instances

The following code example shows how to use run-scheduled-instances.

AWS CLI

To launch a Scheduled Instance

This example launches the specified Scheduled Instance in a VPC.

Command:

aws ec2 run-scheduled-instances --scheduled-instance-id
sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification
file://launch-specification.json

Launch-specification.json:

{
   "ImageId": "ami-12345678",
   "KeyName": "my-key-pair",
   "InstanceType": "c4.large",
   "NetworkInterfaces": [
   
   
   "DeviceIndex": 0,
   "SubnetId": "subnet-12345678",
}
"AssociatePublicIpAddress": true,
"Groups": ["sg-12345678"]
},

"IamInstanceProfile": {
  "Name": "my-iam-role"
}
}

Output:

{
  "InstanceIdSet": [
    "i-1234567890abcdef0"
  ]
}

This example launches the specified Scheduled Instance in EC2-Classic.

Command:

```
aws ec2 run-scheduled-instances --scheduled-instance-id
ci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification
file://launch-specification.json
```

Launch-specification.json:

```
{
  "ImageId": "ami-12345678",
  "KeyName": "my-key-pair",
  "SecurityGroupIds": ["sg-12345678"],
  "InstanceType": "c4.large",
  "Placement": {
    "AvailabilityZone": "us-west-2b"
  }
  "IamInstanceProfile": {
    "Name": "my-iam-role"
  }
}
```

Output:
For API details, see **RunScheduledInstances** in *AWS CLI Command Reference*.

**search-local-gateway-routes**

The following code example shows how to use `search-local-gateway-routes`.

**AWS CLI**

**To search for routes in a local gateway route table**

The following `search-local-gateway-routes` example searches for static routes in the specified local gateway route table.

```
aws ec2 search-local-gateway-routes \
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
    --filters "Name=type,Values=static"
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgvif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
    }
}
```

For API details, see **SearchLocalGatewayRoutes** in *AWS CLI Command Reference*.

**search-transit-gateway-multicast-groups**

The following code example shows how to use `search-transit-gateway-multicast-groups`.

```
{
    "InstanceIdSet": [
        "i-1234567890abcdef0"
    ]
}
```
AWS CLI

To search one or more transit gateway multicast groups and return the group membership information

The following search-transit-gateway-multicast-groups example returns the group membership of the specified multicast group.

```bash
aws ec2 search-transit-gateway-multicast-groups \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-000fb24d04EXAMPLE
```

Output:

```json
{
   "MulticastGroups": [
      {
         "GroupIpAddress": "224.0.1.0",
         "TransitGatewayAttachmentId": "tgw-attach-0372e72386EXAMPLE",
         "SubnetId": "subnet-0187aff814EXAMPLE",
         "ResourceId": "vpc-0065acced4EXAMPLE",
         "ResourceType": "vpc",
         "NetworkInterfaceId": "eni-03847706f6EXAMPLE",
         "GroupMember": false,
         "GroupSource": true,
         "SourceType": "static"
      }
   ]
}
```

For more information, see Managing multicast groups in the Transit Gateways Guide.

- For API details, see SearchTransitGatewayMulticastGroups in AWS CLI Command Reference.

search-transit-gateway-routes

The following code example shows how to use search-transit-gateway-routes.

AWS CLI

To search for routes in the specified transit gateway route table

The following search-transit-gateway-routes example returns all the routes that are of type static in the specified route table.
aws ec2 search-transit-gateway-routes \
   --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAMPLE \ 
   --filters "Name=type,Values=static"

Output:

```json
{
   "Routes": [
      {
         "DestinationCidrBlock": "10.0.2.0/24",
         "TransitGatewayAttachments": [
            {
               "ResourceId": "vpc-4EXAMPLE",
               "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
               "ResourceType": "vpc"
            }
         ],
         "Type": "static",
         "State": "active"
      },
      {
         "DestinationCidrBlock": "10.0.0.0/24",
         "TransitGatewayAttachments": [
            {
               "ResourceId": "vpc-4EXAMPLE",
               "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
               "ResourceType": "vpc"
            }
         ],
         "Type": "static",
         "State": "active"
      }
   ],
   "AdditionalRoutesAvailable": false
}
```

For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/translate/latest/dg/transit-gateway-route-tables.html) in the *Transit Gateways Guide*.

- For API details, see [SearchTransitGatewayRoutes](https://docs.aws.amazon.com/cli/latest/reference/ec2/search-transit-gateway-routes.html) in *AWS CLI Command Reference*. 
**send-diagnostic-interrupt**

The following code example shows how to use send-diagnostic-interrupt.

**AWS CLI**

**To send a diagnostic interrupt**

The following send-diagnostic-interrupt example sends a diagnostic interrupt to the specified instance.

```
aws ec2 send-diagnostic-interrupt \
    --instance-id i-1234567890abcdef0
```

This command produces no output.

- For API details, see [SendDiagnosticInterrupt](#) in *AWS CLI Command Reference*.

**start-instances**

The following code example shows how to use start-instances.

**AWS CLI**

**To start an Amazon EC2 instance**

This example starts the specified Amazon EBS-backed instance.

**Command:**

```
aws ec2 start-instances --instance-ids i-1234567890abcdef0
```

**Output:**

```json
{
    "StartingInstances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "CurrentState": {
                "Code": 0,
                "Name": "pending"
            }
        }
    ]
}
```
For more information, see Stop and Start Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [StartInstances](#) in *AWS CLI Command Reference*.

### start-network-insights-access-scope-analysis

The following code example shows how to use `start-network-insights-access-scope-analysis`.

**AWS CLI**

**To start a Network Insights access scope analysis**

The following `start-network-insights-access-scope-analysis` example starts the scope analysis in your AWS account.

```
aws ec2 start-network-insights-access-scope-analysis
  --region us-east-1
  --network-insights-access-scope-id nis-123456789111
```

**Output:**

```
{
"NetworkInsightsAccessScopeAnalysis": {
  "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
  "NetworkInsightsAccessScopeId": "nis-123456789111",
  "Status": "running",
  "StartDate": "2022-01-26T00:47:06.814000+00:00"
}
}
```
For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/cli/latest/index.html) in the [Network Access Analyzer Guide](https://docs.aws.amazon.com/access-analyzer/latest/userguide/).

### start-network-insights-analysis

The following code example shows how to use **start-network-insights-analysis**.

**AWS CLI**

**To analyze a path**

The following **start-network-insights-analysis** example analyzes the path between the source and destination. To view the results of the path analysis, use the `describe-network-insights-analyses` command.

```bash
aws ec2 start-network-insights-analysis \
  --network-insights-path-id nip-0b26f22f1d131fa8
```

Output:

```
{
    "NetworkInsightsAnalysis": {
        "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
        "NetworkInsightsPathId": "nip-0b26f22f1d131fa8",
        "StartDate": "2021-01-20T22:58:37.495Z",
        "Status": "running"
    }
}
```

For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/index.html) in the [Reachability Analyzer Guide](https://docs.aws.amazon.com/reachability-analyzer/latest/userguide/).

### start-vpc-endpoint-service-private-dns-verification

The following code example shows how to use **start-vpc-endpoint-service-private-dns-verification**.

**Actions and scenarios**

2575
AWS CLI

To initiate the DNS verification process

The following `start-vpc-endpoint-service-private-dns-verification` example initiates the DNS verification process for the specified endpoint service.

```
aws ec2 start-vpc-endpoint-service-private-dns-verification \
   --service-id vpce-svc-071afff70666e61e0
```

This command produces no output.

For more information, see [Manage DNS names](#) in the [AWS PrivateLink User Guide](#).

- For API details, see [StartVpcEndpointServicePrivateDnsVerification](#) in [AWS CLI Command Reference](#).

**stop-instances**

The following code example shows how to use `stop-instances`.

AWS CLI

**Example 1: To stop an Amazon EC2 instance**

The following `stop-instances` example stops the specified Amazon EBS-backed instance.

```
aws ec2 stop-instances \
   --instance-ids i-1234567890abcdef0
```

Output:

```
{
   "StoppingInstances": [
   {
      "InstanceId": "i-1234567890abcdef0",
      "CurrentState": {
         "Code": 64,
         "Name": "stopping"
      }
   }
   ]
}
```
For more information, see Stop and Start Your Instance in the Amazon Elastic Compute Cloud User Guide.

Example 2: To hibernate an Amazon EC2 instance

The following stop-instances example hibernates Amazon EBS-backed instance if the instance is enabled for hibernation and meets the hibernation prerequisites. After the instance is put into hibernation the instance is stopped.

```
aws ec2 stop-instances \
    --instance-ids i-1234567890abcdef0 \ 
    --hibernate
```

Output:

```json
{
    "StoppingInstances": [
        {
            "CurrentState": {
                "Code": 64,
                "Name": "stopping"
            },
            "InstanceId": "i-1234567890abcdef0",
            "PreviousState": {
                "Code": 16,
                "Name": "running"
            }
        }
    ]
}
```

For more information, see Hibernate your On-Demand Linux instance in the Amazon Elastic Cloud Compute User Guide.
For API details, see StopInstances in AWS CLI Command Reference.

**terminate-client-vpn-connections**

The following code example shows how to use terminate-client-vpn-connections.

**AWS CLI**

**To terminate a connection to a Client VPN endpoint**

The following terminate-client-vpn-connections example terminates the specified connection to the Client VPN endpoint.

```
aws ec2 terminate-client-vpn-connections \
  --client-vpn-endpoint-id vpn-endpoint-123456789123abcde \
  --connection-id cvpn-connection-04edd76f5201e0cb8
```

Output:

```
{
  "ClientVpnEndpointId": "vpn-endpoint-123456789123abcde",
  "ConnectionStatuses": [
    {
      "ConnectionId": "cvpn-connection-04edd76f5201e0cb8",
      "PreviousStatus": {
        "Code": "active"
      },
      "CurrentStatus": {
        "Code": "terminating"
      }
    }
  ]
}
```

For more information, see Client Connections in the AWS Client VPN Administrator Guide.

For API details, see TerminateClientVpnConnections in AWS CLI Command Reference.

**terminate-instances**

The following code example shows how to use terminate-instances.
AWS CLI

**To terminate an Amazon EC2 instance**

This example terminates the specified instance.

**Command:**

```
aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
```

**Output:**

```
{
   "TerminatingInstances": [
   {
      "InstanceId": "i-1234567890abcdef0",
      "CurrentState": { 
         "Code": 32,
         "Name": "shutting-down"
      },
      "PreviousState": { 
         "Code": 16,
         "Name": "running"
      }
   }
   ]
}
```

For more information, see Using Amazon EC2 Instances in the *AWS Command Line Interface User Guide*.

- For API details, see [TerminateInstances](#) in *AWS CLI Command Reference*.

**unassign-ipv6-addresses**

The following code example shows how to use unassign-ipv6-addresses.

**AWS CLI**

**To unassign an IPv6 address from a network interface**

This example unassigns the specified IPv6 address from the specified network interface.
**Command:**

```bash
aws ec2 unassign-ipv6-addresses --ipv6-addresses 2001:db8:1234:1a00:3304:8879:34cf:4071 --network-interface-id eni-23c49b68
```

**Output:**

```json
{
   "NetworkInterfaceId": "eni-23c49b68",
   "UnassignedIpv6Addresses": [
      "2001:db8:1234:1a00:3304:8879:34cf:4071"
   ]
}
```

- For API details, see [UnassignIpv6Addresses](#) in *AWS CLI Command Reference*.

### unassign-private-ip-addresses

The following code example shows how to use `unassign-private-ip-addresses`.

**AWS CLI**

**To unassign a secondary private IP address from a network interface**

This example unassigns the specified private IP address from the specified network interface. If the command succeeds, no output is returned.

**Command:**

```bash
aws ec2 unassign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```

- For API details, see [UnassignPrivatIpAddresses](#) in *AWS CLI Command Reference*.

### unassign-private-nat-gateway-address

The following code example shows how to use `unassign-private-nat-gateway-address`.

**AWS CLI**

**To unassign a private IP address from your private NAT gateway**
The following unassign-private-nat-gateway-address example unassigns the specified IP address from the specified private NAT gateway.

```
aws ec2 unassign-private-nat-gateway-address \
  --nat-gateway-id nat-1234567890abcdef0 \
  --private-ip-addresses 10.0.20.197
```

Output:

```
{
    "NatGatewayId": "nat-0ee3edd182361f662",
    "NatGatewayAddresses": [
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "PrivateIp": "10.0.20.197",
            "IsPrimary": false,
            "Status": "unassigning"
        }
    ]
}
```

For more information, see [NAT gateways](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/what-is-nat-gateway.html) in the *Amazon VPC User Guide*.

- For API details, see [UnassignPrivateNatGatewayAddress](https://docs.aws.amazon.com/cli/v1/reference/ec2/unassign-private-nat-gateway-address.html) in *AWS CLI Command Reference*.

**unmonitor-instances**

The following code example shows how to use unmonitor-instances.

**AWS CLI**

**To disable detailed monitoring for an instance**

This example command disables detailed monitoring for the specified instance.

Command:

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

Output:
For API details, see [UnmonitorInstances](#) in *AWS CLI Command Reference*.

### update-security-group-rule-descriptions-egress

The following code example shows how to use `update-security-group-rule-descriptions-egress`.

**AWS CLI**

**To update the description of an outbound security group rule**

The following `update-security-group-rule-descriptions-egress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'Outbound HTTP access to server 2' replaces any existing description for the rule.

```bash
aws ec2 update-security-group-rule-descriptions-egress \  --group-id sg-02f0d35a850ba727f \  --ip-permissions IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=203.0.113.0/24,Description="Outbound HTTP access to server 2"}]
```

**Output:**

```json
{
    "Return": true
}
```

For more information, see [Security group rules](#) in the *Amazon EC2 User Guide*. 
update-security-group-rule-descriptions-ingress

The following code example shows how to use update-security-group-rule-descriptions-ingress.

AWS CLI

**Example 1: To update the description of an inbound security group rule with a CIDR source**

The following update-security-group-rule-descriptions-ingress example updates the description for the security group rule for the specified port and IPv4 address range. The description 'SSH access from ABC office' replaces any existing description for the rule.

```bash
aws ec2 update-security-group-rule-descriptions-ingress \
  --group-id sg-02f0d35a850ba727f \
  --ip-permissions
  IpProtocol=tcp,FromPort=22,ToPort=22,IpRanges='[{|CidrIp=203.0.113.0/16,Description="SSH access from corpnet"}]
```

Output:

```json
{
  "Return": true
}
```

For more information, see Security group rules in the Amazon EC2 User Guide.

**Example 2: To update the description of an inbound security group rule with a prefix list source**

The following update-security-group-rule-descriptions-ingress example updates the description for the security group rule for the specified port and prefix list. The description 'SSH access from ABC office' replaces any existing description for the rule.

```bash
aws ec2 update-security-group-rule-descriptions-ingress \
  --group-id sg-02f0d35a850ba727f \
```
--ip-permissions
IpProtocol=tcp,FromPort=22,ToPort=22,PrefixListIds='[PrefixListId=pl-12345678,Description="SSH access from corpnet"]'

Output:
{
   "Return": true
}

For more information, see Security group rules in the Amazon EC2 User Guide.

- For API details, see UpdateSecurityGroupRuleDescriptionsIngress in AWS CLI Command Reference.

withdraw-byoip-cidr

The following code example shows how to use withdraw-byoip-cidr.

AWS CLI

To stop advertising an address range

The following withdraw-byoip-cidr example stops advertising the specified address range.

aws ec2 withdraw-byoip-cidr
   --cidr 203.0.113.25/24

Output:
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
      "State": "advertised"
   }
}

- For API details, see WithdrawByoipCidr in AWS CLI Command Reference.
Amazon EC2 Instance Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2 Instance Connect.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

**Actions**

**send-ssh-public-key**

The following code example shows how to use `send-ssh-public-key`.

**AWS CLI**

*To send a SSH public key to an instance*

The following `send-ssh-public-key` example sends the specified SSH public key to the specified instance. The key is used to authenticate the specified user.

```bash
aws ec2-instance-connect send-ssh-public-key
    --instance-id i-1234567890abcdef0
    --instance-os-user ec2-user
    --availability-zone us-east-2b
    --ssh-public-key file://path/my-rsa-key.pub
```

This command produces no output.

- For API details, see [SendSshPublicKey](https://docs.aws.amazon.com/cli/latest/reference/ec2-instance-connect/send-ssh-public-key.html) in *AWS CLI Command Reference*. 
Amazon ECR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

**Actions**

*batch-check-layer-availability*

The following code example shows how to use *batch-check-layer-availability*.

**AWS CLI**

**To check the availability of a layer**

The following *batch-check-layer-availability* example checks the availability of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```
aws ecr batch-check-layer-availability  
    --repository-name cluster-autoscaler  
    --layer-digests  
    sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

**Output:**

```
{
}
```
For API details, see `BatchCheckLayerAvailability` in *AWS CLI Command Reference*.

**batch-delete-image**

The following code example shows how to use `batch-delete-image`.

**AWS CLI**

**Example 1: To delete an image**

The following `batch-delete-image` example deletes an image with the tag `precise` in the specified repository in the default registry for an account.

```bash
aws ecr batch-delete-image \
   --repository-name ubuntu \
   --image-ids imageTag=precise
```

**Output:**

```json
{
   "failures": [],
   "imageIds": [
      {
         "imageTag": "precise",
         "imageDigest": "sha256:19665f1e6d1e504117a1743c0a3d3753086354a38375961f2e665416ef4b1b2f"
      }
   ]
}
```
Example 2: To delete multiple images

The following batch-delete-image example deletes all images tagged with prod and team1 in the specified repository.

```bash
aws ecr batch-delete-image \
   --repository-name MyRepository \
   --image-ids imageTag=prod imageTag=team1
```

Output:

```json
{
   "imageIds": [
      {
         "imageDigest": "sha256:123456789012",
         "imageTag": "prod"
      },
      {
         "imageDigest": "sha256:567890121234",
         "imageTag": "team1"
      }
   ],
   "failures": []
}
```

For more information, see Deleting an Image in the Amazon ECR User Guide.

- For API details, see BatchDeleteImage in AWS CLI Command Reference.

batch-get-image

The following code example shows how to use batch-get-image.

AWS CLI

Example 1: To get an image

The following batch-get-image example gets an image with the tag v1.13.6 in a repository called cluster-autoscaler in the default registry for an account.

```bash
aws ecr batch-get-image \
```
--repository-name cluster-autoscaler
--image-ids imageTag=v1.13.6

Output:

```json
{
  "images": [
    {
      "registryId": "012345678910",
      "repositoryName": "cluster-autoscaler",
      "imageId": {
        "imageDigest": "sha256:4a1c6567c38904384ebc64e35b7eedd8451110c299e3368d2210066487d97e5",
        "imageTag": "v1.13.6"
      },
      "imageManifest": "{\n    "schemaVersion": 2,\n    "mediaType": "application/vnd.docker.distribution.manifest.v2+json",
    "config": {\n      "mediaType": "application/vnd.docker.container.image.v1+json",
      "size": 2777,\n      "digest": "sha256:6171c7451a50945f8dd72f7732cc04d7a0d1f48138a426b2e64387fde834ed",
      "layers": [{\n        "mediaType": "application/vnd.docker.image.rootfs.diff.tar.gzip",
        "size": 17743696,\n        "digest": "sha256:39f4c05754f195f134ca11eddb1c9a691ab0484c697fffe5a85900caaf6e1",
        "layers": [{\n          "mediaType": "application/vnd.docker.image.rootfs.diff.tar.gzip",
          "size": 2565026,\n          "digest": "sha256:8c8a779d3a537b767ae1091fe6e00c2590af16767aa6096d1b31867549481f9",
          "layers": [{\n            "mediaType": "application/vnd.docker.image.rootfs.diff.tar.gzip",
            "size": 28005981,\n            "digest": "sha256:c44ba47496991c9982ee493b47fd25c252caabf2b4ae7dd679c9a27b6a3c8fb7",
            "layers": [{\n              "mediaType": "application/vnd.docker.image.rootfs.diff.tar.gzip",
              "size": 775,\n              "digest": "sha256:e2c388b44226544363ca007be7b996bce1baeebea04da23b6165eac30be650f"
            }
          ]
        ]
      ]
    }
  ]
}
```

Example 2: To get multiple images
The following batch-get-image example displays details of all images tagged with prod and team1 in the specified repository.

```bash
aws ecr batch-get-image \
  --repository-name MyRepository \
  --image-ids imageTag=prod imageTag=team1
```

Output:

```json
{
  "images": [
    {
      "registryId": "123456789012",
      "repositoryName": "MyRepository",
      "imageId": {
        "imageDigest": "sha256:123456789012",
        "imageTag": "prod"
      },
      "imageManifest": "manifestExample1"
    },
    {
      "registryId": "567890121234",
      "repositoryName": "MyRepository",
      "imageId": {
        "imageDigest": "sha256:123456789012",
        "imageTag": "team1"
      },
      "imageManifest": "manifestExample2"
    }
  ],
  "failures": []
}
```

For more information, see [Images](https://docs.aws.amazon.com/AmazonECR/latest/userguide/images.html) in the *Amazon ECR User Guide*.

- For API details, see [BatchGetImage](https://docs.aws.amazon.com/cli/latest/reference/ecr/batch-get-image.html) in *AWS CLI Command Reference*.

### complete-layer-upload

The following code example shows how to use complete-layer-upload.
AWS CLI

To complete an image layer upload

The following complete-layer-upload example completes an image layer upload to the layer-test repository.

```
aws ecr complete-layer-upload \
    --repository-name layer-test \
    --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \
    --layer-digests 6cb64b8a-9378-0e33-2ab1-\nb780fab8a9e9:48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e
```

Output:

```
{
    "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
    "layerDigest":
        "sha256:9a77f85878aa1906f2020a0ecdf7a7e962d57e882250acd773383224b3fe9a02",
    "repositoryName": "layer-test",
    "registryId": "130757420319"
}
```

- For API details, see [CompleteLayerUpload](#) in *AWS CLI Command Reference*.

create-repository

The following code example shows how to use create-repository.

AWS CLI

**Example 1: To create a repository**

The following create-repository example creates a repository inside the specified namespace in the default registry for an account.

```
aws ecr create-repository \
    --repository-name project-a/nginx-web-app
```

Output:
For more information, see Creating a Repository in the Amazon ECR User Guide.

Example 2: To create a repository configured with image tag immutability

The following create-repository example creates a repository configured for tag immutability in the default registry for an account.

```bash
aws ecr create-repository \
   --repository-name sample-repo \
   --image-tag-mutability IMMUTABLE
```

Output:

```json
{
   "repository": {
      "registryId": "123456789012",
      "repositoryName": "sample-repo",
      "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/sample-repo",
      "imageTagMutability": "IMMUTABLE"
   }
}
```

For more information, see Image Tag Mutability in the Amazon ECR User Guide.

Example 3: To create a repository configured with a scanning configuration

The following create-repository example creates a repository configured to perform a vulnerability scan on image push in the default registry for an account.

```bash
aws ecr create-repository \
   --repository-name sample-repo \
```

Actions and scenarios
For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see CreateRepository in AWS CLI Command Reference.

### delete-lifecycle-policy

The following code example shows how to use delete-lifecycle-policy.

#### AWS CLI

**To delete the lifecycle policy for a repository**

The following delete-lifecycle-policy example deletes the lifecycle policy for the hello-world repository.

```
aws ecr delete-lifecycle-policy \
    --repository-name hello-world
```

**Output:**

```json
{
    "registryId": "012345678910",
    "repositoryName": "hello-world",
    "lifecyclePolicyText": "{"rules":[{"rulePriority":1,"description":"Remove untagged images."},"selection":{"tagStatus":"untagged"},"countType":",
```
For API details, see [DeleteLifecyclePolicy](#) in *AWS CLI Command Reference*.

### delete-repository-policy

The following code example shows how to use delete-repository-policy.

**AWS CLI**

**To delete the repository policy for a repository**

The following delete-repository-policy example deletes the repository policy for the `cluster-autoscaler` repository.

```bash
aws ecr delete-repository-policy 
--repository-name cluster-autoscaler
```

**Output:**

```json
{
    "registryId": "012345678910",
    "repositoryName": "cluster-autoscaler",
}
```

For API details, see [DeleteRepositoryPolicy](#) in *AWS CLI Command Reference*.

### delete-repository

The following code example shows how to use delete-repository.

**AWS CLI**

**To delete a repository**
The following delete-repository example command force deletes the specified repository in the default registry for an account. The --force flag is required if the repository contains images.

```bash
aws ecr delete-repository \
  --repository-name ubuntu \
  --force
```

Output:

```json
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "ubuntu",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/ubuntu"
  }
}
```

For more information, see Deleting a Repository in the Amazon ECR User Guide.

- For API details, see DeleteRepository in AWS CLI Command Reference.

describe-image-scan-findings

The following code example shows how to use describe-image-scan-findings.

AWS CLI

To describe the scan findings for an image

The following describe-image-scan-findings example returns the image scan findings for an image using the image digest in the specified repository in the default registry for an account.

```bash
aws ecr describe-image-scan-findings \
  --repository-name sample-repo \
  --image-id
  imageDigest=sha256:74b2c688c700ec95a93e478cdbc959737c148d3f3f65ea706abe0318726e885e6
```

Output:

```json
{
}
```
"imageScanFindings": {
    "findings": [
        {
            "name": "CVE-2019-5188",
            "description": "A code execution vulnerability exists in the directory rehashing functionality of E2fsprogs e2fsck 1.45.4. A specially crafted ext4 directory can cause an out-of-bounds write on the stack, resulting in code execution. An attacker can corrupt a partition to trigger this vulnerability."
        },
        {
            "severity": "MEDIUM",
            "attributes": [
                {
                    "key": "package_version",
                    "value": "1.44.1-1ubuntu1.1"
                },
                {
                    "key": "package_name",
                    "value": "e2fsprogs"
                },
                {
                    "key": "CVSS2_VECTOR",
                    "value": "AV:L/AC:L/Au:N/C:P/I:P/A:P"
                },
                {
                    "key": "CVSS2_SCORE",
                    "value": "4.6"
                }
            ]
        }
    ],
    "imageScanCompletedAt": 1579839105.0,
    "vulnerabilitySourceUpdatedAt": 1579811117.0,
    "findingSeverityCounts": {
        "MEDIUM": 1
    }
},
"registryId": "123456789012",
"repositoryName": "sample-repo",
"imageId": {
    "imageDigest": "sha256:74b2c688c700ec95a93e478cddb959737c148df3fbf5ea706abe0318726e885e6"
},
"imageScanStatus": {
    "status": "COMPLETE",
}
"description": "The scan was completed successfully."
}
}

For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see DescribeImageScanFindings in AWS CLI Command Reference.

describe-images

The following code example shows how to use describe-images.

AWS CLI

To describe an image in a repository

The following describe-images example displays details about an image in the cluster-autoscaler repository with the tag v1.13.6.

```bash
aws ecr describe-images \
   --repository-name cluster-autoscaler \
   --image-ids imageTag=v1.13.6
```

Output:

```
{
   "imageDetails": [
   {
   "registryId": "012345678910",
   "repositoryName": "cluster-autoscaler",
   "imageDigest": "sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
   "imageTags": [
   "v1.13.6"
   ],
   "imageSizeInBytes": 48318255,
   "imagePushedAt": 1565128275.0
   }
   ]
}
```

- For API details, see DescribeImages in AWS CLI Command Reference.
describe-repositories

The following code example shows how to use describe-repositories.

AWS CLI

To describe the repositories in a registry

This example describes the repositories in the default registry for an account.

Command:

```
aws ecr describe-repositories
```

Output:

```
{
   "repositories": [
   {
      "registryId": "012345678910",
      "repositoryName": "ubuntu",
      "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/ubuntu"
   },
   {
      "registryId": "012345678910",
      "repositoryName": "test",
      "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/test"
   }
   ]
}
```

• For API details, see DescribeRepositories in AWS CLI Command Reference.

get-authorization-token

The following code example shows how to use get-authorization-token.

AWS CLI

To get an authorization token for your default registry

The following get-authorization-token example command gets an authorization token for your default registry.
aws ecr get-authorization-token

Output:

```
{
    "authorizationData": [
        {
            "authorizationToken": "QVdT0kN...",
            "expiresAt": 1448875853.241,
            "proxyEndpoint": "https://123456789012.dkr.ecr.us-west-2.amazonaws.com"
        }
    ]
}
```

- For API details, see [GetAuthorizationToken](https://docs.aws.amazon.com/cli/latest/reference/ecr/get-authorization-token.html) in *AWS CLI Command Reference*.

get-download-url-for-layer

The following code example shows how to use get-download-url-for-layer.

AWS CLI

To get the download URL of a layer

The following `get-download-url-for-layer` example displays the download URL of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```
aws ecr get-download-url-for-layer \
    --repository-name cluster-autoscaler \
    --layer-digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
```
For API details, see GetDownloadUrlForLayer in AWS CLI Command Reference.

get-lifecycle-policy-preview

The following code example shows how to use get-lifecycle-policy-preview.

AWS CLI

To retrieve details for a lifecycle policy preview

The following get-lifecycle-policy-preview example retrieves the result of a lifecycle policy preview for the specified repository in the default registry for an account.

Command:

```
aws ecr get-lifecycle-policy-preview \
--repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{"rules": [\n    {\n      "rulePriority": 1,\n      "description": "Expire images older than 14 days",\n      "selection": {\n        "tagStatus": "untagged",\n        "countType": "sinceImagePushed",\n        "countUnit": "days",\n        "countNumber": 14\n      },\n      "action": {\n        "type": "expire"\n      }\n    }\n  ],\n  "status": "COMPLETE",
  "previewResults": [],
  "summary": {
    "expiringImageTotalCount": 0
  }
}
```
For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see GetLifecyclePolicyPreview in AWS CLI Command Reference.

get-lifecycle-policy

The following code example shows how to use get-lifecycle-policy.

AWS CLI

To retrieve a lifecycle policy

The following get-lifecycle-policy example displays details of the lifecycle policy for the specified repository in the default registry for the account.

```
aws ecr get-lifecycle-policy \
  --repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
  "registryId": "123456789012",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{"rules": [{"rulePriority": 1, "description": "Expire images older than 14 days", "selection": {"tagStatus": "untagged", "countType": "sinceImagePushed", "countUnit": "days", "countNumber": 14}, "action": {"type": "expire"} } ] }",
  "lastEvaluatedAt": 1504295007.0
}
```

For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see GetLifecyclePolicy in AWS CLI Command Reference.

get-login-password

The following code example shows how to use get-login-password.

AWS CLI

To retrieve a password to authenticate to a registry
The following `get-login-password` displays a password that you can use with a container client of your choice to authenticate to any Amazon ECR registry that your IAM principal has access to.

```
aws ecr get-login-password
```

Output:

```
<password>
```

To use with the Docker CLI, pipe the output of the `get-login-password` command to the `docker login` command. When retrieving the password, ensure that you specify the same Region that your Amazon ECR registry exists in.

```
aws ecr get-login-password \
   --region <region> \
| docker login \
   --username AWS \
   --password-stdin <aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

For more information, see [Registry Authentication](https://docs.aws.amazon.com/AmazonECR/latest/userguide/registry-authentication.html) in the *Amazon ECR User Guide*.

- For API details, see [GetLoginPassword](https://docs.aws.amazon.com/cli/latest/reference/ecr/get-login-password.html) in *AWS CLI Command Reference*.

---

### get-login

The following code example shows how to use `get-login`.

**AWS CLI**

**To retrieve a Docker login command to your default registry**

This example prints a command that you can use to log in to your default Amazon ECR registry.

Command:

```
aws ecr get-login
```

Output:
To log in to another account's registry

This example prints one or more commands that you can use to log in to Amazon ECR registries associated with other accounts.

Command:

```bash
aws ecr get-login --registry-ids 012345678910 023456789012
```

Output:

```bash
docker login -u <username> -p <token-1> -e none <endpoint-1>
docker login -u <username> -p <token-2> -e none <endpoint-2>
```

- For API details, see [GetLogin](#) in *AWS CLI Command Reference*.

get-repository-policy

The following code example shows how to use get-repository-policy.

AWS CLI

To retrieve the repository policy for a repository

The following get-repository-policy example displays details about the repository policy for the cluster-autoscaler repository.

```bash
aws ecr get-repository-policy \
  --repository-name cluster-autoscaler
```

Output:

```json
{
  "registryId": "012345678910",
  "repositoryName": "cluster-autoscaler",
```
For API details, see GetRepositoryPolicy in AWS CLI Command Reference.

initiate-layer-upload

The following code example shows how to use initiate-layer-upload.

AWS CLI

To initiate an image layer upload

The following initiate-layer-upload example initiates an image layer upload to the layer-test repository.

```bash
aws ecr initiate-layer-upload \
   --repository-name layer-test
```

Output:

```json
{
   "partSize": 10485760,
   "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9"
}
```

For API details, see InitiateLayerUpload in AWS CLI Command Reference.

list-images

The following code example shows how to use list-images.

AWS CLI

To list the images in a repository

The following list-images example displays a list of the images in the cluster-autoscaler repository.
aws ecr list-images \
   --repository-name cluster-autoscaler

Output:

```
{
   "imageIds": [
      {
         "imageDigest": "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
         "imageTag": "v1.13.8"
      },
      {
         "imageDigest": "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
         "imageTag": "v1.13.7"
      },
      {
         "imageDigest": "sha256:4a1c6567c38904384ebc64e35b7eedd8451110c299e3368d2210066487d97e5",
         "imageTag": "v1.13.6"
      }
   ]
}
```

- For API details, see [ListImages](#) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

*To list the tags for repository*

The following `list-tags-for-resource` example displays a list of the tags associated with the `hello-world` repository.

```bash
aws ecr list-tags-for-resource \
```
Output:

```json
{
    "tags": [
        {
            "Key": "Stage",
            "Value": "Integ"
        }
    ]
}
```

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**put-image-scanning-configuration**

The following code example shows how to use `put-image-scanning-configuration`.

**AWS CLI**

To update the image scanning configuration for a repository

The following `put-image-scanning-configuration` example updates the image scanning configuration for the specified repository.

```bash
aws ecr put-image-scanning-configuration \
 --repository-name sample-repo \
 --image-scanning-configuration scanOnPush=true
```

Output:

```json
{
    "registryId": "012345678910",
    "repositoryName": "sample-repo",
    "imageScanningConfiguration": {
        "scanOnPush": true
    }
}
```

For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see PutImageScanningConfiguration in AWS CLI Command Reference.
put-image-tag-mutability

The following code example shows how to use put-image-tag-mutability.

AWS CLI

To update the image tag mutability setting for a repository

The following put-image-tag-mutability example configures the specified repository for tag immutability. This prevents all image tags within the repository from being overwritten.

```
aws ecr put-image-tag-mutability \\
    --repository-name hello-repository \\
    --image-tag-mutability IMMUTABLE
```

Output:

```
{
    "registryId": "012345678910",
    "repositoryName": "sample-repo",
    "imageTagMutability": "IMMUTABLE"
}
```

For more information, see Image Tag Mutability in the Amazon ECR User Guide.

- For API details, see PutImageTagMutability in AWS CLI Command Reference.

put-image

The following code example shows how to use put-image.

AWS CLI

To retag an image with its manifest

The following put-image example creates a new tag in the hello-world repository with an existing image manifest.

```
aws ecr put-image \\
    --repository-name hello-world \\
    --image-tag 2019.08 \\
    --image-manifest file://hello-world.manifest.json
```
Contents of hello-world.manifest.json:

```json
{
    "schemaVersion": 2,
    "mediaType": "application/vnd.docker.distribution.manifest.v2+json",
    "config": {

} \n]"}
For API details, see PutImage in AWS CLI Command Reference.

**put-lifecycle-policy**

The following code example shows how to use put-lifecycle-policy.

**AWS CLI**

**To create a lifecycle policy**

The following put-lifecycle-policy example creates a lifecycle policy for the specified repository in the default registry for an account.

```
aws ecr put-lifecycle-policy \
    --repository-name "project-a/amazon-ecs-sample" \
    --lifecycle-policy-text "file://policy.json"
```

Contents of `policy.json`:

```json
{
    "rules": [
        {
            "rulePriority": 1,
            "description": "Expire images older than 14 days",
            "selection": {
                "tagStatus": "untagged",
                "countType": "sinceImagePushed",
                "countUnit": "days",
                "countNumber": 14
            },
            "action": {
                "type": "expire"
            }
        }
    ]
}
```

Output:
```json
{
    "registryId": "<aws_account_id>",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{"rules":[{"rulePriority":1,"description":"Expire images older than 14 days","selection":{"tagStatus":"untagged","countType":"sinceImagePushed","countUnit":"days","countNumber":14},"action": {"type":"expire"}]}]"
}
```

For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see PutLifecyclePolicy in AWS CLI Command Reference.

### set-repository-policy

The following code example shows how to use set-repository-policy.

**AWS CLI**

**To set the repository policy for a repository**

The following set-repository-policy example attaches a repository policy contained in a file to the cluster-autoscaler repository.

```bash
aws ecr set-repository-policy 
    --repository-name cluster-autoscaler 
    --policy-text file://my-policy.json
```

**Contents of my-policy.json:**

```json
{
    "Version": "2008-10-17",
    "Statement": [
        {
            "Sid": "allow public pull",
            "Effect": "Allow",
            "Principal": "*",
            "Action": [
                "ecr:BatchCheckLayerAvailability",
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ]
        }
    ]
}
```
For API details, see [SetRepositoryPolicy](https://docs.aws.amazon.com/cli/latest/reference/ecr/setrepositorypolicy.html) in *AWS CLI Command Reference*.

### start-image-scan

The following code example shows how to use `start-image-scan`.

**AWS CLI**

**To start an image vulnerability scan**

The following `start-image-scan` example starts an image scan for and specified by the image digest in the specified repository.

```bash
aws ecr start-image-scan \
  --repository-name sample-repo \
  --image-id imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6
```

**Output:**

```json
{
  "registryId": "012345678910",
  "repositoryName": "sample-repo",
  "imageId": {
    "imageDigest": "sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6"
  }
}
```
For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see StartImageScan in AWS CLI Command Reference.

**start-lifecycle-policy-preview**

The following code example shows how to use `start-lifecycle-policy-preview`.

**AWS CLI**

**To create a lifecycle policy preview**

The following `start-lifecycle-policy-preview` example creates a lifecycle policy preview defined by a JSON file for the specified repository.

```bash
aws ecr start-lifecycle-policy-preview \
   --repository-name "project-a/amazon-ecs-sample" \
   --lifecycle-policy-text "file://policy.json"
```

**Contents of policy.json:**

```json
{
   "rules": [
      {
         "rulePriority": 1,
         "description": "Expire images older than 14 days",
         "selection": {
            "tagStatus": "untagged",
            "countType": "sinceImagePushed",
            "countUnit": "days",
            "countNumber": 14
         },
         "action": {
            "type": "expire"
         }
      }
   ]
}
```
Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{\n    "rules": [{\n      "rulePriority": 1,
      "description": "Expire images older than 14 days",
      "selection": {
        "tagStatus": "untagged",
        "countType": "sinceImagePushed",
        "countUnit": "days",
        "countNumber": 14
      },
      "action": {
        "type": "expire"
      }
    }],
    "tagStatus": "IN_PROGRESS"
  }
}
```

- For API details, see [StartLifecyclePolicyPreview](https://docs.aws.amazon.com/cli/latest/reference/ecr/start-lifecycle-policy-preview.html) in **AWS CLI Command Reference**.

### tag-resource

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To tag a repository**

The following tag-resource example sets a tag with key `Stage` and value `Integ` on the `hello-world` repository.

```
aws ecr tag-resource \
  --tags Key=Stage,Value=Integ
```

This command produces no output.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/ecr/tag-resource.html) in **AWS CLI Command Reference**.

### untag-resource

The following code example shows how to use `untag-resource`.
### AWS CLI

#### To untag a repository

The following `untag-resource` example removes the tag with the key `Stage` from the `hello-world` repository.

```bash
aws ecr untag-resource \
  --tag-keys Stage
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

#### upload-layer-part

The following code example shows how to use `upload-layer-part`.

### AWS CLI

#### To upload a layer part

This following `upload-layer-part` uploads an image layer part to the `layer-test` repository.

```bash
aws ecr upload-layer-part \
  --repository-name layer-test \
  --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \
  --part-first-byte 0 \
  --part-last-byte 8323314 \
  --layer-part-blob file:///var/lib/docker/image/overlay2/layerdb/sha256/ff986b10a018b48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e/layer.b64
```

**Output:**

```json
{
  "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
  "registryId": "012345678910",
  "lastByteReceived": 8323314,
  "repositoryName": "layer-test"
}
```
Amazon ECS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

create-capacity-provider

The following code example shows how to use create-capacity-provider.

AWS CLI

To create a capacity provider

The following create-capacity-provider example creates a capacity provider that uses an Auto Scaling group named MyASG, has managed scaling and managed termination protection enabled. This configuration is used for Amazon ECS cluster auto scaling.

```bash
aws ecs create-capacity-provider \
  --name "MyCapacityProvider" \
```
Output:

```json
{
    "capacityProvider": {
        "capacityProviderArn": "arn:aws:ecs:us-east-1:123456789012:capacity-provider/MyCapacityProvider",
        "name": "MyCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000,
                "instanceWarmupPeriod": 300
            },
            "managedTerminationProtection": "ENABLED"
        },
        "tags": []
    }
}
```

For more information, see Amazon ECS cluster auto scaling in the Amazon ECS Developer Guide.

- For API details, see CreateCapacityProvider in AWS CLI Command Reference.

**create-cluster**

The following code example shows how to use create-cluster.

**AWS CLI**

**Example 1: To create a new cluster**

The following create-cluster example creates a cluster.

```bash
aws ecs create-cluster \ 
    --cluster-name MyCluster
```

Output:
Example 2: To create a new cluster using capacity providers

The following create-cluster example creates a cluster and associates two existing capacity providers with it. The create-capacity-provider command is used to create a capacity provider. Specifying a default capacity provider strategy is optional, but recommended. In this example, we create a cluster named MyCluster and associate the MyCapacityProvider1 and MyCapacityProvider2 capacity providers with it. A default capacity provider strategy is specified that spreads the tasks evenly across both capacity providers.

```
aws ecs create-cluster --cluster-name MyCluster --capacity-providers MyCapacityProvider1 MyCapacityProvider2 --default-capacity-provider-strategy capacityProvider=MyCapacityProvider1,weight=1 capacityProvider=MyCapacityProvider2,weight=1
```

Output:

```json
{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "PROVISIONING",
      "registeredContainerInstancesCount": 0,
      "pendingTasksCount": 0,
      "runningTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": []
   }
}
```
"settings": [
    {
      "name": "containerInsights",
      "value": "enabled"
    }

**Example 3: To create a new cluster with multiple tags**

The following `create-cluster` example creates a cluster with multiple tags. For more information about adding tags using shorthand syntax, see [Using Shorthand Syntax with the AWS Command Line Interface](#) in the *AWS CLI User Guide*.

```
aws ecs create-cluster \
   --cluster-name MyCluster \
   --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

Output:

```
{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "ACTIVE",
      "registeredContainerInstancesCount": 0,
      "pendingTasksCount": 0,
      "runningTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "tags": [
      {
         "key": "key1",
```
For more information, see [Creating a Cluster](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/creating-a-cluster.html) in the *Amazon ECS Developer Guide*.

- For API details, see [CreateCluster](https://docs.aws.amazon.com/cli/latest/reference/ecs/create-cluster.html) in *AWS CLI Command Reference*.

**create-service**

The following code example shows how to use `create-service`.

**AWS CLI**

**Example 1: To create a service with a Fargate task**

The following `create-service` example shows how to create a service using a Fargate task.

```bash
aws ecs create-service \
  --cluster MyCluster \
  --service-name MyService \
  --task-definition sample-fargate:1 \
  --desired-count 2 \
  --launch-type FARGATE \
  --platform-version LATEST \
  --network-configuration "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321],assignPublicIp=ENABLED}" \
  --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

Output:

```json
{
}
```
"service": {
  "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
  "serviceName": "MyService",
  "loadBalancers": [],
  "serviceRegistries": [],
  "status": "ACTIVE",
  "desiredCount": 2,
  "runningCount": 0,
  "pendingCount": 0,
  "launchType": "FARGATE",
  "platformVersion": "LATEST",
  "deploymentConfiguration": {
    "maximumPercent": 200,
    "minimumHealthyPercent": 100
  },
  "deployments": [
    {
      "id": "ecs-svc/1234567890123456789",
      "status": "PRIMARY",
      "desiredCount": 2,
      "pendingCount": 0,
      "runningCount": 0,
      "createdAt": 1557119253.821,
      "updatedAt": 1557119253.821,
      "launchType": "FARGATE",
      "platformVersion": "1.3.0",
      "networkConfiguration": {
        "awsvpcConfiguration": {
          "subnets": [
            "subnet-12344321"
          ],
          "securityGroups": [
            "sg-12344321"
          ],
          "assignPublicIp": "ENABLED"
        }
      }
    }
  ]
}
Example 2: To create a service using the EC2 launch type

The following `create-service` example shows how to create a service called `ecs-simple-service` with a task that uses the EC2 launch type. The service uses the `sleep360` task definition and it maintains 1 instantiation of the task.
aws ecs create-service \
   --cluster MyCluster \
   --service-name ecs-simple-service \
   --task-definition sleep360:2 \
   --desired-count 1

Output:

{
   "service": {
      "serviceName": "ecs-simple-service",
      "loadBalancers": [],
      "serviceRegistries": [],
      "status": "ACTIVE",
      "desiredCount": 1,
      "runningCount": 0,
      "pendingCount": 0,
      "launchType": "EC2",
      "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:2",
      "deploymentConfiguration": {
         "maximumPercent": 200,
         "minimumHealthyPercent": 100
      },
      "deployments": [
         {
            "id": "ecs-svc/1234567890123456789",
            "status": "PRIMARY",
            "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:2",
            "desiredCount": 1,
            "pendingCount": 0,
            "runningCount": 0,
            "createdAt": 1557206498.798,
            "updatedAt": 1557206498.798,
            "launchType": "EC2"
         }
      ],
      "events": [],
      "createdAt": 1557206498.798,
   }
}
Example 3: To create a service that uses an external deployment controller

The following `create-service` example creates a service that uses an external deployment controller.

```bash
aws ecs create-service \
  --cluster MyCluster \
  --service-name MyService \
  --deployment-controller type=EXTERNAL \
  --desired-count 1
```

Output:

```json
{
  "service": {
    "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
    "serviceName": "MyService",
    "loadBalancers": [],
    "serviceRegistries": [],
    "status": "ACTIVE",
    "desiredCount": 1,
    "runningCount": 0,
    "pendingCount": 0,
    "launchType": "EC2",
    "deploymentConfiguration": {
      "maximumPercent": 200,
      "minimumHealthyPercent": 100
    },
    "taskSets": [],
    "deployments": [],
    "roleArn": "arn:aws:iam::123456789012:role/aws-service-role/ecs.amazonaws.com/AWSServiceRoleForECS",
    "events": []
  }
}
```
Example 4: To create a new service behind a load balancer

The following create-service example shows how to create a service that is behind a load balancer. You must have a load balancer configured in the same Region as your container instance. This example uses the `--cli-input-json` option and a JSON input file called `ecs-simple-service-elb.json` with the following content:

```json
{
    "serviceName": "ecs-simple-service-elb",
    "taskDefinition": "ecs-demo",
    "loadBalancers": [
        {
            "loadBalancerName": "EC2Contai-EcsElast-123456789012",
            "containerName": "simple-demo",
            "containerPort": 80
        }
    ],
    "desiredCount": 10,
    "role": "ecsServiceRole"
}
```

Command:

```
aws ecs create-service \
    --cluster MyCluster \
    --service-name ecs-simple-service-elb \
    --cli-input-json file://ecs-simple-service-elb.json
```

Output:
For more information, see [Creating a Service](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/creating-a-service.html) in the *Amazon ECS Developer Guide*.

- For API details, see [CreateService](https://docs.aws.amazon.com/cli/latest/reference/ecs/create-service.html) in *AWS CLI Command Reference*. 

```json
{
    "service": {
        "status": "ACTIVE",
        "pendingCount": 0,
        "loadBalancers": [
            {
                "containerName": "ecs-demo",
                "containerPort": 80,
                "loadBalancerName": "EC2Contai-EcsElast-123456789012"
            }
        ],
        "roleArn": "arn:aws:iam::123456789012:role/ecsServiceRole",
        "desiredCount": 10,
        "serviceName": "ecs-simple-service-elb",
        "deployments": [
            {
                "status": "PRIMARY",
                "pendingCount": 0,
                "createdAt": 1428100239.123,
                "desiredCount": 10,
                "updatedAt": 1428100239.123,
                "id": "ecs-svc/1234567890123456789",
                "runningCount": 0
            }
        ],
        "events": [],
        "runningCount": 0
    }
}
```
create-task-set

The following code example shows how to use create-task-set.

AWS CLI

To create a task set

The following create-task-set example creates a task set in a service that uses an external deployment controller.

```bash
aws ecs create-task-set \
  --cluster MyCluster \
  --service MyService \
  --task-definition MyTaskDefinition:2 \
  --network-configuration
  "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321]}"
```

Output:

```json
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "status": "ACTIVE",
    "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/MyTaskDefinition:2",
    "computedDesiredCount": 0,
    "pendingCount": 0,
    "runningCount": 0,
    "createdAt": 1557128360.711,
    "updatedAt": 1557128360.711,
    "launchType": "EC2",
    "networkConfiguration": {
      "awsvpcConfiguration": {
        "subnets": ["subnet-12344321"],
        "securityGroups": ["sg-12344321"],
        "assignPublicIp": "DISABLED"
      }
    }
  }
}
```
• For API details, see CreateTaskSet in AWS CLI Command Reference.

**delete-account-setting**

The following code example shows how to use delete-account-setting.

**AWS CLI**

To delete the account settings for a specific IAM user or IAM role

The following example delete-account-setting deletes the account settings for the specific IAM user or IAM role.

```bash
aws ecs delete-account-setting \
  --name serviceLongArnFormat \
  --principal-arn arn:aws:iam::123456789012:user/MyUser
```

**Output:**

```json
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::123456789012:user/MyUser"
  }
}
```

For more information, see Amazon Resource Names (ARNs) and IDs in the Amazon ECS Developer Guide.
For API details, see DeleteAccountSetting in AWS CLI Command Reference.

dele attributes

The following code example shows how to use delete-attributes.

AWS CLI

To delete one or more custom attributes from an Amazon ECS resource

The following delete-attributes deletes an attribute with the name stack from a container instance.

```bash
aws ecs delete-attributes \
    --attributes name=stack,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```
{
    "attributes": [
        {
            "name": "stack",
            "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
            "value": "production"
        }
    ]
}
```

For API details, see DeleteAttributes in AWS CLI Command Reference.

delete-capacity-provider

The following code example shows how to use delete-capacity-provider.

AWS CLI

Example 1: To delete a capacity provider using the Amazon Resource Name (ARN)

The following delete-capacity-provider example deletes a capacity provider by specifying the Amazon Resource Name (ARN) of the capacity provider. The ARN as well as the
status of the capacity provider deletion can be retrieved using the describe-capacity-providers command.

```bash
aws ecs delete-capacity-provider \
```

Output:

```json
{
   "capacityProvider": {
      "name": "ExampleCapacityProvider",
      "status": "ACTIVE",
      "autoScalingGroupProvider": {
         "managedScaling": {
            "status": "ENABLED",
            "targetCapacity": 100,
            "minimumScalingStepSize": 1,
            "maximumScalingStepSize": 10000
         },
         "managedTerminationProtection": "DISABLED",
         "updateStatus": "DELETE_IN_PROGRESS",
         "tags": []
      }
   }
}
```

For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster_capacity_providers.html) in the *Amazon ECS Developer Guide*.

**Example 2: To delete a capacity provider using the name**

The following delete-capacity-provider example deletes a capacity provider by specifying the short name of the capacity provider. The short name as well as the status of the capacity provider deletion can be retrieved using the describe-capacity-providers command.

```bash
aws ecs delete-capacity-provider \
```

---

**Actions and scenarios**

---

**2632**
--capacity-provider ExampleCapacityProvider

Output:

```json
{
    "capacityProvider": {
        "name": "ExampleCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000
            },
            "managedTerminationProtection": "DISABLED"
        },
        "updateStatus": "DELETE_IN_PROGRESS",
        "tags": []
    }
}
```

For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteCapacityProvider](https://docs.aws.amazon.com/cli/latest/reference/ecs/delete-capacity-provider.html) in *AWS CLI Command Reference*.

### delete-cluster

The following code example shows how to use `delete-cluster`.

**AWS CLI**

**To delete an empty cluster**

The following `delete-cluster` example deletes the specified empty cluster.

```
aws ecs delete-cluster --cluster MyCluster
```
Output:

```json
{
  "cluster": {
    "status": "INACTIVE",
    "clusterName": "MyCluster",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,
    "runningTasksCount": 0,
    "activeServicesCount": 0
    "statistics": [],
    "tags": []
  }
}
```

For more information, see [Deleting a Cluster](https://docs.aws.amazon.com/ecs/latest/developer-guide/ deleting-a-cluster.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteCluster](https://docs.aws.amazon.com/cli/latest/reference/ecs/delete-cluster.html) in *AWS CLI Command Reference*.

**delete-service**

The following code example shows how to use `delete-service`.

**AWS CLI**

**To delete a service**

The following `ecs delete-service` example deletes the specified service from a cluster. You can include the `--force` parameter to delete a service even if it has not been scaled to zero tasks.

```
aws ecs delete-service --cluster MyCluster --service MyService1 --force
```

For more information, see [Deleting a Service](https://docs.aws.amazon.com/ecs/latest/developer-guide/deleting-a-service.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteService](https://docs.aws.amazon.com/cli/latest/reference/ecs/delete-service.html) in *AWS CLI Command Reference*.

**delete-task-definitions**

The following code example shows how to use `delete-task-definitions`.
To delete a task definition

The following `delete-task-definitions` example deletes an INACTIVE task definition.

```
aws ecs delete-task-definitions \
   --task-definition curltest:1
```

Output:

```
{
  "taskDefinitions": [
    {
      "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/curltest:1",
      "containerDefinitions": [
        {
          "name": "ctest",
          "image": "mreferre/eksutils",
          "cpu": 0,
          "portMappings": [],
          "essential": true,
          "entryPoint": [
            "sh",
            "-c"
          ],
          "command": [
            "curl ${ECS_CONTAINER_METADATA_URI_V4}/task"
          ],
          "environment": [],
          "mountPoints": [],
          "volumesFrom": [],
          "logConfiguration": {
            "logDriver": "awslogs",
            "options": {
              "awslogs-create-group": "true",
              "awslogs-group": "/ecs/curltest",
              "awslogs-region": "us-east-1",
              "awslogs-stream-prefix": "ecs"
            }
          }
        }
      ]
    }
  ]
}
```
For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DeleteTaskDefinitions in AWS CLI Command Reference.

**delete-task-set**

The following code example shows how to use delete-task-set.

**AWS CLI**

To delete a task set

The following delete-task-set example shows how to delete a task set. You can include the --force parameter to delete a task set even if it has not been scaled to zero.

```
aws ecs delete-task-set \
   --cluster MyCluster \
   --service MyService \
```
```
--task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-svc/1234567890123456789 \
--force
```

Output:

```
{
    "taskSet": {
        "id": "ecs-svc/1234567890123456789",
        "status": "DRAINING",
        "computedDesiredCount": 0,
        "pendingCount": 0,
        "runningCount": 0,
        "createdAt": 1557130260.276,
        "updatedAt": 1557130290.707,
        "launchType": "EC2",
        "networkConfiguration": {
            "awsvpcConfiguration": {
                "subnets": [
                    "subnet-12345678"
                ],
                "securityGroups": [
                    "sg-12345678"
                ],
                "assignPublicIp": "DISABLED"
            }
        },
        "loadBalancers": [],
        "serviceRegistries": [],
        "scale": {
            "value": 0.0,
            "unit": "PERCENT"
        },
        "stabilityStatus": "STABILIZING",
        "stabilityStatusAt": 1557130290.707
    }
}
```

- For API details, see [DeleteTaskSet](https://docs.aws.amazon.com/cli/latest/reference/ecs/delete-task-set.html) in *AWS CLI Command Reference*.
deregister-container-instance

The following code example shows how to use deregister-container-instance.

AWS CLI

To deregister a container instance from a cluster

The following deregister-container-instance example deregisters a container instance from the specified cluster. If there are still tasks running in the container instance, you must either stop those tasks before deregistering, or use the --force option.

```bash
aws ecs deregister-container-instance \
   --cluster arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
   --container-instance arn:aws:ecs:us-west-2:123456789012:container-instance/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
   --force
```

Output:

```json
{
   "containerInstance": {
      "remainingResources": [
         {
            "integerValue": 1024,
            "doubleValue": 0.0,
            "type": "INTEGER",
            "longValue": 0,
            "name": "CPU"
         },
         {
            "integerValue": 985,
            "doubleValue": 0.0,
            "type": "INTEGER",
            "longValue": 0,
            "name": "MEMORY"
         },
         {
            "type": "STRINGSET",
            "integerValue": 0,
            "name": "PORTS",
            "stringSetValue": [
               "22",
```

---

### deregister-task-definition

The following code example shows how to use `deregister-task-definition`.

**AWS CLI**

**To deregister a task definition**

The following `deregister-task-definition` example deregisters the first revision of the `curler` task definition in your default region.

```bash
aws ecs deregister-task-definition --task-definition curler:1
```

Note that in the resulting output, the task definition status shows INACTIVE:

```json
{
    "taskDefinition": {
        "status": "INACTIVE",
        "family": "curler",
        "volumes": [],
        "containerDefinitions": [
            {
                "environment": [],
                "name": "curler",
                "mountPoints": [],
                "image": "curl:latest",
            }
        ]
    }
}
```
The following code example shows how to use `describe-capacity-providers`.

**AWS CLI**

**Example 1: To describe all capacity providers**

The following `describe-capacity-providers` example retrieves details about all capacity providers.

```
aws ecs describe-capacity-providers
```

**Output:**

```

```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster_capacity_providers.html) in the *Amazon ECS Developer Guide*. 

**Example 2: To describe a specific capacity providers**

The following `describe-capacity-providers` example retrieves details about a specific capacity provider. Using the `--include` TAGS parameter will add the tags associated with the capacity provider to the output.

```bash
aws ecs describe-capacity-providers \
  --capacity-providers MyCapacityProvider \
  --include TAGS
```

**Output:**
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DescribeCapacityProviders](https://docs.aws.amazon.com/cli/latest/reference/ecs/describe-capacity-providers.html) in *AWS CLI Command Reference*.

**describe-clusters**

The following code example shows how to use `describe-clusters`.

**AWS CLI**

**Example 1: To describe a cluster**

The following `describe-clusters` example retrieves details about the specified cluster.
aws ecs describe-clusters
  --cluster default

Output:

```
{
  "clusters": [
    {
      "status": "ACTIVE",
      "clusterName": "default",
      "registeredContainerInstancesCount": 0,
      "pendingTasksCount": 0,
      "runningTasksCount": 0,
      "activeServicesCount": 1,
      "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default"
    }
  ],
  "failures": []
}
```

For more information, see [Amazon ECS Clusters](#) in the *Amazon ECS Developer Guide*.

**Example 2: To describe a cluster with the attachment option**

The following describe-clusters example specifies the ATTACHMENTS option. It retrieves details about the specified cluster and a list of resources attached to the cluster in the form of attachments. When using a capacity provider with a cluster, the resources, either AutoScaling plans or scaling policies, will be represented as asp or as_policy ATTACHMENTS.

```
aws ecs describe-clusters \
  --include ATTACHMENTS \
  --clusters sampleCluster
```

Output:

```
{
  "clusters": [
    {
      "clusterName": "sampleCluster",
      "attachments": [
        {
          "name": "sampleCluster",
          "type": "TYPE",
          "value": "VALUE"
        }
      ]
    }
  ],
  "failures": []
}
```
For more information, see Amazon ECS Clusters in the Amazon ECS Developer Guide.

- For API details, see DescribeClusters in AWS CLI Command Reference.

**describe-container-instances**

The following code example shows how to use describe-container-instances.
**AWS CLI**

**To describe container instance**

The following `describe-container-instances` example retrieves details for a container instance in the update cluster, using the container instance UUID as an identifier.

```bash
aws ecs describe-container-instances \
   --cluster update \
   --container-instances a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

**Output:**

```json
{
   "failures": [],
   "containerInstances": [
      {
         "status": "ACTIVE",
         "registeredResources": [
            {
               "integerValue": 2048,
               "longValue": 0,
               "type": "INTEGER",
               "name": "CPU",
               "doubleValue": 0.0
            },
            {
               "integerValue": 3955,
               "longValue": 0,
               "type": "INTEGER",
               "name": "MEMORY",
               "doubleValue": 0.0
            },
            {
               "name": "PORTS",
               "longValue": 0,
               "doubleValue": 0.0,
               "stringSetValue": [
                  "22",
                  "2376",
                  "2375",
                  "51678"
               ]
            }
         ]
      }
   ]
}
```
"type": "STRINGSET",
"integerValue": 0
},

For more information, see Amazon ECS Container Instances in the Amazon ECS Developer Guide.

- For API details, see DescribeContainerInstances in AWS CLI Command Reference.

### describe-services

The following code example shows how to use describe-services.

**AWS CLI**

To describe a service

The following describe-services example retrieves details for the my-http-service service in the default cluster.

```bash
aws ecs describe-services --services my-http-service
```

**Output:**

```
{
  "services": [
    {
      "status": "ACTIVE",
      "pendingCount": 0,
      "loadBalancers": [],
      "desiredCount": 10,
      "createdAt": 1466801808.595,
      "serviceName": "my-http-service",
      "deployments": [
        {
          "status": "PRIMARY",
          "pendingCount": 0,
          "createdAt": 1466801808.595,
          "desiredCount": 10,
```
   "updatedAt": 1428326312.703,
   "id": "ecs-svc/1234567890123456789",
   "runningCount": 10
 },
 "events": [
    {
      "message": "(service my-http-service) has reached a steady state.",
      "id": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "createdAt": 1466801812.435
    }
  ],
  "runningCount": 10
 }
 "failures": []
}

For more information, see Services in the Amazon ECS Developer Guide.

- For API details, see DescribeServices in AWS CLI Command Reference.

describe-task-definition

The following code example shows how to use describe-task-definition.

AWS CLI

To describe a task definition

The following describe-task-definition example retrieves the details of a task definition.

```
aws ecs describe-task-definition \
  --task-definition hello_world:8
```

Output:

```
{
  "tasks": [
  {
```
null
For more information, see [Amazon ECS Task Definitions](amazon-ecs-task-definitions) in the [Amazon ECS Developer Guide](amazon-ecs-developer-guide).

- For API details, see [DescribeTaskDefinition](describe-task-definition) in [AWS CLI Command Reference](aws-cli-command-reference).

### describe-task-sets

The following code example shows how to use `describe-task-sets`.

#### AWS CLI

**To describe a task set**

The following `describe-task-sets` example describes a task set in a service that uses an external deployer.

```bash
aws ecs describe-task-sets \
```
--cluster MyCluster \
--service MyService \

Output:

```json
{
    "taskSets": [
        {
            "id": "ecs-svc/1234567890123456789",
            "status": "ACTIVE",
            "computedDesiredCount": 0,
            "pendingCount": 0,
            "runningCount": 0,
            "createdAt": 1557207715.195,
            "updatedAt": 1557207740.014,
            "launchType": "EC2",

                    "assignPublicIp": "DISABLED"
                }
            },
            "loadBalancers": [],
            "serviceRegistries": [],
            "scale": {
                "value": 0.0,
                "unit": "PERCENT"
            },
            "stabilityStatus": "STABLE",
            "stabilityStatusAt": 1557207740.014
        }
    ]
}
```

• For API details, see DescribeTaskSets in AWS CLI Command Reference.

describe-tasks

The following code example shows how to use describe-tasks.

AWS CLI

Example 1: To describe a single task

The following describe-tasks example retrieves the details of a task in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full ARN of the task.

```
aws ecs describe-tasks \
   --cluster MyCluster \
   --tasks arn:aws:ecs:us-east-1:123456789012:task/MyCluster/4d590253bb114126b7afa7b58EXAMPLE
```

Output:

```
{
   "tasks": [
   {
      "attachments": [],
      "attributes": [
      {
         "name": "ecs.cpu-architecture",
         "value": "x86_64"
      }
      ],
      "availabilityZone": "us-east-1b",

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

**Example 2: To describe multiple tasks**

The following describe-tasks example retrieves the details of multiple tasks in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full IDs of the tasks.

```bash
aws ecs describe-tasks \
   --cluster MyCluster \
   --tasks "74de0355a10a4f979ac495c14EXAMPLE" "d789e94343414c25b9f6bd59eEXAMPLE"
```

Output:

```
{
   "tasks": [
     {
       "attachments": [
         {

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DescribeTasks in AWS CLI Command Reference.

**execute-command**

The following code example shows how to use `execute-command`.

**AWS CLI**

**To run an interactive /bin/sh command**

The following `execute-command` example runs an interactive /bin/sh command against a container named MyContainer for a task with an id of arn:aws:ecs:us-east-1:123456789012:task/MyCluster/d789e94343414c25b9f6bd59eEXAMPLE.

```
aws ecs execute-command \
  --cluster MyCluster \
  --task arn:aws:ecs:us-east-1:123456789012:task/MyCluster/\n  d789e94343414c25b9f6bd59eEXAMPLE \n  --container MyContainer \n  --interactive \n  --command "/bin/sh"
```

This command produces no output.

For more information, see Using Amazon ECS Exec for debugging in the Amazon ECS Developer Guide.

- For API details, see ExecuteCommand in AWS CLI Command Reference.

**list-account-settings**

The following code example shows how to use `list-account-settings`.

**AWS CLI**

**Example 1: To view the account settings for an account**

The following `list-account-settings` example displays the effective account settings for an account.
Example 2: To view the account settings for a specific IAM user or IAM role

The following `list-account-settings` example displays the account settings for the specified IAM user or IAM role.

```
aws ecs list-account-settings --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
   "settings": [
      {
         "name": "serviceLongArnFormat",
         "value": "enabled",
         "principalArn": "arn:aws:iam::123456789012:user/MyUser"
      }
   ]
}
```
The following code example shows how to use `list-attributes`.

**AWS CLI**

**To list the container instances that contain a specific attribute**

The following example lists the attributes for container instances that have the `stack=production` attribute in the default cluster.

```
aws ecs list-attributes \
   --target-type container-instance \
   --attribute-name stack \
   --attribute-value production \
   --cluster default
```

Output:

```
{
   "attributes": [
      {
         "name": "stack",
         "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
         "value": "production"
      }
   ]
}
```

For more information, see [Amazon ECS Container Agent Configuration](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/container-agent-configuration.html) in the *Amazon ECS Developer Guide*.

- For API details, see [ListAttributes](https://docs.aws.amazon.com/cli/latest/reference/ecr/list-attributes.html) in *AWS CLI Command Reference*. 
list-clusters

The following code example shows how to use `list-clusters`.

**AWS CLI**

**To list your available clusters**

The following `list-clusters` example lists all of the available clusters.

```
aws ecs list-clusters
```

Output:

```
{
    "clusterArns": [
        "arn:aws:ecs:us-west-2:123456789012:cluster/AnotherECSCluster"
    ]
}
```

For more information, see [Amazon ECS Clusters](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/ecs-managing-clusters.html) in the *Amazon ECS Developer Guide*.

- For API details, see [ListClusters](https://docs.aws.amazon.com/cli/latest/reference/ecs/list-clusters.html) in *AWS CLI Command Reference*.

list-container-instances

The following code example shows how to use `list-container-instances`.

**AWS CLI**

**To list the container instances in a cluster**

The following `list-container-instances` example lists all of the available container instances in a cluster.

```
aws ecs list-container-instances --cluster MyCluster
```

Output:

```
{
    "containerInstanceArns": [
```

*Actions and scenarios*
For more information, see Amazon ECS Container Instances in the Amazon ECS Developer Guide.

- For API details, see ListContainerInstances in AWS CLI Command Reference.

list-services-by-namespace

The following code example shows how to use list-services-by-namespace.

AWS CLI

To list the services in a namespace

The following list-services-by-namespace example lists all of the services configured for the specified namespace in your default Region.

```bash
aws ecs list-services-by-namespace \
   --namespace service-connect
```

Output:

```json
{
   "serviceArns": [
   ]
}
```

For more information, see Service Connect in the Amazon ECS Developer Guide.

- For API details, see ListServicesByNamespace in AWS CLI Command Reference.

list-services

The following code example shows how to use list-services.
AWS CLI

To list the services in a cluster

The following list-services example shows how to list the services running in a cluster.

```bash
aws ecs list-services --cluster MyCluster
```

Output:

```json
{
   "serviceArns": [
      "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService"
   ]
}
```

For more information, see Services in the Amazon ECS Developer Guide.

- For API details, see ListServices in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a resource

The following list-tags-for-resource example lists the tags for a specific cluster.

```bash
aws ecs list-tags-for-resource \
```

Output:

```json
{
   "tags": [
      {
         "key": "key1",
         "value": "value1"
      },
      {
         "key": "key2",
         "value": "value2"
      }
   ]
}
```
list-task-definition-families

The following code example shows how to use list-task-definition-families.

AWS CLI

Example 1: To list the registered task definition families

The following list-task-definition-families example lists all of the registered task definition families.

```
aws ecs list-task-definition-families
```

Output:

```
{
  "families": [
    "node-js-app",
    "web-timer",
    "hpcc",
    "hpcc-c4-8xlarge"
  ]
}
```

Example 2: To filter the registered task definition families

The following list-task-definition-families example lists the task definition revisions that start with "hpcc".

```
aws ecs list-task-definition-families --family-prefix hpcc
```
Output:

```json
{
    "families": [
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
}
```

For more information, see Task Definition Parameters in the Amazon ECS Developer Guide.

- For API details, see ListTaskDefinitionFamilies in AWS CLI Command Reference.

**list-task-definitions**

The following code example shows how to use `list-task-definitions`.

**AWS CLI**

**Example 1: To list the registered task definitions**

The following `list-task-definitions` example lists all of the registered task definitions.

```bash
aws ecs list-task-definitions
```

Output:

```json
{
    "taskDefinitionArns": [
    ]
}
```

**Example 2: To list the registered task definitions in a family**

The following list-task-definitions example lists the task definition revisions of a specified family.
aws ecs list-task-definitions --family-prefix wordpress

Output:

{
    "taskDefinitionArns": [
    ]
}

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.
• For API details, see ListTaskDefinitions in AWS CLI Command Reference.

list-tasks

The following code example shows how to use list-tasks.

AWS CLI

Example 1: To list the tasks in a cluster

The following list-tasks example lists all of the tasks in a cluster.

aws ecs list-tasks --cluster default

Output:

{
    "taskArns": [
        "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
    ]
}

Example 2: To list the tasks on a particular container instance
The following `list-tasks` example lists the tasks on a container instance, using the container instance UUID as a filter.

```bash
aws ecs list-tasks --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```json
{
   "taskArns": [
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE"
   ]
}
```

For more information, see [Amazon ECS Task Definitions](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/task-definitions.html) in the *Amazon ECS Developer Guide*.

- For API details, see [ListTasks](https://docs.aws.amazon.com/cli/latest/reference/ecs/list-tasks.html) in *AWS CLI Command Reference*.

**put-account-setting-default**

The following code example shows how to use `put-account-setting-default`.

**AWS CLI**

**To modify the default account settings**

The following `put-account-setting-default` example modifies the default account setting for all IAM users or roles on your account. These changes apply to the entire AWS account unless an IAM user or role explicitly overrides these settings for themselves.

```bash
aws ecs put-account-setting-default --name serviceLongArnFormat --value enabled
```

Output:

```json
{
   "setting": {
      "name": "serviceLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::123456789012:root"
   }
}
```
For more information, see Amazon Resource Names (ARNs) and IDs in the Amazon ECS Developer Guide.

- For API details, see PutAccountSettingDefault in AWS CLI Command Reference.

put-account-setting

The following code example shows how to use put-account-setting.

AWS CLI

To modify the account setting for your IAM user account

The following put-account-setting example enables the serviceLongArnFormat account setting for your IAM user account.

```bash
aws ecs put-account-setting --name serviceLongArnFormat --value enabled
```

Output:

```
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::130757420319:user/your_username"
    }
}
```

For more information, see Modifying Account Settings in the Amazon ECS Developer Guide.

- For API details, see PutAccountSetting in AWS CLI Command Reference.

put-account-settings

The following code example shows how to use put-account-settings.

AWS CLI

To modify the account settings for an IAM user or IAM role
The following put-account-setting example modifies the account settings for the specified IAM user or IAM role.

```bash
aws ecs put-account-setting
    --name serviceLongArnFormat
    --value enabled
    --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```json
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:user/MyUser"
    }
}
```

- For API details, see [PutAccountSettings](#) in [AWS CLI Command Reference](#).

**put-attributes**

The following code example shows how to use put-attributes.

**AWS CLI**

To create an attribute and associate it with an Amazon ECS resource

The following put-attributes applies an attribute with the name stack and the value production to a container instance.

```bash
aws ecs put-attributes
    --attributes name=stack,value=production,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```json
{
    "attributes": [
        {
            "name": "stack",
```
put-cluster-capacity-providers

The following code example shows how to use put-cluster-capacity-providers.

AWS CLI

Example 1: To add an existing capacity provider to a cluster

The following put-cluster-capacity-providers example adds an existing capacity provider to a cluster. The create-capacity-provider command is used to create a capacity provider. The describe-clusters command is used to describe the current capacity providers and the default capacity provider strategy associated with a cluster. When adding a new capacity provider to a cluster, you must specify all existing capacity providers in addition to the new capacity provider you want to associate with the cluster. You must also specify the default capacity provider strategy to associate with the cluster. In this example, the MyCluster cluster has the MyCapacityProvider1 capacity provider associated with it and you want to add the MyCapacityProvider2 capacity provider and include it in the default capacity provider strategy so tasks are spread evenly across both capacity providers.

```bash
code:aws ecs put-cluster-capacity-providers \
   --cluster MyCluster \
   --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \
   --default-capacity-provider-strategy \
   capacityProvider=MyCapacityProvider1,weight=1 \
   capacityProvider=MyCapacityProvider2,weight=1
```

Output:

```json
{
   "cluster": {
      "clusterName": "MyCluster",
   }
}
```
"status": "ACTIVE",
"registeredContainerInstancesCount": 0,
"runningTasksCount": 0,
"pendingTasksCount": 0,
"activeServicesCount": 0,
"statistics": [],
"tags": [],
"settings": [
  {
    "name": "containerInsights",
    "value": "enabled"
  }
],
"capacityProviders": [
  "MyCapacityProvider1",
  "MyCapacityProvider2"
],
"defaultCapacityProviderStrategy": [
  {
    "capacityProvider": "MyCapacityProvider1",
    "weight": 1,
    "base": 0
  },
  {
    "capacityProvider": "MyCapacityProvider2",
    "weight": 1,
    "base": 0
  }
],
"attachments": [
  {
    "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
    "type": "as_policy",
    "status": "ACTIVE",
    "details": [
      {
        "name": "capacityProviderName",
        "value": "MyCapacityProvider1"
      },
      {
        "name": "scalingPolicyName",
        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      }
    ]
  }
]
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

Example 2: To remove a capacity provider from a cluster

The following put-cluster-capacity-providers example removes a capacity provider from a cluster. The describe-clusters command is used to describe the current capacity providers associated with a cluster. When removing a capacity provider from a cluster, you must specify the capacity providers you want to remain associated with the cluster as well as the default capacity provider strategy to associate with the cluster. In this example, the cluster has the MyCapacityProvider1 and MyCapacityProvider2 capacity providers associated with it and you want to remove the MyCapacityProvider2 capacity provider, so you specify only MyCapacityProvider1 in the command along with the updated default capacity provider strategy.

```
aws ecs put-cluster-capacity-providers \
  --cluster MyCluster \
  --capacity-providers MyCapacityProvider1 \
  --default-capacity-provider-strategy CapacityProviderStrategy{
  }
```

Output:

```json
{
    "cluster": {
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [
            "MyCapacityProvider1"
        ],
        "defaultCapacityProviderStrategy": [
            "capacityProvider": "MyCapacityProvider1",
            "weight": 1,
            "base": 0
        ],
        "attachments": [
            {
                "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
                "type": "as_policy",
                "status": "ACTIVE",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider1"
                    },
                    {
                        "name": "scalingPolicyName",
```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/ecs/latest/developer-guide/cluster-management.html) in the *Amazon ECS Developer Guide*.

**Example 3: To remove all capacity providers from a cluster**

The following `put-cluster-capacity-providers` example removes all existing capacity providers from the cluster.

```bash
aws ecs put-cluster-capacity-providers 
  --cluster MyCluster 
  --capacity-providers [] 
  --default-capacity-provider-strategy []
```

**Output:**

```json
{
  "cluster": {

```
"clusterName": "MyCluster",
"status": "ACTIVE",
"registeredContainerInstancesCount": 0,
"runningTasksCount": 0,
"pendingTasksCount": 0,
"activeServicesCount": 0,
"statistics": [],
"tags": [],
"settings": [
  {
    "name": "containerInsights",
    "value": "enabled"
  }
],
"capacityProviders": [],
"defaultCapacityProviderStrategy": [],
"attachments": [
  {
    "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
    "type": "as_policy",
    "status": "DELETING",
    "details": [
      {
        "name": "capacityProviderName",
        "value": "MyCapacityProvider1"
      },
      {
        "name": "scalingPolicyName",
        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      }
    ]
  },
  {
    "id": "ae592060-2382-4663-9476-b015c685593c",
    "type": "as_policy",
    "status": "DELETING",
    "details": [
      {
        "name": "capacityProviderName",
        "value": "MyCapacityProvider2"
      },
      {
        "name": "scalingPolicyName",
        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      }
    ]
  }
]
register-task-definition

The following code example shows how to use `register-task-definition`.

**AWS CLI**

**Example 1: To register a task definition with a JSON file**

The following `register-task-definition` example registers a task definition to the specified family. The container definitions are saved in JSON format at the specified file location.

```
aws ecs register-task-definition \
  --cli-input-json file://<path_to_json_file>/sleep360.json
```

Contents of `sleep360.json`:

```json
{
  "containerDefinitions": [
    {
      "name": "sleep",
      "image": "busybox",
      "cpu": 10,
      "command": [
        "sleep",
        "360"
      ],
      "memory": 10,
      "essential": true
    }
  ]
}
```

For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [PutClusterCapacityProviders](https://docs.aws.amazon.com/cli/latest/reference/ecs/put-cluster-capacity-providers.html) in *AWS CLI Command Reference*.
Output:

```json
{
    "taskDefinition": {
        "status": "ACTIVE",
        "family": "sleep360",
        "placementConstraints": [],
        "compatibilities": [
            "EXTERNAL",
            "EC2"
        ],
        "volumes": [],
        "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/sleep360:1",
        "containerDefinitions": [
            {
                "environment": [],
                "name": "sleep",
                "mountPoints": [],
                "image": "busybox",
                "cpu": 10,
                "portMappings": [],
                "command": [
                    "sleep",
                    "360"
                ],
                "memory": 10,
                "essential": true,
                "volumesFrom": []
            }
        ],
        "revision": 1
    }
}
```

For more information, see [Example task definitions](#) in the *Amazon ECS Developer Guide*.

**Example 2: To register a task definition with a JSON string parameter**
The following `register-task-definition` example registers a task definition using container definitions provided as a JSON string parameter with escaped double quotes.

```bash
aws ecs register-task-definition \\
  --family sleep360 \\
  --container-definitions "[
  {"name":"sleep","image":"busybox","cpu":10, \
  "command":["sleep","360"],"memory":10,"essential":true}
]
```

The output is identical to the previous example.

For more information, see [Creating a Task Definition](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/creating-task-definition.html) in the *Amazon ECS Developer Guide*.

- For API details, see [RegisterTaskDefinition](https://docs.aws.amazon.com/cli/latest/reference/ecs/register-task-definition.html) in *AWS CLI Command Reference*.

### run-task

The following code example shows how to use `run-task`.

**AWS CLI**

**To run a task on your default cluster**

The following `run-task` example runs a task on the default cluster and uses a client token.

```bash
aws ecs run-task \\
  --cluster default \\
  --task-definition sleep360:1 \\
  --client-token 550e8400-e29b-41d4-a716-446655440000
```

Output:

```json
{
  "tasks": [
    {
      "attachments": [],
      "attributes": [ 
        {
          "name": "ecs.cpu-architecture",
          "value": "x86_64"
        }
      ],
      "availabilityZone": "us-east-1b",
      "capacityProviderName": "example-capacity-provider",
```

For more information, see Running Tasks in the Amazon ECS Developer Guide.

- For API details, see RunTask in AWS CLI Command Reference.

**start-task**

The following code example shows how to use start-task.

**AWS CLI**

**To start a new task**

The following start-task starts a task using the latest revision of the sleep360 task definition on the specified container instance in the default cluster.

```
aws ecs start-task \
   --task-definition sleep360 \
   --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

Output:

```
{
   "tasks": [ 
   {
     "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/default/666fdccc2e2d4b6894dd422f4eeee8f8",

    "name": "sleep",
    "lastStatus": "PENDING",
    "networkInterfaces": [],
    "cpu": "10",
    "memory": "10"
  }
],
"version": 1,
"createdAt": 1563421494.186,
"group": "family:sleep360",
"launchType": "EC2",
"attachments": [],
"tags": []
},
"failures": []

- For API details, see [StartTask](#) in *AWS CLI Command Reference.*

**stop-task**

The following code example shows how to use `stop-task`.

**AWS CLI**

**To stop a task**

The following `stop-task` stops the specified task from running in the default cluster.

```
aws ecs stop-task \
  --task 666fdccc2e2d4b6894dd422f4eeee8f8
```

**Output:**

```
For API details, see StopTask in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To tag a resource
The following `tag-resource` example adds a single tag to the specified resource.

```
aws ecs tag-resource \
   --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
   --tags key=key1,value=value1
```

This command produces no output.

**To add multiple tags to a resource**

The following `tag-resource` example adds multiple tags to the specified resource.

```
aws ecs tag-resource \
   --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
   --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

This command produces no output.

- For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from a resource**

The following `untag-resource` example removes the listed tags from the specified resource.

```
aws ecs untag-resource \
   --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
   --tag-keys key1,key2
```

This command produces no output.

- For API details, see `UntagResource` in *AWS CLI Command Reference*.

**update-cluster-settings**

The following code example shows how to use `update-cluster-settings`.
AWS CLI

To modify the settings for your cluster

The following update-cluster-settings example enables CloudWatch Container Insights for the default cluster.

```
aws ecs update-cluster-settings \
   --cluster default \
   --settings name=containerInsights,value=enabled
```

Output:

```
{
   "cluster": {
      "clusterName": "default",
      "status": "ACTIVE",
      "registeredContainerInstancesCount": 0,
      "runningTasksCount": 0,
      "pendingTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "tags": [],
      "settings": [
         {
            "name": "containerInsights",
            "value": "enabled"
         }
      ]
   }
}
```

For more information, see Modifying Account Settings in the Amazon ECS Developer Guide.

- For API details, see UpdateClusterSettings in AWS CLI Command Reference.

update-container-agent

The following code example shows how to use update-container-agent.
AWS CLI

To update the container agent on an Amazon ECS container instance

The following update-container-agent example updates the container agent on the specified container instance in the default cluster.

```bash
aws ecs update-container-agent --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```json
{
    "containerInstance": {
        "status": "ACTIVE",
        ...
        "agentUpdateStatus": "PENDING",
        "versionInfo": {
            "agentVersion": "1.0.0",
            "agentHash": "4023248",
            "dockerVersion": "DockerVersion: 1.5.0"
        }
    }
}
```

For more information, see Updating the Amazon ECS Container Agent in the Amazon ECS Developer Guide.

- For API details, see UpdateContainerAgent in AWS CLI Command Reference.

update-container-instances-state

The following code example shows how to use update-container-instances-state.

AWS CLI

To update the state of a container instance

The following update-container-instances-state updates the state of the specified container instance to DRAINING which will remove it from the cluster it is registered to.

```bash
aws ecs update-container-instances-state \
```
Output:

```json
{
  "containerInstances": [
    {
      "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-instance/default/765936fadbdd46b5991a4bd70c2a43d4",

update-service-primary-task-set

The following code example shows how to use update-service-primary-task-set.

AWS CLI

To update the primary task set for a service

The following update-service-primary-task-set example updates the primary task set for the specified service.

```bash
aws ecs update-service-primary-task-set \
  --cluster MyCluster \
  --service MyService \
```

Output:

```json
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "status": "PRIMARY",
    "computedDesiredCount": 1,

}
]

- For API details, see [UpdateServicePrimaryTaskSet](https://docs.aws.amazon.com/cli/latest/reference/ecs/update-service.html) in [AWS CLI Command Reference](https).

**update-service**

The following code example shows how to use update-service.

**AWS CLI**

**Example 1: To change the task definition used in a service**

The following update-service example updates the my-http-service service to use the amazon-ecs-sample task definition.

```bash
aws ecs update-service --service my-http-service --task-definition amazon-ecs-sample
```

**Example 2: To change the number of tasks in a service**

The following update-service example updates the desired task count of the service my-http-service to 3.

```bash
aws ecs update-service --service my-http-service --desired-count 3
```
For more information, see [Updating a Service](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/service-update.html) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateService](https://docs.aws.amazon.com/cli/latest/reference/ecs/update-service.html) in *AWS CLI Command Reference*.

**update-task-set**

The following code example shows how to use `update-task-set`.

**AWS CLI**

**To update a task set**

The following `update-task-set` example updates a task set to adjust the scale.

```
aws ecs update-task-set \
  --cluster MyCluster \
  --service MyService \
  --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-svc/1234567890123456789 \
  --scale value=50,unit=PERCENT
```

Output:

```json
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "status": "ACTIVE",
    "computedDesiredCount": 0,
    "pendingCount": 0,
    "runningCount": 0,
    "createdAt": 1557128360.711,

    "launchType": "EC2",
    "networkConfiguration": {
      "awsvpcConfiguration": {
        "subnets": [
          "subnet-12344321"
        ],
        "securityGroups": [
```
For API details, see UpdateTaskSet in AWS CLI Command Reference.

Amazon EFS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EFS.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**create-file-system**

The following code example shows how to use create-file-system.
To create an encrypted file system

The following `create-file-system` example creates an encrypted file system using the default CMK. It also adds the tag Name=my-file-system.

```
aws efs create-file-system \
  --performance-mode generalPurpose \
  --throughput-mode bursting \
  --encrypted \
  --tags Key=Name,Value=my-file-system
```

Output:

```
{
  "OwnerId": "123456789012",
  "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",

      "Value": "my-file-system"
    }
  ]
}
```
For more information, see Creating Amazon EFS file systems in the Amazon Elastic File System User Guide.

- For API details, see CreateFileSystem in AWS CLI Command Reference.

create-mount-target

The following code example shows how to use create-mount-target.

AWS CLI

To create a mount target

The following create-mount-target example creates a mount target for the specified file system.

```
aws efs create-mount-target \
   --file-system-id fs-c7a0456e \
   --subnet-id subnet-02bf4c428bexample \
   --security-groups sg-068f739363example
```

Output:

```
{
   "OwnerId": "123456789012",
   "MountTargetId": "fsmt-f9a14450",
   "FileSystemId": "fs-c7a0456e",
   "SubnetId": "subnet-02bf4c428bexample",
   "LifeCycleState": "creating",
   "IpAddress": "10.0.1.24",
   "NetworkInterfaceId": "eni-02d542216aexample",
   "AvailabilityZoneId": "use2-az2",
   "AvailabilityZoneName": "us-east-2b",
   "VpcId": "vpc-0123456789abcdef0"
}
```

For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see CreateMountTarget in AWS CLI Command Reference.
delete-file-system

The following code example shows how to use delete-file-system.

AWS CLI

To delete a file system

The following delete-file-system example deletes the specified file system.

```bash
aws efs delete-file-system \
   --file-system-id fs-c7a0456e
```

This command produces no output.

For more information, see Deleting an Amazon EFS file system in the Amazon Elastic File System User Guide.

- For API details, see DeleteFileSystem in AWS CLI Command Reference.

delete-mount-target

The following code example shows how to use delete-mount-target.

AWS CLI

To delete a mount target

The following delete-mount-target example deletes the specified mount target.

```bash
aws efs delete-mount-target \
   --mount-target-id fsmt-f9a14450
```

This command produces no output.

For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see DeleteMountTarget in AWS CLI Command Reference.

describe-file-systems

The following code example shows how to use describe-file-systems.
AWS CLI

To describe a file system

The following describe-file-systems example describes the specified file system.

```
aws efs describe-file-systems \
   --file-system-id fs-c7a0456e
```

Output:

```
{
   "FileSystems": [
      {
         "OwnerId": "123456789012",
         "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
         "FileSystemId": "fs-c7a0456e",
         "CreationTime": 1595286880.0,

         "Name": "my-file-system",
         "NumberOfMountTargets": 3,
         "SizeInBytes": {
            "Value": 6144,
            "Timestamp": 1600991437.0,
            "ValueInIA": 0,
            "ValueInStandard": 6144
         },
         "PerformanceMode": "generalPurpose",
         "Encrypted": true,
         "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a59b3472-e62c-42e4-adcf-30d92example",
         "ThroughputMode": "bursting",
         "Tags": [
            {
               "Key": "Name",
               "Value": "my-file-system"
            }
         ]
      }
   ]
}
```
For more information, see Managing Amazon EFS file systems in the Amazon Elastic File System User Guide.

- For API details, see DescribeFileSystems in AWS CLI Command Reference.

**describe-mount-targets**

The following code example shows how to use describe-mount-targets.

**AWS CLI**

**To describe a mount target**

The following describe-mount-targets example describes the specified mount target.

```bash
aws efs describe-mount-targets \
    --mount-target-id fsmt-f9a14450
```

Output:

```
{
    "MountTargets": [
        {
            "OwnerId": "123456789012",
            "MountTargetId": "fsmt-f9a14450",
            "FileSystemId": "fs-c7a0456e",
            "SubnetId": "subnet-02bf4c428bexample",
            "LifeCycleState": "creating",
            "IpAddress": "10.0.1.24",
            "NetworkInterfaceId": "eni-02d542216aexample",
            "AvailabilityZoneId": "use2-az2",
            "AvailabilityZoneName": "us-east-2b",
            "VpcId": "vpc-0123456789abcdef0"
        }
    ]
}
```

For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see DescribeMountTargets in AWS CLI Command Reference.
**describe-tags**

The following code example shows how to use describe-tags.

**AWS CLI**

To describe the tags for a file system

The following describe-tags example describes the tags for the specified file system.

```
aws efs describe-tags \
    --file-system-id fs-c7a0456e
```

Output:

```
{
    "Tags": [
    {
        "Key": "Name",
        "Value": "my-file-system"
    },
    {
        "Key": "Department",
        "Value": "Business Intelligence"
    }
    ]
}
```

For more information, see [Managing file system tags](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To retrieve the tags for a resource

The following list-tags-for-resource example retrieves the tags associated with the specified file system.
aws efs list-tags-for-resource \
--resource-id fs-c7a0456e

Output:

```json
{
   "Tags": [
      {
         "Key": "Name",
         "Value": "my-file-system"
      },
      {
         "Key": "Department",
         "Value": "Business Intelligence"
      }
   ]
}
```

For more information, see [Managing file system tags](https://docs.aws.amazon.com/efs/latest/ug/) in the *Amazon Elastic File System User Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/efs/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To tag a resource**

The following tag-resource example adds the tag `Department=Business Intelligence` to the specified file system.

```bash
aws efs tag-resource \
--resource-id fs-c7a0456e \
--tags Key=Department,Value="Business Intelligence"
```

This command produces no output.

For more information, see [Managing file system tags](https://docs.aws.amazon.com/efs/latest/ug/) in the *Amazon Elastic File System User Guide*. 
For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

To remove a tag from a resource

The following `untag-resource` example removes the tag with the `Department` tag key from the specified file system.

```bash
aws efs untag-resource \
  --resource-id fs-c7a0456e \
  --tag-keys Department
```

This command produces no output.

For more information, see [Managing file system tags](#) in the *Amazon Elastic File System User Guide*.

* For API details, see `UntagResource` in *AWS CLI Command Reference*.

**Amazon EKS examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EKS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
**Actions**

**create-cluster**

The following code example shows how to use `create-cluster`.

**AWS CLI**

**To create a new cluster**

This example command creates a cluster named prod in your default region.

**Command:**

```bash
aws eks create-cluster --name prod \
--role-arn arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI \
--resources-vpc-config subnetIds=subnet-6782e71e,subnet-e7e761ac,securityGroupIds=sg-6979fe18
```

**Output:**

```json
{
   "cluster": {
      "name": "prod",
      "createdAt": 1527808069.147,
      "version": "1.10",
      "roleArn": "arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI",
      "resourcesVpcConfig": {
         "subnetIds": [
            "subnet-6782e71e",
            "subnet-e7e761ac"
         ],
         "securityGroupIds": [
            "sg-6979fe18"
         ],
         "vpcId": "vpc-950809ec"
      }
   }
}
```
To create a new cluster with private endpoint access and logging enabled

This example command creates a cluster named example in your default region with public endpoint access disabled, private endpoint access enabled, and all logging types enabled.

Command:

```bash
aws eks create-cluster --name example --kubernetes-version 1.12 \
--role-arn arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q \
--resources-vpc-config 
  subnetIds=subnet-0a188dccd2f9a632f,subnet-09290d93da4278664,subnet-0f21dd86e0e91134a,subnet-0173dead68481a583,subnet-051f70a57ed6fcab6,subnet-01322339c5c7de9b4 
\n--logging '{"clusterLogging":{"types": ["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}}'
```

Output:

```json
{
  "cluster": {
    "name": "example",
    "createdAt": 1565804921.901,
    "version": "1.12",
    "roleArn": "arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q",
    "resourcesVpcConfig": {
      "subnetIds": ["subnet-0a188dccd2f9a632f","subnet-09290d93da4278664","subnet-0f21dd86e0e91134a","subnet-0173dead68481a583","subnet-051f70a57ed6fcab6","subnet-01322339c5c7de9b4"],
      "securityGroupIds": ["sg-0c5b580845a031c10"]
  }
}
```
```
{
  "vpcId": "vpc-0f622c01f68d4afec",
  "endpointPublicAccess": false,
  "endpointPrivateAccess": true
},
"logging": {
  "clusterLogging": [
    {
      "types": [
        "api",
        "audit",
        "authenticator",
        "controllerManager",
        "scheduler"
      ],
      "enabled": true
    }
  ],
  "status": "CREATING",
  "certificateAuthority": {},
  "platformVersion": "eks.3"
}
}
```

- For API details, see [CreateCluster] in [AWS CLI Command Reference].

**delete-cluster**

The following code example shows how to use `delete-cluster`.

**AWS CLI**

**To delete a cluster**

This example command deletes a cluster named `devel` in your default region.

Command:

```
aws eks delete-cluster --name devel
```

- For API details, see [DeleteCluster] in [AWS CLI Command Reference].
**describe-cluster**

The following code example shows how to use `describe-cluster`.

**AWS CLI**

**To describe a cluster**

This example command provides a description of the specified cluster in your default region.

Command:

```
aws eks describe-cluster --name devel
```

Output:

```json
{
  "cluster": {
    "name": "devel",
    "createdAt": 1527807879.988,
    "version": "1.10",
    "endpoint": "https://EXAMPLE0A04F01705DD065655C30CC3D.yl4.us-west-2.eks.amazonaws.com",
    "roleArn": "arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI",
    "resourcesVpcConfig": {
      "subnetIds": [
        "subnet-6782e71e",
        "subnet-e7e761ac"
      ],
      "securityGroupIds": [
        "sg-6979fe18"
      ],
      "vpcId": "vpc-950809ec"
    },
    "status": "ACTIVE",
    "certificateAuthority": {
      "data": "EXAMPLECRUdJTiBDRVJUSUZJQ0FURS0tLS0tCk1JSUN5RENDOQWJDZ0F3SUJBZ0lCQURBTkJna3Foa2lHOXcwQkFRC00"  
    }
  }
}
```
describe-update

The following code example shows how to use describe-update.

AWS CLI

To describe an update for a cluster

This example command describes an update for a cluster named example in your default region.

Command:

```
aws eks describe-update --name example \
  --update-id 10bddb13-a71b-425a-b0a6-71cd03e59161
```

Output:

```
{
  "update": {
    "id": "10bddb13-a71b-425a-b0a6-71cd03e59161",
    "status": "Successful",
    "type": "EndpointAccessUpdate",
    "params": [
      {
        "type": "EndpointPublicAccess",
        "value": "true"
      },
      {
        "type": "EndpointPrivateAccess",
        "value": "false"
      }
    ],
    "createdAt": 1565806691.149,
    "errors": []
  }
}
```

For API details, see DescribeUpdate in AWS CLI Command Reference.

For API details, see DescribeCluster in AWS CLI Command Reference.
get-token

The following code example shows how to use get-token.

AWS CLI

To get a cluster authentication token

This example command gets an authentication token for a cluster named example.

Command:

```
aws eks get-token --cluster-name example
```

Output:

```json
{
   "kind": "ExecCredential",
   "apiVersion": "client.authentication.k8s.io/v1beta1",
   "spec": {},
   "status": {
      "expirationTimestamp": "2019-08-14T18:44:27Z",
      "token": "k8s-aws-v1EXAMPLE_TOKEN_DATA_STRING..."
   }
}
```

- For API details, see GetToken in AWS CLI Command Reference.

list-clusters

The following code example shows how to use list-clusters.

AWS CLI

To list your available clusters

This example command lists all of your available clusters in your default region.

Command:

```
aws eks list-clusters
```

Output:

```
{
   "clusters": [
      "devel",
      "prod"
   ]
}
```

- For API details, see `ListClusters` in *AWS CLI Command Reference*.

### list-updates

The following code example shows how to use `list-updates`.

**AWS CLI**

**To list the updates for a cluster**

This example command lists the current updates for a cluster named `example` in your default region.

**Command:**

```
aws eks list-updates --name example
```

**Output:**

```
{
   "updateIds": [
      "10bddb13-a71b-425a-b0a6-71cd03e59161"
   ]
}
```

- For API details, see `ListUpdates` in *AWS CLI Command Reference*.

### update-cluster-config

The following code example shows how to use `update-cluster-config`.

**AWS CLI**

**To update cluster endpoint access**
This example command updates a cluster to disable endpoint public access and enable private endpoint access.

Command:

```bash
aws eks update-cluster-config --name example \
--resources-vpc-config endpointPublicAccess=false,endpointPrivateAccess=true
```

Output:

```
{
   "update": {
      "id": "ec883c93-2e9e-407c-a22f-8f6fa6e67d4f",
      "status": "InProgress",
      "type": "EndpointAccessUpdate",
      "params": [
         {
            "type": "EndpointPublicAccess",
            "value": "false"
         },
         {
            "type": "EndpointPrivateAccess",
            "value": "true"
         }
      ],
      "createdAt": 1565806986.506,
      "errors": []
   }
}
```

To enable logging for a cluster

This example command enables all cluster control plane logging types for a cluster named example.

Command:

```bash
aws eks update-cluster-config --name example \
--logging '{"clusterLogging": [{"types": ["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:
For API details, see **UpdateClusterConfig** in *AWS CLI Command Reference*.

**update-cluster-version**

The following code example shows how to use `update-cluster-version`.

**AWS CLI**

**To update a cluster Kubernetes version**

This example command updates a cluster named `example` from Kubernetes 1.12 to 1.13.

Command:

```bash
aws eks update-cluster-version --name example --kubernetes-version 1.13
```

Output:

```json
{
    "update": {
        "id": "161a74d1-7e8c-4224-825d-b32af149f23a",
        "status": "InProgress",
        "type": "VersionUpdate",
        "params": [
            {
                "type": "ClusterLogging",
                "value": "{"\"clusterLogging\":[{\"types\":[\"api\",\"audit\",\"authenticator\",\"controllerManager\",\"scheduler\"],\"enabled\":true}]}"
            },
            "createdAt": 1565807210.37,
            "errors": []
        ]
    }
}
```
For API details, see [UpdateClusterVersion](#) in AWS CLI Command Reference.

**update-kubeconfig**

The following code example shows how to use update-kubeconfig.

**AWS CLI**

**To update a kubeconfig for your cluster**

This example command updates the default kubeconfig file to use your cluster as the current context.

Command:

```
aws eks update-kubeconfig --name example
```

Output:

```
```

For API details, see [UpdateKubeconfig](#) in AWS CLI Command Reference.

**Elastic Beanstalk examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Beanstalk.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

abort-environment-update

The following code example shows how to use `abort-environment-update`.

AWS CLI

To abort a deployment

The following command aborts a running application version deployment for an environment named `my-env`:

```
aws elasticbeanstalk abort-environment-update --environment-name my-env
```

check-dns-availability

The following code example shows how to use `check-dns-availability`.

AWS CLI

To check the availability of a CNAME

The following command checks the availability of the subdomain `my-cname.elasticbeanstalk.com`:
aws elasticbeanstalk check-dns-availability --cname-prefix my-cname

Output:

```
{
    "Available": true,
    "FullyQualifiedCNAME": "my-cname.elasticbeanstalk.com"
}
```

- For API details, see [CheckDnsAvailability](https://docs.aws.amazon.com/cli/latest/reference/elasticbeanstalk/check-dns-availability.html) in *AWS CLI Command Reference*.

**create-application-version**

The following code example shows how to use `create-application-version`.

**AWS CLI**

**To create a new application version**

The following command creates a new version, "v1" of an application named "MyApp":

```bash
aws elasticbeanstalk create-application-version --application-name MyApp
--version-label v1 --description MyAppv1 --source-bundle S3Bucket="my-bucket",S3Key="sample.war" --auto-create-application
```

The application will be created automatically if it does not already exist, due to the auto-create-application option. The source bundle is a .war file stored in an s3 bucket named "my-bucket" that contains the Apache Tomcat sample application.

Output:

```
{
    "ApplicationVersion": {
        "ApplicationName": "MyApp",
        "VersionLabel": "v1",
        "Description": "MyAppv1",
        "DateCreated": "2015-02-03T23:01:25.412Z",
        "DateUpdated": "2015-02-03T23:01:25.412Z",
        "SourceBundle": {
```
create-application

The following code example shows how to use create-application.

AWS CLI

To create a new application

The following command creates a new application named "MyApp":

```
aws elasticbeanstalk create-application --application-name MyApp --description "my application"
```

The create-application command only configures the application's name and description. To upload source code for the application, create an initial version of the application using create-application-version. create-application-version also has an auto-create-application option that lets you create the application and the application version in one step.

Output:

```
{
   "Application": {
      "ApplicationName": "MyApp",
      "ConfigurationTemplates": [],
      "DateUpdated": "2015-02-12T18:32:21.181Z",
      "Description": "my application",
      "DateCreated": "2015-02-12T18:32:21.181Z"
   }
}
```

For API details, see CreateApplication in AWS CLI Command Reference.
create-configuration-template

The following code example shows how to use create-configuration-template.

**AWS CLI**

**To create a configuration template**

The following command creates a configuration template named `my-app-v1` from the settings applied to an environment with the id `e-rpqsewtp2j`:

```bash
aws elasticbeanstalk create-configuration-template --application-name my-app --template-name my-app-v1 --environment-id e-rpqsewtp2j
```

Output:

```json
{
    "ApplicationName": "my-app",
    "TemplateName": "my-app-v1",
    "DateCreated": "2015-08-12T18:40:39Z",
    "DateUpdated": "2015-08-12T18:40:39Z",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

- For API details, see [CreateConfigurationTemplate](https://docs.aws.amazon.com/cli/latest/reference/elasticbeanstalk/create-configuration-template.html) in *AWS CLI Command Reference*.

create-environment

The following code example shows how to use create-environment.

**AWS CLI**

**To create a new environment for an application**

The following command creates a new environment for version "v1" of a java application named "my-app":

```bash
aws elasticbeanstalk create-environment --application-name my-app --environment-name my-env --cname-prefix my-app --version-label v1 --solution-stack-name "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
```
Output:

```
{
  "ApplicationName": "my-app",
  "EnvironmentName": "my-env",
  "VersionLabel": "v1",
  "Status": "Launching",
  "EnvironmentId": "e-izqpassy4h",
  "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
  "CNAME": "my-app.elasticbeanstalk.com",
  "Health": "Grey",
  "Tier": {
    "Type": "Standard",
    "Name": "WebServer",
    "Version": ""
  },
  "DateUpdated": "2015-02-03T23:04:54.479Z",
  "DateCreated": "2015-02-03T23:04:54.479Z"
}
```

v1 is the label of an application version previously uploaded with create-application-version.

**To specify a JSON file to define environment configuration options**

The following `create-environment` command specifies that a JSON file with the name `myoptions.json` should be used to override values obtained from the solution stack or the configuration template:

```
aws elasticbeanstalk create-environment --environment-name sample-env --application-name sampleapp --option-settings file://myoptions.json
```

`myoptions.json` is a JSON object defining several settings:

```
[
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Interval",
    "Value": "15"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Timeout",
```
For more information, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [CreateEnvironment](#) in *AWS CLI Command Reference*.

**create-storage-location**

The following code example shows how to use `create-storage-location`.

**AWS CLI**

**To create a storage location**

The following command creates a storage location in Amazon S3:

```
aws elasticbeanstalk create-storage-location
```

**Output:**

```
{
  "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012"
}
```

- For API details, see [CreateStorageLocation](#) in *AWS CLI Command Reference*.

**delete-application-version**

The following code example shows how to use `delete-application-version`.
**AWS CLI**

**To delete an application version**

The following command deletes an application version named 22a0-stage-150819_182129 for an application named my-app:

```
aws elasticbeanstalk delete-application-version --version-label 22a0-stage-150819_182129 --application-name my-app
```

- For API details, see [DeleteApplicationVersion](#) in *AWS CLI Command Reference*.

**delete-application**

The following code example shows how to use `delete-application`.

**AWS CLI**

**To delete an application**

The following command deletes an application named my-app:

```
aws elasticbeanstalk delete-application --application-name my-app
```

- For API details, see [DeleteApplication](#) in *AWS CLI Command Reference*.

**delete-configuration-template**

The following code example shows how to use `delete-configuration-template`.

**AWS CLI**

**To delete a configuration template**

The following command deletes a configuration template named my-template for an application named my-app:

```
aws elasticbeanstalk delete-configuration-template --template-name my-template --application-name my-app
```

- For API details, see [DeleteConfigurationTemplate](#) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

2727
delete-environment-configuration

The following code example shows how to use delete-environment-configuration.

AWS CLI

To delete a draft configuration

The following command deletes a draft configuration for an environment named my-env:

```
aws elasticbeanstalk delete-environment-configuration --environment-name my-env --application-name my-app
```

- For API details, see DeleteEnvironmentConfiguration in AWS CLI Command Reference.

describe-application-versions

The following code example shows how to use describe-application-versions.

AWS CLI

To view information about an application version

The following command retrieves information about an application version labeled v2:

```
aws elasticbeanstalk describe-application-versions --application-name my-app --version-label "v2"
```

Output:

```
{
   "ApplicationVersions": [
       {
           "ApplicationName": "my-app",
           "VersionLabel": "v2",
           "Description": "update cover page",
           "DateCreated": "2015-07-23T01:32:26.079Z",
           "DateUpdated": "2015-07-23T01:32:26.079Z",
           "SourceBundle": {
               "S3Bucket": "elasticbeanstalk-us-west-2-015321684451",
               "S3Key": "my-app/5026-stage-150723_224258.war"
           }
       }
   ]
}
```
For API details, see DescribeApplicationVersions in AWS CLI Command Reference.

describe-applications

The following code example shows how to use describe-applications.

AWS CLI

To view a list of applications

The following command retrieves information about applications in the current region:

```
aws elasticbeanstalk describe-applications
```

Output:

```json
{
  "Applications": [
    {
      "ApplicationName": "ruby",
      "ConfigurationTemplates": [],
      "DateUpdated": "2015-08-13T21:05:44.376Z",
      "Versions": [
        "Sample Application"
      ],
      "DateCreated": "2015-08-13T21:05:44.376Z"
    },
    {
      "ApplicationName": "my-app",
      "VersionLabel": "v1",
      "Description": "initial version",
      "DateCreated": "2015-07-23T22:26:10.816Z",
      "DateUpdated": "2015-07-23T22:26:10.816Z",
      "SourceBundle": {
        "S3Bucket": "elasticbeanstalk-us-west-2-015321684451",
        "S3Key": "my-app/5026-stage-150723_222618.war"
      }
    }
  ]
}
```
For API details, see DescribeApplications in AWS CLI Command Reference.

**describe-configuration-options**

The following code example shows how to use describe-configuration-options.

**AWS CLI**

**To view configuration options for an environment**

The following command retrieves descriptions of all available configuration options for an environment named my-env:

```bash
aws elasticbeanstalk describe-configuration-options --environment-name my-env --application-name my-app
```

Output (abbreviated):

```json
{
    "Options": [
```
Available configuration options vary per platform and configuration version. For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeConfigurationOptions in AWS CLI Command Reference.
describe-configuration-settings

The following code example shows how to use describe-configuration-settings.

AWS CLI

To view configurations settings for an environment

The following command retrieves configuration settings for an environment named my-env:

```
aws elasticbeanstalk describe-configuration-settings --environment-name my-env --application-name my-app
```

Output (abbreviated):

```
{
   "ConfigurationSettings": [
   {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Description": "Environment created from the EB CLI using \"eb create \"",
      "DeploymentStatus": "deployed",
      "DateCreated": "2015-08-13T19:16:25Z",
      "OptionSettings": [
         {
            "OptionName": "Availability Zones",
            "ResourceName": "AWSEBAutoScalingGroup",
            "Namespace": "aws:autoscaling:asg",
            "Value": "Any"
         },
         {
            "OptionName": "Cooldown",
            "ResourceName": "AWSEBAutoScalingGroup",
            "Namespace": "aws:autoscaling:asg",
            "Value": "360"
         },
         ...,
         {
            "OptionName": "ConnectionDrainingTimeout",
            "ResourceName": "AWSEBLoadBalancer",
            "Namespace": "aws:elb:polices",
            "Value": "20"
         }
      ]
   }
   ...
```

Actions and scenarios
For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [DescribeConfigurationSettings](https://docs.aws.amazon.com/cli/latest/reference/elasticbeanstalk/describe-configuration-settings.html) in *AWS CLI Command Reference*.

**describe-environment-health**

The following code example shows how to use `describe-environment-health`.

**AWS CLI**

**To view environment health**

The following command retrieves overall health information for an environment named `my-env`:

```sh
aws elasticbeanstalk describe-environment-health --environment-name my-env --attribute-names All
```

**Output**:

```json
{
    "Status": "Ready",
    "EnvironmentName": "my-env",
    "Color": "Green",
    "ApplicationMetrics": {
    }
}
```
"Duration": 10,
"Latency": {
  "P99": 0.004,
  "P75": 0.002,
  "P90": 0.003,
  "P95": 0.004,
  "P85": 0.003,
  "P10": 0.001,
  "P999": 0.004,
  "P50": 0.001
},
"RequestCount": 45,
"StatusCodes": {
  "Status3xx": 0,
  "Status2xx": 45,
  "Status5xx": 0,
  "Status4xx": 0
}
"RefreshedAt": "2015-08-20T21:09:18Z",
"HealthStatus": "Ok",
"InstancesHealth": {
  "Info": 0,
  "Ok": 1,
  "Unknown": 0,
  "Severe": 0,
  "Warning": 0,
  "Degraded": 0,
  "NoData": 0,
  "Pending": 0
},
"Causes": []
}

Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the **AWS Elastic Beanstalk Developer Guide**.

- For API details, see [DescribeEnvironmentHealth](#) in **AWS CLI Command Reference**.

**describe-environment-resources**

The following code example shows how to use `describe-environment-resources`. 
AWS CLI

To view information about the AWS resources in your environment

The following command retrieves information about resources in an environment named my-env:

```bash/aws elasticbeanstalk describe-environment-resources --environment-name my-env
```

Output:

```
{
    "EnvironmentResources": {
        "EnvironmentName": "my-env",
        "AutoScalingGroups": [
            {
                "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingGroup-QSB2Z088SXZT"
            }
        ],
        "Triggers": [],
        "LoadBalancers": [
            {
                "Name": "awseb-e-q-AWSEBLoa-1EEPZ0K98BIF0"
            }
        ],
        "Instances": [
            {
                "Id": "i-0c91c786"
            }
        ],
        "LaunchConfigurations": [
            {
                "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingLaunchConfiguration-1UUVQIBC96TQ2"
            }
        ]
    }
}
```

- For API details, see [DescribeEnvironmentResources](https://docs.aws.amazon.com/cli/latest/reference/elasticbeanstalk/describe-environment-resources.html) in AWS CLI Command Reference.
describe-environments

The following code example shows how to use describe-environments.

AWS CLI

To view information about an environment

The following command retrieves information about an environment named my-env:

```bash
aws elasticbeanstalk describe-environments --environment-names my-env
```

Output:

```json
{
  "Environments": [
    {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "VersionLabel": "7f58-stage-150812_025409",
      "Status": "Ready",
      "EnvironmentId": "e-rpqsewtp2j",
      "EndpointURL": "awseb-e-w-AWSEBLoa-1483140XB0Q4L-109QXY8121.us-west-2.elb.amazonaws.com",
      "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
      "CNAME": "my-env.elasticbeanstalk.com",
      "Health": "Green",
      "AbortableOperationInProgress": false,
      "Tier": {
        "Version": "",
        "Type": "Standard",
        "Name": "WebServer"
      },
      "DateUpdated": "2015-08-12T18:16:55.019Z",
      "DateCreated": "2015-08-07T20:48:49.599Z"
    }
  ]
}
```

- For API details, see DescribeEnvironments in AWS CLI Command Reference.
describe-events

The following code example shows how to use describe-events.

AWS CLI

To view events for an environment

The following command retrieves events for an environment named `my-env`:

```
aws elasticbeanstalk describe-events --environment-name my-env
```

Output (abbreviated):

```json
{
   "Events": [
   {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Message": "Environment health has transitioned from Info to Ok.",
      "EventDate": "2015-08-20T07:06:53.535Z",
      "Severity": "INFO"
   },
   {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Severity": "INFO",
      "RequestId": "b7f3960b-4709-11e5-ba1e-07e16200da41",
      "Message": "Environment update completed successfully.",
      "EventDate": "2015-08-20T07:06:02.049Z"
   },
   ...
   {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Severity": "INFO",
      "RequestId": "ca8dfbf6-41ef-11e5-988b-651aa638f46b",
      "Message": "Using elasticbeanstalk-us-west-2-012445113685 as Amazon S3 storage bucket for environment data.",
      "EventDate": "2015-08-13T19:16:27.561Z"
   },
   {   "ApplicationName": "my-app",
```
For API details, see DescribeEvents in AWS CLI Command Reference.

**describe-instances-health**

The following code example shows how to use describe-instances-health.

**AWS CLI**

*To view environment health*

The following command retrieves health information for instances in an environment named my-env:

```
aws elasticbeanstalk describe-instances-health --environment-name my-env --attribute-names All
```

**Output:**

```
{
    "InstanceHealthList": [
    {
        "InstanceId": "i-08691cc7",
        "ApplicationMetrics": {
            "Duration": 10,
            "Latency": {
                "P99": 0.006,
                "P75": 0.002,
                "P90": 0.004,
                "P95": 0.005,
                "P85": 0.003,
                "P10": 0.0,
                "P999": 0.006,
                "P50": 0.001
            }
        }
    }
]
```
Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeInstancesHealth in AWS CLI Command Reference.

list-available-solution-stacks

The following code example shows how to use list-available-solution-stacks.
To view solution stacks

The following command lists solution stacks for all currently available platform configurations and any that you have used in the past:

aws elasticbeanstalk list-available-solution-stacks

Output (abbreviated):

```json
{
    "SolutionStacks": [
        "64bit Amazon Linux 2015.03 v2.0.0 running Node.js",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.6",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.5",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 3.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 2.7",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 1.9.3",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 7",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 6",
        "64bit Windows Server Core 2012 R2 running IIS 8.5",
        "64bit Windows Server 2012 R2 running IIS 8.5",
        "64bit Windows Server 2012 running IIS 8",
        "64bit Windows Server 2008 R2 running IIS 7.5",
        "64bit Amazon Linux 2015.03 v2.0.0 running Docker 1.6.2",
        "64bit Amazon Linux 2015.03 v2.0.0 running Multi-container Docker 1.6.2 (Generic)",
        "64bit Debian jessie v2.0.0 running GlassFish 4.1 Java 8 (Preconfigured - Docker)",
        "64bit Debian jessie v2.0.0 running GlassFish 4.0 Java 7 (Preconfigured - Docker)",
        "64bit Debian jessie v2.0.0 running Go 1.4 (Preconfigured - Docker)",
        "64bit Debian jessie v2.0.0 running Go 1.3 (Preconfigured - Docker)"
    ]
}```
"64bit Debian jessie v2.0.0 running Python 3.4 (Preconfigured - Docker),
],
"SolutionStackDetails": [
{
    "PermittedFileTypes": [
        "zip"
    ],
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Node.js"
},
...]
}

- For API details, see ListAvailableSolutionStacks in AWS CLI Command Reference.

rebuild-environment

The following code example shows how to use rebuild-environment.

AWS CLI

To rebuild an environment

The following command terminates and recreates the resources in an environment named my-env:

```bash
aws elasticbeanstalk rebuild-environment --environment-name my-env
```

- For API details, see RebuildEnvironment in AWS CLI Command Reference.

request-environment-info

The following code example shows how to use request-environment-info.

AWS CLI

To request tailed logs

The following command requests logs from an environment named my-env:

```bash
aws elasticbeanstalk request-environment-info --environment-name my-env --info-type tail
```
After requesting logs, retrieve their location with `retrieve-environment-info`.

- For API details, see [RequestEnvironmentInfo](#) in *AWS CLI Command Reference*.

**restart-app-server**

The following code example shows how to use `restart-app-server`.

**AWS CLI**

**To restart application servers**

The following command restarts application servers on all instances in an environment named `my-env`:

```bash
aws elasticbeanstalk restart-app-server --environment-name my-env
```

- For API details, see [RestartAppServer](#) in *AWS CLI Command Reference*.

**retrieve-environment-info**

The following code example shows how to use `retrieve-environment-info`.

**AWS CLI**

**To retrieve tailed logs**

The following command retrieves a link to logs from an environment named `my-env`:

```bash
aws elasticbeanstalk retrieve-environment-info --environment-name my-env --info-type tail
```

**Output:**

```json
{
   "EnvironmentInfo": [
      {
         "SampleTimestamp": "2015-08-20T22:23:17.703Z",
         "Message": "https://elasticbeanstalk-us-west-2-0123456789012.s3.amazonaws.com/resources/environments/logs/tail/e-fyqju3yjs/i-09c1c867/TailLogs-1440109397703.out"
      }
   ]
}
```
View the link in a browser. Prior to retrieval, logs must be requested with request-environment-info.

- For API details, see `RetrieveEnvironmentInfo` in *AWS CLI Command Reference*.

**swap-environment-cnames**

The following code example shows how to use `swap-environment-cnames`.

**AWS CLI**

To swap environment CNAMES

The following command swaps the assigned subdomains of two environments:

```
aws elasticbeanstalk swap-environment-cnames --source-environment-name my-env-blue --destination-environment-name my-env-green
```

- For API details, see `SwapEnvironmentCnames` in *AWS CLI Command Reference*.

**terminate-environment**

The following code example shows how to use `terminate-environment`.

**AWS CLI**

To terminate an environment

The following command terminates an Elastic Beanstalk environment named `my-env`:

```
aws elasticbeanstalk terminate-environment --environment-name my-env
```

Output:
For API details, see TerminateEnvironment in AWS CLI Command Reference.

update-application-version

The following code example shows how to use update-application-version.

AWS CLI

To change an application version's description

The following command updates the description of an application version named 22a0-stage-150819_185942:

```
aws elasticbeanstalk update-application-version --version-label 22a0-stage-150819_185942 --application-name my-app --description "new description"
```

Output:

```
{
   "ApplicationVersion": {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Status": "Terminating",
      "EnvironmentId": "e-fh2eravpns",
      "EndpointURL": "awseb-e-f-AWSEBLoa-1I9XUMP4-8492WNUP202574.us-west-2.elb.amazonaws.com",
      "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
      "CNAME": "my-env.elasticbeanstalk.com",
      "Health": "Grey",
      "AbortableOperationInProgress": false,
      "Tier": {,
        "Version": "",
        "Type": "Standard",
        "Name": "WebServer"
      },
      "DateUpdated": "2015-08-12T19:05:54.744Z",
      "DateCreated": "2015-08-12T18:52:53.622Z"
   }
}
```
• For API details, see UpdateApplicationVersion in AWS CLI Command Reference.

update-application

The following code example shows how to use update-application.

AWS CLI

To change an application's description

The following command updates the description of an application named my-app:

```bash
aws elasticbeanstalk update-application --application-name my-app --description "my Elastic Beanstalk application"
```

Output:

```json
{
    "Application": {
        "ApplicationName": "my-app",
        "Description": "my Elastic Beanstalk application",
        "Versions": [
            "2fba-stage-150819_234450",
            "bf07-stage-150820_214945",
            "93f8",
            "fd7c-stage-150820_000431",
            "22a0-stage-150819_185942"
        ],
        "DateCreated": "2015-08-13T19:15:50.449Z",
        "ConfigurationTemplates": [],
        "DateUpdated": "2015-08-20T22:34:56.195Z"
    }
}
```
For API details, see UpdateApplication in AWS CLI Command Reference.

update-configuration-template

The following code example shows how to use update-configuration-template.

AWS CLI

To update a configuration template

The following command removes the configured CloudWatch custom health metrics configuration ConfigDocument from a saved configuration template named my-template:

```
aws elasticbeanstalk update-configuration-template --template-name my-template --application-name my-app --options-to-remove
Namespace=aws:elasticbeanstalk:healthreporting:system,OptionName=ConfigDocument
```

Output:

```
{
    "TemplateName": "my-template",
    "ApplicationName": "my-app",
    "DateCreated": "2015-08-20T22:39:31Z",
    "DateUpdated": "2015-08-20T22:43:11Z",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

For API details, see UpdateConfigurationTemplate in AWS CLI Command Reference.

update-environment

The following code example shows how to use update-environment.

AWS CLI

To update an environment to a new version
The following command updates an environment named "my-env" to version "v2" of the application to which it belongs:

```
aws elasticbeanstalk update-environment --environment-name my-env --version-label v2
```

This command requires that the "my-env" environment already exists and belongs to an application that has a valid application version with the label "v2".

Output:

```
{
   "ApplicationName": "my-app",
   "EnvironmentName": "my-env",
   "VersionLabel": "v2",
   "Status": "Updating",
   "EnvironmentId": "e-sqipays4h",
   "EndpointURL": "awseb-e-i-AWSEBLoa-1RDLX6TC9VUA0-0123456789.us-west-2.elb.amazonaws.com",
   "SolutionStackName": "64bit Amazon Linux running Tomcat 7",
   "CNAME": "my-env.elasticbeanstalk.com",
   "Health": "Grey",
   "Tier": {
      "Version": "",
      "Type": "Standard",
      "Name": "WebServer"
   },
   "DateUpdated": "2015-02-03T23:12:29.119Z",
   "DateCreated": "2015-02-03T23:04:54.453Z"
}
```

To set an environment variable

The following command sets the value of the "PARAM1" variable in the "my-env" environment to "ParamValue":

```
aws elasticbeanstalk update-environment --environment-name my-env --option-settings
   Namespace=aws:elasticbeanstalk:application:environment,OptionName=PARAM1,Value=ParamValue
```

The `option-settings` parameter takes a namespace in addition to the name and value of the variable. Elastic Beanstalk supports several namespaces for options in addition to environment variables.
To configure option settings from a file

The following command configures several options in the `aws:elb:loadbalancer` namespace from a file:

```bash
aws elasticbeanstalk update-environment --environment-name my-env --option-settings file://options.json
```

`options.json` is a JSON object defining several settings:

```json
[
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Interval",
    "Value": "15"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Timeout",
    "Value": "8"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "HealthyThreshold",
    "Value": "2"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "UnhealthyThreshold",
    "Value": "3"
  }
]
```

Output:

```json
{
  "ApplicationName": "my-app",
  "EnvironmentName": "my-env",
  "VersionLabel": "7f58-stage-150812_025409",
  "Status": "Updating",
  "EnvironmentId": "e-wtp2rpqsej",
  "EndpointURL": "awseb-e-w-AWSEBLoa-14XB83101Q4L-104QXY80921.sa-east-1.elb.amazonaws.com",
}
For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [UpdateEnvironment](#) in *AWS CLI Command Reference*.

**validate-configuration-settings**

The following code example shows how to use `validate-configuration-settings`.

**AWS CLI**

**To validate configuration settings**

The following command validates a CloudWatch custom metrics config document:

```
aws elasticbeanstalk validate-configuration-settings --application-name my-app --environment-name my-env --option-settings file://options.json
```

*options.json* is a JSON document that includes one or more configuration settings to validate:

```json
[
  {
    "Namespace": "aws:elasticbeanstalk:healthreporting:system",
    "OptionName": "ConfigDocument",
    "Value": "{"CloudWatchMetrics": {"Environment": {
      "ApplicationLatencyP99.9": null,"InstancesSevere": 60,
      "ApplicationLatencyP90": 60,"ApplicationLatencyP99": null,
      "ApplicationLatencyP95": 60,"InstancesUnknown": 60,"ApplicationLatencyP85":
```
If the options that you specify are valid for the specified environment, Elastic Beanstalk returns an empty Messages array:

```json
{
    "Messages": []
}
```

If validation fails, the response will include information about the error:

```json
{
    "Messages": [
        {
            "OptionName": "ConfigDocument",
            "Message": "Invalid option specification (Namespace: 'aws:elasticbeanstalk:healthreporting:system', OptionName: 'ConfigDocument'): Unknown configuration setting.",
            "Namespace": "aws:elasticbeanstalk:healthreporting:system",
            "Severity": "error"
        }
    ]
}
```

For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.
Elastic Load Balancing examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**add-listener-certificates**

The following code example shows how to use `add-listener-certificates`.

**AWS CLI**

**To add a certificate to a secure listener**

This example adds the specified certificate to the specified secure listener.

**Command:**

```bash
```

**Output:**

For API details, see [ValidateConfigurationSettings](#) in AWS CLI Command Reference.
```json
{
    "Certificates": [
        {
            "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
            "IsDefault": false
        }
    ]
}
```

- For API details, see [AddListenerCertificates](#) in *AWS CLI Command Reference*.

**add-tags**

The following code example shows how to use `add-tags`.

**AWS CLI**

**To add tags to a load balancer**

The following `add-tags` example adds the project and department tags to the specified load balancer.

```bash
aws elbv2 add-tags \\
    --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \\
    --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see [AddTags](#) in *AWS CLI Command Reference*.

**apply-security-groups-to-load-balancer**

The following code example shows how to use `apply-security-groups-to-load-balancer`.

**AWS CLI**

**To associate a security group with a load balancer in a VPC**

This example associates a security group with the specified load balancer in a VPC.

Command:
aws elb apply-security-groups-to-load-balancer --load-balancer-name my-load-balancer --security-groups sg-fc448899

Output:

```json
{
   "SecurityGroups": [
      "sg-fc448899"
   ]
}
```

- For API details, see `ApplySecurityGroupsToLoadBalancer` in `AWS CLI Command Reference`.

**attach-load-balancer-to-subnets**

The following code example shows how to use `attach-load-balancer-to-subnets`.

**AWS CLI**

**To attach subnets to a load balancer**

This example adds the specified subnet to the set of configured subnets for the specified load balancer.

Command:

```bash
aws elb attach-load-balancer-to-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

Output:

```json
{
   "Subnets": [
      "subnet-15aaab61",
      "subnet-0ecac448"
   ]
}
```

- For API details, see `AttachLoadBalancerToSubnets` in `AWS CLI Command Reference`. 

---

Actions and scenarios 2753
configure-health-check

The following code example shows how to use `configure-health-check`.

**AWS CLI**

**To specify the health check settings for your backend EC2 instances**

This example specifies the health check settings used to evaluate the health of your backend EC2 instances.

Command:

```bash
aws elb configure-health-check --load-balancer-name my-load-balancer --health-check
Target=HTTP:80/png,Interval=30,UnhealthyThreshold=2,HealthyThreshold=2,Timeout=3
```

Output:

```json
{
   "HealthCheck": {
      "HealthyThreshold": 2,
      "Interval": 30,
      "Target": "HTTP:80/png",
      "Timeout": 3,
      "UnhealthyThreshold": 2
   }
}
```

- For API details, see [ConfigureHealthCheck](#) in *AWS CLI Command Reference*.

create-app-cookie-stickiness-policy

The following code example shows how to use `create-app-cookie-stickiness-policy`.

**AWS CLI**

**To generate a stickiness policy for your HTTPS load balancer**

This example generates a stickiness policy that follows the sticky session lifetimes of the application-generated cookie.

Command:
aws elb create-app-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-app-cookie-policy --cookie-name my-app-cookie

- For API details, see CreateAppCookieStickinessPolicy in AWS CLI Command Reference.

create-lb-cookie-stickiness-policy

The following code example shows how to use create-lb-cookie-stickiness-policy.

AWS CLI

To generate a duration-based stickiness policy for your HTTPS load balancer

This example generates a stickiness policy with sticky session lifetimes controlled by the specified expiration period.

Command:

```
aws elb create-lb-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy --cookie-expiration-period 60
```

- For API details, see CreateLbCookieStickinessPolicy in AWS CLI Command Reference.

create-listener

The following code example shows how to use create-listener.

AWS CLI

**Example 1: To create an HTTP listener**

The following create-listener example creates an HTTP listener for the specified Application Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \
    --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \ 
    --protocol HTTP \ 
    --port 80 \ 
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```
Example 2: To create an HTTPS listener

The following `create-listener` example creates an HTTPS listener for the specified Application Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for an HTTPS listener. You can create and manage certificates using AWS Certificate Manager (ACM). Alternatively, you can create a certificate using SSL/TLS tools, get the certificate signed by a certificate authority (CA), and upload the certificate to AWS Identity and Access Management (IAM).

```bash
aws elbv2 create-listener
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
  --protocol HTTPS
  --port 443
  --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557
    --ssl-policy ELBSecurityPolicy-2016-08
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see [Add an HTTPS listener](https://docs.aws.amazon.com/elasticloadbalancing/latest/application/create-listener.html) in the *User Guide for Application Load Balancers*.

Example 3: To create a TCP listener

The following `create-listener` example creates a TCP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```bash
aws elbv2 create-listener
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1ce11e
  --protocol TCP
  --port 80
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see [Tutorial: Create a Network Load Balancer using the AWS CLI](https://docs.aws.amazon.com/elasticloadbalancing/latest/network/create-listener.html) in the *User Guide for Network Load Balancers*. 
Example 4: To create a TLS listener

The following `create-listener` example creates a TLS listener for the specified Network Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for a TLS listener.

```bash
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
  --protocol TLS \
  --port 443 \
  --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \
  --ssl-policy ELBSecurityPolicy-2016-08 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see [TLS listeners for your Network Load Balancer](https://docs.aws.amazon.com/elasticloadbalancing/latest/dg/tls-listeners.html) in the *User Guide for Network Load Balancers*.

Example 5: To create a UDP listener

The following `create-listener` example creates a UDP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```bash
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1ce11e \
  --protocol UDP \
  --port 53 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-targets/b6bb954d1361c78
```

For more information, see [Tutorial: Create a Network Load Balancer using the AWS CLI](https://docs.aws.amazon.com/elasticloadbalancing/latest/dg/quickstart-iam-tutorial.html) in the *User Guide for Network Load Balancers*.

Example 6: To create a listener for the specified gateway and forwarding

The following `create-listener` example creates a listener for the specified Gateway Load Balancer that forwards requests to the specified target group.

```bash
aws elbv2 create-listener \
```
Output:

```json
{
   "Listeners": [
      {
         "ListenerArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:listener/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6/afc127db15f925de",
         "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:loadbalancer/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6",
         "DefaultActions": [
            {
               "Type": "forward",
               "ForwardConfig": {
                  "TargetGroups": [
                     {
                        "TargetGroupArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:targetgroup/test-tg-agw-2/007ca469fae3bb1615"
                     }
                  ]
               }
            }
         ]
      }
   ]
}
```

For more information, see [Getting started with Gateway Load Balancers using the AWS CLI](https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway-get-started.html) in the *User Guide for Gateway Load Balancers*.

- For API details, see [CreateListener](https://docs.aws.amazon.com/cli/latest/reference/elastic-load-balancing/create-listener.html) in *AWS CLI Command Reference*.

### create-load-balancer-listeners

The following code example shows how to use `create-load-balancer-listeners`.
AWS CLI

To create HTTP listeners for a load balancer

This example creates a listener for your load balancer at port 80 using the HTTP protocol.

Command:

```bash
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

To create HTTPS listeners for a load balancer

This example creates a listener for your load balancer at port 443 using the HTTPS protocol.

Command:

```bash
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --listeners "Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80"
```

For API details, see [CreateLoadBalancerListeners](https://aws.amazon.com/documentation/cli/reference/elb/create-load-balancer-listeners) in *AWS CLI Command Reference*.

create-load-balancer-policy

The following code example shows how to use `create-load-balancer-policy`.

AWS CLI

To create a policy that enables Proxy Protocol on a load balancer

This example creates a policy that enables Proxy Protocol on the specified load balancer.

Command:

```bash
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-ProxyProtocol-policy --policy-type-name ProxyProtocolPolicyType --policy-attributes AttributeName=ProxyProtocol,AttributeValue=true
```

To create an SSL negotiation policy using the recommended security policy
This example creates an SSL negotiation policy for the specified HTTPS load balancer using the recommended security policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-attributes AttributeName=Reference-Security-Policy,AttributeValue=ELBSecurityPolicy-2015-03
```

To create an SSL negotiation policy using a custom security policy

This example creates an SSL negotiation policy for your HTTPS load balancer using a custom security policy by enabling the protocols and the ciphers.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-attributes AttributeName=Protocol-SSLv3,AttributeValue=true AttributeName=Protocol-TLSv1.1,AttributeValue=true AttributeName=DHE-RSA-AES256-SHA256,AttributeValue=true AttributeName=Server-Defined-Cipher-Order,AttributeValue=true
```

To create a public key policy

This example creates a public key policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-PublicKey-policy --policy-type-name PublicKeyPolicyType --policy-attributes AttributeName=PublicKey,AttributeValue=MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAwAYUjnfyEyXr1pxjhFWBpMlggUcqoi3kl+dS74k/j/c6x7R0tusUaeQCTgIUkayttRDWchuqo1pHC1u+n5xxXnBBe2ejbb2WrsKIQ5xXEeixsjFpFsojpsQKkzhVGI6mJVZBDVKSmswnwLBdofLhzv11povBPTHe+o4haAwvDBALJU0pkSI1FecPHcs2hwxf14zHoXy1e2k36A64nWX43wtx5qcVS1xtCE0jnYRg7RPvybaGfQ+vi4axb/+7J5kEvZhtFQId+bSiJImF1FSUT1WixwzBZPUBcUkkXDj45vC2s3Z8E+Lk7a3uZhvsQHLZnIfuWjBWGwVZ/MhZYGEXAMPLE
```

To create a backend server authentication policy

This example creates a backend server authentication policy that enables authentication on your backend instance using a public key policy.
Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-authentication-policy --policy-type-name BackendServerAuthenticationPolicyType --policy-attributes AttributeName=PublicKeyPolicyName,AttributeValue=my-PublicKey-policy
```

• For API details, see CreateLoadBalancerPolicy in AWS CLI Command Reference.

create-load-balancer

The following code example shows how to use create-load-balancer.

AWS CLI

To create an HTTP load balancer

This example creates a load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --subnets subnet-15aaab61 --security-groups sg-a61988c3
```

Output:

```
{
    "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTP listener in EC2-Classic.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --availability-zones us-west-2a us-west-2b
```

Output:
To create an HTTPS load balancer

This example creates a load balancer with an HTTPS listener in a VPC.

Command:

```bash
```

Output:

```json
{
  "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTPS listener in EC2-Classic.

Command:

```bash
```

Output:

```json
{
  "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

To create an internal load balancer

This example creates an internal load balancer with an HTTP listener in a VPC.
Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
"Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --scheme
internal --subnets subnet-a85db0df --security-groups sg-a61988c3
```

Output:

```
{
  "DNSName": "internal-my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

- For API details, see [CreateLoadBalancer](https://awscli.amazonaws.com/v2/documentation/api/index.html#awscli.CommandReference) in AWS CLI Command Reference.

**create-rule**

The following code example shows how to use `create-rule`.

**AWS CLI**

**Example 1: To create a rule using a path condition and a forward action**

The following `create-rule` example creates a rule that forwards requests to the specified target group if the URL contains the specified pattern.

```
aws elbv2 create-rule \
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
   --priority 5 \n   --conditions file://conditions-pattern.json 
   --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

**Contents of conditions-pattern.json:**

```
[
  {
    "Field": "path-pattern",
    "PathPatternConfig": {
      "Values": ["/images/*"]
    }
  }
]```
Example 2: To create a rule using a host condition and a fixed response

The following `create-rule` example creates a rule that provides a fixed response if the hostname in the host header matches the specified hostname.

```
aws elbv2 create-rule \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --priority 10 \
    --conditions file://conditions-host.json \
    --actions file://actions-fixed-response.json
```

Contents of `conditions-host.json`

```
[
    {
        "Field": "host-header",
        "HostHeaderConfig": {
            "Values": ["*.example.com"]
        }
    }
]
```

Contents of `actions-fixed-response.json`

```
[
    {
        "Type": "fixed-response",
        "FixedResponseConfig": {
            "MessageBody": "Hello world",
            "StatusCode": "200",
            "ContentType": "text/plain"
        }
    }
]
```

Example 3: To create a rule using a source IP address condition, an authenticate action, and a forward action
The following `create-rule` example creates a rule that authenticates the user if the source IP address matches the specified IP address, and forwards the request to the specified target group if authentication is successful.

```bash
aws elbv2 create-rule \
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \ 
   --priority 20 \ 
   --conditions file://conditions-source-ip.json \ 
   --actions file://actions-authenticate.json
```

Contents of `conditions-source-ip.json`

```json
[
  {
    "Field": "source-ip",
    "SourceIpConfig": {
      "Values": ["192.0.2.0/24", "198.51.100.10/32"]
    }
  }
]
```

Contents of `actions-authenticate.json`

```json

    }
  }
]
create-target-group

The following code example shows how to use create-target-group.

AWS CLI

Example 1: To create a target group for an Application Load Balancer

The following create-target-group example creates a target group for an Application Load Balancer where you register targets by instance ID (the target type is instance). This target group uses the HTTP protocol, port 80, and the default health check settings for an HTTP target group.

```
aws elbv2 create-target-group
   --name my-targets
   --protocol HTTP
   --port 80
   --target-type instance
   --vpc-id vpc-3ac0fb5f
```

Output:

```
{
   "TargetGroups": [
     {
       "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
       "TargetGroupName": "my-targets",
       "Protocol": "HTTP",
       "HealthCheckEnabled": true
     }
   ]
}
```
"Port": 80,
"VpcId": "vpc-3ac0fb5f",
"HealthCheckProtocol": "HTTP",
"HealthCheckPort": "traffic-port",
"HealthCheckEnabled": true,
"HealthCheckIntervalSeconds": 30,
"HealthCheckTimeoutSeconds": 5,
"HealthyThresholdCount": 5,
"UnhealthyThresholdCount": 2,
"HealthCheckPath": "/",
"Matcher": {
    "HttpCode": "200"
},
"TargetType": "instance",
"ProtocolVersion": "HTTP1",
"IpAddressType": "ipv4"
]
]

For more information, see Create a target group in the User Guide for Application Load Balancers.

Example 2: To create a target group to route traffic from an Application Load Balancer to a Lambda function

The following create-target-group example creates a target group for an Application Load Balancer where the target is a Lambda function (the target type is lambda). Health checks are disabled for this target group by default.

```bash
aws elbv2 create-target-group \
  --name my-lambda-target \
  --target-type lambda
```

Output:

```json
{
    "TargetGroups": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-lambda-target/a3003e085dbb8ddc",
            "TargetGroupName": "my-lambda-target",
```
"HealthCheckEnabled": false,
"HealthCheckIntervalSeconds": 35,
"HealthCheckTimeoutSeconds": 30,
"HealthyThresholdCount": 5,
"UnhealthyThresholdCount": 2,
"HealthCheckPath": "/",
"Matcher": {
  "HttpCode": "200"
},
"TargetType": "lambda",
"IpAddressType": "ipv4"
]
}

For more information, see Lambda functions as targets in the User Guide for Application Load Balancers.

Example 3: To create a target group for a Network Load Balancer

The following create-target-group example creates a target group for a Network Load Balancer where you register targets by IP address (the target type is ip). This target group uses the TCP protocol, port 80, and the default health check settings for a TCP target group.

```bash
aws elbv2 create-target-group \
  --name my-ip-targets \
  --protocol TCP \
  --port 80 \
  --target-type ip \
  --vpc-id vpc-3ac0fb5f
```

Output:

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-ip-targets/b6bba954d1361c78",
      "TargetGroupName": "my-ip-targets",
      "Protocol": "TCP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
    }
  ]
}
```
"HealthCheckEnabled": true,
"HealthCheckProtocol": "TCP",
"HealthCheckPort": "traffic-port",
"HealthCheckIntervalSeconds": 30,
"HealthCheckTimeoutSeconds": 10,
"HealthyThresholdCount": 5,
"UnhealthyThresholdCount": 2,
"TargetType": "ip",
"IpAddressType": "ipv4"
}
]
}

For more information, see Create a target group in the User Guide for Network Load Balancers.

Example 4: To create a target group to route traffic from a Network Load Balancer to an Application Load Balancer

The following create-target-group example creates a target group for a Network Load Balancer where you register an Application Load Balancer as a target (the target type is alb).

aws elbv2 create-target-group --name my-alb-target --protocol TCP --port 80 --target-type alb --vpc-id vpc-3ac0fb5f

Output:

{
   "TargetGroups": [
   {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-alb-target/a3003e005dbb8ddc",
      "TargetGroupName": "my-alb-target",
      "Protocol": "TCP",
      "Port": 80,
      "VpcId": "vpc-838475fe",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 30,
      "HealthCheckTimeoutSeconds": 6,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "HealthCheckPath": "/",
   }
   ]
}
For more information, see Create a target group with an Application Load Balancer as the target in the User Guide for Network Load Balancers.

**Example 5: To create a target group for a Gateway Load Balancer**

The following `create-target-group` example creates a target group for a Gateway Load Balancer where the target is an instance, and the target group protocol is GENEVE.

```
aws elbv2 create-target-group \
  --name my-glb-targetgroup \
  --protocol GENEVE \
  --port 6081 \
  --target-type instance \
  --vpc-id vpc-838475fe
```

Output:

```
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-glb-targetgroup/00c3d57eacd6f40b6f",
      "TargetGroupName": "my-glb-targetgroup",
      "Protocol": "GENEVE",
      "Port": 6081,
      "VpcId": "vpc-838475fe",
      "HealthCheckProtocol": "TCP",
      "HealthCheckPort": "80",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 10,
      "HealthCheckTimeoutSeconds": 5,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "TargetType": "instance"
    }
  ]
}
```
For more information, see Create a target group in the Gateway Load Balancer User Guide.

- For API details, see `CreateTargetGroup` in `AWS CLI Command Reference`.

**delete-listener**

The following code example shows how to use delete-listener.

**AWS CLI**

**To delete a listener**

The following delete-listener example deletes the specified listener.

```bash
aws elbv2 delete-listener \ 
--listener-arn arn:aws:elasticloadbalancing:ua-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see `DeleteListener` in `AWS CLI Command Reference`.

**delete-load-balancer-listeners**

The following code example shows how to use delete-load-balancer-listeners.

**AWS CLI**

**To delete a listener from your load balancer**

This example deletes the listener for the specified port from the specified load balancer.

**Command:**

```bash
aws elb delete-load-balancer-listeners --load-balancer-name my-load-balancer --load-balancer-ports 80
```

- For API details, see `DeleteLoadBalancerListeners` in `AWS CLI Command Reference`.
delete-load-balancer-policy

The following code example shows how to use delete-load-balancer-policy.

AWS CLI

To delete a policy from your load balancer

This example deletes the specified policy from the specified load balancer. The policy must not be enabled on any listener.

Command:

```
aws elb delete-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy
```

- For API details, see DeleteLoadBalancerPolicy in AWS CLI Command Reference.

delete-load-balancer

The following code example shows how to use delete-load-balancer.

AWS CLI

To delete a load balancer

This example deletes the specified load balancer.

Command:

```
aws elb delete-load-balancer --load-balancer-name my-load-balancer
```

- For API details, see DeleteLoadBalancer in AWS CLI Command Reference.

delete-rule

The following code example shows how to use delete-rule.

AWS CLI

To delete a rule
The following delete-rule example deletes the specified rule.

```
aws elbv2 delete-rule \
   --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3
```

- For API details, see [DeleteRule](#) in [AWS CLI Command Reference](#).

**delete-target-group**

The following code example shows how to use delete-target-group.

**AWS CLI**

**To delete a target group**

The following delete-target-group example deletes the specified target group.

```
aws elbv2 delete-target-group \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

This command produces no output.

- For more information, see [Delete a load balancer](#) in the [Application Load Balancer Guide](#).
- For API details, see [DeleteTargetGroup](#) in [AWS CLI Command Reference](#).

**deregister-instances-from-load-balancer**

The following code example shows how to use deregister-instances-from-load-balancer.

**AWS CLI**

**To deregister instances from a load balancer**

This example deregisters the specified instance from the specified load balancer.

Command:

```
aws elb deregister-instances-from-load-balancer --load-balancer-name my-load-balancer --instances i-d6f6fae3
```
Output:

```json
{
   "Instances": [
       {
           "InstanceId": "i-207d9717"
       },
       {
           "InstanceId": "i-afefb49b"
       }
   ]
}
```

**deregister-targets**

The following code example shows how to use `deregister-targets`.

**AWS CLI**

**Example 1: To deregister a target from a target group**

The following `deregister-targets` example removes the specified instance from the specified target group.

```bash
aws elbv2 deregister-targets \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
   --targets Id=i-1234567890abcdef0
```

**Example 2: To deregister a target registered using port overrides**

The following `deregister-targets` example removes an instance from a target group that was registered using port overrides.

```bash
aws elbv2 deregister-targets \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
   --targets Id=i-1234567890abcdef0,Port=80 Id=i-1234567890abcdef0,Port=766
```

- For API details, see [DeregisterTargets](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/elbv2/deregister-targets.html) in *AWS CLI Command Reference*. 

Actions and scenarios 2774
describe-account-limits

The following code example shows how to use describe-account-limits.

AWS CLI

To describe your Elastic Load Balancing limits

The following describe-account-limits example displays the Elastic Load Balancing limits for your AWS account in the current Region.

```bash
aws elbv2 describe-account-limits
```

Output:

```json
{
   "Limits": [
   {
       "Name": "target-groups",
       "Max": "3000"
   },
   {

**describe-instance-health**

The following code example shows how to use `describe-instance-health`.

### AWS CLI

**To describe the health of the instances for a load balancer**

This example describes the health of the instances for the specified load balancer.

Command:

```
aws elb describe-instance-health --load-balancer-name my-load-balancer
```
Output:

```json
{
   "InstanceStates": [
   {
      "InstanceId": "i-207d9717",
      "ReasonCode": "N/A",
      "State": "InService",
      "Description": "N/A"
   },
   {
      "InstanceId": "i-afefb49b",
      "ReasonCode": "N/A",
      "State": "InService",
      "Description": "N/A"
   }
   ]
}
```

**To describe the health of an instance for a load balancer**

This example describes the health of the specified instance for the specified load balancer.

Command:

```
aws elb describe-instance-health --load-balancer-name my-load-balancer --instances i-7299c809
```

The following is an example response for an instance that is registering.

Output:

```json
{
   "InstanceStates": [
   {
      "InstanceId": "i-7299c809",
      "ReasonCode": "ELB",
      "State": "OutOfService",
      "Description": "Instance registration is still in progress."
   }
   ]
}
```
The following is an example response for an unhealthy instance.

Output:

```json
{
   "InstanceStates": [
      {
         "InstanceId": "i-7299c809",
         "ReasonCode": "Instance",
         "State": "OutOfService",
         "Description": "Instance has failed at least the UnhealthyThreshold number of health checks consecutively."
      }
   ]
}
```

- For API details, see [DescribeInstanceHealth](https://docs.aws.amazon.com/cli/latest/reference/elbv2/describe-instance-health.html) in *AWS CLI Command Reference*.

**describe-listener-certificates**

The following code example shows how to use `describe-listener-certificates`.

**AWS CLI**

**To describe the certificates for a secure listener**

This example describes the certificates for the specified secure listener.

Command:

```bash
aws elbv2 describe-listener-certificates --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```json
{
   "Certificates": [
      {
         "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
         "IsDefault": false
      }
   ]
}
```
The following code example shows how to use describe-listeners.

**AWS CLI**

**To describe a listener**

This example describes the specified listener.

**Command:**

```bash
aws elbv2 describe-listeners --listener-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

**Output:**

```json
{
  "Listeners": [
    {
      "Port": 80,
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
          "Type": "forward"
        }
      ]
    }
  ]
}
```
To describe the listeners for a load balancer

This example describes the listeners for the specified load balancer.

Command:

```
aws elbv2 describe-listeners --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
    "Listeners": [
        {
            "Port": 443,
            "Protocol": "HTTPS",
            "DefaultActions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ],
            "SslPolicy": "ELBSecurityPolicy-2015-05",
            "Certificates": [
                {
                    "CertificateArn": "arn:aws:iam::123456789012:server-certificate/my-server-cert"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65"
        }
    ]
}
```
For API details, see DescribeListeners in AWS CLI Command Reference.

describe-load-balancer-attributes

The following code example shows how to use describe-load-balancer-attributes.

AWS CLI

To describe the attributes of a load balancer

This example describes the attributes of the specified load balancer.

Command:

```
aws elb describe-load-balancer-attributes --load-balancer-name my-load-balancer
```

Output:

```json
{
   "LoadBalancerAttributes": {
      "ConnectionDraining": {
         "Enabled": false,
         "Timeout": 300
      }
   }
}
```
For API details, see DescribeLoadBalancerAttributes in AWS CLI Command Reference.

describe-load-balancer-policies

The following code example shows how to use describe-load-balancer-policies.

AWS CLI

To describe all policies associated with a load balancer

This example describes all of the policies associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer
```

Output:

```json
{
   "PolicyDescriptions": [
      {
         "PolicyAttributeDescriptions": [
            {
               "AttributeName": "ProxyProtocol",
               "AttributeValue": "true"
            }
         ],
         "PolicyName": "my-ProxyProtocol-policy",
         "PolicyTypeName": "ProxyProtocolPolicyType"
      }
   ]
}
```
"PolicyAttributeDescriptions": [
  {
    "AttributeName": "CookieName",
    "AttributeValue": "my-app-cookie"
  },
  {
    "AttributeName": "CookieExpirationPeriod",
    "AttributeValue": "60"
  }
],
"PolicyName": "my-app-cookie-policy",
"PolicyTypeName": "AppCookieStickinessPolicyType"
},
{

]
}

To describe a specific policy associated with a load balancer

This example describes the specified policy associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer --policy-name my-authentication-policy
```

Output:

```
{
  "PolicyDescriptions": [
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "PublicKeyPolicyName",
          "AttributeValue": "my-PublicKey-policy"
        }
      ]
    }
  ]
}
```
describe-load-balancer-policy-types

The following code example shows how to use describe-load-balancer-policy-types.

AWS CLI

To describe the load balancer policy types defined by Elastic Load Balancing

This example describes the load balancer policy types that you can use to create policy configurations for your load balancer.

Command:

```
aws elb describe-load-balancer-policy-types
```

Output:

```json
{
   "PolicyTypeDescriptions": [
      {
         "PolicyAttributeTypeDescriptions": [
            {
               "Cardinality": "ONE",
               "AttributeName": "ProxyProtocol",
               "AttributeType": "Boolean"
            }
         ],
         "PolicyTypeName": "ProxyProtocolPolicyType",
         "Description": "Policy that controls whether to include the IP address and port of the originating request for TCP messages. This policy operates on TCP/SSL listeners only"
      },
      {
      }
   ]
}
```
"PolicyAttributeTypeDescriptions": [ 
  { 
    "Cardinality": "ONE",
    "AttributeName": "PublicKey",
    "AttributeType": "String"
  }
],
"PolicyTypeName": "PublicKeyPolicyType",
"Description": "Policy containing a list of public keys to accept when authenticating the back-end server(s). This policy cannot be applied directly to back-end servers or listeners but must be part of a BackendServerAuthenticationPolicyType."
},
{ 
  "PolicyAttributeTypeDescriptions": [ 
    { 
      "Cardinality": "ONE",
      "AttributeName": "CookieName",
      "AttributeType": "String"
    }
  ],
  "PolicyTypeName": "AppCookieStickinessPolicyType",
  "Description": "Stickiness policy with session lifetimes controlled by the lifetime of the application-generated cookie. This policy can be associated only with HTTP/HTTPS listeners."
},
{ 
  "PolicyAttributeTypeDescriptions": [ 
    { 
      "Cardinality": "ZERO_OR_ONE",
      "AttributeName": "CookieExpirationPeriod",
      "AttributeType": "Long"
    }
  ],
  "PolicyTypeName": "LBCookieStickinessPolicyType",
  "Description": "Stickiness policy with session lifetimes controlled by the browser (user-agent) or a specified expiration period. This policy can be associated only with HTTP/HTTPS listeners."
}
"PolicyTypeNames": [
    "SSLNegotiationPolicyType",
    "Description": "Listener policy that defines the ciphers and protocols that will be accepted by the load balancer. This policy can be associated only with HTTPS/SSL listeners."
],
"PolicyAttributeTypeDescriptions": [ 
    {
        "Cardinality": "ONE_OR_MORE",
        "AttributeName": "PublicKeyPolicyName",
        "AttributeType": "PolicyName"
    }
],
"PolicyTypeNames": "BackendServerAuthenticationPolicyType",
"Description": "Policy that controls authentication to back-end server(s) and contains one or more policies, such as an instance of a PublicKeyPolicyType. This policy can be associated only with back-end servers that are using HTTPS/SSL."
}

- For API details, see [DescribeLoadBalancerPolicyTypes](https://docs.aws.amazon.com/cli/latest/reference/elbv2/describe-load-balancer-policy-types.html) in *AWS CLI Command Reference*.

**describe-load-balancers**

The following code example shows how to use `describe-load-balancers`.

**AWS CLI**

**To describe a load balancer**

This example describes the specified load balancer.

**Command:**

```
aws elbv2 describe-load-balancers --load-balancer-arns
  arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

**Output:**

```
{
```
To describe all load balancers

This example describes all of your load balancers.

Command:

```
aws elbv2 describe-load-balancers
```

- For API details, see [DescribeLoadBalancers](#) in [AWS CLI Command Reference](#).
describe-rules

The following code example shows how to use describe-rules.

**AWS CLI**

**Example 1: To describe a rule**

The following describe-rules example displays details for the specified rule.

```
aws elbv2 describe-rules \
  --rule-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

**Example 2: To describe the rules for a listener**

The following describe-rules example displays details for the rules for the specified listener. The output includes the default rule and any other rules that you've added.

```
aws elbv2 describe-rules \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see [DescribeRules](#) in *AWS CLI Command Reference*.

describe-ssl-policies

The following code example shows how to use describe-ssl-policies.

**AWS CLI**

**Example 1: To list the policies used for SSL negotiation by load balancer type**

The following describe-ssl-policies example displays the names of the polices that you can use for SSL negotiation with an Application Load Balancer. The example uses the --query parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
  --load-balancer-type application \
  --query SslPolicies[*].Name
```

Output:
Example 2: To list the policies that support a specific protocol

The following describe-ssl-policies example displays the names of the policies that support the TLS 1.3 protocol. The example uses the --query parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
  --load-balancer-type application \
  --query SslPolicies[?contains(SslProtocols,'TLSv1.3')].Name
```

Output:

```
[  
  "ELBSecurityPolicy-TLS13-1-2-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",  
  "ELBSecurityPolicy-TLS13-1-3-2021-06",  
  "ELBSecurityPolicy-TLS-1-2-2017-01",  
  "ELBSecurityPolicy-TLS-1-1-2017-01",  
  "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",  
  "ELBSecurityPolicy-FS-2018-06",  
  "ELBSecurityPolicy-2015-05",  
  "ELBSecurityPolicy-TLS-1-0-2015-04",  
  "ELBSecurityPolicy-FS-1-1-2019-08",  
  "ELBSecurityPolicy-FS-1-2-2019-08",  
  "ELBSecurityPolicy-FS-1-2-Res-2020-10"
]
```
Example 3: To display the ciphers for a policy

The following describe-ssl-policies example displays the names of the ciphers for the specified policy. The example uses the --query parameter to display only the cipher names. The first cipher in the list has priority 1, and the remaining ciphers are in priority order.

```bash
aws elbv2 describe-ssl-policies \
   --names ELBSecurityPolicy-TLS13-1-2-2021-06 \
   --query SslPolicies[*].Ciphers[*].Name
```

Output:

```
["TLS_AES_128_GCM_SHA256",
 "TLS_AES_256_GCM_SHA384",
 "TLS_CHACHA20_POLY1305_SHA256",
 "ECDHE-ECDSA-AES128-GCM-SHA256",
 "ECDHE-RSA-AES128-GCM-SHA256",
 "ECDHE-ECDSA-AES128-SHA256",
 "ECDHE-RSA-AES128-SHA256",
 "ECDHE-ECDSA-AES256-GCM-SHA384",
 "ECDHE-RSA-AES256-GCM-SHA384",
 "ECDHE-ECDSA-AES256-SHA384",
 "ECDHE-RSA-AES256-SHA384"
 ]
```

For more information, see Security policies in the User Guide for Application Load Balancers.

- For API details, see DescribeSslPolicies in AWS CLI Command Reference.

**describe-tags**

The following code example shows how to use describe-tags.

**AWS CLI**

**To describe the tags assigned to a load balancer**

This example describes the tags assigned to the specified load balancer.

Command:
aws elb describe-tags --load-balancer-name my-load-balancer

Output:

```json
{
  "TagDescriptions": [
    {
      "Tags": [
        {
          "Value": "lima",
          "Key": "project"
        },
        {
          "Value": "digital-media",
          "Key": "department"
        }
      ],
      "LoadBalancerName": "my-load-balancer"
    }
  ]
}
```

- For API details, see [DescribeTags](https://docs.aws.amazon.com/cli/latest/reference/elb/describe-tags.html) in *AWS CLI Command Reference*.

**describe-target-group-attributes**

The following code example shows how to use `describe-target-group-attributes`.

**AWS CLI**

To describe target group attributes

The following `describe-target-group-attributes` example displays the attributes of the specified target group.

```bash
aws elbv2 describe-target-group-attributes \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

The output includes the attributes if the protocol is HTTP or HTTPS and the target type is `instance` or `ip`. 

Actions and scenarios
The following output includes the attributes if the protocol is HTTP or HTTPS and the target type is lambda.

```json
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "lambda.multi_value_headers.enabled"
        }
    ]
}
```

The following output includes the attributes if the protocol is TCP, TLS, UDP, or TCP_UDP.

```json
{
    "Attributes": [
        {
            "Value": "false",
            "Key": "stickiness.enabled"
        },
        {
            "Value": "300",
            "Key": "deregistration_delay.timeout_seconds"
        },
        {
            "Value": "lb_cookie",
            "Key": "stickiness.type"
        },
        {
            "Value": "86400",
            "Key": "stickiness.lb_cookie.duration_seconds"
        },
        {
            "Value": "0",
            "Key": "slow_start.duration_seconds"
        }
    ]
}
```

The following output includes the attributes if the protocol is HTTP or HTTPS and the target type is lambda.
For API details, see `DescribeTargetGroupAttributes` in *AWS CLI Command Reference*.

**describe-target-groups**

The following code example shows how to use `describe-target-groups`.

**AWS CLI**

**Example 1: To describe a target group**

The following `describe-target-groups` example displays details for the specified target group.

```bash
aws elbv2 describe-target-groups \
  --target-group-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
      "TargetGroupName": "my-targets",
      "Protocol": "HTTP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckEnabled": true,
```

Example 2: To describe all target groups for a load balancer

The following describe-target-groups example displays details for all target groups for the specified load balancer. The example uses the --query parameter to display only the target group names.

```bash
aws elbv2 describe-target-groups \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
  --query TargetGroups[*].TargetGroupName
```

Output:

```
["my-instance-targets", "my-ip-targets", "my-lambda-target"]
```

For more information, see Target groups in the Application Load Balancers Guide.

- For API details, see DescribeTargetGroups in AWS CLI Command Reference.
describe-target-health

The following code example shows how to use describe-target-health.

AWS CLI

**Example 1: To describe the health of the targets for a target group**

The following describe-target-health example displays health details for the targets of the specified target group. These targets are healthy.

```bash
aws elbv2 describe-target-health \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```json
{
   "TargetHealthDescriptions": [
      {
         "HealthCheckPort": "80",
         "Target": {
            "Id": "i-ceddcd4d",
            "Port": 80
         },
         "TargetHealth": {
            "State": "healthy"
         }
      },
      {
         "HealthCheckPort": "80",
         "Target": {
            "Id": "i-0f76fade",
            "Port": 80
         },
         "TargetHealth": {
            "State": "healthy"
         }
      }
   ]
}
```

**Example 2: To describe the health of a target**

Actions and scenarios
The following `describe-target-health` example displays health details for the specified target. This target is healthy.

```
aws elbv2 describe-target-health \
  --targets Id=i-0f76fade,Port=80 \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```json
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "healthy"
      }
    }
  ]
}
```

The following example output is for a target whose target group is not specified in an action for a listener. This target can't receive traffic from the load balancer.

```json
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "unused",
        "Reason": "Target.NotInUse",
        "Description": "Target group is not configured to receive traffic from the load balancer"
      }
    }
  ]
}
```
The following example output is for a target whose target group was just specified in an action for a listener. The target is still being registered.

```
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "initial",
        "Reason": "Elb.RegistrationInProgress",
        "Description": "Target registration is in progress"
      }
    }
  ]
}
```

The following example output is for an unhealthy target.

```
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "unhealthy",
        "Reason": "Target.Timeout",
        "Description": "Connection to target timed out"
      }
    }
  ]
}
```
The following example output is for a target that is a Lambda function and health checks are disabled.

```json
{
   "TargetHealthDescriptions": [
      {
        "Target": {
          "AvailabilityZone": "all",
        },
        "TargetHealth": {
          "State": "unavailable",
          "Reason": "Target.HealthCheckDisabled",
          "Description": "Health checks are not enabled for this target"
        }
      }
   ]
}
```

- For API details, see [DescribeTargetHealth](https://docs.aws.amazon.com/cli/latest/reference/elb/describetargethealth.html) in *AWS CLI Command Reference*.

### detach-load-balancer-from-subnets

The following code example shows how to use `detach-load-balancer-from-subnets`.

**AWS CLI**

**To detach load balancers from subnets**

This example detaches the specified load balancer from the specified subnet.

**Command:**

```bash
aws elb detach-load-balancer-from-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

**Output:**

```json
{
   "Subnets": [
      "subnet-15aaab61"
   ]
}
```
**disable-availability-zones-for-load-balancer**

The following code example shows how to use disable-availability-zones-for-load-balancer.

**AWS CLI**

**To disable Availability Zones for a load balancer**

This example removes the specified Availability Zone from the set of Availability Zones for the specified load balancer.

Command:

```bash
aws elb disable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2a
```

Output:

```json
{
   "AvailabilityZones": [
      "us-west-2b"
   ]
}
```

For API details, see [DisableAvailabilityZonesForLoadBalancer](#) in AWS CLI Command Reference.

**enable-availability-zones-for-load-balancer**

The following code example shows how to use enable-availability-zones-for-load-balancer.

**AWS CLI**

**To enable Availability Zones for a load balancer**

This example adds the specified Availability Zone to the specified load balancer.
Command:

```bash
aws elb enable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2b
```

Output:

```json
{
   "AvailabilityZones": [
      "us-west-2a",
      "us-west-2b"
   ]
}
```

- For API details, see [EnableAvailabilityZonesForLoadBalancer](https://docs.aws.amazon.com/cli/latest/reference/elb/enable-availability-zones-for-load-balancer.html) in [AWS CLI Command Reference](https).

**modify-listener**

The following code example shows how to use `modify-listener`.

**AWS CLI**

**Example 1: To change the default action to a forward action**

The following `modify-listener` example changes the default action (to a `forward` action) for the specified listener.

```bash
aws elbv2 modify-listener \
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
   --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```json
{
   "Listeners": [
      {
         "Protocol": "HTTP",
         "DefaultActions": [
            {
```
Example 2: To change the default action to a redirect action

The following modify-listener example changes the default action to a redirect action for the specified listener.

```
aws elbv2 modify-listener \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \ 
  --default-actions Type=redirect,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```
{
  "Listeners": [
    {
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "Type": "redirect"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "Port": 80,
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
    }
  ]
}
```
Example 3: To change the server certificate

This example changes the server certificate for the specified HTTPS listener.

```bash
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65 \
```

Output:

```json
{
    "Listeners": [
        {
            "Protocol": "HTTPS",
            "DefaultActions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ],
            "SslPolicy": "ELBSecurityPolicy-2015-05",
            "Certificates": [
                {
                    "CertificateArn": "arn:aws:iam::123456789012:server-certificate/my-new-server-cert"
                }
            ],
            "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
            "Port": 443,
            "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65"
        }
    ]
}
```
modify-load-balancer-attributes

The following code example shows how to use modify-load-balancer-attributes.

**AWS CLI**

霖 modify the attributes of a load balancer

This example modifies the CrossZoneLoadBalancing attribute of the specified load balancer.

Command:

```bash
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer --load-balancer-attributes "{"CrossZoneLoadBalancing":{"Enabled":true}}"
```

Output:

```json
{
   "LoadBalancerAttributes": {
      "CrossZoneLoadBalancing": {
         "Enabled": true
      }
   },
   "LoadBalancerName": "my-load-balancer"
}
```

This example modifies the ConnectionDraining attribute of the specified load balancer.

Command:

```bash
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer --load-balancer-attributes "{"ConnectionDraining":{"Enabled":true,"Timeout":300}}"
```

Output:

```json
{
   "LoadBalancerAttributes": {
      "ConnectionDraining": {
         "Enabled": true,
         "Timeout": 300
      }
   }
}
```

modify-rule

The following code example shows how to use modify-rule.

AWS CLI

To modify a rule

The following modify-rule example updates the actions and conditions for the specified rule.

```
aws elbv2 modify-rule 
  --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 
  --conditions Field=path-pattern,Values='/images/*' 
  --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Output:

```
{
  "Rules": [
    {
      "Priority": "10",
      "Conditions": [
        {
          "Field": "path-pattern",
          "Values": [
            "/images/*"
          ]
        }
      ],
      "RuleArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee",
    }
  ]
}
```
modify-target-group-attributes

The following code example shows how to use modify-target-group-attributes.

AWS CLI

To modify the deregistration delay timeout

This example sets the deregistration delay timeout to the specified value for the specified target group.

Command:

```
aws elbv2 modify-target-group-attributes --target-group-arn
  arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 --attributes
    Key=deregistration_delay.timeout_seconds,Value=600
```

Output:

```
{
   "Attributes": [
      {
         "Value": "false",
         "Key": "stickiness.enabled"
      },
      {
         "Value": "600",
```
For API details, see [ModifyTargetGroupAttributes](https://docs.aws.amazon.com/cli/latest/reference/elasticloadbalancing/v2/modify-target-group.html) in *AWS CLI Command Reference*.  

### modify-target-group

The following code example shows how to use modify-target-group.

**AWS CLI**

**To modify the health check configuration for a target group**

The following modify-target-group example changes the configuration of the health checks used to evaluate the health of the targets for the specified target group. Note that due to the way the CLI parses commas, you must surround the range for the `--matcher` option with single quotes instead of double quotes.

```bash
aws elbv2 modify-target-group \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f \
   --health-check-protocol HTTPS \
   --health-check-port 443 \
   --matcher HttpCode='200,299'
```

**Output:**

```
{
   "TargetGroups": [
   {
```
"TargetGroupName": "my-https-targets",
"Protocol": "HTTPS",
"Port": 443,
"VpcId": "vpc-3ac0fb5f",
"HealthCheckProtocol": "HTTPS",
"HealthCheckPort": "443",
"HealthCheckEnabled": true,
"HealthCheckIntervalSeconds": 30,
"HealthCheckTimeoutSeconds": 5,
"HealthyThresholdCount": 5,
"UnhealthyThresholdCount": 2,
"Matcher": {
    "HttpCode": "200,299"
},
"LoadBalancerArns": [
    "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
],
"TargetType": "instance",
"ProtocolVersion": "HTTP1",
"IpAddressType": "ipv4"
]

For more information, see Target groups in the Application Load Balancers Guide.

- For API details, see ModifyTargetGroup in AWS CLI Command Reference.

register-instances-with-load-balancer

The following code example shows how to use register-instances-with-load-balancer.

AWS CLI

To register instances with a load balancer

This example registers the specified instance with the specified load balancer.

Command:

```sh
aws elb register-instances-with-load-balancer --load-balancer-name my-load-balancer --instances i-d6f6f3ae3
```
Output:

```json
{
    "Instances": [
        {
            "InstanceId": "i-d6f6fae3"
        },
        {
            "InstanceId": "i-207d9717"
        },
        {
            "InstanceId": "i-afefb49b"
        }
    ]
}
```

- For API details, see [RegisterInstancesWithLoadBalancer](https://docs.aws.amazon.com/cli/latest/reference/elbv2/register-instances-with-load-balancer.html) in *AWS CLI Command Reference*.

### register-targets

The following code example shows how to use `register-targets`.

**AWS CLI**

**Example 1: To register targets with a target group by instance ID**

The following `register-targets` example registers the specified instances with a target group. The target group must have a target type of `instance`.

```bash
aws elbv2 register-targets \
    --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \ 
    --targets Id=i-1234567890abcdef0 Id=i-0abcdef1234567890
```

**Example 2: To register targets with a target group using port overrides**

The following `register-targets` example registers the specified instance with a target group using multiple ports. This enables you to register containers on the same instance as targets in the target group.

```bash
aws elbv2 register-targets \
```

**Actions and scenarios**
Example 3: To register targets with a target group by IP address

The following register-targets example registers the specified IP addresses with a target group. The target group must have a target type of `ip`.

```
aws elbv2 register-targets
  --targets Id=10.0.1.15 Id=10.0.1.23
```

Example 4: To register a Lambda function as a target

The following register-targets example registers the specified IP addresses with a target group. The target group must have a target type of `lambda`. You must grant Elastic Load Balancing permission to invoke the Lambda function.

```
aws elbv2 register-targets
  --targets Id=arn:aws:lambda:us-west-2:123456789012:function:my-function
```

- For API details, see [RegisterTargets](aws_cli_command_reference) in *AWS CLI Command Reference*.

### remove-listener-certificates

The following code example shows how to use `remove-listener-certificates`.

**AWS CLI**

**To remove a certificate from a secure listener**

This example removes the specified certificate from the specified secure listener.

**Command:**

```
```
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705

- For API details, see `RemoveListenerCertificates` in *AWS CLI Command Reference*.

**remove-tags**

The following code example shows how to use `remove-tags`.

**AWS CLI**

**To remove tags from a load balancer**

This example removes a tag from the specified load balancer.

Command:

```bash
aws elb remove-tags --load-balancer-name my-load-balancer --tags project
```

- For API details, see `RemoveTags` in *AWS CLI Command Reference*.

**set-ip-address-type**

The following code example shows how to use `set-ip-address-type`.

**AWS CLI**

**To set the address type of a load balancer**

This example sets the address type of the specified load balancer to `dualstack`. The load balancer subnets must have associated IPv6 CIDR blocks.

Command:

```bash
aws elbv2 set-ip-address-type --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --ip-address-type dualstack
```

Output:
For API details, see `SetIpAddressType` in *AWS CLI Command Reference*.

**set-load-balancer-listener-ssl-certificate**

The following code example shows how to use `set-load-balancer-listener-ssl-certificate`.

**AWS CLI**

To update the SSL certificate for an HTTPS load balancer

This example replaces the existing SSL certificate for the specified HTTPS load balancer.

Command:

```
```

For API details, see `SetLoadBalancerListenerSslCertificate` in *AWS CLI Command Reference*.

**set-load-balancer-policies-for-backend-server**

The following code example shows how to use `set-load-balancer-policies-for-backend-server`.

**AWS CLI**

To replace the policies associated with a port for a backend instance

This example replaces the policies that are currently associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names my-ProxyProtocol-policy
```
To remove all policies that are currently associated with a port on your backend instance

This example removes all policies associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names []
```

To confirm that the policies are removed, use the `describe-load-balancer-policies` command.

- For API details, see `SetLoadBalancerPoliciesForBackendServer` in AWS CLI Command Reference.

set-load-balancer-policies-of-listener

The following code example shows how to use `set-load-balancer-policies-of-listener`.

AWS CLI

To replace the policies associated with a listener

This example replaces the policies that are currently associated with the specified listener.

Command:

```
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer --load-balancer-port 443 --policy-names my-SSLNegotiation-policy
```

To remove all policies associated with your listener

This example removes all policies that are currently associated with the specified listener.

Command:

```
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer --load-balancer-port 443 --policy-names []
```

To confirm that the policies are removed from the load balancer, use the `describe-load-balancer-policies` command.
set-rule-priorities

The following code example shows how to use set-rule-priorities.

AWS CLI

To set the rule priority

This example sets the priority of the specified rule.

Command:

```
aws elbv2 set-rule-priorities --rule-priorities
  RuleArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-
  load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3,Priority=5
```

Output:

```json
{
  "Rules": [
    {
      "Priority": "5",
      "Conditions": [
        {
          "Field": "path-pattern",
          "Values": [
            "/img/**"
          ]
        }
      ],
      "RuleArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-
  rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3",
      "IsDefault": false,
      "Actions": [
        {
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
          "Type": "forward"
        }
      ]
    }
  ]
}
```
set-security-groups

The following code example shows how to use set-security-groups.

AWS CLI

To associate a security group with a load balancer

This example associates the specified security group with the specified load balancer.

Command:

```bash
aws elbv2 set-security-groups --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --security-groups sg-5943793c
```

Output:

```json
{
   "SecurityGroupIds": [
      "sg-5943793c"
   ]
}
```

set-subnets

The following code example shows how to use set-subnets.

AWS CLI

To enable Availability Zones for a load balancer

This example enables the Availability Zone for the specified subnet for the specified load balancer.
Command:

```
aws elbv2 set-subnets --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --subnets subnet-8360a9e7 subnet-b7d581c0
```

Output:

```
{
    "AvailabilityZones": [
        {
            "SubnetId": "subnet-8360a9e7",
            "ZoneName": "us-west-2a"
        },
        {
            "SubnetId": "subnet-b7d581c0",
            "ZoneName": "us-west-2b"
        }
    ]
}
```

- For API details, see [SetSubnets](#) in [AWS CLI Command Reference](#).

### Elastic Transcoder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Transcoder.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)
Actions

cancel-job

The following code example shows how to use cancel-job.

AWS CLI

To cancel a job for ElasticTranscoder

This cancels the specified job for ElasticTranscoder.

Command:

aws elastictranscoder cancel-job --id 3333333333333-abcde3

- For API details, see CancelJob in AWS CLI Command Reference.

create-job

The following code example shows how to use create-job.

AWS CLI

To create a job for ElasticTranscoder

The following create-job example creates a job for ElasticTranscoder.

```
aws elastictranscoder create-job \
   --pipeline-id 1111111111111-abcde1 \
   --inputs file://inputs.json \
   --outputs file://outputs.json \
   --output-key-prefix "recipes/" \
   --user-metadata file://user-metadata.json
```

Contents of inputs.json:

```json
[{
    "Key":"ETS_example_file.mp4",
    "FrameRate":"auto",
}]
```
Contents of outputs.json:

```
[
  {
    "Key": "webm/ETS_example_file-kindlefirehd.webm",
    "Rotate": "0",
    "PresetId": "1351620000001-100250"
  }
]
```

Contents of user-metadata.json:

```
{
  "Food type": "Italian",
  "Cook book": "recipe notebook"
}
```

Output:

```
{
  "Job": {
    "Status": "Submitted",
    "Inputs": [
      {
        "Container": "mp4",
        "FrameRate": "auto",
        "Key": "ETS_example_file.mp4",
        "AspectRatio": "auto",
        "Resolution": "auto",
        "Interlaced": "auto"
      }
    ],
    "Playlists": [],
    "Outputs": [
      {
        "Status": "Submitted",
        "Container": "mp4",
        "FrameRate": "auto",
        "Key": "ETS_example_file.mp4",
        "AspectRatio": "auto",
        "Resolution": "auto",
        "Interlaced": "auto"
      }
    ]
  }
}
```
"Rotate": "0",
"PresetId": "1351620000001-100250",

"Id": "1533838012294-example",
"Arn": "arn:aws:elastictranscoder:us-west-2:123456789012:job/1533838012294-example"
}

- For API details, see [CreateJob](https://docs.aws.amazon.com/cli/latest/reference/elastictranscoder/create-job.html) in *AWS CLI Command Reference*.

### create-pipeline

The following code example shows how to use `create-pipeline`.
To create a pipeline for ElasticTranscoder

The following create-pipeline example creates a pipeline for ElasticTranscoder.

```bash
aws elastictranscoder create-pipeline \
  --name Default \
  --input-bucket salesoffice.example.com-source \
  --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \
  --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-east-1:111222333444:ETS_Errors \
  --content-config file://content-config.json \
  --thumbnail-config file://thumbnail-config.json
```

Contents of `content-config.json`:

```json
{
    "Bucket": "salesoffice.example.com-public-promos",
    "Permissions": [
        {
            "GranteeType": "Email",
            "Grantee": "marketing-promos@example.com",
            "Access": ["FullControl"]
        }
    ],
    "StorageClass": "Standard"
}
```

Contents of `thumbnail-config.json`:

```json
{
    "Bucket": "salesoffice.example.com-public-promos-thumbnails",
    "Permissions": [
        {
            "GranteeType": "Email",
            "Grantee": "marketing-promos@example.com",
            "Access": ["FullControl"]
        }
    ]
}
```
Output:

```json
{
  "Pipeline": {
    "Status": "Active",
    "ContentConfig": {
      "Bucket": "salesoffice.example.com-public-promos",
      "StorageClass": "Standard",
      "Permissions": [
        {
          "Access": ["FullControl"],
          "Grantee": "marketing-promos@example.com",
          "GranteeType": "Email"
        }
      ],
      "Name": "Default",
      "ThumbnailConfig": {
        "Bucket": "salesoffice.example.com-public-promos-thumbnails",
        "StorageClass": "ReducedRedundancy",
        "Permissions": [
          {
            "Access": ["FullControl"],
            "Grantee": "marketing-promos@example.com",
            "GranteeType": "Email"
          }
        ],
        "Notifications": {
          "Completed": "",
          "Warning": "",
          "Progressing": "",
          "Error": "arn:aws:sns:us-east-1:123456789012:ETS_Errors"
        }
      }
    }
  }
}```
For API details, see [CreatePipeline](#) in *AWS CLI Command Reference*.

### create-preset

The following code example shows how to use `create-preset`.

**AWS CLI**

**To create a preset for ElasticTranscoder**

The following `create-preset` example creates a preset for ElasticTranscoder.

```
aws elastictranscoder create-preset \
    --name DefaultPreset \
    --description "Use for published videos" \
    --container mp4 \
    --video file://video.json \
    --audio file://audio.json \
    --thumbnails file://thumbnails.json
```

**Contents of video.json:**

```json
{
    "Codec":"H.264",
```
"CodecOptions": {
    "Profile": "main",
    "Level": "2.2",
    "MaxReferenceFrames": "3",
    "MaxBitRate": "",
    "BufferSize": "",
    "InterlacedMode": "Progressive",
    "ColorSpaceConversionMode": "None"
},
"KeyframesMaxDist": "240",
"FixedGOP": "false",
"BitRate": "1600",
"FrameRate": "auto",
"MaxFrameRate": "30",
"MaxWidth": "auto",
"MaxHeight": "auto",
"SizingPolicy": "Fit",
"PaddingPolicy": "Pad",
"DisplayAspectRatio": "auto",
"Watermarks": [
    {
        "Id": "company logo",
        "MaxWidth": "20%",
        "MaxHeight": "20%",
        "SizingPolicy": "ShrinkToFit",
        "HorizontalAlignment": "Right",
        "HorizontalOffset": "10px",
        "VerticalAlign": "Bottom",
        "VerticalOffset": "10px",
        "Opacity": "55.5",
        "Target": "Content"
    }
]
}

Contents of audio.json:

{
    "Codec": "AAC",
    "CodecOptions": {
        "Profile": "AAC-LC"
    },
    "SampleRate": "44100",
}
"BitRate": "96",
"Channels": "2"
}

Contents of thumbnails.json:
{
    "Format": "png",
    "Interval": "120",
    "MaxWidth": "auto",
    "MaxHeight": "auto",
    "SizingPolicy": "Fit",
    "PaddingPolicy": "Pad"
}

Output:
{
    "Preset": {
        "Thumbnails": {
            "SizingPolicy": "Fit",
            "MaxWidth": "auto",
            "Format": "png",
            "PaddingPolicy": "Pad",
            "Interval": "120",
            "MaxHeight": "auto"
        },
        "Container": "mp4",
        "Description": "Use for published videos",
        "Video": {
            "SizingPolicy": "Fit",
            "MaxWidth": "auto",
            "PaddingPolicy": "Pad",
            "MaxFrameRate": "30",
            "FrameRate": "auto",
            "MaxHeight": "auto",
            "KeyframesMaxDist": "240",
            "FixedGOP": "false",
            "Codec": "H.264",
            "Watermarks": [
                {
                    "SizingPolicy": "ShrinkToFit",
                    "VerticalOffset": "10px",
                }
            ]
        }
    }
}
For API details, see [CreatePreset](#) in [AWS CLI Command Reference](#).
**delete-pipeline**

The following code example shows how to use delete-pipeline.

**AWS CLI**

To delete the specified ElasticTranscoder pipeline

This deletes the specified ElasticTranscoder pipeline.

Command:

```bash
aws elastictranscoder delete-pipeline --id 1111111111111-abcde1
```

Output:

```json
{
   "Success":"true"
}
```

- For API details, see [DeletePipeline](#) in *AWS CLI Command Reference*.

**delete-preset**

The following code example shows how to use delete-preset.

**AWS CLI**

To delete the specified ElasticTranscoder preset

This deletes the specified ElasticTranscoder preset.

Command:

```bash
aws elastictranscoder delete-preset --id 5555555555555-abcde5
```

- For API details, see [DeletePreset](#) in *AWS CLI Command Reference*.

**list-jobs-by-pipeline**

The following code example shows how to use list-jobs-by-pipeline.
AWS CLI

To retrieve a list of ElasticTranscoder jobs in the specified pipeline

This example retrieves a list of ElasticTranscoder jobs in the specified pipeline.

Command:

```
aws elastictranscoder list-jobs-by-pipeline --pipeline-id 1111111111111-abcde1
```

Output:

```
{
   "Jobs": []
}
```

• For API details, see ListJobsByPipeline in AWS CLI Command Reference.

list-jobs-by-status

The following code example shows how to use list-jobs-by-status.

AWS CLI

To retrieve a list of ElasticTranscoder jobs with a status of Complete

This example retrieves a list of ElasticTranscoder jobs with a status of Complete.

Command:

```
aws elastictranscoder list-jobs-by-status --status Complete
```

Output:

```
{
   "Jobs": []
}
```

• For API details, see ListJobsByStatus in AWS CLI Command Reference.
list-pipelines

The following code example shows how to use list-pipelines.

**AWS CLI**

To retrieve a list of ElasticTranscoder pipelines

This example retrieves a list of ElasticTranscoder pipelines.

Command:

```bash
aws elastictranscoder list-pipelines
```

Output:

```json
{
   "Pipelines": [
      {
         "Status": "Active",
         "ContentConfig": {
            "Bucket": "ets-example",
            "Permissions": []
         },
         "Name": "example-pipeline",
         "ThumbnailConfig": {
            "Bucket": "ets-example",
            "Permissions": []

For API details, see ListPipelines in AWS CLI Command Reference.

**list-presets**

The following code example shows how to use list-presets.

**AWS CLI**

**To retrieve a list of ElasticTranscoder presets**

This example retrieves a list of ElasticTranscoder presets.

Command:

```
aws elastictranscoder list-presets --max-items 2
```

Output:

```
{
    "Presets": [
        {
            "Container": "mp4",
            "Name": "KindleFireHD-preset",
            "Video": {
                "Resolution": "1280x720",
                "FrameRate": "30",

    }
  }
}
For API details, see ListPresets in AWS CLI Command Reference.

read-job

The following code example shows how to use read-job.

AWS CLI

To retrieve an ElasticTranscoder job

This example retrieves the specified ElasticTranscoder job.

Command:

```
aws elastictranscoder read-job --id 1533838012294-example
```

Output:

```
{
```
"Job": {
    "Status": "Progressing",
    "Inputs": [
        {
            "Container": "mp4",

  }
]
**read-preset**

The following code example shows how to use `read-preset`.

**AWS CLI**

**To retrieve an ElasticTranscoder preset**

This example retrieves the specified ElasticTranscoder preset.

Command:

```bash
aws elastictranscoder read-preset --id 1351620000001-500020
```

Output:

```json
{
  "Preset": {
    "Thumbnails": {

### update-pipeline-notifications

The following code example shows how to use `update-pipeline-notifications`.

**AWS CLI**

**To update the notifications of an ElasticTranscoder pipeline**

This example updates the notifications of the specified ElasticTranscoder pipeline.

**Command:**

```bash
code example
aws elastictranscoder update-pipeline-notifications --id 111111111111-abcde1
--notifications Progressing=arn:aws:sns:us-west-2:0123456789012:my-topic,
Completed=arn:aws:sns:us-west-2:0123456789012:my-topic,
Warning=arn:aws:sns:us-west-2:0123456789012:my-topic,
Error=arn:aws:sns:us-east-1:111222333444:ETS Errors
```

**Output:**

```bash
code example
{
}
```
"Pipeline": {
    "Status": "Active",
    "ContentConfig": {
        "Bucket": "ets-example",
        "StorageClass": "Standard",
        "Permissions": [
            {
                "Access": [
                    "FullControl"
                ],
                "Grantee": "marketing-promos@example.com",
                "GranteeType": "Email"
            }
        ]
    },
    "Name": "Default",
    "ThumbnailConfig": {
        "Bucket": "ets-example",
        "StorageClass": "ReducedRedundancy",
        "Permissions": [
            {
                "Access": [
                    "FullControl"
                ],
                "Grantee": "marketing-promos@example.com",
                "GranteeType": "Email"
            }
        ]
    },
    "Notifications": {
        "Error": "arn:aws:sns:us-east-1:111222333444:ETS_Errors"
    },
    "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
    "InputBucket": "ets-example",
    "Id": "1111111111111-abcd1",
    "Arn": "arn:aws:elastictranscoder:us-west-2:123456789012:pipeline/1111111111111-abcd1"
}

- For API details, see [UpdatePipelineNotifications](#) in *AWS CLI Command Reference*.
update-pipeline-status

The following code example shows how to use update-pipeline-status.

AWS CLI

To update the status of an ElasticTranscoder pipeline

This example updates the status of the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder update-pipeline-status --id 1111111111111-abcde1 --status Paused
```

Output:

```
{
   "Pipeline": {
      "Status": "Paused",
      "ContentConfig": {
         "Bucket": "ets-example",
         "StorageClass": "Standard",
         "Permissions": [
            {
               "Access": ["FullControl"],
               "Grantee": "marketing-promos@example.com",
               "GranteeType": "Email"
            }
         ]
      },
      "Name": "Default",
      "ThumbnailConfig": {
         "Bucket": "ets-example",
         "StorageClass": "ReducedRedundancy",
         "Permissions": [
            {
               "Access": ["FullControl"],
               "Grantee": "marketing-promos@example.com",
               "GranteeType": "Email"
            }
         ]
      }
   }
}
```
For API details, see UpdatePipelineStatus in AWS CLI Command Reference.

**update-pipeline**

The following code example shows how to use update-pipeline.

**AWS CLI**

To update an ElasticTranscoder pipeline

The following update-pipeline example updates the specified ElasticTranscoder pipeline.

```bash
aws elastictranscoder update-pipeline \
  --id 1111111111111-abcde1 \
  --name DefaultExample \ 
  --input-bucket salesoffice.example.com-source \ 
  --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \ 
  --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-east-1:111222333444:ETS_Errors \
  --content-config file://content-config.json \ 
  --thumbnail-config file://thumbnail-config.json
```

Contents of content-config.json:

```json
{
```
Contents of thumbnail-config.json:

```
{
  "Bucket":"salesoffice.example.com-public-promos-thumbnails",
  "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",
      "Access":[
        "FullControl"
      ]
    }
  ],
  "StorageClass":"ReducedRedundancy"
}
```

Output:

```
{
  "Pipeline": {
    "Status": "Active",
    "ContentConfig": {
      "Bucket": "ets-example",
      "StorageClass": "Standard",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ],
          "Grantee": "marketing-promos@example.com",
```
"GranteeType": "Email"
}
],
"Name": "DefaultExample",
"ThumbnailConfig": {
  "Bucket": "ets-example",
  "StorageClass": "ReducedRedundancy",
  "Permissions": [
    {
      "Access": [
        "FullControl"
      ],
      "Grantee": "marketing-promos@example.com",
      "GranteeType": "Email"
    }
  ]
},
"Notifications": {
  "Completed": "",
  "Warning": "",
  "Progressing": "",
  "Error": "arn:aws:sns:us-east-1:111222333444:ETS_Errors"

},
"Warnings": [
  {
    "Message": "The SNS notification topic for Error events and the pipeline are in different regions, which increases processing time for jobs in the pipeline and can incur additional charges. To decrease processing time and prevent cross-regional charges, use the same region for the SNS notification topic and the pipeline.",
    "Code": "6006"
  }
]}

- For API details, see [UpdatePipeline](https://docs.aws.amazon.com/elastictranscoder/latest/APIReference/API_UpdatePipeline.html) in *AWS CLI Command Reference*. 
ElastiCache examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with ElastiCache.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

**Actions**

*add-tags-to-resource*

The following code example shows how to use *add-tags-to-resource*.

**AWS CLI**

To add tags to a resource

The following *add-tags-to-resource* example adds up to 10 tags, key-value pairs, to a cluster or snapshot resource.

```bash
aws elasticache add-tags-to-resource 
    --resource-name "arn:aws:elasticache:us-east-1:1234567890:cluster:my-mem-cluster" 
    --tags '{"20150202":15, "ElastiCache":"Service"}"
```

Output:

```
{
    "TagList": [
```
authorize-cache-security-group-ingress

The following code example shows how to use authorize-cache-security-group-ingress.

AWS CLI

To authorize cache security group for ingress

The following authorize-cache-security-group-ingress example allows network ingress to a cache security group.

```bash
aws elasticache authorize-cache-security-group-ingress \
  --cache-security-group-name "my-sec-grp" \
  --ec2-security-group-name "my-ec2-sec-grp" \
  --ec2-security-group-owner-id "1234567890"
```

The command produces no output.

For more information, see Self-Service Updates in Amazon ElastiCache in the Elasticache User Guide.

- For API details, see AuthorizeCacheSecurityGroupIngress in AWS CLI Command Reference.

batch-apply-update-action

The following code example shows how to use batch-apply-update-action.
AWS CLI

To apply a service update

The following batch-apply-update-action example applies a service update to a Redis cluster.

```bash
aws elasticache batch-apply-update-action \
    --service-update-name elc-xxxxx406-xxx \
    --replication-group-ids test-cluster
```

Output:

```
{
    "ProcessedUpdateActions": [
        {
            "ReplicationGroupId": "pat-cluster",
            "ServiceUpdateName": "elc-xxxxx406-xxx",
            "UpdateActionStatus": "waiting-to-start"
        }
    ],
    "UnprocessedUpdateActions": []
}
```

For more information, see [Self-Service Updates in Amazon ElastiCache](https://docs.aws.amazon.com/elasticache/latest/mgmt/ebs-update.html) in the Elasticache User Guide.

batch-stop-update-action

The following code example shows how to use batch-stop-update-action.

AWS CLI

To stop a service update

The following batch-stop-update-action example applies a service update to a Redis cluster.

```bash
aws elasticache batch-stop-update-action \
    --service-update-name elc-xxxxx406-xxx
```
--replication-group-ids test-cluster

Output:

```
{
  "ProcessedUpdateActions": [
    {
      "ReplicationGroupId": "pat-cluster",
      "ServiceUpdateName": "elc-xxxxx406-xxx",
      "UpdateActionStatus": "stopping"
    }
  ],
  "UnprocessedUpdateActions": []
}
```

For more information, see [Self-Service Updates in Amazon ElastiCache](https://docs.aws.amazon.com/elasticache/latest/userguide/elasticache-self-service.html) in the [Elasticache User Guide](https://docs.aws.amazon.com/elasticache/latest/mdb/user-guide/)

**copy-snapshot**

The following code example shows how to use `copy-snapshot`.

**AWS CLI**

To copy a snapshot

The following `copy-snapshot` example makes a copy of an existing snapshot.

```
aws elasticache copy-snapshot \
  --source-snapshot-name "my-snapshot" \
  --target-snapshot-name "my-snapshot-copy"
```

Output:

```
{
  "Snapshot":{
    "Engine": "redis",
    "CacheParameterGroupName": "default.redis3.2",
    "VpcId": "vpc-3820329f3",
    "CacheClusterId": "my-redis4",
  }
}
```
For more information, see Exporting a Backup in the Elasticache User Guide.

- For API details, see CopySnapshot in AWS CLI Command Reference.

create-cache-cluster

The following code example shows how to use create-cache-cluster.

**AWS CLI**

To create a cache cluster

The following create-cache-cluster example creates a cache cluster using the Redis engine.

```bash
aws elasticache create-cache-cluster \
  --cache-cluster-id "cluster-test" \n  --engine redis \
```
--cache-node-type cache.m5.large \
--num-cache-nodes 1

Output:

```
{
   "CacheCluster": {
      "CacheClusterId": "cluster-test",
      "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
      "CacheNodeType": "cache.m5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "CacheClusterStatus": "creating",
      "NumCacheNodes": 1,
      "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
      "PendingModifiedValues": {},
      "CacheSecurityGroups": [],
      "CacheParameterGroup": {
         "CacheParameterGroupName": "default.redis5.0",
         "ParameterApplyStatus": "in-sync",
         "CacheNodeIdsToReboot": []
      },
      "CacheSubnetGroupName": "default",
      "AutoMinorVersionUpgrade": true,
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "06:30-07:30",
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```

For more information, see Creating a Cluster in the Elasticache User Guide.

- For API details, see CreateCacheCluster in AWS CLI Command Reference.

create-cache-parameter-group

The following code example shows how to use create-cache-parameter-group.

AWS CLI

To create a cache parameter group
The following `create-cache-parameter-group` example creates a new Amazon ElastiCache cache parameter group.

```bash
aws elasticache create-cache-parameter-group \
    --cache-parameter-group-family "redis5.0" \
    --cache-parameter-group-name "mygroup" \
    --description "mygroup"
```

Output:

```json
{
    "CacheParameterGroup": {
        "CacheParameterGroupName": "mygroup",
        "CacheParameterGroupFamily": "redis5.0",
        "Description": "my group"
    }
}
```

For more information, see [Creating a Parameter Group](https://docs.aws.amazon.com/elasticache/latest/userguide/parameter-groups.create.html) in the Elasticache User Guide.

• For API details, see [CreateCacheParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-cache-parameter-group.html) in AWS CLI Command Reference.

create-cache-subnet-group

The following code example shows how to use `create-cache-subnet-group`.

AWS CLI

To create a cache subnet group

The following `create-cache-subnet-group` example creates a new cache subnet group.

```bash
aws elasticache create-cache-subnet-group \
    --cache-subnet-group-name "mygroup" \
    --cache-subnet-group-description "my subnet group" \
    --subnet-ids "subnet-xxxxec4f"
```

Output:

```json
{
    "CacheSubnetGroup": {
        "CacheSubnetGroupName": "mygroup",
        "CacheSubnetGroupDescription": "my subnet group"
    }
}
```
"CacheSubnetGroupDescription": "my subnet group",
"VpcId": "vpc-a3e97cdb",
"Subnets": [
  {
    "SubnetIdentifier": "subnet-xxxxec4f",
    "SubnetAvailabilityZone": {
      "Name": "us-west-2d"
    }
  }
]
}

For more information, see Creating a Cache Subnet Group in the Elasticache User Guide.

- For API details, see CreateCacheSubnetGroup in AWS CLI Command Reference.

### create-global-replication-group

The following code example shows how to use create-global-replication-group.

**AWS CLI**

**To create a global replication group**

The following create-global-replication-group example creates a new global replication group.

```bash
aws elasticache create-global-replication-group \
  --global-replication-group-id-suffix my-global-replication-group \
  --primary-replication-group-id my-primary-cluster
```

**Output:**

```json
{
  "GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "sguai-my-global-replication-group",
    "GlobalReplicationGroupDescription": "",
    "Status": "creating",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "Members": [
```
For more information, see Replication Across AWS Regions Using Global Datastore in the Elasticache User Guide.

- For API details, see CreateGlobalReplicationGroup in AWS CLI Command Reference.

create-replication-group

The following code example shows how to use create-replication-group.

AWS CLI

To create a replication group

The following create-replication-group example creates a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group. This operation is valid for Redis only.

```
aws elasticache create-replication-group \
  --replication-group-id "mygroup" \
  --replication-group-description "my group" \
  --engine "redis" \
  --cache-node-type "cache.m5.large"
```
Output:

```json
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mygroup",
        "Description": "my group",
        "Status": "creating",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "mygroup-001"
        ],
        "AutomaticFailover": "disabled",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "06:00-07:00",
        "ClusterEnabled": false,
        "CacheNodeType": "cache.m5.large",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see [Creating a Redis Replication Group](https://docs.aws.amazon.com/elasticache/latest/userguide/creating-replication-group.html) in the Elasticache User Guide.

- For API details, see [CreateReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-replication-group.html) in AWS CLI Command Reference.

**create-snapshot**

The following code example shows how to use create-snapshot.

**AWS CLI**

To create a snapshot

The following create-snapshot example creates a snapshot using the Redis engine.

```
aws elasticache create-snapshot \
    --snapshot-name mysnapshot \
    --cache-cluster-id cluster-test
```

Output:

```json
{
}
```
"Snapshot": {
  "SnapshotName": "mysnapshot",
  "CacheClusterId": "cluster-test",
  "SnapshotStatus": "creating",
  "SnapshotSource": "manual",
  "CacheNodeType": "cache.m5.large",
  "Engine": "redis",
  "EngineVersion": "5.0.5",
  "NumCacheNodes": 1,
  "PreferredAvailabilityZone": "us-west-2b",
  "CacheClusterCreateTime": "2020-03-19T03:12:01.483Z",
  "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
  "Port": 6379,
  "CacheParameterGroupName": "default.redis5.0",
  "CacheSubnetGroupName": "default",
  "VpcId": "vpc-a3e97cdb",
  "AutoMinorVersionUpgrade": true,
  "SnapshotRetentionLimit": 0,
  "SnapshotWindow": "06:30-07:30",
  "NodeSnapshots": [
    {
      "CacheNodeId": "0001",
      "CacheSize": "",
      "CacheNodeCreateTime": "2020-03-19T03:12:01.483Z"
    }
  ]
}

For more information, see [Backup and Restore for ElastiCache for Redis](https://docs.aws.amazon.com/elasticache/latest/userguide/backup-restore.html) in the *Elasticache User Guide*.

- For API details, see [CreateSnapshot](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-snapshot.html) in *AWS CLI Command Reference*.

**create-user-group**

The following code example shows how to use `create-user-group`.

**AWS CLI**

**To create a user group**

The following `create-user-group` example creates a new user group.
AWS Command Line Interface

User Guide for Version 2

aws elasticache create-user-group
   --user-group-id myusergroup \
   --engine redis \
   --user-ids default

Output:

{
   "UserGroupId": "myusergroup",
   "Status": "creating",
   "Engine": "redis",
   "UserIds": [
      "default"
   ],
   "ReplicationGroups": [],
}

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see CreateUserGroup in AWS CLI Command Reference.

create-user

The following code example shows how to use create-user.

AWS CLI

To create a user

The following create-user example creates a new user.

aws elasticache create-user \
   --user-id user1 \
   --user-name myUser \
   --passwords mYnuUzrpAxXw2rdzx \
   --engine redis \
   --access-string "on ~app::* -@all +@read"

Output:
For more information, see **Authenticating Users with Role-Based Access Control (RBAC)** in the *Elasticache User Guide*.

- For API details, see [CreateUser](aws:reference:*CLI) in *AWS CLI Command Reference*.

### decrease-node-groups-in-global-replication-group

The following code example shows how to use `decrease-node-groups-in-global-replication-group`.

**AWS CLI**

**To decrease the number of node groups in a global replication group**

The following `decrease-node-groups-in-global-replication-group` decreases the node group count using the Redis engine.

```bash
aws elasticache decrease-node-groups-in-global-replication-group \
  --global-replication-group-id sgaui-test \
  --node-group-count 1 \
  --apply-immediately \
  --global-node-groups-to-retain sgaui-test-0003
```

**Output:**

```
{

```
"GlobalReplicationGroup":
{
    "GlobalReplicationGroupId": "sgaii-test",
    "GlobalReplicationGroupDescription": "test",
    "Status": "modifying",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "Members": [
        {
            "ReplicationGroupId": "test-2",
            "ReplicationGroupRegion": "us-east-1",
            "Role": "SECONDARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
        },
        {
            "ReplicationGroupId": "test-1",
            "ReplicationGroupRegion": "us-west-2",
            "Role": "PRIMARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
        }
    ],
    "ClusterEnabled": true,
    "GlobalNodeGroups": [
        {
            "GlobalNodeGroupId": "sgaii-test-0001",
            "Slots": "0-449,1816-5461"
        },
        {
            "GlobalNodeGroupId": "sgaii-test-0002",
            "Slots": "6827-10922"
        },
        {
            "GlobalNodeGroupId": "sgaii-test-0003",
            "Slots": "10923-14052,15418-16383"
        },
        {
            "GlobalNodeGroupId": "sgaii-test-0004",
            "Slots": "450-1815,5462-6826,14053-15417"
        }
    ],
    "AuthTokenEnabled": false,
For more information, see [Replication Across AWS Regions Using Global Datastore](Elasticache User Guide).  

- For API details, see [DecreaseNodeGroupsInGlobalReplicationGroup](AWS CLI Command Reference).

### decrease-replica-count

The following code example shows how to use `decrease-replica-count`.

**AWS CLI**

**To decrease replica count**

The following `decrease-replica-count` example dynamically decreases the number of replicas in a Redis (cluster mode disabled) replication group or the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache decrease-replica-count \\
  --replication-group-id my-cluster \\
  --apply-immediately \\
  --new-replica-count 2
```

**Output:**

```json
{
  "ReplicationGroup": {
    "ReplicationGroupId": "my-cluster",
    "Description": "",
    "Status": "modifying",
    "PendingModifiedValues": {},
    "MemberClusters": [
      "myrepliace",
      "my-cluster-001",
      "my-cluster-002",
      "my-cluster-003"
    ]
  }
}
```

"NodeGroups": [
{
  "NodeGroupId": "0001",
  "Status": "modifying",
  "PrimaryEndpoint": {
    "Address": "my-cluster.xxxxx.ng.0001.usw2.cache.amazonaws.com",
    "Port": 6379
  },
  "ReaderEndpoint": {
    "Address": "my-cluster-ro.xxxxx.ng.0001.usw2.cache.amazonaws.com",
    "Port": 6379
  },
  "NodeGroupMembers": [
    {
      "CacheClusterId": "myrepliace",
      "CacheNodeId": "0001",
      "ReadEndpoint": {
        "Address": "myrepliace.xxxxx.0001.usw2.cache.amazonaws.com",
        "Port": 6379
      },
      "PreferredAvailabilityZone": "us-west-2a",
      "CurrentRole": "replica"
    },
    {
      "CacheClusterId": "my-cluster-001",
      "CacheNodeId": "0001",
      "ReadEndpoint": {
        "Address": "my-cluster-001.xxxxx.0001.usw2.cache.amazonaws.com",
        "Port": 6379
      },
      "PreferredAvailabilityZone": "us-west-2a",
      "CurrentRole": "primary"
    },
    {
      "CacheClusterId": "my-cluster-002",
      "CacheNodeId": "0001",
      "ReadEndpoint": {
        "Address": "my-cluster-002.xxxxx.0001.usw2.cache.amazonaws.com",
        "Port": 6379
      }
    }
  ]
},
{...}
For more information, see [Changing the Number of Replicas](#) in the Elasticache User Guide.

- For API details, see [DecreaseReplicaCount](#) in AWS CLI Command Reference.

**delete-cache-cluster**

The following code example shows how to use delete-cache-cluster.

**AWS CLI**

**To delete a cache cluster**

The following delete-cache-cluster example deletes the specified previously provisioned cluster. The command deletes all associated cache nodes, node endpoints, and the cluster itself.
When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the cluster; you can't cancel or revert this operation.

This operation is not valid for the following:

Redis (cluster mode enabled) clusters
A cluster that is the last read replica of a replication group
A node group (shard) that has Multi-AZ mode enabled
A cluster from a Redis (cluster mode enabled) replication group
A cluster that is not in the available state

```
aws elasticache delete-cache-cluster \
   --cache-cluster-id "my-cluster-002"
```

Output:

```
{
   "CacheCluster": {
      "CacheClusterId": "my-cluster-002",
      "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
      "CacheNodeType": "cache.r5.xlarge",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "CacheClusterStatus": "deleting",
      "NumCacheNodes": 1,
      "PreferredAvailabilityZone": "us-west-2a",
      "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
      "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
      "PendingModifiedValues": {},
      "CacheSecurityGroups": [],
      "CacheParameterGroup": {
         "CacheParameterGroupName": "mygroup",
         "ParameterApplyStatus": "in-sync",
         "CacheNodeIdToReboot": []
      },
      "CacheSubnetGroupName": "kxkxk",
      "AutoMinorVersionUpgrade": true,
      "SecurityGroups": [
         {
            "SecurityGroupId": "sg-xxxxxxxxx9836",
            "SecurityGroupOwnerInfo": {
               "OwnerId": "123456789012",
               "GroupName": "mygroup"
            }
         }]
   }
}
```
For more information, see [Deleting a Cluster](#) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheCluster](#) in *AWS CLI Command Reference*.

### delete-cache-parameter-group

The following code example shows how to use `delete-cache-parameter-group`.

**AWS CLI**

**To delete a cache parameter group**

The following `delete-cache-parameter-group` example deletes the specified cache parameter group. You can't delete a cache parameter group if it's associated with any cache clusters.

```
aws elasticache delete-cache-parameter-group \
  --cache-parameter-group-name myparamgroup
```

This command produces no output.

For more information, see [Deleting a Parameter Group](#) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheParameterGroup](#) in *AWS CLI Command Reference*.

### delete-cache-subnet-group

The following code example shows how to use `delete-cache-subnet-group`.

**AWS CLI**

**To delete a cache subnet group**

The following delete-cache-subnet-group example deletes the specified cache subnet group. You can't delete a cache subnet group if it's associated with any clusters.

```
aws elasticache delete-cache-subnet-group \
    --cache-subnet-group-name "mygroup"
```

This command produces no output.

For more information, see [Deleting a Subnet Group](#) in the *Elasticache User Guide*.
- For API details, see [DeleteCacheSubnetGroup](#) in *AWS CLI Command Reference*.

**delete-global-replication-group**

The following code example shows how to use delete-global-replication-group.

**AWS CLI**

**To delete a global replication group**

The following delete-global-replication-group example deletes a new global replication group.

```
aws elasticache delete-global-replication-group \
    --global-replication-group-id my-global-replication-group \
    --retain-primary-replication-group
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgau1-my-grg",
        "GlobalReplicationGroupDescription": "my-grg",
        "Status": "deleting",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
```
```
AWS Command Line Interface

For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/userguide/ReplicationAcrossRegions.html) in the Elasticache User Guide.

- For API details, see [DeleteGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/delete-global-replication-group.html) in AWS CLI Command Reference.

delete-replication-group

The following code example shows how to use delete-replication-group.

AWS CLI

**To delete a replication group**

The following delete-replication-group example deletes an existing replication group. By default, this operation deletes the entire replication group, including the primary/primaries and all of the read replicas. If the replication group has only one primary, you can optionally delete only the read replicas, while retaining the primary by setting RetainPrimaryCluster=true.

When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the selected resources; you cannot cancel or revert this operation. Valid for Redis only.

```
aws elasticache delete-replication-group \
  --replication-group-id "mygroup"
```

**Output:**

```
{
}  
```
For API details, see [DeleteReplicationGroup](#) in AWS CLI Command Reference.

**delete-snapshot**

The following code example shows how to use `delete-snapshot`.

**AWS CLI**

**To delete a snapshot**

The following `delete-snapshot` example deleted a snapshot using the Redis engine.

```bash
aws elasticache delete-snapshot \
   --snapshot-name mysnapshot
```

Output:

```json
{
   "Snapshot": {
      "SnapshotName": "my-cluster-snapshot",
      "ReplicationGroupId": "mycluster",
      "ReplicationGroupDescription": "mycluster",
      "SnapshotStatus": "deleting",
      "SnapshotSource": "manual",
      "CacheNodeType": "cache.r5.xlarge",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "PreferredMaintenanceWindow": "thu:12:00-thu:13:00",
      "Port": 6379,
   }
}
```
"CacheParameterGroupName": "default.redis5.0.cluster.on",
"CacheSubnetGroupName": "default",
"VpcId": "vpc-a3e97cdb",
"AutoMinorVersionUpgrade": true,
"SnapshotRetentionLimit": 1,
"SnapshotWindow": "13:00-14:00",
"NumNodeGroups": 4,
"AutomaticFailover": "enabled",
"NodeSnapshots": [
  {
    "CacheClusterId": "mycluster-0002-003",
    "NodeGroupId": "0002",
    "CacheNodeId": "0001",

### delete-user-group

The following code example shows how to use `delete-user-group`.

**AWS CLI**

**To delete a user group**

The following `delete-user-group` example deletes a user group.

```bash
aws elasticache delete-user-group \\n  --user-group-id myusergroup
```

**Output:**

```json
{
  "UserGroupId": "myusergroup",
  "Status": "deleting",
  "Engine": "redis",
  "UserIds": [
    "default"
  ],
  "ReplicationGroups": [],
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/multipurposeguide/role-based-access-control.html) in the *Elasticache User Guide*.

- For API details, see [DeleteUserGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/delete-user.html) in *AWS CLI Command Reference*.

### delete-user

The following code example shows how to use `delete-user`.
AWS CLI

To delete a user

The following delete-user example deletes a user.

```bash
aws elasticache delete-user \
  --user-id user2
```

Output:

```json
{
  "UserId": "user1",
  "UserName": "myUser",
  "Status": "deleting",
  "Engine": "redis",
  "AccessString": "on ~* +@all",
  "UserGroupIds": [
    "myusergroup"
  ],
  "Authentication": {
    "Type": "password",
    "PasswordCount": 1
  },
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/pg-rbac-authenticating-users.html) in the Elasticache User Guide.

- For API details, see [DeleteUser](https://docs.aws.amazon.com/cli/latest/reference/elasticache/delete-user.html) in AWS CLI Command Reference.

**describe-cache-clusters**

The following code example shows how to use describe-cache-clusters.

AWS CLI

To describe a cache cluster

The following describe-cache-clusters example describes a cache cluster.
aws elasticache describe-cache-clusters

Output:

```json
{
    "CacheClusters": [
        {
            "CacheClusterId": "my-cluster-003",
            "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
            "CacheNodeType": "cache.r5.large",

            "TransitEncryptionEnabled": false,
            "AtRestEncryptionEnabled": false,
        }
    ]
}
```
For more information, see Managing Clusters in the Elasticache User Guide.

- For API details, see DescribeCacheClusters in AWS CLI Command Reference.

**describe-cache-engine-versions**

The following code example shows how to use describe-cache-engine-versions.

**AWS CLI**

**To describe a cache engine version**

The following describe-cache-engine-versions example returns a list of the available cache engines and their versions.

```
aws elasticache describe-cache-engine-versions \
--engine "Redis"
```

**Output:**

```
{
   "CacheEngineVersions": [
      
   ]
}
"Engine": "redis",
"EngineVersion": "2.6.13",
"CacheParameterGroupFamily": "redis2.6",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.6.13"
},
{
"Engine": "redis",
"EngineVersion": "2.8.19",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.19"
},
{
"Engine": "redis",
"EngineVersion": "2.8.21",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.21"
},
{
"Engine": "redis",
"EngineVersion": "2.8.22",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.22"
},
{
"Engine": "redis",
"EngineVersion": "2.8.23",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.23"
},
{
"Engine": "redis",
"EngineVersion": "2.8.24",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.24"
},
{
"Engine": "redis",
"EngineVersion": "2.8.6",
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.6"
"CacheParameterGroupFamily": "redis2.8",
"CacheEngineDescription": "Redis",
"CacheEngineVersionDescription": "redis version 2.8.6"
},
{
    "Engine": "redis",
    "EngineVersion": "3.2.10",
    "CacheParameterGroupFamily": "redis3.2",
    "CacheEngineDescription": "Redis",
    "CacheEngineVersionDescription": "redis version 3.2.10"
},
{
    "Engine": "redis",
    "EngineVersion": "3.2.4",
    "CacheParameterGroupFamily": "redis3.2",
    "CacheEngineDescription": "Redis",
    "CacheEngineVersionDescription": "redis version 3.2.4"
},
{
    "Engine": "redis",
    "EngineVersion": "3.2.6",
    "CacheParameterGroupFamily": "redis3.2",
    "CacheEngineDescription": "Redis",
    "CacheEngineVersionDescription": "redis version 3.2.6"
},
{
    "Engine": "redis",
    "EngineVersion": "4.0.10",
    "CacheParameterGroupFamily": "redis4.0",
    "CacheEngineDescription": "Redis",
    "CacheEngineVersionDescription": "redis version 4.0.10"
},
{
    "Engine": "redis",
    "EngineVersion": "5.0.0",
    "CacheParameterGroupFamily": "redis5.0",
    "CacheEngineDescription": "Redis",
    "CacheEngineVersionDescription": "redis version 5.0.0"
},
{
    "Engine": "redis",
    "EngineVersion": "5.0.3",
    "CacheParameterGroupFamily": "redis5.0",
    "CacheEngineDescription": "Redis",

For API details, see DescribeCacheEngineVersions in AWS CLI Command Reference.

describe-cache-parameter-groups

The following code example shows how to use describe-cache-parameter-groups.

AWS CLI

To describe a cache parameter group

The following describe-cache-parameter-groups example returns a list of cache parameter group descriptions.

```
aws elasticache describe-cache-parameter-groups \
   --cache-parameter-group-name "mygroup"
```

Output:

```
{
   "CacheParameterGroups": [
   {
      "CacheParameterGroupName": "mygroup",
      "CacheParameterGroupFamily": "redis5.0",
```
For more information, see Configuring Engine Parameters Using Parameter Groups in the Elasticache User Guide.

- For API details, see DescribeCacheParameterGroups in AWS CLI Command Reference.

**describe-cache-parameters**

The following code example shows how to use describe-cache-parameters.

**AWS CLI**

**To describe cache parameters**

The following "describe-cache-parameters" example returns the detailed parameter list for the specified cache parameter group.

```
aws elasticache describe-cache-parameters \\  
   --cache-parameter-group-name "myparamgroup"
```

**Output:**

```
{
   "Parameters": [
      {
         "ParameterName": "activedefrag",

For more information, see Parameter Management in the Elasticache User Guide.

- For API details, see DescribeCacheParameters in AWS CLI Command Reference.

**describe-cache-subnet-groups**

The following code example shows how to use describe-cache-subnet-groups.
AWS CLI

To describe cache subnet groups

The following describe-cache-subnet-groups example returns a list of subnet groups.

```
aws elasticache describe-cache-subnet-groups
```

Output:

```json
{
   "CacheSubnetGroups": [
      {
         "CacheSubnetGroupName": "default",
         "CacheSubnetGroupDescription": "Default CacheSubnetGroup",
         "VpcId": "vpc-a3e97cdb",
         "Subnets": [
            {
               "SubnetIdentifier": "subnet-8d4bacf5",
               "SubnetAvailabilityZone": {
                  "Name": "us-west-2b"
               }
            },
            {
               "SubnetIdentifier": "subnet-dde21380",
               "SubnetAvailabilityZone": {
                  "Name": "us-west-2c"
               }
            },
            {
               "SubnetIdentifier": "subnet-6485ec4f",
               "SubnetAvailabilityZone": {
                  "Name": "us-west-2d"
               }
            },
            {
               "SubnetIdentifier": "subnet-b4ebebff",
               "SubnetAvailabilityZone": {
                  "Name": "us-west-2a"
               }
            }
         ]
      }
   ]
}
```
For more information, see Subnets and Subnet Groups in the Elasticache User Guide or Subnets and Subnet Groups in the ElastiCache for Memcached User Guide.

- For API details, see DescribeCacheSubnetGroups in AWS CLI Command Reference.

**describe-engine-default-parameters**

The following code example shows how to use describe-engine-default-parameters.

**AWS CLI**

To describe engine default parameters
The following describe-engine-default-parameters example returns the default engine and system parameter information for the specified cache engine.

```
aws elasticache describe-engine-default-parameters \
   --cache-parameter-group-family "redis5.0"
```

Output:

```
{

For API details, see DescribeEngineDefaultParameters in AWS CLI Command Reference.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To describe events of a replication group

The following describe-events example returns a list of events for a replication group.

```shell
aws elasticache describe-events \
    --source-identifier test-cluster \
    --source-type replication-group
```

Output:
For more information, see [Monitoring Events](#) in the *Elastcache User Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

**describe-global-replication-groups**

The following code example shows how to use `describe-global-replication-groups`.

**AWS CLI**

**To describe global replication groups**

The following `describe-global-replication-groups` example returns details of a Global datastore.

```
aws elasticache describe-global-replication-groups \
  --global-replication-group-id my-grg
```

**Output:**

```
{
  "GlobalReplicationGroups": [
    {
      "GlobalReplicationGroupId": "my-grg",
      "SourceIdentifier": "test-cluster",
      "SourceType": "replication-group",
      "Message": "Automatic failover has been turned on for replication group test-cluster",
      "Date": "2020-03-18T23:51:34.457Z"
    },
    {
      "SourceIdentifier": "test-cluster",
      "SourceType": "replication-group",
      "Message": "Replication group test-cluster created",
      "Date": "2020-03-18T23:50:31.378Z"
    }
  ]
}
```
For more information, see Replication Across AWS Regions Using Global Datastore in the Elasticache User Guide.

- For API details, see DescribeGlobalReplicationGroups in AWS CLI Command Reference.

**describe-replication-groups**

The following code example shows how to use describe-replication-groups.

**AWS CLI**

To return a list of replication group details

The following describe-replication-groups example returns the replication groups.

```bash
aws elasticache describe-replication-groups
```

Output:

```json
{
   "ReplicationGroups": [
      {
         "ReplicationGroupId": "my-cluster",

describe-reserved-cache-nodes-offerings

The following code example shows how to use describe-reserved-cache-nodes-offerings.

**AWS CLI**

To describe reserved-cache-nodes-offerings

The following describe-reserved-cache-nodes-offerings example returns details of a reserved-cache-node options.

```
aws elasticache describe-reserved-cache-nodes-offerings
```

Output:

```
{
  "ReservedCacheNodesOfferings": [
    {
      "ReservedCacheNodesOfferingId": "01ce0a19-a476-41cb-8aee-48eacbc8cde5",

        {
          "RecurringChargeAmount": 0.0005,
          "RecurringChargeFrequency": "Hourly"
        }
      ]
    }
  ]
}
```

- For API details, see DescribeReservedCacheNodesOfferings in AWS CLI Command Reference.

describe-reserved-cache-nodes

The following code example shows how to use describe-reserved-cache-nodes.

AWS CLI

To describe reserved cache nodes

The following describe-reserved-cache-nodes example returns information about reserved cache nodes for this account, or about the specified reserved cache node.

aws elasticache describe-reserved-cache-nodes

Output:

```json
{
   "ReservedCacheNodes": [
   {
```
For more information, see Managing Costs with Reserved Nodes in the Elasticache User Guide.

- For API details, see DescribeReservedCacheNodes in AWS CLI Command Reference.

describe-service-updates

The following code example shows how to use describe-service-updates.

AWS CLI

To describe service updates

The following describe-service-updates example returns details about service updates.

```bash
aws elasticache describe-service-updates
```

Output:

```json
{
   "ServiceUpdates": [

   ]
}
```
For API details, see [DescribeServiceUpdates](#) in *AWS CLI Command Reference*.

**describe-snapshots**

The following code example shows how to use `describe-snapshots`.

**AWS CLI**

To describe snapshots
The following "describe-snapshots" example returns information about your cluster or replication group snapshots.

```bash
aws elasticache describe-snapshots
```

Output:

```json
{
  "Snapshots": [
    {
      "SnapshotName": "automatic.my-cluster2-002-2019-12-05-06-38",

### describe-user-groups

The following code example shows how to use `describe-user-groups`.

**AWS CLI**

To describe user-groups

The following `describe-user-groups` example returns a list of user groups.

```bash
aws elasticache describe-user-groups
```

Output:

```json
{
   "UserGroups": [
      {
         "UserGroupId": "myusergroup",
         "Status": "active",
         "Engine": "redis",
         "UserIds": ["default"],
         "ReplicationGroups": [],
      }
   ]
}
```
For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/userguide/role-based-access-control.html) in the *Elasticache User Guide*.

- For API details, see [DescribeUserGroups](https://docs.aws.amazon.com/cli/latest/reference/elasticache/describe-user-groups.html) in *AWS CLI Command Reference*.

**describe-users**

The following code example shows how to use describe-users.

**AWS CLI**

To describe users

The following describe-users example returns a list of users.

```bash
aws elasticache describe-users
```

Output:

```json
{
   "Users": [
      {
         "UserId": "default",
         "UserName": "default",
         "Status": "active",
         "Engine": "redis",
         "AccessString": "on ~* +@all",
         "UserGroupIds": [
            "myusergroup"
         ],
         "Authentication": {
            "Type": "no-password"
         },
         "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxxx52:user:default"
      },
      {
         "UserId": "user1",
         "UserName": "myUser",
         "Status": "active",
         "Engine": "redis",
```
"AccessString": "on ~* +@all",
"UserGroupIds": [],
"Authentication": {
  "Type": "password",
  "PasswordCount": 1
},
"ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
},
{
  "UserId": "user2",
  "UserName": "myUser",
  "Status": "active",
  "Engine": "redis",
  "AccessString": "on ~app:::* -@all +read +@hash +@bitmap -@geo -setbit -bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -georadiusbymember",
  "UserGroupIds": [],
  "Authentication": {
    "Type": "password",
    "PasswordCount": 1
  },
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
]

For more information, see Authentici...in the Elasticache User Guide.

- For API details, see DescribeUsers in AWS CLI Command Reference.

dissociate-global-replication-group

The following code example shows how to use disassociate-global-replication-group.

AWS CLI

To dissociate a secondary cluster from a global replication group

The following disassociate-global-replication-group example removes a secondary cluster from a Global datastore

```bash
aws elasticache disassociate-global-replication-group \
```
```
--global-replication-group-id my-grg \
--replication-group-id my-cluster-grg-secondary \
--replication-group-region us-east-1
```

Output:

```
{
  "GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "my-grg",
    "GlobalReplicationGroupDescription": "my-grg",
    "Status": "modifying",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "Members": [
      {
        "ReplicationGroupId": "my-cluster-grg-secondary",
        "ReplicationGroupRegion": "us-east-1",
        "Role": "SECONDARY",
        "AutomaticFailover": "enabled",
        "Status": "associated"
      },
      {
        "ReplicationGroupId": "my-cluster-grg",
        "ReplicationGroupRegion": "us-west-2",
        "Role": "PRIMARY",
        "AutomaticFailover": "enabled",
        "Status": "associated"
      }
    ],
    "ClusterEnabled": false,
    "AuthTokenEnabled": false,
    "TransitEncryptionEnabled": false,
    "AtRestEncryptionEnabled": false
  }
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/userguide/Replication-Global.html) in the Elasticache User Guide.

- For API details, see [DisassociateGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/disassociate-global-replication-group.html) in AWS CLI Command Reference.
increase-node-groups-in-global-replication-group

The following code example shows how to use `increase-node-groups-in-global-replication-group`.

**AWS CLI**

**To increase the number of node groups in a global replication group**

The following `increase-node-groups-in-global-replication-group` increases the node group count using the Redis engine.

```
aws elasticache increase-node-groups-in-global-replication-group \
   --global-replication-group-id sgaui-pat-test-4 \
   --node-group-count 6 \
   --apply-immediately
```

**Output:**

```json
{
   "GlobalReplicationGroup": {
      "GlobalReplicationGroupId": "sgaui-test-4",
      "GlobalReplicationGroupDescription": "test-4",
      "Status": "modifying",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.6",
      "Members": [
         {
            "ReplicationGroupId": "my-cluster-b",
            "ReplicationGroupRegion": "us-east-1",
            "Role": "SECONDARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
         },
         {
            "ReplicationGroupId": "my-cluster-a",
            "ReplicationGroupRegion": "us-west-2",
            "Role": "PRIMARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
         }
      ]
   }
}
```
For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/userguide/Replication Across AWS Regions Using Global Datastore) in the Elasticache User Guide.

- For API details, see [IncreaseNodeGroupsInGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/increase-node-groups-in-global-replication-group) in AWS CLI Command Reference.

**increase-replica-count**

The following code example shows how to use increase-replica-count.

**AWS CLI**

To increase replica count
The following `increase-replica-count` example does one of two things. It can dynamically increase the number of replicas in a Redis (cluster mode disabled) replication group. Or it can dynamically increase the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```bash
aws elasticache increase-replica-count
   --replication-group-id "my-cluster"
   --apply-immediately
   --new-replica-count 3
```

Output:

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "my-cluster",
        "Description": "",
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "my-cluster-001",
            "my-cluster-002",
            "my-cluster-003",
            "my-cluster-004"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "modifying",
                "PrimaryEndpoint": {
                    "Address": "my-cluster.xxxxxxih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "ReaderEndpoint": {
                    "Address": "my-cluster-ro.xxxxxxih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "NodeGroupMembers": [
                    {
                        "CacheClusterId": "my-cluster-001",
```

Actions and scenarios
"CacheNodeId": "0001",

For more information, see [Increasing the Number of Replicas in a Shard](https://docs.aws.amazon.com/elasticache/latest/userguide/replication্ড-0001.html) in the *Elasticache User Guide*.

- For API details, see [IncreaseReplicaCount](https://docs.aws.amazon.com/cli/latest/reference/elasticache/increase-replica-count.html) in *AWS CLI Command Reference*.

**list-allowed-node-type-modifications**

The following code example shows how to use `list-allowed-node-type-modifications`.
AWS CLI

To list the allowed node modifications

The following list-allowed-node-type-modifications example lists all the available node types that you can scale your Redis cluster's or replication group's current node type to.

```bash
aws elasticache list-allowed-node-type-modifications
  --replication-group-id "my-replication-group"
```

Output:

```json
{
  "ScaleUpModifications": [
    "cache.m5.12xlarge",
    "cache.m5.24xlarge",
    "cache.m5.4xlarge",
    "cache.r5.12xlarge",
    "cache.r5.24xlarge",
    "cache.r5.2xlarge",
    "cache.r5.4xlarge",
    "cache.r5.8xlarge"
  ],
  "ScaleDownModifications": [
    "cache.m3.large",
    "cache.m3.medium",
    "cache.m3.xlarge",
    "cache.m4.large",
    "cache.m4.xlarge",
    "cache.m5.2xlarge",
    "cache.m5.large",
    "cache.m5.xlarge",
    "cache.r3.large",
    "cache.r4.large",
    "cache.r4.xlarge",
    "cache.r5.large",
    "cache.t2.medium",
    "cache.t2.micro",
    "cache.t2.small",
    "cache.t3.medium",
    "cache.t3.micro",
    "cache.t3.small"
  ]
}
```
For more information, see Scaling ElastiCache for Redis Clusters in the Elasticache User Guide.

- For API details, see ListAllowedNodeTypeModifications in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

**To list tags for a resource**

The following list-tags-for-resource example lists tags for a resource.

```bash
aws elasticache list-tags-for-resource \
    --resource-name "arn:aws:elasticache:us-east-1:123456789012:cluster:my-cluster"
```

Output:

```json
{
   "TagList": [
      {
         "Key": "Project",
         "Value": "querySpeedUp"
      },
      {
         "Key": "Environment",
         "Value": "PROD"
      }
   ]
}
```

For more information, see Listing Tags Using the AWS CLI in the Elasticache User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

modify-cache-cluster

The following code example shows how to use modify-cache-cluster.

AWS CLI

**To modify cache clusters**
The following `modify-cache-cluster` example modifies the settings for the specified cluster.

```
aws elasticache modify-cache-cluster \
  --cache-cluster-id "my-cluster" \
  --num-cache-nodes 1
```

Output:

```
{
  "CacheCluster": {
    "CacheClusterId": "my-cluster",
    "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
    "CacheNodeType": "cache.m5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.5",
    "CacheClusterStatus": "available",
    "NumCacheNodes": 1,
    "PreferredAvailabilityZone": "us-west-2c",
    "CacheClusterCreateTime": "2019-12-04T18:24:56.652Z",
    "PreferredMaintenanceWindow": "sat:10:00-sat:11:00",
    "PendingModifiedValues": {},
    "CacheSecurityGroups": [],
    "CacheParameterGroup": {
      "CacheParameterGroupName": "default.redis5.0",
      "ParameterApplyStatus": "in-sync",
      "CacheNodeIdsToReboot": []
    },
    "CacheSubnetGroupName": "default",
    "AutoMinorVersionUpgrade": true,
    "SnapshotRetentionLimit": 0,
    "SnapshotWindow": "07:00-08:00",
    "TransitEncryptionEnabled": false,
    "AtRestEncryptionEnabled": false
  }
}
```

For more information, see [Modifying an ElastiCache Cluster](https://docs.aws.amazon.com/elasticache/latest/migration/Modifying-a-Cluster.html) in the *Elasticache User Guide*.

- For API details, see [ModifyCacheCluster](https://docs.aws.amazon.com/cli/latest/reference/elasticache/modify-cache-cluster.html) in *AWS CLI Command Reference*. 
modify-cache-parameter-group

The following code example shows how to use modify-cache-parameter-group.

AWS CLI

To modify a cache parameter group

The following modify-cache-parameter-group example modifies the parameters of the specified cache parameter group.

```bash
aws elasticache modify-cache-parameter-group \
   --cache-parameter-group-name "mygroup" \
   --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```json
{
   "CacheParameterGroupName": "mygroup"
}
```

For more information, see Modifying a Parameter Group in the Elasticache User Guide.

- For API details, see ModifyCacheParameterGroup in AWS CLI Command Reference.

modify-cache-subnet-group

The following code example shows how to use modify-cache-subnet-group.

AWS CLI

To modify a cache subnet group

The following modify-cache-subnet-group example modifies the specified cache subnet group.

```bash
aws elasticache modify-cache-subnet-group \
   --cache-subnet-group-name kxkxk \
   --cache-subnet-group-description "mygroup"
```

Output:
For more information, see Modifying a Subnet Group in the Elasticache User Guide.

- For API details, see ModifyCacheSubnetGroup in AWS CLI Command Reference.

modify-global-replication-group

The following code example shows how to use modify-global-replication-group.

AWS CLI

To modify a global replication group

The following modify-global-replication-group modifies the properties of a global replication group, in this case disabling automatic failover, using the Redis engine.

```bash
aws elasticache modify-global-replication-group \
   --global-replication-group-id sgaui-pat-group \
   --apply-immediately \
   --no-automatic-failover-enabled
```

Output

```json
{
   "GlobalReplicationGroup": {
      "GlobalReplicationGroupId": "sgaui-test-group",
      "GlobalReplicationGroupDescription": "",
```
The following code example shows how to use `modify-replication-group-shard-configuration`.

**AWS CLI**

To modify a replication group shard configuration

The following `modify-replication-group-shard-configuration` decreases the node group count using the Redis engine.

```
aws elasticache modify-replication-group-shard-configuration \
  --replication-group-id mycluster \
  --node-group-count 3 \
  --apply-immediately \
  --node-groups-to-remove 0002
```

**Output**

```
{
  "ReplicationGroup": {
    "ReplicationGroupId": "mycluster",
    "Description": "mycluster",
    "GlobalReplicationGroupInfo": {},
    "Status": "modifying",
  }
}
```

modify-replication-group

The following code example shows how to use modify-replication-group.

**AWS CLI**

**To modify a replication group**

The following modify-replication-group disables Multi-AZ using the Redis engine.

```
aws elasticache modify-replication-group \
    --replication-group-id test-cluster \
    --no-multi-az-enabled \
    --apply-immediately
```

**Output**

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test-cluster",
        "Description": "test-cluster",
        "GlobalReplicationGroupInfo": {

For more information, see [Modifying a Replication Group](https://docs.aws.amazon.com/elasticache/latest/userguide/replication-groups-add-user.html) in the *Elasticache User Guide*.

- For API details, see [ModifyReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/modify-replication-group.html) in *AWS CLI Command Reference*.

**modify-user-group**

The following code example shows how to use `modify-user-group`.

**AWS CLI**

**To modify a user group**

The following `modify-user-group` example adds a user to the user group.

```bash
aws elasticache modify-user-group \  
   --user-group-id myusergroup \  
   --user-ids-to-add user1
```

**Output:**

```json
{
   "UserGroupId": "myusergroup",
   "Status": "modifying",
   "Engine": "redis",
   "UserIds": [
      "default"
   ],
   "PendingChanges": {
      "UserIdsToAdd": [
         "user1"
      ]
   },
   "ReplicationGroups": [],
}
```
For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see ModifyUserGroup in AWS CLI Command Reference.

modify-user

The following code example shows how to use modify-user.

AWS CLI

To modify a user

The following modify-user example modifies a user's access string.

```bash
aws elasticache modify-user \
    --user-id user2 \
    --append-access-string "on ~* +@all"
```

Output:

```
{
    "UserId": "user2",
    "UserName": "myUser",
    "Status": "modifying",
    "Engine": "redis",
    "AccessString": "on ~* +@all",
    "UserGroupIds": [],
    "Authentication": {

}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see ModifyUser in AWS CLI Command Reference.
purchase-reserved-cache-nodes-offering

The following code example shows how to use `purchase-reserved-cache-nodes-offering`.

**AWS CLI**

To purchase a reserved-cache-node-offering

The following `purchase-reserved-cache-nodes-offering` example allows you to purchase a reserved cache node offering.

```bash
aws elasticache purchase-reserved-cache-nodes-offering \\   --reserved-cache-nodes-offering-id xxxxxxxx-4ca5-4b90-b92d-929fbd7abed2
```

**Output**

```json
{
   "ReservedCacheNode": {
      "ReservedCacheNodeId": "ri-2020-06-30-17-59-40-474",
      "ReservedCacheNodesOfferingId": "xxxxxxx-4da5-4b90-b92d-929fbd7abed2",
      "CacheNodeType": "cache.m3.2xlarge",
      "StartTime": "2020-06-30T17:59:40.474000+00:00",
      "Duration": 31536000,

            "RecurringChargeFrequency": "Hourly"
         }
      ]
   }
}
```

**reboot-cache-cluster**

The following code example shows how to use `reboot-cache-cluster`.

**AWS CLI**

**To reboot a cache cluster**

The following `reboot-cache-cluster` example reboots some, or all, of the cache nodes within a provisioned cluster. This operation applies any modified cache parameter groups to the cluster. The reboot operation takes place as soon as possible, and results in a momentary outage to the cluster. During the reboot, the cluster status is set to `REBOOTING`.

```
aws elasticache reboot-cache-cluster \
  --cache-cluster-id "my-cluster-001" \
  --cache-node-ids-to-reboot "0001"
```

Output:

```json
{
  "CacheCluster": {
    "CacheClusterId": "my-cluster-001",
home#client-download:",
    "CacheNodeType": "cache.r5.xlarge",
    "Engine": "redis",
    "EngineVersion": "5.0.5",
    "CacheClusterStatus": "rebooting cache cluster nodes",
    "NumCacheNodes": 1,
    "PreferredAvailabilityZone": "us-west-2a",
    "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
    "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
    "PendingModifiedValues": {},
    "NotificationConfiguration": {
      "TopicStatus": "active"
    },
    "CacheSecurityGroups": [],
    "CacheParameterGroup": {
      "CacheParameterGroupName": "mygroup",
      "ParameterApplyStatus": "in-sync",
      "CacheNodeIdsToReboot": []
    }
  }
}```

- For API details, see RebootCacheCluster in AWS CLI Command Reference.

**reset-cache-parameter-group**

The following code example shows how to use `reset-cache-parameter-group`.

**AWS CLI**

**To reset a cache parameter group**

The following `reset-cache-parameter-group` example modifies the parameters of a cache parameter group to the engine or system default value. You can reset specific parameters by submitting a list of parameter names. To reset the entire cache parameter group, specify the `--reset-all-parameters` and `--cache-parameter-group-name` parameters.

```bash
aws elasticache reset-cache-parameter-group
    --cache-parameter-group-name "mygroup" \
    --reset-all-parameters
```
**Output:**

```json
{
   "CacheParameterGroupName": "mygroup"
}
```

- For API details, see [ResetCacheParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/reset-cache-parameter-group.html) in *AWS CLI Command Reference*.

### start-migration

The following code example shows how to use `start-migration`.

**AWS CLI**

**To start a migration**

The following `start-migration` migrates your data from self-hosted Redis on Amazon EC2 to Amazon ElastiCache, using the Redis engine.

```bash
aws elasticache start-migration \
   --replication-group-id test \
   --customer-node-endpoint-list \
   "Address='test.g2xbih.ng.0001.usw2.cache.amazonaws.com',Port=6379"
```

**Output**

```json
{
   "ReplicationGroup": {
      "ReplicationGroupId": "test",
      "Description": "test",
      "GlobalReplicationGroupInfo": {},
      "Status": "modifying",
      "PendingModifiedValues": {},
      "MemberClusters": [
         "test-001",
         "test-002",
         "test-003"
      ],
      "NodeGroups": [
         {
            "NodeGroupId": "0001",
            "Status": "available",
```
"PrimaryEndpoint": {
  "Address": "test.g2xbih.ng.0001.usw2.cache.amazonaws.com",
  "Port": 6379
},
"ReaderEndpoint": {
  "Address": "test-ro.g2xbih.ng.0001.usw2.cache.amazonaws.com",
  "Port": 6379
},
"NodeGroupMembers": [

      "Port": 6379
    },
    "PreferredAvailabilityZone": "us-west-2b",
    "CurrentRole": "replica"
  }
]
For more information, see Online Migration to ElastiCache in the Elasticache User Guide.

- For API details, see StartMigration in AWS CLI Command Reference.

**test-failover**

The following code example shows how to use test-failover.

**AWS CLI**

The following `test-failover` example tests automatic failover on the specified node group (called a shard in the console) in a replication group (called a cluster in the console).

```
aws elasticache test-failover /
   --replication-group-id "mycluster" /
   --node-group-id "0001"
```

Output:

```
{
   "ReplicationGroup": {
      "ReplicationGroupId": "mycluster",
      "Description": "My Cluster",
      "Status": "available",
      "PendingModifiedValues": {},
      "MemberClusters": [
         "mycluster-0001-001",

MediaStore examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

create-container

The following code example shows how to use create-container.

AWS CLI

To create a container

The following create-container example creates a new, empty container.

aws mediastore create-container --container-name ExampleContainer

Output:

```json
{
   "Container": {
```
For more information, see Creating a Container in the AWS Elemental MediaStore User Guide.

- For API details, see CreateContainer in AWS CLI Command Reference.

**delete-container-policy**

The following code example shows how to use delete-container-policy.

**AWS CLI**

**To delete a container policy**

The following delete-container-policy example deletes the policy that is assigned to the specified container. When the policy is deleted, AWS Elemental MediaStore automatically assigns the default policy to the container.

```bash
aws mediastore delete-container-policy \ 
   --container-name LiveEvents
```

This command produces no output.

For more information, see DeleteContainerPolicy in the AWS Elemental MediaStore API reference.

- For API details, see DeleteContainerPolicy in AWS CLI Command Reference.

**delete-container**

The following code example shows how to use delete-container.

**AWS CLI**

**To delete a container**
The following delete-container example deletes the specified container. You can delete a container only if it has no objects.

```
aws mediastore delete-container \
   --container-name=ExampleLiveDemo
```

This command produces no output.

For more information, see Deleting a Container in the AWS Elemental MediaStore User Guide.

- For API details, see DeleteContainer in AWS CLI Command Reference.

delete-cors-policy

The following code example shows how to use delete-cors-policy.

AWS CLI

To delete a CORS policy

The following delete-cors-policy example deletes the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore delete-cors-policy \
   --container-name ExampleContainer
```

This command produces no output.

For more information, see Deleting a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see DeleteCorsPolicy in AWS CLI Command Reference.

delete-lifecycle-policy

The following code example shows how to use delete-lifecycle-policy.

AWS CLI

To delete an object lifecycle policy

The following delete-lifecycle-policy example deletes the object lifecycle policy attached to the specified container. This change can take up to 20 minutes to take effect.
```
aws mediastore delete-lifecycle-policy \
   --container-name LiveEvents
```

This command produces no output.

For more information, see [Deleting an Object Lifecycle Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DeleteLifecyclePolicy](#) in *AWS CLI Command Reference*.

### describe-container

The following code example shows how to use `describe-container`.

**AWS CLI**

**To view the details of a container**

The following `describe-container` example displays the details of the specified container.

```
aws mediastore describe-container \
   --container-name ExampleContainer
```

Output:

```
{
   "Container": {
      "CreationTime": 1563558086,
      "AccessLoggingEnabled": false,
      "Status": "ACTIVE",
      "Name": "ExampleContainer",
      "Endpoint": "https://aaabbbccddddee.data.mediastore.us-west-2.amazonaws.com"
   }
}
```

For more information, see [Viewing the Details for a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DescribeContainer](#) in *AWS CLI Command Reference*. 
describe-object

The following code example shows how to use describe-object.

AWS CLI

To view a list of objects and folders in a specific container

The following describe-object example displays items (objects and folders) stored in a specific container.

```bash
aws mediastore-data describe-object \
   --endpoint https://aabbccdddee.data.mediastore.us-west-2.amazonaws.com \
   --path /folder_name/file1234.jpg
```

Output:

```json
{
   "ContentType": "image/jpeg",
   "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
   "ContentLength": "2307346",
   "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f555555555555da6d3"
}
```

For more information, see Viewing the Details of an Object in the AWS Elemental MediaStore User Guide.

- For API details, see DescribeObject in AWS CLI Command Reference.

get-container-policy

The following code example shows how to use get-container-policy.

AWS CLI

To view a container policy

The following get-container-policy example displays the resource-based policy of the specified container.

```bash
aws mediastore get-container-policy \
   --container-name ExampleLiveDemo
```
get-cors-policy

The following code example shows how to use get-cors-policy.

AWS CLI

To view a CORS policy

The following get-cors-policy example displays the cross-origin resource sharing (CORS) policy that is assigned to the specified container.
aws mediastore get-cors-policy \
--container-name ExampleContainer \
--region us-west-2

Output:

```json
{
   "CorsPolicy": [
   {
      "AllowedMethods": [
         "GET",
         "HEAD"
      ],
      "MaxAgeSeconds": 3000,
      "AllowedOrigins": [
         ""
      ],
      "AllowedHeaders": [
         ""
      ]
   }
]
}
```

For more information, see Viewing a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see GetCorsPolicy in AWS CLI Command Reference.

get-lifecycle-policy

The following code example shows how to use get-lifecycle-policy.

AWS CLI

To view an object lifecycle policy

The following get-lifecycle-policy example displays the object lifecycle policy attached to the specified container.

```
aws mediastore get-lifecycle-policy \
    --container-name LiveEvents
```
Output:

```json
{
    "LifecyclePolicy": {
        "rules": [
            {
                "definition": {
                    "path": [
                        {
                            "prefix": "Football/"
                        },
                        {
                            "prefix": "Baseball/"
                        }
                    ],
                    "days_since_create": [
                        {
                            "numeric": [
                                {
                                    "">", 28
                                }
                            ]
                        }
                    ]
                },
                "action": "EXPIRE"
            }
        ]
    }
}
```

For more information, see [Viewing an Object Lifecycle Policy](https://docs.aws.amazon.com/AWSElementalMediaStore/latest/userguide/index.html) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetLifecyclePolicy](https://docs.aws.amazon.com/cli/latest/reference/media/lifecycle/get-lifecycle-policy.html) in *AWS CLI Command Reference*.

### get-object

The following code example shows how to use `get-object`.

**AWS CLI**

To download an object
The following get-object example download an object to the specified endpoint.

```
aws mediastore-data get-object \
   --endpoint https://aaabbbccddddee.data.mediastore.us-west-2.amazonaws.com \
   --path=/folder_name/README.md README.md
```

Output:

```
{
   "ContentLength": "2307346",
   "ContentType": "image/jpeg",
   "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
   "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f5555555555da6d3",
   "StatusCode": 200
}
```

To download part of an object

The following get-object example downloads a portion an object to the specified endpoint.

```
aws mediastore-data get-object \
   --endpoint https://aaabbbccddddee.data.mediastore.us-west-2.amazonaws.com \
   --path /folder_name/README.md \
   --range="bytes=0-100" README2.md
```

Output:

```
{
   "StatusCode": 206,
   "ContentRange": "bytes 0-100/2307346",
   "ContentLength": "101",
   "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
   "ContentType": "image/jpeg",
   "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f5555555555da6d3"
}
```

For more information, see Downloading an Object in the AWS Elemental MediaStore User Guide.

- For API details, see GetObject in AWS CLI Command Reference.
list-containers

The following code example shows how to use list-containers.

AWS CLI

To view a list of containers

The following list-containers example displays a list of all containers that are associated with your account.

```
aws mediastore list-containers
```

Output:

```
{
    "Containers": [
        {
            "CreationTime": 1505317931,
            "Endpoint": "https://aaabbccddddee.data.mediastore.us-west-2.amazonaws.com",
            "Status": "ACTIVE",
            "AccessLoggingEnabled": false,
            "Name": "ExampleLiveDemo"
        },
        {
            "CreationTime": 1506528818,
            "Endpoint": "https://fffgghhhiiijj.data.mediastore.us-west-2.amazonaws.com",
            "Status": "ACTIVE",
            "AccessLoggingEnabled": false,
            "Name": "ExampleContainer"
        }
    ]
}
```

For more information, see Viewing a List of Containers in the AWS Elemental MediaStore User Guide.
For API details, see ListContainers in AWS CLI Command Reference.

list-items

The following code example shows how to use list-items.

AWS CLI

Example 1: To view a list of objects and folders in a specific container

The following list-items example displays items (objects and folders) stored in the specified container.

```
aws mediastore-data list-items \\
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{
  "Items": [
    {
      "ContentType": "image/jpeg",
      "LastModified": 1563571859.379,
      "Name": "filename.jpg",
      "Type": "OBJECT",
      "ETag": "543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
      "ContentLength": 3784
    },
    {
      "Type": "FOLDER",
      "Name": "ExampleLiveDemo"
    }
  ]
}
```

Example 2: To view a list of objects and folders in a specific folder

The following list-items example displays items (objects and folders) stored in a specific folder.

```
aws mediastore-data list-items 
```
Output:

```json
{
  "Items": [
    {
      "ContentType": "image/jpeg",
      "LastModified": 1563571859.379,
      "Name": "filename.jpg",
      "Type": "OBJECT",
      "ETag": "543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
      "ContentLength": 3784
    },
    {
      "Type": "FOLDER",
      "Name": "ExampleLiveDemo"
    }
  ]
}
```

For more information, see [Viewing a List of Objects](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [ListItems](#) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for a container**

The following `list-tags-for-resource` example displays the tag keys and values assigned to the specified container.

```
aws mediastore list-tags-for-resource \
```

Output:
For more information, see ListTagsForResource in the AWS Elemental MediaStore API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

put-container-policy

The following code example shows how to use put-container-policy.

**AWS CLI**

**To edit a container policy**

The following put-container-policy example assigns a different policy to the specified container. In this example, the updated policy is defined in a file named LiveEventsContainerPolicy.json.

```
aws mediastore put-container-policy \
   --container-name LiveEvents \
   --policy file://LiveEventsContainerPolicy.json
```

This command produces no output.

For more information, see Editing a Container Policy in the AWS Elemental MediaStore User Guide.

- For API details, see PutContainerPolicy in AWS CLI Command Reference.
put-cors-policy

The following code example shows how to use put-cors-policy.

AWS CLI

Example 1: To add a CORS policy

The following put-cors-policy example adds a cross-origin resource sharing (CORS) policy to the specified container. The contents of the CORS policy are in the file named corsPolicy.json.

```bash
aws mediastore put-cors-policy \
    --container-name ExampleContainer \
    --cors-policy file://corsPolicy.json
```

This command produces no output.

For more information, see Adding a CORS Policy to a Container in the AWS Elemental MediaStore User Guide.

Example 2: To edit a CORS policy

The following put-cors-policy example updates the cross-origin resource sharing (CORS) policy that is assigned to the specified container. The contents of the updated CORS policy are in the file named corsPolicy2.json.

For more information, see Editing a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see PutCorsPolicy in AWS CLI Command Reference.

put-lifecycle-policy

The following code example shows how to use put-lifecycle-policy.

AWS CLI

To create an object lifecycle policy

The following put-lifecycle-policy example attaches an object lifecycle policy to the specified container. This enables you to specify how long the service should store objects in your container. MediaStore deletes objects in the container once
they reach their expiration date, as indicated in the policy, which is in the file named LiveEventsLifecyclePolicy.json.

```bash
aws mediastore put-lifecycle-policy \
  --container-name ExampleContainer \
  --lifecycle-policy file://ExampleLifecyclePolicy.json
```

This command produces no output.

For more information, see Adding an Object Lifecycle Policy to a Container in the AWS Elemental MediaStore User Guide.

- For API details, see PutLifecyclePolicy in AWS CLI Command Reference.

**put-object**

The following code example shows how to use put-object.

**AWS CLI**

**To upload an object**

The following put-object example uploads an object to the specified container. You can specify a folder path where the object will be saved within the container. If the folder already exists, AWS Elemental MediaStore stores the object in the folder. If the folder doesn't exist, the service creates it, and then stores the object in the folder.

```bash
aws mediastore-data put-object \
  --endpoint https://aaabbbccdde.data.mediastore.us-west-2.amazonaws.com \
  --body README.md \
  --path /folder_name/README.md \
  --cache-control "max-age=6, public" \
  --content-type binary/octet-stream
```

**Output:**

```json
{
  "ContentSHA256": "74b5fdb517f423ed750ef214c44adfe2be36e37d861eafe9c842cbe1bf387a9d",
  "StorageClass": "TEMPORAL",
  "ETag": "af3e4731af032167a106015d1f2fe934e68b32ed1aa297a9e325f5c64979277b"
}
```
For more information, see [Uploading an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [PutObject](#) in *AWS CLI Command Reference*.

**start-access-logging**

The following code example shows how to use `start-access-logging`.

**AWS CLI**

**To enable access logging on a container**

The following `start-access-logging` example enable access logging on the specified container.

```
aws mediastore start-access-logging \
   --container-name LiveEvents
```

This command produces no output.

For more information, see [Enabling Access Logging for a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [StartAccessLogging](#) in *AWS CLI Command Reference*.

**stop-access-logging**

The following code example shows how to use `stop-access-logging`.

**AWS CLI**

**To disable access logging on a container**

The following `stop-access-logging` example disables access logging on the specified container.

```
aws mediastore stop-access-logging \
   --container-name LiveEvents
```

This command produces no output.
For more information, see Disabling Access Logging for a Container in the AWS Elemental MediaStore User Guide.

- For API details, see StopAccessLogging in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To add tags to a container

The following tag-resource example adds tag keys and values to the specified container.

```bash
aws mediastore tag-resource \
    --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer \
    --tags '[{"Key": "Region", "Value": "West"}, \
            {"Key": "Environment", "Value": "Test"}]'
```

This command produces no output.

For more information, see TagResource in the AWS Elemental MediaStore API Reference.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

To remove tags from a container

The following untag-resource example removes the specified tag key and its associated value from a container.

```bash
aws mediastore untag-resource \
    --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer \
    --tag-keys Region
```
This command produces no output.

For more information, see `Un TAGResource` in the `AWS Elemental Media Store API Reference`.

- For API details, see `Un TAGResource` in `AWS CLI Command Reference`.

**Amazon EMR examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**add-instance-fleet**

The following code example shows how to use `add-instance-fleet`.

**AWS CLI**

**To add a task instance fleet to a cluster**

This example adds a new task instance fleet to the cluster specified.

Command:

```bash
aws emr add-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet InstanceFleetType=TASK,TargetSpotCapacity=1,LaunchSpecifications={SpotSpecification='{TimeoutDurationMinutes=20,TimeoutAction=TERMINATE_CLUSTER}'}
```

Output:
For API details, see AddInstanceFleet in AWS CLI Command Reference.

add-steps

The following code example shows how to use add-steps.

AWS CLI

1. To add Custom JAR steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps
  Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/mytest.jar,Args=arg1,arg2,arg3
  Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3
```

Required parameters:

- Jar

Optional parameters:

- Type, Name, ActionOnFailure, Args

Output:

```json
{
   "StepIds": [
     "s-XXXXXXXX",
     "s-YYYYYYYY"
   ]
}
```
2. To add Streaming steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/wordcount/input,-output,s3://mybucket/wordcount/output]
```

Required parameters:

- **Type**, **Args**

Optional parameters:

- **Name**, **ActionOnFailure**

JSON equivalent (contents of step.json):

```json
[
  {
    "Name": "JSON Streaming Step",
    "Args": ["-files","s3://elasticmapreduce/samples/wordcount/wordSplitter.py","-mapper","wordSplitter.py","-reducer","aggregate","-input","s3://elasticmapreduce/samples/wordcount/input","-output","s3://mybucket/wordcount/output"],
    "ActionOnFailure": "CONTINUE",
    "Type": "STREAMING"
  }
]
```

NOTE: JSON arguments must include options and values as their own items in the list.

Command (using step.json):

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps file:///./step.json
```

Output:

```json
{
  "StepIds": [
```

Actions and scenarios

2968
3. To add a Streaming step with multiple files to a cluster (JSON only)

JSON (multiplefiles.json):

```json
[
    {
        "Name": "JSON Streaming Step",
        "Type": "STREAMING",
        "ActionOnFailure": "CONTINUE",
        "Args": [
            "-files",
            "s3://mybucket/mapper.py,s3://mybucket/reducer.py",
            "-mapper",
            "mapper.py",
            "-reducer",
            "reducer.py",
            "-input",
            "s3://mybucket/input",
            "-output",
            "s3://mybucket/output"
        ]
    }
]
```

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps file:///multiplefiles.json
```

Required parameters:

- **Type**, **Args**

Optional parameters:

- **Name**, **ActionOnFailure**

Output:
4. To add Hive steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/myhivescript.q,-d,INPUT=s3://mybucket/myhiveinput,-d,OUTPUT=s3://mybucket/myhiveoutput,arg1,arg2]
Type=HIVE,Name='Hive steps',ActionOnFailure=TERMINATE_CLUSTER,Args=[-f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://mybucket/hive-ads/output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs]
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```json
{
   "StepIds":[
      "s-XXXXXXXX",
      "s-YYYYYYYY"
   ]
}
```

5. To add Pig steps to a cluster

Command:

```bash
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/mypigscript.pig,-
```
p,INPUT=s3://mybucket/mypiginput,-p,OUTPUT=s3://mybucket/mypigoutput,arg1,arg2
Type=PIG,Name='Pig program',Args=[-f,s3://elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output,arg1,arg2]

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

{
  "StepIds":[
    "s-XXXXXXXX",
    "s-YYYYYYYY"
  ]
}

6. To add Impala steps to a cluster

Command:

aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=IMPALA,Name='Impala program',ActionOnFailure=CONTINUE,Args=--impala-script,s3://myimpala/input,--console-output-path,s3://myimpala/output

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:
add-tags

The following code example shows how to use add-tags.

AWS CLI

1. To add tags to a cluster

   Command:

   ```
   aws emr add-tags --resource-id j-xxxxxxx --tags name="John Doe" age=29 sex=male
   address="123 East NW Seattle"
   ```

   Output:

   None

2. To list tags of a cluster

   --Command:

   ```
   aws emr describe-cluster --cluster-id j-XXXXXXYY --query Cluster.Tags
   ```

   Output:

   ```
   [
   {
   "Value": "male",
   "Key": "sex"
   },
   {
   "Value": "123 East NW Seattle",
   ```
• For API details, see AddTags in AWS CLI Command Reference.

create-cluster-examples

The following code example shows how to use create-cluster-examples.

AWS CLI

Most of the following examples assume that you specified your Amazon EMR service role and Amazon EC2 instance profile. If you have not done this, you must specify each required IAM role or use the --use-default-roles parameter when creating your cluster. For more information about specifying IAM roles, see Configure IAM Roles for Amazon EMR Permissions to AWS Services in the Amazon EMR Management Guide.

Example 1: To create a cluster

The following create-cluster example creates a simple EMR cluster.

```bash
aws emr create-cluster \
  --release-label emr-5.14.0 \
  --instance-type m4.large \
  --instance-count 2
```

This command produces no output.

Example 2: To create an Amazon EMR cluster with default ServiceRole and InstanceProfile roles

The following create-cluster example creates an Amazon EMR cluster that uses the --instance-groups configuration.
Example 3: To create an Amazon EMR cluster that uses an instance fleet

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-fleets` configuration, specifying two instance types for each fleet and two EC2 Subnets.

```
aws emr create-cluster \
   --release-label emr-5.14.0 \
   --service-role EMR_DefaultRole \
   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
   --instance-fleets InstanceFleetType=MASTER,TargetOnDemandCapacity=1,InstanceTypeConfigs=[\'{InstanceType=m4.large}'] \n   InstanceFleetType=CORE,TargetSpotCapacity=11,InstanceTypeConfigs=[\'{InstanceType=m4.large,BidPrice=0.5,WeightedCapacity=3}...\',\'{InstanceType=m4.large,BidPrice=0.5,WeightedCapacity=5}\'] \n   LaunchSpecifications={SpotSpecification='{TimeoutDurationMinutes=120,TimeoutAction=SWITCH_TO_ON_DEMAND}'}
```

Example 4: To create a cluster with default roles

The following `create-cluster` example uses the `--use-default-roles` parameter to specify the default service role and instance profile.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --use-default-roles \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \n   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \n   --auto-terminate
```

Example 5: To create a cluster and specify the applications to install

The following `create-cluster` example uses the `--applications` parameter to specify the applications that Amazon EMR installs. This example installs Hadoop, Hive and Pig.

```
aws emr create-cluster \
   --applications Name=Hadoop Name=Hive Name=Pig \
```
Example 6: To create a cluster that includes Spark

The following example installs Spark.

```bash
aws emr create-cluster \
  --release-label emr-5.9.0 \ 
  --applications Name=Spark \ 
  --ec2-attributes KeyName=myKey \ 
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \ 
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \ 
  --auto-terminate
```

Example 7: To specify a custom AMI to use for cluster instances

The following `create-cluster` example creates a cluster instance based on the Amazon Linux AMI with ID `ami-a518e6df`.

```bash
aws emr create-cluster \
  --name "Cluster with My Custom AMI" \ 
  --custom-ami-id ami-a518e6df \ 
  --ebs-root-volume-size 20 \ 
  --release-label emr-5.9.0 \ 
  --use-default-roles \ 
  --instance-count 2 \ 
  --instance-type m4.large
```

Example 8: To customize application configurations

The following examples use the `--configurations` parameter to specify a JSON configuration file that contains application customizations for Hadoop. For more information, see Configuring Applications in the Amazon EMR Release Guide.

Contents of `configurations.json`:

```json
[
  {
```
The following example references **configurations.json** as a local file.

```bash
aws emr create-cluster \
   --configurations file://configurations.json \
   --release-label emr-5.9.0 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --auto-terminate
```

The following example references **configurations.json** as a file in Amazon S3.

```bash
aws emr create-cluster \
   --configurations https://s3.amazonaws.com/myBucket/configurations.json \
   --release-label emr-5.9.0 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --auto-terminate
```

**Example 9: To create a cluster with master, core, and task instance groups**

The following `create-cluster` example uses `--instance-groups` to specify the type and number of EC2 instances to use for master, core, and task instance groups.
Example 10: To specify that a cluster should terminate after completing all steps

The following `create-cluster` example uses `--auto-terminate` to specify that the cluster should shut down automatically after completing all steps.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --instance-groups 
   Name=Master,InstanceGroupType=MASTER,InstanceType=m4.large,InstanceCount=1 
   Name=Core,InstanceGroupType=CORE,InstanceType=m4.large,InstanceCount=2 
   Name=Task,InstanceGroupType=TASK,InstanceType=m4.large,InstanceCount=2 \n   --auto-terminate
```

Example 11: To specify cluster configuration details such as the Amazon EC2 key pair, network configuration, and security groups

The following `create-cluster` example creates a cluster with the Amazon EC2 key pair named `myKey` and a customized instance profile named `myProfile`. Key pairs are used to authorize SSH connections to cluster nodes, most often the master node. For more information, see [Use an Amazon EC2 Key Pair for SSH Credentials](https://docs.aws.amazon.com/emr/latest/management-guide/use-ec2-key-pair.html) in the *Amazon EMR Management Guide*.

```
aws emr create-cluster \
   --ec2-attributes KeyName=myKey,InstanceProfile=myProfile \
   --release-label emr-5.9.0 \
   --instance-groups 
   InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large 
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \n   --auto-terminate
```

The following example creates a cluster in an Amazon VPC subnet.

```
aws emr create-cluster \
   --ec2-attributes SubnetId=subnet-xxxxx \
   --release-label emr-5.9.0 \
   --instance-groups 
   InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large 
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \n```
The following example creates a cluster in the us-east-1b availability zone.

```
aws emr create-cluster \
   --ec2-attributes AvailabilityZone=us-east-1b \
   --release-label emr-5.9.0 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only the Amazon EMR-managed security groups.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-master1,EmrManagedSlaveSecurityGroup=sg-slave1 \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only additional Amazon EC2 security groups.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies the EMR-Managed security groups, as well as additional security groups.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```
The following example creates a cluster in a VPC private subnet and use a specific Amazon EC2 security group to enable Amazon EMR service access, which is required for clusters in private subnets.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --ec2-attributes InstanceProfile=myRole,ServiceAccessSecurityGroup=sg-service-access,EmrManagedMasterSecurityGroup=sg-master,EmrManagedSlaveSecurityGroup=sg-slave  \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example specifies security group configuration parameters using a JSON file named `ec2_attributes.json` that is stored locally. NOTE: JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --service-role myServiceRole \
   --ec2-attributes file://ec2_attributes.json  \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Contents of `ec2_attributes.json`:

```
[
 {
   "SubnetId": "subnet-xxxxx",
   "KeyName": "myKey",
   "InstanceProfile":"myRole",
   "EmrManagedMasterSecurityGroup": "sg-master1",
   "EmrManagedSlaveSecurityGroup": "sg-slave1",
   
```
Example 12: To enable debugging and specify a log URI

The following create-cluster example uses the --enable-debugging parameter, which allows you to view log files more easily using the debugging tool in the Amazon EMR console. The --log-uri parameter is required with --enable-debugging.

```
aws emr create-cluster \
  --enable-debugging \
  --log-uri s3://myBucket/myLog \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 13: To add tags when creating a cluster

Tags are key-value pairs that help you identify and manage clusters. The following create-cluster example uses the --tags parameter to create three tags for a cluster, one with the key name name and the value Shirley Rodriguez, a second with the key name age and the value 29, and a third tag with the key name department and the value Analytics.

```
aws emr create-cluster \
  --tags name="Shirley Rodriguez" age=29 department="Analytics" \
  --release-label emr-5.32.0 \
  --instance-type m5.xlarge \
  --instance-count 3 \
  --use-default-roles
```

The following example lists the tags applied to a cluster.

```
aws emr describe-cluster \
  --cluster-id j-XXXXXXYY \
```
Example 14: To use a security configuration that enables encryption and other security features

The following `create-cluster` example uses the `--security-configuration` parameter to specify a security configuration for an EMR cluster. You can use security configurations with Amazon EMR version 4.8.0 or later.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --security-configuration mySecurityConfiguration
```

Example 15: To create a cluster with additional EBS storage volumes configured for the instance groups

When specifying additional EBS volumes, the following arguments are required: `VolumeType`, `SizeInGB` if `EbsBlockDeviceConfigs` is specified.

The following `create-cluster` example creates a cluster with multiple EBS volumes attached to EC2 instances in the core instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-groups
    --auto-terminate
```

The following example creates a cluster with multiple EBS volumes attached to EC2 instances in the master instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-groups 'InstanceGroupType=MASTER, InstanceCount=1, InstanceType=d2.xlarge, EbsConfiguration={EbsOptimized=true, VolumeSpecification=[{VolumeType=gp2, SizeInGB=100}, {VolumeType=io1, SizeInGB=100, Iops=100}, VolumesPerInstance=4]}]' \
    --auto-terminate
```
Example 16: To create a cluster with an automatic scaling policy

You can attach automatic scaling policies to core and task instance groups using Amazon EMR version 4.0 and later. The automatic scaling policy dynamically adds and removes EC2 instances in response to an Amazon CloudWatch metric. For more information, see Using Automatic Scaling in Amazon EMR <https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-automatic-scaling.html>`_ in the Amazon EMR Management Guide.

When attaching an automatic scaling policy, you must also specify the default role for automatic scaling using `--auto-scaling-role EMR_AutoScaling_DefaultRole`

The following `create-cluster` example specifies the automatic scaling policy for the CORE instance group using the `AutoScalingPolicy` argument with an embedded JSON structure, which specifies the scaling policy configuration. Instance groups with an embedded JSON structure must have the entire collection of arguments enclosed in single quotes. Using single quotes is optional for instance groups without an embedded JSON structure.

```
aws emr create-cluster
   --release-label emr-5.9.0 \
   --use-default-roles --auto-scaling-role EMR_AutoScaling_DefaultRole \
   --instance-groups
       InstanceGroupType=MASTER,InstanceType=d2.xlarge,InstanceCount=1
   'InstanceGroupType=CORE,InstanceType=d2.xlarge,InstanceCount=2,AutoScalingPolicy={Constraints={MinCapacity=1,MaxCapacity=5 ...

The following example uses a JSON file, `instancegroupconfig.json`, to specify the configuration of all instance groups in a cluster. The JSON file specifies the automatic scaling policy configuration for the core instance group.

```
Contents of instancegroupconfig.json:

```json
[
  {
    "InstanceCount": 1,
    "Name": "MyMasterIG",
    "InstanceGroupType": "MASTER",
    "InstanceType": "m4.large"
  },
  {
    "InstanceCount": 2,
    "Name": "MyCoreIG",
    "InstanceGroupType": "CORE",
    "InstanceType": "m4.large",
    "AutoScalingPolicy": {
      "Constraints": {
        "MinCapacity": 2,
        "MaxCapacity": 10
      },
      "Rules": [
        {
          "Name": "Default-scale-out",
          "Description": "Replicates the default scale-out rule in the console for YARN memory."
        }
      ],
      "Action": {
        "SimpleScalingPolicyConfiguration": {
          "AdjustmentType": "CHANGE_IN_CAPACITY",
          "ScalingAdjustment": 1,
          "CoolDown": 300
        }
      },
      "Trigger": {
        "CloudWatchAlarmDefinition": {
          "ComparisonOperator": "LESS_THAN",
          "EvaluationPeriods": 1,
          "MetricName": "YARNMemoryAvailablePercentage",
          "Namespace": "AWS/ElasticMapReduce",
          "Period": 300,
          "Threshold": 15,
          "Statistic": "AVERAGE",
          "Unit": "PERCENT",
          "Dimensions": [
            {
              "Key": "JobFlowId",
```
Example 17: Add custom JAR steps when creating a cluster

The following create-cluster example adds steps by specifying a JAR file stored in Amazon S3. Steps submit work to a cluster. The main function defined in the JAR file executes after EC2 instances are provisioned, any bootstrap actions have executed, and applications are installed. The steps are specified using Type=CUSTOM_JAR.

Custom JAR steps require the Jar= parameter, which specifies the path and file name of the JAR. Optional parameters are Type, Name, ActionOnFailure, Args, and MainClass. If main class is not specified, the JAR file should specify Main-Class in its manifest file.

```
aws emr create-cluster \
  --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://myBucket/mytest.jar,Args=arg1,arg2,arg3 \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 18: To add streaming steps when creating a cluster

The following create-cluster examples add a streaming step to a cluster that terminates after all steps run. Streaming steps require parameters Type and Args. Streaming steps optional parameters are Name and ActionOnFailure.

The following example specifies the step inline.

```
aws emr create-cluster \
  --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://myBucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3 \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```
The following example uses a locally stored JSON configuration file named `multiplefiles.json`. The JSON configuration specifies multiple files. To specify multiple files within a step, you must use a JSON configuration file to specify the step. JSON arguments must include options and values as their own items in the list.

```bash
cat multiplefiles.json
```

```json
[
  {
    "Name": "JSON Streaming Step",
    "Args": [
      "-files", "s3://elasticmapreduce/samples/wordcount/wordSplitter.py",
      "-mapper", "wordSplitter.py", "-reducer", "aggregate", "-input", "s3://elasticmapreduce/samples/wordcount/input",
      "-output", "s3://mybucket/wordcount/output"
    ],
    "ActionOnFailure": "CONTINUE",
    "Type": "STREAMING"
  }
]
```

Contents of `multiplefiles.json`:
Example 19: To add Hive steps when creating a cluster

The following example adds Hive steps when creating a cluster. Hive steps require parameters Type and Args. Hive steps optional parameters are Name and ActionOnFailure.

```
aws emr create-cluster \
  --steps Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,ActionOnFailure=TERMINATE_CLUSTER,Args=[-f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://mybucket/hive-ads/output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs] \
  --applications Name=Hive \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Example 20: To add Pig steps when creating a cluster

The following example adds Pig steps when creating a cluster. Pig steps required parameters are Type and Args. Pig steps optional parameters are Name and ActionOnFailure.

```
aws emr create-cluster \
  --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,ActionOnFailure=TERMINATE_CLUSTER,Args=[-f,s3://elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output] \
  --applications Name=Pig \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Example 21: To add bootstrap actions

The following create-cluster example runs two bootstrap actions defined as scripts that are stored in Amazon S3.

```
aws emr create-cluster \
  --bootstrap-actions Path=s3://mybucket/myscript1,Name=BootstrapAction1,Args=[arg1,arg2] Path=s3://mybucket/myscript2,Name=BootstrapAction2,Args=[arg1,arg2] \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
```
Example 22: To enable EMRFS consistent view and customize the RetryCount and RetryPeriod settings

The following create-cluster example specifies the retry count and retry period for EMRFS consistent view. The Consistent=true argument is required.

```
aws emr create-cluster \
  --instance-type m4.large \
  --release-label emr-5.9.0 \
  --emrfs Consistent=true,RetryCount=6,RetryPeriod=30
```

The following example specifies the same EMRFS configuration as the previous example, using a locally stored JSON configuration file named emrfsconfig.json.

```
aws emr create-cluster \
  --instance-type m4.large \
  --release-label emr-5.9.0 \
  --emrfs file://emrfsconfig.json
```

Contents of emrfsconfig.json:

```
{
  "Consistent": true,
  "RetryCount": 6,
  "RetryPeriod": 30
}
```

Example 23: To create a cluster with Kerberos configured

The following create-cluster examples create a cluster using a security configuration with Kerberos enabled, and establishes Kerberos parameters for the cluster using --kerberos-attributes.

The following command specifies Kerberos attributes for the cluster inline.

```
aws emr create-cluster \
  --instance-type m3.xlarge \
  --release-label emr-5.10.0 \
  --auto-terminate
```
The following command specifies the same attributes, but references a locally stored JSON file named `kerberos_attributes.json`. In this example, the file is saved in the same directory where you run the command. You can also reference a configuration file saved in Amazon S3.

```
aws emr create-cluster
    --instance-type m3.xlarge
    --release-label emr-5.10.0
    --service-role EMR_DefaultRole
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole
    --security-configuration mySecurityConfiguration
    --kerberos-attributes file://kerberos_attributes.json
```

Contents of `kerberos_attributes.json`:

```
{
    "Realm": "EC2.INTERNAL",
    "KdcAdminPassword": "123",
    "CrossRealmTrustPrincipalPassword": "123",
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration and has a managed scaling policy.

```
aws emr create-cluster
    --release-label emr-5.30.0
    --service-role EMR_DefaultRole
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole
    --instance-groups InstanceProfile=EMR_EC2_DefaultRole
        InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
        InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
    --managed-scaling-policy
        ComputeLimits='{MinimumCapacityUnits=2,MaximumCapacityUnits=4,UnitType=Instances}'
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--log-encryption-kms-key-id` to define KMS key ID utilized for Log encryption.
aws emr create-cluster \
    --release-label emr-5.30.0 \
    --log-uri s3://myBucket/myLog \
    --log-encryption-kms-key-id arn:aws:kms:us-east-1:110302272565:key/dd559181-283e-45d7-99d1-66da348c4d33 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
    InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \

The following create-cluster example creates an Amazon EMR cluster that uses the "--placement-group-configs" configuration to place master nodes in a high-availability (HA) cluster within an EC2 placement group using SPREAD placement strategy.

aws emr create-cluster \
    --release-label emr-5.30.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups \
        InstanceGroupType=MASTER,InstanceCount=3,InstanceType=m4.large \
    
    --placement-group-configs InstanceRole=MASTER \

The following create-cluster example creates an Amazon EMR cluster that uses the "--auto-termination-policy" configuration to place an automatic idle termination threshold for the cluster.

aws emr create-cluster \
    --release-label emr-5.34.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups \
        InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
        InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large \
    --auto-termination-policy IdleTimeout=100 \

The following create-cluster example creates an Amazon EMR cluster that uses the "--os-release-label" to define an Amazon Linux release for cluster launch

aws emr create-cluster \
    --release-label emr-6.6.0 \
    --os-release-label 2.0.20220406.1 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \

Actions and scenarios
Example 24: To specify an EBS root volume attributes: size, iops and throughput for cluster instances created with EMR releases 6.15.0 and later

The following create-cluster example creates an Amazon EMR cluster that uses root volume attributes to configure root volumes specifications for the EC2 instances.

```bash
aws emr create-cluster \
   --name "Cluster with My Custom AMI" \
   --custom-ami-id ami-a518e6df \
   --ebs-root-volume-size 20 \
   --ebs-root-volume-iops 3000 \
   --ebs-root-volume-throughput 125 \
   --release-label emr-6.15.0 \
   --use-default-roles \
   --instance-count 2 \
   --instance-type m4.large
```

- For API details, see [CreateClusterExamples](#) in *AWS CLI Command Reference*.

create-default-roles

The following code example shows how to use create-default-roles.

**AWS CLI**

1. To create the default IAM role for EC2

   Command:

   ```bash
   aws emr create-default-roles
   ```

   Output:

   If the role already exists then the command returns nothing.

   If the role does not exist then the output will be:

   ```
   [
   ```

Actions and scenarios

2992


For API details, see CreateDefaultRoles in AWS CLI Command Reference.
create-security-configuration

The following code example shows how to use create-security-configuration.

AWS CLI

1. To create a security configuration with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider

Command:

```bash
aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
    "EncryptionConfiguration": {
        "EnableInTransitEncryption" : true,
        "EnableAtRestEncryption" : true,
        "InTransitEncryptionConfiguration" : {
            "TLS CertificateConfiguration" : {
                "CertificateProviderType" : "PEM",
                "S3Object" : "s3://mycertstore/artifacts/MyCerts.zip"
            }
        },
        "AtRestEncryptionConfiguration" : {
            "S3EncryptionConfiguration" : {
                "EncryptionMode" : "SSE-S3"
            },
            "LocalDiskEncryptionConfiguration" : {
                "EncryptionKeyProviderType" : "AwsKms",
                "AwsKmsKey" : "arn:aws:kms:us-east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
            }
        }
    }
}'
```

Output:

```
{
    "CreationDateTime": 1474070889.129,
    "Name": "MySecurityConfig"
}
```
JSON equivalent (contents of security_configuration.json):

```json
{
    "EncryptionConfiguration": {
        "EnableInTransitEncryption": true,
        "EnableAtRestEncryption": true,
        "InTransitEncryptionConfiguration": {
            "TLSCertificateConfiguration": {
                "CertificateProviderType": "PEM",
                "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
            }
        },
        "AtRestEncryptionConfiguration": {
            "S3EncryptionConfiguration": {
                "EncryptionMode": "SSE-S3"
            },
            "LocalDiskEncryptionConfiguration": {
                "EncryptionKeyProviderType": "AwsKms",
                "AwsKmsKey": "arn:aws:kms:us-east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
            }
        }
    }
}
```

Command (using security_configuration.json):

```bash
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file://./security_configuration.json
```

Output:

```json
{
    "CreationDateTime": 1474070889.129,
    "Name": "MySecurityConfig"
}
```

2. To create a security configuration with Kerberos enabled using cluster-dedicated KDC and cross-realm trust

Command:
aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
    "AuthenticationConfiguration": { 
        "KerberosConfiguration": { 
            "Provider": "ClusterDedicatedKdc",
            "ClusterDedicatedKdcConfiguration": { 
                "TicketLifetimeInHours": 24,
                "CrossRealmTrustConfiguration": { 
                    "Realm": "AD.DOMAIN.COM",
                    "Domain": "ad.domain.com",
                    "AdminServer": "ad.domain.com",
                    "KdcServer": "ad.domain.com"
                }
            }
        }
    }
}'

Output:

```json
{
    "CreationDateTime": 1490225558.982,
    "Name": "MySecurityConfig"
}
```

JSON equivalent (contents of security_configuration.json):

```json
{
    "AuthenticationConfiguration": { 
        "KerberosConfiguration": { 
            "Provider": "ClusterDedicatedKdc",
            "ClusterDedicatedKdcConfiguration": { 
                "TicketLifetimeInHours": 24,
                "CrossRealmTrustConfiguration": { 
                    "Realm": "AD.DOMAIN.COM",
                    "Domain": "ad.domain.com",
                    "AdminServer": "ad.domain.com",
                    "KdcServer": "ad.domain.com"
                }
            }
        }
    }
}
```
Command (using security_configuration.json):

```bash
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file://./security_configuration.json
```

Output:

```json
{"CreationDateTime": 1490225558.982, "Name": "MySecurityConfig"}
```

**delete-security-configuration**

The following code example shows how to use delete-security-configuration.

**AWS CLI**

To delete a security configuration in the current region

Command:

```bash
aws emr delete-security-configuration --name MySecurityConfig
```

Output:

None

**describe-cluster**

The following code example shows how to use describe-cluster.

**AWS CLI**

Command:
aws emr describe-cluster --cluster-id j-XXXXXXXX

Output:

For release-label based uniform instance groups cluster:

```
{
   "Cluster": {
      "Status": {
         "Timeline": {
            "ReadyDateTime": 1436475075.199,

- For API details, see [DescribeCluster](#) in *AWS CLI Command Reference*. 
**describe-step**

The following code example shows how to use `describe-step`.

**AWS CLI**

The following command describes a step with the step ID `s-3LZC0QUT43AM` in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```bash
aws emr describe-step --cluster-id j-3SD91U2E1L2QX --step-id s-3LZC0QUT43AM
```

**Output:**

```json
{
  "Step": {
    "Status": {
      "Timeline": {
        "EndDateTime": 1433200470.481,
        "CreationDateTime": 1433199926.597,
        "StartDateTime": 1433200404.959
      },
      "State": "COMPLETED",
      "StateChangeReason": {}
    },
    "Config": {
      "Args": [
        "s3://us-west-2.elasticmapreduce/libs/hive/hive-script",
        "--base-path",
        "s3://us-west-2.elasticmapreduce/libs/hive/",
        "--install-hive",
        "--hive-versions",
        "0.13.1"
      ],
      "Jar": "s3://us-west-2.elasticmapreduce/libs/script-runner/script-runner.jar",
      "Properties": {}
    },
    "Id": "s-3LZC0QUT43AM",
    "ActionOnFailure": "TERMINATE_CLUSTER",
    "Name": "Setup hive"
  }
}
```
• For API details, see `DescribeStep` in *AWS CLI Command Reference*.

**get**

The following code example shows how to use `get`.

**AWS CLI**

The following downloads the `hadoop-examples.jar` archive from the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr get --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src /home/hadoop-examples.jar --dest ~
```

• For API details, see `Get` in *AWS CLI Command Reference*.

**list-clusters**

The following code example shows how to use `list-clusters`.

**AWS CLI**

The following command lists all active EMR clusters in the current region:

```
aws emr list-clusters --active
```

Output:

```json
{
    "Clusters": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200405.353,
                    "CreationDateTime": 1433199926.596
                },
                "State": "WAITING",
                "StateChangeReason": {
                    "Message": "Waiting after step completed"
                }
            }
        }
    ]
}
```
For API details, see ListClusters in AWS CLI Command Reference.

**list-instance-fleets**

The following code example shows how to use list-instance-fleets.

**AWS CLI**

**To get configuration details of instance fleets in a cluster**

This example lists the details of instance fleets in the cluster specified.

**Command:**

```bash
list-instance-fleets --cluster-id 'j-12ABCDEFGHI34JK'
```

**Output:**

```json
{
    "InstanceFleets": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1488759094.637,
                    "CreationDateTime": 1488758719.817
                },
                "State": "RUNNING",
                "StateChangeReason": {
                    "Message": ""
                }
            },
            "ProvisionedSpotCapacity": 6,
            "Name": "CORE",
            "InstanceFleetType": "CORE",
            "NormalizedInstanceHours": 6,
            "Id": "j-3SD91U2E1L2QX",
            "Name": "my-cluster"
        }
    ]
}
```
"LaunchSpecifications": {
   "SpotSpecification": {
      "TimeoutDurationMinutes": 60,
      "TimeoutAction": "TERMINATE_CLUSTER"
   },
   "ProvisionedOnDemandCapacity": 2,
   "InstanceTypeSpecifications": [
      {
         "BidPrice": "0.5",
         "InstanceType": "m3.xlarge",
         "WeightedCapacity": 2
      }
   ],
   "Id": "if-1ABC2DEFGHIJ3"
},
{
   "Status": {
      "Timeline": {
         "ReadyDateTime": 1488759058.598,
         "CreationDateTime": 1488758719.811
      },
      "State": "RUNNING",
      "StateChangeReason": {
         "Message": ""
      }
   },
   "ProvisionedSpotCapacity": 0,
   "Name": "MASTER",
   "InstanceFleetType": "MASTER",
   "ProvisionedOnDemandCapacity": 1,
   "InstanceTypeSpecifications": [
      {
         "BidPriceAsPercentageOfOnDemandPrice": 100.0,
         "InstanceType": "m3.xlarge",
         "WeightedCapacity": 1
      }
   ],
   "Id": "if-2ABC4DEFGHIJ4"
}
}

• For API details, see ListInstanceFleets in AWS CLI Command Reference.
list-instances

The following code example shows how to use list-instances.

AWS CLI

The following command lists all of the instances in a cluster with the cluster ID j-3C6XNQ39VR9WL:

```
aws emr list-instances --cluster-id j-3C6XNQ39VR9WL
```

Output:

For a uniform instance group based cluster

```json
{
  "Instances": [
    {
      "Status": {
        "Timeline": {
          "ReadyDateTime": 1433200400.03,
          "CreationDateTime": 1433199960.152
        },
        "State": "RUNNING",
        "StateChangeReason": {}
      },
      "Ec2InstanceId": "i-f19ecfee",
      "PublicDnsName": "ec2-52-52-41-150.us-west-2.compute.amazonaws.com",
      "PrivateDnsName": "ip-172-21-11-216.us-west-2.compute.internal",
      "PublicIpAddress": "52.52.41.150",
      "Id": "ci-3NNHQUQ2TWB6Y",
      "PrivateIpAddress": "172.21.11.216"
    },
    {
      "Status": {
        "Timeline": {
          "ReadyDateTime": 1433200400.031,
          "CreationDateTime": 1433199949.102
        },
        "State": "RUNNING",
        "StateChangeReason": {}
      },
      "Ec2InstanceId": "i-1feee4c2",
      "PublicDnsName": "ec2-52-63-246-32.us-west-2.compute.amazonaws.com",
```

For a fleet based cluster:
{
  "Instances": [
  {
    "Status": {
      "Timeline": {
        "ReadyDateTime": 1487810810.878,
        "CreationDateTime": 1487810588.367,
        "EndDateTime": 1488022990.924
      },
      "State": "TERMINATED",
      "StateChangeReason": {
        "Message": "Instance was terminated."
      }
    },
    "Ec2InstanceId": "i-xxxxx",
    "InstanceFleetId": "if-xxxxx",
    "EbsVolumes": [],
    "PublicDnsName": "ec2-xx-xxx-xxx-xxx.compute-1.amazonaws.com",
    "PrivateDnsName": "ip-172-31-24-129.us-west-2.compute.internal",
    "PublicIpAddress": "52.25.246.63",
    "Id": "ci-2W3TDFFB47UAD",
    "PrivateIpAddress": "172.21.11.214"
  }
  ]
}
"InstanceType": "m3.xlarge",
"PrivateDnsName": "ip-xx-xx-xxx-xx.ec2.internal",
"Market": "SPOT",
"PublicIpAddress": "xx.xx.xxx.xxx",
"Id": "ci-xxxxx",
"PrivateIpAddress": "10.47.191.80"
}
]

• For API details, see [ListInstances](#) in *AWS CLI Command Reference*.

**list-security-configurations**

The following code example shows how to use `list-security-configurations`.

**AWS CLI**

**To list security configurations in the current region**

**Command:**

```bash
aws emr list-security-configurations
```

**Output:**

```json
{
   "SecurityConfigurations": [
   {
      "CreationDateTime": 1473889697.417,
      "Name": "MySecurityConfig-1"
   },
   {
      "CreationDateTime": 1473889697.417,
      "Name": "MySecurityConfig-2"
   }
   ]
}
```

• For API details, see [ListSecurityConfigurations](#) in *AWS CLI Command Reference*.
**list-steps**

The following code example shows how to use `list-steps`.

**AWS CLI**

The following command lists all of the steps in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```bash
aws emr list-steps --cluster-id j-3SD91U2E1L2QX
```

- For API details, see [ListSteps](https://docs.aws.amazon.com/cli/latest/reference/emr/list-steps.html) in *AWS CLI Command Reference*.

**modify-cluster-attributes**

The following code example shows how to use `modify-cluster-attributes`.

**AWS CLI**

The following command sets the visibility of an EMR cluster with the ID `j-301CDNY0J5XM4` to all users:

```bash
aws emr modify-cluster-attributes --cluster-id j-301CDNY0J5XM4 --visible-to-all-users
```

- For API details, see [ModifyClusterAttributes](https://docs.aws.amazon.com/cli/latest/reference/emr/modify-cluster-attributes.html) in *AWS CLI Command Reference*.

**modify-instance-fleet**

The following code example shows how to use `modify-instance-fleet`.

**AWS CLI**

**To change the target capacities of an instance fleet**

This example changes the On-Demand and Spot target capacities to 1 for the instance fleet specified.

Command:

```bash
aws emr modify-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet InstanceFleetId='if-2ABC4DEFGHIJ4',TargetOnDemandCapacity=1,TargetSpotCapacity=1
```
• For API details, see ModifyInstanceFleet in AWS CLI Command Reference.

put

The following code example shows how to use put.

AWS CLI

The following command uploads a file named healthcheck.sh to the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```bash
aws emr put --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src ~/scripts/healthcheck.sh --dest /home/hadoop/bin/healthcheck.sh
```

• For API details, see Put in AWS CLI Command Reference.

remove-tags

The following code example shows how to use remove-tags.

AWS CLI

The following command removes a tag with the key prod from a cluster with the cluster ID j-3SD91U2E1L2QX:

```bash
aws emr remove-tags --resource-id j-3SD91U2E1L2QX --tag-keys prod
```

• For API details, see RemoveTags in AWS CLI Command Reference.

schedule-hbase-backup

The following code example shows how to use schedule-hbase-backup.

AWS CLI

Note: This command can only be used with HBase on AMI version 2.x and 3.x

1. To schedule a full HBase backup >>>>>>> 06ab6d6e13564b5733d75abaf3b599f93cf39a23

Command:
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type full --dir s3://myBucket/backup --interval 10 --unit hours --start-time 2014-04-21T05:26:10Z --consistent

Output:
None

2. To schedule an incremental HBase backup

Command:

aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type incremental --dir s3://myBucket/backup --interval 30 --unit minutes --start-time 2014-04-21T05:26:10Z --consistent

Output:
None

- For API details, see ScheduleHbaseBackup in AWS CLI Command Reference.

socks

The following code example shows how to use socks.

AWS CLI

The following command opens a socks connection with the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

aws emr socks --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem

The key pair file option takes a local path to a private key file.
- For API details, see Socks in AWS CLI Command Reference.

ssh

The following code example shows how to use ssh.
AWS CLI

The following command opens an ssh connection with the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```bash
aws emr ssh --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

Output:

```
ssh -o StrictHostKeyChecking=no -o ServerAliveInterval=10 -i /home/local/user/.ssh/mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Warning: Permanently added 'ec2-52-52-41-150.us-west-2.compute.amazonaws.com,52.52.41.150' (ECDSA) to the list of known hosts.

Run "sudo yum update" to apply all updates.
```

Welcome to Amazon Elastic MapReduce running Hadoop and Amazon Linux.

Hadoop is installed in `/home/hadoop`. Log files are in `/mnt/var/log/hadoop`. Check `/mnt/var/log/hadoop/steps` for diagnosing step failures.

The Hadoop UI can be accessed via the following commands:

```
NameNode           lynx http://ip-172-21-11-216:9101/
```

```
[hadoop@ip-172-31-16-216 ~]$`

- For API details, see `Ssh` in *AWS CLI Command Reference.*
Amazon EMR on EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR on EKS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

*update-role-trust-policy*

The following code example shows how to use `update-role-trust-policy`.

**AWS CLI**

*To update the trust policy of an IAM Role to be used with Amazon EMR on EKS*

This example command updates the trust policy of a role named *example_iam_role* such that it can be used with Amazon EMR on EKS with *example_namespace* namespace from an EKS cluster named *example_cluster*.

**Command:**

```
aws emr-containers update-role-trust-policy \
    --cluster example_cluster \
    --namespace example_namespace \
    --role-name example_iam_role
```

**Output:**

If the trust policy has already been updated, then the output will be:
Trust policy statement already exists for role example_iam_role. No changes were made!

If the trust policy has not been updated yet, then the output will be:
Successfully updated trust policy of role example_iam_role.

- For API details, see [UpdateRoleTrustPolicy](#) in AWS CLI Command Reference.

**EventBridge examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

**delete-rule**

The following code example shows how to use `delete-rule`.

**AWS CLI**

*To delete a CloudWatch Events rule*

This example deletes the rule named `EC2InstanceStateChanges`:

```
aws events delete-rule --name "EC2InstanceStateChanges"
```

- For API details, see [DeleteRule](#) in AWS CLI Command Reference.
describe-rule

The following code example shows how to use describe-rule.

AWS CLI

To display information about a CloudWatch Events rule

This example displays information about the rule named DailyLambdaFunction:

```bash
aws events describe-rule --name "DailyLambdaFunction"
```

• For API details, see DescribeRule in AWS CLI Command Reference.

disable-rule

The following code example shows how to use disable-rule.

AWS CLI

To disable a CloudWatch Events rule

This example disables the rule named DailyLambdaFunction. The rule is not deleted:

```bash
aws events disable-rule --name "DailyLambdaFunction"
```

• For API details, see DisableRule in AWS CLI Command Reference.

enable-rule

The following code example shows how to use enable-rule.

AWS CLI

To enable a CloudWatch Events rule

This example enables the rule named DailyLambdaFunction, which had been previously disabled:

```bash
aws events enable-rule --name "DailyLambdaFunction"
```

• For API details, see EnableRule in AWS CLI Command Reference.
**list-rule-names-by-target**

The following code example shows how to use `list-rule-names-by-target`.

**AWS CLI**

To display all the rules that have a specified target

This example displays all rules that have the Lambda function named "MyFunctionName" as the target:

```bash
aws events list-rule-names-by-target --target-arn "arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

For API details, see [ListRuleNamesByTarget](https://docs.aws.amazon.com/cli/latest/reference/events/list-rule-names-by-target.html) in *AWS CLI Command Reference*.

**list-rules**

The following code example shows how to use `list-rules`.

**AWS CLI**

To display a list of all CloudWatch Events rules

This example displays all CloudWatch Events rules in the region:

```bash
aws events list-rules
```

To display a list of CloudWatch Events rules beginning with a certain string.

This example displays all CloudWatch Events rules in the region that have a name starting with "Daily":

```bash
aws events list-rules --name-prefix "Daily"
```

For API details, see [ListRules](https://docs.aws.amazon.com/cli/latest/reference/events/list-rules.html) in *AWS CLI Command Reference*.

**list-targets-by-rule**

The following code example shows how to use `list-targets-by-rule`.
AWS CLI

To display all the targets for a CloudWatch Events rule

This example displays all the targets of the rule named DailyLambdaFunction:

```bash
aws events list-targets-by-rule --rule "DailyLambdaFunction"
```

- For API details, see `ListTargetsByRule` in *AWS CLI Command Reference*.

**put-events**

The following code example shows how to use `put-events`.

AWS CLI

To send a custom event to CloudWatch Events

This example sends a custom event to CloudWatch Events. The event is contained within the `putevents.json` file:

```bash
aws events put-events --entries file://putevents.json
```

Here are the contents of the `putevents.json` file:

```json
[
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{"key1": "value1", "key2": "value2" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
  },
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{"key1": "value3", "key2": "value4" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
```
For API details, see [PutEvents](#) in *AWS CLI Command Reference*.

**put-rule**

The following code example shows how to use `put-rule`.

**AWS CLI**

**To create CloudWatch Events rules**

This example creates a rule that triggers every day at 9:00am (UTC). If you use `put-targets` to add a Lambda function as a target of this rule, you could run the Lambda function every day at the specified time:

```
aws events put-rule --name "DailyLambdaFunction" --schedule-expression "cron(0 9 * * ? *)"
```

This example creates a rule that triggers when any EC2 instance in the region changes state:

```
aws events put-rule --name "EC2InstanceStateChanges" --event-pattern "{"source": ["aws.ec2"], "detail-type": ["EC2 Instance State-change Notification"]}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example creates a rule that triggers when any EC2 instance in the region is stopped or terminated:

```
aws events put-rule --name "EC2InstanceStateChangeStopOrTerminate" --event-pattern "{"source": ["aws.ec2"], "detail-type": ["EC2 Instance State-change Notification"], "detail": {"state": ["stopped", "terminated"]}}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

For API details, see [PutRule](#) in *AWS CLI Command Reference*.

**put-targets**

The following code example shows how to use `put-targets`.

---

"DetailType": "myDetailType"
}]
• For API details, see [PutEvents](#) in *AWS CLI Command Reference*.
AWS CLI

To add targets for CloudWatch Events rules

This example adds a Lambda function as the target of a rule:

```bash
aws events put-targets --rule DailyLambdaFunction --targets
  "Id"="1", "Arn"="arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

This example sets an Amazon Kinesis stream as the target, so that events caught by this rule are relayed to the stream:

```bash
aws events put-targets --rule EC2InstanceStateChanges --targets
  "Id"="1", "Arn"="arn:aws:kinesis:us-east-1:123456789012:stream/MyStream", "RoleArn"="arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example sets two Amazon Kinesis streams as targets for one rule:

```bash
aws events put-targets --rule DailyLambdaFunction --targets
  "Id"="Target1", "Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/MyStream1", "RoleArn"="arn:aws:iam::379642911888:role/MyRoleToAccessLambda"
  "Id"="Target2", "Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/MyStream2", "RoleArn"="arn:aws:iam::379642911888:role/MyRoleToAccessLambda"
```

- For API details, see [PutTargets](#) in *AWS CLI Command Reference*.

remove-targets

The following code example shows how to use remove-targets.

AWS CLI

To remove a target for an event

This example removes the Amazon Kinesis stream named MyStream1 from being a target of the rule DailyLambdaFunction. When DailyLambdaFunction was created, this stream was set as a target with an ID of Target1:

```bash
aws events remove-targets --rule "DailyLambdaFunction" --ids "Target1"
```

- For API details, see [RemoveTargets](#) in *AWS CLI Command Reference*. 
test-event-pattern

The following code example shows how to use test-event-pattern.

AWS CLI

To check whether an event pattern matches a specified event

This example tests whether the pattern "source:com.mycompany.myapp" matches the specified event. In this example, the output would be "true":

```
aws events test-event-pattern --event-pattern "{"source":["com.mycompany.myapp"]}" --event "{"id":"1","source":"com.mycompany.myapp","detail-type":"myDetailType","account":"123456789012","region":"us-east-1","time":"2017-04-11T20:11:04Z"}"
```

• For API details, see TestEventPattern in AWS CLI Command Reference.

Firewall Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firewall Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

associate-admin-account

The following code example shows how to use associate-admin-account.
AWS CLI

To set the Firewall Manager administrator account

The following associate-admin-account example sets the administrator account for Firewall Manager.

```
aws fms associate-admin-account
  --admin-account 123456789012
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see AssociateAdminAccount in AWS CLI Command Reference.

delete-notification-channel

The following code example shows how to use delete-notification-channel.

AWS CLI

To remove the SNS topic information for Firewall Manager logs

The following delete-notification-channel example removes the SNS topic information.

```
aws fms delete-notification-channel
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see DeleteNotificationChannel in AWS CLI Command Reference.

delete-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete a Firewall Manager policy
The following delete-policy example removes the policy with the specified ID, along with all of its resources.

```bash
aws fms delete-policy \
   --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
   --delete-all-policy-resources
```

This command produces no output.

For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see `DeletePolicy` in AWS CLI Command Reference.

**disassociate-admin-account**

The following code example shows how to use disassociate-admin-account.

**AWS CLI**

**To remove the Firewall Manager administrator account**

The following disassociate-admin-account example removes the current administrator account association from Firewall Manager.

```bash
aws fms disassociate-admin-account
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see `DisassociateAdminAccount` in AWS CLI Command Reference.

**get-admin-account**

The following code example shows how to use get-admin-account.

**AWS CLI**

**To retrieve the Firewall Manager administrator account**

The following get-admin-account example retrieves the administrator account.
aws fms get-admin-account

Output:

```
{
    "AdminAccount": "123456789012",
    "RoleStatus": "READY"
}
```

For more information, see [AWS Firewall Manager Prerequisites](https://aws.amazon.com/waf/prerequisites) in the [AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide](https://docs.aws.amazon.com/waf/latest/developerguide/).

### get-compliance-detail

The following code example shows how to use `get-compliance-detail`.

**AWS CLI**

**To retrieve the compliance information for an account**

The following `get-compliance-detail` example retrieves compliance information for the specified policy and member account.

```
aws fms get-compliance-detail \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --member-account 123456789012
```

Output:

```
{
    "PolicyComplianceDetail": {
        "EvaluationLimitExceeded": false,
        "IssueInfoMap": {},
        "MemberAccount": "123456789012",
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyOwner": "123456789012",
        "Violators": []
    }
}
```
For more information, see [Viewing Resource Compliance with a Policy](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetComplianceDetail](#) in *AWS CLI Command Reference*.

### get-notification-channel

The following code example shows how to use `get-notification-channel`.

**AWS CLI**

To retrieve the SNS topic information for Firewall Manager logs

The following `get-notification-channel` example retrieves the SNS topic information.

```
aws fms get-notification-channel
```

Output:

```
{
    "SnsRoleName": "arn:aws:iam::123456789012:role/aws-service-role/fms.amazonaws.com/AWSServiceRoleForFMS"
}
```

For more information, see [Configure Amazon SNS Notifications and Amazon CloudWatch Alarms](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetNotificationChannel](#) in *AWS CLI Command Reference*.

### get-policy

The following code example shows how to use `get-policy`.

**AWS CLI**

To retrieve a Firewall Manager policy

The following `get-policy` example retrieves the policy with the specified ID.

```
aws fms get-policy \
```
Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:p+2RpKR4wPFx7mcrL1UOQQ==",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_COMMON",
            "ResourceType": "AWS::EC2::Instance",
            "ResourceTags": [],
            "ExcludeResourceTags": false,
            "RemediationEnabled": false
        },
        "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/d1ac59b8-938e-42b3-b2e0-7c620422ddc2"
    }
}
```

For more information, see [Working with AWS Firewall Manager Policies](https://docs.aws.amazon.com/waf/latest/developerguide/working-with-firewall-manager-policies.html) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetPolicy](https://docs.aws.amazon.com/cli/latest/reference/fms/get-policy.html) in *AWS CLI Command Reference*.

### list-compliance-status

The following code example shows how to use `list-compliance-status`.

**AWS CLI**

**To retrieve the policy compliance information for member accounts**

The following `list-compliance-status` example retrieves member account compliance information for the specified policy.

```
aws fms list-compliance-status \
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```
For more information, see Viewing Resource Compliance with a Policy in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListComplianceStatus in AWS CLI Command Reference.

**list-member-accounts**

The following code example shows how to use list-member-accounts.

**AWS CLI**

To retrieve the member accounts in the organization

The following list-member-accounts example lists all of the member accounts that are in the Firewall Manager administrator's organization.
aws fms list-member-accounts

Output:

```json
{
    "MemberAccounts": [
        "222222222222",
        "333333333333",
        "444444444444"
    ]
}
```

For more information, see [AWS Firewall Manager](https://aws.amazon.com/waf) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListMemberAccounts](https://docs.aws.amazon.com/cli/latest/reference/fms/list-member-accounts.html) in *AWS CLI Command Reference*.

**list-policies**

The following code example shows how to use list-policies.

**AWS CLI**

**To retrieve all Firewall Manager policies**

The following list-policies example retrieves the list of policies for the account. In this example, the output is limited to two results per request. Each call returns a NextToken that can be used as the value for the --starting-token parameter in the next list-policies call to get the next set of results for the list.

```
aws fms list-policies \
    --max-items 2
```

Output:

```json
{
    "PolicyList": [
        {
            "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/\n                        a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```
For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListPolicies in AWS CLI Command Reference.

put-notification-channel

The following code example shows how to use put-notification-channel.

**AWS CLI**

To set the SNS topic information for Firewall Manager logs

The following put-notification-channel example sets the SNS topic information.

```bash
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.
For API details, see PutNotificationChannel in AWS CLI Command Reference.

put-policy

The following code example shows how to use put-policy.

AWS CLI

To create a Firewall Manager policy

The following put-policy example creates a Firewall Manager security group policy.

```
aws fms put-policy \\
   --cli-input-json file://policy.json
```

Contents of policy.json:

```
{
   "Policy": {
      "PolicyName": "test",
      "SecurityServicePolicyData": {
         "Type": "SECURITY_GROUPS_USAGE_AUDIT",
         "ManagedServiceData": "{"type":"SECURITY_GROUPS_USAGE_AUDIT","deleteUnusedSecurityGroups":false,"coalesceRedundantSecurityGroups":true}'",
         "ResourceType": "AWS::EC2::SecurityGroup",
         "ResourceTags": [],
         "ExcludeResourceTags": false,
         "RemediationEnabled": false
      },
      "TagList": [
         {
            "Key": "foo",
            "Value": "foo"
         }
      ]
   }
}
```

Output:

```
{
```
"Policy": {
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyName": "test",
    "PolicyUpdateToken": "1:X9QGexP7HASDlsFp+G31Iw==",
    "SecurityServicePolicyData": {
        "Type": "SECURITY_GROUPS_USAGE_AUDIT",
        "ManagedServiceData": "{"type"":"SECURITY_GROUPS_USAGE_AUDIT","deleteUnusedSecurityGroups":false,"coalesceRedundantSecurityGroups":true,"optionalDelayForUnusedInMinutes":null}"},
    "ResourceType": "AWS::EC2::SecurityGroup",
    "ResourceTags": [],
    "ExcludeResourceTags": false,
    "RemediationEnabled": false
},
"PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}

For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see PutPolicy in AWS CLI Command Reference.

AWS FIS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS FIS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**create-experiment-template**

The following code example shows how to use `create-experiment-template`.

**AWS CLI**

To create an experiment template

The following `create-experiment-template` example creates an experiment template in your AWS FIS account.

```bash
aws fis create-experiment-template \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```json
{
    "description": "experimentTemplate",
    "stopConditions": [
    {
        "source": "aws:cloudwatch:alarm",
        "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
    }
    ],
    "targets": {
    "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
            "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
    }
    },
    "actions": {
    "reboot": {
        "actionId": "aws:ec2:reboot-instances",
        "description": "reboot",
        "parameters": {},
        "targets": {
            "Instances": "Instances-Target-1"
        }
    }
    }
}
```
Output:

```json
{
  "experimentTemplate": {
    "id": "ABCDE1fgHIkJlmNop",
    "description": "experimentTemplate",
    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",

        "targets": {
          "Instances": "Instances-Target-1"
        }
      }
    },
    "stopConditions": [
      {
        "source": "aws:cloudwatch:alarm",
        "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
      }
    ],
    "creationTime": 1616434850.659,
    "lastUpdateTime": 1616434850.659,
    "roleArn": "arn:aws:iam::123456789012:role/myRole",
    "tags": {}  
  }
}
```
For more information, see Create an experiment template in the AWS Fault Injection Simulator User Guide.

- For API details, see CreateExperimentTemplate in AWS CLI Command Reference.

**delete-experiment-template**

The following code example shows how to use delete-experiment-template.

**AWS CLI**

**To delete an experiment template**

The following delete-experiment-template example deletes the specified experiment template.

```bash
aws fis delete-experiment-template \
   --id ABCDE1fgHIjkLmNop
```

**Output:**

```
{
   "experimentTemplate": {
      "id": "ABCDE1fgHIjkLmNop",
      "description": "myExperimentTemplate",
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
               "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
         }
      },
      "actions": {
         "testaction": {
            "actionId": "aws:ec2:stop-instances",
            "parameters": {},
            "targets": {
               "Instances": "Instances-Target-1"
            }
         }
      }
   }
}
```
For more information, see Delete an experiment template in the AWS Fault Injection Simulator User Guide.

- For API details, see DeleteExperimentTemplate in AWS CLI Command Reference.

get-action

The following code example shows how to use get-action.

AWS CLI

To get action details

The following get-action example gets the details of the specified action.

```bash
aws fis get-action \
   --id aws:ec2:stop-instances
```

Output:

```json
{
   "action": {
      "id": "aws:ec2:stop-instances",
      "description": "Stop the specified EC2 instances.",
      "parameters": {
         "startInstancesAfterDuration": {
            "description": "The time to wait before restarting the instances (ISO 8601 duration).",
            "required": false
```
get-experiment-template

The following code example shows how to use `get-experiment-template`.

**AWS CLI**

To get experiment template details

The following `get-experiment-template` example gets the details of the specified experiment template.

```
aws fis get-experiment-template \
   --id ABCDE1fgHIjKLmNop
```

Output:

```json
{
   "experimentTemplate": {
      "id": "ABCDE1fgHIjKLmNop",
      "description": "myExperimentTemplate",
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
                i-12a3b4c5678e9012"
            ]
         }
      }
   }
}
```
For more information, see Experiment templates in the AWS Fault Injection Simulator User Guide.

- For API details, see GetExperimentTemplate in AWS CLI Command Reference.

get-experiment

The following code example shows how to use get-experiment.

AWS CLI

To get experiment details

The following get-experiment example gets the details of the specified experiment.

```bash
aws fis get-experiment \
   --id ABC12DeFGhI3jKLMNOP
```
Output:

```json
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIjkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "completed",
            "reason": "Experiment completed."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "state": {
                    "status": "completed",
                    "reason": "Action was completed."
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432509.662,
        "startTime": 1616432509.962,
        "endTime": 1616432522.307,
        "tags": {}
    }
}
For more information, see [Experiments for AWS FIS](https://aws.amazon.com/fis) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [GetExperiment](https://docs.aws.amazon.com/cli/latest/reference/fis/get-experiment.html) in *AWS CLI Command Reference*.

**list-actions**

The following code example shows how to use `list-actions`.

**AWS CLI**

**To list actions**

The following `list-actions` example lists the available actions.

```bash
aws fis list-actions
```

**Output:**

```json
{
    "actions": [
        {
            "id": "aws:ec2:reboot-instances",
            "description": "Reboot the specified EC2 instances.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        },
        {
            "id": "aws:ec2:stop-instances",
            "description": "Stop the specified EC2 instances.",
            "targets": {
                "Instances": {
                    "resourceType": "aws:ec2:instance"
                }
            },
            "tags": {}
        }
    ]
}
```
{
  "id": "aws:ec2:terminate-instances",
  "description": "Terminate the specified EC2 instances.",
  "targets": {
    "Instances": {
      "resourceType": "aws:ec2:instance"
    }},
  "tags": {}
},
{
  "id": "aws:ecs:drain-container-instances",
  "description": "Drain percentage of underlying EC2 instances on an ECS cluster.",
  "targets": {

       "resourceType": "aws:rds:cluster"
     },
     "tags": {}
   },
 {  
   "id": "aws:rds:reboot-db-instances",
   "description": "Reboot the specified DB instances.",
   "targets": {
     "DBInstances": {
       "resourceType": "aws:rds:db"
     }  
   }
For more information, see Actions in the AWS Fault Injection Simulator User Guide.

- For API details, see ListActions in AWS CLI Command Reference.

**list-experiment-templates**

The following code example shows how to use `list-experiment-templates`.

**AWS CLI**

**To list experiment templates**

The following `list-experiment-templates` example lists the experiment templates in your AWS account.

```
aws fis list-experiment-templates
```

Output:

```
{
    "experimentTemplates": [
    {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017191.124,
    ]
}
```
For more information, see [Experiment templates](#) in the AWS Fault Injection Simulator User Guide.

- For API details, see [ListExperimentTemplates](#) in *AWS CLI Command Reference*.

### list-experiments

The following code example shows how to use list-experiments.

**AWS CLI**

To list experiments

The following `list-experiments` example lists the experiments in your AWS account.

```
aws fis list-experiments
```

Output:

```
{
   "experiments": [
   {
      "id": "ABCdeF1GHiJkLM23NO",
      "experimentTemplateId": "ABCDE1fgHIJkLmNop",
      "state": {
         "status": "running",
         "reason": "Experiment is running."
      },
      "creationTime": 1616017341.197,
      "tags": {
         "key": "value"
      }
   }
   ]
}
```
For more information, see Experiments in the AWS Fault Injection Simulator User Guide.

- For API details, see ListExperiments in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a resource

The following list-tags-for-resource example lists the tags for the specified resource.

```bash
aws fis list-tags-for-resource \
```

Output:

```json
{
   "tags": {
      "key1": "value1",
      "key2": "value2"
   }
}
```

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

start-experiment

The following code example shows how to use start-experiment.

AWS CLI

To start an experiment

The following start-experiment example starts the specified experiment.
```bash
aws fis start-experiment \
   --experiment-template-id ABCDE1fgHIJkLmNop
```

**Output:**

```json
{
   "experiment": {
      "id": "ABC12DeFGhI3jKLMNOP",
      "experimentTemplateId": "ABCDE1fgHIJkLmNop",
      "roleArn": "arn:aws:iam::123456789012:role/myRole",
      "state": {
         "status": "initiating",
         "reason": "Experiment is initiating."
      },
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
            "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
         }
      },
      "actions": {
         "reboot": {
            "actionId": "aws:ec2:reboot-instances",
            "parameters": {},
            "targets": {
               "Instances": "Instances-Target-1"
            },
            "state": {
               "status": "pending",
               "reason": "Initial state"
            }
         }
      },
      "stopConditions": [
         {
            "source": "none"
         }
      ],
      "creationTime": 1616432464.025,
   }
}
```
For more information, see Experiments for AWS FIS in the AWS Fault Injection Simulator User Guide.

- For API details, see StartExperiment in AWS CLI Command Reference.

stop-experiment

The following code example shows how to use stop-experiment.

AWS CLI

To stop an experiment

The following stop-experiment example stops the specified experiment from running.

/aws fis stop-experiment \
  --id ABC12DeFGhI3jKLMNOP

Output:

```json
{
  "experiment": {
    "id": "ABC12DeFGhI3jKLMNOP",
    "experimentTemplateId": "ABCDE1fgHIjkLmNop",
    "roleArn": "arn:aws:iam::123456789012:role/myRole",
    "state": {
      "status": "stopping",
      "reason": "Stopping Experiment."
    },
    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
          "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
      }
    }
  }
}```
For more information, see [Experiments for AWS FIS](https://docs.aws.amazon.com/fis/latest/userguide/) in the [AWS Fault Injection Simulator User Guide](https://docs.aws.amazon.com/fis/latest/userguide/).

- For API details, see [StopExperiment](https://docs.aws.amazon.com/cli/latest/reference/fis/stop-experiment.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/fis/).
tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following tag-resource example tags the specified resource.

```
aws fis tag-resource \
   --tags key1=value1,key2=value2
```

This command produces no output.

For more information, see [Tag your AWS FIS resources](#) in the [AWS Fault Injection Simulator User Guide](#).

- For API details, see [TagResource](#) in [AWS CLI Command Reference](#).

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To untag a resource

The following untag-resource example removes the tags from the specified resource.

```
aws fis untag-resource \
```

This command produces no output.

For more information, see [Tag your AWS FIS resources](#) in the [AWS Fault Injection Simulator User Guide](#).

- For API details, see [UntagResource](#) in [AWS CLI Command Reference](#).
update-experiment-template

The following code example shows how to use update-experiment-template.

AWS CLI

To update an experiment template

The following update-experiment-template example updates the description of the specified experiment template.

```
aws fis update-experiment-template \
   --id ABCDE1fgHIJkLmNop \
   ---description myExperimentTemplate
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ]
    }
}
```
For more information, see Update an experiment template in the AWS Fault Injection Simulator User Guide.

- For API details, see UpdateExperimentTemplate in AWS CLI Command Reference.

Amazon GameLift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon GameLift.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**create-build**

The following code example shows how to use create-build.
AWS CLI

Example 1: To create a game build from files in an S3 bucket

The following create-build example creates a custom game build resource. It uses zipped files that are stored in an S3 location in an AWS account that you control. This example assumes that you’ve already created an IAM role that gives Amazon GameLift permission to access the S3 location. Since the request does not specify an operating system, the new build resource defaults to WINDOWS_2012.

```
aws gamelift create-build \
    --storage-location file://storage-loc.json \n    --name MegaFrogRaceServer.NA \n    --build-version 12345.678
```

Contents of `storage-loc.json`:

```
{
    "Bucket":"MegaFrogRaceServer_NA_build_files"
    "Key":"MegaFrogRaceServer_build_123.zip"
    "RoleArn":"arn:aws:iam::123456789012:role/gamelift"
}
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA",
        "OperatingSystem": "WINDOWS_2012",
        "SizeOnDisk": 479303,
        "Status": "INITIALIZED",
        "Version": "12345.678"
    },
    "StorageLocation": {
        "Bucket": "MegaFrogRaceServer_NA_build_files",
        "Key": "MegaFrogRaceServer_build_123.zip"
    }
}
```
Example2: To create a game build resource for manually uploading files to GameLift

The following create-build example creates a new build resource. It also gets a storage location and temporary credentials that allow you to manually upload your game build to the GameLift location in Amazon S3. Once you've successfully uploaded your build, the GameLift service validates the build and updates the new build's status.

```bash
aws gamelift create-build \
   --name MegaFrogRaceServer.NA \
   --build-version 12345.678 \
   --operating-system AMAZON_LINUX
```

Output:

```
{
   "Build": {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
      "CreationTime": 1496708916.18,
      "Name": "MegaFrogRaceServer.NA",
      "OperatingSystem": "AMAZON_LINUX",
      "SizeOnDisk": 0,
      "Status": "INITIALIZED",
      "Version": "12345.678"
   },
   "StorageLocation": {
      "Bucket": "gamelift-builds-us-west-2",
      "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111"
   },
   "UploadCredentials": {
      "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
      "SecretAccessKey": "wJalrXUtntFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
      "SessionToken": "AgoGb3JpZ21uENz...EXAMPLETOKEN=="
   }
}
```

For more information, see [Upload a Custom Server Build to GameLift](https://docs.aws.amazon.com/gamelift/latest/developerguide/upload-custom-server-build.html) in the Amazon GameLift Developer Guide.
create-fleet

The following code example shows how to use create-fleet.

AWS CLI

Example 1: To create a basic Linux fleet

The following create-fleet example creates a minimally configured fleet of on-demand Linux instances to host a custom server build. You can complete the configuration by using update-fleet.

```
aws gamelift create-fleet \
   --name MegaFrogRaceServer.NA.v2 \ 
   --description 'Hosts for v2 North America' \ 
   --build-id build-1111aaaa-22bb-33cc-44dd-5555eeee66ff \ 
   --certificate-configuration 'CertificateType=GENERATED' \ 
   --ec2-instance-type c4.large \ 
   --fleet-type ON_DEMAND \ 
   --runtime-configuration 'ServerProcesses=[{LaunchPath=/local/game/release-na/MegaFrogRace_Server.exe,ConcurrentExecutions=1}]
```

Output:

```
{
   "FleetAttributes": {
      "BuildId": "build-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
      "CertificateConfiguration": {
         "CertificateType": "GENERATED",
      },
      "CreationTime": 1496365885.44,
      "Description": "Hosts for v2 North America",
      "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
      "FleetId": "fleets-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
      "FleetType": "ON_DEMAND",
      "InstanceType": "c4.large",
      "MetricGroups": ["default"],
      "Name": "MegaFrogRace.NA.v2",
      "NewGameSessionProtectionPolicy": "NoProtection",
```
Example 2: To create a basic Windows fleet

The following `create-fleet` example creates a minimally configured fleet of spot Windows instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```bash
aws gamelift create-fleet \
   --name MegaFrogRace.NA.v2 \
   --description 'Hosts for v2 North America' \
   --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff \
   --certificate-configuration 'CertificateType=GENERATED' \
   --ec2-instance-type c4.large \
   --fleet-type SPOT \
   --runtime-configuration 'ServerProcesses=[{LaunchPath=C:\game Bin64.Release.Dedicated\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```json
{
    "FleetAttributes": {
        "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "SPOT",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "OperatingSystem": "WINDOWS_2012",
        "ServerLaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
```

Actions and scenarios
Example 3: To create a fully configured fleet

The following `create-fleet` example creates a fleet of Spot Windows instances for a custom server build, with most commonly used configuration settings provided.

```bash
aws gamelift create-fleet \
   --name MegaFrogRace.NA.v2 \ 
   --description 'Hosts for v2 North America' \ 
   --build-id build-2222aaaa-33bb-44cc-55dd-6666eeeee77ff \ 
   --certificate-configuration 'CertificateType=GENERATED' \ 
   --ec2-instance-type c4.large \ 
   --ec2-inbound-permissions 'FromPort=33435,ToPort=33435,IpRange=10.24.34.0/23,Protocol=UDP' \ 
   --fleet-type SPOT \ 
   --new-game-session-protection-policy FullProtection \ 
   --runtime-configuration file://runtime-config.json \ 
   --metric-groups default \ 
   --instance-role-arn 'arn:aws:iam::444455556666:role/GameLiftS3Access'
```

Contents of `runtime-config.json`:

```json
GameSessionActivationTimeoutSeconds=300,
MaxConcurrentGameSessionActivations=2,
ServerProcesses=[
  {LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,Parameters=-debug,ConcurrentExecutions=1},
  {LaunchPath=C:\game\Bin64.Release.Dedicated \MegaFrogRace_Server.exe,ConcurrentExecutions=1}]
```

Output:

```json
{
    "FleetAttributes": {
        "InstanceRoleArn": "arn:aws:iam::444455556666:role/GameLiftS3Access",
        "Status": "NEW",
        "InstanceType": "c4.large",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
```

```
```
Example 4: To create a Realtime Servers fleet

The following `create-fleet` example creates a fleet of Spot instances with a Realtime configuration script that has been uploaded to Amazon GameLift. All Realtime servers are deployed onto Linux machines. For the purposes of this example, assume that the uploaded Realtime script includes multiple script files, with the `Init()` function located in the script file called `MainScript.js`. As shown, this file is identified as the launch script in the runtime configuration.

```bash
aws gamelift create-fleet \
    --name MegaFrogRace.NA.realtime \
    --description 'Mega Frog Race Realtime fleet' \
    --script-id script-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
    --ec2-instance-type c4.large \
    --fleet-type SPOT \
    --certificate-configuration 'CertificateType=GENERATED' --runtime-configuration 'ServerProcesses=[[LaunchPath=/local/game/MainScript.js,Parameters=+map Winter444,ConcurrentExecutions=5]]'
```

Output:

```
{
```
For API details, see CreateFleet in AWS CLI Command Reference.

create-game-session-queue

The following code example shows how to use create-game-session-queue.

AWS CLI

Example1: To set up an ordered game session queue

The following create-game-session-queue example creates a new game session queue with destinations in two regions. It also configures the queue so that game session requests time out after waiting 10 minutes for placement. Since no latency policies are defined, GameLift attempts to place all game sessions with the first destination listed.

```
aws gamelift create-game-session-queue \
   --name MegaFrogRaceServer-NA \
   --destinations file://destinations.json \n   --timeout-in-seconds 600
```
Contents of destinations.json:

```json
{
    "Destinations": [
        {
            "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

Output:

```json
{
    "GameSessionQueues": [
        {
            "Name": "MegaFrogRaceServer-NA",
            "TimeoutInSeconds": 600,
            "Destinations": [
                {
                    "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                },
                {
                    "DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                }
            ]
        }
    ]
}
```

**Example2: To set up a game session queue with player latency policies**

The following `create-game-session-queue` example creates a new game session queue with two player latency policies. The first policy sets a 100ms latency cap that is enforced during the first minute of a game session placement attempt. The second policy raises the latency cap to 200ms until the placement request times out at 3 minutes.

```bash
aws gamelift create-game-session-queue \
  --name MegaFrogRaceServer-NA \
  --destinations file://destinations.json \
  --player-latency-policies file://latency-policies.json \
  --timeout-in-seconds 180
```
Contents of destinations.json:

```json
{
   "Destinations": [
      {
         "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      },
      {
         "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
      }
   ]
}
```

Contents of latency-policies.json:

```json
{
   "PlayerLatencyPolicies": [
      {
         "MaximumIndividualPlayerLatencyMilliseconds": 200
      },
      {
         "MaximumIndividualPlayerLatencyMilliseconds": 100,
         "PolicyDurationSeconds": 60
      }
   ]
}
```

Output:

```json
{
   "GameSessionQueue": {
      "Name": "MegaFrogRaceServer-NA",
      "TimeoutInSeconds": 600,
      "PlayerLatencyPolicies": [
      {
         "MaximumIndividualPlayerLatencyMilliseconds": 100,
         "PolicyDurationSeconds": 60
      },
      {
         "MaximumIndividualPlayerLatencyMilliseconds": 200
      }
      ],
      "Destinations": [
      {
         "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      },
      {
         "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
      }
   ]
}
```
For more information, see Create a Queue in the Amazon GameLift Developer Guide.

- For API details, see CreateGameSessionQueue in AWS CLI Command Reference.

**delete-build**

The following code example shows how to use delete-build.

**AWS CLI**

**To delete a custom game build**

The following delete-build example removes a build from your Amazon GameLift account. After the build is deleted, you cannot use it to create new fleets. This operation cannot be undone.

```
aws gamelift delete-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

- For API details, see DeleteBuild in AWS CLI Command Reference.

**delete-fleet**

The following code example shows how to use delete-fleet.

**AWS CLI**

**To delete a fleet that is no longer in use**

The following delete-fleet example removes a fleet that has been scaled down to zero instances. If the fleet capacity is greater than zero, the request fails with an HTTP 400 error.

```
aws gamelift delete-fleet \
   --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.
For more information, see Manage GameLift Fleets in the Amazon GameLift Developer Guide.

- For API details, see DeleteFleet in AWS CLI Command Reference.

**delete-game-session-queue**

The following code example shows how to use delete-game-session-queue.

**AWS CLI**

**To delete a game session queue**

The following delete-game-session-queue example deletes a specified game session queue.

```bash
aws gamelift delete-game-session-queue \
    --name MegaFrogRace-NA
```

This command produces no output.

- For API details, see DeleteGameSessionQueue in AWS CLI Command Reference.

**describe-build**

The following code example shows how to use describe-build.

**AWS CLI**

**To get information on a custom game build**

The following describe-build example retrieves properties for a game server build resource.

```bash
aws gamelift describe-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    
```
For more information, see [Upload a Custom Server Build to GameLift](#) in the [Amazon GameLift Developer Guide](#).

- For API details, see [DescribeBuild](#) in [AWS CLI Command Reference](#).

### describe-ec2-instance-limits

The following code example shows how to use `describe-ec2-instance-limits`.

**AWS CLI**

**To retrieve service limits for an EC2 instance type**

The following `describe-ec2-instance-limits` example displays the maximum allowed instances and current instances in use for the specified EC2 instance type in the current Region. The result indicates that only five of the allowed twenty instances are being used.

```bash
aws gamelift describe-ec2-instance-limits \
   --ec2-instance-type m5.large
```

**Output:**

```
{
   "EC2InstanceLimits": [
      {
         "EC2InstanceType": "m5.large",
         "CurrentInstances": 5,
         "InstanceLimit": 20
      }
   ]
}
```
For more information, see Choose Computing Resources in the Amazon GameLift Developer Guide.

- For API details, see DescribeEc2InstanceLimits in AWS CLI Command Reference.

describe-fleet-attributes

The following code example shows how to use describe-fleet-attributes.

AWS CLI

**Example1: To view attributes for a list of fleets**

The following describe-fleet-attributes example retrieves fleet attributes for two specified fleets. As shown, the requested fleets are deployed with the same build, one for On-Demand instances and one for Spot instances, with some minor configuration differences.

```bash
aws gamelift describe-fleet-attributes \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "FleetType": "ON_DEMAND",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-od",
            "CreationTime": 1568836191.995,
            "Status": "ACTIVE",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\game\MegaFrogRace_Server.exe",
            "ServerLaunchParameters": "+gamelift_start_server",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
```
"default",
"CertificateConfiguration": {
    "CertificateType": "DISABLED"
}
},
{
    "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "FleetType": "SPOT",
    "InstanceType": "c4.large",
    "Description": "On-demand hosts for v2 North America",
    "Name": "MegaFrogRaceServer.NA.v2-spot",
    "CreationTime": 1568838275.379,
    "Status": "ACTIVATING",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "ServerLaunchPath": "C:\game\MegaFrogRace_Server.exe",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "OperatingSystem": "WINDOWS_2012",
    "MetricGroups": [
        "default"
    ],
    "CertificateConfiguration": {
        "CertificateType": "GENERATED"
    }
}
}

**Example2: To request attributes for all fleets**

The following `describe-fleet-attributes` returns fleet attributes for all fleets with any status. This example illustrates the use of pagination parameters to return one fleet at a time.

```
aws gamelift describe-fleet-attributes \
    --limit 1
```

**Output:**

```
{
```
"FleetAttributes": [
  {
    "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "FleetType": "SPOT",
    "InstanceType": "c4.large",
    "Description": "On-demand hosts for v2 North America",
    "Name": "MegaFrogRaceServer.NA.v2-spot",
    "CreationTime": 1568838275.379,
    "Status": "ACTIVATING",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "ServerLaunchPath": "C:\game\MegaFrogRace_Server.exe",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "OperatingSystem": "WINDOWS_2012",
    "MetricGroups": [
      "default"
    ],
    "CertificateConfiguration": {
      "CertificateType": "GENERATED"
    }
  }
],
"NextToken": "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJjY2FlLTQ3YTctOWI5ZS1iYjFkYTQwMjEXAMPLE1"
}

The output includes a NextToken value that you can use when you call the command a second time. Pass the value to the --next-token parameter to specify where to pick up the output. The following command returns the second result in the output.

```
aws gamelift describe-fleet-attributes \
  --limit 1 \
  --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTzmMSI
```

Repeat until the response doesn't include a NextToken value.

For more information, see Setting Up GameLift Fleets in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetAttributes in AWS CLI Command Reference.
describe-fleet-capacity

The following code example shows how to use describe-fleet-capacity.

AWS CLI

To view capacity status for a list of fleets

The following describe-fleet-capacity example retrieves current capacity for two specified fleets.

```bash
aws gamelift describe-fleet-capacity \
   --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```json
{
   "FleetCapacity": [
      {
         "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "InstanceType": "c5.large",
         "InstanceCounts": {
            "DESIRED": 10,
            "MINIMUM": 1,
            "MAXIMUM": 20,
            "PENDING": 0,
            "ACTIVE": 10,
            "IDLE": 3,
            "TERMINATING": 0
         }
      },
      {
         "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
         "InstanceType": "c5.large",
         "InstanceCounts": {
            "DESIRED": 13,
            "MINIMUM": 1,
            "MAXIMUM": 20,
            "PENDING": 0,
            "ACTIVE": 15,
            "IDLE": 2,
            "TERMINATING": 2
         }
      }
   ]
}
```
For more information, see GameLift Metrics for Fleets in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetCapacity in AWS CLI Command Reference.

**describe-fleet-events**

The following code example shows how to use describe-fleet-events.

**AWS CLI**

To request events for a specified time span

The following describe-fleet-events example displays details of all fleet-related events that occurred during the specified time span.

```bash
aws gamelift describe-fleet-events \
  --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --start-time 1579647600 \
  --end-time 1579649400 \
  --limit 5
```

Output:

```json
{
  "Events": [
    {
      "EventId": "a37b6892-5d07-4d3b-8b47-80244ecf66b9",
      "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "EventCode": "FLEET_STATE_ACTIVE",
      "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed state to ACTIVE",
      "EventTime": 1579649342.191
    },
    {
      "EventId": "67da4ec9-92a3-4d95-886a-5d6772c24063",
      "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

Actions and scenarios
For more information, see [Debug GameLift Fleet Issues](#) in the Amazon GameLift Developer Guide.

- For API details, see [DescribeFleetEvents](#) in AWS CLI Command Reference.

**describe-fleet-port-settings**

The following code example shows how to use `describe-fleet-port-settings`.

**AWS CLI**

**To view inbound connection permissions for a fleet**

The following `describe-fleet-port-settings` example retrieves connection settings for a specified fleet.

```bash
aws gamelift describe-fleet-port-settings \
   --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111
```

Output:

```json
{
   "InboundPermissions": [
      {
         "FromPort": 33400,
         "ToPort": 33500,
         "IpRange": "0.0.0.0/0",
         "Protocol": "UDP"
      },
      
   ]
}
```
"FromPort": 1900,
"ToPort": 2000,
"IpRange": "0.0.0.0/0",
"Protocol": "TCP"
}
]
}

For more information, see Setting Up GameLift Fleets in the Amazon GameLift Developer Guide.
- For API details, see DescribeFleetPortSettings in AWS CLI Command Reference.

describe-fleet-utilization

The following code example shows how to use describe-fleet-utilization.

AWS CLI

Example1: To view usage data for a list of fleets

The following describe-fleet-utilization example retrieves current usage information for one specified fleet.

```
aws gamelift describe-fleet-utilization \
   --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
   "FleetUtilization": [
      {
         "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "ActiveServerProcessCount": 100,
         "ActiveGameSessionCount": 62,
         "CurrentPlayerSessionCount": 329,
         "MaximumPlayerSessionCount": 1000
      }
   ]
}
```

Example2: To request usage data for all fleets

Actions and scenarios
The following `describe-fleet-utilization` returns fleet usage data for all fleets with any status. This example uses pagination parameters to return data for two fleets at a time.

```bash
aws gamelift describe-fleet-utilization \
--limit 2
```

Output:

```
{
  "FleetUtilization": [
    {
      "FleetId": "fleet-1111aaaa-22bb-33cc-44dd-5555eeeee66ff",
      "ActiveServerProcessCount": 100,
      "ActiveGameSessionCount": 13,
      "CurrentPlayerSessionCount": 98,
      "MaximumPlayerSessionCount": 1000
    },
    {
      "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
      "ActiveServerProcessCount": 100,
      "ActiveGameSessionCount": 62,
      "CurrentPlayerSessionCount": 329,
      "MaximumPlayerSessionCount": 1000
    }
  ],
  "NextToken": "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM5IiwieGxldG9yIjoiYm9yYXZlbGUudHlwZSIsImNhdGFsbGFnZSI6IjEwMzQ2NjAzNjZmMzIwMjMwMDU5IiwidmFsdWV9"
}
```

Call the command a second time, passing the `NextToken` value as the argument to the `--next-token` parameter to see the next two results.

```
aws gamelift describe-fleet-utilization \
--limit 2 \
--next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM5IiwieGxldG9yIjoiYm9yYXZlbGUudHlwZSIsImNhdGFsbGFnZSI6IjEwMzQ2NjAzNjZmMzIwMjMwMDU5IiwidmFsdWV9"
```

Repeat until the response no longer includes a `NextToken` value in the output.

For more information, see [GameLift Metrics for Fleets](https://docs.aws.amazon.com/gamelift/latest/developerguide/api-metrics.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetUtilization](https://docs.aws.amazon.com/cli/latest/reference/gamelift/describe-fleet-utilization.html) in *AWS CLI Command Reference*. 
describe-game-session-queues

The following code example shows how to use describe-game-session-queues.

AWS CLI

To view game session queues

The following describe-game-session-queues example retrieves properties for two specified queues.

```bash
aws gamelift describe-game-session-queues \
   --names MegaFrogRace-NA MegaFrogRace-EU
```

Output:

```json
{
   "GameSessionQueues": [
      {
         "Destinations": [

For more information, see [Using Multi-Region Queues](https://docs.aws.amazon.com/gamelift/latest/developerguide/multi-region-queues.html) in the Amazon GameLift Developer Guide.

- For API details, see [DescribeGameSessionQueues](https://docs.aws.amazon.com/cli/latest/reference/gamelift/describe-game-session-queues.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/index.html).

**describe-runtime-configuration**

The following code example shows how to use `describe-runtime-configuration`.

**AWS CLI**

To request the runtime configuration for a fleet

The following `describe-runtime-configuration` example retrieves details about the current runtime configuration for a specified fleet.

```
aws gamelift describe-runtime-configuration \
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
  "RuntimeConfiguration": {
    "ServerProcesses": [
      {
        "LaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
```

Actions and scenarios 3074
"Parameters": "+gamelift_start_server",
"ConcurrentExecutions": 3
},
{
  "LaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
  "Parameters": "+gamelift_start_server +debug",
  "ConcurrentExecutions": 1
}
],
"MaxConcurrentGameSessionActivations": 2147483647,
"GameSessionActivationTimeoutSeconds": 300
}

For more information, see Run Multiple Processes on a Fleet in the Amazon GameLift Developer Guide.

- For API details, see DescribeRuntimeConfiguration in AWS CLI Command Reference.

list-builds

The following code example shows how to use list-builds.

AWS CLI

Example1: To get a list of custom game builds

The following list-builds example retrieves properties for all game server builds in the current Region. The sample request illustrates how to use the pagination parameters, Limit and NextToken, to retrieve the results in sequential sets. The first command retrieves the first two builds. Because there are more than two available, the response includes a NextToken to indicate that more results are available.

```
aws gamelift list-builds \
   --limit 2
```

Output:

```
{
   "Builds": [
   {
   ```
You can then call the command again with the `--next-token` parameter as follows to see the next two builds.

```
aws gamelift list-builds \
  --limit 2 \
  --next-token eyJhd3NBY2NvdW50SWQiOnsicI6IjI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM5IjwibmFtZSI6I0B1c2VyIiwiaWNvZGluZ3MiOiJib3N0aW9uIiwidHlwZSI6ImlkZWQiLCJpZCI6IjIwMjIxLCJ1c2VyX2lkIjwibmFtZSIyIiwiY2xvc2l0aW9uIjoxMDMwIiwicmVmcyI6IjIwMjExMCIsImlhdCI6MTM5NzQ4NjA5MH0\n```

Repeat until the response doesn't include a `NextToken` value.

**Example2: To get a list of custom game builds in failure status**

The following `list-builds` example retrieves properties for all game server builds in the current region that currently have status FAILED.

```
aws gamelift list-builds \
```

**Actions and scenarios**
Output:

```json
{
  "Builds": [
    {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "CreationTime": 1495528748.555,
      "Name": "My_Game_Server_Build_Two",
      "OperatingSystem": "AMAZON_LINUX_2",
      "SizeOnDisk": 8567781,
      "Status": "FAILED",
      "Version": "23456.789"
    }
  ]
}
```

- For API details, see [ListBuilds](https://docs.aws.amazon.com/cli/latest/reference/gamelift/list-builds.html) in *AWS CLI Command Reference*.

### list-fleets

The following code example shows how to use list-fleets.

**AWS CLI**

**Example 1: To get a list of all fleets in a Region**

The following list-fleets example displays the fleet IDs of all fleets in the current Region. This example uses pagination parameters to retrieve two fleet IDs at a time. The response includes a next-token attribute, which indicates that there are more results to retrieve.

```
aws gamelift list-fleets \
   --limit 2
```

Output:

```json
{
  "FleetIds": [
```
You can pass the `NextToken` value from the previous response in the next command, as shown here to get the next two results.

```
aws gamelift list-fleets
   --limit 2
   --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiIjMjIjIjIjMCJ9
```

Example 2: To get a list of all fleets in a Region with a specific build or script

The following `list-builds` example retrieves the IDs of fleets that are deployed with the specified game build. If you're working with Realtime Servers, you can provide a script ID in place of a build ID. Because this example does not specify the limit parameter, the results can include up to 16 fleet IDs.

```
aws gamelift list-fleets
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
   "FleetIds": [
      "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
      "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
   ]
}
```

- For API details, see [ListFleets](#) in *AWS CLI Command Reference*.

**request-upload-credentials**

The following code example shows how to use `request-upload-credentials`.

```
AWS CLI

To refresh access credentials for uploading a build

The following create-build example obtains new, valid access credentials for uploading a GameLift build file to an Amazon S3 location. Credentials have a limited life span. You get the build ID from the response to the original CreateBuild request.

```
aws gamelift request-upload-credentials \\
--build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
  "StorageLocation": {
    "Bucket": "gamelift-builds-us-west-2",
    "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  },
  "UploadCredentials": {
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "SecretAccessKey": "wJalrXUtFEMI/K7MDENG/bPxFiCYEXAMPELEKEY",
    "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
  }
}
```

For more information, see [Upload a Custom Server Build to GameLift](https://docs.aws.amazon.com/gamelift/latest/developerguide/server-build.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [RequestUploadCredentials](https://docs.aws.amazon.com/cli/latest/reference/gamelift/request-upload-credentials.html) in *AWS CLI Command Reference*.

**start-fleet-actions**

The following code example shows how to use start-fleet-actions.

AWS CLI

To restart fleet automatic scaling activity

The following start-fleet-actions example resumes the use of all scaling policies that are defined for the specified fleet but were stopped by calling ```stop-fleet-actions```. After starting, the scaling policies immediately begin tracking their respective metrics.
aws gamelift start-fleet-actions \
   --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \ 
   --actions AUTO_SCALING

This command produces no output.

- For API details, see StopFleetActions in AWS CLI Command Reference.

**stop-fleet-actions**

The following code example shows how to use stop-fleet-actions.

AWS CLI

**To stop a fleet's automatic scaling activity**

The following stop-fleet-actions example stops the use of all scaling policies that are defined for the specified fleet. After the policies are suspended, fleet capacity remains at the same active instance count unless you adjust it manually.

aws gamelift start-fleet-actions \
   --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \ 
   --actions AUTO_SCALING

This command produces no output.

- For API details, see StopFleetActions in AWS CLI Command Reference.

**update-build**

The following code example shows how to use update-build.

AWS CLI

**To update a custom game build**

The following update-build example changes the name and version information that is associated with a specified build resource. The returned build object verifies that the changes were made successfully.

aws gamelift update-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
--name MegaFrogRaceServer.NA.east \
--build-version 12345.east

Output:

```json
{
   "Build": {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "CreationTime": 1496708916.18,
      "Name": "MegaFrogRaceServer.NA.east",
      "OperatingSystem": "AMAZON_LINUX_2",
      "SizeOnDisk": 1304924,
      "Status": "READY",
      "Version": "12345.east"
   }
}
```

For more information, see [Update Your Build Files](#) in the [Amazon GameLift Developer Guide](#).

- For API details, see [UpdateBuild](#) in [AWS CLI Command Reference](#).

**update-game-session-queue**

The following code example shows how to use `update-game-session-queue`.

**AWS CLI**

To update a game session queue configuration

The following `update-game-session-queue` example adds a new destination and updates the player latency policies for an existing game session queue.

```bash
aws gamelift update-game-session-queue \
   --name MegaFrogRace-NA \
   --destinations file://destinations.json \
   --player-latency-policies file://latency-policies.json
```

Contents of `destinations.json`:

```json
{}
```
"Destinations": [
    {
        "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
    {
        "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
    {
        "DestinationArn": "arn:aws:gamelift:us-east-1::alias/alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"
    }
]

Contents of latency-policies.json:

{
    "PlayerLatencyPolicies": [
        {
            "MaximumIndividualPlayerLatencyMilliseconds": 200,
            "MaximumIndividualPlayerLatencyMilliseconds": 150,
            "PolicyDurationSeconds": 120,
            "MaximumIndividualPlayerLatencyMilliseconds": 100,
            "PolicyDurationSeconds": 120
        }
    ]
}

Output:

{
    "GameSessionQueue": {
    "Destinations": [
    {
        "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
        {
        "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
        {
        "DestinationArn": "arn:aws:gamelift:us-east-1::alias/alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"
    },
    "Name": "MegaFrogRace-NA",
    "TimeoutInSeconds": 600,
    "PlayerLatencyPolicies": [
        {
            "MaximumIndividualPlayerLatencyMilliseconds": 200,
            "MaximumIndividualPlayerLatencyMilliseconds": 150,
            "PolicyDurationSeconds": 120
        }
    ]
}
For more information, see [Using Multi-Region Queues](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [UpdateGameSessionQueue](#) in *AWS CLI Command Reference*.

### upload-build

The following code example shows how to use `upload-build`.

**AWS CLI**

**Example1: To upload a Linux game server build**

The following `upload-build` example uploads Linux game server build files from a file directory to the GameLift service and creates a build resource.

```bash
aws gamelift upload-build \
  --name MegaFrogRaceServer.NA \
  --build-version 2.0.1 \
  --build-root ~/MegaFrogRace_Server/release-na \
  --operating-system AMAZON_LINUX_2 \
  --server-sdk-version 4.0.2
```

Output:

```
Uploading ~/MegaFrogRace_Server/release-na:  16.0 KiB / 74.6 KiB (21.45%) 
Uploading ~/MegaFrogRace_Server/release-na:  32.0 KiB / 74.6 KiB (42.89%) 
Uploading ~/MegaFrogRace_Server/release-na:  48.0 KiB / 74.6 KiB (64.34%) 
Uploading ~/MegaFrogRace_Server/release-na:  64.0 KiB / 74.6 KiB (85.79%) 
Uploading ~/MegaFrogRace_Server/release-na:  74.6 KiB / 74.6 KiB (100.00%) 
Successfully uploaded ~/MegaFrogRace_Server/release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Example2: To upload a Windows game server build**

The following `upload-build` example uploads Windows game server build files from a directory to the GameLift service and creates a build record.
aws gamelift upload-build \
    --name MegaFrogRaceServer.NA \
    --build-version 2.0.1 \
    --build-root C:\MegaFrogRace_Server\release-na \
    --operating-system WINDOWS_2012 \
    --server-sdk-version 4.0.2

Output:

Uploading C:\MegaFrogRace_Server\release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading C:\MegaFrogRace_Server\release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading C:\MegaFrogRace_Server\release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading C:\MegaFrogRace_Server\release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading C:\MegaFrogRace_Server\release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded C:\MegaFrogRace_Server\release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

For more information, see Upload a Custom Server Build to GameLift in the Amazon GameLift Developer Guide.

- For API details, see UploadBuild in AWS CLI Command Reference.

Global Accelerator examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Global Accelerator.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions
Actions

add-custom-routing-endpoints

The following code example shows how to use add-custom-routing-endpoints.

AWS CLI

To add a VPC subnet endpoint to an endpoint group for a custom routing accelerator

The following add-custom-routing-endpoints example adds a VPC subnet endpoint to an endpoint group for a custom routing accelerator.

```
aws globalaccelerator add-custom-routing-endpoints \
  --endpoint-group-arn
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd \
  --endpoint-configurations "EndpointId=subnet-1234567890abcdef0"
```

Output:

```
{
    "EndpointDescriptions": [ 
        {
            "EndpointId": "subnet-1234567890abcdef0"
        }
    ],
    "EndpointGroupArn":"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd"
}
```

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see AddCustomRoutingEndpoints in AWS CLI Command Reference.

advertise-byoip-cidr

The following code example shows how to use advertise-byoip-cidr.
**AWS CLI**

**To advertise an address range**

The following `advertise-byoip-cidr` example requests AWS to advertise an address range that you've provisioned for use with your AWS resources.

```
aws globalaccelerator advertise-byoip-cidr \
   --cidr 198.51.100.0/24
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "198.51.100.0/24",
      "State": "PENDING_ADVERTISING"
   }
}
```

For more information, see [Bring Your Own IP Address in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/advertise-byoip-cidr.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [AdvertiseByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/advertise-byoip-cidr.html) in *AWS CLI Command Reference*.

**allow-custom-routing-traffic**

The following code example shows how to use `allow-custom-routing-traffic`.

**AWS CLI**

**To allow traffic to specific Amazon EC2 instance destinations in a VPC subnet for a custom routing accelerator**

The following `allow-custom-routing-traffic` example specifies that traffic is allowed to certain Amazon EC2 instance (destination) IP addresses and ports for a VPC subnet endpoint in a custom routing accelerator can receive traffic.

```
aws globalaccelerator allow-custom-routing-traffic \
   --endpoint-group-arn
   arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example \
   --endpoint-id subnet-abcd123example
```
create-accelerator

The following code example shows how to use create-accelerator.

AWS CLI

To create an accelerator

The following create-accelerator example creates an accelerator with two tags with two BYOIP static IP addresses. You must specify the US-West-2 (Oregon) Region to create or update an accelerator.

    aws globalaccelerator create-accelerator \
        --name ExampleAccelerator \
        --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
        --ip-addresses 192.0.2.250 198.51.100.52

Output:

    {
        "Accelerator": {
            "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcddefgh",
            "IpAddressType": "IPV4",
            "Name": "ExampleAccelerator",
            "Enabled": true,
            "Status": "IN_PROGRESS",
            "IpSets": [
                {
                    "IpAddresses": [
                        "192.0.2.250",
                        "198.51.100.52"
                    ]
                }
            ]
        }
    }
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateAccelerator in AWS CLI Command Reference.

### create-custom-routing-accelerator

The following code example shows how to use create-custom-routing-accelerator.

**AWS CLI**

To create a custom routing accelerator

The following create-custom-routing-accelerator example creates a custom routing accelerator with the tags Name and Project.

```bash
aws globalaccelerator create-custom-routing-accelerator \
  --name ExampleCustomRoutingAccelerator \
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
  --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAccelerator",
        "Enabled": true,
    
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateCustomRoutingAccelerator in AWS CLI Command Reference.

**create-custom-routing-endpoint-group**

The following code example shows how to use create-custom-routing-endpoint-group.

**AWS CLI**

**To create an endpoint group for a custom routing accelerator**

The following create-custom-routing-endpoint-group example creates an endpoint group for a custom routing accelerator.

```bash
aws globalaccelerator create-custom-routing-endpoint-group \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --endpoint-group-region us-east-2 \
    --destination-configurations "FromPort=80,ToPort=81,Protocols=TCP,UDP"
```

Output:

```json
{
    "EndpointGroup": {
    
```
  "EndpointGroupRegion": "us-east-2",
  "DestinationDescriptions": [
    {
      "FromPort": 80,
      "ToPort": 81,
      "Protocols": ["TCP", "UDP"
    ]
  },
  "EndpointDescriptions": []
}

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

• For API details, see CreateCustomRoutingEndpointGroup in AWS CLI Command Reference.

create-custom-routing-listener

The following code example shows how to use create-custom-routing-listener.

AWS CLI

To create a listener for a custom routing accelerator

The following create-custom-routing-listener example creates a listener with a port range from 5000 to 10000 for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-listener \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234abcd-1234abcd-1234abcd-1234abcdefgh \ 
  --port-ranges FromPort=5000,ToPort=10000
```

Output:

```
{
  "Listener": {
```
For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/listeners.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateCustomRoutingListener](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/create-custom-routing-listener.html) in *AWS CLI Command Reference*.

### create-endpoint-group

The following code example shows how to use `create-endpoint-group`.

**AWS CLI**

**To create an endpoint group**

The following `create-endpoint-group` example creates an endpoint group with one endpoint.

```shell
aws globalaccelerator create-endpoint-group \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --endpoint-group-region us-east-1 \
    --endpoint-configurations EndpointId=i-1234567890abcdef0,Weight=128
```

**Output:**

```json
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "i-1234567890abcdef0"
            }
        ]
    }
}
```
   "EndpointGroupRegion": "us-east-1"
}
]
}

For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/endpoint-groups.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/global-accelerator/latest/dg/endpoint-groups.html).

**create-listener**

The following code example shows how to use `create-listener`.

**AWS CLI**

**To create a listener**

The following `create-listener` example creates a listener with two ports.

```bash
aws globalaccelerator create-listener \
   --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234abcd-1234abcdefgh \
   --port-ranges FromPort=80,ToPort=80 FromPort=81,ToPort=81 \
   --protocol TCP
```

**Output:**

```json
{
   "Listener": {
      "PortRanges": [
         {
            "ToPort": 80,
            "FromPort": 80
         },
         {
            "ToPort": 81,
            "FromPort": 81
         }
      ],
      "ClientAffinity": "NONE",
   "ListenerState": "ENABLED"
}
```
deny-custom-routing-traffic

The following code example shows how to use deny-custom-routing-traffic.

**AWS CLI**

To specify a destination address that cannot receive traffic in a custom routing accelerator

The following deny-custom-routing-traffic example specifies destination address or addresses in a subnet endpoint that cannot receive traffic for a custom routing accelerator. To specify more than one destination address, separate the addresses with a space. There's no response for a successful deny-custom-routing-traffic call.

```
aws globalaccelerator deny-custom-routing-traffic \
   --endpoint-group-arn \
   "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-\n   abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example" \
   --endpoint-id "subnet-abcd123example" \
   --destination-addresses "198.51.100.52"
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DenyCustomRoutingTraffic in AWS CLI Command Reference.

deprovision-byoip-cidr

The following code example shows how to use deprovision-byoip-cidr.
**AWS CLI**

**To deprovision an address range**

The following deprovision-byoip-cidr example releases the specified address range that you provisioned to use with your AWS resources.

```bash
aws globalaccelerator deprovision-byoip-cidr \
    --cidr "198.51.100.0/24"
```

Output:

```json
{
    "ByoipCidr": {
        "Cidr": "198.51.100.0/24",
        "State": "PENDING_DEPROVISIONING"
    }
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://docs.aws.amazon.com/ga2019/latest/devguide/bring-your-own-ip.html) in the `AWS Global Accelerator Developer Guide`.

- For API details, see [DeprovisionByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/deprovision-byoip-cidr.html) in `AWS CLI Command Reference`.

**describe-accelerator-attributes**

The following code example shows how to use describe-accelerator-attributes.

**AWS CLI**

**To describe an accelerator's attributes**

The following describe-accelerator-attributes example retrieves the attribute details for an accelerator.

```bash
aws globalaccelerator describe-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
}
```
"AcceleratorAttributes": {
  "FlowLogsEnabled": true,
  "FlowLogsS3Bucket": "flowlogs-abc",
  "FlowLogsS3Prefix": "bucketprefix-abc"
}
}

For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeAcceleratorAttributes in AWS CLI Command Reference.

**describe-accelerator**

The following code example shows how to use describe-accelerator.

**AWS CLI**

To describe an accelerator

The following describe-accelerator example retrieves the details about the specified accelerator.

```bash
aws globalaccelerator describe-accelerator \
--accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
  "Accelerator": {
    "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
    "IpAddressType": "IPV4",
    "Name": "ExampleAccelerator",
    "Enabled": true,
    "Status": "IN_PROGRESS",
    "IpSets": [
      {
        "IpAddresses": [
          "192.0.2.250",
          "...
```
The following code example shows how to use describe-custom-routing-accelerator-attributes.

**AWS CLI**

To describe a custom routing accelerator's attributes

The following describe-custom-routing-accelerator-attributes example describes the attributes for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": false
    }
}
```

For more information, see [Custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/custom-routing-accelerators.html) in the AWS Global Accelerator Developer Guide.
• For API details, see `DescribeCustomRoutingAcceleratorAttributes` in `AWS CLI Command Reference`.

**describe-custom-routing-accelerator**

The following code example shows how to use `describe-custom-routing-accelerator`.

**AWS CLI**

To describe a custom routing accelerator

The following `describe-custom-routing-accelerator` example retrieves the details about the specified custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-accelerator \
   --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
   "Accelerator": {
      "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
      "IpAddressType": "IPV4",
      "Name": "ExampleCustomRoutingAccelerator",
      "Enabled": true,
      "Status": "IN_PROGRESS",
      "IpSets": [
         {
            "IpAddresses": [
               "192.0.2.250",
               "198.51.100.52"
            ],
            "IpFamily": "IPv4"
         }
      ],
      "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
      "CreatedTime": 1542394847,
      "LastModifiedTime": 1542395013
   }
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeCustomRoutingAccelerator in AWS CLI Command Reference.

**describe-custom-routing-endpoint-group**

The following code example shows how to use describe-custom-routing-endpoint-group.

**AWS CLI**

To describe an endpoint group for a custom routing accelerator

The following describe-custom-routing-endpoint-group example describes an endpoint group for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-endpoint-group \
    --endpoint-group-arn
    arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example",
        "EndpointGroupRegion": "us-east-2",
        "DestinationDescriptions": [
            {
                "FromPort": 5000,
                "ToPort": 10000,
                "Protocols": [
                    "UDP"
                ]
            }
        ],
        "EndpointDescriptions": [
            {
```

Actions and scenarios 3098
"EndpointId": "subnet-1234567890abcdef0"
}
]
}
}

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeCustomRoutingEndpointGroup in AWS CLI Command Reference.

describe-custom-routing-listener

The following code example shows how to use describe-custom-routing-listener.

AWS CLI

To describe a listener for a custom routing accelerator

The following describe-custom-routing-listener example describes a listener for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-listener \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
  "Listener": {
    "PortRanges": [
      "FromPort": 5000,
      "ToPort": 10000
    ],
    "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234"
  }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.
For API details, see DescribeCustomRoutingListener in AWS CLI Command Reference.

describe-endpoint-group

The following code example shows how to use describe-endpoint-group.

AWS CLI

To describe an endpoint group

The following describe-endpoint-group example retrieves details about an endpoint group with the following endpoints: an Amazon EC2 instance, an ALB, and an NLB.

```bash
aws globalaccelerator describe-endpoint-group \
   --endpoint-group-arn
   arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/ab88888example
```

Output:

```
{
   "EndpointGroup": {
      "TrafficDialPercentage": 100.0,
      "EndpointDescriptions": [
         {
            "Weight": 128,
            "EndpointId": "i-1234567890abcdef0"
         },
         {
            "Weight": 128,
            "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
         },
         {
            "Weight": 128,
            "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
         }
      ],
   "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/ab88888example"
```
For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/endpoint-groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-endpoint-group.html) in *AWS CLI Command Reference*.

**describe-listener**

The following code example shows how to use `describe-listener`.

**AWS CLI**

**To describe a listener**

The following `describe-listener` example describes a listener.

```bash
aws globalaccelerator describe-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

**Output:**

```json
{
    "Listener": {
        "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
        "PortRanges": [
            {
                "FromPort": 80,
                "ToPort": 80
            }
        ],
        "Protocol": "TCP",
        "ClientAffinity": "NONE"
    }
}
```
For more information, see Listeners in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeListener in AWS CLI Command Reference.

**list-accelerators**

The following code example shows how to use list-accelerators.

**AWS CLI**

**To list your accelerators**

The following list-accelerators example lists the accelerators in your AWS account. This account has two accelerators.

```
aws globalaccelerator list-accelerators
```

Output:

```
{
   "Accelerators": [
      {
         "Arn": "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-abcd-5555EXAMPLE1",
         "Name": "TestAccelerator",
         "IpAddressType": "IPV4",
         "Enabled": true,
         "IpSets": [
            {
              "IpFamily": "IPv4",
              "IpAddresses": [
                "192.0.2.250",
                "198.51.100.52"
              ]
            }
         ],
         "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
         "Status": "DEPLOYED",
         "CreatedTime": 1552424416.0,
         "LastModifiedTime": 1569375641.0
      }
   ]
}
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListAccelerators in AWS CLI Command Reference.

list-byoip-cidr

The following code example shows how to use list-byoip-cidr.

AWS CLI

To list your address ranges

The following list-byoip-cidr example list the bring your own IP address (BYOIP) address ranges that you've provisioned for use with Global Accelerator.

aws globalaccelerator list-byoip-cidrs
Output:

```json
{
    "ByoipCidrs": [
        {
            "Cidr": "198.51.100.0/24",
            "State": "READY"
        },
        {
            "Cidr": "203.0.113.25/24",
            "State": "READY"
        }
    ]
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/brioip.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-byoip-cidr.html) in *AWS CLI Command Reference*.

### list-custom-routing-accelerators

The following code example shows how to use `list-custom-routing-accelerators`.

#### AWS CLI

**To list your custom routing accelerators**

The following `list-custom-routing-accelerators` example lists the custom routing accelerators in an AWS account.

```bash
aws globalaccelerator list-custom-routing-accelerators
```

Output:

```json
{
    "Accelerators": [
        {
            "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-EXAMPLE1",
            "Name": "TestCustomRoutingAccelerator",
```
"IpAddressType": "IPV4",
"Enabled": true,
"IpSets": [
    {
        "IpFamily": "IPv4",
        "IpAddresses": [
            "192.0.2.250",
            "198.51.100.52"
        ]
    }
],
"DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
"Status": "DEPLOYED",
"CreatedTime": 1552424416.0,
"LastModifiedTime": 1569375641.0
},
{
    "AcceleratorArn": "arn:aws:globalaccelerator::888888888888:accelerator/8888abcd-abcd-8888-abcd-8888EXAMPLE2",
    "Name": "ExampleCustomRoutingAccelerator",
    "IpAddressType": "IPV4",
    "Enabled": true,
    "IpSets": [
        {
            "IpFamily": "IPv4",
            "IpAddresses": [
                "192.0.2.100",
                "198.51.100.10"
            ]
        }
    ],
    "DnsName": "6a6a6a6a6a6a6a6a.awsglobalaccelerator.com",
    "Status": "DEPLOYED",
    "CreatedTime": 1575585564.0,
    "LastModifiedTime": 1579809243.0
}
]
}

For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingAccelerators in AWS CLI Command Reference.
**list-custom-routing-endpoint-groups**

The following code example shows how to use `list-custom-routing-endpoint-groups`.

**AWS CLI**

**To list endpoint groups for a listener in a custom routing accelerator**

The following `list-custom-routing-endpoint-groups` example lists the endpoint groups for a listener in a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-endpoint-groups \\
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

**Output:**

```json
{
  "EndpointGroups": [
    {
      "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
      "EndpointGroupRegion": "eu-central-1",
      "DestinationDescriptions": [
        {
          "FromPort": 80,
          "ToPort": 80,
          "Protocols": [
            "TCP",
            "UDP"
          ]
        }
      ],
      "EndpointDescriptions": [
        {
          "EndpointId": "subnet-abcd123example"
        }
      ]
    }
  ]
}
```
For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/endpoint-groups.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/globalaccelerator/latest/dg/)

### list-custom-routing-listeners

The following code example shows how to use `list-custom-routing-listeners`.

#### AWS CLI

**To list listeners for custom routing accelerators**

The following `list-custom-routing-listeners` example lists the listeners for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-listeners \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

**Output:**

```
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 5000,
                    "ToPort": 10000
                }
            ],
            "Protocol": "TCP"
        }
    ]
}
```

For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/listeners.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/globalaccelerator/latest/dg/)

The following code example shows how to use `list-custom-routing-port-mappings-by-destination`.

**AWS CLI**

To list the port mappings for a specific custom routing accelerator destination

The following `list-custom-routing-port-mappings-by-destination` example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-port-mappings-by-destination \
  --endpoint-id subnet-abcd123example \
  --destination-address 198.51.100.52
```

Output:

```json
{
  "DestinationPortMappings": [
  {
    "AcceleratorArn": "arn:aws:globalaccelerator::402092451327:accelerator/24ea29b8-d750-4489-8919-3095f3c4b0a7",
    "AcceleratorSocketAddresses": [
    {
      "IpAddress": "192.0.2.250",
      "Port": 65514
    },
    {
      "IpAddress": "192.10.100.99",
      "Port": 65514
    }
    ],
    "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example",
    "EndpointId": "subnet-abcd123example",
    "EndpointGroupRegion": "us-west-2",

      "Port": 65514
    }
  }
  ]
}
```

### list-custom-routing-port-mappings

The following code example shows how to use `list-custom-routing-port-mappings`.

**AWS CLI**

To list the port mappings in a custom routing accelerator

The following `list-custom-routing-port-mappings` example provides a partial list of the port mappings in a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-port-mappings \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "PortMappings": [
      {
         "AcceleratorPort": 40480,
         "EndpointId": "subnet-1234567890abcdef0",
         "DestinationSocketAddress": {
            "IpAddress": "192.0.2.250",
            "Port": 80
         }
      }
   ]
}
```

---

**Actions and scenarios**

3109
For more information, see How custom routing accelerators work in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingPortMappings in AWS CLI Command Reference.
Output:

```json
{
    "EndpointGroups": [
        {
            "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",

            "ThresholdCount": 3
        }
    ]
}
```

For more information, see [Endpoint Groups in AWS Global Accelerator](https://docs.aws.amazon.com/globalessentials/latest/howto/endpoint-groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListEndpointGroups](https://docs.aws.amazon.com/cli/latest/reference/global-accelerator/list-endpoint-groups.html) in *AWS CLI Command Reference*.

**list-listeners**

The following code example shows how to use `list-listeners`.
AWS CLI

To list listeners

The following list-listeners example lists the listeners for an accelerator.

```bash
aws globalaccelerator list-listeners \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "Listeners": [
      {
         "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
         "PortRanges": [
            {
               "FromPort": 80,
               "ToPort": 80
            }
         ],
         "Protocol": "TCP",
         "ClientAffinity": "NONE"
      }
   ]
}
```

For more information, see [Listeners in AWS Global Accelerator](https://docs.aws.amazon.com/g*aoc/2017/latest/userguide) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListListeners](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-listeners.html) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for an accelerator
The following `list-tags-for-resource` example lists the tags for a specific accelerator.

```bash
aws globalaccelerator list-tags-for-resource \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "Tags": [
      {
         "Key": "Project",
         "Value": "A123456"
      }
   ]
}
```

For more information, see [Tagging in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/tagging.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### provision-byoip-cidr

The following code example shows how to use `provision-byoip-cidr`.

**AWS CLI**

**To provision an address range**

The following `provision-byoip-cidr` example provisions the specified address range to use with your AWS resources.

```bash
aws globalaccelerator provision-byoip-cidr \
   --cidr 192.0.2.250/24 \
   --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```json
{
}
```
"ByoipCidr": {
    "Cidr": "192.0.2.250/24",
    "State": "PENDING_PROVISIONING"
}
}

For more information, see Bring your own IP address in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ProvisionByoipCidr in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To tag an accelerator

The following tag-resource example adds tags Name and Project to an accelerator, along with corresponding values for each.

```bash
aws globalaccelerator tag-resource \
  --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

To remove a tag from an accelerator
The following `untag-resource` example removes the tags Name and Project from an accelerator.

```bash
aws globalaccelerator untag-resource \
    --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcddefgh \
    --tag-keys Key="Name" Key="Project"
```

This command produces no output.

For more information, see [Tagging in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/tagging.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see `UntagResource` in *AWS CLI Command Reference*.

**update-accelerator-attributes**

The following code example shows how to use `update-accelerator-attributes`.

**AWS CLI**

**To update an accelerator's attributes**

The following `update-accelerator-attributes` example updates an accelerator to enable flow logs. You must specify the US-West-2 (Oregon) Region to create or update accelerator attributes.

```bash
aws globalaccelerator update-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcddefgh \
    --flow-logs-enabled \
    --flow-logs-s3-bucket flowlogs-abc \
    --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```json
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true,
        "FlowLogsS3Bucket": "flowlogs-abc",
        "FlowLogsS3Prefix": "bucketprefix-abc"
    }
}
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateAcceleratorAttributes in AWS CLI Command Reference.

update-accelerator

The following code example shows how to use update-accelerator.

AWS CLI

To update an accelerator

The following update-accelerator example modifies an accelerator to change the accelerator name to ExampleAcceleratorNew. You must specify the US-West-2 (Oregon) Region to create or update accelerators.

```
aws globalaccelerator update-accelerator \
   --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh \ 
   --name ExampleAcceleratorNew
```

Output:

```
{
    "Accelerator": {
        "IpAddressType": "IPV4",
        "Name": "ExampleAcceleratorNew",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            { "IpAddresses": [ "192.0.2.250", "198.51.100.52" ], "IpFamily": "IPv4" }
        ]
    }
}
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateAccelerator in AWS CLI Command Reference.

update-custom-routing-accelerator-attributes

The following code example shows how to use update-custom-routing-accelerator-attributes.

AWS CLI

To update a custom routing accelerator's attributes

The following update-custom-routing-accelerator-attributes example updates a custom routing accelerator to enable flow logs.

```
aws globalaccelerator update-custom-routing-accelerator-attributes 
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh 
  --flow-logs-enabled 
  --flow-logs-s3-bucket flowlogs-abc 
  --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
  "AcceleratorAttributes": {
    "FlowLogsEnabled": true
    "FlowLogsS3Bucket": flowlogs-abc
    "FlowLogsS3Prefix": bucketprefix-abc
  }
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateCustomRoutingAcceleratorAttributes in AWS CLI Command Reference.

**update-custom-routing-accelerator**

The following code example shows how to use update-custom-routing-accelerator.

**AWS CLI**

**To update a custom routing accelerator**

The following update-custom-routing-accelerator example modifies a custom routing accelerator to change the accelerator name.

```
aws globalaccelerator --region us-west-2 update-custom-routing-accelerator \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --name ExampleCustomRoutingAcceleratorNew
```

**Output:**

```
{
  "Accelerator": {
    "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
    "IpAddressType": "IPV4",
    "Name": "ExampleCustomRoutingAcceleratorNew",
    "Enabled": true,
    "Status": "IN_PROGRESS",
    "IpSets": [
      {
        "IpAddresses": [
          "192.0.2.250",
          "198.51.100.52"
        ],
        "IpFamily": "IPv4"
      }
    ],
    "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
  }
}
```
For more information, see [Custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/custom-routing-accelerators.html) in the AWS Global Accelerator Developer Guide.

update-custom-routing-listener

The following code example shows how to use update-custom-routing-listener.

**AWS CLI**

To update a listener for a custom routing accelerator

The following `update-custom-routing-listener` example updates a listener to change the port range.

```bash
aws globalaccelerator update-custom-routing-listener \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
  --port-ranges FromPort=10000,ToPort=20000
```

Output:

```json
{
  "Listener": {
    "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz",
    "PortRanges": [
      {
        "FromPort": 10000,
        "ToPort": 20000
      }
    ],
    "Protocol": "TCP"
  }
}
For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateCustomRoutingListener in AWS CLI Command Reference.

update-endpoint-group

The following code example shows how to use update-endpoint-group.

AWS CLI

To update an endpoint group

The following update-endpoint-group example adds three endpoints to an endpoint group: an Elastic IP address, an ALB, and an NLB.

```bash
aws globalaccelerator update-endpoint-group \
  --endpoint-group-arn \
  arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-67891mnopqrs/endpoint-group/ab8888example \
  --endpoint-configurations \
    EndpointId=eipalloc-eip01234567890abc,Weight=128 \
    EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz,Weight=128 \
    EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "eip01234567890abc"
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
            }
        ]
    }
}
```
For more information, see Endpoint groups in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateEndpointGroup in AWS CLI Command Reference.

update-listener

The following code example shows how to use update-listener.

**AWS CLI**

**To update a listener**

The following update-listener example updates a listener to change the port to 100.

```bash
aws globalaccelerator update-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --port-ranges FromPort=100,ToPort=100
```

**Output:**

```json
{
    "Listener": {
        "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz"
    }
}
```
```
{  
  "FromPort": 100,
  "ToPort": 100
}
,
"Protocol": "TCP",
"ClientAffinity": "NONE"
}
```

For more information, see [Listeners in AWS Global Accelerator](https://docs.aws.amazon.com/glc/latest/accelerator/listeners.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glc/latest/accelerator/).  

### withdraw-byoip-cidr

The following code example shows how to use `withdraw-byoip-cidr`.

**AWS CLI**

**To withdraw an address range**

The following `withdraw-byoip-cidr` example withdraws an address range from AWS Global Accelerator that you previously advertised for use with your AWS resources.

```
aws globalaccelerator withdraw-byoip-cidr \
 --cidr 192.0.2.250/24
```

Output:

```
{
  "ByoipCidr": {
    "Cidr": "192.0.2.250/24",
    "State": "PENDING_WITHDRAWING"
  }
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://docs.aws.amazon.com/glc/latest/accelerator/brin-your-own-ip-address.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glc/latest/accelerator/).  

AWS Glue examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Glue.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**batch-stop-job-run**

The following code example shows how to use `batch-stop-job-run`.

**AWS CLI**

**To stop job runs**

The following `batch-stop-job-run` example stops a job run.

```
aws glue batch-stop-job-run \
  --job-name "my-testing-job" \
  --job-run-id jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f
```

**Output:**

```
{
  "SuccessfulSubmissions": [
    {
      "JobName": "my-testing-job",
      "JobRunId": "jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f"
    }
  ]
}
```
For more information, see [Job Runs](#) in the AWS Glue Developer Guide.

- For API details, see [BatchStopJobRun](#) in AWS CLI Command Reference.

**create-connection**

The following code example shows how to use create-connection.

**AWS CLI**

**To create a connection for AWS Glue data stores**

The following create-connection example creates a connection in the AWS Glue Data Catalog that provides connection information for a Kafka data store.

```bash
aws glue create-connection \
   --connection-input '{ \
   "Name":"conn-kafka-custom", \
   "Description":"kafka connection with ssl to custom kafka", \
   "ConnectionType":"KAFKA", \
   "ConnectionProperties":{ \
   "KAFKA_BOOTSTRAP_SERVERS":"<Kafka-broker-server-url>:<SSL-Port>", \
   "KAFKA_SSL_ENABLED":"true", \
   "KAFKA_CUSTOM_CERT": "s3://bucket/prefix/cert-file.pem" \
   }, \
   "PhysicalConnectionRequirements":{ \
   
```
This command produces no output.

For more information, see Defining Connections in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

- For API details, see CreateConnection in AWS CLI Command Reference.

create-database

The following code example shows how to use create-database.

AWS CLI

To create a database

The following create-database example creates a database in the AWS Glue Data Catalog.

```bash
aws glue create-database \
  --database-input "{"Name":"tempdb"}" \
  --profile my_profile \
  --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining a Database in Your Data Catalog in the AWS Glue Developer Guide.

- For API details, see CreateDatabase in AWS CLI Command Reference.

create-job

The following code example shows how to use create-job.

AWS CLI

To create a job to transform data
The following `create-job` example creates a streaming job that runs a script stored in S3.

```
aws glue create-job 
   --name my-testing-job  
   --role AWSGlueServiceRoleDefault  
   --command '{
       "Name": "gluestreaming",
       "ScriptLocation": "s3://DOC-EXAMPLE-BUCKET/folder/"
   }'  
   --region us-east-1  
   --output json  
   --default-arguments '{
       "--job-language": "scala",  
       "--class": "GlueApp"
   }'  
   --profile my-profile  
   --endpoint https://glue.us-east-1.amazonaws.com
```

Contents of `test_script.scala`:

```scala
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite

    // @return: datasink4
    // @inputs: [frame = resolvechoice3]
    val datasink4 = glueContext.getCatalogSink(database = "tempdb", tableName = "my-s3-sink", redshiftTmpDir = ",", transformationContext = "datasink4").writeDynamicFrame(resolvechoice3)
    Job.commit()
For more information, see Authoring Jobs in AWS Glue in the AWS Glue Developer Guide.

- For API details, see CreateJob in AWS CLI Command Reference.

create-table

The following code example shows how to use create-table.

AWS CLI

Example 1: To create a table for a Kinesis data stream

The following create-table example creates a table in the AWS Glue Data Catalog that describes a Kinesis data stream.

```bash
aws glue create-table \
  --database-name tempdb \
  --table-input '{"Name":"test-kinesis-input", "StorageDescriptor":{
    "Columns":[
      {"Name":"sensorid", "Type":"int"},
      {"Name":"currenttemperature", "Type":"int"},
      {"Name":"status", "Type":"string"}
    ],
    "Location":"my-testing-stream",
    "Parameters":{
      "typeOfData":"kinesis","streamName":"my-testing-stream",
      "kinesisUrl":"https://kinesis.us-east-1.amazonaws.com"
    },
    "SerdeInfo":{
      "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"}
  },
  "Parameters":{
    "classification":"json"}
}' \
  --profile my-profile \
  --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.
For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

Example 2: To create a table for a Kafka data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kafka data store.

```
aws glue create-table "database-name tempdb" "table-input '{"Name":"test-kafka-input", "StorageDescriptor":{ "Columns": [ {"Name":"sensorid", "Type":"int"}, {"Name":"currenttemperature", "Type":"int"}, {"Name":"status", "Type":"string"} ], "Location":"glue-topic", "Parameters": { "typeOfData":"kafka","topicName":"glue-topic","connectionName":"my-kafka-connection" }, "SerdeInfo": { "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde" }, "Parameters": { "separatorChar":"," } },"Location":"glue-topic", "Parameters": { "typeOfData":"kafka","topicName":"glue-topic","connectionName":"my-kafka-connection" }, "SerdeInfo": { "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde" }, "Parameters": { "separatorChar":"," } }',"profile my-profile"
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

Example 3: To create a table for a AWS S3 data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a AWS Simple Storage Service (AWS S3) data store.

```
aws glue create-table "database-name tempdb" "table-input '{"Name":"test-s3-input", "StorageDescriptor":{ "Columns": [ {"Name":"sensorid", "Type":"int"}, {"Name":"currenttemperature", "Type":"int"}, {"Name":"status", "Type":"string"} ], "Location":"s3://test-bucket/test-dir", "Parameters": { "typeOfData":"s3","bucketName":"test-bucket","objectPath":"test-dir" }, "SerdeInfo": { "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde" }, "Parameters": { "separatorChar":"," } }',"profile my-profile"
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.
--database-name tempdb \
--table-input '{"Name":"s3-output", "StorageDescriptor":{ \
    "Columns": [ \
        {"Name":"s1", "Type":"string"}, \
        {"Name":"s2", "Type":"int"}, \
        {"Name":"s3", "Type":"string"} \
    ], \
    "Location":"s3://bucket-path/", \
    "SerdeInfo": { \
        "SerializationLibrary": "org.openx.data.jsonserde.JsonSerDe" \
    }, \
    "Parameters": { \
        "classification": "json" \
    } \
}, \
--profile my-profile \
--endpoint https://glue.us-east-1.amazonaws.com

This command produces no output.

For more information, see [Defining Tables in the AWS Glue Data Catalog](https://docs.aws.amazon.com/glue/latest/dg/table-definition.html) in the [AWS Glue Developer Guide](https://docs.aws.amazon.com/glue/latest/dg/).

- For API details, see [CreateTable](https://docs.aws.amazon.com/cli/latest/reference/glue/create-table.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/glue/).

### delete-job

The following code example shows how to use `delete-job`.

**AWS CLI**

**To delete a job**

The following `delete-job` example deletes a job that is no longer needed.

```bash
glue delete-job \
  --job-name my-testing-job
```

**Output:**

```json
{
  "JobName": "my-testing-job"
}
```
For more information, see Working with Jobs on the AWS Glue Console in the AWS Glue Developer Guide.

- For API details, see DeleteJob in AWS CLI Command Reference.

get-databases

The following code example shows how to use get-databases.

AWS CLI

To list the definitions of some or all of the databases in the AWS Glue Data Catalog

The following get-databases example returns information about the databases in the Data Catalog.

```
aws glue get-databases
```

Output:

```json
{
   "DatabaseList": [
   {
      "Name": "default",
      "Description": "Default Hive database",
      "LocationUri": "file:/spark-warehouse",
      "CreateTime": 1602084052.0,
      "CreateTableDefaultPermissions": [
         {
            "Principal": {
               "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
            },
            "Permissions": [
               "ALL"
            ]
         }
      ],
      "CatalogId": "111122223333"
   },
   {
      "Name": "flights-db",
      "CreateTime": 1587072847.0,
      "CreateTableDefaultPermissions": [
      ]
   }
   ]
}
```

{
    "Principal": {
        "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
    },
    "Permissions": [
        "ALL"
    ]
},
"CatalogId": "111122223333"
},
{
    "Name": "legislators",
    "CreateTime": 1601415625.0,
    "CreateTableDefaultPermissions": [
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
            },
            "Permissions": [
                "ALL"
            ]
        }
    ],
    "CatalogId": "111122223333"
},
{
    "Name": "tempdb",
    "CreateTime": 1601498566.0,
    "CreateTableDefaultPermissions": [
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
            },
            "Permissions": [
                "ALL"
            ]
        }
    ],
    "CatalogId": "111122223333"
}
For more information, see [Defining a Database in Your Data Catalog](http://aws.amazon.com) in the [AWS Glue Developer Guide](http://aws.amazon.com).

- For API details, see [GetDatabases](http://aws.amazon.com) in [AWS CLI Command Reference](http://aws.amazon.com).

### get-job-run

The following code example shows how to use `get-job-run`.

#### AWS CLI

**To get information about a job run**

The following `get-job-run` example retrieves information about a job run.

```bash
aws glue get-job-run \
   --job-name "Combine legislators data" \
   --run-id jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e
```

**Output:**

```json
{
   "JobRun": {
      "Id": "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",
      "Attempt": 0,
      "JobName": "Combine legislators data",
      "StartedOn": 1602873931.255,
      "LastModifiedOn": 1602874075.985,
      "CompletedOn": 1602874075.985,
      "JobRunState": "SUCCEEDED",
      "Arguments": {
         "--enable-continuous-cloudwatch-log": "true",
         "--enable-metrics": "",
         "--enable-spark-ui": "true",
         "--job-bookmark-option": "job-bookmark-enable",
         "--spark-event-logs-path": "s3://aws-glue-assets-111122223333-us-east-1/sparkHistoryLogs/
      }},
   "PredecessorRuns": [],
   "AllocatedCapacity": 10,
   "ExecutionTime": 117,
   "Timeout": 2880,
   "MaxCapacity": 10.0,
}
```
For more information, see [Job Runs](#) in the AWS Glue Developer Guide.

- For API details, see [GetJobRun](#) in AWS CLI Command Reference.

### get-job-runs

The following code example shows how to use `get-job-runs`.

**AWS CLI**

To get information about all job runs for a job

The following `get-job-runs` example retrieves information about job runs for a job.

```
aws glue get-job-runs \
  --job-name "my-testing-job"
```

Output:

```
{
  "JobRuns": [
    {
      "Id": "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",
      "Attempt": 0,
      "JobName": "my-testing-job",
      "StartedOn": 1602873931.255,
      "LastModifiedOn": 1602874075.985,
      "CompletedOn": 1602874075.985,
      "JobRunState": "SUCCEEDED",
      "Arguments": {
        "--enable-continuous-cloudwatch-log": "true",
        "--enable-metrics": "",
        "--enable-spark-ui": "true",
        "--job-bookmark-option": "job-bookmark-enable",
      }
    }
  ]
}
```

    "Attempt": 1,
For more information, see **Job Runs** in the *AWS Glue Developer Guide*.

- For API details, see **GetJobRuns** in *AWS CLI Command Reference*.  

**get-job**

The following code example shows how to use get-job.

**AWS CLI**

**To retrieve information about a job**

The following *get-job* example retrieves information about a job.

```
aws glue get-job 
```
--job-name my-testing-job

Output:

```json
{
    "Job": {
        "Name": "my-testing-job",
        "Role": "Glue_DefaultRole",
        "CreatedOn": 1602805698.167,
        "LastModifiedOn": 1602805698.167,

            "Name": "gluestreaming",
            "ScriptLocation": "s3://janetst-bucket-01/Scripts/test_script.scala",
            "PythonVersion": "2"
        },
        "DefaultArguments": {
            "--class": "GlueApp",
            "--job-language": "scala"
        },
        "MaxRetries": 0,
        "AllocatedCapacity": 10,
        "MaxCapacity": 10.0,
        "GlueVersion": "1.0"
    }
}
```

For more information, see Jobs in the AWS Glue Developer Guide.

- For API details, see GetJob in AWS CLI Command Reference.

**get-plan**

The following code example shows how to use get-plan.

**AWS CLI**

To get the generated code for mapping data from source tables to target tables

The following get-plan retrieves the generated code for mapping columns from the data source to the data target.
aws glue get-plan --mapping '[[
  {
    "SourcePath":"sensorid",
    "SourceTable":"anything",
    "SourceType":"int",
    "TargetPath":"sensorid",
    "TargetTable":"anything",
    "TargetType":"int"
  },
  {
    "SourcePath":"currenttemperature",
    "SourceTable":"anything",
    "SourceType":"int",
    "TargetPath":"currenttemperature",
    "TargetTable":"anything",
    "TargetType":"int"
  },
  {
    "SourcePath":"status",
    "SourceTable":"anything",
    "SourceType":"string",
    "TargetPath":"status",
    "TargetTable":"anything",
    "TargetType":"string"
  }]]'
--source '{
  "DatabaseName":"tempdb",
  "TableName":"s3-source"
}'
--sinks '[[
  {
    "DatabaseName":"tempdb",
    "TableName":"my-s3-sink"
  }]
--language "scala"
--endpoint https://glue.us-east-1.amazonaws.com
--output "text"

Output:

import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import com.amazonaws.services.glue.util.JsonOptions
import org.apache.spark.SparkContext
import scala.collection.JavaConverters._

object GlueApp {
  def main(sysArgs: Array[String]) {
    val spark: SparkContext = new SparkContext()
    val glueContext: GlueContext = new GlueContext(spark)
    // @params: [JOB_NAME]
    val args = GlueArgParser.getResolvedOptions(sysArgs, Seq("JOB_NAME").toArray)
    Job.init(args("JOB_NAME"), glueContext, args.asJava)
    // @type: DataSource
    // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx = "datasource0"]
    // @return: datasource0
    // @inputs: []
    val datasource0 = glueContext.getCatalogSource(database = "tempdb",
        tableName = "s3-source", redshiftTmpDir = "", transformationContext = "datasource0").getDynamicFrame()
    // @type: ApplyMapping
    // @args: [mapping = ["sensorid", "int", "sensorid", "int"],
        ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
        "status", "string")], transformation_ctx = "applymapping1"]
    // @return: applymapping1
    // @inputs: [frame = datasource0]
    val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid", "int", "sensorid", "int"),
        ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
        "status", "string")), caseSensitive = false,
        transformationContext = "applymapping1")
    // @type: SelectFields
    // @args: [paths = ["sensorid", "currenttemperature", "status"],
        transformation_ctx = "selectfields2"]
    // @return: selectfields2
    // @inputs: [frame = applymapping1]
    val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",
        "currenttemperature", "status"), transformationContext = "selectfields2")
    // @type: ResolveChoice
    // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-s3-sink", transformation_ctx = "resolvechoice3"]
    // @return: resolvechoice3
  }
}
For more information, see Editing Scripts in AWS Glue in the AWS Glue Developer Guide.

- For API details, see GetPlan in AWS CLI Command Reference.

### get-tables

The following code example shows how to use get-tables.

#### AWS CLI

**To list the definitions of some or all of the tables in the specified database**

The following get-tables example returns information about the tables in the specified database.

```bash
aws glue get-tables --database-name 'tempdb'
```

**Output:**

```json
{
  "TableList": [
    {
      "Name": "my-s3-sink",
      "DatabaseName": "tempdb",
      "CreateTime": 1602730539.0,

      }
    ],
    "Location": "my-testing-stream",
    "Compressed": false,
For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

- For API details, see GetTables in AWS CLI Command Reference.

**start-crawler**

The following code example shows how to use `start-crawler`.

**AWS CLI**

**To start a crawler**

The following `start-crawler` example starts a crawler.

```
aws glue start-crawler --name my-crawler
```

Output:

```
None
```
For more information, see Defining Crawlers in the AWS Glue Developer Guide.

- For API details, see StartCrawler in AWS CLI Command Reference.

**start-job-run**

The following code example shows how to use `start-job-run`.

**AWS CLI**

**To start running a job**

The following `start-job-run` example starts a job.

```bash
aws glue start-job-run \\
  --job-name my-job
```

Output:

```json
{
   "JobRunId":
    "jr_22208b1f44eb5376a60569d4b21dd20fcb8621e1a366b4e7b2494af764b82ded"
}
```

For more information, see Authoring Jobs in the AWS Glue Developer Guide.

- For API details, see StartJobRun in AWS CLI Command Reference.

**GuardDuty examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with GuardDuty.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Actions

accept-invitation

The following code example shows how to use accept-invitation.

AWS CLI

To accept an invitation to become a GuardDuty member account in the current region

The following accept-invitation example shows how to accept an invitation to become a GuardDuty member account in the current region.

```
aws guardduty accept-invitation \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --master-id 123456789111 \
    --invitation-id d6b94fb03a66ff665f7db8764example
```

This command produces no output.

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see AcceptInvitation in AWS CLI Command Reference.

archive-findings

The following code example shows how to use archive-findings.

AWS CLI

To archive findings in the current region

This example shows how to archive findings in the current region.

```
aws guardduty archive-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-ids d6b94fb03a66ff665f7db8764example 3eb970e0de00c16ec14e6910fexample
```
This command produces no output.

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see ArchiveFindings in AWS CLI Command Reference.

create-detector

The following code example shows how to use create-detector.

**AWS CLI**

**To enable GuardDuty in the current region**

This example shows how to create a new detector, which enables GuardDuty, in the current region:

```bash
aws guardduty create-detector \
--enable
```

**Output:**

```
{
   "DetectorId": "b6b992d6d2f48e64bc59180bfexample"
}
```

For more information, see Enable Amazon GuardDuty in the GuardDuty User Guide.

- For API details, see CreateDetector in AWS CLI Command Reference.

create-filter

The following code example shows how to use create-filter.

**AWS CLI**

**To create a new filter for the current region**

This example creates a filter that matches all portscan findings for instance created from a specific image:

```bash
aws guardduty create-filter \
```

For more information, see Filtering findings in the GuardDuty User Guide.

- For API details, see CreateFilter in AWS CLI Command Reference.

create-ip-set

The following code example shows how to use create-ip-set.

AWS CLI

To create a trusted IP set

The following create-ip-set example creates and activates a trusted IP set in the current region.

```
aws guardduty create-ip-set
   --detector-id 12abc34d567e8fa901bc2d34eexample
   --name new-ip-set
   --format TXT
   --location s3://AWSDOC-EXAMPLE-BUCKET/customtrustlist.csv
   --activate
```

Output:

```
{
   "IpSetId": "d4b94fc952d6912b8f3060768example"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.
create-members

The following code example shows how to use create-members.

AWS CLI

To associate a new member with your GuardDuty master account in the current region.

This example shows how to associate member accounts to be managed by the current account as the GuardDuty master.

```
aws guardduty create-members
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --account-details AccountId=111122223333,Email=first+member@example.com
   AccountId=111111111111 ,Email=another+member@example.com
```

Output:

```
{
   "UnprocessedAccounts": []
}
```

For more information, see Managing multiple accounts in the GuardDuty User Guide.

create-publishing-destination

The following code example shows how to use create-publishing-destination.

AWS CLI

To create a publishing destination to export GuardDuty findings in the current region to.

This example shows how to create a publishing destination for GuardDuty findings.

```
aws guardduty create-publishing-destination \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --destination-type S3 \
```
--destination-properties
  DestinationArn=arn:aws:s3:::yourbucket,KmsKeyArn=arn:aws:kms:us-west-1:111122223333:key/84cee9c5-dea1-401a-ab6d-e1de7example

Output:

  
  {  
    "DestinationId": "46b99823849e1bbc242dfbe3cexample"  
  }

For more information, see Exporting findings in the GuardDuty User Guide.
- For API details, see CreatePublishingDestination in AWS CLI Command Reference.

create-sample-findings

The following code example shows how to use create-sample-findings.

AWS CLI

  To create sample GuardDuty findings in the current region.

  This example shows how to create a sample finding of the provided types.

aws guardduty create-sample-findings \
  --detector-id b6b992d6d2f48e64bc59180bfexample \n  --finding-types UnauthorizedAccess:EC2/TorClient UnauthorizedAccess:EC2/TorRelay

This command produces no output.

For more information, see Sample findings in the GuardDuty User Guide.
- For API details, see CreateSampleFindings in AWS CLI Command Reference.

create-threat-intel-set

The following code example shows how to use create-threat-intel-set.

AWS CLI

  To create a new threat intel set in the current region.

  This example shows how to upload a threat intel set to GuardDuty and activate it immediately.
aws guardduty create-threat-intel-set \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --name myThreatSet \
   --format TXT \
   --location s3://EXAMPLEBUCKET/threatlist.csv \
   --activate

Output:

{  
   "ThreatIntelSetId": "20b9a4691aeb33506b808878cexample"
}

For more information, see Trusted IP and threat lists in the GuardDuty User Guide.

• For API details, see CreateThreatIntelSet in AWS CLI Command Reference.

decline-invitations

The following code example shows how to use decline-invitations.

AWS CLI

To decline an invitation to have Guardduty managed by another account in the current region.

This example shows how to decline a membership invitation.

aws guardduty decline-invitations \
   --account-ids 111122223333

Output:

{  
   "UnprocessedAccounts": []
}

For more information, see Managing GuardDuty accounts by invitation in the GuardDuty User Guide.

• For API details, see DeclineInvitations in AWS CLI Command Reference.
delete-detector

The following code example shows how to use delete-detector.

AWS CLI

To delete a detector, and disable GuardDuty, in the current region.

This example shows how to delete a detector, if successful, this will disable GuardDuty in the region associated with that detector.

```
aws guardduty delete-detector \
    --detector-id b6b992d6d2f48e64bc59180bfexample
```

This command produces no output.

For more information, see Suspending or disabling GuardDuty in the GuardDuty User Guide.

• For API details, see DeleteDetector in AWS CLI Command Reference.

delete-filter

The following code example shows how to use delete-filter.

AWS CLI

To delete an existing filter in the current region

This example shows how to create delete a filter.

```
aws guardduty delete-filter \\n    --detector-id b6b992d6d2f48e64bc59180bfexample \n    --filter-name byebyeFilter
```

This command produces no output.

For more information, see Filtering findings in the GuardDuty User Guide.

• For API details, see DeleteFilter in AWS CLI Command Reference.

disable-organization-admin-account

The following code example shows how to use disable-organization-admin-account.
**AWS CLI**

To remove an account as the delegated administrator for GuardDuty within your organization

This example shows how to remove an account as the delegated administrator for GuardDuty.

```bash
aws guardduty disable-organization-admin-account \
  --admin-account-id 111122223333
```

This command produces no output.

For more information, see [Managing accounts with AWS organizations](#) in the *GuardDuty User Guide*.

- For API details, see [DisableOrganizationAdminAccount](#) in *AWS CLI Command Reference*.

**disassociate-from-master-account**

The following code example shows how to use disassociate-from-master-account.

**AWS CLI**

To disassociate from your current master account in the current region

The following disassociate-from-master-account example disassociates your account from the current GuardDuty master account in the current AWS region.

```bash
aws guardduty disassociate-from-master-account \
  --detector-id d4b040365221be2b54a6264dcexample
```

This command produces no output.

For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](#) in the GuardDuty User Guide.

- For API details, see [DisassociateFromMasterAccount](#) in *AWS CLI Command Reference*.

**get-detector**

The following code example shows how to use get-detector.

### Actions and scenarios

[3152]
AWS CLI

To retrieve details of a specific detector

The following `get-detector` example displays the configurations details of the specified detector.

```bash
aws guardduty get-detector \
   --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```json
{
   "Status": "ENABLED",
   "ServiceRole": "arn:aws:iam::111122223333:role/aws-service-role/guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",
   "Tags": {},
   "FindingPublishingFrequency": "SIX_HOURS",
   "UpdatedAt": "2018-11-07T03:24:22.938Z",
   "CreatedAt": "2017-12-22T22:51:31.940Z"
}
```

For more information, see [Concepts and Terminology](#) in the GuardDuty User Guide.

- For API details, see [GetDetector](#) in `AWS CLI Command Reference`.

get-findings

The following code example shows how to use `get-findings`.

AWS CLI

Example 1: To retrieve the details of a specific finding

The following `get-findings` example retrieves the full JSON finding details of the specified finding.

```bash
aws guardduty get-findings \
   --detector-id 12abc34d567e8fa901bc2d34eexample \
   --finding-id 1ab92989eaf0e742df4a014d5example
```
Output:

```json
{
    "Findings": [
        {
            "Resource": {
                "ResourceType": "AccessKey",
                "AccessKeyDetails": {
                    "UserName": "testuser",
                    "UserType": "IAMUser",
                    "PrincipalId": "AIDACKCEVSQ6C2EXAMPLE",
                    "AccessKeyId": "ASIASZ4SI7REEEXAMPLE"
                }
            },
            "Description": "APIs commonly used to discover the users, groups, policies and permissions in an account, was invoked by IAM principal testuser under unusual circumstances. Such activity is not typically seen from this principal.",
            "Service": {
                "Count": 5,
                "Archived": false,
                "ServiceName": "guardduty",
                "EventFirstSeen": "2020-05-26T22:02:24Z",
                "ResourceRole": "TARGET",
                "DetectorId": "d4b040365221be2b54a6264dceexample",
                "Action": {
                    "ActionType": "AWS_API_CALL",
                    "AwsApiCallAction": {
                        "RemoteIpDetails": {
                            "GeoLocation": {
                                "Lat": 51.5164,
                                "Lon": -0.093
                            },
                            "City": {
                                "CityName": "London"
                            },
                            "IpAddressV4": "52.94.36.7",
                            "Organization": {
                                "Org": "Amazon.com",
                                "Isp": "Amazon.com",
                                "Asn": "16509",
                                "AsnOrg": "AMAZON-02"
                            }
                        },
                        "Country": {
```
For more information, see [Findings](#) in the GuardDuty User Guide.
- For API details, see [GetFindings](#) in *AWS CLI Command Reference*.

**get-ip-set**

The following code example shows how to use get-ip-set.

**AWS CLI**

**To list get details on a specified trusted IP set**

The following `get-ip-set` example shows the status and details of the specified trusted IP set.

```bash
aws guardduty get-ip-set 
    --detector-id 12abc34d567e8fa901bc2d34eexample 
    --ip-set-id d4b94fc952d6912b8f3060768example
```
Output:

```
{
    "Status": "ACTIVE",
    "Location": "s3://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/customlist.csv",
    "Tags": {},
    "Format": "TXT",
    "Name": "test-ip-set"
}
```

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [GetIpSet](#) in [AWS CLI Command Reference](#).

**get-master-account**

The following code example shows how to use get-master-account.

**AWS CLI**

To retrieve details about your master account in the current region

The following get-master-account example displays the status and details of the master account associated with your detector in the current region.

```
aws guardduty get-master-account \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "Master": {
        "InvitationId": "04b94d9704854a73f94e061e8example",
        "InvitedAt": "2020-06-09T22:23:04.970Z",
        "RelationshipStatus": "Enabled",
        "AccountId": "123456789111"
    }
}
```
For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see GetMasterAccount in AWS CLI Command Reference.

**list-detectors**

The following code example shows how to use list-detectors.

**AWS CLI**

**To list the available detectors in the current region**

The following list-detectors example lists the available detectors in your current AWS region.

```bash
aws guardduty list-detectors
```

**Output:**

```json
{
    "DetectorIds": [
        "12abc34d567e8fa901bc2d34eexample"
    ]
}
```

For more information, see Concepts and Terminology in the GuardDuty User Guide.

- For API details, see ListDetectors in AWS CLI Command Reference.

**list-findings**

The following code example shows how to use list-findings.

**AWS CLI**

**Example 1: To list all findings for the current region**

The following list-findings example displays a list of all findingIds for the current region sorted by severity from highest to lowest.
aws guardduty list-findings \
   --detector-id 12abc34d567e8fa901bc2d34eexample \ 
   --sort-criteria '{"AttributeName": "severity","OrderBy": "DESC"}'

Output:

```json
{
   "FindingIds": [
      "04b8ab50fd29c64fc771b232dexample",
      "5ab8ab50fd21373735c826d3aexample",
      "90b93de7aba69107f05bbe60bexample",
      ...
   ]
}
```

For more information, see [Findings](#) in the GuardDuty User Guide.

**Example 2: To list findings for the current region matching a specific finding criteria**

The following `list-findings` example displays a list of all findingIds that match a specified finding type.

```bash
aws guardduty list-findings \
   --detector-id 12abc34d567e8fa901bc2d34eexample \
   --finding-criteria '{"Criterion":{"type": {"Eq": ["UnauthorizedAccess:EC2/SSHBruteForce"]}}}"
```

Output:

```json
{
   "FindingIds": [
      "90b93de7aba69107f05bbe60bexample",
      "6eb9430d7023d30774d6f05e3example",
      "2eb91a2d060ac9a21963a5848example",
      "44b8ab50fd2b0039a9e48f57example",
      "9eb8ab4cd2b7e5b66ba4f5e96example",
      "e0b8ab3a38e9b0312cc390ceexample"
   ]
}
```

For more information, see [Findings](#) in the GuardDuty User Guide.
Example 3: To list findings for the current region matching a specific set of finding criteria defined within a JSON file

The following list-findings example displays a list of all findingIds that are not archived, and involve the IAM user named "testuser", as specified in a JSON file.

```bash
aws guardduty list-findings \
   --detector-id 12abc34d567e8fa901bc2d34eexample \
   --finding-criteria  file://myfile.json
```

Contents of myfile.json:

```json
{"Criterion": {
   "resource.accessKeyDetails.userName":{
      "Eq":[
         "testuser"
      ]
   },
   "service.archived": {
      "Eq": ["false"
      ]
   }
}}
```

Output:

```json
{
   "FindingIds": ["1ab92989eaf0e742df4a014d5example"
}
```

For more information, see Findings in the GuardDuty User Guide.
- For API details, see ListFindings in AWS CLI Command Reference.

**list-invitations**

The following code example shows how to use list-invitations.
AWS CLI

To list details on your invitations to become a member account in the current region

The following list-invitations example lists details and statuses on your invitations to become a GuardDuty member account in the current region.

```
aws guardduty list-invitations
```

Output:

```
{
   "Invitations": [
       {
           "InvitationId": "d6b94fb03a66ff665f7db8764example",
           "InvitedAt": "2020-06-10T17:56:38.221Z",
           "RelationshipStatus": "Invited",
           "AccountId": "123456789111"
       }
   ]
}
```

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see ListInvitations in AWS CLI Command Reference.

list-ip-sets

The following code example shows how to use list-ip-sets.

AWS CLI

To list trusted IP sets in the current region

The following list-ip-sets example lists the trusted IP sets in your current AWS region.

```
aws guardduty list-ip-sets \
   --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:
For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [ListIpSets](#) in *AWS CLI Command Reference*.

### list-members

The following code example shows how to use `list-members`.

**AWS CLI**

**To list all members in the current region**

The following `list-members` example lists all member accounts and their details for the current region.

```bash
aws guardduty list-members \
   --detector-id 12abc34d567e8fa901bc2d34eexample
```

**Output:**

```json
{
   "Members": [
      {
         "RelationshipStatus": "Enabled",
         "InvitedAt": "2020-06-09T22:49:00.910Z",
         "MasterId": "123456789111",
         "DetectorId": "7ab8b2f61b256c87f793f6a86example",
         "UpdatedAt": "2020-06-09T23:08:22.512Z",
         "Email": "your+member@example.com",
         "AccountId": "123456789222"
      }
   ]
}
```
For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see ListMembers in AWS CLI Command Reference.

update-ip-set

The following code example shows how to use update-ip-set.

AWS CLI

To update a trusted IP set

The following update-ip-set example shows how to update the details of a trusted IP set.

```bash
aws guardduty update-ip-set \
   --detector-id 12abc34d567e8fa901bc2d34eexample \
   --ip-set-id d4b94fc952d6912b8f3060768example \
   --location https://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/customtrustlist2.csv
```

This command produces no output.

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see UpdateIpSet in AWS CLI Command Reference.

AWS Health examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Health.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Actions

describe-affected-entities

The following code example shows how to use describe-affected-entities.

AWS CLI

To list the entities that are affected by a specified AWS Health event

The following describe-affected-entities example lists the entities that are affected by the specified AWS Health event. This event is a billing notification for the AWS account.

```
aws health describe-affected-entities \
   --filter "eventArns=arn:aws:health:global::event/BILLING/ 
   AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd- 
   EXAMPLE11145" \
   --region us-east-1
```

Output:

```
{
   "entities": [
      {
         "entityArn": "arn:aws:health:global:123456789012:entity/ 
               EXAMPLEimSMoULmWhp", 
         "eventArn": "arn:aws:health:global::event/BILLING/ 
               AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd- 
               EXAMPLE11145", 
         "entityValue": "AWS_ACCOUNT", 
         "awsAccountId": "123456789012", 
         "lastUpdatedTime": 1588356454.08
      }
   ]
}
```

For more information, see Event log in the AWS Health User Guide.

- For API details, see DescribeAffectedEntities in AWS CLI Command Reference.
**describe-event-details**

The following code example shows how to use `describe-event-details`.

**AWS CLI**

**To list information about an AWS Health event**

The following `describe-event-details` example lists information about the specified AWS Health event.

```bash
aws health describe-event-details \
  --event-arns "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111" \
  --region us-east-1
```

**Output:**

```json
{
  "successfulSet": [ 
    {
      "event": {
        "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
        "service": "EC2",
        "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
        "eventTypeCategory": "issue",
        "region": "us-east-1",
        "startTime": 1587462325.096,
        "endTime": 1587464204.774,
        "lastUpdatedTime": 1587464204.865,
        "statusCode": "closed"
      },
      "eventDescription": {
        "latestDescription": "[RESOLVED] Increased API Error Rates and Latencies\n        [02:45 AM PDT] We are investigating increased API error rates and latencies in the US-EAST-1 Region.\n        [03:16 AM PDT] Between 2:10 AM and 2:59 AM PDT we experienced increased API error rates and latencies in the US-EAST-1 Region.\n        The issue has been resolved and the service is operating normally."
      }
    }
  ],
  "failedSet": []
}
```
For more information, see Event details pane in the AWS Health User Guide.

- For API details, see DescribeEventDetails in AWS CLI Command Reference.

describe-events

The following code example shows how to use describe-events.

AWS CLI

Example 1: To list AWS Health events

The following describe-events example lists recent AWS Health events.

```
aws health describe-events \
  --region us-east-1
```

Output:

```
{
  "events": [
    {
      "arn": "arn:aws:health:us-west-1::event/ECS/AWS_ECS_OPERATIONAL_ISSUE/AWS_ECS_OPERATIONAL_ISSUE_KWQPY_EXAMPLE111",
      "service": "ECS",
      "eventTypeCode": "AWS_ECS_OPERATIONAL_ISSUE",

"statusCode": "closed",
"eventScopeCode": "PUBLIC"
}
]
}

For more information, see Getting started with the AWS Personal Health Dashboard in the AWS Health User Guide.

Example 2: To list AWS Health events by service and event status code

The following describe-events example lists AWS Health events for Amazon Elastic Compute Cloud (Amazon EC2) where the event status is closed.

aws health describe-events \
   --filter "services=EC2,eventStatusCodes=closed"

Output:

{
   "events": [
   {
   "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2OPERATIONAL_ISSUE/
AWS_EC2OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
For more information, see Getting started with the AWS Personal Health Dashboard in the AWS Health User Guide.

- For API details, see DescribeEvents in AWS CLI Command Reference.
HealthImaging examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthImaging.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

copy-image-set

The following code example shows how to use copy-image-set.

AWS CLI

Example 1: To copy an image set without a destination.

The following copy-image-set code example makes a duplicate copy of an image set without a destination.

```bash
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \ 
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \ 
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" } }'
```

Output:

```json
{
```
"destinationImageSetProperties": {  
    "latestVersionId": "1",
    "imageSetWorkflowStatus": "COPYING",
    "updatedAt": 1680042357.432,
    "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
    "imageSetState": "LOCKED",
    "createdAt": 1680042357.432
  },
  "sourceImageSetProperties": {  
    "latestVersionId": "5",
    "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
    "updatedAt": 1680042357.432,
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436
  },
  "datastoreId": "12345678901234567890123456789012"
}

Example 2: To copy an image set with a destination.

The following copy-image-set code example makes a duplicate copy of an image set with a destination.

```
aws medical-imaging copy-image-set \
  --datastore-id 12345678901234567890123456789012 \
  --source-image-set-id ea92b0d8310c72e3f25d00d13616f87e \
  --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "5" },"destinationImageSet": { "imageSetId": "ea92b0d8310c72e3f25d00d13616f87e", "latestVersionId": "1"} }'
```

Output:

```
{
    "destinationImageSetProperties": {  
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042505.135,
        "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {  
        "latestVersionId": "5",
```
For more information, see [Copying an image set](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [CopyImageSet](#) in *AWS CLI Command Reference*.

### create-datastore

The following code example shows how to use `create-datastore`.

#### AWS CLI

**To create a data store**

The following `create-datastore` code example creates a data store with the name *my-datastore*.

```bash
aws medical-imaging create-datastore \
    --datastore-name "my-datastore"
```

**Output:**

```json
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "CREATING"
}
```

For more information, see [Creating a data store](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [CreateDatastore](#) in *AWS CLI Command Reference*.

### delete-datastore

The following code example shows how to use `delete-datastore`.

"imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
"updatedAt": 1680042505.135,
"imageSetId": "ea92b0d8838c72a3f25d000d13616f87e",
"imageSetState": "LOCKED",
"createdAt": 1680027126.436
},
"datastoreId": "12345678901234567890123456789012"
}
AWS CLI

To delete a data store

The following delete-datastore code example deletes a data store.

```bash
aws medical-imaging delete-datastore \
   --datastore-id "12345678901234567890123456789012"
```

Output:

```json
{
   "datastoreId": "12345678901234567890123456789012",
   "datastoreStatus": "DELETING"
}
```

For more information, see Deleting a data store in the AWS HealthImaging Developer Guide. For API details, see DeleteDatastore in AWS CLI Command Reference.

delete-image-set

The following code example shows how to use delete-image-set.

AWS CLI

To delete an image set

The following delete-image-set code example deletes an image set.

```bash
aws medical-imaging delete-image-set \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```json
{
   "imageSetWorkflowStatus": "DELETING",
   "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
   "imageSetState": "LOCKED",
   "datastoreId": "12345678901234567890123456789012"
}
```
For more information, see [Deleting an image set](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [DeleteImageSet](#) in *AWS CLI Command Reference*.

### get-datastore

The following code example shows how to use `get-datastore`.

**AWS CLI**

#### To get a data store's properties

The following `get-datastore` code example gets a data store's properties.

```
aws medical-imaging get-datastore \
  --datastore-id 12345678901234567890123456789012
```

**Output:**

```
{
    "datastoreProperties": {
        "datastoreId": "12345678901234567890123456789012",
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "datastoreArn": "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012",
        "createdAt": "2022-11-15T23:33:09.643000+00:00",
        "updatedAt": "2022-11-15T23:33:09.643000+00:00"
    }
}
```

For more information, see [Getting data store properties](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetDatastore](#) in *AWS CLI Command Reference*.

### get-dicom-import-job

The following code example shows how to use `get-dicom-import-job`.
AWS CLI

To get a dicom import job's properties

The following get-dicom-import-job code example gets a dicom import job's properties.

```bash
aws medical-imaging get-dicom-import-job \
    --datastore-id "12345678901234567890123456789012" \
    --job-id "09876543210987654321098765432109"
```

Output:

```
{
    "jobProperties": {
        "jobId": "09876543210987654321098765432109",
        "jobName": "my-job",
        "jobStatus": "COMPLETED",
        "datastoreId": "12345678901234567890123456789012",
        "dataAccessRoleArn": "arn:aws:iam::123456789012:role/ImportJobDataAccessRole",
        "endedAt": "2022-08-12T11:29:42.285000+00:00",
        "submittedAt": "2022-08-12T11:28:11.152000+00:00",
        "inputS3Uri": "s3://medical-imaging-dicom-input/dicom_input/",
        "outputS3Uri": "s3://medical-imaging-output/job_output/12345678901234567890123456789012-DicomImport-09876543210987654321098765432109/"
    }
}
```

For more information, see Getting import job properties in the AWS HealthImaging Developer Guide.

- For API details, see GetDICOMImportJob in AWS CLI Command Reference.

**get-image-frame**

The following code example shows how to use get-image-frame.

AWS CLI

To get image set pixel data

The following get-image-frame code example gets an image frame.
aws medical-imaging get-image-frame  
   --datastore-id "12345678901234567890123456789012"  
   --image-set-id "98765412345612345678907890789012"  
   --image-frame-information imageFrameId=3abf5d5d7ae72f80a0ec81b2c0de3ef4 
   imageframe.jph

Note: This code example does not include output because the GetImageFrame action returns a stream of pixel data to the imageframe.jph file. For information about decoding and viewing image frames, see HTJ2K decoding libraries.

For more information, see Getting image set pixel data in the AWS HealthImaging Developer Guide.

• For API details, see GetImageFrame in AWS CLI Command Reference.

get-image-set-metadata

The following code example shows how to use get-image-set-metadata.

AWS CLI

Example 1: To get image set metadata without version

The following get-image-set-metadata code example gets metadata for an image set without specifying a version.

Note: outfile is a required parameter

aws medical-imaging get-image-set-metadata  
   --datastore-id 12345678901234567890123456789012  
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e  
   studymetadata.json.gz

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```json
{
   "contentType": "application/json",
   "contentEncoding": "gzip"
}
```
Example 2: To get image set metadata with version

The following `get-image-set-metadata` code example gets metadata for an image set with a specified version.

Note: `outfile` is a required parameter

```bash
aws medical-imaging get-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --version-id 1 \
    studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the `studymetadata.json.gz` file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```json
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

For more information, see [Getting image set metadata](#) in the AWS HealthImaging Developer Guide.

- For API details, see [GetImageSetMetadata](#) in AWS CLI Command Reference.

get-image-set

The following code example shows how to use `get-image-set`.

AWS CLI

To get image set properties

The following `get-image-set` code example gets the properties for an image set.

```bash
aws medical-imaging get-image-set \
    --datastore-id 12345678901234567890123456789012 \
```
--image-set-id 18f88ac7870584f58d56256646b4d92b \ 
--version-id 1

Output:

```
{
    "versionId": "1",
    "imageSetWorkflowStatus": "COPIED",
    "updatedAt": 1680027253.471,
    "imageSetId": "18f88ac7870584f58d56256646b4d92b",
    "imageSetState": "ACTIVE",
    "createdAt": 1679592510.753,
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see [Getting image set properties](https://aws.amazon.com/awsdocs/en_us/services/health-imaging/DeveloperGuide/) in the *AWS HealthImaging Developer Guide*.

### list-datastores

The following code example shows how to use `list-datastores`.

#### AWS CLI

**To list data stores**

The following `list-datastores` code example lists available data stores.

```
aws medical-imaging list-datastores
```

Output:

```
{
    "datastoreSummaries": [
    {
        "datastoreId": "12345678901234567890123456789012",
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "datastoreArn": "arn:aws:medical-imaging:us-east-1:123456789012:datstore/12345678901234567890123456789012",
```
For more information, see [Listing data stores](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [ListDatastores](#) in *AWS CLI Command Reference*.

### list-dicom-import-jobs

The following code example shows how to use `list-dicom-import-jobs`.

**AWS CLI**

**To list dicom import jobs**

The following `list-dicom-import-jobs` code example lists dicom import jobs.

```bash
aws medical-imaging list-dicom-import-jobs \
    --datastore-id "12345678901234567890123456789012"
```

**Output:**

```json
{
    "jobSummaries": [
    {
        "jobId": "09876543210987654321098765432109",
        "jobName": "my-job",
        "jobStatus": "COMPLETED",
        "datastoreId": "12345678901234567890123456789012",
        "dataAccessRoleArn": "arn:aws:iam::123456789012:role/ImportJobDataAccessRole",
        "endedAt": "2022-08-12T11:56:504000+00:00",
        "submittedAt": "2022-08-12T11:21.734000+00:00"
    }
    ]
}
```

For more information, see [Listing import jobs](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [ListDICOMImportJobs](#) in *AWS CLI Command Reference*. 
list-image-set-versions

The following code example shows how to use list-image-set-versions.

AWS CLI

To list image set versions

The following list-image-set-versions code example lists the version history for an image set.

```bash
aws medical-imaging list-image-set-versions \
  --datastore-id 12345678901234567890123456789012 \n  --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```json
{
  "imageSetPropertiesList": [
    {
      "ImageSetWorkflowStatus": "UPDATED",
      "versionId": "4",
      "updatedAt": 1680029436.304,
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
      "imageSetState": "ACTIVE",
      "createdAt": 1680027126.436
    },
    {
      "ImageSetWorkflowStatus": "UPDATED",
      "versionId": "3",
      "updatedAt": 1680029163.325,
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
      "imageSetState": "ACTIVE",
      "createdAt": 1680027126.436
    },
    {
      "ImageSetWorkflowStatus": "COPY_FAILED",
      "versionId": "2",
      "updatedAt": 1680027455.944,
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
      "imageSetState": "ACTIVE",
      "message": "INVALID_REQUEST: Series of SourceImageSet and DestinationImageSet don't match."
    }
  ]
}
```
For more information, see [Listing image set versions](#) in the AWS HealthImaging Developer Guide.

- For API details, see [ListImageSetVersions](#) in AWS CLI Command Reference.

### list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

#### AWS CLI

**Example 1: To list resource tags for a data store**

The following list-tags-for-resource code example lists tags for a data store.

```bash
aws medical-imaging list-tags-for-resource \
--resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012"
```

**Output:**

```json
{
  "tags":{
    "Deployment":"Development"
  }
}
```

**Example 2: To list resource tags for an image set**

The following list-tags-for-resource code example lists tags for an image set.

```bash
aws medical-imaging list-tags-for-resource \
```

**Output:**

```json
{
  "tags":{
    "Deployment":"Development"
  }
}
```
aws medical-imaging list-tags-for-resource \ 
  --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012/imageset/18f88ac7870584f58d56256646b4d92b"

Output:

{
   "tags":{
      "Deployment":"Development"
   }
}

For more information, see Tagging resources with AWS HealthImaging in the AWS HealthImaging Developer Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

search-image-sets

The following code example shows how to use search-image-sets.

AWS CLI

Example 1: To search image sets with an EQUAL operator

The following search-image-sets code example uses the EQUAL operator to search image sets based on a specific value.

aws medical-imaging search-image-sets \ 
  --datastore-id 12345678901234567890123456789012 \ 
  --search-criteria file://search-criteria.json

Contents of search-criteria.json

{
   "filters": [[[  
      "values": ["DICOMPatientId" : "SUBJECT08701"],  
      "operator": "EQUAL"
   ]]
}
Output:

```json
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

Example 2: To search image sets with a BETWEEN operator using DICOMStudyDate and DICOMStudyTime

The following `search-image-sets` code example searches for image sets with DICOM Studies generated between January 1, 1990 (12:00 AM) and January 1, 2023 (12:00 AM).

Note: DICOMStudyTime is optional. If it is not present, 12:00 AM (start of the day) is the time value for the dates provided for filtering.

```
aws medical-imaging search-image-sets
   --datastore-id 12345678901234567890123456789012
   --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```json
{
}
```
Example 3: To search image sets with a BETWEEN operator using createdAt (time studies were previously persisted)
The following `search-image-sets` code example searches for image sets with DICOM Studies persisted in HealthImaging between the time ranges in UTC time zone.

Note: Provide `createdAt` in example format ("1985-04-12T23:20:50.52Z").

```bash
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \
   --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```json
{
   "filters": [ [
      "values": [[
         "createdAt": "1985-04-12T23:20:50.52Z"
      ],
      [ "createdAt": "2022-04-12T23:20:50.52Z" ]],
      "operator": "BETWEEN"
   ]
}
```

Output:

```json
{
   "imageSetsMetadataSummaries": [ {
      "imageSetId": "09876543210987654321098765432109",
      "createdAt": "2022-12-06T21:40:59.429000+00:00",
      "version": 1,
      "DICOMTags": { 
         "DICOMStudyId": "2011201407",
         "DICOMStudyDate": "19991122",
         "DICOMPatientSex": "F",
         "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
         "DICOMPatientBirthDate": "19201120",
         "DICOMStudyDescription": "UNKNOWN",
         "DICOMPatientId": "SUBJECT08701",
         "DICOMPatientName": "Melissa844 Huel628",
         "DICOMNumberOfStudyRelatedInstances": 1,
         "DICOMStudyTime": "140728",
         "DICOMNumberOfStudyRelatedSeries": 1
      }
   }
}
```
For more information, see [Searching image sets](#) in the [AWS HealthImaging Developer Guide](#).

- For API details, see [SearchImageSets](#) in [AWS CLI Command Reference](#).

### start-dicom-import-job

The following code example shows how to use `start-dicom-import-job`.

**AWS CLI**

**To start a dicom import job**

The following `start-dicom-import-job` code example starts a dicom import job.

```bash
aws medical-imaging start-dicom-import-job \
--job-name "my-job" \
--datastore-id "12345678901234567890123456789012" \
--input-s3-uri "s3://medical-imaging-dicom-input/dicom_input/" \
--output-s3-uri "s3://medical-imaging-output/job_output/" \
--data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"
```

**Output:**

```json
{
   "datastoreId": "12345678901234567890123456789012",
   "jobId": "09876543210987654321098765432109",
   "jobStatus": "SUBMITTED",
   "submittedAt": "2022-08-12T11:28:11.152000+00:00"
}
```

For more information, see [Starting an import job](#) in the [AWS HealthImaging Developer Guide](#).

- For API details, see [StartDICOMImportJob](#) in [AWS CLI Command Reference](#).

### tag-resource

The following code example shows how to use `tag-resource`.

```bash
},
    "lastUpdatedAt": "2022-12-06T21:40:59.429000+00:00"
}]
}]
```

```json
{
   "datastoreId": "12345678901234567890123456789012",
   "jobId": "09876543210987654321098765432109",
   "jobStatus": "SUBMITTED",
   "submittedAt": "2022-08-12T11:28:11.152000+00:00"
}
```

```bash
aws medical-imaging start-dicom-import-job \
--job-name "my-job" \
--datastore-id "12345678901234567890123456789012" \
--input-s3-uri "s3://medical-imaging-dicom-input/dicom_input/" \
--output-s3-uri "s3://medical-imaging-output/job_output/" \
--data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"
```

```json
{
   "datastoreId": "12345678901234567890123456789012",
   "jobId": "09876543210987654321098765432109",
   "jobStatus": "SUBMITTED",
   "submittedAt": "2022-08-12T11:28:11.152000+00:00"
}
```
Example 1: To tag a data store

The following `tag-resource` code examples tags a data store.

```
aws medical-imaging tag-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datarstore/12345678901234567890123456789012" \
   --tags '{"Deployment":"Development"}'
```

This command produces no output.

Example 2: To tag an image set

The following `tag-resource` code examples tags an image set.

```
aws medical-imaging tag-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datarstore/12345678901234567890123456789012/\n   imageset/18f88ac7870584f58d56256646b92b" \
   --tags '{"Deployment":"Development"}'
```

This command produces no output.

For more information, see Tagging resources with AWS HealthImaging in the AWS HealthImaging Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To untag a data store

The following `untag-resource` code example untags a data store.

```
aws medical-imaging untag-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datarstore/12345678901234567890123456789012"
```
This command produces no output.

**Example 2: To untag an image set**

The following `untag-resource` code example untags an image set.

```
aws medical-imaging untag-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012/\n      imageset/18f88ac7870584f58d56256646b4d92b" \
   --tag-keys ['"Deployment"']
```

This command produces no output.

For more information, see [Tagging resources with AWS HealthImaging](https://docs.aws.amazon.com/healthimaging/latest/developerguide/tagging.html) in the *AWS HealthImaging Developer Guide*.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/medical-imaging/untag-resource.html) in *AWS CLI Command Reference*.

**update-image-set-metadata**

The following code example shows how to use `update-image-set-metadata`.

**AWS CLI**

**To update image set metadata**

The following `update-image-set-metadata` code example updates image set metadata.

```
aws medical-imaging update-image-set-metadata \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
   --latest-version-id 1 \
   --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```json
{
   "DICOMUpdates": {
```

**Actions and scenarios**
Note: updatableAttributes is a Base64 encoded JSON string. Here is the unencoded JSON string.

{"SchemaVersion":1.1,"Patient":{"DICOM":{"PatientName":"MX^MX"}}}

Output:

{  "latestVersionId": "5",  "imageSetWorkflowStatus": "UPDATING",  "updatedAt": 1680042257.908,  "imageSetId": "ea92b0d883c72a3f25d00d13616f87e",  "imageSetState": "LOCKED",  "createdAt": 1680027126.436,  "datastoreId": "12345678901234567890123456789012"}

For more information, see [Updating image set metadata](#) in the [AWS HealthImaging Developer Guide](#).

- For API details, see [UpdateImageSetMetadata](#) in [AWS CLI Command Reference](#).

---

### HealthLake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthLake.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
create-fhir-datastore

The following code example shows how to use `create-fhir-datastore`.

**AWS CLI**

To create a FHIR Data Store.

The following `create-fhir-datastore` example demonstrates how to create a new Data Store in Amazon HealthLake.

```bash
aws healthlake create-fhir-datastore 
   --region us-east-1 
   --datastore-type-version R4 
   --datastore-type-version R4 
   --datastore-name "FhirTestDatastore"
```

Output:

```json
{
   "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
   "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
   "DatastoreStatus": "CREATING",
   "DatastoreId": "(Datastore ID)"
}
```

For more information, see Creating and monitoring a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see CreateFhirDatastore in AWS CLI Command Reference.

delete-fhir-datastore

The following code example shows how to use `delete-fhir-datastore`.

---

**Actions**

- **create-fhir-datastore**

- **delete-fhir-datastore**
AWS CLI

To delete a FHIR Data Store

The following delete-fhir-datastore example demonstrates how to delete a Data Store and all of its contents in Amazon HealthLake.

```
aws healthlake delete-fhir-datastore \
    --datastore-id (Data Store ID) \
    --region us-east-1
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
    "DatastoreStatus": "DELETING",
    "DatastoreId": "(Datastore ID)"
}
```

For more information, see Creating and monitoring a FHIR Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/working-with-FHIR-healthlake.html> in the Amazon HealthLake Developer Guide.

- For API details, see DeleteFhirDatastore in AWS CLI Command Reference.

describe-fhir-datastore

The following code example shows how to use describe-fhir-datastore.

AWS CLI

To describe a FHIR Data Store

The following describe-fhir-datastore example demonstrates how to find the properties of a Data Store in Amazon HealthLake.

```
aws healthlake describe-fhir-datastore \
    --datastore-id "1f2f459836ac6c513ce899f9e4f66a59" \
    --region us-east-1
```
Output:

```
{
   "DatastoreProperties": {
       "PreloadDataConfig": {
           "PreloadDataType": "SYNTHEA"
       },
       "DatastoreName": "FhirTestDatastore",
       "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
       "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
       "DatastoreStatus": "CREATING",
       "DatastoreTypeVersion": "R4",
       "DatastoreId": "(Datastore ID)"
   }
}
```

For more information, see [Creating and monitoring a FHIR Data Stores](https://aws.amazon.com/healthlake/user-guide/) in the *Amazon HealthLake Developer Guide*.

- For API details, see [DescribeFhirDatastore](https://docs.aws.amazon.com/cli/) in *AWS CLI Command Reference*.

### describe-fhir-export-job

The following code example shows how to use `describe-fhir-export-job`.

### AWS CLI

**To describe a FHIR export job**

The following `describe-fhir-export-job` example shows how to find the properties of a FHIR export job in Amazon HealthLake.

```
aws healthlake describe-fhir-export-job \
   --datastore-id (Datastore ID) \
   --job-id 9b9a51943afaedd0a8c0c26c49135a31
```

Output:

```
{
   "ExportJobProperties": {
```
For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirExportJob in AWS CLI Command Reference.

**describe-fhir-import-job**

The following code example shows how to use describe-fhir-import-job.

**AWS CLI**

*To describe a FHIR import job*

The following describe-fhir-import-job example shows how to learn the properties of a FHIR import job using Amazon HealthLake.

```
aws healthlake describe-fhir-import-job 
  --datastore-id (Datastore ID) 
  --job-id c145fbb27b192af392f8ce6e7838e34f 
  --region us-east-1
```

**Output:**

```
{
  "ImportJobProperties": {
    "InputDataConfig": {
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/59593b2d0367ce252b5e66bf5fd6b574-FHIR_EXPORT-9009813e9d69ba7cf79bcb3468780f16/"
    },
    "DatastoreId": "(Datastore ID)"
  }
}
```
"DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
"JobStatus": "COMPLETED",
"JobId": "c145fbb27b192af392f8ce6e7838e34f",
"SubmitTime": 1606272542.161,
"EndTime": 1606272609.497,
"DatastoreId": "(Datastore ID)"
}
}

For more information, see Importing files to a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirImportJob in AWS CLI Command Reference.

list-fhir-datastores

The following code example shows how to use list-fhir-datastores.

AWS CLI

**To list FHIR Data Stores**

The following list-fhir-datastores example shows to how to use the command and how users can filter results based on Data Store status in Amazon HealthLake.

```
aws healthlake list-fhir-datastores \
--region us-east-1 \
--filter DatastoreStatus=ACTIVE
```

Output:

```
{
   "DatastorePropertiesList": [ 
    {
       "PreloadDataConfig": {
          "PreloadDataType": "SYNTHEA"
       },
       "DatastoreName": "FhirTestDatastore",
       "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/<Datastore ID>",
       "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/<Datastore ID>/r4/"
    }
   ]
}
```
For more information, see Creating and monitoring a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see ListFhirDatastores in AWS CLI Command Reference.

**list-fhir-export-jobs**

The following code example shows how to use list-fhir-export-jobs.

**AWS CLI**

To list all FHIR export jobs

The following list-fhir-export-jobs example shows how to use the command to view a list of export jobs associated with an account.

```bash
aws healthlake list-fhir-export-jobs \
  --datastore-id (Datastore ID) \ 
  --submitted-before (DATE like 2024-10-13T19:00:00Z)\ 
  --submitted-after (DATE like 2020-10-13T19:00:00Z )\ 
  --job-name "FHIR-EXPORT" \ 
  --job-status SUBMITTED \ 
  --max-results (Integer between 1 and 500)
```
Output:

```json
{
    "ExportJobProperties": {
        "OutputDataConfig": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
            "S3Configuration": {
                "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                "KmsKeyId": "(KmsKeyId)"
            }
        },
        "DataAccessRoleArn": "arn:aws:iamb::(AWS Account ID):role/(Role Name)",
        "JobStatus": "COMPLETED",
        "JobId": "c145fbb27b192af392f8ce6e7838e34f",
        "JobName": "FHIR-EXPORT",
        "SubmitTime": 1606272542.161,
        "EndTime": 1606272609.497,
        "DatastoreId": "(Datastore ID)"
    }
}
"NextToken": String
```

For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see ListFhirExportJobs in AWS CLI Command Reference.

**list-fhir-import-jobs**

The following code example shows how to use list-fhir-import-jobs.

**AWS CLI**

**To list all FHIR import jobs**

The following list-fhir-import-jobs example shows how to use the command to view a list of all import jobs associated with an account.

```bash
aws healthlake list-fhir-import-jobs \
   --datastore-id (Datastore ID) \
   --submitted-before (DATE like 2024-10-13T19:00:00Z) \
   --submitted-after (DATE like 2020-10-13T19:00:00Z ) \
   --job-name "FHIR-IMPORT"
```
Output:

```
{
   "ImportJobProperties": {
      "OutputDataConfig": {
         "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
         "S3Configuration": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
            "KmsKeyId": "(KmsKey Id)"
         }
      },
      "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
      "JobStatus": "COMPLETED",
      "JobId": "c145fbb27b192af392f8ce6e7838e34f",
      "JobName": "FHIR-IMPORT",
      "SubmitTime": 1606272542.161,
      "EndTime": 1606272609.497,
      "DatastoreId": "(Datastore ID)"
   }
}

"NextToken": String
```

For more information, see Importing files to FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see ListFhirImportJobs in AWS CLI Command Reference.

### list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a Data Store**

The following list-tags-for-resource example lists the tags associated with the specified Data Store:

```
aws healthlake list-tags-for-resource \
```
The following code example shows how to use `start-fhir-export-job`.

**AWS CLI**

**To start a FHIR export job**

The following `start-fhir-export-job` example shows how to start a FHIR export job using Amazon HealthLake.

```
aws healthlake start-fhir-export-job \
  --output-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
  --datastore-id (Datastore ID) \
  --data-access-role-arn arn:aws:iam::(AWS Account ID):role/(Role Name)
```

Output:

```
{   "DatastoreId": "(Datastore ID)",   "JobStatus": "SUBMITTED",   "JobId": "9b9a51943afaedd0a8c0c26c49135a31"
}
```
For more information, see [Exporting files from a FHIR Data Store](https://docs.aws.amazon.com/healthlake/latest/devguide/export-datastore.html) in the *Amazon HealthLake Developer Guide*.

- For API details, see [StartFhirExportJob](https://docs.aws.amazon.com/cli/latest/reference/healthlake/start-fhir-export-job.html) in *AWS CLI Command Reference*.

### start-fhir-import-job

The following code example shows how to use `start-fhir-import-job`.

**AWS CLI**

**To start a FHIR import job**

The following `start-fhir-import-job` example shows how to start a FHIR import job using Amazon HealthLake.

```
aws healthlake start-fhir-import-job \
  --input-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)" \
  --datastore-id (Datastore ID) \
  --data-access-role-arn "arn:aws:iam::(AWS Account ID):role/(Role Name)" \
  --region us-east-1
```

Output:

```
{
    "DatastoreId": "(Datastore ID)",
    "JobStatus": "SUBMITTED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f"
}
```

For more information, see Importing files to a FHIR Data Store 'https://docs.aws.amazon.com/healthlake/latest/devguide/import-datastore.html in the *Amazon HealthLake Developer Guide*.

- For API details, see [StartFhirImportJob](https://docs.aws.amazon.com/cli/latest/reference/healthlake/start-fhir-import-job.html) in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to Data Store**
The following `tag-resource` example shows how to add a tag to a Data Store.

```bash
aws healthlake tag-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:691207106566:datastore/fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
    --tags '[["Key": "key1", "Value": "value1"]]' \
    --region us-east-1
```

This command produces no output.

For more information, see 'Adding a tag to a Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/add-a-tag.html>' in the *Amazon HealthLake Developer Guide*.

- For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a Data Store.**

The following `untag-resource` example shows how to remove tags from a Data Store.

```bash
aws healthlake untag-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/fhir/b91723d65c6fdeb1d26543a49d2ed1fa" \
    --tag-keys '[["key1"]]' \
    --region us-east-1
```

This command produces no output.

For more information, see [Removing tags from a Data Store](https://docs.aws.amazon.com/healthlake/latest/devguide/remove-a-tag.html) in the *Amazon HealthLake Developer Guide*.

- For API details, see `UntagResource` in *AWS CLI Command Reference*.

**HealthOmics examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthOmics.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

abort-multipart-read-set-upload

The following code example shows how to use abort-multipart-read-set-upload.

AWS CLI

To stop a multipart read set upload

The following abort-multipart-read-set-upload example stops a multipart read set upload into your HealthOmics sequence store.

```
aws omics abort-multipart-read-set-upload \
   --sequence-store-id 0123456789 \
   --upload-id 1122334455
```

This command produces no output.

For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

- For API details, see AbortMultipartReadSetUpload in AWS CLI Command Reference.

accept-share

The following code example shows how to use accept-share.
AWS CLI

**To accept a share of analytics store data**

The following accept-share example accepts a share of HealthOmics analytics store data.

```bash/aws omics accept-share \
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "status": "ACTIVATING"
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [AcceptShare](#) in *AWS CLI Command Reference*.

**batch-delete-read-set**

The following code example shows how to use batch-delete-read-set.

AWS CLI

**To delete multiple read sets**

The following batch-delete-read-set example deletes two read sets.

```bash/aws omics batch-delete-read-set \
    --sequence-store-id 1234567890 \
    --ids 1234567890 0123456789
```

If there is an error deleting any of the specified read sets, the service returns an error list.

```
{
    "errors": [
        {
            "code": "",
            "id": "0123456789",
```
"message": "The specified readset does not exist."
}
]
}

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see BatchDeleteReadSet in AWS CLI Command Reference.

cancel-annotation-import-job

The following code example shows how to use cancel-annotation-import-job.

AWS CLI

To cancel an annotation import job

The following cancel-annotation-import-job example cancels an annotation import job with ID 04f57618-xmpl-4fd0-9349-e5a85aefb997.

```aws omics cancel-annotation-import-job \\   --job-id 04f57618-xmpl-4fd0-9349-e5a85aefb997```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CancelAnnotationImportJob in AWS CLI Command Reference.

cancel-run

The following code example shows how to use cancel-run.

AWS CLI

To cancel a run

The following cancel-run example cancels a run with ID 1234567.

```aws omics cancel-run \\   --id 1234567```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.
cancel-variant-import-job

The following code example shows how to use cancel-variant-import-job.

**AWS CLI**

To cancel a variant import job

The following cancel-variant-import-job example cancels a variant import job with ID 69cb65d6-xmpl-4a4a-9025-4565794b684e.

```
aws omics cancel-variant-import-job \
    --job-id 69cb65d6-xmpl-4a4a-9025-4565794b684e
```

For more information, see [Omics Analytics](https://docs.aws.amazon.com/omics/latest/devguide/) in the *Amazon Omics Developer Guide*.

**complete-multipart-read-set-upload**

The following code example shows how to use complete-multipart-read-set-upload.

**AWS CLI**

To conclude a multipart upload once you have uploaded all of the components.

The following complete-multipart-read-set-upload example concludes a multipart upload into a sequence store once all of the components have been uploaded.

```
aws omics complete-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --parts '[["checksum":"gaCBQMe+rpCFzXLpoP6gydBoXaKKDA/\n        Vobh5zBDb4W4=","partNumber":1,"partSource":"SOURCE1"]]'
```

Output:

```
{
    "readSetId": "0000000001"
}
```
create-annotation-store-version

The following code example shows how to use create-annotation-store-version.

AWS CLI

To create a new version of an annotation store

The following create-annotation-store-version example creates a new version of an annotation store.

```bash
aws omics create-annotation-store-version \
  --name my_annotation_store \
  --version-name my_version
```

Output:

```json
{
  "creationTime": "2023-07-21T17:15:49.251040+00:00",
  "id": "3b93cdef69d2",
  "name": "my_annotation_store",
  "reference": {
  },
  "status": "CREATING",
  "versionName": "my_version"
}
```

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

For API details, see CreateAnnotationStoreVersion in AWS CLI Command Reference.
create-annotation-store

The following code example shows how to use create-annotation-store.

AWS CLI

Example 1: To create a VCF annotation store

The following create-annotation-store example creates a VCF format annotation store.

```bash
aws omics create-annotation-store \
  --name my_ann_store \
  --store-format VCF \
```

Output:

```json
{
  "id": "0a91xmplc71f",
  "name": "my_ann_store",
  "reference": {
  },
  "status": "CREATING",
  "storeFormat": "VCF"
}
```

Example 2: To create a TSV annotation store

The following create-annotation-store example creates a TSV format annotation store.

```bash
aws omics create-annotation-store \
  --name tsv_ann_store \
  --store-format TSV \
  --store-options file://tsv-store-options.json
```

tsv-store-options.json configures format options for annotations.
Output:

```json
{
  "creationTime": "2022-11-30T01:28:08.525586Z",
  "id": "861cxmpl96b0",
  "name": "tsv_ann_store",
  "reference": {
  },
  "status": "CREATING",
  "storeFormat": "TSV",
  "storeOptions": {
    "tsvStoreOptions": {
      "annotationType": "CHR_START_END_ZERO_BASE",
      "formatToHeader": {
        "CHR": "chromosome",
        "START": "start",
        "END": "end"
      },
      "schema": [
        {
          "chromosome": "STRING"
        },
        {
          "start": "LONG"
        },
        {
          "end": "LONG"
        },
        {
          "name": "STRING"
        }
      ]
    }
  }
}
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CreateAnnotationStore in AWS CLI Command Reference.

create-multipart-read-set-upload

The following code example shows how to use create-multipart-read-set-upload.

AWS CLI

To begin a multipart read set upload.

The following create-multipart-read-set-upload example initiates a multipart read set upload.

```
aws omics create-multipart-read-set-upload \
   --sequence-store-id 0123456789 \
   --name HG00146 \n   --source-file-type FASTQ \n   --subject-id mySubject\n   --sample-id mySample\n   --description "FASTQ for HG00146"\n   --generated-from "1000 Genomes"
```
Output:

```json
{
    "description": "FASTQ for HG00146",
    "generatedFrom": "1000 Genomes",
    "name": "HG00146",
    "sampleId": "mySample",
    "sequenceStoreId": "0123456789",
    "sourceFileType": "FASTQ",
    "subjectId": "mySubject",
    "uploadId": "1122334455"
}
```

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [CreateMultipartReadSetUpload](#) in *AWS CLI Command Reference*.

**create-reference-store**

The following code example shows how to use `create-reference-store`.

**AWS CLI**

**To create a reference store**

The following `create-reference-store` example creates a reference store `my-ref-store`.

```bash
aws omics create-reference-store \
    --name my-ref-store
```

Output:

```json
{
    "id": "1234567890",
    "name": "my-ref-store"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.
- For API details, see [CreateReferenceStore](#) in **AWS CLI Command Reference**.

**create-run-group**

The following code example shows how to use `create-run-group`.

**AWS CLI**

**To create a run group**

The following `create-run-group` example creates a run group named `cram-converter`.

```bash
aws omics create-run-group \
  --name cram-converter \
  --max-cpus 20 \
  --max-duration 600
```

Output:

```
{
  "id": "1234567",
  "tags":{}
}
```

For more information, see [Omics Workflows](#) in the **Amazon Omics Developer Guide**.

- For API details, see [CreateRunGroup](#) in **AWS CLI Command Reference**.

**create-sequence-store**

The following code example shows how to use `create-sequence-store`.

**AWS CLI**

**To create a sequence store**

The following `create-sequence-store` example creates a sequence store.

```bash
aws omics create-sequence-store \
  --name my-seq-store
```
Output:

```json
{
    "creationTime": "2022-11-23T01:24:33.629Z",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/userguide/) in the *Amazon Omics Developer Guide*.

- For API details, see [CreateSequenceStore](https://docs.aws.amazon.com/cli/latest/reference/omics/create-sequence-store.html) in *AWS CLI Command Reference*.

**create-share**

The following code example shows how to use `create-share`.

**AWS CLI**

**To create a share of a HealthOmics analytics store**

The following `create-share` example shows how to create a share of a HealthOmics analytics store that can be accepted by a subscriber outside the account.

```bash
aws omics create-share \
    --principal-subscriber "123456789012" \
    --name "my_Share-123"
```

Output:

```json
{
    "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c38fa848b5bd8e5a7e0a",
    "name": "my_Share-123",
    "status": "PENDING"
}
```

For more information, see [Cross-account sharing](https://docs.aws.amazon.com/healthomics/latest/userguide/) in the *AWS HealthOmics User Guide*.

- For API details, see [CreateShare](https://docs.aws.amazon.com/cli/latest/reference/omics/create-share.html) in *AWS CLI Command Reference*.
**create-variant-store**

The following code example shows how to use `create-variant-store`.

**AWS CLI**

**To create a variant store**

The following `create-variant-store` example creates a variant store named `my_var_store`.

```bash
aws omics create-variant-store \
   --name my_var_store \
```

Output:

```json
{
   "creationTime": "2022-11-23T22:09:07.534499Z",
   "id": "02dexmplcfdd",
   "name": "my_var_store",
   "reference": {
   },
   "status": "CREATING"
}
```

For more information, see [Omics Analytics](https://docs.aws.amazon.com/omics/latest/dg/creating-variant-store.html) in the *Amazon Omics Developer Guide*.

- For API details, see [CreateVariantStore](https://docs.aws.amazon.com/omics/latest/APIReference/API_CreateVariantStore.html) in *AWS CLI Command Reference*.

**create-workflow**

The following code example shows how to use `create-workflow`.

**AWS CLI**

**To create a workflow**

The following `create-workflow` example creates a WDL workflow.
aws omics create-workflow \
  --name cram-converter \
  --engine WDL \
  --definition-zip fileb://workflow-crambam.zip \
  --parameter-template file://workflow-params.json

workflow-crambam.zip is a ZIP archive containing a workflow definition. workflow-params.json defines runtime parameters for the workflow.

```
{
  "ref_fasta" : {
      "description": "Reference genome fasta file",
      "optional": false
  },
  "ref_fasta_index" : {
      "description": "Index of the reference genome fasta file",
      "optional": false
  },
  "ref_dict" : {
      "description": "dictionary file for 'ref_fasta'",
      "optional": false
  },
  "input_cram" : {
      "description": "The Cram file to convert to BAM",
      "optional": false
  },
  "sample_name" : {
      "description": "The name of the input sample, used to name the output BAM",
      "optional": false
  }
}
```

Output:

```
{
  "id": "1234567",
  "status": "CREATING",
  "tags": {} 
}
```

For more information, see [Omics Workflows](http://aws.amazon.com) in the *Amazon Omics Developer Guide*. 
For API details, see CreateWorkflow in AWS CLI Command Reference.

**delete-annotation-store-versions**

The following code example shows how to use delete-annotation-store-versions.

**AWS CLI**

To delete an annotation store version

The following delete-annotation-store-versions example deletes an annotation store version.

```
aws omics delete-annotation-store-versions \\
  --name my_annotation_store \\
  --versions my_version
```

Output:

```
{
   "errors": []
}
```

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

For API details, see DeleteAnnotationStoreVersions in AWS CLI Command Reference.

**delete-annotation-store**

The following code example shows how to use delete-annotation-store.

**AWS CLI**

To delete an annotation store

The following delete-annotation-store example deletes an annotation store named my_vcf_store.

```
aws omics delete-annotation-store \\
  --name my_vcf_store
```
Output:

```json
{
    "status": "DELETING"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see DeleteAnnotationStore in AWS CLI Command Reference.

### delete-reference-store

The following code example shows how to use `delete-reference-store`.

**AWS CLI**

**To delete a reference store**

The following `delete-reference-store` example deletes a reference store with ID 1234567890.

```bash
aws omics delete-reference-store
    --id 1234567890
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see DeleteReferenceStore in AWS CLI Command Reference.

### delete-reference

The following code example shows how to use `delete-reference`.

**AWS CLI**

**To delete a reference**

The following `delete-reference` example deletes a reference.

```bash
aws omics delete-reference
    --reference-store-id 1234567890
    --id 1234567890
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see DeleteReference in AWS CLI Command Reference.

**delete-run-group**

The following code example shows how to use delete-run-group.

**AWS CLI**

**To delete a run group**

The following delete-run-group example deletes a run group with ID 1234567.

```
aws omics delete-run-group \
--id 1234567
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see DeleteRunGroup in AWS CLI Command Reference.

**delete-run**

The following code example shows how to use delete-run.

**AWS CLI**

**To delete a workflow run**

The following delete-run example deletes a run with ID 1234567.

```
aws omics delete-run \
--id 1234567
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see DeleteRun in AWS CLI Command Reference.

**delete-sequence-store**

The following code example shows how to use delete-sequence-store.
AWS CLI

**To delete a sequence store**

The following `delete-sequence-store` example deletes a sequence store with ID 1234567890.

```
aws omics delete-sequence-store \
   --id 1234567890
```

For more information, see [Oomics Storage](#) in the *Amazon Oomics Developer Guide*.

- For API details, see [DeleteSequenceStore](#) in *AWS CLI Command Reference*.

**delete-share**

The following code example shows how to use `delete-share`.

AWS CLI

**To delete a share of HealthOmics analytics data**

The following `delete-share` example deletes a cross-account share of analytics data.

```
aws omics delete-share \
   --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```json
{
   "status": "DELETING"
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [DeleteShare](#) in *AWS CLI Command Reference*.

**delete-variant-store**

The following code example shows how to use `delete-variant-store`.
AWS CLI

To delete a variant store

The following `delete-variant-store` example deletes a variant store named `my_var_store`.

```
aws omics delete-variant-store \
   --name my_var_store
```

Output:

```
{
   "status": "DELETING"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see DeleteVariantStore in AWS CLI Command Reference.

delete-workflow

The following code example shows how to use `delete-workflow`.

AWS CLI

To delete a workflow

The following `delete-workflow` example deletes a workflow with ID `1234567`.

```
aws omics delete-workflow \
   --id 1234567
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see DeleteWorkflow in AWS CLI Command Reference.

get-annotation-import-job

The following code example shows how to use `get-annotation-import-job`.

Actions and scenarios
To view an annotation import job

The following get-annotation-import-job example gets details about an annotation import job.

```bash
aws omics get-annotation-import-job \
   --job-id 984162c7-xmpl-4d23-ab47-286f7950bfbf
```

Output:

```
{
   "creationTime": "2022-11-30T01:40:11.017746Z",
   "destinationName": "tsv_ann_store",
   "id": "984162c7-xmpl-4d23-ab47-286f7950bfbf",
   "items": [
      {
         "jobStatus": "COMPLETED",
         "source": "s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz"
      }
   ],
   "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
   "runLeftNormalization": false,
   "status": "COMPLETED",
   "updateTime": "2022-11-30T01:42:39.134009Z"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.
- For API details, see GetAnnotationImportJob in AWS CLI Command Reference.

get-annotation-store-version

The following code example shows how to use get-annotation-store-version.

AWS CLI

To retrieve the metadata for an annotation store version

The following get-annotation-store-version example retrieves the metadata for the requested annotation store version.
aws omics get-annotation-store-version \
   --name my_annotation_store \
   --version-name my_version

Output:

```json
{
   "storeId": "4934045d1c6d",
   "id": "2a3f4a44aa7b",
   "status": "ACTIVE",
   "name": "my_annotation_store",
   "versionName": "my_version",
   "creationTime": "2023-07-21T17:15:49.251040+00:00",
   "updateTime": "2023-07-21T17:15:56.434223+00:00",
   "statusMessage": "",
   "versionSizeBytes": 0
}
```

For more information, see [Creating new versions of annotation stores](#) in the *AWS HealthOmics User Guide*.

- For API details, see [GetAnnotationStoreVersion](#) in *AWS CLI Command Reference*.

---

**get-annotation-store**

The following code example shows how to use `get-annotation-store`.

**AWS CLI**

**To view an annotation store**

The following `get-annotation-store` example gets details about an annotation store named `my_ann_store`.

```
aws omics get-annotation-store \
   --name my_ann_store
```

Output:

```json
{
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetAnnotationStore in AWS CLI Command Reference.

**get-read-set-activation-job**

The following code example shows how to use get-read-set-activation-job.

**AWS CLI**

To view a read set activation job

The following get-read-set-activation-job example gets details about a read set activation job.

```
aws omics get-read-set-activation-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:33:42.828Z",
    "creationTime": "2022-12-06T22:32:45.213Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "sources": [
        {
```
"readSetId": "1234567890",
"status": "FINISHED",
"statusMessage": "No activation needed as read set is already in ACTIVATING or ACTIVE state."
}
],
"status": "COMPLETED",
"statusMessage": "The job completed successfully."
}

For more information, see Omics Storage in the Amazon Omics Developer Guide.

• For API details, see GetReadSetActivationJob in AWS CLI Command Reference.

get-read-set-export-job

The following code example shows how to use get-read-set-export-job.

AWS CLI

To view a read set export job

The following get-read-set-export-job example gets details about a read set export job.

aws omics get-read-set-export-job \
   --sequence-store-id 1234567890 \
   --id 1234567890

Output:

{
   "completionTime": "2022-12-06T22:39:14.491Z",
   "creationTime": "2022-12-06T22:37:18.612Z",
   "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
   "id": "1234567890",
   "sequenceStoreId": "1234567890",
   "status": "COMPLETED",
   "statusMessage": "The job is submitted and will start soon."
}

For more information, see Omics Storage in the Amazon Omics Developer Guide.

• For API details, see GetReadSetExportJob in AWS CLI Command Reference.
get-read-set-import-job

The following code example shows how to use get-read-set-import-job.

AWS CLI

To view a read set import job

The following get-read-set-import-job example gets details about a read set import job.

```bash
aws omics get-read-set-import-job \
   --sequence-store-id 1234567890 \
   --id 1234567890
```

Output:

```json
{
   "creationTime": "2022-11-23T01:36:38.158Z",

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/developer-guide) in the *Amazon Omics Developer Guide*.
get-read-set-metadata

The following code example shows how to use get-read-set-metadata.

AWS CLI

To view a read set

The following get-read-set-metadata example gets details about a read set's files.

```bash
aws omics get-read-set-metadata \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```json
{
    "creationTime": "2022-11-23T21:55:00.515Z",
    "fileType": "FASTQ",
    "files": {
        "source1": {
            "contentLength": 310054739,
            "partSize": 104857600,
            "totalParts": 3
        },
        "source2": {
            "contentLength": 307846621,
            "partSize": 104857600,
            "totalParts": 3
        }
    },
    "id": "1234567890",
    "name": "HG00146",
    "sampleId": "fastq-sample",
    "sequenceInformation": {
        "alignment": "UNALIGNED",
        "totalBaseCount": 677717384
    }
}
```
For more information, see [Omics Storage](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [GetReadSetMetadata](#) in [AWS CLI Command Reference](#).

**get-read-set**

The following code example shows how to use `get-read-set`.

**AWS CLI**

To download a read set

The following `get-read-set` example downloads part 3 of a read set as `1234567890.3.bam`.

```bash
aws omics get-read-set \
    --sequence-store-id 1234567890 \
    --id 1234567890 \
    --part-number 3 1234567890.3.bam
```

For more information, see [Omics Storage](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [GetReadSet](#) in [AWS CLI Command Reference](#).

**get-reference-import-job**

The following code example shows how to use `get-reference-import-job`.

**AWS CLI**

To view a reference import job

The following `get-reference-import-job` example example gets details about a reference import job.

```bash
aws omics get-reference-import-job \
    --reference-store-id 1234567890
```
--id 1234567890

Output:

```json
{
    "creationTime": "2022-11-22T22:25:41.124Z",
    "id": "1234567890",
    "referenceStoreId": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
    "sources": [
        {
            "name": "assembly-38",
            "sourceFile": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.fasta",
            "status": "IN_PROGRESS",
            "statusMessage": "The source job is currently in progress."
        }
    ],
    "status": "IN_PROGRESS",
    "statusMessage": "The job is currently in progress."
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/userguide/omics-storage.html) in the *Amazon Omics Developer Guide*.

**get-reference-metadata**

The following code example shows how to use `get-reference-metadata`.

**AWS CLI**

**To view a reference**

The following `get-reference-metadata` example gets details about a reference.

```bash/aws omics get-reference-metadata \
    --reference-store-id 1234567890 \
    --id 1234567890
```

Output:
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReferenceMetadata in AWS CLI Command Reference.

**get-reference-store**

The following code example shows how to use get-reference-store.

**AWS CLI**

**To view a reference store**

The following get-reference-store example gets details about a reference store.

```bash
aws omics get-reference-store \ 
--id 1234567890
```

Output:
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReferenceStore in AWS CLI Command Reference.

get-reference

The following code example shows how to use get-reference.

AWS CLI

To download a genome reference

The following get-reference example downloads part 1 of a genome as hg38.1.fa.

```bash
aws omics get-reference \
    --reference-store-id 1234567890 \
    --id 1234567890 \
    --part-number 1 hg38.1.fa
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReference in AWS CLI Command Reference.

get-run-group

The following code example shows how to use get-run-group.

AWS CLI

To view a run group

The following get-run-group example gets details about a run group.

```bash
aws omics get-run-group \
```
--id 1234567

Output:

```
{
  "creationTime": "2022-12-01T00:58:42.915219Z",
  "id": "1234567",
  "maxCpus": 20,
  "maxDuration": 600,
  "name": "cram-convert",
  "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see GetRunGroup in AWS CLI Command Reference.

get-run-task

The following code example shows how to use get-run-task.

AWS CLI

To view a task

The following get-run-task example gets details about a workflow task.

```
aws omics get-run-task \
  --id 1234567 \
  --task-id 1234567
```

Output:

```
{
  "cpus": 1,
  "creationTime": "2022-11-30T23:13:00.718651Z",
  "memory": 15,
  "name": "CramToBamTask",
  "startTime": "2022-11-30T23:17:47.016Z",
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see GetRunTask in AWS CLI Command Reference.

get-run

The following code example shows how to use get-run.

AWS CLI

To view a workflow run

The following get-run example gets details about a workflow run.

```
aws omics get-run \
   --id 1234567
```

Output:

```
{
   "creationTime": "2022-11-30T22:58:22.615865Z",
   "digest": "sha256:c54bxmpl742dcc26f7fa1f0e37550ddd8f251f418277c0a58e895b801ed28cf",
   "id": "1234567",
   "name": "cram-to-bam",
   "outputUri": "s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/",
   "parameters": {
      "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.dict",
      "ref_fasta_index": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.fasta.fai",
      "ref_fasta": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.fasta",
      "sample_name": "NA12878",
      "input_cram": "s3://omics-artifacts-01d6xmpl4e72dd32/NA12878.cram"
   },
   "resourceDigests": {
```

Actions and scenarios
For more information, see [Omics Workflows](https://docs.aws.amazon.com/omics/latest/userguide/) in the Amazon Omics Developer Guide.

**get-sequence-store**

The following code example shows how to use get-sequence-store.

**AWS CLI**

### To view a sequence store

The following get-sequence-store example gets details about a sequence store with ID 1234567890.

```bash
aws omics get-sequence-store \
  --id 1234567890
```

**Output:**

```json
{
  "arn": "arn:aws:omics:us-east-1:123456789012:sequenceStore/1234567890",
  "id": "1234567890",
  "name": "my-seq-store"
}
```
For more information, see [Omics Storage](https://docs.aws.amazon.com/omics-developer-guide) in the *Amazon Omics Developer Guide*.

- For API details, see [GetSequenceStore](https://docs.aws.amazon.com/omics-cli/latest/userguide/aws-cli-getsequencestore.html) in *AWS CLI Command Reference*.

### get-share

The following code example shows how to use `get-share`.

**AWS CLI**

**To retrieves the metadata about a share of a HealthOmics analytics data**

The following `get-share` example retrieves the metadata for a cross-account share of analytics data.

```
aws omics get-share \
   --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

**Output:**

```json
{
   "share": {
      "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
      "name": "my_Share-123",
      "principalSubscriber": "123456789012",
      "ownerId": "555555555555",
      "status": "PENDING"
   }
}
```

For more information, see [Cross-account sharing](https://docs.aws.amazon.com/healthomics/latest/userguide/cross-account-sharing.html) in the *AWS HealthOmics User Guide*.

- For API details, see [GetShare](https://docs.aws.amazon.com/omics-cli/latest/userguide/aws-cli-getshare.html) in *AWS CLI Command Reference*.

### get-variant-import-job

The following code example shows how to use `get-variant-import-job`.

---

**Actions and scenarios**

3233
AWS CLI

To view a variant import job

The following get-variant-import-job example gets details about a variant import job.

```bash
aws omics get-variant-import-job 
   --job-id edd7b8ce-xmpl-47e2-bc99-258cac95a508
```

Output:

```
{
   "creationTime": "2022-11-23T22:42:50.037812Z",
   "destinationName": "my_var_store",
   "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
   "items": [
      {
         "jobStatus": "IN_PROGRESS",
         "source": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.known_indels.vcf.gz"
      }
   ],
   "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ",
   "runLeftNormalization": false,
   "status": "IN_PROGRESS",
   "updateTime": "2022-11-23T22:43:05.898309Z"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetVariantImportJob in AWS CLI Command Reference.

get-variant-store

The following code example shows how to use get-variant-store.

AWS CLI

To view a variant store

The following get-variant-store example gets details about a variant store.
aws omics get-variant-store \
   --name my_var_store

Output:

```json
{
   "creationTime": "2022-11-23T22:09:07.534499Z",
   "id": "02dexamplcfdd",
   "name": "my_var_store",
   "reference": {
   },
   "status": "CREATING",
   "storeSizeBytes": 0,
   "tags": {},
   "updateTime": "2022-11-23T22:09:24.931711Z"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetVariantStore in AWS CLI Command Reference.

---

**get-workflow**

The following code example shows how to use get-workflow.

**AWS CLI**

**To view a workflow**

The following get-workflow example gets details about a workflow with ID 1234567.

```bash
aws omics get-workflow \
   --id 1234567
```

Output:

```json
{
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see GetWorkflow in AWS CLI Command Reference.

**list-annotation-import-jobs**

The following code example shows how to use list-annotation-import-jobs.

**AWS CLI**

To get a list of annotation import jobs
The following `list-annotation-import-jobs` gets a list of annotation import jobs.

```
aws omics list-annotation-import-jobs
```

Output:

```
{
  "annotationImportJobs": [
    {
      "creationTime": "2022-11-30T01:39:41.478294Z",
      "destinationName": "gff_ann_store",
      "id": "18a9e792-xmpl-4869-a105-e5b602900444",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "runLeftNormalization": false,
      "status": "COMPLETED",
      "updateTime": "2022-11-30T01:47:09.145178Z"
    },
    {
      "creationTime": "2022-11-30T00:45:58.007838Z",
      "destinationName": "my_ann_store",
      "id": "4e9eafc8-xmpl-431e-a0b2-3bda27cb600a",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "runLeftNormalization": false,
      "status": "FAILED",
      "updateTime": "2022-11-30T00:47:01.706325Z"
    }
  ]
}
```

For more information, see [Omics Analytics](https://docs.aws.amazon.com/omics/2022-10-01/userguide.html) in the *Amazon Omics Developer Guide*.

- For API details, see [ListAnnotationImportJobs](https://docs.aws.amazon.com/cli/latest/reference/omics/list-annotation-import-jobs.html) in *AWS CLI Command Reference*.

### list-annotation-store-versions

The following code example shows how to use `list-annotation-store-versions`.

**AWS CLI**

To list all the versions of an annotation store.
The following list-annotation-store-versions example lists all versions that exist of an annotation store.

```bash
aws omics list-annotation-store-versions
   --name my_annotation_store
```

Output:

```
{
   "annotationStoreVersions": [
      {
         "storeId": "4934045d1c6d",
         "id": "2a3f4a44aa7b",
         "status": "CREATING",
         "name": "my_annotation_store",
         "versionName": "my_version_2",
         "creationTime": "2023-07-21T17:20:59.380043+00:00",
         "versionSizeBytes": 0
      },
      {
         "storeId": "4934045d1c6d",
         "id": "4934045d1c6d",
         "status": "ACTIVE",
         "name": "my_annotation_store",
         "versionName": "my_version_1",
         "creationTime": "2023-07-21T17:15:49.251040+00:00",
         "updateTime": "2023-07-21T17:15:56.434223+00:00",
         "statusMessage": "",
         "versionSizeBytes": 0
      }
   ]
}
```

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see ListAnnotationStoreVersions in AWS CLI Command Reference.
list-annotation-stores

The following code example shows how to use list-annotation-stores.

**AWS CLI**

To get a list of annotation stores

The following `list-annotation-stores` example gets a list of annotation stores.

```bash
aws omics list-annotation-stores
```

Output:

```
{
   "annotationStores": [
   {
      "id": "0a91xmplc71f",
      "name": "my_ann_store",
      "reference": {
      },
      "status": "ACTIVE",
      "statusMessage": "",
      "storeFormat": "VCF",
      "storeSizeBytes": 0,
      "updateTime": "2022-11-23T22:53:27.372840Z"
   }
   ]
}
```

For more information, see [Omens Analytics](https://docs.aws.amazon.com/omics/latest/userguide) in the *Amazon Omics Developer Guide*.

- For API details, see [ListAnnotationStores](https://docs.aws.amazon.com/omics/latest/userguide) in *AWS CLI Command Reference*.

list-multipart-read-set-uploads

The following code example shows how to use list-multipart-read-set-uploads.
AWS CLI

To list all multipart read set uploads and their statuses.

The following `list-multipart-read-set-uploads` example lists all multipart read set uploads and their statuses.

```
aws omics list-multipart-read-set-uploads \\
   --sequence-store-id 0123456789
```

Output:

```
{
   "uploads":
   [
   
   
   { "sequenceStoreId": "0123456789",
   "uploadId": "8749584421",
   "sourceFileType": "FASTQ",
   "subjectId": "mySubject",
   "sampleId": "mySample",
   "generatedFrom": "1000 Genomes",
   "name": "HG00146",
   "description": "FASTQ for HG00146",
   "creationTime": "2023-11-29T19:22:51.349298+00:00"
   },
   
   
   { "sequenceStoreId": "0123456789",
   "uploadId": "5290538638",
   "sourceFileType": "BAM",
   "subjectId": "mySubject",
   "sampleId": "mySample",
   "generatedFrom": "1000 Genomes",
   "name": "HG00146",
   "description": "BAM for HG00146",
   "creationTime": "2023-11-29T19:23:33.116516+00:00"
   },
   
   
   { "sequenceStoreId": "0123456789",
   "uploadId": "4174220862",
   "sourceFileType": "BAM",
   "subjectId": "mySubject",
   "sampleId": "mySample",
   "generatedFrom": "1000 Genomes",
   "name": "HG00146",
   "description": "BAM for HG00146",
   "creationTime": "2023-11-29T19:23:33.116516+00:00"
   }
   
   
}
```
For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListMultipartReadSetUploads](#) in *AWS CLI Command Reference*.

### list-read-set-activation-jobs

The following code example shows how to use `list-read-set-activation-jobs`.

**AWS CLI**

To get a list of read set activation jobs

The following `list-read-set-activation-jobs` example gets a list of activation jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-activation-jobs \
  --sequence-store-id 1234567890
```

Output:

```json
{
  "activationJobs": [
    {
      "completionTime": "2022-12-06T22:33:42.828Z",
      "creationTime": "2022-12-06T22:32:45.213Z",
      "id": "1234567890",
      "sequenceStoreId": "1234567890",
      "status": "COMPLETED"
    }
  ]
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

• For API details, see ListReadSetActivationJobs in AWS CLI Command Reference.

list-read-set-export-jobs

The following code example shows how to use list-read-set-export-jobs.

AWS CLI

To get a list of read set export jobs

The following list-read-set-export-jobs example gets a list of export jobs for a sequence store with id 1234567890.

aws omics list-read-set-export-jobs \
   --sequence-store-id 1234567890

Output:

{  
    "exportJobs": [  
        {  
            "completionTime": "2022-12-06T22:39:14.491Z",  
            "creationTime": "2022-12-06T22:37:18.612Z",  
            "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",  
            "id": "1234567890",  
            "sequenceStoreId": "1234567890",  
            "status": "COMPLETED"  
        },  
        {  
            "completionTime": "2022-12-06T22:38:04.871Z",  
            "creationTime": "2022-12-06T22:37:18.612Z",  
            "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",  
            "id": "1234567890",  
            "sequenceStoreId": "1234567890",  
            "status": "IN_PROGRESS"  
        }
    ]
}
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReadSetExportJobs in AWS CLI Command Reference.

list-read-set-import-jobs

The following code example shows how to use list-read-set-import-jobs.

AWS CLI

To get a list of read set import jobs

The following list-read-set-import-jobs example gets a list of import jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-import-jobs \
   --sequence-store-id 1234567890
```

Output:

```json
{
   "importJobs": [
   {
      "completionTime": "2022-11-29T18:17:49.244Z",
      "creationTime": "2022-11-29T17:32:47.700Z",
      "id": "1234567890",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "sequenceStoreId": "1234567890",
      "status": "COMPLETED"
   },
   {
      "completionTime": "2022-11-23T22:01:34.090Z",
      "creationTime": "2022-11-23T21:52:43.289Z",
      "id": "1234567890",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "sequenceStoreId": "1234567890",
      "status": "COMPLETED"
   }
   ]
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReadSetImportJobs in AWS CLI Command Reference.

**list-read-set-upload-parts**

The following code example shows how to use list-read-set-upload-parts.

**AWS CLI**

**To list all parts in a requested multipart upload for a sequence store.**

The following list-read-set-upload-parts example list all parts in a requested multipart upload for a sequence store.

```
aws omics list-read-set-upload-parts \ 
   --sequence-store-id 0123456789 \ 
   --upload-id 1122334455 \ 
   --part-source SOURCE1
```

**Output:**

```json
{
   "parts": [
   {
      "partNumber": 1,
      "partSize": 94371840,
      "file": "SOURCE1",
      "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
      "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
   },
   {
      "partNumber": 2,
      "partSize": 10471840,
      "file": "SOURCE1",
```
For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

- For API details, see ListReadSetUploadParts in AWS CLI Command Reference.

list-read-sets

The following code example shows how to use list-read-sets.

AWS CLI

To get a list of read sets

The following list-read-sets example gets a list of read sets for a sequence store with id 1234567890.

```
aws omics list-read-sets \
  --sequence-store-id 1234567890
```

Output:

```json
{
  "readSets": [
    {
      "creationTime": "2022-11-23T21:55:00.515Z",
      "fileType": "FASTQ",
      "id": "1234567890",
      "name": "HG00146",
      "sampleId": "fastq-sample",
      "sequenceStoreId": "1234567890",
    }
  ]
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReadSets in AWS CLI Command Reference.

**list-reference-import-jobs**

The following code example shows how to use `list-reference-import-jobs`.

**AWS CLI**

**To get a list of reference import jobs**

The following `list-reference-import-jobs` example gets a list of reference import jobs for a reference store with id `1234567890`.

```bash
aws omics list-reference-import-jobs
  --reference-store-id 1234567890
```

Output:

```json
{
  "importJobs": [
    {
      "completionTime": "2022-11-23T19:54:58.204Z",
      "creationTime": "2022-11-23T19:53:20.729Z",
      "id": "1234567890",
      "referenceStoreId": "1234567890",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ",
      "status": "COMPLETED"
    },
    {
      "creationTime": "2022-11-23T20:34:03.250Z",
      "id": "1234567890",
      "referenceStoreId": "1234567890",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ",
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReferenceImportJobs in AWS CLI Command Reference.

### list-reference-stores

The following code example shows how to use list-reference-stores.

**AWS CLI**

**To get a list of reference stores**

The following list-reference-stores example gets a list of reference stores.

```bash
aws omics list-reference-stores
```

**Output:**

```json
{
   "referenceStores": [ 
   {
      "id": "1234567890",
      "name": "my-ref-store"
   }
   ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReferenceStores in AWS CLI Command Reference.

### list-references

The following code example shows how to use list-references.
**AWS CLI**

**To get a list of references**

The following `list-references` example gets a list of genome references for a reference store with id 1234567890.

```bash
aws omics list-references \
    --reference-store-id 1234567890
```

Output:

```json
{
    "references": [
        {
            "id": "1234567890",
            "md5": "7ff134953dcca8c8997453bbb80b6b5e",
            "name": "assembly-38",
            "referenceStoreId": "1234567890",
            "status": "ACTIVE",
        }
    ]
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/developer-guide/omics-storage.html) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReferences](https://docs.aws.amazon.com/cli/latest/reference/omics/list-references.html) in *AWS CLI Command Reference*.

**list-run-groups**

The following code example shows how to use `list-run-groups`.

**AWS CLI**

**To get a list of run groups**

The following `list-run-groups` example gets a list of run groups.
aws omics list-run-groups

Output:

```
{
   "items": [
      {
         "creationTime": "2022-12-01T00:58:42.915219Z",
         "id": "1234567",
         "maxCpus": 20,
         "maxDuration": 600,
         "name": "cram-convert"
      }
   ]
}
```

For more information, see [Omics Workflows](#) in the Amazon Omics Developer Guide.

- For API details, see [ListRunGroups](#) in AWS CLI Command Reference.

### list-run-tasks

The following code example shows how to use `list-run-tasks`.

**AWS CLI**

**To get a list of tasks**

The following `list-run-tasks` example gets a list of tasks for a workflow run.

```
aws omics list-run-tasks \
   --id 1234567
```

Output:

```
{
   "items": [
      {
         "cpus": 1,
         "creationTime": "2022-11-30T23:13:00.718651Z",
         "memory": 15,
      }
   ]
}
```
For more information, see [Omics Workflows](Omics Workflows) in the [Amazon Omics Developer Guide](Amazon Omics Developer Guide).

- For API details, see [ListRunTasks](ListRunTasks) in AWS CLI Command Reference.

**list-runs**

The following code example shows how to use `list-runs`.

**AWS CLI**

**To get a list of workflow runs**

The following `list-runs` example gets a list of workflow runs.

```
aws omics list-runs
```

Output:

```json
{
  "items": [
    {
      "creationTime": "2022-12-02T23:20:01.202074Z",
      "id": "1234567",
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see ListRuns in AWS CLI Command Reference.

list-sequence-stores

The following code example shows how to use list-sequence-stores.

AWS CLI

To get a list of sequence stores

The following list-sequence-stores example gets a list of sequence stores.
aws omics list-sequence-stores

Output:

```
{
    "sequenceStores": [
        {
            "creationTime": "2022-11-23T01:24:33.629Z",
            "id": "1234567890",
            "name": "my-seq-store"
        }
    ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListSequenceStores in AWS CLI Command Reference.

list-shares

The following code example shows how to use list-shares.

AWS CLI

To list the available shares of a HealthOmics analytics data

The following list-shares example lists all shares that have been created for a resource-owner.

```
aws omics list-shares \
    --resource-owner SELF
```

Output:

```
{
    "shares": [
        {
            "shareId": "595c1cbd-a008-4eca-a887-954d30c91c6e",
            "name": "myShare",
        }
    ]
}
```
For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListShares](#) in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To get a list of tags**

The following `list-tags-for-resource` example gets a list of tags for a workflow with id `1234567`:

```bash
aws omics list-tags-for-resource \
```

Output:

```json
{
    "tags": {
        "department": "analytics"
    }
}
```

For more information, see [Tagging resources in Amazon Omics](https://docs.aws.amazon.com/omics/latest/APIReference/API_TagResource.html) in the *Amazon Omics Developer Guide*. For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/omics/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### list-variant-import-jobs

The following code example shows how to use `list-variant-import-jobs`.

**AWS CLI**

**To get a list of variant import jobs**

The following `list-variant-import-jobs` example gets a list of variant import jobs.

```
aws omics list-variant-import-jobs
```

Output:

```json
{
    "variantImportJobs": [
        {
            "creationTime": "2022-11-23T22:47:02.514002Z",
            "destinationName": "my_var_store",
            "id": "69cb65d6-xmpl-4a4a-9025-4565794b684e",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-23T22:49:17.976597Z"
        },
        {
```
For more information, see [Omics Analytics](https://docs.aws.amazon.com/omics/latest/user-guide/) in the *Amazon Omics Developer Guide*.

- For API details, see [ListVariantImportJobs](https://docs.aws.amazon.com/omics/latest/user-guide/) in *AWS CLI Command Reference*.

### list-variant-stores

The following code example shows how to use `list-variant-stores`.

**AWS CLI**

**To get a list of variant stores**

The following `list-variant-stores` example gets a list of variant stores.

```shell
aws omics list-variant-stores
```

**Output:**

```json
{
    "variantStores": [
    {
        "creationTime": "2022-11-23T22:09:07.534999Z",
        "id": "02dexmplcfdd",
        "name": "my_var_store",
        "reference": {
        },
        "status": "CREATING",
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see ListVariantStores in AWS CLI Command Reference.

**list-workflows**

The following code example shows how to use list-workflows.

**AWS CLI**

**To get a list of workflows**

The following list-workflows example gets a list of workflows.

```
aws omics list-workflows
```

**Output:**

```
{
  "items": [
    {
      "creationTime": "2022-09-23T23:08:22.041227Z",
      "digest": "nSCNo/qMWFxmplXpUdokXJnwgneOaxyyc2YOxVxrJTE=",
      "id": "1234567",
      "name": "my-wkflow-0",
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see ListWorkflows in AWS CLI Command Reference.

**start-annotation-import-job**

The following code example shows how to use start-annotation-import-job.

**AWS CLI**

**To import annotations**

The following start-annotation-import-job example imports annotations from Amazon S3.

```bash
aws omics start-annotation-import-job \
  --destination-name tsv_ann_store \
  --no-run-left-normalization \
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ \
  --items source=s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz
```

Output:

```
{
  "jobId": "984162c7-xmpl-4d23-ab47-286f7950bfbf"
}```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see StartAnnotationImportJob in AWS CLI Command Reference.

**start-read-set-activation-job**

The following code example shows how to use start-read-set-activation-job.

**AWS CLI**

**To activate an archived read set**

The following start-read-set-activation-job example activates two read sets.

```bash
aws omics start-read-set-activation-job \
  --sequence-store-id 1234567890 \
  --sources readSetId=1234567890 readSetId=1234567890
```

**Output:**

```json
{
  "creationTime": "2022-12-06T22:35:10.100Z",
  "id": "1234567890",
  "sequenceStoreId": "1234567890",
  "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see StartReadSetActivationJob in AWS CLI Command Reference.

**start-read-set-export-job**

The following code example shows how to use start-read-set-export-job.

**AWS CLI**

**To export a read set**

The following start-read-set-export-job example exports two read sets to Amazon S3.
aws omics start-read-set-export-job \
--sequence-store-id 1234567890 \
--sources readSetId=1234567890 readSetId=1234567890 \
--role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801X1KPL7QZ \
--destination s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/

Output:

```
{
  "creationTime": "2022-12-06T22:37:18.612Z",
  "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
  "id": "1234567890",
  "sequenceStoreId": "1234567890",
  "status": "SUBMITTED"
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/devguide/Omics-Storage.html) in the *Amazon Omics Developer Guide*.

- For API details, see [StartReadSetExportJob](https://docs.aws.amazon.com/cli/latest/reference/omics/start-read-set-export-job.html) in *AWS CLI Command Reference*.

**start-read-set-import-job**

The following code example shows how to use `start-read-set-import-job`.

**AWS CLI**

### To import a read set

The following `start-read-set-import-job` example imports a read set.

```
aws omics start-read-set-import-job \
--sequence-store-id 1234567890 \
--role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801X1KPL7QZ \
--sources file://readset-sources.json
```

`readset-sources.json` is a JSON document with the following content.

```
[

```
The following code example shows how to use `start-reference-import-job`.

**AWS CLI**

To import a reference genome

The following `start-reference-import-job` example imports a reference genome from Amazon S3.

```bash
aws omics start-reference-import-job
```
--reference-store-id 1234567890 \
--role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ \
--sources sourceFile=s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta,name=assembly-38

Output:

```
{
   "creationTime": "2022-11-22T22:25:41.124Z",
   "id": "1234567890",
   "referenceStoreId": "1234567890",
   "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
   "status": "SUBMITTED"
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/userguide/omics-reference-store.html) in the *Amazon Omics Developer Guide*.

- For API details, see [StartReferenceImportJob](https://docs.aws.amazon.com/cli/latest/reference/omics/start-reference-import-job.html) in *AWS CLI Command Reference*.

### start-run

The following code example shows how to use `start-run`.

**AWS CLI**

#### To run a workflow

The following `start-run` example runs a workflow with ID 1234567.

```
aws omics start-run \
   --workflow-id 1234567 \
   --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ \
   --name 'cram-to-bam' \
   --output-uri s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/ \
   --run-group-id 1234567 \
   --priority 1 \
   --storage-capacity 10 \
   --log-level ALL \
   --parameters file://workflow-inputs.json
```
workflow-inputs.json is a JSON document with the following content.

```json
{
    "sample_name": "NA12878",
    "input_cram": "s3://omics-artifacts-01d6xmpl4e72dd32/NA12878.cram",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.dict",
    "ref_fasta": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta",
    "ref_fasta_index": "omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta.fai"
}
```

Output:

```json
{
    "id": "1234567",
    "status": "PENDING",
    "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

To load source files from Amazon Omics

You can also load source files from Amazon Omics storage, by using service-specific URIs. The following example workflow-inputs.json file uses Amazon Omics URIs for read set and reference genome sources.

```json
{
    "sample_name": "NA12878",
    "input_cram": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/readSet/1234567890/source1",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.dict",
    "ref_fasta": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/reference/1234567890",
    "ref_fasta_index": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/reference/1234567890/index"
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see StartRun in AWS CLI Command Reference.

**start-variant-import-job**

The following code example shows how to use start-variant-import-job.

**AWS CLI**

To import a variant file

The following start-variant-import-job example imports a VCF format variant file.

```
aws omics start-variant-import-job \
   --destination-name my_var_store \
   --no-run-left-normalization \
   --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMP\L7QZ \
   --items source=s3://omics-artifacts-01d6xmpl4e72dd32/\n   Homo_sapiens_assembly38.known_indels.vcf.gz
```

Output:

```
{
   "jobId": "edd7b8ce-xmpl-47e2-bc99-258cac95a508"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see StartVariantImportJob in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To tag a resource

The following tag-resource example adds a department tag to a workflow with id 1234567.
aws omics tag-resource
   --tags department=analytics

For more information, see Tagging resources in Amazon Omics in the Amazon Omics Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource

The following untag-resource example removes the department tag from a workflow.

aws omics untag-resource
   --tag-keys department

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-annotation-store

The following code example shows how to use update-annotation-store.

AWS CLI

To update an annotation store

The following update-annotation-store example updates the description of an annotation store named my_vcf_store.

aws omics update-annotation-store
   --name my_vcf_store
--description "VCF annotation store"

Output:

```json
{
    "creationTime": "2022-12-05T18:00:56.101860Z",
    "description": "VCF annotation store",
    "id": "bd6axmpl2444",
    "name": "my_vcf_store",
    "reference": {
        "status": "ACTIVE",
        "storeFormat": "VCF",
        "updateTime": "2022-12-05T18:13:16.100051Z"
    }
}
```

For more information, see [Omics Analytics](https://docs.aws.amazon.com/omics/latest/devguide/) in the *Amazon Omics Developer Guide*.

- For API details, see [UpdateAnnotationStore](https://docs.aws.amazon.com/cli/latest/reference/omics/update-annotation-store.html) in *AWS CLI Command Reference*.

**update-run-group**

The following code example shows how to use `update-run-group`.

**AWS CLI**

**To update a run group**

The following `update-run-group` example updates the settings of a run group with id 1234567.

```bash
aws omics update-run-group \
    --id 1234567 \
    --max-cpus 10
```

Output:

```json
{
    "creationTime": "2022-12-01T00:58:42.915219Z",
```
For more information, see [Omics Workflows](https://aws.amazon.com/omics/workflows/) in the *Amazon Omics Developer Guide*.

- For API details, see [UpdateRunGroup](https://docs.aws.amazon.com/cli/latest/reference/omics/update-run-group.html) in *AWS CLI Command Reference*.

**update-variant-store**

The following code example shows how to use `update-variant-store`.

### AWS CLI

**To update a variant store**

The following `update-variant-store` example updates the description of a variant store named `my_var_store`.

```bash
aws omics update-variant-store
  --name my_var_store
  --description "variant store"
```

**Output:**

```json
{
  "creationTime": "2022-11-23T22:09:07.534499Z",
  "description": "variant store",
  "id": "02dexmplcfdd",
  "name": "my_var_store",
  "reference": {
  },
  "status": "ACTIVE",
  "updateTime": "2022-12-05T18:23:37.686402Z"
}
```

For more information, see [Omics Analytics](https://aws.amazon.com/omics/analytics/) in the *Amazon Omics Developer Guide*.
update-workflow

The following code example shows how to use update-workflow.

**AWS CLI**

**To update a workflow**

The following update-workflow example updates the description of a workflow with ID 1234567.

```
aws omics update-workflow \
   --id 1234567 \
   --description "copy workflow"
```

For more information, see [Omics Storage](https://aws.amazon.com) in the *Amazon Omics Developer Guide*.

For API details, see [UpdateWorkflow](https://aws.amazon.com) in *AWS CLI Command Reference*.

upload-read-set-part

The following code example shows how to use upload-read-set-part.

**AWS CLI**

**To upload a read set part.**

The following upload-read-set-part example uploads a specified part of a read set.

```
aws omics upload-read-set-part \
   --sequence-store-id 0123456789 \
   --upload-id 112234455 \
   --part-source SOURCE1 \
   --part-number 1 \
   --payload /path/to/file/read_1_part_1.fastq.gz
```

Output:

```json
{
   "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635"
}
```
For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [UploadReadSetPart](#) in *AWS CLI Command Reference*.

### IAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

**Actions**

**add-client-id-to-open-id-connect-provider**

The following code example shows how to use `add-client-id-to-open-id-connect-provider`.

**AWS CLI**

---

**To add a client ID (audience) to an Open-ID Connect (OIDC) provider**

The following `add-client-id-to-open-id-connect-provider` command adds the client ID `my-application-ID` to the OIDC provider named `server.example.com`.

```
aws iam add-client-id-to-open-id-connect-provider \
   --client-id my-application-ID \
```
This command produces no output.

To create an OIDC provider, use the `create-open-id-connect-provider` command.

For more information, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/iam/latest/userguide/idp-openidconnect.html) in the AWS IAM User Guide.

- For API details, see [AddClientToOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/add-client-to-openidconnect-provider.html) in AWS CLI Command Reference.

### add-role-to-instance-profile

The following code example shows how to use `add-role-to-instance-profile`.

**AWS CLI**

**To add a role to an instance profile**

The following `add-role-to-instance-profile` command adds the role named `S3Access` to the instance profile named `Webserver`.

```
aws iam add-role-to-instance-profile
  --role-name S3Access
  --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the `create-instance-profile` command.

For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](https://docs.aws.amazon.com/iam/latest/userguide/using-instance-profiles.html) in the AWS IAM User Guide.

- For API details, see [AddRoleToInstanceProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/add-role-to-instance-profile.html) in AWS CLI Command Reference.

### add-user-to-group

The following code example shows how to use `add-user-to-group`.

**AWS CLI**

**To add a user to an IAM group**
The following add-user-to-group command adds an IAM user named Bob to the IAM group named Admins.

```bash
aws iam add-user-to-group
   --user-name Bob
   --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the AWS IAM User Guide.

- For API details, see AddUserToGroup in AWS CLI Command Reference.

**attach-group-policy**

The following code example shows how to use attach-group-policy.

**AWS CLI**

To attach a managed policy to an IAM group

The following attach-group-policy command attaches the AWS managed policy named ReadOnlyAccess to the IAM group named Finance.

```bash
aws iam attach-group-policy
   --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess
   --group-name Finance
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.

- For API details, see AttachGroupPolicy in AWS CLI Command Reference.

**attach-role-policy**

The following code example shows how to use attach-role-policy.

**AWS CLI**

To attach a managed policy to an IAM role
The following attach-role-policy command attaches the AWS managed policy named ReadOnlyAccess to the IAM role named ReadOnlyRole.

```
aws iam attach-role-policy
   --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess
   --role-name ReadOnlyRole
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.
- For API details, see AttachRolePolicy in AWS CLI Command Reference.

**attach-user-policy**

The following code example shows how to use attach-user-policy.

**AWS CLI**

**To attach a managed policy to an IAM user**

The following attach-user-policy command attaches the AWS managed policy named AdministratorAccess to the IAM user named Alice.

```
aws iam attach-user-policy
   --policy-arn arn:aws:iam::aws:policy/AdministratorAccess
   --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.
- For API details, see AttachUserPolicy in AWS CLI Command Reference.

**change-password**

The following code example shows how to use change-password.

**AWS CLI**

**To change the password for your IAM user**
To change the password for your IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the `--cli-input-json` parameter, start by using the change-password command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam change-password \
  --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called `change-password.json` that you can use to fill in your old and new passwords. For example, the file might look like the following.

```
{
    "OldPassword": "3s0K_;xh4~8XXI",
    "NewPassword": "]35d/[pB9Fo9wJ"
}
```

Next, to change your password, use the `change-password` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `change-password` command uses the `--cli-input-json` parameter with a JSON file called `change-password.json`.

```
aws iam change-password \
  --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an `InvalidUserType` error.

For more information, see [How an IAM user changes their own password](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_password-change.html) in the *AWS IAM User Guide*.

- For API details, see [ChangePassword](https://docs.aws.amazon.com/cli/latest/reference/iam/change-password.html) in *AWS CLI Command Reference*.

### create-access-key

The following code example shows how to use `create-access-key`.
AWS CLI

To create an access key for an IAM user

The following create-access-key command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam create-access-key \
   --user-name Bob
```

Output:

```
{
   "AccessKey": {
      "UserName": "Bob",
      "Status": "Active",
      "CreateDate": "2015-03-09T18:39:23.411Z",
      "SecretAccessKey": "wJalrXUttnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
      "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
   }
}
```

Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

• For API details, see CreateAccessKey in AWS CLI Command Reference.

create-account-alias

The following code example shows how to use create-account-alias.

AWS CLI

To create an account alias

The following create-account-alias command creates the alias examplecorp for your AWS account.

```
aws iam create-account-alias \
   --account-alias examplecorp
```
This command produces no output.

For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.

- For API details, see CreateAccountAlias in AWS CLI Command Reference.

create-group

The following code example shows how to use create-group.

AWS CLI

To create an IAM group

The following create-group command creates an IAM group named Admins.

```
aws iam create-group \
   --group-name Admins
```

Output:

```
{
  "Group": {
    "Path": "/",
    "CreateDate": "2015-03-09T20:30:24.940Z",
    "GroupId": "AIDGPMS9R04H3FEXAMPLE",
    "Arn": "arn:aws:iam::123456789012:group/Admins",
    "GroupName": "Admins"
  }
}
```

For more information, see Creating IAM user groups in the AWS IAM User Guide.

- For API details, see CreateGroup in AWS CLI Command Reference.

create-instance-profile

The following code example shows how to use create-instance-profile.

AWS CLI

To create an instance profile
The following create-instance-profile command creates an instance profile named Webserver.

```
aws iam create-instance-profile \
   --instance-profile-name Webserver
```

Output:

```
{
   "InstanceProfile": {
      "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
      "Roles": [],
      "CreateDate": "2015-03-09T20:33:19.626Z",
      "InstanceProfileName": "Webserver",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
   }
}
```

To add a role to an instance profile, use the add-role-to-instance-profile command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the AWS IAM User Guide.

- For API details, see CreateInstanceProfile in AWS CLI Command Reference.

**create-login-profile**

The following code example shows how to use create-login-profile.

**AWS CLI**

**To create a password for an IAM user**

To create a password for an IAM user, we recommend using the --cli-input-json parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the --cli-input-json parameter, start by using the create-login-profile command with the --generate-cli-skeleton parameter, as in the following example.
aws iam create-login-profile \
   --generate-cli-skeleton > create-login-profile.json

The previous command creates a JSON file called create-login-profile.json that you can use to fill in the information for a subsequent create-login-profile command. For example:

```
{
    "UserName": "Bob",
    "Password": "&1-3a6u:RA0djs",
    "PasswordResetRequired": true
}
```

Next, to create a password for an IAM user, use the create-login-profile command again, this time passing the --cli-input-json parameter to specify your JSON file. The following create-login-profile command uses the --cli-input-json parameter with a JSON file called create-login-profile.json.

```
aws iam create-login-profile \
   --cli-input-json file://create-login-profile.json
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2015-03-10T20:55:40.274Z",
        "PasswordResetRequired": true
    }
}
```

If the new password violates the account password policy, the command returns a PasswordPolicyViolation error.

To change the password for a user that already has one, use update-login-profile. To set a password policy for the account, use the update-account-password-policy command.

If the account password policy allows them to, IAM users can change their own passwords using the change-password command.

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.
create-open-id-connect-provider

The following code example shows how to use create-open-id-connect-provider.

AWS CLI

To create an OpenID Connect (OIDC) provider

To create an OpenID Connect (OIDC) provider, we recommend using the --cli-input-json parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with https://. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the --cli-input-json parameter gets around this limitation.

To use the --cli-input-json parameter, start by using the create-open-id-connect-provider command with the --generate-cli-skeleton parameter, as in the following example.

```bash
aws iam create-open-id-connect-provider \
   --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called create-open-id-connect-provider.json that you can use to fill in the information for a subsequent create-open-id-connect-provider command. For example:

```json
{
   "Url": "https://server.example.com",
   "ClientIDList": [
      "example-application-ID"
   ],
   "ThumbprintList": [
      "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"
   ]
}
```

Next, to create the OpenID Connect (OIDC) provider, use the create-open-id-connect-provider command again, this time passing the --cli-input-json parameter to specify
your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called `create-open-id-connect-provider.json`.

```bash
aws iam create-open-id-connect-provider \
   --cli-input-json file://create-open-id-connect-provider.json
```

Output:

```json
{
   "OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/server.example.com"
}
```

For more information about OIDC providers, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_api oidc-provider.html) in the *AWS IAM User Guide*.

For more information about obtaining thumbprints for an OIDC provider, see [Obtaining the thumbprint for an OpenID Connect Identity Provider](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_api oidc-provider.html) in the *AWS IAM User Guide*.

- For API details, see [CreateOpenIdConnectProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/create-open-id-connect-provider.html) in *AWS CLI Command Reference*.

---

**create-policy-version**

The following code example shows how to use `create-policy-version`.

**AWS CLI**

**To create a new version of a managed policy**

This example creates a new v2 version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version.

```bash
aws iam create-policy-version \
   --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
   --policy-document file://NewPolicyVersion.json \
   --set-as-default
```

Output:

```json
{
}
```
For more information, see Versioning IAM policies in the AWS IAM User Guide.

- For API details, see CreatePolicyVersion in AWS CLI Command Reference.

create-policy

The following code example shows how to use create-policy.

AWS CLI

Example 1: To create a customer managed policy

The following command creates a customer managed policy named my-policy.

```bash
aws iam create-policy \
  --policy-name my-policy \
  --policy-document file://policy
```

The file policy is a JSON document in the current folder that grants read only access to the shared folder in an Amazon S3 bucket named my-bucket.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:Get*",
                "s3:List*"
            ],
            "Resource": [
                "arn:aws:s3:::my-bucket/shared/*"
            ]
        }
    ]
}
```
Output:

```json
{
  "Policy": {
    "PolicyName": "my-policy",
    "CreateDate": "2015-06-01T19:31:18.620Z",
    "AttachmentCount": 0,
    "IsAttachable": true,
    "PolicyId": "ZXR6A36LTYANPAI7NJ5UV",
    "DefaultVersionId": "v1",
    "Path": "/",
    "Arn": "arn:aws:iam::0123456789012:policy/my-policy",
    "UpdateDate": "2015-06-01T19:31:18.620Z"
  }
}
```

For more information on using files as input for string parameters, see [Specify parameter values for the AWS CLI](https://docs.aws.amazon.com/cli/latest/userguide/cli-awacl-index.html) in the *AWS CLI User Guide*.

**Example 2: To create a customer managed policy with a description**

The following command creates a customer managed policy named `my-policy` with an immutable description:

```
aws iam create-policy \
  --policy-name my-policy \
  --policy-document file://policy.json \
  --description "This policy grants access to all Put, Get, and List actions for my-bucket"
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
```
"s3:ListBucket*",
  "s3:PutBucket*",
  "s3:GetBucket*"
],
"Resource": [
  "arn:aws:s3:::my-bucket"
]
}
}

Output:

{
  "Policy": {
    "PolicyName": "my-policy",
    "PolicyId": "ANPAWGSUGIDPEXAMPLE",
    "Arn": "arn:aws:iam::123456789012:policy/my-policy",
    "Path": "/",
    "DefaultVersionId": "v1",
    "AttachmentCount": 0,
    "PermissionsBoundaryUsageCount": 0,
    "IsAttachable": true,
    "CreateDate": "2023-05-24T22:38:47+00:00",
    "UpdateDate": "2023-05-24T22:38:47+00:00"
  }
}

For more information on Identity-based Policies, see [Identity-based policies and resource-based policies](#) in the AWS IAM User Guide.

**Example 3: To Create a customer managed policy with tags**

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: 

```json
{"Key": "Department", "Value": "Accounting"} 
{"Key": "Location", "Value": "Seattle"}
```

Alternatively, the `--tags` flag can be used with tags in the shorthand format:

```
Key=Department,Value=Accounting Key=Location,Value=Seattle
```

```bash
aws iam create-policy \
  --policy-name my-policy \
  --policy-document file://policy.json
```
The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*
            ],
            "Resource": [
                "arn:aws:s3:::my-bucket"
            ]
        }
    ]
}
```

Output:

```json
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDEXAMPLE",
        "Arn": "arn:aws:iam::12345678012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T23:16:39+00:00",
        "UpdateDate": "2023-05-24T23:16:39+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```
For more information on Tagging policies, see Tagging customer managed policies in the AWS IAM User Guide.

- For API details, see CreatePolicy in AWS CLI Command Reference.

create-role

The following code example shows how to use create-role.

AWS CLI

Example 1: To create an IAM role

The following create-role command creates a role named Test-Role and attaches a trust policy to it.

```bash
aws iam create-role \
  --role-name Test-Role \
  --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```json
{
  "Role": {
    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
    "RoleId": "AKIAIOSFODNN7EXAMPLE",
    "CreateDate": "2013-06-07T20:43:32.821Z",
    "RoleName": "Test-Role",
    "Path": "/",
    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
  }
}
```

The trust policy is defined as a JSON document in the Test-Role-Trust-Policy.json file. (The file name and extension do not have significance.) The trust policy must specify a principal.
To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see [Creating IAM roles](#) in the *AWS IAM User Guide*.

**Example 2: To create an IAM role with specified maximum session duration**

The following `create-role` command creates a role named `Test-Role` and sets a maximum session duration of 7200 seconds (2 hours).

```bash
aws iam create-role \
   --role-name Test-Role \
   --assume-role-policy-document file://Test-Role-Trust-Policy.json \
   --max-session-duration 7200
```

Output:

```
{
   "Role": {
      "Path": "/",
      "RoleName": "Test-Role",
      "RoleId": "AKIAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::12345678012:role/Test-Role",
      "CreateDate": "2023-05-24T23:50:25+00:00",
      "AssumeRolePolicyDocument": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Sid": "Statement1",
               "Effect": "Allow",
               "Principal": {
                  "AWS": "arn:aws:iam::12345678012:root"
               },
               "Action": "sts:AssumeRole"
            }
         ]
      }
   }
}
```

For more information, see [Modifying a role maximum session duration (AWS API)](#) in the *AWS IAM User Guide*.

**Example 3: To create an IAM Role with tags**
The following command creates an IAM Role Test-Role with tags. This example uses the --tags parameter flag with the following JSON-formatted tags: 'KeyValue: "Department", Value: "Accounting"' '{"Key": "Location", Value: "Seattle"}' . Alternatively, the --tags flag can be used with tags in the shorthand format: 'Key=Department, Value=Accounting Key=Location, Value=Seattle'.

```
aws iam create-role \
  --role-name Test-Role \
  --assume-role-policy-document file://Test-Role-Trust-Policy.json \
  --tags '{"Key": "Department", "Value": "Accounting"}', '{"Key": "Location", "Value": "Seattle"}'
```

Output:

```
{
  "Role": {
    "Path": "/",
    "RoleName": "Test-Role",
    "RoleId": "AKIAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::123456789012:role/Test-Role",
    "CreateDate": "2023-05-25T23:29:41+00:00",
    "AssumeRolePolicyDocument": {
      "Version": "2012-10-17",
      "Statement": [
        {
          "Sid": "Statement1",
          "Effect": "Allow",
          "Principal": {
            "AWS": "arn:aws:iam::123456789012:root"
          },
          "Action": "sts:AssumeRole"
        }
      ],
      "Tags": [
        {
          "Key": "Department",
          "Value": "Accounting"
        },
        {
          "Key": "Location",
          "Value": "Seattle"
        }
      ]
    }
  }
}
```
create-saml-provider

The following code example shows how to use create-saml-provider.

AWS CLI

To create a SAML provider

This example creates a new SAML provider in IAM named MySAMLProvider. It is described by the SAML metadata document found in the file SAMLMetaData.xml.

```
aws iam create-saml-provider \
   --saml-metadata-document file://SAMLMetaData.xml \
   --name MySAMLProvider
```

Output:

```
{
   "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see CreateSAMLProvider in AWS CLI Command Reference.

create-service-linked-role

The following code example shows how to use create-service-linked-role.

AWS CLI

To create a service-linked role
The following `create-service-linked-role` example creates a service-linked role for the specified AWS service and attaches the specified description.

```bash
aws iam create-service-linked-role
   --aws-service-name lex.amazonaws.com
   --description "My service-linked role to support Lex"
```

Output:

```json
{
   "Role": {
      "Path": "/aws-service-role/lex.amazonaws.com/",
      "RoleName": "AWSServiceRoleForLexBots",
      "RoleId": "AROA1234567890EXAMPLE",
      "Arn": "arn:aws:iam::1234567890:role/aws-service-role/lex.amazonaws.com/AWSServiceRoleForLexBots",
      "CreateDate": "2019-04-17T20:34:14+00:00",
      "AssumeRolePolicyDocument": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Action": [
                  "sts:AssumeRole"
               ],
               "Effect": "Allow",
               "Principal": {
                  "Service": [
                     "lex.amazonaws.com"
                  ]
               }
            }
         ]
      }
   }
}
```

For more information, see [Using service-linked roles](https://docs.aws.amazon.com/iam/latest/UserGuide/service-linked-roles.html) in the AWS IAM User Guide.

- For API details, see [CreateServiceLinkedRole](https://docs.aws.amazon.com/cli/latest/reference/iam/create-service-linked-role.html) in AWS CLI Command Reference.
**create-service-specific-credential**

The following code example shows how to use `create-service-specific-credential`.

**AWS CLI**

**Create a set of service-specific credentials for a user**

The following `create-service-specific-credential` example creates a username and password that can be used to access only the configured service.

```bash
aws iam create-service-specific-credential \
   --user-name sofia \
   --service-name codecommit.amazonaws.com
```

**Output:**

```json
{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServicePassword": "k1zPZM6uVxMQ3oxqgoY1NuJPyRTZ1vREs76zTQE3eJk=",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
      "Status": "Active"
   }
}
```

- For API details, see [CreateServiceSpecificCredential](https://docs.aws.amazon.com/cli/latest/reference/iam/create-service-specific-credential.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iam/index.html).

**create-user**

The following code example shows how to use `create-user`.

**AWS CLI**

**Example 1: To create an IAM user**
The following `create-user` command creates an IAM user named Bob in the current account.

```bash
aws iam create-user \
    --user-name Bob
```

Output:

```
{
   "User": {
      "UserName": "Bob",
      "Path": "/",
      "CreateDate": "2023-06-08T03:20:41.270Z",
      "UserId": "AIDAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:user/Bob"
   }
}
```

For more information, see Creating an IAM user in your AWS account in the AWS IAM User Guide.

**Example 2: To create an IAM user at a specified path**

The following `create-user` command creates an IAM user named Bob at the specified path.

```bash
aws iam create-user \
    --user-name Bob \
    --path /division_abc/subdivision_xyz/
```

Output:

```
{
   "User": {
      "Path": "/division_abc/subdivision_xyz/",
      "UserName": "Bob",
      "UserId": "AIDAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
      "CreateDate": "2023-05-24T18:20:17+00:00"
   }
}
```

For more information, see IAM identifiers in the AWS IAM User Guide.

**Example 3: To Create an IAM User with tags**
The following `create-user` command creates an IAM user named Bob with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: '{"Key": "Department", "Value": "Accounting"}', '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the `--tags` flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```bash
aws iam create-user \
  --user-name Bob \
  --tags '{"Key": "Department", "Value": "Accounting"}', '{"Key": "Location", "Value": "Seattle"}'
```

Output:

```json
{
  "User": {
    "Path": "/",
    "UserName": "Bob",
    "UserId": "AIDAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::12345678012:user/Bob",
    "CreateDate": "2023-05-25T17:14:21+00:00",
    "Tags": [
      {
        "Key": "Department",
        "Value": "Accounting"
      },
      {
        "Key": "Location",
        "Value": "Seattle"
      }
    ]
  }
}
```

For more information, see Tagging IAM users in the AWS IAM User Guide.

**Example 3: To create an IAM user with a set permissions boundary**

The following `create-user` command creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```bash
aws iam create-user \
```

Actions and scenarios
For more information, see [Permissions boundaries for IAM entities](https://docs.aws.amazon.com/IAM/latest/userguide/permissions-boundaries.html) in the *AWS IAM User Guide*.

- For API details, see [CreateUser](https://docs.aws.amazon.com/cli/latest/reference/iam/create-user.html) in *AWS CLI Command Reference*.

### create-virtual-mfa-device

The following code example shows how to use `create-virtual-mfa-device`.

**AWS CLI**

**To create a virtual MFA device**

This example creates a new virtual MFA device called BobsMFADevice. It creates a file that contains bootstrap information called QRCode.png and places it in the C:/ directory. The bootstrap method used in this example is QRCODEPNG.

```bash
aws iam create-virtual-mfa-device
  --virtual-mfa-device-name BobsMFADevice
  --outfile C:/QRCode.png
  --bootstrap-method QRCODEPNG
```

Output:
For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see CreateVirtualMfaDevice in AWS CLI Command Reference.

**deactivate-mfa-device**

The following code example shows how to use deactivate-mfa-device.

**AWS CLI**

**To deactivate an MFA device**

This command deactivates the virtual MFA device with the ARN arn:aws:iam::210987654321:mfa/BobsMFADevice that is associated with the user Bob.

```bash
aws iam deactivate-mfa-device \
   --user-name Bob \
   --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see DeactivateMfaDevice in AWS CLI Command Reference.

**decode-authorization-message**

The following code example shows how to use decode-authorization-message.

**AWS CLI**

**To decode a authorization failure message**

The following decode-authorization-message example decodes the message returned by the EC2 console when attempting to launch an instance without the required permissions.
aws sts decode-authorization-message
   --encoded-message lxzA8VEjEvu-s0TT3PgYCXik9YaKoaQsRFJGRZR98xNcyWAXwRql4xIvd-
   npzbgTevuuCtbjeBAAaDARq9cbTk1rJbg3awM33o-Vy3ebPExE2-
mWR9hVYdvX-0zKgV0WF9pWjZaJSQxM6-aLXo-I_8TTvBq88x8IFPbM5tNdpu0IjxDjzf22PF3S0E3XvIq-
   _PE09aUqHCCsS5Ftxmm6yQ3nbbV1TvIfzaoBzy81soMo7sJvaj2r5vph65Y5vCCW0g6o2JKe5hIHTa8zRrDbZ5FMKcX-
   Xx9AYAAIr6hcis7C_bZh4d1AAWooHFGloJcWdgzgbu9hWyVvKpeot5hsb8qANYjJRCPTKpi6PZfidiJkw6g

The output is formatted as a single-line string of JSON text that you can parse with any JSON text processor.

```json
{
   "DecodedMessage": "{\"allowed\":false,\"explicitDeny\":false,\"matchedStatements\":[]},\"failures\":[]},\"context\":\"principal\",
   \"id\":\"AIDAV3UEFP6J7GY7O6LO\",\"name\":\"chain-user\",\"arn\":\n   \"arn:aws:iam::403299380220:user/chain-user\",\"action\":\"ec2:RunInstances\",
   \"resource\":\"arn:aws:ec2:us-east-2:403299380220:instance/*\",\"conditions\":
   [{\"key\":\"ec2:InstanceMarketType\",\"value\":\"on-demand\"}],
   [{\"key\":\"aws:Resource\",\"values\":\"instance/*\"}],
   [{\"key\":\"aws:Account\",\"values\":\"403299380220\"}],
   [{\"key\":\"ec2:AvailabilityZone\",\"values\":[]},
   [{\"key\":\"ec2:InstanceType\",\"values\":\"t2.micro\"}],
   [{\"key\":\"ec2:RootDeviceType\",\"values\":\"ebs\"}],
   [{\"key\":\"aws:Region\",\"values\":\"us-east-2\"}],
   [{\"key\":\"aws:Service\",\"values\":\"ec2\"}],
   [{\"key\":\"ec2:InstanceID\",\"values\":\"*\"}],
   [{\"key\":\"ec2:Tenancy\",\"values\":\"default\"}],
   [{\"key\":\"ec2:Region\",\"values\":\"us-east-2\"}],
   [{\"key\":\"aws:ARN\",\"values\":\"arn:aws:ec2:us-east-2:403299380220:instance/*\"}]
}
```

For more information, see How can I decode an authorization failure message after receiving an "UnauthorizedOperation" error during an EC2 instance launch? in AWS re:Post.

- For API details, see DecodeAuthorizationMessage in AWS CLI Command Reference.

**delete-access-key**

The following code example shows how to use delete-access-key.
AWS CLI

To delete an access key for an IAM user

The following delete-access-key command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key \
   --access-key-id AKIDPMS9RO4H3FEXAMPLE \
   --user-name Bob
```

This command produces no output.

To list the access keys defined for an IAM user, use the list-access-keys command.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

- For API details, see DeleteAccessKey in AWS CLI Command Reference.

delete-account-alias

The following code example shows how to use delete-account-alias.

AWS CLI

To delete an account alias

The following delete-account-alias command removes the alias mycompany for the current account.

```
aws iam delete-account-alias \
   --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.

- For API details, see DeleteAccountAlias in AWS CLI Command Reference.

delete-account-password-policy

The following code example shows how to use delete-account-password-policy.
**AWS CLI**

**To delete the current account password policy**

The following `delete-account-password-policy` command removes the password policy for the current account.

```
aws iam delete-account-password-policy
```

This command produces no output.

For more information, see [Setting an account password policy for IAM users](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-policies-account-policy-secrets.html) in the *AWS IAM User Guide*.

- For API details, see [DeleteAccountPasswordPolicy](https://docs.aws.amazon.com/AWS CLI Command Reference) in *AWS CLI Command Reference*.

**delete-group-policy**

The following code example shows how to use `delete-group-policy`.

**AWS CLI**

**To delete a policy from an IAM group**

The following `delete-group-policy` command deletes the policy named `ExamplePolicy` from the group named `Admins`.

```
aws iam delete-group-policy \
   --group-name Admins \
   --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the `list-group-policies` command.

For more information, see [Managing IAM policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-auth-manage-policies.html) in the *AWS IAM User Guide*.

- For API details, see [DeleteGroupPolicy](https://docs.aws.amazon.com/AWS CLI Command Reference) in *AWS CLI Command Reference*.

**delete-group**

The following code example shows how to use `delete-group`.
AWS CLI

To delete an IAM group

The following delete-group command deletes an IAM group named MyTestGroup.

```
aws iam delete-group \
    --group-name MyTestGroup
```

This command produces no output.

For more information, see Deleting an IAM user group in the AWS IAM User Guide. • For API details, see DeleteGroup in AWS CLI Command Reference.

delete-instance-profile

The following code example shows how to use delete-instance-profile.

AWS CLI

To delete an instance profile

The following delete-instance-profile command deletes the instance profile named ExampleInstanceProfile.

```
aws iam delete-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see Using instance profiles in the AWS IAM User Guide. • For API details, see DeleteInstanceProfile in AWS CLI Command Reference.

delete-login-profile

The following code example shows how to use delete-login-profile.

AWS CLI

To delete a password for an IAM user
The following `delete-login-profile` command deletes the password for the IAM user named Bob.

```bash
aws iam delete-login-profile \
  --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.

- For API details, see `DeleteLoginProfile` in AWS CLI Command Reference.

### delete-open-id-connect-provider

The following code example shows how to use `delete-open-id-connect-provider`.

**AWS CLI**

To delete an IAM OpenID Connect identity provider

This example deletes the IAM OIDC provider that connects to the provider example.oidcprovider.com.

```bash
aws iam delete-open-id-connect-provider \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see `DeleteOpenIdConnectProvider` in AWS CLI Command Reference.

### delete-policy-version

The following code example shows how to use `delete-policy-version`.

**AWS CLI**

To delete a version of a managed policy
This example deletes the version identified as v2 from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```bash
aws iam delete-policy-version
   --policy-arn arn:aws:iam::123456789012:policy/MyPolicy
   --version-id v2
```

This command produces no output.

- For API details, see [DeletePolicyVersion](https://docs.aws.amazon.com/cli/latest/reference/iam/delete-policy-version.html) in *AWS CLI Command Reference*.

---

### delete-policy

The following code example shows how to use `delete-policy`.

**AWS CLI**

**To delete an IAM policy**

This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```bash
aws iam delete-policy
   --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

This command produces no output.

- For API details, see [DeletePolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/delete-policy.html) in *AWS CLI Command Reference*.

---

### delete-role-permissions-boundary

The following code example shows how to use `delete-role-permissions-boundary`.

**AWS CLI**

**To delete a permissions boundary from an IAM role**
The following delete-role-permissions-boundary example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the put-role-permissions-boundary command.

```
aws iam delete-role-permissions-boundary \
  --role-name lambda-application-role
```

This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see DeleteRolePermissionsBoundary in AWS CLI Command Reference.

**delete-role-policy**

The following code example shows how to use delete-role-policy.

**AWS CLI**

**To remove a policy from an IAM role**

The following delete-role-policy command removes the policy named `ExamplePolicy` from the role named `Test-Role`.

```
aws iam delete-role-policy \
  --role-name Test-Role \
  --policy-name ExamplePolicy
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see DeleteRolePolicy in AWS CLI Command Reference.

**delete-role**

The following code example shows how to use delete-role.

**AWS CLI**

**To delete an IAM role**

The following delete-role command removes the role named `Test-Role`.
aws iam delete-role \
   --role-name Test-Role

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (remove-role-from-instance-profile), detach any managed policies (detach-role-policy) and delete any inline policies that are attached to the role (delete-role-policy).

For more information, see Creating IAM roles and Using instance profiles in the AWS IAM User Guide.

- For API details, see DeleteRole in AWS CLI Command Reference.

delete-saml-provider

The following code example shows how to use delete-saml-provider.

AWS CLI

To delete a SAML provider

This example deletes the IAM SAML 2.0 provider whose ARN is arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider.

aws iam delete-saml-provider \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider

This command produces no output.

For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see DeleteSAMLProvider in AWS CLI Command Reference.

delete-server-certificate

The following code example shows how to use delete-server-certificate.

AWS CLI

To delete a server certificate from your AWS account
The following delete-server-certificate command removes the specified server certificate from your AWS account.

```
aws iam delete-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the list-server-certificates command.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.

- For API details, see DeleteServerCertificate in AWS CLI Command Reference.

**delete-service-linked-role**

The following code example shows how to use delete-service-linked-role.

**AWS CLI**

**To delete a service-linked role**

The following delete-service-linked-role example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the get-service-linked-role-deletion-status command.

```
aws iam delete-service-linked-role \
    --role-name AWSServiceRoleForLexBots
```

Output:

```
{
   "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcd7890-abcdEXAMPLE"
}
```

For more information, see Using service-linked roles in the AWS IAM User Guide.
For API details, see `DeleteServiceLinkedRole` in *AWS CLI Command Reference*.

**delete-service-specific-credential**

The following code example shows how to use `delete-service-specific-credential`.

**AWS CLI**

**Example 1: Delete a service-specific credential for the requesting user**

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the user making the request. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```bash
aws iam delete-service-specific-credential \
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

**Example 2: Delete a service-specific credential for a specified user**

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the specified user. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```bash
aws iam delete-service-specific-credential \
  --user-name sofia \
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

For more information, see *Create Git credentials for HTTPS connections to CodeCommit* in the *AWS CodeCommit User Guide*.

- For API details, see `DeleteServiceSpecificCredential` in *AWS CLI Command Reference*.

**delete-signing-certificate**

The following code example shows how to use `delete-signing-certificate`.

```bash
aws iam delete-signing-certificate
```
AWS CLI

To delete a signing certificate for an IAM user

The following `delete-signing-certificate` command deletes the specified signing certificate for the IAM user named Bob.

```
aws iam delete-signing-certificate
   --user-name Bob
   --certificate-id TA7SMP42TDN5Z260BPJE7EXAMPLE
```

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the Amazon EC2 User Guide.
- For API details, see `DeleteSigningCertificate` in AWS CLI Command Reference.

delete-ssh-public-key

The following code example shows how to use `delete-ssh-public-key`.

AWS CLI

To delete an SSH public keys attached to an IAM user

The following `delete-ssh-public-key` command deletes the specified SSH public key attached to the IAM user sofia.

```
aws iam delete-ssh-public-key
   --user-name sofia
   --ssh-public-key-id APKA123456789EXAMPLE
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.
- For API details, see `DeleteSshPublicKey` in AWS CLI Command Reference.

delete-user-permissions-boundary

The following code example shows how to use `delete-user-permissions-boundary`.
AWS CLI

To delete a permissions boundary from an IAM user

The following delete-user-permissions-boundary example deletes the permissions boundary attached to the IAM user named intern. To apply a permissions boundary to a user, use the put-user-permissions-boundary command.

```text
aws iam delete-user-permissions-boundary \
   --user-name intern
```

This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see DeleteUserPermissionsBoundary in AWS CLI Command Reference.

delete-user-policy

The following code example shows how to use delete-user-policy.

AWS CLI

To remove a policy from an IAM user

The following delete-user-policy command removes the specified policy from the IAM user named Bob.

```text
aws iam delete-user-policy \
   --user-name Bob \
   --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the list-user-policies command.

For more information, see Creating an IAM user in your AWS account in the AWS IAM User Guide.

- For API details, see DeleteUserPolicy in AWS CLI Command Reference.

delete-user

The following code example shows how to use delete-user.
AWS CLI

To delete an IAM user

The following `delete-user` command removes the IAM user named Bob from the current account.

```
aws iam delete-user
   --user-name Bob
```

This command produces no output.

For more information, see Deleting an IAM user in the AWS IAM User Guide.
- For API details, see `DeleteUser` in AWS CLI Command Reference.

delete-virtual-mfa-device

The following code example shows how to use `delete-virtual-mfa-device`.

AWS CLI

To remove a virtual MFA device

The following `delete-virtual-mfa-device` command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device
   --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the AWS IAM User Guide.
- For API details, see `DeleteVirtualMfaDevice` in AWS CLI Command Reference.

detach-group-policy

The following code example shows how to use `detach-group-policy`.

AWS CLI

To detach a policy from a group
This example removes the managed policy with the ARN
arn:aws:iam::123456789012:policy/TesterAccessPolicy from the group called
Testers.

```
aws iam detach-group-policy \
  --group-name Testers \
  --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.

For more information, see Managing IAM user groups in the AWS IAM User Guide.

- For API details, see DetachGroupPolicy in AWS CLI Command Reference.

**detach-role-policy**

The following code example shows how to use detach-role-policy.

**AWS CLI**

**To detach a policy from a role**

This example removes the managed policy with the ARN
arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy from the role
called FedTesterRole.

```
aws iam detach-role-policy \
  --role-name FedTesterRole \
  --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see DetachRolePolicy in AWS CLI Command Reference.

**detach-user-policy**

The following code example shows how to use detach-user-policy.
AWS CLI

To detach a policy from a user

This example removes the managed policy with the ARN

```
aws iam detach-user-policy \
  --user-name Bob \
  --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.

For more information, see Changing permissions for an IAM user in the AWS IAM User Guide.

- For API details, see DetachUserPolicy in AWS CLI Command Reference.

enable-mfa-device

The following code example shows how to use enable-mfa-device.

AWS CLI

To enable an MFA device

After you use the create-virtual-mfa-device command to create a new virtual MFA device, you can assign the MFA device to a user. The following enable-mfa-device example assigns the MFA device with the serial number arn:aws:iam::210987654321:mfa/BobsMFADevice to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device \
  --user-name Bob \
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
  --authentication-code1 123456 \
  --authentication-code2 789012
```

This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the AWS IAM User Guide.

- For API details, see EnableMfaDevice in AWS CLI Command Reference.
generate-credential-report

The following code example shows how to use generate-credential-report.

AWS CLI

To generate a credential report

The following example attempts to generate a credential report for the AWS account.

```bash
aws iam generate-credential-report
```

Output:

```
{
   "State": "STARTED",
   "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see [Getting credential reports for your AWS account](https://docs.aws.amazon.com/IAM/latest/UserGuide/get-credential-reports.html) in the *AWS IAM User Guide*.

- For API details, see [GenerateCredentialReport](https://docs.aws.amazon.com/cli/latest/reference/iam/generate-credential-report.html) in *AWS CLI Command Reference*.

generate-organizations-access-report

The following code example shows how to use generate-organizations-access-report.

AWS CLI

Example 1: To generate an access report for a root in an organization

The following generate-organizations-access-report example starts a background job to create an access report for the specified root in an organization. You can display the report after it's created by running the `get-organizations-access-report` command.

```bash
aws iam generate-organizations-access-report \
   --entity-path o-4fxmplt198/r-c3xb
```

Output:

```
{
```

Actions and scenarios 3308
Example 2: To generate an access report for an account in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID 123456789012 in the organization `o-4fxmplt198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```bash
aws iam generate-organizations-access-report \
  --entity-path o-4fxmplt198/r-c3xb/123456789012
```

Output:

```json
{
  "JobId": "14b6c071-75f6-2xmp-fb77-faf6fb4201d2"
}
```

Example 3: To generate an access report for an account in an organizational unit in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID 234567890123 in organizational unit `ou-c3xb-lmu7j2yg` in the organization `o-4fxmplt198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```bash
aws iam generate-organizations-access-report \
  --entity-path o-4fxmplt198/r-c3xb/ou-c3xb-lmu7j2yg/234567890123
```

Output:

```json
{
  "JobId": "2eb6c2e6-0xmp-ec04-1425-c937916a64af"
}
```

To get details about roots and organizational units in your organization, use the `organizations list-roots` and `organizations list-organizational-units-for-parent` commands.

**generate-service-last-accessed-details**

The following code example shows how to use `generate-service-last-accessed-details`.

**AWS CLI**

**Example 1: To generate a service access report for a custom policy**

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```bash
aws iam generate-service-last-accessed-details \
   --arn arn:aws:iam::123456789012:policy/intern-boundary
```

**Output:**

```json
{
   "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"
}
```

**Example 2: To generate a service access report for the AWS managed AdministratorAccess policy**

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the `AWS managed AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```bash
aws iam generate-service-last-accessed-details \
   --arn arn:aws:iam::aws:policy/AdministratorAccess
```

**Output:**

```json
```
get-access-key-last-used

The following code example shows how to use get-access-key-last-used.

**AWS CLI**

**To retrieve information about when the specified access key was last used**

The following example retrieves information about when the access key ABCDEXAMPLE was last used.

```
aws iam get-access-key-last-used \
   --access-key-id ABCDEXAMPLE
```

**Output:**

```
{
   "UserName": "Bob",
   "AccessKeyLastUsed": {
      "Region": "us-east-1",
      "ServiceName": "iam",
      "LastUsedDate": "2015-06-16T22:45:00Z"
   }
}
```

For more information, see [Managing access keys for IAM users](https://docs.aws.amazon.com/IAM/latest_USER GUIDE/using-access-keys.html) in the [AWS IAM User Guide](https://docs.aws.amazon.com/IAM/latest_USER GUIDE/).  

- For API details, see [GetAccessKeyLastUsed](https://docs.aws.amazon.com/cli/latest/reference/iam/get-access-key-last-used.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iam.html).

get-account-authorization-details

The following code example shows how to use get-account-authorization-details.

For more information, see [Refining permissions in AWS using last accessed information](https://docs.aws.amazon.com/IAM/latest_USER_GUIDE/using-access-keys.html) in the [AWS IAM User Guide](https://docs.aws.amazon.com/IAM/latest_USER_GUIDE/).  

AWS CLI

To list an AWS accounts IAM users, groups, roles, and policies

The following `get-account-authorization-details` command returns information about all IAM users, groups, roles, and policies in the AWS account.

```
aws iam get-account-authorization-details
```

Output:

```
{
   "RoleDetailList": [
      {
         "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
               {
                  "Sid": "",
                  "Effect": "Allow",
                  "Principal": {
                     "Service": "ec2.amazonaws.com"
                  },
                  "Action": "sts:AssumeRole"
               }
            ]
         },

  "IsAttachable": true,
  "PolicyId": "ANPA1234567890EXAMPLE",
  "DefaultVersionId": "v1",
  "PolicyVersionList": [}
For more information, see [AWS security audit guidelines](https://aws.amazon.com/security/guides/audit/) in the [AWS IAM User Guide](https://docs.aws.amazon.com/IAM/latest/UserGuide/).  

get-account-password-policy

The following code example shows how to use get-account-password-policy.

AWS CLI

To see the current account password policy

The following get-account-password-policy command displays details about the password policy for the current account.

```bash
aws iam get-account-password-policy
```

Output:

```json
{
    "PasswordPolicy": {
        "AllowUsersToChangePassword": false,
        "RequireLowercaseCharacters": false,
        "RequireUppercaseCharacters": false,
        "MinimumPasswordLength": 8,
        "RequireNumbers": true,
        "RequireSymbols": true
    }
}
```

If no password policy is defined for the account, the command returns a NoSuchEntity error.

get-account-summary

The following code example shows how to use get-account-summary.

AWS CLI

To get information about IAM entity usage and IAM quotas in the current account

The following get-account-summary command returns information about the current IAM entity usage and current IAM entity quotas in the account.
aws iam get-account-summary

Output:

```
{
    "SummaryMap": {
        "UsersQuota": 5000,
        "GroupsQuota": 100,
        "InstanceProfiles": 6,
        "SigningCertificatesPerUserQuota": 2,
        "AccountAccessKeysPresent": 0,
        "RolesQuota": 250,
        "RolePolicySizeQuota": 10240,
        "AccountSigningCertificatesPresent": 0,
        "Users": 27,
        "ServerCertificatesQuota": 20,
        "ServerCertificates": 0,
        "AssumeRolePolicySizeQuota": 2048,
        "Groups": 7,
        "MFADevicesInUse": 1,
        "Roles": 3,
        "AccountMFAEnabled": 1,
        "MFADevices": 3,
        "GroupsPerUserQuota": 10,
        "GroupPolicySizeQuota": 5120,
        "InstanceProfilesQuota": 100,
        "AccessKeysPerUserQuota": 2,
        "Providers": 0,
        "UserPolicySizeQuota": 2048
    }
}
```

For more information about entity limitations, see [IAM and AWS STS quotas](https://docs.aws.amazon.com/IAM/latest/userguide/quotas.html) in the [AWS IAM User Guide](https://docs.aws.amazon.com/IAM/latest/userguide/quotas.html).

get-context-keys-for-custom-policy

The following code example shows how to use get-context-keys-for-custom-policy.
AWS CLI

Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following get-context-keys-for-custom-policy command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands simulate-custom-policy and simulate-custom-policy. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the get-context-keys-for-custom-policy command. Parameter values that begin with file:// instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```bash
aws iam get-context-keys-for-custom-policy \
```

Output:

```
{
   "ContextKeyNames": [ "aws:username", "aws:CurrentTime" ]
}
```

Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input

The following get-context-keys-for-custom-policy command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```
[ "Policy1", "Policy2"
```
So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash ".

```
```

This file can then be submitted to the following command.

```
aws iam get-context-keys-for-custom-policy \
   --policy-input-list file://policyfile.json
```

Output:

```
{
   "ContextKeyNames": [
      "aws:username",
      "aws:CurrentTime"
   ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the AWS IAM User Guide.

- For API details, see `GetContextKeysForCustomPolicy` in AWS CLI Command Reference.

**get-context-keys-for-principal-policy**

The following code example shows how to use get-context-keys-for-principal-policy.

**AWS CLI**

**To list the context keys referenced by all policies associated with an IAM principal**

The following get-context-keys-for-principal-policy command retrieves all policies that are attached to the user saanvi and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which
context key values you must supply to successfully use the simulate-custom-policy and simulate-principal-policy commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the get-context-keys-for-custom-policy command.

```bash
aws iam get-context-keys-for-principal-policy \
--policy-source-arn arn:aws:iam::123456789012:user/saanvi
```

Output:

```
{
  "ContextKeyNames": [
    "aws:username",
    "aws:CurrentTime"
  ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the AWS IAM User Guide.

- For API details, see GetContextKeysForPrincipalPolicy in AWS CLI Command Reference.

**get-credential-report**

The following code example shows how to use get-credential-report.

**AWS CLI**

**To get a credential report**

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```bash
aws iam get-credential-report
```

Output:

```
{
  "GeneratedTime": "2015-06-17T19:50Z",
  "ReportFormat": "text/csv"
}
```
For more information, see Getting credential reports for your AWS account in the AWS IAM User Guide.

- For API details, see GetCredentialReport in AWS CLI Command Reference.

get-group-policy

The following code example shows how to use get-group-policy.

AWS CLI

To get information about a policy attached to an IAM group

The following get-group-policy command gets information about the specified policy attached to the group named Test-Group.

```bash
aws iam get-group-policy \
    --group-name Test-Group \
    --policy-name S3-ReadOnly-Policy
```

Output:

```json
{
    "GroupName": "Test-Group",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": [
                    "s3:Get*",
                    "s3:List*"
                ],
                "Resource": "*",
                "Effect": "Allow"
            }
        ],
        "PolicyName": "S3-ReadOnly-Policy"
    }
}
```

For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see GetGroupPolicy in AWS CLI Command Reference.
get-group

The following code example shows how to use get-group.

AWS CLI

To get an IAM group

This example returns details about the IAM group Admins.

```bash
aws iam get-group \
   --group-name Admins
```

Output:

```json
{
   "Group": {
      "Path": "/",
      "CreateDate": "2015-06-16T19:41:48Z",
      "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/Admins",
      "GroupName": "Admins"
   },
   "Users": []
}
```

For more information, see [IAM Identities (users, user groups, and roles)](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the AWS IAM User Guide.

get-instance-profile

The following code example shows how to use get-instance-profile.

AWS CLI

To get information about an instance profile

The following get-instance-profile command gets information about the instance profile named ExampleInstanceProfile.
aws iam get-instance-profile
  --instance-profile-name ExampleInstanceProfile

Output:

```json
{
    "InstanceProfile": {
        "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
        "Roles": [
            {
                "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                "RoleId": "AIDGPMS9R04H3FEXAMPLE",
                "CreateDate": "2013-01-09T06:33:26Z",
                "RoleName": "Test-Role",
                "Path": "/",
                "Arn": "arn:aws:iam::336924118301:role/Test-Role"
            }
        ],
        "CreateDate": "2013-06-12T23:52:02Z",
        "InstanceProfileName": "ExampleInstanceProfile",
        "Path": "/",
        "Arn": "arn:aws:iam::336924118301:instance-profile/ExampleInstanceProfile"
    }
}
```

For more information, see [Using instance profiles](https://docs.aws.amazon.com/IAM/latest/UserGuide/) in the AWS IAM User Guide.

get-login-profile

The following code example shows how to use get-login-profile.

**AWS CLI**

**To get password information for an IAM user**

The following get-login-profile command gets information about the password for the IAM user named Bob.

```bash
aws iam get-login-profile \
```
The `get-login-profile` command can be used to verify that an IAM user has a password. The command returns a `NoSuchEntity` error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (`update-login-profile`) for the user. Alternatively, you can delete the login profile (`delete-login-profile`) for the user and then create a new one (`create-login-profile`).

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.

- For API details, see GetLoginProfile in AWS CLI Command Reference.

**get-mfa-device**

The following code example shows how to use `get-mfa-device`.

**AWS CLI**

**To retrieve information about a FIDO security key**

The following `get-mfa-device` command example retrieves information about the specified FIDO security key.

```
aws iam get-mfa-device \
   --serial-number arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE
```

**Output:**

```
{}
```
For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see GetMfaDevice in AWS CLI Command Reference.

**get-open-id-connect-provider**

The following code example shows how to use get-open-id-connect-provider.

**AWS CLI**

**To return information about the specified OpenID Connect provider**

This example returns details about the OpenID Connect provider whose ARN is arn:aws:iam::123456789012:oidc-provider/server.example.com.

```bash
aws iam get-open-id-connect-provider \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

Output:

```json
{
  "Url": "server.example.com",
  "CreateDate": "2015-06-16T19:41:48Z",
  "ThumbprintList": [
    "12345abcdefgij67890lmnopqrst987example",
  ],
  "ClientIDList": [
    "example-application-ID"
  ]
}
```
For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see GetOpenIdConnectProvider in AWS CLI Command Reference.

**get-organizations-access-report**

The following code example shows how to use get-organizations-access-report.

**AWS CLI**

**To retrieve an access report**

The following get-organizations-access-report example displays a previously generated access report for an AWS Organizations entity. To generate a report, use the generate-organizations-access-report command.

```bash
aws iam get-organizations-access-report \
  --job-id a8b6c06f-aaa4-8xmp-28bc-81da71836359
```

**Output:**

```json
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-09-30T06:53:36.187Z",
    "JobCompletionDate": "2019-09-30T06:53:37.547Z",
    "NumberOfServicesAccessible": 188,
    "NumberOfServicesNotAccessed": 171,
    "AccessDetails": [
        {
            "ServiceName": "Alexa for Business",
            "ServiceNamespace": "a4b",
            "TotalAuthenticatedEntities": 0
        },
        ...
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see GetOrganizationsAccessReport in AWS CLI Command Reference.
get-policy-version

The following code example shows how to use get-policy-version.

AWS CLI

To retrieve information about the specified version of the specified managed policy

This example returns the policy document for the v2 version of the policy whose ARN is arn:aws:iam::123456789012:policy/MyManagedPolicy.

```
aws iam get-policy-version \
   --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
   --version-id v2
```

Output:

```
{
   "PolicyVersion": {
      "Document": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Effect": "Allow",
               "Action": "iam:*",
               "Resource": "*"
            }
         ],
         "VersionId": "v2",
         "IsDefaultVersion": true,
         "CreateDate": "2023-04-11T00:22:54+00:00"
      }
   }
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see GetPolicyVersion in AWS CLI Command Reference.

get-policy

The following code example shows how to use get-policy.
AWS CLI

**To retrieve information about the specified managed policy**

This example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```bash
aws iam get-policy \
   --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```json
{
   "Policy": {
      "PolicyName": "MySamplePolicy",
      "CreateDate": "2015-06-17T19:23;32Z",
      "AttachmentCount": 0,
      "IsAttachable": true,
      "PolicyId": "Z27SI6FQMGNQ2EXAMPLE1",
      "DefaultVersionId": "v1",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:policy/MySamplePolicy",
      "UpdateDate": "2015-06-17T19:23:32Z"
   }
}
```

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/iam/latest/userguide/policies_and_permissions.html) in the *AWS IAM User Guide*.

- For API details, see [GetPolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/get-policy.html) in *AWS CLI Command Reference*.

**get-role-policy**

The following code example shows how to use `get-role-policy`.

**AWS CLI**

**To get information about a policy attached to an IAM role**

The following `get-role-policy` command gets information about the specified policy attached to the role named `Test-Role`.

```bash
aws iam get-role-policy \
```

For actions and scenarios
--role-name Test-Role
--policy-name ExamplePolicy

Output:

```json
{
  "RoleName": "Test-Role",
  "PolicyDocument": {
    "Statement": [
      {
        "Action": [
          "s3:ListBucket",
          "s3:Put*",
          "s3:Get*",
          "s3:*MultipartUpload*
        ],
        "Resource": "*",
        "Effect": "Allow",
        "Sid": "1"
      }
    ],
    "PolicyName": "ExamplePolicy"
  }
}
```

For more information, see [Creating IAM roles](https://docs.aws.amazon.com/IAM/latest/userguide/creating-iam-roles.html) in the AWS IAM User Guide.

**get-role**

The following code example shows how to use get-role.

**AWS CLI**

**To get information about an IAM role**

The following `get-role` command gets information about the role named Test-Role.

```bash
aws iam get-role
   --role-name Test-Role
```

Output:
The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the `list-role-policies` command.

For more information, see `Creating IAM roles` in the *AWS IAM User Guide*.

- For API details, see `GetRole` in *AWS CLI Command Reference*.

**get-saml-provider**

The following code example shows how to use `get-saml-provider`.

**AWS CLI**

**To retrieve the SAML provider metadocument**

This example retrieves the details about the SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS`. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```bash
aws iam get-saml-provider
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

### get-server-certificate

The following code example shows how to use `get-server-certificate`.

#### AWS CLI

**To get details about a server certificate in your AWS account**

The following `get-server-certificate` command retrieves all of the details about the specified server certificate in your AWS account.

```
aws iam get-server-certificate
  --server-certificate-name myUpdatedServerCertificate
```

**Output:**

```
{
  "ServerCertificate": {
    "ServerCertificateMetadata": {
      "Path": "/",
      "ServerCertificateName": "myUpdatedServerCertificate",
      "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
    },
  }
}
```
"Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
"UploadDate": "2019-04-22T21:13:44+00:00",
"Expiration": "2019-10-15T22:24:16+00:00"
}

To list the server certificates available in your AWS account, use the list-server-certificates command.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.

- For API details, see GetServerCertificate in AWS CLI Command Reference.
get-service-last-accessed-details-with-entities

The following code example shows how to use get-service-last-accessed-details-with-entities.

AWS CLI

To retrieve a service access report with details for a service

The following get-service-last-accessed-details-with-entities example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the generate-service-last-accessed-details command. To get a list of services accessed with namespaces, use get-service-last-accessed-details.

```
aws iam get-service-last-accessed-details-with-entities \
  --job-id 78b6c2ba-d09e-6xmp-7039-ecde30b26916 \
  --service-namespace lambda
```

Output:

```
{
  "JobStatus": "COMPLETED",
  "JobCreationDate": "2019-10-01T03:55:41.756Z",
  "JobCompletionDate": "2019-10-01T03:55:42.533Z",
  "EntityDetailsList": [
  {
    "EntityInfo": {
      "Arn": "arn:aws:iam::123456789012:user/admin",
      "Name": "admin",
      "Type": "USER",
      "Id": "AIDAIO2XMPLENQEXAMPLE",
      "Path": "/"
    },
    "LastAuthenticated": "2019-09-30T23:02:00Z"
  },
  {
    "EntityInfo": {
      "Arn": "arn:aws:iam::123456789012:user/developer",
      "Name": "developer",
      "Type": "USER",
      "Id": "AIDAIBEYXMP2YEXAMPLE",
      "Path": "/"
    },
    "LastAuthenticated": "2019-09-30T23:02:00Z"
  }
  ]
}
```
For more information, see [Refining permissions in AWS using last accessed information](https://docs.aws.amazon.com/IAM/latest/UserGuide/idbitrary-permissions-policy-refine-last-accessed-details.html) in the **AWS IAM User Guide**.

- For API details, see [GetServiceLastAccessedDetailsWithEntities](https://docs.aws.amazon.com/cli/latest/reference/iam/get-service-last-accessed-details.html) in **AWS CLI Command Reference**.

### get-service-last-accessed-details

The following code example shows how to use `get-service-last-accessed-details`.

**AWS CLI**

**To retrieve a service access report**

The following `get-service-last-accessed-details` example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the `generate-service-last-accessed-details` command.

```bash
aws iam get-service-last-accessed-details
  --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc
```

**Output:**

```json
{
  "JobStatus": "COMPLETED",
  "JobCreationDate": "2019-10-01T03:50:35.929Z",
  "ServicesLastAccessed": [
    ...
    {
      "ServiceName": "AWS Lambda",
      "LastAuthenticated": "2019-09-30T23:02:00Z",
      "ServiceNamespace": "lambda",
      "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
      "TotalAuthenticatedEntities": 6
    },
    ...
  ]
}
```
For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see GetServiceLastAccessedDetails in AWS CLI Command Reference.

get-service-linked-role-deletion-status

The following code example shows how to use get-service-linked-role-deletion-status.

AWS CLI

To check the status of a request to delete a service-linked role

The following get-service-linked-role-deletion-status example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a DeletionTaskId value that you provide as a parameter for this command.

```bash
aws iam get-service-linked-role-deletion-status \
--deletion-task-id task/aws-service-role/lex.amazonaws.com/AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```
{
 "Status": "SUCCEEDED"
}
```

For more information, see Using service-linked roles in the AWS IAM User Guide.

- For API details, see GetServiceLinkedRoleDeletionStatus in AWS CLI Command Reference.

get-ssh-public-key

The following code example shows how to use get-ssh-public-key.

AWS CLI

Example 1: To retrieve an SSH public key attached to an IAM user in SSH encoded form
The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user sofia. The output is in SSH encoding.

```bash
aws iam get-ssh-public-key \
   --user-name sofia \
   --ssh-public-key-id APKA123456789EXAMPLE \
   --encoding SSH
```

Output:

```
{
   "SSHPublicKey": {
       "UserName": "sofia",
       "SSHPublicKeyId": "APKA123456789EXAMPLE",
       "SSHPublicKeyBody": "ssh-rsa <<long encoded SSH string>>",
       "Status": "Inactive",
       "UploadDate": "2019-04-18T17:04:49+00:00"
   }
}
```

**Example 2: To retrieve an SSH public key attached to an IAM user in PEM encoded form**

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user sofia. The output is in PEM encoding.

```bash
aws iam get-ssh-public-key \
   --user-name sofia \
   --ssh-public-key-id APKA123456789EXAMPLE \
   --encoding PEM
```

Output:

```
{
   "SSHPublicKey": {
       "UserName": "sofia",
       "SSHPublicKeyId": "APKA123456789EXAMPLE",
       "SSHPublicKeyBody": "-----BEGIN PUBLIC KEY-----
<<long encoded PEM string>>
-----END PUBLIC KEY-----",
       "Status": "Inactive",
       "UploadDate": "2019-04-18T17:04:49+00:00"
   }
}
```
get-user-policy

The following code example shows how to use get-user-policy.

AWS CLI

To list policy details for an IAM user

The following get-user-policy command lists the details of the specified policy that is attached to the IAM user named Bob.

aws iam get-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy

Output:

```
{
    "UserName": "Bob",
    "PolicyName": "ExamplePolicy",
    "PolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
            {
                "Action": "*",
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    }
}
```

To get a list of policies for an IAM user, use the list-user-policies command.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.
For API details, see [GetUserPolicy](#) in *AWS CLI Command Reference*.

### get-user

The following code example shows how to use `get-user`.

**AWS CLI**

**To get information about an IAM user**

The following `get-user` command gets information about the IAM user named *Paulo*.

```
aws iam get-user \
  --user-name Paulo
```

**Output:**

```
{
  "User": {
    "UserName": "Paulo",
    "Path": "/",
    "CreateDate": "2019-09-21T23:03:13Z",
    "UserId": "AIDA123456789EXAMPLE",
    "Arn": "arn:aws:iam::123456789012:user/Paulo"
  }
}
```

For more information, see [Managing IAM users](#) in the *AWS IAM User Guide*.

For API details, see [GetUser](#) in *AWS CLI Command Reference*.

### list-access-keys

The following code example shows how to use `list-access-keys`.

**AWS CLI**

**To list the access key IDs for an IAM user**

The following `list-access-keys` command lists the access keys IDs for the IAM user named *Bob*.
aws iam list-access-keys
   --user-name Bob

Output:

```json
{
   "AccessKeyMetadata": [
   {
      "UserName": "Bob",
      "Status": "Active",
      "CreateDate": "2013-06-04T18:17:34Z",
      "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
   },
   {
      "UserName": "Bob",
      "Status": "Inactive",
      "CreateDate": "2013-06-06T20:42:26Z",
      "AccessKeyId": "AKIAI44QH8DHBEXAMPLE"
   }
   
}
```

You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the `create-access-keys` command.

For more information, see [Managing access keys for IAM users](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_access-keys.html) in the AWS IAM User Guide.

- For API details, see [ListAccessKeys](https://docs.aws.amazon.com/cli/latest/reference/iam/list-access-keys.html) in AWS CLI Command Reference.

**list-account-aliases**

The following code example shows how to use `list-account-aliases`.

**AWS CLI**

**To list account aliases**

The following `list-account-aliases` command lists the aliases for the current account.

```bash
aws iam list-account-aliases
```

Output:
For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.

- For API details, see ListAccountAliases in AWS CLI Command Reference.

**list-attached-group-policies**

The following code example shows how to use list-attached-group-policies.

**AWS CLI**

To list all managed policies that are attached to the specified group

This example returns the names and ARNs of the managed policies that are attached to the IAM group named Admins in the AWS account.

```bash
aws iam list-attached-group-policies \
  --group-name Admins
```

**Output:**

```json
{
   "AttachedPolicies": [ 
   {
      "PolicyName": "AdministratorAccess",
      "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
   },
   {
      "PolicyName": "SecurityAudit",
      "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
   }
   ],
   "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.
list-attached-role-policies

The following code example shows how to use list-attached-role-policies.

AWS CLI

To list all managed policies that are attached to the specified role

This command returns the names and ARNs of the managed policies attached to the IAM role named SecurityAuditRole in the AWS account.

```bash
aws iam list-attached-role-policies \
--role-name SecurityAuditRole
```

Output:

```json
{
    "AttachedPolicies": [
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

list-attached-user-policies

The following code example shows how to use list-attached-user-policies.

AWS CLI

To list all managed policies that are attached to the specified user

This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.
aws iam list-attached-user-policies \
   --user-name Bob

Output:

```
{
   "AttachedPolicies": [
   {
      "PolicyName": "AdministratorAccess",
      "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
   },
   {
      "PolicyName": "SecurityAudit",
      "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
   }
   ],
   "IsTruncated": false
}
```

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/iam/latest/userguide/policies-and-permissions.html) in the *AWS IAM User Guide*.

- For API details, see [ListAttachedUserPolicies](https://docs.aws.amazon.com/cli/latest/reference/iam/list-attached-user-policies.html) in *AWS CLI Command Reference*.

### list-entities-for-policy

The following code example shows how to use `list-entities-for-policy`.

**AWS CLI**

**To list all users, groups, and roles that the specified managed policy is attached to**

This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
aws iam list-entities-for-policy \
   --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```
{
   "PolicyGroups": [
```
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

• For API details, see ListEntitiesForPolicy in AWS CLI Command Reference.

**list-group-policies**

The following code example shows how to use list-group-policies.

**AWS CLI**

To list all inline policies that are attached to the specified group

The following list-group-policies command lists the names of inline policies that are attached to the IAM group named Admins in the current account.

```bash
aws iam list-group-policies \
  --group-name Admins
```

Output:

```json
{
  "PolicyNames": [
  
  ]
}
```
"AdminRoot",
"ExamplePolicy"
]
}

For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see ListGroupPolicies in AWS CLI Command Reference.

**list-groups-for-user**

The following code example shows how to use `list-groups-for-user`.

**AWS CLI**

**To list the groups that an IAM user belongs to**

The following `list-groups-for-user` command displays the groups that the IAM user named Bob belongs to.

```
aws iam list-groups-for-user \
--user-name Bob
```

**Output:**

```json
{
  "Groups": [
    {
      "Path": "/",
      "CreateDate": "2013-05-06T01:18:08Z",
      "GroupId": "AKIAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/Admin",
      "GroupName": "Admin"
    },
    {
      "Path": "/",
      "CreateDate": "2013-05-06T01:37:28Z",
      "GroupId": "AKIAI44QH8DH8EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/s3-Users",
      "GroupName": "s3-Users"
    }
  ]
}
```
For more information, see Managing IAM user groups in the AWS IAM User Guide.

- For API details, see ListGroupsForUser in AWS CLI Command Reference.

list-groups

The following code example shows how to use list-groups.

AWS CLI

To list the IAM groups for the current account

The following list-groups command lists the IAM groups in the current account.

aws iam list-groups

Output:

```json
{
   "Groups": [
   {
        "Path": "/",
        "CreateDate": "2013-06-04T20:27:27.972Z",
        "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    },
    {
        "Path": "/",
        "CreateDate": "2013-04-16T20:30:42Z",
        "GroupId": "AIDGPM9R04H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
        "GroupName": "S3-Admins"
    }
   ]
}
```

For more information, see Managing IAM user groups in the AWS IAM User Guide.

- For API details, see ListGroups in AWS CLI Command Reference.
list-instance-profile-tags

The following code example shows how to use list-instance-profile-tags.

AWS CLI

To list the tags attached to an instance profile

The following list-instance-profile-tags command retrieves the list of tags associated with the specified instance profile.

```
aws iam list-instance-profile-tags \
   --instance-profile-name deployment-role
```

Output:

```
{
   "Tags": [
   {
      "Key": "DeptID",
      "Value": "123456"
   },
   {
      "Key": "Department",
      "Value": "Accounting"
   }
   ]
}
```

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListInstanceProfileTags in AWS CLI Command Reference.

list-instance-profiles-for-role

The following code example shows how to use list-instance-profiles-for-role.

AWS CLI

To list the instance profiles for an IAM role

The following list-instance-profiles-for-role command lists the instance profiles that are associated with the role Test-Role.
aws iam list-instance-profiles-for-role \
   --role-name Test-Role

Output:

```json
{
   "InstanceProfiles": [
       {
           "InstanceProfileId": "AIDGPMS9RO4H3FEXAMPLE",
           "Roles": [
               {
                   "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                   "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
                   "CreateDate": "2013-06-07T20:42:15Z",
                   "RoleName": "Test-Role",
                   "Path": "/",
                   "Arn": "arn:aws:iam::123456789012:role/Test-Role"
               }
           ],
           "CreateDate": "2013-06-07T21:05:24Z",
           "InstanceProfileName": "ExampleInstanceProfile",
           "Path": "/",
           "Arn": "arn:aws:iam::123456789012:instance-profile/ExampleInstanceProfile"
       }
   ]
}
```

For more information, see [Using instance profiles](https://docs.aws.amazon.com/IAM/latest/UserGuide/id实例配置的.html) in the *AWS IAM User Guide*.

- For API details, see [ListInstanceProfilesForRole](https://docs.aws.amazon.com/cli/latest/reference/iam/list-instance-profiles-for-role.html) in *AWS CLI Command Reference*.

**list-instance-profiles**

The following code example shows how to use `list-instance-profiles`.

**AWS CLI**

To lists the instance profiles for the account

The following `list-instance-profiles` command lists the instance profiles that are associated with the current account.
aws iam list-instance-profiles

Output:

{
   "InstanceProfiles": [
      {
         "Path": "/",
         "InstanceProfileName": "example-dev-role",
         "InstanceProfileId": "AIPIXEU4NUHUPEXAMPLE",
         "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
         "CreateDate": "2023-09-21T18:41+00:00",
         "Roles": [
            {
               "Path": "/",
               "RoleName": "example-dev-role",
               "RoleId": "AROAJ52OTH4H7LEXAMPLE",
               "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
               "CreateDate": "2023-09-21T18:40+00:00",
               "AssumeRolePolicyDocument": {
                  "Version": "2012-10-17",
                  "Statement": [
                     {
                        "Effect": "Allow",
                        "Principal": {
                           "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                     }
                  ]
               }
            }
         ]
      },
      {
         "Path": "/",
         "InstanceProfileName": "example-s3-role",
         "InstanceProfileId": "AIPIJVNRIQFREXAMPLE",
         "Arn": "arn:aws:iam::123456789012:instance-profile/example-s3-role",

               "InstanceProfileId": "AIPIJVNRIQFREXAMPLE",
               "Arn": "arn:aws:iam::123456789012:instance-profile/example-s3-role",
               "CreateDate": "2023-09-21T18:40+00:00",
               "Roles": [
                  {
                     "Path": "/",
                     "InstanceProfileName": "example-dev-role",
                     "InstanceProfileId": "AIPIXEU4NUHUPEXAMPLE",
                     "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
                     "CreateDate": "2023-09-21T18:41+00:00",
                     "Roles": [
                        {
                           "Path": "/",
                           "RoleName": "example-dev-role",
                           "RoleId": "AROAJ52OTH4H7LEXAMPLE",
                           "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
                           "CreateDate": "2023-09-21T18:40+00:00",
                           "AssumeRolePolicyDocument": {
                              "Version": "2012-10-17",
                              "Statement": [
                                 {
                                    "Effect": "Allow",
                                    "Principal": {
                                       "Service": "ec2.amazonaws.com"
                                    },
                                    "Action": "sts:AssumeRole"
                                 }
                              ]
                           }
                        }
                     ]
                  }
               ]
            }
         ]
      }
   ]
}
For more information, see [Using instance profiles](https://docs.aws.amazon.com/AmazonS3/latest/userguide/using-instance-profiles.html) in the *AWS IAM User Guide*.

- For API details, see [ListInstanceProfiles](https://docs.aws.amazon.com/cli/latest/reference/iam/list-instance-profiles.html) in *AWS CLI Command Reference*.

### list-mfa-device-tags

The following code example shows how to use `list-mfa-device-tags`.

**AWS CLI**

**To list the tags attached to an MFA device**

The following `list-mfa-device-tags` command retrieves the list of tags associated with the specified MFA device.

```
aws iam list-mfa-device-tags \
  --serial-number arn:aws:iam::123456789012:mfa/alice
```

Output:

```bash
{
```
"Tags": [
  {
    "Key": "DeptID",
    "Value": "123456"
  },
  {
    "Key": "Department",
    "Value": "Accounting"
  }
]

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListMfaDeviceTags in AWS CLI Command Reference.

list-mfa-devices

The following code example shows how to use list-mfa-devices.

AWS CLI

To list all MFA devices for a specified user

This example returns details about the MFA device assigned to the IAM user Bob.

```bash
aws iam list-mfa-devices \
  --user-name Bob
```

Output:

```json
{
    "MFADevices": [
      {
        "UserName": "Bob",
        "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
        "EnableDate": "2019-10-28T20:37:09+00:00"
      },
      {
        "UserName": "Bob",
        "SerialNumber": "GAKT12345678",
        "EnableDate": "2023-02-18T21:44:42+00:00"
      }
    ]
}
```

**list-open-id-connect-provider-tags**

The following code example shows how to use `list-open-id-connect-provider-tags`.

**AWS CLI**

To list the tags attached to an OpenID Connect (OIDC)-compatible identity provider

The following `list-open-id-connect-provider-tags` command retrieves the list of tags associated with the specified OIDC identity provider.

```bash
aws iam list-open-id-connect-provider-tags \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

Output:

```json
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "Finance"
        }
    ]
}
```
For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/iam/latest/userguide/creating-taggable-resources.html) in the *AWS IAM User Guide*.

- For API details, see [ListOpenIdConnectProviderTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-open-id-connect-providers.html) in *AWS CLI Command Reference*.

**list-open-id-connect-providers**

The following code example shows how to use list-open-id-connect-providers.

**AWS CLI**

To list information about the OpenID Connect providers in the AWS account

This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```bash
aws iam list-open-id-connect-providers
```

Output:

```json
{
  "OpenIDConnectProviderList": [ 
    {
      "Arn": "arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com"
    }
  ]
}
```

For more information, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/iam/latest/userguide/creating-open-id-connect-providers.html) in the *AWS IAM User Guide*.

- For API details, see [ListOpenIdConnectProviders](https://docs.aws.amazon.com/cli/latest/reference/iam/list-open-id-connect-providers.html) in *AWS CLI Command Reference*. 

---
**list-policies-granting-service-access**

The following code example shows how to use list-policies-granting-service-access.

**AWS CLI**

To list the policies that grant a principal access to the specified service

The following list-policies-granting-service-access example retrieves the list of policies that grant the IAM user sofia access to AWS CodeCommit service.

```bash
aws iam list-policies-granting-service-access \
   --arn arn:aws:iam::123456789012:user/sofia \
   --service-namespaces codecommit
```

Output:

```json
{
   "PoliciesGrantingServiceAccess": [
      {
         "ServiceNamespace": "codecommit",
         "Policies": [
            {
               "PolicyName": "Grant-Sofia-Access-To-CodeCommit",
               "PolicyType": "INLINE",
               "EntityName": "sofia"
            }
         ]
      },
      "IsTruncated": false
   }
}
```

For more information, see Using IAM with CodeCommit: Git credentials, SSH keys, and AWS access keys in the AWS IAM User Guide.

- For API details, see ListPoliciesGrantingServiceAccess in AWS CLI Command Reference.

**list-policies**

The following code example shows how to use list-policies.
AWS CLI

To list managed policies that are available to your AWS account

This example returns a collection of the first two managed policies available in the current AWS account.

```bash
aws iam list-policies \
   --max-items 3
```

Output:

```json
{
   "Policies": [
     {
         "PolicyName": "AWSCloudTrailAccessPolicy",
         "PolicyId": "ANPAXQE2BSPJ7YEXAMPLE",
         "Path": "/",
         "DefaultVersionId": "v1",
         "AttachmentCount": 0,
         "PermissionsBoundaryUsageCount": 0,
         "IsAttachable": true,
         "CreateDate": "2019-09-04T17:43:42+00:00",
         "UpdateDate": "2019-09-04T17:43:42+00:00"
     },
     {
         "PolicyName": "AdministratorAccess",
         "PolicyId": "ANPAIWMBCKSKE64ZLYK",
         "Arn": "arn:aws:iam::aws:policy/AdministratorAccess",
         "Path": "/",
         "DefaultVersionId": "v1",
         "AttachmentCount": 6,
         "PermissionsBoundaryUsageCount": 0,
         "IsAttachable": true,
         "CreateDate": "2015-02-06T18:39:46+00:00",
         "UpdateDate": "2015-02-06T18:39:46+00:00"
     },
     {
         "PolicyName": "PowerUserAccess",
         "PolicyId": "ANPAJYRXTHIB4FOVS3ZXS",
         "Arn": "arn:aws:iam::aws:policy/PowerUserAccess",
         "Path": "/",
```
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListPolicies in AWS CLI Command Reference.

list-policy-tags

The following code example shows how to use list-policy-tags.

AWS CLI

To list the tags attached to a managed policy

The following list-policy-tags command retrieves the list of tags associated with the specified managed policy.

```bash
aws iam list-policy-tags \
   --policy-arn arn:aws:iam::123456789012:policy/billing-access
```

Output:

```json
{
   "Tags": [ 
      {
         "Key": "DeptID",
         "Value": "123456"
      },
      {
         "Key": "Department",
         "Value": "Accounting"
      }
   ]
}
```
The following code example shows how to use `list-policy-versions`.

**AWS CLI**

```bash
aws iam list-policy-versions
  --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

**Output:**

```json
{
  "IsTruncated": false,
  "Versions": [
    {
      "VersionId": "v2",
      "IsDefaultVersion": true,
      "CreateDate": "2015-06-02T23:19:44Z"
    },
    {
      "VersionId": "v1",
      "IsDefaultVersion": false,
      "CreateDate": "2015-06-02T22:30:47Z"
    }
  ]
}
```

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/iam/latest/userguide/policies-and-permissions-in-iam.html) in the *AWS IAM User Guide*.

- For API details, see [ListPolicyVersions](https://docs.aws.amazon.com/cli/latest/reference/iam/list-policy-versions.html) in *AWS CLI Command Reference*. 

---

**list-policy-versions**

The following code example shows how to use `list-policy-versions`.

**AWS CLI**

**To list information about the versions of the specified managed policy**

This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```bash
aws iam list-policy-versions
  --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

**Output:**

```json
{
  "IsTruncated": false,
  "Versions": [
    {
      "VersionId": "v2",
      "IsDefaultVersion": true,
      "CreateDate": "2015-06-02T23:19:44Z"
    },
    {
      "VersionId": "v1",
      "IsDefaultVersion": false,
      "CreateDate": "2015-06-02T22:30:47Z"
    }
  ]
}
```

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/iam/latest/userguide/policies-and-permissions-in-iam.html) in the *AWS IAM User Guide*.

- For API details, see [ListPolicyVersions](https://docs.aws.amazon.com/cli/latest/reference/iam/list-policy-versions.html) in *AWS CLI Command Reference*. 

---
list-role-policies

The following code example shows how to use list-role-policies.

AWS CLI

To list the policies attached to an IAM role

The following list-role-policies command lists the names of the permissions policies for the specified IAM role.

```bash
aws iam list-role-policies \
   --role-name Test-Role
```

Output:

```
{
   "PolicyNames": [
      "ExamplePolicy"
   ]
}
```

To see the trust policy attached to a role, use the get-role command. To see the details of a permissions policy, use the get-role-policy command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see ListRolePolicies in AWS CLI Command Reference.

list-role-tags

The following code example shows how to use list-role-tags.

AWS CLI

To list the tags attached to a role

The following list-role-tags command retrieves the list of tags associated with the specified role.

```bash
aws iam list-role-tags \
   --role-name production-role
```
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListRoleTags in AWS CLI Command Reference.

### list-roles

The following code example shows how to use list-roles.

**AWS CLI**

**To list IAM roles for the current account**

The following list-roles command lists IAM roles for the current account.

```bash
aws iam list-roles
```

**Output:**

```json
{
  "Roles": [
    {
      "Path": "/",
      "RoleName": "ExampleRole",
      "RoleId": "AROAJ52OTH4H7LEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:role/ExampleRole",
    
```
For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see ListRoles in AWS CLI Command Reference.
list-saml-provider-tags

The following code example shows how to use list-saml-provider-tags.

AWS CLI

To list the tags attached to a SAML provider

The following list-saml-provider-tags command retrieves the list of tags associated with the specified SAML provider.

```bash
aws iam list-saml-provider-tags \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

Output:

```json
{
   "Tags": [
      {
         "Key": "DeptID",
         "Value": "123456"
      },
      {
         "Key": "Department",
         "Value": "Accounting"
      }
   ]
}
```

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListSamlProviderTags in AWS CLI Command Reference.

list-saml-providers

The following code example shows how to use list-saml-providers.

AWS CLI

To list the SAML providers in the AWS account

This example retrieves the list of SAML 2.0 providers created in the current AWS account.
aws iam list-saml-providers

Output:

{
   "SAMLProviderList": [
      {
         "Arn": "arn:aws:iam::123456789012:saml-provider/SAML-ADFS",
         "ValidUntil": "2015-06-05T22:45:14Z",
         "CreateDate": "2015-06-05T22:45:14Z"
      }
   ]
}

For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see ListSAMLProviders in AWS CLI Command Reference.

list-server-certificate-tags

The following code example shows how to use list-server-certificate-tags.

AWS CLI

To list the tags attached to a server certificate

The following list-server-certificate-tags command retrieves the list of tags associated with the specified server certificate.

aws iam list-server-certificate-tags \
   --server-certificate-name ExampleCertificate

Output:

{
   "Tags": [
      {
         "Key": "DeptID",
         "Value": "123456"
      },
      
}
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListServerCertificateTags in AWS CLI Command Reference.

list-server-certificates

The following code example shows how to use list-server-certificates.

AWS CLI

To list the server certificates in your AWS account

The following list-server-certificates command lists all of the server certificates stored and available for use in your AWS account.

```bash
aws iam list-server-certificates
```

Output:

```json
{
   "ServerCertificateMetadataList": [
   {
      "Path": "/",
      "ServerCertificateName": "myUpdatedServerCertificate",
      "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
      "UploadDate": "2019-04-22T21:13:44+00:00",
      "Expiration": "2019-10-15T22:23:16+00:00"
   },
   {
      "Path": "/cloudfront/",
      "ServerCertificateName": "MyTestCert",
      "ServerCertificateId": "ASCAEXAMPLE456EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyTestCert",
```
For more information, see [Managing server certificates in IAM](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_credentials_sertificate-servers.html) in the *AWS IAM User Guide*.

- For API details, see [ListServerCertificates](https://docs.aws.amazon.com/cli/latest/reference/iam/list-server-certificates.html) in *AWS CLI Command Reference*.

### list-service-specific-credential

The following code example shows how to use `list-service-specific-credential`.

**AWS CLI**

**Example 1: List the service-specific credentials for a user**

The following `list-service-specific-credentials` example displays all service-specific credentials assigned to the specified user. Passwords are not included in the response.

```bash
aws iam list-service-specific-credentials \\
  --user-name sofia
```

Output:

```json
{
  "ServiceSpecificCredential": {
    "CreateDate": "2019-04-18T20:45:36+00:00",
    "ServiceName": "codecommit.amazonaws.com",
    "ServiceUserName": "sofia-at-123456789012",
    "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
    "UserName": "sofia",
    "Status": "Active"
  }
}
```

**Example 2: List the service-specific credentials for a user filtered to a specified service**

The following `list-service-specific-credentials` example displays the service-specific credentials assigned to the user making the request. The list is filtered to include only those credentials for the specified service. Passwords are not included in the response.
aws iam list-service-specific-credentials \
   --service-name codecommit.amazonaws.com

Output:

{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
      "Status": "Active"
   }
}

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see ListServiceSpecificCredential in AWS CLI Command Reference.

**list-service-specific-credentials**

The following code example shows how to use list-service-specific-credentials.

**AWS CLI**

**To retrieve a list of credentials**

The following list-service-specific-credentials example lists the credentials generated for HTTPS access to AWS CodeCommit repositories for a user named developer.

aws iam list-service-specific-credentials \
   --user-name developer \
   --service-name codecommit.amazonaws.com

Output:

{
   "ServiceSpecificCredentials": [
      {

   
   
}
For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see ListServiceSpecificCredentials in AWS CLI Command Reference.

list-signing-certificates

The following code example shows how to use list-signing-certificates.

AWS CLI

To list the signing certificates for an IAM user

The following list-signing-certificates command lists the signing certificates for the IAM user named Bob.

```
aws iam list-signing-certificates \
   --user-name Bob
```

Output:

```
{
   "Certificates": [
```

For more information, see Manage signing certificates in the Amazon EC2 User Guide.

- For API details, see ListSigningCertificates in AWS CLI Command Reference.

list-ssh-public-keys

The following code example shows how to use list-ssh-public-keys.

AWS CLI

To list the SSH public keys attached to an IAM user

The following list-ssh-public-keys example lists the SSH public keys attached to the IAM user sofia.

```bash
aws iam list-ssh-public-keys
   --user-name sofia
```

Output:

```
{
   "SSHPublicKeys": [
   {
      "UserName": "sofia",
      "SSHPublicKeyId": "APKA1234567890EXAMPLE",
      "Status": "Inactive",
      "UploadDate": "2019-04-18T17:04:49+00:00"
   }
   ]
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide
list-user-policies

The following code example shows how to use list-user-policies.

AWS CLI

To list policies for an IAM user

The following list-user-policies command lists the policies that are attached to the IAM user named Bob.

```bash
aws iam list-user-policies \
   --user-name Bob
```

Output:

```
{
   "PolicyNames": [
      "ExamplePolicy",
      "TestPolicy"
   ]
}
```

For more information, see Creating an IAM user in your AWS account in the AWS IAM User Guide.

list-user-tags

The following code example shows how to use list-user-tags.

AWS CLI

To list the tags attached to a user

The following list-user-tags command retrieves the list of tags associated with the specified IAM user.

```bash
aws iam list-user-tags \
```
--user-name alice

Output:

```json
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see [Tagging IAM resources](http://example.com) in the *AWS IAM User Guide*.

- For API details, see [ListUserTags](http://example.com) in *AWS CLI Command Reference*.

**list-users**

The following code example shows how to use `list-users`.

**AWS CLI**

**To list IAM users**

The following `list-users` command lists the IAM users in the current account.

```bash
aws iam list-users
```

Output:

```json
{
    "Users": [
        {
            "UserName": "Adele",
            "Path": "/",
```
For more information, see Listing IAM users in the AWS IAM User Guide.

- For API details, see ListUsers in AWS CLI Command Reference.

**list-virtual-mfa-devices**

The following code example shows how to use list-virtual-mfa-devices.

**AWS CLI**

**To list virtual MFA devices**

The following list-virtual-mfa-devices command lists the virtual MFA devices that have been configured for the current account.

```bash
aws iam list-virtual-mfa-devices
```

**Output:**

```json
{
   "VirtualMFADevices": [
      {
         "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
      },
      {
         "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
      }
   ]
}
```
For more information, see [Enabling a virtual multi-factor authentication (MFA) device](#) in the [AWS IAM User Guide](#).

- For API details, see [ListVirtualMfaDevices](#) in *AWS CLI Command Reference*.

**put-group-policy**

The following code example shows how to use `put-group-policy`.

**AWS CLI**

**To add a policy to a group**

The following `put-group-policy` command adds a policy to the IAM group named `Admins`.

```
aws iam put-group-policy
  --group-name Admins
  --policy-document file://AdminPolicy.json
  --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

For more information, see [Managing IAM policies](#) in the *AWS IAM User Guide*.

- For API details, see [PutGroupPolicy](#) in *AWS CLI Command Reference*.

**put-role-permissions-boundary**

The following code example shows how to use `put-role-permissions-boundary`.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM role**

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.
aws iam put-role-permissions-boundary \
   --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
   --role-name lambda-application-role

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role**

The following put-role-permissions-boundary example applies the AWS managed PowerUserAccess policy as the permissions boundary for the specified IAM role.

aws iam put-role-permissions-boundary \
   --permissions-boundary arn:aws:policy/PowerUserAccess \
   --role-name x-account-admin

This command produces no output.

For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/id修改Role.html) in the *AWS IAM User Guide*.

- For API details, see [PutRolePermissionsBoundary](https://docs.aws.amazon.com/AWSCLI/latest/userguide/cli-aws-iam.html#putrolepermissionsboundary) in *AWS CLI Command Reference*.

**put-role-policy**

The following code example shows how to use put-role-policy.

**AWS CLI**

**To attach a permissions policy to an IAM role**

The following put-role-policy command adds a permissions policy to the role named Test-Role.

aws iam put-role-policy \
   --role-name Test-Role \
   --policy-name ExamplePolicy \
   --policy-document file://AdminPolicy.json

This command produces no output.
The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see [Modifying a role](#) in the [AWS IAM User Guide](#).

- For API details, see [PutRolePolicy](#) in [AWS CLI Command Reference](#).

**put-user-permissions-boundary**

The following code example shows how to use `put-user-permissions-boundary`.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM user**

The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
   --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
   --user-name intern
```

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user**

The following `put-user-permissions-boundary` example applies the AWS managed policy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
   --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
   --user-name developer
```

This command produces no output.

For more information, see [Adding and removing IAM identity permissions](#) in the [AWS IAM User Guide](#).

- For API details, see [PutUserPermissionsBoundary](#) in [AWS CLI Command Reference](#).
**put-user-policy**

The following code example shows how to use `put-user-policy`.

**AWS CLI**

To attach a policy to an IAM user

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```bash
aws iam put-user-policy \
   --user-name Bob \
   --policy-name ExamplePolicy \
   --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

For more information, see [Adding and removing IAM identity permissions](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [PutUserPolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/put-user-policy.html) in *AWS CLI Command Reference*.

**remove-client-id-from-open-id-connect-provider**

The following code example shows how to use `remove-client-id-from-open-id-connect-provider`.

**AWS CLI**

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```bash
aws iam remove-client-id-from-open-id-connect-provider \
   --client-id My-TestApp-3
```
This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

For API details, see RemoveClientIdFromOpenIdConnectProvider in AWS CLI Command Reference.

remove-role-from-instance-profile

The following code example shows how to use remove-role-from-instance-profile.

AWS CLI

To remove a role from an instance profile

The following remove-role-from-instance-profile command removes the role named Test-Role from the instance profile named ExampleInstanceProfile.

```bash
aws iam remove-role-from-instance-profile \
   --instance-profile-name ExampleInstanceProfile \
   --role-name Test-Role
```

For more information, see Using instance profiles in the AWS IAM User Guide.

For API details, see RemoveRoleFromInstanceProfile in AWS CLI Command Reference.

remove-user-from-group

The following code example shows how to use remove-user-from-group.

AWS CLI

To remove a user from an IAM group

The following remove-user-from-group command removes the user named Bob from the IAM group named Admins.

```bash
aws iam remove-user-from-group \
```
--user-name Bob \
--group-name Admins

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the AWS IAM User Guide.

- For API details, see RemoveUserFromGroup in AWS CLI Command Reference.

**reset-service-specific-credential**

The following code example shows how to use reset-service-specific-credential.

**AWS CLI**

**Example 1: Reset the password for a service-specific credential attached to the user making the request**

The following reset-service-specific-credential example generates a new cryptographically strong password for the specified service-specific credential attached to the user making the request.

```bash
aws iam reset-service-specific-credential \
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

**Output:**

```
{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServicePassword": "+oaFsNk7tLc0+obP9GhhcQzGcK0ayTmE3LnAmAmH4=",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
      "Status": "Active"
   }
}
```

**Example 2: Reset the password for a service-specific credential attached to a specified user**
The following `reset-service-specific-credential` example generates a new cryptographically strong password for a service-specific credential attached to the specified user.

```bash
aws iam reset-service-specific-credential \
   --user-name sofia \
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

**Output:**

```json
{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServicePassword": "+oaFsNk7tlc0+C/obP9Ghhc0zGcK0ayaYmE3LnAmAmH4=",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
      "Status": "Active"
   }
}
```

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](https://aws.amazon.com/codecommit/userguide/) in the *AWS CodeCommit User Guide*.

- For API details, see [ResetServiceSpecificCredential](https://docs.aws.amazon.com/cli/latest/reference/iam/reset-service-specific-credential.html) in *AWS CLI Command Reference*.

## resync-mfa-device

The following code example shows how to use `resync-mfa-device`.

**AWS CLI**

To synchronize an MFA device

The following `resync-mfa-device` example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/BobsMFADevice` with an authenticator program that provided the two authentication codes.

```bash
aws iam resync-mfa-device \
   --user-name Bob \
   --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
```
This command produces no output.

For more information, see [Using multi-factor authentication (MFA) in AWS](https://docs.aws.amazon.com/iam/latest/userguide/using-mfa.html) in the *AWS IAM User Guide*.

- For API details, see [ResyncMfaDevice](https://docs.aws.amazon.com/cli/latest/reference/iam/resync-mfa-device.html) in *AWS CLI Command Reference*.

### set-default-policy-version

The following code example shows how to use `set-default-policy-version`.

**AWS CLI**

To set the specified version of the specified policy as the policy's default version.

This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```bash
aws iam set-default-policy-version
  --policy-arn arn:aws:iam::123456789012:policy/MyPolicy
  --version-id v2
```

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/iam/latest/userguide/policies-and-permissions-in-iam.html) in the *AWS IAM User Guide*.

### set-security-token-service-preferences

The following code example shows how to use `set-security-token-service-preferences`.

**AWS CLI**

To set the global endpoint token version

The following `set-security-token-service-preferences` example configures Amazon STS to use version 2 tokens when you authenticate against the global endpoint.

```bash
aws iam set-security-token-service-preferences
  --global-endpoint-token-version v2Token
```
This command produces no output.

For more information, see Managing AWS STS in an AWS Region in the AWS IAM User Guide.

- For API details, see SetSecurityTokenServicePreferences in AWS CLI Command Reference.

**simulate-custom-policy**

The following code example shows how to use simulate-custom-policy.

**AWS CLI**

**Example 1: To simulate the effects of all IAM policies associated with an IAM user or role**

The following simulate-custom-policy shows how to provide both the policy and define variable values and simulate an API call to see if it is allowed or denied. The following example shows a policy that enables database access only after a specified date and time. The simulation succeeds because the simulated actions and the specified aws:CurrentTime variable all match the requirements of the policy.

```
aws iam simulate-custom-policy \
  --policy-input-list '{"Version":"2012-10-17","Statement":\n  {"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":\n  {"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \
  --action-names dynamodb:CreateBackup \
  --context-entries \n  "ContextKeyName='aws:CurrentTime',ContextKeyValues='2019-04-25T11:00:00Z',ContextKeyType=date"
```

Output:

```
{
  "EvaluationResults": [ 
    { 
      "EvalActionName": "dynamodb:CreateBackup", 
      "EvalResourceName": "*", 
      "EvalDecision": "allowed", 
      "MatchedStatements": [ 
        { 
          "SourcePolicyId": "PolicyInputList.1", 
          "StartPosition": { 
            "Line": 1, 
            "Column": 38
```
Example 2: To simulate a command that is prohibited by the policy

The following simulate-custom-policy example shows the results of simulating a command that is prohibited by the policy. In this example, the provided date is before that required by the policy's condition.

```
aws iam simulate-custom-policy \
  --policy-input-list '{"Version":"2012-10-17","Statement":\n  {"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":\n  {"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \n  --action-names dynamodb:CreateBackup \n  --context-entries
  "ContextKeyName='aws:CurrentTime',ContextKeyValues='2014-04-25T11:00:00Z',ContextKeyType=date"
```

Output:

```
{
   "EvaluationResults": [
      {
        "EvalActionName": "dynamodb:CreateBackup",
        "EvalResourceName": "*",
        "EvalDecision": "implicitDeny",
        "MatchedStatements": [],
        "MissingContextValues": []
      }
   ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the AWS IAM User Guide.
• For API details, see SimulateCustomPolicy in AWS CLI Command Reference.

simulate-principal-policy

The following code example shows how to use simulate-principal-policy.

AWS CLI

Example 1: To simulate the effects of an arbitrary IAM policy

The following simulate-principal-policy shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the codecommit:ListRepositories action.

```bash
aws iam simulate-principal-policy
  --policy-source-arn arn:aws:iam::123456789012:user/alejandro
  --action-names codecommit:ListRepositories
```

Output:

```json
{
  "EvaluationResults": [
    {
      "EvalActionName": "codecommit:ListRepositories",
      "EvalResourceName": "*",
      "EvalDecision": "allowed",
      "MatchedStatements": [
        {
          "SourcePolicyId": "Grant-Access-To-CodeCommit-ListRepo",
          "StartPosition": {
            "Line": 3,
            "Column": 19
          },
          "EndPosition": {
            "Line": 9,
            "Column": 10
          }
        }
      ]
    },
    "MissingContextValues": []
  ]
}
```
Example 2: To simulate the effects of a prohibited command

The following simulate-custom-policy example shows the results of simulating a command that is prohibited by one of the user's policies. In the following example, the user has a policy that permits access to a DynamoDB database only after a certain date and time. The simulation has the user attempting to access the database with an `aws:CurrentTime` value that is earlier than the policy's condition permits.

```
aws iam simulate-principal-policy \
  --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
  --action-names dynamodb:CreateBackup \
  --context-entries
  "ContextKeyName='aws:CurrentTime',ContextKeyValues='2018-04-25T11:00:00Z',ContextKeyType=date"
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "implicitDeny",
            "MatchedStatements": [],
            "MissingContextValues": []
        }
    ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the AWS IAM User Guide.

- For API details, see SimulatePrincipalPolicy in AWS CLI Command Reference.

`tag-instance-profile`

The following code example shows how to use `tag-instance-profile`. 
**AWS CLI**

**To add a tag to an instance profile**

The following `tag-instance-profile` command adds a tag with a Department name to the specified instance profile.

```bash
aws iam tag-instance-profile \
    --instance-profile-name deployment-role \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/IAM-controlaccess.html) in the *AWS IAM User Guide*.

- For API details, see [TagInstanceProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-instance-profile.html) in *AWS CLI Command Reference*.

**tag-mfa-device**

The following code example shows how to use `tag-mfa-device`.

**AWS CLI**

**To add a tag to an MFA device**

The following `tag-mfa-device` command adds a tag with a Department name to the specified MFA device.

```bash
aws iam tag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/IAM-controlaccess.html) in the *AWS IAM User Guide*.

- For API details, see [TagMfaDevice](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-mfa-device.html) in *AWS CLI Command Reference*.

**tag-open-id-connect-provider**

The following code example shows how to use `tag-open-id-connect-provider`.
AWS CLI

To add a tag to an OpenID Connect (OIDC)-compatible identity provider

The following `tag-open-id-connect-provider` command adds a tag with a Department name to the specified OIDC identity provider.

```bash
aws iam tag-open-id-connect-provider \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com \
   --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagOpenIdConnectProvider in AWS CLI Command Reference.

tag-policy

The following code example shows how to use `tag-policy`.

AWS CLI

To add a tag to a customer managed policy

The following `tag-policy` command adds a tag with a Department name to the specified customer managed policy.

```bash
aws iam tag-policy \
   --policy-arn arn:aws:iam::123456789012:policy/billing-access \
   --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagPolicy in AWS CLI Command Reference.

tag-role

The following code example shows how to use `tag-role`.
AWS CLI

**To add a tag to a role**

The following `tag-role` command adds a tag with a Department name to the specified role.

```bash
aws iam tag-role --role-name my-role \
  --tags '{"Key": "Department", "Value": "Accounting"}"
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tag-resources.html) in the AWS IAM User Guide.

- For API details, see [TagRole](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-role.html) in AWS CLI Command Reference.

**tag-saml-provider**

The following code example shows how to use `tag-saml-provider`.

**AWS CLI**

**To add a tag to a SAML provider**

The following `tag-saml-provider` command adds a tag with a Department name to the specified SAML provider.

```bash
aws iam tag-saml-provider \
  --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
  --tags '[["Key": "Department", "Value": "Accounting"]]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tag-resources.html) in the AWS IAM User Guide.

- For API details, see [TagSamlProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-saml-provider.html) in AWS CLI Command Reference.

**tag-server-certificate**

The following code example shows how to use `tag-server-certificate`.

**AWS CLI**

**To add a tag to a server certificate**
The following `tag-saml-provider` command adds a tag with a Department name to the specified server certificate.

```bash
aws iam tag-server-certificate \
   --server-certificate-name ExampleCertificate \
   --tags '[["Key": "Department", "Value": "Accounting"]]
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [TagServerCertificate](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-server-certificate.html) in *AWS CLI Command Reference*.

**tag-user**

The following code example shows how to use `tag-user`.

**AWS CLI**

**To add a tag to a user**

The following `tag-user` command adds a tag with the associated Department to the specified user.

```bash
aws iam tag-user \
   --user-name alice \
   --tags '{"Key": "Department", "Value": "Accounting"}"
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [TagUser](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-user.html) in *AWS CLI Command Reference*.

**untag-instance-profile**

The following code example shows how to use `untag-instance-profile`.

**AWS CLI**

**To remove a tag from an instance profile**
The following `untag-instance-profile` command removes any tag with the key name 'Department' from the specified instance profile.

```bash
aws iam untag-instance-profile \
   --instance-profile-name deployment-role \
   --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagInstanceProfile in AWS CLI Command Reference.

### `untag-mfa-device`

The following code example shows how to use `untag-mfa-device`.

**AWS CLI**

**To remove a tag from an MFA device**

The following `untag-mfa-device` command removes any tag with the key name 'Department' from the specified MFA device.

```bash
aws iam untag-mfa-device \
   --serial-number arn:aws:iam::123456789012:mfa/alice \
   --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagMfaDevice in AWS CLI Command Reference.

### `untag-open-id-connect-provider`

The following code example shows how to use `untag-open-id-connect-provider`.

**AWS CLI**

**To remove a tag from an OIDC identity provider**
The following `untag-open-id-connect-provider` command removes any tag with the key name 'Department' from the specified OIDC identity provider.

```
aws iam untag-open-id-connect-provider \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com \
   --tag-keys Department
```

This command produces no output.

**untag-policy**

The following code example shows how to use `untag-policy`.

**AWS CLI**

**To remove a tag from a customer managed policy**

The following `untag-policy` command removes any tag with the key name 'Department' from the specified customer managed policy.

```
aws iam untag-policy \
   --policy-arn arn:aws:iam::452925170507:policy/billing-access \
   --tag-keys Department
```

This command produces no output.

**untag-role**

The following code example shows how to use `untag-role`.

**AWS CLI**

**To remove a tag from a role**
The following `untag-role` command removes any tag with the key name 'Department' from the specified role.

```bash
aws iam untag-role \
    --role-name my-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagRole in AWS CLI Command Reference.

**untag-saml-provider**

The following code example shows how to use `untag-saml-provider`.

**AWS CLI**

**To remove a tag from a SAML provider**

The following `untag-saml-provider` command removes any tag with the key name 'Department' from the specified instance profile.

```bash
aws iam untag-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagSamlProvider in AWS CLI Command Reference.

**untag-server-certificate**

The following code example shows how to use `untag-server-certificate`.

**AWS CLI**

**To remove a tag from a server certificate**
The following `untag-server-certificate` command removes any tag with the key name 'Department' from the specified server certificate.

```
aws iam untag-server-certificate \
  --server-certificate-name ExampleCertificate \
  --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagServerCertificate in AWS CLI Command Reference.

`untag-user`

The following code example shows how to use `untag-user`.

**AWS CLI**

**To remove a tag from a user**

The following `untag-user` command removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \
  --user-name alice \
  --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagUser in AWS CLI Command Reference.

`update-access-key`

The following code example shows how to use `update-access-key`.

**AWS CLI**

**To activate or deactivate an access key for an IAM user**
The following update-access-key command deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam update-access-key \
  --access-key-id AKIAIOSFODNN7EXAMPLE \
  --status Inactive \
  --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.

- For API details, see UpdateAccessKey in AWS CLI Command Reference.

**update-account-password-policy**

The following code example shows how to use update-account-password-policy.

**AWS CLI**

**To set or change the current account password policy**

The following update-account-password-policy command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \
  --minimum-password-length 8 \
  --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see UpdateAccountPasswordPolicy in AWS CLI Command Reference.
**update-assume-role-policy**

The following code example shows how to use `update-assume-role-policy`.

**AWS CLI**

**To update the trust policy for an IAM role**

The following `update-assume-role-policy` command updates the trust policy for the role named Test-Role.

```bash
code
aws iam update-assume-role-policy \
    --role-name Test-Role \
    --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.

The trust policy is defined as a JSON document in the `Test-Role-Trust-Policy.json` file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see [Creating IAM roles](https://aws.amazon.com/documentation/iam/user-guide/creating-iam-roles/) in the *AWS IAM User Guide*.

- For API details, see [UpdateAssumeRolePolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/update-assume-role-policy.html) in *AWS CLI Command Reference*.

**update-group**

The following code example shows how to use `update-group`.

**AWS CLI**

**To rename an IAM group**

The following `update-group` command changes the name of the IAM group Test to Test-1.

```bash
code
aws iam update-group \
    --group-name Test \
    --new-group-name Test-1
```

This command produces no output.

For more information, see [Renaming an IAM user group](https://aws.amazon.com/documentation/iam/user-guide/renaming-iam-user-group/) in the *AWS IAM User Guide*. 
**update-login-profile**

The following code example shows how to use `update-login-profile`.

**AWS CLI**

To update the password for an IAM user

The following `update-login-profile` command creates a new password for the IAM user named Bob.

```bash
aws iam update-login-profile \
  --user-name Bob \
  --password <password>
```

This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see [Managing passwords for IAM users](https://docs.aws.amazon.com/IAM/latest/userguide/managing-passwords.html) in the *AWS IAM User Guide*.

**update-open-id-connect-provider-thumbprint**

The following code example shows how to use `update-open-id-connect-provider-thumbprint`.

**AWS CLI**

To replace the existing list of server certificate thumbprints with a new list
This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```bash
aws iam update-open-id-connect-provider-thumbprint \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com \
   --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see UpdateOpenIdConnectProviderThumbprint in AWS CLI Command Reference.

**update-role-description**

The following code example shows how to use `update-role-description`.

**AWS CLI**

**To change an IAM role's description**

The following `update-role` command changes the description of the IAM role `production-role` to Main production role.

```bash
aws iam update-role-description \
   --role-name production-role \
   --description 'Main production role'
```

Output:

```json
{
   "Role": {
      "Path": "/",
      "RoleName": "production-role",
      "RoleId": "AROA1234567890EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:role/production-role",
```
For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_create_iam Roles.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateRole](https://docs.aws.amazon.com/AWSCommandLineReference/latest/CLI-1.11.10/reference-summary.html#update-role) in *AWS CLI Command Reference*.

**update-role**

The following code example shows how to use `update-role`.

**AWS CLI**

**To change an IAM role's description or session duration**

The following `update-role` command changes the description of the IAM role `production-role` to *Main production role* and sets the maximum session duration to 12 hours.

```
aws iam update-role \
    --role-name production-role \
    --description 'Main production role' \
    --max-session-duration 43200
```

This command produces no output.

For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_create_iam Roles.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateRole](https://docs.aws.amazon.com/AWSCommandLineReference/latest/CLI-1.11.10/reference-summary.html#update-role) in *AWS CLI Command Reference*.
**update-saml-provider**

The following code example shows how to use `update-saml-provider`.

**AWS CLI**

To update the metadata document for an existing SAML provider

This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`.

```bash
aws iam update-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

**Output:**

```json
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/SAMLADFS"
}
```

For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see UpdateSamlProvider in AWS CLI Command Reference.

**update-server-certificate**

The following code example shows how to use `update-server-certificate`.

**AWS CLI**

To change the path or name of a server certificate in your AWS account

The following `update-server-certificate` command changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the list-server-certificates command.

```bash
aws-iam update-server-certificate \
```

---

**Actions and scenarios** 3398
update-service-specific-credential

The following code example shows how to use update-service-specific-credential.

AWS CLI

**Example 1: To update the status of the requesting user's service-specific credential**

The following update-service-specific-credential example changes the status for the specified credential for the user making the request to Inactive.

```
aws iam update-service-specific-credential \ 
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \ 
  --status Inactive
```

This command produces no output.

**Example 2: To update the status of a specified user's service-specific credential**

The following update-service-specific-credential example changes the status for the credential of the specified user to Inactive.

```
aws iam update-service-specific-credential \ 
  --user-name sofia \ 
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \ 
  --status Inactive
```

This command produces no output.

For more information, see Create Git Credentials for HTTPS Connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see UpdateServiceSpecificCredential in AWS CLI Command Reference.
**update-signing-certificate**

The following code example shows how to use `update-signing-certificate`.

**AWS CLI**

**To activate or deactivate a signing certificate for an IAM user**

The following `update-signing-certificate` command deactivates the specified signing certificate for the IAM user named Bob.

```bash
aws iam update-signing-certificate \
  --certificate-id TA7SMP42TDN5Z260BPJE7EXAMPLE \
  --status Inactive \
  --user-name Bob
```

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see [Manage signing certificates](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-manage-signing-certificates.html) in the *Amazon EC2 User Guide*.

**update-ssh-public-key**

The following code example shows how to use `update-ssh-public-key`.

**AWS CLI**

**To change the status of an SSH public key**

The following `update-ssh-public-key` command changes the status of the specified public key to Inactive.

```bash
aws iam update-ssh-public-key \
  --user-name sofia \
  --ssh-public-key-id APKA1234567890EXAMPLE \
  --status Inactive
```

This command produces no output.

For more information, see [Use SSH keys and SSH with CodeCommit](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-ssh-ec2.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateSshPublicKey](https://docs.aws.amazon.com/cli/latest/reference/iam/update-ssh-public-key.html) in *AWS CLI Command Reference*.
**update-user**

The following code example shows how to use `update-user`.

**AWS CLI**

To change an IAM user's name

The following `update-user` command changes the name of the IAM user Bob to Robert.

```bash
aws iam update-user \
  --user-name Bob \
  --new-user-name Robert
```

This command produces no output.

For more information, see [Renaming an IAM user group](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_create_change_name.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateUser](https://docs.aws.amazon.com/cli/latest/reference/iam/update-user.html) in *AWS CLI Command Reference*.

**upload-server-certificate**

The following code example shows how to use `upload-server-certificate`.

**AWS CLI**

To upload a server certificate to your AWS account

The following `upload-server-certificate` command uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the certificate chain provided by the certificate authority (CA) is in the `my_certificate_chain_file.pem` file. When the file has finished uploading, it is available under the name `myServerCertificate`. Parameters that begin with `file://` tells the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```bash
aws iam upload-server-certificate \
  --server-certificate-name myServerCertificate \
  --certificate-body file://public_key_cert_file.pem \
  --private-key file://my_private_key.pem \
  --certificate-chain file://my_certificate_chain_file.pem
```
Output:

```json
{
    "ServerCertificateMetadata": {
        "Path": "/",
        "ServerCertificateName": "myServerCertificate",
        "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
        "UploadDate": "2019-04-22T21:13:44+00:00",
        "Expiration": "2019-10-15T22:23:16+00:00"
    }
}
```

For more information, see Creating, Uploading, and Deleting Server Certificates in the *Using IAM* guide.

- For API details, see [UploadServerCertificate](#) in *AWS CLI Command Reference*.

**upload-signing-certificate**

The following code example shows how to use `upload-signing-certificate`.

**AWS CLI**

**To upload a signing certificate for an IAM user**

The following `upload-signing-certificate` command uploads a signing certificate for the IAM user named Bob.

```bash
aws iam upload-signing-certificate \
    --user-name Bob \
    --certificate-body file://certificate.pem
```

Output:

```json
{
    "Certificate": {
        "UserName": "Bob",
        "Status": "Active",
        "CertificateBody": "-----BEGIN CERTIFICATE-----
<certificate-body>
-----END CERTIFICATE-----",
        "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
    }
}
```
The certificate is in a file named `certificate.pem` in PEM format.

For more information, see Creating and Uploading a User Signing Certificate in the `Using IAM` guide.

- For API details, see `UploadSigningCertificate` in `AWS CLI Command Reference`.

### upload-ssh-public-key

The following code example shows how to use `upload-ssh-public-key`.

**AWS CLI**

**To upload an SSH public key and associate it with a user**

The following `upload-ssh-public-key` command uploads the public key found in the file `sshkey.pub` and attaches it to the user sofia.

```
aws iam upload-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-body file://sshkey.pub
```

**Output:**

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA1234567890EXAMPLE",
        "SSHPublicKeyBody": "ssh-rsa <<long string generated by ssh-keygen command>>",
        "Status": "Active",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information about how to generate keys in a format suitable for this command, see [SSH and Linux, macOS, or Unix: Set up the public and private keys for Git and CodeCommit](#).
or SSH and Windows: Set up the public and private keys for Git and CodeCommit in the AWS CodeCommit User Guide.

- For API details, see UploadSshPublicKey in AWS CLI Command Reference.

IAM Access Analyzer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM Access Analyzer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

apply-archive-rule

The following code example shows how to use apply-archive-rule.

AWS CLI

To apply an archive rule to existing findings that meet the archive rule criteria

The following apply-archive-rule example applies an archive rule to existing findings that meet the archive rule criteria.

```bash
aws accessanalyzer apply-archive-rule \
    --rule-name MyArchiveRule
```
This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see ApplyArchiveRule in AWS CLI Command Reference.

cancel-policy-generation

The following code example shows how to use cancel-policy-generation.

**AWS CLI**

To cancel the requested policy generation

The following cancel-policy-generation example cancels the requested policy generation job id.

```bash
aws accessanalyzer cancel-policy-generation \
--job-id 923a56b0-ebb8-4e80-8a3c-a11ccfbc6f2
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

- For API details, see CancelPolicyGeneration in AWS CLI Command Reference.

check-access-not-granted

The following code example shows how to use check-access-not-granted.

**AWS CLI**

To check whether the specified access isn't allowed by a policy

The following check-access-not-granted example checks whether the specified access isn't allowed by a policy.

```bash
aws accessanalyzer check-access-not-granted \
--policy-document file://myfile.json \
--access actions="s3:DeleteBucket","s3:GetBucketLocation" \
--policy-type IDENTITY_POLICY
```

Contents of myfile.json:
Output:

```json
{
    "result": "PASS",
    "message": "The policy document does not grant access to perform the listed actions."
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see CheckAccessNotGranted in AWS CLI Command Reference.

**check-no-new-access**

The following code example shows how to use check-no-new-access.

**AWS CLI**

To check whether new access is allowed for an updated policy when compared to the existing policy

The following check-no-new-access example checks whether new access is allowed for an updated policy when compared to the existing policy.
aws accessanalyzer check-no-new-access \
   --existing-policy-document file://existing-policy.json \
   --new-policy-document file://new-policy.json \
   --policy-type IDENTITY_POLICY

Contents of existing-policy.json:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "s3:GetObject",
            "s3:ListBucket"
         ],
         "Resource": [
            "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
            "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
         ]
      }
   ]
}
```

Contents of new-policy.json:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "s3:GetObject",
            "s3:GetObjectAcl",
            "s3:ListBucket"
         ],
         "Resource": [
            "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
            "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
         ]
      }
   ]
}
```
Output:

```json
{
   "result": "FAIL",
   "message": "The modified permissions grant new access compared to your existing policy.",
   "reasons": [
      {
         "description": "New access in the statement with index: 0.",
         "statementIndex": 0
      }
   ]
}
```

For more information, see [Previewing access with IAM Access Analyzer APIs](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-access-analyzer-preview.html) in the AWS IAM User Guide.

**create-access-preview**

The following code example shows how to use `create-access-preview`.

**AWS CLI**

To create an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions

The following `create-access-preview` example creates an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions in your AWS account.

```
aws accessanalyzer create-access-preview \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
   --configurations file://myfile.json
```

Contents of `myfile.json`:

```json
{
   
```
"arn:aws:s3:::DOC-EXAMPLE-BUCKET": {  
  "s3Bucket": {  
  BUCKET/*"}]],"bucketPublicAccessBlock": {  
    "ignorePublicAcls": true,  
  },  
  "bucketAclGrants": [  
    {  
      "grantee": {  
        "id": "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"  
      },  
      "permission": "READ"  
    }  
  ]  
}  
}  

Output:

{
  "id": "3c65eb13-6ef9-4629-8919-a32043619e6b"
}

For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see CreateAccessPreview in AWS CLI Command Reference.

create-analyzer

The following code example shows how to use create-analyzer.

AWS CLI

To create an analyzer

The following create-analyzer example creates an analyzer in your AWS account.
aws accessanalyzer create-analyzer \
   --analyzer-name example \
   --type ACCOUNT

Output:

{   "arn": "arn:aws:access-analyzer:us-east-2:111122223333:analyzer/example"
}

For more information, see Getting started with AWS Identity and Access Management Access Analyzer findings in the AWS IAM User Guide.

• For API details, see CreateAnalyzer in AWS CLI Command Reference.

create-archive-rule

The following code example shows how to use create-archive-rule.

AWS CLI

To create an archive rule for the specified analyzer

The following create-archive-rule example creates an archive rule for the specified analyzer in your AWS account.

aws accessanalyzer create-archive-rule \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
   --rule-name MyRule \
   --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

• For API details, see CreateArchiveRule in AWS CLI Command Reference.

delete-analyzer

The following code example shows how to use delete-analyzer.
AWS CLI

To delete the specified analyzer

The following delete-analyzer example deletes the specified analyzer in your AWS account.

```bash
aws accessanalyzer delete-analyzer \
   --analyzer-name example
```

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see DeleteAnalyzer in AWS CLI Command Reference.

delete-archive-rule

The following code example shows how to use delete-archive-rule.

AWS CLI

To delete the specified archive rule

The following delete-archive-rule example deletes the specified archive rule in your AWS account.

```bash
aws accessanalyzer delete-archive-rule \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
   --rule-name MyRule
```

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.

- For API details, see DeleteArchiveRule in AWS CLI Command Reference.

get-access-preview

The following code example shows how to use get-access-preview.

AWS CLI

To retrieves information about an access preview for the specified analyzer
The following `get-access-preview` example retrieves information about an access preview for the specified analyzer in your AWS account.

```
aws accessanalyzer get-access-preview \
   --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
```

Output:

```json
{
   "accessPreview": {
      "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
      "createdAt": "2024-02-17T00:18:44+00:00",
      "status": "COMPLETED",
      "configurations": {
         "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
            "s3Bucket": {
            "bucketAclGrants": [
               {
                  "permission": "READ",
                  "grantee": {
                     "id": "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                  }
               }
            ],
            "bucketPublicAccessBlock": {
               "ignorePublicAcls": true,
               "restrictPublicBuckets": true
            }
         }
      }
   }
}
```
For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see GetAccessPreview in AWS CLI Command Reference.

get-analyzed-resource

The following code example shows how to use get-analyzed-resource.

**AWS CLI**

To retrieve information about a resource that was analyzed

The following get-analyzed-resource example retrieves information about a resource that was analyzed in your AWS account.

```
aws accessanalyzer get-analyzed-resource \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
  --resource-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET
```

Output:

```
{
  "resource": {
    "analyzedAt": "2024-02-15T18:01:53.002000+00:00",
    "isPublic": false,
    "resourceArn": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
    "resourceOwnerAccount": "111122223333",
    "resourceType": "AWS::S3::Bucket"
  }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see GetAnalyzedResource in AWS CLI Command Reference.

get-analyzer

The following code example shows how to use get-analyzer.
AWS CLI

To retrieve information about the specified analyzer

The following `get-analyzer` example retrieves information about the specified analyzer in your AWS account.

```bash
aws accessanalyzer get-analyzer \\
   --analyzer-name ConsoleAnalyzer-account
```

Output:

```
{
   "analyzer": {
      "createdAt": "2019-12-03T07:28:17+00:00",
      "lastResourceAnalyzedAt": "2024-02-15T18:01:53.003000+00:00",
      "name": "ConsoleAnalyzer-account",
      "status": "ACTIVE",
      "tags": {
         "auto-delete": "no"
      },
      "type": "ACCOUNT"
   }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see `GetAnalyzer` in AWS CLI Command Reference.

get-archive-rule

The following code example shows how to use `get-archive-rule`.

AWS CLI

To retrieve information about an archive rule

The following `get-archive-rule` example retrieves information about an archive rule in your AWS account.
aws accessanalyzer get-archive-rule
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
  --rule-name MyArchiveRule

Output:

```json
{
  "archiveRule": {
    "createdAt": "2024-02-15T00:49:27+00:00",
    "filter": {
      "resource": {
        "contains": [
          "Cognito"
        ]
      },
      "resourceType": {
        "eq": [
          "AWS::IAM::Role"
        ]
      }
    },
    "ruleName": "MyArchiveRule",
    "updatedAt": "2024-02-15T00:49:27+00:00"
  }
}
```

For more information, see [Archive rules](aws-iam-user-guide) in the *AWS IAM User Guide*.

- For API details, see [GetArchiveRule](aws-cli-command-reference) in *AWS CLI Command Reference*.

**get-finding-v2**

The following code example shows how to use get-finding-v2.

**AWS CLI**

*To retrieve information about the specified finding*

The following get-finding-v2 example retrieves information about the specified finding in your AWS account.

```bash
aws accessanalyzer get-finding-v2 \
```
Output:

```json
{
    "findingDetails": [
        {
            "externalAccessDetails": {
                "action": [
                    "sts:AssumeRoleWithWebIdentity"
                ],
                "condition": {
                    "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
                },
                "isPublic": false,
                "principal": {
                    "Federated": "cognito-identity.amazonaws.com"
                }
            }
        }
    ],
    "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
    "status": "ACTIVE",
    "error": null,
    "createdAt": "2021-02-26T21:17:50.905000+00:00",
    "resourceType": "AWS::IAM::Role",
    "findingType": "ExternalAccess",
    "resourceOwnerAccount": "111122223333",
    "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
    "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
    "updatedAt": "2021-02-26T21:17:50.905000+00:00"
}
```

For more information, see [Reviewing findings](https://docs.aws.amazon.com/IAM/latest/UserGuide/aclprincipal-policies.html) in the *AWS IAM User Guide*.

- For API details, see [GetFindingV2](https://docs.aws.amazon.com/cli/latest/reference/access-analyzer/get-finding.html) in *AWS CLI Command Reference*.

### get-finding

The following code example shows how to use `get-finding`.
AWS CLI

To retrieve information about the specified finding

The following `get-finding` example retrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-organization \ 
   --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```
{
   "finding": {
      "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
      "principal": {
         "Federated": "cognito-identity.amazonaws.com"
      },
      "action": [
         "sts:AssumeRoleWithWebIdentity"
      ],
      "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
      "isPublic": false,
      "resourceType": "AWS::IAM::Role",
      "condition": {
         "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
      },
      "createdAt": "2021-02-26T21:17:50.905000+00:00",
      "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
      "updatedAt": "2021-02-26T21:17:50.905000+00:00",
      "status": "ACTIVE",
      "resourceOwnerAccount": "111122223333"
   }
}
```

For more information, see [Reviewing findings](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-users-list-findings.html) in the *AWS IAM User Guide*.

- For API details, see [GetFinding](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/get-finding.html) in *AWS CLI Command Reference*. 
**get-generated-policy**

The following code example shows how to use `get-generated-policy`.

**AWS CLI**

To retrieve the policy that was generated using the `StartPolicyGeneration` API

The following `get-generated-policy` example retrieves the policy that was generated using the StartPolicyGeneration API in your AWS account.

```bash
aws accessanalyzer get-generated-policy \
   --job-id c557dc4a-0338-4489-95dd-739014860ff9
```

**Output:**

```json
{
   "generatedPolicyResult": {
      "generatedPolicies": [
      {
       "policy": "{"Version":"2012-10-17","Statement": [
       "Resource": "*"
      ]
   }
   
   "properties": {
      "cloudTrailProperties": {
       "endTime": "2024-02-14T22:44:40+00:00",
       "startTime": "2024-02-13T00:30:00+00:00",
       "trailProperties": [
       
       "allRegions": true,
      
```
For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

- For API details, see GetGeneratedPolicy in AWS CLI Command Reference.

list-access-preview-findings

The following code example shows how to use list-access-preview-findings.

AWS CLI

To retrieve a list of access preview findings generated by the specified access preview

The following list-access-preview-findings example retrieves a list of access preview findings generated by the specified access preview in your AWS account.

```bash
aws accessanalyzer list-access-preview-findings \
    --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
```

Output:

```
{
    "findings": [
```
For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see ListAccessPreviewFindings in AWS CLI Command Reference.

**list-access-previews**

The following code example shows how to use list-access-previews.

**AWS CLI**

To retrieve a list of access previews for the specified analyzer

The following list-access-previews example retrieves a list of access previews for the specified analyzer in your AWS account.

```
aws accessanalyzer list-access-previews \
```

Output:

```json
{
   "accessPreviews": [
      {
         "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
         "createdAt": "2024-02-17T00:18:44+00:00",
         "status": "COMPLETED"
      }
   ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the AWS IAM User Guide.

- For API details, see ListAccessPreviews in AWS CLI Command Reference.

### list-analyzed-resources

The following code example shows how to use list-analyzed-resources.

**AWS CLI**

**To list the available widgets**

The following list-analyzed-resources example lists the available widgets in your AWS account.

```bash
aws accessanalyzer list-analyzed-resources \
   --analyser-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
   --resource-type AWS::IAM::Role
```

Output:

```json
{
   "analyzedResources": [
   
   ]
}
```
The following code example shows how to use `list-analyzers`.

**AWS CLI**

**To retrieve a list of analyzers**

The following `list-analyzers` example retrieves a list of analyzers in your AWS account.

```bash
aws accessanalyzer list-analyzers
```

Output:

```json
{
}
```
"analyzers": [
    {
      "createdAt": "2024-02-15T00:46:40+00:00",
      "name": "UnusedAccess-ConsoleAnalyzer-organization",
      "status": "ACTIVE",
      "tags": {
        "auto-delete": "no"
      },
      "type": "ORGANIZATION_UNUSED_ACCESS"
    },
    {
      "createdAt": "2020-04-25T07:43:28+00:00",
      "lastResourceAnalyzed": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
      "lastResourceAnalyzedAt": "2024-02-15T21:51:56.517000+00:00",
      "name": "ConsoleAnalyzer-organization",
      "status": "ACTIVE",
      "tags": {
        "auto-delete": "no"
      },
      "type": "ORGANIZATION"
    },
    {
      "createdAt": "2019-12-03T07:28:17+00:00",

      "name": "ConsoleAnalyzer-account",
      "status": "ACTIVE",
      "tags": {
        "auto-delete": "no"
      },
      "type": "ACCOUNT"
    }
]
list-archive-rules

The following code example shows how to use list-archive-rules.

AWS CLI

To retrieve a list of archive rules created for the specified analyzer

The following list-archive-rules example retrieves a list of archive rules created for the specified analyzer in your AWS account.

```bash
aws accessanalyzer list-archive-rules \
   --analyzer-name UnusedAccess-ConsoleAnalyzer-organization
```

Output:

```json
{
   "archiveRules": [
      {
         "createdAt": "2024-02-15T00:49:27+00:00",
         "filter": {
            "resource": {
               "contains": [
                  "Cognito"
               ],
               "resourceType": {
                  "eq": [
                     "AWS::IAM::Role"
                  ]
               }
            },
            "resourceType": {
               "eq": [
                  "AWS::IAM::Role"
               ]
            }
         },
         "ruleName": "MyArchiveRule",
         "updatedAt": "2024-02-15T00:49:27+00:00"
      },
      {
         "createdAt": "2024-02-15T23:27:45+00:00",
         "filter": {
```
The following code example shows how to use list-findings-v2.

**AWS CLI**

To retrieve a list of findings generated by the specified analyzer

The following list-findings-v2 example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains Cognito.

```shell
aws accessanalyzer list-findings-v2 \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
   --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

Output:

```json
{
   "findings": [
      {
         "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
         "createdAt": "2021-02-26T21:17:24.710000+00:00",
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListArchiveRules in AWS CLI Command Reference.
For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListFindingsV2 in AWS CLI Command Reference.

**list-findings**

The following code example shows how to use list-findings.

**AWS CLI**

To retrieve a list of findings generated by the specified analyzer

The following list-findings example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains Cognito.

```bash
aws accessanalyzer list-findings \
   --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
```
Output:

```
{
   "findings": [  
   {
       "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
       "principal": {  
           "Federated": "cognito-identity.amazonaws.com"
       },
       "action": [  
           "sts:AssumeRoleWithWebIdentity"
       ],
       "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolUnauth_Role",
       "isPublic": false,
       "resourceType": "AWS::IAM::Role",
       "condition": {  
           "cognito-identity.amazonaws.com:aud": "us-west-2:EXAMPLE0-0000-0000-0000-000000000000"
       },

       "updatedAt": "2021-02-26T21:17:24.710000+00:00",
       "status": "ACTIVE",
       "resourceOwnerAccount": "111122223333"
   }
]
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see ListFindings in AWS CLI Command Reference.

### list-policy-generations

The following code example shows how to use list-policy-generations.

#### AWS CLI

**To list all of the policy generations requested in the last seven days**

The following list-policy-generations example lists all of the policy generations requested in the last seven days in your AWS account.

```bash
aws accessanalyzer list-policy-generations
```

**Output:**

```
{
    "policyGenerations": [
        {
            "completedOn": "2024-02-14T23:43:38+00:00",
            "jobId": "923a56b0-ebb8-4e80-8a3c-a11ccfbc0d6f2",
            "principalArn": "arn:aws:iam::111122223333:role/Admin",
            "startedOn": "2024-02-14T23:43:02+00:00",
            "status": "CANCELED"
        },
        {
            "completedOn": "2024-02-14T22:47:01+00:00",
            "jobId": "c557dc4a-0338-4e80-8a3c-a11ccfbc0d6f2",
            "principalArn": "arn:aws:iam::111122223333:role/Admin",
            "startedOn": "2024-02-14T22:47:01+00:00",
            "status": "CANCELED"
        }
    ]
}
```
For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

• For API details, see ListPolicyGenerations in AWS CLI Command Reference.

### list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To retrieve a list of tags applied to the specified resource

The following list-tags-for-resource example retrieves a list of tags applied to the specified resource in your AWS account.

```bash
aws accessanalyzer list-tags-for-resource \
```

Output:

```json
{
    "tags": {
        "Zone-of-trust": "Account",
        "Name": "ConsoleAnalyzer"
    }
}
```

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

• For API details, see ListTagsForResource in AWS CLI Command Reference.

### start-policy-generation

The following code example shows how to use start-policy-generation.

Actions and scenarios

3429
AWS CLI

To start a policy generation request

The following `start-policy-generation` example starts a policy generation request in your AWS account.

```bash
aws accessanalyzer start-policy-generation \\
   --policy-generation-details '{"principalArn":"arn:aws:iam::111122223333:role/Admin"}' \\
   --cloud-trail-details file://myfile.json
```

Contents of `myfile.json`:

```json
{
    "accessRole": "arn:aws:iam::111122223333:role/service-role/AccessAnalyzerMonitorServiceRole",
    "startTime": "2024-02-13T00:30:00Z",
    "trails": [
        {
            "allRegions": true,
        }
    ]
}
```

Output:

```json
{
    "jobId": "c557dc4a-0338-4489-95dd-739014860ff9"
}
```

For more information, see IAM Access Analyzer policy generation in the AWS IAM User Guide.

- For API details, see **StartPolicyGeneration** in AWS CLI Command Reference.

**start-resource-scan**

The following code example shows how to use `start-resource-scan`. 
AWS CLI

**To immediately start a scan of the policies applied to the specified resource**

The following `start-resource-scan` example immediately starts a scan of the policies applied to the specified resource in your AWS account.

```bash
aws accessanalyzer start-resource-scan \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/ConsoleAnalyzer-account \
  --resource-arn arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role
```

This command produces no output.

For more information, see [IAM Access Analyzer policy generation](https://docs.aws.amazon.com/iam/latest/userguide/accessanalyzer-policy-generation.html) in the *AWS IAM User Guide*.
- For API details, see [StartResourceScan](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/start-resource-scan.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to the specified resource**

The following `tag-resource` example adds a tag to the specified resource in your AWS account.

```bash
aws accessanalyzer tag-resource \
  --tags Environment=dev,Purpose=testing
```

This command produces no output.

For more information, see [Using AWS Identity and Access Management Access Analyzer](https://docs.aws.amazon.com/iam/latest/userguide/using-accessanalyzer.html) in the *AWS IAM User Guide*.
- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/tag-resource.html) in *AWS CLI Command Reference*.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from the specified resources

The following untag-resource example removes tags from the specified resource in your AWS account.

```bash
aws accessanalyzer untag-resource \
  --tag-keys Environment Purpose
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the AWS IAM User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-archive-rule

The following code example shows how to use update-archive-rule.

AWS CLI

To update the criteria and values for the specified archive rule

The following update-archive-rule example updates the criteria and values for the specified archive rule in your AWS account.

```bash
aws accessanalyzer update-archive-rule \
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
  --rule-name MyArchiveRule \
  --filter '{"resource": {"contains": ["Cognito"], "resourceType": {"eq": ["AWS::IAM::Role"]}}}'
```

This command produces no output.

For more information, see Archive rules in the AWS IAM User Guide.
For API details, see `UpdateArchiveRule` in *AWS CLI Command Reference*.

**update-findings**

The following code example shows how to use `update-findings`.

**AWS CLI**

To update the status for the specified findings

The following `update-findings` example updates the status for the specified findings in your AWS account.

```
aws accessanalyzer update-findings \
   --ids 4f319ac3-2e0c-4dc4-bf51-7013a086b6ae 780d586a-2cce-4f72-aff6-359d450e7500 \
   --status ARCHIVED
```

This command produces no output.

For more information, see *Using AWS Identity and Access Management Access Analyzer* in the *AWS IAM User Guide*.

For API details, see `UpdateFindings` in *AWS CLI Command Reference*.

**validate-policy**

The following code example shows how to use `validate-policy`.

**AWS CLI**

To request the validation of a policy and returns a list of findings

The following `validate-policy` example requests the validation of a policy and returns a list of findings. The policy in the example is a role trust policy for an Amazon Cognito role used for web identity federation. The findings generated from the trust policy relate to an empty Sid element value and a mismatched policy principal due to the incorrect assume role action being used, `sts:AssumeRole`. The correct assume role action for use with Cognito is `sts:AssumeRoleWithWebIdentity`. 
aws accessanalyzer validate-policy \
   --policy-document file://myfile.json \
   --policy-type RESOURCE_POLICY

Contents of myfile.json:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
                "Federated": "cognito-identity.amazonaws.com"
            },
            "Action": [
                "sts:AssumeRole",
                "sts:TagSession"
            ],
            "Condition": {
                "StringEquals": {
                    "cognito-identity.amazonaws.com:aud": "us-west-2_EXAMPLE"
                }
            }
        }
    ]
}
```

Output:

```json
{
    "findings": [
        {
            "findingDetails": "Add a value to the empty string in the Sid element."
        },
        {
            "findingDetails": "Add a value to the empty string in the Sid element."
        }
    ]
}
```
The sts:AssumeRole action is invalid with the following principal(s): cognito-identity.amazonaws.com. Use a SAML provider principal with the sts:AssumeRoleWithSAML action or use an OIDC provider principal with the sts:AssumeRoleWithWebIdentity action. Ensure the provider is Federated if you use either of the two options.

"findingDetails": "The sts:AssumeRole action is invalid with the following principal(s): cognito-identity.amazonaws.com. Use a SAML provider principal with the sts:AssumeRoleWithSAML action or use an OIDC provider principal with the sts:AssumeRoleWithWebIdentity action. Ensure the provider is Federated if you use either of the two options.",
"findingType": "ERROR",
"issueCode": "MISMATCHED_ACTION_FOR_PRINCIPAL",
"locations": [
  {
    "path": [
      {
        "value": "Statement"
      },
      {
        "index": 0
      }
    ]
  }
]
Actions and scenarios
The following actions: sts:TagSession are not supported by the condition key cognito-identity.amazonaws.com:aud. The condition will not be evaluated for these actions. We recommend that you move these actions to a different statement without this condition key.

学习更多有关支持的条件键的信息，请访问以下链接：
For more information, see Checks for validating policies in the AWS IAM User Guide.

- For API details, see ValidatePolicy in AWS CLI Command Reference.
Image Builder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Image Builder.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**create-component**

The following code example shows how to use `create-component`.

**AWS CLI**

To create a component

The following `create-component` example creates a component that uses a JSON document file and references a component document in YAML format that is uploaded to an Amazon S3 bucket.

```bash
aws imagebuilder create-component \
   --cli-input-json file://create-component.json
```

**Contents of create-component.json:**

```json
{
    "name": "MyExampleComponent",
    "semanticVersion": "2019.12.02",
    "description": "An example component that builds, validates and tests an image",
}
create-distribution-configuration

The following code example shows how to use create-distribution-configuration.

AWS CLI

To create a distribution configuration

The following create-distribution-configuration example creates a distribution configuration using a JSON file.

aws imagebuilder create-distribution-configuration \ 
   --cli-input-json file:/create-distribution-configuration.json

Contents of create-distribution-configuration.json:

```json
{
   "name": "MyExampleDistribution",
   "description": "Copies AMI to eu-west-1",
   "distributions": [
     {
       "region": "us-west-2",
       "amiDistributionConfiguration": {
```
"name": "Name {{imagebuilder:buildDate}}",
"description": "An example image name with parameter references",
"amiTags": {
    "KeyName": "{{ssm:parameter_name}}"
},
"launchPermission": {
    "userIds": [
        "123456789012"
    ]
}

{
    "region": "eu-west-1",
    "amiDistributionConfiguration": {
        "name": "My {{imagebuilder:buildVersion}} image {{imagebuilder:buildDate}}",
        "amiTags": {
            "KeyName": "Value"
        },
        "launchPermission": {
            "userIds": [
                "123456789012"
            ]
        }
    }
}
}

Output:

{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-configuration/myexampledistribution"
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateDistributionConfiguration in AWS CLI Command Reference.
create-image-pipeline

The following code example shows how to use create-image-pipeline.

AWS CLI

To create an image pipeline

The following create-image-pipeline example creates an image pipeline using a JSON file.

```bash
aws imagebuilder create-image-pipeline \
   --cli-input-json file://create-image-pipeline.json
```

Contents of `create-image-pipeline.json`:

```json
{
   "name": "MyWindows2016Pipeline",
   "description": "Builds Windows 2016 Images",
   "imageTestsConfiguration": {
     "imageTestsEnabled": true,
     "timeoutMinutes": 60
   },
   "schedule": {
     "scheduleExpression": "cron(0 0 * * SUN)",
     "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
   },
   "status": "ENABLED"
}
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImagePipeline in AWS CLI Command Reference.

create-image-recipe

The following code example shows how to use create-image-recipe.

AWS CLI

To create a recipe

The following create-image-recipe example creates an image recipe using a JSON file. Components are installed in the order in which they are specified.

```bash
aws imagebuilder create-image-recipe \
    --cli-input-json file://create-image-recipe.json
```

Contents of create-image-recipe.json:

```json
{
    "name": "MyBasicRecipe",
    "description": "This example image recipe creates a Windows 2016 image.",
    "semanticVersion": "2019.12.03",
    "components": [
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
        },
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
        }
    ],
    "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-server-2016-english-full-base-x86/xxxx.x.x"
}
```
Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImageRecipe in AWS CLI Command Reference.

**create-image**

The following code example shows how to use `create-image`.

**AWS CLI**

**To create an image**

The following create-image example creates an image.

```bash
aws imagebuilder create-image \
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImage in AWS CLI Command Reference.
create-infrastructure-configuration

The following code example shows how to use create-infrastructure-configuration.

AWS CLI

To create an infrastructure configuration

The following create-infrastructure-configuration example creates an infrastructure configuration using a JSON file.

```
aws imagebuilder create-infrastructure-configuration \
   --cli-input-json file://create-infrastructure-configuration.json
```

Contents of create-infrastructure-configuration.json:

```
{
   "name": "MyExampleInfrastructure",
   "description": "An example that will retain instances of failed builds",
   "instanceTypes": [
      "m5.large", "m5.xlarge"
   ],
   "instanceProfileName": "EC2InstanceProfileForImageBuilder",
   "securityGroupIds": [
      "sg-a1b2c3d4"
   ],
   "subnetId": "subnet-a1b2c3d4",
   "logging": {
      "s3Logs": {
         "s3BucketName": "bucket-name",
         "s3KeyPrefix": "bucket-path"
      }
   },
   "keyPair": "key-pair-name",
   "terminateInstanceOnFailure": false,
}
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE1111111",
```
"clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateInfrastructureConfiguration in AWS CLI Command Reference.

delete-component

The following code example shows how to use delete-component.

AWS CLI

To delete a component

The following delete-component example deletes a component build version by specifying its ARN.

```
aws imagebuilder delete-component \\
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteComponent in AWS CLI Command Reference.

delete-image-pipeline

The following code example shows how to use delete-image-pipeline.
AWS CLI

To delete an image pipeline

The following delete-image-pipeline example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-image-pipeline \
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteImagePipeline in AWS CLI Command Reference.

delete-image-recipe

The following code example shows how to use delete-image-recipe.

AWS CLI

To delete an image recipe

The following delete-image-recipe example deletes an image recipe by specifying its ARN.

```
aws imagebuilder delete-image-recipe \
```

Output:

```
{

```
The following code example shows how to use `delete-image`.

### AWS CLI

**To delete an image**

The following `delete-image` example deletes an image build version by specifying its ARN.

```bash
aws imagebuilder delete-image \
```

**Output:**

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/EC2/latest/UserGuide/imagebuilder-cli.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [DeleteImageRecipe](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/delete-image.html) in *AWS CLI Command Reference*.

---

### delete-infrastructure-configuration

The following code example shows how to use `delete-infrastructure-configuration`.

---

Actions and scenarios
AWS CLI

To delete an infrastructure configuration

The following delete-infrastructure-configuration example deletes an image pipeline by specifying its ARN.

```bash
aws imagebuilder delete-infrastructure-configuration \
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteInfrastructureConfiguration in AWS CLI Command Reference.

get-component-policy

The following code example shows how to use get-component-policy.

AWS CLI

To get component policy details

The following get-component-policy example lists the details of a component policy by specifying its ARN.

```bash
aws imagebuilder get-component-policy \
```

Output:

```json
{
}
```
"Policy": "\{
  "Version": "2012-10-17",
  "Statement": [  
    {  
      "Effect": "Allow",
      "Principal": {  
        "AWS": [  "123456789012"
      ],
      "Action": [  
        "imagebuilder:GetComponent",
        "imagebuilder:ListComponents"
      ],
      "Resource": [  
      ]
    }
  ]
}" 

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI <https://docs.aws.amazon.com/imagebuilder/latest/userguide/managing-image-builder-cli.html>`__ in the `EC2 Image Builder Users Guide`

  - For API details, see [GetComponentPolicy](#) in `AWS CLI Command Reference`.

get-component

The following code example shows how to use get-component.

AWS CLI

**To get component details**

The following get-component example lists the details of a component by specifying its ARN.

```bash
aws imagebuilder get-component \
  --component-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0/1
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "component": {
    "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0/1",
    "name": "component-name",
    "version": "1.0.0",
    "type": "TEST",
    "platform": "Linux",
    "owner": "123456789012",
    "data": "name: HelloWorldTestingDocument
description: This is hello world testing document.
schemaVersion: 1.0
phases:
  - name: test
    steps:
      - name: HelloWorldStep
        action: ExecuteBash
        inputs:
          commands:
            - echo "Hello World! Test."
```

Actions and scenarios 3450
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetComponent in AWS CLI Command Reference.

get-distribution-configuration

The following code example shows how to use get-distribution-configuration.

AWS CLI

To get the details of a distribution configuration

The following get-distribution-configuration example displays the details of a distribution configuration by specifying its ARN.

```bash
aws imagebuilder get-distribution-configuration \\
  --distribution-configuration-arn \\
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "distributionConfiguration": {
        "name": "MyExampleDistribution",
        "description": "Copies AMI to eu-west-1 and exports to S3",
        "distributions": [
            {
                "region": "us-west-2",
                "amiDistributionConfiguration": {
                    "name": "Name {{imagebuilder:buildDate}}",
                    "description": "An example image name with parameter references",
                }
            }
        ]
    }
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetDistributionConfiguration in AWS CLI Command Reference.

get-image-pipeline

The following code example shows how to use get-image-pipeline.

AWS CLI

To get image pipeline details
The following `get-image-pipeline` example lists the details of an image pipeline by specifying its ARN.

```
aws imagebuilder get-image-pipeline \
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipeline": {
        "name": "MyWindows2016Pipeline",
        "description": "Builds Windows 2016 Images",
        "platform": "Windows",
        "imageTestsConfiguration": {
            "imageTestsEnabled": true,
            "timeoutMinutes": 60
        },
        "schedule": {
            "scheduleExpression": "cron(0 0 * * SUN)",
            "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
        },
        "status": "ENABLED",
        "dateCreated": "2020-02-19T19:04:01.253Z",
        "dateUpdated": "2020-02-19T19:04:01.253Z",
        "tags": {}
    }
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/AWSEC2/UserGuide/ec2-image-builder-cli.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [GetImagePipeline](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/get-image-pipeline.html) in *AWS CLI Command Reference*.
get-image-policy

The following code example shows how to use get-image-policy.

AWS CLI

To get image policy details

The following get-image-policy example lists the details of an image policy by specifying its ARN.

```
aws imagebuilder get-image-policy \
```

Output:

```
{
    "Policy": 
    
    "Version": 
    "2012-10-17",
    "Statement": 
    [ 
        
        "Effect": 
        "Allow",
        
        "Principal": 
        { "AWS": 
        [ "123456789012" ] },
        
        "Action": 
        [ "imagebuilder:GetImage",
        
        "imagebuilder:ListImages" ],
        
        "Resource": 
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImagePolicy in AWS CLI Command Reference.

get-image-recipe-policy

The following code example shows how to use get-image-recipe-policy.

AWS CLI

To get image recipe policy details

The following get-image-recipe-policy example lists the details of an image recipe policy by specifying its ARN.

```
aws imagebuilder get-image-recipe-policy \
```

Actions and scenarios

Output:

```
{
   "Policy": {
       "Version": "2012-10-17",
       "Statement": [
           {
               "Effect": "Allow",
               "Principal": {
                   "AWS": [
                       "123456789012"
                   ]
               },
               "Action": [
                   "imagebuilder:GetImageRecipe",
                   "imagebuilder:ListImageRecipes"
               ],
               "Resource": [
               ]
           }
       ]
   }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImageRecipePolicy in AWS CLI Command Reference.

get-image

The following code example shows how to use get-image.

AWS CLI

To get image details

The following get-image example lists the details of an image by specifying its ARN.

```
aws imagebuilder get-image \
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "image": {
        "name": "MyBasicRecipe",
        "version": "2019.12.03/1",
        "platform": "Windows",
    }
}
```
"state": {
    "status": "BUILDING"
},

        "sg-a1b2c3d4"
    ],
    "subnetId": "subnet-a1b2c3d4",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"}},
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImage in AWS CLI Command Reference.

get-infrastructure-configuration

The following code example shows how to use get-infrastructure-configuration.

AWS CLI

To get infrastructure configuration details

The following get-infrastructure-configuration example lists the details of an infrastructure configuration by specifying its ARN.

```
aws imagebuilder get-infrastructure-configuration \
```

Output:

```
{
```

Actions and scenarios
import-component

The following code example shows how to use import-component.

AWS CLI

To import a component

The following import-component example imports a preexisting script using a JSON file.
aws imagebuilder import-component \
  --cli-input-json file://import-component.json

Contents of import-component.json:

```json
{
  "name": "MyImportedComponent",
  "semanticVersion": "1.0.0",
  "description": "An example of how to import a component",
  "changeDescription": "First commit message.",
  "format": "SHELL",
  "platform": "Windows",
  "type": "BUILD",
  "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
  "componentBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ImportComponent in AWS CLI Command Reference.

list-component-build-versions

The following code example shows how to use list-component-build-versions.

AWS CLI

To list component build versions

The following list-component-build-versions example lists the component build versions with a specific semantic version.
aws imagebuilder list-component-build-versions --component-version-arn

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentSummaryList": [
        {
            "name": "MyExampleComponent",
            "version": "2019.12.02",
            "platform": "Windows",
            "type": "BUILD",
            "owner": "123456789012",
            "description": "An example component that builds, validates and tests an image",
            "changeDescription": "Initial version.",
            "dateCreated": "2020-02-19T18:53:45.940Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListComponentBuildVersions in AWS CLI Command Reference.

list-components

The following code example shows how to use list-components.

AWS CLI

To list all of the component semantic versions
The following `list-components` example lists all of the component semantic versions to which you have access. You can optionally filter on whether to list components owned by you, by Amazon, or that have been shared with you by other accounts.

```
aws imagebuilder list-components
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentVersionList": [
    {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0",
        "name": "component-name",
        "version": "1.0.0",
        "platform": "Linux",
        "type": "TEST",
        "owner": "123456789012",
        "dateCreated": "2020-01-27T20:43:30.306Z"
    }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see `ListComponent` in AWS CLI Command Reference.

### list-distribution-configurations

The following code example shows how to use `list-distribution-configurations`.

**AWS CLI**

**To list distributions**

The following `list-distribution-configurations` example lists all of your distributions.

```
aws imagebuilder list-distribution-configurations
```

Output:

}```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListDistributionConfigurations in AWS CLI Command Reference.

**list-image-build-versions**

The following code example shows how to use list-image-build-versions.

**AWS CLI**

**To list image build versions**

The following list-image-build-versions example lists all of the image build versions with a semantic version.

```bash
aws imagebuilder list-image-build-versions \
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "imageSummaryList": [
      {
         "name": "MyExampleDistribution",
         "description": "Copies AMI to eu-west-1 and exports to S3",
         "dateCreated": "2020-02-19T18:40:10.529Z",
         "tags": {
            "KeyName": "KeyValue"
         }
      }
   ]
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/imagebuilder/latest/userguide/imagepipeline.html) in the [EC2 Image Builder Users Guide](https://docs.aws.amazon.com/imagebuilder/latest/userguide/).  

### list-image-pipeline-images

The following code example shows how to use `list-image-pipeline-images`.

#### AWS CLI

**To list image pipeline pipeline images**

The following `list-image-pipeline-images` example lists all images that were created by a specific image pipeline.

```bash
```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
  "imagePipelineList": [
    {
      "name": "MyWindows2016Pipeline",
      "description": "Builds Windows 2016 Images",
      "platform": "Windows",
      "imageTestsConfiguration": {
        "imageTestsEnabled": true,
        "timeoutMinutes": 60
      },
      "schedule": {
        "scheduleExpression": "cron(0 0 * * SUN)",
        "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
      },
      "status": "ENABLED",
      "dateCreated": "2020-02-19T19:04:01.253Z",
      "dateUpdated": "2020-02-19T19:04:01.253Z",
      "tags": {
        "KeyName": "KeyValue"
      }
    },
    {
      "name": "PipelineName",
      "platform": "Linux",
      "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/recipe-name-a1b2c3d45678/1.0.0",
      "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-configuration/infrastructureconfiguration-name-a1b2c3d45678",
      "imageTestsConfiguration": {
        "imageTestsEnabled": true,
      }
    }
  ]
}
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImagePipelineImages in AWS CLI Command Reference.

**list-image-recipes**

The following code example shows how to use `list-image-recipes`.

**AWS CLI**

To list image recipes

The following `list-image-recipes` example lists all of your image recipes.

```bash
aws imagebuilder list-image-recipes
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "imageRecipeSummaryList": [
    {
      "name": "MyBasicRecipe",
      "platform": "Windows",
      "owner": "123456789012",
    }
  ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImageRecipes in AWS CLI Command Reference.

list-images

The following code example shows how to use list-images.

AWS CLI

To list images

The following list-images example lists all of the semantic versions you have access to.

aws imagebuilder list-images

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImages in AWS CLI Command Reference.

list-infrastructure-configurations

The following code example shows how to use list-infrastructure-configurations.

AWS CLI

To list infrastructure configurations

The following list-infrastructure-configurations example lists all of your infrastructure configurations.

```sh/aws imagebuilder list-infrastructure-configurations
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "infrastructureConfigurationSummaryList": [
      {
         "name": "MyExampleInfrastructure",
         "description": "An example that will retain instances of failed builds",
      }
   ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListInfrastructureConfigurations in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a specific resource**

The following list-tags-for-resource example lists all of the tags for a specific resource.

```bash
aws imagebuilder list-tags-for-resource \
```

Output:

```json
{
    "tags": {
        "KeyName": "KeyValue"
    }
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**put-component-policy**

The following code example shows how to use put-component-policy.

**AWS CLI**

To apply a resource policy to a component

The following put-component-policy command applies a resource policy to a build component to enable cross-account sharing of build components. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-component-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-component-policy \
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutComponentPolicy in AWS CLI Command Reference.
**put-image-policy**

The following code example shows how to use `put-image-policy`.

**AWS CLI**

**To apply a resource policy to an image**

The following `put-image-policy` command applies a resource policy to an image to enable cross-account sharing of images. We recommend you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```bash
aws imagebuilder put-image-policy
```

**Output:**

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "imageArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1"
}
```

**put-image-recipe-policy**

The following code example shows how to use `put-image-recipe-policy`.

**AWS CLI**

**To apply a resource policy to an image recipe**
The following `put-image-recipe-policy` command applies a resource policy to an image recipe to enable cross-account sharing of image recipes. We recommend that you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-recipe-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-recipe-policy
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/example-image-recipe/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see `PutImageRecipePolicy` in AWS CLI Command Reference.

**start-image-pipeline-execution**

The following code example shows how to use `start-image-pipeline-execution`.

**AWS CLI**

To start an image pipeline manually

The following `start-image-pipeline-execution` example manually starts an image pipeline.

```
aws imagebuilder start-image-pipeline-execution
```
Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/imagebuilder/latest/userguide/setting-up-managing-ec2-image-builder-pipeline-cli.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [StartImagePipelineExecution](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/start-image-pipeline-execution.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

To tag a resource

The following `tag-resource` example adds and tags a resource to EC2 Image Builder using a JSON file.

```
aws imagebuilder tag-resource \
  --cli-input-json file://tag-resource.json
```

Contents of `tag-resource.json`:

```json
{
  "tags": {
    "KeyName": "KeyValue"
  }
}
```
This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource

The following untag-resource example removes a tag from a resource using a JSON file.

```
aws imagebuilder untag-resource 
--cli-input-json file://tag-resource.json
```

Contents of untag-resource.json:

```
{
  "tagKeys": [
    "KeyName"
  ]
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-distribution-configuration

The following code example shows how to use update-distribution-configuration.
AWS CLI

To update a distribution configuration

The following update-distribution-configuration example updates a distribution configuration using a JSON file.

```
aws imagebuilder update-distribution-configuration \
   --cli-input-json file://update-distribution-configuration.json
```

Contents of update-distribution-configuration.json:

```json
{
    "description": "Copies AMI to eu-west-2 and exports to S3",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references"
            }
        },
        {
            "region": "eu-west-2",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image {{imagebuilder:buildDate}}"
            }
        }
    ]
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.
• For API details, see UpdateDistributionConfiguration in AWS CLI Command Reference.

update-image-pipeline

The following code example shows how to use update-image-pipeline.

AWS CLI

To update an image pipeline

The following update-image-pipeline example updates an image pipeline using a JSON file.

```bash
aws imagebuilder update-image-pipeline \
    --cli-input-json file://update-image-pipeline.json
```

Contents of update-image-pipeline.json:

```json
{
    "imageTestsConfiguration": {
        "imageTestsEnabled": true,
        "timeoutMinutes": 120
    },
    "schedule": {
        "scheduleExpression": "cron(0 0 * * MON)",
        "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "DISABLED"
}
```

Output:

```json
{
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UpdateImagePipeline in AWS CLI Command Reference.

update-infrastructure-configuration

The following code example shows how to use update-infrastructure-configuration.

AWS CLI

To update an infrastructure configuration

The following update-infrastructure-configuration example updates an infrastructure configuration using a JSON file.

```
aws imagebuilder update-infrastructure-configuration \
--cli-input-json file:/update-infrastructure-configuration.json
```

Contents of update-infrastructure-configuration.json:

```json
{
    "description": "An example that will terminate instances of failed builds",
    "instanceTypes": [
        "m5.large",
        "m5.2xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageFactory",
    "securityGroupIds": [
        "sg-a48c95ef"
    ],
    "subnetId": "subnet-a48c95ef",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "terminateInstanceOnFailure": true,
```
"snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name"
}

Output:

{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UpdateInfrastructureConfiguration in AWS CLI Command Reference.

Incident Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

create-replication-set

The following code example shows how to use create-replication-set.

AWS CLI

To create the replication set
The following `create-replication-set` example creates the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account. This example uses the us-east-1 and us-east-2 Regions while creating the replication set.

```bash
aws ssm-incidents create-replication-set \
   --regions '{"us-east-1": {"sseKmsKeyId": "arn:aws:kms:us-east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}, "us-east-2": {"sseKmsKeyId": "arn:aws:kms:us-east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}}'
```

Output:

```json
{
   "replicationSetArns": [
      "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
   ]
}
```

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see CreateReplicationSet in AWS CLI Command Reference.

**create-response-plan**

The following code example shows how to use `create-response-plan`.

**AWS CLI**

**To create a response plan**

The following `create-response-plan` example creates a response plan with the specified details.

```bash
aws ssm-incidents create-response-plan \
   --chat-channel '{"chatbotSns": ["arn:aws:sns:us-east-1:111122223333:Standard_User"]}' \
   --display-name "Example response plan" \
   --incident-template '{"impact": 5, "title": "example-incident"}' \
   --name "example-response"
```
--actions '[["ssmAutomation": {"documentName": "AWSIncidents-CriticalIncidentRunbookTemplate", "documentVersion": "$DEFAULT", "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm- incidents.amazonaws.com/AWSServiceRoleForIncidentManager", "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"}],"engagements '"]'

Output:

```json
{
  "arn": "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
}
```

For more information, see Incident preparation in the Incident Manager User Guide.

- For API details, see CreateResponsePlan in AWS CLI Command Reference.

create-timeline-event

The following code example shows how to use create-timeline-event.

AWS CLI

Example 1: To create a custom timeline event

The following create-timeline-event example creates a custom timeline event at the specified time on the specified incident.

```bash
aws ssm-incidents create-timeline-event \
  --event-data "\"example timeline event\"" \
  --event-time 2022-10-01T20:30:00.000 \
  --event-type "Custom Event" \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

Output:

```json
{
  "eventId": "c0bcc885-a41d-eb01-b4ab-9d2deEXAMPLE",
  "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```
Example 2: To create a timeline event with an incident note

The following create-timeline-event example creates a timeline event that is listed in the 'Incident notes' panel.

```
aws ssm-incidents create-timeline-event \
   --event-data ""New Note"" "\n   --event-type "Note" "\n   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE" "\n   --event-time 2023-06-20T12:06:00.000 "\n   --event-references '[["resource":"arn:aws:ssm-incidents::111122223333:incident-record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE"}]
```

Output:

```json
{
   "eventId": "a41dc885-c0bc-b4ab-eb01-de9d2EXAMPLE",
   "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
}
```

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [CreateTimelineEvent](#) in *AWS CLI Command Reference*.

delete-incident-record

The following code example shows how to use delete-incident-record.

**AWS CLI**

**To delete an incident record**

The following delete-incident-record example deletes the specified incident record.

```
aws ssm-incidents delete-incident-record \
   --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```
This command produces no output.

For more information, see Incident tracking in the Incident Manager User Guide.

- For API details, see DeleteIncidentRecord in AWS CLI Command Reference.

delete-replication-set

The following code example shows how to use delete-replication-set.

AWS CLI

To delete the replication set

The following delete-replication-set example deletes the replication set from your Amazon Web Services account. Deleting the replication set also deletes all Incident Manager data. This can't be undone.

```
aws ssm-incidents delete-replication-set \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see DeleteReplicationSet in AWS CLI Command Reference.

delete-resource-policy

The following code example shows how to use delete-resource-policy.

AWS CLI

To delete a resource policy

The following delete-resource-policy example deletes a resource policy from a response plan. This will revoke access from the principal or organization that the response plan was shared with.

```
aws ssm-incidents delete-resource-policy \
```
--policy-id "be8b57191f0371f1c6827341aa3f0a03" \\
--resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"

This command produces no output.

For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

- For API details, see DeleteResourcePolicy in AWS CLI Command Reference.

delete-response-plan

The following code example shows how to use delete-response-plan.

AWS CLI

To delete a response plan

The following delete-response-plan example deletes the specified response plan.

```
aws ssm-incidents delete-response-plan \\
--arn "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
```

This command produces no output.

For more information, see Incident preparation in the Incident Manager User Guide.

- For API details, see DeleteResponsePlan in AWS CLI Command Reference.

delete-timeline-event

The following code example shows how to use delete-timeline-event.

AWS CLI

To delete a timeline event

The following delete-timeline-event example deletes a custom timeline event from the specified incident record.

```
aws ssm-incidents delete-timeline-event \\
--event-id "c0bcc885-a41d-eb01-b4ab-9d2de193643c"
```
This command produces no output.

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see DeleteTimelineEvent in AWS CLI Command Reference.

get-incident-record

The following code example shows how to use get-incident-record.

AWS CLI

To get an incident record

The following get-incident-record example gets details about the specified incident record.

```bash
aws ssm-incidents get-incident-record \
   --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```json
{
   "incidentRecord": {
      "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
      "automationExecutions": [],
      "creationTime": "2021-05-21T18:16:57.579000+00:00",
      "dedupeString": "c4bcc812-85e7-938d-2b78-17181176ee1a",
      "impact": 5,
      "incidentRecordSource": {
         "createdBy": "arn:aws:iam::111122223333:user/draliatp",
         "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
         "source": "aws.ssm-incidents.custom"
      },
      "lastModifiedBy": "arn:aws:iam::111122223333:user/draliatp",
      "lastModifiedTime": "2021-05-21T18:16:59.149000+00:00",
      "notificationTargets": [],
      "status": "OPEN",
   }
}
```
For more information, see Incident details in the Incident Manager User Guide.

- For API details, see GetIncidentRecord in AWS CLI Command Reference.

get-replication-set

The following code example shows how to use get-replication-set.

AWS CLI

To get the replication set

The following get-replication-set example gets the details of the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account.

```
aws ssm-incidents get-replication-set \\
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
```

Output:

```
{
   "replicationSet": {
      "createdBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
      "createdTime": "2021-05-14T17:57:22.010000+00:00",
      "deletionProtected": false,
      "lastModifiedBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
      "lastModifiedTime": "2021-05-14T17:57:22.010000+00:00",
      "regionMap": {
         "us-east-1": {
            "sseKmsKeyId": "DefaultKey",
            "status": "ACTIVE"
         },
         "us-east-2": {
            "sseKmsKeyId": "DefaultKey",
            "status": "ACTIVE",
            "statusMessage": "Tagging inaccessible"
         }
      }
   }
}
```
For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see GetReplicationSet in AWS CLI Command Reference.

get-resource-policies

The following code example shows how to use get-resource-policies.

AWS CLI

To list resource policies for a response plan

The following command-name example lists the resource policies associated with the specified response plan.

```bash
aws ssm-incidents get-resource-policies \
   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```json
{
   "resourcePolicies": [ 
   {
   }
   ]
}
```
For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

- For API details, see GetResourcePolicies in AWS CLI Command Reference.

**get-response-plan**

The following code example shows how to use get-response-plan.

**AWS CLI**

To get details of a response plan

The following command-name example gets details about a specified response plan in your AWS account.

```bash
aws ssm-incidents get-response-plan \
  --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```json
{
  "actions": [
    {
      "ssmAutomation": {
        "documentName": "AWSIncidents-CriticalIncidentRunbookTemplate",
        "documentVersion": "$DEFAULT",
        "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-incidents.amazonaws.com/AWSServiceRoleForIncidentManager",
        "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"
      }
    },
    {
      "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
      "chatChannel": {
        "chatbotSns": [
        ]
      }
    }
  ],
  "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
}
```
For more information, see Incident preparation in the Incident Manager User Guide.

- For API details, see GetResponsePlan in AWS CLI Command Reference.

get-timeline-event

The following code example shows how to use get-timeline-event.

AWS CLI

To get details of a timeline event

The following get-timeline-event example returns details of the specified timeline event.

```bash
aws ssm-incidents get-timeline-event \
--event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \
--incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "event": {
        "eventData": "Incident Started",
        "eventId": "20bcc812-8a94-4cd7-520c-0ff742111424",
        "eventTime": "2021-05-21T18:16:57+00:00",
        "eventType": "Custom Event",
        "eventUpdatedTime": "2021-05-21T18:16:59.944000+00:00",
        "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
    }
}
```
For more information, see Incident details in the Incident Manager User Guide.

- For API details, see GetTimelineEvent in AWS CLI Command Reference.

**list-incident-records**

The following code example shows how to use list-incident-records.

**AWS CLI**

**To list incident records**

The following command-name example lists the incident records in your Amazon Web Services account.

```
aws ssm-incidents list-incident-records
```

Output:

```json
{
   "incidentRecordSummaries": [
      {
         "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
         "creationTime": "2021-05-21T18:16:57.579000+00:00",
         "impact": 5,
         "incidentRecordSource": {
            "createdBy": "arn:aws:iam::111122223333:user/draliatp",
            "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
            "source": "aws.ssm-incidents.custom"
         },
         "status": "OPEN",
         "title": "Example-Incident"
      }
   ]
}
```

For more information, see Incident list in the Incident Manager User Guide.

- For API details, see ListIncidentRecords in AWS CLI Command Reference.
list-related-items

The following code example shows how to use list-related-items.

AWS CLI

**To list related items**

The following `list-related-items` example lists the related items of the specified incident.

```bash
aws ssm-incidents list-related-items \\
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```json
{
   "relatedItems": [
   {
      "identifier": {
         "type": "OTHER",
         "value": {
            "url": "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?region=us-east-1"
         }
      },
      "title": "Example related item"
   },
   {
      "identifier": {
         "type": "PARENT",
         "value": {
            "arn": "arn:aws:ssm:us-east-1:111122223333:opsitem/oi-8084126392ac"
         }
      },
      "title": "parentItem"
   }
   ]
}
```

For more information, see [Incident details](https://aws.amazon.com/documentation/systemsmanager/incident-ref/) in the *Incident Manager User Guide*. 
list-replication-sets

The following code example shows how to use list-replication-sets.

AWS CLI

To list the replication set

The following list-replication-set example lists the replication set Incident Manager uses to replicate and encrypt data in your AWS account.

```bash
aws ssm-incidents list-replication-sets
```

Output:

```
{
  "replicationSetArns": [
    "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
  ]
}
```

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

• For API details, see ListReplicationSets in AWS CLI Command Reference.

list-response-plans

The following code example shows how to use list-response-plans.

AWS CLI

To list the available response plans

The following list-response-plans example lists the available response plans in your Amazon Web Services account.

```bash
aws ssm-incidents list-response-plans
```
Output:

```json
{
   "responsePlanSummaries": [
      {
         "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
         "displayName": "Example response plan",
         "name": "Example-Response-Plan"
      }
   ]
}
```

For more information, see Incident preparation in the Incident Manager User Guide.

- For API details, see ListResponsePlans in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a response plan

The following list-tags-for-resource example lists the tags associated with the specified response plan.

```bash
aws ssm-incidents list-tags-for-resource \
  --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```json
{
   "tags": {
      "group1": "1"
   }
}
```

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.
list-timeline-events

The following code example shows how to use list-timeline-events.

AWS CLI

To list timeline events of an incident

The following command-name example lists the timeline events of the specified incident.

aws ssm-incidents list-timeline-events \
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"

Output:

```json
{
    "eventSummaries": [ 
        {
            "eventId": "8cbcc889-35e1-a42d-2429-d6f100799915",
            "eventTime": "2021-05-21T22:36:13.766000+00:00",
            "eventType": "SSM Incident Record Update",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
            "eventId": "a2bcc825-aab5-1787-c605-f9bb2640d85b",
            "eventTime": "2021-05-21T18:58:46.443000+00:00",
            "eventType": "SSM Incident Record Update",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
            "eventId": "5abcc812-89c0-405e-4065-8d2b14d29b92",
            "eventTime": "2021-05-21T18:16:59.149000+00:00",
            "eventType": "SSM Incident Record Update",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        }]
```
put-resource-policy

The following code example shows how to use put-resource-policy.

AWS CLI

To share a response plan and incidents

The following command-name example adds a resource policy to the Example-Response-Plan that shares the response plan and associated incidents with the specified principal.

```bash
aws ssm-incidents put-resource-policy \
   --resource-arn "arn:aws:ssm-incidents::11112223333:response-plan/Example-Response-Plan"
```

Output:

```
{  "policyId": "be8b57191f0371f1c6827341aa3f0a03"
}
```

For more information, see [Working with shared contacts and response plans](https://docs.aws.amazon.com/incidentmanager/latest/userguide/working-shared-contacts-response-plans.html) in the *Incident Manager User Guide*.

### start-incident

The following code example shows how to use `start-incident`.

**AWS CLI**

**To start an incident**

The following `start-incident` example starts an incident using the specified response plan.

```bash
aws ssm-incidents start-incident
```

Output:

```
{
   "incidentRecordArn": "arn:aws:ssm-incidents::682428703967:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
}
```
For more information, see Incident creation in the Incident Manager User Guide.

- For API details, see StartIncident in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To tag a response plan

The following tag-resource example tags a specified response plan with the provided tag key-value pair.

```bash
aws ssm-incidents tag-resource
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
    --tags '{"group1":"1"}'
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

To remove tags from a response plan

The following untag-resource example removes the specified tags from the response plan.

```bash
aws ssm-incidents untag-resource
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```
update-deletion-protection

The following code example shows how to use update-deletion-protection.

AWS CLI

To update replication set deletion protection

The following update-deletion-protection example updates the deletion protection in your account to protect you from deleting the last Region in your replication set.

```
aws ssm-incidents update-deletion-protection \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/a2bcc5c9-0f53-8047-7fef-c20749989b40" \
   --deletion-protected
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see UpdateDeletionProtection in AWS CLI Command Reference.

update-incident-record

The following code example shows how to use update-incident-record.

AWS CLI

To update an incident record

The following command-name example resolves the specified incident.

```
aws ssm-incidents update-incident-record \
```
Attachment
--arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
--status "RESOLVED"

This command produces no output.

For more information, see Incident details in the Incident Manager User Guide.
- For API details, see UpdateIncidentRecord in AWS CLI Command Reference.

update-related-items

The following code example shows how to use update-related-items.

AWS CLI

To update an incidents related item

The following update-related-item example removes a related item from the specified incident record.

```
aws ssm-incidents update-related-items \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
  --related-items-update '{"itemToRemove": {"type": "OTHER", "value": {"url": "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?region=us-east-1"}}}'
```

This command produces no output.

For more information, see Incident details in the Incident Manager User Guide.
- For API details, see UpdateRelatedItems in AWS CLI Command Reference.

update-replication-set

The following code example shows how to use update-replication-set.

AWS CLI

To update a replication set

The following command-name example deletes the us-east-2 Region from the replication set.
aws ssm-incidents update-replication-set \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/a2bcc5c9-0f53-8047-7fef-c20749989b40" \
   --actions '[["deleteRegionAction": {"regionName": "us-east-2"}]]'

This command produces no output.

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see UpdateReplicationSet in AWS CLI Command Reference.

update-response-plan

The following code example shows how to use update-response-plan.

AWS CLI

**To update a response plan**

The following update-response-plan example removes a chat channel from the specified response plan.

aws ssm-incidents update-response-plan \
   --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \
   --chat-channel '{"empty":{}}'

This command produces no output.

For more information, see Incident preparation in the Incident Manager User Guide.

- For API details, see UpdateResponsePlan in AWS CLI Command Reference.

update-timeline-event

The following code example shows how to use update-timeline-event.

AWS CLI

**To update a timeline event**
The following update-timeline-event example updates the time that the event occurred.

```bash
aws ssm-incidents update-timeline-event \
  --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
  --event-time "2021-05-21T18:10:57+00:00"
```

This command produces no output.

For more information, see Incident details in the Incident Manager User Guide.
- For API details, see UpdateTimelineEvent in AWS CLI Command Reference.

Incident Manager Contacts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager Contacts.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

accept-page

The following code example shows how to use accept-page.

AWS CLI

To accept a page during and engagement
The following accept-page example uses an accept code sent to the contact channel to accept a page.

```bash
aws ssm-contacts accept-page \
  --page-id "arn:aws:ssm-contacts:us-east-2:682428703967:page/akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3" \
  --accept-type READ \
  --accept-code 425440
```

This command produces no output

For more information, see [Contacts](#) in the [*Incident Manager User Guide*](#).

- For API details, see [AcceptPage](#) in [*AWS CLI Command Reference*](#).

### activate-contact-channel

The following code example shows how to use `activate-contact-channel`.

**AWS CLI**

**Activate a contact's contact channel**

The following `activate-contact-channel` example activates a contact channel and makes it usable as part of an incident.

```bash
aws ssm-contacts activate-contact-channel \
  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d" \
  --activation-code "466136"
```

This command produces no output.

For more information, see [Contacts](#) in the [*Incident Manager User Guide*](#).

- For API details, see [ActivateContactChannel](#) in [*AWS CLI Command Reference*](#).

### command-name

The following code example shows how to use `command-name`.
AWS CLI

**To delete a contact**

The following command-name example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```bash
aws ssm-contacts delete-contact \
  --contact-id "arn:aws:ssm-contacts:us-east-1:682428703967:contact/alejr"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [CommandName](#) in *AWS CLI Command Reference*.

**create-contact-channel**

The following code example shows how to use create-contact-channel.

**AWS CLI**

**To create a contact channel**

Creates a contact channel of type SMS for the contact Akua Mansa. Contact channels can be created of type SMS, EMAIL, or VOICE.

```bash
aws ssm-contacts create-contact-channel \
  --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
  --name "akuas sms-test" \
  --type SMS \
  --delivery-address '{"SimpleAddress": "+15005550199"}'
```

Output:

```json
{
  "ContactChannelArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/02f506b9-ea5d-4764-af89-2daa793ff024"
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [CreateContactChannel](#) in *AWS CLI Command Reference*. 
create-contact

The following code example shows how to use create-contact.

AWS CLI

To create a contact

The following create-contact example creates a contact in your environment with a blank plan. The plan can be updated after creating contact channels. Use the create-contact-channel command with the output ARN of this command. After you have created contact channels for this contact use update-contact to update the plan.

```
aws ssm-contacts create-contact \
  --alias "akuam" \
  --display-name "Akua Mansa" \
  --type PERSONAL \
  --plan '{"Stages": []}"
```

Output:

```
{
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
}
```

For more information, see Contacts in the Incident Manager User Guide.
• For API details, see CreateContact in AWS CLI Command Reference.

deactivate-contact-channel

The following code example shows how to use deactivate-contact-channel.

AWS CLI

To deactivate a contact channel

The following deactivate-contact-channel example deactivates a contact channel. Deactivating a contact channel means the contact channel will no longer be paged during an incident. You can also reactivate a contact channel at any time using the activate-contact-channel command.
This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.
• For API details, see DeactivateContactChannel in AWS CLI Command Reference.

delete-contact-channel

The following code example shows how to use delete-contact-channel.

AWS CLI

To delete a contact channel

The following delete-contact-channel example deletes a contact channel. Deleting a contact channel ensures the contact channel will not be paged during an incident.

```
aws ssm-contacts delete-contact-channel \
   --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/13149bad-52ee-45ea-ae1e-45857f78f9b2"
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.
• For API details, see DeleteContactChannel in AWS CLI Command Reference.

delete-contact

The following code example shows how to use delete-contact.

AWS CLI

To delete a contact

The following delete-contact example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.
aws ssm-contacts delete-contact \
   --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/alejr"

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see DeleteContact in AWS CLI Command Reference.

describe-engagement

The following code example shows how to use describe-engagement.

AWS CLI

To describe the details of an engagement

The following describe-engagement example lists the details of an engagement to a contact or escalation plan. The subject and content are sent to the contact channels.

aws ssm-contacts describe-engagement \
   --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"

Output:

{
   "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation",
   "Sender": "cli",
   "Subject": "cli-test",
   "Content": "Testing engagements via CLI",
   "PublicSubject": "cli-test",
   "PublicContent": "Testing engagements via CLI",
   "StartTime": "2021-05-18T18:25:41.151000+00:00"
}

For more information, see Contacts in the Incident Manager User Guide.
For API details, see **DescribeEngagement** in *AWS CLI Command Reference*.

### describe-page

The following code example shows how to use describe-page.

**AWS CLI**

**To list the details of a page to a contact channel**

The following `describe-page` example lists details of a page to a contact channel. The page will include the subject and content provided.

```bash
aws ssm-contacts describe-page \
```

**Output:**

```json
{
   "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
   "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
   "Sender": "cli",
   "Subject": "cli-test",
   "Content": "Testing engagements via CLI",
   "PublicSubject": "cli-test",
   "PublicContent": "Testing engagements via CLI",
   "SentTime": "2021-05-18T18:43:29.301000+00:00",
   "ReadTime": "2021-05-18T18:43:55.708000+00:00",
   "DeliveryTime": "2021-05-18T18:43:55.265000+00:00"
}
```

For more information, see **Contacts** in the *Incident Manager User Guide*.

- For API details, see **DescribePage** in *AWS CLI Command Reference*.

### get-contact-channel

The following code example shows how to use get-contact-channel.
AWS CLI

To list the details of a contact channel

The following `get-contact-channel` example lists the details of a contact channel.

```
aws ssm-contacts get-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
    "Name": "akuas sms",
    "Type": "SMS",
    "DeliveryAddress": {
        "SimpleAddress": "+15005550199"
    },
    "ActivationStatus": "ACTIVATED"
}
```

For more information, see [Contacts](#) in the [Incident Manager User Guide](#).

- For API details, see [GetContactChannel](#) in [AWS CLI Command Reference](#).

get-contact-policy

The following code example shows how to use `get-contact-policy`.

AWS CLI

To list the resource policies of a contact

The following `get-contact-policy` example lists the resource policies associated with the specified contact.

```
aws ssm-contacts get-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:
For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

- For API details, see GetContactPolicy in AWS CLI Command Reference.

get-contact

The following code example shows how to use get-contact.

AWS CLI

**Example 1: To describe a contact plan**

The following get-contact example describes a contact.

```bash
aws ssm-contacts get-contact \
   --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```json
{
   "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
   "Alias": "akuam",
   "DisplayName": "Akua Mansa",
   "Type": "PERSONAL",
   "Plan": {
      "Stages": [
         {
            "DurationInMinutes": 5,
            "Targets": [
               {
```
```
Example 2: To describe an escalation plan

The following `get-contact` example describes an escalation plan.

```
aws ssm-contacts get-contact \
--contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation"
```
Output:

```json
{
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation",
  "Alias": "example_escalation",
  "DisplayName": "Example Escalation",
  "Type": "ESCALATION",
  "Plan": {
    "Stages": [
    {
      "DurationInMinutes": 5,
      "Targets": [
        {
          "ContactTargetInfo": {
            "ContactId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
            "IsEssential": true
          }
        }
      ]
    },
    {
      "DurationInMinutes": 5,
      "Targets": [
        {
          "ContactTargetInfo": {
            "ContactId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/alejr",
            "IsEssential": false
          }
        }
      ]
    },
    {
      "DurationInMinutes": 0,
      "Targets": [
        {
          "ContactTargetInfo": {
            "ContactId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/anasi",
            "IsEssential": false
          }
        }
      ]
    }
  ]
}
```
list-contact-channels

The following code example shows how to use list-contact-channels.

AWS CLI

To list the contact channels of a contact

The following list-contact-channels example lists the available contact channels of the specified contact.

```
aws ssm-contacts list-contact-channels \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
    [
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
            "Name": "akuas email",
            "Type": "EMAIL",
            "DeliveryAddress": {
                "SimpleAddress": "akuam@example.com"
            },
            "ActivationStatus": "NOT_ACTIVATED"
        },
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
        }
    ]
}
```
For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListContactChannels](#) in *AWS CLI Command Reference*.

### list-contacts

The following code example shows how to use list-contacts.

#### AWS CLI

**To list all escalation plans and contacts**

The following list-contacts example lists the contacts and escalation plans in your account.

```
aws ssm-contacts list-contacts
```

**Output:**

```json
{
    "Contacts": [
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
            "Alias": "akuam",
            "DisplayName": "Akua Mansa",
            "Type": "PERSONAL"
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/alejr",
            "Alias": "alejr",
            "DisplayName": "Alejandro Rosalez",
            "Type": "PERSONAL"
        }
    ]
}
```
For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListContacts in AWS CLI Command Reference.

list-engagements

The following code example shows how to use list-engagements.

AWS CLI

To list all engagements

The following list-engagements example lists engagements to escalation plans and contacts. You can also list engagements for a single incident.

```
aws ssm-contacts list-engagements
```

Output:

```
{
  "Engagements": [
    {
```
For more information, see [Contacts](#) in the [Incident Manager User Guide](#).

- For API details, see [ListEngagements](#) in [AWS CLI Command Reference](#).

### list-page-receipts

The following code example shows how to use `list-page-receipts`.

**AWS CLI**

To list page receipts
The following command-name example lists whether a page was received or not by a contact.

```
aws ssm-contacts list-page-receipts \
   --page-id "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3"
```

Output:

```
{
   "Receipts": [
       {
           "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
           "ReceiptType": "DELIVERED",
           "ReceiptInfo": "425440",
           "ReceiptTime": "2021-05-18T20:42:57.485000+00:00"
       },
       {
           "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
           "ReceiptType": "READ",
           "ReceiptInfo": "425440",
           "ReceiptTime": "2021-05-18T20:42:57.907000+00:00"
       },
       {
           "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
           "ReceiptType": "SENT",
           "ReceiptInfo": "SM6656c19132f1465f9c9c1123a5dde7c9",
           "ReceiptTime": "2021-05-18T20:42:57.907000+00:00"
       }
   ]
}
```

For more information, see `Contacts` in the *Incident Manager User Guide*.

- For API details, see `ListPageReceipts` in *AWS CLI Command Reference*.

**list-pages-by-contact**

The following code example shows how to use `list-pages-by-contact`. 
AWS CLI

To list pages by contact

The following list-pages-by-contact example lists all pages to the specified contact.

```bash
aws ssm-contacts list-pages-by-contact \
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```json
{
  "Pages": [
    {
      "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
      "Sender": "cli",
      "SentTime": "2021-05-18T18:43:29.301000+00:00",
      "DeliveryTime": "2021-05-18T18:43:55.265000+00:00",
      "ReadTime": "2021-05-18T18:43:55.708000+00:00"
    }
  ]
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListPagesByContact in AWS CLI Command Reference.

list-pages-by-engagement

The following code example shows how to use list-pages-by-engagement.

AWS CLI

To list pages to contact channels started from an engagement.

The following list-pages-by-engagement example lists the pages that occurred while engaging the defined engagement plan.
aws ssm-contacts list-pages-by-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0"

Output:

```json
{
   "Pages": [
      {
         "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
         "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
         "Sender": "cli",
         "SentTime": "2021-05-18T18:40:27.245000+00:00"
      }
   ]
}
```

For more information, see [Contacts](Incident Manager User Guide) in the *Incident Manager User Guide*.  
• For API details, see [ListPagesByEngagement](AWS CLI Command Reference) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a contact**

The following list-tags-for-resource example lists the tags of the specified contact.

```bash
aws ssm-contacts list-tags-for-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```json
{
   "Tags": [  
```
For more information, see Tagging in the Incident Manager User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**put-contact-policy**

The following code example shows how to use put-contact-policy.

**AWS CLI**

To share a contact and engagements

The following put-contact-policy example adds a resource policy to the contact Akua that shares the contact and related engagements with the principal.

```
aws ssm-contacts put-contact-policy \
   --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
```

This command produces no output.

For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

- For API details, see PutContactPolicy in AWS CLI Command Reference.

**send-activation-code**

The following code example shows how to use send-activation-code.
AWS CLI

To send an activation code

The following send-activation-code example sends an activation code and message to the specified contact channel.

```
aws ssm-contacts send-activation-code \
  --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/8ddae2d1-12c8-4e45-b852-c8587266c400"
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see SendActivationCode in AWS CLI Command Reference.

start-engagement

The following code example shows how to use start-engagement.

AWS CLI

Example 1: To page a contact's contact channels

The following start-engagement pages contact's contact channels. Sender, subject, public-subject, and public-content are all free from fields. Incident Manager sends the subject and content to the provided VOICE or EMAIL contact channels. Incident Manager sends the public-subject and public-content to the provided SMS contact channels. Sender is used to track who started the engagement.

```
aws ssm-contacts start-engagement \
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \
  --sender "cli" \
  --subject "cli-test" \
  --content "Testing engagements via CLI" \
  --public-subject "cli-test" \
  --public-content "Testing engagements via CLI"
```

Output:

```
{
```
"EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f"
}

For more information, see Contacts in the Incident Manager User Guide.

**Example 2: To page a contact in the provided escalation plan.**

The following start-engagement engages contact's through an escalation plan. Each contact is paged according to their engagement plan.

```bash
aws ssm-contacts start-engagement \
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation" \
  --sender "cli" \
  --subject "cli-test" \
  --content "Testing engagements via CLI" \
  --public-subject "cli-test" \
  --public-content "Testing engagements via CLI"
```

Output:

```json
{
  "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see StartEngagement in AWS CLI Command Reference.

**stop-engagement**

The following code example shows how to use stop-engagement.

**AWS CLI**

**To stop an engagement**

The following stop-engagement example stops an engagement from paging further contacts and contact channels.
This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see StopEngagement in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To tag a contact**

The following tag-resource example tags a specified contact with the provided tag key value pair.

```bash
aws ssm-contacts tag-resource \
   --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
   --tags '{{"Key":"group1","Value":"1"}}'
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove tags from a contact**

The following untag-resource example removes the group1 tag from the specified contact.

```bash
aws ssm-contacts untag-resource \
```
This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-contact-channel

The following code example shows how to use update-contact-channel.

AWS CLI

To update a contact channel

The following update-contact-channel example updates the name and delivery address of a contact channel.

```
aws ssm-contacts update-contact-channel \
   --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad" \
   --name "akuas voice channel" \
   --delivery-address '{"SimpleAddress": "+15005550198"}'
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see UpdateContactChannel in AWS CLI Command Reference.

update-contact

The following code example shows how to use update-contact.

AWS CLI

To update the engagement plan of contact

The following update-contact example updates the engagement plan of the contact Akua to include the three types of contacts channels. This is done after creating contact channels for Akua.
This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see UpdateContact in AWS CLI Command Reference.

Amazon Inspector examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Inspector.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

add-attributes-to-findings

The following code example shows how to use add-attributes-to-findings.
AWS CLI

To add attributes to findings

The following add-attribute-to-finding command assigns an attribute with the key of Example and value of example to the finding with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU:

```
aws inspector add-attributes-to-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attributes key=Example,value=example
```

Output:

```
{
   "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the Amazon Inspector guide.

- For API details, see AddAttributesToFindings in AWS CLI Command Reference.

create-assessment-target

The following code example shows how to use create-assessment-target.

AWS CLI

To create an assessment target

The following create-assessment-target command creates an assessment target named ExampleAssessmentTarget using the resource group with the ARN of arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv:

```
```

Output:

```
{
}
```
"assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX"
}

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.
- For API details, see CreateAssessmentTarget in AWS CLI Command Reference.

create-assessment-template

The following code example shows how to use create-assessment-template.

AWS CLI

To create an assessment template

The following create-assessment-template command creates an assessment template called ExampleAssessmentTemplate for the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX:

```
aws inspector create-assessment-template --assessment-target-arn
  --assessment-template-name ExampleAssessmentTemplate
  --duration-in-seconds 180
  --rules-package-arns
  --user-attributes-for-findings key=ExampleTag,value=examplevalue
```

Output:

```json
{
  "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T"
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.
- For API details, see CreateAssessmentTemplate in AWS CLI Command Reference.

create-resource-group

The following code example shows how to use create-resource-group.
AWS CLI

To create a resource group

The following `create-resource-group` command creates a resource group using the tag key of Name and value of example:

```
aws inspector create-resource-group --resource-group-tags key=Name,value=example
```

Output:

```
{
   "resourceGroupArn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv"
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [CreateResourceGroup](https://docs.aws.amazon.com/cli/latest/reference/inspector/create-resource-group.html) in *AWS CLI Command Reference*.

delete-assessment-run

The following code example shows how to use `delete-assessment-run`.

AWS CLI

To delete an assessment run

The following `delete-assessment-run` command deletes the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe`:

```
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [DeleteAssessmentRun](https://docs.aws.amazon.com/cli/latest/reference/inspector/delete-assessment-run.html) in *AWS CLI Command Reference*.
**delete-assessment-target**

The following code example shows how to use `delete-assessment-target`.

**AWS CLI**

To delete an assessment target

The following `delete-assessment-target` command deletes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```bash
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see `DeleteAssessmentTarget` in AWS CLI Command Reference.

**delete-assessment-template**

The following code example shows how to use `delete-assessment-template`.

**AWS CLI**

To delete an assessment template

The following `delete-assessment-template` command deletes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```bash
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see `DeleteAssessmentTemplate` in AWS CLI Command Reference.

**describe-assessment-runs**

The following code example shows how to use `describe-assessment-runs`.
AWS CLI

To describe assessment runs

The following `describe-assessment-run` command describes an assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```bash
aws inspector describe-assessment-runs --assessment-run-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```json
{
  "assessmentRuns": [
    {
      "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
      "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
      "createdAt": 1458680170.035,
      "dataCollected": true,
      "durationInSeconds": 3600,
      "name": "Run 1 for ExampleAssessmentTemplate",
      "notifications": [],
      "rulesPackageArns": [
      ],
      "startedAt": 1458680170.161,
      "state": "COMPLETED",
      "stateChangedAt": 1458680301.4,
      "stateChanges": [
        {
          "state": "CREATED",
          "stateChangedAt": 1458680170.035
        },
        {
          "state": "START_DATA_COLLECTION_PENDING",
          "stateChangedAt": 1458680170.065
        },
        {
```

Actions and scenarios 3530
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DescribeAssessmentRuns in AWS CLI Command Reference.

```
describe-assessment-targets
```

The following code example shows how to use describe-assessment-targets.

**AWS CLI**

To describe assessment targets
The following describe-assessment-targets command describes the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq:

```
aws inspector describe-assessment-targets --assessment-target-arns
arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
   "assessmentTargets": [
   {
      "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
      "createdAt": 1458074191.459,
      "name": "ExampleAssessmentTarget",
      "resourceGroupArn": "arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-PyGXopAI",
      "updatedAt": 1458074191.459
   }
   ],
   "failedItems": {}
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide. 
- For API details, see [DescribeAssessmentTargets](https://docs.aws.amazon.com/cli/latest/reference/inspector/describe-assessment-targets.html) in *AWS CLI Command Reference*.

### describe-assessment-templates

The following code example shows how to use describe-assessment-templates.

#### AWS CLI

**To describe assessment templates**

The following describe-assessment-templates command describes the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw:

```
aws inspector describe-assessment-templates --assessment-template-arns
arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw
```

Output:
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DescribeAssessmentTemplates in AWS CLI Command Reference.

### describe-cross-account-access-role

The following code example shows how to use describe-cross-account-access-role.

#### AWS CLI

**To describe the cross account access role**

The following describe-cross-account-access-role command describes the IAM role that enables Amazon Inspector to access your AWS account:

```bash
aws inspector describe-cross-account-access-role
```

**Output:**

```json
{
    "registeredAt": 1458069182.826,
    "roleArn": "arn:aws:iam::123456789012:role/inspector",
    "rulesPackageArns": [
    ],
    "userAttributesForFindings": []
}
```
For more information, see Setting up Amazon Inspector in the Amazon Inspector guide.

- For API details, see DescribeCrossAccountAccessRole in AWS CLI Command Reference.

**describe-findings**

The following code example shows how to use describe-findings.

**AWS CLI**

**To describe findings**

The following describe-findings command describes the finding with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4:

```
aws inspector describe-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4
```

**Output:**

```json
{
   "failedItems": {},
   "findings": [
     {
       "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
       "assetAttributes": {
         "ipv4Addresses": [],
         "schemaVersion": 1
       },
       "assetType": "ec2-instance",
       "attributes": [],
       "confidence": 10,
       "createdAt": 1458680301.37,
       "description": "Amazon Inspector did not find any potential security issues during this assessment."
     }
   ]
}
```
For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [DescribeFindings](#) in *AWS CLI Command Reference*.

**describe-resource-groups**

The following code example shows how to use `describe-resource-groups`.

**AWS CLI**

**To describe resource groups**

The following `describe-resource-groups` command describes the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI`:

```
aws inspector describe-resource-groups --resource-group-arns arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI
```

**Output:**

```
{
   "failedItems": {},
   "resourceGroups": [
   
   ]
}
```
For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [DescribeResourceGroups](#) in *AWS CLI Command Reference*.

**describe-rules-packages**

The following code example shows how to use describe-rules-packages.

**AWS CLI**

**To describe rules packages**

The following describe-rules-packages command describes the rules package with the ARN of `arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p`:

```
```

Output:

```json
{
   "failedItems": {},
   "rulesPackages": [
   {
       "description": "The rules in this package help verify whether the EC2 instances in your application are exposed to Common Vulnerabilities and Exposures (CVEs). Attacks can exploit unpatched vulnerabilities to compromise the confidentiality, integrity, or availability of your service
```
or data. The CVE system provides a reference for publicly known information security vulnerabilities and exposures. For more information, see [https://cve.mitre.org/](https://cve.mitre.org/). If a particular CVE appears in one of the produced Findings at the end of a completed Inspector assessment, you can search [https://cve.mitre.org/](https://cve.mitre.org/) using the CVE's ID (for example, "CVE-2009-0021") to find detailed information about this CVE, its severity, and how to mitigate it.

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see [DescribeRulesPackages](https://docs.aws.amazon.com/cli/latest/reference/inspector/describe-rules-packages.html) in AWS CLI Command Reference.

**get-telemetry-metadata**

The following code example shows how to use `get-telemetry-metadata`.

**AWS CLI**

**To get the telemetry metadata**

The following `get-telemetry-metadata` command generates information about the data that is collected for the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`

```
aws inspector get-telemetry-metadata --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

**Output:**

```
{
  "telemetryMetadata": [
    {
      "count": 2,
      "dataSize": 345,
    }
  ]
}
```
"messageType": "InspectorDuplicateProcess"
},
{
    "count": 3,
    "dataSize": 255,
    "messageType": "InspectorTimeEventMsg"
},
{
    "count": 4,
    "dataSize": 1082,
    "messageType": "InspectorNetworkInterface"
},
{

"messageType": "Total"
},

Actions and scenarios
list-assessment-run-agents

The following code example shows how to use list-assessment-run-agents.

AWS CLI

To list assessment run agents

The following list-assessment-run-agents command lists the agents of the assessment run with the specified ARN.

```bash
aws inspector list-assessment-run-agents \
   --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```json
{
   "assessmentRunAgents": [

   {
      "agentHealth": "HEALTHY",
      "agentHealthCode": "HEALTHY",
      "agentId": "i-49113b93",
      "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
      "telemetryMetadata": [
        
      ]
   }

}
"count": 2,
"dataSize": 345,
"messageType": "InspectorDuplicateProcess"
},
{
"count": 3,
"dataSize": 255,
"messageType": "InspectorTimeEventMsg"
},
{
"count": 4,
"dataSize": 1082,
"messageType": "InspectorNetworkInterface"
},
{
"count": 2,
"dataSize": 349,

- For API details, see [ListAssessmentRunAgents](#) in AWS CLI Command Reference.

### list-assessment-runs

The following code example shows how to use `list-assessment-runs`.

**AWS CLI**

**To list assessment runs**

The following `list-assessment-runs` command lists all existing assessment runs.

```bash
aws inspector list-assessment-runs
```

Output:

```json
{
   "assessmentRunArns": [
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-v5D6fI3v"
   ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector User Guide.

- For API details, see ListAssessmentRuns in AWS CLI Command Reference.

**list-assessment-targets**

The following code example shows how to use list-assessment-targets.

**AWS CLI**

**To list assessment targets**

The following list-assessment-targets command lists all existing assessment targets:

```
aws inspector list-assessment-targets
```

**Output:**

```
{
    "assessmentTargetArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq"
    ]
}
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see ListAssessmentTargets in AWS CLI Command Reference.

**list-assessment-templates**

The following code example shows how to use list-assessment-templates.

**AWS CLI**

**To list assessment templates**

The following list-assessment-templates command lists all existing assessment templates:

```
aws inspector list-assessment-templates

Output:

```json
{
  "assessmentTemplateArns": [
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-Uza6ihLh"
  ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see ListAssessmentTemplates in AWS CLI Command Reference.

**list-event-subscriptions**

The following code example shows how to use list-event-subscriptions.

**AWS CLI**

**To list event subscriptions**

The following list-event-subscriptions command lists all the event subscriptions for the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0:

```
aws inspector list-event-subscriptions --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0
```

Output:

```json
{
  "subscriptions": [
    {
      "eventSubscriptions": [
        {
        }
      ]
    }
  ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [ListEventSubscriptions](https://docs.aws.amazon.com/cli/latest/reference/inspector/list-findings) in *AWS CLI Command Reference*.

### list-findings

The following code example shows how to use `list-findings`.

#### AWS CLI

**To list findings**

The following `list-findings` command lists all of the generated findings:

```
aws inspector list-findings
```

**Output:**

```
{
    "findingArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0/run/0-v5D6fI3v/finding/0-tyvmqBLy"
    ]
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [ListFindings](https://docs.aws.amazon.com/cli/latest/reference/inspector/list-findings) in *AWS CLI Command Reference*.  

list-rules-packages

The following code example shows how to use list-rules-packages.

AWS CLI

To list rules packages

The following list-rules-packages command lists all available Inspector rules packages:

```bash
aws inspector list-rules-packages
```

Output:

```json
{
    "rulesPackageArns": [
    ]
}
```

For more information, see Amazon Inspector Rules Packages and Rules in the Amazon Inspector guide.

- For API details, see ListRulesPackages in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for resource

The following list-tags-for-resource command lists all tags associated with the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu`:

```bash
```
The following code example shows how to use `preview-agents`.

**AWS CLI**

**To preview agents**

The following `preview-agents` command previews the agents installed on the EC2 instances that are part of the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```bash
```

**Output:**

```json
{
   "agentPreviews": [ {
       "agentId": "i-49113b93"
   } ]
}
```
For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [PreviewAgents](#) in *AWS CLI Command Reference*.

**register-cross-account-access-role**

The following code example shows how to use `register-cross-account-access-role`.

**AWS CLI**

**To register the cross account access role**

The following `register-cross-account-access-role` command registers the IAM role with the ARN of `arn:aws:iam::123456789012:role/inspector` that Amazon Inspector uses to list your EC2 instances at the start of the assessment run of when you call the `preview-agents` command:

```bash
aws inspector register-cross-account-access-role --role-arn arn:aws:iam::123456789012:role/inspector
```

For more information, see Setting up Amazon Inspector in the *Amazon Inspector* guide.

- For API details, see [RegisterCrossAccountAccessRole](#) in *AWS CLI Command Reference*.

**remove-attributes-from-findings**

The following code example shows how to use `remove-attributes-from-findings`.

**AWS CLI**

**To remove attributes from findings**

The following `remove-attributes-from-finding` command removes the attribute with the key of `Example` and value of `example` from the finding with the ARN of:

```bash
aws inspector remove-attributes-from-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attribute-keys key=Example,value=example
```
Output:

```json
{
    "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [RemoveAttributesFromFindings](#) in *AWS CLI Command Reference*.

**set-tags-for-resource**

The following code example shows how to use `set-tags-for-resource`.

**AWS CLI**

**To set tags for a resource**

The following `set-tags-for-resource` command sets the tag with the key of Example and value of example to the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```
aws inspector set-tags-for-resource --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --tags key=Example,value=example
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [SetTagsForResource](#) in *AWS CLI Command Reference*.

**start-assessment-run**

The following code example shows how to use `start-assessment-run`.

**AWS CLI**

**To start an assessment run**

The following `start-assessment-run` command starts the assessment run named `examplerun` using the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T:`

Output:

```json
{
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see StartAssessmentRun in AWS CLI Command Reference.

**stop-assessment-run**

The following code example shows how to use stop-assessment-run.

**AWS CLI**

To stop an assessment run

The following stop-assessment-run command stops the assessment run with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY:

```bash
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see StopAssessmentRun in AWS CLI Command Reference.

**subscribe-to-event**

The following code example shows how to use subscribe-to-event.
**AWS CLI**

**To subscribe to an event**

The following example enables the process of sending Amazon SNS notifications about the ASSESSMENT_RUN_COMPLETED event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`

```bash
aws inspector subscribe-to-event \
  --event ASSESSMENT_RUN_COMPLETED \
  --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 \
```

This command produces no output.

For more information, see [Amazon Inspector Assessment Templates and Assessment Runs](https://docs.aws.amazon.com/inspector/latest/guide/) in the [Amazon Inspector guide](https).

- For API details, see [SubscribeToEvent](https://docs.aws.amazon.com/cli/latest/reference/inspector/subscribe-to-event.html) in AWS CLI Command Reference.

**unsubscribe-from-event**

The following code example shows how to use `unsubscribe-from-event`.

**AWS CLI**

**To unsubscribe from an event**

The following `unsubscribe-from-event` command disables the process of sending Amazon SNS notifications about the ASSESSMENT_RUN_COMPLETED event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`:

```bash
aws inspector unsubscribe-from-event --event ASSESSMENT_RUN_COMPLETED --resource-arn 
  arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 -- 
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the [Amazon Inspector guide](https).

- For API details, see [UnsubscribeFromEvent](https://docs.aws.amazon.com/cli/latest/reference/inspector/unsubscribe-from-event.html) in AWS CLI Command Reference.
update-assessment-target

The following code example shows how to use update-assessment-target.

AWS CLI

To update an assessment target

```bash
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see UpdateAssessmentTarget in AWS CLI Command Reference.

AWS IoT examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions
Actions

accept-certificate-transfer

The following code example shows how to use accept-certificate-transfer.

AWS CLI

To accept a device certificate transferred from a different AWS account

The following accept-certificate-transfer example accepts a device certificate transferred from another AWS account. The certificate is identified by its ID.

```aws iot accept-certificate-transfer \ 
   --certificate-id 488b6a7f2acdeb00a77384e63c4e40b18bEXAMPLEe57b7272ba44c45e3448142```

This command does not produce any output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.

- For API details, see AcceptCertificateTransfer in AWS CLI Command Reference.

add-thing-to-billing-group

The following code example shows how to use add-thing-to-billing-group.

AWS CLI

Example 1: To add a thing by name to a billing group

The following add-thing-to-billing-group example adds the thing named MyLightBulb to the billing group named GroupOne.

```aws iot add-thing-to-billing-group \ 
   --billing-group-name GroupOne \ 
   --thing-name MyLightBulb```

This command produces no output.
Example 2: To add a thing by ARN to a billing group

The following add-thing-to-billing-group example adds a thing with a specified ARN to a billing group with the specified ARN. Specifying an ARN is helpful if you work with multiple AWS Regions or accounts. It can help ensure that you are adding to the right Region and account.

```bash
aws iot add-thing-to-thing-group
   --billing-group-arn "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne" \
   --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb"
```

This command produces no output.

For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see AddThingToBillingGroup in AWS CLI Command Reference.

add-thing-to-thing-group

The following code example shows how to use add-thing-to-thing-group.

AWS CLI

**To add a thing to a group**

The following add-thing-to-thing-group example adds the specified thing to the specified thing group.

```bash
aws iot add-thing-to-thing-group
   --thing-name MyLightBulb \
   --thing-group-name LightBulbs
```

This command produces no output.

For more information, see Thing Groups in the AWS IoT Developers Guide.

- For API details, see AddThingToThingGroup in AWS CLI Command Reference.

associate-targets-with-job

The following code example shows how to use associate-targets-with-job.
**AWS CLI**

**To associate a thing group with a continuous job**

The following `associate-targets-with-job` example associates the specified thing group with the specified continuous job.

```bash
aws iot associate-targets-with-job \
    --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --job-id "example-job-04"
```

Output:

```json
{
    "jobId": "example-job-04",
    "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the _AWS IoT Developer Guide_.

- For API details, see AssociateTargetsWithJob in AWS CLI Command Reference.

**attach-policy**

The following code example shows how to use `attach-policy`.

**AWS CLI**

**Example 1: To attach a policy to a thing group**

The following `attach-policy` example attaches the specified policy to a thing group identified by its ARN.

```bash
aws iot attach-policy \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --policy-name "UpdateDeviceCertPolicy"
```

This command does not produce any output.

For more information, see Thing Groups in the _AWS IoT Developers Guide_.

**Example 2: To attach a policy to a certificate**
The following `attach-policy` example attaches the policy `UpdateDeviceCertPolicy` to the principal specified by a certificate.

```
aws iot attach-policy \
  --policy-name UpdateDeviceCertPolicy \
  --target "arn:aws:iot:us-west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

This command does not produce any output.

For more information, see [Attach an AWS IoT Policy to a Device Certificate](https://docs.aws.amazon.com/iot/latest/developerguide/detect-policy.html) in the *AWS IoT Developers Guide*.

- For API details, see [AttachPolicy](http://docs.aws.amazon.com/cli/latest/reference/iot/attach-policy.html) in *AWS CLI Command Reference*.

### `attach-security-profile`

The following code example shows how to use `attach-security-profile`.

**AWS CLI**

**To associate a security profile with all unregistered devices**

The following `attach-security-profile` example associates the AWS IoT Device Defender security profile named `Testprofile` with all unregistered devices in the `us-west-2` region for this AWS account.

```
aws iot attach-security-profile \
  --security-profile-name Testprofile \
```

This command produces no output.

For more information, see [Detect Commands](https://docs.aws.amazon.com/iot/latest/developerguide/detect-security-profile.html) in the *AWS IoT Developer Guide*.

- For API details, see [AttachSecurityProfile](http://docs.aws.amazon.com/cli/latest/reference/iot/attach-security-profile.html) in *AWS CLI Command Reference*.

### `attach-thing-principal`

The following code example shows how to use `attach-thing-principal`.

```
aws iot attach-thing-principal \
```
AWS CLI

To attach a certificate to your thing

The following `attach-thing-principal` example attaches a certificate to the MyTemperatureSensor thing. The certificate is identified by an ARN. You can find the ARN for a certificate in the AWS IoT console.

```bash
aws iot attach-thing-principal \
  --thing-name MyTemperatureSensor \
  --principal arn:aws:iot:us-west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/how-to-manage-things-with-the-registry) in the [AWS IoT Developers Guide](https).

- For API details, see [AttachThingPrincipal](https://docs.aws.amazon.com/cli/latest/reference/iot/attach-thing-principal.html) in [AWS CLI Command Reference](https).

cancel-audit-mitigation-actions-task

The following code example shows how to use `cancel-audit-mitigation-actions-task`.

AWS CLI

To cancel an audit mitigation actions task

The following `cancel-audit-mitigations-action-task` example cancels the application of mitigation actions for the specified task. You cannot cancel tasks that are already completed.

```bash
aws iot cancel-audit-mitigation-actions-task \
  --task-id "myActionsTaskId"
```

This command produces no output.

For more information, see [CancelAuditMitigationActionsTask (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/developerguide/mitigation-action-commands.html) in the [AWS IoT Developer Guide](https).

- For API details, see [CancelAuditMitigationActionsTask](https://docs.aws.amazon.com/cli/latest/reference/iot/cancel-audit-mitigation-actions-task.html) in [AWS CLI Command Reference](https).
cancel-audit-task

The following code example shows how to use cancel-audit-task.

**AWS CLI**

**To cancel an audit task**

The following cancel-audit-task example cancels an audit task with the specified task ID. You cannot cancel a task that is complete.

```bash
aws iot cancel-audit-task \
--task-id a3aea00955e501a31b764abe1bebd3d
```

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see CancelAuditTask in AWS CLI Command Reference.

cancel-certificate-transfer

The following code example shows how to use cancel-certificate-transfer.

**AWS CLI**

**To cancel the transfer a certificate to a different AWS account**

The following cancel-certificate-transfer example cancels the transfer of the specified certificate transfer. The certificate is identified by a certificate ID. You can find the ID for a certificate in the AWS IoT console.

```bash
aws iot cancel-certificate-transfer \
--certificate-id f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78add5e605d630e05c7fc8
```

This command produces no output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.
• For API details, see CancelCertificateTransfer in AWS CLI Command Reference.

cancel-job-execution

The following code example shows how to use cancel-job-execution.

AWS CLI

To cancel a job execution on a device

The following cancel-job-execution example cancels the execution of the specified job on a device. If the job is not in the QUEUED state, you must add the --force parameter.

```bash
aws iot cancel-job-execution \
   --job-id "example-job-03" \
   --thing-name "MyRPi"
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

• For API details, see CancelJobExecution in AWS CLI Command Reference.

cancel-job

The following code example shows how to use cancel-job.

AWS CLI

To cancel a job

The following cancel-job example cancels the specified job.

```bash
aws iot cancel-job \
   --job-job "example-job-03"
```

Output:

```json
{
   "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-03",
   "jobId": "example-job-03",
```
For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see CancelJob in AWS CLI Command Reference.

**clear-default-authorizer**

The following code example shows how to use clear-default-authorizer.

**AWS CLI**

To clear the default authorizer

The following clear-default-authorizer example clears the currently configured default custom authorizer. After you run this command, there is no default authorizer. When you use a custom authorizer, you must specify it by name in the HTTP request headers.

```bash
aws iot clear-default-authorizer
```

This command produces no output.

For more information, see ClearDefaultAuthorizer in the AWS IoT API Reference.

- For API details, see ClearDefaultAuthorizer in AWS CLI Command Reference.

**confirm-topic-rule-destination**

The following code example shows how to use confirm-topic-rule-destination.

**AWS CLI**

To confirm a topic rule destination

The following confirm-topic-rule-destination example confirms a topic rule destination with a confirmation token received at an HTTP endpoint.

```bash
aws iot confirm-topic-rule-destination \
   --confirmation-token "AYADelcmtq-ZkxfpiwIqQHWMSucAXwABABVhd3MtY3J5cHRvLXB1YmxpYy1rZXkAREFxY1E0Um1GeDg0V21BZWZ1VjZtZwMuk_A4dPiC6eyPGuMAAAAfjB8BgkqhkiG9w0BBwagbzBtAgEAMGgGCSqGSIb3DQEHATAeBglghkgBZQMEAS4wEQQM9vtRMpf9D3CiZ8sMAgEQgDuFd0Txy-
```
This command produces no output.

For more information, see Confirming a topic rule destination in the AWS IoT Developer Guide.
- For API details, see ConfirmTopicRuleDestination in AWS CLI Command Reference.

create-audit-suppression

The following code example shows how to use create-audit-suppression.

AWS CLI

To create an audit finding suppression

The following create-audit-suppression example creates an audit finding suppression for a policy named "virtualMachinePolicy" that has been flagged for being overly permissive.

```bash
aws iot create-audit-suppression \
  --check-name IOT_POLICY_OVERLY_PERMISSIVE_CHECK \
  --resource-identifier
  policyVersionIdentifier="{"policyName"="virtualMachinePolicy","policyVersionId"="1"}"
  --no-suppress-indefinitely \
  --expiration-date 2020-10-20
```

This command produces no output.

For more information, see Audit finding suppressions in the AWS IoT Developers Guide.
- For API details, see CreateAuditSuppression in AWS CLI Command Reference.

create-authorizer

The following code example shows how to use create-authorizer.
AWS CLI

To create a custom authorizer

The following create-authorizer example creates a custom authorizer that uses the specified Lambda function as part of a custom authentication service.

```bash
aws iot create-authorizer \
   --authorizer-name "CustomAuthorizer" \
   --authorizer-function-arn "arn:aws:lambda:us-west-2:123456789012:function:CustomAuthorizerFunction" \
   --token-key-name "MyAuthToken" \
   --status ACTIVE \
   --token-signing-public-keys FIRST_KEY="-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPg/1M6ZfIwoZ+7ENxAio9q6QD4FFqkJGsvjtYwjoelRKK0U8Eq9xb503kRSmyIwTzwzx/f4Gf0YZUloj+t3PUwHxmbYTAgTrCUGrFygjgfwGCPs5ZAX4Eyt5cr+AIHIiUDBxSa7pzwOBXPeic0asNjpqT8pkBbRaKyleJh5oo81NDHhmVtbBmS5A5YijjqXYLhLVaowKzZ+GqsNvAQ9Jy1w2VrEa10fl8f1DB/BJLm7zjpfP0HDJQgI0XnZwA1NnZcOhCwIX50g2L20y9R/dmqtDmjIP97Z4GyxxPvw1YHrzUXY0i1R3AR/Ac1NhCTGZMwVDB1lQIDAQAB
-----END PUBLIC KEY-----"
```

Output:

```
{
   "authorizerName": "CustomAuthorizer",
   "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer2"
}
```

For more information, see `CreateAuthorizer` in the AWS IoT API Reference.

- For API details, see `CreateAuthorizer` in AWS CLI Command Reference.

create-billing-group

The following example shows how to use create-billing-group.

AWS CLI

To create a billing group
The following `create-billing-group` example creates a simple billing group named GroupOne.

```
aws iot create-billing-group \
   --billing-group-name GroupOne
```

Output:

```
{
   "billingGroupName": "GroupOne",
   "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
   "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562"
}
```

For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see CreateBillingGroup in AWS CLI Command Reference.

create-certificate-from-csr

The following code example shows how to use `create-certificate-from-csr`.

**AWS CLI**

To create a device certificate from a certificate signing request (CSR)

The following `create-certificate-from-csr` example creates a device certificate from a CSR. You can use the `openssl` command to create a CSR.

```
aws iot create-certificate-from-csr \
   --certificate-signing-request=file://certificate.csr
```

Output:

```
{
   "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/c0c57bb8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
   "certificateId": "c0c57bb8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
   "certificatePem": "<certificate-text>"
}
```
For more information, see CreateCertificateFromCSR in the AWS IoT API Reference.

- For API details, see CreateCertificateFromCSR in AWS CLI Command Reference.

create-custom-metric

The following code example shows how to use create-custom-metric.

AWS CLI

To create a custom metric published by your devices to Device Defender

The following create-custom-metric example creates a custom metric that measures battery percentage.

```
aws iot create-custom-metric \
    --metric-name "batteryPercentage" \
    --metric-type "number" \
    --display-name "Remaining battery percentage." \
    --region us-east-1 \
    --client-request-token "02ccb92b-33e8-4dfa-a0c1-35b181ed26b0"
```

Output:

```
{
    "metricName": "batteryPercentage",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/batteryPercentage"
}
```

For more information, see Custom metrics in the AWS IoT Core Developer Guide.

- For API details, see CreateCustomMetric in AWS CLI Command Reference.

create-dimension

The following code example shows how to use create-dimension.

AWS CLI

To create a dimension
The following `create-dimension` creates a dimension with a single topic filter called `TopicFilterForAuthMessages`.

```bash
aws iot create-dimension \
  --name TopicFilterForAuthMessages \
  --type TOPIC_FILTER \
  --string-values device/+/auth
```

Output:

```json
{
  "name": "TopicFilterForAuthMessages",
  "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see [Detect Commands](https://docs.aws.amazon.com/iot-devices/latest/developerguide/detect-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [CreateDimension](https://docs.aws.amazon.com/cli/latest/reference/iot/create-dimension.html) in *AWS CLI Command Reference*.

### create-domain-configuration

The following code example shows how to use `create-domain-configuration`.

**AWS CLI**

**To create a domain configuration**

The following `create-domain-configuration` example creates an AWS-managed domain configuration with a service type of DATA.

```bash
aws iot create-domain-configuration \
  --domain-configuration-name "additionalDataDomain" \
  --service-type "DATA"
```

Output:

```json
{
  "domainConfigurationName": "additionalDataDomain",
  "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```
For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see CreateDomainConfiguration in AWS CLI Command Reference.

create-dynamic-thing-group

The following code example shows how to use create-dynamic-thing-group.

AWS CLI

To create a dynamic thing group

The following create-dynamic-thing-group example creates a dynamic thing group that contains any thing with a temperature attribute that is greater than 60 degrees. You must enable AWS IoT fleet indexing before you can use dynamic thing groups.

```bash
aws iot create-dynamic-thing-group \
   --thing-group-name "RoomTooWarm" \
   --query-string "attributes.temperature>60"
```

Output:

```json
{
   "thingGroupName": "RoomTooWarm",
   "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/RoomTooWarm",
   "thingGroupId": "9d52492a-fc87-43f4-b6e2-e571d2ffcad1",
   "indexName": "AWS_Things",
   "queryString": "attributes.temperature>60",
   "queryVersion": "2017-09-30"
}
```

For more information, see Dynamic Thing Groups in the AWS IoT Developers Guide.

- For API details, see CreateDynamicThingGroup in AWS CLI Command Reference.

create-job

The following code example shows how to use create-job.
### Example 1: To create a job

The following `create-job` example creates a simple AWS IoT job that sends a JSON document to the MyRaspberryPi device.

```bash
aws iot create-job \
   --job-id "example-job-01" \
   --targets "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi" \
   --document file://example-job.json \
   --description "example job test" \
   --target-selection SNAPSHOT
```

Output:

```
{
   "jobId": "example-job-01",
   "description": "example job test"
}
```

### Example 2: To create a continuous job

The following `create-job` example creates a job that continues to run after the things specified as targets have completed the job. In this example, the target is a thing group, so when new devices are added to the group, the continuous job runs on those new things.

```bash
```

Output:

```
{
   "jobId": "example-job-04",
   "description": "example continuous job"
}
```

For more information, see [Creating and Managing Jobs (CLI)](https://docs.aws.amazon.com/iot/latest/developerguide/creating-managing-jobs-cli.html) in the *AWS IoT Developer Guide*. 
• For API details, see CreateJob in AWS CLI Command Reference.

create-keys-and-certificate

The following code example shows how to use create-keys-and-certificate.

AWS CLI

To create an RSA key pair and issue an X.509 certificate

The following create-keys-and-certificate creates a 2048-bit RSA key pair and issues an X.509 certificate using the issued public key. Because this is the only time that AWS IoT provides the private key for this certificate, be sure to keep it in a secure location.

```bash
aws iot create-keys-and-certificate
   --certificate-pem-outfile "myTest.cert.pem"
   --public-key-outfile "myTest.public.key"
   --private-key-outfile "myTest.private.key"
```

Output:

```json
{
   "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
   "certificateId": "9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
   "certificatePem": "-----BEGIN CERTIFICATE-----
MIICiTCCEXAMPLE6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMC

```

Actions and scenarios 3571
For more information, see Create and Register an AWS IoT Device Certificate in the AWS IoT Developer Guide.

- For API details, see CreateKeysAndCertificate in AWS CLI Command Reference.

**create-mitigation-action**

The following code example shows how to use create-mitigation-action.

AWS CLI

To create a mitigation action

The following create-mitigation-action example defines a mitigation action named AddThingsToQuarantineGroup1Action that, when applied, moves things into the thing group named QuarantineGroup1. This action overrides dynamic thing groups.

```
aws iot create-mitigation-action --cli-input-json file::params.json
```

Contents of params.json:

```
{
    "actionName": "AddThingsToQuarantineGroup1Action",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ]
        }
    }
}
```
Output:

```json
{
   "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroup1Action",
   "actionId": "992e9a63-a899-439a-aa50-4e20c52367e1"
}
```

For more information, see [CreateMitigationAction (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/developerguide/CreateMitigationAction.html) in the *AWS IoT Developer Guide*.

- For API details, see [CreateMitigationAction](https://docs.aws.amazon.com/cli/latest/reference/iot/create-mitigation-action.html) in *AWS CLI Command Reference*.

### create-ota-update

The following code example shows how to use `create-ota-update`.

**AWS CLI**

To create an OTA update for use with Amazon FreeRTOS

The following `create-ota-update` example creates an AWS IoT OTAUpdate on a target group of things or groups. This is part of an Amazon FreeRTOS over-the-air update which makes it possible for you to deploy new firmware images to a single device or a group of devices.

```bash
aws iot create-ota-update \
   --cli-input-json file://create-ota-update.json
```

Contents of `create-ota-update.json`:

```json
{
   "otaUpdateId": "ota12345",
   "description": "A critical update needed right away."
   "targets": [
```
The following code example shows how to use `create-policy-version`.

```json
{
  "policyName": "my_policy",
  "policyDocument": """
}
```

For more information, see [CreateOTAUpdate](https://docs.aws.amazon.com/iot/latest/apireference/API_CreateOTAUpdate.html) in the **AWS IoT API Reference**.

- For API details, see [CreateOtaUpdate](https://docs.aws.amazon.com/iot/latest/iot-api-for-device-farm/API_CreateOtaUpdate.html) in **AWS CLI Command Reference**.

**create-policy-version**

The following code example shows how to use create-policy-version.
**AWS CLI**

### To update a policy with a new version

The following `create-policy-version` example updates a policy definition, creating a new policy version. This example also makes the new version the default.

```bash
aws iot create-policy-version \
  --policy-name UpdateDeviceCertPolicy \
  --policy-document file://policy.json \
  --set-as-default
```

**Contents of `policy.json`:**

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "iot:UpdateCertificate",
      "Resource": "*"
    }
  ]
}
```

**Output:**

```json
{
  "policyVersionId": "2",
  "isDefaultVersion": true
}
```

For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/iot-policies.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreatePolicyVersion](https://docs.aws.amazon.com/cli/latest/reference/iot/create-policy-version.html) in *AWS CLI Command Reference*.

### create-policy

The following code example shows how to use `create-policy`. 
AWS CLI

To create an AWS IoT policy

The following `create-policy` example creates an AWS IoT policy named `TemperatureSensorPolicy`. The `policy.json` file contains statements that allow AWS IoT policy actions.

```
aws iot create-policy \
   --policy-name TemperatureSensorPolicy \
   --policy-document file://policy.json
```

Contents of `policy.json`:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "iot:Publish",
            "iot:Receive"
         ],
         "Resource": [
            "arn:aws:iot:us-west-2:123456789012:topic/topic_2"
         ]
      },
      {
         "Effect": "Allow",
         "Action": [
            "iot:Subscribe"
         ],
         "Resource": [
            "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
         ]
      },
      {
         "Effect": "Allow",
         "Action": [
            "iot:Connect"
         ]
      }
   ]
}
```
Output:

```
{
    "policyName": "TemperatureSensorPolicy",
    "policyDocument": "{
        "Version": "2012-10-17",
        "Statement": [
            {
                "Effect": "Allow",
                "Action": [
                    "iot:Publish",
                    "iot:Receive"
                ],
                "Resource": [
                    "arn:aws:iot:us-west-2:123456789012:topic/topic_2"
                ]
            },
            {
                "Effect": "Allow",
                "Action": [
                    "iot:Subscribe"
                ],
                "Resource": [
                    "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
                ]
            },
            {
                "Effect": "Allow",
                "Action": [
                    "iot:Connect"
                ],
                "Resource": [

```

Actions and scenarios
For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/policies.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreatePolicy](https://docs.aws.amazon.com/cli/latest/reference/iot/create-policy.html) in *AWS CLI Command Reference*.

### create-provisioning-claim

The following code example shows how to use create-provisioning-claim.

**AWS CLI**

To create a provisioning claim

The following `create-provisioning-claim` example creates a provisioning claim from a provisioning template.

```sh
aws iot create-provisioning-claim
  --template-name MyTestProvisioningTemplate
```

Output:

```json
{
  "certificateId": "78de02184b2ce80cf8fb709bda59e62b19fb83513590483eb0434589476ab09f",

Actions and scenarios 3578
For more information, see [Provisioning by trusted user](https://aws.amazon.com/iot-devices/whats-new/iot-core-provisioning-feature/) in the *AWS IoT Core Developers Guide*.

- For API details, see [CreateProvisioningClaim](https://docs.aws.amazon.com/cli/latest/userguide/cli-aws-iot.html#create-provisioning-claim) in *AWS CLI Command Reference*.

### create-provisioning-template-version

The following code example shows how to use `create-provisioning-template-version`.

**AWS CLI**

**To create a provisioning template version**

The following example creates a version for the specified provisioning template. The body of the new version is supplied in the file `template.json`.

```
aws iot create-provisioning-template-version
```
---template-name widget-template \
---template-body file://template.json

Contents of template.json:

```json
{
    "Parameters": {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    },
    "Resources": {
        "thing": {
            "Type": "AWS::IoT::Thing",
            "Properties": {
                "AttributePayload": {
                    "version": "v1",
                    "serialNumber": "serialNumber"
                },
                "ThingName": {
                    "Fn::Join": ["", ["ThingPrefix_", {
                        "Ref": "SerialNumber"
                    }]],
                    "ThingTypePrefix": {
                        "Fn::Join": ["", ["ThingTypePrefix_", {
                            "Ref": "SerialNumber"
                        }]],
                        "widgets": ["widgets", "WA"],
                        "BillingGroup": "BillingGroup"
                    }
                },
                "OverrideSettings": {
                    "AttributePayload": "MERGE",
                    "ThingTypeName": "REPLACE",
                    "ThingGroups": "DO_NOTHING"
                }
            }
        },
        "certificate": {
            "Type": "AWS::IoT::Certificate",
            "Properties": {
                "CertificateId": {
                    "Ref": "AWS::IoT::Certificate::Id"
                }
            }
        }
    }
}
```
"Status" : "Active"

  "LocationUrl" : {
    "Fn::FindInMap" : ["LocationTable",{"Ref" : "DeviceLocation"},
    "LocationUrl"]
  }
}

Output:

{
  "templateName" : "widget-template",
  "versionId" : 2,
  "isDefaultVersion" : false
}

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-secure-tunneling.html) in the [AWS IoT Core Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

create-provisioning-template

The following code example shows how to use create-provisioning-template.

AWS CLI

To create a provisioning template

The following create-provisioning-template example creates a provisioning template as defined by the file template.json.

```bash
aws iot create-provisioning-template \
  --template-name widget-template \
  --description "A provisioning template for widgets" \
  --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role \
  --template-body file://template.json
```

Contents of template.json:

```json
{
  "Parameters" : {
    "DeviceLocation": {
      "Type": "String"
    }
  },
  "Mappings": {
    "LocationTable": {
      "Seattle": {
        "LocationUrl": "https://example.aws"
      }
    }
  },
  "Resources" : {
    "thing" : {
      "Type": "AWS::IoT::Thing",
      "Properties": {
        "AttributePayload" : {
          "version": "v1",
          "serialNumber": "serialNumber"
        }
      }
    }
  }
}
```
"ThingTypeName" : {
  "Fn::Join" : [ "", [ "ThingTypePrefix_", {
    "Ref" : "SerialNumber" ] ] ]},
"ThingGroups" : [ "widgets", "WA" ],
"BillingGroup" : "BillingGroup"
},
"OverrideSettings" : {
  "AttributePayload" : "MERGE",
  "ThingTypeName" : "REPLACE",
  "ThingGroups" : "DO_NOTHING"
},
"certificate" : {
  "Type" : "AWS::IoT::Certificate",
  "Properties" : {
    "CertificateId" : { "Ref" : "AWS::IoT::Certificate::Id" },
    "Status" : "Active"
  }
},
"policy" : {
  "Type" : "AWS::IoT::Policy",
  "Properties" : {
    "PolicyDocument" : {
      "Version" : "2012-10-17",
      "Statement" : [{
        "Effect" : "Allow",
        "Action" : [ "iot:Publish" ],
      }]
    }
  }
},
"DeviceConfiguration" : {
  "FallbackUrl" : "https://www.example.com/test-site",
  "LocationUrl" : {
    "Fn::FindInMap" : [ "LocationTable", { "Ref" : "DeviceLocation" }, "LocationUrl" ]
  }
}

Output:
For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateProvisioningTemplate](https://docs.aws.amazon.com/cli/latest/reference/iot/create-provisioning-template.html) in *AWS CLI Command Reference*.

**create-role-alias**

The following code example shows how to use create-role-alias.

**AWS CLI**

To create a role alias

The following `create-role-alias` example creates a role alias called `LightBulbRole` for the specified role.

```bash
aws iot create-role-alias 
   --role-alias LightBulbRole 
   --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:

```
{
   "roleAlias": "LightBulbRole",
   "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see [CreateRoleAlias](https://docs.aws.amazon.com/iot/latest/apireference/API_CreateRoleAlias.html) in the *AWS IoT API Reference*.

- For API details, see [CreateRoleAlias](https://docs.aws.amazon.com/cli/latest/reference/iot/create-role-alias.html) in *AWS CLI Command Reference*.

**create-scheduled-audit**

The following code example shows how to use create-scheduled-audit.

```json
{
   "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-template",
   "templateName": "widget-template",
   "defaultVersionId": 1
}
```

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateProvisioningTemplate](https://docs.aws.amazon.com/cli/latest/reference/iot/create-provisioning-template.html) in *AWS CLI Command Reference*. 

- For API details, see [CreateRoleAlias](https://docs.aws.amazon.com/iot/latest/apireference/API_CreateRoleAlias.html) in the *AWS IoT API Reference*.

- For API details, see [CreateRoleAlias](https://docs.aws.amazon.com/cli/latest/reference/iot/create-role-alias.html) in *AWS CLI Command Reference*. 

- For API details, see [CreateRoleAlias](https://docs.aws.amazon.com/iot/latest/apireference/API_CreateScheduledAudit.html) in the *AWS IoT API Reference*.

- For API details, see [CreateRoleAlias](https://docs.aws.amazon.com/cli/latest/reference/iot/create-scheduled-audit.html) in *AWS CLI Command Reference*.
AWS CLI

**To create a scheduled audit**

The following `create-scheduled-audit` example creates a scheduled audit that runs weekly, on Wednesday, to check if CA certificates or device certificates are expiring.

```bash
aws iot create-scheduled-audit \
   --scheduled-audit-name WednesdayCertCheck \
   --frequency WEEKLY \
   --day-of-week WED \
   --target-check-names CA_CERTIFICATE_EXPIRING_CHECK DEVICE_CERTIFICATE_EXPIRING_CHECK
```

Output:

```json
{
   "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/WednesdayCertCheck"
}
```

For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/audit-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [CreateScheduledAudit](https://docs.aws.amazon.com/cli/latest/reference/iot/create-scheduled-audit.html) in *AWS CLI Command Reference*.

**create-security-profile**

The following code example shows how to use `create-security-profile`.

AWS CLI

**To create a security profile**

The following `create-security-profile` example creates a security profile that checks if cellular bandwidth exceeds a threshold or if more than 10 authorization failures occur within a five-minute period.

```bash
aws iot create-security-profile \
   --security-profile-name PossibleIssue \
   --security-profile-description "Check to see if authorization fails 10 times in 5 minutes or if cellular bandwidth exceeds 128"
```
--behaviors "[{
  "name": "CellularBandwidth",
  "metric": "aws:message-byte-size",
  "criteria": {
    "comparisonOperator": "greater-than",
    "value": {
      "count": 128,
      "consecutiveDatapointsToAlarm": 1,
      "consecutiveDatapointsToClear": 1
    }
  },
  "name": "Authorization",
  "metric": "aws:num-authorization-failures",
  "criteria": {
    "comparisonOperator": "less-than",
    "value": {
      "count": 10,
      "durationSeconds": 300,
      "consecutiveDatapointsToAlarm": 1,
      "consecutiveDatapointsToClear": 1
    }
  }
]"

Output:

{
  "securityProfileName": "PossibleIssue",
  "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/PossibleIssue"
}

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see CreateSecurityProfile in AWS CLI Command Reference.

create-stream

The following code example shows how to use create-stream.

AWS CLI

To create a stream for delivering one or more large files in chunks over MQTT

The following create-stream example creates a stream for delivering one or more large files in chunks over MQTT. A stream transports data bytes in chunks or blocks packaged as MQTT messages from a source like S3. You can have one or more files associated with a stream.

```
aws iot create-stream \
  --cli-input-json file://create-stream.json
```

Contents of create-stream.json:

```json
{
  "streamId": "stream12345",
  "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
  "files": [
    {
      "fileId": 123,
```
"s3Location": {
    "bucket": "codesign-ota-bucket",
    "key": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
}
],
"roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
}
}

Output:

{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "streamVersion": "1"
}

For more information, see CreateStream in the AWS IoT API Reference.

- For API details, see CreateStream in AWS CLI Command Reference.

create-thing-group

The following code example shows how to use create-thing-group.

AWS CLI

**Example 1: To create a thing group**

The following create-thing-group example creates a thing group named LightBulbs with a description and two attributes.

```bash
aws iot create-thing-group \
    --thing-group-name LightBulbs \
    --thing-group-properties "thingGroupDescription="Generic bulb group",
    attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```json
{
    "thingGroupName": "LightBulbs",
```
Example 2: To create a thing group that's part of a parent group

The following create-thing-group creates a thing group named HalogenBulbs that has a parent thing group named LightBulbs.

```bash
aws iot create-thing-group \
    --thing-group-name HalogenBulbs \
    --parent-group-name LightBulbs
```

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e"
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/). 
- For API details, see [CreateThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/create-thing-group.html) in AWS CLI Command Reference.

### create-thing-type

The following code example shows how to use create-thing-type.

**AWS CLI**

**To define a thing type**

The following create-thing-type example defines a thing type and associated attributes.

```bash
aws iot create-thing-type \
    --thing-type-name "LightBulb" \
    --thing-type-properties "thingTypeDescription=light bulb type, searchableAttributes=wattage,model"
```

Output:
For more information, see Thing Types in the AWS IoT Developers Guide.

• For API details, see CreateThingType in AWS CLI Command Reference.

create-thing

The following code example shows how to use create-thing.

AWS CLI

Example 1: To create a thing record in the registry

The following create-thing example creates an entry for a device in the AWS IoT thing registry.

```
aws iot create-thing \
   --thing-name SampleIoTThing
```

Output:

```
{
   "thingName": "SampleIoTThing",
   "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/SampleIoTThing",
   "thingId": "EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE"
}
```

Example 2: To define a thing that is associated with a thing type

The following create-thing example create a thing that has the specified thing type and its attributes.

```
aws iot create-thing \
   --thing-name "MyLightBulb" \n   --thing-type-name "LightBulb"
```
--attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"

Output:

```
{
    "thingName": "MyLightBulb",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingId": "40da2e73-c6af-406e-b415-15acae538797"
}
```

For more information, see [How to Manage Things with the Registry](#) and [Thing Types](#) in the [AWS IoT Developers Guide](#).

- For API details, see [CreateThing](#) in [AWS CLI Command Reference](#).

### create-topic-rule-destination

The following code example shows how to use `create-topic-rule-destination`.

**AWS CLI**

**To create a topic rule destination**

The following `create-topic-rule-destination` example creates a topic rule destination for an HTTP endpoint.

```
aws iot create-topic-rule-destination \
    --destination-configuration httpUrlConfiguration={confirmationUrl=https://example.com}
```

Output:

```
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "status": "IN_PROGRESS",
        "statusReason": "Awaiting confirmation. Confirmation message sent on 2020-07-09T22:47:54.154Z; no response received from the endpoint.",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
        }
    }
```
For more information, see [Creating a topic rule destination](https://docs.aws.amazon.com/iot/latest/developerguide/create-rule-topic.html) in the *AWS IoT Developer Guide*.

- For API details, see [CreateTopicRuleDestination](https://docs.aws.amazon.com/cli/latest/reference/iot/create-topic-rule.html) in *AWS CLI Command Reference*.

### create-topic-rule

The following code example shows how to use `create-topic-rule`.

**AWS CLI**

**To create a rule that sends an Amazon SNS alert**

The following `create-topic-rule` example creates a rule that sends an Amazon SNS message when soil moisture level readings, as found in a device shadow, are low.

```bash
aws iot create-topic-rule \
   --rule-name "LowMoistureRule" \
   --topic-rule-payload file://plant-rule.json
```

The example requires the following JSON code to be saved to a file named `plant-rule.json`:

```json
{
    "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE state.reported.moisture = 'low'\n",
    "description": "Sends an alert whenever soil moisture level readings are too low.",
    "ruleDisabled": false,
    "awsIotSqlVersion": "2016-03-23",
    "actions": [{
        "sns": {
            "roleArn": "arn:aws:iam::123456789012:role/service-role/MyRPiLowMoistureTopicRole",
            "messageFormat": "RAW"
        }
    }]
}
```
This command produces no output.

For more information, see Creating an AWS IoT Rule in the AWS IoT Developers Guide.

- For API details, see CreateTopicRule in AWS CLI Command Reference.

delete-account-audit-configuration

The following code example shows how to use delete-account-audit-configuration.

AWS CLI

To disable all audit checks for your AWS account

The following delete-account-audit-configuration example restores the default settings for AWS IoT Device Defender for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account. Use this command with caution.

```
aws iot delete-account-audit-configuration \
    --delete-scheduled-audits
```

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DeleteAccountAuditConfiguration in AWS CLI Command Reference.

delete-audit-suppression

The following code example shows how to use delete-audit-suppression.

AWS CLI

To delete an audit finding suppression

The following delete-audit-suppression example deletes an audit finding suppression for DEVICE_CERTIFICATE_EXPIRING_CHECK.

```
aws iot delete-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK
```
This command produces no output.

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-cli-delete-audit-suppression.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteAuditSuppression](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-cli-command-reference.html) in *AWS CLI Command Reference*.

### delete-authorizer

The following code example shows how to use `delete-authorizer`.

**AWS CLI**

**To delete a custom authorizer**

The following `delete-authorizer` example deletes the authorizer named `CustomAuthorizer`. A custom authorizer must be in the INACTIVE state before you can delete it.

```bash
aws iot delete-authorizer \   
   --authorizer-name CustomAuthorizer
```

This command produces no output.

For more information, see [DeleteAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-cli-command-reference.html) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-cli-command-reference.html) in *AWS CLI Command Reference*.

### delete-billing-group

The following code example shows how to use `delete-billing-group`.

**AWS CLI**

**To delete a billing group**

The following `delete-billing-group` example deletes the specified billing group. You can delete a billing group even if it contains one or more things.

```bash
aws iot delete-billing-group \
```

Actions and scenarios
This command does not produce any output.

For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see DeleteBillingGroup in AWS CLI Command Reference.

deleate-ca-certificate

The following code example shows how to use delete-ca-certificate.

AWS CLI

To delete a CA certificate

The following delete-ca-certificate example deletes the CA certificate with the specified certificate ID.

```
aws iot delete-ca-certificate \
   --certificate-id \
   f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

This command produces no output.

For more information, see DeleteCACertificate in the AWS IoT API Reference.

- For API details, see DeleteCaCertificate in AWS CLI Command Reference.

deleate-certificate

The following code example shows how to use delete-certificate.

AWS CLI

To delete a device certificate

The following delete-certificate example deletes the device certificate with the specified ID.

```
aws iot delete-certificate \
```
This command produces no output.

For more information, see DeleteCertificate in the AWS IoT API Reference.

- For API details, see DeleteCertificate in AWS CLI Command Reference.

delte-custom-metric

The following code example shows how to use delete-custom-metric.

AWS CLI

To delete a custom metric

The following delete-custom-metric example deletes a custom metric.

```
aws iot delete-custom-metric \
    --metric-name batteryPercentage \
    --region us-east-1
```

Output:

HTTP 200

For more information, see Custom metrics in the AWS IoT Core Developer Guide.

- For API details, see DeleteCustomMetric in AWS CLI Command Reference.

delte-dimension

The following code example shows how to use delete-dimension.

AWS CLI

To delete a dimension

The following delete-dimension example deletes a dimension called TopicFilterForAuthMessages.
aws iot delete-dimension \ 
   --name TopicFilterForAuthMessages

This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.
- For API details, see DeleteDimension in AWS CLI Command Reference.

delete-domain-configuration

The following code example shows how to use delete-domain-configuration.

AWS CLI

To delete a domain configuration

The following delete-domain-configuration example deletes a domain configuration named additionalDataDomain from your AWS account.

aws iot delete-domain-configuration \ 
   --domain-configuration-name "additionalDataDomain" \ 
   --domain-configuration-status "OK"

This command produces no output.

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.
- For API details, see DeleteDomainConfiguration in AWS CLI Command Reference.

delete-dynamic-thing-group

The following code example shows how to use delete-dynamic-thing-group.

AWS CLI

To delete a dynamic thing group

The following delete-dynamic-thing-group example deletes the specified dynamic thing group.

aws iot delete-dynamic-thing-group \

This command produces no output.

For more information, see Dynamic Thing Groups in the AWS IoT Developers Guide.

- For API details, see DeleteDynamicThingGroup in AWS CLI Command Reference.

delete-job-execution

The following code example shows how to use delete-job-execution.

AWS CLI

To delete a job execution

The following delete-job-execution example deletes the job execution of the specified job on a device. Use describe-job-execution to get the execution number.

```
aws iot delete-job-execution
   --job-id "example-job-02"
   --thing-name "MyRaspberryPi"
   --execution-number 1
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DeleteJobExecution in AWS CLI Command Reference.

delete-job

The following code example shows how to use delete-job.

AWS CLI

To delete a job

The following delete-job example deletes the specified job. By specifying the --force option, the job is deleted even if the status is IN_PROGRESS.

```
aws iot delete-job \
```
--job-id "example-job-04" \
--force

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DeleteJob in AWS CLI Command Reference.

delemitigation-action

The following code example shows how to use delete-mitigation-action.

AWS CLI

To delete a mitigation action

The following delete-mitigation-action example deletes the specified mitigation action.

aws iot delete-mitigation-action \
--action-name AddThingsToQuarantineGroup1Action

This command produces no output.

For more information, see DeleteMitigationAction (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see DeleteMitigationAction in AWS CLI Command Reference.

delete-ota-update

The following code example shows how to use delete-ota-update.

AWS CLI

To delete an OTA update

The following delete-ota-update example deletes the specified OTA update.

aws iot delete-ota-update \
--ota-update-id ota12345 \

This command produces no output.

For more information, see DeleteOTAUpdate in the AWS IoT API Reference.

For API details, see DeleteOtaUpdate in AWS CLI Command Reference.

delte-policy-version

The following code example shows how to use delete-policy-version.

AWS CLI

To delete a version of policy

The following delete-policy-version example deletes version 2 of the specified policy from your AWS account.

```
aws iot delete-policy-version \
  --policy-name UpdateDeviceCertPolicy \
  --policy-version-id 2
```

This command produces no output.

For more information, see AWS IoT Policies in the AWS IoT Developer Guide.

For API details, see DeletePolicyVersion in AWS CLI Command Reference.

delte-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete a policy

The following delete-policy example deletes the specified policy from your AWS account.

```
aws iot delete-policy --policy-name UpdateDeviceCertPolicy
```
This command produces no output.

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

- For API details, see DeletePolicy in AWS CLI Command Reference.

**delete-provisioning-template-version**

The following code example shows how to use delete-provisioning-template-version.

**AWS CLI**

**To delete a provisioning template version**

The following delete-provisioning-template-version example deletes version 2 of the specified provisioning template.

```bash
aws iot delete-provisioning-template-version \
  --version-id 2 \n  --template-name "widget-template"
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the AWS IoT Core Developer Guide.

- For API details, see DeleteProvisioningTemplateVersion in AWS CLI Command Reference.

**delete-provisioning-template**

The following code example shows how to use delete-provisioning-template.

**AWS CLI**

**To delete a provisioning template**

The following delete-provisioning-template example deletes the specified provisioning template.

```bash
aws iot delete-provisioning-template \
  --template-name widget-template
```
This command produces no output.

For more information, see [AWS IoT Secure Tunneling](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [DeleteProvisioningTemplate](#) in *AWS CLI Command Reference*.

### delete-registration-code

The following code example shows how to use `delete-registration-code`.

**AWS CLI**

**To delete your registration code**

The following `delete-registration-code` example deletes an AWS IoT account-specific registration code.

```
aws iot delete-registration-code
```

This command produces no output.

For more information, see [Use Your Own Certificate](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteRegistrationCode](#) in *AWS CLI Command Reference*.

### delete-role-alias

The following code example shows how to use `delete-role-alias`.

**AWS CLI**

**To delete an AWS IoT role alias**

The following `delete-role-alias` example deletes an AWS IoT role alias named `LightBulbRole`.

```
aws iot delete-role-alias \
   --role-alias LightBulbRole
```

This command produces no output.
For more information, see Authorizing Direct Calls to AWS Services in the AWS IoT Developer Guide.

- For API details, see DeleteRoleAlias in AWS CLI Command Reference.

delete-scheduled-audit

The following code example shows how to use delete-scheduled-audit.

AWS CLI

To delete a scheduled audit

The following delete-scheduled-audit example deletes the AWS IoT Device Defender scheduled audit named AWSIoTDeviceDefenderDailyAudit.

```bash
aws iot delete-scheduled-audit \
  --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DeleteScheduledAudit in AWS CLI Command Reference.

delete-security-profile

The following code example shows how to use delete-security-profile.

AWS CLI

To delete a security profile

The following delete-security-profile example deletes a security profile named PossibleIssue.

```bash
aws iot delete-security-profile \
  --security-profile-name PossibleIssue
```

This command produces no output.
For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DeleteSecurityProfile in AWS CLI Command Reference.

delete-stream

The following code example shows how to use delete-stream.

AWS CLI

To delete a stream

The following delete-stream example deletes the specified stream.

```bash
aws iot delete-stream \
   --stream-id stream12345
```

This command produces no output.

For more information, see DeleteStream in the AWS IoT API Reference.
- For API details, see DeleteStream in AWS CLI Command Reference.

delete-thing-group

The following code example shows how to use delete-thing-group.

AWS CLI

To delete a thing group

The following delete-thing-group example deletes the specified thing group. You cannot delete a thing group if it contains child thing groups.

```bash
aws iot delete-thing-group \
   --thing-group-name DefectiveBulbs
```

This command produces no output.

For more information, see Thing Groups in the AWS IoT Developers Guide.
- For API details, see DeleteThingGroup in AWS CLI Command Reference.
**delete-thing-type**

The following code example shows how to use `delete-thing-type`.

**AWS CLI**

**Example 1: To delete a thing type**

The following `delete-thing-type` example deletes a deprecated thing type.

```
aws iot delete-thing-type \
  --thing-type-name "obsoleteThingType"
```

This command produces no output.

For more information, see [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/thing-types.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThingType](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-thing-type.html) in *AWS CLI Command Reference*.

**delete-thing**

The following code example shows how to use `delete-thing`.

**AWS CLI**

**To display detailed information about a thing**

The following `delete-thing` example deletes a thing from the AWS IoT registry for your AWS account.

```
aws iot delete-thing --thing-name "FourthBulb"
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/thing-registry-manage.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThing](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-thing.html) in *AWS CLI Command Reference*.

**delete-topic-rule-destination**

The following code example shows how to use `delete-topic-rule-destination`.
AWS CLI

**To delete a topic rule destination**

The following `delete-topic-rule-destination` example deletes the specified topic rule destination.

```bash
aws iot delete-topic-rule-destination --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

This command produces no output.

For more information, see [Deleting a topic rule destination](https://docs.aws.amazon.com/iot/latest/developerguide/iot-topic-rule-destination.html) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteTopicRuleDestination](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-topic-rule-destination.html) in *AWS CLI Command Reference*.

**delete-topic-rule**

The following code example shows how to use `delete-topic-rule`.

AWS CLI

**To delete a rule**

The following `delete-topic-rule` example deletes the specified rule.

```bash
aws iot delete-topic-rule --rule-name "LowMoistureRule"
```

This command produces no output.

For more information, see [Deleting a Rule](https://docs.aws.amazon.com/iot/latest/developerguide/iot-rule-delete.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteTopicRule](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-topic-rule.html) in *AWS CLI Command Reference*.

**delete-v2-logging-level**

The following code example shows how to use `delete-v2-logging-level`.

AWS CLI

**To delete the logging level for a thing group**
The following `delete-v2-logging-level` example deletes the logging level for the specified thing group.

```
aws iot delete-v2-logging-level
   --target-type THING_GROUP
   --target-name LightBulbs
```

This command produces no output.

- For API details, see `DeleteV2LoggingLevel` in *AWS CLI Command Reference*.

**deprecate-thing-type**

The following code example shows how to use `deprecate-thing-type`.

**AWS CLI**

**Example 1: To deprecate a thing type**

The following `deprecate-thing-type` example deprecates a thing type so that users can't associate any new things with it.

```
aws iot deprecate-thing-type
   --thing-type-name "obsoleteThingType"
```

This command produces no output.

**Example 2: To reverse the deprecation of a thing type**

The following `deprecate-thing-type` example reverses the deprecation of a thing type, which makes it possible for users to associate new things with it again.

```
aws iot deprecate-thing-type
   --thing-type-name "obsoleteThingType"
   --undo-deprecate
```

This command produces no output.

For more information, see *Thing Types* in the *AWS IoT Developers Guide*.

- For API details, see `DeprecateThingType` in *AWS CLI Command Reference*. 
describe-account-audit-configuration

The following code example shows how to use describe-account-audit-configuration.

AWS CLI

**To view current audit configuration settings**

The following describe-account-audit-configuration example lists the current settings for your AWS IoT Device Defender audit configuration.

```bash
aws iot describe-account-audit-configuration
```

**Output:**

```json
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/AWSIoTDeviceDefenderAudit_1551201085996",
    "auditNotificationTargetConfigurations": {
        "SNS": {
            "roleArn": "arn:aws:iam::123456789012:role/service-role/AWSIoTDeviceDefenderAudit",
            "enabled": true
        }
    },
    "auditCheckConfigurations": {
        "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
            "enabled": true
        },
        "CA_CERTIFICATE_EXPIRING_CHECK": {
            "enabled": true
        },
        "CONFLICTING_CLIENT_IDS_CHECK": {
            "enabled": true
        },
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "enabled": true
        },
        "DEVICE_CERTIFICATE_SHARED_CHECK": {
            "enabled": true
        },
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
```
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DescribeAccountAuditConfiguration in AWS CLI Command Reference.

describe-audit-finding

The following code example shows how to use describe-audit-finding.

AWS CLI

To list details for an audit finding

The following describe-audit-finding example lists the details for the specified AWS IoT Device Defender audit finding. An audit can produce multiple findings. Use the list-audit-findings command to get a list of the findings from an audit to get the findingId.

```bash
aws iot describe-audit-finding \\
  --finding-id "ef4826b8-e55a-44b9-b460-5c485355371b"
```

Output:

```json
{
  "finding": {
    "findingId": "ef4826b8-e55a-44b9-b460-5c485355371b",
```
For more information, see Check Audit Results (Audit Commands) in the AWS IoT Developer Guide.

- For API details, see DescribeAuditFinding in AWS CLI Command Reference.

describe-audit-mitigation-actions-task

The following code example shows how to use describe-audit-mitigation-actions-task.

AWS CLI

To show the details of an audit mitigation actions task

The following describe-audit-mitigation-actions-task example shows the details for the specified task, where the ResetPolicyVersionAction was applied to a finding. The results include when the task started and ended, how many findings were targeted (and the outcome), and the definition of the action that is applied as part of this task.

aws iot describe-audit-mitigation-actions-task \
  --task-id ResetPolicyTask01
Output:

```json
{
    "taskStatus": "COMPLETED",
    "startTime": "2019-12-10T15:13:19.457000-08:00",
    "endTime": "2019-12-10T15:13:19.947000-08:00",
    "taskStatistics": {
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
            "totalFindingsCount": 1,
            "failedFindingsCount": 0,
            "succeededFindingsCount": 1,
            "skippedFindingsCount": 0,
            "canceledFindingsCount": 0
        }
    },
    "target": {
        "findingIds": [
            "ef4826b8-e55a-44b9-b460-5c485355371b"
        ]
    },
    "auditCheckToActionsMapping": {
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": [
            "ResetPolicyVersionAction"
        ]
    },
    "actionsDefinition": [
        {
            "name": "ResetPolicyVersionAction",
            "id": "1ea0b415-bef1-4a01-bd13-72fb63c59af8",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/ReplacePolicyVersionRole",
            "actionParams": {
                "replaceDefaultPolicyVersionParams": {
                    "templateName": "BLANK_POLICY"
                }
            }
        }
    ]
}
```

For more information, see [DescribeAuditMitigationActionsTask (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/developerguide/mfaudit-api-descr-behavior-action.html) in the AWS IoT Developer Guide.

- For API details, see [DescribeAuditMitigationActionsTask](https://docs.aws.amazon.com/iot/latest/developerguide/mfaudit-api-descr-behavior-action.html) in AWS CLI Command Reference.
describe-audit-suppression

The following code example shows how to use describe-audit-suppression.

AWS CLI

To get details about an audit finding suppression

The following describe-audit-suppression example lists details about an audit finding suppression.

```
aws iot describe-audit-task \
  --task-id "787ed873b69cb4d6c6d6ae6ddd06996c5"
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK",
    "taskStartTime": 1596168096.157,
    "taskStatistics": {
        "totalChecks": 1,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 0,
        "nonCompliantChecks": 1,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "auditDetails": {
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_NON_COMPLIANT",
            "checkCompliant": false,
            "totalResourcesCount": 195,
            "nonCompliantResourcesCount": 2
        }
    }
}
```

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/latest/developerguide/audit-suppressions.html) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeAuditSuppression](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-audit-suppression.html) in *AWS CLI Command Reference.*
describe-audit-task

The following code example shows how to use describe-audit-task.

AWS CLI

To get information about an audit instance

The following describe-audit-task example gets information about an instance of an AWS IoT Device Defender audit. If the audit is complete, summary statistics for the run are included in the results.

```bash
aws iot describe-audit-task \
  --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "taskType": "ON_DEMAND_AUDIT_TASK",
    "taskStartTime": 1560356923.434,
    "taskStatistics": {
        "totalChecks": 3,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 3,
        "nonCompliantChecks": 0,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "auditDetails": {
        "CA_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 0,
            "nonCompliantResourcesCount": 0
        },
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 6,
            "nonCompliantResourcesCount": 0
        }
    }
}
```
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DescribeAuditTask in AWS CLI Command Reference.

describe-authorizer

The following code example shows how to use describe-authorizer.

AWS CLI

To get information about a custom authorizer

The following describe-authorizer example displays details for the specified custom authorizer.

```
aws iot describe-authorizer \
   --authorizer-name CustomAuthorizer
```

Output:

```
{
   "authorizerDescription": {
      "authorizerName": "CustomAuthorizer",
      "tokenKeyName": "MyAuthToken",
      "tokenSigningPublicKeys": {
         "FIRST_KEY": "-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwoZ+7ENxAio9q6QD4FFqjGZsvjtYwjoehK0U8E9xsb503kRSmyIwTzwzm/f4Gf0Y-----END PUBLIC KEY-----"
      }
   }
}
```
For more information, see [DescribeAuthorizer](#) in the AWS IoT API Reference.

- For API details, see [DescribeAuthorizer](#) in AWS CLI Command Reference.

**describe-billing-group**

The following code example shows how to use `describe-billing-group`.

**AWS CLI**

**To get information about a billing group**

The following `describe-billing-group` example gets information for the specified billing group.

```
aws iot describe-billing-group --billing-group-name GroupOne
```

**Output:**

```json
{
    "billingGroupName": "GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "version": 1,
    "billingGroupProperties": {},
    "billingGroupMetadata": {
        "creationDate": 1560199355.378
    }
}
```
For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see DescribeBillingGroup in AWS CLI Command Reference.

**describe-ca-certificate**

The following code example shows how to use describe-ca-certificate.

**AWS CLI**

**To get details about a CA certificate**

The following describe-ca-certificate example displays the details for the specified CA certificate.

```bash
aws iot describe-ca-certificate \
   --certificate-id f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```json
{
   "certificateDescription": {
      "certificateId": "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
      "status": "INACTIVE",
      "certificatePem": "-----BEGIN CERTIFICATE-----

For more information, see [DescribeCACertificate](https://docs.aws.amazon.com/iot/latest/Developerguide/iot-apis.html#iot-apis-003) in the *AWS IoT API Reference*.

- For API details, see [DescribeCaCertificate](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-certificate.html) in *AWS CLI Command Reference*.

**describe-certificate**

The following code example shows how to use `describe-certificate`.

**AWS CLI**

**To get information about a certificate**

The following `describe-certificate` example displays the details for the specified certificate.

```
aws iot describe-certificate \
    --certificate-id \\
        "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

**Output:**

```
{
    "certificateDescription": {
        "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",
        "certificateId": "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",
        "status": "ACTIVE",

For more information, see DescribeCertificate in the AWS IoT API Reference.

- For API details, see DescribeCertificate in AWS CLI Command Reference.

describe-custom-metric

The following code example shows how to use describe-custom-metric.

AWS CLI

To get information about a Device Defender custom metric

The following describe-custom-metric example gets information about a custom metric named myCustomMetric.
aws iot describe-custom-metric \
    --metric-name myCustomMetric

Output:

```json
{
    "metricName": "myCustomMetric",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/myCustomMetric",
    "metricType": "number",
    "displayName": "My custom metric",
    "creationDate": 2020-11-17T23:02:12.879000-09:00,
    "lastModifiedDate": 2020-11-17T23:02:12.879000-09:00
}
```

For more information, see Custom metrics in the AWS IoT Core Developer Guide.

- For API details, see DescribeCustomMetric in AWS CLI Command Reference.

**describe-default-authorizer**

The following code example shows how to use describe-default-authorizer.

**AWS CLI**

**To get information about the default custom authorizer**

The following describe-default-authorizer example displays details for the default custom authorizer.

```bash
aws iot describe-default-authorizer
```

Output:

```json
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer"
}
```

For more information, see DescribeDefaultAuthorizer in the AWS IoT API Reference.

- For API details, see DescribeDefaultAuthorizer in AWS CLI Command Reference.
describe-dimension

The following code example shows how to use describe-dimension.

AWS CLI

To get information about a dimension

The following describe-dimension example gets information about a dimension named TopicFilterForAuthMessages.

```
aws iot describe-dimension \
   --name TopicFilterForAuthMessages
```

Output:

```
{
   "name": "TopicFilterForAuthMessages",
   "type": "TOPIC_FILTER",
   "stringValues": [
      "device/+/auth"
   ],
   "creationDate": 1578620223.255,
   "lastModifiedDate": 1578620223.255
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DescribeDimension in AWS CLI Command Reference.

describe-domain-configuration

The following code example shows how to use describe-domain-configuration.

AWS CLI

To describe a domain configuration

The following describe-domain-configuration example displays details about the specified domain configuration.
aws iot describe-domain-configuration \
   --domain-configuration-name "additionalDataDomain"

Output:

```json
{
   "domainConfigurationName": "additionalDataDomain",
   "domainConfigurationArn": "arn:aws:iot:us-east-1:758EXAMPLE143:domainconfiguration/additionalDataDomain/norpw",
   "domainName": "d055exampleed74y71zfd-ats.beta.us-east-1.iot.amazonaws.com",
   "serverCertificates": [],
   "domainConfigurationStatus": "ENABLED",
   "serviceType": "DATA",
   "domainType": "AWS_MANAGED",
   "lastStatusChangeDate": 1601923783.774
}
```

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see DescribeDomainConfiguration in AWS CLI Command Reference.

**describe-endpoint**

The following code example shows how to use describe-endpoint.

**AWS CLI**

**Example 1: To get your current AWS endpoint**

The following describe-endpoint example retrieves the default AWS endpoint to which all commands are applied.

```bash
aws iot describe-endpoint
```

Output:

```json
{
   "endpointAddress": "abc123defghijk.iot.us-west-2.amazonaws.com"
}
```

For more information, see DescribeEndpoint in the AWS IoT Developer Guide.
Example 2: To get your ATS endpoint

The following describe-endpoint example retrieves the Amazon Trust Services (ATS) endpoint.

```bash
aws iot describe-endpoint
   --endpoint-type iot:Data-ATS
```

Output:

```json
{
   "endpointAddress": "abc123defghijk-ats.iot.us-west-2.amazonaws.com"
}
```

For more information, see X.509 Certificates and AWS IoT in the AWS IoT Developer Guide.

- For API details, see DescribeEndpoint in AWS CLI Command Reference.

**describe-event-configurations**

The following code example shows how to use describe-event-configurations.

**AWS CLI**

To show which event types are published

The following describe-event-configurations example lists the configuration that controls which events are generated when something is added, updated, or deleted.

```bash
aws iot describe-event-configurations
```

Output:

```json
{
   "eventConfigurations": {
      "CA_CERTIFICATE": {
         "Enabled": false
      },
      "CERTIFICATE": {
         "Enabled": false
      }
   }
}
```
"JOB": {
    "Enabled": false
},
"JOB_EXECUTION": {
    "Enabled": false
},
"POLICY": {
    "Enabled": false
},
"THING": {
    "Enabled": false
},
"THING_GROUP": {
    "Enabled": false
},
"THING_GROUP_HIERARCHY": {
    "Enabled": false
},
"THING_GROUP_MEMBERSHIP": {
    "Enabled": false
},
"THING_TYPE": {
    "Enabled": false
},
"THING_TYPE_ASSOCIATION": {
    "Enabled": false
}
}

For more information, see [Event Messages](#) in the [AWS IoT Developer Guide](#).

- For API details, see [DescribeEventConfigurations](#) in [AWS CLI Command Reference](#).

describe-index

The following code example shows how to use describe-index.

**AWS CLI**

**To retrieve the current status of the thing index**

The following describe-index example retrieves the current status of the thing index.
```bash
aws iot describe-index \\n   --index-name "AWS_Things"
```

Output:

```json
{
    "indexName": "AWS_Things",
    "indexStatus": "ACTIVE",
    "schema": "REGISTRY_AND_SHADOW_AND_CONNECTIVITY_STATUS"
}
```

For more information, see [Managing Thing Indexing](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeIndex](#) in *AWS CLI Command Reference*.

### describe-job-execution

The following code example shows how to use `describe-job-execution`.

**AWS CLI**

**To get execution details for a job on a device**

The following `describe-job-execution` example gets execution details for the specified job.

```bash
aws iot describe-job-execution \\
   --job-id "example-job-01" \\
   --thing-name "MyRaspberryPi"
```

Output:

```json
{
    "execution": {
        "jobId": "example-job-01",
        "status": "QUEUED",
        "statusDetails": {},
        "queuedAt": 1560787023.636,
        "lastUpdatedAt": 1560787023.636,
        "executionNumber": 1,
        "versionNumber": 1
    }
}
```
For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DescribeJobExecution in AWS CLI Command Reference.

**describe-job**

The following code example shows how to use `describe-job`.

**AWS CLI**

**To get detailed status for a job**

The following `describe-job` example gets detailed status for the job whose ID is `example-job-01`.

```bash
aws iot describe-job \
   --job-id "example-job-01"
```

**Output:**

```json
{
   "job": {
      "jobId": "example-job-01",
      "targetSelection": "SNAPSHOT",
      "status": "IN_PROGRESS",
      "targets": [
      ],
      "description": "example job test",
      "presignedUrlConfig": {},
      "jobExecutionsRolloutConfig": {},
      "createdAt": 1560787022.733,
      "lastUpdatedAt": 1560787026.294,
      "jobProcessDetails": {
         "numberOfCanceledThings": 0,
         "numberOfSucceededThings": 0,
         "numberOfFailedThings": 0,
         "numberOfRejectedThings": 0,
         "numberOfQueuedThings": 1,
```
"numberOfInProgressThings": 0,
"numberOfRemovedThings": 0,
"numberOfTimedOutThings": 0
},
"timeoutConfig": {}
}
}

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DescribeJob in AWS CLI Command Reference.

describe-mitigation-action

The following code example shows how to use describe-mitigation-action.

AWS CLI

To view the details for a defined mitigation action

The following describe-mitigation-action example displays details for the specified mitigation action.

```
aws iot describe-mitigation-action \
    --action-name AddThingsToQuarantineGroupAction
```

Output:

```json
{
    "actionName": "AddThingsToQuarantineGroupAction",
    "actionType": "ADD_THINGS_TO_THING_GROUP",
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
    "actionId": "2fd2726d-9be1-4abf-b10f-09465ccd6bfa",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/MoveThingsToQuarantineGroupRole",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ],
            "overrideDynamicGroups": true
        }
    }
}
```
For more information, see `DescribeMitigationAction (Mitigation Action Commands)` in the *AWS IoT Developer Guide*.

- For API details, see `DescribeMitigationAction` in *AWS CLI Command Reference*.

**describe-provisioning-template-version**

The following code example shows how to use `describe-provisioning-template-version`.

**AWS CLI**

**To describe a provisioning template version**

The following `describe-provisioning-template-version` example describes a provisioning template version.

```bash
aws iot describe-provisioning-template-version \
  --template-name MyTestProvisioningTemplate \
  --version-id 1
```

**Output:**

```json
{
  "versionId": 1,
  "creationDate": 1589308310.574,
  "templateBody": {
    "Parameters": {
      "SerialNumber": {
        "Type": "String"
      },
      "AWS::IoT::Certificate::Id": {
        "Type": "String"
      }
    },
    "Resources": {
      "certificate": {
        "Properties": {

```
For more information, see Provisioning devices that don’t have device certificates using fleet provisioning in the AWS IoT Core Developers Guide.

- For API details, see DescribeProvisioningTemplateVersion in AWS CLI Command Reference.
describe-provisioning-template

The following code example shows how to use describe-provisioning-template.

AWS CLI

To describe a provisioning template

The following describe-provisioning-template example describes a provisioning template.

```bash
aws iot describe-provisioning-template \
   --template-name MyTestProvisioningTemplate
```

Output:

```json
{
   "templateName": "MyTestProvisioningTemplate",
   "creationDate": 1589308310.574,
   "lastModifiedDate": 1589308345.539,
   "defaultVersionId": 1,
   "templateBody": "{"Parameters":{
      "SerialNumber":{
         "Type":"String"
      },
      "AWS::IoT::Certificate::Id":{
         "Type":"String"
      }
   },
   "Resources":{
      "certificate":{
         "Properties":{

For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the AWS IoT Core Developers Guide.

- For API details, see DescribeProvisioningTemplate in AWS CLI Command Reference.

describe-role-alias

The following code example shows how to use describe-role-alias.
AWS CLI

To get information about an AWS IoT role alias

The following `describe-role-alias` example displays details for the specified role alias.

```bash
aws iot describe-role-alias \
    --role-alias LightBulbRole
```

Output:

```json
{
    "roleAliasDescription": {
        "roleAlias": "LightBulbRole",
        "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole",
        "roleArn": "arn:aws:iam::123456789012:role/light_bulb_role_001",
        "owner": "123456789012",
        "credentialDurationSeconds": 3600,
        "creationDate": 1570558643.221,
        "lastModifiedDate": 1570558643.221
    }
}
```

For more information, see `DescribeRoleAlias` in the AWS IoT API Reference.
- For API details, see `DescribeRoleAlias` in AWS CLI Command Reference.

describe-scheduled-audit

The following code example shows how to use `describe-scheduled-audit`.

AWS CLI

To get information about a scheduled audit

The following `describe-scheduled-audit` example gets detailed information about an AWS IOT Device Defender scheduled audit named AWSIoTDeviceDefenderDailyAudit.

```bash
aws iot describe-scheduled-audit \
    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

Output:
For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeScheduledAudit](#) in *AWS CLI Command Reference*.

describe-security-profile

The following code example shows how to use `describe-security-profile`.

**AWS CLI**

**To get information about a security profile**

The following `describe-security-profile` example gets information about the AWS IoT Device Defender security profile named `PossibleIssue`.

```bash
aws iot describe-security-profile \
  --security-profile-name PossibleIssue
```

**Output:**

```json
{
  "securityProfileName": "PossibleIssue",
  "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/PossibleIssue",
  "securityProfileDescription": "check to see if authorization fails 10 times in 5 minutes or if cellular bandwidth exceeds 128",
  "behaviors": [
```
For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DescribeSecurityProfile in AWS CLI Command Reference.

**describe-stream**

The following code example shows how to use describe-stream.

**AWS CLI**

**To get information about a stream**

The following describe-stream example displays the details about the specified stream.
```bash
aws iot describe-stream
--stream-id stream12345
```

Output:

```json
{
    "streamInfo": {
        "streamId": "stream12345",
        "streamVersion": 1,
        "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
        "files": [
            {
                "fileId": "123",
                "s3Location": {
                    "bucket": "codesign-ota-bucket",
                    "key": "48c67f5c-63bb-4f92-a98a-4ee0fbc2bef6"
                }
            }
        ],
        "createdAt": 1557863215.995,
        "lastUpdatedAt": 1557863215.995,
        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
    }
}
```

For more information, see [DescribeStream](https://docs.aws.amazon.com/iot/latest/developerguide/reference-nodejs.html) in the [AWS IoT API Reference](https://docs.aws.amazon.com/iot/latest/developerguide/reference-nodejs.html).

- For API details, see [DescribeStream](https://docs.aws.amazon.com/iot/latest/developerguide/reference-nodejs.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/iot/latest/developerguide/reference-nodejs.html).

**describe-thing-group**

The following code example shows how to use `describe-thing-group`.

**AWS CLI**

```
aws iot describe-thing-group
```

To get information about a thing group

The following `describe-thing-group` example gets information about the thing group named HalogenBulbs.
--thing-group-name HalogenBulbs

Output:

```javascript
{
  "thingGroupName": "HalogenBulbs",
  "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e",
  "version": 1,
  "thingGroupProperties": {},
  "thingGroupMetadata": {
    "parentGroupName": "LightBulbs",
    "rootToParentThingGroups": [
      {
        "groupName": "LightBulbs",
        "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
      }
    ],
    "creationDate": 1559927609.897
  }
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

- For API details, see [DescribeThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-thing-group.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-thing-group.html).

describe-thing-type

The following code example shows how to use describe-thing-type.

**AWS CLI**

To get information about a thing type

The following `describe-thing-type` example display information about the specified thing type defined in your AWS account.

```
aws iot describe-thing-type \
  --thing-type-name "LightBulb"
```

Output:
For more information, see Thing Types in the AWS IoT Developers Guide.

- For API details, see DescribeThingType in AWS CLI Command Reference.

describe-thing

The following code example shows how to use describe-thing.

AWS CLI

To display detailed information about a thing

The following describe-thing example display information about a thing (device) that is defined in the AWS IoT registry for your AWS account.

aws iot describe-thing --thing-name "MyLightBulb"

Output:

```json
{
    "defaultClientId": "MyLightBulb",
    "thingName": "MyLightBulb",
    "thingId": "40da2e73-c6af-406e-b415-15acae538797",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingTypeName": "LightBulb",
    "attributes": {
```
For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot-developer-guide/how-to-manage-things-with-the-registry.html) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeThing](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-thing.html) in *AWS CLI Command Reference*.

**detach-policy**

The following code example shows how to use `detach-policy`.

**AWS CLI**

**Example 1: To detach an AWS IoT policy from a thing group**

The following `detach-policy` example detaches the specified policy from a thing group and, by extension, from all things in that group and any of the group's child groups.

```bash
aws iot detach-policy
   --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
   --policy-name "MyFirstGroup_Core-policy"
```

This command produces no output.

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot-developer-guide/thing-groups.html) in the *AWS IoT Developers Guide*.

**Example 2: To detach an AWS IoT policy from a device certificate**

The following `detach-policy` example detaches the TemperatureSensorPolicy policy from a device certificate identified by ARN.

```bash
aws iot detach-policy
   --policy-name TemperatureSensorPolicy
   --target arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3c4aae57b7272ba44c4e3448142
```

This command produces no output.

- For API details, see [DetachPolicy](https://docs.aws.amazon.com/cli/latest/reference/iot/detach-policy.html) in *AWS CLI Command Reference*. 
**detach-security-profile**

The following code example shows how to use `detach-security-profile`.

**AWS CLI**

*To disassociate a security profile from a target*

The following `detach-security-profile` example removes the association between the AWS IoT Device Defender security profile named Testprofile and the all registered things target.

```
aws iot detach-security-profile \
    --security-profile-name Testprofile \
```

This command produces no output.

For more information, see [Detect Commands](https://docs.aws.amazon.com/iot-developer-guide/) in the *AWS IoT Developer Guide*.

- For API details, see [DetachSecurityProfile](https://docs.aws.amazon.com/cli/latest/reference/iot/detach-security-profile.html) in *AWS CLI Command Reference*.

**detach-thing-principal**

The following code example shows how to use `detach-thing-principal`.

**AWS CLI**

*To detach a certificate/principal from a thing*

The following `detach-thing-principal` example removes a certificate that represents a principal from the specified thing.

```
aws iot detach-thing-principal \
    --thing-name "MyLightBulb" \
    --principal "arn:aws:iot:us-west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36"
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot-developer-guide/) in the *AWS IoT Developers Guide*. 
• For API details, see DetachThingPrincipal in AWS CLI Command Reference.

disable-topic-rule

The following code example shows how to use disable-topic-rule.

AWS CLI

To disable a topic rule

The following disable-topic-rule example disables the specified topic rule.

```
aws iot disable-topic-rule  
  --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see Viewing Your Rules in the AWS IoT Developer Guide.

• For API details, see DisableTopicRule in AWS CLI Command Reference.

enable-topic-rule

The following code example shows how to use enable-topic-rule.

AWS CLI

To enable a topic rule

The following enable-topic-rule example enables (or re-enables) the specified topic rule.

```
aws iot enable-topic-rule  
  --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see Viewing Your Rules in the AWS IoT Developer Guide.

• For API details, see EnableTopicRule in AWS CLI Command Reference.

get-behavior-model-training-summaries

The following code example shows how to use get-behavior-model-training-summaries.
AWS CLI

To list a Device Defender's ML Detect Security Profile training model's status

The following `get-behavior-model-training-summaries` example lists model training status for the configured behaviors in the chosen Security Profile. For each behavior, the name, model status, and percentage of datapoints collected are listed.

```bash
aws iot get-behavior-model-training-summaries \
   --security-profile-name MySecuirtyProfileName
```

Output:

```json
{
   "summaries": [
   {
      "securityProfileName": "MySecuirtyProfileName",
      "behaviorName": "Messages_sent_ML_behavior",
      "modelStatus": "PENDING_BUILD",
      "datapointsCollectionPercentage": 0.0
   },
   {
      "securityProfileName": "MySecuirtyProfileName",
      "behaviorName": "Messages_received_ML_behavior",
      "modelStatus": "PENDING_BUILD",
      "datapointsCollectionPercentage": 0.0
   },
   {
      "securityProfileName": "MySecuirtyProfileName",
      "behaviorName": "Authorization_failures_ML_behavior",
      "modelStatus": "PENDING_BUILD",
      "datapointsCollectionPercentage": 0.0
   },
   {
      "securityProfileName": "MySecuirtyProfileName",
      "behaviorName": "Message_size_ML_behavior",
      "modelStatus": "PENDING_BUILD",
      "datapointsCollectionPercentage": 0.0
   },
   {
      "securityProfileName": "MySecuirtyProfileName",
      "behaviorName": "Connection_attempts_ML_behavior",
      "modelStatus": "PENDING_BUILD",
      "datapointsCollectionPercentage": 0.0
   }
   ]
}
```
For more information, see `GetBehaviorModelTrainingSummaries (Detect Commands)` in the `AWS IoT Developer Guide`.

- For API details, see `GetBehaviorModelTrainingSummaries` in `AWS CLI Command Reference`.

**get-cardinality**

The following code example shows how to use get-cardinality.

**AWS CLI**

**To return the approximate count of unique values that match the query**

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 3 attributes.

```bash
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
Racks=(Rack1 Rack1 Rack2 Rack2 Rack3 Rack4 Rack5 Rack6 Rack6 Rack6)
IsNormal=(true true true true true true false false false false)
for ((i=0; i<10 ; i++))
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
  attributes="{temperature=${Temperatures[i]},rackId=${Racks[i]},stateNormal=
  ${IsNormal[i]}}")
  aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
  "version": 1,
```

The following get-cardinality example queries the 10 sensors created by the setup script and returns the number of racks that have temperature sensors reporting abnormal temperature values. If the temperature value is below 60 or above 80, the temperature sensor is in an abnormal state.

```
aws iot get-cardinality \
   --aggregation-field "attributes.rackId" \
   --query-string "thingName:TempSensor* AND attributes.stateNormal:false"
```

Output:

```
{
   "cardinality": 2
}
```

For more information, see Querying for Aggregate Data<https://docs.aws.amazon.com/iot/latest/developerguide/index-aggregate.html> in the AWS IoT Developer Guide.

- For API details, see GetCardinality in AWS CLI Command Reference.

**get-effective-policies**

The following code example shows how to use get-effective-policies.

**AWS CLI**

To list the policies that effect a thing

The following get-effective-policies example lists the policies that effect the specified thing, including policies attached to any groups to which it belongs.
aws iot get-effective-policies
   --thing-name TemperatureSensor-001
   --principal arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142

Output:

```json
{
    "effectivePolicies": [
    {
        "policyName": "TemperatureSensorPolicy",
        "policyDocument": "{"Version": "2012-10-17", "Statement": [
            {"Effect": "Allow", "Action": ["iot:Connect"]}
        ]}
    }
}
```
The following code example shows how to use `get-indexing-configuration`.

**AWS CLI**

**To get the thing indexing configuration**

The following `get-indexing-configuration` example gets the current configuration data for AWS IoT fleet indexing.

```bash
aws iot get-indexing-configuration
```

Output:

```json
{
    "thingIndexingConfiguration": {
        "thingIndexingMode": "OFF",
        "thingConnectivityIndexingMode": "OFF"
    },
    "thingGroupIndexingConfiguration": {
        "thingGroupIndexingMode": "OFF"
    }
}
```

For more information, see [Managing Thing Indexing](https://docs.aws.amazon.com/iot/latest/developerguide/index.html) in the *AWS IoT Developers Guide*. **

For more information, see [Get Effective Policies for a Thing](https://docs.aws.amazon.com/iot/latest/developerguide/policy-effective.html) in the *AWS IoT Developers Guide*. **
get-job-document

The following code example shows how to use get-job-document.

AWS CLI

To retrieve the document for a job

The following get-job-document example displays details about the document for the job whose ID is example-job-01.

```bash
aws iot get-job-document \
--job-id "example-job-01"
```

Output:

```
{
   "document": "\n   \"operation\":\"customJob\",\n   \"someValue\"\n}\n
```

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

get-logging-options

The following code example shows how to use get-logging-options.

AWS CLI

To get the logging options

The following get-logging-options example gets the current logging options for your AWS account.

```bash
aws iot get-logging-options
```
Output:

```json
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/iotLoggingRole",
    "logLevel": "ERROR"
}
```

For more information, see title in the AWS IoT Developer Guide.

**get-ota-update**

The following code example shows how to use `get-ota-update`.

**AWS CLI**

**To retrieve information about an OTA Update**

The following `get-ota-update` example displays details about the specified OTA Update.

```
aws iot get-ota-update \
    --ota-update-id ota12345
```

Output:

```json
{
    "otaUpdateInfo": {
        "otaUpdateId": "ota12345",
        "creationDate": 1557863215.995,
        "lastModifiedDate": 1557863215.995,
        "description": "A critical update needed right away.",
        "targets": [
            "device1",
            "device2",
            "device3",
            "device4"
        ],
        "targetSelection": "SNAPSHOT",
        "protocols": ["HTTP"],
        "awsJobExecutionsRolloutConfig": {
```
"maximumPerMinute": 10,
"otaUpdateFiles": [
  {
    "fileName": "firmware.bin",
    "fileLocation": {
      "stream": {
        "streamId": "004",
        "fileId": 123
      }
    },
    "codeSigning": {
      "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
    }
  }
],
"roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role",
"otaUpdateStatus": "CREATE_COMPLETE",
"awsIotJobId": "job54321",
"errorInfo": {
}
}
}

For more information, see [GetOTAUpdate](#) in the [AWS IoT API Reference](#).
- For API details, see [GetOtaUpdate](#) in [AWS CLI Command Reference](#).

### get-percentiles

The following code example shows how to use get-percentiles.

**AWS CLI**

To group the aggregated values that match the query into percentile groupings

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 1 attribute.

```
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
for ((i=0; i<10 ; i++))
```
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
  attributes="{temperature=${Temperatures[i]}}")
  aws iot describe-thing --thing-name "TempSensor$i"
done

Example output of the setup script:

```json
{
  "version": 1,
  "thingName": "TempSensor0",
  "defaultClientId": "TempSensor0",
  "attributes": {
    "temperature": "70"
  },
  "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
  "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-percentiles` example queries the 10 sensors created by the setup script and returns a value for each percentile group specified. The percentile group "10" contains the aggregated field value that occurs in approximately 10 percent of the values that match the query. In the following output, {"percent": 10.0, "value": 67.7} means approximately 10.0% of the temperature values are below 67.7.

```
aws iot get-percentiles \
  --aggregation-field "attributes.temperature" \ 
  --query-string "thingName:TempSensor*" \ 
  --percents 10 25 50 75 90
```

Output:

```json
{
  "percentiles": [
    {
      "percent": 10.0,
      "value": 67.7
    },
    {
      "percent": 25.0,
      "value": 71.25
    }
  ]
}
```
For more information, see Querying for Aggregate Data in the AWS IoT Developer Guide.

- For API details, see GetPercentiles in AWS CLI Command Reference.

**get-policy-version**

The following code example shows how to use get-policy-version.

**AWS CLI**

**To get information about a specific version of a policy**

The following get-policy-version example gets information about the first version of the specified policy.

```bash
aws iot get-policy \
  --policy-name UpdateDeviceCertPolicy \
  --policy-version-id "1"
```

**Output:**

```
{
  "policyName": "UpdateDeviceCertPolicy",
```
For more information, see [AWS IoT Policies](https://aws.amazon.com/iot/policies/) in the *AWS IoT Developers Guide*.

**get-policy**

The following code example shows how to use get-policy.

**AWS CLI**

**To get information about the default version of a policy**

The following `get-policy` example retrieves information about the default version of the specified policy.

```bash
aws iot get-policy \
   --policy-name UpdateDeviceCertPolicy
```

**Output:**

```json
{
   "policyName": "UpdateDeviceCertPolicy",
   "defaultVersionId": "2",
   "creationDate": 1559925941.924,
   "lastModifiedDate": 1559925941.924,
   "generationId": "5066f1b6712ce9d2a1e56399771649a272d6a921762feed080e24fe52f24e042"
}
```

For more information, see [AWS IoT Policies](https://aws.amazon.com/iot/policies/) in the *AWS IoT Developers Guide*. 
• For API details, see GetPolicy in AWS CLI Command Reference.

get-registration-code

The following code example shows how to use get-registration-code.

AWS CLI

To get your AWS account-specific registration code

The following get-registration-code example retrieves your AWS account-specific registration code.

```bash
aws iot get-registration-code
```

Output:

```json
{
  "registrationCode":
  "15c51ae5e36ba59ba77042df1115862076bea4bd15841c838fcb68d5010a614c"
}
```

For more information, see Use Your Own Certificate in the AWS IoT Developer Guide.

• For API details, see GetRegistrationCode in AWS CLI Command Reference.

get-statistics

The following code example shows how to use get-statistics.

AWS CLI

To search the device index for aggregate data

The following get-statistics example returns the number of things that have a property called connectivity.connected set to false (that is, the number of devices that are not connected) in their device shadow.

```bash
aws iot get-statistics \
--index-name AWS_Things \
--query-string "connectivity.connected:false"
```
Output:

```json
{
   "statistics": {
      "count": 6
   }
}
```

For more information, see [Getting Statistics About Your Device Fleet](https://docs.aws.amazon.com/iot/latest/developerguide/) in the *AWS IoT Developer Guide*.

- For API details, see [GetStatistics](https://docs.aws.amazon.com/iot/latest/developerguide/) in *AWS CLI Command Reference*.

### get-topic-rule-destination

The following code example shows how to use `get-topic-rule-destination`.

#### AWS CLI

**To get a topic rule destination**

The following `get-topic-rule-destination` example gets information about a topic rule destination.

```
aws iot get-topic-rule-destination \\
   --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```json
{
   "topicRuleDestination": {
      "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "status": "DISABLED",
      "httpUrlProperties": {
         "confirmationUrl": "https://example.com"
      }
   }
}
```

For more information, see [Working with topic rule destinations](https://docs.aws.amazon.com/iot/latest/developerguide/) in the *AWS IoT Developer Guide*.
get-topic-rule

The following code example shows how to use get-topic-rule.

AWS CLI

To get information about a rule

The following get-topic-rule example gets information about the specified rule.

```
aws iot get-topic-rule \
    --rule-name MyRPiLowMoistureAlertRule
```

Output:

```
{
    "rule": {
        "ruleName": "MyRPiLowMoistureAlertRule",
        "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE state.reported.moisture = 'low'",
        "description": "Sends an alert whenever soil moisture level readings are too low.",
        "createdAt": 1558624363.0,
        "actions": [
            {
                "sns": {
