   --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
   --tags '[["Key":"group1","Value":"1"]]
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a contact**

The following `untag-resource` example removes the group1 tag from the specified contact.

```bash
aws ssm-contacts untag-resource \
   --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
   --tag-keys "group1"
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

For API details, see UntagResource in AWS CLI Command Reference.
update-contact-channel

The following code example shows how to use update-contact-channel.

AWS CLI

To update a contact channel

The following update-contact-channel example updates the name and delivery address of a contact channel.

```
aws ssm-contacts update-contact-channel
  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad"
  --name "akuas voice channel"
  --delivery-address '{"SimpleAddress": "+15005550198"}'
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see UpdateContactChannel in AWS CLI Command Reference.

update-contact

The following code example shows how to use update-contact.

AWS CLI

To update the engagement plan of contact

The following update-contact example updates the engagement plan of the contact Akua to include the three types of contacts channels. This is done after creating contact channels for Akua.

```
aws ssm-contacts update-contact
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
  --plan '{"Stages": [{"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65", "RetryIntervalInMinutes": 1 }], "DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad", "RetryIntervalInMinutes": 1 }]}],
```

Actions and scenarios
This command produces no output.

For more information, see `Contacts` in the *Incident Manager User Guide*.

- For API details, see `UpdateContact` in *AWS CLI Command Reference*.

### Amazon Inspector examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Inspector.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

### Actions

#### add-attributes-to-findings

The following code example shows how to use `add-attributes-to-findings`.

### AWS CLI

**To add attributes to findings**

The following add-attribute-to-finding command assigns an attribute with the key of `Example` and value of `example` to the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-811VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU:`
aws inspector add-attributes-to-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attributes key=Example,value=example

Output:

{
   "failedItems": {}
}

For more information, see Amazon Inspector Findings in the Amazon Inspector guide.

- For API details, see AddAttributesToFindings in AWS CLI Command Reference.

create-assessment-target

The following code example shows how to use create-assessment-target.

AWS CLI

To create an assessment target

The following create-assessment-target command creates an assessment target named ExampleAssessmentTarget using the resource group with the ARN of arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv:

Output:

{
   "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX"
}

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see CreateAssessmentTarget in AWS CLI Command Reference.
create-assessment-template

The following code example shows how to use create-assessment-template.

AWS CLI

To create an assessment template

The following create-assessment-template command creates an assessment template called ExampleAssessmentTemplate for the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX:

```bash
```

Output:

```json
{
   "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T"
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see [CreateAssessmentTemplate](aws CLI Command Reference).

create-resource-group

The following code example shows how to use create-resource-group.

AWS CLI

To create a resource group

The following create-resource-group command creates a resource group using the tag key of Name and value of example:

```bash
aws inspector create-resource-group --resource-group-tags key=Name,value=example
```
Output:

```
{
    "resourceGroupArn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv"
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [CreateResourceGroup](https://docs.aws.amazon.com/cli/latest/reference/inspector/create-resource-group.html) in *AWS CLI Command Reference*.

### delete-assessment-run

The following code example shows how to use `delete-assessment-run`.

**AWS CLI**

**To delete an assessment run**

The following `delete-assessment-run` command deletes the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5rZS4T/run/0-11LMTAVe`:

```
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [DeleteAssessmentRun](https://docs.aws.amazon.com/cli/latest/reference/inspector/delete-assessment-run.html) in *AWS CLI Command Reference*.

### delete-assessment-target

The following code example shows how to use `delete-assessment-target`.

**AWS CLI**

**To delete an assessment target**

The following `delete-assessment-target` command deletes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see DeleteAssessmentTarget in AWS CLI Command Reference.

delete-assessment-template

The following code example shows how to use delete-assessment-template.

AWS CLI

To delete an assessment template

The following delete-assessment-template command deletes the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T:

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DeleteAssessmentTemplate in AWS CLI Command Reference.

describe-assessment-runs

The following code example shows how to use describe-assessment-runs.

AWS CLI

To describe assessment runs

The following describe-assessment-run command describes an assessment run with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE:

aws inspector describe-assessment-runs --assessment-run-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE

Actions and scenarios 3655
Output:

```json
{
    "assessmentRuns": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
            "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
            "completedAt": 1458680301.4,
            "createdAt": 1458680170.035,
            "dataCollected": true,
            "durationInSeconds": 3600,
            "name": "Run 1 for ExampleAssessmentTemplate",
            "notifications": [],
            "rulesPackageArns": [
            ],
            "startedAt": 1458680170.161,
            "state": "COMPLETED",
            "stateChangedAt": 1458680301.4,
            "stateChanges": [
                {
                    "state": "CREATED",
                    "stateChangedAt": 1458680170.035
                },
                {
                    "state": "START_DATA_COLLECTION_PENDING",
                    "stateChangedAt": 1458680170.065
                },
                {
                    "state": "START_DATA_COLLECTION_IN_PROGRESS",
                    "stateChangedAt": 1458680170.096
                },
                {
                    "state": "COLLECTING_DATA",
                    "stateChangedAt": 1458680170.161
                },
                {
                    "state": "STOP_DATA_COLLECTION_PENDING",
                    "stateChangedAt": 1458680239.883
                },
                {
                    "state": "DATA_COLLECTED",
                    "stateChangedAt": 1458680301.4
                }
            ]
        }
    ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see `DescribeAssessmentRuns` in AWS CLI Command Reference.

**describe-assessment-targets**

The following code example shows how to use `describe-assessment-targets`.

**AWS CLI**

**To describe assessment targets**

The following `describe-assessment-targets` command describes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector describe-assessment-targets --assessment-target-arns
arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
   "assessmentTargets": [
   {
      "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
   }
   ]
}
```
For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see `DescribeAssessmentTargets` in AWS CLI Command Reference.

describe-assessment-templates

The following code example shows how to use describe-assessment-templates.

AWS CLI

To describe assessment templates

The following describe-assessment-templates command describes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw`:

```
aws inspector describe-assessment-templates --assessment-template-arns
    arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw
```

Output:

```
{
    "assessmentTemplates": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
            "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
            "createdAt": 1458074191.844,
            "durationInSeconds": 3600,
            "name": "ExampleAssessmentTemplate",
            "rulesPackageArns": [
        }
    ],
    "failedItems": {}
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see [DescribeAssessmentTemplates](#) in AWS CLI Command Reference.

### describe-cross-account-access-role

The following code example shows how to use `describe-cross-account-access-role`.

**AWS CLI**

To describe the cross account access role

The following `describe-cross-account-access-role` command describes the IAM role that enables Amazon Inspector to access your AWS account:

```bash
aws inspector describe-cross-account-access-role
```

**Output:**

```
{
  "registeredAt": 1458069182.826,
  "roleArn": "arn:aws:iam::123456789012:role/inspector",
  "valid": true
}
```

For more information, see Setting up Amazon Inspector in the Amazon Inspector guide.

- For API details, see [DescribeCrossAccountAccessRole](#) in AWS CLI Command Reference.

### describe-findings

The following code example shows how to use `describe-findings`.
To describe findings

The following describe-findings command describes the finding with the ARN of
arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4:

```bash
aws inspector describe-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4
```

Output:

```json
{
   "failedItems": {},
   "findings": [
      {
         "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
         "assetAttributes": {
            "ipv4Addresses": [],
            "schemaVersion": 1
         },
         "assetType": "ec2-instance",
         "attributes": [],
         "confidence": 10,
         "createdAt": 1458680301.37,
         "description": "Amazon Inspector did not find any potential security issues during this assessment.",
         "indicatorOfCompromise": false,
         "numericSeverity": 0,
         "recommendation": "No remediation needed.",
         "schemaVersion": 1,
         "service": "Inspector",
         "serviceAttributes": {
            "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
            "schemaVersion": 1
         },
         "severity": "Informational"
      }
   ]
}
```
For more information, see Amazon Inspector Findings in the Amazon Inspector guide.

- For API details, see DescribeFindings in AWS CLI Command Reference.

**describe-resource-groups**

The following code example shows how to use `describe-resource-groups`.

**AWS CLI**

**To describe resource groups**

The following `describe-resource-groups` command describes the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI`:

```
aws inspector describe-resource-groups --resource-group-arns arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI
```

Output:

```
{
    "failedItems": {},
    "resourceGroups": [
        {
            "createdAt": 1458074191.098,
            "tags": [
                {
                    "key": "Name",
                    "value": "example"
                }]
        }
    ]
}
```
For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see `DescribeResourceGroups` in AWS CLI Command Reference.

describe-rules-packages

The following code example shows how to use `describe-rules-packages`.

AWS CLI

To describe rules packages

The following `describe-rules-packages` command describes the rules package with the ARN of `arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p`:

```
```

Output:

```
{
    "failedItems": {},
    "rulesPackages": [
    {
        "description": "The rules in this package help verify whether the EC2 instances in your application are exposed to Common Vulnerabilities and Exposures (CVEs). Attacks can exploit unpatched vulnerabilities to compromise the confidentiality, integrity, or availability of your service or data. The CVE system provides a reference for publicly known information security vulnerabilities and exposures. For more information, see [https://cve.mitre.org/](https://cve.mitre.org/). If a particular CVE appears in one of the produced Findings at the end of a completed Inspector assessment, you can search [https://cve.mitre.org/](https://cve.mitre.org/) using the CVE's ID (for example, "CVE-2009-0021") to find detailed information about this CVE, its severity, and how to mitigate it.",
        "name": "Common Vulnerabilities and Exposures",
        "provider": "Amazon Web Services, Inc.",
        "version": "1.1"
    }
    ]
}
```
For more information, see Amazon Inspector Rules Packages and Rules in the Amazon Inspector guide.

- For API details, see DescribeRulesPackages in AWS CLI Command Reference.

get-telemetry-metadata

The following code example shows how to use get-telemetry-metadata.

**AWS CLI**

**To get the telemetry metadata**

The following get-telemetry-metadata command generates information about the data that is collected for the assessment run with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE:

```sh
aws inspector get-telemetry-metadata --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

**Output:**

```json
{
    "telemetryMetadata": [
        {
            "count": 2,
            "dataSize": 345,
            "messageType": "InspectorDuplicateProcess"
        },
        {
            "count": 3,
            "dataSize": 255,
            "messageType": "InspectorTimeEventMsg"
        },
        {
            "count": 4,
            "dataSize": 1082,
            "messageType": "InspectorNetworkInterface"
        }
    ]
}
```
Actions and scenarios

```json
[
  {
    "count": 2,
    "dataSize": 349,
    "messageType": "InspectorDnsEntry"
  },
  {
    "count": 11,
    "dataSize": 2514,
    "messageType": "InspectorDirectoryInfoMsg"
  },
  {
    "count": 1,
    "dataSize": 179,
    "messageType": "InspectorTcpV6ListeningPort"
  },
  {
    "count": 101,
    "dataSize": 10949,
    "messageType": "InspectorTerminal"
  },
  {
    "count": 26,
    "dataSize": 5916,
    "messageType": "InspectorUser"
  },

  "messageType": "InspectorLoadImageInProcess"
]
For API details, see `GetTelemetryMetadata` in *AWS CLI Command Reference*.

**list-assessment-run-agents**

The following code example shows how to use `list-assessment-run-agents`.

**AWS CLI**

**To list assessment run agents**

The following `list-assessment-run-agents` command lists the agents of the assessment run with the specified ARN.

```bash
aws inspector list-assessment-run-agents \
   --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

**Output:**

```
{
   "assessmentRunAgents": [

For more information, see AWS Agents in the Amazon Inspector User Guide.

- For API details, see ListAssessmentRunAgents in AWS CLI Command Reference.

**list-assessment-runs**

The following code example shows how to use list-assessment-runs.

**AWS CLI**

**To list assessment runs**

The following list-assessment-runs command lists all existing assessment runs.

```
aws inspector list-assessment-runs
```

**Output:**

```
{
   "assessmentRunArns": [
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-v5D6fI3v"
   ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector User Guide.

- For API details, see ListAssessmentRuns in AWS CLI Command Reference.

**list-assessment-targets**

The following code example shows how to use list-assessment-targets.
AWS CLI

To list assessment targets

The following `list-assessment-targets` command lists all existing assessment targets:

```
aws inspector list-assessment-targets
```

Output:

```
{
    "assessmentTargetArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq"
    ]
}
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see `ListAssessmentTargets` in AWS CLI Command Reference.

list-assessment-templates

The following code example shows how to use `list-assessment-templates`.

AWS CLI

To list assessment templates

The following `list-assessment-templates` command lists all existing assessment templates:

```
aws inspector list-assessment-templates
```

Output:

```
{
    "assessmentTemplateArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-Uza6ihLh"
    ]
}
```
list-event-subscriptions

The following code example shows how to use list-event-subscriptions.

AWS CLI

To list event subscriptions

The following list-event-subscriptions command lists all the event subscriptions for the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0:

```
aws inspector list-event-subscriptions --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0
```

Output:

```
{
   "subscriptions": [
   {
       "eventSubscriptions": [
       {
           "event": "ASSESSMENT_RUN_COMPLETED",
           "subscribedAt": 1459455440.867
       }
       ],
       "resourceArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0",
       "topicArn": "arn:aws:sns:us-west-2:123456789012:exampletopic"
   }
   ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.
list-findings

The following code example shows how to use list-findings.

AWS CLI

To list findings

The following list-findings command lists all of the generated findings:

```bash
aws inspector list-findings
```

Output:

```json
{
    "findingArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-v5D6fI3v/finding/0-tyvmqBLy"
    ]
}
```

For more information, see Amazon Inspector Findings in the Amazon Inspector guide.

list-rules-packages

The following code example shows how to use list-rules-packages.

AWS CLI

To list rules packages

The following list-rules-packages command lists all available Inspector rules packages:

```bash
aws inspector list-rules-packages
```
Output:

```json
{
    "rulesPackageArns": [
    ]
}
```

For more information, see Amazon Inspector Rules Packages and Rules in the `Amazon Inspector` guide.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for resource**

The following `list-tags-for-resource` command lists all tags associated with the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu`:

```bash
```

Output:

```json
{
    "tags": [
        {
            "key": "Name",
            "value": "Example"
        }
    ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/inspector/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### preview-agents

The following code example shows how to use `preview-agents`.

**AWS CLI**

**To preview agents**

The following `preview-agents` command previews the agents installed on the EC2 instances that are part of the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```bash
```

Output:

```json
{
    "agentPreviews": [
    {
        "agentId": "i-49113b93"
    }
    ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [PreviewAgents](https://docs.aws.amazon.com/cli/latest/reference/inspector/preview-agents.html) in *AWS CLI Command Reference*.

### register-cross-account-access-role

The following code example shows how to use `register-cross-account-access-role`.

**AWS CLI**

**To register the cross account access role**
The following `register-cross-account-access-role` command registers the IAM role with the ARN of `arn:aws:iam::123456789012:role/inspector` that Amazon Inspector uses to list your EC2 instances at the start of the assessment run of when you call the preview-agents command:

```
aws inspector register-cross-account-access-role --role-arn arn:aws:iam::123456789012:role/inspector
```

For more information, see Setting up Amazon Inspector in the *Amazon Inspector* guide.

- For API details, see [RegisterCrossAccountAccessRole](https://docs.aws.amazon.com/cli/latest/reference/inspector/register-cross-account-access-role.html) in [AWS CLI Command Reference](https).

### remove-attributes-from-findings

The following code example shows how to use `remove-attributes-from-findings`.

**AWS CLI**

**To remove attributes from findings**

The following `remove-attributes-from-finding` command removes the attribute with the key of `Example` and value of `example` from the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`:

```
aws inspector remove-attributes-from-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attribute-keys key=Example,value=example
```

Output:

```
{
   "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [RemoveAttributesFromFindings](https://docs.aws.amazon.com/cli/latest/reference/inspector/remove-attributes-from-findings.html) in [AWS CLI Command Reference](https).
**set-tags-for-resource**

The following code example shows how to use `set-tags-for-resource`.

**AWS CLI**

**To set tags for a resource**

The following `set-tags-for-resource` command sets the tag with the key of Example and value of example to the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```
aws inspector set-tags-for-resource --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --tags key=Example,value=example
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see `SetTagsForResource` in *AWS CLI Command Reference*.

**start-assessment-run**

The following code example shows how to use `start-assessment-run`.

**AWS CLI**

**To start an assessment run**

The following `start-assessment-run` command starts the assessment run named examplerun using the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```
```

Output:

```json
{
    "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-j0oroxyY"
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see StartAssessmentRun in AWS CLI Command Reference.

**stop-assessment-run**

The following code example shows how to use `stop-assessment-run`.

**AWS CLI**

**To stop an assessment run**

The following `stop-assessment-run` command stops the assessment run with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY:

```bash
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see StopAssessmentRun in AWS CLI Command Reference.

**subscribe-to-event**

The following code example shows how to use `subscribe-to-event`.

**AWS CLI**

**To subscribe to an event**

The following example enables the process of sending Amazon SNS notifications about the ASSESSMENT_RUN_COMPLETED event to the topic with the ARN of arn:aws:sns:us-west-2:123456789012:exampletopic

```bash
aws inspector subscribe-to-event \
   --event ASSESSMENT_RUN_COMPLETED \
```

```
This command produces no output.

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see SubscribeToEvent in AWS CLI Command Reference.

**unsubscribe-from-event**

The following code example shows how to use unsubscribe-from-event.

**AWS CLI**

**To unsubscribe from an event**

The following unsubscribe-from-event command disables the process of sending Amazon SNS notifications about the ASSESSMENT_RUN_COMPLETED event to the topic with the ARN of arn:aws:sns:us-west-2:123456789012:exampletopic:

```
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see UnsubscribeFromEvent in AWS CLI Command Reference.

**update-assessment-target**

The following code example shows how to use update-assessment-target.

**AWS CLI**

**To update an assessment target**

The following update-assessment-target command updates the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX and
the name of Example, and the resource group with the ARN of arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt:

```
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

### AWS IoT examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

**accept-certificate-transfer**

The following code example shows how to use `accept-certificate-transfer`.

**AWS CLI**

To accept a device certificate transferred from a different AWS account

The following `accept-certificate-transfer` example accepts a device certificate transferred from another AWS account. The certificate is identified by its ID.
aws iot accept-certificate-transfer \
   --certificate-id 
488b6a7f2acdeb00a77384e63c4e40b18bEXAMPLEe57b7272ba44c45e3448142

This command does not produce any output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.

- For API details, see AcceptCertificateTransfer in AWS CLI Command Reference.

**add-thing-to-billing-group**

The following code example shows how to use add-thing-to-billing-group.

**AWS CLI**

**Example 1: To add a thing by name to a billing group**

The following add-thing-to-billing-group example adds the thing named MyLightBulb to the billing group named GroupOne.

```
aws iot add-thing-to-billing-group \
   --billing-group-name GroupOne \
   --thing-name MyLightBulb
```

This command produces no output.

**Example 2: To add a thing by ARN to a billing group**

The following add-thing-to-billing-group example adds a thing with a specified ARN to a billing group with the specified ARN. Specifying an ARN is helpful if you work with multiple AWS Regions or accounts. It can help ensure that you are adding to the right Region and account.

```
aws iot add-thing-to-billing-group \
   --billing-group-arn "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne" \
   --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb"
```

This command produces no output.
For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see AddThingToBillingGroup in AWS CLI Command Reference.

**add-thing-to-thing-group**

The following code example shows how to use add-thing-to-thing-group.

**AWS CLI**

**To add a thing to a group**

The following add-thing-to-thing-group example adds the specified thing to the specified thing group.

```bash
aws iot add-thing-to-thing-group \
--thing-name MyLightBulb \
--thing-group-name LightBulbs
```

This command produces no output.

For more information, see Thing Groups in the AWS IoT Developers Guide.

- For API details, see AddThingToThingGroup in AWS CLI Command Reference.

**associate-targets-with-job**

The following code example shows how to use associate-targets-with-job.

**AWS CLI**

**To associate a thing group with a continuous job**

The following associate-targets-with-job example associates the specified thing group with the specified continuous job.

```bash
aws iot associate-targets-with-job \
--targets "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
--job-id "example-job-04"
```

Output:
For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see AssociateTargetsWithJob in AWS CLI Command Reference.

attach-policy

The following code example shows how to use attach-policy.

AWS CLI

Example 1: To attach a policy to a thing group

The following attach-policy example attaches the specified policy to a thing group identified by its ARN.

```
aws iot attach-policy \
   --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
   --policy-name "UpdateDeviceCertPolicy"
```

This command does not produce any output.

For more information, see Thing Groups in the AWS IoT Developers Guide.

Example 2: To attach a policy to a certificate

The following attach-policy example attaches the policy UpdateDeviceCertPolicy to the principal specified by a certificate.

```
aws iot attach-policy \
   --policy-name UpdateDeviceCertPolicy \
   --target "arn:aws:iot:us-west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

This command does not produce any output.
For more information, see Attach an AWS IoT Policy to a Device Certificate in the AWS IoT Developers Guide.

- For API details, see AttachPolicy in AWS CLI Command Reference.

attach-security-profile

The following code example shows how to use attach-security-profile.

AWS CLI

To associate a security profile with all unregistered devices

The following attach-security-profile example associates the AWS IoT Device Defender security profile named Testprofile with all unregistered devices in the us-west-2 region for this AWS account.

```
aws iot attach-security-profile \
   --security-profile-name Testprofile \
```

This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.
- For API details, see AttachSecurityProfile in AWS CLI Command Reference.

attach-thing-principal

The following code example shows how to use attach-thing-principal.

AWS CLI

To attach a certificate to your thing

The following attach-thing-principal example attaches a certificate to the MyTemperatureSensor thing. The certificate is identified by an ARN. You can find the ARN for a certificate in the AWS IoT console.

```
aws iot attach-thing-principal \
```
This command produces no output.

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/iot-registry-manage-things.html) in the *AWS IoT Developers Guide*.

- For API details, see [AttachThingPrincipal](https://docs.aws.amazon.com/cli/latest/reference/iot/attach-thing-principal.html) in *AWS CLI Command Reference*.

### cancel-audit-mitigation-actions-task

The following code example shows how to use `cancel-audit-mitigation-actions-task`.

**AWS CLI**

**To cancel an audit mitigation actions task**

The following `cancel-audit-mitigation-actions-task` example cancels the application of mitigation actions for the specified task. You cannot cancel tasks that are already completed.

```bash
aws iot cancel-audit-mitigation-actions-task
   --task-id "myActionsTaskId"
```

This command produces no output.

For more information, see [CancelAuditMitigationActionsTask](https://docs.aws.amazon.com/iot/latest/developerguide/iot-lambda-mitigate-audit-findings.html) in the *AWS IoT Developer Guide*.

- For API details, see [CancelAuditMitigationActionsTask](https://docs.aws.amazon.com/cli/latest/reference/iot/cancel-audit-mitigation-actions-task.html) in *AWS CLI Command Reference*.

### cancel-audit-task

The following code example shows how to use `cancel-audit-task`.

**AWS CLI**

**To cancel an audit task**

The following `cancel-audit-task` example cancels an audit task with the specified task ID. You cannot cancel a task that is complete.
aws iot cancel-audit-task
--task-id a3aea009955e501a31b764abe1bebd3d

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.
• For API details, see CancelAuditTask in AWS CLI Command Reference.

cancel-certificate-transfer

The following code example shows how to use cancel-certificate-transfer.

AWS CLI

To cancel the transfer a certificate to a different AWS account

The following cancel-certificate-transfer example cancels the transfer of the specified certificate transfer. The certificate is identified by a certificate ID. You can find the ID for a certificate in the AWS IoT console.

aws iot cancel-certificate-transfer
--certificate-id
f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78add5e605d630e05c7fc8

This command produces no output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.
• For API details, see CancelCertificateTransfer in AWS CLI Command Reference.

cancel-job-execution

The following code example shows how to use cancel-job-execution.

AWS CLI

To cancel a job execution on a device

The following cancel-job-execution example cancels the execution of the specified job on a device. If the job is not in the QUEUED state, you must add the --force parameter.
```bash
aws iot cancel-job-execution
   --job-id "example-job-03"
   --thing-name "MyRPi"
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see CancelJobExecution in AWS CLI Command Reference.

cancel-job

The following code example shows how to use cancel-job.

AWS CLI

To cancel a job

The following cancel-job example cancels the specified job.

```bash
aws iot cancel-job
   --job-job "example-job-03"
```

Output:

```json
{
   "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-03",
   "jobId": "example-job-03",
   "description": "example job test"
}
```

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see CancelJob in AWS CLI Command Reference.

clear-default-authorizer

The following code example shows how to use clear-default-authorizer.

AWS CLI

To clear the default authorizer
The following `clear-default-authorizer` example clears the currently configured default custom authorizer. After you run this command, there is no default authorizer. When you use a custom authorizer, you must specify it by name in the HTTP request headers.

```bash
aws iot clear-default-authorizer
```

This command produces no output.

For more information, see [ClearDefaultAuthorizer](https://docs.aws.amazon.com/iot/latest/APIReference/API_ClearDefaultAuthorizer.html) in the *AWS IoT API Reference*.

- For API details, see [ClearDefaultAuthorizer](https://docs.aws.amazon.com/cli/latest/reference/iot/clear-default-authorizer.html) in *AWS CLI Command Reference*.

**confirm-topic-rule-destination**

The following code example shows how to use `confirm-topic-rule-destination`.

**AWS CLI**

**To confirm a topic rule destination**

The following `confirm-topic-rule-destination` example confirms a topic rule destination with a confirmation token received at an HTTP endpoint.

```bash
aws iot confirm-topic-rule-destination \
--confirmation-token "AYADeIcmtq-ZkxfpiWIQqHWM5ucAXwABABVhd3MtY3J5cHRvLXB1YmxpYy1rZXkAREFxY1E0Um1GeDg0V21BZWZ1VjZvZWFREVUJJUKtvaywpPqg8YEa11D4B40aj2s1wEHKMybiF1RoOZzYisI0IvslzQ5UmCkq3tV-3f7-nKfosgIAAAAADAAAAAAAABAAAAAAAIAAAAAAA19RMgy-V19V9m6Iw2xfbw_____wAAAAEAAAAAAAAAAAAAAAAB1hw4SokgUcxiJ3gT06n50NLJvpzyQR1UmPIj5sShqXEQg0OiufgrzTeP18RZyOWr006Aj9DiVzJX-1iD6Pu-G6PUw1ka07Knzs2B4AD0qfrHUF4pRTvyUgBnMGUCMQC8ZXRmKqndt_c6Kgrow3bMUDBvNqo2qZr8Z8Jm2rzgseR01AnPIetJ803Z4IIF8xX1cdPGP-PV1d0XFemyL8g"
```

This command produces no output.

For more information, see [Confirming a topic rule destination](https://docs.aws.amazon.com/iot/latest/developerguide/confirm-topic-rule-destination.html) in the *AWS IoT Developer Guide*.

- For API details, see [ConfirmTopicRuleDestination](https://docs.aws.amazon.com/cli/latest/reference/iot/confirm-topic-rule-destination.html) in *AWS CLI Command Reference*.

**create-audit-suppression**

The following code example shows how to use `create-audit-suppression`.

---

Actions and scenarios
**AWS CLI**

**To create an audit finding suppression**

The following `create-audit-suppression` example creates an audit finding suppression for a policy named "virtualMachinePolicy" that has been flagged for being overly permissive.

```bash
aws iot create-audit-suppression \
   --check-name IOT_POLICY_OVERLY_PERMISSIVE_CHECK \
   --resource-identifier policyVersionIdentifier={"policyName":"virtualMachinePolicy","policyVersionId":"1"} \n   --no-suppress-indefinitely \n   --expiration-date 2020-10-20
```

This command produces no output.

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/latest/developerguide/audit-suppression.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateAuditSuppression](https://docs.aws.amazon.com/cli/latest/reference/iot/create-audit-suppression.html) in *AWS CLI Command Reference*.

**create-authorizer**

The following code example shows how to use `create-authorizer`.

**AWS CLI**

**To create a custom authorizer**

The following `create-authorizer` example creates a custom authorizer that uses the specified Lambda function as part of a custom authentication service.

```bash
aws iot create-authorizer \
   --authorizer-name "CustomAuthorizer" \
   --authorizer-function-arn "arn:aws:lambda:us-west-2:123456789012:function:CustomAuthorizerFunction" \
   --token-key-name "MyAuthToken" \
   --status ACTIVE \
   --token-signing-public-keys FIRST_KEY="-----BEGIN PUBLIC KEY-----MIIBjANBgkqhkiG9w0BAQEFAAOCQA8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwoZ+7ENxAio9q6QD4FFqjGZsvjtYwjo1RKK0U8Eq9xb503kRSmyIwTzwzm/f4Gf0YZUloJ+t3PUuwHrmbyTAqTrCUgRFygjfgVwGCps5ZAX4Eyqt5cr+AIHIiUDbx5a7pzwOBKPeic0asNjqpT8PkbBrAeKyleJh5oo81NDHHmVtb6m5A5YiJjYqYXLYaVAowKzZ----END PUBLIC KEY-----"
```

Actions and scenarios 3690
For more information, see `CreateAuthorizer` in the *AWS IoT API Reference*.

- For API details, see `CreateAuthorizer` in *AWS CLI Command Reference*.

**create-billing-group**

The following code example shows how to use `create-billing-group`.

**AWS CLI**

**To create a billing group**

The following `create-billing-group` example creates a simple billing group named GroupOne.

```bash
aws iot create-billing-group \
   --billing-group-name GroupOne
```

**Output:**

```json
{
   "billingGroupName": "GroupOne",
   "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
   "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562"
}
```

For more information, see `Billing Groups` in the *AWS IoT Developers Guide*.

- For API details, see `CreateBillingGroup` in *AWS CLI Command Reference*.
create-certificate-from-csr

The following code example shows how to use create-certificate-from-csr.

AWS CLI

To create a device certificate from a certificate signing request (CSR)

The following create-certificate-from-csr example creates a device certificate from a CSR. You can use the openssl command to create a CSR.

```bash
aws iot create-certificate-from-csr \
   --certificate-signing-request=file://certificate.csr
```

Output:

```json
{
   "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
   "certificateId": "c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
   "certificatePem": "<certificate-text>"
}
```

For more information, see CreateCertificateFromCSR in the AWS IoT API Reference.

- For API details, see CreateCertificateFromCsr in AWS CLI Command Reference.

create-custom-metric

The following code example shows how to use create-custom-metric.

AWS CLI

To create a custom metric published by your devices to Device Defender

The following create-custom-metric example creates a custom metric that measures battery percentage.

```bash
aws iot create-custom-metric \
   --metric-name "batteryPercentage" \ 
   --metric-type "number"
```
Output:

```json
{
   "metricName": "batteryPercentage",
   "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/batteryPercentage"
}
```

For more information, see [Custom metrics](https://docs.aws.amazon.com/iot/latest/developerguide/custom-metrics.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateCustomMetric](https://docs.aws.amazon.com/cli/latest/reference/iot/create-custom-metric.html) in *AWS CLI Command Reference*.

---

**create-dimension**

The following code example shows how to use `create-dimension`.

**AWS CLI**

**To create a dimension**

The following `create-dimension` creates a dimension with a single topic filter called `TopicFilterForAuthMessages`.

```bash
aws iot create-dimension \
   --name TopicFilterForAuthMessages \
   --type TOPIC_FILTER \
   --string-values device/+/auth
```

Output:

```json
{
   "name": "TopicFilterForAuthMessages",
   "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see [Detect Commands](https://docs.aws.amazon.com/iot/latest/developerguide/detect-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [CreateDimension](https://docs.aws.amazon.com/cli/latest/reference/iot/create-dimension.html) in *AWS CLI Command Reference*. 

---

Actions and scenarios
create-domain-configuration

The following code example shows how to use create-domain-configuration.

AWS CLI

To create a domain configuration

The following create-domain-configuration example creates an AWS-managed domain configuration with a service type of DATA.

```bash
aws iot create-domain-configuration \
   --domain-configuration-name "additionalDataDomain" \
   --service-type "DATA"
```

Output:

```
{
   "domainConfigurationName": "additionalDataDomain",
   "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see CreateDomainConfiguration in AWS CLI Command Reference.

create-dynamic-thing-group

The following code example shows how to use create-dynamic-thing-group.

AWS CLI

To create a dynamic thing group

The following create-dynamic-thing-group example creates a dynamic thing group that contains any thing with a temperature attribute that is greater than 60 degrees. You must enable AWS IoT fleet indexing before you can use dynamic thing groups.

```bash
aws iot create-dynamic-thing-group \
   --thing-group-name "RoomTooWarm" \
   --query-string "attributes.temperature>60"
```
Output:

```json
{
  "thingGroupName": "RoomTooWarm",
  "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/RoomTooWarm",
  "thingGroupId": "9d52492a-fc87-43f4-b6e2-e571d2ffcad1",
  "indexName": "AWS_Things",
  "queryString": "attributes.temperature>60",
  "queryVersion": "2017-09-30"
}
```

For more information, see [Dynamic Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateDynamicThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/create-dynamic-thing-group.html) in *AWS CLI Command Reference*.

**create-job**

The following code example shows how to use `create-job`.

**AWS CLI**

**Example 1: To create a job**

The following `create-job` example creates a simple AWS IoT job that sends a JSON document to the `MyRaspberryPi` device.

```bash
aws iot create-job \
--job-id "example-job-01" \
--targets "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi" \
--document file://example-job.json \
--description "example job test" \
--target-selection SNAPSHOT
```

Output:

```json
{
  "jobId": "example-job-01",
  "description": "example job test"
}
```

**Example 2: To create a continuous job**
The following `create-job` example creates a job that continues to run after the things specified as targets have completed the job. In this example, the target is a thing group, so when new devices are added to the group, the continuous job runs on those new things.

```
```

Output:

```
{
   "jobId": "example-job-04",
   "description": "example continuous job"
}
```

For more information, see [Creating and Managing Jobs (CLI)](https://docs.aws.amazon.com/iot/latest/developerguide/creating-managing-jobs-cli.html) in the AWS IoT Developer Guide.

- For API details, see [CreateJob](https://docs.aws.amazon.com/cli/latest/reference/iot/create-job.html) in AWS CLI Command Reference.

### create-keys-and-certificate

The following code example shows how to use `create-keys-and-certificate`.

**AWS CLI**

**To create an RSA key pair and issue an X.509 certificate**

The following `create-keys-and-certificate` creates a 2048-bit RSA key pair and issues an X.509 certificate using the issued public key. Because this is the only time that AWS IoT provides the private key for this certificate, be sure to keep it in a secure location.

```
aws iot create-keys-and-certificate \
   --certificate-pem-outfile "myTest.cert.pem" \
   --public-key-outfile "myTest.public.key" \
   --private-key-outfile "myTest.private.key"
```

Output:

```
{
```
create-mitigation-action

The following code example shows how to use create-mitigation-action.

For more information, see Create and Register an AWS IoT Device Certificate in the AWS IoT Developer Guide.

- For API details, see CreateKeysAndCertificate in AWS CLI Command Reference.
**AWS CLI**

To create a mitigation action

The following create-mitigation-action example defines a mitigation action named AddThingsToQuarantineGroup1Action that, when applied, moves things into the thing group named QuarantineGroup1. This action overrides dynamic thing groups.

aws iot create-mitigation-action --cli-input-json file::params.json

Contents of params.json:

```json
{
    "actionName": "AddThingsToQuarantineGroup1Action",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ],
            "overrideDynamicGroups": true
        }
    },
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MoveThingsToQuarantineGroupRole"
}
```

Output:

```json
{
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroup1Action",
    "actionId": "992e9a63-a899-439a-aa50-4e20c52367e1"
}
```

For more information, see [CreateMitigationAction (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/developerguide/migration-action.html#create-mitigation-action) in the AWS IoT Developer Guide.

- For API details, see [CreateMitigationAction](https://docs.aws.amazon.com/iot/latest/developerguide/migration-action.html#create-mitigation-action) in AWS CLI Command Reference.

**create-ota-update**

The following code example shows how to use create-ota-update.
AWS CLI

**To create an OTA update for use with Amazon FreeRTOS**

The following `create-ota-update` example creates an AWS IoT OTAUpdate on a target group of things or groups. This is part of an Amazon FreeRTOS over-the-air update which makes it possible for you to deploy new firmware images to a single device or a group of devices.

```
aws iot create-ota-update \\
    --cli-input-json file://create-ota-update.json
```

**Contents of `create-ota-update.json`:**

```
{
    "otaUpdateId": "ota12345",
    "description": "A critical update needed right away.",
    "targets": [
        "device1",
        "device2",
        "device3",
        "device4"
    ],
    "targetSelection": "SNAPSHOT",
    "awsJobExecutionsRolloutConfig": {
        "maximumPerMinute": 10
    },
    "files": [
        {
            "fileName": "firmware.bin",
            "fileLocation": {
                "stream": {
                    "streamId": "004",
                    "fileId":123
                }
            },
            "codeSigning": {
                "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
        }
    ],
    "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
}
```
Output:

```json
{
    "otaUpdateId": "ota12345",
    "awsIotJobId": "job54321",
    "otaUpdateStatus": "CREATE_IN_PROGRESS"
}
```

For more information, see [CreateOTAUpdate](https://docs.aws.amazon.com/iot/latest/api/reference/API_CreateOTAUpdate.html) in the [AWS IoT API Reference](https://docs.aws.amazon.com/iot/latest/api/index.html).

### create-policy-version

The following code example shows how to use `create-policy-version`.

**AWS CLI**

**To update a policy with a new version**

The following `create-policy-version` example updates a policy definition, creating a new policy version. This example also makes the new version the default.

```
aws iot create-policy-version \
    --policy-name UpdateDeviceCertPolicy \ 
    --policy-document file://policy.json \ 
    --set-as-default
```

**Contents of `policy.json`:**

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "iot:UpdateCertificate",
            "Resource": "*
        }
    ]
}
```
Output:

```json
{
  "policyVersionId": "2",
  "isDefaultVersion": true
}
```

For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-policies.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreatePolicyVersion](https://docs.aws.amazon.com/cli/latest/reference/iot/create-policy-version.html) in *AWS CLI Command Reference*.

**create-policy**

The following code example shows how to use `create-policy`.

**AWS CLI**

**To create an AWS IoT policy**

The following `create-policy` example creates an AWS IoT policy named `TemperatureSensorPolicy`. The `policy.json` file contains statements that allow AWS IoT policy actions.

```bash
aws iot create-policy \
  --policy-name TemperatureSensorPolicy \
  --policy-document file://policy.json
```

**Contents of policy.json:**

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "iot:Publish",
        "iot:Receive"
      ],
      "Resource": [
```

Actions and scenarios

3701
Output:

```json
{
    "policyName": "TemperatureSensorPolicy",
    "policyDocument": "{ "Version": "2012-10-17", "Statement": [ {
        "Effect": "Allow",
        "Action": [ "iot:Publish", "iot:Receive" ],
    } ] }
}
```
"arn:aws:iot:us-west-2:123456789012:topic/topic_2"

"arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
],
"Resource": [
]
}
"policyVersionId": "1"
}

For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-security-policy.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

- For API details, see [CreatePolicy](https://docs.aws.amazon.com/cli/latest/reference/iot/create-policy.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/).

**create-provisioning-claim**

The following code example shows how to use `create-provisioning-claim`.

**AWS CLI**

**To create a provisioning claim**

The following `create-provisioning-claim` example creates a provisioning claim from a provisioning template.

```
aws iot create-provisioning-claim
```
Output:

```json
{
    "certificateId": "78de0218b2ce80cf8fb709bda59e62b19fb85315390483eb0434589476ab09f",

3705
create-provisioning-template-version

The following code example shows how to use create-provisioning-template-version.

AWS CLI

To create a provisioning template version

The following example creates a version for the specified provisioning template. The body of the new version is supplied in the file template.json.

```
aws iot create-provisioning-template-version \
--template-name widget-template \
--template-body file://template.json
```

Contents of template.json:

```json
{
    "Parameters" : {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    },

   "versionId": 2,
   "isDefaultVersion": false
}

For more information, see AWS IoT Secure Tunneling in the AWS IoT Core Developer Guide.

- For API details, see CreateProvisioningTemplateVersion in AWS CLI Command Reference.

create-provisioning-template

The following code example shows how to use create-provisioning-template.

AWS CLI

To create a provisioning template

The following create-provisioning-template example creates a provisioning template as defined by the file template.json.

```
aws iot create-provisioning-template \
   --template-name widget-template \
   --description "A provisioning template for widgets" \
   --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role \
   --template-body file://template.json
```

Contents of template.json:

```
{
   "Parameters": {
      "DeviceLocation": {
         "Type": "String"
      }
   },
   "Mappings": {
```

        }
      ]
    }
  }
}
create-role-alias

The following code example shows how to use create-role-alias.

AWS CLI

To create a role alias

The following create-role-alias example creates a role alias called LightBulbRole for the specified role.

```
aws iot create-role-alias \
  --role-alias LightBulbRole \
  --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:
```
{
    "roleAlias": "LightBulbRole",
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see CreateRoleAlias in the AWS IoT API Reference.

- For API details, see CreateRoleAlias in AWS CLI Command Reference.

**create-scheduled-audit**

The following code example shows how to use create-scheduled-audit.

**AWS CLI**

**To create a scheduled audit**

The following create-scheduled-audit example creates a scheduled audit that runs weekly, on Wednesday, to check if CA certificates or device certificates are expiring.

```
aws iot create-scheduled-audit \
    --scheduled-audit-name WednesdayCertCheck \
    --frequency WEEKLY \
    --day-of-week WED \
    --target-check-names CA_CERTIFICATE_EXPIRING_CHECK DEVICE_CERTIFICATE_EXPIRING_CHECK
```

Output:

```
{
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/WednesdayCertCheck"
}
```

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see CreateScheduledAudit in AWS CLI Command Reference.

**create-security-profile**

The following code example shows how to use create-security-profile.
AWS CLI

To create a security profile

The following `create-security-profile` example creates a security profile that checks if cellular bandwidth exceeds a threshold or if more than 10 authorization failures occur within a five-minute period.

```bash
aws iot create-security-profile \
    --security-profile-name PossibleIssue \
    --security-profile-description "Check to see if authorization fails 10 times in 5 minutes or if cellular bandwidth exceeds 128" \
    --behaviors "[{{"name":"CellularBandwidth","metric":"aws:message-byte-size"},"criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"less-than","value":{"count":10},"durationSeconds":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}]"
```

Output:

```json
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/PossibleIssue"
}
```

For more information, see [Detect Commands](#) in the [AWS IoT Developer Guide](#).

- For API details, see [CreateSecurityProfile](#) in [AWS CLI Command Reference](#).

create-stream

The following code example shows how to use `create-stream`.

AWS CLI

To create a stream for delivering one or more large files in chunks over MQTT

The following `create-stream` example creates a stream for delivering one or more large files in chunks over MQTT. A stream transports data bytes in chunks or blocks packaged as MQTT messages from a source like S3. You can have one or more files associated with a stream.
aws iot create-stream \
   --cli-input-json file://create-stream.json

Contents of create-stream.json:

```json
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "files": [
        {
            "fileId": 123,
            "s3Location": {
                "bucket": "codesign-ota-bucket",
                "key": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
        }
    ],
    "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
}
```

Output:

```json
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "streamVersion": "1"
}
```

For more information, see CreateStream in the AWS IoT API Reference.

- For API details, see CreateStream in AWS CLI Command Reference.

**create-thing-group**

The following code example shows how to use create-thing-group.

**AWS CLI**

**Example 1: To create a thing group**
The following `create-thing-group` example creates a thing group named `LightBulbs` with a description and two attributes.

```bash
aws iot create-thing-group \
  --thing-group-name LightBulbs \
  --thing-group-properties "thingGroupDescription="Generic bulb group"", attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```json
{
  "thingGroupName": "LightBulbs",
  "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs",
  "thingGroupId": "9198bf9f-1e76-4a88-8e8c-e7140142c331"
}
```

Example 2: To create a thing group that's part of a parent group

The following `create-thing-group` creates a thing group named `HalogenBulbs` that has a parent thing group named `LightBulbs`.

```bash
aws iot create-thing-group \
  --thing-group-name HalogenBulbs \
  --parent-group-name LightBulbs
```

Output:

```json
{
  "thingGroupName": "HalogenBulbs",
  "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e"
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/create-thing-group.html) in *AWS CLI Command Reference*.

**create-thing-type**

The following code example shows how to use `create-thing-type`.
AWS CLI

To define a thing type

The following create-thing-type example defines a thing type and associated attributes.

```sh
aws iot create-thing-type
   --thing-type-name "LightBulb"
   --thing-type-properties "thingTypeDescription=light bulb type,
searchableAttributes=wattage,model"
```

Output:

```json
{
   "thingTypeName": "LightBulb",
   "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
   "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190"
}
```

For more information, see **Thing Types** in the *AWS IoT Developers Guide*.

- For API details, see **CreateThingType** in *AWS CLI Command Reference*.

create-thing

The following code example shows how to use create-thing.

**AWS CLI**

**Example 1: To create a thing record in the registry**

The following create-thing example creates an entry for a device in the AWS IoT thing registry.

```sh
aws iot create-thing
   --thing-name SampleIoTThing
```

Output:

```json
{
   "thingName": "SampleIoTThing",
...
Example 2: To define a thing that is associated with a thing type

The following create-thing example create a thing that has the specified thing type and its attributes.

```bash
aws iot create-thing
  --thing-name "MyLightBulb" \
  --thing-type-name "LightBulb" \
  --attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"
```

Output:

```json
{
  "thingName": "MyLightBulb",
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
  "thingId": "40da2e73-c6af-406e-b415-15acae538797"
}
```

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/things.html) and [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/thing-types.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThing](https://docs.aws.amazon.com/cli/latest/reference/iot/create-thing.html) in *AWS CLI Command Reference*.

create-topic-rule-destination

The following code example shows how to use create-topic-rule-destination.

AWS CLI

To create a topic rule destination

The following create-topic-rule-destination example creates a topic rule destination for an HTTP endpoint.

```bash
aws iot create-topic-rule-destination
  --destination-configuration httpUrlConfiguration={confirmationUrl=https://example.com}
```
Output:

```json
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "status": "IN_PROGRESS",
        "statusReason": "Awaiting confirmation. Confirmation message sent on 2020-07-09T22:47:54.154Z; no response received from the endpoint.",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
        }
    }
}
```

For more information, see [Creating a topic rule destination](https://docs.aws.amazon.com/iot/latest/developerguide/create-topic-rule-destination.html) in the *AWS IoT Developer Guide*.

- For API details, see [CreateTopicRuleDestination](https://docs.aws.amazon.com/cli/latest/reference/iot/create-topic-rule-destination.html) in *AWS CLI Command Reference*.

**create-topic-rule**

The following code example shows how to use `create-topic-rule`.

**AWS CLI**

**To create a rule that sends an Amazon SNS alert**

The following `create-topic-rule` example creates a rule that sends an Amazon SNS message when soil moisture level readings, as found in a device shadow, are low.

```bash
aws iot create-topic-rule \
    --rule-name "LowMoistureRule" \
    --topic-rule-payload file://plant-rule.json
```

The example requires the following JSON code to be saved to a file named `plant-rule.json`:

```json
{
    "sql": "SELECT * FROM '{aws/things/MyRPi/shadow/update/accepted' WHERE state.reported.moisture = 'low'"n",
    "description": "Sends an alert whenever soil moisture level readings are too low."
    "ruleDisabled": false,
```
This command produces no output.

For more information, see Creating an AWS IoT Rule in the AWS IoT Developers Guide.
• For API details, see CreateTopicRule in AWS CLI Command Reference.

define-event-type

The following code example shows how to use define-event-type.

AWS CLI

To define an event-type for your AWS account

The following define-event-type example defines a custom event-type for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account.

aws iot define-event-type
  --event-type MyEvent
  --target-role AmazonIotDeviceDefender

This command produces no output.

For more information, see DefineEventTypeDef in the AWS IoT Developer Guide.
• For API details, see DefineEventTypeDef in AWS CLI Command Reference.

delete-account-audit-configuration

The following code example shows how to use delete-account-audit-configuration.

AWS CLI

To disable all audit checks for your AWS account

The following delete-account-audit-configuration example restores the default settings for AWS IoT Device Defender for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account. Use this command with caution.

aws iot delete-account-audit-configuration
  --delete-scheduled-audits

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.
• For API details, see DeleteAccountAuditConfiguration in AWS CLI Command Reference.

define-event-rule

The following code example shows how to use define-event-rule.

AWS CLI

To define an event-rule for your AWS account

The following define-event-rule example defines a custom event-rule for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account.
**AWS CLI**

**To delete an audit finding suppression**

The following `delete-audit-suppression` example deletes an audit finding suppression for `DEVICE_CERTIFICATE_EXPIRING_CHECK`.

```
aws iot delete-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
    --resource-identifier deviceCertificateId="c7691e<shortened>"
```

This command produces no output.

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/latest/developerguide/audit-suppressions.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteAuditSuppression](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-audit-suppression.html) in *AWS CLI Command Reference*.

**delete-authorizer**

The following code example shows how to use `delete-authorizer`.

**AWS CLI**

**To delete a custom authorizer**

The following `delete-authorizer` example deletes the authorizer named `CustomAuthorizer`. A custom authorizer must be in the INACTIVE state before you can delete it.

```
aws iot delete-authorizer \
    --authorizer-name CustomAuthorizer
```

This command produces no output.

For more information, see [DeleteAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/delete-authorizer.html) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteAuthorizer](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-authorizer.html) in *AWS CLI Command Reference*.

**delete-billing-group**

The following code example shows how to use `delete-billing-group`.
AWS CLI

To delete a billing group

The following delete-billing-group example deletes the specified billing group. You can delete a billing group even if it contains one or more things.

```
aws iot delete-billing-group \
  --billing-group-name BillingGroupTwo
```

This command does not produce any output.

For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see DeleteBillingGroup in AWS CLI Command Reference.

delete-ca-certificate

The following code example shows how to use delete-ca-certificate.

AWS CLI

To delete a CA certificate

The following delete-ca-certificate example deletes the CA certificate with the specified certificate ID.

```
aws iot delete-ca-certificate \
  --certificate-id \n  f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

This command produces no output.

For more information, see DeleteCACertificate in the AWS IoT API Reference.

- For API details, see DeleteCaCertificate in AWS CLI Command Reference.

delete-certificate

The following code example shows how to use delete-certificate.
AWS CLI

To delete a device certificate

The following delete-certificate example deletes the device certificate with the specified ID.

```
aws iot delete-certificate \
   --certificate-id \
   c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9
```

This command produces no output.

For more information, see DeleteCertificate in the AWS IoT API Reference.
- For API details, see DeleteCertificate in AWS CLI Command Reference.

**delete-custom-metric**

The following code example shows how to use delete-custom-metric.

AWS CLI

To delete a custom metric

The following delete-custom-metric example deletes a custom metric.

```
aws iot delete-custom-metric \
   --metric-name batteryPercentage \
   --region us-east-1
```

Output:

```
HTTP 200
```

For more information, see Custom metrics in the AWS IoT Core Developer Guide.
- For API details, see DeleteCustomMetric in AWS CLI Command Reference.

**delete-dimension**

The following code example shows how to use delete-dimension.
AWS CLI

To delete a dimension

The following delete-dimension example deletes a dimension called TopicFilterForAuthMessages.

```bash
aws iot delete-dimension \
   --name TopicFilterForAuthMessages
```

This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DeleteDimension in AWS CLI Command Reference.

delete-domain-configuration

The following code example shows how to use delete-domain-configuration.

AWS CLI

To delete a domain configuration

The following delete-domain-configuration example deletes a domain configuration named additionalDataDomain from your AWS account.

```bash
aws iot delete-domain-configuration \
   --domain-configuration-name "additionalDataDomain" \
   --domain-configuration-status "OK"
```

This command produces no output.

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see DeleteDomainConfiguration in AWS CLI Command Reference.

delete-dynamic-thing-group

The following code example shows how to use delete-dynamic-thing-group.
AWS CLI

To delete a dynamic thing group

The following delete-dynamic-thing-group example deletes the specified dynamic thing group.

```bash
aws iot delete-dynamic-thing-group \
   --thing-group-name "RoomTooWarm"
```

This command produces no output.

For more information, see Dynamic Thing Groups in the AWS IoT Developers Guide.
- For API details, see DeleteDynamicThingGroup in AWS CLI Command Reference.

delete-job-execution

The following code example shows how to use delete-job-execution.

AWS CLI

To delete a job execution

The following delete-job-execution example deletes the job execution of the specified job on a device. Use describe-job-execution to get the execution number.

```bash
aws iot delete-job-execution 
   --job-id "example-job-02" 
   --thing-name "MyRaspberryPi" 
   --execution-number 1
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.
- For API details, see DeleteJobExecution in AWS CLI Command Reference.

delete-job

The following code example shows how to use delete-job.
AWS CLI

To delete a job

The following delete-job example deletes the specified job. By specifying the --force option, the job is deleted even if the status is IN_PROGRESS.

```
aws iot delete-job \\
   --job-id "example-job-04" \\
   --force
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

• For API details, see DeleteJob in AWS CLI Command Reference.

delete-mitigation-action

The following code example shows how to use delete-mitigation-action.

AWS CLI

To delete a mitigation action

The following delete-mitigation-action example deletes the specified mitigation action.

```
aws iot delete-mitigation-action \\
   --action-name AddThingsToQuarantineGroup1Action
```

This command produces no output.

For more information, see DeleteMitigationAction (Mitigation Action Commands) in the AWS IoT Developer Guide.

• For API details, see DeleteMitigationAction in AWS CLI Command Reference.

delete-ota-update

The following code example shows how to use delete-ota-update.
To delete an OTA update

The following `delete-ota-update` example deletes the specified OTA update.

```
aws iot delete-ota-update \
    --ota-update-id ota12345 \
    --delete-stream \
    --force-delete-aws-job
```

This command produces no output.

For more information, see `DeleteOTAUpdate` in the *AWS IoT API Reference*.

- For API details, see `DeleteOTAUpdate` in *AWS CLI Command Reference*.

delete-policy-version

The following code example shows how to use `delete-policy-version`.

AWS CLI

To delete a version of policy

The following `delete-policy-version` example deletes version 2 of the specified policy from your AWS account.

```
aws iot delete-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-version-id 2
```

This command produces no output.

For more information, see `AWS IoT Policies` in the *AWS IoT Developer Guide*.

- For API details, see `DeletePolicyVersion` in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use `delete-policy`.
AWS CLI

To delete a policy

The following delete-policy example deletes the specified policy from your AWS account.

```bash
aws iot delete-policy --policy-name UpdateDeviceCertPolicy
```

This command produces no output.

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.
- For API details, see DeletePolicy in AWS CLI Command Reference.

delete-provisioning-template-version

The following code example shows how to use delete-provisioning-template-version.

AWS CLI

To delete a provisioning template version

The following delete-provisioning-template-version example deletes version 2 of the specified provisioning template.

```bash
aws iot delete-provisioning-template-version \  
   --version-id 2 \  
   --template-name "widget-template"
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the AWS IoT Core Developer Guide.
- For API details, see DeleteProvisioningTemplateVersion in AWS CLI Command Reference.

delete-provisioning-template

The following code example shows how to use delete-provisioning-template.

AWS CLI

To delete a provisioning template
The following delete-provisioning-template example deletes the specified provisioning template.

```
aws iot delete-provisioning-template \
   --template-name widget-template
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the AWS IoT Core Developer Guide.

- For API details, see DeleteProvisioningTemplate in AWS CLI Command Reference.

**delete-registration-code**

The following code example shows how to use delete-registration-code.

**AWS CLI**

**To delete your registration code**

The following delete-registration-code example deletes an AWS IoT account-specific registration code.

```
aws iot delete-registration-code
```

This command produces no output.

For more information, see Use Your Own Certificate in the AWS IoT Developer Guide.

- For API details, see DeleteRegistrationCode in AWS CLI Command Reference.

**delete-role-alias**

The following code example shows how to use delete-role-alias.

**AWS CLI**

**To delete an AWS IoT role alias**

The following delete-role-alias example deletes an AWS IoT role alias named LightBulbRole.

```
aws iot delete-role-alias \
```
--role-alias LightBulbRole

This command produces no output.

For more information, see Authorizing Direct Calls to AWS Services in the AWS IoT Developer Guide.

- For API details, see DeleteRoleAlias in AWS CLI Command Reference.

delete-scheduled-audit

The following code example shows how to use delete-scheduled-audit.

AWS CLI

To delete a scheduled audit

The following delete-scheduled-audit example deletes the AWS IoT Device Defender scheduled audit named AWSSIoTDeviceDefenderDailyAudit.

```
aws iot delete-scheduled-audit \
    --scheduled-audit-name AWSSIoTDeviceDefenderDailyAudit
```

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DeleteScheduledAudit in AWS CLI Command Reference.

delete-security-profile

The following code example shows how to use delete-security-profile.

AWS CLI

To delete a security profile

The following delete-security-profile example deletes a security profile named PossibleIssue.

```
aws iot delete-security-profile \
    --security-profile-name PossibleIssue
```
This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.
- For API details, see DeleteSecurityProfile in AWS CLI Command Reference.

delete-stream

The following code example shows how to use delete-stream.

AWS CLI

To delete a stream

The following delete-stream example deletes the specified stream.

```bash
aws iot delete-stream \
   --stream-id stream12345
```

This command produces no output.

For more information, see DeleteStream in the AWS IoT API Reference.
- For API details, see DeleteStream in AWS CLI Command Reference.

delete-thing-group

The following code example shows how to use delete-thing-group.

AWS CLI

To delete a thing group

The following delete-thing-group example deletes the specified thing group. You cannot delete a thing group if it contains child thing groups.

```bash
aws iot delete-thing-group \
   --thing-group-name DefectiveBulbs
```

This command produces no output.

For more information, see Thing Groups in the AWS IoT Developers Guide.
- For API details, see DeleteThingGroup in AWS CLI Command Reference.
delete-thing-type

The following code example shows how to use delete-thing-type.

AWS CLI

Example 1: To delete a thing type

The following delete-thing-type example deletes a deprecated thing type.

```
aws iot delete-thing-type \
   --thing-type-name "obsoleteThingType"
```

This command produces no output.

For more information, see Thing Types in the AWS IoT Developers Guide.
- For API details, see DeleteThingType in AWS CLI Command Reference.

delete-thing

The following code example shows how to use delete-thing.

AWS CLI

To display detailed information about a thing

The following delete-thing example deletes a thing from the AWS IoT registry for your AWS account.

```
aws iot delete-thing --thing-name "FourthBulb"
```

This command produces no output.

For more information, see How to Manage Things with the Registry in the AWS IoT Developers Guide.
- For API details, see DeleteThing in AWS CLI Command Reference.

delete-topic-rule-destination

The following code example shows how to use delete-topic-rule-destination.
AWS CLI

To delete a topic rule destination

The following delete-topic-rule-destination example deletes the specified topic rule destination.

```
aws iot delete-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

This command produces no output.

For more information, see Deleting a topic rule destination in the AWS IoT Developer Guide.  
- For API details, see DeleteTopicRuleDestination in AWS CLI Command Reference.

delete-topic-rule

The following code example shows how to use delete-topic-rule.

AWS CLI

To delete a rule

The following delete-topic-rule example deletes the specified rule.

```
aws iot delete-topic-rule \
    --rule-name "LowMoistureRule"
```

This command produces no output.

For more information, see Deleting a Rule in the AWS IoT Developers Guide.  
- For API details, see DeleteTopicRule in AWS CLI Command Reference.

delete-v2-logging-level

The following code example shows how to use delete-v2-logging-level.

AWS CLI

To delete the logging level for a thing group
The following `delete-v2-logging-level` example deletes the logging level for the specified thing group.

```
aws iot delete-v2-logging-level \
  --target-type THING_GROUP \
  --target-name LightBulbs
```

This command produces no output.

- For API details, see `DeleteV2LoggingLevel` in *AWS CLI Command Reference*.

**deprecate-thing-type**

The following code example shows how to use `deprecate-thing-type`.

**AWS CLI**

**Example 1: To deprecate a thing type**

The following `deprecate-thing-type` example deprecates a thing type so that users can't associate any new things with it.

```
aws iot deprecate-thing-type \
  --thing-type-name "obsoleteThingType"
```

This command produces no output.

**Example 2: To reverse the deprecation of a thing type**

The following `deprecate-thing-type` example reverses the deprecation of a thing type, which makes it possible for users to associate new things with it again.

```
aws iot deprecate-thing-type \
  --thing-type-name "obsoleteThingType" \
  --undo-deprecate
```

This command produces no output.

For more information, see *Thing Types* in the *AWS IoT Developers Guide*.

- For API details, see `DeprecateThingType` in *AWS CLI Command Reference*. 
describe-account-audit-configuration

The following code example shows how to use describe-account-audit-configuration.

AWS CLI

To view current audit configuration settings

The following describe-account-audit-configuration example lists the current settings for your AWS IoT Device Defender audit configuration.

```bash
aws iot describe-account-audit-configuration
```

Output:

```json
{
   "roleArn": "arn:aws:iam::123456789012:role/service-role/AWSIoTDeviceDefenderAudit_1551201085996",
   "auditNotificationTargetConfigurations": {
      "SNS": {
         "roleArn": "arn:aws:iam::123456789012:role/service-role/AWSIoTDeviceDefenderAudit",
         "enabled": true
      }
   },
   "auditCheckConfigurations": {
      "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
         "enabled": true
      },
      "CA_CERTIFICATE_EXPIRING_CHECK": {
         "enabled": true
      },
      "CONFLICTING_CLIENT_IDS_CHECK": {
         "enabled": true
      },
      "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
         "enabled": true
      },
      "DEVICE_CERTIFICATE_SHARED_CHECK": {
         "enabled": true
      },
      "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
```
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DescribeAccountAuditConfiguration in AWS CLI Command Reference.

describe-audit-finding

The following code example shows how to use describe-audit-finding.

AWS CLI

To list details for an audit finding

The following describe-audit-finding example lists the details for the specified AWS IoT Device Defender audit finding. An audit can produce multiple findings. Use the list-audit-findings command to get a list of the findings from an audit to get the findingId.

```
aws iot describe-audit-finding \
   --finding-id "ef4826b8-e55a-44b9-b460-5c485355371b"
```

Output:

```
{
   "finding": {
      "findingId": "ef4826b8-e55a-44b9-b460-5c485355371b",
```

```
"taskId": "873ed69c74a9ec8fa9b8e88e9abc4661",
"checkName": "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
"taskStartTime": 1576012045.745,
"findingTime": 1576012046.168,
"severity": "CRITICAL",
"nonCompliantResource": {
  "resourceType": "IOT_POLICY",
  "resourceIdentifier": {
    "policyVersionIdentifier": {
      "policyName": "smp-ggrass-group_Core-policy",
      "policyVersionId": "1"
    }
  }
},
"reasonForNonCompliance": "Policy allows broad access to IoT data plane actions: [iot:Subscribe, iot:Connect, iot:GetThingShadow, iot:DeleteThingShadow, iot:UpdateThingShadow, iot:Publish].",
"reasonForNonComplianceCode": "ALLOWS_BROAD_ACCESS_TO_IOT_DATA_PLANE_ACTIONS"
}

For more information, see Check Audit Results (Audit Commands) in the AWS IoT Developer Guide.

- For API details, see DescribeAuditFinding in AWS CLI Command Reference.

**describe-audit-mitigation-actions-task**

The following code example shows how to use describe-audit-mitigation-actions-task.

**AWS CLI**

**To show the details of an audit mitigation actions task**

The following describe-audit-mitigation-actions-task example shows the details for the specified task, where the ResetPolicyVersionAction was applied to a finding. The results include when the task started and ended, how many findings were targeted (and the outcome), and the definition of the action that is applied as part of this task.

```
aws iot describe-audit-mitigation-actions-task \   --task-id ResetPolicyTask01
```

- For API details, see [DescribeAuditMitigationActionsTask](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-audit-mitigation-actions-task.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-audit-mitigation-actions-task.html).
describe-audit-suppression

The following code example shows how to use describe-audit-suppression.

AWS CLI

To get details about an audit finding suppression

The following describe-audit-suppression example lists details about an audit finding suppression.

```
aws iot describe-audit-task \
    --task-id "787ed873b69cb4d6c6dbae6ddd06996c5"
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK",
    "taskStartTime": 1596168096.157,
    "taskStatistics": {
        "totalChecks": 1,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 0,
        "nonCompliantChecks": 1,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "auditDetails": {
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_NON_COMPLIANT",
            "checkCompliant": false,
            "totalResourcesCount": 195,
            "nonCompliantResourcesCount": 2
        }
    }
}
```

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/latest/developerguide/audit-suppressions.html) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeAuditSuppression](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-audit-suppression.html) in *AWS CLI Command Reference*.
describe-audit-task

The following code example shows how to use describe-audit-task.

AWS CLI

To get information about an audit instance

The following describe-audit-task example gets information about an instance of an AWS IoT Device Defender audit. If the audit is complete, summary statistics for the run are included in the results.

```bash
aws iot describe-audit-task \
  --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```json
{
  "taskStatus": "COMPLETED",
  "taskType": "ON_DEMAND_AUDIT_TASK",
  "taskStartTime": 1560356923.434,
  "taskStatistics": {
    "totalChecks": 3,
    "inProgressChecks": 0,
    "waitingForDataCollectionChecks": 0,
    "compliantChecks": 3,
    "nonCompliantChecks": 0,
    "failedChecks": 0,
    "canceledChecks": 0
  },
  "auditDetails": {
    "CA_CERTIFICATE_EXPIRING_CHECK": {
      "checkRunStatus": "COMPLETED_COMPLIANT",
      "checkCompliant": true,
      "totalResourcesCount": 0,
      "nonCompliantResourcesCount": 0
    },
    "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
      "checkRunStatus": "COMPLETED_COMPLIANT",
      "checkCompliant": true,
      "totalResourcesCount": 6,
      "nonCompliantResourcesCount": 0
    }
  }
}
```
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DescribeAuditTask in AWS CLI Command Reference.

describe-authorizer

The following code example shows how to use describe-authorizer.

AWS CLI

To get information about a custom authorizer

The following describe-authorizer example displays details for the specified custom authorizer.

```
aws iot describe-authorizer
    --authorizer-name CustomAuthorizer
```

Output:

```json
{
    "authorizerDescription": {
        "authorizerName": "CustomAuthorizer",
        "tokenKeyName": "MyAuthToken",
        "tokenSigningPublicKeys": {
            "FIRST_KEY": "-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwoZ+7ENxAio9q6QD4FFqjGZsvjtYwjoe1RKK0U8Eq9xb503kRSmyIwTzwzm/f4Gf0Y
-----END PUBLIC KEY-----"
        }
    }
}
```
For more information, see [DescribeAuthorizer](https://docs.aws.amazon.com/iot/latest/APIReference/API_DescribeAuthorizer.html) in the *AWS IoT API Reference*.  
- For API details, see [DescribeAuthorizer](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-authorizer.html) in *AWS CLI Command Reference*.

**describe-billing-group**

The following code example shows how to use `describe-billing-group`.

**AWS CLI**

To get information about a billing group

The following `describe-billing-group` example gets information for the specified billing group.

```bash
aws iot describe-billing-group --billing-group-name GroupOne
```

Output:

```json
{
   "billingGroupName": "GroupOne",
   "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562",
   "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
   "version": 1,
   "billingGroupProperties": {},
   "billingGroupMetadata": {
      "creationDate": 1560199355.378
   }
}
```
For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see DescribeBillingGroup in AWS CLI Command Reference.

describe-ca-certificate

The following code example shows how to use describe-ca-certificate.

AWS CLI

To get details about a CA certificate

The following describe-ca-certificate example displays the details for the specified CA certificate.

```
aws iot describe-ca-certificate \
   --certificate-id f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```
{
    "certificateDescription": {
        "certificateId": "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
        "status": "INACTIVE",
        "certificatePem": "-----BEGIN CERTIFICATE-----\nMIICzzCCAbegEXAMPLEJANVEPWX18taPMA0GCSqGSIb3DQEBBQUAMBA4xEDAbswJwMQ4XkVmbEBDBzU0XGkxX7c+1wYnAAAQ==-----END CERTIFICATE-----\n"}
```
For more information, see [DescribeCACertificate](https://docs.aws.amazon.com/iot/latest/developerguide/certificate-manage.html) in the *AWS IoT API Reference*.

- For API details, see [DescribeCaCertificate](https://docs.aws.amazon.com/iot/latest/developerguide/certificate-manage.html) in *AWS CLI Command Reference*.

**describe-certificate**

The following code example shows how to use describe-certificate.

**AWS CLI**

To get information about a certificate

The following describe-certificate example displays the details for the specified certificate.

```bash
aws iot describe-certificate \
   --certificate-id \
   "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

Output:

```json
{
   "certificateDescription": {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",
      "certificateId": "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",
      "status": "ACTIVE",
```
```
For more information, see DescribeCertificate in the AWS IoT API Reference.

- For API details, see DescribeCertificate in AWS CLI Command Reference.

describe-custom-metric

The following code example shows how to use describe-custom-metric.

AWS CLI

To get information about a Device Defender custom metric

The following describe-custom-metric example gets information about a custom metric named myCustomMetric.
aws iot describe-custom-metric \
   --metric-name myCustomMetric

Output:

```
{
   "metricName": "myCustomMetric",
   "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/myCustomMetric",
   "metricType": "number",
   "displayName": "My custom metric",
   "creationDate": 2020-11-17T23:02:12.879000-09:00,
   "lastModifiedDate": 2020-11-17T23:02:12.879000-09:00
}
```

For more information, see Custom metrics in the AWS IoT Core Developer Guide.

- For API details, see DescribeCustomMetric in AWS CLI Command Reference.

**describe-default-authorizer**

The following code example shows how to use describe-default-authorizer.

**AWS CLI**

**To get information about the default custom authorizer**

The following describe-default-authorizer example displays details for the default custom authorizer.

```
aws iot describe-default-authorizer
```

Output:

```
{
   "authorizerName": "CustomAuthorizer",
   "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer"
}
```

For more information, see DescribeDefaultAuthorizer in the AWS IoT API Reference.

- For API details, see DescribeDefaultAuthorizer in AWS CLI Command Reference.
describe-dimension

The following code example shows how to use describe-dimension.

AWS CLI

To get information about a dimension

The following describe-dimension example gets information about a dimension named TopicFilterForAuthMessages.

```
aws iot describe-dimension \
  --name TopicFilterForAuthMessages
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "type": "TOPIC_FILTER",
    "stringValues": [
        "device/+/auth"
    ],
    "creationDate": 1578620223.255,
    "lastModifiedDate": 1578620223.255
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DescribeDimension in AWS CLI Command Reference.

describe-domain-configuration

The following code example shows how to use describe-domain-configuration.

AWS CLI

To describe a domain configuration

The following describe-domain-configuration example displays details about the specified domain configuration.
aws iot describe-domain-configuration \
    --domain-configuration-name "additionalDataDomain"

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-east-1:758EXAMPLE143:domainconfiguration/additionalDataDomain/norpw",
    "domainName": "d055exampleed74y71zfd-ats.beta.us-east-1.iot.amazonaws.com",
    "serverCertificates": [],
    "domainConfigurationStatus": "ENABLED",
    "serviceType": "DATA",
    "domainType": "AWS_MANAGED",
    "lastStatusChangeDate": 1601923783.774
}
```

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see DescribeDomainConfiguration in AWS CLI Command Reference.

describe-endpoint

The following code example shows how to use describe-endpoint.

AWS CLI

**Example 1: To get your current AWS endpoint**

The following describe-endpoint example retrieves the default AWS endpoint to which all commands are applied.

```
aws iot describe-endpoint
```

Output:

```
{
    "endpointAddress": "abc123defghijk.iot.us-west-2.amazonaws.com"
}
```

For more information, see DescribeEndpoint in the AWS IoT Developer Guide.
Example 2: To get your ATS endpoint

The following describe-endpoint example retrieves the Amazon Trust Services (ATS) endpoint.

```bash
aws iot describe-endpoint \
   --endpoint-type iot:Data-ATS
```

Output:

```json
{
    "endpointAddress": "abc123defghijk-ats.iot.us-west-2.amazonaws.com"
}
```

For more information, see [X.509 Certificates and AWS IoT](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeEndpoint](#) in *AWS CLI Command Reference*.

**describe-event-configurations**

The following code example shows how to use describe-event-configurations.

**AWS CLI**

**To show which event types are published**

The following describe-event-configurations example lists the configuration that controls which events are generated when something is added, updated, or deleted.

```bash
aws iot describe-event-configurations
```

Output:

```json
{
    "eventConfigurations": {
        "CA_CERTIFICATE": {
            "Enabled": false
        },
        "CERTIFICATE": {
            "Enabled": false
        }
    }
}
```
For more information, see Event Messages in the AWS IoT Developer Guide.

- For API details, see DescribeEventConfigurations in AWS CLI Command Reference.

**describe-index**

The following code example shows how to use describe-index.

**AWS CLI**

To retrieve the current status of the thing index

The following describe-index example retrieves the current status of the thing index.
aws iot describe-index \
  --index-name "AWS_Things"

Output:

{
  "indexName": "AWS_Things",
  "indexStatus": "ACTIVE",
  "schema": "REGISTRY_AND_SHADOW_AND_CONNECTIVITY_STATUS"
}

For more information, see [Managing Thing Indexing](#) in the [AWS IoT Developer Guide](#).
- For API details, see [DescribeIndex](#) in [AWS CLI Command Reference](#).

describe-job-execution

The following code example shows how to use describe-job-execution.

**AWS CLI**

**To get execution details for a job on a device**

The following describe-job-execution example gets execution details for the specified job.

aws iot describe-job-execution \
  --job-id "example-job-01" \
  --thing-name "MyRaspberryPi"

Output:

{
  "execution": {
    "jobId": "example-job-01",
    "status": "QUEUED",
    "statusDetails": {},
    "queuedAt": 1560787023.636,
    "lastUpdatedAt": 1560787023.636,
    "executionNumber": 1,
    "versionNumber": 1
  }
}
The following code example shows how to use `describe-job`.

AWS CLI

**To get detailed status for a job**

The following `describe-job` example gets detailed status for the job whose ID is `example-job-01`.

```bash
aws iot describe-job \
  --job-id "example-job-01"
```

Output:

```
{
  "job": {
    "jobId": "example-job-01",
    "targetSelection": "SNAPSHOT",
    "status": "IN_PROGRESS",
    "targets": ["arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"],
    "description": "example job test",
    "presignedUrlConfig": {},
    "jobExecutionsRolloutConfig": {},
    "createdAt": 1560787022.733,
    "lastUpdatedAt": 1560787026.294,
    "jobProcessDetails": {
      "numberOfCanceledThings": 0,
      "numberOfSucceededThings": 0,
      "numberOfFailedThings": 0,
      "numberOfRejectedThings": 0,
      "numberOfQueuedThings": 1,
```

For more information, see [Creating and Managing Jobs (CLI)] in the AWS IoT Developer Guide.

- For API details, see [DescribeJobExecution] in AWS CLI Command Reference.
"numberOfInProgressThings": 0,
"numberOfRemovedThings": 0,
"numberOfTimedOutThings": 0
},
"timeoutConfig": {}
}

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DescribeJob in AWS CLI Command Reference.

describe-mitigation-action

The following code example shows how to use describe-mitigation-action.

AWS CLI

To view the details for a defined mitigation action

The following describe-mitigation-action example displays details for the specified mitigation action.

```
aws iot describe-mitigation-action \
   --action-name AddThingsToQuarantineGroupAction
```

Output:

```json
{
   "actionName": "AddThingsToQuarantineGroupAction",
   "actionType": "ADD_THINGS_TO_THING_GROUP",
   "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
   "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa",
   "roleArn": "arn:aws:iam::123456789012:role/service-role/MoveThingsToQuarantineGroupRole",
   "actionParams": {
      "addThingsToThingGroupParams": {
         "thingGroupName": [ "QuarantineGroup1"
      ],
      "overrideDynamicGroups": true
   }
```
The following code example shows how to use `describe-provisioning-template-version`.

**AWS CLI**

**To describe a provisioning template version**

The following `describe-provisioning-template-version` example describes a provisioning template version.

```
aws iot describe-provisioning-template-version \
    --template-name MyTestProvisioningTemplate \ 
    --version-id 1
```

Output:

```
{
   "versionId": 1,
   "creationDate": 1589308310.574,
   "templateBody": {
       "Parameters": {
           "SerialNumber": {
               "Type": "String"
           },
           "AWS::IoT::Certificate::Id": {
               "Type": "String"
           }
       },
       "Resources": {
           "certificate": {
               "Properties": {
               
               }
           }
       }
   }
}
```
For more information, see Provisioning devices that don’t have device certificates using fleet provisioning in the AWS IoT Core Developers Guide.

- For API details, see DescribeProvisioningTemplateVersion in AWS CLI Command Reference.
describe-provisioning-template

The following code example shows how to use describe-provisioning-template.

AWS CLI

To describe a provisioning template

The following describe-provisioning-template example describes a provisioning template.

```
aws iot describe-provisioning-template \
  --template-name MyTestProvisioningTemplate
```

Output:

```
{
  "templateName": "MyTestProvisioningTemplate",
  "creationDate": 1589308310.574,
  "lastModifiedDate": 1589308345.539,
  "defaultVersionId": 1,
  "templateBody": "{ 
    "Parameters":{ 
      "SerialNumber":{ 
        "Type": "String" 
      },
      "AWS::IoT::Certificate::Id":{ 
        "Type": "String" 
      }
    },
    "Resources":{ 
      "certificate":{ 
        "Properties":{ 
          "CertificateId":{ 
            "Ref": "AWS::IoT::Certificate::Id" 
          },
          "Status": "Active" 
        },
        "Type": "AWS::IoT::Certificate" 
      },
      "policy":{ 
        ""}

For more information, see [Provisioning devices that don't have device certificates using fleet provisioning](https://docs.aws.amazon.com/iot/latest/developerguide/fleet-provisioning.html) in the [AWS IoT Core Developers Guide](https://docs.aws.amazon.com/iot/core/latest/developerguide/).  

**describe-role-alias**

The following code example shows how to use `describe-role-alias`.

**Actions and scenarios**
AWS CLI

To get information about an AWS IoT role alias

The following `describe-role-alias` example displays details for the specified role alias.

```bash
aws iot describe-role-alias \
  --role-alias LightBulbRole
```

Output:

```json
{
  "roleAliasDescription": {
    "roleAlias": "LightBulbRole",
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/\nLightBulbRole",
    "roleArn": "arn:aws:iam::123456789012:role/light_bulb_role_001",
    "owner": "123456789012",
    "credentialDurationSeconds": 3600,
    "creationDate": 1570558643.221,
    "lastModifiedDate": 1570558643.221
  }
}
```

For more information, see `DescribeRoleAlias` in the *AWS IoT API Reference*.

- For API details, see `DescribeRoleAlias` in *AWS CLI Command Reference*.

**describe-scheduled-audit**

The following code example shows how to use `describe-scheduled-audit`.

AWS CLI

To get information about a scheduled audit

The following `describe-scheduled-audit` example gets detailed information about an AWS IOT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```bash
aws iot describe-scheduled-audit \
  --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

Output:
For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeScheduledAudit](#) in *AWS CLI Command Reference*.

### describe-security-profile

The following code example shows how to use `describe-security-profile`.

**AWS CLI**

**To get information about a security profile**

The following `describe-security-profile` example gets information about the AWS IoT Device Defender security profile named `PossibleIssue`.

```
aws iot describe-security-profile \
   --security-profile-name PossibleIssue
```

**Output:**

```
{
   "securityProfileName": "PossibleIssue",
   "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
   PossibleIssue",
   "securityProfileDescription": "check to see if authorization fails 10 times in 5
   minutes or if cellular bandwidth exceeds 128",
   "behaviors": [
     
   
```
The following code example shows how to use `describe-stream`.

**AWS CLI**

**To get information about a stream**

The following `describe-stream` example displays the details about the specified stream.

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeSecurityProfile](#) in *AWS CLI Command Reference*.
Output:

```
{
    "streamInfo": {
        "streamId": "stream12345",
        "streamVersion": 1,
        "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
        "files": [
            {
                "fileId": "123",
                "s3Location": {
                    "bucket": "codesign-ota-bucket",

        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
    }
}
```

For more information, see DescribeStream in the AWS IoT API Reference.

- For API details, see DescribeStream in AWS CLI Command Reference.

**describe-thing-group**

The following code example shows how to use describe-thing-group.

**AWS CLI**

**To get information about a thing group**

The following describe-thing-group example gets information about the thing group named HalogenBulbs.

```
aws iot describe-thing-group \
```
--thing-group-name HalogenBulbs

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e",
    "version": 1,
    "thingGroupProperties": {},
    "thingGroupMetadata": {
        "parentGroupName": "LightBulbs",
        "rootToParentThingGroups": [
            {
                "groupName": "LightBulbs",
                "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
            }
        ],
        "creationDate": 1559927609.897
    }
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeThingGroup](https://docs.aws.amazon.com/iot/latest/developerguide/api-reference.html) in *AWS CLI Command Reference*.

**describe-thing-type**

The following code example shows how to use describe-thing-type.

**AWS CLI**

**To get information about a thing type**

The following describe-thing-type example display information about the specified thing type defined in your AWS account.

```
aws iot describe-thing-type \
  --thing-type-name "LightBulb"
```

Output:
For more information, see Thing Types in the AWS IoT Developers Guide.

For API details, see DescribeThingType in AWS CLI Command Reference.

describe-thing

The following code example shows how to use describe-thing.

AWS CLI

To display detailed information about a thing

The following describe-thing example display information about a thing (device) that is defined in the AWS IoT registry for your AWS account.

aws iot describe-thing --thing-name "MyLightBulb"

Output:

```json
{
    "defaultClientId": "MyLightBulb",
    "thingName": "MyLightBulb",
    "thingId": "40da2e73-c6af-406e-b415-15acae538797",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingTypeName": "LightBulb",
    "attributes": {
```
For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot-devices/latest/developerguide/registry-labels.html) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeThing](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-thing.html) in *AWS CLI Command Reference*.

### detach-policy

The following code example shows how to use `detach-policy`.

**AWS CLI**

**Example 1: To detach an AWS IoT policy from a thing group**

The following `detach-policy` example detaches the specified policy from a thing group and, by extension, from all things in that group and any of the group's child groups.

```
aws iot detach-policy \\n   --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \\n   --policy-name "MyFirstGroup_Core-policy"
```

This command produces no output.

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot-devices/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

**Example 2: To detach an AWS IoT policy from a device certificate**

The following `detach-policy` example detaches the `TemperatureSensorPolicy` policy from a device certificate identified by ARN.

```
aws iot detach-policy \\n   --policy-name TemperatureSensorPolicy \\n   --target arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a7738463c4e40b18b1b3caaae57b7272ba44c45e3448142
```

This command produces no output.

- For API details, see [DetachPolicy](https://docs.aws.amazon.com/cli/latest/reference/iot/detach-policy.html) in *AWS CLI Command Reference*. 

Actions and scenarios 3762
detach-security-profile

The following code example shows how to use detach-security-profile.

AWS CLI

To disassociate a security profile from a target

The following detach-security-profile example removes the association between the AWS IoT Device Defender security profile named Testprofile and the all registered things target.

```bash
aws iot detach-security-profile \
  --security-profile-name Testprofile \
```

This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DetachSecurityProfile in AWS CLI Command Reference.

detach-thing-principal

The following code example shows how to use detach-thing-principal.

AWS CLI

To detach a certificate/principal from a thing

The following detach-thing-principal example removes a certificate that represents a principal from the specified thing.

```bash
aws iot detach-thing-principal \
  --thing-name "MyLightBulb" \
  --principal "arn:aws:iot:us-west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36"
```

This command produces no output.

For more information, see How to Manage Things with the Registry in the AWS IoT Developers Guide.
• For API details, see [DetachThingPrincipal](#) in *AWS CLI Command Reference.*

**disable-topic-rule**

The following code example shows how to use `disable-topic-rule`.

**AWS CLI**

**To disable a topic rule**

The following `disable-topic-rule` example disables the specified topic rule.

```bash
aws iot disable-topic-rule
    --rule-name "MyPlant Pi Moisture Alert Rule"
```

This command produces no output.

For more information, see [Viewing Your Rules](#) in the *AWS IoT Developer Guide.*

• For API details, see [DisableTopicRule](#) in *AWS CLI Command Reference.*

**enable-topic-rule**

The following code example shows how to use `enable-topic-rule`.

**AWS CLI**

**To enable a topic rule**

The following `enable-topic-rule` example enables (or re-enables) the specified topic rule.

```bash
aws iot enable-topic-rule
    --rule-name "MyPlant Pi Moisture Alert Rule"
```

This command produces no output.

For more information, see [Viewing Your Rules](#) in the *AWS IoT Developer Guide.*

• For API details, see [EnableTopicRule](#) in *AWS CLI Command Reference.*

**get-behavior-model-training-summaries**

The following code example shows how to use `get-behavior-model-training-summaries`.
AWS CLI

To list a Device Defender's ML Detect Security Profile training model's status

The following `get-behavior-model-training-summaries` example lists model training status for the configured behaviors in the chosen Security Profile. For each behavior, the name, model status, and percentage of datapoints collected are listed.

```
aws iot get-behavior-model-training-summaries \
    --security-profile-name MySecurityProfileName
```

Output:

```
{
    "summaries": [
        {
            "securityProfileName": "MySecurityProfileName",
            "behaviorName": "Messages_sent_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecurityProfileName",
            "behaviorName": "Messages_received_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecurityProfileName",
            "behaviorName": "Authorization_failures_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecurityProfileName",
            "behaviorName": "Message_size_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecurityProfileName",
            "behaviorName": "Connection_attempts_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        }
    ]
}
```
For more information, see **GetBehaviorModelTrainingSummaries (Detect Commands)** in the **AWS IoT Developer Guide**.

- For API details, see **GetBehaviorModelTrainingSummaries** in **AWS CLI Command Reference**.

### get-cardinality

The following code example shows how to use **get-cardinality**.

**AWS CLI**

**To return the approximate count of unique values that match the query**

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 3 attributes.

```bash
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
Racks=(Rack1 Rack1 Rack2 Rack2 Rack3 Rack4 Rack5 Rack6 Rack6 Rack6)
IsNormal=(true true true true true true false false false false)
for ((i=0; i<10 ; i++))
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload attributes="{temperature=${Temperatures[i]},rackId=${Racks[i]},stateNormal=${IsNormal[i]}}")
  aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```json
{
  "version": 1,
  "datapointsCollectionPercentage": 0.0
}
```
The following get-cardinality example queries the 10 sensors created by the setup script and returns the number of racks that have temperature sensors reporting abnormal temperature values. If the temperature value is below 60 or above 80, the temperature sensor is in an abnormal state.

```bash
aws iot get-cardinality \
  --aggregation-field "attributes.rackId" \
  --query-string "thingName:TempSensor* AND attributes.stateNormal:false"
```

Output:

```json
{
  "cardinality": 2
}
```

For more information, see Querying for Aggregate Data<https://docs.aws.amazon.com/iot/latest/developerguide/index-aggregate.html> in the AWS IoT Developer Guide.

- For API details, see GetCardinality in AWS CLI Command Reference.

**get-effective-policies**

The following code example shows how to use get-effective-policies.

**AWS CLI**

To list the policies that effect a thing

The following get-effective-policies example lists the policies that effect the specified thing, including policies attached to any groups to which it belongs.
aws iot get-effective-policies \
  --thing-name TemperatureSensor-001 \
  --principal arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b12caaae57b7272ba44c45e3448142

Output:

{
   "effectivePolicies": [
   {
      "policyName": "TemperatureSensorPolicy",
      "policyDocument": "{\"Version\": \"2012-10-17\",\"Statement\": [
   ]}
   ]
}
get-indexing-configuration

The following code example shows how to use get-indexing-configuration.

AWS CLI

To get the thing indexing configuration

The following get-indexing-configuration example gets the current configuration data for AWS IoT fleet indexing.

```
aws iot get-indexing-configuration
```

Output:

```
{
   "thingIndexingConfiguration": {
      "thingIndexingMode": "OFF",
      "thingConnectivityIndexingMode": "OFF"
   },
   "thingGroupIndexingConfiguration": {
      "thingGroupIndexingMode": "OFF"
   }
}
```

For more information, see Managing Thing Indexing in the AWS IoT Developers Guide.
get-job-document

The following code example shows how to use get-job-document.

AWS CLI

To retrieve the document for a job

The following get-job-document example displays details about the document for the job whose ID is example-job-01.

```
aws iot get-job-document \
  --job-id "example-job-01"
```

Output:

```
{
    "document": "\n    \"operation\":\"customJob\",\n    \"someValue\"\n\n}"
```

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

get-logging-options

The following code example shows how to use get-logging-options.

AWS CLI

To get the logging options

The following get-logging-options example gets the current logging options for your AWS account.

```
aws iot get-logging-options
```
Output:

```json
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/iotLoggingRole",
    "logLevel": "ERROR"
}
```

For more information, see title in the AWS IoT Developer Guide.

- For API details, see GetLoggingOptions in AWS CLI Command Reference.

**get-ota-update**

The following code example shows how to use `get-ota-update`.

**AWS CLI**

**To retrieve information about an OTA Update**

The following `get-ota-update` example displays details about the specified OTA Update.

```
aws iot get-ota-update \
    --ota-update-id ota12345
```

Output:

```json
{
    "otaUpdateInfo": {
        "otaUpdateId": "ota12345",
        "creationDate": 1557863215.995,
        "lastModifiedDate": 1557863215.995,
        "description": "A critical update needed right away.",
        "targets": [
            "device1",
            "device2",
            "device3",
            "device4"
        ],
        "targetSelection": "SNAPSHOT",
        "protocols": ["HTTP"],
        "awsJobExecutionsRolloutConfig": {
```
For more information, see [GetOTAUpdate](https://docs.aws.amazon.com/iot/latest/developerguide/getotaupdate.html) in the AWS IoT API Reference.

**get-percentiles**

The following code example shows how to use get-percentiles.

**AWS CLI**

> **To group the aggregated values that match the query into percentile groupings**

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 1 attribute.

```bash
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
for ((i=0; i<10 ; i++))
```
do
    thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
        attributes="{temperature=${Temperatures[i]}}")
    aws iot describe-thing --thing-name "TempSensor$i"
done

Example output of the setup script:

```
{
    "version": 1,
    "thingName": "TempSensor0",
    "defaultClientId": "TempSensor0",
    "attributes": {
        "temperature": "70"
    },
    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
    "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following get-percentiles example queries the 10 sensors created by the setup script and returns a value for each percentile group specified. The percentile group "10" contains the aggregated field value that occurs in approximately 10 percent of the values that match the query. In the following output, {"percent": 10.0, "value": 67.7} means approximately 10.0% of the temperature values are below 67.7.

```
aws iot get-percentiles \
   --aggregation-field "attributes.temperature" \
   --query-string "thingName:TempSensor*" \
   --percents 10 25 50 75 90
```

Output:

```
{
    "percentiles": [
        {
            "percent": 10.0,
            "value": 67.7
        },
        {
            "percent": 25.0,
            "value": 71.25
```
For more information, see Querying for Aggregate Data in the AWS IoT Developer Guide.

- For API details, see GetPercentiles in AWS CLI Command Reference.

get-policy-version

The following code example shows how to use get-policy-version.

AWS CLI

To get information about a specific version of a policy

The following get-policy-version example gets information about the first version of the specified policy.

```bash
aws iot get-policy
   --policy-name UpdateDeviceCertPolicy
   --policy-version-id "1"
```

Output:

```json
{
   "policyName": "UpdateDeviceCertPolicy",
```
For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

- For API details, see GetPolicyVersion in AWS CLI Command Reference.

get-policy

The following code example shows how to use get-policy.

AWS CLI

To get information about the default version of a policy

The following get-policy example retrieves information about the default version of the specified policy.

aws iot get-policy \
   --policy-name UpdateDeviceCertPolicy

Output:

{
   "policyName": "UpdateDeviceCertPolicy",
   "defaultVersionId": "2",
   "creationDate": 1559925941.924,
   "lastModifiedDate": 1559925941.924,
   "generationId": "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.
• For API details, see `GetPolicy` in *AWS CLI Command Reference*.

**get-registration-code**

The following code example shows how to use `get-registration-code`.

**AWS CLI**

*To get your AWS account-specific registration code*

The following `get-registration-code` example retrieves your AWS account-specific registration code.

```bash
aws iot get-registration-code
```

Output:

```json
{
    "registrationCode":
    "15c51ae5e36ba59ba77042df1115862076bea4bd15841c838fcb68d5010a614c"
}
```

For more information, see *Use Your Own Certificate* in the *AWS IoT Developer Guide*.

• For API details, see `GetRegistrationCode` in *AWS CLI Command Reference*.

**get-statistics**

The following code example shows how to use `get-statistics`.

**AWS CLI**

*To search the device index for aggregate data*

The following `get-statistics` example returns the number of things that have a property called `connectivity.connected` set to false (that is, the number of devices that are not connected) in their device shadow.

```bash
aws iot get-statistics \
    --index-name AWS_Things \
    --query-string "connectivity.connected:false"
```
Output:

```
{
   "statistics": {
      "count": 6
   }
}
```

For more information, see [Getting Statistics About Your Device Fleet](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetStatistics](#) in *AWS CLI Command Reference*.

### get-topic-rule-destination

The following code example shows how to use `get-topic-rule-destination`.

**AWS CLI**

#### To get a topic rule destination

The following `get-topic-rule-destination` example gets information about a topic rule destination.

```
aws iot get-topic-rule-destination \
   --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/\n    a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```
{
   "topicRuleDestination": {
      "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/\n       a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "status": "DISABLED",
      "httpUrlProperties": {
         "confirmationUrl": "https://example.com"
      }
   }
}
```

For more information, see [Working with topic rule destinations](#) in the *AWS IoT Developer Guide*. 

Actions and scenarios 3777
get-topic-rule

The following code example shows how to use `get-topic-rule`.

AWS CLI

To get information about a rule

The following `get-topic-rule` example gets information about the specified rule.

```bash
aws iot get-topic-rule \
--rule-name MyRPiLowMoistureAlertRule
```

Output:

```json
{
    "rule": {
        "ruleName": "MyRPiLowMoistureAlertRule",
        "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE state.reported.moisture = 'low'
                  ",
        "description": "Sends an alert whenever soil moisture level readings are too low",
        "createdAt": 1558624363.0,
        "actions": [
            {
                "sns": {
                    "roleArn": "arn:aws:iam::123456789012:role/service-role/MyRPiLowMoistureTopicRole",
                    "messageFormat": "RAW"
                }
            }
        ],
        "ruleDisabled": false,
        "awsIotSqlVersion": "2016-03-23"
    }
}
```
For more information, see Viewing Your Rules in the AWS IoT Developers Guide.

- For API details, see GetTopicRule in AWS CLI Command Reference.

get-v2-logging-options

The following code example shows how to use get-v2-logging-options.

AWS CLI

To list the current logging options

The following get-v2-logging-options example lists the current logging options for AWS IoT.

```bash
aws iot get-v2-logging-options
```

Output:

```
{
    "roleArn": "arn:aws:iam::094249569039:role/service-role/iotLoggingRole",
    "defaultLogLevel": "WARN",
    "disableAllLogs": false
}
```

For more information, see title in the AWS IoT Developer Guide.

- For API details, see GetV2LoggingOptions in AWS CLI Command Reference.

list-active-violations

The following code example shows how to use list-active-violations.

AWS CLI

To list the active violations

The following list-active-violations example lists all violations for the specified security profile.

```bash
aws iot list-active-violations \
    --security-profile-name Testprofile
```
Output:

```json
{
   "activeViolations": [
   {
      "violationId": "174db59167fa474c80a652ad1583fd44",
      "thingName": "iotconsole-1560269126751-1",
      "securityProfileName": "Testprofile",
      "behavior": {
         "name": "Authorization",
         "metric": "aws:num-authorization-failures",
         "criteria": {
            "comparisonOperator": "greater-than",
            "value": {
               "count": 10
            },
            "durationSeconds": 300,
            "consecutiveDatapointsToAlarm": 1,

• For API details, see ListActiveViolations in AWS CLI Command Reference.

list-attached-policies

The following code example shows how to use list-attached-policies.

AWS CLI

Example 1: To list the policies attached to a group

The following list-attached-policies example lists the policies that are attached to the specified group.

aws iot list-attached-policies \
   --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"

Output:

{
   "policies": [
   {
      "policyName": "UpdateDeviceCertPolicy",
   }
   ]
}

For more information, see Thing Groups in the AWS IoT Developers Guide.

Example 2: To list the policies attached to a device certificate
The following `list-attached-policies` example lists the AWS IoT policies attached to the device certificate. The certificate is identified by its ARN.

```bash
aws iot list-attached-policies \\
   --target arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{
   "policies": [ 
      {
         "policyName": "TemperatureSensorPolicy",
      }
   ]
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [ListAttachedPolicies](https://docs.aws.amazon.com/cli/latest/reference/iot/list-attached-policies.html) in *AWS CLI Command Reference*.

### list-audit-findings

The following code example shows how to use `list-audit-findings`.

**AWS CLI**

**Example 1: To list all findings from an audit**

The following `list-audit-findings` example lists all findings from an AWS IoT Device Defender audit with a specified task ID.

```bash
aws iot list-audit-findings \\
   --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{
   "findings": []
}
```
Example 2: To list findings for an audit check type

The following list-audit-findings example shows findings from AWS IoT Device Defender audits that ran between June 5, 2019 and June 19, 2019 in which devices are sharing a device certificate. When you specify a check name, you must provide a start and end time.

```bash
aws iot list-audit-findings \
    --check-name DEVICE_CERTIFICATE_SHARED_CHECK \ 
    --start-time 1559747125 \ 
    --end-time 1560962028
```

Output:

```json
{
    "findings": [
        {
            "taskId": "eeef61068b0eb03c456d746c5a26ee04",
            "checkName": "DEVICE_CERTIFICATE_SHARED_CHECK",
            "taskStartTime": 1560161017.172,

   }
The following code example shows how to use `list-audit-mitigation-actions-executions`.

**AWS CLI**

To list the details of an audit mitigation action execution

An audit mitigation action task applies a mitigation action to one or more findings from an AWS IoT Device Defender audit. The following `list-audit-mitigation-actions-executions` example lists the details for the mitigation action task with the specified `taskId` and for the specified finding.

```
aws iot list-audit-mitigation-actions-executions \
  --task-id myActionsTaskId \
  --finding-id 0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464
```

Output:

```
{
  "actionsExecutions": [
    {
      "taskId": "myActionsTaskId",
      "findingId": "0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464",
      "actionName": "ResetPolicyVersionAction",
      "actionId": "1ea0b415-bef1-4a01-bd13-72fb63c59afb",
```

For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/audit-commands.html) in the [AWS IoT Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).  

- For API details, see [ListAuditFindings](https://docs.aws.amazon.com/cli/latest/reference/iot/list-audit-findings.html) in *AWS CLI Command Reference*. 

---

**DISCONNECTION_TIME**: "1559826728402"
For more information, see **ListAuditMitigationActionsExecutions (Mitigation Action Commands)** in the *AWS IoT Developer Guide*.

- For API details, see [ListAuditMitigationActionsExecutions](https://docs.aws.amazon.com/cli/latest/reference/iot/list-audit-mitigation-actions-executions.html) in *AWS CLI Command Reference*.

### list-audit-mitigation-actions-tasks

The following code example shows how to use `list-audit-mitigation-actions-tasks`.

**AWS CLI**

**To list audit mitigation action tasks**

The following `list-audit-mitigation-actions-tasks` example lists the mitigation actions that were applied to findings within the specified time period.

```bash
aws iot list-audit-mitigation-actions-tasks 
   --start-time 1594157400 
   --end-time 1594157430
```

**Output:**

```json
{
   "tasks": [
      {
         "taskId": "0062f2d6-3999-488f-88c7-bef005414103",
         "startTime": "2020-07-07T14:30:15.172000-07:00",
         "taskStatus": "COMPLETED"
      }
   ]
}
```

For more information, see **ListAuditMitigationActionsTasks (Mitigation Action Commands)** in the *AWS IoT Developer Guide*. 
list-audit-suppressions

The following code example shows how to use list-audit-suppressions.

AWS CLI

To list all audit finding suppressions

The following list-audit-suppressions example lists all active audit finding suppressions.

```
aws iot list-audit-suppressions
```

Output:

```
{
  "suppressions": [
    {
      "checkName": "DEVICE_CERTIFICATE_EXPIRING_CHECK",
      "resourceIdentifier": {
        "deviceCertificateId": "c7691e<shortened>"
      },
      "expirationDate": 1597881600.0,
      "suppressIndefinitely": false
    }
  ]
}
```

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/latest/developerguide/auditfinding-suppressions.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/). 

list-audit-tasks

The following code example shows how to use list-audit-tasks.

AWS CLI

To list all findings from an audit

- For API details, see [ListAuditMitigationActionsTasks](https://docs.aws.amazon.com/cli/latest/reference/iot/list-audit-tasks.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iot/list-audit-tasks.html).
The following `list-audit-tasks` example lists the audit tasks that ran between June 5, 2019 and June 12, 2019.

```bash
aws iot list-audit-tasks \
    --start-time 1559747125 \
    --end-time 1560357228
```

Output:

```
{
    "tasks": [
        {
            "taskId": "a3aea009955e501a31b764abe1bebd3d",
            "taskStatus": "COMPLETED",
            "taskType": "ON_DEMAND_AUDIT_TASK"
        },
        {
            "taskId": "f76b4b5102b632cd9ae38a279c266da1",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "51d9967d9f9ff4d26529505f6d2c444a",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "eeef61068b0eb03c456d746c5a26ee04",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "041c49557b7c04c079a49514b55589",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "82c7f2afac1562d18a4560be73998acc",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "bade6b5efd2e1b1569822f6021b39cf5",
```
For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListAuditTasks](#) in *AWS CLI Command Reference*.

### list-authorizers

The following code example shows how to use list-authorizers.

**AWS CLI**

**To list your custom authorizer**

The following list-authorizers example lists the custom authorizers in your AWS account.

```
aws iot list-authorizers
```

**Output:**

```json
{
   "authorizers": [
   {
      "authorizerName": "CustomAuthorizer",
      "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer"
   },
   {
```

Actions and scenarios
For more information, see ListAuthorizers in the AWS IoT API Reference.

- For API details, see ListAuthorizers in AWS CLI Command Reference.

**list-billing-groups**

The following code example shows how to use list-billing-groups.

**AWS CLI**

**To list the billing groups for your AWS account and region**

The following list-billing-groups example lists all billing groups that are defined for your AWS account and AWS Region.

```bash
aws iot list-billing-groups
```

Output:

```json
{
   "billingGroups": [
      {
         "groupName": "GroupOne",
         "groupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne"
      }
   ]
}
```

For more information, see Billing Groups in the AWS IoT Developers Guide.
The following code example shows how to use list-ca-certificates.

**AWS CLI**

To list the CA certificates registered in your AWS account

The following list-ca-certificates example lists the CA certificates registered in your AWS account.

```bash
aws iot list-ca-certificates
```

Output:

```
{
  "certificates": [
    {
      "certificateId": "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
      "status": "INACTIVE",
      "creationDate": 1569365372.053
    }
  ]
}
```

For more information, see Use Your Own Certificate in the AWS IoT Developer Guide.

For API details, see ListCaCertificates in AWS CLI Command Reference.

The following code example shows how to use list-certificates-by-ca.

**AWS CLI**

To list all device certificates signed with a CA certificate
The following `list-certificates-by-ca` example lists all device certificates in your AWS account that are signed with the specified CA certificate.

```
aws iot list-certificates-by-ca \
  --ca-certificate-id \
  f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```
{
   "certificates": [
      {
         "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
         "status": "ACTIVE",
         "creationDate": 1569363250.557
      }
   ]
}
```

For more information, see `ListCertificatesByCA` in the `AWS IoT API Reference`.

- For API details, see `ListCertificatesByCa` in `AWS CLI Command Reference`.

`list-certificates`

The following code example shows how to use `list-certificates`.

**AWS CLI**

**Example 1: To list the certificates registered in your AWS account**

The following `list-certificates` example lists all certificates registered in your account. If you have more than the default paging limit of 25, you can use the `nextMarker` response value from this command and supply it to the next command to get the next batch of results. Repeat until `nextMarker` returns without a value.

```
aws iot list-certificates
```
Output:

```json
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "certificateId": "604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "status": "ACTIVE",
            "creationDate": 1556810537.617
        },
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/262a1ac8a7d8aa72f6e96e365480f7313a9db74b8339ec65d34dc3074e1c31e",

        },
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/54458aa39ebb3eb39c91ffbbdcc3a6ca1c7c094d1644b889f735a6fc2cd9a7e3",
            "certificateId": "54458aa39ebb3eb39c91ffbbdcc3a6ca1c7c094d1644b889f735a6fc2cd9a7e3",
            "status": "ACTIVE",
            "creationDate": 1541113568.611
        }
    ]
}
```
For API details, see ListCertificates in AWS CLI Command Reference.

list-custom-metrics

The following code example shows how to use list-custom-metrics.

AWS CLI

To list your custom metrics

The following list-custom-metrics example lists all of your custom metrics.

```
aws iot list-custom-metrics \\
   --region us-east-1
```

Output:

```
{
   "metricNames": [
      "batteryPercentage"
   ]
}
```

For more information, see Custom metrics in the AWS IoT Core Developer Guide.

• For API details, see ListCustomMetrics in AWS CLI Command Reference.

list-dimensions

The following code example shows how to use list-dimensions.
To list the dimensions for your AWS account

The following list-dimensions example lists all AWS IoT Device Defender dimensions that are defined in your AWS account.

```bash
aws iot list-dimensions
```

Output:

```json
{
    "dimensionNames": [
        "TopicFilterForAuthMessages",
        "TopicFilterForActivityMessages"
    ]
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see ListDimensions in AWS CLI Command Reference.

**list-domain-configurations**

The following code example shows how to use list-domain-configurations.

**AWS CLI**

**To list domain configurations**

The following list-domain-configurations example lists the domain configurations in your AWS account that have the specified service type.

```bash
aws iot list-domain-configurations \
    --service-type "DATA"
```

Output:

```json
{
    "domainConfigurations":
```
For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see ListDomainConfigurations in AWS CLI Command Reference.

### list-indices

The following code example shows how to use list-indices.

**AWS CLI**

**To list the configured search indices**

The following list-indices example lists all configured search indices in your AWS account. If you have not enabled thing indexing, you might not have any indices.
aws iot list-indices

Output:

{
    "indexNames": [
        "AWS_Things"
    ]
}

For more information, see Managing Thing Indexing in the AWS IoT Developer Guide.

- For API details, see ListIndices in AWS CLI Command Reference.

**list-job-executions-for-job**

The following code example shows how to use list-job-executions-for-job.

**AWS CLI**

**To list the jobs in your AWS account**

The following list-job-executions-for-job example lists all job executions for a job in your AWS account, specified by the jobId.

aws iot list-job-executions-for-job \
   --job-id my-ota-job

Output:

{
    "executionSummaries": [
        {
            "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/my_thing",
            "jobExecutionSummary": {
                "status": "QUEUED",
                "queuedAt": "2022-03-07T15:58:42.195000-08:00",
                "lastUpdatedAt": "2022-03-07T15:58:42.195000-08:00",
                "executionNumber": 1,
                "retryAttempt": 0
            }
        }
    ]
}
For more information, see [Creating and Managing Jobs (CLI)](https://docs.aws.amazon.com/iot/latest/developerguide/aws-cli-create-manage-jobs.html) in the *AWS IoT Developer Guide*.

- For API details, see [ListJobExecutionsForJob](https://docs.aws.amazon.com/cli/latest/reference/iot/list-job-executions-for-job.html) in *AWS CLI Command Reference*.

### list-job-executions-for-thing

The following code example shows how to use `list-job-executions-for-thing`.

**AWS CLI**

#### To list the jobs that were executed for a thing

The following `list-job-executions-for-thing` example lists all jobs that were executed for the thing named `MyRaspberryPi`.

```
aws iot list-job-executions-for-thing \
  --thing-name "MyRaspberryPi"
```

**Output:**

```json
{
  "executionSummaries": [
    {
      "jobId": "example-job-01",
      "jobExecutionSummary": {
        "status": "QUEUED",
        "queuedAt": 1560787023.636,
        "lastUpdatedAt": 1560787023.636,
        "executionNumber": 1
      }
    }
  ]
}
```

For more information, see [Creating and Managing Jobs (CLI)](https://docs.aws.amazon.com/iot/latest/developerguide/aws-cli-create-manage-jobs.html) in the *AWS IoT Developer Guide*.

- For API details, see [ListJobExecutionsForThing](https://docs.aws.amazon.com/cli/latest/reference/iot/list-job-executions-for-thing.html) in *AWS CLI Command Reference*. 
list-jobs

The following code example shows how to use list-jobs.

AWS CLI

To list the jobs in your AWS account

The following list-jobs example lists all jobs in your AWS account, sorted by the job status.

```bash
aws iot list-jobs
```

Output:

```json
{
    "jobs": [
        {
            "jobId": "example-job-01",
            "targetSelection": "SNAPSHOT",
            "status": "IN_PROGRESS",
            "createdAt": 1560787022.733,
            "lastUpdatedAt": 1560787026.294
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see ListJobs in AWS CLI Command Reference.

list-mitigation-actions

The following code example shows how to use list-mitigation-actions.

AWS CLI

To list all defined mitigation actions

The following list-mitigation-actions example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.
aws iot list-mitigation-actions

Output:

```json
{
    "actionIdentifiers": [
        {
            "actionName": "DeactivateCACertAction",
            "creationDate": "2019-12-10T11:12:47.574000-08:00"
        },
        {
            "actionName": "ResetPolicyVersionAction",
            "creationDate": "2019-12-10T11:11:48.920000-08:00"
        },
        {
            "actionName": "PublishFindingToSNSAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/PublishFindingToSNSAction",
            "creationDate": "2019-12-10T11:10:49.546000-08:00"
        },
        {
            "actionName": "AddThingsToQuarantineGroupAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
            "creationDate": "2019-12-10T11:09:35.999000-08:00"
        },
        {
            "actionName": "UpdateDeviceCertAction",
            "creationDate": "2019-12-10T11:08:44.263000-08:00"
        },
        {
            "actionName": "SampleMitigationAction",
            "creationDate": "2019-12-10T11:03:41.840000-08:00"
        }
    ]
}
```
For more information, see \textit{ListMitigationActions (Mitigation Action Commands)} in the \textit{AWS IoT Developer Guide}.

- For API details, see \textit{ListMitigationActions} in \textit{AWS CLI Command Reference}.

\textbf{list-mitigations-actions}

The following code example shows how to use \texttt{list-mitigations-actions}.

\textbf{AWS CLI}

\textbf{To list all defined mitigation actions}

The following \texttt{list-mitigations-actions} example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

\begin{verbatim}
aws iot list-mitigation-actions
\end{verbatim}

Output:

\begin{verbatim}
{
   "actionIdentifiers": [
   {
      "actionName": "DeactivateCACertAction",
      "creationDate": "2019-12-10T11:12:47.574000-08:00"
   },
   {
      "actionName": "ResetPolicyVersionAction",
      "creationDate": "2019-12-10T11:11:48.920000-08:00"
   },
   {
      "actionName": "PublishFindingToSNSAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/PublishFindingToSNSAction",
      "creationDate": "2019-12-10T11:10:49.546000-08:00"
   }
   ]
\end{verbatim}
For more information, see ListMitigationActions (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see ListMitigationsActions in AWS CLI Command Reference.

**list-ota-updates**

The following code example shows how to use `list-ota-updates`.

**AWS CLI**

**To list OTA Updates for the account**

The following `list-ota-updates` example lists the available OTA updates.

```bash
aws iot list-ota-updates
```

Output:

```json
{
   "otaUpdates": [
   {
      "otaUpdateId": "itsaupdate",
      "creationDate": "2019-12-10T11:09:35.999000-08:00"
   },
   {
      "otaUpdateId": "itsupdate",
      "creationDate": "2019-12-10T11:08:44.263000-08:00"
   },
   {
      "otaUpdateId": "itsasupdate",
      "creationDate": "2019-12-10T11:03:41.840000-08:00"
   }
   ]
}
```
For more information, see **ListOTAUpdates** in the *AWS IoT API Reference*.

- For API details, see **ListOtaUpdates** in *AWS CLI Command Reference*.

### list-outgoing-certificates

The following code example shows how to use list-outgoing-certificates.

**AWS CLI**

**To list certificates being transferred to a different AWS account**

The following list-outgoing-certificates example lists all device certificates that are in the process of being transferred to a different AWS account using the transfer-certificate command.

```
aws iot list-outgoing-certificates
```

**Output:**

```
{
    "outgoingCertificates": [
        {
            "certificateArn": "arn:aws:iot:us-west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "certificateId": "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "transferredTo": "030714055129",
            "transferDate": 1569427780.441,
            "creationDate": 1569363250.557
        }
    ]
}
```

For more information, see **ListOutgoingCertificates** in the *AWS IoT API Reference*.
• For API details, see ListOutgoingCertificates in AWS CLI Command Reference.

**list-policies**

The following code example shows how to use list-policies.

**AWS CLI**

To list the policies defined in your AWS account

The following list-policies example lists all policies defined in your AWS account.

```
aws iot list-policies
```

Output:

```
{
    "policies": [
        {
            "policyName": "UpdateDeviceCertPolicy",
        },
        {
            "policyName": "PlantIoTPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/PlantIoTPolicy"
        },
        {
            "policyName": "MyPiGroup_Core-policy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/MyPiGroup_Core-policy"
        }
    ]
}
```

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

• For API details, see ListPolicies in AWS CLI Command Reference.

**list-policy-versions**

The following code example shows how to use list-policy-versions.
AWS CLI

Example 1: To see all versions of a policy

The following `list-policy-versions` example lists all versions of the specified policy and their creation dates.

```
aws iot list-policy-versions \
   --policy-name LightBulbPolicy
```

Output:

```
{
   "policyVersions": [
      {
         "versionId": "2",
         "isDefaultVersion": true,
         "createDate": 1559925941.924
      },
      {
         "versionId": "1",
         "isDefaultVersion": false,
         "createDate": 1559925941.924
      }
   ]
}
```

For more information, see `AWS IoT Policies` in the `AWS IoT Developers Guide`.

- For API details, see `ListPolicyVersions` in `AWS CLI Command Reference`.

list-principal-things

The following code example shows how to use `list-principal-things`.

AWS CLI

To list the things attached with a principal

The following `list-principal-things` example lists the things attached to the principal specified by an ARN.
aws iot list-principal-things \
--principal arn:aws:iot:us-west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8

Output:

{
   "things": [
      "DeskLamp",
      "TableLamp"
   ]
}

For more information, see ListPrincipalThings in the AWS IoT API Reference.

- For API details, see ListPrincipalThings in AWS CLI Command Reference.

list-provisioning-template-versions

The following code example shows how to use list-provisioning-template-versions.

AWS CLI

To list provisioning template versions

The following list-provisioning-template-versions example lists the available versions of the specified provisioning template.

aws iot list-provisioning-template-versions \
--template-name "widget-template"

Output:

{
   "versions": [
      {
         "versionId": 1,
         "creationDate": 1574800471.339,
         "isDefaultVersion": true
      },
      {

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-secure-tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [ListProvisioningTemplateVersions](https://docs.aws.amazon.com/cli/latest/reference/iot/list-provisioning-template-versions.html) in *AWS CLI Command Reference*.

### list-provisioning-templates

The following code example shows how to use `list-provisioning-templates`.

**AWS CLI**

**To list provisioning templates**

The following `list-provisioning-templates` example lists all of the provisioning templates in your AWS account.

```bash
aws iot list-provisioning-templates
```

**Output:**

```json
{
  "templates": [
    {
      "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-template",
      "templateName": "widget-template",
      "description": "A provisioning template for widgets",
      "creationDate": 1574800471.367,
      "lastModifiedDate": 1574801192.324,
      "enabled": false
    }
  ]
}
```

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-secure-tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [ListProvisioningTemplates](https://docs.aws.amazon.com/cli/latest/reference/iot/list-provisioning-template-versions.html) in *AWS CLI Command Reference*. 
list-role-aliases

The following code example shows how to use list-role-aliases.

AWS CLI

To list the AWS IoT role aliases in your AWS account

The following list-role-aliases example lists the AWS IoT role aliases in your AWS account.

```bash
aws iot list-role-aliases
```

Output:

```json
{
   "roleAliases": [
      "ResidentAlias",
      "ElectricianAlias"
   ]
}
```

For more information, see ListRoleAliases in the AWS IoT API Reference.

- For API details, see ListRoleAliases in AWS CLI Command Reference.

list-scheduled-audits

The following code example shows how to use list-scheduled-audits.

AWS CLI

To list the scheduled audits for your AWS account

The following list-scheduled-audits example lists any audits scheduled for your AWS account.

```bash
aws iot list-scheduled-audits
```

Output:
For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/audit-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [ListScheduledAudits](https://docs.aws.amazon.com/cli/latest/reference/iot/list-scheduled-audits.html) in *AWS CLI Command Reference*.

**list-security-profiles-for-target**

The following code example shows how to use `list-security-profiles-for-target`.

**AWS CLI**

**To list the security profiles attached to a target**

The following `list-security-profiles-for-target` example lists the AWS IoT Device Defender security profiles that are attached to unregistered devices.

```bash
aws iot list-security-profiles-for-target \
```

**Output:**

```json
{
    "securityProfileTargetMappings": [
    
    ]
}
```
For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListSecurityProfilesForTarget](#) in *AWS CLI Command Reference*.

### list-security-profiles

The following code example shows how to use list-security-profiles.

**AWS CLI**

**To list the security profiles for your AWS account**

The following `list-security-profiles` example lists all AWS IoT Device Defender security profiles that are defined in your AWS account.

```
aws iot list-security-profiles
```

Output:

```
{
   "securityProfileIdentifiers": [
      {
         "name": "Testprofile",
         "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/Testprofile"
      }
   ]
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.
• For API details, see ListSecurityProfiles in AWS CLI Command Reference.

list-streams

The following code example shows how to use list-streams.

AWS CLI

To list the streams in the account

The following list-streams example lists all of the streams in your AWS account.

aws iot list-streams

Output:

```
{
   "streams": [
      {
         "streamId": "stream12345",
         "streamVersion": 1,
         "description": "This stream is used for Amazon FreeRTOS OTA Update 12345."
      },
      {
         "streamId": "stream54321",
         "streamVersion": 1,
         "description": "This stream is used for Amazon FreeRTOS OTA Update 54321."
      }
   ]
}
```

For more information, see ListStreams in the AWS IoT API Reference.

• For API details, see ListStreams in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.
AWS CLI

To display the tags and their values associated with a resource

The following `list-tags-for-resource` example displays the tags and values associated with the thing group LightBulbs.

```
aws iot list-tags-for-resource \
```

Output:

```
{
   "tags": [
      {
         "Key": "Assembly",
         "Value": "Fact1NW"
      },
      {
         "Key": "MyTag",
         "Value": "777"
      }
   ]
}
```

For more information, see Tagging Your AWS IoT Resources in the AWS IoT Developer Guide.

- For API details, see `ListTagsForResource` in AWS CLI Command Reference.

list-targets-for-policy

The following code example shows how to use `list-targets-for-policy`.

AWS CLI

To list the principals associated with an AWS IoT policy

The following `list-targets-for-policy` example lists the device certificates to which the specified policy is attached.

```
aws iot list-targets-for-policy \
```
--policy-name UpdateDeviceCertPolicy

Output:

```
{
  "targets": [
    "arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
    "arn:aws:iot:us-west-2:123456789012:cert/d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be"
  ]
}
```

For more information, see [Thing Groups](#) in the [AWS IoT Developers Guide](#).

- For API details, see [ListTargetsForPolicy](#) in [AWS CLI Command Reference](#).

### list-targets-for-security-profile

The following code example shows how to use `list-targets-for-security-profile`.

**AWS CLI**

**To list the targets to which a security profile is applied**

The following `list-targets-for-security-profile` example lists the targets to which the AWS IoT Device Defender security profile named `PossibleIssue` is applied.

```
aws iot list-targets-for-security-profile \
  --security-profile-name Testprofile
```

Output:

```
{
  "securityProfileTargets": [
    {
      "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
    },
    {
      "arn": "arn:aws:iot:us-west-2:123456789012:all/registered-things"
    }
  ]
}
```
The following code example shows how to use `list-thing-groups-for-thing`.

**AWS CLI**

**To list the groups that a thing belongs to**

The following `list-thing-groups-for-thing` example lists the groups to which the specified thing belongs.

```
aws iot list-thing-groups-for-thing \\
--thing-name MyLightBulb
```

Output:

```
{
   "thingGroups": [
      {
         "groupName": "DeadBulbs",
         "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs"
      },
      {
         "groupName": "LightBulbs",
         "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
      }
   ]
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingGroupsForThing](https://docs.aws.amazon.com/cli/latest/reference/iot/list-thing-groups-for-thing) in *AWS CLI Command Reference*.

**list-thing-groups**

The following code example shows how to use `list-thing-groups`.

AWS CLI

To list the thing groups defined in your AWS account

The following describe-thing-group example lists all thing groups defined in your AWS account.

```
aws iot list-thing-groups
```

Output:

```
{
    "thingGroups": [ 
    {
        "groupName": "HalogenBulbs",
        "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs"
    },
    {
        "groupName": "LightBulbs",
        "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
    }
    ]
}
```

For more information, see Thing Groups in the AWS IoT Developers Guide.
- For API details, see ListThingGroups in AWS CLI Command Reference.

list-thing-principals

The following code example shows how to use list-thing-principals.

AWS CLI

To list the principals associated with a thing

The following list-thing-principals example lists the principals (X.509 certificates, IAM users, groups, roles, Amazon Cognito identities, or federated identities) associated with the specified thing.

```
aws iot list-thing-principals \
   --thing-name MyRaspberryPi
```
Output:

```json
{
   "principals": [
   "arn:aws:iot:us-west-2:123456789012:cert/33475ac865079a5fffd5ecd44240640349293facc760642d7d8d5dbb6b4c86893"
   ]
}
```

For more information, see ListThingPrincipals in the AWS IoT API Reference.

- For API details, see ListThingPrincipals in AWS CLI Command Reference.

**list-thing-types**

The following code example shows how to use list-thing-types.

**AWS CLI**

**To list the defined thing types**

The following list-thing-types example displays a list of thing types defined in your AWS account.

```bash
aws iot list-thing-types
```

Output:

```json
{
   "thingTypes": [
   {
   "thingTypeName": "LightBulb",
   "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
   "thingTypeProperties": {
   "thingTypeDescription": "light bulb type",
   "searchableAttributes": [
   "model",
   "wattage"
   ]
   },
   "thingTypeMetadata": {
   
```

---

**Actions and scenarios**

3818
For more information, see [Thing Types](https://aws.amazon.com/documentation/iot-devguide/#thing_types) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingTypes](https://docs.aws.amazon.com/cli/latest/reference/iot/list-things-in-billing-group.html) in *AWS CLI Command Reference*.

**list-things-in-billing-group**

The following code example shows how to use `list-things-in-billing-group`.

**AWS CLI**

**To list the things in a billing group**

The following `list-things-in-billing-group` example lists the things that are in the specified billing group.

```bash
aws iot list-things-in-billing-group \
   --billing-group-name GroupOne
```

Output:

```json
{
   "things": [
      "MyOtherLightBulb",
      "MyLightBulb"
   ]
}
```

For more information, see [Billing Groups](https://aws.amazon.com/documentation/iot-devguide/#billing_groups) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingsInBillingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/list-things-in-billing-group.html) in *AWS CLI Command Reference*.

**list-things-in-thing-group**

The following code example shows how to use `list-things-in-thing-group`.
AWS CLI

To list the things that belong to a group

The following `list-things-in-thing-group` example lists the things that belong to the specified thing group.

```bash
aws iot list-things-in-thing-group \
   --thing-group-name LightBulbs
```

Output:

```json
{
   "things": [
     "MyLightBulb"
   ]
}
```

For more information, see Thing Groups in the AWS IoT Developers Guide.
- For API details, see `ListThingsInThingGroup` in AWS CLI Command Reference.

list-things

The following code example shows how to use `list-things`.

AWS CLI

**Example 1: To list all things in the registry**

The following `list-things` example lists the things (devices) that are defined in the AWS IoT registry for your AWS account.

```bash
aws iot list-things
```

Output:

```json
{
   "things": [
     {
       "thingName": "ThirdBulb",
       "thingTypeName": "LightBulb",
       "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingType:LightBulb",
       "createdTimestamp": 1531809234000,
       "lastUpdatedTimestamp": 1531809234000
     }
   ]
}
```
Example 2: To list the defined things that have a specific attribute

The following `list-things` example displays a list of things that have an attribute named `wattage`.

```
aws iot list-things \
--attribute-name wattage
```
For more information, see [How to Manage Things with the Registry](https://aws.amazon.com/iot-developer-guide/) in the *AWS IoT Developers Guide*.

- For API details, see [ListThings](https://aws.amazon.com/iot-cli-command-reference/) in *AWS CLI Command Reference*.

### list-topic-rule-destinations

The following code example shows how to use list-topic-rule-destinations.

**AWS CLI**

**To list your topic rule destinations**

The following list-topic-rule-destinations example lists all topic rule destinations that you have defined in the current AWS Region.
aws iot list-topic-rule-destinations

Output:

```json
{
    "destinationSummaries": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "status": "ENABLED",
            "httpUrlSummary": {
                "confirmationUrl": "https://example.com"
            }
        }
    ]
}
```

For more information, see [Working with topic rule destinations](https://docs.aws.amazon.com/iot/latest/developerguide/list-topic-rule-destinations.html) in the *AWS IoT Developer Guide*.

- For API details, see [ListTopicRuleDestinations](https://docs.aws.amazon.com/cli/latest/reference/iot/list-topic-rule-destinations.html) in *AWS CLI Command Reference*.

**list-topic-rules**

The following code example shows how to use `list-topic-rules`.

**AWS CLI**

**To list your rules**

The following `list-topic-rules` example lists all rules that you have defined.

```bash
aws iot list-topic-rules
```

Output:

```json
{
    "rules": [
        {
            "ruleName": "MyRPiLowMoistureAlertRule",
            "topicPattern": "$aws/things/MyRPi/shadow/update/accepted",
```
For more information, see [Viewing Your Rules](https://docs.aws.amazon.com/iot/latest/developerguide/rules-view.html) in the *AWS IoT Developers Guide*.

- For API details, see [ListTopicRules](https://docs.aws.amazon.com/cli/latest/reference/iot/list-topic-rules.html) in *AWS CLI Command Reference*.

### list-v2-logging-levels

The following code example shows how to use `list-v2-logging-levels`.

#### AWS CLI

**To list logging levels**

The following `list-v2-logging-levels` example lists the configured logging levels. If logging levels were not set, a `NotConfiguredException` occurs when you run this command.

```
aws iot list-v2-logging-levels
```

**Output:**

```
{
   "logTargetConfigurations": [
      {
        "logTarget": {
          "targetType": "DEFAULT"
        },
        "logLevel": "ERROR"
      }
   ]
}
```
list-violation-events

The following code example shows how to use list-violation-events.

AWS CLI

To list the security profile violations during a time period

The following list-violation-events example lists violations that occurred between June 5, 2019 and June 12, 2019 for all AWS IoT Device Defender security profiles for the current AWS account and AWS Region.

```bash
aws iot list-violation-events \
  --start-time 1559747125 \ 
  --end-time 1560351925
```

Output:

```json
{
  "violationEvents": [
    {
      "violationId": "174db59167fa474c80a652ad1583fd44",
      "thingName": "iotconsole-1560269126751-1",
      "securityProfileName": "Testprofile",
      "behavior": {
        "name": "Authorization",
        "metric": "aws:num-authorization-failures",
        "criteria": {
          "comparisonOperator": "greater-than",
          "value": {
            "count": 10
          },
          "durationSeconds": 300,
          "consecutiveDatapointsToAlarm": 1,
          "consecutiveDatapointsToClear": 1
        }
      },
      "metricValue": {
        "count": 10
      }
    }
  ]
}
```
{
  "violations": [
    {
      "violationId": "c8a9466a093d3b7b35cd44ca58bdeab",
      "thingName": "TvnQoEoU",
      "securityProfileName": "Testprofile",
      "behavior": {
        "name": "CellularBandwidth",
        "metric": "aws:message-byte-size",
        "criteria": {
          "comparisonOperator": "greater-than",
          "value": {
            "count": 128
          },
          "consecutiveDatapointsToAlarm": 1,
          "consecutiveDatapointsToClear": 1
        }
      },
      "metricValue": {
        "count": 110
      },
      "violationEventTime": 1560279000.0
    },
    {
      "violationId": "74aa393adea02e6648f3ac362beed55e",
      "thingName": "iotconsole-1560269232412-2",
      "securityProfileName": "Testprofile",
      "behavior": {
        "name": "Authorization",
        "metric": "aws:num-authorization-failures",
        "criteria": {
          "comparisonOperator": "greater-than",
          "value": {
            "count": 10
          },
          "durationSeconds": 300,
          "consecutiveDatapointsToAlarm": 1,
          "consecutiveDatapointsToClear": 1
        }
      },
      "metricValue": {
        "count": 0
      },
      "violationEventTime": 1560276600.0
    }
  ]
}

Actions and scenarios
For more information, see [Detect Commands](aws-iot-developer-guide) in the *AWS IoT Developer Guide*.

- For API details, see [ListViolationEvents](aws-cli-command-reference) in *AWS CLI Command Reference*.

**register-ca-certificate**

The following code example shows how to use `register-ca-certificate`.

**AWS CLI**

To register a certificate authority (CA) certificate
The following `register-ca-certificate` example registers a CA certificate. The command supplies the CA certificate and a key verification certificate that proves you own the private key associated with the CA certificate.

```
aws iot register-ca-certificate \
  --ca-certificate file://rootCA.pem \
  --verification-cert file://verificationCert.pem
```

Output:

```
{
  "certificateId": "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467"
}
```

For more information, see [RegisterCACertificate](https://docs.aws.amazon.com/iotsitecore/latest/APIReference/API_RegisterCACertificate.html) in the AWS IoT API Reference.

- For API details, see [RegisterCaCertificate](https://docs.aws.amazon.com/cli/latest/reference/iot/register-ca-certificate.html) in AWS CLI Command Reference.

### register-certificate

The following code example shows how to use `register-certificate`.

**AWS CLI**

**To register a self signed device certificate**

The following `register-certificate` example registers the `deviceCert.pem` device certificate signed by the `rootCA.pem` CA certificate. The CA certificate must be registered before you use it to register a self-signed device certificate. The self-signed certificate must be signed by the same CA certificate you pass to this command.

```
aws iot register-certificate \
  --certificate-pem file://deviceCert.pem \
  --ca-certificate-pem file://rootCA.pem
```

Output:

```
{
```
For more information, see `RegisterCertificate` in the `AWS IoT API Reference`.

- For API details, see `RegisterCertificate` in `AWS CLI Command Reference`.

**register-thing**

The following code example shows how to use `register-thing`.

**AWS CLI**

To register a thing

The following `register-thing` example registers a thing using a provisioning template.

```bash
aws iot register-thing \
  --template-body '{"Parameters":{"ThingName":
  {"Type":"String"},"AWS::IoT::Certificate::Id":{"Type":"String"},"Resources":
  {"certificate":{"Properties":{"CertificateId":
    {"Ref":"AWS::IoT::Certificate::Id"},"Status":"Active"},"Type":"AWS::IoT::Certificate"},"policy":
    {"Properties":{"PolicyName":"MyIotPolicy"},"Type":"AWS::IoT::Policy"},"thing":
    {"OverrideSettings":
      {"AttributePayload":"MERGE","ThingGroups":"DO NOTHING","ThingTypeName":"REPLACE"},"Properties":
      {"AttributePayload":{},"ThingGroups":[]},"ThingName":
      {"Ref":"ThingName"},"ThingTypeName":"VirtualThings"},"Type":"AWS::IoT::Thing"}}' \
  --parameters '{"ThingName":"Register-thing-trial-1","AWS::IoT::Certificate::Id":"799a9ea048a1e6aea42b55EXAMPLEf8697b4bafcd77a318a3068e30404b9233c"}'
```

Output:

```json
{
  "certificatePem": "-----BEGIN CERTIFICATE-----
MIIDWTCCAkGgAwIBAgIUYLk81I35cIppobpw
HiOJ2jnboIwDQYJKoZIhvcNAQEL
\nBQAwTTFLMEkGA1UECwxCQW1hem9uIFdIYiBTZXJ2aWN1cyBPPUFTyXpvbi
5bjb29g\n5Sw5jL1BMPVNlYXR0bGUgU1Q9V2FzaGluzZ3RvbiBDPVVTMB4XDTIwMDcyMzE2NDUw
\n0VoXDTQ5MTIzMT

```

For more information, see [Provisioning by trusted user](https://docs.aws.amazon.com/iot/latest/developerguide/provisioning-trusted-users.html) in the [AWS IoT Core Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

**reject-certificate-transfer**

The following code example shows how to use `reject-certificate-transfer`.

**AWS CLI**

To reject a certificate transfer

The following `reject-certificate-transfer` example rejects the transfer of the specified device certificate from another AWS account.
aws iot reject-certificate-transfer \
   --certificate-id
f0f33678c7c9a046e5cc87b2b1a58dafa0beec26db78add5e605d630e05c7fc8

This command produces no output.

For more information, see [Transfer a certificate to another account](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [RejectCertificateTransfer](#) in *AWS CLI Command Reference*.

**remove-thing-from-billing-group**

The following code example shows how to use `remove-thing-from-billing-group`.

**AWS CLI**

To remove a thing from a billing group

The following `remove-thing-from-billing-group` example removes the specified thing from a billing group.

```
aws iot remove-thing-from-billing-group \
   --billing-group-name GroupOne \
   --thing-name MyOtherLightBulb
```

This command produces no output.

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [RemoveThingFromBillingGroup](#) in *AWS CLI Command Reference*.

**remove-thing-from-thing-group**

The following code example shows how to use `remove-thing-from-thing-group`.

**AWS CLI**

To remove a thing from a thing group

The following `remove-thing-from-thing-group` example removes the specified thing from a thing group.
aws iot remove-thing-from-thing-group
   --thing-name bulb7 \
   --thing-group-name DeadBulbs

This command produces no output.

For more information, see Thing Groups <https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html > in the AWS IoT Developer Guide.

- For API details, see RemoveThingFromThingGroup in AWS CLI Command Reference.

replace-topic-rule

The following code example shows how to use replace-topic-rule.

AWS CLI

To update a topic's rule definition

The following replace-topic-rule example updates the specified rule to send an SNS alert when soil moisture level readings are too low.

aws iot replace-topic-rule \
   --rule-name MyRPiLowMoistureAlertRule \

This command produces no output.

For more information, see Creating an AWS IoT Rule in the AWS IoT Developer Guide.

- For API details, see ReplaceTopicRule in AWS CLI Command Reference.

search-index

The following code example shows how to use search-index.
To query the thing index

The following search-index example queries the AWS_Things index for things that have a type of LightBulb.

```bash
aws iot search-index \
  --index-name "AWS_Things" \
  --query-string "thingTypeName:LightBulb"
```

Output:

```json
{
  "things": [
    {
      "thingName": "MyLightBulb",
      "thingId": "40da2e73-c6af-406e-b415-15acae538797",
      "thingTypeName": "LightBulb",
      "thingGroupNames": [
        "LightBulbs",
        "DeadBulbs"
      ],
      "attributes": {
        "model": "123",
        "wattage": "75"
      },
      "connectivity": {
        "connected": false
      }
    },
    {
      "thingName": "ThirdBulb",
      "thingId": "615c8455-33d5-40e8-95fd-3ee8b24490af",
      "thingTypeName": "LightBulb",
      "attributes": {
        "model": "123",
        "wattage": "75"
      },
      "connectivity": {
        "connected": false
      }
    }
  ]
}
```
For more information, see Managing Thing Indexing in the AWS IoT Developer Guide.

- For API details, see SearchIndex in AWS CLI Command Reference.

**set-default-authorizer**

The following code example shows how to use set-default-authorizer.

**AWS CLI**

**To set a default authorizer**

The following set-default-authorizer example sets the custom authorizer named CustomAuthorizer as the default authorizer.

```bash/aws iot set-default-authorizer \ 
   --authorizer-name CustomAuthorizer
```

Output:

```json
{
   "authorizerName": "CustomAuthorizer",
   "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer"
}
```

For more information, see CreateDefaultAuthorizer in the AWS IoT API Reference.
• For API details, see SetDefaultAuthorizer in AWS CLI Command Reference.

**set-default-policy-version**

The following code example shows how to use set-default-policy-version.

**AWS CLI**

**To set the default version for a policy**

The following `set-default-policy-version` example sets the default version to 2 for the policy named `UpdateDeviceCertPolicy`.

```bash
aws iot set-default-policy-version \   --policy-name UpdateDeviceCertPolicy \   --policy-version-id 2
```

This command produces no output.

• For API details, see SetDefaultPolicyVersion in AWS CLI Command Reference.

**set-v2-logging-level**

The following code example shows how to use set-v2-logging-level.

**AWS CLI**

**To set the logging level for a thing group**

The following `set-v2-logging-level` example sets the logging level to log warnings for the specified thing group.

```bash
aws iot set-v2-logging-level \   --log-target "{"targetType"":"THING_GROUP","targetName":"LightBulbs"}" \   --log-level WARN
```

This command produces no output.

• For API details, see SetV2LoggingLevel in AWS CLI Command Reference.
**set-v2-logging-options**

The following code example shows how to use `set-v2-logging-options`.

**AWS CLI**

**To set the logging options**

The following `set-v2-logging-options` example sets the default logging verbosity level to `ERROR` and specifies the ARN to use for logging.

```bash
aws iot set-v2-logging-options \
   --default-log-level ERROR \ 
   --role-arn "arn:aws:iam::094249569039:role/service-role/iotLoggingRole"
```

This command produces no output.

- For API details, see `SetV2LoggingOptions` in *AWS CLI Command Reference*.

**start-audit-mitigation-actions-task**

The following code example shows how to use `start-audit-mitigation-actions-task`.

**AWS CLI**

**To apply a mitigation action to the findings from an audit**

The following `start-audit-mitigation-actions-task` example applies the `ResetPolicyVersionAction` action (which clears the policy) to the specified single finding.

```bash
aws iot start-audit-mitigation-actions-task \
   --task-id "myActionsTaskId" \ 
   --target "findingIds=["0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464"]" \ 
   --audit-check-to-actions-mapping "IOT_POLICY_OVERLY_PERMISSIVE_CHECK=["ResetPolicyVersionAction"]" \ 
   --client-request-token "adhadhahda"
```

Output:

```json
{
   "taskId": "myActionsTaskId"
}
```
The following code example shows how to use `start-on-demand-audit-task`.

**AWS CLI**

**To start an audit right away**

The following `start-on-demand-audit-task` example starts an AWS IoT Device Defender audit and performs three certificate checks.

```bash
aws iot start-on-demand-audit-task \
   --target-check-names CA_CERTIFICATE_EXPIRING_CHECK \
   DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK
```

Output:

```json
{
   "taskId": "a3aea00955e501a31b764abe1bebd3d"
}
```

For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/audit-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [StartOnDemandAuditTask](https://docs.aws.amazon.com/cli/latest/reference/iot/start-on-demand-audit-task.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To specify a tag key and value for a resource**

The following `tag-resource` example applies the tag with a key `Assembly` and the value `Fact1NW` to the thing group `LightBulbs`.
aws iot tag-resource \
  --tags Key=Assembly,Value="Fact1NW" \

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the AWS IoT Developer Guide.
- For API details, see TagResource in AWS CLI Command Reference.

test-authorization

The following code example shows how to use test-authorization.

AWS CLI

To test your AWS IoT policies

The following test-authorization example tests the AWS IoT policies associated with the specified principal.

aws iot test-authorization \
  --auth-infos actionType=CONNECT,resources=arn:aws:iot:us-east-1:123456789012:client/client1 \
  --principal arn:aws:iot:us-west-2:123456789012:cert/aab1068f7f43ac3e3cae4b3a8aa3f308d2a750e6350507962e32c1eb465d9775

Output:

```json
{
  "authResults": [
    {
      "authInfo": {
        "actionType": "CONNECT",
        "resources": [
          "arn:aws:iot:us-east-1:123456789012:client/client1"
        ]
      },
      "allowed": {
        "policies": [
          {
            "policyName": "TestPolicyAllowed",
```
},
],
},
"denied": {
  "implicitDeny": {
    "policies": [
    {
      "policyName": "TestPolicyDenied",
    }
  ],
  },
  "explicitDeny": {
    "policies": [
    {
      "policyName": "TestPolicyExplicitDenied",
    }
  ],
  },
  "authDecision": "IMPLICIT_DENY",
  "missingContextValues": []
}
}

For more information, see TestAuthorization in the AWS IoT API Reference.

- For API details, see TestAuthorization in AWS CLI Command Reference.

test-invoke-authorizer

The following code example shows how to use test-invoke-authorizer.

AWS CLI

To test your custom authorizer

The following test-invoke-authorizer example tests your custom authorizer.
aws iot test-invoke-authorizer \
    --authorizer-name IoTAuthorizer \
    --token allow \
    --token-signature "mE0GvaHqy9nER/FdgtJ3X51XYE3b3vE7t1gEszc0TKGgLKWXnKpb2AbKnOAZ81Gy0N5dVtWDWVm25m7+\nzjbYIMk2TBvyGxh0mvKFBfkGdyA43KL6SiZy0cTq1PMcQDoS7PV2x7CTowCxSNKphGXdQe0/\nI5dQ+j06KUAhWcmupt0/MejKtaNwiia064j6wpr0AUwG531YYFuRd0X\nwfo8pb0DubAIx1u705kuhRUcTx4SxUShEYKmN4IDEvLB6FsIr0B2wvB7y4iPmcajxzGl2ExvyCUNctCV9dY1RRGj\n
Output:

{
    "isAuthenticated": true,
    "principalId": "principalId",
    "policyDocuments": [
        {"Version":"2012-10-17","Statement": [
    ],
    "refreshAfterInSeconds": 600,
    "disconnectAfterInSeconds": 3600
}

For more information, see TestInvokeAuthorizer in the AWS IoT API Reference.

- For API details, see TestInvokeAuthorizer in AWS CLI Command Reference.

transfer-certificate

The following code example shows how to use transfer-certificate.

AWS CLI

To transfer a device certificate to a different AWS account

The following transfer-certificate example transfers a device certificate to another AWS account. The certificate and AWS account are identified by ID.

aws iot transfer-certificate \
    --certificate-id 488b6a7f2acde800a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142 \
    --target-aws-account 030714055129
Output:

```
{
   "transferredCertificateArn": "arn:aws:iot:us-west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
}
```

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.

- For API details, see TransferCertificate in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove a tag key from a resource**

The following untag-resource example removes the tag MyTag and its value from the thing group LightBulbs.

```
command
```

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the AWS IoT Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-account-audit-configuration

The following code example shows how to use update-account-audit-configuration.

**AWS CLI**

**Example 1: To enable Amazon SNS notifications for audit notifications**

The following update-account-audit-configuration example enables Amazon SNS notifications for AWS IoT Device Defender audit notifications, specifying a target and the role used to write to that target.
aws iot update-account-audit-configuration \

This command produces no output.

**Example 2: To enable an audit check**

The following update-account-audit-configuration example enables the AWS IoT Device Defender audit check named AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK. You cannot disable an audit check if it is part of the targetCheckNames for one or more scheduled audits for the AWS account.

aws iot update-account-audit-configuration \
   --audit-check-configurations "{"AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK":{"enabled":true}}"

This command produces no output.

For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/audit-commands.html) in the [AWS IoT Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

**update-audit-suppression**

The following code example shows how to use update-audit-suppression.

**AWS CLI**

**To update an audit finding suppression**

The following update-audit-suppression example updates an audit finding suppression's expiration date to 2020-09-21.

aws iot update-audit-suppression \
   --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
   --resource-identifier deviceCertificateId=c7691e<shortened> \
   --no-suppress-indefinitely \
   --expiration-date 2020-09-21
This command produces no output.

For more information, see Audit finding suppressions in the AWS IoT Developers Guide.

- For API details, see UpdateAuditSuppression in AWS CLI Command Reference.

update-authorizer

The following code example shows how to use update-authorizer.

AWS CLI

To update a custom authorizer

The following update-authorizer example he state of CustomAuthorizer2 to INACTIVE.

```bash
aws iot update-authorizer \
  --authorizer-name CustomAuthorizer2 \
  --status INACTIVE
```

Output:

```json
{
  "authorizerName": "CustomAuthorizer2",
  "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer2"
}
```

For more information, see UpdateAuthorizer in the AWS IoT API Reference.

- For API details, see UpdateAuthorizer in AWS CLI Command Reference.

update-billing-group

The following code example shows how to use update-billing-group.

AWS CLI

To update information about a billing group

The following update-billing-group example updates the description for the specified billing group.
aws iot update-billing-group \
   --billing-group-name GroupOne \
   --billing-group-properties "billingGroupDescription="Primary bulb billing group"
"
Output:

```
{
   "version": 2
}
```

For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see UpdateBillingGroup in AWS CLI Command Reference.

**update-ca-certificate**

The following code example shows how to use update-ca-certificate.

**AWS CLI**

**To update a certificate authority (CA) certificate**

The following update-ca-certificate example sets the specified CA certificate to ACTIVE status.

```
aws iot update-ca-certificate \
   --certificate-id \n   f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467 \n   --new-status ACTIVE
```

This command produces no output.

For more information, see UpdateCACertificate in the AWS IoT API Reference.

- For API details, see UpdateCaCertificate in AWS CLI Command Reference.

**update-certificate**

The following code example shows how to use update-certificate.
**AWS CLI**

**To update a device certificate**

The following `update-certificate` example sets the specified device certificate to INACTIVE status.

```bash
aws iot update-certificate \
  --certificate-id d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be \
  --new-status INACTIVE
```

This command produces no output.

For more information, see [UpdateCertificate](#) in the [AWS IoT API Reference](#).

- For API details, see [UpdateCertificate](#) in [AWS CLI Command Reference](#).

**update-custom-metric**

The following code example shows how to use `update-custom-metric`.

**AWS CLI**

**To update a custom metric**

The following `update-custom-metric` example updates a custom metric to have a new display-name.

```bash
aws iot update-custom-metric \
  --metric-name batteryPercentage \
  --display-name 'remaining battery percentage on device' \
  --region us-east-1
```

**Output:**

```json
{
  "metricName": "batteryPercentage",
  "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/batteryPercentage",
  "metricType": "number",
}
```
For more information, see Custom metrics in the AWS IoT Core Developer Guide.

- For API details, see UpdateCustomMetric in AWS CLI Command Reference.

**update-dimension**

The following code example shows how to use update-dimension.

**AWS CLI**

**To update a dimension**

The following update-dimension example updates a dimension.

```bash
aws iot update-dimension \
  --name TopicFilterForAuthMessages \
  --string-values device/${iot:ClientId}/auth
```

**Output:**

```json
{
    "name": "TopicFilterForAuthMessages",
    "lastModifiedDate": 1585866222.317,
    "stringValues": [
        "device/${iot:ClientId}/auth"
    ],
    "creationDate": 1585854500.474,
    "type": "TOPIC_FILTER",
    "arn": "arn:aws:iot:us-west-2:1234564789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see Scoping metrics in security profiles using dimensions in the AWS IoT Core Developer Guide.

- For API details, see UpdateDimension in AWS CLI Command Reference.
update-domain-configuration

The following code example shows how to use update-domain-configuration.

AWS CLI

To update a domain configuration

The following update-domain-configuration example disables the specified domain configuration.

```bash
aws iot update-domain-configuration \
--domain-configuration-name "additionalDataDomain" \
--domain-configuration-status "DISABLED"
```

Output:

```json
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see UpdateDomainConfiguration in AWS CLI Command Reference.

update-dynamic-thing-group

The following code example shows how to use update-dynamic-thing-group.

AWS CLI

To update a dynamic thing group

The following update-dynamic-thing-group example updates the specified dynamic thing group. It provides a description and updates the query string to change the group membership criteria.

```bash
aws iot update-dynamic-thing-group \
--thing-group-name "RoomTooWarm"
```
Output:

```json
{
    "version": 2
}
```

For more information, see [Dynamic Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/dynamic-things.html) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateDynamicThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/update-dynamic-thing-group.html) in *AWS CLI Command Reference*.

**update-event-configurations**

The following code example shows how to use `update-event-configurations`.

**AWS CLI**

**To show which event types are published**

The following `update-event-configurations` example updates the configuration to enable messages when the CA certificate is added, updated, or deleted.

```bash
aws iot update-event-configurations \
    --event-configurations "{"CA_CERTIFICATE":{"Enabled":true}}"
```

This command produces no output.

For more information, see [Event Messages](https://docs.aws.amazon.com/iot/latest/developerguide/event-data.html) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateEventConfigurations](https://docs.aws.amazon.com/cli/latest/reference/iot/update-event-configurations.html) in *AWS CLI Command Reference*.

**update-indexing-configuration**

The following code example shows how to use `update-indexing-configuration`.

**AWS CLI**

**To enable thing indexing**
The following `update-indexing-configuration` example enables thing indexing to support searching registry data, shadow data, and thing connectivity status using the AWS_Things index.

```bash
aws iot update-indexing-configuration
    --thing-indexing-configuration
    thingIndexingMode=REGISTRY_AND_SHADOW,thingConnectivityIndexingMode=STATUS
```

This command produces no output.

For more information, see [Managing Thing Indexing](https://docs.aws.amazon.com/iot/latest/developerguide/thing-indexing.html) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateIndexingConfiguration](https://docs.aws.amazon.com/cli/latest/reference/iot/update-indexing-configuration.html) in *AWS CLI Command Reference*.

**update-job**

The following code example shows how to use `update-job`.

**AWS CLI**

**To get detailed status for a job**

The following `update-job` example gets detailed status for the job whose ID is example-job-01.

```bash
aws iot describe-job \
    --job-id "example-job-01"
```

Output:

```json
{
    "job": {
        "jobId": "example-job-01",
        "targetSelection": "SNAPSHOT",
        "status": "IN_PROGRESS",
        "targets": [
        ],
        "description": "example job test",
        "presignedUrlConfig": {},
```
"jobExecutionsRolloutConfig": {},
"createdAt": 1560787022.733,
"lastUpdatedAt": 1560787026.294,
"jobProcessDetails": {
  "numberOfCanceledThings": 0,
  "numberOfSucceededThings": 0,
  "numberOfFailedThings": 0,
  "numberOfRejectedThings": 0,
  "numberOfQueuedThings": 1,
  "numberOfInProgressThings": 0,
  "numberOfRemovedThings": 0,
  "numberOfTimedOutThings": 0
},
"timeoutConfig": {}
}

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see UpdateJob in AWS CLI Command Reference.

update-mitigation-action

The following code example shows how to use update-mitigation-action.

AWS CLI

To update a mitigation action

The following update-mitigation-action example updates the specified mitigation action named AddThingsToQuarantineGroupAction, changes the thing group name, and sets overrideDynamicGroups to false. You can verify your changes by using the describe-mitigation-action command.

```bash
aws iot update-mitigation-action \
--cli-input-json "{"actionName": "AddThingsToQuarantineGroupAction","actionParams": {"addThingsToThingGroupParams": {"thingGroupNames": ["QuarantineGroup2"],"overrideDynamicGroups": false}}}
```

Output:

```json
{
}
For more information, see UpdateMitigationAction (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see UpdateMitigationAction in AWS CLI Command Reference.

**update-provisioning-template**

The following code example shows how to use update-provisioning-template.

**AWS CLI**

**To update a provisioning template**

The following update-provisioning-template example modifies the description and role arn for the specified provisioning template and enables the template.

```bash
aws iot update-provisioning-template \
  --template-name widget-template \
  --enabled \
  --description "An updated provisioning template for widgets" \
  --provisioning-role-arn arn:aws:iam::504350838278:role/Provision_role
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the AWS IoT Core Developer Guide.

- For API details, see UpdateProvisioningTemplate in AWS CLI Command Reference.

**update-role-alias**

The following code example shows how to use update-role-alias.

**AWS CLI**

**To update a role alias**

The following update-role-alias example updates the LightBulbRole role alias.
aws iot update-role-alias  
   --role-alias LightBulbRole  
   --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001

Output:
{
   "roleAlias": "LightBulbRole",
   "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}

For more information, see UpdateRoleAlias in the AWS IoT API Reference.

- For API details, see UpdateRoleAlias in AWS CLI Command Reference.

update-scheduled-audit

The following code example shows how to use update-scheduled-audit.

AWS CLI

To update a scheduled audit definition

The following update-scheduled-audit example changes the target check names for an AWS IoT Device Defender scheduled audit.

aws iot update-scheduled-audit  
   --scheduled-audit-name WednesdayCertCheck  
   --target-check-names CA_CERTIFICATE_EXPIRING_CHECK
   DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK

Output:
{
   "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/WednesdayCertCheck"
}

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see UpdateScheduledAudit in AWS CLI Command Reference.
update-security-profile

The following code example shows how to use `update-security-profile`.

**AWS CLI**

**To change a security profile**

The following update-security-profile example updates both the description and the behaviors for an AWS IoT Device Defender security profile.

```bash
aws iot update-security-profile \
    --security-profile-name PossibleIssue \
    --security-profile-description "Check to see if authorization fails 12 times in 5 minutes or if cellular bandwidth exceeds 128" \
    --behaviors "[
        {"name":"CellularBandwidth","metric":"aws:message-byte-size","criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1},
        {"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"less-than","value":{"count":12},"durationSeconds":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}]
"
```

**Output:**

```json
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 12 times in 5 minutes or if cellular bandwidth exceeds 128",
    "behaviors": [
        {
            "name": "CellularBandwidth",
            "metric": "aws:message-byte-size",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 128
                },
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        },
        {
            "name": "Authorization",
            "metric": "aws:num-authorization-failures",
            "criteria": {
                "comparisonOperator": "less-than",
                "value": {
                    "count": 12,
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            }
        }
    ]
}
```
For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see UpdateSecurityProfile in AWS CLI Command Reference.

**update-stream**

The following code example shows how to use update-stream.

**AWS CLI**

**To update a stream**

The following update-stream example updates an existing stream. The stream version is incremented by one.

```
aws iot update-stream \n  --cli-input-json file://update-stream.json
```

**Contents of update-stream.json:**

```
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "files": [
```
Output:

```json
{
  "streamId": "stream12345",
  "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
  "streamVersion": 2
}
```

For more information, see UpdateStream in the AWS IoT API Reference.

- For API details, see UpdateStream in AWS CLI Command Reference.

**update-thing-group**

The following code example shows how to use update-thing-group.

**AWS CLI**

To update the definition for a thing group

The following update-thing-group example updates the definition for the specified thing group, changing the description and two attributes.

```bash
aws iot update-thing-group \
  --thing-group-name HalogenBulbs \
  --thing-group-properties "thingGroupDescription="Halogen bulb group",
  attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:
For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/things-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/update-thing-group.html) in *AWS CLI Command Reference*.

**update-thing-groups-for-thing**

The following code example shows how to use `update-thing-groups-for-thing`.

**AWS CLI**

**To change the groups to which a thing belongs**

The following `update-thing-groups-for-thing` example removes the thing named `MyLightBulb` from the group named `DeadBulbs` and adds it to the group named `replaceableItems` at the same time.

```bash
aws iot update-thing-groups-for-thing \
  --thing-name MyLightBulb \
  --thing-groups-to-add "replaceableItems" \
  --thing-groups-to-remove "DeadBulbs"
```

This command produces no output.

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/things-groups.html) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateThingGroupsForThing](https://docs.aws.amazon.com/cli/latest/reference/iot/update-thing-groups-for-thing.html) in *AWS CLI Command Reference*.

**update-thing**

The following code example shows how to use `update-thing`.

**AWS CLI**

**To associate a thing with a thing type**

The following `update-thing` example associates a thing in the AWS IoT registry with a thing type. When you make the association, you provide values for the attributes defined by the thing type.
aws iot update-thing
   --thing-name "MyOtherLightBulb" \
   --thing-type-name "LightBulb" \
   --attribute-payload 
   "{"attributes": {"wattage":75, "model":123}}"

This command does not produce output. Use the describe-thing command to see the result.

For more information, see Thing Types in the AWS IoT Developers Guide.

For API details, see UpdateThing in AWS CLI Command Reference.

**update-topic-rule-destination**

The following code example shows how to use update-topic-rule-destination.

**AWS CLI**

**Example 1: To enable a topic rule destination**

The following update-topic-rule-destination example enables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \
   --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
   --status ENABLED
```

This command produces no output.

For more information, see Enabling a topic rule destination in the AWS IoT Developer Guide.

**Example 2: To disable a topic rule destination**

The following update-topic-rule-destination example disables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \
   --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
   --status DISABLED
```

This command produces no output.
For more information, see Disabling a topic rule destination in the AWS IoT Developer Guide.

Example 3: To send a new confirmation message

The following update-topic-rule-destination example sends a new confirmation message for a topic rule destination.

```bash
aws iot update-topic-rule-destination \
   --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
   --status IN_PROGRESS
```

This command produces no output.

For more information, see Sending a new confirmation message in the AWS IoT Developer Guide.

- For API details, see UpdateTopicRuleDestination in AWS CLI Command Reference.

validate-security-profile-behaviors

The following code example shows how to use validate-security-profile-behaviors.

AWS CLI

Example 1: To validate the behaviors parameters for a security profile

The following validate-security-profile-behaviors example validates a well-formed and correct set of behaviors for an AWS IoT Device Defender security profile.

```bash
aws iot validate-security-profile-behaviors \
   --behaviors "[{{"name":"CellularBandwidth","metric":"aws:message-byte-size","criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"greater-than","value":{"count":12},"durationSeconds":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}}]"
```

Output:

```json
{
   "valid": true,
```
Example 2: To validate incorrect behaviors parameters for a security profile

The following validate-security-profile-behaviors example validates a set of behaviors that contains an error for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \
    --behaviors "[{"name":"CellularBandwidth","metric":"aws:message-byte-size","criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"greater-than","value":{"count":12},"durationSeconds":300,"consecutiveDatapointsToAlarm":100000,"consecutiveDatapointsToClear":1}]"
```

Output:

```
{
  "valid": false,
  "validationErrors": [
    {
      "errorMessage": "Behavior Authorization is malformed. consecutiveDatapointsToAlarm 100000 should be in range[1,10]"
    }
  ]
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see ValidateSecurityProfileBehaviors in AWS CLI Command Reference.

AWS IoT 1-Click Devices examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT 1-Click Devices.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**claim-devices-by-claim-code**

The following code example shows how to use `claim-devices-by-claim-code`.

**AWS CLI**

To claim one or more AWS IoT 1-Click devices using a claim code

The following `claim-devices-by-claim-code` example claims the specified AWS IoT 1-Click device using a claim code (instead of a device ID).

```
aws iot1click-devices claim-devices-by-claim-code \
  --claim-code C-123EXAMPLE
```

Output:

```
{
  "Total": 9
  "ClaimCode": "C-123EXAMPLE"
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot/latest/developerguide/iot1click-cli.html) in the [AWS IoT 1-Click Developer Guide](https://docs.aws.amazon.com/iot1click/latest/developerguide/)

- For API details, see [ClaimDevicesByClaimCode](https://docs.aws.amazon.com/iot/latest/developerguide/) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iot1click-devices.html).

**describe-device**

The following code example shows how to use `describe-device`.
### AWS CLI

#### To describe a device

The following describe-device example describes the specified device.

```
aws iot1click-devices describe-device \
   --device-id G030PM0123456789
```

**Output:**

```
{
   "DeviceDescription": {
      "Attributes": {
         "projectRegion": "us-west-2",
         "projectName": "AnytownDumpsters",
         "placementName": "customer217",
         "deviceTemplateName": "empty-dumpster-request"
      },
      "DeviceId": "G030PM0123456789",
      "Enabled": false,
      "RemainingLife": 99.9,
      "Type": "button",
      "Tags": {}
   }
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the AWS IoT 1-Click Developer Guide.

- For API details, see [DescribeDevice](#) in AWS CLI Command Reference.

#### finalize-device-claim

The following code example shows how to use finalize-device-claim.

### AWS CLI

#### To finalize a claim request for an AWS IoT 1-Click device using a device ID

The following finalize-device-claim example finalizes a claim request for the specified AWS IoT 1-Click device using a device ID (instead of a claim code).
aws iot1click-devices finalize-device-claim \
   --device-id G030PM0123456789

Output:

{
    "State": "CLAIMED"
}

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see FinalizeDeviceClaim in AWS CLI Command Reference.

get-device-methods

The following code example shows how to use get-device-methods.

AWS CLI

To list the available methods for a device

The following get-device-methods example lists the available methods for a device.

aws iot1click-devices get-device-methods \
   --device-id G030PM0123456789

Output:

{
    "DeviceMethods": [
        {
            "MethodName": "getDeviceHealthParameters"
        },
        {
            "MethodName": "setDeviceHealthMonitorCallback"
        },
        {
            "MethodName": "getDeviceHealthMonitorCallback"
        },
        {
            "MethodName": "getDeviceHealthMonitorCallback"
        },
        {"MethodName": "getDeviceHealthMonitorCallback"
        },
        {"MethodName": "getDeviceHealthMonitorCallback"
        }
    ]
}

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developerguide/) in the [*AWS IoT 1-Click Developer Guide*](https://docs.aws.amazon.com/iot1click/latest/developerguide/).

- For API details, see [GetDeviceMethods](https://docs.aws.amazon.com/iot1click/latest/developerguide/) in *AWS CLI Command Reference*.

### initiate-device-claim

The following code example shows how to use `initiate-device-claim`.

**AWS CLI**

**To initiate a claim request for an AWS IoT 1-Click device using a device ID**

The following `initiate-device-claim` example initiates a claim request for the specified AWS IoT 1-Click device using a device ID (instead of a claim code).

```
aws iot1click-devices initiate-device-claim \
  --device-id G030PM0123456789
```

**Output:**

```
{
  "State": "CLAIM_INITIATED"
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developerguide/) in the [*AWS IoT 1-Click Developer Guide*](https://docs.aws.amazon.com/iot1click/latest/developerguide/).

- For API details, see [InitiateDeviceClaim](https://docs.aws.amazon.com/iot1click/latest/developerguide/) in *AWS CLI Command Reference*.

### invoke-device-method

The following code example shows how to use `invoke-device-method`.

```python
"MethodName": "setOnClickCallback"

"
```
AWS CLI

To invoke a device method on a device

The following invoke-device-method example invokes the specified method on a device.

```bash
aws iot1click-devices invoke-device-method \
   --cli-input-json file://invoke-device-method.json
```

Contents of `invoke-device-method.json`:

```json
{
   "DeviceId": "G030PM0123456789",
   "DeviceMethod": {
      "DeviceType": "device",
      "MethodName": "getDeviceHealthParameters"
   }
}
```

Output:

```json
{
   "DeviceMethodResponse": "{\"remainingLife\": 99.8}"
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the AWS IoT 1-Click Developer Guide.

- For API details, see [InvokeDeviceMethod](#) in AWS CLI Command Reference.

list-device-events

The following code example shows how to use list-device-events.

AWS CLI

To list a device's events for a specified time range

The following list-device-events example lists the specified device's events for the specified time range.
The following code example shows how to use `list-devices`.

```
aws iot1click-devices list-device-events \
  --device-id G030PM0123456789 \
```

Output:

```
{
   "Events": [
      
      "Device": {
         "Attributes": {},
         "DeviceId": "G030PM0123456789",
         "Type": "button"
      },
      "StdEvent": "{"clickType": "SINGLE",
         "reportedTime": "2019-07-18T23:47:55.015Z",
         "certificateId": "fe8798a6c97c62ef8756b80eeefdcf2280f3352f82faa8080c74cc4f4a4d1811",
         "remainingLife": 99.85000000000001, "testMode": false}"
      },
      
      "Device": {
         "Attributes": {},
         "DeviceId": "G030PM0123456789",
         "Type": "button"
      },
      "StdEvent": "{"clickType": "DOUBLE",
         "reportedTime": "2019-07-19T00:14:41.353Z",
         "certificateId": "fe8798a6c97c62ef8756b80eeefdcf2280f3352f82faa8080c74cc4f4a4d1811",
         "remainingLife": 99.8, "testMode": false}"
      ]
   }
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see ListDeviceEvents in AWS CLI Command Reference.

**list-devices**

The following code example shows how to use list-devices.
AWS CLI

To list the devices of a specified type

The following `list-devices` example lists the devices of a specified type.

```bash
aws iot1click-devices list-devices \
   --device-type button
```

This command produces no output.

Output:

```json
{
   "Devices": [
      {
         "remainingLife": 99.9,
         "attributes": {
            "type": "button",
            "deviceId": "G030PM0123456789",
            "enabled": false
         }
      }
   ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see ListDevices in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a device

The following `list-tags-for-resource` example list the tags for the specified device.
aws iot1click-devices list-tags-for-resource \

Output:

```json
{
   "Tags": {
      "Driver Phone": "123-555-0199",
      "Driver": "Jorge Souza"
   }
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developerguide/using-iot1click-cli.html) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/iot1click-devices/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To add tags to a device AWS resource**

The following tag-resource example adds two tags to the specified resource.

```
aws iot1click-devices tag-resource \
   --cli-input-json file://devices-tag-resource.json
```

Contents of `devices-tag-resource.json`:

```json
{
   "Tags": {
      "Driver": "Jorge Souza",
      "Driver Phone": "123-555-0199"
   }
}
```
This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**unclaim-device**

The following code example shows how to use unclaim-device.

**AWS CLI**

**To unclaim (deregister) a device from your AWS account**

The following unclaim-device example unclaims (deregisters) the specified device from your AWS account.

```bash
aws iot1click-devices unclaim-device \
   --device-id G030PM0123456789
```

**Output:**

```json
{
   "State": "UNCLAIMED"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see UnclaimDevice in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove tags from a device AWS resource**
The following untag-resource example removes the tags with the names Driver Phone and Driver from the specified device resource.

```bash
aws iot1click-devices untag-resource \
   --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/AnytownDumpsters" \
   --tag-keys "Driver Phone" "Driver"
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developer-guide/iot1click-devices-cli.html) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/iot1click-devices/untag-resource.html) in *AWS CLI Command Reference*.

**update-device-state**

The following code example shows how to use update-device-state.

**AWS CLI**

To update the `enabled` state for a device

The following update-device-state sets the state of the specified device to enabled.

```bash
aws iot1click-devices update-device-state \
   --device-id G030PM0123456789 \
   --enabled
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developer-guide/iot1click-devices-cli.html) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [UpdateDeviceState](https://docs.aws.amazon.com/cli/latest/reference/iot1click-devices/update-device-state.html) in *AWS CLI Command Reference*.

**AWS IoT 1-Click Projects examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT 1-Click Projects.
**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- [Actions](#)

### Actions

**associate-device-with-placement**

The following code example shows how to use `associate-device-with-placement`.

**AWS CLI**

To associate an AWS IoT 1-Click device with an existing placement

The following `associate-device-with-placement` example associates the specified AWS IoT 1-Click device with an existing placement.

```bash
aws iot1click-projects associate-device-with-placement
   --project-name AnytownDumpsters
   --placement-name customer217
   --device-template-name empty-dumpster-request
   --device-id G030PM0123456789
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.
- For API details, see [AssociateDeviceWithPlacement](#) in *AWS CLI Command Reference*.

**create-placement**

The following code example shows how to use `create-placement`.

---

*Actions and scenarios*
AWS CLI

To create an AWS IoT 1-Click placement for a project

The following create-placement example create an AWS IoT 1-Click placement for the specified project.

```bash
aws iot1click-projects create-placement \
  --project-name AnytownDumpsters \
  --placement-name customer217 \
  --attributes "{"location": "123 Any Street Anytown, USA 10001", "phone": "123-456-7890"}"
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see CreatePlacement in AWS CLI Command Reference.

create-project

The following code example shows how to use create-project.

AWS CLI

To create an AWS IoT 1-Click project for zero or more placements

The following create-project example creates an AWS IoT 1-Click project for a placement.

```bash
aws iot1click-projects create-project --cli-input-json file://create-project.json
```

Contents of create-project.json:

```json
{
    "projectName": "AnytownDumpsters",
    "description": "All dumpsters in the Anytown region.",
    "placementTemplate": {
        "defaultAttributes": {
            "City": "Anytown"
        },
        "deviceTemplates": {
            "empty-dumpster-request": {
```
delete-placement

The following code example shows how to use **delete-placement**.

**AWS CLI**

**To delete a placement from a project**

The following delete-placement example deletes the specified placement from a project.

```shell
aws iot1click-projects delete-placement \
   --project-name AnytownDumpsters \
   --placement-name customer217
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://aws.amazon.com/documentation/iot-1-click/) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [CreateProject](https://docs.aws.amazon.com/cli/latest/reference/iot1click-projects/create-project.html) in *AWS CLI Command Reference*.

delete-project

The following code example shows how to use **delete-project**.

**AWS CLI**

**To delete a project from your AWS account**

The following delete-project example deletes the specified project from your AWS account.
aws iot1click-projects delete-project \
  --project-name AnytownDumpsters

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see DeleteProject in AWS CLI Command Reference.

describe-placement

The following code example shows how to use describe-placement.

AWS CLI

To describe a placement for a project

The following describe-placement example describes a placement for the specified project.

aws iot1click-projects describe-placement \
  --project-name AnytownDumpsters \
  --placement-name customer217

Output:

{
  "placement": {
    "projectName": "AnytownDumpsters",
    "placementName": "customer217",
    "attributes": {
      "phone": "123-555-0110",
      "location": "123 Any Street Anytown, USA 10001"
    },
    "createdDate": 1563488454,
    "updatedDate": 1563488454
  }
}

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.
- For API details, see DescribePlacement in AWS CLI Command Reference.

**describe-project**

The following code example shows how to use describe-project.

**AWS CLI**

To describe an AWS IoT 1-Click project

The following describe-project example describes the specified AWS IoT 1-Click project.

```
aws iot1click-projects describe-project \
    --project-name AnytownDumpsters
```

Output:

```json
{
    "project": {
        "projectName": "AnytownDumpsters",
        "description": "All dumpsters in the Anytown region.",
        "createdDate": 1563483100,
        "updatedDate": 1563483100,
        "placementTemplate": {
            "defaultAttributes": {
                "City": "Anytown"
            },
            "deviceTemplates": {
                "empty-dumpster-request": {
                    "deviceType": "button",
                    "callbackOverrides": {}
                }
            }
        },
        "tags": {}
    }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.
For API details, see DescribeProject in AWS CLI Command Reference.

**disassociate-device-from-placement**

The following code example shows how to use disassociate-device-from-placement.

**AWS CLI**

To disassociate a device from a placement

The following disassociate-device-from-placement example disassociates the specified device from a placement.

```bash
aws iot1click-projects disassociate-device-from-placement \\
   --project-name AnytownDumpsters \\
   --placement-name customer217 \\
   --device-template-name empty-dumpster-request
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

For API details, see DisassociateDeviceFromPlacement in AWS CLI Command Reference.

**get-devices-in-placement**

The following code example shows how to use get-devices-in-placement.

**AWS CLI**

To list all devices in a placement contained in a project

The following get-devices-in-placement example lists all devices in a the specified placement contained in the specified project.

```bash
aws iot1click-projects get-devices-in-placement \\
   --project-name AnytownDumpsters \\
   --placement-name customer217
```

Output:
For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

• For API details, see GetDevicesInPlacement in AWS CLI Command Reference.

list-placements

The following code example shows how to use list-placements.

AWS CLI

To list all AWS IoT 1-Click placements for a project

The following list-placements example lists all AWS IoT 1-Click placements for the specified project.

```bash
aws iot1click-projects list-placements \
   --project-name AnytownDumpsters
```

Output:

```json
{
   "placements": [
      {
         "projectName": "AnytownDumpsters",
         "placementName": "customer217",
         "createdDate": 1563488454,
         "updatedDate": 1563488454
      }
   ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

• For API details, see ListPlacements in AWS CLI Command Reference.
list-projects

The following code example shows how to use list-projects.

AWS CLI

To list all AWS IoT 1-Click projects

The following list-projects example list all AWS IoT 1-Click projects in your account.

```bash
aws iot1click-projects list-projects
```

Output:

```
{
    "projects": [
        {
            "projectName": "AnytownDumpsters",
            "createdDate": 1563483100,
            "updatedDate": 1563483100,
            "tags": {}
        }
    ]
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot/latest/developerguide/using-iot-1-click-cli.html) in the [AWS IoT 1-Click Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/iot-1-click-intro.html).

- For API details, see [ListProjects](https://docs.aws.amazon.com/cli/latest/reference/iot1click-projects/list-projects.html) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a project resource

The following list-tags-for-resource example list the tags for the specified project resource.
aws iot1click-projects list-tags-for-resource \

Output:

```json
{
   "tags": {
      "Manager": "Li Juan",
      "Account": "45215"
   }
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](https://docs.aws.amazon.com/iot1click/latest/developerguide/using-aws-iot-1-click-with-aws-cli.html) in the AWS IoT 1-Click Developer Guide.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/iot1click-projects/list-tags-for-resource.html) in AWS CLI Command Reference.

### tag-resource

The following code example shows how to use tag-resource.

**AWS CLI**

**To add tags to a project resource**

The following `tag-resource` example adds two tags to the specified project resource.

```
aws iot1click-projects tag-resource \
   --cli-input-json file://devices-tag-resource.json
```

**Contents of devices-tag-resource.json:**

```json
{
   "resourceArn": "arn:aws:iot1click:us-west-2:123456789012:projects/AnytownDumpsters",
   "tags": {
      "Account": "45215",
      "Manager": "Li Juan"
   }
}
```
This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove tags from a project resource**

The following untag-resource example removes the tag with the key name Manager from the specified project.

```bash
aws iot1click-projects untag-resource \
   --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/AnytownDumpsters" \
   --tag-keys "Manager"
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-placement**

The following code example shows how to use update-placement.

**AWS CLI**

**To update the "attributes" key-value pairs of a placement**

The following update-placement example update the "attributes" key-value pairs of a placement.

```bash
aws iot1click-projects update-placement \
```
--cli-input-json file://update-placement.json

Contents of update-placement.json:

```json
{
   "projectName": "AnytownDumpsters",
   "placementName": "customer217",
   "attributes": {
      "phone": "123-456-7890",
      "location": "123 Any Street Anytown, USA 10001"
   }
}
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see UpdatePlacement in AWS CLI Command Reference.

update-project

The following code example shows how to use update-project.

AWS CLI

**To update settings for a project**

The following update-project example updates the description for a project.

```bash
aws iot1click-projects update-project \
   --project-name AnytownDumpsters \
   --description "All dumpsters (yard waste, recycling, garbage) in the Anytown region."
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the AWS IoT 1-Click Developer Guide.

- For API details, see UpdateProject in AWS CLI Command Reference.
AWS IoT Analytics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Analytics.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**batch-put-message**

The following code example shows how to use `batch-put-message`.

**AWS CLI**

**To send a message to a channel**

The following `batch-put-message` example sends a message to the specified channel.

```
aws iotanalytics batch-put-message
    --cli-binary-format raw-in-base64-out
    --cli-input-json file://batch-put-message.json
```

Contents of `batch-put-message.json`:

```
{
   "channelName": "mychannel",
   "messages": [
      {
         "messageId": "0001",
         "payload": "eyJidGVtcGVyYXR1cmUiOiAyMCB9"
      }
   ]
}
```
Output:

```json
{
    "batchPutMessageErrorEntries": []
}
```

For more information, see `BatchPutMessage` in the *AWS IoT Analytics API Reference*.

- For API details, see `BatchPutMessage` in *AWS CLI Command Reference*.

### cancel-pipeline-reprocessing

The following code example shows how to use `cancel-pipeline-reprocessing`.

**AWS CLI**

**To cancel the reprocessing of data through a pipeline**

The following `cancel-pipeline-reprocessing` example cancels the reprocessing of data through the specified pipeline.

```
aws iotanalytics cancel-pipeline-reprocessing 
   --pipeline-name mypipeline 
   --reprocessing-id "6ad2764f-fb13-4de3-b101-4e74af03b043"
```

This command produces no output.

For more information, see `CancelPipelineReprocessing` in the *AWS IoT Analytics API Reference*.

- For API details, see `CancelPipelineReprocessing` in *AWS CLI Command Reference*.

### create-channel

The following code example shows how to use `create-channel`.

**AWS CLI**

**To create a channel**
The following `create-channel` example creates a channel with the specified configuration. A channel collects data from an MQTT topic and archives the raw, unprocessed messages before publishing the data to a pipeline.

```bash
aws iotanalytics create-channel \
   --cli-input-json file://create-channel.json
```

**Contents of `create-channel.json`:**

```json
{
   "channelName": "mychannel",
   "retentionPeriod": {
      "unlimited": true
   },
   "tags": [
      {
         "key": "Environment",
         "value": "Production"
      }
   ]
}
```

**Output:**

```json
{
   "channelArn": "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel",
   "channelName": "mychannel",
   "retentionPeriod": {
      "unlimited": true
   }
}
```

For more information, see [CreateChannel](https://docs.aws.amazon.com/iotevents/latest/APIReference/API_CreateChannel.html) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreateChannel](https://docs.aws.amazon.com/iotevents/latest/APIReference/API_CreateChannel.html) in *AWS CLI Command Reference*.

**create-dataset-content**

The following code example shows how to use `create-dataset-content`.

```json
"channelArn": "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel",
"channelName": "mychannel",
"retentionPeriod": {
   "unlimited": true
}
```
AWS CLI

To create the content of a dataset

The following create-dataset-content example creates the content of the specified dataset by applying a queryAction (an SQL query) or a containerAction (executing a containerized application).

```bash
aws iotanalytics create-dataset-content \\
    --dataset-name mydataset
```

Output:

```json
{
    "versionId": "d494b416-9850-4670-b885-ca22f1e89d62"
}
```

For more information, see CreateDatasetContent in the AWS IoT Analytics API Reference.

- For API details, see CreateDatasetContent in AWS CLI Command Reference.

create-dataset

The following code example shows how to use create-dataset.

AWS CLI

To create a dataset

The following create-dataset example creates a dataset. A dataset stores data retrieved from a data store by applying a queryAction (a SQL query) or a containerAction (executing a containerized application). This operation creates the skeleton of a dataset. You can populate the dataset manually by calling CreateDatasetContent or automatically according to a trigger you specify.

```bash
aws iotanalytics create-dataset \\
    --cli-input-json file://create-dataset.json
```

Contents of create-dataset.json:
The following code example shows how to create a data store:

```json
{
    "datasetName": "mydataset",
    "actions": [
        {
            "actionName": "myDatasetAction",
            "queryAction": {
                "sqlQuery": "SELECT * FROM mydatastore"
            }
        }
    ],
    "retentionPeriod": {
        "unlimited": true
    },
    "tags": [
        {
            "key": "Environment",
            "value": "Production"
        }
    ]
}
```

Output:

```json
{
    "datasetName": "mydataset",
    "retentionPeriod": {
        "unlimited": true
    },
}
```

For more information, see CreateDataset in the AWS IoT Analytics API Reference.

- For API details, see CreateDataset in AWS CLI Command Reference.

### create-datastore

The following code example shows how to use create-datastore.

**AWS CLI**

To create a data store
The following `create-datastore` example creates a data store, which is a repository for messages.

```bash
aws iotanalytics create-datastore \
   --cli-input-json file://create-datastore.json
```

Contents of `create-datastore.json`:

```json
{
    "datastoreName": "mydatastore",
    "retentionPeriod": {
        "numberOfDays": 90
    },
    "tags": [
        {
            "key": "Environment",
            "value": "Production"
        }
    ]
}
```

Output:

```json
{
    "datastoreName": "mydatastore",
    "retentionPeriod": {
        "numberOfDays": 90,
        "unlimited": false
    }
}
```

For more information, see `CreateDatastore` in the AWS IoT Analytics API Reference.

- For API details, see `CreateDatastore` in AWS CLI Command Reference.

**create-pipeline**

The following code example shows how to use `create-pipeline`.
Create an IoT Analytics Pipeline

The following create-pipeline example creates a pipeline. A pipeline consumes messages from a channel and allows you to process the messages before storing them in a data store. You must specify both a channel and a data store activity and, optionally, as many as 23 additional activities in the pipelineActivities array.

```
aws iotanalytics create-pipeline \
    --cli-input-json file://create-pipeline.json
```

Contents of create-pipeline.json:

```json
{
    "pipelineName": "mypipeline",
    "pipelineActivities": [
        {
            "channel": {
                "name": "myChannelActivity",
                "channelName": "mychannel",
                "next": "myMathActivity"
            }
        },
        {
            "datastore": {
                "name": "myDatastoreActivity",
                "datastoreName": "mydatastore"
            }
        },
        {
            "math": {
                "name": "myMathActivity",
                "math": "((temp - 32) * 5.0) / 9.0",
                "attribute": "tempC",
                "next": "myDatastoreActivity"
            }
        }
    ],
    "tags": [
        {
            "key": "Environment",
            "value": "Beta"
        }
    ]
}
```
Output:

```
{
  "pipelineName": "mypipeline"
}
```

For more information, see `CreatePipeline` in the *AWS IOT Analytics API Reference*.

- For API details, see `CreatePipeline` in *AWS CLI Command Reference*.

**delete-channel**

The following code example shows how to use delete-channel.

**AWS CLI**

**Delete an IoT Analytics Channel**

The following `delete-channel` example deletes the specified channel.

```
aws iotanalytics delete-channel \
  --channel-name mychannel
```

This command produces no output.

For more information, see `DeleteChannel` in the *AWS IOT Analytics API Reference*.

- For API details, see `DeleteChannel` in *AWS CLI Command Reference*.

**delete-dataset-content**

The following code example shows how to use delete-dataset-content.

**AWS CLI**

**To delete dataset content**
The following `delete-dataset-content` example deletes the content of the specified dataset.

```bash
aws iotanalytics delete-dataset-content \
   --dataset-name mydataset
```

This command produces no output.

For more information, see `DeleteDatasetContent` in the *AWS IoT Analytics API Reference*.

- For API details, see `DeleteDatasetContent` in *AWS CLI Command Reference*.

### delete-dataset

The following code example shows how to use `delete-dataset`.

#### AWS CLI

**To delete a dataset**

The following `delete-dataset` example deletes the specified dataset. You don't have to delete the content of the dataset before you perform this operation.

```bash
aws iotanalytics delete-dataset \
   --dataset-name mydataset
```

This command produces no output.

For more information, see `DeleteDataset` in the *AWS IoT Analytics API Reference*.

- For API details, see `DeleteDataset` in *AWS CLI Command Reference*.

### delete-datastore

The following code example shows how to use `delete-datastore`.

#### AWS CLI

**To delete a data store**

The following `delete-datastore` example deletes the specified data store.
aws iotanalytics delete-datastore \
   --datastore-name mydatastore

This command produces no output.

For more information, see DeleteDatastore in the AWS IoT Analytics API Reference.

- For API details, see DeleteDatastore in AWS CLI Command Reference.

delete-pipeline

The following code example shows how to use delete-pipeline.

AWS CLI

To delete a pipeline

The following delete-pipeline example deletes the specified pipeline.

aws iotanalytics delete-pipeline \
   --pipeline-name mypipeline

This command produces no output.

For more information, see DeletePipeline in the AWS IoT Analytics API Reference.

- For API details, see DeletePipeline in AWS CLI Command Reference.

describe-channel

The following code example shows how to use describe-channel.

AWS CLI

To retrieve information about a channel

The following describe-channel example displays details, including statistics, for the specified channel.

aws iotanalytics describe-channel \
   --channel-name mychannel \
   --include-statistics
describe-dataset

The following code example shows how to use `describe-dataset`.

**AWS CLI**

**To retrieve information about a dataset**

The following `describe-dataset` example displays details for the specified dataset.

```
aws iotanalytics describe-dataset \
  --dataset-name mydataset
```

**Output:**

```
{
  "dataset": {
    
  }
}
```

For more information, see [DescribeChannel](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DescribeChannel](#) in *AWS CLI Command Reference*.

---

**Actions and scenarios**

3891
For more information, see DescribeDataset in the AWS IoT Analytics API Reference.

- For API details, see DescribeDataset in AWS CLI Command Reference.

describe-datastore

The following code example shows how to use describe-datastore.

AWS CLI

To retrieve information about a data store

The following describe-datastore example displays details, including statistics, for the specified data store.

```sh
code
aws iotanalytics describe-datastore \
  --datastore-name mydatastore \
  --include-statistics
```

Output:
For more information, see DescribeDatastore in the AWS IoT Analytics API Reference.

• For API details, see DescribeDatastore in AWS CLI Command Reference.

describe-logging-options

The following code example shows how to use describe-logging-options.

AWS CLI

To retrieve the current logging options

The following describe-logging-options example displays the current AWS IoT Analytics logging options.

aws iotanalytics describe-logging-options

This command produces no output. Output:

```json
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/service-role/myIoTAnalyticsRole",
        "enabled": true,
    }
}
```
For more information, see `DescribeLoggingOptions` in the AWS IoT Analytics API Reference.

- For API details, see `DescribeLoggingOptions` in AWS CLI Command Reference.

**describe-pipeline**

The following code example shows how to use describe-pipeline.

**AWS CLI**

**To retrieve information about a pipeline**

The following describe-pipeline example displays details for the specified pipeline.

```bash
aws iotanalytics describe-pipeline \
   --pipeline-name mypipeline
```

Output:

```
{
   "pipeline": {
      "activities": [
         {
            "channel": {
               "channelName": "mychannel",
               "name": "mychannel_28",
               "next": "mydatastore_29"
            },
         },
         {
            "datastore": {
               "datastoreName": "mydatastore",
               "name": "mydatastore_29"
            }
         }
      ],
      "name": "mypipeline",
      "lastUpdateTime": 1561676362.515,
      "creationTime": 1557859124.432,
   }
```

Actions and scenarios
For more information, see `DescribePipeline` in the *AWS IoT Analytics API Reference*.

- For API details, see `DescribePipeline` in *AWS CLI Command Reference*.

**get-dataset-content**

The following code example shows how to use `get-dataset-content`.

**AWS CLI**

**To retrieve the contents of a dataset**

The following `get-dataset-content` example retrieves the contents of a dataset as presigned URIs.

```bash
aws iotanalytics get-dataset-content --dataset-name mydataset
```

**Output:**

```json
{
    "status": {
        "state": "SUCCEEDED"
    },
    "status": 1557863215.995,
    "entries": [
    ]
}
```
For more information, see GetDatasetContent in the guide.

- For API details, see GetDatasetContent in AWS CLI Command Reference.

**list-channels**

The following code example shows how to use list-channels.

**AWS CLI**

**To retrieve a list of channels**

The following list-channels example displays summary information for the available channels.

```bash
aws iotanalytics list-channels
```

Output:

```json
{
  "channelSummaries": [ 
    {
      "status": "ACTIVE",
      "channelName": "mychannel",
      "creationTime": 1557860351.001,
      "lastUpdateTime": 1557860351.001
    }
  ]
}
```

For more information, see ListChannels in the AWS IoT Analytics API Reference.

- For API details, see ListChannels in AWS CLI Command Reference.

**list-dataset-contents**

The following code example shows how to use list-dataset-contents.
AWS CLI

To list information about dataset contents

The following `list-dataset-contents` example lists information about dataset contents that have been created.

```
aws iotanalytics list-dataset-contents \\
   --dataset-name mydataset
```

Output:

```json
{
   "datasetContentSummaries": [
      {
         "status": {
            "state": "SUCCEEDED"
         },
         "scheduleTime": 1557863215.995,
         "version": "b10ea2a9-66c1-4d99-8d1f-518113b738d0",
         "creationTime": 1557863215.995
      }
   ]
}
```

For more information, see `ListDatasetContents` in the *AWS IoT Analytics API Reference*.

- For API details, see `ListDatasetContents` in *AWS CLI Command Reference*.

**list-datasets**

The following code example shows how to use `list-datasets`.

AWS CLI

To retrieve information about datasets

The following `list-datasets` example lists summary information about available datasets.

```
aws iotanalytics list-datasets
```

Output:
For more information, see `ListDatasets` in the AWS IoT Analytics API Reference.

- For API details, see `ListDatasets` in AWS CLI Command Reference.

### list-datastores

The following code example shows how to use `list-datastores`.

**AWS CLI**

**To retrieve a list of data stores**

The following `list-datastores` example displays summary information about the available data stores.

```
aws iotanalytics list-datastores
```

Output:

```json
{
   "datastoreSummaries": [
      {
         "status": "ACTIVE",
         "datastoreName": "mydatastore",
         "creationTime": 1557859240.658,
         "actions": [
            {
               "actionName": "query_32",
               "actionType": "QUERY"
            }
         ]
      }
   ]
}
```
For more information, see ListDatastores in the AWS IoT Analytics API Reference.

- For API details, see ListDatastores in AWS CLI Command Reference.

**list-pipelines**

The following code example shows how to use list-pipelines.

**AWS CLI**

To retrieve a list of pipelines

The following list-pipelines example displays a list of available pipelines.

```bash
aws iotanalytics list-pipelines
```

Output:

```
{
    "pipelineSummaries": [
        {
            "pipelineName": "mypipeline",
            "creationTime": 1557859124.432,
            "lastUpdateTime": 1557859124.432,
            "reprocessingSummaries": []
        }
    ]
}
```

For more information, see ListPipelines in the AWS IoT Analytics API Reference.

- For API details, see ListPipelines in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.
AWS CLI

To list tags for a resource

The following list-tags-for-resource example Lists the tags that you have attached to the specified resource.

```bash
aws iotanalytics list-tags-for-resource \
```

Output:

```json
{
    "tags": [
        {
            "value": "bar",
            "key": "foo"
        }
    ]
}
```

For more information, see ListTagsForResource in the AWS IoT Analytics API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

put-logging-options

The following code example shows how to use put-logging-options.

AWS CLI

To set or update logging options

The following put-logging-options example sets or updates the AWS IoT Analytics logging options. If you update the value of any loggingOptions field, it can take up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the "roleArn" field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```bash
aws iotanalytics put-logging-options \
```
--cli-input-json file://put-logging-options.json

Contents of put-logging-options.json:

```json
{
   "loggingOptions": {
      "roleArn": "arn:aws:iam::123456789012:role/service-role/myIoTAnalyticsRole",
      "level": "ERROR",
      "enabled": true
   }
}
```

This command produces no output.

For more information, see PutLoggingOptions in the AWS IoT Analytics API Reference.

- For API details, see PutLoggingOptions in AWS CLI Command Reference.

**run-pipeline-activity**

The following code example shows how to use `run-pipeline-activity`.

**AWS CLI**

**To simulate a pipeline activity**

The following `run-pipeline-activity` example simulates the results of running a pipeline activity on a message payload.

```
aws iotanalytics run-pipeline-activity \
   --pipeline-activity file://maths.json \
   --payloads file://payloads.json
```

Contents of `maths.json`:

```json
{
   "math": {
      "name": "MyMathActivity",
      "math": "((temp - 32) * 5.0) / 9.0",
      "attribute": "tempC"
   }
}
```
Contents of payloads.json:

```
[ 
  "{"humidity": 52, "temp": 68 
  },
  "{"humidity": 52, "temp": 32 
"
]
```

Output:

```
{
   "logResult": ",",
   "payloads": [
      "eyJodW1pZGl0eSI6NTIsInRlbXAiOjY4LCJ0ZW1wQyI6MjB9",
      "eyJodW1pZGl0eSI6NTIsInRlbXAiOjMyLCJ0ZW1wQyI6MH0="
   ]
}
```

For more information, see RunPipelineActivity in the AWS IoT Analytics API Reference.
- For API details, see RunPipelineActivity in AWS CLI Command Reference.

**sample-channel-data**

The following code example shows how to use sample-channel-data.

**AWS CLI**

To retrieve sample messages from a channel

The following sample-channel-data example retrieves a sample of messages from the specified channel ingested during the specified timeframe. You can retrieve up to 10 messages.

```
aws iotanalytics sample-channel-data \
   --channel-name mychannel
```

Output:

```
{
```
For more information, see SampleChannelData in the AWS IoT Analytics API Reference.

- For API details, see SampleChannelData in AWS CLI Command Reference.

**start-pipeline-reprocessing**

The following code example shows how to use `start-pipeline-reprocessing`.

**AWS CLI**

**To start pipeline reprocessing**

The following `start-pipeline-reprocessing` example starts the reprocessing of raw message data through the specified pipeline.

```bash
aws iotanalytics start-pipeline-reprocessing \
  --pipeline-name mypipeline
```

Output:

```
{
    "reprocessingId": "6ad2764f-fb13-4de3-b101-4e74af03b043"
}
```

For more information, see StartPipelineReprocessing in the AWS IoT Analytics API Reference.

- For API details, see StartPipelineReprocessing in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add or modify tags for a resource**
The following tag-resource example adds to or modifies the tags attached to the specified resource.

```bash
aws iotanalytics tag-resource 
   --tags "{{"key": "Environment", "value": "Production"}}"
```

This command produces no output.

For more information, see TagResource in the AWS IoT Analytics API Reference.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a resource

The following untag-resource example removes the tags with the specified key names from the specified resource.

```bash
aws iotanalytics untag-resource 
   --tag-keys "["Environment"]"
```

This command produces no output.

For more information, see UntagResource <https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_UntagResource.html> in the AWS IoT Analytics API Reference.

- For API details, see UntagResource in AWS CLI Command Reference.

update-channel

The following code example shows how to use update-channel.

AWS CLI

To modify a channel
The following update-channel example modifies the settings for the specified channel.

```
aws iotanalytics update-channel \
   --cli-input-json file://update-channel.json
```

Contents of update-channel.json:

```
{
   "channelName": "mychannel",
   "retentionPeriod": {
      "numberOfDays": 92
   }
}
```

This command produces no output.

For more information, see UpdateChannel in the AWS IoT Analytics API Reference.

- For API details, see UpdateChannel in AWS CLI Command Reference.

**update-dataset**

The following code example shows how to use update-dataset.

**AWS CLI**

**To update a dataset**

The following update-dataset example modifies the settings of the specified dataset.

```
aws iotanalytics update-dataset \
   --cli-input-json file://update-dataset.json
```

Contents of update-dataset.json:

```
{
   "datasetName": "mydataset",
   "actions": [
      {
         "actionName": "myDatasetUpdateAction",
         "queryAction": {
            "sqlQuery": "SELECT * FROM mydatastore"
         }
      }
   ]
}
```
The following code example shows how to use `update-datastore`.

**AWS CLI**

**To update a data store**

The following `update-datastore` example modifies the settings of the specified data store.

```
aws iotanalytics update-datastore \
    --cli-input-json file://update-datastore.json
```

Contents of `update-datastore.json`:

```
{
    "datastoreName": "mydatastore",
    "retentionPeriod": {
        "numberOfDays": 93
    }
}
```

This command produces no output.

For more information, see [UpdateDataset](https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_UpdateDataset.html) in the [AWS IoT Analytics API Reference](https://docs.aws.amazon.com/iotanalytics/latest/APIReference/).  
- For API details, see [UpdateDataset](https://docs.aws.amazon.com/iotanalytics/latest/APIReference/) in [AWS CLI Command Reference](https://docs.aws.amazon.com/iotanalytics/latest/APIReference/).
update-pipeline

The following code example shows how to use `update-pipeline`.

**AWS CLI**

**To update a pipeline**

The following `update-pipeline` example modifies the settings of the specified pipeline. You must specify both a channel and a data store activity and, optionally, as many as 23 additional activities, in the `pipelineActivities` array.

```bash
aws iotanalytics update-pipeline \
   --cli-input-json file://update-pipeline.json
```

Contents of `update-pipeline.json`:

```json
{
   "pipelineName": "mypipeline",
   "pipelineActivities": [
      {
         "channel": {
            "name": "myChannelActivity",
            "channelName": "mychannel",
            "next": "myMathActivity"
         }
      },
      {
         "datastore": {
            "name": "myDatastoreActivity",
            "datastoreName": "mydatastore"
         }
      },
      {
         "math": {
            "name": "myMathActivity",
            "math": "(((temp - 32) * 5.0) / 9.0) + 273.15",
            "attribute": "tempK",
            "next": "myDatastoreActivity"
         }
      }
   ]
}
```
This command produces no output.

For more information, see UpdatePipeline in the AWS IoT Analytics API Reference.
- For API details, see UpdatePipeline in AWS CLI Command Reference.

Device Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Advisor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-suite-definition

The following code example shows how to use create-suite-definition.

AWS CLI

Example 1: To create an IoT Device Advisor test suite

The following create-suite-definition example creates a device advisor test suite in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition --suite-definition-configuration '{
  
```
Output:

```
{
    "suiteDefinitionId": "0jtsgio7yenu",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/0jtsgio7yenu",
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```

For more information, see [Create a test suite definition](https://docs.aws.amazon.com/iot/core/latest/developerguide/aws-iot-core-create-test-suite-definition.html) in the AWS IoT Core Developer Guide.

**Example 2: To create an IoT Device Advisor Latest Qualification test suite**

The following `create-suite-definition` example creates a device advisor qualification test suite with the latest version in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition
    --suite-definition-configuration '{
        "suiteDefinitionName": "TestSuiteName",
        "devices": [{"thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIoTThing"}],
        "intendedForQualification": true,
        "rootGroup": "",
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "txgsuolk2myj",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/txgsuolk2myj",
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```
For more information, see Create a test suite definition in the AWS IoT Core Developer Guide.

- For API details, see CreateSuiteDefinition in AWS CLI Command Reference.

### delete-suite-definition

The following code example shows how to use delete-suite-definition.

**AWS CLI**

**To delete the IoT Device Advisor test suite**

The following delete-suite-definition example deletes the device advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor delete-suite-definition
  --suite-definition-id 0jtsgio7yenu
```

This command produces no output.

For more information, see DeleteSuiteDefinition in the AWS IoT API Reference.

- For API details, see DeleteSuiteDefinition in AWS CLI Command Reference.

### get-endpoint

The following code example shows how to use get-endpoint.

**AWS CLI**

**Example 1: To get the information about an IoT Device Advisor Account-level endpoint**

The following get-endpoint example gets the information about a device advisor Account-level test endpoint.

```
aws iotdeviceadvisor get-endpoint
```

Output:
Example 2: To get the information about an IoT Device Advisor Device-level endpoint

The following get-endpoint example gets the information about a device advisor device-level test endpoint with the specified thing-arn or certificate-arn.

```bash
aws iotdeviceadvisor get-endpoint \
   --thing-arn arn:aws:iot:us-east-1:123456789012:thing/MyIotThing
```

Output:

```
{
   "endpoint": "t6y4c143x9sfo.deviceadvisor.iot.us-east-1.amazonaws.com"
}
```

For more information, see Get a test endpoint in the AWS IoT Core Developer Guide.

- For API details, see GetEndpoint in AWS CLI Command Reference.

get-suite-definition

The following code example shows how to use get-suite-definition.

AWS CLI

To get the information about an IoT Device Advisor test suite

The following get-suite-definition example get the information about an device advisor test suite with the specified suite definition ID.

```bash
aws iotdeviceadvisor get-suite-definition \
   --suite-definition-id qqcsmyyjyabl
```

Output:

```
{
   "suiteDefinitionId": "qqcsmyyjyabl",
}
```
"suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/qqcsmyyyjabl",
"suiteDefinitionVersion": "v1",
"latestVersion": "v1",
"suiteDefinitionConfiguration": {
    "suiteDefinitionName": "MQTT connection",
    "devices": [],
    "intendedForQualification": false,
    "isLongDurationTest": false,
    "rootGroup": "{"configuration":{},"tests":[]}",
"name":"MQTT Connect","configuration":{},"test":{
  "testCase":null,"version":"0.0.0"}}
"devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole",
"protocol": "MqttV3_1_1"
},
"createdAt": "2022-11-11T22:28:52.389000-05:00",
"lastModifiedAt": "2022-11-11T22:28:52.389000-05:00",
"tags": {}
}

For more information, see Get a test suite definition in the AWS IoT Core Developer Guide.

- For API details, see GetSuiteDefinition in AWS CLI Command Reference.

get-suite-run-report

The following code example shows how to use get-suite-run-report.

AWS CLI

To get the information about an IoT Device Advisor qualifying test suite run report

The following get-suite-run-report example gets the report download link for a successful device advisor qualifying test suite run with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run-report \
   --suite-definition-id ztvb5ae4w4x \
   --suite-run-id p6awv83nre6v
```

Output:

```
{
```
For more information, see [Get a qualification report for a successful qualification test suite run](https://docs.aws.amazon.com/iot-deviceadvisor/latest/developerguide/suite-run-report.html) in the *AWS IoT Core Developer Guide*.

### get-suite-run

The following code example shows how to use `get-suite-run`.

#### AWS CLI

**To get the information about an IoT Device Advisor test suite run status**

The following `get-suite-run` example gets the information about a device advisor test suite run status with the specified suite definition ID and suite run ID.

```bash
aws iotdeviceadvisor get-suite-run \
   --suite-definition-id qqcsmtyyjabl \
   --suite-run-id nzlfyhaa18oa
```

**Output:**

```
{
   "suiteDefinitionId": "qqcsmtyyjabl",
   "suiteDefinitionVersion": "v1",
   "suiteRunId": "nzlfyhaa18oa",
   "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/qqcsmtyyjabl/nzlfyhaa18oa",
   "suiteRunConfiguration": {
      "primaryDevice": {
         "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIotThing",
         "certificateArn": "arn:aws:iot:us-east-1:123456789012:cert/certFile"
      },
      "parallelRun": false
   },
   "testResult": {
      "groups": [
      {
         "groupId": "uta5d9j1kvwc",
```
For more information, see Get a test suite run in the AWS IoT Core Developer Guide.

- For API details, see GetSuiteRun in AWS CLI Command Reference.

list-suite-definitions

The following code example shows how to use list-suite-definitions.

AWS CLI

Example 1: To list the IoT Device Advisor test suites you created

The following list-suite-definitions example lists up to 25 device advisor test suites you created in AWS IoT. If you have more than 25 test suites, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suites you created.

aws iotdeviceadvisor list-suite-definitions
Output:

```
{
    "suiteDefinitionInformationList": [
        {
            "suiteDefinitionId": "3hsn88h4p2g5",
            "suiteDefinitionName": "TestSuite1",
            "defaultDevices": [
                {
                    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIotThing"
                }
            ],
            "intendedForQualification": false,
            "isLongDurationTest": false,
            "protocol": "MqttV3_1_1",
            "createdAt": "2022-11-17T14:15:56.830000-05:00"
        },
        {
            .......
        }
    ],
    "nextToken": "nextTokenValue"
}
```

Example 2: To list the IoT Device Advisor test suites you created with the specified settings

The following `list-suite-definitions` example lists device advisor test suites you created in AWS IoT with the specified max-result number. If you have more test suites than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suites you created that weren't shown before.

```
aws iotdeviceadvisor list-suite-definitions \
    --max-result 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteDefinitionInformationList": [
        {
            "suiteDefinitionId": "ztvb5aew4w4x",
```
For more information, see ListSuiteDefinitions in the AWS IoT API Reference.

- For API details, see ListSuiteDefinitions in AWS CLI Command Reference.

list-suite-runs

The following code example shows how to use list-suite-runs.

AWS CLI

Example 1: To list all information about the specified IoT Device Advisor test suite runs status

The following list-suite-runs example lists all information about a device advisor test suite runs status with the specified suite definition ID. If you have more than 25 test suite runs, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suite runs.

```bash
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id ztvb5aew4w4x
```

Output:

```json
{
    "suiteRunsList": [
        {
            "suiteDefinitionId": "ztvb5aew4w4x",
            "suiteDefinitionVersion": "v1",
            "suiteDefinitionName": "TestSuite",
            "suiteRunId": "p6awv89nre6v",
```
Example 2: To list information about the specified IoT Device Advisor test suite runs status with the specified settings

The following `list-suite-runs` example lists information about a device advisor test suite runs status with the specified suite definition ID and the specified max-result number. If you have more test suite runs than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suite runs that weren't shown before.

```
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id qqcsmtyyjaml \
    --max-result 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteRunsList": [
    {
        "suiteDefinitionId": "qqcsmtyyjaml",
        "suiteDefinitionVersion": "v1",
        "suiteDefinitionName": "MQTT connection",
        "suiteRunId": "gz9vm2s6d2jy",
        "createdAt": "2022-12-01T20:10:27.079000-05:00",
        "startedAt": "2022-12-01T20:10:28.003000-05:00",
        "endAt": "2022-12-01T20:10:45.084000-05:00",
        "status": "STOPPED",
        "passed": 0,
        "failed": 0
    }
    ],
    "nextToken": "nextTokenValue"
}
```

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags attached to an IoT Device Advisor resource

The following list-tags-for-resource example lists the tags attached to a device advisor resource. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```bash
aws iotdeviceadvisor list-tags-for-resource \
   --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/ba0uyjpg38ny
```

Output:

```json
{
   "tags": {
       "TestTagKey": "TestTagValue"
   }
}
```

For more information, see ListTagsForResource in the AWS IoT API Reference and Resource types defined by AWS IoT Core Device Advisor in the Service Authorization Reference.

For API details, see ListTagsForResource in AWS CLI Command Reference.

start-suite-run

The following code example shows how to use start-suite-run.

AWS CLI

To start an IoT Device Advisor test suite run
The following `start-suite-run` example lists the available widgets in your AWS account.

```bash
aws iotdeviceadvisor start-suite-run \
   --suite-definition-id qqcsmtyyjabl \
   --suite-definition-version v1 \
```

Output:

```
{
   "suiteRunId": "pwmucgw7lt9s",
   "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/qqcsmtyyjabl/pwmucgw7lk9s",
   "createdAt": "2022-12-02T15:43:05.581000-05:00"
}
```

For more information, see [Start a test suite run](https://docs.aws.amazon.com/iot/latest/developerguide/start-test-suite-run.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [StartSuiteRun](https://docs.aws.amazon.com/cli/latest/reference/iotdeviceadvisor/start-suite-run.html) in *AWS CLI Command Reference*.

### stop-suite-run

The following code example shows how to use `stop-suite-run`.

**AWS CLI**

**To stop an IoT Device Advisor test suite that is currently running**

The following `stop-suite-run` example stops a device advisor test suite that is currently running with the specified suite definition ID and suite run ID.

```bash
aws iotdeviceadvisor stop-suite-run \
   --suite-definition-id qqcsmtyyjabl \
   --suite-run-id nzlfyhaa18oa
```

This command produces no output.

For more information, see [Stop a test suite run](https://docs.aws.amazon.com/iot/latest/developerguide/stop-test-suite-run.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [StopSuiteRun](https://docs.aws.amazon.com/cli/latest/reference/iotdeviceadvisor/stop-suite-run.html) in *AWS CLI Command Reference*.  

---

Actions and scenarios 3919
tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add to and modify the existing tags of an IoT Device Advisor resource

The following tag-resource example adds to and modifies the existing tags of a device advisor resource with the specified resource arn and tags. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```bash
aws iotdeviceadvisor tag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/ba0uyjpg38ny \
    --tags '{"TagKey": "TagValue"}'
```

This command produces no output.

For more information, see TagResource in the AWS IoT API Reference and Resource types defined by AWS IoT Core Device Advisor in the Service Authorization Reference.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove the existing tags from an IoT Device Advisor resource

The following untag-resource example removes the existing tags from a device advisor resource with the specified resource arn and tag key. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```bash
aws iotdeviceadvisor untag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/ba0uyjpg38ny \
    --tag-keys "TagKey"
```
This command produces no output.

For more information, see `UntagResource` in the AWS IoT API Reference and Resource types defined by AWS IoT Core Device Advisor in the Service Authorization Reference.

- For API details, see `UntagResource` in AWS CLI Command Reference.

**update-suite-definition**

The following code example shows how to use `update-suite-definition`.

**AWS CLI**

**Example 1: To update an IoT Device Advisor test suite**

The following update-suite-definition example updates a device advisor test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```bash
aws iotdeviceadvisor update-suite-definition \
   --suite-definition-id 3hsn88h4p2g5 \
   --suite-definition-configuration '{\n      "suiteDefinitionName": "TestSuiteName", \n      "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/MyIoTThing"}], \n      "intendedForQualification": false, \n      "rootGroup":{"configuration":{},"tests":[]} \n    }',
```

Output:

```json
{
  "suiteDefinitionId": "3hsn88h4p2g5",
  "suiteDefinitionName": "TestSuiteName",
  "suiteDefinitionVersion": "v3",
  "createdAt": "2022-11-17T14:15:56.830000-05:00",
  "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

**Example 2: To update an IoT Device Advisor Qualification test suite**
The following update-suite-definition example updates a device advisor qualification test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \
  --suite-definition-id txgsuolk2myj \
  --suite-definition-configuration '{
    "suiteDefinitionName": "TestSuiteName", 
    "devices": ["thingArn":"arn:aws:iot:us-east-1:123456789012:thing/MyIotThing"], 
    "intendedForQualification": true, 
    "rootGroup": ",
    "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"
}'
```

Output:

```
{
  "suiteDefinitionId": "txgsuolk2myj",
  "suiteDefinitionName": "TestSuiteName",
  "suiteDefinitionVersion": "v3",
  "createdAt": "2022-11-17T14:15:56.830000-05:00",
  "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

For more information, see [UpdateSuiteDefinition](https://docs.aws.amazon.com/iot/latest/apireference/API_UpdateSuiteDefinition.html) in the **AWS IoT API Reference**.

- For API details, see [UpdateSuiteDefinition](https://docs.aws.amazon.com/cli/latest/reference/iotdeviceadvisor/update-suite-definition.html) in **AWS CLI Command Reference**.

• Actions

Actions

delete-thing-shadow

The following code example shows how to use delete-thing-shadow.

AWS CLI

To delete a device's shadow document

The following delete-thing-shadow example deletes the entire shadow document for the device named MyRPi.

```bash
aws iot-data delete-thing-shadow \
  --thing-name MyRPi \ 
  "output.txt"
```

The command produces no output on the display, but output.txt contains information that confirms the version and timestamp of the shadow document that you deleted.

```
{"version":2,"timestamp":1560270384}
```

For more information, see Using Shadows in the AWS IoT Developers Guide.

• For API details, see DeleteThingShadow in AWS CLI Command Reference.

get-thing-shadow

The following code example shows how to use get-thing-shadow.

AWS CLI

To get a thing shadow document

The following get-thing-shadow example gets the thing shadow document for the specified IoT thing.

```bash
aws iot-data get-thing-shadow \
```

update-thing-shadow

The following code example shows how to use update-thing-shadow.

AWS CLI

To update a thing shadow

The following update-thing-shadow example modifies the current state of the device shadow for the specified thing and saves it to the file output.txt.

```bash
aws iot-data update-thing-shadow \
--thing-name MyRPi \
--payload "{"state":{"reported":{"moisture":"okay"}}}" \
"output.txt"
```
The command produces no output on the display, but the following shows the contents of output.txt:

```json
{
    "state": {
        "reported": {
            "moisture": "okay"
        }
    },
    "metadata": {
        "reported": {
            "moisture": {
                "timestamp": 1560270036
            }
        }
    },
    "version": 2,
    "timestamp": 1560270036
}
```

For more information, see [Device Shadow Service Data Flow](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateThingShadow](#) in *AWS CLI Command Reference*.

**AWS IoT Events examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

**Actions**

**batch-put-message**

The following code example shows how to use batch-put-message.

**AWS CLI**

**To send messages (inputs) to AWS IoT Events**

The following batch-put-message example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify (inputName) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \
   --cli-input-json file://highPressureMessage.json
```

Contents of highPressureMessage.json:

```json
{
   "messages": [
      {
         "messageId": "00001",
         "inputName": "PressureInput",
         "payload": "{\\"motorid\\": \"Fulton-A32\\", \"sensorData\\": {\\"pressure\\": 80, \"temperature\\": 39} }"
      }
   ]
}
```

Output:

```json
{
   "BatchPutMessageErrorEntries": []
}
```

For more information, see [BatchPutMessage](#) in the AWS IoT Events API Reference.

- For API details, see [BatchPutMessage](#) in [AWS CLI Command Reference](#).
batch-update-detector

The following code example shows how to use batch-update-detector.

AWS CLI

To update a detector (instance)

The following batch-update-detector example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

aws iotevents-data batch-update-detector \
--cli-input-json file://budFulton-A32.json

Contents of budFulton-A32.json:

```
{
   "detectors": [
   {

}
```
create-detector-model

The following code example shows how to use create-detector-model.

AWS CLI

To create a detector model

The following create-detector-model example creates a detector model with its configuration specified by a parameter file.

aws iotevents create-detector-model  
   --cli-input-json file://motorDetectorModel.json

Contents of motorDetectorModel.json:

```json
{
   "detectorModelName": "motorDetectorModel",
   "detectorModelDefinition": {
      "states": [
         {
            "stateName": "Normal",
            "onEnter": {
               "events": [
                  {
                     "eventName": "init",

For more information, see [CreateDetectorModel](https://docs.aws.amazon.com/iot-events/latest/apireference/API_CreateDetectorModel.html) in the *AWS IoT Events API Reference*.

- For API details, see [CreateDetectorModel](https://docs.aws.amazon.com/cli/latest/reference/iotevents/create-detector-model.html) in *AWS CLI Command Reference*.

**create-input**

The following code example shows how to use `create-input`.

**AWS CLI**

**To create an input**

The following `create-input` example creates an input.
aws iotevents create-input  
   --cli-input-json file://pressureInput.json

Contents of pressureInput.json:

```json
{
   "inputName": "PressureInput",
   "inputDescription": "Pressure readings from a motor",
   "inputDefinition": {
      "attributes": [
         { "jsonPath": "sensorData.pressure" },
         { "jsonPath": "motorid" }
      ]
   }
}
```

Output:

```json
{
   "inputConfiguration": {
      "status": "ACTIVE",
      "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
      "lastUpdateTime": 1560795312.542,
      "creationTime": 1560795312.542,
      "inputName": "PressureInput",
      "inputDescription": "Pressure readings from a motor"
   }
}
```

For more information, see [CreateInput](#) in the *AWS IoT Events API Reference*.

- For API details, see [CreateInput](#) in *AWS CLI Command Reference*.

**delete-detector-model**

The following code example shows how to use delete-detector-model.

**AWS CLI**

To delete a detector model
The following `delete-detector-model` example deletes the specified detector model. Any active instances of the detector model are also deleted.

```bash
aws iotevents delete-detector-model \\
  --detector-model-name motorDetectorModel
```

This command produces no output.

For more information, see [DeleteDetectorModel](#) in the AWS IoT Events API Reference.
- For API details, see [DeleteDetectorModel](#) in AWS CLI Command Reference.

**delete-input**

The following code example shows how to use `delete-input`.

**AWS CLI**

**To delete an input**

The following `delete-input` example deletes the specified input.

```bash
aws iotevents delete-input \\
  --input-name PressureInput
```

This command produces no output.

For more information, see [DeleteInput](#) in the AWS IoT Events API Reference.
- For API details, see [DeleteInput](#) in AWS CLI Command Reference.

**describe-detector-model**

The following code example shows how to use `describe-detector-model`.

**AWS CLI**

**To get information about a detector model**

The following `describe-detector-model` example displays details for the specified detector model. Because the version parameter is not specified, information about the latest version is returned.
aws iotevents describe-detector-model \
   --detector-model-name motorDetectorModel

Output:

```json
{
    "detectorModel": {
        "detectorModelConfiguration": {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,

For more information, see `DescribeDetectorModel` in the *AWS IoT Events API Reference*.

- For API details, see `DescribeDetectorModel` in *AWS CLI Command Reference*.

### describe-detector

The following code example shows how to use `describe-detector`.

**AWS CLI**

**To get information about a detector (instance).**

The following `describe-detector` example displays details for the specified detector (instance).

```
aws iotevents-data describe-detector \
    --detector-model-name motorDetectorModel \
    --key-value "Fulton-A32"
```

**Output:**

```json
{
    "detector": {
        "lastUpdateTime": 1560797852.776,
        "creationTime": 1560797852.775,
```
For more information, see DescribeDetector in the AWS IoT Events API Reference.

- For API details, see DescribeDetector in AWS CLI Command Reference.

describe-input

The following code example shows how to use describe-input.

AWS CLI

To get information about an input

The following describe-input example displays details for the specified input.

```
aws iotevents describe-input \
   --input-name PressureInput
```

Output:

```json
{
   "input": {
      "inputConfiguration": {
         "status": "ACTIVE",
         "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
         "lastUpdateTime": 1560795312.542,
         "creationTime": 1560795312.542,
```
For more information, see `DescribeInput` in the *AWS IoT Events API Reference*.

- For API details, see `DescribeInput` in *AWS CLI Command Reference*.

**describe-logging-options**

The following code example shows how to use `describe-logging-options`.

**AWS CLI**

**To get information about logging settings**

The following `describe-logging-options` example retrieves the current settings of the AWS IoT Events logging options.

```
aws iotevents describe-logging-options
```

**Output:**

```json
{
   "loggingOptions": {
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
      "enabled": false,
      "level": "ERROR"
   }
}
```
For more information, see DescribeLoggingOptions in the AWS IoT Events API Reference.

- For API details, see DescribeLoggingOptions in AWS CLI Command Reference.

list-detector-model-versions

The following code example shows how to use list-detector-model-versions.

**AWS CLI**

**To get information about versions of a detector model**

The following list-detector-model-versions example Lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```bash
aws iotevents list-detector-model-versions \
   --detector-model-name motorDetectorModel
```

**Output:**

```json
{
   "detectorModelVersionSummaries": [
      {
         "status": "ACTIVE",
         "lastUpdateTime": 1560796816.077,
         "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
         "creationTime": 1560796816.077,
         "detectorModelName": "motorDetectorModel",
         "detectorModelVersion": "1"
      }
   ]
}
```

For more information, see ListDetectorModelVersions in the AWS IoT Events API Reference.

- For API details, see ListDetectorModelVersions in AWS CLI Command Reference.

list-detector-models

The following code example shows how to use list-detector-models.
AWS CLI

To get a list of your detector models

The following `list-detector-models` example lists the detector models you have created. Only the metadata associated with each detector model is returned.

```
aws iotevents list-detector-models
```

Output:

```
{
  "detectorModelSummaries": [
    {
      "detectorModelName": "motorDetectorModel",
      "creationTime": 1552072424.212,
      "detectorModelDescription": "Detect overpressure in a motor."
    }
  ]
}
```

For more information, see `ListDetectorModels` in the *AWS IoT Events API Reference*. For API details, see `ListDetectorModels` in *AWS CLI Command Reference*.

**list-detectors**

The following code example shows how to use `list-detectors`.

**AWS CLI**

To get a list of detectors for a detector model

The following `list-detectors` example lists the detectors (the instances of a detector model) in your account.

```
aws iotevents-data list-detectors \
    --detector-model-name motorDetectorModel
```

Output:

```
{
```
```
"detectorSummaries": [ 
  {
    "lastUpdateTime": 1558129925.2,
    "creationTime": 1552073155.527,
    "state": {
      "stateName": "Normal"
    },
    "keyValue": "Fulton-A32",
    "detectorModelName": "motorDetectorModel",
    "detectorModelVersion": "1"
  }
]

For more information, see ListDetectors in the AWS IoT Events API Reference.

- For API details, see ListDetectors in AWS CLI Command Reference.

### list-inputs

The following code example shows how to use list-inputs.

**AWS CLI**

#### To list inputs

The following list-inputs example lists the inputs you have created in your account.

```bash
aws iotevents list-inputs
```

This command produces no output. Output:

```
{
  {
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1551742986.768,
    "creationTime": 1551742986.768,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
  }
}
```
For more information, see ListInputs in the AWS IoT Events API Reference.

- For API details, see ListInputs in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list tags assigned to a resource.

The following `list-tags-for-resource` example lists the tag key names and values you have assigned to the resource.

```
aws iotevents list-tags-for-resource \
  --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```
{
   "tags": [
     {
       "value": "motor",
       "key": "deviceType"
     }
   ]
}
```

For more information, see ListTagsForResource in the AWS IoT Events API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**put-logging-options**

The following code example shows how to use put-logging-options.

**AWS CLI**

To set logging options

The following `put-logging-options` example sets or updates the AWS IoT Events logging options. If you update the value of any loggingOptions` field, it can take up to
one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the `roleArn` field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```
aws iotevents put-logging-options \
   --cli-input-json file://logging-options.json
```

Contents of `logging-options.json`:

```json
{
   "loggingOptions": {
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
      "level": "DEBUG",
      "enabled": true,
      "detectorDebugOptions": [
         {
            "detectorModelName": "motorDetectorModel",
            "keyValue": "Fulton-A32"
         }
      ]
   }
}
```

This command produces no output.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add tags to a resource**

The following `tag-resource` example adds or modifies (if key `deviceType` already exists) the tag attached the specified resource.

```
aws iotevents tag-resource \
   --cli-input-json file://pressureInput.tag.json
```
Contents of `pressureInput.tag.json`:

```json
{
   "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
   "tags": [
      {
         "key": "deviceType",
         "value": "motor"
      }
   ]
}
```

This command produces no output.

For more information, see [TagResource](https://docs.aws.amazon.com/iot/events/latest/APIReference/API_TagResource.html) in the *AWS IoT Events API Reference*.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/iotevents/tag-resource.html) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

*To remove tags from a resource*

The following `untag-resource` example removes the tag with the specified key name from the specified resource.

```bash
aws iotevents untag-resource \
   --resource-arn arn:aws:iotevents:us-west-2:123456789012:input/PressureInput \
   --tagkeys deviceType
```

This command produces no output.

For more information, see [UntagResource](https://docs.aws.amazon.com/iot/events/latest/APIReference/API_UntagResource.html) in the *AWS IoT Events API Reference*.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/iotevents/untag-resource.html) in *AWS CLI Command Reference*.

**update-detector-model**

The following code example shows how to use `update-detector-model`.

Actions and scenarios
AWS CLI

To update a detector model

The following `update-detector-model` example updates the specified detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \
   --cli-input-json file://motorDetectorModel.update.json
```

Contents of `motorDetectorModel.update.json`:

```json
{
   "detectorModelName": "motorDetectorModel",
   "detectorModelDefinition": {
      "states": [
      {
         "stateName": "Normal",
         "onEnter": {
            "events": [
            {
               "eventName": "init",
               "condition": "true",
               "actions": [
               {
                  "setVariable": {
                     "variableName": "pressureThresholdBreached",
                     "value": "0"
                  }
               }
            }
            ]
         }
      },
      "onInput": {
      "transitionEvents": [
      {
         "eventName": "Overpressurized",
         "condition": "${input.PressureInput.sensorData.pressure > 70}",
         "actions": [
         {
```

Actions and scenarios
"setVariable": {
  "variableName": "pressureThresholdBreached",
  "value": "$variable.pressureThresholdBreached + 3"
}
],
"nextState": "Dangerous"
}]
,
{
  "stateName": "Dangerous",
  "onEnter": {
    "events": [
      {
        "eventName": "Pressure Threshold Breached",
        "condition": "$variable.pressureThresholdBreached > 1",
        "actions": [
          {
            "sns": {
              "targetArn": "arn:aws:sns:us-east-1:123456789012:underPressureAction"
            }
          }
        ]
      }
    ]
  }
},
"onInput": {
  "events": [
    {

         }
      }
   ]
} ]
},
"initialStateName": "Normal"
Output:

```
{
   "detectorModelConfiguration": {
      "status": "ACTIVATING",
      "lastUpdateTime": 1560799387.719,
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
      "creationTime": 1560799387.719,
      "key": "motorid",
      "detectorModelName": "motorDetectorModel",
      "detectorModelVersion": "2"
   }
}
```

For more information, see [UpdateDetectorModel](https://docs.aws.amazon.com/iot-events/latest/developerguide/iot-events-api-update-detection-model.html) in the *AWS IoT Events API Reference*.

- For API details, see [UpdateDetectorModel](https://docs.aws.amazon.com/cli/latest/reference/iotevents/update-detection-model.html) in *AWS CLI Command Reference*.

**update-input**

The following code example shows how to use `update-input`.

**AWS CLI**

**To update an input**

The following `update-input` example updates the specified input with a new description and definition.

```
aws iotevents update-input \
   --cli-input-json file://pressureInput.json
```

**Contents of** `pressureInput.json`:

```
{
   "inputName": "PressureInput",
   "description": "Pressure Input",
   "definition": "This input represents a pressure sensor."
}
```
"inputDescription": "Pressure readings from a motor",
"inputDefinition": {
  "attributes": [
    { "jsonPath": "sensorData.pressure" },
    { "jsonPath": "motorid" }
  ]
}
}

Output:

{
  "inputConfiguration": {
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1560795976.458,
    "creationTime": 1560795312.542,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
  }
}

For more information, see [UpdateInput](#) in the AWS IoT Events API Reference.

- For API details, see [UpdateInput](#) in AWS CLI Command Reference.

AWS IoT Events-Data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events-Data.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
• **Actions**

**Actions**

**batch-put-message**

The following code example shows how to use `batch-put-message`.

**AWS CLI**

**To send messages (inputs) to AWS IoT Events**

The following `batch-put-message` example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify (`inputName`) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \
  --cli-binary-format raw-in-base64-out \
  --cli-input-json file://highPressureMessage.json
```

**Contents of highPressureMessage.json:**

```
{
    "messages": [
        {
            "messageId": "00001",
            "inputName": "PressureInput",
            "payload": "{"motorid": "Fulton-A32", "sensorData": {"pressure": 80, "temperature": 39} }"
        }
    ]
}
```

**Output:**

```
{
    "BatchPutMessageErrorEntries": []
}
```
For more information, see `BatchPutMessage` in the *AWS IoT Events Developer Guide*.

- For API details, see `BatchPutMessage` in *AWS CLI Command Reference*.

**batch-update-detector**

The following code example shows how to use batch-update-detector.

**AWS CLI**

**To update a detector (instance)**

The following batch-update-detector example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```
aws iotevents-data batch-update-detector \
--cli-input-json file://budFulton-A32.json
```

Contents of `budFulton-A32.json`:

```json
{
   "detectors": [
      {
         "messageId": "00001",
         "detectorModelName": "motorDetectorModel",
         "keyValue": "Fulton-A32",
         "state": {
            "stateName": "Normal",
            "variables": [
               {
                  "name": "pressureThresholdBreached",
                  "value": "0"
               }
            ],
            "timers": [
            ]
         }
      }
   ]
}
```

Output:
For more information, see `BatchUpdateDetector` in the *AWS IoT Events Developer Guide*.

- For API details, see `BatchUpdateDetector` in *AWS CLI Command Reference*.

### create-detector-model

The following code example shows how to use `create-detector-model`.

**AWS CLI**

**To create a detector model**

The following `create-detector-model` example creates a detector model.

```bash
aws iotevents create-detector-model \
   --cli-input-json file://motorDetectorModel.json
```

Contents of `motorDetectorModel.json`:

```json
{
   "detectorModelName": "motorDetectorModel",
   "detectorModelDefinition": {
      "states": [
         {
            "stateName": "Normal",
            "onEnter": {
               "events": [
                  {
                     "eventName": "init",
                     "condition": "true",
                     "actions": [
                        {
                           "setVariable": {
                              "variableName": "pressureThresholdBreached",
                              "value": "0"
                           }
                        }
                     ]
                  }
               ]
            }
         }
      ]
   }
}
```
"transitionEvents": [
  {
    "eventName": "Overpressurized",
    "condition": "$input.PressureInput.sensorData.pressure &gt; 70",
    "actions": [
      {
        "setVariable": {
          "variableName": "pressureThresholdBreached",
          "value": "$variable.pressureThresholdBreached + 3"
        }
      }
    ],
    "nextState": "Dangerous"
  }
],
"onInput": {
  "events": [
    {
      "eventName": "Pressure Threshold Breached",
      "condition": "$variable.pressureThresholdBreached &gt; 1",
      "actions": [
        {
          "sns": {
            "targetArn": "arn:aws:sns:us-east-1:123456789012:underPressureAction"
          }
        }
      ]
    }
  ]
}
"eventName": "Overpressurized",
"condition": "$input.PressureInput.sensorData.pressure &gt; 70",
"actions": [
    {
        "setVariable": {
            "variableName": "pressureThresholdBreached",
            "value": "3"
        }
    }
],

"eventName": "Pressure Okay",
"condition": "$input.PressureInput.sensorData.pressure &lt;= 70",
"actions": [
    {
        "setVariable": {
            "variableName": "pressureThresholdBreached",
            "value": "$variable.pressureThresholdBreached - 1"
        }
    }
],

"transitionEvents": [
    {
        "eventName": "BackToNormal",
        "condition": "$input.PressureInput.sensorData.pressure &lt;= 70 &amp;&amp; $variable.pressureThresholdBreached &lt;= 1",
        "nextState": "Normal"
    }
],

"onExit": {
    "events": [
        {
            "eventName": "Normal Pressure Restored",
            "condition": "true",
            "actions": [
                {
                    "sns": {
                        "..." // Further actions
                    }
                }
            ]
        }
    ]
}
For more information, see `CreateDetectorModel` in the *AWS IoT Events Developer Guide*.

- For API details, see `CreateDetectorModel` in *AWS CLI Command Reference.*

**create-input**

The following code example shows how to use `create-input`.

**AWS CLI**

To create an input
The following create-input example creates an input.

```bash
code
aws iotevents create-input \
   --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```json
{
   "inputName": "PressureInput",
   "inputDescription": "Pressure readings from a motor",
   "inputDefinition": {
      "attributes": [
         { "jsonPath": "sensorData.pressure" },
         { "jsonPath": "motorid" }
      ]
   }
}
```

Output:

```json
{
   "inputConfiguration": {
      "status": "ACTIVE",
      "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
      "lastUpdateTime": 1560795312.542,
      "creationTime": 1560795312.542,
      "inputName": "PressureInput",
      "inputDescription": "Pressure readings from a motor"
   }
}
```

For more information, see `CreateInput` in the *AWS IoT Events Developer Guide*.

- For API details, see `CreateInput` in *AWS CLI Command Reference*.

---

**delete-detector-model**

The following code example shows how to use delete-detector-model.

**AWS CLI**

To delete a detector model
The following `delete-detector-model` example deletes a detector model. Any active instances of the detector model are also deleted.

```bash
aws iotevents delete-detector-model \
   --detector-model-name motorDetectorModel
```

This command produces no output.

For more information, see `DeleteDetectorModel` in the *AWS IoT Events Developer Guide*.

- For API details, see `DeleteDetectorModel` in *AWS CLI Command Reference*.

### delete-input

The following code example shows how to use `delete-input`.

**AWS CLI**

**To delete an input**

The following `delete-input` example deletes an input.

```bash
aws iotevents delete-input \
   --input-name PressureInput
```

This command produces no output.

For more information, see `DeleteInput` in the *AWS IoT Events Developer Guide*.

- For API details, see `DeleteInput` in *AWS CLI Command Reference*.

### describe-detector-model

The following code example shows how to use `describe-detector-model`.

**AWS CLI**

**To get information about a detector model**

The following `describe-detector-model` example describes a detector model. If the `version` parameter is not specified, the command returns information about the latest version.
aws iotevents describe-detector-model \
  --detector-model-name motorDetectorModel

Output:

```json
{
  "detectorModel": {
    "detectorModelConfiguration": {
      "status": "ACTIVE",
      "lastUpdateTime": 1560796816.077,
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
      "creationTime": 1560796816.077,
      "key": "motorid",
      "detectorModelName": "motorDetectorModel",
      "detectorModelVersion": "1"
    },
    "detectorModelDefinition": {
      "states": [
        {
          "onInput": {
            "transitionEvents": [
              {
                "eventName": "Overpressurized",
                "actions": [
                  {
                    "setVariable": {
                      "variableName": "$variable.pressureThresholdBreached",
                      "value": "$variable.pressureThresholdBreached + 3"
                    }
                  }
                ],
                "condition": "$input.PressureInput.sensorData.pressure > 70",
                "nextState": "Dangerous"
              }
            ]
          }
        },
        "events": []
      ],
      "stateName": "Normal",
      "key": "motorid",
      "detectorModelName": "motorDetectorModel",
      "detectorModelVersion": "1"
    }
  }
}```
"onEnter": {
    "events": [
        {
            "eventName": "init",
            "actions": [
                {
                    "setVariable": {
                        "variableName": "pressureThresholdBreached",
                        "value": "0"
                    }
                }
            ],
            "condition": "true"
        }
    ],
    "onExit": {
        "events": []
    }
}

```
],
"condition": "$input.PressureInput.sensorData.pressure > 70"
},
{
    "eventName": "Pressure Okay",
    "actions": [
        {
            "setVariable": {
                "variableName": "pressureThresholdBreached",
                "value": "$variable.pressureThresholdBreached - 1"
            }
        }
    ],
    "condition": "$input.PressureInput.sensorData.pressure <= 70"
}
],
"stateName": "Dangerous",
"onEnter": {
    "events": [
        {
            "eventName": "Pressure Threshold Breached",
            "actions": [
                {
                    "sns": {
                        "targetArn": "arn:aws:sns:us-east-1:123456789012:underPressureAction"
                    }
                }
            ],
            "condition": "$variable.pressureThresholdBreached > 1"
        }
    ]
},
"onExit": {
    "events": [
        {
            "eventName": "Normal Pressure Restored",
            "actions": [
                
```
The following code example shows how to use describe-detector.

**AWS CLI**

**To get information about a detector (instance)**

The following describe-detector example returns information about the specified detector (instance).

```bash
aws iotevents-data describe-detector \
  --detector-model-name motorDetectorModel \
  --key-value "Fulton-A32"
```

**Output:**

```json
{
  "detector": {
    "lastUpdateTime": 1560797852.776,
    "creationTime": 1560797852.775,
    "targetArn": "arn:aws:sns:us-east-1:123456789012:pressureClearedAction",
    "condition": "true",
    "initialStateName": "Normal"
  }
}
```

For more information, see [DescribeDetectorModel](#) in the *AWS IoT Events Developer Guide*.

- For API details, see [DescribeDetectorModel](#) in *AWS CLI Command Reference*. 

- **describe-detector**

- **AWS CLI**

- **To get information about a detector (instance)**

- The following describe-detector example returns information about the specified detector (instance).

```bash
aws iotevents-data describe-detector \
  --detector-model-name motorDetectorModel \
  --key-value "Fulton-A32"
```

**Output:**

```json
{
  "detector": {
    "lastUpdateTime": 1560797852.776,
    "creationTime": 1560797852.775,
    "targetArn": "arn:aws:sns:us-east-1:123456789012:pressureClearedAction",
    "condition": "true",
    "initialStateName": "Normal"
  }
}
```
describe-input

The following code example shows how to use describe-input.

AWS CLI

**To get information about an input**

The following describe-input example retrieves the details of an input.

```bash
aws iotevents describe-input \
   --input-name PressureInput
```

Output:

```json
{
   "input": {
      "inputConfiguration": {
         "status": "ACTIVE",
         "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
         "lastUpdateTime": 1560795312.542,
         "creationTime": 1560795312.542,
   
```

For more information, see [DescribeDetector](#) in the *AWS IoT Events Developer Guide*.

- For API details, see [DescribeDetector](#) in *AWS CLI Command Reference*.

```json
"state": {
   "variables": [
      {
         "name": "pressureThresholdBreached",
         "value": "3"
      }
   ],
   "stateName": "Dangerous",
   "timers": []
},

"keyValue": "Fulton-A32",
"detectorModelName": "motorDetectorModel",
"detectorModelVersion": "1"
}
```
"inputName": "PressureInput",
  "inputDescription": "Pressure readings from a motor"
},
"inputDefinition": {
  "attributes": [
    {
      "jsonPath": "sensorData.pressure"
    },
    {
      "jsonPath": "motorid"
    }
  ]
}
}
}

For more information, see DescribeInput in the AWS IoT Events Developer Guide*. For API details, see DescribeInput in AWS CLI Command Reference.

describe-logging-options

The following code example shows how to use describe-logging-options.

AWS CLI

To get information about logging settings

The following describe-logging-options example retrieves the current AWS IoT Events logging options.

aws iotevents describe-logging-options

Output:

{
  "loggingOptions": {
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
    "enabled": false,
    "level": "ERROR"
  }
}
For more information, see DescribeLoggingOptions in the AWS IoT Events Developer Guide*. 

- For API details, see DescribeLoggingOptions in AWS CLI Command Reference.

**list-detector-model-versions**

The following code example shows how to use list-detector-model-versions.

**AWS CLI**

To get information about versions of a detector model

The following list-detector-model-versions example lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```bash
aws iotevents list-detector-model-versions \
   --detector-model-name motorDetectorModel
```

Output:

```
{
   "detectorModelVersionSummaries": [
     {
       "status": "ACTIVE",
       "lastUpdateTime": 1560796816.077,
       "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
       "creationTime": 1560796816.077,
       "detectorModelName": "motorDetectorModel",
       "detectorModelVersion": "1"
     }
   ]
}
```

For more information, see ListDetectorModelVersions in the AWS IoT Events Developer Guide*. 

- For API details, see ListDetectorModelVersions in AWS CLI Command Reference.

**list-detector-models**

The following code example shows how to use list-detector-models.
AWS CLI

To get a list of your detector models

The following list-detector-models example lists the detector models you have created. Only the metadata associated with each detector model is returned.

```bash
aws iotevents list-detector-models
```

Output:

```json
{
    "detectorModelSummaries": [
        {
            "detectorModelName": "motorDetectorModel",
            "creationTime": 1552072424.212,
            "detectorModelDescription": "Detect overpressure in a motor."
        }
    ]
}
```

For more information, see `ListDetectorModels` in the *AWS IoT Events Developer Guide*.  
- For API details, see `ListDetectorModels` in *AWS CLI Command Reference*.

list-detectors

The following code example shows how to use list-detectors.

AWS CLI

To get a list of detectors for a detector model

The following list-detectors example lists detectors (the instances of a detector model).

```bash
aws iotevents-data list-detectors \
    --detector-model-name motorDetectorModel
```

Output:

```json
{
    "detectorSummaries": [ 
```
For more information, see ListDetectors in the AWS IoT Events Developer Guide.

- For API details, see ListDetectors in AWS CLI Command Reference.

**list-inputs**

The following code example shows how to use list-inputs.

**AWS CLI**

**To list inputs**

The following list-inputs example lists the inputs that you've created.

```
aws iotevents list-inputs
```

**Output:**

```
{
  "status": "ACTIVE",
  "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
  "lastUpdateTime": 1551742986.768,
  "creationTime": 1551742986.768,
  "inputName": "PressureInput",
  "inputDescription": "Pressure readings from a motor"
}
```

For more information, see ListInputs in the AWS IoT Events Developer Guide.

- For API details, see ListInputs in AWS CLI Command Reference.
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags assigned to a resource

The following list-tags-for-resource example lists the tags (metadata) you have assigned to the resource.

```bash
aws iotevents list-tags-for-resource \
   --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```json
{
   "tags": [
   {
       "value": "motor",
       "key": "deviceType"
   }
   ]
}
```

For more information, see ListTagsForResource in the AWS IoT Events Developer Guide*. For API details, see ListTagsForResource in AWS CLI Command Reference.

put-logging-options

The following code example shows how to use put-logging-options.

AWS CLI

To set logging options

The following list-tags-for-resource example sets or updates the AWS IoT Events logging options. If you update the value of any loggingOptions field, it takes up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the roleArn field (for example, to correct an invalid policy) it takes up to five minutes for that change to take effect.
aws iotevents put-logging-options \
  --cli-input-json file://logging-options.json

Contents of logging-options.json:

```json
{
  "loggingOptions": {
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
    "level": "DEBUG",
    "enabled": true,
    "detectorDebugOptions": [
      {
        "detectorModelName": "motorDetectorModel",
        "keyValue": "Fulton-A32"
      }
    ]
  }
}
```

This command produces no output.

For more information, see PutLoggingOptions in the AWS IoT Events Developer Guide*.
- For API details, see PutLoggingOptions in AWS CLI Command Reference.

### tag-resource

The following code example shows how to use tag-resource.

**AWS CLI**

**To add tags to a resource**

The following tag-resource example adds to or modifies the tags of the given resource. Tags are metadata that can be used to manage a resource.

```bash
aws iotevents tag-resource \
  --cli-input-json file://pressureInput.tag.json
```

Contents of pressureInput.tag.json:

```json
{
}
```
This command produces no output.

For more information, see `TagResource` in the *AWS IoT Events Developer Guide*.

- For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove tags from a resource**

The following untag-resource example removes the specified tags from the resource.

```bash
aws iotevents untag-resource \
   --cli-input-json file://pressureInput.untag.json
```

Contents of `pressureInput.untag.json`:

```json
{
   "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
   "tags": [
      {
         "key": "deviceType",
         "value": "motor"
      }
   ]
}
```

This command produces no output.

For more information, see `UntagResource` in the *AWS IoT Events Developer Guide*.

- For API details, see `UntagResource` in *AWS CLI Command Reference*.
**update-detector-model**

The following code example shows how to use `update-detector-model`.

**AWS CLI**

**To update a detector model**

The following `update-detector-model` example updates a detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```bash
aws iotevents update-detector-model --cli-input-json file://motorDetectorModel.update.json
```

Contents of `motorDetectorModel.update.json`:

```json
{
  "detectorModelName": "motorDetectorModel",
  "detectorModelDefinition": {
    "states": [
      {
        "stateName": "Normal",
        "onEnter": {
          "events": [
            {
              "eventName": "init",
              "condition": "true",
              "actions": [
                {
                  "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "0"
                  }
                }
              ]
            }
          ]
        }
      },
      "onInput": {
        "transitionEvents": [
          {
            "eventName": "Overpressurized",
          }
        ]
      }
    ]
  }
}
```
"condition": "input.PressureInput.sensorData.pressure > 70",
"actions": [
{
  "setVariable": {
    "variableName": "pressureThresholdBreached",
    "value": "variable.pressureThresholdBreached + 3"
  }
},
"nextState": "Dangerous"
}
],
"stateName": "Dangerous",
"onEnter": {
  "events": [
    {
      "eventName": "Pressure Threshold Breached",
      "condition": "variable.pressureThresholdBreached > 1",
      "actions": [
        {
          "sns": {
            "targetArn": "arn:aws:sns:us-east-1:123456789012:underPressureAction"
          }
        }
      ]
    }
  ]
},
"onInput": {
  "events": [
    {
      "eventName": "Overpressurized",
      "condition": "input.PressureInput.sensorData.pressure > 70",
      "actions": [
        {
          "setVariable": {
            "variableName": "pressureThresholdBreached",
            "value": "3"
          }
        }
      ]
    }
  ]
}

{
  "eventName": "Pressure Okay",
  "condition": "\$input.PressureInput.sensorData.pressure <= 70",
  "actions": [
    {
      "setVariable": {
        "variableName": "pressureThresholdBreached",
        "value": "\$variable.pressureThresholdBreached - 1"
      }
    }
  ]
},

"transitionEvents": [
  {
    "eventName": "BackToNormal",
    "condition": "\$input.PressureInput.sensorData.pressure <= 70 && \$variable.pressureThresholdBreached <= 1",
    "nextState": "Normal"
  }
],

"onExit": {
  "events": [
    {
      "eventName": "Normal Pressure Restored",
      "condition": "true",
      "actions": [
        {
          "sns": {
            "targetArn": "arn:aws:sns:us-east-1:123456789012:pressureClearedAction"
          }
        }
      ]
    }
  ]
},

"initialStateName": "Normal"
"roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole"
}

Output:

{
    "detectorModelConfiguration": {
        "status": "ACTIVATING",
        "lastUpdateTime": 1560799387.719,
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "creationTime": 1560799387.719,
        "key": "motorid",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "2"
    }
}

For more information, see [UpdateDetectorModel](#) in the [AWS IoT Events Developer Guide](#).

- For API details, see [UpdateDetectorModel](#) in [AWS CLI Command Reference](#).

**update-input**

The following code example shows how to use update-input.

**AWS CLI**

**To update an input**

The following update-input example updates an input.

```
aws iotevents update-input \
    --cli-input-json file://pressureInput.json
```

Contents of pressureInput.json:

```json
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
```
"inputDefinition": {
    "attributes": [
        { "jsonPath": "sensorData.pressure" },
        { "jsonPath": "motorid" }
    ]
}

Output:

{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795976.458,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}

For more information, see [UpdateInput](https://docs.aws.amazon.com/iot/events/latest/developerguide/) in the *AWS IoT Events Developer Guide*.

- For API details, see [UpdateInput](https://docs.aws.amazon.com/cli/latest/reference/iotevents/update-input.html) in *AWS CLI Command Reference*.

**AWS IoT Greengrass examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
Actions

associate-role-to-group

The following code example shows how to use associate-role-to-group.

AWS CLI

To associate a role with a Greengrass group

The following associate-role-to-group example associates the specified IAM role with a Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services. For example, your group role might grant permissions required for CloudWatch Logs integration.

```bash
aws greengrass associate-role-to-group \
  --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b \
  --role-arn arn:aws:iam::123456789012:role/GG-Group-Role
```

Output:

```json
{
  "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see Configure the Group Role in the AWS IoT Greengrass Developer Guide.

For API details, see AssociateRoleToGroup in AWS CLI Command Reference.

associate-service-role-to-account

The following code example shows how to use associate-service-role-to-account.

AWS CLI

To associate a service role with your AWS account

The following associate-service-role-to-account example associates an IAM service role, specified by its ARN, with AWS IoT Greengrass in your AWS account. You must have
previously created the service role in IAM, and you must associate a policy document with it that allows AWS IoT Greengrass to assume this role.

/aws greengrass associate-service-role-to-account \
   --role-arn "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"

Output:

```
{
   "AssociatedAt": "2019-06-25T18:12:45Z"
}
```

For more information, see Greengrass Service Role in the AWS IoT Greengrass Developer Guide.
- For API details, see AssociateServiceRoleToAccount in AWS CLI Command Reference.

create-connector-definition-version

The following code example shows how to use create-connector-definition-version.

AWS CLI

**To create a connector definition version**

The following create-connector-definition-version example creates a connector definition version and associates it with the specified connector definition. All connectors in a version define values for their parameters.

/aws greengrass create-connector-definition-version \
   --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \

Output:

```
{
```

Actions and scenarios

For API details, see CreateConnectorDefinitionVersion in AWS CLI Command Reference.

**create-connector-definition**

The following code example shows how to use create-connector-definition.

**AWS CLI**

**To create a connector definition**

The following create-connector-definition example example creates a connector definition and an initial connector definition version. The initial version contains one connector. All connectors in a version define values for their parameters.

```bash
aws greengrass create-connector-definition \
   --name MySNSConnector \
```

**Output:**

```
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
   "CreationTimestamp": "2019-06-19T19:30:01.300Z",
   "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
   "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
   "LatestVersion": "63c57963-c7c2-4a26-a7e2-7bf478ea2623",
   "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
   "Name": "MySNSConnector"
}
```
For more information, see Getting Started with Greengrass Connectors (CLI) in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateConnectorDefinition in AWS CLI Command Reference.

create-core-definition-version

The following code example shows how to use create-core-definition-version.

AWS CLI

To create a core definition version

The following create-core-definition-version example creates a core definition version and associates it with the specified core definition. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following iot commands, which return the ThingArn and CertificateArn required for the create-core-definition-version command.

Create the AWS IoT thing that corresponds to the core device:

```bash
aws iot create-thing \
  --thing-name "MyCoreDevice"
```

Output:

```json
{
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
  "thingName": "MyCoreDevice",
  "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the create-keys-and-certificate command and requires write permissions to the current directory. Alternatively, you can use the create-certificate-from-csr command.

```bash
aws iot create-keys-and-certificate \
  --set-as-active \
  --certificate-pem-outfile "myCore.cert.pem"
```
AWS Command Line Interface

--public-key-outfile "myCore.public.key" \
--private-key-outfile "myCore.private.key"

Output:

```
{
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
  "certificatePem": "-----BEGIN CERTIFICATE-----
MIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS
-----END CERTIFICATE-----",
  "keyPair": {
    "PublicKey": "-----BEGIN PUBLIC KEY-----
MIIBIjANBzrqhkiG9w0BAQEFAOAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB
-----END PUBLIC KEY-----",
    "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
MIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4zMCxDr...fvY4+te
-----END RSA PRIVATE KEY-----",
  },
  "certificateId": "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```

Create an AWS IoT policy that allows iot and greengrass actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
  --policy-name "Core_Devices" \
"
```

Output:

```
{
  "policyName": "Core_Devices",
```
Attach the policy to the certificate:

```bash
aws iot attach-policy \
--policy-name "Core_Devices" \
--target "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```bash
aws iot attach-thing-principal \
--thing-name "MyCoreDevice" \
--principal "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition version:

```bash
aws greengrass create-core-definition-version \
--core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" \
--cores "[{"Id":"MyCoreDevice","ThingArn":"arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice","CertificateArn":"arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz","SyncShadow":true}]"
```

Output:

```json
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12 versions/3fcd1190-2ce5-44de-b98b-eec8f9571014",
    "Version": "3fcd1190-2ce5-44de-b98b-eec8f9571014",
    "CreationTimestamp": "2019-09-18T00:15:09.838Z",
}
```
For more information, see [Configure the AWS IoT Greengrass Core](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/configure-greengrass-core.html) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateCoreDefinitionVersion](https://docs.aws.amazon.com/cli/latest/reference/greengrass/create-core-definition-version.html) in *AWS CLI Command Reference*.

### create-core-definition

The following code example shows how to use `create-core-definition`.

**AWS CLI**

**Example 1: To create an empty core definition**

The following `create-core-definition` example creates an empty (no initial version) Greengrass core definition. Before the core is usable, you must use the `create-core-definition-version` command to provide the other parameters for the core.

```bash
aws greengrass create-core-definition \
    --name cliGroup_Core
```

**Output:**

```json
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/\n7b5c08008-54cb-44bd-9eeb-c121b04283b5",
    "Id": "b5c08008-54cb-44bd-9eeb-c121b04283b5",
    "Name": "cliGroup_Core"
}
```

**Example 2: To create a core definition with an initial version**

The following `create-core-definition` example creates a core definition that contains an initial core definition version. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition` command.

```bash
aws iot thing-provisioning create-thing-definition \
    --thing-definition-name my-thing-definition \
    --thing-definition-body file://thing-definition.json
```

**Output:**

```json
{
    "Id": "my-thing-definition",
    "LastUpdatedDate": "2019-06-25T18:23:22.106Z",
    "ThingDefinitionState": "ACTIVE",
    "DefinitionVersion": 1,
    "DefinitionContent": "{"ThingDescription": {"(thingDefinitionId"},
```

**Example 3: To create a core definition with an initial version and a specific version number**

The following `create-core-definition` example creates a core definition that contains an initial core definition version with a specific version number. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition` command.

```bash
aws iot thing-provisioning create-thing-definition \
    --thing-definition-name my-thing-definition \
    --thing-definition-body file://thing-definition.json

aws greengrass create-core-definition \
    --thing-definition-name my-thing-definition \
    --thing-definition-body file://thing-definition.json
    --thing-definition-version-name my-thing-definition-v1
    --thing-definition-version-body file://thing-definition-v1.json
```

**Output:**

```json
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/\n7b5c08008-54cb-44bd-9eeb-c121b04283b5",
    "Id": "b5c08008-54cb-44bd-9eeb-c121b04283b5",
    "Name": "cliGroup_Core"
}
```

**Example 4: To create a core definition with an initial version and a specific version number and a custom name**

The following `create-core-definition` example creates a core definition that contains an initial core definition version with a specific version number and a custom name. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition` command.

```bash
aws iot thing-provisioning create-thing-definition \
    --thing-definition-name my-thing-definition \
    --thing-definition-body file://thing-definition.json

aws greengrass create-core-definition \
    --thing-definition-name my-thing-definition \
    --thing-definition-body file://thing-definition.json
    --thing-definition-version-name my-thing-definition-v1
    --thing-definition-version-body file://thing-definition-v1.json
```

**Output:**

```json
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/\n7b5c08008-54cb-44bd-9eeb-c121b04283b5",
    "Id": "b5c08008-54cb-44bd-9eeb-c121b04283b5",
    "Name": "cliGroup_Core"
}
```
Create the AWS IoT thing that corresponds to the core device:

```bash
aws iot create-thing \
   --thing-name "MyCoreDevice"
```

Output:

```json
{
   "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
   "thingName": "MyCoreDevice",
   "thingId": "cb419a19-9099-4515-9ce-c9-b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```bash
aws iot create-keys-and-certificate \
   --set-as-active \
   --certificate-pem-outfile "myCore.cert.pem" \
   --public-key-outfile "myCore.public.key" \
   --private-key-outfile "myCore.private.key"
```

Output:

```json
{
   "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
   "certificatePem": "-----BEGIN CERTIFICATE-----
MIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIRndgQEFW+gwDQYJKoZIhvc...KdGewQS
-----END CERTIFICATE-----",
   "keyPair": {
      "PublicKey": "-----BEGIN PUBLIC KEY-----
MIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB
-----END PUBLIC KEY-----",
      "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
MIIEowIBAKCAQEAgKpRgnn6yq26U3yt5YFZquyukfRjbMxDCtNOK4zMCxDR...fY+y4+te
-----END RSA PRIVATE KEY-----"
   },
   "certificateId": "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```
Create an AWS IoT policy that allows iot and greengrass actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```bash
aws iot create-policy \\
  --policy-name "Core_Devices" \\
```

Output:

```json
{
  "policyName": "Core_Devices",
  "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```bash
aws iot attach-policy \\
  --policy-name "Core_Devices" \\
  --target "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```bash
aws iot attach-thing-principal \\
  --thing-name "MyCoreDevice"
```
This command produces no output.

Create the core definition:

```bash
aws greengrass create-core-definition
   --name "MyCores"
   --initial-version "{"Cores": [{"Id":"MyCoreDevice","ThingArn":"arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice","CertificateArn":"arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz","SyncShadow":true}]
```

Output:

```
{
   "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/cc87b5b3-8f4b-465d-944c-1d6de5dbfcdcb",
   "Name": "MyCores",
   "LastUpdatedTimestamp": "2019-09-18T00:11:06.197Z",
   "LatestVersion": "cc87b5b3-8f4b-465d-944c-1d6de5dbfcdcb",
   "CreationTimestamp": "2019-09-18T00:11:06.197Z",
   "Id": "582efe12-b05a-409e-9a24-a2ba1bcc4a12",
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12"
}
```

For more information, see [Configure the AWS IoT Greengrass Core](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/configure-greengrass-core.html) in the *AWS IoT Greengrass Developer Guide*.  
- For API details, see [CreateCoreDefinition](https://docs.aws.amazon.com/cli/latest/reference/greengrass/create-core-definition.html) in *AWS CLI Command Reference*.  

**create-deployment**

The following code example shows how to use `create-deployment`.

**AWS CLI**

To create a deployment for a version of a Greengrass group
The following create-deployment example deploys the specified version of a Greengrass group.

```bash
aws greengrass create-deployment \
   --deployment-type NewDeployment \ 
   --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \ 
   --group-version-id "dc40c1e9-e8c8-4d28-a84d-a9cad5f599c9"
```

Output:

```json
{
   "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/deployments/bfceb608-4e97-45bc-af5c-460144270308",
   "DeploymentId": "bfceb608-4e97-45bc-af5c-460144270308"
}
```

For more information, see [Getting Started with Connectors (CLI)](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/getting-started-connectors-cli.html) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateDeployment](https://docs.aws.amazon.com/cli/latest/reference/greengrass/create-deployment.html) in *AWS CLI Command Reference*.

### create-device-definition-version

The following code example shows how to use create-device-definition-version.

**AWS CLI**

**To create a device definition version**

The following create-device-definition-version example creates a device definition version and associates it with the specified device definition. The version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following *iot* commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```bash
aws iot create-thing \ 
   --thing-name "InteriorTherm"
```
Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```bash
aws iot create-keys-and-certificate \
  --set-as-active \
  --certificate-pem-outfile "myDevice.cert.pem" \
  --public-key-outfile "myDevice.public.key" \
  --private-key-outfile "myDevice.private.key"
```

Output:

```json
{
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
  "certificatePem": "-----BEGIN CERTIFICATE-----
MIIDWTCAkGgAwIBATgIUCqg6EGqou6ZFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS
-----END CERTIFICATE-----",
  "keyPair": {
    "PublicKey": "-----BEGIN PUBLIC KEY-----
MIIBIjANBzrqhkiG9w0BAQFAAAQ8AMIIBCgKCAQEAkPrgnn6yq26U3y...wIDAQAB
-----END PUBLIC KEY-----",
    "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
MIIEowIABAKCAQEAkPrgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4tMCxDR...fvY4+te
-----END RSA PRIVATE KEY-----",
  },
  "certificateId": "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```bash
aws iot create-policy \
```

Output:

```json
{
  "policyName": "IoT_and_Greengrass_Policy",
  "policyDocument": ""Action = "sts:AssumeRole"
  Effect = Allow
  Resource = "*"
  Action = "iot:InvokeCustomDataBearerPolicy"
  Effect = Allow
  Resource = "*"
  Action = "greengrass:GetResourcechure",
  Effect = Allow
  Resource = "*"
"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:
--policy-name "GG_Devices" \

Output:

```
{
    "policyName": "GG_Devices",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "GG_Devices" \
    --target "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate:

```
aws iot attach-thing-principal \
    --thing-name "InteriorTherm" \
    --principal "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the ThingArn and CertificateArn from the first two commands in the following example.

```
aws greengrass create-device-definition-version \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/versions/83c13984-6fed-447e-84d5-5b8aa45df5f71",
  "Version": "83c13984-6fed-447e-84d5-5b8aa45df5f71",
  "CreationTimestamp": "2019-09-11T00:15:09.838Z",
  "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

- For API details, see CreateDeviceDefinitionVersion in AWS CLI Command Reference.

create-device-definition

The following code example shows how to use create-device-definition.

AWS CLI

**To create a device definition**

The following create-device-definition example creates a device definition that contains an initial device definition version. The initial version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following iot commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```
aws iot create-thing
  --thing-name "InteriorTherm"
```

Output:
Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myDevice.cert.pem" \
    --public-key-outfile "myDevice.public.key" \
    --private-key-outfile "myDevice.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END CERTIFICATE-----
",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQFEAA0CAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4zMCxDR...fvY4+te\n
\n-----END PUBLIC KEY-----
",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4zMCxDR...fvY4+te

\n-----END RSA PRIVATE KEY-----
"
    },
    "certificateId": "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```
aws iot create-policy \
```

```
```
--policy-name "GG_Devices" \

Output:

```
{
   "policyName": "GG_Devices",
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
   --policy-name "GG_Devices" \
   --target "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate

```
aws iot attach-thing-principal \
   --thing-name "InteriorTherm" \
   --principal "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the ThingArn and CertificateArn from the first two commands in the following example.

```
aws greengrass create-device-definition \
```

Actions and scenarios
create-function-definition-version

The following code example shows how to use create-function-definition-version.

AWS CLI

To create a version of the function definition

The following create-function-definition-version example creates a new version of the specified function definition. This version specifies a single function whose ID is Hello-World-function, allows access to the file system, and specifies a maximum memory size and timeout period.

```bash
aws greengrass create-function-definition-version \
```
create-function-definition

The following code example shows how to use create-function-definition.

AWS CLI

To create a Lambda function definition

The following create-function-definition example creates a Lambda function definition and an initial version by providing a list of Lambda functions (in this case, a list of just one function named TempMonitorFunction) and their configurations. Before you can create the function definition, you need the Lambda function ARN. To create the function and its alias, use Lambda's create-function and publish-version commands. Lambda's create-function command requires the ARN of the execution role, even though AWS IoT Greengrass doesn't use that role because permissions are specified in the Greengrass group role. You can use the IAM create-role command to create an empty role to get an ARN to use with Lambda's create-function or you can use an existing execution role.

```
aws greengrass create-function-definition
```
```bash
--name MyGreengrassFunctions
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b",
    "CreationTimestamp": "2019-06-19T22:44:44.585Z",
    "Id": "3b0d0080-87e7-48c6-b182-503ec743a08b",
    "LastUpdatedTimestamp": "2019-06-19T22:24:44.585Z",
    "LatestVersion": "67f918b9-efb4-40b0-b87c-de8c9f085b",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/versions/67f918b9-efb4-40b0-b87c-de8c9f085b",
    "Name": "MyGreengrassFunctions"
}
```

- For API details, see [CreateFunctionDefinition](https://docs.aws.amazon.com/greengrass/latest/developerguide/api-create-function-definition.html) in [AWS CLI Command Reference](https://awscli.amazonaws.com/v2/documentation/api/1.18.20/greengrass.html).

---

**create-group-certificate-authority**

The following code example shows how to use `create-group-certificate-authority`.

**AWS CLI**

**To create a certificate authority (CA) for a group**

The following `create-group-certificate-authority` example creates or rotates a CA for the specified group.

```
aws greengrass create-group-certificate-authority \
    --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"
```

Output:
The following code example shows how to use create-group-version.

AWS CLI

To create a version of a Greengrass group

The following create-group-version example creates a group version and associates it with the specified group. The version references the core, resource, connector, function, and subscription versions that contain the entities to include in this group version. You must create these entities before you can create the group version.

To create a resource definition with an initial version, use the create-resource-definition command. To create a connector definition with an initial version, use the create-connector-definition command. To create a function definition with an initial version, use the create-function-definition command. To create a subscription definition with an initial version, use the create-subscription-definition command. To retrieve the ARN of the latest core definition version, use the get-group-version command and specify the ID of the latest group version.

```bash
aws greengrass create-group-version \
  --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
  --core-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/6a630442-8708-4838-ad36-eb98849d975e/versions/6c87151b-1fb4-4cb2-8b31-6ee715d8f8ba" \
  --resource-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/a5f94d0b-f6bc-40f4-bb78-7a1c5fe13bal" \
```

For more information, see AWS IoT Greengrass Security in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateGroupCertificateAuthority in AWS CLI Command Reference.
--connector-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/55d0052b-0d7d-44d6-b56f-21867215e118/versions/78a3331b-895d-489b-8823-17b4f9f418a0" \\
--function-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/versions/67f918b9-efb4-40b0-b87c-de8c9faf085b" \\
--subscription-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/aa645b47-ac90-420d-9091-8c74f4103f"

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/ce2e701-3240-4c24-b8e6-f6f6e7a9eeca/versions/e10b0459-4345-4a09-88a4-1af1f5d34638",
    "CreationTimestamp": "2019-06-20T18:42:47.020Z",
    "Id": "ce2e701-3240-4c24-b8e6-f6f6e7a9eeca",
    "Version": "e10b0459-4345-4a09-88a4-1af1f5d34638"
}
```

For more information, see Overview of the AWS IoT Greengrass Group Object Model in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateGroupVersion in AWS CLI Command Reference.

**create-group**

The following code example shows how to use create-group.

**AWS CLI**

To create a Greengrass group

The following create-group example creates a group named cli-created-group.

```
aws greengrass create-group \\
--name cli-created-group
```

Output:

```
{
```
For more information, see [Overview of the AWS IoT Greengrass Group Object Model](https://docs.aws.amazon.com/iot-greengrass/latest/developer-guide/overview-objects.html) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateGroup](https://docs.aws.amazon.com/cli/latest/reference/greengrass/create-group.html) in *AWS CLI Command Reference*.

### create-logger-definition-version

The following code example shows how to use `create-logger-definition-version`.

**AWS CLI**

**To create a logger definition version**

The following `create-logger-definition-version` example creates a logger definition version and associates it with a logger definition. The version defines four logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, 3) system component logs in Amazon CloudWatch Logs, and 4) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```bash
aws greengrass create-logger-definition-version \
  --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \
  --loggers "[{"Id":"1","Component":"GreengrassSystem"},{"Level":"ERROR","Space":10240,"Type":"FileSystem"},{"Id":"2","Component":"Lambda","Level":"INFO","Space":10240,"Type":"FileSystem"},{"Id":"3","Component":"GreengrassSystem","Level":"WARN","Type":"AWSCloudWatch"},{"Id":"4","Component":"Lambda","Level":"INFO","Type":"AWSCloudWatch"}]"
```

**Output:**

```bash
{
```
create-logger-definition

The following code example shows how to use create-logger-definition.

AWS CLI

To create a logger definition

The following create-logger-definition example creates a logger definition that contains an initial logger definition version. The initial version defines three logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, and 3) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```
aws greengrass create-logger-definition
    --name "LoggingConfigs"
    --initial-version 
        
        
        
        
        "Loggers": [{"Id":"1","Component":"GreengrassSystem","Level":"ERROR","Space":10240,"Type":"FileSystem"},{"Id":"2","Component":"Lambda","Level":"INFO","Space":10240,"Type":"FileSystem"},{"Id":"3","Component":"Lambda","Level":"INFO","Type":"AWSCloudWatch"}]

Output:

{
}
"Name": "LoggingConfigs",
"LastUpdatedTimestamp": "2019-07-23T23:52:17.165Z",
"LatestVersion": "de1d9854-1588-4525-b25e-b378f60f2322",
"Id": "a454b62a-5d56-4ca9-bdc4-8254e1662cb0",
"Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
}

For more information, see Monitoring with AWS IoT Greengrass Logs in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateLoggerDefinition in AWS CLI Command Reference.

create-resource-definition-version

The following code example shows how to use create-resource-definition-version.

AWS CLI

To create a version of a resource definition

The following create-resource-definition-version example creates a new version of a TwilioAuthToken.

```
aws greengrass create-resource-definition-version \
  --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/b3bcada0-5fb6-42df-bf0b-1ee4f15e769e",
  "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
  "Version": "b3bcada0-5fb6-42df-bf0b-1ee4f15e769e"
}
```
create-resource-definition

The following code example shows how to use create-resource-definition.

AWS CLI

To create a resource definition

The following create-resource-definition example creates a resource definition that contains a list of resources to be used in a Greengrass group. In this example, an initial version of the resource definition is included by providing a list of resources. The list includes one resource for a Twilio authorization token and the ARN for a secret stored in AWS Secrets Manager. You must create the secret before you can create the resource definition.

```
aws greengrass create-resource-definition \
  --name MyGreengrassResources \
  --initial-version "{\"Resources\": \"[\"Id\": \"TwilioAuthToken\", \"Name\": \"MyTwilioAuthToken\", \"ResourceDataContainer\": \"{"SecretsManagerSecretResourceData": \"{"ARN": \"arn:aws:secretsmanager:us-west-2:123456789012:secret:greengrass-TwilioAuthToken-ntS1p6\"}}\"]\")\"}
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
  "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
  "LatestVersion": "a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1",
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1",
  "Name": "MyGreengrassResources"
}
```

For more information, see How to Configure Local Resource Access Using the AWS Command Line Interface in the AWS IoT Greengrass Developer Guide.
create-software-update-job

The following code example shows how to use create-software-update-job.

AWS CLI

To create a software update job for a core

The following create-software-update-job example creates an over-the-air (OTA) update job to update the AWS IoT Greengrass Core software on the core whose name is MyFirstGroup_Core. This command requires an IAM role that allows access to software update packages in Amazon S3 and includes iot.amazonaws.com as a trusted entity.

```bash
aws greengrass create-software-update-job \
  --update-targets-architecture armv7l \
  --update-targets ["arn:aws:iot:us-west-2:123456789012:thing/MyFirstGroup_Core"] \
  --update-targets-operating-system raspbian \
  --software-to-update core \
  --s3-url-signer-role arn:aws:iam::123456789012:role/OTA_signer_role \
  --update-agent-log-level WARN
```

Output:

```
{
  "IotJobId": "GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
  "IotJobArn": "arn:aws:iot:us-west-2:123456789012:job/GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
  "PlatformSoftwareVersion": "1.9.3"
}
```

For more information, see OTA Updates of AWS IoT Greengrass Core Software in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateSoftwareUpdateJob in AWS CLI Command Reference.

create-subscription-definition-version

The following code example shows how to use create-subscription-definition-version.
AWS CLI

To create a new version of a subscription definition

The following create-subscription-definition-version example creates a new version of a subscription definition that contains three subscriptions: a trigger notification, a temperature input, and an output status.

```bash
aws greengrass create-subscription-definition-version \
   --subscription-definition-id "9d611d57-5d5d-44bd-a3b4-feccbdd69112" \
   --subscriptions "[{"Id": "TriggerNotification", "Source": \
   "arn:aws:greengrass:us-west-2::/connectors/TwilioNotifications/versions/1", "Subject": "twilio/message/status", "Target": \
   "cloud\"]]"
```

Output:

```json
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/7b65dfae-50b6-4d0f-b3e0-27728bfb0620",
   "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
   "Version": "7b65dfae-50b6-4d0f-b3e0-27728bfb0620"
}
```

• For API details, see CreateSubscriptionDefinitionVersion in AWS CLI Command Reference.

create-subscription-definition

The following code example shows how to use create-subscription-definition.

AWS CLI

To create a subscription definition

The following create-subscription-definition example creates a subscription definition and specifies its initial version. The initial version contains three subscriptions: one for the
MQTT topic to which the connector subscribes, one to allow a function to receive temperature readings from AWS IoT, and one to allow AWS IoT to receive status information from the connector. The example provides the ARN for the Lambda function alias that was created earlier by using Lambda's `create-alias` command.

```
aws greengrass create-subscription-definition \
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112",
  "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
  "LastUpdatedTimestamp": "2019-06-19T22:34:26.677Z",
  "LatestVersion": "aa645c47-ac90-420d-9091-8c7ffa4f103f",
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/aa645c47-ac90-420d-9091-8c7ffa4f103f"
}
```

For more information, see Getting Started with Connectors (CLI) in the AWS IoT Greengrass Developer Guide.

- For API details, see CreateSubscriptionDefinition in AWS CLI Command Reference.

**delete-connector-definition**

The following code example shows how to use `delete-connector-definition`.

**AWS CLI**

To delete a connector definition
The following `delete-connector-definition` example deletes the specified Greengrass connector definition. If you delete a connector definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-connector-definition \
   --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

This command produces no output.

- For API details, see `DeleteConnectorDefinition` in *AWS CLI Command Reference*.

### delete-core-definition

The following code example shows how to use `delete-core-definition`.

**AWS CLI**

**To delete a core definition**

The following `delete-core-definition` example deletes the specified Greengrass core definition, including all versions. If you delete a core that is associated with a Greengrass group, that group can't be deployed successfully.

```
aws greengrass delete-core-definition \
   --core-definition-id "ff36cc5f-9f98-4994-b468-9d9b6dc52abd"
```

This command produces no output.

- For API details, see `DeleteCoreDefinition` in *AWS CLI Command Reference*.

### delete-device-definition

The following code example shows how to use `delete-device-definition`.

**AWS CLI**

**To delete a device definition**

The following `delete-device-definition` example deletes the specified device definition, including all of its versions. If you delete a device definition version that is used by a group version, the group version cannot be deployed successfully.
aws greengrass delete-device-definition \
   --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"

This command produces no output.

- For API details, see DeleteDeviceDefinition in AWS CLI Command Reference.

delete-function-definition

The following code example shows how to use delete-function-definition.

AWS CLI

To delete a function definition

The following delete-function-definition example deletes the specified Greengrass function definition. If you delete a function definition that is used by a group, that group can't be deployed successfully.

aws greengrass delete-function-definition \
   --function-definition-id "fd4b906a-dff3-4c1b-96eb-52ebfcfac06a"

This command produces no output.

- For API details, see DeleteFunctionDefinition in AWS CLI Command Reference.

delete-group

The following code example shows how to use delete-group.

AWS CLI

To delete a group

The following delete-group example deletes the specified Greengrass group.

aws greengrass delete-group \
   --group-id "4e22bd92-898c-436b-ade5-434d883ff749"

This command produces no output.
For API details, see `DeleteGroup` in *AWS CLI Command Reference*.

**delete-logger-definition**

The following code example shows how to use `delete-logger-definition`.

**AWS CLI**

**To delete a logger definition**

The following `delete-logger-definition` example deletes the specified logger definition, including all logger definition versions. If you delete a logger definition version that is used by a group version, the group version cannot be deployed successfully.

```bash
aws greengrass delete-logger-definition \
   --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
```

This command produces no output.

For more information, see [Monitoring with AWS IoT Greengrass Logs](https://docs.aws.amazon.com/iot-greengrass/latest/developerguide/greengrass-monitoring.html) in the *AWS IoT Greengrass Developer Guide*.

**delete-resource-definition**

The following code example shows how to use `delete-resource-definition`.

**AWS CLI**

**To delete a resource definition**

The following `delete-resource-definition` example deletes the specified resource definition, including all resource versions. If you delete a resource definition that is used by a group, that group can't be deployed successfully.

```bash
aws greengrass delete-resource-definition \
   --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

This command produces no output.
For API details, see `DeleteResourceDefinition` in `AWS CLI Command Reference`.

**delete-subscription-definition**

The following code example shows how to use `delete-subscription-definition`.

**AWS CLI**

**To delete a subscription definition**

The following `delete-subscription-definition` example deletes the specified Greengrass subscription definition. If you delete a subscription that is being used by a group, that group can’t be deployed successfully.

```bash
aws greengrass delete-subscription-definition \
   --subscription-definition-id "cd6f1c37-d9a4-4e90-be94-01a7404f5967"
```

This command produces no output.

For API details, see `DeleteSubscriptionDefinition` in `AWS CLI Command Reference`.

**disassociate-role-from-group**

The following code example shows how to use `disassociate-role-from-group`.

**AWS CLI**

**To disassociate the role from a Greengrass group**

The following `disassociate-role-from-group` example disassociates the IAM role from the specified Greengrass group.

```bash
aws greengrass disassociate-role-from-group \
   --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```
{
   "DisassociatedAt": "2019-09-10T20:05:49Z"
}
```
For more information, see Configure the Group Role in the AWS IoT Greengrass Developer Guide.

- For API details, see DisassociateRoleFromGroup in AWS CLI Command Reference.

**disassociate-service-role-from-account**

The following code example shows how to use disassociate-service-role-from-account.

**AWS CLI**

**To disassociate a service role from your AWS account**

The following disassociate-service-role-from-account example removes the service role that is associated with your AWS account. If you are not using the service role in any AWS Region, use the delete-role-policy command to detach the AWSGreengrassResourceAccessRolePolicy managed policy from the role, and then use the delete-role command to delete the role.

```bash
aws greengrass disassociate-service-role-from-account
```

Output:

```
{
   "DisassociatedAt": "2019-06-25T22:12:55Z"
}
```

For more information, see Greengrass Service Role in the AWS IoT Greengrass Developer Guide.

- For API details, see DisassociateServiceRoleFromAccount in AWS CLI Command Reference.

**get-associated-role**

The following code example shows how to use get-associated-role.

**AWS CLI**

**To get the role associated with a Greengrass group**

```bash

```
The following `get-associated-role` example gets the IAM role that's associated with the specified Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services.

```
aws greengrass get-associated-role
   --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```
{
   "RoleArn": "arn:aws:iam::123456789012:role/GG-Group-Role",
   "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see Configure the Group Role in the AWS IoT Greengrass Developer Guide.

- For API details, see GetAssociatedRole in AWS CLI Command Reference.

### get-bulk-deployment-status

The following code example shows how to use `get-bulk-deployment-status`.

**AWS CLI**

**To check the status of your bulk deployment**

The following `get-bulk-deployment-status` example retrieves status information for the specified bulk deployment operation. In this example, the file that specified the groups to be deployed has an invalid input record.

```
aws greengrass get-bulk-deployment-status
   --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
```

Output:

```
{
   "BulkDeploymentMetrics": {
      "InvalidInputRecords": 1,
      "RecordsProcessed": 1,
      "RetryAttempts": 0
   },
```
For more information, see [Create Bulk Deployments for Groups](https://aws.amazon.com/IoT-Greengrass/developer-guide/) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [GetBulkDeploymentStatus](https://aws.amazon.com/cli/command-reference/) in *AWS CLI Command Reference*.

**get-connectivity-info**

The following code example shows how to use `get-connectivity-info`.

**AWS CLI**

**To get the connectivity information for a Greengrass core**

The following `get-connectivity-info` example displays the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata.

```bash
aws greengrass get-connectivity-info \
   --thing-name "MyGroup_Core"
```

Output:

```
{
   "ConnectivityInfo": [
   {
      "Metadata": "",
      "PortNumber": 8883,
      "HostAddress": "127.0.0.1",
      "Id": "AUTOIP_127.0.0.1_0"
   },
   {
      "Metadata": "",
      "PortNumber": 8883,
      "HostAddress": "192.168.1.3",
      "Id": "AUTOIP_192.168.1.3_1"
   },
   {
```
For API details, see `GetConnectivityInfo` in *AWS CLI Command Reference*.

**get-connector-definition-version**

The following code example shows how to use `get-connector-definition-version`.

**AWS CLI**

To retrieve information about a specific version of a connector definition

The following `get-connector-definition-version` example retrieves information about the specified version of the specified connector definition. To retrieve the IDs of all versions of the connector definition, use the `list-connector-definition-versions` command. To retrieve the ID of the last version added to the connector definition, use the `get-connector-definition` command and check the `LatestVersion` property.

```
aws greengrass get-connector-definition-version \
  --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8" \
  --connector-definition-version-id "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
```

**Output:**

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
  "CreationTimestamp": "2019-06-19T19:30:01.300Z",
}
```
"Definition": {
  "Connectors": [
    {
      "ConnectorArn": "arn:aws:greengrass:us-west-2::/connectors/SNS/versions/1",
      "Id": "MySNSConnector",
      "Parameters": {
        "DefaultSNSArn": "arn:aws:sns:us-west-2:123456789012:GGConnectorTopic"
      }
    }
  ],
  "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
  "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
}

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the AWS IoT Greengrass Developer Guide.

- For API details, see GetConnectorDefinitionVersion in AWS CLI Command Reference.

get-connector-definition

The following code example shows how to use get-connector-definition.

AWS CLI

To retrieve information about a connector definition

The following get-connector-definition example retrieves information about the specified connector definition. To retrieve the IDs of your connector definitions, use the list-connector-definitions command.

```
aws greengrass get-connector-definition \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
```
For more information, see [Integrate with Services and Protocols Using Greengrass Connectors](#) in the [AWS IoT Greengrass Developer Guide](#).

- For API details, see [GetConnectorDefinition](#) in [AWS CLI Command Reference](#).

### get-core-definition-version

The following code example shows how to use `get-core-definition-version`.

**AWS CLI**

To retrieve details about a specific version of the Greengrass core definition

The following `get-core-definition-version` example retrieves information about the specified version of the specified core definition. To retrieve the IDs of all versions of the core definition, use the `list-core-definition-versions` command. To retrieve the ID of the last version added to the core definition, use the `get-core-definition` command and check the `LatestVersion` property.

```bash
aws greengrass get-core-definition-version \
  --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46" \
  --core-definition-version-id "42aeeac3-fd9d-4312-a8fd-ffa9404a20e0"
```

**Output:**

```json
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/c906ed39-a1e3-4822-a981-7b9bd57b4b46/versions/42aeeac3-fd9d-4312-a8fd-ffa9404a20e0",
  "Definition": {
```
"Cores": [
  {
    "CertificateArn": "arn:aws:iot:us-west-2:123456789012:cert/928dea7b82331b47c3ff77b0e763fc5e64e2f7c884e6ef391baed9b6b8e21b45",
    "Id": "1a39ac7-0885-4417-91f6-23e4cea6c511",
    "SyncShadow": false,
    "ThingArn": "arn:aws:iot:us-west-2:123456789012:thing/GGGroup4Pi3_Core"
  }
],
"Id": "c906ed39-a1e3-4822-a981-7b9bd57b4b46",
"Version": "42aeac3-fd9d-4312-a8fd-ffa9404a20e0"
}

- For API details, see [GetCoreDefinitionVersion](#) in *AWS CLI Command Reference*.

get-core-definition

The following code example shows how to use get-core-definition.

AWS CLI

To retrieve details for a Greengrass core definition

The following get-core-definition example retrieves information about the specified core definition. To retrieve the IDs of your core definitions, use the list-core-definitions command.

```
aws greengrass get-core-definition \
  --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46"
```

Output:

```
{
  "CreationTimestamp": "2018-10-18T04:47:06.721Z",
  "Id": "237d6916-27cf-457f-ba0c-e86cfb5d25cd",
  "LastUpdatedTimestamp": "2018-10-18T04:47:06.721Z",
  "LatestVersion": "bd2cd6d4-2bc5-468a-8962-39e071e34b68",
```
For API details, see [GetCoreDefinition] in *AWS CLI Command Reference*.

### get-deployment-status

The following code example shows how to use `get-deployment-status`.

**AWS CLI**

**To retrieve the status of a deployment**

The following `get-deployment-status` example retrieves the status for the specified deployment of the specified Greengrass group. To get the deployment ID, use the `list-deployments` command and specify the group ID.

```
aws greengrass get-deployment-status
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
   --deployment-id "1065b8a0-812b-4f21-9d5d-e89b232a530f"
```

**Output:**

```
{
   "DeploymentStatus": "Success",
   "DeploymentType": "NewDeployment",
   "UpdatedAt": "2019-06-18T17:04:44.761Z"
}
```

For API details, see [GetDeploymentStatus] in *AWS CLI Command Reference*.

### get-device-definition-version

The following code example shows how to use `get-device-definition-version`.

**AWS CLI**

**To get a device definition version**
The following get-device-definition-version example retrieves information about the specified version of the specified device definition. To retrieve the IDs of all versions of the device definition, use the list-device-definition-versions command. To retrieve the ID of the last version added to the device definition, use the get-device-definition command and check the LatestVersion property.

```
aws greengrass get-device-definition-version \
   --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
   --device-definition-version-id "83c13984-6fed-447e-84d5-5b8aa45d5f71"
```

Output:

```
{
   "Definition": {
      "Devices": [
         {

   }
}
```

**get-device-definition**

The following code example shows how to use `get-device-definition`.

**AWS CLI**

**To get a device definition**

The following `get-device-definition` example retrieves information about the specified device definition. To retrieve the IDs of your device definitions, use the `list-device-definitions` command.

```bash
aws greengrass get-device-definition \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

**Output:**

```json
{
    "Name": "TemperatureSensors",
    "tags": {},
    "LastUpdatedTimestamp": "2019-09-11T00:19:03.698Z",
    "CreationTimestamp": "2019-09-11T00:11:06.197Z",
    "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

- For API details, see [GetDeviceDefinition](#) in *AWS CLI Command Reference*.

**get-function-definition-version**

The following code example shows how to use `get-function-definition-version`.

**AWS CLI**

**To retrieve details about a specific version of a Lambda function**
The following `get-function-definition-version` retrieves information about the specified version of the specified function definition. To retrieve the IDs of all versions of the function definition, use the `list-function-definition-versions` command. To retrieve the ID of the last version added to the function definition, use the `get-function-definition` command and check the `LatestVersion` property.

```
aws greengrass get-function-definition-version \
  --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85" \
  --function-definition-version-id "9748fda7-1589-4fcc-ac94-f5559e88678b"
```

**Output:**

```json
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85/versions/9748fda7-1589-4fcc-ac94-f5559e88678b",
  "CreationTimestamp": "2019-06-18T17:04:30.776Z",
  "Definition": {
    "Functions": [
      {
        "FunctionArn": "arn:aws:lambda:::function:GGIPDetector:1",
        "FunctionConfiguration": {
          "Environment": {},
          "MemorySize": 32768,
          "Pinned": true,
          "Timeout": 3
        },
        "Id": "26b69bdb-e547-46bc-9812-84ec04b6cc8c"
      },

        "FunctionConfiguration": {
          "EncodingType": "json",
          "Environment": {
            "Variables": {}
          },
          "MemorySize": 16384,
          "Pinned": true,
          "Timeout": 25
        },
        "Id": "384465a8-eedf-48c6-b793-4c35f7bfae9b"
      }
    ]
  }
}
```
To retrieve a function definition

The following get-function-definition example displays details for the specified function definition. To retrieve the IDs of your function definitions, use the list-function-definitions command.

```bash
aws greengrass get-function-definition \
   --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85"
```

Output:

```json
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:greengrass/definition/functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85",

   "tags": {}
}
```

For API details, see `GetFunctionDefinitionVersion` in AWS CLI Command Reference.
get-group-certificate-authority

The following code example shows how to use get-group-certificate-authority.

AWS CLI

To retrieve the CA associated with a Greengrass group

The following get-group-certificate-authority example retrieves the certificate authority (CA) that is associated with the specified Greengrass group. To get the certificate authority ID, use the list-group-certificate-authorities command and specify the group ID.

```bash
aws greengrass get-group-certificate-authority \
  --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
  --certificate-authority-id "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
```

Output:

```json
{
  "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/certificateauthorities/

Actions and scenarios
• For API details, see GetGroupCertificateAuthority in AWS CLI Command Reference.

get-group-certificate-configuration

The following code example shows how to use get-group-certificate-configuration.

AWS CLI

To retrieve the configuration for the certificate authority used by the Greengrass group

The following get-group-certificate-configuration example retrieves the configuration for the certificate authority (CA) used by the specified Greengrass group.

```
aws greengrass get-group-certificate-configuration \\
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
   "CertificateAuthorityExpiryInMilliseconds": 2524607999000,
   "CertificateExpiryInMilliseconds": 604800000,
   "GroupId": "1013db12-8b58-45ff-acc7-704248f66731"
}
```

• For API details, see GetGroupCertificateConfiguration in AWS CLI Command Reference.

get-group-version

The following code example shows how to use get-group-version.

AWS CLI

To retrieve information about a version of a Greengrass group

The following get-group-version example retrieves information about the specified version of the specified group. To retrieve the IDs of all versions of the group, use the list-group-versions command. To retrieve the ID of the last version added to the group, use the get-group command and check the LatestVersion property.
aws greengrass get-group-version \\
   --group-id "1013db12-8b58-45ff-acc7-704248f66731" \\
   --group-version-id "115136b3-cfd7-4462-b77f-8741a4b00e5e"

Output:

{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-b77f-8741a4b00e5e",

   },
   "Id": "1013db12-8b58-45ff-acc7-704248f66731",
   "Version": "115136b3-cfd7-4462-b77f-8741a4b00e5e"
}

- For API details, see GetGroupVersion in AWS CLI Command Reference.

**get-group**

The following code example shows how to use get-group.

**AWS CLI**

**To retrieve information about a Greengrass group**

The following get-group example retrieves information about the specified Greengrass group. To retrieve the IDs of your groups, use the list-groups command.

aws greengrass get-group \\
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
Output:

```json
{
   "Id": "1013db12-8b58-45ff-acc7-704248f66731",
   "LatestVersion": "115136b3-cfd7-4462-b77f-8741a4b00e5e",
   "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-b77f-8741a4b00e5e",
   "Name": "GGGroup4Pi3",
   "tags": {}
}
```

- For API details, see [GetGroup](#) in *AWS CLI Command Reference*.

**get-logger-definition-version**

The following code example shows how to use `get-logger-definition-version`.

**AWS CLI**

**To retrieve information about a version of a logger definition**

The following `get-logger-definition-version` example retrieves information about the specified version of the specified logger definition. To retrieve the IDs of all versions of the logger definition, use the `list-logger-definition-versions` command. To retrieve the ID of the last version added to the logger definition, use the `get-logger-definition` command and check the `LatestVersion` property.

```bash
aws greengrass get-logger-definition-version \\
   --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23" \\
   --logger-definition-version-id "5e3f6f64-a565-491e-8de0-3c0d8e0f2073"
```

Output:

```json
{
   "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23/versions/5e3f6f64-a565-491e-8de0-3c0d8e0f2073",
```
get-logger-definition

The following code example shows how to use get-logger-definition.

AWS CLI

To retrieve information about a logger definition

The following get-logger-definition example retrieves information about the specified logger definition. To retrieve the IDs of your logger definitions, use the list-logger-definitions command.

```
aws greengrass get-logger-definition
  --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23"
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23",
  "CreationTimestamp": "2019-05-08T16:10:13.809Z",

  "tags": {}
}
```

For API details, see GetLoggerDefinition in AWS CLI Command Reference.
get-resource-definition-version

The following code example shows how to use get-resource-definition-version.

AWS CLI

To retrieve information about a specific version of a resource definition

The following get-resource-definition-version example retrieves information about the specified version of the specified resource definition. To retrieve the IDs of all versions of the resource definition, use the list-resource-definition-versions command. To retrieve the ID of the last version added to the resource definition, use the get-resource-definition command and check the LatestVersion property.

```
aws greengrass get-resource-definition-version \
    --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658" \
    --resource-definition-version-id "26e8829a-491a-464d-9c87-664bf6f6f2be"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/versions/26e8829a-491a-464d-9c87-664bf6f6f2be",

    "tags": {}
}
```

- For API details, see [GetResourceDefinition](#) in AWS CLI Command Reference.

**get-service-role-for-account**

The following code example shows how to use get-service-role-for-account.
To retrieve the details for the service role that is attached to your account

The following get-service-role-for-account example retrieves information about the service role that is attached to your AWS account.

```
aws greengrass get-service-role-for-account
```

Output:

```
{
  "AssociatedAt": "2018-10-18T15:59:20Z",
  "RoleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see Greengrass Service Role in the AWS IoT Greengrass Developer Guide.

- For API details, see GetServiceRoleForAccount in AWS CLI Command Reference.

get-subscription-definition-version

The following code example shows how to use get-subscription-definition-version.

AWS CLI

To retrieve information about a specific version of a subscription definition

The following get-subscription-definition-version example retrieves retrieves information about the specified version of the specified subscription definition. To retrieve the IDs of all versions of the subscription definition, use the list-subscription-definition-versions command. To retrieve the ID of the last version added to the subscription definition, use the get-subscription-definition command and check the LatestVersion property.

```
aws greengrass get-subscription-definition-version \
   --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152" \
   --subscription-definition-version-id "88ae8699-12ac-4663-ba3f-4d7f0519140b"
```
get-subscription-definition

The following code example shows how to use `get-subscription-definition`.

AWS CLI

To retrieve information about a subscription definition

The following `get-subscription-definition` example retrieves information about the specified subscription definition. To retrieve the IDs of your subscription definitions, use the `list-subscription-definitions` command.

```
aws greengrass get-subscription-definition \  
  --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152"
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/versions/88ae8699-12ac-4663-ba3f-4d7f0519140b",
  "CreationTimestamp": "2019-06-18T17:03:52.499Z",
  "Definition": {
    "Subscriptions": [
      {
        "Id": "692c4484-d89f-4f64-8edd-1a041a65e5b6",
        "Subject": "hello/world",
        "Target": "cloud"
      }
    ]
  },
  "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
  "Version": "88ae8699-12ac-4663-ba3f-4d7f0519140b"
}
```
• For API details, see [GetSubscriptionDefinition](https://docs.aws.amazon.com/cli/latest/reference/greengrass/get-subscription-definition) in *AWS CLI Command Reference*.

### get-thing-runtime-configuration

The following code example shows how to use `get-thing-runtime-configuration`.

**AWS CLI**

To retrieve the runtime configuration of a Greengrass core

The following `get-thing-runtime-configuration` example retrieves the runtime configuration of a Greengrass core. Before you can retrieve the runtime configuration, you must use the `update-thing-runtime-configuration` command to create a runtime configuration for the core.

```bash
aws greengrass get-thing-runtime-configuration \
  --thing-name SampleGreengrassCore
```

**Output:**

```
{
  "RuntimeConfiguration": {
    "TelemetryConfiguration": {
      "ConfigurationSyncStatus": "OutOfSync",
      "Telemetry": "On"
    }
  }
}
```
For more information, see Configuring telemetry settings in the AWS IoT Greengrass Developer Guide.

- For API details, see GetThingRuntimeConfiguration in AWS CLI Command Reference.

**list-bulk-deployment-detailed-reports**

The following code example shows how to use `list-bulk-deployment-detailed-reports`.

**AWS CLI**

To list information about individual deployments in a bulk deployment

The following `list-bulk-deployment-detailed-reports` example displays information about the individual deployments in a bulk deployment operation, including status.

```
aws greengrass list-bulk-deployment-detailed-reports \
    --bulk-deployment-id 42ce9c42-489b-4ed4-b905-8996aa50ef9d
```

**Output:**

```json
{
    "Deployments": [
        {
            "DeploymentType": "NewDeployment",
            "DeploymentStatus": "Success",
            "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/deployments/123456789012:123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/versions/123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "CreatedAt": "2020-01-21T21:34:16.501Z"
        },
        {
            "DeploymentType": "NewDeployment",
            "DeploymentStatus": "InProgress",
            "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555/deployments/123456789012:123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
```

**Actions and scenarios**
The following code example shows how to use list-bulk-deployments.

**AWS CLI**

**To list bulk deployments**

The following list-bulk-deployments example lists all bulk deployments.

```bash
aws greengrass list-bulk-deployments
```

**Output:**

```json
{
   "BulkDeployments": [
   {
      "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:greengrass/bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
      "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
      "CreatedAt": "2019-06-25T16:11:33.265Z"
   }
   ]
}
```

For more information, see [Create Bulk Deployments for Groups](https://docs.aws.amazon.com/greengrass/latest/developerguide/create-bulk-deployments-groups.html) in the AWS IoT Greengrass Developer Guide.

For API details, see [ListBulkDeploymentDetailedReports](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-bulk-deployments.html) in AWS CLI Command Reference.
**list-connector-definition-versions**

The following code example shows how to use `list-connector-definition-versions`.

**AWS CLI**

To list the versions that are available for a connector definition

The following `list-connector-definition-versions` example lists the versions that are available for the specified connector definition. Use the `list-connector-definitions` command to get the connector definition ID.

```bash
aws greengrass list-connector-definition-versions \
  --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```json
{
  "Versions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
      "CreationTimestamp": "2019-06-19T19:30:01.300Z",
      "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
      "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
    }
  ]
}
```

**list-connector-definitions**

The following code example shows how to use `list-connector-definitions`.

**AWS CLI**

To list the Greengrass connectors that are defined

```bash
aws greengrass list-connector-definitions
```
The following `list-connector-definitions` example lists all of the Greengrass connectors that are defined for your AWS account.

```
aws greengrass list-connector-definitions
```

Output:

```
{
   "Definitions": [
       {
           "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
           "CreationTimestamp": "2019-06-19T19:30:01.300Z",
           "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
           "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
           "LatestVersion": "63c57963-c7c2-4a26-a7e2-7bf478ea2623",
           "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
           "Name": "MySNSConnector"
       }
   ]
}
```

- For API details, see [ListConnectorDefinitions](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-connector-definitions.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-connector-definitions.html).

### list-core-definition-versions

The following code example shows how to use `list-core-definition-versions`.

**AWS CLI**

**To list the versions of a Greengrass core definition**

The following `list-core-definitions` example lists all versions of the specified Greengrass core definition. You can use the `list-core-definitions` command to get the version ID.

```
aws greengrass list-core-definition-versions \
```
Output:

```json
{
   "Versions": [
      {
         "Id": "eaf280cb-138c-4d15-af36-6f681a1348f7",
         "Version": "467c36e4-c5da-440c-a97b-084e62593b4c"
      }
   ]
}
```

- For API details, see [ListCoreDefinitionVersions](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-core-definition-versions.html) in *AWS CLI Command Reference*.

### list-core-definitions

The following code example shows how to use `list-core-definitions`.

**AWS CLI**

**To list Greengrass core definitions**

The following `list-core-definitions` example lists all of the Greengrass core definitions for your AWS account.

```bash
aws greengrass list-core-definitions
```

Output:

```json
{
   "Definitions": [
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/0507843c-c1ef-4f06-b051-817030df7e7d",
         "CreationTimestamp": "2018-10-17T04:30:32.786Z",
```

Actions and scenarios
For API details, see ListCoreDefinitions in AWS CLI Command Reference.
list-deployments

The following code example shows how to use list-deployments.

AWS CLI

To list the deployments for a Greengrass group

The following list-deployments example lists the deployments for the specified Greengrass group. You can use the list-groups command to look up your group ID.

```
aws greengrass list-deployments \
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
   "Deployments": [
   {
      "CreatedAt": "2019-06-18T17:04:32.702Z",
      "DeploymentId": "1065b8a0-812b-4f21-9d5d-e89b232a530f",
      "DeploymentType": "NewDeployment",
      "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-b77f-8741a4b00e5e"
   }
   ]
}
```

- For API details, see ListDeployments in AWS CLI Command Reference.

list-device-definition-versions

The following code example shows how to use list-device-definition-versions.

AWS CLI

To list the versions of a device definition

The following list-device-definition-versions example displays the device definition versions associated with the specified device definition.
aws greengrass list-device-definition-versions \
   --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"

Output:

```
{
   "Versions": [
   {
      "Version": "83c13984-6fed-447e-84d5-5b8aa45d5f71",
      "CreationTimestamp": "2019-09-11T00:15:09.838Z",
      "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/83c13984-6fed-447e-84d5-5b8aa45d5f71"
   },
   {
      "Version": "3b5cc510-58c1-44b5-9d98-4ad858ffa795",
      "CreationTimestamp": "2019-09-11T00:11:06.197Z",
      "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/3b5cc510-58c1-44b5-9d98-4ad858ffa795"
   }
   ]
}
```

- For API details, see [ListDeviceDefinitionVersions](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-device-definition-versions.html) in *AWS CLI Command Reference*.

### list-device-definitions

The following code example shows how to use `list-device-definitions`.

#### AWS CLI

**To list your device definitions**

The following `list-device-definitions` example displays details about the device definitions in your AWS account in the specified AWS Region.

```
aws greengrass list-device-definitions \
   --region us-west-2
```
Output:

```json
{
  "Definitions": [
    {
       greengrass/definition/devices/50f3274c-3f0a-4f57-b114-6f46085281ab/versions/
       c777b0f5-1059-449b-bea-f003ebc56c34",
      "LastUpdatedTimestamp": "2019-06-14T15:42:09.059Z",
      "LatestVersion": "c777b0f5-1059-449b-bea-f003ebc56c34",
      "CreationTimestamp": "2019-06-14T15:42:09.059Z",
      "Id": "50f3274c-3f0a-4f57-b114-6f46085281ab",
       definition/devices/50f3274c-3f0a-4f57-b114-6f46085281ab"
    },
    {
       greengrass/definition/devices/e01951c9-6134-479a-969a-1a15cac11c40/

      "LatestVersion": "83c13984-6fed-447e-84d5-5b8aa45df71",
      "CreationTimestamp": "2019-09-11T00:11:06.197Z",
      "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
       definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd"
    }
  ]
}
```

- For API details, see [ListDeviceDefinitions](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-device-definitions) in *AWS CLI Command Reference.*
list-function-definition-versions

The following code example shows how to use list-function-definition-versions.

AWS CLI

To list the versions of a Lambda function

The following list-function-definition-versions example lists all of the versions of the specified Lambda function. You can use the list-function-definitions command to get the ID.

```bash
aws greengrass list-function-definition-versions \
   --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85"
```

Output:

```
{
   "Versions": [
   {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
      greengrass/definition/functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85/
      versions/9748fda7-1589-4fcc-ac94-f5559e88678b",
      "CreationTimestamp": "2019-06-18T17:04:30.776Z",
      "Id": "063f5d1a-1dd1-40b4-9b51-56f8993d0f85",
      "Version": "9748fda7-1589-4fcc-ac94-f5559e88678b"
   },
   {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/

      versions/9b08df77-26f2-4c29-93d2-769715edcfc",
      "CreationTimestamp": "2019-06-18T17:02:44.087Z",
      "Id": "063f5d1a-1dd1-40b4-9b51-56f8993d0f85",
      "Version": "9b08df77-26f2-4c29-93d2-769715edcfc"
   },
   {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
      greengrass/definition/functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85/
      versions/4236239f-94f7-4b90-a2f8-2a24c829d21e",
      "CreationTimestamp": "2019-06-18T17:01:42.284Z",
      "Id": "063f5d1a-1dd1-40b4-9b51-56f8993d0f85",
      "Version": "4236239f-94f7-4b90-a2f8-2a24c829d21e"
   }
]
```
For API details, see ListFunctionDefinitionVersions in AWS CLI Command Reference.

list-function-definitions

The following code example shows how to use list-function-definitions.

AWS CLI

To list Lambda functions

The following list-function-definitions example lists all of the Lambda functions defined for your AWS account.

aws greengrass list-function-definitions

Output:

```json
{
   "Definitions": [
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/017970a5-8952-46dd-b1c1-020b3ae8e960",
         "CreationTimestamp": "2018-10-17T04:30:32.884Z",
         "Id": "017970a5-8952-46dd-b1c1-020b3ae8e960",
         "LastUpdatedTimestamp": "2018-10-17T04:30:32.884Z",
         "LatestVersion": "4380b302-790d-4ed8-92bf-02e88afecb15",
      }
   ]
}``
For API details, see ListFunctionDefinitions in AWS CLI Command Reference.

list-group-certificate-authorities

The following code example shows how to use list-group-certificate-authorities.
AWS CLI

To list the current CAs for a group

The following `list-group-certificate-authorities` example lists the current certificate authorities (CAs) for the specified Greengrass group.

```bash
aws greengrass list-group-certificate-authorities \
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```json
{
   "GroupCertificateAuthorities": [
      {
         "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/certificateauthorities/\n            f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6",
         "GroupCertificateAuthorityId": "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
      }
   ]
}
```

- For API details, see `ListGroupCertificateAuthorities` in AWS CLI Command Reference.

list-group-versions

The following code example shows how to use `list-group-versions`.

AWS CLI

To list the versions of a Greengrass group

The following `list-group-versions` example lists the versions of the specified Greengrass group.

```bash
aws greengrass list-group-versions \
   --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```
Output:

```json
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-b77f-8741a4b00e5e",
            "CreationTimestamp": "2019-06-18T17:04:30.915Z",
            "Id": "1013db12-8b58-45ff-acc7-704248f66731",
            "Version": "115136b3-cfd7-4462-b77f-8741a4b00e5e"
        },
        {
            "CreationTimestamp": "2019-06-18T17:03:52.663Z",
            "Id": "1013db12-8b58-45ff-acc7-704248f66731",
            "Version": "4340669d-d14d-44e3-920c-46c928750750"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/1b06e099-2d5b-4f10-91b9-78c4e060f5da",
            "CreationTimestamp": "2019-06-18T17:02:44.189Z",
            "Id": "1013db12-8b58-45ff-acc7-704248f66731",
            "Version": "1b06e099-2d5b-4f10-91b9-78c4e060f5da"
        },
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/2d3f27f1-3b43-4554-ab7a-73ec30477efe",
            "CreationTimestamp": "2019-06-18T17:01:42.401Z",
            "Id": "1013db12-8b58-45ff-acc7-704248f66731",
            "Version": "2d3f27f1-3b43-4554-ab7a-73ec30477efe"
        },
        {
            "Id": "1013db12-8b58-45ff-acc7-704248f66731",
            "Version": "d20f7ae9-3444-4c1c-b025-e2ede23cdd31"
        }
    ]
}
```
For API details, see ListGroupVersions in AWS CLI Command Reference.

**list-groups**

The following code example shows how to use list-groups.

**AWS CLI**

**To list the Greengrass groups**

The following list-groups example lists all Greengrass groups that are defined in your AWS account.

```bash
aws greengrass list-groups
```

**Output:**

```json
{
   "Groups": [
      {
         "Id": "1013db12-8b58-45ff-acc7-704248f66731",
         "LatestVersion": "115136b3-cfd7-4462-b77f-8741a4b00e5e",
         "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-b77f-8741a4b00e5e",
         "Name": "GGGroup4Pi3"
      },
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1402daf9-71cf-4cfe-8be0-d5e80526d0d8",
         "CreationTimestamp": "2018-10-31T21:52:46.603Z",
         "Id": "1402daf9-71cf-4cfe-8be0-d5e80526d0d8",
         "LastUpdatedTimestamp": "2018-10-31T21:52:46.603Z",
         "LatestVersion": "749af901-60ab-456f-a096-91b12d983c29",
         "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1402daf9-71cf-4cfe-8be0-d5e80526d0d8/versions/749af901-60ab-456f-a096-91b12d983c29"
      }
   ]
}
```
For API details, see [ListGroups](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-groups.html) in *AWS CLI Command Reference*.

### list-logger-definition-versions

The following code example shows how to use `list-logger-definition-versions`.

**AWS CLI**

**To get a list of versions of a logger definition**

The following `list-logger-definition-versions` example gets a list of all versions of the specified logger definition.

```bash
aws greengrass list-logger-definition-versions \
  --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23"
```

**Output:**

```json
{
    "Versions": [
        { "Name": "smp-ggrass-group"
    }
]}
```
For API details, see [ListLoggerDefinitionVersions](https://docs.aws.amazon.com/cli/latest/reference/greengrass/list-logger-definition-versions.html) in *AWS CLI Command Reference*.

**list-logger-definitions**

The following code example shows how to use `list-logger-definitions`.

**AWS CLI**

To get a list of logger definitions

The following `list-logger-definitions` example lists all of the logger definitions for your AWS account.

```bash
aws greengrass list-logger-definitions
```

Output:

```json
{
   "Definitions": [
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23/versions/5e3f6f64-a565-491e-8de0-3c0d8e0f2073",
         "CreationTimestamp": "2019-05-08T16:10:13.866Z",
         "Id": "49eeeb66-f1d3-4e34-86e3-3617262abf23",
         "Version": "5e3f6f64-a565-491e-8de0-3c0d8e0f2073"
      },
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23/versions/3ec6d3af-eb85-48f9-a16d-1c795fe696d7",
         "CreationTimestamp": "2019-05-08T16:10:13.809Z",
         "Id": "49eeeb66-f1d3-4e34-86e3-3617262abf23",
         "Version": "3ec6d3af-eb85-48f9-a16d-1c795fe696d7"
      }
   ]
}
```
For API details, see [ListLoggerDefinitions](#) in AWS CLI Command Reference.

### list-resource-definition-versions

The following code example shows how to use `list-resource-definition-versions`.

#### AWS CLI

**To list the versions of a resource definition**

The following `list-resource-definition-versions` example lists the versions for the specified Greengrass resource.

```bash
aws greengrass list-resource-definition-versions \
   --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

**Output:**

```
{
   "Versions": [
       {
           "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/
versions/26e8829a-491a-464d-9c87-664bf6f6f2be",
           "CreationTimestamp": "2019-06-19T16:40:59.392Z",
           "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
           "Version": "26e8829a-491a-464d-9c87-664bf6f6f2be"
       },
       {
           "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/
versions/432d92f6-12de-4ec9-a704-619a942a62aa",
       }
   ]
}
```
list-resource-definitions

The following code example shows how to use `list-resource-definitions`.

**AWS CLI**

To list the resources that are defined

The following `list-resource-definitions` example lists the resources that are defined for AWS IoT Greengrass to use.

```bash/aws greengrass list-resource-definitions
```

Output:

```json
{
  "Definitions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658",
      "CreationTimestamp": "2019-06-19T16:40:59.261Z",
      "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
      "LastUpdatedTimestamp": "2019-06-19T16:40:59.261Z",
      "LatestVersion": "26e8829a-491a-464d-9c87-664bf6f6f2be",
      "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/versions/26e8829a-491a-464d-9c87-664bf6f6f2be"
    },
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
      
```
• For API details, see ListResourceDefinitions in AWS CLI Command Reference.

**list-subscription-definition-versions**

The following code example shows how to use list-subscription-definition-versions.

**AWS CLI**

To list the versions of a subscription definition

The following list-subscription-definition-versions example lists all versions of the specified subscription. You can use the list-subscription-definitions command to look up the subscription ID.

```bash
aws greengrass list-subscription-definition-versions \
   --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152"
```

Output:

```json
{
   "Versions": [
      {
         "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/versions/88ae8699-12ac-4663-ba3f-4d7f0519140b",
         "CreationTimestamp": "2019-06-18T17:03:52.499Z",
         "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
         "Version": "88ae8699-12ac-4663-ba3f-4d7f0519140b"
      }
   ]
}
```
For API details, see **ListSubscriptionDefinitionVersions** in *AWS CLI Command Reference*.

**list-subscription-definitions**

The following code example shows how to use `list-subscription-definitions`.

**AWS CLI**

**To get a list subscription definitions**

The following `list-subscription-definitions` example lists all of the AWS IoT Greengrass subscriptions that are defined in your AWS account.

```
aws greengrass list-subscription-definitions
```

**Output:**

```
{
  "Definitions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/versions/7e320ba3-c369-4069-a2f0-90acb7f219d6",
      "CreationTimestamp": "2019-06-18T17:03:52.392Z",
      "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
      "Version": "7e320ba3-c369-4069-a2f0-90acb7f219d6"
    }
  ]
}
```
For API details, see ListSubscriptionDefinitions in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list the tags attached to a resource

The following list-tags-for-resource example lists the tags and their values that are attached to the specified resource.

```
aws greengrass list-tags-for-resource \
   --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

Output:
For more information, see Tagging Your Greengrass Resources in the AWS IoT Greengrass Developer Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**reset-deployments**

The following code example shows how to use reset-deployments.

**AWS CLI**

To clean up deployment information for a Greengrass group

The following `reset-deployments` example cleans up deployment information for the specified Greengrass group. When you add the `--force` option, the deployment information is reset without waiting for the core device to respond.

```
aws greengrass reset-deployments \
   --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
   --force
```

Output:

```
{
   "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1402daf9-71cf-4cfe-8be0-d5e80526d0d8/deployments/7dd4e356-9882-46a3-9e28-6d21900c011a",
   "DeploymentId": "7dd4e356-9882-46a3-9e28-6d21900c011a"
}
```

For more information, see Reset Deployments in the AWS IoT Greengrass Developer Guide.

- For API details, see ResetDeployments in AWS CLI Command Reference.
**start-bulk-deployment**

The following code example shows how to use `start-bulk-deployment`.

**AWS CLI**

**To start a bulk deployment operation**

The following `start-bulk-deployment` example starts a bulk deployment operation, using a file stored in an S3 bucket to specify the groups to be deployed.

```
aws greengrass start-bulk-deployment
   --cli-input-json "{"InputFileUri":"https://gg-group-deployment1.s3-us-west-2.amazonaws.com/MyBulkDeploymentInputFile.txt","ExecutionRoleArn":"arn:aws:iam::123456789012:role/ggCreateDeploymentRole","AmznClientToken":"yourAmazonClientToken"}"
```

Output:

```
{
   "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
   "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
}
```

For more information, see [Create Bulk Deployments for Groups](https://docs.aws.amazon.com/greengrass/latest/developerguide/create-bulk-deployments.html) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [StartBulkDeployment](https://docs.aws.amazon.com/greengrass/latest/developerguide/API_StartBulkDeployment.html) in *AWS CLI Command Reference*.

**stop-bulk-deployment**

The following code example shows how to use `stop-bulk-deployment`.

**AWS CLI**

**To stop a bulk deployment**

The following `stop-bulk-deployment` example stops the specified bulk deployment. If you try to stop a bulk deployment that is complete, you receive an error: `InvalidInputException: Cannot change state of finished execution`. 

For more information, see [Stop Bulk Deployments](https://docs.aws.amazon.com/greengrass/latest/developerguide/stop-bulk-deployments.html) in the *AWS IoT Greengrass Developer Guide*. 

- For API details, see [StopBulkDeployment](https://docs.aws.amazon.com/greengrass/latest/developerguide/API_StopBulkDeployment.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**
aws greengrass stop-bulk-deployment \ 
  --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"

This command produces no output.

For more information, see Create Bulk Deployments for Groups in the AWS IoT Greengrass Developer Guide.

- For API details, see StopBulkDeployment in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To apply tags to a resource

The following tag-resource example applies two tags, ResourceType and ResourceSubType, to the specified Greengrass resource. This operation can both add new tags and values or update the value for existing tags. Use the untag-resource command to remove a tag.

aws greengrass tag-resource \ 
  --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658" \ 
  --tags "ResourceType=Device,ResourceSubType=USB"

This command produces no output.

For more information, see Tagging Your Greengrass Resources in the AWS IoT Greengrass Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag and its value from a resource
The following untag-resource example removes the tag whose key is Category from the specified Greengrass group. If the key Category does not exist for the specified resource, no error is returned.

```
aws greengrass untag-resource \
groups/1013db12-8b58-45ff-acc7-704248f66731" \
  --tag-keys "Category"
```

This command produces no output.

For more information, see [Tagging Your Greengrass Resources](aws-iot-greengrass-developer-guide) in the [AWS IoT Greengrass Developer Guide](aws-iot-greengrass-developer-guide).

- For API details, see [UntagResource](awscli-reference) in [AWS CLI Command Reference](awscli-reference).

**update-connectivity-info**

The following code example shows how to use update-connectivity-info.

**AWS CLI**

**To update the connectivity information for a Greengrass core**

The following update-connectivity-info example changes the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata. You might need to update connectivity information when the local network changes.

```
aws greengrass update-connectivity-info \
  --thing-name "MyGroup_Core" \
  --connectivity-info "[{
  "Metadata": "",
  "PortNumber": 8883,
  "HostAddress": "127.0.0.1",
  "Id": "localhost_127.0.0.1_0"}, {
  "Metadata": "",
  "PortNumber": 8883,
  "HostAddress": "192.168.1.3",
  "Id": "localIP_192.168.1.3"}]"
```

Output:

```
{
  "Version": "312de337-59af-4cf9-a278-2a23bd39c300"
}
```
• For API details, see UpdateConnectivityInfo in AWS CLI Command Reference.

update-connector-definition

The following code example shows how to use update-connector-definition.

AWS CLI

To update the name for a connector definition

The following update-connector-definition example updates the name for the specified connector definition. If you want to update the details for the connector, use the create-connector-definition-version command to create a new version.

```bash
aws greengrass update-connector-definition \   --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \   --name "GreengrassConnectors2019"
```

For more information, see Integrate with Services and Protocols Using Connectors in the AWS IoT Greengrass Developer Guide.

• For API details, see UpdateConnectorDefinition in AWS CLI Command Reference.

update-core-definition

The following code example shows how to use update-core-definition.

AWS CLI

To update a core definition

The following update-core-definition example changes the name of the specified core definition. You can update only the name property of a core definition.

```bash
aws greengrass update-core-definition \   --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bCc4a12" \   --name "MyCoreDevices"
```

This command produces no output.

For more information, see Configure the AWS IoT Greengrass Core in the AWS IoT Greengrass Developer Guide.
• For API details, see UpdateCoreDefinition in AWS CLI Command Reference.

**update-device-definition**

The following code example shows how to use `update-device-definition`.

**AWS CLI**

**To update a device definition**

The following `update-device-definition` example changes the name of the specified device definition. You can only update the name property of a device definition.

```
aws greengrass update-device-definition \
   --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
   --name "TemperatureSensors"
```

This command produces no output.

• For API details, see UpdateDeviceDefinition in AWS CLI Command Reference.

**update-function-definition**

The following code example shows how to use `update-function-definition`.

**AWS CLI**

**To update the name for a function definition**

The following `update-function-definition` example updates the name for the specified function definition. If you want to update the details for the function, use the create-function-definition-version command to create a new version.

```
aws greengrass update-function-definition \
   --function-definition-id "e47952bd-dea9-4e2c-a7e1-37bbe8807f46" \
   --name ObsoleteFunction
```

This command produces no output.

For more information, see Run Local Lambda Functions in the AWS IoT Greengrass Developer Guide.
update-group-certificate-configuration

The following code example shows how to use update-group-certificate-configuration.

AWS CLI

To update the expiry of a group's certificates

The following update-group-certificate-configuration example sets a 10-day expiry for the certificates generated for the specified group.

```
aws greengrass update-group-certificate-configuration \
   --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1" \
   --certificate-expiry-in-milliseconds 864000000
```

Output:

```
{
   "CertificateExpiryInMilliseconds": 864000000,
   "CertificateAuthorityExpiryInMilliseconds": 2524607999000,
   "GroupId": "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"
}
```

For more information, see AWS IoT Greengrass Security in the AWS IoT Greengrass Developer Guide.

• For API details, see UpdateGroupCertificateConfiguration in AWS CLI Command Reference.

update-group

The following code example shows how to use update-group.

AWS CLI

To update the group name

The following update-group example updates the name of the specified Greengrass group. If you want to update the details for the group, use the create-group-version command to create a new version.
aws greengrass update-group \
  --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
  --name TestGroup4of6

For more information, see Configure AWS IoT Greengrass on AWS IoT in the AWS IoT Greengrass Developer Guide.

- For API details, see UpdateGroup in AWS CLI Command Reference.

update-logger-definition

The following code example shows how to use update-logger-definition.

AWS CLI

To update a logger definition

The following update-logger-definition example changes the name of the specified logger definition. You can only update the name property of a logger definition.

aws greengrass update-logger-definition \
  --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \
  --name "LoggingConfigsForSensors"

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass Logs in the AWS IoT Greengrass Developer Guide.

- For API details, see UpdateLoggerDefinition in AWS CLI Command Reference.

update-resource-definition

The following code example shows how to use update-resource-definition.

AWS CLI

To update the name for a resource definition

The following update-resource-definition example updates the name for the specified resource definition. If you want to change the details for the resource, use the create-resource-definition-version command to create a new version.
This command produces no output.

For more information, see Access Local Resources with Lambda Functions and Connectors in the AWS IoT Greengrass Developer Guide.

- For API details, see UpdateResourceDefinition in AWS CLI Command Reference.

update-subscription-definition

The following code example shows how to use update-subscription-definition.

AWS CLI

To update the name for a subscription definition

The following update-subscription-definition example updates the name for the specified subscription definition. If you want to change details for the subscription, use the create-subscription-definition-version command to create a new version.

```
aws greengrass update-subscription-definition \
    --subscription-definition-id "fa81bc84-3f59-4377-a84b-5d0134da359b" \
    --name "ObsoleteSubscription"
```

This command produces no output.

For more information, see title in the guide.

- For API details, see UpdateSubscriptionDefinition in AWS CLI Command Reference.

update-thing-runtime-configuration

The following code example shows how to use update-thing-runtime-configuration.

AWS CLI

To turn on telemetry in the runtime configuration of a Greengrass core
The following update-thing-runtime-configuration example updates the runtime configuration of a Greengrass core to turn on telemetry.

```
aws greengrass update-thing-runtime-configuration \
    --thing-name SampleGreengrassCore \
    --telemetry-configuration {"Telemetry":"On"}
```

This command produces no output.

For more information, see Configuring telemetry settings in the AWS IoT Greengrass Developer Guide.

- For API details, see UpdateThingRuntimeConfiguration in AWS CLI Command Reference.

### AWS IoT Greengrass V2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass V2.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**associate-service-role-to-account**

The following code example shows how to use associate-service-role-to-account.

**AWS CLI**

To associate the Greengrass service role to your AWS account
The following `associate-service-role-to-account` example associates a service role with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 associate-service-role-to-account \
   --role-arn arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole
```

Output:

```
{
   "associatedAt": "2022-01-19T19:53Z"
}
```

For more information, see [Greengrass service role](#) in the [AWS IoT Greengrass V2 Developer Guide](#).

- For API details, see [AssociateServiceRoleToAccount](#) in [AWS CLI Command Reference](#).

### batch-associate-client-device-with-core-device

The following code example shows how to use `batch-associate-client-device-with-core-device`.

**AWS CLI**

**To associate client devices with a core device**

The following `batch-associate-client-device-with-core-device` example associates two client devices with a core device.

```
aws greengrassv2 batch-associate-client-device-with-core-device \
   --core-device-thing-name MyGreengrassCore \
   --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{
   "errorEntries": []
}
```

For more information, see [Interact with local IoT devices](#) in the [AWS IoT Greengrass V2 Developer Guide](#).
batch-disassociate-client-device-from-core-device

The following code example shows how to use batch-disassociate-client-device-from-core-device.

**AWS CLI**

**To disassociate client devices from a core device**

The following batch-disassociate-client-device-from-core-device example disassociates two client devices from a core device.

```
aws greengrassv2 batch-disassociate-client-device-from-core-device \
    --core-device-thing-name MyGreengrassCore \
    --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see [Interact with local IoT devices](#) in the [AWS IoT Greengrass V2 Developer Guide](#).

**cancel-deployment**

The following code example shows how to use cancel-deployment.

**AWS CLI**

**To cancel a deployment**

The following cancel-deployment example stops a continuous deployment to a thing group.
aws greengrassv2 cancel-deployment \
--deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

Output:

{
   "message": "SUCCESS"
}

For more information, see Cancel deployments in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see CancelDeployment in AWS CLI Command Reference.

create-component-version

The following code example shows how to use create-component-version.

AWS CLI

Example 1: To create a component version from a recipe

The following create-component-version example creates a version of a Hello World component from a recipe file.

aws greengrassv2 create-component-version \
--inline-recipe fileb://com.example.HelloWorld-1.0.0.json

Contents of com.example.HelloWorld-1.0.0.json:

```json
{
   "RecipeFormatVersion": "2020-01-25",
   "ComponentName": "com.example.HelloWorld",
   "ComponentVersion": "1.0.0",
   "ComponentDescription": "My first AWS IoT Greengrass component.",
   "ComponentPublisher": "Amazon",
   "ComponentConfiguration": {
      "DefaultConfiguration": {
         "Message": "world"
      }
   },
   "Manifests": []
}
```
Output:

```json
{
   "componentName": "com.example.HelloWorld",
   "componentVersion": "1.0.0",
   "creationTimestamp": "2021-01-07T16:24:33.650000-08:00",
   "status": {
      "componentState": "REQUESTED",
      "message": "NONE",
      "errors": {}
   }
}
```

For more information, see Create custom components and Upload components to deploy in the AWS IoT Greengrass V2 Developer Guide.

### Example 2: To create a component version from an AWS Lambda function

The following create-component-version example creates a version of a Hello World component from an AWS Lambda function.

```
aws greengrassv2 create-component-version \
   --cli-input-json file://lambda-function-component.json
```

Contents of lambda-function-component.json:

```json
{
   "lambdaFunction": {
```
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "componentLambdaParameters": {
      "eventSources": [
        {
          "topic": "hello/world/+",
          "type": "IOT_CORE"
        }
      ]
    }
  }
}

Output:

{
  "componentName": "com.example.HelloWorld",
  "componentVersion": "1.0.0",
  "creationTimestamp": "2021-01-07T17:05:27.347000-08:00",
  "status": {
    "componentState": "REQUESTED",
    "message": "NONE",
    "errors": {}  
  }
}

For more information, see Run AWS Lambda functions in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see CreateComponentVersion in AWS CLI Command Reference.

create-deployment

The following code example shows how to use create-deployment.

AWS CLI

Example 1: To create a deployment
The following create-deployment example deploys the AWS IoT Greengrass Command Line Interface to a core device.

```bash
aws greengrassv2 create-deployment \
   --cli-input-json file://cli-deployment.json
```

Contents of `cli-deployment.json`:

```json
{
   "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
   "deploymentName": "Deployment for MyGreengrassCore",
   "components": {
       "aws.greengrass.Cli": {
           "componentVersion": "2.0.3"
       }
   },
   "deploymentPolicies": {
       "failureHandlingPolicy": "DO NOTHING",
       "componentUpdatePolicy": {
           "timeoutInSeconds": 60,
           "action": "NOTIFY_COMPONENTS"
       },
       "configurationValidationPolicy": {
           "timeoutInSeconds": 60
       }
   },
   "iotJobConfiguration": {} 
}
```

Output:

```json
{
   "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create deployments in the AWS IoT Greengrass V2 Developer Guide.

**Example 2: To create a deployment that updates component configurations**

The following create-deployment example deploys the AWS IoT Greengrass nucleus component to a group of core devices. This deployment applies the following configuration updates for the nucleus component:
Reset the target devices' proxy settings to their default no proxy settings.
Reset the target devices' MQTT settings to their defaults.
Sets the JVM options for the nucleus' JVM.
Sets the logging level for the nucleus.

```
aws greengrassv2 create-deployment \
   --cli-input-json file://nucleus-deployment.json
```

Contents of `nucleus-deployment.json`:

```json
{
   "deploymentName": "Deployment for MyGreengrassCoreGroup",
   "components": {
      "aws.greengrass.Nucleus": {
         "componentVersion": "2.0.3",
         "configurationUpdate": {
            "reset": ["/networkProxy", "/mqtt"],
            "merge": "{"jvmOptions":"-Xmx64m","logging":{"level":"WARN"}}"
         }
      }
   },
   "deploymentPolicies": {
      "failureHandlingPolicy": "ROLLBACK",
      "componentUpdatePolicy": {
         "timeoutInSeconds": 60,
         "action": "NOTIFY_COMPONENTS"
      },
      "configurationValidationPolicy": {
         "timeoutInSeconds": 60
      }
   },
   "iotJobConfiguration": {}
}
```

Output:

```
{

```
For more information, see Create deployments and Update component configurations in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see CreateDeployment in AWS CLI Command Reference.

delete-component

The following code example shows how to use delete-component.

AWS CLI

To delete a component version

The following delete-component example deletes a Hello World component.

```bash
aws greengrassv2 delete-component \
```

This command produces no output.

For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see DeleteComponent in AWS CLI Command Reference.

delete-core-device

The following code example shows how to use delete-core-device.

AWS CLI

To delete a core device

The following delete-core-device example deletes an AWS IoT Greengrass core device.

```bash
aws greengrassv2 delete-core-device \
    --core-device-thing-name MyGreengrassCore
```
This command produces no output.

For more information, see Uninstall the AWS IoT Greengrass Core software in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see DeleteCoreDevice in AWS CLI Command Reference.

describe-component

The following code example shows how to use describe-component.

AWS CLI

To describe a component version

The following describe-component example describes a Hello World component.

```
aws greengrassv2 describe-component \\
```

Output:

```
{
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T17:12:11.133000-08:00",
    "publisher": "Amazon",
    "description": "My first AWS IoT Greengrass component.",
    "status": {
        "componentState": "DEPLOYABLE",
        "message": "NONE",
        "errors": {}
    },
    "platforms": [
        {
            "attributes": {
                "os": "linux"
            }
        }
    ]
}
```
disassociate-service-role-from-account

The following code example shows how to use disassociate-service-role-from-account.

AWS CLI

To disassociate the Greengrass service role from your AWS account

The following disassociate-service-role-from-account example disassociates the Greengrass service role from AWS IoT Greengrass for your AWS account.

```bash
aws greengrassv2 disassociate-service-role-from-account
```

Output:

```json
{
   "disassociatedAt": "2022-01-19T19:26:09Z"
}
```

For more information, see Greengrass service role in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see DisassociateServiceRoleFromAccount in AWS CLI Command Reference.

get-component-version-artifact

The following code example shows how to use get-component-version-artifact.

AWS CLI

To get a URL to download a component artifact

The following get-component-version-artifact example gets a URL to download the local debug console component's JAR file.

```bash
aws greengrassv2 get-component-version-artifact
```
--artifact-name "Uvt6ZEkQ9TKiAuLBfXBM=APdY0T8ks3uc46tHFHTzBM=/aws.greengrass.LocalDebugConsole.jar"

Output:

```json
{
}
```

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetComponentVersionArtifact](#) in *AWS CLI Command Reference*.

**get-component**

The following code example shows how to use get-component.

**AWS CLI**

**Example 1: To download a component's recipe in YAML format (Linux, macOS, or Unix)**

The following get-component example downloads a Hello World component's recipe to a file in YAML format. This command does the following:

- Uses the `--output` and `--query` parameters to control the command's output. These parameters extract the recipe blob from the command's output. For more information about controlling output, see [Controlling Command Output](#) in the *AWS Command Line Interface User Guide*. Uses the base64 utility. This utility decodes the extracted blob to the original text. The blob that is returned by a successful `get-component` command is base64-encoded text. You must decode this blob to obtain the original text. Saves the decoded text to a file. The final section of the command (`> com.example.HelloWorld-1.0.0.json`) saves the decoded text to a file.

```bash
aws greengrassv2 get-component \
```
Example 2: To download a component's recipe in YAML format (Windows CMD)

The following get-component example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```bash
aws greengrassv2 get-component ^
   --recipe-output-format YAML ^
   --query recipe ^
   --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

Example 3: To download a component's recipe in YAML format (Windows PowerShell)

The following get-component example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```bash
aws greengrassv2 get-component `^
   --recipe-output-format YAML `^
   --query recipe `^
   --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetComponent in AWS CLI Command Reference.
**get-connectivity-info**

The following code example shows how to use `get-connectivity-info`.

**AWS CLI**

To get the connectivity information for a Greengrass core device

The following `get-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```bash
aws greengrassv2 get-connectivity-info \
   --thing-name MyGreengrassCore
```

Output:

```
{
   "connectivityInfo": [ 
   {
      "id": "localIP_192.0.2.0",
      "hostAddress": "192.0.2.0",
      "portNumber": 8883
   }
   ]
}
```

For more information, see Manage core device endpoints in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetConnectivityInfo in AWS CLI Command Reference.

**get-core-device**

The following code example shows how to use `get-core-device`.

**AWS CLI**

To get a core device

The following `get-core-device` example gets information about an AWS IoT Greengrass core device.
aws greengrassv2 get-core-device \
   --core-device-thing-name MyGreengrassCore

Output:

```
{
    "coreDevice ThingName": "MyGreengrassCore",
    "coreVersion": "2.0.3",
    "platform": "linux",
    "architecture": "amd64",
    "status": "HEALTHY",
    "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00",
    "tags": {} 
}
```

For more information, see Check core device status in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetCoreDevice in AWS CLI Command Reference.

get-deployment

The following code example shows how to use get-deployment.

AWS CLI

**To get a deployment**

The following get-deployment example gets information about the deployment of the AWS IoT Greengrass nucleus component to a group of core devices.

aws greengrassv2 get-deployment \
   --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

Output:

```
{
    "revisionId": "14",
```
For more information, see Deploy components to devices in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see GetDeployment in AWS CLI Command Reference.

get-service-role-for-account

The following code example shows how to use get-service-role-for-account.
AWS CLI

**To get the Greengrass service role for your AWS account**

The following get-service-role-for-account example gets the service role that's associated with AWS IoT Greengrass for your AWS account.

```bash
aws greengrassv2 get-service-role-for-account
```

Output:

```json
{
    "associatedAt": "2022-01-19T19:21:53Z",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see [Greengrass service role](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetServiceRoleForAccount](#) in *AWS CLI Command Reference*.

**list-client-devices-associated-with-core-device**

The following code example shows how to use list-client-devices-associated-with-core-device.

**AWS CLI**

**To list the client devices associated with a core device**

The following list-client-devices-associated-with-core-device example lists all client devices associated with a core device.

```bash
aws greengrassv2 list-client-devices-associated-with-core-device \
--core-device-thing-name MyTestGreengrassCore
```

Output:

```json
{
    "associatedClientDevices": [
```
For more information, see [Interact with local IoT devices](aws-iot-greengrass-developer-guide) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListClientDevicesAssociatedWithCoreDevice](aws-cli-command-reference) in *AWS CLI Command Reference*.

### list-component-versions

The following code example shows how to use `list-component-versions`.

**AWS CLI**

**To list the versions of a component**

The following `list-component-versions` example lists all versions of a Hello World component.

```bash
aws greengrassv2 list-component-versions \
```

**Output:**

```json
{
    "componentVersions": [
        {
            "componentName": "com.example.HelloWorld",
            "componentVersion": "1.0.1",
        }
    ]
}
```
For more information, see Manage components in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see ListComponentVersions in AWS CLI Command Reference.

**list-components**

The following code example shows how to use list-components.

**AWS CLI**

**To list components**

The following list-components example lists each component and its latest version defined in your AWS account in the current Region.

```
aws greengrassv2 list-components
```

Output:

```
{
   "components": [
     {
       "componentName": "com.example.HelloWorld",
       "latestVersion": {
         "componentVersion": "1.0.1",
         "creationTimestamp": "2021-01-08T16:51:07.352000-08:00",
         "description": "My first AWS IoT Greengrass component.",
         "publisher": "Amazon",
         "platforms": [   
```
For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListComponents](#) in *AWS CLI Command Reference*.

**list-core-devices**

The following code example shows how to use `list-core-devices`.

**AWS CLI**

**To list core devices**

The following `list-core-devices` example lists the AWS IoT Greengrass core devices in your AWS account in the current Region.

```bash
aws greengrassv2 list-core-devices
```

Output:

```json
{
   "coreDevices": [
       {
           "coreDeviceThingName": "MyGreengrassCore",
           "status": "HEALTHY",
           "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00"
       }
   ]
}
```

For more information, see [Check core device status](#) in the *AWS IoT Greengrass V2 Developer Guide*.
For API details, see `ListCoreDevices` in *AWS CLI Command Reference*.

**list-deployments**

The following code example shows how to use `list-deployments`.

**AWS CLI**

**To list deployments**

The following `list-deployments` example lists the latest revision of each deployment defined in your AWS account in the current Region.

```bash
aws greengrassv2 list-deployments
```

Output:

```json
{
    "deployments": [
    {
        "revisionId": "14",
        "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "deploymentName": "Deployment for MyGreengrassCoreGroup",
        "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
        "deploymentStatus": "ACTIVE",
        "isLatestForTarget": false
    },
    {
        "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
        "revisionId": "1",
        "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "deploymentName": "Deployment for MyGreengrassCore",
        "creationTimestamp": "2021-01-06T16:10:42.407000-08:00",
        "deploymentStatus": "COMPLETED",
        "isLatestForTarget": false
    }
    ]
}
```
For more information, see Deploy components to devices in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see ListDeployments in AWS CLI Command Reference.

list-effective-deployments

The following code example shows how to use list-effective-deployments.

AWS CLI

To list deployment jobs

The following list-effective-deployments example lists the deployments that apply to an AWS IoT Greengrass core device.

```bash
aws greengrassv2 list-effective-deployments \
   --core-device-thing-name MyGreengrassCore
```

Output:

```json
{
   "effectiveDeployments": [
      {
         "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "deploymentName": "Deployment for MyGreengrassCore",
         "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
         "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
         "coreDeviceExecutionStatus": "COMPLETED",
         "reason": "SUCCESSFUL",
         "creationTimestamp": "2021-01-06T16:10:42.442000-08:00",
         "modifiedTimestamp": "2021-01-08T17:21:27.830000-08:00"
      },
      {
         "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
         "deploymentName": "Deployment for MyGreengrassCoreGroup",
         "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
         "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
         "coreDeviceExecutionStatus": "SUCCEEDED",
```

Actions and scenarios
For more information, see Check core device status in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see ListEffectiveDeployments in AWS CLI Command Reference.

**list-installed-components**

The following code example shows how to use list-installed-components.

**AWS CLI**

**To list components installed on a core device**

The following list-installed-components example lists the components that are installed on an AWS IoT Greengrass core device.

```
aws greengrassv2 list-installed-components \
   --core-device-thing-name MyGreengrassCore
```

**Output:**

```
{
   "installedComponents": [
   {
   "componentName": "aws.greengrass.Cli",
   "componentVersion": "2.0.3",
   "lifecycleState": "RUNNING",
   "isRoot": true
   },
   {
   "componentName": "aws.greengrass.Nucleus",
   "componentVersion": "2.0.3",
   "lifecycleState": "FINISHED",
   "isRoot": true
   }
   ]
}
```
For more information, see Check core device status in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see ListInstalledComponents in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a resource**

The following list-tags-for-resource example lists all tags for an AWS IoT Greengrass core device.

```bash
aws greengrassv2 list-tags-for-resource \
```

Output:

```json
{
   "tags": {
      "Owner": "richard-roe"
   }
}
```

For more information, see Tag your resources in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To add a tag to a resource**
The following **tag-resource** example adds an owner tag to an AWS IoT Greengrass core device. You can use this tag to control access to the core device based on who owns it.

```
aws greengrassv2 tag-resource \
    --tags Owner richard-roe
```

This command produces no output.

For more information, see Tag your resources in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use **untag-resource**.

**AWS CLI**

To remove a tag from a resource

The following **untag-resource** example removes an owner tag from an AWS IoT Greengrass core device.

```
aws iotsitewise untag-resource \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tag your resources in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-connectivity-info**

The following code example shows how to use **update-connectivity-info**.

**AWS CLI**

To update connectivity information for a Greengrass core device
The following update-connectivity-info example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 update-connectivity-info \
  --thing-name MyGreengrassCore \
  --cli-input-json file://core-device-connectivity-info.json
```

Contents of `core-device-connectivity-info.json`:

```json
{
  "connectivityInfo": [
    {
      "hostAddress": "192.0.2.0",
      "portNumber": 8883,
      "id": "localIP_192.0.2.0"
    }
  ]
}
```

Output:

```json
{
  "version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Manage core device endpoints in the AWS IoT Greengrass V2 Developer Guide.

- For API details, see UpdateConnectivityInfo in AWS CLI Command Reference.

AWS IoT Jobs SDK release examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Jobs SDK release.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

describe-job-execution

The following code example shows how to use describe-job-execution.

AWS CLI

To get the details of a job execution

The following describe-job-execution example retrieves the details of the latest execution of the specified job and thing.

```bash
aws iot-jobs-data describe-job-execution \
  --job-id SampleJob \ 
  --thing-name MotionSensor1 \ 
  --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```json
{
  "execution": {
    "approximateSecondsBeforeTimedOut": 88,
    "executionNumber": 2939653338,
    "jobId": "SampleJob",
    "lastUpdatedAt": 1567701875.743,
    "queuedAt": 1567701902.444,
    "status": "QUEUED",
    "thingName": "MotionSensor1",
    "versionNumber": 3
  }
}
```
For more information, see Devices and Jobs in the AWS IoT Developer Guide.

- For API details, see DescribeJobExecution in AWS CLI Command Reference.

get-pending-job-executions

The following code example shows how to use get-pending-job-executions.

AWS CLI

To get a list of all jobs that are not in a terminal status for a thing

The following get-pending-job-executions example displays a list of all jobs that aren't in a terminal state for the specified thing.

```
aws iot-jobs-data get-pending-job-executions \
   --thing-name MotionSensor1 \
   --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
   "inProgressJobs": [ ],
   "queuedJobs": [
      {
         "executionNumber": 2939653338,
         "jobId": "SampleJob",
         "lastUpdatedAt": 1567701875.743,
         "queuedAt": 1567701902.444,
         "versionNumber": 3
      }
   ]
}
```

For more information, see Devices and Jobs in the AWS IoT Developer Guide.

- For API details, see GetPendingJobExecutions in AWS CLI Command Reference.

start-next-pending-job-execution

The following code example shows how to use start-next-pending-job-execution.
AWS CLI

To get and start the next pending job execution for a thing

The following `start-next-pending-job-execution` example retrieves and starts the next job execution whose status is IN_PROGRESS or QUEUED for the specified thing.

```bash
aws iot-jobs-data start-next-pending-job-execution \
   --thing-name MotionSensor1 \
   --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```json
{
   "execution": {
      "approximateSecondsBeforeTimedOut": 88,
      "executionNumber": 2939653338,
      "jobId": "SampleJob",
      "lastUpdatedAt": 1567714853.743,
      "queuedAt": 1567701902.444,
      "startedAt": 1567714871.690,
      "status": "IN_PROGRESS",
      "thingName": "MotionSensor1",
      "versionNumber": 3
   }
}
```

For more information, see [Devices and Jobs](https://docs.aws.amazon.com/iot-device-data/latest/developer-guide/devices-and-jobs.html) in the AWS IoT Developer Guide.

update-job-execution

The following code example shows how to use `update-job-execution`.

AWS CLI

To update the status of a job execution

The following `update-job-execution` example updates the status of the specified job and thing.

```bash
aws iot-jobs-data update-job-execution \
```

Actions and scenarios
Output:

```json
{
    "executionState": {
        "status": "REMOVED",
        "versionNumber": 3
    }
}
```

For more information, see [Devices and Jobs](#) in the AWS IoT Developer Guide.

- For API details, see [UpdateJobExecution](#) in AWS CLI Command Reference.

### AWS IoT SiteWise examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT SiteWise.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**associate-assets**

The following code example shows how to use **associate-assets**.
AWS CLI

To associate a child asset to a parent asset

The following `associate-assets` example associates a wind turbine asset to a wind farm asset, where the wind turbine asset model exists as a hierarchy in the wind farm asset model.

```bash
aws iotsitewise associate-assets \
  --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
  --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \
  --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see Associating assets in the AWS IoT SiteWise User Guide.

- For API details, see AssociateAssets in AWS CLI Command Reference.

### batch-associate-project-assets

The following code example shows how to use `batch-associate-project-assets`.

AWS CLI

To associate an asset to a project

The following `batch-associate-project-assets` example associates a wind farm asset to a project.

```bash
aws iotsitewise batch-associate-project-assets \
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
  --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see Adding assets to projects in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see BatchAssociateProjectAssets in AWS CLI Command Reference.

### batch-disassociate-project-assets

The following code example shows how to use `batch-disassociate-project-assets`.
AWS CLI

To disassociate an asset from a project

The following batch-disassociate-project-assets example disassociates a wind farm asset from a project.

```bash
aws iotsitewise batch-disassociate-project-assets \
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
  --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see Adding assets to projects in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see BatchDisassociateProjectAssets in AWS CLI Command Reference.

batch-put-asset-property-value

The following code example shows how to use batch-put-asset-property-value.

AWS CLI

To send data to asset properties

The following batch-put-asset-property-value example sends power and temperature data to the asset properties identified by property aliases.

```bash
aws iotsitewise batch-put-asset-property-value \
  --cli-input-json file://batch-put-asset-property-value.json
```

Contents of batch-put-asset-property-value.json:

```json
{
  "entries": [
    {
      "entryId": "1575691200-company-windfarm-3-turbine-7-power",
      "propertyAlias": "company-windfarm-3-turbine-7-power",
      "propertyValues": [
        {
          "value": {
            "doubleValue": 4.92
          }
        }
      ]
    }
  ]
}
```
The following code example shows how to use `create-access-policy`.

**AWS CLI**

**Example 1: To grant a user administrative access to a portal**
The following `create-access-policy` example creates an access policy that grants a user administrative access to a web portal for a wind farm company.

```bash
aws iotsitewise create-access-policy \
   --cli-input-json file://create-portal-administrator-access-policy.json
```

Contents of `create-portal-administrator-access-policy.json`:

```json
{
   "accessPolicyIdentity": {
      "user": {
         "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
      }
   },
   "accessPolicyPermission": "ADMINISTRATOR",
   "accessPolicyResource": {
      "portal": {
         "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
      }
   }
}
```

Output:

```json
{
   "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
   "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE"
}
```

For more information, see Adding or removing portal administrators in the AWS IoT SiteWise User Guide.

**Example 2: To grant a user read-only access to a project**

The following `create-access-policy` example creates an access policy that grants a user read-only access to a wind farm project.

```bash
aws iotsitewise create-access-policy \
   --cli-input-json file://create-project-viewer-access-policy.json
```
Contents of create-project-viewer-access-policy.json:

```json
{
   "accessPolicyIdentity": {
      "user": {
         "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
      }
   },
   "accessPolicyPermission": "VIEWER",
   "accessPolicyResource": {
      "project": {
         "id": "a1b2c3d4-5678-90ab-cdef-eeeeEXAMPLE"
      }
   }
}
```

Output:

```json
{
   "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE",
   "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE"
}
```

For more information, see Assigning project viewers in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see CreateAccessPolicy in AWS CLI Command Reference.

create-asset-model

The following code example shows how to use create-asset-model.

AWS CLI

To create an asset model

The following create-asset-model example creates an asset model that defines a wind turbine with the following properties:

Serial number - The serial number of a wind turbine
Generated power - The generated power data stream from a wind turbine
Temperature C - The temperature data stream from a wind
turbine in CelsiusTemperature F - The mapped temperature data points from Celsius to Fahrenheit

```
aws iotsitewise create-asset-model \
  --cli-input-json file://create-wind-turbine-model.json
```

Contents of `create-wind-turbine-model.json`:

```json
{
  "assetModelName": "Wind Turbine Model",
  "assetModelDescription": "Represents a wind turbine",
  "assetModelProperties": [
    {
      "name": "Serial Number",
      "dataType": "STRING",
      "type": {
        "attribute": {}
      }
    },
    {
      "name": "Generated Power",
      "dataType": "DOUBLE",
      "unit": "kW",
      "type": {
        "measurement": {}
      }
    },
    {
      "name": "Temperature C",
      "dataType": "DOUBLE",
      "unit": "Celsius",
      "type": {
        "measurement": {}
      }
    },
    {
      "name": "Temperature F",
      "dataType": "DOUBLE",
      "unit": "Fahrenheit",
      "type": {
        "transform": {
          "expression": "temp_c * 9 / 5 + 32",
          "variables": [
```
{  "name": "temp_c",  "value": {   "propertyId": "Temperature C"  }  }
}

{  "name": "Total Generated Power",  "dataType": "DOUBLE",  "unit": "kW",  "type": {   "metric": {    "expression": "sum(power)",    "variables": [     {      "name": "power",      "value": {       "propertyId": "Generated Power"      }     }    ],    "window": {      "tumbling": {        "interval": "1h"      }    }   }  }  }
}

Output:

{  "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",  "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",  "assetModelStatus": {
For more information, see Defining asset models in the AWS IoT SiteWise User Guide.

- For API details, see CreateAssetModel in AWS CLI Command Reference.

create-asset

The following code example shows how to use create-asset.

AWS CLI

**To create an asset**

The following create-asset example creates a wind turbine asset from a wind turbine asset model.

```bash
aws iotsitewise create-asset \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
    --asset-name "Wind Turbine 1"
```

Output:

```json
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
    "assetStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Creating assets in the AWS IoT SiteWise User Guide.

- For API details, see CreateAsset in AWS CLI Command Reference.

create-dashboard

The following code example shows how to use create-dashboard.
AWS CLI

To create a dashboard

The following `create-dashboard` example creates a dashboard with a line chart that displays total generated power for a wind farm.

```
aws iotsitewise create-dashboard \
   --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
   --dashboard-name "Wind Farm" \
   --dashboard-definition file://create-wind-farm-dashboard.json
```

Contents of `create-wind-farm-dashboard.json`:

```json
{
   "widgets": [
      {
         "type": "monitor-line-chart",
         "title": "Generated Power",
         "x": 0,
         "y": 0,
         "height": 3,
         "width": 3,
         "metrics": [
            {
               "label": "Power",
               "type": "iotsitewise",
               "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
               "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
            }
         ]
      }
   ]
}
```

Output:

```json
{
   "dashboardId": "a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE",
   "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE"
}
```
For more information, see Creating dashboards (CLI) in the AWS IoT SiteWise User Guide.

- For API details, see CreateDashboard in AWS CLI Command Reference.

**create-gateway**

The following code example shows how to use create-gateway.

**AWS CLI**

**To create a gateway**

The following create-gateway example creates a gateway that runs on AWS IoT Greengrass.

```
aws iotsitewise create-gateway
   --gateway-name ExampleCorpGateway
   --gateway-platform greengrass={groupArn=arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE}
```

Output:

```
{
   "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
   "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE"
}
```

For more information, see Configuring a gateway in the AWS IoT SiteWise User Guide.

- For API details, see CreateGateway in AWS CLI Command Reference.

**create-portal**

The following code example shows how to use create-portal.

**AWS CLI**

**To create a portal**

The following create-portal example creates a web portal for a wind farm company. You can create portals only in the same Region where you enabled AWS Single Sign-On.
aws iotsitewise create-portal \
   --portal-name WindFarmPortal \
   --portal-description "A portal that contains wind farm projects for Example Corp." \
   --portal-contact-email support@example.com \
   --role-arn arn:aws:iam::123456789012:role/service-role/MySiteWiseMonitorServiceRole

Output:

```
{
   "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
   "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
   "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE.app.iotsitewise.aws",
   "portalStatus": {
      "state": "CREATING"
   },
   "ssoApplicationId": "ins-a1b2c3d4-EXAMPLE"
}
```

For more information, see Getting started with AWS IoT SiteWise Monitor in the AWS IoT SiteWise User Guide and Enabling AWS SSO in the AWS IoT SiteWise User Guide.

- For API details, see CreatePortal in AWS CLI Command Reference.

create-project

The following code example shows how to use create-project.

AWS CLI

To create a project

The following create-project example creates a wind farm project.

```
aws iotsitewise create-project \
   --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \
   --project-name "Wind Farm 1" \
   --project-description "Contains asset visualizations for Wind Farm #1 for Example Corp."
```
Output:

```json
{
    "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
}
```

For more information, see [Creating projects](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see `CreateProject` in *AWS CLI Command Reference*.

delete-access-policy

The following code example shows how to use `delete-access-policy`.

AWS CLI

**To revoke a user's access to a project or portal**

The following `delete-access-policy` example deletes an access policy that grants a user administrative access to a portal.

```bash
aws iotsitewise delete-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE
```

This command produces no output.

For more information, see [Adding or removing portal administrators](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see `DeleteAccessPolicy` in *AWS CLI Command Reference*.

delete-asset-model

The following code example shows how to use `delete-asset-model`.

AWS CLI

**To delete an asset model**
The following `delete-asset-model` example deletes a wind turbine asset model.

```
aws iotsitewise delete-asset-model \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "assetModelStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting asset models in the AWS IoT SiteWise User Guide.

- For API details, see DeleteAssetModel in AWS CLI Command Reference.

**delete-asset**

The following code example shows how to use `delete-asset`.

**AWS CLI**

To delete an asset

The following `delete-asset` example deletes a wind turbine asset.

```
aws iotsitewise delete-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{
    "assetStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting assets in the AWS IoT SiteWise User Guide.
For API details, see DeleteAsset in AWS CLI Command Reference.

**delete-dashboard**

The following code example shows how to use delete-dashboard.

**AWS CLI**

**To delete a dashboard**

The following delete-dashboard example deletes a wind turbine dashboard.

```bash
aws iotsitewise delete-dashboard \
   --dashboard-id a1b2c3d4-5678-90ab-cdef-ffffffffEXAMPLE
```

This command produces no output.

For more information, see Deleting dashboards in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see DeleteDashboard in AWS CLI Command Reference.

**delete-gateway**

The following code example shows how to use delete-gateway.

**AWS CLI**

**To delete a gateway**

The following delete-gateway example deletes a gateway.

```bash
aws iotsitewise delete-gateway \
   --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

This command produces no output.

For more information, see Ingesting data using a gateway in the AWS IoT SiteWise User Guide.

- For API details, see DeleteGateway in AWS CLI Command Reference.
delete-portal

The following code example shows how to use delete-portal.

AWS CLI

To delete a portal

The following delete-portal example deletes a web portal for a wind farm company.

```bash
aws iotsitewise delete-portal \
   --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```json
{
   "portalStatus": {
      "state": "DELETING"
   }
}
```

For more information, see Deleting a portal in the AWS IoT SiteWise User Guide.

- For API details, see DeletePortal in AWS CLI Command Reference.

delete-project

The following code example shows how to use delete-project.

AWS CLI

To delete a project

The following delete-project example deletes a wind farm project.

```bash
aws iotsitewise delete-project \
   --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

This command produces no output.

For more information, see Deleting projects in the AWS IoT SiteWise Monitor Application Guide.
For API details, see `DeleteProject` in *AWS CLI Command Reference*.

### describe-access-policy

The following code example shows how to use describe-access-policy.

**AWS CLI**

**To describe an access policy**

The following `describe-access-policy` example describes an access policy that grants a user administrative access to a web portal for a wind farm company.

```bash
aws iotsitewise describe-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE
```

Output:

```json
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",

For API details, see `DescribeAccessPolicy` in *AWS CLI Command Reference*. 
describe-asset-model

The following code example shows how to use describe-asset-model.

AWS CLI

To describe an asset model

The following describe-asset-model example describes a wind farm asset model.

```
aws iotsitewise describe-asset-model \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-22222EXAMPLE
```

Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelName": "Wind Farm Model",
    "assetModelDescription": "Represents a wind farm that comprises many wind turbines",
    "assetModelProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE",
                                "hierarchyId": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE"
                            }

describe-asset-property

The following code example shows how to use describe-asset-property.

AWS CLI

To describe an asset property
The following `describe-asset-property` example describes a wind farm asset's total generated power property.

```bash
aws iotsitewise describe-asset-property
   --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
   --property-id a1b2c3d4-5678-90ab-cdef-99999EXAMPLE
```

Output:

```json
{
  "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
  "assetName": "Wind Farm 1",
  "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",

    }
  }
}
```
For more information, see [Describing a specific asset property](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAssetProperty](#) in *AWS CLI Command Reference*.

describe-asset

The following code example shows how to use `describe-asset`.

**AWS CLI**

To describe an asset

The following `describe-asset` example describes a wind farm asset.

```
aws iotsitewise describe-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

Output:

```json
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetName": "Wind Farm 1",
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetProperties": [
        {

            "dataType": "STRING"
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW"
        }
    ]
}
```
For more information, see [Describing a specific asset](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAsset](#) in *AWS CLI Command Reference*.

**describe-dashboard**

The following code example shows how to use describe-dashboard.

**AWS CLI**

**To describe a dashboard**

The following describe-dashboard example describes the specified wind farm dashboard.

```
aws iotsitewise describe-dashboard
  --dashboard-id a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE
```

**Output:**

```
{
  "dashboardId": "a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE",
  "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE",

  "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
  "dashboardDefinition": "{"widgets":{{"type":"monitor-line-chart","title":"Generated Power","x":0,"y":0,"height":3,"width":3,"metrics":{{"label":"Power","type":"iotsitewise","assetId":"a1b2c3d4-5678-90ab-cdef-99999EXAMPLE","propertyId":"a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"}}}},
  "dashboardCreationDate": "2020-05-01T20:32:12.228476348Z",
```
describe-gateway-capability-configuration

The following code example shows how to use describe-gateway-capability-configuration.

AWS CLI

To describe a gateway capability

The following describe-gateway-capability-configuration example describes an OPC-UA source capability.

```
aws iotsitewise describe-gateway-capability-configuration \
   --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \n   --capability-namespace "iotsitewise:opcuacollector:1"
```

Output:

```
{
   "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
   "capabilityNamespace": "iotsitewise:opcuacollector:1",
   "capabilityConfiguration": 
      "{"source": ["Wind Farm #1",

      "measurementDataStreamPrefix": ""}], "capabilitySyncStatus": "IN_SYNC"
}
```

For more information, see Configuring data sources in the AWS IoT SiteWise User Guide.

- For API details, see DescribeGatewayCapabilityConfiguration in AWS CLI Command Reference.
**describe-gateway**

The following code example shows how to use `describe-gateway`.

**AWS CLI**

**To describe a gateway**

The following `describe-gateway` example describes a gateway.

```bash
aws iotsitewise describe-gateway \
--gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

Output:

```json
{
  "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
  "gatewayName": "ExampleCorpGateway",
  "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
  "gatewayPlatform": {
    "greengrass": {
      "groupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE"
    }
  },
  "gatewayCapabilitySummaries": [
    {
      "capabilityNamespace": "iotsitewise:opcuacollector:1",
      "capabilitySyncStatus": "IN_SYNC"
    }
  ],
  "creationDate": 1588369971.457,
  "lastUpdateDate": 1588369971.457
}
```

For more information, see [Ingesting data using a gateway](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/in-aws.html) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeGateway](https://docs.aws.amazon.com/cli/latest/reference/iotsitewise/describe-gateway.html) in *AWS CLI Command Reference*.

**describe-logging-options**

The following code example shows how to use `describe-logging-options`.
**AWS CLI**

**To retrieve the current AWS IoT SiteWise logging options**

The following describe-logging-options example retrieves the current AWS IoT SiteWise logging options for your AWS account in the current Region.

```
aws iotsitewise describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "level": "INFO"
    }
}
```

For more information, see [Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs](https://docs.aws.amazon.com/iot-sitewise/latest/userguide) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeLoggingOptions](https://docs.aws.amazon.com/cli/latest/reference/iotsitewise/describe-logging-options.html) in *AWS CLI Command Reference*.

**describe-portal**

The following code example shows how to use describe-portal.

**AWS CLI**

**To describe a portal**

The following describe-portal example describes a web portal for a wind farm company.

```
aws iotsitewise describe-portal \
   --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
    "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalName": "WindFarmPortal",
```
"portalDescription": "A portal that contains wind farm projects for Example Corp.",
"portalClientId": "E-a1b2c3d4e5f6_a1b2c3d4e5f6EXAMPLE",
"portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE.app.iotsitewise.aws",
"portalContactEmail": "support@example.com",
"portalStatus": {
    "state": "ACTIVE"
},
"portalCreationDate": "2020-02-04T23:01:52.90248068Z",
"portalLastUpdateDate": "2020-02-04T23:01:52.90248078Z",
"roleArn": "arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole"
}

For more information, see Administering your portals in the AWS IoT SiteWise User Guide.

- For API details, see DescribePortal in AWS CLI Command Reference.

describe-project

The following code example shows how to use describe-project.

AWS CLI

To describe a project

The following describe-project example describes a wind farm project.

```bash
aws iotsitewise describe-project \
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE
```

Output:

```json
{
  "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE",
  "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE",
  "projectName": "Wind Farm 1",
  "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
  "projectDescription": "Contains asset visualizations for Wind Farm #1 for Example Corp.",
  "projectCreationDate": "2020-02-20T21:58:43.362246001Z",
  "projectLastUpdateDate": "2020-02-20T21:58:43.362246095Z"
}
```
For more information, see [Viewing project details](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [DescribeProject](#) in *AWS CLI Command Reference*.

**disassociate-assets**

The following code example shows how to use `disassociate-assets`.

**AWS CLI**

**To disassociate a child asset from a parent asset**

The following `disassociate-assets` example disassociates a wind turbine asset from a wind farm asset.

```
aws iotsitewise disassociate-assets \
  --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
  --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \
  --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see [Associating assets](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DisassociateAssets](#) in *AWS CLI Command Reference*.

**get-asset-property-aggregates**

The following code example shows how to use `get-asset-property-aggregates`.

**AWS CLI**

**To retrieve an asset property's aggregated average and count values**

The following `get-asset-property-aggregates` example retrieves a wind turbine asset's average total power and count of total power data points for a 1 hour period in time.

```
aws iotsitewise get-asset-property-aggregates \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```
Output:

```
{
  "aggregatedValues": [
    {
      "timestamp": 1580850000.0,
      "quality": "GOOD",
      "value": {
        "average": 8723.46538886233,
        "count": 12.0
      }
    }
  ]
}
```

For more information, see [Querying asset property aggregates](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/querying-asset-property-aggregates.html) in the *AWS IoT SiteWise User Guide*.

- For API details, see [GetAssetPropertyAggregates](https://docs.aws.amazon.com/cli/latest/reference/iot/sitewise/get-asset-property-aggregates.html) in *AWS CLI Command Reference*.

### get-asset-property-value-history

The following code example shows how to use `get-asset-property-value-history`.

**AWS CLI**

To retrieve an asset property's historical values

The following `get-asset-property-value-history` example retrieves a wind turbine asset's total power values for a 20 minute period in time.

```
aws iotsitewise get-asset-property-value-history
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
  --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE
  --start-date 1580851800
  --end-date 1580853000
```
Output:

```json
{
    "assetPropertyValueHistory": [
        {
            "value": {
                "doubleValue": 7217.787046814844
            },
            "timestamp": {
                "timeInSeconds": 1580852100,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6941.242811875451
            },
            "timestamp": {
                "timeInSeconds": 1580852400,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6976.797662266717
            },
            "timestamp": {
                "timeInSeconds": 1580852700,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6890.8677520453875
            },
            "timestamp": {
                "timeInSeconds": 1580853000,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        }
    ]
}
```
For more information, see [Querying historical asset property values](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [GetAssetPropertyValueHistory](#) in *AWS CLI Command Reference*.

### get-asset-property-value

The following code example shows how to use `get-asset-property-value`.

**AWS CLI**

**To retrieve an asset property's current value**

The following `get-asset-property-value` example retrieves a wind turbine asset's current total power.

```bash
aws iotsitewise get-asset-property-value \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE
```

**Output:**

```json
{
  "propertyValue": {
    "value": {
      "doubleValue": 6890.867520453875
    },
    "timestamp": {
      "timeInSeconds": 1580853000,
      "offsetInNanos": 0
    },
    "quality": "GOOD"
  }
}
```

For more information, see [Querying current asset property values](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [GetAssetPropertyValue](#) in *AWS CLI Command Reference*. 
list-access-policies

The following code example shows how to use list-access-policies.

AWS CLI

To list all access policies

The following list-access-policies example lists all access policies for a user who is a portal administrator.

```
aws iotsitewise list-access-policies \
    --identity-type USER \ 
    --identity-id a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE
```

Output:

```
{
    "accessPolicySummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-ccccccEXAMPLE",
            "identity": {
                "user": {
                    "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbbEXAMPLE"
                }
            },
            "resource": {
                "portal": {
                    "id": "a1b2c3d4-5678-90ab-cdef-aaaaaaEXAMPLE"
                }
            },
            "permission": "ADMINISTRATOR"
        }
    ]
}
```

For more information, see Administering your portals in the AWS IoT SiteWise User Guide.

- For API details, see ListAccessPolicies in AWS CLI Command Reference.

list-asset-models

The following code example shows how to use list-asset-models.
AWS CLI

To list all asset models

The following `list-asset-models` example lists all asset models that are defined in your AWS account in the current Region.

```plaintext
aws iotsitewise list-asset-models
```

Output:

```plaintext
{
    "assetModelSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "name": "Wind Farm Model",
            "description": "Represents a wind farm that comprises many wind turbines",
            "creationDate": 1575671284.0,
            "lastUpdateDate": 1575671988.0,
            "status": {
                "state": "ACTIVE"
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",

                "state": "ACTIVE"
            }
        }
    ]
}
```

For more information, see [Listing all asset models](#) in the AWS IoT SiteWise User Guide.
• For API details, see `ListAssetModels` in *AWS CLI Command Reference*.

**list-assets**

The following code example shows how to use `list-assets`.

**AWS CLI**

**Example 1: To list all top-level assets**

The following `list-assets` example lists all assets that are top-level in the asset hierarchy tree and defined in your AWS account in the current Region.

```bash
aws iotsitewise list-assets \
  --filter TOP_LEVEL
```

**Output:**

```json
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
            "name": "Wind Farm 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "creationDate": 1575672453.0,
            "lastUpdateDate": 1575672453.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": [
                {
                    "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
                    "name": "Wind Turbines"
                }
            ]
        }
    ]
}
```

For more information, see [Listing assets](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/listing-assets.html) in the *AWS IoT SiteWise User Guide*. 

Actions and scenarios 4122
Example 2: To list all assets based on an asset model

The following list-assets example lists all assets based on an asset model and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
  "assetSummaries": [
    {
      "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
      "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
      "name": "Wind Turbine 1",
      "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "creationDate": 1575671550.0,
      "lastUpdateDate": 1575686308.0,
      "status": {
        "state": "ACTIVE"
      },
      "hierarchies": []
    }
  ]
}
```

For more information, see Listing assets in the AWS IoT SiteWise User Guide.

- For API details, see ListAssets in AWS CLI Command Reference.

**list-associated-assets**

The following code example shows how to use list-associated-assets.

**AWS CLI**

To list all assets associated to an asset in a specific hierarchy

The following list-associated-assets example lists all wind turbine assets associated to the specified wind farm asset.
aws iotsitewise list-associated-assets \
   --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \n   --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE

Output:

```
{
   "assetSummaries": [
   {
      "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
      "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
      "name": "Wind Turbine 1",
      "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "creationDate": 1575671550.0,
      "lastUpdateDate": 1575686308.0,
      "status": {
         "state": "ACTIVE"
      },
      "hierarchies": []
   }
   ]
}
```

For more information, see [Listing assets associated to a specific asset](https://docs.aws.amazon.com/iot-sitewise/latest/UserGuide/listing-assets-associated-to-specific-asset.html) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListAssociatedAssets](https://docs.aws.amazon.com/cli/latest/reference/iotsitewise/list-associated-assets.html) in *AWS CLI Command Reference*.

### list-dashboards

The following code example shows how to use `list-dashboards`.

**AWS CLI**

**To list all dashboards in a project**

The following `list-dashboards` example lists all dashboards that are defined in a project.

```bash
aws iotsitewise list-dashboards \
   --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```
For more information, see [Viewing dashboards](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [ListDashboards](#) in *AWS CLI Command Reference*.

**list-gateways**

The following code example shows how to use `list-gateways`.

**AWS CLI**

**To list all gateways**

The following `list-gateways` example lists all gateways that are defined in your AWS account in the current Region.

```
aws iotsitewise list-gateways
```

**Output:**

```
{
   "gatewaySummaries": [
      {
         "gatewayId": "a1b2c3d4-5678-90ab-cdef-fffffffEXAMPLE",
         "gatewayName": "ExampleCorpGateway",
         "gatewayCapabilitySummaries": [
            {
               "capabilityNamespace": "iotsitewise:opcuacollector:1",
               "capabilitySyncStatus": "IN_SYNC"
            }
```
For more information, see Ingesting data using a gateway in the AWS IoT SiteWise User Guide.

- For API details, see ListGateways in AWS CLI Command Reference.

**list-portals**

The following code example shows how to use list-portals.

**AWS CLI**

**To list all portals**

The following list-portals example lists all portals that are defined in your AWS account in the current Region.

```bash
aws iotsitewise list-portals
```

Output:

```json
{
   "portalSummaries": [ 
   {
      "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
      "name": "WindFarmPortal",
      "description": "A portal that contains wind farm projects for Example Corp.",
      "startUrl": "https://a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE.app.iotsitewise.aws",
      "creationDate": "2020-02-04T23:01:52.90248068Z",
      "lastUpdateDate": "2020-02-04T23:01:52.90248078Z",
      "roleArn": "arn:aws:iam::123456789012:role/service-role/MySiteWiseMonitorServiceRole"
   }
   ]
}
```
For more information, see Administering your portals in the AWS IoT SiteWise User Guide.

- For API details, see ListPortals in AWS CLI Command Reference.

list-project-assets

The following code example shows how to use list-project-assets.

AWS CLI

To list all assets associated to a project

The following list-project-assets example lists all assets that are associated to a wind farm project.

```
aws iotsitewise list-projects \
   --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

Output:

```json
{
   "assetIds": [
      "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE"
   ]
}
```

For more information, see Adding assets to projects in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see ListProjectAssets in AWS CLI Command Reference.

list-projects

The following code example shows how to use list-projects.

AWS CLI

To list all projects in a portal

The following list-projects example lists all projects that are defined in a portal.
aws iotsitewise list-projects \
   --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE

Output:

{
   "projectSummaries": [
   {
      "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
      "name": "Wind Farm 1",
      "description": "Contains asset visualizations for Wind Farm #1 for Example Corp.",
      "creationDate": "2020-02-20T21:58:43.362246001Z",
      "lastUpdateDate": "2020-02-20T21:58:43.362246095Z"
   }
   ]
}

For more information, see Viewing project details in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see ListProjects in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list all tags for a resource

The following list-tags-for-resource example lists all tags for a wind turbine asset.

aws iotsitewise list-tags-for-resource \
   --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE

Output:

{
   "tags": {

For more information, see Tagging your resources in the AWS IoT SiteWise User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**put-logging-options**

The following code example shows how to use put-logging-options.

**AWS CLI**

**To specify the level of logging**

The following put-logging-options example enables INFO level logging in AWS IoT SiteWise. Other levels include DEBUG and OFF.

```sh
aws iotsitewise put-logging-options
--logging-options level=INFO
```

This command produces no output.

For more information, see Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs in the AWS IoT SiteWise User Guide.

- For API details, see PutLoggingOptions in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To add a tag to a resource**

The following tag-resource example adds an owner tag to a wind turbine asset. This lets you control access to the asset based on who owns it.

```sh
aws iotsitewise tag-resource
```
This command produces no output.

For more information, see Tagging your resources in the AWS IoT SiteWise User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource

The following untag-resource example removes an owner tag from a wind turbine asset.

```bash
aws iotsitewise untag-resource \
  --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --tag-keys Owner
```

This command produces no output.

For more information, see Tagging your resources in the AWS IoT SiteWise User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-access-policy

The following code example shows how to use update-access-policy.

AWS CLI

To grant a project viewer ownership of a project

The following update-access-policy example updates an access policy that grants a project viewer ownership of a project.
aws iotsitewise update-access-policy \
  --access-policy-id a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE \
  --cli-input-json file://update-project-viewer-access-policy.json

Contents of update-project-viewer-access-policy.json:

```json
{
  "accessPolicyIdentity": {
    "user": {
      "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbbEXAMPLE"
    }
  },
  "accessPolicyPermission": "ADMINISTRATOR",
  "accessPolicyResource": {
    "project": {
      "id": "a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE"
    }
  }
}
```

This command produces no output.

For more information, see Assigning project owners in the AWS IoT SiteWise Monitor Application Guide.

- For API details, see UpdateAccessPolicy in AWS CLI Command Reference.

update-asset-model

The following code example shows how to use update-asset-model.

AWS CLI

  **To update an asset model**

The following update-asset-model example updates a wind farm asset model's description. This example includes the model's existing IDs and definitions, because update-asset-model overwrites the existing model with the new model.

aws iotsitewise update-asset-model \
  --cli-input-json file://update-wind-farm-model.json
Contents of update-wind-farm-model.json:

```json
{
    "assetModelName": "Wind Farm Model",
    "assetModelDescription": "Represents a wind farm that comprises many wind turbines",
    "assetModelProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",
            "name": "Region",
            "dataType": "STRING",
            "type": {
                "attribute": {}
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "hierarchyId": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
                                "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE"
                            }
                        }
                    ],
                    "window": {
                        "tumbling": {
                            "interval": "1h"
                        }
                    }
                }
            }
        }
    ],
    "assetModelHierarchies": [
    
```
Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelStatus": {
        "state": "CREATING"
    }
}
```

For more information, see [Updating asset models](https://docs.aws.amazon.com/iot-sitewise/latest/userguide/update-asset-models.html) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdateAssetModel](https://docs.aws.amazon.com/iot-sitewise/latest/apireference/API_UpdateAssetModel.html) in *AWS CLI Command Reference*.

**update-asset-property**

The following code example shows how to use `update-asset-property`.

**AWS CLI**

**Example 1: To update an asset property's alias**

The following `update-asset-property` example updates a wind turbine asset's power property alias.

```
aws iotsitewise update-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-55555EXAMPLE \
    --property-alias "/examplecorp/windfarm/1/turbine/1/power" \
    --property-notification-state DISABLED
```

This command produces no output.
For more information, see Mapping industrial data streams to asset properties in the AWS IoT SiteWise User Guide.

**Example 2: To enable asset property notifications**

The following update-asset-property example enables asset property update notifications for a wind turbine asset's power property. Property value updates are published to the MQTT topic $aws/sitewise/asset-models/<assetModelId>/assets/<assetId>/properties/<propertyId>$, where each ID is replaced by the property, asset, and model ID of the asset property.

```bash
aws iotsitewise update-asset-property \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
  --property-notification-state ENABLED \
  --property-alias "/examplecorp/windfarm/1/turbine/1/power"
```

This command produces no output.

For more information, see Interacting with other services in the AWS IoT SiteWise User Guide.

- For API details, see UpdateAssetProperty in AWS CLI Command Reference.

**update-asset**

The following code example shows how to use update-asset.

**AWS CLI**

**To update an asset's name**

The following update-asset example updates a wind turbine asset's name.

```bash
aws iotsitewise update-asset \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --asset-name "Wind Turbine 2"
```

Output:

```json
{
  "assetStatus": {
```

Actions and scenarios
For more information, see Updating assets in the AWS IoT SiteWise User Guide.
- For API details, see UpdateAsset in AWS CLI Command Reference.

update-dashboard

The following code example shows how to use update-dashboard.

AWS CLI

To update a dashboard

The following update-dashboard example changes the title of a dashboard's line chart that displays total generated power for a wind farm.

```
aws iotsitewise update-dashboard \
  --project-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE \
  --dashboard-name "Wind Farm" \
  --dashboard-definition file://update-wind-farm-dashboard.json
```

Contents of update-wind-farm-dashboard.json:

```
{
  "widgets": [ 
    {
      "type": "monitor-line-chart",
      "title": "Total Generated Power",
      "x": 0,
      "y": 0,
      "height": 3,
      "width": 3,
      "metrics": [
        {
          "label": "Power",
          "type": "iotsitewise",
          "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
          "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
        }
      ]
    }
  ]
}
```
This command produces no output.

For more information, see Creating dashboards (CLI) in the AWS IoT SiteWise User Guide.

- For API details, see UpdateDashboard in AWS CLI Command Reference.

**update-gateway-capability-configuration**

The following code example shows how to use update-gateway-capability-configuration.

**AWS CLI**

To update a gateway capability

The following update-gateway-capability-configuration example configures an OPC-UA source with the following properties:

- Trusts any certificate.
- Uses the Basic256 algorithm to secure messages.
- Uses the SignAndEncrypt mode to secure connections.
- Uses authentication credentials stored in an AWS Secrets Manager secret.

```bash
aws iotsitewise update-gateway-capability-configuration
   --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
   --capability-namespace "iotsitewise:opcuacollector:1"
   --capability-configuration file://opc-ua-capability-configuration.json
```

Contents of opc-ua-capability-configuration.json:

```json
{
    "sources": [
        {
            "name": "Wind Farm #1",
            "endpoint": {
                "certificateTrust": {
                    "type": "TrustAny"
                },
                "endpointUri": "opc.tcp://203.0.113.0:49320",
            }
        }
    ]
}
```
"securityPolicy": "BASIC256",
"messageSecurityMode": "SIGN_AND_ENCRYPT",
"identityProvider": {
   "type": "Username",
},
"nodeFilterRules": []
},
"measurementDataStreamPrefix": ""
}
]

Output:

{
   "capabilityNamespace": "iotsitewise:opcuacollector:1",
   "capabilitySyncStatus": "OUT_OF_SYNC"
}

For more information, see Configuring data sources in the AWS IoT SiteWise User Guide.

- For API details, see UpdateGatewayCapabilityConfiguration in AWS CLI Command Reference.

update-gateway

The following code example shows how to use update-gateway.

AWS CLI

To update a gateway's name

The following update-gateway example updates a gateway's name.

aws iotsitewise update-gateway \
   --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
   --gateway-name ExampleCorpGateway1

This command produces no output.

For more information, see Ingesting data using a gateway in the AWS IoT SiteWise User Guide.
For API details, see UpdateGateway in AWS CLI Command Reference.

**update-portal**

The following code example shows how to use update-portal.

**AWS CLI**

**To update a portal's details**

The following update-portal example updates a web portal for a wind farm company.

```bash
aws iotsitewise update-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \
    --portal-name WindFarmPortal \
    --portal-description "A portal that contains wind farm projects for Example Corp." \
    --portal-contact-email support@example.com \
    --role-arn arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole
```

Output:

```json
{
    "portalStatus": {
        "state": "UPDATING"
    }
}
```

For more information, see Administering your portals in the AWS IoT SiteWise User Guide.

For API details, see UpdatePortal in AWS CLI Command Reference.

**update-project**

The following code example shows how to use update-project.

**AWS CLI**

**To update a project's details**

The following update-project example updates a wind farm project.
aws iotsitewise update-project
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeEXAMPLE \
    --project-name "Wind Farm 1" \ 
    --project-description "Contains asset visualizations for Wind Farm #1 for Example Corp."

This command produces no output.

For more information, see Changing project details in the AWS IoT SiteWise Monitor Application Guide.

• For API details, see UpdateProject in AWS CLI Command Reference.

AWS IoT Things Graph examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Things Graph.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
  • Actions

Actions

associate-entity-to-thing

The following code example shows how to use associate-entity-to-thing.

AWS CLI

To associate a thing with a device
The following associate-entity-to-thing example associates a thing with a device. The example uses a motion sensor device that is in the public namespace.

```bash
aws iotthingsgraph associate-entity-to-thing \
--thing-name "MotionSensorName" \
--entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

This command produces no output.

For more information, see Creating and Uploading Models in the AWS IoT Things Graph User Guide.

- For API details, see AssociateEntityToThing in AWS CLI Command Reference.

**create-flow-template**

The following code example shows how to use create-flow-template.

**AWS CLI**

**To create a flow**

The following create-flow-template example creates a flow (workflow). The value of MyFlowDefinition is the GraphQL that models the flow.

```bash
aws iotthingsgraph create-flow-template \
--definition language=GRAPHQL,text="MyFlowDefinition"
```

**Output:**

```json
{
"summary": {
  "createdAt": 1559248067.545,
  "revisionNumber": 1
}
}
```

For more information, see Working with Flows in the AWS IoT Things Graph User Guide.

- For API details, see CreateFlowTemplate in AWS CLI Command Reference.
create-system-instance

The following code example shows how to use `create-system-instance`.

AWS CLI

To create a system instance

The following `create-system-instance` example creates a system instance. The value of `MySystemInstanceDefinition` is the GraphQL that models the system instance.

```bash
aws iotthingsgraph create-system-instance -
    -definition language=GRAPHQL,text="MySystemInstanceDefinition" \
    --target CLOUD \
    --flow-actions-role-arn myRoleARN
```

Output:

```json
{
    "summary": {
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
        "status": "NOT_DEPLOYED",
        "target": "CLOUD",
        "createdAt": 1559249315.208,
        "updatedAt": 1559249315.208
    }
}
```

For more information, see "Working with Systems and Flow Configurations" in the AWS IoT Things Graph User Guide.

- For API details, see `CreateSystemInstance` in AWS CLI Command Reference.

create-system-template

The following code example shows how to use `create-system-template`.

AWS CLI

To create a system
The following create-system-template example creates a system. The value of MySystemDefinition is the GraphQL that models the system.

```
aws iotthingsgraph create-system-template \\n   --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{
   "summary": {
      "createdAt": 1559249776.254,
      "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
      "revisionNumber": 1
   }
}
```

For more information, see Creating Systems in the AWS IoT Things Graph User Guide.

- For API details, see CreateSystemTemplate in AWS CLI Command Reference.

**delete-flow-template**

The following code example shows how to use delete-flow-template.

**AWS CLI**

To delete a flow

The following delete-flow-template example deletes a flow (workflow).

```
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.

- For API details, see DeleteFlowTemplate in AWS CLI Command Reference.
**delete-namespace**

The following code example shows how to use delete-namespace.

**AWS CLI**

**To delete a namespace**

The following delete-namespace example deletes a namespace.

```bash
aws iotthingsgraph delete-namespace
```

Output:

```
{
  "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
  "namespaceName": "us-west-2/123456789012/default"
}
```

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.

- For API details, see DeleteNamespace in AWS CLI Command Reference.

**delete-system-instance**

The following code example shows how to use delete-system-instance.

**AWS CLI**

**To delete a system instance**

The following delete-system-instance example deletes a system instance.

```bash
aws iotthingsgraph delete-system-instance
   --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.
• For API details, see DeleteSystemInstance in AWS CLI Command Reference.

delete-system-template

The following code example shows how to use delete-system-template.

AWS CLI

To delete a system

The following delete-system-template example deletes a system.

```bash
aws iotthingsgraph delete-system-template \
   --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.

• For API details, see DeleteSystemTemplate in AWS CLI Command Reference.

deploy-system-instance

The following code example shows how to use deploy-system-instance.

AWS CLI

To deploy a system instance

The following delete-system-template example deploys a system instance.

```bash
aws iotthingsgraph deploy-system-instance \
   --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```json
{
   "summary": {
      "createdAt": 1559249776.254,
      "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
   }
}
```
For more information, see Working with Systems and Flow Configurations in the AWS IoT Things Graph User Guide.

- For API details, see DeploySystemInstance in AWS CLI Command Reference.

deprecate-flow-template

The following code example shows how to use deprecate-flow-template.

AWS CLI

To deprecate a flow

The following deprecate-flow-template example deprecates a flow (workflow).

```bash
aws iotthingsgraph deprecate-flow-template \
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.

- For API details, see DeprecateFlowTemplate in AWS CLI Command Reference.

deprecate-system-template

The following code example shows how to use deprecate-system-template.

AWS CLI

To deprecate a system

The following deprecate-system-template example deprecates a system.

```bash
aws iotthingsgraph deprecate-system-template \
```
This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.

- For API details, see DeprecateSystemTemplate in AWS CLI Command Reference.

describe-namespace

The following code example shows how to use describe-namespace.

AWS CLI

To get a description of your namespace

The following describe-namespace example gets a description of your namespace.

```
aws iotthingsgraph describe-namespace
```

Output:

```
{
  "namespaceName": "us-west-2/123456789012/default",
  "trackingNamespaceName": "aws",
  "trackingNamespaceVersion": 1,
  "namespaceVersion": 5
}
```

For more information, see Namespaces in the AWS IoT Things Graph User Guide.

- For API details, see DescribeNamespace in AWS CLI Command Reference.

dissociate-entity-from-thing

The following code example shows how to use dissociate-entity-from-thing.

AWS CLI

To dissociate a thing from a device
The following `dissociate-entity-from-thing` example dissociates a thing from a device.

```bash
aws iotthingsgraph dissociate-entity-from-thing \
   --thing-name "MotionSensorName" \
   --entity-type "DEVICE"
```

This command produces no output.

For more information, see [Creating and Uploading Models](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DissociateEntityFromThing](#) in *AWS CLI Command Reference*.

**get-entities**

The following code example shows how to use `get-entities`.

**AWS CLI**

To get definitions for entities

The following `get-entities` example gets a definition for a device model.

```bash
aws iotthingsgraph get-entities \
   --ids "urn:tdm:aws/examples:DeviceModel:MotionSensor"
```

Output:

```json
{
   "descriptions": [ 
   {
      "id": "urn:tdm:aws/examples:DeviceModel:MotionSensor",
      "type": "DEVICE_MODEL",
      "createdAt": 1559256190.599,
      "definition": { 
         "language": "GRAPHQL",
         "text": "##
# Specification of motion sensor devices interface.
##

type MotionSensor @deviceModel(id: "urn:tdm:aws/examples:deviceModel:MotionSensor",
    capability: "urn:tdm:aws/examples:capability:MotionSensorCapability")
{ignore:void}"
      }
   }
   ]
}
```
For more information, see Creating and Uploading Models in the AWS IoT Things Graph User Guide.

- For API details, see GetEntities in AWS CLI Command Reference.

get-flow-template-revisions

The following code example shows how to use get-flow-template-revisions.

AWS CLI

To get revision information about a flow

The following get-flow-template-revisions example gets revision information about a flow (workflow).

```bash
aws iotthingsgraph get-flow-template-revisions \\
```

Output:

```json
{
    "summaries": [
        {
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        }
    ]
}
```

For more information, see Working with Flows in the AWS IoT Things Graph User Guide.

- For API details, see GetFlowTemplateRevisions in AWS CLI Command Reference.

get-flow-template

The following code example shows how to use get-flow-template.
AWS CLI

To get a flow definition

The following `get-flow-template` example gets a definition for a flow (workflow).

```
aws iotthingsgraph get-flow-template \
```

Output:

```
{
  "description": {
    "summary": {
      "revisionNumber": 1,
      "createdAt": 1559247540.292
    },
    "definition": {
      "language": "GRAPHQL",
      "text": "query MyFlow($camera: string!, $screen: string!) {
    @workflowType(id: "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow")
    @annotation(type: "tgc:FlowEvent", id: "sledged790c1b2bcd949e09da0c9bfc077f79d",
    x: 1586, y: 653) @triggers(definition: "{MotionSensor(description: \"") @position(x: 1045, y: 635.6666564941406) {\n      condition(expr: "devices[name == "motionSensor"][0].events[name == "StateChanged"]().lastEvent")\n      action(expr: \")")
    }") {
      variables {
        cameraResult @property(id: "urn:tdm:aws/examples:property:CameraStateProperty")
      }
      steps {
        step(name: "Camera", outEvent: ["sledged790c1b2bcd949e09da0c9bfc077f79d"]) @position(x: 1377, y: 638.6666564941406) {
          DeviceActivity(deviceModel: "urn:tdm:aws/examples:deviceModel:Camera",
            out: "cameraResult", deviceId: "${camera}")
            {\n              capture
            }
        }
        step(name: "Screen", inEvent: ["sledged790c1b2bcd949e09da0c9bfc077f79d"]) @position(x: 1675.6666870117188, y: 637.9999847412109) {
          DeviceActivity(deviceModel: "urn:tdm:aws/examples:deviceModel:Screen",
            deviceModel: "${screen}")
            {\n              display(imageUrl: "$cameraResult.lastClickedImage")
            }
        }
      }
    }
  }
}
```

For more information, see [Working with Flows](https://aws.amazon.com/documentation/iot-devices/) in the *AWS IoT Things Graph User Guide*. 
- For API details, see `GetFlowTemplate` in *AWS CLI Command Reference*.

**get-namespace-deletion-status**

The following code example shows how to use get-namespace-deletion-status.

**AWS CLI**

**To get the status of the namespace deletion task**

The following `get-namespace-deletion-status` example gets the status of the namespace deletion task.

```bash
aws iotthingsgraph get-namespace-deletion-status
```

Output:

```
{
  "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
  "namespaceName": "us-west-2/123456789012/default",
  "status": "SUCCEEDED"
}
```

For more information, see [Namespaces](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see `GetNamespaceDeletionStatus` in *AWS CLI Command Reference*.

**get-system-instance**

The following code example shows how to use get-system-instance.

**AWS CLI**

**To get a system instance**

The following `get-system-instance` example gets a definition for a system instance.

```bash
aws iotthingsgraph get-system-instance \
  --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:
For more information, see Working with Systems and Flow Configurations in the AWS IoT Things Graph User Guide.

- For API details, see GetSystemInstance in AWS CLI Command Reference.

get-system-template-revisions

The following code example shows how to use get-system-template-revisions.

AWS CLI

To get revision information about a system
The following `get-system-template-revisions` example gets revision information about a system.

```bash
aws iotthingsgraph get-system-template-revisions \
   --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```json
{
   "summaries": [
      {
         "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
         "revisionNumber": 1,
         "createdAt": 1559247540.656
      }
   ]
}
```

For more information, see [Working with Systems and Flow Configurations](https://docs.aws.amazon.com/iotthingsgraph/latest/userguide/) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetSystemTemplateRevisions](https://docs.aws.amazon.com/cli/latest/reference/iotthingsgraph/get-system-template-revisions.html) in *AWS CLI Command Reference*.

### get-system-template

The following code example shows how to use `get-system-template`.

**AWS CLI**

#### To get a system

The following `get-system-template` example gets a definition for a system.

```bash
aws iotthingsgraph get-system-template \
   --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```json
{
   "description": {
```
get-upload-status

The following code example shows how to use get-upload-status.

AWS CLI

To get the status of your entity upload

The following get-upload-status example gets the status of your entity upload operation. The value of MyUploadId is the ID value returned by the upload-entity-definitions operation.

```
aws iotthingsgraph get-upload-status \
    --upload-id "MyUploadId"
```

Output:
For more information, see [Modeling Entities](https://docs.aws.amazon.com/iotthingsgraph/latest/userguide/) in the [AWS IoT Things Graph User Guide](https://docs.aws.amazon.com/iotthingsgraph/latest/userguide/).

### list-flow-execution-messages

The following code example shows how to use `list-flow-execution-messages`.

#### AWS CLI

**To get information about events in a flow execution**

The following `list-flow-execution-messages` example gets information about events in a flow execution.

```bash
aws iotthingsgraph list-flow-execution-messages \
```

**Output:**

```json
{
   "messages": [
      {
         "eventType": "EXECUTION_STARTED",
         " messageId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
         "payload": "Flow execution started",
         "timestamp": 1559247540.656
      }
   ]
}
```

For more information, see [Working with Flows](https://docs.aws.amazon.com/iotthingsgraph/latest/userguide/) in the [AWS IoT Things Graph User Guide](https://docs.aws.amazon.com/iotthingsgraph/latest/userguide/).
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list all tags for a resource

The following list-tags-for-resource example list all tags for an AWS IoT Things Graph resource.

```bash
aws iotthingsgraph list-tags-for-resource \
```

Output:

```json
{
    "tags": [
        {
            "key": "Type",
            "value": "Residential"
        }
    ]
}
```

For more information, see Tagging Your AWS IoT Things Graph Resources in the AWS IoT Things Graph User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

search-entities

The following code example shows how to use search-entities.

AWS CLI

To search for entities

The following search-entities example searches for all entities of type EVENT.
aws iotthingsgraph search-entities
   --entity-types "EVENT"

Output:

```json
{
   "descriptions": [
   {
   "id": "urn:tdm:aws/examples:Event:MotionSensorEvent",
   "type": "EVENT",
   "definition": {
   "language": "GRAPHQL",
   "text": "##
# Description of events emitted by motion
sensor.
##

type MotionSensorEvent @eventType(id: "urn:tdm:aws/examples:event:MotionSensorEvent", payload: "urn:tdm:aws/examples:property:MotionSensorStateProperty\") {ignore: void}"
   }
   },
   {
   "id": "urn:tdm:us-west-2/123456789012/default:Event:CameraClickedEventV2",
   "type": "EVENT",
   "definition": {
   "language": "GRAPHQL",
   "text": "type CameraClickedEventV2 @eventType(id: "urn:tdm:us-west-2/123456789012/default:event:CameraClickedEventV2", payload: "urn:tdm:aws:Property:Boolean\"){ignore: void}"
   }
   },
   {
   "id": "urn:tdm:us-west-2/123456789012/default:Event:MotionSensorEventV2",
   "type": "EVENT",
   "definition": {
   "language": "GRAPHQL",
   "text": "# Event emitted by the motion sensor.

type MotionSensorEventV2 @eventType(id: "urn:tdm:us-west-2/123456789012/default:event:MotionSensorEventV2", payload: "urn:tdm:us-west-2/123456789012/default:property:MotionSensorStateProperty2\") {ignore: void}"
   }
   }
   ],
   "nextToken": "urn:tdm:us-west-2/123456789012/default:Event:MotionSensorEventV2"
}
```
For more information, see [AWS IoT Things Graph Data Model Reference](aws-iot-things-graph-data-model-reference) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchEntities](aws-iot-things-graph-api-reference) in *AWS CLI Command Reference*.

**search-flow-executions**

The following code example shows how to use `search-flow-executions`.

**AWS CLI**

**To search for flow executions**

The following search-flow-executions example search for all executions of a flow in a specified system instance.

```bash
aws iotthingsgraph search-flow-executions \ 
   --system-instance-id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```json
{
  "summaries": [
    {
      "createdAt": 1559247540.656,
      "flowExecutionId": "f6294f1e-b109-4b93-9073-f451a2da2da",
      "status": "RUNNING",
      "systemInstanceId": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
      "updatedAt": 1559247540.656
    }
  ]
}
```

For more information, see [Working with Systems and Flow Configurations](aws-iot-things-graph-user-guide) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchFlowExecutions](aws-iot-things-graph-api-reference) in *AWS CLI Command Reference*.
search-flow-templates

The following code example shows how to use search-flow-templates.

AWS CLI

To search for flows (or workflows)

The following search-flow-templates example searches for all flows (workflows) that contain the Camera device model.

```
aws iotthingsgraph search-flow-templates \
   --filters name="DEVICE_MODEL_ID",value="urn:tdm:aws/examples:DeviceModel:Camera"
```

Output:

```
{
   "summaries": [
   {
      "revisionNumber": 1,
      "createdAt": 1559247540.292
   },
   {
      "revisionNumber": 3,
      "createdAt": 1548283099.27
   }
   ]
}
```

For more information, see Working with Flows in the AWS IoT Things Graph User Guide.

- For API details, see SearchFlowTemplates in AWS CLI Command Reference.

search-system-instances

The following code example shows how to use search-system-instances.

AWS CLI

To search for system instances
The following `search-system-instances` example searches for all system instances that contain the specified system.

```
aws iotthingsgraph search-system-instances \
```

Output:

```
{
   "summaries": [
       {
           "id": "urn:tdm:us-west-2/123456789012/default:Deployment:DeploymentForSample",
           "status": "NOT_DEPLOYED",
           "target": "GREENGRASS",
           "greengrassGroupName": "ThingsGraphGrnGr",
           "createdAt": 1555716314.707,
           "updatedAt": 1555716314.707
       },
       {
           "id": "urn:tdm:us-west-2/123456789012/default:Deployment:MockDeployment",
           "status": "DELETED_IN_TARGET",
           "target": "GREENGRASS",
           "greengrassGroupName": "ThingsGraphGrnGr",
           "createdAt": 1549416462.049,
           "updatedAt": 1549416722.361,
           "greengrassGroupId": "01d04b07-2a51-467f-9d03-0c90b3cdcaaf",
           "greengrassGroupVersionId": "7365aed7-2d3e-4d13-aad8-75443d45eb05"
       },
       {
           "id": "urn:tdm:us-west-2/123456789012/default:Deployment:MockDeployment2",
           "status": "DEPLOYED_IN_TARGET",
           "target": "GREENGRASS",
           "greengrassGroupName": "ThingsGraphGrnGr",
```
For more information, see [Working with Systems and Flow Configurations](#) in the [AWS IoT Things Graph User Guide](#).

- For API details, see [SearchSystemInstances](#) in [AWS CLI Command Reference](#).

**search-system-templates**

The following code example shows how to use search-system-templates.

**AWS CLI**

**To search for system**

The following search-system-templates example searches for all systems that contain the specified flow.
aws iotthingsgraph search-system-templates \

Output:

```
{
   "summaries": [
   {
      "revisionNumber": 1,
      "createdAt": 1548283099.433
   }
   ]
}
```

For more information, see [Working with Flows](aws-iot-things-graph-user-guide) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchSystemTemplates](aws-cli-command-reference) in *AWS CLI Command Reference*.

**search-things**

The following code example shows how to use search-things.

**AWS CLI**

**To search for things associated with devices and device models**

The following search-things example searches for all things that are associated with the HCSR501MotionSensor device.

```
aws iotthingsgraph search-things \
   --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

Output:

```
{
   "things": [
```
For more information, see [Creating and Uploading Models](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchThings](#) in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To create a tag for a resource**

The following `tag-resource` example creates a tag for the specified resource.

```bash
aws iotthingsgraph tag-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/Room218" \
    --tags key="Type",value="Residential"
```

This command produces no output.

For more information, see [Tagging Your AWS IoT Things Graph Resources](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

### undeploy-system-instance

The following code example shows how to use `undeploy-system-instance`.
AWS CLI

To undeploy a system instance from its target

The following undeploy-system-instance example removes a system instance from its target.

```
aws iotthingsgraph undeploy-system-instance \
  --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room215"
```

Output:

```
{
  "summary": {
    "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room215",
    "status": "PENDING_DELETE",
    "target": "GREENGRASS",
    "greengrassGroupName": "ThingsGraphGrnGr",
    "createdAt": 1553189694.255,
    "updatedAt": 1559344549.601,
    "greengrassGroupId": "01d04b07-2a51-467f-9d03-0c90b3cdcaaf",
    "greengrassGroupVersionId": "731b371d-d644-4b67-ac64-3934e99b75d7"
  }
}
```

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the AWS IoT Things Graph User Guide.

- For API details, see UndeploySystemInstance in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag for a resource

The following untag-resource example removes a tag for the specified resource.
This command produces no output.

For more information, see Tagging Your AWS IoT Things Graph Resources in the AWS IoT Things Graph User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-flow-template

The following code example shows how to use update-flow-template.

AWS CLI

To update a flow

The following update-flow-template example updates a flow (workflow). The value of MyFlowDefinition is the GraphQL that models the flow.

```
aws iotthingsgraph update-flow-template \
  --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow" \
  --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{
   "summary": {
      "createdAt": 1559248067.545,
      "revisionNumber": 2
   }
}
```

For more information, see Working with Flows in the AWS IoT Things Graph User Guide.

- For API details, see UpdateFlowTemplate in AWS CLI Command Reference.
**update-system-template**

The following code example shows how to use `update-system-template`.

**AWS CLI**

To update a system

The following `update-system-template` example updates a system. The value of `MySystemDefinition` is the GraphQL that models the system.

```bash
aws iotthingsgraph update-system-template \
   --id "urn:tdm:us-west-2/123456789012/default:System:MySystem" \
   --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```json
{
   "summary": {
      "createdAt": 1559249776.254,
      "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
      "revisionNumber": 2
   }
}
```

For more information, see [Creating Systems](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UpdateSystemTemplate](#) in *AWS CLI Command Reference*.

**upload-entity-definitions**

The following code example shows how to use `upload-entity-definitions`.

**AWS CLI**

To upload entity definitions

The following `upload-entity-definitions` example uploads entity definitions to your namespace. The value of `MyEntityDefinitions` is the GraphQL that models the entities.

```bash
aws iotthingsgraph upload-entity-definitions \
```

Actions and scenarios
Output:

```json
{
  "uploadId": "f6294f1e-b109-4bbe-9073-f451a2dda2da"
}
```

For more information, see [Modeling Entities](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UploadEntityDefinitions](#) in *AWS CLI Command Reference*.

---

**AWS IoT Wireless examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Wireless.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- *Actions*

**Actions**

associate-aws-account-with-partner-account

The following code example shows how to use `associate-aws-account-with-partner-account`.

**AWS CLI**

To associate a partner account with your AWS account
The following associate-aws-account-with-partner-account example associates the following Sidewalk account credentials with your AWS account.

```
aws iotwireless associate-aws-account-with-partner-account \
   --sidewalk
AmazonId="12345678901234",AppServerPrivateKey="a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
```

Output:

```
{
   "Sidewalk": {
      "AmazonId": "12345678901234",
      "AppServerPrivateKey": "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
   }
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the AWS IoT Developers Guide.

- For API details, see AssociateAwsAccountWithPartnerAccount in AWS CLI Command Reference.

**associate-wireless-device-with-thing**

The following code example shows how to use associate-wireless-device-with-thing.

**AWS CLI**

To associate a thing to a wireless device

The following associate-wireless-device-with-thing example associates a thing to your wireless device that has the specified ID.

```
aws iotwireless associate-wireless-device-with-thing \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
   --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.
associate-wireless-gateway-with-certificate

The following code example shows how to use associate-wireless-gateway-with-certificate.

**AWS CLI**

**To associate the certificate with the wireless gateway**

The following associate-wireless-gateway-with-certificate associates a wireless gateway with a certificate.

```
aws iotwireless associate-wireless-gateway-with-certificate \\
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \\
   --iot-certificate-id "a123b45c6d78e9f012a34cd5e6a7890b12c345e6f78a1b234c56d7e890a1234"
```

Output:

```
{
   "IotCertificateId": "a123b45c6d78e9f012a34cd5e6a7890b12c345e6f78a1b234c56d7e890a1234"
}
```

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

• For API details, see AssociateWirelessGatewayWithCertificate in AWS CLI Command Reference.

associate-wireless-gateway-with-thing

The following code example shows how to use associate-wireless-gateway-with-thing.

**AWS CLI**

**To associate a thing to a wireless gateway**

The following associate-wireless-gateway-with-thing example associates a thing to a wireless gateway.
aws iotwireless associate-wireless-gateway-with-thing \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
   --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see AssociateWirelessGatewayWithThing in AWS CLI Command Reference.

create-destination

The following code example shows how to use create-destination.

AWS CLI

To create an IoT wireless destination

The following create-destination example creates a destination for mapping a device message to an AWS IoT rule. Before you run this command, you must have created an IAM role that gives AWS IoT Core for LoRaWAN the permissions necessary to send data to the AWS IoT rule.

aws iotwireless create-destination \
   --name IoTWirelessDestination \
   --expression-type RuleName \
   --expression IoTWirelessRule \
   --role-arn arn:aws:iam::123456789012:role/IoTWirelessDestinationRole

Output:

{
   "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination",
   "Name": "IoTWirelessDestination"
}

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.
create-device-profile

The following code example shows how to use create-device-profile.

AWS CLI

To create a new device profile

The following create-device-profile example creates a new IoT wireless device profile.

```
aws iotwireless create-device-profile
```

Output:

```
{
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d",
  "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

create-service-profile

The following code example shows how to use create-service-profile.

AWS CLI

To create a new service profile

The following create-service-profile example creates a new IoT wireless service profile.

```
aws iotwireless create-service-profile
```

Output:
For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see CreateServiceProfile in AWS CLI Command Reference.

create-wireless-device

The following code example shows how to use create-wireless-device.

AWS CLI

To create an IoT wireless device

The following create-wireless-device example creates a wireless device resource of the type LoRaWAN.

```shell
aws iotwireless create-wireless-device \
   --cli-input-json file://input.json
```

Contents of input.json:

```json
{
   "Description": "My LoRaWAN wireless device",
   "DestinationName": "IOTWirelessDestination",
   "LoRaWAN": {
      "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",
      "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",
      "OtaaV1_1": {
         "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
         "JoinEui": "b4c231a359bc2e3d",
         "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
      },
      "DevEui": "ac12efc654d23fc2"
   },
   "Name": "SampleIoTWirelessThing"
}
```
"Type": LoRaWAN
}

Output:

{
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
  "Id": "1ffd32c8-8130-4194-96df-622f072a315f"
}

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://aws.amazon.com) in the [AWS IoT Developers Guide](https://aws.amazon.com).

- For API details, see [CreateWirelessDevice](https://aws.amazon.com) in [AWS CLI Command Reference](https://aws.amazon.com).

create-wireless-gateway-task-definition

The following code example shows how to use create-wireless-gateway-task-definition.

**AWS CLI**

To create a wireless gateway task definition

The following create-wireless-gateway-task-definition automatically creates tasks using this task definition for all gateways with the specified current version.

```
aws iotwireless create-wireless-gateway-task-definition \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "AutoCreateTasks": true,
  "Name": "TestAutoUpdate",
  "Update":{
    "UpdateDataSource" : "s3://cupsalphagafirmwarebin/station",
    "UpdateDataRole" : "arn:aws:iam::001234567890:role/SDK_Test_Role",
    "LoRaWAN" :{
      "CurrentVersion" :{
        "PackageVersion" : "1.0.0",
```

**Actions and scenarios**
create-wireless-gateway-task

The following code example shows how to use `create-wireless-gateway-task`.

**AWS CLI**

To create the task for a wireless gateway

The following `create-wireless-gateway-task` example creates a task for a wireless gateway.

```bash
aws iotwireless create-wireless-gateway-task \\ --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \\ --wireless-gateway-task-definition-id "aa000102-0304-b0cd-ef56-a1b23cde456a"
```

Output:

```json
{
}
```
"WirelessGatewayTaskDefinitionId": "aa204003-0604-30fb-ac82-a4f95aaf450a",
"Status": "Success"
}

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see CreateWirelessGatewayTask in AWS CLI Command Reference.

create-wireless-gateway

The following code example shows how to use create-wireless-gateway.

AWS CLI

To create a wireless gateway

The following create-wireless-gateway example creates a wireless LoRaWAN device gateway.

```
aws iotwireless create-wireless-gateway \
   --lorawan GatewayEui="a1b2c3d4567890ab",RfRegion="US915" \
   --name "myFirstLoRaWANGateway" \
   --description "Using my first LoRaWAN gateway"
```

Output:

```
{
   "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessGateway/12345678-a1b2-3c45-67d8-e90fa1b2c34d",
   "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see CreateWirelessGateway in AWS CLI Command Reference.

delete-destination

The following code example shows how to use delete-destination.
To delete an IoT wireless destination

The following delete-destination example deletes the wireless destination resource with the name IoTWirelessDestination that you created.

```bash
aws iotwireless delete-destination \
   --name "IoTWirelessDestination"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

* For API details, see DeleteDestination in AWS CLI Command Reference.

delete-device-profile

The following code example shows how to use delete-device-profile.

AWS CLI

To delete a device profile

The following delete-device-profile example deletes a device profile with the specified ID that you created.

```bash
aws iotwireless delete-device-profile \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

* For API details, see DeleteDeviceProfile in AWS CLI Command Reference.

delete-service-profile

The following code example shows how to use delete-service-profile.
AWS CLI

**To delete a service profile**

The following delete-service-profile example deletes a service profile with the specified ID that you created.

```sh
aws iotwireless delete-service-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iotwireless/latest/developerguide/add-profiles-to-aws-iot-core-for-lorawan.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteServiceProfile](http://docs.aws.amazon.com/cli/latest/reference/iotwireless/delete-service-profile.html) in *AWS CLI Command Reference*.

**delete-wireless-device**

The following code example shows how to use delete-wireless-device.

AWS CLI

**To delete a wireless device**

The following delete-wireless-device example deletes a wireless device that has the specified ID.

```sh
aws iotwireless delete-wireless-device \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iotwireless/latest/developerguide/establish-device-gateway-connection.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteWirelessDevice](http://docs.aws.amazon.com/cli/latest/reference/iotwireless/delete-wireless-device.html) in *AWS CLI Command Reference*.

**delete-wireless-gateway-task-definition**

The following code example shows how to use delete-wireless-gateway-task-definition.
AWS CLI

To delete a wireless gateway task definition

The following delete-wireless-gateway-task-definition example deletes the wireless gateway task definition that you created with the following ID.

```
aws iotwireless delete-wireless-gateway-task-definition
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see DeleteWirelessGatewayTaskDefinition in AWS CLI Command Reference.

delete-wireless-gateway-task

The following code example shows how to use delete-wireless-gateway-task.

AWS CLI

To delete a wireless gateway task

The following delete-wireless-gateway-task example deletes the wireless gateway task that has the specified ID.

```
aws iotwireless delete-wireless-gateway-task
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see DeleteWirelessGatewayTask in AWS CLI Command Reference.

delete-wireless-gateway

The following code example shows how to use delete-wireless-gateway.
AWS CLI

**To delete a wireless gateway**

The following delete-wireless-gateway example deletes a wireless gateway that has the specified ID.

```
aws iotwireless delete-wireless-gateway \
--id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/wireless/latest/developerguide/connect-device-gateway-to-aws-iot-core.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteWirelessGateway](https://docs.aws.amazon.com/iotwireless/latest/APIReference/API_DeleteWirelessGateway.html) in *AWS CLI Command Reference*.

**disassociate-aws-account-from-partner-account**

The following code example shows how to use disassociate-aws-account-from-partner-account.

**AWS CLI**

**To disassociate the partner account from the AWS account**

The following disassociate-aws-account-from-partner-account example disassociates a partner account from your currently associated AWS account.

```
aws iotwireless disassociate-aws-account-from-partner-account \
--partner-account-id "12345678901234" \
--partner-type "Sidewalk"
```

This command produces no output.

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/wireless/latest/developerguide/add-gateway-device-to-aws-iot-core.html) in the *AWS IoT Developers Guide*.

- For API details, see [DisassociateAwsAccountFromPartnerAccount](https://docs.aws.amazon.com/iotwireless/latest/APIReference/API_DisassociateAwsAccountFromPartnerAccount.html) in *AWS CLI Command Reference*.
**disassociate-wireless-device-from-thing**

The following code example shows how to use `disassociate-wireless-device-from-thing`.

**AWS CLI**

**To disassociate the thing from the wireless device**

The following `disassociate-wireless-device-from-thing` example disassociates a wireless device from its currently associated thing.

```bash
aws iotwireless disassociate-wireless-device-from-thing 
--id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see DisassociateWirelessDeviceFromThing in AWS CLI Command Reference.

**disassociate-wireless-gateway-from-certificate**

The following code example shows how to use `disassociate-wireless-gateway-from-certificate`.

**AWS CLI**

**To disassociate the certificate from the wireless gateway**

The following `disassociate-wireless-gateway-from-certificate` disassociates a wireless gateway from its currently associated certificate.

```bash
aws iotwireless disassociate-wireless-gateway-from-certificate 
--id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.
• For API details, see DisassociateWirelessGatewayFromCertificate in AWS CLI Command Reference.

disassociate-wireless-gateway-from-thing

The following code example shows how to use disassociate-wireless-gateway-from-thing.

AWS CLI

To disassociate the thing from the wireless gateway

The following disassociate-wireless-gateway-from-thing example disassociates a wireless gateway from its currently associated thing.

```
aws iotwireless disassociate-wireless-gateway-from-thing \\
--id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.
• For API details, see DisassociateWirelessGatewayFromThing in AWS CLI Command Reference.

get-destination

The following code example shows how to use get-destination.

AWS CLI

To get information about an IoT wireless destination

The following get-destination example gets information about the destination resource with the name IoTWirelessDestination that you created.

```
aws iotwireless get-destination \\
--name "IoTWirelessDestination"
```

Output:
For more information, see Add destinations to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetDestination in AWS CLI Command Reference.

**get-device-profile**

The following code example shows how to use get-device-profile.

**AWS CLI**

To get information about a device profile

The following get-device-profile example gets information about the device profile with the specified ID that you created.

```bash
aws iotwireless get-device-profile \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

Output:

```json
{
   "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d",
   "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
   "LoRaWAN": {
       "MacVersion": "1.0.3",
       "MaxDutyCycle": 10,
       "Supports32BitFCnt": false,
       "RegParamsRevision": "RP002-1.0.1",
       "SupportsJoin": true,
       "RfRegion": "US915"
   }
}
```
For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

• For API details, see GetDeviceProfile in AWS CLI Command Reference.

get-partner-account

The following code example shows how to use get-partner-account.

AWS CLI

To get the partner account information

The following get-partner-account example gets information about your Sidewalk account that has the following ID.

```
aws iotwireless get-partner-account \\
    --partner-account-id "12345678901234" \\
    --partner-type "Sidewalk"
```

Output:

```
{
    "Sidewalk": {
        "AmazonId": "12345678901234",
        "Fingerprint": "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234",
        "AccountLinked": false
    }
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the AWS IoT Developers Guide.

• For API details, see GetPartnerAccount in AWS CLI Command Reference.
get-service-endpoint

The following code example shows how to use get-service-endpoint.

AWS CLI

To get the service endpoint

The following get-service-endpoint example gets the account-specific endpoint for CUPS protocol.

```bash
aws iotwireless get-service-endpoint
```

Output:

```json
{
  "ServiceType": "CUPS",
  "ServiceEndpoint": "https://A1RMKZ37ACAGOT.cups.lorawan.us-east-1.amazonaws.com:443",
  "ServerTrust": "-----BEGIN CERTIFICATE-----

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com) in the *AWS IoT Developers Guide*.

- For API details, see [GetServiceEndpoint](https://docs.aws.amazon.com) in *AWS CLI Command Reference*.

**get-service-profile**

The following code example shows how to use get-service-profile.

### AWS CLI

#### To get information about a service profile

The following get-service-profile example gets information about the service profile with the specified ID that you created.

```bash
aws iotwireless get-service-profile \
   --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

**Output:**

```json
{
   "Arn": "arn:aws:iotwireless:us-east-1:651419225604:ServiceProfile/538185bb-d7e7-4b95-96a0-c51aa4a5b9a0",
   "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
   "LoRaWAN": {
      "HrAllowed": false,
      "NwkGeoLoc": false,
      "DrMax": 15,
      "UlBucketSize": 4096,
      "PrAllowed": false,
      "ReportDevStatusBattery": false,
      "DrMin": 0,
      "DlRate": 60,
      "AddGwMetadata": false,
      "ReportDevStatusMargin": false,
      "MinGwDiversity": 1,
      "RaAllowed": false,
      "DlBucketSize": 4096,
      "DevStatusReqFreq": 24,
   }
}
```
For more information, see [Add profiles to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/add-profiles.html) in the *AWS IoT Developers Guide*.

- For API details, see [GetServiceProfile](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/get-service-profile.html) in *AWS CLI Command Reference*.

### get-wireless-device-statistics

The following code example shows how to use `get-wireless-device-statistics`.

**AWS CLI**

**To get operating information about a wireless device**

The following `get-wireless-device-statistics` example gets operating information about a wireless device.

```bash
aws iotwireless get-wireless-device-statistics \
    --wireless-device-id "1ffd32c8-8130-4194-96df-622f072a315f"
```

Output:

```json
{
    "WirelessDeviceId": "1ffd32c8-8130-4194-96df-622f072a315f"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/connect-devices-to-iot-core.html) in the *AWS IoT Developers Guide*.

### get-wireless-device

The following code example shows how to use `get-wireless-device`.

**AWS CLI**

**To get information about the wireless device**

```bash
aws iotwireless get-wireless-device \
    --wireless-device-id "1ffd32c8-8130-4194-96df-622f072a315f"
```

Output:

```json
{
    "WirelessDeviceId": "1ffd32c8-8130-4194-96df-622f072a315f"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/connect-devices-to-iot-core.html) in the *AWS IoT Developers Guide*.

The following `get-wireless-device` example lists the available widgets in your AWS account.

```bash
aws iotwireless get-wireless-device \
    --identifier "1ffd32c8-8130-4194-96df-622f072a315f" \
    --identifier-type WirelessDeviceID
```

Output:

```json
{
    "Name": "myLoRaWANDevice",
    "ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/44b87eb4-9bce-423d-b5fc-973f5ecc358b",
    "DestinationName": "IoTWirelessDestination",
    "Id": "1ffd32c8-8130-4194-96df-622f072a315f",
    "ThingName": "44b87eb4-9bce-423d-b5fc-973f5ecc358b",
    "Type": "LoRaWAN",
    "LoRaWAN": {
        "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",
        "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",
        "OtaaV1_1": {
            "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
            "JoinEui": "b4c231a359bc2e3d",
            "NwkKey": "01c3f004a2d6e0ffe32c4eda14bcd2b4"
        },
        "DevEui": "ac12efc654d23fc2"
    },
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
    "Description": "My LoRaWAN wireless device"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iot/latest/developerguide/connect-device-lorawan.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

### get-wireless-gateway-certificate

The following code example shows how to use `get-wireless-gateway-certificate`.
AWS CLI

To get the ID of a certificate associated with a wireless gateway

The following get-wireless-gateway-certificate example gets the certificate ID associated with a wireless gateway that has the specified ID.

```
aws iotwireless get-wireless-gateway-certificate \
    --id "6c44ab31-8b4d-407a-bed3-19b6c7cda551"
```

Output:

```
{
    "IotCertificateId": "8ea4aae3db34c78c76e75d9a830356869ead69729997e0603e5fd032c804b6f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGatewayCertificate in AWS CLI Command Reference.

get-wireless-gateway-firmware-information

The following code example shows how to use get-wireless-gateway-firmware-information.

AWS CLI

To get firmware information about a wireless gateway

The following get-wireless-gateway-firmware-information example gets firmware version and other information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-firmware-information \
    --id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```
{
    "LoRaWAN": {
```
For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGatewayFirmwareInformation in AWS CLI Command Reference.

get-wireless-gateway-statistics

The following code example shows how to use get-wireless-gateway-statistics.

AWS CLI

To get operating information about a wireless gateway

The following get-wireless-gateway-statistics example gets operating information about a wireless gateway.

```bash
aws iotwireless get-wireless-gateway-statistics \
   --wireless-gateway-id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```json
{
   "WirelessGatewayId": "3039b406-5cc9-4307-925b-9948c63da25b"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGatewayStatistics in AWS CLI Command Reference.

get-wireless-gateway-task-definition

The following code example shows how to use get-wireless-gateway-task-definition.
AWS CLI

To get information about a wireless gateway task definition

The following get-wireless-gateway-task-definition example gets information about the wireless task definition with the specified ID.

```
aws iotwireless get-wireless-gateway-task-definition \
--id "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
```

Output:

```
{
   "AutoCreateTasks": true,
   "Name": "TestAutoUpdate",
   "Update":{
      "UpdateDataSource": "s3://cupsalphagafirmwarebin/station",
      "UpdateDataRole": "arn:aws:iam::001234567890:role/SDK_Test_Role",
      "LoRaWAN":{
         "CurrentVersion":{
            "PackageVersion": "1.0.0",
            "Station": "2.0.5",
            "Model": "linux"
         },
         "UpdateVersion":{
            "PackageVersion": "1.0.1",
            "Station": "2.0.5",
            "Model": "minihub"
         }
      }
   }
}
```

---

get-wireless-gateway-task

The following code example shows how to use get-wireless-gateway-task.
AWS CLI

To get information about the wireless gateway task

The following get-wireless-gateway-task example gets information about the wireless gateway task with the specified ID.

```bash
aws iotwireless get-wireless-gateway-task \
--id "11693a46-6866-47c3-a031-c9a616e7644b"
```

Output:

```
{
    "WirelessGatewayId": "6c44ab31-8b4d-407a-bed3-19b6c7cda551",
    "WirelessGatewayTaskDefinitionId": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",
    "Status": "Success"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGatewayTask in AWS CLI Command Reference.

get-wireless-gateway

The following code example shows how to use get-wireless-gateway.

AWS CLI

To get information about a wireless gateway

The following get-wireless-gateway example gets information about the wireless gateway myFirstLoRaWANGateway.

```bash
aws iotwireless get-wireless-gateway \
--identifier "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
--identifier-type WirelessGatewayId
```

Output:

```
{

```
For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see GetWirelessGateway in AWS CLI Command Reference.

### list-destinations

The following code example shows how to use list-destinations.

**AWS CLI**

**To list the wireless destinations**

The following list-destinations example lists the available destinations registered to your AWS account.

```bash
aws iotwireless list-destinations
```

Output:

```json
{
   "DestinationList": [
   {
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination",
      "Name": "IoTWirelessDestination",
      "Expression": "IoTWirelessRule",
      "OwnerId": "123456789012",
      "CreatedAt": "2023-04-15T12:00:00Z",
      "UpdatedAt": "2023-04-15T12:00:00Z"
   }
   
   {
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/AnotherDestination",
      "Name": "AnotherDestination",
      "Expression": "AnotherRule",
      "OwnerId": "123456789012",
      "CreatedAt": "2023-04-16T12:00:00Z",
      "UpdatedAt": "2023-04-16T12:00:00Z"
   }
   ]
}
```
"Description": "Destination for messages processed using
IoTWirelessRule",
  "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
}],
{
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination2",
  "Name": "IoTWirelessDestination2",
  "Expression": "IoTWirelessRule2",
  "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
}
]
}

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListDestinations in AWS CLI Command Reference.

list-device-profiles

The following code example shows how to use list-device-profiles.

AWS CLI

To list the device profiles

The following list-device-profiles example lists the available device profiles registered to your AWS account.

```bash
aws iotwireless list-device-profiles
```

Output:

```json
{
   "DeviceProfileList": [
      {
         "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
         "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d"
      },
```
For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListDeviceProfiles in AWS CLI Command Reference.

list-partner-accounts

The following code example shows how to use list-partner-accounts.

AWS CLI

To list the partner accounts

The following list-partner-accounts example lists the available partner accounts associated with your AWS account.

```
aws iotwireless list-partner-accounts
```

Output:

```
{
    "Sidewalk": [
        {
            "AmazonId": "78965678771228",
            "Fingerprint": "bd96d8ef66dbfd2160eb60e156849e82ad7018b8b73c1ba0b4fc65c32498ee35"
        },
        {
            "AmazonId": "89656787651228",
            "Fingerprint": "bc5e99e151c07be14be7e6603e4489c53f858b271213a36ebe3370777ba06e9b"
        }
    ]
}
```
For more information, see Amazon Sidewalk Integration for AWS IoT Core in the AWS IoT Developers Guide.

- For API details, see ListPartnerAccounts in AWS CLI Command Reference.

### list-service-profiles

The following code example shows how to use list-service-profiles.

**AWS CLI**

**To list the service profiles**

The following `list-service-profiles` example lists the available service profiles registered to your AWS account.

```
aws iotwireless list-service-profiles
```

**Output:**

```
{
   "ServiceProfileList": [
   {
      "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/538185bb-d7e7-4b95-96a0-c51aa4a5b9a0"
   },
   {
      "Id": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/ea8bc823-5d13-472e-8d26-9550737d8100"
   }
   ]
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListServiceProfiles in AWS CLI Command Reference.
**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To list the tags assigned to the resource

The following `list-tags-for-resource` example lists the tags assigned to a wireless destination resource.

```
aws iotwireless list-tags-for-resource \
    --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination"
```

Output:

```
{
    "Tags": [
        {
            "Value": "MyValue",
            "Key": "MyTag"
        }
    ]
}
```

For more information, see [Describe your AWS IoT Core for LoRaWAN resources](https://docs.aws.amazon.com/iot/latest/developerguide/iot-core-lorawan.html) in the *AWS IoT Developers Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/iotwireless/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**list-wireless-devices**

The following code example shows how to use `list-wireless-devices`.

**AWS CLI**

To list the available wireless devices

The following `list-wireless-devices` example lists the available wireless devices registered to your AWS account.
aws iotwireless list-wireless-devices

Output:

```json
{
   "WirelessDeviceList": [
      {
         "Name": "myLoRaWANDevice",
         "DestinationName": "IoTWirelessDestination",
         "Id": "1ffd32c8-8130-4194-96df-622f072a315f",
         "Type": "LoRaWAN",
         "LoRaWAN": {
            "DevEui": "ac12efc654d23fc2"
         },
         "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f"
      }
   ]
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://docs.aws.amazon.com/iotwireless/latest/developerguide/lorawan_setup.html) in the *AWS IoT Developers Guide*.

### list-wireless-gateway-task-definitions

The following code example shows how to use `list-wireless-gateway-task-definitions`.

**AWS CLI**

**To list the wireless gateway task definitions**

The following `list-wireless-gateway-task-definitions` example lists the available wireless gateway task definitions registered to your AWS account.

aws iotwireless list-wireless-gateway-task-definitions

Output:

```json
{
}
```
"TaskDefinitions": [
  {
    "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",
    "LoRaWAN": {
      "CurrentVersion": {
        "PackageVersion": "1.0.0",
        "Station": "2.0.5",
        "Model": "linux"
      },
      "UpdateVersion": {
        "PackageVersion": "1.0.1",
        "Station": "2.0.5",
        "Model": "minihub"
      }
    }
  }
]

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListWirelessGatewayTaskDefinitions in AWS CLI Command Reference.

list-wireless-gateways

The following code example shows how to use list-wireless-gateways.

AWS CLI

To list the wireless gateways

The following list-wireless-gateways example lists the available wireless gateways in your AWS account.

/aws iotwireless list-wireless-gateways

Output:

{
  "WirelessGatewayList": ["
For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see ListWirelessGateways in AWS CLI Command Reference.

**send-data-to-wireless-device**

The following code example shows how to use send-data-to-wireless-device.

**AWS CLI**

**To send data to the wireless device**

The following send-data-to-wireless-device example sends a decrypted application data frame to the wireless device.

```
aws iotwireless send-data-to-wireless-device \
  --id "11aa5eae-2f56-4b8e-a023-b28d98494e49" \
```

--transmit-mode "1" \
--payload-data "SGVsbG8gVG8gRGV2c2lt" \
--wireless-metadata LoRaWAN={FPort=1}

Output:

```
{
    MessageId: "6011dd36-0043d6eb-0072-0008"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see SendDataToWirelessDevice in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To specify a tag key and value for a resource**

The following tag-resource example tags the wireless destination IoTWirelessDestination with the key MyTag and value MyValue.

```
aws iotwireless tag-resource \
    --resource-arn "arn:aws:iotwireless:us-east-1:651419225604:Destination/IoTWirelessDestination" \
    --tags Key="MyTag",Value="MyValue"
```

This command produces no output.

For more information, see Describe your AWS IoT Core for LoRaWAN resources in the AWS IoT Developers Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**test-wireless-device**

The following code example shows how to use test-wireless-device.
**AWS CLI**

**To test the wireless device**

The following test-wireless-device example sends uplink data of Hello to a device with specified ID.

```
aws iotwireless test-wireless-device \
   --id "11aa5eae-2f56-4b8e-a023-b28d98494e49"
```

Output:

```
{
   Result: "Test succeeded. one message is sent with payload: hello"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](https://aws.amazon.com/getting-started/guides/lora-connect/) in the *AWS IoT Developers Guide*.

- For API details, see [TestWirelessDevice](https://docs.aws.amazon.com/iot/latest/APIReference/API_TestWirelessDevice.html) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove one or more tags from a resource**

The following untag-resource example removes the tag `MyTag` and its value from the wireless destination `IoTWirelessDestination`.

```
aws iotwireless untag-resource \
   --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/IoTWirelessDestination" \
   --tag-keys "MyTag"
```

This command produces no output.

For more information, see [Describe your AWS IoT Core for LoRaWAN resources](https://aws.amazon.com/getting-started/guides/lora-describe/) in the *AWS IoT Developers Guide*. 
• For API details, see UntagResource in AWS CLI Command Reference.

update-destination

The following code example shows how to use update-destination.

AWS CLI

To update the properties of a destination

The following update-destination example updates the description property of a wireless destination.

```
aws iotwireless update-destination \
   --name "IoTWirelessDestination" \
   --description "Destination for messages processed using IoTWirelessRule"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

• For API details, see UpdateDestination in AWS CLI Command Reference.

update-partner-account

The following code example shows how to use update-partner-account.

AWS CLI

To update the properties of a partner account

The following update-partner-account updates the AppServerPrivateKey for the account that has the specified ID.

```
aws iotwireless update-partner-account \
   --partner-account-id "78965678771228" \
   --partner-type "Sidewalk" \
   --sidewalk
   AppServerPrivateKey="f798ab4899346a88599180fee9e14fa1ada7b6df989425b7c6d2146dd6c815bb"
```

This command produces no output.
For more information, see Amazon Sidewalk Integration for AWS IoT Core in the AWS IoT Developers Guide.

- For API details, see UpdatePartnerAccount in AWS CLI Command Reference.

**update-wireless-device**

The following code example shows how to use update-wireless-device.

**AWS CLI**

**To update the properties of a wireless device**

The following update-wireless-device example updates the properties of a wireless device registered to your AWS account.

```bash
aws iotwireless update-wireless-device \
  --id "1ffd32c8-8130-4194-96df-622f072a315f" \
  --destination-name IoTWirelessDestination2 \
  --description "Using my first LoRaWAN device"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see UpdateWirelessDevice in AWS CLI Command Reference.

**update-wireless-gateway**

The following code example shows how to use update-wireless-gateway.

**AWS CLI**

**To update the wireless gateway**

The following update-wireless-gateway example updates the description of your wireless gateway.

```bash
aws iotwireless update-wireless-gateway \
  --id "3285bdc7-5a12-4991-84ed-dadca65e342e" \
  --description "Using my LoRaWAN gateway"
```
This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the AWS IoT Developers Guide.

- For API details, see UpdateWirelessGateway in AWS CLI Command Reference.

Amazon IVS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**batch-get-channel**

The following code example shows how to use batch-get-channel.

**AWS CLI**

To get channel configuration information about multiple channels

The following batch-get-channel example lists information about the specified channels.

```bash
aws ivs batch-get-channel \ 
    --arns arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDdefgh \ 
    arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl
```
Output:

```json
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDEFGh",
            "authorized": false,
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "insecureIngest": false,
            "latencyMode": "LOW",
            "name": "channel-1",
            "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel-1.abcdEFGH.m3u8",
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "srt": {
                "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
                "passphrase": "AB1C2defGHiJkLMNo3PqQRstUvwxyzaBCDEfghh4ijk1MN5opqrStuVWxyzAbCDEfghIJ"
            },
            "tags": {},
            "type": "STANDARD"
        },
        {
            "authorized": false,
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "insecureIngest": true,
            "latencyMode": "LOW",
            "name": "channel-2",
            "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel-2.abcdEFGH.m3u8",
            "preset": "",
            "recordingConfigurationArn": "",
            "srt": {
                "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
                "passphrase": "BA1C2defGHiJkLMNo3PqQRstUvwxyzaBCDEfghh4ijk1MN5opqrStuVWxyzAbCDEfghIJ"
            },
            "tags": {},
        }
    ]
}
```
The following code example shows how to use `batch-get-stream-key`.

**AWS CLI**

To get information about multiple stream keys

The following `batch-get-stream-key` example gets information about the specified stream keys.

```bash
aws ivs batch-get-stream-key \
  --arns arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh \
  arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop
```

Output:

```json
{
  "streamKeys": [
    {
      "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "tags": {}
    },
    {
      "value": "sk_us-west-2_abcdABCDefgh_567890ghijkl",
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "tags": {}
    }
  ]
}
```
batch-start-viewer-session-revocation

The following code example shows how to use batch-start-viewer-session-revocation.

AWS CLI

To revoke viewer sessions for multiple channel-ARN and viewer-ID pairs

The following batch-start-viewer-session-revocation example performs session revocation on multiple channel-ARN and viewer-ID pairs simultaneously. The request may complete normally but return values in the errors field if the caller does not have permission to revoke specified session.

```
aws ivs batch-start-viewer-session-revocation \
   --viewer-sessions '[["channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDEFGh1","viewerId":"abcdefg1","viewerSessionVersionsLessThanOrEqualTo":1234567890],\n   ["channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDEFGh2","viewerId":"abcdefg2","viewerSessionVersionsLessThanOrEqualTo":1234567890]]'
```

Output:

```
{
   "errors": [  
      
      
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDEFGh1",
      "viewerId": "abcdefg1",
      "code": "403",
      "message": "not authorized",
   ],
   
   
   "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDEFGh2",
   "viewerId": "abcdefg2",
   "code": "403",
   "message": "not authorized",
 }
```
For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

- For API details, see BatchStartViewerSessionRevocation in AWS CLI Command Reference.

**create-channel**

The following code example shows how to use create-channel.

**AWS CLI**

**Example 1: To create a channel with no recording**

The following create-channel example creates a new channel and an associated stream key to start streaming.

```bash
aws ivs create-channel \\
  --name "test-channel" \\
  --no-insecure-ingest
```

**Output:**

```json
{
  "channel": {
    "authorized": false,
    "name": "test-channel",
    "latencyMode": "LOW",
    "playbackRestrictionPolicyArn": "",
    "recordingConfigurationArn": "",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase": "AB1C2defGHijklMNopqrStuvWxyzAbCDEfghIJ"
    },
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
    "insecureIngest": false,
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
  }
}
```
For more information, see [Create a Channel](#) in the [IVS Low-Latency User Guide](#).

Example 2: To create a channel with recording enabled, using the RecordingConfiguration resource specified by its ARN

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up recording for the channel.

```bash
aws ivs create-channel \
  --name test-channel-with-recording \
  --insecure-ingest \
```

Output:

```json
{
  "channel": {
    "name": "test-channel-with-recording",
    "latencyMode": "LOW",
    "type": "STANDARD",
    "playbackRestrictionPolicyArn": "",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase": "BA1C2defGHijkLMNo3PqRstUvwxyzaBCDEfghh4ijk1MN5opqrStuVWxyzAbCDEfghIJ"
    }
  }
}```
For more information, see [Record to Amazon S3](#) in the *IVS Low-Latency User Guide*.

**Example 3: To create a channel with a playback restriction policy specified by its ARN**

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up a playback restriction policy for the channel.

```bash
aws ivs create-channel \
   --name test-channel-with-playback-restriction-policy \
   --insecure-ingest \
```

**Output:**

```json
{
   "channel": {
      "name": "test-channel-with-playback-restriction-policy",
      "latencyMode": "LOW",
      "type": "STANDARD",
      "recordingConfigurationArn": "",
      "srt": {
```
For more information, see Undesired Content and Viewers in the IVS Low-Latency User Guide.

- For API details, see CreateChannel in AWS CLI Command Reference.

**create-playback-restriction-policy**

The following code example shows how to use create-playback-restriction-policy.

**AWS CLI**

To create a playback restriction policy

The following create-playback-restriction-policy example creates a new playback restriction policy.

```bash
code
aws ivs create-playback-restriction-policy \
  --name "test-playback-restriction-policy" \
  --enable-strict-origin-enforcement \
  --tags "key1=value1, key2=value2" \
  --allowed-countries US MX \
```
Output:

```json
{
    "playbackRestrictionPolicy": {
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).

- For API details, see [CreatePlaybackRestrictionPolicy](#) in [AWS CLI Command Reference](#).

**create-recording-configuration**

The following code example shows how to use `create-recording-configuration`.

**AWS CLI**

**To create a RecordingConfiguration resource**

The following `create-recording-configuration` example creates a RecordingConfiguration resource to enable recording to Amazon S3.

```
aws ivs create-recording-configuration \
    --name "test-recording-config" \
    --recording-reconnect-window-seconds 60 \
    --tags "key1=value1, key2=value2"
```
--rendition-configuration renditionSelection="CUSTOM",renditions="HD" \
--thumbnail-configuration 
recordingMode="INTERVAL",targetIntervalSeconds=1,storage="LATEST",resolution="LOWEST_RESOLUTION" \
--destination-configuration s3={bucketName=demo-recording-bucket}

Output:

```json
{
    "recordingConfiguration": {
        "name": "test-recording-config",
        "destinationConfiguration": {
            "s3": {
                "bucketName": "demo-recording-bucket"
            }
        },
        "state": "CREATING",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        },
        "thumbnailConfiguration": {
            "recordingMode": "INTERVAL",
            "targetIntervalSeconds": 1,
            "resolution": "LOWEST_RESOLUTION",
            "storage": [
                "LATEST"
            ]
        },
        "recordingReconnectWindowSeconds": 60,
        "renditionConfiguration": {
            "renditionSelection": "CUSTOM",
            "renditions": [
                "HD"
            ]
        }
    }
}
```

For more information, see [Record to Amazon S3](https://aws.amazon.com) in the *Amazon Interactive Video Service User Guide*. 
create-stream-key

The following code example shows how to use create-stream-key.

AWS CLI

To create a stream key

The following create-stream-key example creates a stream key for a specified ARN (Amazon Resource Name).

```
aws ivs create-stream-key \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "streamKey": {
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see CreateStreamKey in AWS CLI Command Reference.

delete-channel

The following code example shows how to use delete-channel.

AWS CLI

To delete a channel and its associated stream keys

The following delete-channel example deletes the channel with the specified ARN (Amazon Resource Name).
aws ivs delete-channel \
   --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh

This command produces no output.

For more information, see Create a Channel in the IVS Low-Latency User Guide.
• For API details, see DeleteChannel in AWS CLI Command Reference.

delete-playback-key-pair

The following code example shows how to use delete-playback-key-pair.

AWS CLI

To delete a specified playback key pair

The following delete-playback-key-pair example returns the fingerprint of the specified key pair.

aws ivs delete-playback-key-pair \

This command produces no output.

For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.
• For API details, see DeletePlaybackKeyPair in AWS CLI Command Reference.

delete-playback-restriction-policy

The following code example shows how to use delete-playback-restriction-policy.

AWS CLI

To delete a playback restriction policy

The following delete-playback-restriction-policy example deletes the playback restriction policy with the specified policy ARN (Amazon Resource Name).

aws ivs delete-playback-restriction-policy \
This command produces no output.

For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).

- For API details, see [DeletePlaybackRestrictionPolicy](#) in [AWS CLI Command Reference](#).

delete-recording-configuration

The following code example shows how to use delete-recording-configuration.

**AWS CLI**

**To delete the RecordingConfiguration resource specified by its ARN**

The following delete-recording-configuration example deletes the RecordingConfiguration resource with the specified ARN.

```
aws ivs delete-recording-configuration
  --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

This command produces no output.

For more information, see [Record to Amazon S3](#) in the [Amazon Interactive Video Service User Guide](#).

- For API details, see [DeleteRecordingConfiguration](#) in [AWS CLI Command Reference](#).

delete-stream-key

The following code example shows how to use delete-stream-key.

**AWS CLI**

**To delete a stream key**

The following delete-stream-key example deletes the stream key for a specified ARN (Amazon Resource Name), so it can no longer be used to stream.

```
aws ivs delete-stream-key
```
This command produces no output.

For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see DeleteStreamKey in AWS CLI Command Reference.

get-channel

The following code example shows how to use get-channel.

AWS CLI

To get a channel's configuration information

The following get-channel example gets the channel configuration for a specified channel ARN (Amazon Resource Name).

```bash
aws ivs get-channel \\
  --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```json
{
  "channel": {
    "name": "channel-1",
    "latencyMode": "LOW",
    "type": "STANDARD",
    "playbackRestrictionPolicyArn": "",
    "preset": "",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase": "AB1C2defGHijkLMNo3PqRstUvwxyzABCD12cdEFgh",
      "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
      "insecureIngest": false,
      "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
```
For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see GetChannel in AWS CLI Command Reference.

get-playback-key-pair

The following code example shows how to use get-playback-key-pair.

AWS CLI

To get a specified playback key pair

The following get-playback-key-pair example returns the fingerprint of the specified key pair.

```bash
aws ivs get-playback-key-pair \
```

Output:

```json
{
    "keyPair": {
        "name": "my-playback-key",
        "tags": {}
    }
}
```

For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

- For API details, see GetPlaybackKeyPair in AWS CLI Command Reference.

get-playback-restriction-policy

The following code example shows how to use get-playback-restriction-policy.
AWS CLI

To get a playback restriction policy's configuration information

The following get-playback-restriction-policy example gets the playback restriction policy configuration with the specified policy ARN (Amazon Resource Name).

```bash
aws ivs get-playback-restriction-policy \
```

Output:

```json
{
    "playbackRestrictionPolicy": {
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the IVS Low-Latency User Guide.

- For API details, see GetPlaybackRestrictionPolicy in AWS CLI Command Reference.

get-recording-configuration

The following code example shows how to use get-recording-configuration.
AWS CLI

To get information about a RecordingConfiguration resource

The following get-recording-configuration example gets information about the RecordingConfiguration resource for the specified ARN.

```bash
aws ivs get-recording-configuration \
   --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

Output:

```json
{
  "recordingConfiguration": {
    "destinationConfiguration": {
      "s3": {
        "bucketName": "demo-recording-bucket"
      }
    },
    "name": "test-recording-config",
    "recordingReconnectWindowSeconds": 60,
    "state": "ACTIVE",
    "tags": {
      "key1": "value1",
      "key2": "value2"
    },
    "thumbnailConfiguration": {
      "recordingMode": "INTERVAL",
      "targetIntervalSeconds": 1,
      "resolution": "LOWEST_RESOLUTION",
      "storage": ["LATEST"
      ]
    },
    "renditionConfiguration": {
      "renditionSelection": "CUSTOM",
      "renditions": ["HD"
      ]
    }
  }
}
```
For more information, see Record to Amazon S3 in the Amazon Interactive Video Service User Guide.

- For API details, see GetRecordingConfiguration in AWS CLI Command Reference.

get-stream-key

The following code example shows how to use get-stream-key.

AWS CLI

To get information about a stream

The following get-stream-key example gets information about the specified stream key.

```
aws ivs get-stream-key \
```

Output:

```
{
    "streamKey": {
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see GetStreamKey in AWS CLI Command Reference.

get-stream-session

The following code example shows how to use get-stream-session.

AWS CLI

To get metadata for a specified stream
The following `get-stream-session` example gets the metadata configuration for the specified channel ARN (Amazon Resource Name) and the specified stream; if streamId is not provided, the most recent stream for the channel is selected.

```
aws ivs get-stream-session \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --stream-id "mystream"
```

Output:

```
{
    "streamSession": {
        "streamId": "mystream1",
        "startTime": "2023-06-26T19:09:28+00:00",
        "channel": {
            "name": "mychannel",
            "latencyMode": "LOW",
            "type": "STANDARD",
            "srt": {
                "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
                "passphrase": "AB1C2defGHijklMNopqrStuwxyzAbCDEfghIj"
            },
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "playbackUrl": "url-string",
            "authorized": false,
            "insecureIngest": false,
            "preset": ""
        },
        "ingestConfiguration": {
            "video": {
                "avcProfile": "Baseline",
                "avcLevel": "4.2",
                "codec": "avc1.42C02A",

}
}

For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see GetStreamSession in AWS CLI Command Reference.

get-stream

The following code example shows how to use get-stream.

AWS CLI

To get information about a stream

The following get-stream example gets information about the stream for the specified channel.

```bash
aws ivs get-stream \
   --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```json
{
   "stream": {
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
      "startTime": "2020-05-05T21:55:38Z",
      "state": "LIVE",
      "health": "HEALTHY",
      "streamId": "st-ABCDEfghij01234KLMN5678"
   }
}
For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see GetStream in AWS CLI Command Reference.

import-playback-key-pair

The following code example shows how to use import-playback-key-pair.

AWS CLI

To import the public portion of a new key pair

The following import-playback-key-pair example imports the specified public key (specified as a string in PEM format) and returns the arn and fingerprint of the new key pair.

```bash
aws ivs import-playback-key-pair 
   --name "my-playback-key" 
   --public-key-material "G1lbnQxOTA3BgNVBAMMMFdoeSBhcmUgeW91IGRl..."
```

Output:

```json
{
   "keyPair": {
      "name": "my-playback-key",
      "tags": {}
   }
}
```

For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

- For API details, see ImportPlaybackKeyPair in AWS CLI Command Reference.

list-channels

The following code example shows how to use list-channels.
Example 1: To get summary information about all channels

The following `list-channels` example lists all channels for your AWS account.

```bash
aws ivs list-channels
```

Output:

```json
{
   "channels": [
      {
         "name": "channel-1",
         "latencyMode": "LOW",
         "authorized": false,
         "insecureIngest": false,
         "preset": "",
         "playbackRestrictionPolicyArn": "",
         "tags": {},
         "type": "STANDARD"
      },
      {
         "name": "channel-2",
         "latencyMode": "LOW",
         "authorized": false,
         "insecureIngest": false,
         "preset": "",
         "recordingConfigurationArn": "",
         "tags": {},
         "type": "STANDARD"
      }
   ]
}
```

For more information, see [Create a Channel](link) in the *IVS Low-Latency User Guide*. 

Actions and scenarios
Example 2: To get summary information about all channels, filtered by the specified RecordingConfiguration ARN

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified RecordingConfiguration ARN.

```bash
code/aws ivs list-channels \
```

Output:

```json
{
   "channels": [
   {
      "name": "channel-1",
      "latencyMode": "LOW",
      "authorized": false,
      "insecureIngest": false,
      "preset": "",
      "playbackRestrictionPolicyArn": "",
      "tags": {},
      "type": "STANDARD"
   }
   ]
}
```

For more information, see [Record to Amazon S3](https://docs.aws.amazon.com/ivs/latest/userguide/record-to-s3.html) in the *IVS Low-Latency User Guide*.

Example 3: To get summary information about all channels, filtered by the specified PlaybackRestrictionPolicy ARN

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified PlaybackRestrictionPolicy ARN.

```bash
code/aws ivs list-channels \
```
Output:

```json
{
  "channels": [
    {
      "name": "channel-2",
      "latencyMode": "LOW",
      "authorized": false,
      "preset": "",
      "recordingConfigurationArn": "",
      "tags": {},
      "type": "STANDARD"
    }
  ]
}
```

For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).

- For API details, see [ListChannels](#) in [AWS CLI Command Reference](#).

**list-playback-key-pairs**

The following code example shows how to use `list-playback-key-pairs`.

**AWS CLI**

**To get summary information about all playback key pairs**

The following `list-playback-key-pairs` example returns information about all key pairs.

```bash
aws ivs list-playback-key-pairs
```

Output:

```json
{
  "keyPairs": [
    {
      "name": "test-key-0",
      "tags": {}
    }
  ]
}
```
For more information, see Setting Up Private Channels in the Amazon Interactive Video Service User Guide.

- For API details, see ListPlaybackKeyPairs in AWS CLI Command Reference.

### list-playback-restriction-policies

The following code example shows how to use list-playback-restriction-policies.

**AWS CLI**

**To get summary information about all playback restriction policies**

The following list-playback-restriction-policies example lists all playback restriction policies for your AWS account.

```bash
aws ivs list-playback-restriction-policies
```

**Output:**

```json
{
   "playbackRestrictionPolicies": [
      {
         "allowedCountries": [
            "US",
            "MX"
         ],
         "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
         ]
      }
   ]
}
```
For more information, see Undesired Content and Viewers in the IVS Low-Latency User Guide.

• For API details, see ListPlaybackRestrictionPolicies in AWS CLI Command Reference.

list-recording-configurations

The following code example shows how to use list-recording-configurations.

AWS CLI

To list all the RecordingConfiguration resources created in this account

The following list-recording-configurations example gets information about all RecordingConfiguration resources in your account.

aws ivs list-recording-configurations

Output:

```json
{
  "recordingConfigurations": [
    {
      "name": "test-recording-config-1",
      "destinationConfiguration": {
        "s3": {
          "bucketName": "demo-recording-bucket-1"
        }
      },
      "state": "ACTIVE",
      "tags": {}
    },
  ]
}
```
For more information, see [Record to Amazon S3](https://docs.aws.amazon.com/ivs/latest/devguide/record-to-s3.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListRecordingConfigurations](https://docs.aws.amazon.com/cli/latest/reference/ivs/list-recording-configurations.html) in *AWS CLI Command Reference*.

### list-stream-keys

The following code example shows how to use `list-stream-keys`.

**AWS CLI**

**To get a list of stream keys**

The following `list-stream-keys` example lists all stream keys for a specified ARN (Amazon Resource Name).

```sh
aws ivs list-stream-keys \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

**Output:**

```json
{
  "streamKeys": [
    {
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "tags": {}
    }
  ]
}
```
For more information, see [Create a Channel](https://docs.aws.amazon.com/ivs/latest/userguide/creatchannel.html) in the [IVS Low-Latency User Guide](https://docs.aws.amazon.com/ivs/latest/userguide/).

### list-stream-sessions

The following code example shows how to use `list-stream-sessions`.

**AWS CLI**

To get a summary of current and previous streams for a specified channel in the current AWS region

The following `list-stream-sessions` example reports summary information for streams for a specified channel ARN (Amazon Resource Name).

```bash
aws ivs list-stream-sessions \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
  --max-results 25 \
  --next-token ""
```

**Output:**

```json
{
  "nextToken": "set-2",
  "streamSessions": [
    {
      "startTime": 1641578182,
      "endTime": 1641579982,
      "hasErrorEvent": false,
      "streamId": "mystream"
    }
    ...
  ]
}
```

For more information, see [Create a Channel](https://docs.aws.amazon.com/ivs/latest/userguide/creatchannel.html) in the [IVS Low-Latency User Guide](https://docs.aws.amazon.com/ivs/latest/userguide/).

- For API details, see [ListStreamSessions](https://docs.aws.amazon.com/cli/latest/reference/ivs/list-stream-sessions.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ivs/).
list-streams

The following code example shows how to use list-streams.

AWS CLI

To get a list of live streams and their state

The following list-streams example lists all live streams for your AWS account.

```bash
aws ivs list-streams
```

Output:

```
{
  "streams": [
    {
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDeFgh",
      "state": "LIVE",
      "health": "HEALTHY",
      "streamId": "st-ABCDEFghij01234KLmN5678",
      "viewerCount": 1
    }
  ]
}
```

For more information, see Create a Channel in the IVS Low-Latency User Guide.

- For API details, see ListStreams in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list all tags for an AWS resource (for example: channel, stream key)

The following list-tags-for-resource example lists all tags for a specified resource ARN (Amazon Resource Name).

```bash
aws ivs list-tags-for-resource \
```
Output:

```
{
  "tags":
  {
    "key1": "value1",
    "key2": "value2"
  }
}
```

For more information, see [Tagging](#) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

**put-metadata**

The following code example shows how to use put-metadata.

**AWS CLI**

To insert metadata into the active stream for a specified channel

The following put-metadata example inserts the given metadata into the stream for the specified channel.

```
aws ivs put-metadata \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
  --metadata '{"my": "metadata"}'
```

This command produces no output.

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [PutMetadata](#) in *AWS CLI Command Reference*.

**start-viewer-session-revocation**

The following code example shows how to use start-viewer-session-revocation.

**AWS CLI**

To revoke a viewer session for a given multiple channel-ARN and viewer-ID pair
The following `start-viewer-session-revocation` example starts the process of revoking the viewer session associated with a specified channel ARN and viewer ID, up to and including the specified session version number. If the version is not provided, it defaults to 0.

```
aws ivs batch-start-viewer-session-revocation \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --viewer-id abcdefg \
    --viewer-session-versions-less-than-or-equal-to 1234567890
```

This command produces no output.

For more information, see [Setting Up Private Channels](https://docs.aws.amazon.com/ivs/latest/userguide/) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [StartViewerSessionRevocation](https://docs.aws.amazon.com/cli/latest/reference/ivs/start-viewer-session-revocation.html) in *AWS CLI Command Reference*.

**stop-stream**

The following code example shows how to use `stop-stream`.

**AWS CLI**

**To stop a specified stream**

The following `stop-stream` example stops the stream on the specified channel.

```
aws ivs stop-stream \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see [Create a Channel](https://docs.aws.amazon.com/ivs/latest/userguide/) in the *IVS Low-Latency User Guide*.

- For API details, see [StopStream](https://docs.aws.amazon.com/cli/latest/reference/ivs/stop-stream.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add or update tags for an AWS resource (for example: channel, stream key)**
The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name).

```bash
aws ivs tag-resource \
   --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
   --tags "tagkey1=tagvalue1, tagkey2=tagvalue2"
```

This command produces no output.

For more information, see [Tagging](https://docs.aws.amazon.com/ivs/latest/api_reference/tagging.html) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/ivs/tag-resource.html) in *AWS CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

To remove tags for an AWS resource (for example: channel, stream key)

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name).

```bash
aws ivs untag-resource \
   --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
   --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see [Tagging](https://docs.aws.amazon.com/ivs/latest/api_reference/tagging.html) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/ivs/untag-resource.html) in *AWS CLI Command Reference*.

`update-channel`

The following code example shows how to use `update-channel`.

**AWS CLI**

**Example 1: To update a channel's configuration information**
The following update-channel example updates the channel configuration for a specified channel ARN to change the channel name. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
   --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \n   --name "channel-1" \n   --insecure-ingest
```

Output:

```
{
   "channel": {
      "name": "channel-1",
      "latencyMode": "LOW",
      "type": "STANDARD",
      "playbackRestrictionPolicyArn": "",
      "recordingConfigurationArn": "",  
      "srt": {
         "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
         "passphrase": "AB1C2defGHijkLMno3PqRstUvwxyzabCDefghh4ijklMN5opqrstuWxYZabCDEfghij"
      },
      "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
      "insecureIngest": true,
      "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
      "preset": "",
      "authorized": false,
      "tags": {}
   }
}
```

For more information, see Create a Channel in the IVS Low-Latency User Guide.

**Example 2: To update a channel's configuration to enable recording**

The following update-channel example updates the channel configuration for a specified channel ARN to enable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
```

Actions and scenarios
Output:

```json
{
    "channel": {
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase": "BA1C2defGHijklMN03PqRstUvwxyzAbCDEfghh4ijklMN5opqrStuVwxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see [Record to Amazon S3](#) in the *IVS Low-Latency User Guide*.

**Example 3: To update a channel’s configuration to disable recording**

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
    --recording-configuration-arn ""
```
For more information, see [Record to Amazon S3](#) in the [IVS Low-Latency User Guide](#).

**Example 4: To update a channel's configuration to enable playback restriction**

The following `update-channel` example updates the channel configuration for a specified channel ARN to apply a playback restriction policy. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```bash
aws ivs update-channel \
  --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
  --no-insecure-ingest \
```

**Output:**

```json
{
  "channel": {
    "name": "test-channel-with-recording",
    "latencyMode": "LOW",
    "type": "STANDARD",
    "playbackRestrictionPolicyArn": "",
    "recordingConfigurationArn": "",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase": "AB1C2edfGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijk1MN5opqrStuWxyzAbCDEfghIJ",
      "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
      "insecureIngest": false,
      "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
      "preset": "",
      "authorized": false,
      "tags": {}
    }
  }
}
```
For more information, see **Undesired Content and Viewers** in the *IVS Low-Latency User Guide*.

**Example 5: To update a channel's configuration to disable playback restriction**

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable playback restriction. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
   --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
   --playback-restriction-policy-arn ""
```

Output:

```
{
   "channel": {
      "name": "test-channel-with-playback-restriction-policy",
      "latencyMode": "LOW",
      "type": "STANDARD",
      "recordingConfigurationArn": "",
      "srt": {

For more information, see [Undesired Content and Viewers](#) in the [IVS Low-Latency User Guide](#).

- For API details, see [UpdateChannel](#) in [AWS CLI Command Reference](#).

**update-playback-restriction-policy**

The following code example shows how to use `update-playback-restriction-policy`.

**AWS CLI**

**To update a playback restriction policy**

The following `update-playback-restriction-policy` example updates the playback restriction policy with the specified policy ARN to disable strict origin enforcement. This does not affect an ongoing stream of the associated channel; you must stop and restart the stream for the changes to take effect.

```bash
aws ivs update-playback-restriction-policy \
  --no-enable-strict-origin-enforcement
```

Output:

```json
{
```

---

Actions and scenarios 4240
For more information, see Undesired Content and Viewers in the IVS Low-Latency User Guide.

- For API details, see UpdatePlaybackRestrictionPolicy in AWS CLI Command Reference.

Amazon IVS Chat examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Chat.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions
**Actions**

**create-chat-token**

The following code example shows how to use create-chat-token.

**AWS CLI**

**To create a chat token**

The following create-chat-token example creates an encrypted chat token that is used to establish an individual WebSocket connection to a room. The token is valid for one minute, and a connection (session) established with the token is valid for the specified duration.

```bash
aws ivschat create-chat-token \
   --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6", \
   --userId "11231234" \
   --capabilities "SEND_MESSAGE", \
   --sessionDurationInMinutes" 30
```

Output:

```json
{
   "token": "ACEGmnoq#1rstu2...BDFH3vxwy!4hlm!#5",
   "sessionExpirationTime": "2022-03-16T04:44:09+00:00"
   "state": "CREATING",
   "tokenExpirationTime": "2022-03-16T03:45:09+00:00"
}
```

For more information, see [Step 3: Authenticate and Authorize Chat Clients](#) in the Amazon Interactive Video Service User Guide.

- For API details, see [CreateChatToken](#) in AWS CLI Command Reference.

**create-logging-configuration**

The following code example shows how to use create-logging-configuration.

**AWS CLI**

**To create a chat LoggingConfiguration resource**
The following `create-logging-configuration` example creates a `LoggingConfiguration` resource that allows clients to store and record sent messages.

```bash
aws ivschat create-logging-configuration \
  --destination-configuration s3={bucketName=demo-logging-bucket} \
  --name "test-logging-config" \
  --tags "key1=value1, key2=value2"
```

Output:

```
{
  "createTime": "2022-09-14T17:48:00.653000+00:00",
  "destinationConfiguration": {
    "s3": {
      "bucketName": "demo-logging-bucket"
    }
  },
  "id": "ABcdef34ghIJ",
  "name": "test-logging-config",
  "state": "ACTIVE",
  "tags": { "key1" : "value1", "key2" : "value2" },
  "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see [Getting Started with Amazon IVS Chat](Amazon Interactive Video Service User Guide) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateLoggingConfiguration](AWS CLI Command Reference) in *AWS CLI Command Reference*.

**create-room**

The following code example shows how to use `create-room`.

**AWS CLI**

To create a room

The following `create-room` example creates a new room.

```bash
aws ivschat create-room \
```
--name "test-room-1" \ 
--logging-configuration-identifiers "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ" \ 
--maximum-message-length 256 \ 
--maximum-message-rate-per-second 5

Output:

```json
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:room/g1H2I3j4k5L6",
    "id": "g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "test-room-1",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see [Step 2: Create a Chat Room](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateRoom](#) in *AWS CLI Command Reference*.

**delete-logging-configuration**

The following code example shows how to use `delete-logging-configuration`.

**AWS CLI**

**To delete a chat LoggingConfiguration resource**

The following `delete-logging-configuration` example deletes the LoggingConfiguration resource for the specified ARN.

```bash
aws ivschat delete-logging-configuration \
```

This command produces no output.
For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteLoggingConfiguration](#) in *AWS CLI Command Reference*.

### delete-message

The following code example shows how to use `delete-message`.

**AWS CLI**

**To delete messages from a specified room**

The following `delete-message` example sends an even to the specified room, which directs clients to delete the specified message: that is, unrender it from view and delete it from the client's chat history.

```bash
aws ivschat delete-message \
  --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
  --id "ABC123def456" \
  --reason "Message contains profanity"
```

**Output:**

```json
{
  "id": "12345689012"
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteMessage](#) in *AWS CLI Command Reference*.

### delete-room

The following code example shows how to use `delete-room`.

**AWS CLI**

**To delete a room**
The following delete-room example deletes the specified room. Connected clients are disconnected. On success it returns HTTP 204 with an empty response body.

```
aws ivschat delete-room \
  --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see DeleteRoom in AWS CLI Command Reference.

**disconnect-user**

The following code example shows how to use disconnect-user.

**AWS CLI**

**To disconnect a user from a room**

The following disconnect-user example disconnects all connections for the specified user from the specified room. On success it returns HTTP 200 with an empty response body.

```
aws ivschat disconnect-user \
  --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
  --userId "ABC123def456" \
  --reason "Violated terms of service"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see DisconnectUser in AWS CLI Command Reference.

**get-logging-configuration**

The following code example shows how to use get-logging-configuration.
AWS CLI

To get information about a LoggingConfiguration resource

The following get-logging-configuration example gets information about the LoggingConfiguration resource for the specified ARN.

```bash
aws ivschat get-logging-configuration \
```

Output:

```json
{
   "createTime": "2022-09-14T17:48:00.653000+00:00",
   "destinationConfiguration": {
      "s3": {
         "bucketName": "demo-logging-bucket"
      }
   },
   "id": "ABcdef34ghIJ",
   "name": "test-logging-config",
   "state": "ACTIVE",
   "tags": { "key1" : "value1", "key2" : "value2" },
   "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see GetLoggingConfiguration in AWS CLI Command Reference.

get-room

The following code example shows how to use get-room.

AWS CLI

To get the specified room

The following get-room example gets information about the specified room.
AWS Command Line Interface

aws ivschat get-room \
   --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"

Output:

```json
{
   "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
   "createTime": "2022-03-16T04:44:09+00:00",
   "id": "g1H2I3j4k5L6",
   "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
   "maximumMessageLength": 256,
   "maximumMessageRatePerSecond": 5,
   "name": "test-room-1",
   "tags": {},
   "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see [Getting Started with Amazon IVS Chat](https://docs.aws.amazon.com/AmazonInteractiveVideoService/latest/APIReference/Welcome.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetRoom](https://docs.aws.amazon.com/cli/latest/reference/ivschat/get-room.html) in *AWS CLI Command Reference*.

**list-logging-configurations**

The following code example shows how to use list-logging-configurations.

**AWS CLI**

To get summary information about all logging configurations for the user in the AWS region where the API request is processed

The following list-logging-configurations example lists information about all LoggingConfiguration resources for the user in the AWS region where the API request is processed.

```bash
aws ivschat list-logging-configurations \
   --max-results 2 \
   --next-token ""
```

Output:
For more information, see [Getting Started with Amazon IVS Chat](https://docs.aws.amazon.com/AmazonIVS/latest/chat-getting-started/index.html) in the [Amazon Interactive Video Service User Guide](https://docs.aws.amazon.com/AmazonIVS/latest/chat-getting-started/index.html).

### list-rooms

The following code example shows how to use `list-rooms`.

**AWS CLI**

To get summary information about all your rooms in the current region

The following `list-rooms` example gets summary information about all the rooms in the AWS region where the request is processed. Results are sorted in descending order of `updateTime`.

```bash
aws ivschat list-rooms \
    --max-results 10 \
```
Output:

```json
{
    "nextToken": "page3",
    "rooms": [
        {
            "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
            "createTime": "2022-03-16T04:44:09+00:00",
            "id": "g1H2I3j4k5L6",
            "loggingConfigurationIdentifiers": [
                "arn:aws:ivschat:us-west-2:12345689012:logging-configuration/ABcdef34ghIJ"
            ],
            "name": "test-room-1",
            "tags": {},
            "updateTime": "2022-03-16T07:22:09+00:00"
        }
    ]
}
```

For more information, see [Getting Started with Amazon IVS Chat](https://docs.aws.amazon.com/AmazonIVS/latest/APIReference/Welcome.html) in the Amazon Interactive Video Service User Guide.

- For API details, see [ListRooms](https://docs.aws.amazon.com/AmazonIVS/latest/APIReference/API_ListRooms.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ivschat/list-rooms.html).

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To list all tags for an AWS resource (for example: Room)

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```bash
aws ivschat list-tags-for-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6
```

Output:

```json
{
}
```
"tags":
{
   "key1": "value1",
   "key2": "value2"
}
}

For more information, see Tagging in the Amazon Interactive Video Service API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**send-event**

The following code example shows how to use send-event.

**AWS CLI**

**To send an event to a room**

The following send-event example sends the given event to the specified room.

```
aws ivschat send-event
   --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
   --eventName "SystemMessage"
   --attributes
      "msgType"="user-notification",
      "msgText"="This chat room will close in 15 minutes."
```

Output:

```
{
   "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see SendEvent in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.
AWS CLI

**To add or update tags for an AWS resource (for example: Room)**

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```bash
aws ivschat tag-resource \
  --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
  --tags "tagkey1=tagkeyvalue1, tagkey2=tagkeyvalue2"
```

This command produces no output.

For more information, see [Tagging](#) in the Amazon Interactive Video Service API Reference.

- For API details, see [TagResource](#) in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use `untag-resource`.

AWS CLI

**To remove tags for an AWS resource (for example: Room)**

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```bash
aws ivschat untag-resource \
  --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
  --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see [Tagging](#) in the Amazon Interactive Video Service API Reference.

- For API details, see [UntagResource](#) in AWS CLI Command Reference.

**update-logging-configuration**

The following code example shows how to use `update-logging-configuration`.
AWS CLI

To update a room's logging configuration

The following update-logging-configuration example updates a LoggingConfiguration resource with the given data.

```
aws ivschat update-logging-configuration
   --destination-configuration s3={bucketName=demo-logging.bucket} \
   ABcdef34ghIJ" \
   --name "test-logging-config"
```

Output:

```
{
   ABcdef34ghIJ",
   "createTime": "2022-09-14T17:48:00.653000+00:00",
   "destinationConfiguration": {
       "s3": {
           "bucketName": "demo-logging.bucket"
       }
   },
   "id": "ABcdef34ghIJ",
   "name": "test-logging-config",
   "state": "ACTIVE",
   "tags": { "key1" : "value1", "key2" : "value2" },
   "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see UpdateLoggingConfiguration in AWS CLI Command Reference.

update-room

The following code example shows how to use update-room.

AWS CLI

To update a room's configuration
The following update-room example updates the specified room's configuration with the given data.

```shell/aws ivschat update-room \
   --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
   --logging-configuration-identifiers "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
   --name "chat-room-a" \
   --maximum-message-length 256 \
   --maximum-message-rate-per-second 5
```

Output:

```json
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "id": "g1H2I3j4k5L6",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "chat-room-a",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the Amazon Interactive Video Service User Guide.

- For API details, see UpdateRoom in AWS CLI Command Reference.

Amazon IVS Real-Time Streaming examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Real-Time Streaming.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

create-encoder-configuration

The following code example shows how to use create-encoder-configuration.

AWS CLI

To create a composition encoder configuration

The following create-encoder-configuration example creates a composition encoder configuration with the specified properties.

```
aws ivs-realtime create-encoder-configuration \
   --name test-ec --video bitrate=3500000,framerate=30.0,height=1080,width=1920
```

Output:

```
{
   "encoderConfiguration": {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef",
      "name": "test-ec",
      "tags": {},
      "video": {
         "bitrate": 3500000,
         "framerate": 30,
         "height": 1080,
         "width": 1920
      }
   }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.
For API details, see CreateEncoderConfiguration in AWS CLI Command Reference.

create-participant-token

The following code example shows how to use create-participant-token.

AWS CLI

To create a stage participant token

The following create-participant-token example creates a participant token for the specified stage.

```bash
aws ivs-realtime create-participant-token
   --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
   --user-id bob
```

Output:

```json
{
   "participantToken": {
      "expirationTime": "2023-03-07T09:47:43+00:00",
      "participantId": "ABCDEfghij01234KLMN6789",
      "token": "abcd1234defg5678"
   }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

For API details, see CreateParticipantToken in AWS CLI Command Reference.

create-stage

The following code example shows how to use create-stage.

AWS CLI

To create a stage

The following create-stage example creates a stage and stage participant token for a specified user.
aws ivs-realtime create-stage \
  --name stage1 \ 
  --participant-token-configurations userId=alice

Output:

```
{
    "participantTokens": [
        {
            "participantId": "ABCDEfghij01234KLMN5678",
            "token": "a1b2c3d4567890ab",
            "userId": "alice"
        }
    ],
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dev/enabling-multiple-hosts-on-an-amazon-ivs-stream.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateStage](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/create-stage.html) in *AWS CLI Command Reference*.

**create-storage-configuration**

The following code example shows how to use `create-storage-configuration`.

**AWS CLI**

**To create a composition storage configuration**

The following `create-storage-configuration` example creates a composition storage configuration with the specified properties.

```
aws ivs-realtime create-storage-configuration \
  --name "test-sc" --s3 "bucketName=test-bucket-name"
```

Output:

```json
{
  "storageConfiguration": {
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/ABabCDcdEFef",
    "name": "test-sc",
    "s3": {
      "bucketName": "test-bucket-name"
    },
    "tags": {}
  }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](amazoninteractivevideoserviceuserguide) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateStorageConfiguration](awscli) in *AWS CLI Command Reference*.

**delete-encoder-configuration**

The following code example shows how to use `delete-encoder-configuration`.

**AWS CLI**

To delete a composition encoder configuration

The following `delete-encoder-configuration` deletes the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```bash
aws ivs-realtime delete-encoder-configuration --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](amazoninteractivevideoserviceuserguide) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteEncoderConfiguration](awscli) in *AWS CLI Command Reference*.

**delete-stage**

The following code example shows how to use `delete-stage`.
To delete a stage

The following delete-stage example deletes the specified stage.

```
aws ivs-realtime delete-stage \
--arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dg/streaming-multiple-hosts.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteStage](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/delete-stage.html) in *AWS CLI Command Reference*.

 delete-storage-configuration

The following code example shows how to use delete-storage-configuration.

AWS CLI

To delete a composition storage configuration

The following delete-storage-configuration deletes the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-storage-configuration \
--arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/ABabCDcdEFef"
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dg/streaming-multiple-hosts.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteStorageConfiguration](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/delete-storage-configuration.html) in *AWS CLI Command Reference*.

disconnect-participant

The following code example shows how to use disconnect-participant.
AWS CLI

To disconnect a stage participant

The following disconnect-participant example disconnects the specified participant from the specified stage.

```bash
aws ivs-realtime disconnect-participant \
   --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
   --participant-id ABCDEfghij01234KLMN5678
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see DisconnectParticipant in AWS CLI Command Reference.

get-composition

The following code example shows how to use get-composition.

AWS CLI

Example 1: To get a composition with default layout settings

The following get-composition example gets the composition for the ARN (Amazon Resource Name) specified.

```bash
aws ivs-realtime get-composition \
   --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

Output:

```
{
   "composition": {
      "destinations": [
         {
            "configuration": {
               "channel": {
                  "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",
```
"encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
},
  "name": ""
},
"id": "AabBCcdDEefF",
"startTime": "2023-10-16T23:26:00+00:00",
"state": "ACTIVE"
}

"configuration": {
  "name": "",
  "s3": {
    "encoderConfigurationArns": [
    ],
    "recordingConfiguration": {
      "format": "HLS"
    },
    "storageConfigurationArn": "arn:arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/FefABabCDcdE"
  }
},
  "detail": {
    "s3": {
      "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/composite"
    }
  },
  "id": "GHFabcgefABC",
  "startTime": "2023-10-16T23:26:00+00:00",
  "state": "STARTING"
],
"layout": {
  "grid": {
    "featuredParticipantAttribute": ""
  }
},
  "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd"
For more information, see Composite Recording (Real-Time Streaming) in the Amazon Interactive Video Service User Guide.

Example 2: To get a composition with PiP layout

The following get-composition example gets the composition for the ARN (Amazon Resource Name) specified, which uses PiP layout.

```bash
aws ivs-realtime get-composition \
   --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs"
```

Output:

```
{
   "composition": {
      "destinations": [
         {
            "configuration": {
               "channel": {
                  "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",

get-encoder-configuration

The following code example shows how to use get-encoder-configuration.

AWS CLI

To get a composition encoder configuration

The following get-encoder-configuration example gets the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```bash
aws ivs-realtime get-encoder-configuration \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/abcdABCDEfgh"
```

Output:

```
{
    "encoderConfiguration": {
        "name": "test-ec",
        "tags": {},
        "video": {
            "bitrate": 3500000,
            "framerate": 30,
            "height": 1080,
            "width": 1920
        }
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see GetEncoderConfiguration in AWS CLI Command Reference.

get-participant

The following code example shows how to use get-participant.
AWS CLI

To get a stage participant

The following get-participant example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime get-participant \
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
  --session-id st-a1b2c3d4e5f6g \
  --participant-id abCDEf12GHIj
```

Output:

```
{
   "participant": {
      "browserName", "Google Chrome",
      "browserVersion", "116",
      "firstJoinTime": "2023-04-26T20:30:34+00:00",
      "ispName", "Comcast",
      "osName", "Microsoft Windows 10 Pro",
      "osVersion", "10.0.19044",
      "participantId": "abCDEf12GHIj",
      "published": true,
      "sdkVersion", "",
      "state": "DISCONNECTED",
      "userId": ""
   }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see GetParticipant in AWS CLI Command Reference.

get-stage-session

The following code example shows how to use get-stage-session.

AWS CLI

To get a stage session
The following `get-stage-session` example gets the stage session for a specified session ID of a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime get-stage-session \
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
  --session-id st-a1b2c3d4e5f6g
```

Output:

```json
{
  "stageSession": {
    "endTime": "2023-04-26T20:36:29+00:00",
    "sessionId": "st-a1b2c3d4e5f6g",
    "startTime": "2023-04-26T20:30:29.602000+00:00"
  }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/userguide/index.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetStageSession](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/get-stage-session.html) in *AWS CLI Command Reference*.

### get-stage

The following code example shows how to use `get-stage`.

**AWS CLI**

**To get a stage's configuration information**

The following `get-stage` example gets the stage configuration for a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime get-stage \
  --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```json
{
  "stage": {
    "activeSessionId": "st-a1b2c3d4e5f6g",
    ...
  }
}
```
get-storage-configuration

The following code example shows how to use get-storage-configuration.

AWS CLI

To get a composition storage configuration

The following get-storage-configuration example gets the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-storage-configuration \
  --name arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/abcdABCDefgh"
```

Output:

```
{
    "storageConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/abcdABCDefgh",
        "name": "test-sc",
        "s3": {
            "bucketName": "test-bucket-name"
        },
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see GetStorageConfiguration in AWS CLI Command Reference.
list-compositions

The following code example shows how to use list-compositions.

AWS CLI

To get a list of compositions

The following list-compositions lists all compositions for your AWS account, in the AWS region where the API request is processed.

aws ivs-realtime list-compositions

Output:

```json
{
    "compositions": [
        {
            "destinations": [
                {
                    "id": "AabBCcdDEefF",
                    "startTime": "2023-10-16T23:25:23+00:00",
                    "state": "ACTIVE"
                }
            ],
            "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
            "startTime": "2023-10-16T23:25:21+00:00",
            "state": "ACTIVE",
            "tags": {}
        },
        {
            "destinations": [
                {
                    "endTime": "2023-10-16T23:25:00.786512+00:00",
                    "id": "aABbcCDdeEFF",
                    "startTime": "2023-10-16T23:24:01+00:00",
                    "state": "STOPPED"
                }
            ],
            "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
            "startTime": "2023-10-16T23:25:21+00:00",
            "state": "ACTIVE",
            "tags": {}
        }
    ]
}
```
For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dg/multiple-hosts-stream.html) in the [Amazon Interactive Video Service User Guide](https://docs.aws.amazon.com/ivs/latest/dg/).

- For API details, see [ListCompositions](https://docs.aws.amazon.com/ivs/latest/dg/API_ListCompositions.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ivs-realtime/list-encoder-configurations.html).

### list-encoder-configurations

The following code example shows how to use list-encoder-configurations.

**AWS CLI**

**To list composition encoder configurations**

The following list-encoder-configurations lists all composition encoder configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-encoder-configurations
```

**Output:**

```
{
   "encoderConfigurations": [ [
   "name": "test-ec-1",
   ]
  ]
}
```
For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/interactive-video/latest/userguide/Enabling-multiple-hosts-in-IVS-streams.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListEncoderConfigurations](https://docs.aws.amazon.com/cli/latest/reference/ivs-list-encoder-configurations.html) in *AWS CLI Command Reference*.

### list-participant-events

The following code example shows how to use `list-participant-events`.

**AWS CLI**

**To get a list of stage participant events**

The following `list-participant-events` example lists all participant events for a specified participant ID and session ID of a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime list-participant-events \
   --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
   --session-id st-a1b2c3d4efgh \
   --participant-id abCDEf12GHIj
```

**Output:**

```json
{
   "events": [
      {
         "eventTime": "2023-04-26T20:36:28+00:00",
         "name": "LEFT",
         "participantId": "abCDEf12GHIj"
      },
      {
         "eventTime": "2023-04-26T20:36:28+00:00",
```
For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListParticipantEvents](#) in *AWS CLI Command Reference*.

**list-participants**

The following code example shows how to use list-participants.

**AWS CLI**

**To get a list of stage participants**

The following list-participants example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime list-participants \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

**Output:**

```
{
    "participants": [
    {
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "participantId": "abCDEf12GHIj"
    }
    ]
}
```
For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListParticipants](#) in *AWS CLI Command Reference*.

### list-stage-sessions

The following code example shows how to use `list-stage-sessions`.

**AWS CLI**

**To get a list of stage sessions**

The following list-stage-sessions example lists all sessions for a specified stage ARN (Amazon Resource Name).

```bash
aws ivs-realtime list-stage-sessions \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDEFGHIJKLMNOPQRSTUVWXYZ
```

**Output:**

```json
{
    "stageSessions": [
        {
            "endTime": "2023-04-26T20:36:29+00:00",
            "sessionId": "st-a1b2c3d4e5f6g",
            "startTime": "2023-04-26T20:30:29.602000+00:00"
        }
    ]
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListStageSessions](#) in *AWS CLI Command Reference*.
list-stages

The following code example shows how to use list-stages.

AWS CLI

**To get summary information about all stages**

The following list-stages example lists all stages for your AWS account, in the AWS region where the API request is processed.

```bash
aws ivs-realtime list-stages
```

Output:

```json
{
  "stages": [
    {
      "activeSessionId": "st-a1b2c3d4e5f6g",
      "name": "stage1",
      "tags": {}
    },
    {
      "activeSessionId": "st-a123bcd456efg",
      "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcd1234ABCD",
      "name": "stage2",
      "tags": {}
    },
    {
      "activeSessionId": "st-abcDEF1234ghi",
      "name": "stage3",
      "tags": {}
    }
  ]
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](https://docs.aws.amazon.com/ivs/latest/dg/multiple-hosts-on-an-ivs-stream.html) in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStages in *AWS CLI Command Reference*. 
list-storage-configurations

The following code example shows how to use list-storage-configurations.

AWS CLI

To list composition storage configurations

The following list-storage-configurations lists all composition storage configurations for your AWS account, in the AWS region where the API request is processed.

aws ivs-realtime list-storage-configurations

Output:

```json
{
  "storageConfigurations": [
    {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/abcdABCDefgh",
      "name": "test-sc-1",
      "s3": {
        "bucketName": "test-bucket-1-name"
      },
      "tags": {}
    },
    {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/ABCDEFGabc",
      "name": "test-sc-2",
      "s3": {
        "bucketName": "test-bucket-2-name"
      },
      "tags": {}
    }
  ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see ListStorageConfigurations in AWS CLI Command Reference.
**start-composition**

The following code example shows how to use start-composition.

**AWS CLI**

**Example 1: To start a composition with default layout settings**

The following start-composition example starts a composition for the specified stage to be streamed to the specified locations.

```
aws ivs-realtime start-composition
   --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd
   --destinations '[["channel": {"channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg", 
   "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"}], 
   {"s3":{"encoderConfigurationArns": ["arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], 
   "storageConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/FefABabCDcdE"}]}'
```

Output:

```
{
    "composition": {
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "id": "AabBCcdDEefF",
                    "name": "",
                    "state": "STARTING"
                },
                "configuration": {
                    "configuration": {
                        "channel": {
                            "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",
                            "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                        },
                        "id": "AabBCcdDEefF",
                        "name": "",
                        "state": "STARTING"
                    }
                }
            }
        ]
    }
}
```
"name": "",
"s3": {
    "encoderConfigurationArns": [
    ],

For more information, see Composite Recording (Real-Time Streaming) in the Amazon Interactive Video Service User Guide.

Example 2: To start a composition with PiP layout
The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations using PiP layout.

```bash
aws ivs-realtime start-composition \
  --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd \
  --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg", \
  --layout pip='{featuredParticipantAttribute="abcdefg"}'
```

Output:

```json

"state": "STARTING",
"tags": {}
}
}

For more information, see Composite Recording (Real-Time Streaming) in the Amazon Interactive Video Service User Guide.

- For API details, see StartComposition in AWS CLI Command Reference.

**stop-composition**

The following code example shows how to use stop-composition.
AWS CLI

To stop a composition

The following stop-composition stops the composition specified by the given ARN (Amazon Resource Name).

```bash
aws ivs-realtime stop-composition \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see StopComposition in AWS CLI Command Reference.

update-stage

The following code example shows how to use update-stage.

AWS CLI

To update a stage's configuration

The following update-stage example updates a stage for a specified stage ARN to update the stage name.

```bash
aws ivs-realtime update-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --name stage1a
```

Output:

```json
{
    "stage": {
        "name": "stage1a"
    }
}
```
For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the Amazon Interactive Video Service User Guide.

- For API details, see UpdateStage in AWS CLI Command Reference.

Amazon Kendra examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Kendra.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

create-data-source

The following code example shows how to use create-data-source.

AWS CLI

To create an Amazon Kendra data source connector

The following create-data-source creates and configures an Amazon Kendra data source connector. You can use describe-data-source to view the status of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra create-data-source \
```
--name "example data source 1" \  
--description "Example data source 1 for example index 1 contains the first set of example documents" \  
--tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources", "Value": "aws"}' \  
--role-arn "arn:aws:iam::my-account-id:role/KendraRoleForS3TemplateConfigDataSource" \  
--index-id exampleindex1 \  
--language-code "es" \  
--schedule "0 0 18 ? * TUE,MON,WED,THU,FRI,SAT *" \  
--configuration '{"TemplateConfiguration": {"Template": file://s3schemaconfig.json}}' \  
--type "TEMPLATE" \  
--custom-document-enrichment-configuration '{"PostExtractionHookConfiguration": {"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs", "S3Bucket": "s3://my-s3-bucket/scanned-image-text-example-docs"}, "RoleArn": "arn:aws:iam:my-account-id:role/KendraRoleForCDE"}' \  
--vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds": ["subnet-1c234","subnet-2b134"]}'

Output:

{
   "Id": "exampledatasource1"
}

For more information, see [Getting started with an Amazon Kendra index and data source connector](https://docs.aws.amazon.com/kendra/latest/dg/getting-started-data-source-connector.html) in the Amazon Kendra Developer Guide.

- For API details, see [CreateDataSource](https://docs.aws.amazon.com/cli/latest/reference/index/create-data-source.html) in AWS CLI Command Reference.

create-index

The following code example shows how to use create-index.

AWS CLI

To create an Amazon Kendra index

The following create-index creates and configures an Amazon Kendra index. You can use describe-index to view the status of an index, and read any error messages if the status shows an index "FAILED" to completely create.
aws kendra create-index \   
  --name "example index 1" \   
  --description "Example index 1 contains the first set of example documents" \   
  --tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources", "Value": "aws"}'} \   
  --role-arn "arn:aws:iam::my-account-id:role/KendraRoleForExampleIndex" \   
  --edition "DEVELOPER_EDITION" \   
  --server-side-encryption-configuration '{"KmsKeyId": "my-kms-key-id"}' \   
  --user-context-policy "USER_TOKEN" \   
  --user-token-configurations '{"JwtTokenTypeConfiguration": "USER_TOKEN"}' \   
  --tags '{"Key": "test resources", "Value": "aws"}'}

Output:

```
{
  "Id": index1
}```

For more information, see [Getting started with an Amazon Kendra index and data source connector](https://docs.aws.amazon.com/kendra/latest/dg/getting-started.html) in the Amazon Kendra Developer Guide.

- For API details, see [CreateIndex](https://docs.aws.amazon.com/cli/latest/reference/kendra/create-index.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/index.html).

describe-data-source

The following code example shows how to use `describe-data-source`.

AWS CLI

**To get information about an Amazon Kendra data source connector**

The following `describe-data-source` gets information about an Amazon Kendra data source connector. You can view the configuration of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra describe-data-source \   
  --id exampledatasource1 \   
  --index-id exampleindex1
```

Output:
{  
  "Configuration": {  
    "TemplateConfiguration": {  
      "Template": {  
        "connectionConfiguration": {  
          "repositoryEndpointMetadata": {  
            "BucketName": "my-bucket"  
          }  
        },

update-data-source

The following code example shows how to use `update-data-source`.

AWS CLI

To update an Amazon Kendra data source connector

The following `update-data-source` updates the configuration of an Amazon Kendra data source connector. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use `describe-data-source` to view the configuration and status of a data source connector.

```
aws kendra update-data-source \
```
This command produces no output.

For more information, see Getting started with an Amazon Kendra index and data source connector in the Amazon Kendra Developer Guide.

- For API details, see UpdateDataSource in AWS CLI Command Reference.

**update-index**

The following code example shows how to use update-index.

**AWS CLI**

To update an Amazon Kendra index

The following update-index updates the configuration of an Amazon Kendra index. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use describe-index to view the configuration and status of an index.

```bash
aws kendra update-index \
   --id enterpriseindex1 \
   --name "new name for Enterprise Edition index 1" \
   --description "new description for Enterprise Edition index 1" \
   --role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForEnterpriseIndex \
   --capacity-units '{"QueryCapacityUnits": 2, "StorageCapacityUnits": 1}' 
```

Actions and scenarios 4288
This command produces no output.

For more information, see [Getting started with an Amazon Kendra index and data source connector](https://docs.aws.amazon.com/kendra/latest/dg) in the *Amazon Kendra Developer Guide*.

- For API details, see [UpdateIndex](https://docs.aws.amazon.com/cli/latest/reference/index/update-index.html) in *AWS CLI Command Reference*.

### Kinesis examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Kinesis.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

#### Topics
- [Actions](#)

#### Actions

**add-tags-to-stream**

The following code example shows how to use `add-tags-to-stream`.

#### AWS CLI

To add tags to a data stream
The following add-tags-to-stream example assigns a tag with the key samplekey and value example to the specified stream.

```
aws kinesis add-tags-to-stream \
    --stream-name samplestream \
    --tags samplekey=example
```

This command produces no output.

For more information, see Tagging Your Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see AddTagsToStream in AWS CLI Command Reference.

create-stream

The following code example shows how to use create-stream.

**AWS CLI**

To create a data stream

The following create-stream example creates a data stream named samplestream with 3 shards.

```
aws kinesis create-stream \
    --stream-name samplestream \
    --shard-count 3
```

This command produces no output.

For more information, see Creating a Stream in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see CreateStream in AWS CLI Command Reference.

decrease-stream-retention-period

The following code example shows how to use decrease-stream-retention-period.
AWS CLI

**To decrease data stream retention period**

The following `decrease-stream-retention-period` example decreases the retention period (the length of time data records are accessible after they are added to the stream) of a stream named `samplestream` to 48 hours.

```bash
aws kinesis decrease-stream-retention-period \
  --stream-name samplestream \
  --retention-period-hours 48
```

This command produces no output.

For more information, see [Changing the Data Retention Period](#) in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see `DecreaseStreamRetentionPeriod` in AWS CLI Command Reference.

**delete-stream**

The following code example shows how to use `delete-stream`.

**AWS CLI**

**To delete a data stream**

The following `delete-stream` example deletes the specified data stream.

```bash
aws kinesis delete-stream \
  --stream-name samplestream
```

This command produces no output.

For more information, see [Deleting a Stream](#) in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see `DeleteStream` in AWS CLI Command Reference.

**deregister-stream-consumer**

The following code example shows how to use `deregister-stream-consumer`.
AWS CLI

To deregister a data stream consumer

The following deregister-stream-consumer example deregisters the specified consumer from the specified data stream.

```bash
aws kinesis deregister-stream-consumer \
   --consumer-name KinesisConsumerApplication
```

This command produces no output.

For more information, see Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see DeregisterStreamConsumer in AWS CLI Command Reference.

describe-limits

The following code example shows how to use describe-limits.

AWS CLI

To describe shard limits

The following describe-limits example displays the shard limits and usage for the current AWS account.

```bash
aws kinesis describe-limits
```

Output:

```
{
   "ShardLimit": 500,
   "OpenShardCount": 29
}
```

For more information, see Resharding a Stream in the Amazon Kinesis Data Streams Developer Guide.
- For API details, see [DescribeLimits](#) in AWS CLI Command Reference.

**describe-stream-consumer**

The following code example shows how to use describe-stream-consumer.

**AWS CLI**

**To describe a data stream consumer**

The following describe-stream-consumer example returns the description of the specified consumer, registered with the specified data stream.

```bash
aws kinesis describe-stream-consumer
  --consumer-name KinesisConsumerApplication
```

Output:

```
{
    "ConsumerDescription": {
        "ConsumerName": "KinesisConsumerApplication",
        "ConsumerStatus": "ACTIVE",
        "ConsumerCreationTimestamp": 1572383852.0,
    }
}
```

For more information, see [Reading Data from Amazon Kinesis Data Streams](#) in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see [DescribeStreamConsumer](#) in AWS CLI Command Reference.

**describe-stream-summary**

The following code example shows how to use describe-stream-summary.

**AWS CLI**

**To describe a data stream summary**
The following describe-stream-summary example provides a summarized description (without the shard list) of the specified data stream.

```bash
aws kinesis describe-stream-summary \
   --stream-name samplestream
```

Output:

```
{
    "StreamDescriptionSummary": {
        "StreamName": "samplestream",
        "StreamStatus": "ACTIVE",
        "RetentionPeriodHours": 48,
        "StreamCreationTimestamp": 1572297168.0,
        "EnhancedMonitoring": [
            {
                "ShardLevelMetrics": []
            }
        ],
        "EncryptionType": "NONE",
        "OpenShardCount": 3,
        "ConsumerCount": 0
    }
}
```

For more information, see [Creating and Managing Streams](https://docs.aws.amazon.com/AmazonKinesis/latest/dev/creating-managing-streams.html) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DescribeStreamSummary](https://docs.aws.amazon.com/cli/latest/reference/kinesis/describe-stream-summary.html) in AWS CLI Command Reference.

**describe-stream**

The following code example shows how to use describe-stream.

**AWS CLI**

**To describe a data stream**

The following describe-stream example returns the details of the specified data stream.

```bash
aws kinesis describe-stream \
```
Output:

```json
{
   "StreamDescription": {
      "Shards": [
      {
         "ShardId": "shardId-000000000000",

}
]

For more information, see Creating and Managing Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see DescribeStream in AWS CLI Command Reference.

disable-enhanced-monitoring

The following code example shows how to use disable-enhanced-monitoring.

AWS CLI

To disable enhanced monitoring for shard-level metrics

The following disable-enhanced-monitoring example disables enhanced Kinesis data stream monitoring for shard-level metrics.

aws kinesis disable-enhanced-monitoring \
  --stream-name samplestream --shard-level-metrics ALL

Output:

{
  "StreamName": "samplestream",
  "CurrentShardLevelMetrics": [
    "IncomingBytes",
    "OutgoingRecords",
    "IteratorAgeMilliseconds",
    "IncomingRecords",
    "ReadProvisionedThroughputExceeded",
  ]
}
For more information, see Monitoring Streams in Amazon Kinesis Data Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see DisableEnhancedMonitoring in AWS CLI Command Reference.

**enable-enhanced-monitoring**

The following code example shows how to use enable-enhanced-monitoring.

**AWS CLI**

To enable enhanced monitoring for shard-level metrics

The following enable-enhanced-monitoring example enables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis enable-enhanced-monitoring \
   --stream-name samplestream \
   --shard-level-metrics ALL
```

Output:

```
{
   "StreamName": "samplestream",
   "CurrentShardLevelMetrics": [],
   "DesiredShardLevelMetrics": [
      "IncomingBytes",
      "OutgoingRecords",
      "IteratorAgeMilliseconds",
      "IncomingRecords",
      "ReadProvisionedThroughputExceeded",
      "WriteProvisionedThroughputExceeded",
      "OutgoingBytes"
   ]
}
```
For more information, see Monitoring Streams in Amazon Kinesis Data Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see EnableEnhancedMonitoring in AWS CLI Command Reference.

get-records

The following code example shows how to use get-records.

AWS CLI

To obtain records from a shard

The following get-records example gets data records from a Kinesis data stream's shard using the specified shard iterator.

```
aws kinesis get-records \
  --shard-iterator AAAAAAAAAAF7/0mWD7IuHj1yGv/
  TKuNgX2ukD5xipCY4cy4gU96orWwZwc5Xh3K9tAmGYe0ZyLZrvrze0FVf9iN99hUPw/w/
  b0YwYeefNvnf1DYt5XpDjghLKr3DzgnkTMymDP3R+3wRKeuEw6/kdxY2yKJH0veaiekaVc4N2VwK/
  GvaGP2Hh9Fg7N++q0Adg6fIDQPt4p8RpaVDbk+A4sL9SWE1
```

Output:

```
{
  "Records": [],
  "MillisBehindLatest": 80742000
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see GetRecords in AWS CLI Command Reference.

get-shard-iterator

The following code example shows how to use get-shard-iterator.

AWS CLI

To obtain a shard iterator
The following `get-shard-iterator` example uses the AT_SEQUENCE_NUMBER shard iterator type and generates a shard iterator to start reading data records exactly from the position denoted by the specified sequence number.

```bash
aws kinesis get-shard-iterator \
   --stream-name samplestream \
   --shard-id shardId-000000000001 \
   --shard-iterator-type LATEST
```

**Output:**

```
{
   "ShardIterator": "AAAAAAAAAAFEvJjIYI+3jw/4aqgH9FifJ+n48XWTh/
   IFIsbILP6o5eDueD39NXNBfpZ10WL5K6ADXk8w+5H+Qhd9cFA9k268CPXCz/kebq1TGYI7Vy
   +1uKaj9BuN3xvATxMBGxRY3zYK05gqgvaIRn94085qeEwqhwgZxNWxID3Ej7YYYcxQi8Q/fIrCjGAY/
   n2r5Z9G864YpWDFn9upNNQAR/ii0WKs"
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the Amazon Kinesis Data Streams Developer Guide.
- For API details, see `GetShardIterator` in AWS CLI Command Reference.

### increase-stream-retention-period

The following code example shows how to use `increase-stream-retention-period`.

**AWS CLI**

**To increase data stream retention period**

The following `increase-stream-retention-period` example increases the retention period (the length of time data records are accessible after they are added to the stream) of the specified stream to 168 hours.

```bash
aws kinesis increase-stream-retention-period \
   --stream-name samplestream \
   --retention-period-hours 168
```

This command produces no output.
For more information, see [Changing the Data Retention Period](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [IncreaseStreamRetentionPeriod](#) in *AWS CLI Command Reference*.

list-shards

The following code example shows how to use `list-shards`.

**AWS CLI**

To list shards in a data stream

The following `list-shards` example lists all shards in the specified stream starting with the shard whose ID immediately follows the specified `exclusive-start-shard-id` of shardId-000000000000.

```bash
aws kinesis list-shards \
   --stream-name samplestream \
   --exclusive-start-shard-id shardId-000000000000
```

Output:

```json
{
   "Shards": [
      {
         "ShardId": "shardId-000000000001",
         "HashKeyRange": {
            "StartingHashKey": "113427455640312821154458202477256070485",
            "EndingHashKey": "226854911280625642308916404954512140969"
         },
         "SequenceNumberRange": {
            "StartingSequenceNumber": "49600871682979337187563555549332609155523708941634633746"
         }
      },
      {
         "ShardId": "shardId-000000000002",
         "HashKeyRange": {
            "StartingHashKey": "226854911280625642308916404954512140970",
            "EndingHashKey": "340282366920938463463374607431768211455"
         }
      }
   ]
}```
For more information, see Listing Shards in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see ListShards in AWS CLI Command Reference.

**list-streams**

The following code example shows how to use list-streams.

**AWS CLI**

**To list data streams**

The following list-streams example lists all active data streams in the current account and region.

```bash
aws kinesis list-streams
```

Output:

```json
{
   "StreamNames": [
      "samplestream",
      "samplestream1"
   ]
}
```

For more information, see Listing Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see ListStreams in AWS CLI Command Reference.

**list-tags-for-stream**

The following code example shows how to use list-tags-for-stream.
AWS CLI

To list tags for a data stream

The following `list-tags-for-stream` example lists the tags attached to the specified data stream.

```bash
aws kinesis list-tags-for-stream \
--stream-name samplestream
```

Output:

```json
{
   "Tags": [
       {
          "Key": "samplekey",
          "Value": "example"
       }
   ],
   "HasMoreTags": false
}
```

For more information, see [Tagging Your Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [ListTagsForStream](#) in *AWS CLI Command Reference*.

merge-shards

The following code example shows how to use `merge-shards`.

AWS CLI

To merge shards

The following `merge-shards` example merges two adjacent shards with IDs of `shardId-000000000000` and `shardId-000000000001` in the specified data stream and combines them into a single shard.

```bash
aws kinesis merge-shards \
--stream-name samplestream \
--shard-to-merge shardId-000000000000 \
```
**--adjacent-shard-to-merge shardId-000000000001**

This command produces no output.

For more information, see [Merging Two Shards](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [MergeShards](#) in *AWS CLI Command Reference*.

**put-record**

The following code example shows how to use put-record.

**AWS CLI**

**To write a record into a data stream**

The following put-record example writes a single data record into the specified data stream using the specified partition key.

```
aws kinesis put-record \
   --stream-name samplestream \
   --data sampledatarecord \
   --partition-key samplepartitionkey
```

Output:

```json
{
   "ShardId": "shardId-000000000009",
   "SequenceNumber": "49600902273357540915989931256901506243878407835297513618",
   "EncryptionType": "KMS"
}
```

For more information, see [Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [PutRecord](#) in *AWS CLI Command Reference*.

**put-records**

The following code example shows how to use put-records.
AWS CLI

**To write multiple records into a data stream**

The following put-records example writes a data record using the specified partition key and another data record using a different partition key in a single call.

```
aws kinesis put-records \
   --stream-name samplestream \
   --records Data=blob1,PartitionKey=partitionkey1 
      Data=blob2,PartitionKey=partitionkey2
```

**Output:**

```
{
   "FailedRecordCount": 0,
   "Records": [
      {
         "SequenceNumber": "496008333117147151967479558823853149846539990093808706",
         "ShardId": "shardId-000000000004"
      },
      {
         "SequenceNumber": "49600902273357540915989931256902715169698037101720764562",
         "ShardId": "shardId-000000000009"
      }
   ],
   "EncryptionType": "KMS"
}
```

For more information, see [Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java](https://docs.aws.amazon.com/kinesis/latest/dev/index.html) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [PutRecords](https://docs.aws.amazon.com/cli/latest/reference/kinesis/put-records.html) in *AWS CLI Command Reference*.

**register-stream-consumer**

The following code example shows how to use register-stream-consumer.

AWS CLI

**To register a data stream consumer**
The following `register-stream-consumer` example registers a consumer called `KinesisConsumerApplication` with the specified data stream.

```
aws kinesis register-stream-consumer \
  --consumer-name KinesisConsumerApplication
```

Output:

```
{
  "Consumer": {
    "ConsumerName": "KinesisConsumerApplication",
    "ConsumerStatus": "CREATING",
    "ConsumerCreationTimestamp": 1572383852.0
  }
}
```

For more information, see [Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API](https://docs.aws.amazon.com/kinesis/latest/dev/develop-consumers.html) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [RegisterStreamConsumer](https://docs.aws.amazon.com/cli/latest/reference/kinesis/register-stream-consumer.html) in *AWS CLI Command Reference*.

### remove-tags-from-stream

The following code example shows how to use `remove-tags-from-stream`.

**AWS CLI**

To remove tags from a data stream

The following `remove-tags-from-stream` example removes the tag with the specified key from the specified data stream.

```
aws kinesis remove-tags-from-stream \
  --stream-name samplestream \
  --tag-keys samplekey
```

This command produces no output.
For more information, see [Tagging Your Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [RemoveTagsFromStream](#) in *AWS CLI Command Reference*.

### split-shard

The following code example shows how to use `split-shard`.

**AWS CLI**

**To split shards**

The following `split-shard` example splits the specified shard into two new shards using a new starting hash key of 10.

```bash
aws kinesis split-shard \
  --stream-name samplestream \
  --shard-to-split shardId-000000000000 \
  --new-starting-hash-key 10
```

This command produces no output.

For more information, see [Splitting a Shard](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [SplitShard](#) in *AWS CLI Command Reference*.

### start-stream-encryption

The following code example shows how to use `start-stream-encryption`.

**AWS CLI**

**To enable data stream encryption**

The following `start-stream-encryption` example enables server-side encryption for the specified stream, using the specified AWS KMS key.

```bash
aws kinesis start-stream-encryption \
  --encryption-type KMS \
```

---

For more information, see [Tagging Your Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

For API details, see [RemoveTagsFromStream](#) in *AWS CLI Command Reference*.

- For API details, see [SplitShard](#) in *AWS CLI Command Reference*.

---

For more information, see [Splitting a Shard](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [SplitShard](#) in *AWS CLI Command Reference*.
stop-stream-encryption

The following code example shows how to use stop-stream-encryption.

AWS CLI

To disable data stream encryption

The following stop-stream-encryption example disables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \
  --encryption-type KMS \
  --key-id arn:aws:kms:us-west-2:012345678912:key/a3c4a7cd-728b-45dd-b334-4d3eb496e452 \ 
  --stream-name samplestream
```

This command produces no output.

For more information, see Data Protection in Amazon Kinesis Data Streams in the Amazon Kinesis Data Streams Developer Guide.

- For API details, see StartStreamEncryption in AWS CLI Command Reference.

update-shard-count

The following code example shows how to use update-shard-count.

AWS CLI

To update the shard count in a data stream
The following `update-shard-count` example updates the shard count of the specified data stream to 6. This example uses uniform scaling, which creates shards of equal size.

```
aws kinesis update-shard-count 
  --stream-name samplestream 
  --scaling-type UNIFORM_SCALING 
  --target-shard-count 6
```

Output:

```
{
  "StreamName": "samplestream",
  "CurrentShardCount": 3,
  "TargetShardCount": 6
}
```

For more information, see [Resharding a Stream](https://docs.aws.amazon.com/kinesis/data-streams/latest/dev/resharding-streams-v2.html) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [UpdateShardCount](https://docs.aws.amazon.com/cli/latest/reference/kinesis/update-shard-count.html) in *AWS CLI Command Reference*.

**AWS KMS examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS KMS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)
Actions

cancel-key-deletion

The following code example shows how to use cancel-key-deletion.

AWS CLI

To cancel the scheduled deletion of a customer managed KMS key

The following cancel-key-deletion example cancels the scheduled deletion of a customer managed KMS key.

```bash
aws kms cancel-key-deletion \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```json
{
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

When the cancel-key-deletion command succeeds, the scheduled deletion is canceled. However, the key state of the KMS key is Disabled, so you can't use the KMS key in cryptographic operations. To restore its functionality, use the enable-key command.

For more information, see Scheduling and canceling key deletion in the AWS Key Management Service Developer Guide.

- For API details, see CancelKeyDeletion in AWS CLI Command Reference.

connect-custom-key-store

The following code example shows how to use connect-custom-key-store.

AWS CLI

To connect a custom key store
The following `connect-custom-key-store` example reconnects the specified custom key store. You can use a command like this one to connect a custom key store for the first time or to reconnect a key store that was disconnected.

You can use this command to connect an AWS CloudHSM key store or an external key store.

```bash
aws kms connect-custom-key-store \
   --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the command was effective, use the `describe-custom-key-stores` command.

For information about connecting an AWS CloudHSM key store, see [Connecting and disconnecting an AWS CloudHSM key store](aws-key-management-service-developer-guide) in the [AWS Key Management Service Developer Guide](aws-key-management-service-developer-guide).

For information about connecting an external key store, see [Connecting and disconnecting an external key store](aws-key-management-service-developer-guide) in the [AWS Key Management Service Developer Guide](aws-key-management-service-developer-guide).

- For API details, see [ConnectCustomKeyStore](aws-cli-command-reference) in [AWS CLI Command Reference](aws-cli-command-reference).

**create-alias**

The following code example shows how to use `create-alias`.

**AWS CLI**

**To create an alias for a KMS key**

The following `create-alias` command creates an alias named `example-alias` for the KMS key identified by key ID `1234abcd-12ab-34cd-56ef-1234567890ab`.

Alias names must begin with `alias/`. Do not use alias names that begin with `alias/aws`; these are reserved for use by AWS.

```bash
aws kms create-alias \
   --alias-name alias/example-alias \
   --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command doesn't return any output. To see the new alias, use the `list-aliases` command.
For more information, see Using aliases in the AWS Key Management Service Developer Guide.

- For API details, see CreateAlias in AWS CLI Command Reference.

create-custom-key-store

The following code example shows how to use create-custom-key-store.

AWS CLI

Example 1: To create an AWS CloudHSM key store

The following create-custom-key-store example creates an AWS CloudHSM key store backed by an AWS CloudHSM cluster using the required parameters. You can also add the custom-key-store-type parameter with the default value: `AWS_CLOUDHSM`.

To specify the file input for the trust-anchor-certificate command in the AWS CLI, the file:// prefix is required.

```
aws kms create-custom-key-store 
  --custom-key-store-name ExampleCloudHSMKeyStore 
  --cloud-hsm-cluster-id cluster-1a23b4cdefg 
  --key-store-password kmsPswd 
  --trust-anchor-certificate file://customerCA.crt
```

Output:

```
{
  "CustomKeyStoreId": "cks-1234567890abcdef0"
}
```

For more information, see Creating an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

Example 2: To create an external key store with public endpoint connectivity

The following create-custom-key-store example creates an external key store (XKS) that communicates with AWS KMS over the internet.

In this example, the XksProxyUriPath uses an optional prefix of example-prefix.
NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store
   --custom-key-store-name ExamplePublicEndpointXKS
   --custom-key-store-type EXTERNAL_KEY_STORE
   --xks-proxy-connectivity PUBLIC_ENDPOINT
   --xks-proxy-uri-endpoint "https://myproxy.xks.example.com"
   --xks-proxy-uri-path "/example-prefix/kms/xks/v1"
   --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{
   "CustomKeyStoreId": cks-2234567890abcdef0
}
```

For more information, see [Creating an external key store](https://docs.aws.amazon.com/kms/latest/developerguide/external-key-store.html) in the *AWS Key Management Service Developer Guide*.

**Example 3: To create an external key store with VPC endpoint service connectivity**

The following `create-custom-key-store` example creates an external key store (XKS) that uses an Amazon VPC endpoint service to communicate with AWS KMS.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
   --custom-key-store-name ExamplePublicEndpointXKS \
   --custom-key-store-type EXTERNAL_KEY_STORE \
   --xks-proxy-connectivity PUBLIC_ENDPOINT \
   --xks-proxy-uri-endpoint "https://myproxy.xks.example.com" \
   --xks-proxy-uri-path "/example-prefix/kms/xks/v1" \
   --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```
--custom-key-store-name ExampleVPC EndpointXKS \
--custom-key-store-type EXTERNAL KEY STORE \
--xks-proxy-connectivity VPC ENDPOINT SERVICE \
--xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
--xks-proxy-uri-path "/kms/xks/v1" \
--xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-example1" \
--xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE, RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo=

Output:

```
{
   "CustomKeyStoreId": cks-3234567890abcdef0
}
```

For more information, see Creating an external key store in the AWS Key Management Service Developer Guide.

- For API details, see CreateCustomKeyStore in AWS CLI Command Reference.

### create-grant

The following code example shows how to use create-grant.

**AWS CLI**

**To create a grant**

The following create-grant example creates a grant that allows the exampleUser user to use the decrypt command on the 1234abcd-12ab-34cd-56ef-1234567890ab example KMS key. The retiring principal is the adminRole role. The grant uses the EncryptionContextSubset grant constraint to allow this permission only when the encryption context in the decrypt request includes the "Department": "IT" key-value pair.

```
aws kms create-grant \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --grantee-principal arn:aws:iam::123456789012:user/exampleUser \
   --operations Decrypt \
   --constraints EncryptionContextSubset={Department=IT} \
   --retiring-principal arn:aws:iam::123456789012:role/adminRole
```
Output:

```json
{
    "GrantId": "1a2b3c4d2f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
    "GrantToken": "<grant token here>"
}
```

To view detailed information about the grant, use the `list-grants` command.

For more information, see [Grants in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/Grants.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [CreateGrant](https://docs.aws.amazon.com/cli/latest/reference/kms/create-grant.html) in *AWS CLI Command Reference*.

---

**create-key**

The following code example shows how to use `create-key`.

**AWS CLI**

**Example 1: To create a customer managed KMS key in AWS KMS**

The following `create-key` example creates a symmetric encryption KMS key.

To create the basic KMS key, a symmetric encryption key, you do not need to specify any parameters. The default values for those parameters create a symmetric encryption key.

Because this command doesn't specify a key policy, the KMS key gets the [default key policy](https://docs.aws.amazon.com/kms/latest/developerguide/default-key-policy.html) for programmatically created KMS keys. To view the key policy, use the `get-key-policy` command. To change the key policy, use the `put-key-policy` command.

```
aws kms create-key
```

The `create-key` command returns the key metadata, including the key ID and ARN of the new KMS key. You can use these values to identify the KMS key in other AWS KMS operations. The output does not include the tags. To view the tags for a KMS key, use the `list-resource-tags` command.

Output:

```json
{
    "KeyMetadata": {
```
Note: The create-key command does not let you specify an alias, To create an alias for the new KMS key, use the create-alias command.

For more information, see Creating keys in the AWS Key Management Service Developer Guide.

**Example 2: To create an asymmetric RSA KMS key for encryption and decryption**

The following create-key example creates a KMS key that contains an asymmetric RSA key pair for encryption and decryption.

```bash
aws kms create-key \
    --key-spec RSA_4096 \
    --key-usage ENCRYPT_DECRYPT
```

**Output:**

```json
{
   "KeyMetadata": {
      "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
      "AWSAccountId": "111122223333",
      "CreationDate": "2021-04-05T14:04:55-07:00",
      "CustomerMasterKeySpec": "RSA_4096",
      "Description": "",
      "Enabled": true,
      "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "KeyManager": "CUSTOMER",
      "KeySpec": "SYMMETRIC_DEFAULT",
      "KeyState": "Enabled",
      "KeyUsage": "ENCRYPT_DECRYPT",
      "MultiRegion": false,
      "Origin": "AWS_KMS",
      "EncryptionAlgorithms": [
         "SYMMETRIC_DEFAULT"
      ]
   }
}
```
For more information, see [Asymmetric keys in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/asymmetric-keys.html) in the *AWS Key Management Service Developer Guide*.

**Example 3: To create an asymmetric elliptic curve KMS key for signing and verification**

To create an asymmetric KMS key that contains an asymmetric elliptic curve (ECC) key pair for signing and verification. The `--key-usage` parameter is required even though `SIGN_VERIFY` is the only valid value for ECC KMS keys.

```bash
aws kms create-key \
  --key-spec ECC_NIST_P521 \
  --key-usage SIGN_VERIFY
```

**Output:**

```json
{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-east-2:11112222333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2019-12-02T07:48:55-07:00",
    "CustomerMasterKeySpec": "ECC_NIST_P521",
    "Description": "",
    "Enabled": true,
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "EncryptionAlgorithms": [
      "RSAES_OAEP_SHA_1",
      "RSAES_OAEP_SHA_256"
    ],
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "RSA_4096",
    "KeyState": "Enabled",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": false,
    "Origin": "AWS_KMS"
  }
}
```
"KeySpec": "ECC_NIST_P521",
"KeyState": "Enabled",
"KeyUsage": "SIGN_VERIFY",
"MultiRegion": false,
"Origin": "AWS_KMS",
"SigningAlgorithms": [
    "ECDSA_SHA_512"
]
}
}

For more information, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

Example 4: To create an HMAC KMS key

The following `create-key` example creates a 384-bit HMAC KMS key. The `GENERATE_VERIFY_MAC` value for the `--key-usage` parameter is required even though it's the only valid value for HMAC KMS keys.

```bash
aws kms create-key \
    --key-spec HMAC_384 \
    --key-usage GENERATE_VERIFY_MAC
```

Output:

```json
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2022-04-05T14:04:55-07:00",
        "CustomerMasterKeySpec": "HMAC_384",
        "Description": "",
        "Enabled": true,
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "HMAC_384",
        "KeyState": "Enabled",
        "KeyUsage": "GENERATE_VERIFY_MAC",
        "MacAlgorithms": [
            "HMAC_SHA_384"
        ]
    }
}
```
For more information, see [HMAC keys in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/) in the AWS Key Management Service Developer Guide.

**Example 4: To create a multi-Region primary KMS key**

The following create-key example creates a multi-Region primary symmetric encryption key. Because the default values for all parameters create a symmetric encryption key, only the --multi-region parameter is required for this KMS key. In the AWS CLI, to indicate that a Boolean parameter is true, just specify the parameter name.

```bash
aws kms create-key \\
   --multi-region
```

**Output:**

```json
{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-west-2:111122223333:key/mrk-1234abcd12ab34cd56ef12345678990ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2021-09-02T016:15:21-09:00",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "Description": "",
    "Enabled": true,
    "EncryptionAlgorithms": ["SYMMETRIC_DEFAULT"],
    "KeyId": "mrk-1234abcd12ab34cd56ef12345678990ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "SYMMETRIC_DEFAULT",
    "KeyState": "Enabled",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": true,
    "MultiRegionConfiguration": {
      "MultiRegionKeyType": "PRIMARY",
      "PrimaryKey": {
```

```
For more information, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

**Example 5: To create a KMS key for imported key material**

The following `create-key` example creates a KMS key with no key material. When the operation is complete, you can import your own key material into the KMS key. To create this KMS key, set the `--origin` parameter to `EXTERNAL`.

```bash
aws kms create-key \
  --origin EXTERNAL
```

**Output:**

```json
{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2019-12-02T07:48:55-07:00",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "Description": "",
    "Enabled": false,
    "EncryptionAlgorithms": ["SYMMETRIC_DEFAULT"],
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "SYMMETRIC_DEFAULT",
    "KeyState": "PendingImport",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": false,
    "Origin": "EXTERNAL"
  }
}
```
For more information, see Importing key material in AWS KMS keys in the AWS Key Management Service Developer Guide.

Example 6: To create a KMS key in an AWS CloudHSM key store

The following create-key example creates a KMS key in the specified AWS CloudHSM key store. The operation creates the KMS key and its metadata in AWS KMS and creates the key material in the AWS CloudHSM cluster associated with the custom key store. The --custom-key-store-id and --origin parameters are required.

```
aws kms create-key \
  --origin AWS_CLOUDHSM \
  --custom-key-store-id cks-1234567890abcdef0
```

Output:

```
{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CloudHsmClusterId": "cluster-1a23b4cdefg",
    "CreationDate": "2019-12-02T07:48:55-07:00",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "CustomKeyStoreId": "cks-1234567890abcdef0",
    "Description": "",
    "Enabled": true,
    "EncryptionAlgorithms": ["SYMMETRIC_DEFAULT"],
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "SYMMETRIC_DEFAULT",
    "KeyState": "Enabled",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": false,
    "Origin": "AWS_CLOUDHSM"
  }
}
```
Example 7: To create a KMS key in an external key store

The following `create-key` example creates a KMS key in the specified external key store. The `--custom-key-store-id`, `--origin`, and `--xks-key-id` parameters are required in this command.

The `--xks-key-id` parameter specifies the ID of an existing symmetric encryption key in your external key manager. This key serves as the external key material for the KMS key. The value of the `--origin` parameter must be `EXTERNAL_KEY_STORE`. The `custom-key-store-id` parameter must identify an external key store that is connected to its external key store proxy.

```
aws kms create-key \
    --origin EXTERNAL_KEY_STORE \
    --custom-key-store-id cks-9876543210fedcba9 \
    --xks-key-id bb8562717f809024
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2022-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "CustomKeyStoreId": "cks-9876543210fedcba9",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "EXTERNAL_KEY_STORE",
        "XksKeyConfiguration": {
```
For more information, see External key stores in the AWS Key Management Service Developer Guide.

- For API details, see CreateKey in AWS CLI Command Reference.

**decrypt**

The following code example shows how to use decrypt.

**AWS CLI**

**Example 1: To decrypt an encrypted message with a symmetric KMS key (Linux and macOS)**

The following decrypt command example demonstrates the recommended way to decrypt data with the AWS CLI. This version shows how to decrypt data under a symmetric KMS key.

Provide the ciphertext in a file. In the value of the --ciphertext-blob parameter, use the file:// prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html> in the AWS Command Line Interface User Guide and Best Practices for Local File Parameters<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/> in the AWS Command Line Tool Blog. Specify the KMS key to decrypt the ciphertext. The --key-id parameter is not required when decrypting with a symmetric KMS key. AWS KMS can get the key ID of the KMS key that was used to encrypt the data from the metadata in the ciphertext. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust. Request the plaintext output as a text value. The --query parameter tells the CLI to get only the value of the Plaintext field from the output. The --output parameter returns the output as text. Base64-decode the plaintext and save it in a file. The following example pipes (!) the value of the Plaintext parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the ExamplePlaintext file.
Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --output text \
    --query Plaintext | base64 \
    --decode > ExamplePlaintextFile
```

This command produces no output. The output from the decrypt command is base64-decoded and saved in a file.

For more information, see Decrypt in the AWS Key Management Service API Reference.

**Example 2: To decrypt an encrypted message with a symmetric KMS key (Windows command prompt)**

The following example is the same as the previous one except that it uses the certutil utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt ^
    --ciphertext-blob fileb://ExampleEncryptedFile ^
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^
    --output text ^
    --query Plaintext > ExamplePlaintextFile.base64
```

Run the certutil command.

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```
For more information, see Decrypt in the AWS Key Management Service API Reference.

Example 3: To decrypt an encrypted message with an asymmetric KMS key (Linux and macOS)

The following decrypt command example shows how to decrypt data encrypted under an RSA asymmetric KMS key.

When using an asymmetric KMS key, the encryption-algorithm parameter, which specifies the algorithm used to encrypt the plaintext, is required.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
   --ciphertext-blob fileb://ExampleEncryptedFile \
   --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
   --encryption-algorithm RSAES_OAEP_SHA_256 \
   --output text \
   --query Plaintext | base64 \
   --decode > ExamplePlaintextFile
```

This command produces no output. The output from the decrypt command is base64-decoded and saved in a file.

For more information, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

- For API details, see Decrypt in AWS CLI Command Reference.

delete-alias

The following code example shows how to use delete-alias.

AWS CLI

To delete an AWS KMS alias

The following delete-alias example deletes the alias alias/example-alias. The alias name must begin with alias/.

```
aws kms delete-alias \
```
--alias-name alias/example-alias

This command produces no output. To find the alias, use the list-aliases command.

For more information, see Deleting an alias in the AWS Key Management Service Developer Guide.

- For API details, see DeleteAlias in AWS CLI Command Reference.

delete-custom-key-store

The following code example shows how to use delete-custom-key-store.

AWS CLI

To delete a custom key store

The following delete-custom-key-store example deletes the specified custom key store.

Deleting an AWS CloudHSM key store has no effect on the associated CloudHSM cluster.
Deleting an external key store has no effect on the associated external key store proxy, external key manager, or external keys.

NOTE: Before you can delete a custom key store, you must schedule the deletion of all KMS keys in the custom key store and then wait for those KMS keys to be deleted. Then, you must disconnect the custom key store. For help finding the KMS keys in your custom key store, see Delete an AWS CloudHSM key store (API) in the AWS Key Management Service Developer Guide.

delete-custom-key-store \ --custom-key-store-id cks-1234567890abcdef0

This command does not return any output. To verify that the custom key store is deleted, use the describe-custom-key-stores command.

For information about deleting an AWS CloudHSM key stores, see Deleting an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

For information about deleting external key stores, see Deleting an external key store in the AWS Key Management Service Developer Guide.

- For API details, see DeleteCustomKeyStore in AWS CLI Command Reference.
**delete-imported-key-material**

The following code example shows how to use delete-imported-key-material.

**AWS CLI**

To delete imported key material from a KMS key

The following delete-imported-key-material example deletes key material that had been imported into a KMS key.

```
aws kms delete-imported-key-material \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the key material is deleted, use the describe-key command to look for a key state of PendingImport or PendingDeletion.

For more information, see Deleting imported key material<https://docs.aws.amazon.com/kms/latest/developerguide/importing-keys-delete-key-material.html> in the *AWS Key Management Service Developer Guide*.

- For API details, see [DeleteImportedKeyMaterial](https://docs.aws.amazon.com/cli/latest/reference/kms/delete-imported-key-material.html) in *AWS CLI Command Reference*.

**describe-custom-key-stores**

The following code example shows how to use describe-custom-key-stores.

**AWS CLI**

Example 1: To get details about an AWS CloudHSM key store

The following describe-custom-key-store example displays details about the specified AWS CloudHSM key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the custom-key-store-name or custom-key-store-id parameter.

```
aws kms describe-custom-key-stores \
   --custom-key-store-name ExampleCloudHSMKeyStore
```
The output of this command includes useful details about the AWS CloudHSM key store including its connection state (ConnectionState). If the connection state is FAILED, the output includes a ConnectionErrorCode field that describes the problem.

Output:

```json
{
    "CustomKeyStores": [ 
        {
            "CloudHsmClusterId": "cluster-1234567890abcdef0",
            "ConnectionState": "CONNECTED",
            "CreationDate": "2022-04-05T14:04:55-07:00",
            "CustomKeyStoreId": "cks-1234567890abcdef0",
            "CustomKeyStoreName": "ExampleExternalKeyStore",
            "TrustAnchorCertificate": "<certificate appears here>"
        }
    ]
}
```

For more information, see Viewing an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

**Example 2: To get details about an external key store with public endpoint connectivity**

The following describe-custom-key-store example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the custom-key-store-name or custom-key-store-id parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-id cks-9876543210fedcba9
```

The output of this command includes useful details about the external key store including its connection state (ConnectionState). If the connection state is FAILED, the output includes a ConnectionErrorCode field that describes the problem.

Output:
For more information, see Viewing an external key store in the AWS Key Management Service Developer Guide.

Example 3: To get details about an external key store with VPC endpoint service connectivity

The following describe-custom-key-store example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the custom-key-store-name or custom-key-store-id parameter.

```bash
aws kms describe-custom-key-stores \
   --custom-key-store-id cks-2234567890abcdef0
```

The output of this command includes useful details about the external key store including its connection state (ConnectionState). If the connection state is FAILED, the output includes a ConnectionErrorCode field that describes the problem.

Output:
For more information, see Viewing an external key store in the AWS Key Management Service Developer Guide.

- For API details, see DescribeCustomKeyStores in AWS CLI Command Reference.

describe-key

The following code example shows how to use describe-key.

**AWS CLI**

**Example 1: To find detailed information about a KMS key**

The following describe-key example gets detailed information about the AWS managed key for Amazon S3 in the example account and Region. You can use this command to find details about AWS managed keys and customer managed keys.

To specify the KMS key, use the key-id parameter. This example uses an alias name value, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```bash
aws kms describe-key 
--key-id alias/aws/s3
```
Output:

```json
{
   "KeyMetadata": {
      "AWSAccountId": "846764612917",
      "KeyId": "b8a9477d-836c-491f-857e-07937918959b",
      "CreationDate": 2017-06-30T21:44:32.140000+00:00,
      "Enabled": true,
      "Description": "Default KMS key that protects my S3 objects when no other key is defined",
      "KeyUsage": "ENCRYPT_DECRYPT",
      "KeyState": "Enabled",
      "Origin": "AWS_KMS",
      "KeyManager": "AWS",
      "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
      "EncryptionAlgorithms": [
         "SYMMETRIC_DEFAULT"
      ]
   }
}
```

For more information, see [Viewing keys](#) in the *AWS Key Management Service Developer Guide*.

**Example 2: To get details about an RSA asymmetric KMS key**

The following `describe-key` example gets detailed information about an asymmetric RSA KMS key used for signing and verification.

```bash
aws kms describe-key \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```json
{
   "KeyMetadata": {
      "AWSAccountId": "111122223333",
      "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "Arn": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
      "CreationDate": "2019-12-02T19:47:47.861000+00:00",
      "CustomerMasterKeySpec": "RSA_2048",
```
Example 3: To get details about a multi-Region replica key

The following describe-key example gets metadata for a multi-Region replica key. This multi-Region key is a symmetric encryption key. The output of a describe-key command for any multi-Region key returns information about the primary key and all of its replicas.

```
aws kms describe-key \
   --key-id arn:aws:kms:ap-northeast-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab
```

Output:

```
{
   "KeyMetadata": {
      "MultiRegion": true,
      "AWSAccountId": "111122223333",
      "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
      "CreationDate": "2021-06-28T21:09:16.114000+00:00",
      "Description": "",
      "Enabled": true,
      "KeyId": "mrk-1234abcd12ab34cd56ef1234567890ab",
      "KeyManager": "CUSTOMER",
      "KeyUsage": "SIGN_VERIFY",
      "SigningAlgorithms": [
         "RSASSA_PKCS1_V1_5_SHA_256",
         "RSASSA_PKCS1_V1_5_SHA_384",
         "RSASSA_PKCS1_V1_5_SHA_512",
         "RSASSA_PSS_SHA_256",
         "RSASSA_PSS_SHA_384",
         "RSASSA_PSS_SHA_512"
      ]
   }
}
```
"KeyState": "Enabled",
"KeyUsage": "ENCRYPT_DECRYPT",
"Origin": "AWS_KMS",
"CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
"EncryptionAlgorithms": [ 
    "SYMMETRIC_DEFAULT"
],
"MultiRegionConfiguration": {
    "MultiRegionKeyType": "PRIMARY",
    "PrimaryKey": {
        "Arn": "arn:aws:kms:us-west-2:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
        "Region": "us-west-2"
    },
    "ReplicaKeys": [
        {
            "Arn": "arn:aws:kms:eu-west-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
            "Region": "eu-west-1"
        },
        {
            "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
            "Region": "ap-northeast-1"
        },
        {
            "Arn": "arn:aws:kms:sa-east-1:111122223333:key/mrk-1234abcd12ab34cd56ef1234567890ab",
            "Region": "sa-east-1"
        }
    ]
}

Example 4: To get details about an HMAC KMS key

The following describe-key example gets detailed information about an HMAC KMS key.

```
aws kms describe-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:
• For API details, see DescribeKey in AWS CLI Command Reference.

disable-key-rotation

The following code example shows how to use disable-key-rotation.

AWS CLI

To disable automatic rotation of a KMS key

The following disable-key-rotation example disables automatic rotation of a customer managed KMS key. To reenable automatic rotation, use the enable-key-rotation command.

```bash
aws kms disable-key-rotation \
   --key-id arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that automatic rotation is disable for the KMS key, use the get-key-rotation-status command.

For more information, see Rotating keys in the AWS Key Management Service Developer Guide.
For API details, see DisableKeyRotation in AWS CLI Command Reference.

disable-key

The following code example shows how to use disable-key.

AWS CLI

To temporarily disable a KMS key

The following example uses the disable-key command to disable a customer managed KMS key. To re-enable the KMS key, use the enable-key command.

/aws kms disable-key
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab

This command produces no output.

For more information, see Enabling and Disabling Keys in the AWS Key Management Service Developer Guide.

For API details, see DisableKey in AWS CLI Command Reference.

disconnect-custom-key-store

The following code example shows how to use disconnect-custom-key-store.

AWS CLI

To disconnect a custom key store

The following disconnect-custom-key-store example disconnects a custom key store from its AWS CloudHSM cluster. You might disconnect a key store to troubleshoot a problem, to update its settings, or to prevent KMS keys in the keystore from being used in cryptographic operations.

This command is the same for all custom key stores, including AWS CloudHSM key stores and external key stores.

Before running this command, replace the example custom key store ID with a valid one.
$ aws kms disconnect-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0

This command produces no output. Verify that the command was effective, use the `describe-custom-key-stores` command.

For more information about disconnecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the AWS Key Management Service Developer Guide.

For more information about disconnecting an external key store, see Connecting and disconnecting an external key store in the AWS Key Management Service Developer Guide.

- For API details, see DisconnectCustomKeyStore in AWS CLI Command Reference.

**enable-key-rotation**

The following code example shows how to use `enable-key-rotation`.

AWS CLI

**To enable automatic rotation of a KMS key**

The following enable-key-rotation example enables automatic rotation of a customer-managed KMS key with a rotation period of 180 days. The KMS key will be rotated one year (approximate 365 days) from the date that this command completes and every year thereafter.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key. The `--rotation-period-in-days` parameter specifies the number of days between each rotation date. Specify a value between 90 and 2560 days. If no value is specified, the default value is 365 days.

```
aws kms enable-key-rotation \
    --key-id arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --rotation-period-in-days 180
```

This command produces no output. To verify that the KMS key is enabled, use the `get-key-rotation-status` command.
For more information, see Rotating keys in the AWS Key Management Service Developer Guide.

- For API details, see EnableKeyRotation in AWS CLI Command Reference.

**enable-key**

The following code example shows how to use enable-key.

**AWS CLI**

**To enable a KMS key**

The following enable-key example enables a customer managed key. You can use a command like this one to enable a KMS key that you temporarily disabled by using the disable-key command. You can also use it to enable a KMS key that is disabled because it was scheduled for deletion and the deletion was canceled.

To specify the KMS key, use the key-id parameter. This example uses an key ID value, but you can use a key ID or key ARN value in this command.

Before running this command, replace the example key ID with a valid one.

```
aws kms enable-key \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the KMS key is enabled, use the describe-key command. See the values of the KeyState and Enabled fields in the describe-key output.

- For more information, see Enabling and Disabling Keys in the AWS Key Management Service Developer Guide.

- For API details, see EnableKey in AWS CLI Command Reference.

**encrypt**

The following code example shows how to use encrypt.

**AWS CLI**

**Example 1: To encrypt the contents of a file on Linux or MacOS**
The following encrypt command demonstrates the recommended way to encrypt data with the AWS CLI.

```bash
aws kms encrypt \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --plaintext fileb://ExamplePlaintextFile \
   --output text \
   --query CiphertextBlob | base64 \
   --decode > ExampleEncryptedFile
```

The command does several things:

Uses the `--plaintext` parameter to indicate the data to encrypt. This parameter value must be base64-encoded. The value of the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file. If the file is not in the current directory, type the full path to file. For example: `fileb:///var/tmp/ExamplePlaintextFile` or `fileb://C:\Temp\ExamplePlaintextFile`. For more information about reading AWS CLI parameter values from a file, see [Loading Parameters from a File](#) in the AWS Command Line Interface User Guide and [Best Practices for Local File Parameters](#) on the AWS Command Line Tool Blog. Uses the `--output` and `--query` parameters to control the command's output. These parameters extract the encrypted data, called the ciphertext, from the command's output. For more information about controlling output, see [Controlling Command Output](#) in the AWS Command Line Interface User Guide. Uses the `base64` utility to decode the extracted output into binary data. The ciphertext that is returned by a successful encrypt command is base64-encoded text. You must decode this text before you can use the AWS CLI to decrypt it. Saves the binary ciphertext to a file. The final part of the command (`> ExampleEncryptedFile`) saves the binary ciphertext to a file to make decryption easier. For an example command that uses the AWS CLI to decrypt data, see the decrypt examples.

**Example 2: Using the AWS CLI to encrypt data on Windows**

This example is the same as the previous one, except that it uses the `certutil` tool instead of `base64`. This procedure requires two commands, as shown in the following example.

```bash
aws kms encrypt \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --plaintext fileb://ExamplePlaintextFile \
   --output text \
   --query CiphertextBlob > C:\Temp\ExampleEncryptedFile.base64
```
Example 3: Encrypting with an asymmetric KMS key

The following encrypt command shows how to encrypt plaintext with an asymmetric KMS key. The `--encryption-algorithm` parameter is required. As in all `encrypt` CLI commands, the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

```
certutil -decode C:\Temp\ExampleEncryptedFile.base64 C:\Temp\ExampleEncryptedFile
```

```
aws kms encrypt \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob | base64 \
    --decode > ExampleEncryptedFile
```

This command produces no output.
- For API details, see Encrypt in AWS CLI Command Reference.

`generate-data-key-pair-without-plaintext`

The following code example shows how to use `generate-data-key-pair-without-plaintext`.

**AWS CLI**

**To generate an ECC NIST P384 asymmetric data key pair**

The following `generate-data-key-pair-without-plaintext` example requests an ECC NIST P384 key pair for use outside of AWS.

The command returns a plaintext public key and a copy of the private key encrypted under the specified KMS key. It does not return a plaintext private key. You can safely store the encrypted private key with the encrypted data, and call AWS KMS to decrypt the private key when you need to use it.

To request an ECC NIST P384 asymmetric data key pair, use the `key-pair-spec` parameter with a value of ECC_NIST_P384.
The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a
KeySpec value of SYMMETRIC_DEFAULT.

NOTE: The values in the output of this example are truncated for display.

```bash
aws kms generate-data-key-pair-without-plaintext
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
   --key-pair-spec ECC_NIST_P384
```

Output:

```
{
   "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdK12aJTzkK6Fbh0tQkM1QJJH3PdtHvS/y+hAFFxmiD134doUDzMGfCetcAAAHaTCCB2UGCSqGS1b3DQEHBqCCB1...",
   "PublicKey": "MIIBojANBgkqhkiG9w0BAQEFAAOCAoCAAMIIBigKCAYEA3A3eGMyPrvSn7+Ld1JE1oUoQV5HpEuHAVbd0yND+NmYDH/ml1OSIEuLrcdZ5hrMH4pk83r40l...",
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "KeyPairSpec": "ECC_NIST_P384"
}
```

The PublicKey and PrivateKeyCiphertextBlob are returned in base64-encoded format.

For more information, see [Data key pairs](https://aws.amazon.com/key-management-service/) in the AWS Key Management Service Developer Guide.

- For API details, see [GenerateDataKeyPairWithoutPlaintext](https://docs.aws.amazon.com/cli/latest/reference/kms/generate-data-key-pair-without-plaintext.html) in AWS CLI Command Reference.

**generate-data-key-pair**

The following code example shows how to use `generate-data-key-pair`.

**AWS CLI**

To generate an 2048-bit RSA asymmetric data key pair

The following generate-data-key-pair example requests a 2048-bit RSA asymmetric data key pair for use outside of AWS. The command returns a plaintext public key and a plaintext private key for immediate use and deletion, and a copy of the private key encrypted under the specified KMS key. You can safely store the encrypted private key with the encrypted data.
To request a 2048-bit RSA asymmetric data key pair, use the `key-pair-spec` parameter with a value of `RSA_2048`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `KeySpec` value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --key-pair-spec RSA_2048
```

Output:

```
{
  "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdKl2aJTzkK6Fbh0tQkM1QJJH3PdtHvS/y+hAFFxmiD134doUDzMGmFCEtcAAAHaTCCB2UGCSqGSIf3DQEBHqCCB1...",
  "PrivateKeyPlaintext": "MIIG/QIBADANBgkqhkiG9w0BAQEFAASCBygwwCQYDVQQDBBAcSB0MHEQYDVQQDDBBo...",
  "PublicKey": "MIIBojANBgkqhkiG9w0BAQEFAAOCAY8AMIIBigKCAYEAI0GMyPrvSn7+Ld1JE1oUoQV5HpEuHAVbd0yND+NmYDH/mL10SIEuLrcdZ5hrMH4pk83r40l...",
  "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "KeyPairSpec": "RSA_2048"
}
```

The `PublicKey`, `PrivateKeyPlaintext`, and `PrivateKeyCiphertextBlob` are returned in base64-encoded format.

For more information, see [Data key pairs](https://docs.aws.amazon.com/awsklm/latest/userguide/data-key-pairs.html) in the [AWS Key Management Service Developer Guide](https://docs.aws.amazon.com/awsklm/latest/userguide/).

---

### generate-data-key-without-plaintext

The following code example shows how to use `generate-data-key-without-plaintext`.

```bash
aws kms generate-data-key-without-plaintext \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --key-pair-spec RSA_2048
```

Output:

```
{
  "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "KeyPairSpec": "RSA_2048"
}
```

To generate a 256-bit symmetric data key without a plaintext key.
The following `generate-data-key-without-plaintext` example requests an encrypted copy of a 256-bit symmetric data key for use outside of AWS. You can call AWS KMS to decrypt the data key when you are ready to use it.

To request a 256-bit data key, use the `key-spec` parameter with a value of AES_256. To request a 128-bit data key, use the `key-spec` parameter with a value of AES_128. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```bash
code
aws kms generate-data-key-without-plaintext 
   --key-id "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab" 
   --key-spec AES_256
```

Output:

```
{
   "CiphertextBlob": "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfThbJ1Gfr8P3w1wAAA4wA8YJKoZIhvcNAQcGoG8wbQIBADBoBegkqh
   "KeyId": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

The `CiphertextBlob` (encrypted data key) is returned in base64-encoded format.

For more information, see [Data keys](https://docs.aws.amazon.com/kms/latest/developerguide/data-keys.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see *GenerateDataKeyWithoutPlaintext* in *AWS CLI Command Reference*.

### generate-data-key

The following code example shows how to use `generate-data-key`.

**AWS CLI**

**Example 1: To generate a 256-bit symmetric data key**

The following `generate-data-key` example requests a 256-bit symmetric data key for use outside of AWS. The command returns a plaintext data key for immediate use and deletion,
and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a 256-bit data key, use the key-spec parameter with a value of AES_256. To request a 128-bit data key, use the key-spec parameter with a value of AES_128. For all other data key lengths, use the number-of-bytes parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```
aws kms generate-data-key
   --key-id alias/ExampleAlias
   --key-spec AES_256
```

Output:

```
{
   "Plaintext": "VdzKNHGzUAzJeRBVY+uUmofUGGiDzyB3+i9fVkh3piw=",
   "KeyId": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "CiphertextBlob":
      "AQEDAHjRYf5WyTIC0C857tF5nBaPn2F8DgfShbJ1gfR8P3lwAAAH4wfAYJKoZIhvCAQcGo8wbQlBADBoBqkqhk
   +YdhV8MrkBQPac0ReRVNDt9qleAt+SgIRF8P0H+7U="
}
```

The Plaintext (plaintext data key) and the CiphertextBlob (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys <https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys in the AWS Key Management Service Developer Guide.

**Example 2: To generate a 512-bit symmetric data key**

The following generate-data-key example requests a 512-bit symmetric data key for encryption and decryption. The command returns a plaintext data key for immediate use and deletion, and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a key length other than 128 or 256 bits, use the number-of-bytes parameter. To request a 512-bit data key, the following example uses the number-of-bytes parameter with a value of 64 (bytes).
The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

NOTE: The values in the output of this example are truncated for display.

```bash
aws kms generate-data-key \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --number-of-bytes 64
```

Output:

```json
{
  "CiphertextBlob": "AQIBAHi6LtupRpdKl2aJTzkK6Fbh0tQkM1QJJH3PdtHvS/y+hAEnX/QQNmMwDfg2korNMCec8AAACaDCCAmQGCSqGSIb3DQEHBqCCAlUwggJRAgEAMIICSgYJKoZ...",
  "Plaintext": "ty8Lr0Bk6OF07M2Wt6qbFdNB+G00ZLtf5MSEb4a13R2UKWGOp06njAwy2n72VRm2m7z/Pm9Wpbttz6a4LSo9hgPvKhz5y6RTm40ovEXiVfBveyX3DQxDzRSwbKDpk/...",
  "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

The Plaintext (plaintext data key) and CiphertextBlob (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys <https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys in the AWS Key Management Service Developer Guide.>

- For API details, see GenerateDataKey in AWS CLI Command Reference.

**generate-random**

The following code example shows how to use generate-random.

**AWS CLI**

**Example 1: To generate a 256-bit random byte string (Linux or macOS)**

The following generate-random example generates a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file.

When you run this command, you must use the number-of-bytes parameter to specify the length of the random value in bytes.
You don't specify a KMS key when you run this command. The random byte string is unrelated to any KMS key.

By default, AWS KMS generates the random number. However, if you specify a custom key store<https://docs.aws.amazon.com/kms/latest/developerguide/custom-key-store-overview.html>, the random byte string is generated in the AWS CloudHSM cluster associated with the custom key store.

This example uses the following parameters and values:

It uses the required `--number-of-bytes` parameter with a value of 32 to request a 32-byte (256-bit) string. It uses the `--output` parameter with a value of `text` to direct the AWS CLI to return the output as text, instead of JSON. It uses the `--query` parameter to extract the value of the `Plaintext` property from the response. It pipes (|) the output of the command to the `base64` utility, which decodes the extracted output. It uses the redirection operator (>) to save decoded byte string to the `ExampleRandom` file. It uses the redirection operator (>) to save the binary ciphertext to a file.

```
aws kms generate-random \
  --number-of-bytes 32 \
  --output text \
  --query Plaintext | base64 --decode > ExampleRandom
```

This command produces no output.

For more information, see `GenerateRandom` in the *AWS Key Management Service API Reference*.

**Example 2: To generate a 256-bit random number (Windows Command Prompt)**

The following example uses the `generate-random` command to generate a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file. This example is the same as the previous example, except that it uses the `certutil` utility in Windows to base64-decode the random byte string before saving it in a file.

First, generate a base64-encoded random byte string and saves it in a temporary file, `ExampleRandom.base64`.

```
aws kms generate-random \
  --number-of-bytes 32 \
  --output text \
  --query Plaintext > ExampleRandom.base64
```
Because the output of the `generate-random` command is saved in a file, this example produces no output.

Now use the `certutil -decode` command to decode the base64-encoded byte string in the `ExampleRandom.base64` file. Then, it saves the decoded byte string in the `ExampleRandom` file.

```
certutil -decode ExampleRandom.base64 ExampleRandom
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see [GenerateRandom](#) in the [AWS Key Management Service API Reference](#).

- For API details, see [GenerateRandom](#) in [AWS CLI Command Reference](#).

**get-key-policy**

The following code example shows how to use `get-key-policy`.

**AWS CLI**

To copy a key policy from one KMS key to another KMS key

The following `get-key-policy` example gets the key policy from one KMS key and saves it in a text file. Then, it replaces the policy of a different KMS key using the text file as the policy input.

Because the `--policy` parameter of `put-key-policy` requires a string, you must use the `--output text` option to return the output as a text string instead of JSON.

```
aws kms get-key-policy
   --policy-name default
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
   --query Policy
   --output text > policy.txt

aws kms put-key-policy
   --policy-name default
```

Actions and scenarios
This command produces no output.

For more information, see PutKeyPolicy in the AWS KMS API Reference.

- For API details, see GetKeyPolicy in AWS CLI Command Reference.

get-key-rotation-status

The following code example shows how to use get-key-rotation-status.

AWS CLI

To retrieve the rotation status for a KMS key.

The following get-key-rotation-status example returns information about the rotation status of the specified KMS key, including whether automatic rotation is enabled, the rotation period, and the next scheduled rotation date. You can use this command on customer managed KMS keys and AWS managed KMS keys. However, all AWS managed KMS keys are automatically rotated every year.

```bash
aws kms get-key-rotation-status \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
   "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
   "KeyRotationEnabled": true,
   "NextRotationDate": "2024-02-14T18:14:33.587000+00:00",
   "RotationPeriodInDays": 365
}
```

For more information, see Rotating keys in the AWS Key Management Service Developer Guide.

- For API details, see GetKeyRotationStatus in AWS CLI Command Reference.

get-parameters-for-import

The following code example shows how to use get-parameters-for-import.
AWS CLI

To get the items required to import key material into a KMS key

The following get-parameters-for-import example gets the public key and import token that you need to import key material into a KMS key. When you use the import-key-material command, be sure to use the import token and key material encrypted by the public key that were returned in the same get-parameters-for-import command. Also, the wrapping algorithm that you specify in this command must be one that you use to encrypt the key material with the public key.

To specify the KMS key, use the key-id parameter. This example uses an key ID, but you can use a key ID or key ARN in this command.

```
aws kms get-parameters-for-import 
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab 
   --wrapping-algorithm RSAES_OAEP_SHA_256 
   --wrapping-key-spec RSA_2048
```

Output:

```
{
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "PublicKey": "<public key base64 encoded data>",
   "ImportToken": "<import token base64 encoded data>",
   "ParametersValidTo": 1593893322.32
}
```

For more information, see Download the public key and import token in the AWS Key Management Service Developer Guide.

- For API details, see GetParametersForImport in AWS CLI Command Reference.

get-public-key

The following code example shows how to use get-public-key.

AWS CLI

Example 1: To download the public key of an asymmetric KMS key
The following `get-public-key` example downloads the public key of an asymmetric KMS key.

In addition to returning the public key, the output includes information that you need to use the public key safely outside of AWS KMS, including the key usage and supported encryption algorithms.

```
aws kms get-public-key \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "PublicKey": "jANBgkqhkiG9w0BAQEFAAAOCg=
   "CustomerMasterKeySpec": "RSA_4096",
   "KeyUsage": "ENCRYPT_DECRYPT",
   "EncryptionAlgorithms": [
      "RSAES_OAEP_SHA_1",
      "RSAES_OAEP_SHA_256"
   ]
}
```

For more information about using asymmetric KMS keys in AWS KMS, see [Using Symmetric and Asymmetric Keys](https://docs.aws.amazon.com/kms/latest/developerguide/aws-kms-using-key.html) in the AWS Key Management Service API Reference.

**Example 2: To convert a public key to DER format (Linux and macOS)**

The following `get-public-key` example downloads the public key of an asymmetric KMS key and saves it in a DER file.

When you use the `get-public-key` command in the AWS CLI, it returns a DER-encoded X.509 public key that is Base64-encoded. This example gets the value of the PublicKey property as text. It Base64-decodes the PublicKey and saves it in the `public_key.der` file. The output parameter returns the output as text, instead of JSON. The `--query` parameter gets only the PublicKey property, not the properties that you need to use the public key safely outside of AWS KMS.

Before running this command, replace the example key ID with a valid key ID from your AWS account.
aws kms get-public-key
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
   --output text
   --query PublicKey | base64 --decode > public_key.der

This command produces no output.

For more information about using asymmetric KMS keys in AWS KMS, see Using Symmetric and Asymmetric Keys in the AWS Key Management Service API Reference.

- For API details, see GetPublicKey in AWS CLI Command Reference.

import-key-material

The following code example shows how to use import-key-material.

AWS CLI

To import key material into a KMS key

The following import-key-material example uploads key material into a KMS key that was created with no key material. The key state of the KMS key must be PendingImport.

This command uses key material that you encrypted with the public key that the get-parameters-for-import command returned. It also uses the import token from the same get-parameters-for-import command.

The expiration-model parameter indicates that the key material automatically expires on the date and time specified by the valid-to parameter. When the key material expires, AWS KMS deletes the key material, the key state of the KMS key changes to Pending import and the KMS key becomes unusable. To restore the KMS key, you must reimport the same key material. To use different key material, you must create a new KMS key.

Before running this command, replace the example key ID with a valid key ID or key ARN from your AWS account.

aws kms import-key-material
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
   --encrypted-key-material fileb://EncryptedKeyMaterial.bin
   --import-token fileb://ImportToken.bin
   --expiration-model KEY_MATERIAL_EXPIRES
This command produces no output.

For more information about importing key material, see Importing Key Material in the AWS Key Management Service Developer Guide.

- For API details, see ImportKeyMaterial in AWS CLI Command Reference.

### list-aliases

The following code example shows how to use list-aliases.

#### AWS CLI

**Example 1: To list all aliases in an AWS account and Region**

The following example uses the list-aliases command to list all aliases in the default Region of the AWS account. The output includes aliases associated with AWS managed KMS keys and customer managed KMS keys.

```bash
aws kms list-aliases
```

Output:

```json
{
   "Aliases": [
      {
         "AliasName": "alias/testKey",
         "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
      },
      {
         "AliasName": "alias/FinanceDept",
         "TargetKeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
      },
      {
         "AliasName": "alias/aws/dynamodb",
         "TargetKeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
      }
   ]
}
```
Example 2: To list all aliases for a particular KMS key

The following example uses the list-aliases command and its key-id parameter to list all aliases that are associated with a particular KMS key.

Each alias is associated with only one KMS key, but a KMS key can have multiple aliases. This command is very useful because the AWS KMS console lists only one alias for each KMS key. To find all aliases for a KMS key, you must use the list-aliases command.

This example uses the key ID of the KMS key for the --key-id parameter, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms list-aliases --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
   "Aliases": [
   {
      "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "AliasName": "alias/oregon-test-key"
   },
   {
      "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "AliasName": "alias/project121-test"
   }
   ]
}
```

For more information, see Working with Aliases in the AWS Key Management Service Developer Guide.

- For API details, see ListAliases in AWS CLI Command Reference.
list-grants

The following code example shows how to use list-grants.

AWS CLI

To view the grants on an AWS KMS key

The following list-grants example displays all of the grants on the specified AWS managed KMS key for Amazon DynamoDB in your account. This grant allows DynamoDB to use the KMS key on your behalf to encrypt a DynamoDB table before writing it to disk. You can use a command like this one to view the grants on the AWS managed KMS keys and customer managed KMS keys in the AWS account and Region.

This command uses the key-id parameter with a key ID to identify the KMS key. You can use a key ID or key ARN to identify the KMS key. To get the key ID or key ARN of an AWS managed KMS key, use the list-keys or list-aliases command.

```bash
aws kms list-grants \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

The output shows that the grant gives Amazon DynamoDB permission to use the KMS key for cryptographic operations, and gives it permission to view details about the KMS key (DescribeKey) and to retire grants (RetireGrant). The EncryptionContextSubset constraint limits these permission to requests that include the specified encryption context pairs. As a result, the permissions in the grant are effective only on specified account and DynamoDB table.

```
{
   "Grants": [
   {
      "Constraints": {
         "EncryptionContextSubset": {
            "aws:dynamodb:subscriberId": "123456789012",
            "aws:dynamodb:tableName": "Services"
         }
      },
      "IssuingAccount": "arn:aws:iam::123456789012:root",
      "Name": "8276b9a6-6cf0-46f1-b2f0-7993a7f8c89a",
      "Operations": [
         "Decrypt",
```

For more information, see Grants in AWS KMS in the AWS Key Management Service Developer Guide.

- For API details, see ListGrants in AWS CLI Command Reference.

**list-key-policies**

The following code example shows how to use list-key-policies.

**AWS CLI**

To get the names of key policies for a KMS key

The following list-key-policies example gets the names of the key policies for a customer managed key in the example account and Region. You can use this command to find the names of key policies for AWS managed keys and customer managed keys.

Because the only valid key policy name is default, this command is not useful.

To specify the KMS key, use the key-id parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```bash
aws kms list-key-policies 
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```
Output:

```
{
   "PolicyNames": [
      "default"
   ]
}
```

For more information about AWS KMS key policies, see [Using Key Policies in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/using-key-policies.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListKeyPolicies](https://docs.aws.amazon.com/cli/latest/reference/kms/list-key-policies.html) in *AWS CLI Command Reference*.

### list-key-rotations

The following code example shows how to use `list-key-rotations`.

**AWS CLI**

To retrieve information about all completed key material rotations

The following `list-key-rotations` example lists information about all completed key material rotations for the specified KMS key.

```
aws kms list-key-rotations \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
   "Rotations": [
      {
         "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
         "RotationDate": "2024-03-02T10:11:36.564000+00:00",
         "RotationType": "AUTOMATIC"
      },
      {
         "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
         "RotationDate": "2024-04-05T15:14:47.757000+00:00",
         "RotationType": "ON_DEMAND"
      }
   ]
}
```
For more information, see Rotating keys in the AWS Key Management Service Developer Guide.

- For API details, see ListKeyRotations in AWS CLI Command Reference.

list-keys

The following code example shows how to use list-keys.

**AWS CLI**

**To get the KMS keys in an account and Region**

The following list-keys example gets the KMS keys in an account and Region. This command returns both AWS managed keys and customer managed keys.

```bash
aws kms list-keys
```

**Output:**

```json
{
   "Keys": [
   {
      "KeyArn": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
      "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
   },
   {
      "KeyArn": "arn:aws:kms:us-west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
      "KeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
   },
   {
      "KeyArn": "arn:aws:kms:us-east-2:111122223333:key/1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d",
      "KeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
   }
  ]
}
```
For more information, see Viewing Keys in the AWS Key Management Service Developer Guide.

- For API details, see ListKeys in AWS CLI Command Reference.

**list-resource-tags**

The following code example shows how to use list-resource-tags.

**AWS CLI**

**To get the tags on a KMS key**

The following list-resource-tags example gets the tags for a KMS key. To add or replace resource tags on KMS keys, use the tag-resource command. The output shows that this KMS key has two resource tags, each of which has a key and value.

To specify the KMS key, use the key-id parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-resource-tags \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
   "Tags": [
   {
      "TagKey": "Dept",
      "TagValue": "IT"
   },
   {
      "TagKey": "Purpose",
      "TagValue": "Test"
   }
   ],
   "Truncated": false
}
```

For more information about using tags in AWS KMS, see Tagging keys in the AWS Key Management Service Developer Guide.

- For API details, see ListResourceTags in AWS CLI Command Reference.
list-retirable-grants

The following code example shows how to use list-retirable-grants.

AWS CLI

To view the grants that a principal can retire

The following list-retirable-grants example displays all of the grants that the ExampleAdmin user can retire on the KMS keys in an AWS account and Region. You can use a command like this one to view the grants that any account principal can retire on KMS keys in the AWS account and Region.

The value of the required retiring-principal parameter must be the Amazon Resource Name (ARN) of an account, user, or role.

You cannot specify a service for the value of retiring-principal in this command, even though a service can be the retiring principal. To find the grants in which a particular service is the retiring principal, use the list-grants command.

The output shows that ExampleAdmin user has permission to retire grants on two different KMS keys in the account and region. In addition to the retiring principal, the account has permission to retire any grant in the account.

```bash
aws kms list-retirable-grants \
   --retiring-principal arn:aws:iam::111122223333:user/ExampleAdmin
```

Output:

```json
{
   "Grants": [
   {
   "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "GrantId": "156b69c63cb154aa21f59929ff19760717be8d9d82b99df53e18b94a15a5e88e",
   "Name": "",
   "CreationDate": 2021-01-14T20:17:36.419000+00:00,
   "GranteePrincipal": "arn:aws:iam::111122223333:user/ExampleUser",
   "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",
   "IssuingAccount": "arn:aws:iam::111122223333:root",
   "Operations": ["
```

Actions and scenarios
"Encrypt"
],
"Constraints": {
  "EncryptionContextSubset": {
    "Department": "IT"
  }
},
{
  "KeyId": "arn:aws:kms:us-west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
  "GrantId": "8c94d1f12f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
  "Name": "",
  "CreationDate": "2021-02-02T19:49:49.638000+00:00",
  "GranteePrincipal": "arn:aws:iam::111122223333:role/ExampleRole",
  "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",
  "IssuingAccount": "arn:aws:iam::111122223333:root",
  "Operations": [
    "Decrypt"
  ],
  "Constraints": {
    "EncryptionContextSubset": {
      "Department": "IT"
    }
  }
}
],
"Truncated": false
}

For more information, see [Grants in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/grants.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListRetirableGrants](https://docs.aws.amazon.com/cli/latest/reference/kms/list-retriable-grants.html) in *AWS CLI Command Reference*.

**put-key-policy**

The following code example shows how to use `put-key-policy`.

**AWS CLI**

To change the key policy for a KMS key
The following put-key-policy example changes the key policy for a customer managed key.

To begin, create a key policy and save it in a local JSON file. In this example, the file is `key_policy.json`. You can also specify the key policy as a string value of the policy parameter.

The first statement in this key policy gives the AWS account permission to use IAM policies to control access to the KMS key. The second statement gives the `test-user` user permission to run the `describe-key` and `list-keys` commands on the KMS key.

Contents of `key_policy.json`:

```json
{
    "Version" : "2012-10-17",
    "Id" : "key-default-1",
    "Statement" : [
        {
            "Sid" : "Enable IAM User Permissions",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:root"
            },
            "Action" : "kms:*",
            "Resource" : "*"
        },
        {
            "Sid" : "Allow Use of Key",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:user/test-user"
            },
            "Action" : [
                "kms:DescribeKey",
                "kms:ListKeys"
            ],
            "Resource" : "*"
        }
    ]
}
```

To identify the KMS key, this example uses the key ID, but you can also use a key ARN. To specify the key policy, the command uses the `policy` parameter. To indicate that the policy
is in a file, it uses the required file:// prefix. This prefix is required to identify files on all supported operating systems. Finally, the command uses the policy-name parameter with a value of default. If no policy name is specified, the default value is default. The only valid value is default.

```
aws kms put-key-policy \
   --policy-name default \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --policy file://key_policy.json
```

This command does not produce any output. To verify that the command was effective, use the get-key-policy command. The following example command gets the key policy for the same KMS key. The output parameter with a value of text returns a text format that is easy to read.

```
aws kms get-key-policy \
   --policy-name default \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --output text
```

Output:

```
{
   "Version" : "2012-10-17",
   "Id" : "key-default-1",
   "Statement" : [
      {
         "Sid" : "Enable IAM User Permissions",
         "Effect" : "Allow",
         "Principal" : {
            "AWS" : "arn:aws:iam::111122223333:root"
         },
         "Action" : "kms:*",
         "Resource" : "*"
      },
      {
         "Sid" : "Allow Use of Key",
         "Effect" : "Allow",
         "Principal" : {
            "AWS" : "arn:aws:iam::111122223333:user/test-user"
         }
      }
   ]
}
```
"Action" : [ "kms:Describe", "kms:List" ],
"Resource" : "*"
]
}
}

For more information, see Changing a Key Policy in the AWS Key Management Service Developer Guide.

- For API details, see PutKeyPolicy in AWS CLI Command Reference.

**re-encrypt**

The following code example shows how to use `re-encrypt`.

**AWS CLI**

**Example 1: To re-encrypt an encrypted message under a different symmetric KMS key (Linux and macOS).**

The following `re-encrypt` command example demonstrates the recommended way to re-encrypt data with the AWS CLI.

Provide the ciphertext in a file. In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html> in the AWS Command Line Interface User Guide and Best Practices for Local File Parameters<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/> in the AWS Command Line Tool Blog. Specify the source KMS key, which decrypts the ciphertext. The `--source-key-id` parameter is not required when decrypting with symmetric encryption KMS keys. AWS KMS can get the KMS key that was used to encrypt the data from the metadata in the ciphertext blob. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust. Specify the destination KMS key, which re-encrypts the data. The `--destination-key-id` parameter is always required. This example uses a key ARN, but you can use any valid key identifier. Request the plaintext output as a text value. The `--query` parameter tells the CLI to get only the value of the Plaintext field from the output. The `--output` parameter returns the output as text. Base64-decode
the plaintext and save it in a file. The following example pipes (|) the value of the Plaintext parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the ExamplePlaintext file.

Before running this command, replace the example key IDs with valid key identifiers from your AWS account.

```bash
aws kms re-encrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --query CiphertextBlob \n    --output text | base64 --decode > ExampleReEncryptedFile
```

This command produces no output. The output from the `re-encrypt` command is base64-decoded and saved in a file.

For more information, see ReEncrypt <https://docs.aws.amazon.com/kms/latest/APIReference/API_ReEncrypt.html in the AWS Key Management Service API Reference.

**Example 2: To re-encrypt an encrypted message under a different symmetric KMS key (Windows command prompt).**

The following `re-encrypt` command example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```bash
aws kms re-encrypt ^
    --ciphertext-blob fileb://ExampleEncryptedFile ^
    --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^
    --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 ^
    --query CiphertextBlob ^
    --output text > ExampleReEncryptedFile.base64
```

Then use the `certutil` utility

```bash
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```
CertUtil: -decode command completed successfully.

For more information, see ReEncrypt <https://docs.aws.amazon.com/kms/latest/APIReference/API_ReEncrypt.html> in the AWS Key Management Service API Reference.

- For API details, see ReEncrypt in AWS CLI Command Reference.

retire-grant

The following code example shows how to use retire-grant.

**AWS CLI**

**To retire a grant on a customer master key**

The following retire-grant example deletes a grant from a KMS key.

The following example command specifies the grant-id and the key-id parameters. The value of the key-id parameter must be the key ARN of the KMS key.

```bash
aws kms retire-grant \\
   --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \\
   --key-id arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was retired, use the list-grants command.

For more information, see Retiring and revoking grants in the AWS Key Management Service Developer Guide.

- For API details, see RetireGrant in AWS CLI Command Reference.

revoke-grant

The following code example shows how to use revoke-grant.
AWS CLI

**To revoke a grant on a customer master key**

The following `revoke-grant` example deletes a grant from a KMS key. The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter can be the key ID or key ARN of the KMS key.

```bash
aws kms revoke-grant \
  --grant-id 1234a2345b8a4e350500d432bcca8ed65006710e1391880c4f7f7140160c9af3 \n  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was revoked, use the `list-grants` command.

For more information, see [Retiring and revoking grants](https://docs.aws.amazon.com/kms/latest/developerguide/retiring-revoking-grants.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [RevokeGrant](https://docs.aws.amazon.com/cli/latest/reference/kms/revoke-grant.html) in *AWS CLI Command Reference*.

**rotate-key-on-demand**

The following code example shows how to use `rotate-key-on-demand`.

AWS CLI

**To perform on-demand rotation of a KMS key**

The following `rotate-key-on-demand` example immediately initiates rotation of the key material for the specified KMS key.

```bash
aws kms rotate-key-on-demand \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```json
{
  "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
}
```
For more information, see How to perform on-demand key rotation in the AWS Key Management Service Developer Guide.

- For API details, see `RotateKeyOnDemand` in AWS CLI Command Reference.

### schedule-key-deletion

The following code example shows how to use `schedule-key-deletion`.

#### AWS CLI

To schedule the deletion of a customer managed KMS key.

The following `schedule-key-deletion` example schedules the specified customer managed KMS key to be deleted in 15 days.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key. The `--pending-window-in-days` parameter specifies the length of the 7-30 day waiting period. By default, the waiting period is 30 days. This example specifies a value of 15, which tells AWS to permanently delete the KMS key 15 days after the command completes.

```shell
aws kms schedule-key-deletion \
   --key-id arn:aws:kms:us-west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \
   --pending-window-in-days 15
```

The response includes the key ARN, key state, waiting period (`PendingWindowInDays`), and the deletion date in Unix time. To view the deletion date in local time, use the AWS KMS console. KMS keys in the `PendingDeletion` key state cannot be used in cryptographic operations.

```json
{
   "KeyId": "arn:aws:kms:us-west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
   "DeletionDate": "2022-06-18T23:43:51.272000+00:00",
   "KeyState": "PendingDeletion",
   "PendingWindowInDays": 15
}
```

For more information, see Deleting keys in the AWS Key Management Service Developer Guide.
For API details, see ScheduleKeyDeletion in AWS CLI Command Reference.

**sign**

The following code example shows how to use sign.

**AWS CLI**

**Example 1: To generate a digital signature for a message**

The following sign example generates a cryptographic signature for a short message. The output of the command includes a base-64 encoded Signature field that you can verify by using the verify command.

You must specify a message to sign and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms for your KMS key, use the describe-key command.

In AWS CLI 2.0, the value of the message parameter must be Base64-encoded. Or, you can save the message in a file and use the fileb:// prefix, which tells the AWS CLI to read binary data from the file.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

```bash
msg=(echo 'Hello World' | base64)
aws kms sign \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://UnsignedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256
```

Output:

```json
{
    "KeyId": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "Signature": "ABCDEFGHIJKLMNOPQRSTUVWXYZabcdef1234567890ab",
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```
For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

Example 2: To save a digital signature in a file (Linux and macOS)

The following sign example generates a cryptographic signature for a short message stored in a local file. The command also gets the Signature property from the response, Base64-decodes it and saves it in the ExampleSignature file. You can use the signature file in a verify command that verifies the signature.

The sign command requires a Base64-encoded message and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms that your KMS key supports, use the describe-key command.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

echo 'hello world' | base64 > EncodedMessage

aws kms sign \n  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \n  --message fileb://EncodedMessage \n  --message-type RAW \n  --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \n  --output text \n  --query Signature | base64 --decode > ExampleSignature

This command produces no output. This example extracts the Signature property of the output and saves it in a file.

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the AWS Key Management Service Developer Guide.

• For API details, see Sign in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.
AWS CLI

**To add a tag to a KMS key**

The following `tag-resource` example adds "Purpose":"Test" and "Dept":"IT" tags to a customer managed KMS key. You can use tags like these to label KMS keys and create categories of KMS keys for permissions and auditing.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms tag-resource \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --tags TagKey='Purpose',TagValue='Test' TagKey='Dept',TagValue='IT'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see [Tagging keys](https://docs.aws.amazon.com/kms/latest/developerguide/tagging-keys.html) in the [AWS Key Management Service Developer Guide](https://docs.aws.amazon.com/kms/latest/developerguide/tagging-keys.html).

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/kms/tag-resource.html) in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use `untag-resource`.

AWS CLI

**To delete a tag from a KMS key**

The following `untag-resource` example deletes the tag with the "Purpose" key from a customer managed KMS key.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command. Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms untag-resource \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --tag-key 'Purpose'
```
This command produces no output. To view the tags on an AWS KMS KMS key, use the list-resource-tags command.

For more information about using tags in AWS KMS, see Tagging keys in the AWS Key Management Service Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-alias**

The following code example shows how to use update-alias.

**AWS CLI**

**To associate an alias with a different KMS key**

The following update-alias example associates the alias alias/test-key with a different KMS key.

The --alias-name parameter specifies the alias. The alias name value must begin with alias/.
The --target-key-id parameter specifies the KMS key to associate with the alias. You don't need to specify the current KMS key for the alias.

```bash
aws kms update-alias \
  --alias-name alias/test-key \
  --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To find the alias, use the list-aliases command.

For more information, see Updating aliases in the AWS Key Management Service Developer Guide.

- For API details, see UpdateAlias in AWS CLI Command Reference.

**update-custom-key-store**

The following code example shows how to use update-custom-key-store.

**AWS CLI**

**Example 1: To edit the friendly name of a custom key store**
The following update-custom-key-store example changes the name of the custom key store. This example works for an AWS CloudHSM key store or an external key store.

Use the custom-key-store-id to identify the key store. Use the new-custom-key-store-name parameter to specify the new friendly name.

To update the friendly name of an AWS CloudHSM key store, you must first disconnect the key store, such as by using the disconnect-custom-key-store command. You can update the friendly name of an external key store while it is connected or disconnected. To find the connection state of your custom key store, use the describe-custom-key-store command.

```
aws kms update-custom-key-store \
   --custom-key-store-id cks-1234567890abcdef0 \
   --new-custom-key-store-name ExampleKeyStore
```

This command does not return any data. To verify that the command worked, use a describe-custom-key-stores command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the AWS Key Management Service Developer Guide.

For more information about updating an external key store, see Editing external key store properties in the AWS Key Management Service Developer Guide.

**Example 2: To edit the kmsuser password of an AWS CloudHSM key store**

The following update-custom-key-store example updates the value of the kmsuser password to the current password for the kmsuser in the CloudHSM cluster associated with the specified key store. This command doesn't change the kmsuser password in the cluster. It just tells AWS KMS the current password. If KMS doesn't have the current kmsuser password, it cannot connect to the AWS CloudHSM key store.

**NOTE:** Before updating an AWS CloudHSM key store, you must disconnect it. Use the disconnect-custom-key-store command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the connect-custom-key-store command.

```
aws kms update-custom-key-store \
   --custom-key-store-id cks-1234567890abcdef0 \
   --key-store-password ExamplePassword
```
This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see [Editing AWS CloudHSM key store settings](https://docs.aws.amazon.com/kms/latest/developerguide/edit-cloudhsm-key-store-settings.html) in the *AWS Key Management Service Developer Guide*.

**Example 3: To edit the AWS CloudHSM cluster of an AWS CloudHSM key store**

The following example changes the AWS CloudHSM cluster that is associated with an AWS CloudHSM key store to a related cluster, such as a different backup of the same cluster.

**NOTE:** Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
  --custom-key-store-id cks-1234567890abcdef0 \
  --cloud-hsm-cluster-id cluster-1a23b4cdefg
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see [Editing AWS CloudHSM key store settings](https://docs.aws.amazon.com/kms/latest/developerguide/edit-cloudhsm-key-store-settings.html) in the *AWS Key Management Service Developer Guide*.

**Example 4: To edit the proxy authentication credential of an external key store**

The following example updates the proxy authentication credential for your external key store. You must specify both the `raw-secret-access-key` and the `access-key-id`, even if you are changing only one of the values. You can use this feature to fix an invalid credential or to change the credential when the external key store proxy rotates it.

Establish the proxy authentication credential for AWS KMS on your external key store. Then use this command to provide the credential to AWS KMS. AWS KMS uses this credential to sign its requests to your external key store proxy.

You can update the proxy authentication credential while the external key store is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \
```

Actions and scenarios
This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see [Editing external key store properties](https://docs.aws.amazon.com/kms/latest/userguide/editing-external-key-store-properties.html) in the *AWS Key Management Service Developer Guide*.

**Example 5: To edit the proxy connectivity of an external key store**

The following example changes the external key store proxy connectivity option from public endpoint connectivity to VPC endpoint service connectivity. In addition to changing the `xks-proxy-connectivity` value, you must change the `xks-proxy-uri-endpoint` value to reflect the private DNS name associated with the VPC endpoint service. You must also add an `xks-proxy-vpc-endpoint-service-name` value.

**NOTE:** Before updating the proxy connectivity of an external store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the external key store by using the `connect-custom-key-store` command.

```bash
aws kms update-custom-key-store
   --custom-key-store-id cks-1234567890abcdef0 \
   --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
   --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
   --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-example"
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see [Editing external key store properties](https://docs.aws.amazon.com/kms/latest/userguide/editing-external-key-store-properties.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [UpdateCustomKeyStore](https://docs.aws.amazon.com/cli/latest/reference/kms/update-custom-key-store.html) in *AWS CLI Command Reference*.

**update-key-description**

The following code example shows how to use `update-key-description`.

```bash
aws kms update-key-description
   --key-id alias/key1
   --description "This is a new description for key1."`
```
Example 1: To add or change a description to a customer managed KMS key

The following `update-key-description` example adds a description to a customer managed KMS key. You can use the same command to change an existing description.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ARN value, but you can use either the key ID or the key ARN of the KMS key. The `--description` parameter specifies the new description. The value of this parameter replaces the current description of the KMS key, if any.

```
aws kms update-key-description \
  --key-id arn:aws:kms:us-west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \
  --description "IT Department test key"
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see `UpdateKeyDescription` in the AWS Key Management Service API Reference.

Example 2: To delete the description of a customer managed KMS key

The following `update-key-description` example deletes the description to a customer managed KMS key.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ID value, but you can use either the key ID or the key ARN of the KMS key. The `--description` parameter with an empty string value (""") deletes the existing description.

```
aws kms update-key-description \
  --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
  --description ''
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see `UpdateKeyDescription` in the AWS Key Management Service API Reference.
verify

The following code example shows how to use `verify`.

**AWS CLI**

To verify a digital signature

The following `verify` example verifies a cryptographic signature for a short, Base64-encoded message. The key ID, message, message type, and signing algorithm must be same ones that were used to sign the message. The signature that you specify cannot be base64-encoded. For help decoding the signature that the `sign` command returns, see the `sign` command examples.

The output of the command includes a Boolean `SignatureValid` field that indicates that the signature was verified. If the signature validation fails, the `verify` command fails, too.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```bash
aws kms verify \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
   --message fileb://EncodedMessage \
   --message-type RAW \
   --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
   --signature fileb://ExampleSignature
```

Output:

```json
{
    "KeyId": "arn:aws:kms:us-west-2:11112222333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "SignatureValid": true,
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```

For more information about using asymmetric KMS keys in AWS KMS, see [Using asymmetric keys](https://docs.aws.amazon.com/kms/latest/developerguide/asymmetric-keys.html) in the AWS Key Management Service Developer Guide.
Lake Formation examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lake Formation.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- *Actions*

**Actions**

**add-lf-tags-to-resource**

The following code example shows how to use `add-lf-tags-to-resource`.

**AWS CLI**

To attach one or more LF-tags to an existing resource

The following `add-lf-tags-to-resource` example attaches given LF-tag to the table resource.

```
aws lakeformation add-lf-tags-to-resource \
--cli-input-json file://input.json
```

Contents of `input.json`:

```
{
```
The following code example shows how to use `batch-grant-permissions`.

**AWS CLI**

**To bulk grant permissions on resources to the principals**

The following `batch-grant-permissions` example bulk grants access on specified resources to the principals.

```
aws lakeformation batch-grant-permissions \
  --cli-input-json file://input.json
```
Contents of `input.json`:

```json
{
    "CatalogId": "123456789111",
    "Entries": [{
        "Id": "1",
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
        },
        "Resource": {
            "Table": {
                "CatalogId": "123456789111",
                "DatabaseName": "tpc",
                "Name": "dl_tpc_promotion"
            }
        },
        "Permissions": [
            "ALL"
        ],
        "PermissionsWithGrantOption": [
            "ALL"
        ]
    },
    {
        "Id": "2",
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
        },
        "Resource": {
            "Table": {
                "CatalogId": "123456789111",
                "DatabaseName": "tpc",
                "Name": "dl_tpc_customer"
            }
        },
        "Permissions": [
            "ALL"
        ],
        "PermissionsWithGrantOption": [
            "ALL"
        ]
    }
}
```
Output:

```json
{
   "Id": "3",
   "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-business-analyst"
   },

      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
   },
   "Resource": {
      "DataCellsFilter": {
         "TableCatalogId": "123456789111",
         "DatabaseName": "tpc",
         "TableName": "dl_tpc_item",
         "Name": "developer_item"
      }
   },
   "Permissions": [
      "SELECT"
   ],
   "PermissionsWithGrantOption": []
}
}
```
For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

- For API details, see BatchGrantPermissions in AWS CLI Command Reference.

**batch-revoke-permissions**

The following code example shows how to use batch-revoke-permissions.

**AWS CLI**

**To bulk revoke permissions on resources from the principals**

The following batch-revoke-permissions example bulk revokes access on specified resources from the principals.

```
aws lakeformation batch-revoke-permissions \
   --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
   "CatalogId": "123456789111",
   "Entries": [{
      "Id": "1",
      "Principal": {
         "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
      },
      "Resource": {
         "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
         }
      },
      "Permissions": [ ...
```
The following code example shows how to use `cancel-transaction`.

For more information, see [Granting and revoking permissions on Data Catalog resources](https://docs.aws.amazon.com/ads得力/DeveloperGuide/data-catalog-permissions.html) in the AWS Lake Formation Developer Guide.

- For API details, see [BatchRevokePermissions](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/cancel-transaction.html) in AWS CLI Command Reference.

**cancel-transaction**

The following code example shows how to use `cancel-transaction`.
AWS CLI

To cancel a transaction

The following cancel-transaction example cancels the transaction.

```bash
aws lakeformation cancel-transaction \
   --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

This command produces no output.

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions-reading-writing-data-lake.html) in the [AWS Lake Formation Developer Guide](https).

- For API details, see [CancelTransaction](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/cancel-transaction.html) in [AWS CLI Command Reference](https).

commit-transaction

The following code example shows how to use commit-transaction.

AWS CLI

To commit transaction

The following commit-transaction example commits the transaction.

```bash
aws lakeformation commit-transaction \
   --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

Output:

```
{
   "TransactionStatus": "committed"
}
```

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions-reading-writing-data-lake.html) in the [AWS Lake Formation Developer Guide](https).

- For API details, see [CommitTransaction](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/commit-transaction.html) in [AWS CLI Command Reference](https).
create-data-cells-filter

The following code example shows how to use create-data-cells-filter.

AWS CLI

Example 1: To create data cell filter

The following create-data-cells-filter example creates a data cell filter to allow one to grant access to certain columns based on row condition.

```bash
aws lakeformation create-data-cells-filter \
   --cli-input-json file://input.json
```

Contents of input.json:

```json
{
   "TableData": {
      "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
      "DatabaseName": "tpc",
      "Name": "developer_promotion",
      "RowFilter": {
         "FilterExpression": "p_promo_name='ese'"
      },
      "TableCatalogId": "123456789111",
      "TableName": "dl_tpc_promotion"
   }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the AWS Lake Formation Developer Guide.

Example 2: To create column filter

The following create-data-cells-filter example creates a data filter to allow one to grant access to certain columns.

```bash
aws lakeformation create-data-cells-filter \
   --cli-input-json file://input.json
```

Contents of input.json:
This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the AWS Lake Formation Developer Guide.

**Example 3: To create data filter with exclude columns**

The following `create-data-cells-filter` example creates a data filter to allow one to grant access all except the mentioned columns.

```
aws lakeformation create-data-cells-filter \
   --cli-input-json file://input.json
```

**Contents of input.json:**

```json
{
    "TableData": {
        "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
        "DatabaseName": "tpc",
        "Name": "developer_promotion_excludecolumn",
        "RowFilter": {
            "AllRowsWildcard": {}
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```
AWS Command Line Interface

User Guide for Version 2

This command produces no output.
For more information, see Data ﬁltering and cell-level security in Lake Formation in the AWS
Lake Formation Developer Guide.
• For API details, see CreateDataCellsFilter in AWS CLI Command Reference.
create-lf-tag
The following code example shows how to use create-lf-tag.
AWS CLI
To create LF-Tag
The following create-lf-tag example creates an LF-Tag with the speciﬁed name and values.
aws lakeformation create-lf-tag \
--catalog-id '123456789111' \
--tag-key 'usergroup' \
--tag-values '["developer","analyst","campaign"]'

This command produces no output.
For more information, see Managing LF-Tags for metadata access control in the AWS Lake
Formation Developer Guide.
• For API details, see CreateLfTag in AWS CLI Command Reference.
delete-data-cells-filter
The following code example shows how to use delete-data-cells-filter.
AWS CLI
To delete data cell ﬁlter
The following delete-data-cells-filter example deletes given data cell ﬁlter.
aws lakeformation delete-data-cells-filter \
--cli-input-json file://input.json

Contents of input.json:
Actions and scenarios

4384


This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the AWS Lake Formation Developer Guide.
- For API details, see DeleteDataCellsFilter in AWS CLI Command Reference.

**delete-lf-tag**

The following code example shows how to use delete-lf-tag.

**AWS CLI**

**To delete LF-Tag definition**

The following delete-lf-tag example deletes LF-Tag definition.

```bash
aws lakeformation delete-lf-tag \
   --catalog-id '123456789111' \
   --tag-key 'usergroup'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the AWS Lake Formation Developer Guide.
- For API details, see DeleteLfTag in AWS CLI Command Reference.

**delete-objects-on-cancel**

The following code example shows how to use delete-objects-on-cancel.

**AWS CLI**

**To delete object when transaction is cancelled**
The following delete-objects-on-cancel example deletes the listed s3 object when the transaction is cancelled.

```
aws lakeformation delete-objects-on-cancel \
   --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
   "CatalogId": "012345678901",
   "DatabaseName": "tpc",
   "TableName": "dl_tpc_household_demographics_gov",
   "TransactionId": "1234d972ca8347b89825e33c5774aec4",
   "Objects": [{
      "Uri": "s3://lf-data-lake-012345678901/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
   ff26b17504414fe88b302cd795eab00.parquet",
      "ETag": "1234ab1fc50a316b149b4e1f21a73800"
   }]
}
```

This command produces no output.

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions.html) in the [AWS Lake Formation Developer Guide](https://docs.aws.amazon.com/lakeformation/latest/dg/).  

### deregister-resource

The following code example shows how to use deregister-resource.

**AWS CLI**

To deregister data lake storage

The following `deregister-resource` example deregisters the resource as managed by the Lake Formation.

```
aws lakeformation deregister-resource \
   --cli-input-json file://input.json
```
Contents of `input.json`:

```json
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123"
}
```

This command produces no output.

For more information, see [Adding an Amazon S3 location to your data lake](https://docs.aws.amazon.com/lakeformation/latest/developerguide/adding-s3-location.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [DeregisterResource](https://docs.aws.amazon.com/cli/latest/apireference/Command/LakeFormation_DeregisterResource.html) in *AWS CLI Command Reference*.

### describe-transaction

The following code example shows how to use `describe-transaction`.

**AWS CLI**

**To retrieve a transaction details**

The following `describe-transaction` example returns the details of a single transaction.

```
aws lakeformation describe-transaction \
    --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

**Output:**

```json
{
    "TransactionDescription": {
        "TransactionId": "12345972ca8347b89825e33c5774aec4",
        "TransactionStatus": "committed",
        "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
        "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
    }
}
```

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/developerguide/reading-writing-data-lake.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [DescribeTransaction](https://docs.aws.amazon.com/cli/latest/apireference/Command/LakeFormation_DescribeTransaction.html) in *AWS CLI Command Reference*.
extend-transaction

The following code example shows how to use extend-transaction.

AWS CLI

To extend a transaction

The following extend-transaction example extends the transaction.

```
aws lakeformation extend-transaction \
   --transaction-id='8cb4b1a7cc8d486fbaca9a64e7f95ce'
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the AWS Lake Formation Developer Guide.

- For API details, see ExtendTransaction in AWS CLI Command Reference.

get-data-lake-settings

The following code example shows how to use get-data-lake-settings.

AWS CLI

To retrieve AWS Lake Formation-managed data lake settings

The following get-data-lake-settings example retrieves the list of data lake administrators and other data lake settings.

```
aws lakeformation get-data-lake-settings \
   --cli-input-json file://input.json
```

Contents of input.json:

```
{
   "CatalogId": "123456789111"
}
```

Output:
For more information, see Changing the default security settings for your data lake in the AWS Lake Formation Developer Guide.

- For API details, see GetDataLakeSettings in AWS CLI Command Reference.

get-effective-permissions-for-path

The following code example shows how to use get-effective-permissions-for-path.

AWS CLI

To retrieve permissions on resources located at specific path

The following get-effective-permissions-for-path example returns the Lake Formation permissions for a specified table or database resource located at a path in Amazon S3.
aws lakeformation get-effective-permissions-for-path
   --cli-input-json file://input.json

Contents of input.json:

```json
{
   "CatalogId": "123456789111",
   "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"
}
```

Output:

```json
{
   "Permissions": [
      {
         "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iам::123456789111:user/lf-
campaign-manager"
         },
         "Resource": {
            "Database": {
               "Name": "tpc"
            }
         },
         "Permissions": ["DESCRIBE"],
         "PermissionsWithGrantOption": []
      },
      {
         "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iам::123456789111:role/EMR-
RuntimeRole"
         },
         "Resource": {
            "Database": {
               "Name": "tpc"
            }
         },
         "Permissions": ["ALL"],
         "PermissionsWithGrantOption": []
      }
   ]
}
```
"Principal": {
  "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:saml-provider/oktaSAMLProvider:user/emr-developer"
},
"Resource": {
  "Database": {
    "Name": "tpc"
  }
},
"Permissions": [
  "ALL",
  "DESCRIBE"
],
"PermissionsWithGrantOption": []
},
{"Principal": {
  "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
},
"Resource": {
  "Database": {
    "Name": "tpc"
  }
},
"Permissions": [
  "ALL",
  "ALTER",
  "CREATE_TABLE",
  "DESCRIBE",
  "DROP"
],
"PermissionsWithGrantOption": [
  "ALL",
  "ALTER",
  "CREATE_TABLE",
  "DESCRIBE",
  "DROP"
]
},
{"Principal": {

"DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/LF-GlueServiceRole",
  
  
  "Resource": {
    "Database": {
      "Name": "tpc"
    }
  },
  "Permissions": [
    "CREATE_TABLE"
  ],
  "PermissionsWithGrantOption": []
},

"NextToken": "E5SlJDSTZleUp6SWpvaU9UQTNORE0zTXpFeE5Ua3pJbjE5TENKbGVIQnBjbUywYVc5dUlqcDdJbk5sWTI5dVpITW1P"

For more information, see Managing Lake Formation permissions in the AWS Lake Formation Developer Guide.

- For API details, see GetEffectivePermissionsForPath in AWS CLI Command Reference.

**get-lf-tag**

The following code example shows how to use get-lf-tag.

**AWS CLI**

To retrieve LF-tag definition

The following get-lf-tag example retrieves LF-tag definition.

```bash
aws lakeformation get-lf-tag \
  --catalog-id '123456789111' \
  --tag-key 'usergroup'
```

Output:

```json
{
  "CatalogId": "123456789111",
  "TagKey": "usergroup",
  "TagValues": [
```
For more information, see Managing LF-Tags for metadata access control in the AWS Lake Formation Developer Guide.

- For API details, see GETLFTag in AWS CLI Command Reference.

get-query-state

The following code example shows how to use get-query-state.

AWS CLI

To retrieve state of a submitted query

The following get-query-state example returns the state of a query previously submitted.

```bash
aws lakeformation get-query-state
  --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```json
{
  "State": "FINISHED"
}
```

For more information, see Transactional data operations in the AWS Lake Formation Developer Guide.

- For API details, see GetQueryState in AWS CLI Command Reference.

get-query-statistics

The following code example shows how to use get-query-statistics.

AWS CLI

To retrieve query statistics
The following get-query-statistics example retrieves statistics on the planning and execution of a query.

```
aws lakeformation get-query-statistics \
   --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
   "ExecutionStatistics": {
      "AverageExecutionTimeMillis": 0,
      "DataScannedBytes": 0,
      "WorkUnitsExecutedCount": 0
   },
   "PlanningStatistics": {
      "EstimatedDataToScanBytes": 43235,
      "PlanningTimeMillis": 2377,
      "QueueTimeMillis": 440,
      "WorkUnitsGeneratedCount": 1
   },
   "QuerySubmissionTime": "2022-08-11T02:14:38.641870+00:00"
}
```

For more information, see Transactional data operations in the AWS Lake Formation Developer Guide.

- For API details, see GetQueryStatistics in AWS CLI Command Reference.

get-resource-lf-tags

The following code example shows how to use get-resource-lf-tags.

**AWS CLI**

**To list LF-tags**

The following list-lf-tags example returns list of LF-tags that the requester has permission to view.

```
aws lakeformation list-lf-tags \ 
   --cli-input-json file://input.json
```

Contents of input.json:

```json
{
   "CatalogId": "123456789111",
   "ResourceShareType": "ALL",
   "MaxResults": 2
}
```

Output:

```json
{
   "LFTags": [{
      "CatalogId": "123456789111",
      "TagKey": "category",
      "TagValues": [
         "private",
         "public"
      ]
   },
   {  
      "CatalogId": "123456789111",
      "TagKey": "group",
      "TagValues": [
         "analyst",
         "campaign",
         "developer"
      ]
   }]
},

"NextToken": "kIiwizXhwaXJhdGlvbiI6eyJzzWVbmRzIjoxNjYwMDY4dCI6ZmFsc2V9"
```

For more information, see Managing LF-Tags for metadata access control in the AWS Lake Formation Developer Guide.

- For API details, see GetResourceLfTags in AWS CLI Command Reference.

**get-table-objects**

The following code example shows how to use get-table-objects.

**AWS CLI**

To list objects of governed table
The following `get-table-objects` example returns the set of Amazon S3 objects that make up the specified governed table.

```
aws lakeformation get-table-objects
   --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
   "CatalogId": "012345678901",
   "DatabaseName": "tpc",
   "TableName": "dl_tpc_household_demographics_gov",
   "QueryAsOfTime": "2022-08-10T15:00:00"
}
```

Output:

```json
{
   "Objects": [ [
      "PartitionValues": [],
      "Objects": [ [
         "Uri": "s3://lf-data-lake-012345678901/target/dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-ff26b1750414fe88b502cd795eabd00.parquet",
         "ETag": "12345b1fc50a316b149b4e1f21a73800",
         "Size": 43235
      ]]
   ]
}
```

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/ug/) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetTableObjects](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/get-table-objects.html) in *AWS CLI Command Reference*.

**get-work-unit-results**

The following code example shows how to use `get-work-unit-results`.

**AWS CLI**

To retrieve work units of given query
The following `get-work-unit-results` example returns the work units resulting from the query.

```bash
aws lakeformation get-work-units \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b' \
    --work-unit-id '0' \
    --work-unit-token 'B2fMSdmQXe9umX8Ux8XCo4=' outfile
```

Output:

```
outfile with Blob content.
```

For more information, see [Transactional data operations](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetWorkUnitResults](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/get-work-units.html) in *AWS CLI Command Reference*.

### get-work-units

The following code example shows how to use `get-work-units`.

**AWS CLI**

**To retrieve work units**

The following `get-work-units` example retrieves the work units generated by the StartQueryPlanning operation.

```bash
aws lakeformation get-work-units \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
    "WorkUnitRanges": [{
        "WorkUnitIdMax": 0,
        "WorkUnitIdMin": 0,
        "WorkUnitToken": "1234eMAk4kLO4umqEL4Z5WuxL04AXwABABVhd3MtY335cHRvLXB1YmxpYy1rZXkAREEwYm9QbkhINmFYTWphbmMxZWR+88jzGrYq22gE6jkJQlp0B +0et2eqNUmFdAAAAfjB8BkgqhkiG9w0BBwagbzBtAgEAMGgGCsQGSIb3DQEHATAeBglghkgBZQMEAS4wEQQMC0EWRda
```
The following code example shows how to use grant-permissions.

**AWS CLI**

**Example 1: To grant permissions to the principal on resources using LF-Tags**

The following grant-permissions example grants ALL permissions to the principal on database resource that matches the LF-Tag policy.

```
aws lakeformation grant-permissions
   --cli-input-json file://input.json
```

**Contents of input.json:**

```json
{
   "CatalogId": "123456789111",
   "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
   },
   "Resource": {
      "LFTagPolicy": {
         "CatalogId": "123456789111",
         "ResourceType": "DATABASE",
         "Expression": [{
```

For more information, see [Transactional data operations](https://aws.amazon.com) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetWorkUnits](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/get-workunits.html) in *AWS CLI Command Reference*. 

---

**grant-permissions**

The following code example shows how to use grant-permissions.
This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

**Example 2: To grant column level permissions to the principal**

The following grant-permissions example grants permission to select specific column to the principal.

```bash
aws lakeformation grant-permissions \
  --cli-input-json file://input.json
```

**Contents of input.json**:

```json
{
  "CatalogId": "123456789111",
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
  },
  "Resource": {
    "TableWithColumns": {
      "CatalogId": "123456789111",
      "ColumnNames": ["p_end_date_sk"],
      "DatabaseName": "tpc",
      "Name": "dl_tpc_promotion"
    }
  }
}
```
This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

**Example 3: To grant table permissions to the principal**

The following grant-permissions example grants select permission on all tables of given database to the principal.

```
aws lakeformation grant-permissions \
   --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
   "CatalogId": "123456789111",
   "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
   },
   "Resource": {
      "Table": {
         "CatalogId": "123456789111",
         "DatabaseName": "tpc",
         "TableWildcard": {}  
      }
   },
   "Permissions": [
      "SELECT"
   ],
   "PermissionsWithGrantOption": []
}
```

This command produces no output.
For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

Example 4: To grant permissions on LF-Tags to the principal

The following grant-permissions example grants associate permission on LF-Tags to the principal.

```bash
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of input.json:

```json
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private", "public"
            ]
        }
    },
    "Permissions": [
        "ASSOCIATE"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

Example 5: To grant permissions on data locations to the principal

The following grant-permissions example grants permission on data location to the principal.
aws lakeformation grant-permissions \
--cli-input-json file://input.json

Contents of input.json:

```json
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "DataLocation": {
            "CatalogId": "123456789111",
            "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"
        }
    },
    "Permissions": [
        "DATA_LOCATION_ACCESS"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](https://docs.aws.amazon.com/athena/latest/ug/lakeformation-permissions.html) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GrantPermissions](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/grant-permissions.html) in *AWS CLI Command Reference*.

### list-data-cells-filter

The following code example shows how to use `list-data-cells-filter`.

**AWS CLI**

To list data cell filters

The following `list-data-cells-filter` example list data cell filter for given table.

```bash
aws lakeformation list-data-cells-filter \
--cli-input-json file://input.json
```
Contents of input.json:

```json
{
   "MaxResults": 2,
   "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "Name": "dl_tpc_promotion"
   }
}
```

Output:

```json
{
   "DataCellsFilters": [{
      "TableCatalogId": "123456789111",
      "DatabaseName": "tpc",
      "TableName": "dl_tpc_promotion",
      "Name": "developer_promotion",
      "RowFilter": {
         "FilterExpression": "p_promo_name='ese'"
      },
      "ColumnNames": [
         "p_channel_details",
         "p_start_date_sk",
         "p_purpose",
         "p_promo_id",
         "p_promo_name",
         "p_end_date_sk",
         "p_discount_active"
      ]
   },
   {
      "TableCatalogId": "123456789111",
      "DatabaseName": "tpc",
      "TableName": "dl_tpc_promotion",
      "Name": "developer_promotion_allrows",
      "RowFilter": {
         "FilterExpression": "TRUE",
         "AllRowsWildcard": {}
      },
      "ColumnNames": [
         "p_channel_details",
         "p_start_date_sk",
         "p_purpose",
         "p_promo_id",
         "p_promo_name",
         "p_end_date_sk",
         "p_discount_active"
      ]
   }
}
```
"p_start_date_sk",
"p_promo_name"
]
}
],
"NextToken": "2MDA2MTgwNiwibmFub3MiOjE0MDAwMDAwMH19"
}

For more information, see Data filtering and cell-level security in Lake Formation in the AWS Lake Formation Developer Guide.

- For API details, see ListDataCellsFilter in AWS CLI Command Reference.

list-permissions

The following code example shows how to use list-permissions.

AWS CLI

Example 1: To retrieve list of principal permissions on the resource

The following list-permissions example returns a list of principal permissions on the database resources.

```
aws lakeformation list-permissions \
   --cli-input-json file://input.json
```

Contents of input.json:

```json
{
   "CatalogId": "123456789111",
   "ResourceType": "DATABASE",
   "MaxResults": 2
}
```

Output:

```json
{
   "PrincipalResourcePermissions": [{
      "Principal": {
         "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-campaign-manager"
      }
   }
```
For more information, see [Managing Lake Formation permissions](https://docs.aws.amazon.com/lakeformation/latest/dg/permissions-list.html) in the *AWS Lake Formation Developer Guide*.

**Example 2: To retrieve list of principal permissions on the table with data filters**

The following `list-permissions` example list the permissions on the table with related data filters granted to the principal.

```bash/aws lakeformation list-permissions \
  --cli-input-json file://input.json
```

**Contents of input.json:**

```json
{
  "CatalogId": "123456789111",
  "Resource": {
    "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "Name": "dl_tpc_customer"
    }
  },
  "IncludeRelated": "TRUE",
  "MaxResults": 10
}
```
Output:

```json
{
    "PrincipalResourcePermissions": [
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/Admin"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "Name": "customer_invoice"
                }
            },
            "Permissions": [
                "ALL",
                "ALTER",
                "DELETE",
                "DESCRIBE",
                "DROP",
                "INSERT"
            ],
            "PermissionsWithGrantOption": [
                "ALL",
                "ALTER",
                "DELETE",
                "DESCRIBE",
                "DROP",
                "INSERT"
            ]
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/Admin"
            },
            "Resource": {
                "TableWithColumns": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "Name": "customer_invoice",
                    "ColumnWildcard": {}
                }
            }
        }
    ]
}
```
"Permissions": ["SELECT"],
"PermissionsWithGrantOption": ["SELECT"]},
{
"Principal": {
"DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/Admin"
},
"Resource": {
"DataCellsFilter": {
"TableCatalogId": "123456789111",
"DatabaseName": "customer",
"TableName": "customer_invoice",
"Name": "dl_us_customer"
}
},
"Permissions": ["DESCRIBE",
"SELECT",
"DROP"
],
"PermissionsWithGrantOption": []
],
"NextToken": "VyeUFjY291bnRQZXJtaXNzaW9ucyI6ZmFsc2V9"
}

For more information, see [Managing Lake Formation permissions](https://docs.aws.amazon.com/lakeformation/latest/dg/) in the *AWS Lake Formation Developer Guide*.

**Example 3: To retrieve list of principal permissions on the LF-Tags**

The following `list-permissions` example list the permissions on the LF-Tags granted to the principal.

```
aws lakeformation list-permissions \
  --cli-input-json file://input.json
```
Contents of input.json:

```json
{
    "CatalogId": "123456789111",
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private"
            ]
        },
        "MaxResults": 10
    }
}
```

Output:

```json
{
    "PrincipalResourcePermissions": [{
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
        },
        "Resource": {
            "LFTag": {
                "CatalogId": "123456789111",
                "TagKey": "category",
                "TagValues": [
                    "*
                ]
            }
        },
        "Permissions": [
            "DESCRIBE"
        ],
        "PermissionsWithGrantOption": [
            "DESCRIBE"
        ]
    },
    {
        "Principal": {
```
"DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin",
"Resource": {
"LFTag": {
"CatalogId": "123456789111",
"TagKey": "category",
"TagValues": [
"*
]
}
},
"Permissions": [
"ASSOCIATE"
],
"PermissionsWithGrantOption": [
"ASSOCIATE"
]
},
"NextToken": "EJwY21GMGFXOXVJanA3SW5Ocm1pc3Npb25zIjpmYWxzZX0="
}

For more information, see [Managing Lake Formation permissions](https://docs.aws.amazon.com/lakeformation/latest/devguide) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListPermissions](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/list-permissions.html) in *AWS CLI Command Reference*.

### list-resources

The following code example shows how to use list-resources.

**AWS CLI**

**To lists the resources managed by the Lake Formation**

The following list-resources example lists the resources matching the condition that is managed by the Lake Formation.

```
aws lakeformation list-resources \
   --cli-input-json file://input.json
```

**Contents of input.json:**
Output:

```json
{
  "ResourceInfoList": [
    {
      "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111",
      "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole",
      "LastModified": "2022-07-21T02:12:46.669000+00:00"
    },
    {
      "ResourceArn": "arn:aws:s3:::lf-emr-test-123456789111",
      "RoleArn": "arn:aws:iam::123456789111:role/EMRLFS3Role",
      "LastModified": "2022-07-29T16:22:03.211000+00:00"
    }
  ]
}
```

For more information, see [Managing Lake Formation permissions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListResources](#) in *AWS CLI Command Reference*.

### list-transactions

The following code example shows how to use list-transactions.

**AWS CLI**

To list all transactions details

The following list-transactions example returns metadata about transactions and their status.
aws lakeformation list-transactions \
   --cli-input-json file://input.json

Contents of input.json:

```json
{
   "CatalogId": "123456789111",
   "StatusFilter": "ALL",
   "MaxResults": 3
}
```

Output:

```json
{
   "Transactions": [
      {
         "TransactionId": "1234569f08804cb790d950d4d0fe485e",
         "TransactionStatus": "committed",
         "TransactionStartTime": "2022-08-10T14:32:29.220000+00:00",
         "TransactionEndTime": "2022-08-10T14:32:33.751000+00:00"
      },
      {
         "TransactionId": "12345972ca8347b89825e33c5774aec4",
         "TransactionStatus": "committed",
         "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
         "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
      },
      {
         "TransactionId": "12345daf6cb047dbba8ad9b0414613b2",
         "TransactionStatus": "committed",
         "TransactionStartTime": "2022-08-10T13:56:51.261000+00:00",
         "TransactionEndTime": "2022-08-10T13:56:51.547000+00:00"
      }
   ],
   "NextToken": "77X1ebyp5is+X2lhHsZLgncDK3nNGpwRdFpic5OHgcX1/QMoniUAKcpR3k3ts3PVdMA=="
}
```

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions.html) in the **AWS Lake Formation Developer Guide**.

- For API details, see [ListTransactions](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/list-transactions.html) in **AWS CLI Command Reference**.
**put-data-lake-settings**

The following code example shows how to use `put-data-lake-settings`.

**AWS CLI**

To set AWS Lake Formation-managed data lake settings

The following `put-data-lake-settings` example sets the list of data lake administrators and other data lake settings.

```
aws lakeformation put-data-lake-settings \
   --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
   "DataLakeSettings": {
      "DataLakeAdmins": [
         {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
         }
      ],
      "CreateDatabaseDefaultPermissions": [],
      "CreateTableDefaultPermissions": [],
      "TrustedResourceOwners": [],
      "AllowExternalDataFiltering": true,
      "ExternalDataFilteringAllowList": [
         {
            "DataLakePrincipalIdentifier": "123456789111"
         }
      ],
      "AuthorizedSessionTagValueList": ["Amazon EMR"]
   }
}
```

This command produces no output.

For more information, see [Changing the default security settings for your data lake](https://docs.aws.amazon.com/lakeformation/latest/dg/changing-default-security-settings.html) in the *AWS Lake Formation Developer Guide*.

**register-resource**

The following code example shows how to use `register-resource`.

**AWS CLI**

**Example 1: To register data lake storage using Service Linked Role**

The following `register-resource` example registers the resource as managed by the Lake Formation using Service linked role.

```
aws lakeformation register-resource \
--cli-input-json file:///input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",
    "UseServiceLinkedRole": true
}
```

This command produces no output.

For more information, see [Adding an Amazon S3 location to your data lake](http://docs.aws.amazon.com/lakeformation/latest/developer-guide/) in the *AWS Lake Formation Developer Guide*.

**Example 2: To register data lake storage using custom role**

The following `register-resource` example registers the resource as managed by the Lake Formation using custom role.

```
aws lakeformation register-resource \
--cli-input-json file:///input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",
    "UseServiceLinkedRole": false,
    "RoleArn": "arn:aws:iam::123456789111:role/LF-GLueServiceRole"
}
```
This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the AWS Lake Formation Developer Guide.

- For API details, see RegisterResource in AWS CLI Command Reference.

**remove-lf-tags-from-resource**

The following code example shows how to use remove-lf-tags-from-resource.

**AWS CLI**

To remove LF-Tag from a resource

The following remove-lf-tags-from-resource example removes the LF-Tag association with the table resource.

```bash
aws lakeformation remove-lf-tags-from-resource \
--cli-input-json file://input.json
```

**Contents of input.json:**

```json
{
   "CatalogId": "123456789111",
   "Resource": {
      "Table": {
         "CatalogId": "123456789111",
         "DatabaseName": "tpc",
         "Name": "dl_tpc_promotion"
      }
   },
   "LFTags": [{
      "CatalogId": "123456789111",
      "TagKey": "usergroup",
      "TagValues": ["developer"
   }
}
```

**Output:**
For more information, see Assigning LF-Tags to Data Catalog resources in the AWS Lake Formation Developer Guide.

- For API details, see RemoveLfTagsFromResource in AWS CLI Command Reference.

revoke-permissions

The following code example shows how to use revoke-permissions.

**AWS CLI**

To revoke permissions on resources from the principal

The following revoke-permissions example revoke principal access to specific table of a given database.

```
aws lakeformation revoke-permissions \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
  "CatalogId": "123456789111",
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
  },
  "Resource": {
    "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "Name": "dl_tpc_promotion"
    }
  },
  "Permissions": [
    "ALL"
  ],
  "PermissionsWithGrantOption": []
}
```
This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the AWS Lake Formation Developer Guide.

- For API details, see RevokePermissions in AWS CLI Command Reference.

**search-databases-by-lf-tags**

The following code example shows how to use search-databases-by-lf-tags.

**AWS CLI**

**To search on database resources by LFTags**

The following search-databases-by-lf-tags example search on database resources matching LFTag expression.

```bash
aws lakeformation search-databases-by-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```json
{
    "MaxResults": 1,
    "CatalogId": "123456789111",
    "Expression": [{
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```json
{
    "DatabaseList": [{
        "Database": {
            "CatalogId": "123456789111",
            "Name": "tpc"
        }
    }]
}
```
For more information, see Viewing the resources that a LF-Tag is assigned to in the AWS Lake Formation Developer Guide.

- For API details, see SearchDatabasesByLfTags in AWS CLI Command Reference.

**search-tables-by-lf-tags**

The following code example shows how to use search-tables-by-lf-tags.

**AWS CLI**

*To search on table resources by LFTags*

The following search-tables-by-lf-tags example search on table resources matching LFTag expression.

```
aws lakeformation search-tables-by-lf-tags
   --cli-input-json file://input.json
```

**Contents of input.json:**

```
{
   "MaxResults": 2,
   "CatalogId": "123456789111",
   "Expression": [
      {
         "TagKey": "usergroup",
         "TagValues": [
            "developer"
         ]
      }
   ]
}
```
Output:

```json
{
   "NextToken": "c2VhcmNoQWxsVGFnuc0luVGFibGVzIjpmYWxzZX0=",
   "TableList": [
      {
         "CatalogId": "123456789111",
         "DatabaseName": "tpc",
         "Name": "dl_tpc_item"
      },
      "LFTagOnDatabase": [
         {
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
               "developer"
            ]
         }
      ],
      "LFTagsOnTable": [
         {
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
               "developer"
            ]
         }
      ],
      "LFTagsOnColumns": [
         {
            "Name": "i_item_desc",
            "LFTags": [
               {
                  "CatalogId": "123456789111",
                  "TagKey": "usergroup",
                  "TagValues": [
                     "developer"
                  ]
               }
            ]
         },
         {
            "Name": "i_container",
            "LFTags": [
               {
                  "CatalogId": "123456789111",

  }]
}
For more information, see [Viewing the resources that a LF-Tag is assigned to](https://aws.amazon.com) in the *AWS Lake Formation Developer Guide*.

- For API details, see [SearchTablesByLfTags](https://aws.amazon.com) in *AWS CLI Command Reference*.

**start-query-planning**

The following code example shows how to use `start-query-planning`.

**AWS CLI**

**To process query statement**

The following `start-query-planning` example submits a request to process a query statement.
aws lakeformation start-query-planning \
   --cli-input-json file://input.json

Contents of input.json:

```json
{
    "QueryPlanningContext": {
        "CatalogId": "012345678901",
        "DatabaseName": "tpc"
    },
    "QueryString": "select * from dl_tpc_household_demographics_gov where hd_income_band_sk=9"
}
```

Output:

```json
{
    "QueryId": "772a273f-4a62-4cda-8d98-69615ee8be9b"
}
```

For more information, see [Reading from and writing to the data lake within transactions](https://docs.aws.amazon.com/lakeformation/latest/dg/transactions.html) in the AWS Lake Formation Developer Guide.

- For API details, see [StartQueryPlanning](https://docs.aws.amazon.com/cli/latest/reference/lakeformation/start-query-planning.html) in *AWS CLI Command Reference*.

### start-transaction

The following code example shows how to use `start-transaction`.

**AWS CLI**

To start new transaction

The following start-transaction example starts a new transaction and returns its transaction ID.

```bash
aws lakeformation start-transaction \
   --transaction-type='READ_AND_WRITE'
```

Output:
For more information, see Reading from and writing to the data lake within transactions in the AWS Lake Formation Developer Guide.

- For API details, see StartTransaction in AWS CLI Command Reference.

**update-lf-tag**

The following code example shows how to use update-lf-tag.

**AWS CLI**

To update LF-Tag definition

The following update-lf-tag example updates LF-Tag definition.

```bash
aws lakeformation update-lf-tag \
--catalog-id '123456789111' \ 
--tag-key 'usergroup' \ 
--tag-values-to-add '["admin"]'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the AWS Lake Formation Developer Guide.

- For API details, see UpdateLfTag in AWS CLI Command Reference.

**update-table-objects**

The following code example shows how to use update-table-objects.

**AWS CLI**

To modify objects of governed table

The following update-table-objects example adds provided S3 objects to the specified governed table.
aws lakeformation update-table-objects \
--cli-input-json file://input.json

Contents of input.json:

```json
{
  "CatalogId": "012345678901",
  "DatabaseName": "tpc",
  "TableName": "dl_tpc_household_demographics_gov",
  "TransactionId": "12347a9f75424b9b915f6ff201d2a190",
  "WriteOperations": [{
    "AddObject": {
      "Uri": "s3://lf-data-lake-012345678901/target/dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-ff26b17504414fe88b302cd795eabd00.parquet",
      "ETag": "1234ab1fc50a316b149b4e1f21a73800",
      "Size": 42200
    }
  }]
}
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the AWS Lake Formation Developer Guide.

- For API details, see UpdateTableObjects in AWS CLI Command Reference.

**Lambda examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lambda.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
The following code example shows how to use `add-layer-version-permission`.

**AWS CLI**

**To add permissions to a layer version**

The following `add-layer-version-permission` example grants permission for the specified account to use version 1 of the layer `my-layer`.

```bash
aws lambda add-layer-version-permission \
    --layer-name my-layer \ 
    --statement-id xaccount \ 
    --action lambda:GetLayerVersion \ 
    --principal 123456789012 \ 
    --version-number 1
```

**Output:**

```json
{
    "RevisionId": "35d87451-f796-4a3f-a618-95a3671b0a0c",
    "Statement":
    {
        "Sid":"xaccount",
        "Effect":"Allow",
        "Principal":{
            "AWS":"arn:aws:iam::210987654321:root"
        },
        "Action":"lambda:GetLayerVersion",
    }
}
```

For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/latest/dg/lambda-layers.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/).
For API details, see AddLayerVersionPermission in AWS CLI Command Reference.

**add-permission**

The following code example shows how to use add-permission.

**AWS CLI**

**To add permissions to an existing Lambda function**

The following add-permission example grants the Amazon SNS service permission to invoke a function named my-function.

```bash
aws lambda add-permission \
   --function-name my-function \
   --action lambda:InvokeFunction \
   --statement-id sns \
   --principal sns.amazonaws.com
```

Output:

```json
{
   "Statement": {
       "Sid": "sns",
       "Effect": "Allow",
       "Principal": {
           "Service": "sns.amazonaws.com"
       },
       "Action": "lambda:InvokeFunction",
   }
}
```

For more information, see Using Resource-based Policies for AWS Lambda in the AWS Lambda Developer Guide.

- For API details, see AddPermission in AWS CLI Command Reference.

**create-alias**

The following code example shows how to use create-alias.
To create an alias for a Lambda function

The following `create-alias` example creates an alias named `LIVE` that points to version 1 of the `my-function` Lambda function.

```bash
aws lambda create-alias \
   --function-name my-function \
   --description "alias for live version of function" \
   --function-version 1 \
   --name LIVE
```

Output:

```json
{
   "FunctionVersion": "1",
   "Name": "LIVE",
   "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",
   "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see CreateAlias in AWS CLI Command Reference.

create-event-source-mapping

The following code example shows how to use `create-event-source-mapping`.

AWS CLI

To create a mapping between an event source and an AWS Lambda function

The following `create-event-source-mapping` example creates a mapping between an SQS queue and the `my-function` Lambda function.

```bash
aws lambda create-event-source-mapping \
   --function-name my-function \
```
The following code example shows how to use `create-function`.

**AWS CLI**

To create a Lambda function

The following `create-function` example creates a Lambda function named `my-function`.

```sh
aws lambda create-function \
  --function-name my-function \
  --runtime nodejs18.x \
  --zip-file fileb://my-function.zip \
  --handler my-function.handler \
  --role arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-tges6bf4
```

Contents of `my-function.zip`:

This file is a deployment package that contains your function code and any dependencies.
The following code example shows how to use `delete-alias`.

**AWS CLI**

**To delete an alias of a Lambda function**

The following `delete-alias` example deletes the alias named `LIVE` from the `my-function` Lambda function.

```bash
aws lambda delete-alias \
  --function-name my-function \ 
  --name LIVE
```
This command produces no output.

For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see DeleteAlias in AWS CLI Command Reference.

**delete-event-source-mapping**

The following code example shows how to use delete-event-source-mapping.

**AWS CLI**

To delete the mapping between an event source and an AWS Lambda function

The following delete-event-source-mapping example deletes the mapping between an SQS queue and the my-function Lambda function.

```bash
aws lambda delete-event-source-mapping \\
--uuid a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

**Output:**

```json
{
  "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
  "StateTransitionReason": "USER_INITIATED",
  "LastModified": 1569285870.271,
  "BatchSize": 5,
  "State": "Deleting",
  "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the AWS Lambda Developer Guide.

- For API details, see DeleteEventSourceMapping in AWS CLI Command Reference.

**delete-function-concurrency**

The following code example shows how to use delete-function-concurrency.
AWS CLI

To remove the reserved concurrent execution limit from a function

The following delete-function-concurrency example deletes the reserved concurrent execution limit from the my-function function.

```
aws lambda delete-function-concurrency \
    --function-name my-function
```

This command produces no output.

For more information, see Reserving Concurrency for a Lambda Function in the AWS Lambda Developer Guide.

- For API details, see DeleteFunctionConcurrency in AWS CLI Command Reference.

delete-function-event-invoke-config

The following code example shows how to use delete-function-event-invoke-config.

AWS CLI

To delete an asynchronous invocation configuration

The following delete-function-event-invoke-config example deletes the asynchronous invocation configuration for the GREEN alias of the specified function.

```
aws lambda delete-function-event-invoke-config --function-name my-function:GREEN
```

- For API details, see DeleteFunctionEventInvokeConfig in AWS CLI Command Reference.

delete-function

The following code example shows how to use delete-function.

AWS CLI

Example 1: To delete a Lambda function by function name

The following delete-function example deletes the Lambda function named my-function by specifying the function's name.
aws lambda delete-function \
--function-name my-function

This command produces no output.

**Example 2: To delete a Lambda function by function ARN**

The following delete-function example deletes the Lambda function named my-function by specifying the function's ARN.

    aws lambda delete-function \

This command produces no output.

**Example 3: To delete a Lambda function by partial function ARN**

The following delete-function example deletes the Lambda function named my-function by specifying the function's partial ARN.

    aws lambda delete-function \
      --function-name 123456789012:function:my-function

This command produces no output.

For more information, see [AWS Lambda Function Configuration](amazonaws.com) in the AWS Lambda Developer Guide.

- For API details, see [DeleteFunction](amazonaws.com) in AWS CLI Command Reference.

**delete-layer-version**

The following code example shows how to use delete-layer-version.

**AWS CLI**

**To delete a version of a Lambda layer**

The following delete-layer-version example deletes version 2 of the layer named my-layer.
aws lambda delete-layer-version \
  --layer-name my-layer \
  --version-number 2

This command produces no output.

For more information, see AWS Lambda Layers in the AWS Lambda Developer Guide.
- For API details, see DeleteLayerVersion in AWS CLI Command Reference.

delete-provisioned-concurrency-config

The following code example shows how to use delete-provisioned-concurrency-config.

AWS CLI

To delete a provisioned concurrency configuration

The following delete-provisioned-concurrency-config example deletes the provisioned concurrency configuration for the GREEN alias of the specified function.

aws lambda delete-provisioned-concurrency-config \
  --function-name my-function \
  --qualifier GREEN

- For API details, see DeleteProvisionedConcurrencyConfig in AWS CLI Command Reference.

get-account-settings

The following code example shows how to use get-account-settings.

AWS CLI

To retrieve details about your account in an AWS Region

The following get-account-settings example displays the Lambda limits and usage information for your account.

aws lambda get-account-settings

Output:
For more information, see [AWS Lambda Limits](https://docs.aws.amazon.com/lambda/latest/dg/limits.html) in the *AWS Lambda Developer Guide*.

- For API details, see [GetAccountSettings](https://docs.aws.amazon.com/cli/latest/reference/lambda/get-account-settings.html) in *AWS CLI Command Reference*.

### get-alias

The following code example shows how to use `get-alias`.

**AWS CLI**

**To retrieve details about a function alias**

The following `get-alias` example displays details for the alias named `LIVE` on the `my-function` Lambda function.

```bash
aws lambda get-alias \
    --function-name my-function \
    --name LIVE
```

**Output:**

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
    "Description": "alias for live version of function"
}
```
For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see GetAlias in AWS CLI Command Reference.

**get-event-source-mapping**

The following code example shows how to use get-event-source-mapping.

**AWS CLI**

**To retrieve details about an event source mapping**

The following get-event-source-mapping example displays the details for the mapping between an SQS queue and the my-function Lambda function.

```
aws lambda get-event-source-mapping \\
   --uuid "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```json
{
   "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
   "StateTransitionReason": "USER_INITIATED",
   "LastModified": 1569284520.333,
   "BatchSize": 5,
   "State": "Enabled",
   "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the AWS Lambda Developer Guide.

- For API details, see GetEventSourceMapping in AWS CLI Command Reference.

**get-function-concurrency**

The following code example shows how to use get-function-concurrency.
**AWS CLI**

**To view the reserved concurrency setting for a function**

The following `get-function-concurrency` example retrieves the reserved concurrency setting for the specified function.

```bash
aws lambda get-function-concurrency \
   --function-name my-function
```

Output:

```
{
   "ReservedConcurrentExecutions": 250
}
```

- For API details, see *GetFunctionConcurrency* in *AWS CLI Command Reference*.

**get-function-configuration**

The following code example shows how to use `get-function-configuration`.

**AWS CLI**

**To retrieve the version-specific settings of a Lambda function**

The following `get-function-configuration` example displays the settings for version 2 of the `my-function` function.

```bash
aws lambda get-function-configuration \
   --function-name my-function:2
```

Output:

```
{
   "FunctionName": "my-function",
   "LastModified": "2019-09-26T20:28:40.438+0000",
   "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
   "MemorySize": 256,
   "Version": "2",
   "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
   "Timeout": 3,
```
"Runtime": "nodejs10.x",
"TracingConfig": {
   "Mode": "PassThrough"
},
"CodeSha256": "5tT2qqzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
"Description": "",
"VpcConfig": {
   "SubnetIds": [],
   "VpcId": "",
   "SecurityGroupIds": []
},
"CodeSize": 304,
"Handler": "index.handler"
}

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-function.html) in the AWS Lambda Developer Guide.

### get-function-event-invoke-config

The following code example shows how to use `get-function-event-invoke-config`.

#### AWS CLI

To view an asynchronous invocation configuration

The following `get-function-event-invoke-config` example retrieves the asynchronous invocation configuration for the BLUE alias of the specified function.

```bash
aws lambda get-function-event-invoke-config \ 
--function-name my-function:BLUE
```

Output:

```
{
   "LastModified": 1577824396.653,
   "MaximumRetryAttempts": 0,
   "MaximumEventAgeInSeconds": 3600,
}```
"DestinationConfig": {  
    "OnSuccess": {},  
    "OnFailure": {  
        "Destination": "arn:aws:sqs:us-east-2:123456789012:failed-invocations"  
    }  
}  
}

- For API details, see `GetFunctionEventInvokeConfig` in *AWS CLI Command Reference*.

**get-function**

The following code example shows how to use `get-function`.

**AWS CLI**

**To retrieve information about a function**

The following `get-function` example displays information about the `my-function` function.

```bash
aws lambda get-function
   --function-name my-function
```

Output:

```json
{
   "Concurrency": {
      "ReservedConcurrentExecutions": 100
   },
   "Code": {
      "RepositoryType": "S3",
   },
   "Configuration": {
      "TracingConfig": {
         "Mode": "PassThrough"
      },
      "Version": "$LATEST",
      "CodeSha256": "5tT2qgzYUHoqwR616pZ2dpkn/0J1FrzJmlKidWaaCgk=",
      "FunctionName": "my-function",
      "VpcConfig": {
```
For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-arn.html) in the *AWS Lambda Developer Guide*.

- For API details, see [GetFunction](https://docs.aws.amazon.com/cli/latest/reference/lambda/get-function.html) in *AWS CLI Command Reference*.

**get-layer-version-by-arn**

The following code example shows how to use `get-layer-version-by-arn`.

**AWS CLI**

*To retrieve information about a Lambda layer version*

The following `get-layer-version-by-arn` example displays information about the layer version with the specified Amazon Resource Name (ARN).

```bash
aws lambda get-layer-version-by-arn \
```

**Output:**

```json
{
    ...
}
```
For more information, see AWS Lambda Layers in the AWS Lambda Developer Guide.

- For API details, see GetLayerVersionByArn in AWS CLI Command Reference.

get-layer-version-policy

The following code example shows how to use get-layer-version-policy.

AWS CLI

To retrieve the permissions policy for a Lambda layer version

The following get-layer-version-policy example displays policy information about version 1 for the layer named my-layer.

```bash
aws lambda get-layer-version-policy \
   --layer-name my-layer \
   --version-number 1
```

Output:

```
{
```

Actions and scenarios
"Policy": {
   "Version":"2012-10-17",
   "Id":"default",
   "Statement": [ 
      { 
         "Sid":"xaccount",
         "Effect":"Allow",
         "Principal": {"AWS":"arn:aws:iam::123456789012:root"},
         "Action":"lambda:GetLayerVersion",
      } 
   ],
   "RevisionId": "c68f21d2-cbf0-4026-90f6-1375ee465cd0"
}

For more information, see AWS Lambda Layers in the AWS Lambda Developer Guide.

- For API details, see GetLayerVersionPolicy in AWS CLI Command Reference.

get-layer-version

The following code example shows how to use get-layer-version.

AWS CLI

To retrieve information about a Lambda layer version

The following get-layer-version example displays information for version 1 of the layer named my-layer.

aws lambda get-layer-version \
   --layer-name my-layer \
   --version-number 1

Output:

{ 
   "Content": { 
      "Location": "https://awslambda-us-east-2-layers.s3.us-east-2.amazonaws.com/snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?versionId=27iWyA73cCAYqqH...",
}
For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/latest/dg/01-layers.html) in the *AWS Lambda Developer Guide*.

### get-policy

The following code example shows how to use `get-policy`.

**AWS CLI**

**To retrieve the resource-based IAM policy for a function, version, or alias**

The following `get-policy` example displays policy information about the `my-function` Lambda function.

```bash
aws lambda get-policy
  --function-name my-function
```

**Output:**

```json
{
  "Policy": {
    "Version": "2012-10-17",
    "Id": "default",
    "Statement": [
      {
        "Sid": "iot-events",
```
For more information, see Using Resource-based Policies for AWS Lambda in the AWS Lambda Developer Guide.

- For API details, see GetPolicy in AWS CLI Command Reference.

get-provisioned-concurrency-config

The following code example shows how to use get-provisioned-concurrency-config.

**AWS CLI**

To view a provisioned concurrency configuration

The following get-provisioned-concurrency-config example displays details for the provisioned concurrency configuration for the BLUE alias of the specified function.

```bash
aws lambda get-provisioned-concurrency-config \\
   --function-name my-function \\
   --qualifier BLUE
```

Output:

```json
{
   "RequestedProvisionedConcurrentExecutions": 100,
   "AvailableProvisionedConcurrentExecutions": 100,
   "AllocatedProvisionedConcurrentExecutions": 100,
   "Status": "READY",
   "LastModified": "2019-12-31T20:28:49+0000"
}
```

- For API details, see GetProvisionedConcurrencyConfig in AWS CLI Command Reference.
invoke

The following code example shows how to use invoke.

AWS CLI

Example 1: To invoke a Lambda function synchronously

The following invoke example invokes the my-function function synchronously. The cli-binary-format option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the AWS Command Line Interface User Guide.

```
aws lambda invoke \
    --function-name my-function \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }' \
    response.json
```

Output:

```
{
    "ExecutedVersion": "$LATEST",
    "StatusCode": 200
}
```

For more information, see Synchronous Invocation in the AWS Lambda Developer Guide.

Example 2: To invoke a Lambda function asynchronously

The following invoke example invokes the my-function function asynchronously. The cli-binary-format option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the AWS Command Line Interface User Guide.

```
aws lambda invoke \
    --function-name my-function \
    --invocation-type Event \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }' \
    response.json
```
For more information, see Asynchronous Invocation in the AWS Lambda Developer Guide.

- For API details, see Invoke in AWS CLI Command Reference.

list-aliases

The following code example shows how to use list-aliases.

AWS CLI

To retrieve the list of aliases for a Lambda function

The following list-aliases example displays a list of the aliases for the my-function Lambda function.

```
aws lambda list-aliases \
    --function-name my-function
```

Output:

```
{
    "Aliases": [
    {

        "Name": "LIVE",
        "Description": "alias for live version of function"
    }
]
}
```
For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see ListAliases in AWS CLI Command Reference.

list-event-source-mappings

The following code example shows how to use list-event-source-mappings.

AWS CLI

To list the event source mappings for a function

The following list-event-source-mappings example displays a list of the event source mappings for the my-function Lambda function.

```bash
aws lambda list-event-source-mappings \
   --function-name my-function
```

Output:

```json
{
   "EventSourceMappings": [
      {
         "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
         "StateTransitionReason": "USER_INITIATED",
         "LastModified": 1569284520.333,
         "BatchSize": 5,
         "State": "Enabled",
         "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
      }
   ]
}
```

For more information, see AWS Lambda Event Source Mapping in the AWS Lambda Developer Guide.
list-function-event-invoke-configs

The following code example shows how to use list-function-event-invoke-configs.

AWS CLI

To view a list of asynchronous invocation configurations

The following list-function-event-invoke-configs example lists the asynchronous invocation configurations for the specified function.

```bash
aws lambda list-function-event-invoke-configs \
   --function-name my-function
```

Output:

```json
{
   "FunctionEventInvokeConfigs": [
      {
         "LastModified": 1577824406.719,
         "MaximumRetryAttempts": 2,
         "MaximumEventAgeInSeconds": 1800
      },
      {
         "LastModified": 1577824396.653,
         "MaximumRetryAttempts": 0,
         "MaximumEventAgeInSeconds": 3600
      }
   ]
}
```

list-functions

The following code example shows how to use list-functions.

• For API details, see ListFunctionEventInvokeConfigs in AWS CLI Command Reference.
AWS CLI

To retrieve a list of Lambda functions

The following `list-functions` example displays a list of all of the functions for the current user.

```
aws lambda list-functions
```

Output:

```json
{
   "Functions": [ 
      {
         "TracingConfig": {
            "Mode": "PassThrough"
         },

### list-layer-versions

The following code example shows how to use `list-layer-versions`.

**AWS CLI**

To list the versions of an AWS Lambda layer

The following `list-layers-versions` example displays information about the versions for the layer named `my-layer`.

```
aws lambda list-layer-versions \
  --layer-name my-layer
```

**Output:**

```
{
  "Layers": [
    {
      "Version": 2,
      "Description": "My layer",
      "CreatedDate": "2023-11-15T00:37:46.592+0000",
      "CompatibleRuntimes": [
        "python3.10",
        "python3.11"
      ]
    }
  ]
}
```
For more information, see AWS Lambda Layers in the AWS Lambda Developer Guide.

- For API details, see ListLayerVersions in AWS CLI Command Reference.

**list-layers**

The following code example shows how to use list-layers.

**AWS CLI**

**To list the layers that are compatible with your function's runtime**

The following list-layers example displays information about layers that are compatible with the Python 3.11 runtime.

```bash
aws lambda list-layers \
   --compatible-runtime python3.11
```

**Output:**

```json
{
   "Layers": [
      {
         "LayerName": "my-layer",
         "LatestMatchingVersion": {
            "Version": 2,
            "Description": "My layer",
            "CreatedDate": "2023-11-15T00:37:46.592+0000",
            "CompatibleRuntimes": [
               "python3.10",
               "python3.11"
            ]
         }
      }
   ]
}
```
For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/latest/dg/using-layers.html) in the *AWS Lambda Developer Guide*.

- For API details, see [ListLayers](https://docs.aws.amazon.com/cli/latest/reference/lambda/list-layers.html) in *AWS CLI Command Reference*.

### list-provisioned-concurrency-configs

The following code example shows how to use `list-provisioned-concurrency-configs`.

**AWS CLI**

**To get a list of provisioned concurrency configurations**

The following `list-provisioned-concurrency-configs` example lists the provisioned concurrency configurations for the specified function.

```
aws lambda list-provisioned-concurrency-configs \
  --function-name my-function
```

Output:

```
{
  "ProvisionedConcurrencyConfigs": [ 
    {
      "RequestedProvisionedConcurrentExecutions": 100,
      "AvailableProvisionedConcurrentExecutions": 100,
      "AllocatedProvisionedConcurrentExecutions": 100,
      "Status": "READY",
      "LastModified": "2019-12-31T20:29:00+0000"
    },
    {
      "RequestedProvisionedConcurrentExecutions": 100,
      "AvailableProvisionedConcurrentExecutions": 100,
      "AllocatedProvisionedConcurrentExecutions": 100,
      "Status": "READY",
      "LastModified": "2019-12-31T20:28:49+0000"
    }
  ]
}
```
For API details, see ListProvisionedConcurrencyConfigs in AWS CLI Command Reference.

list-tags

The following code example shows how to use list-tags.

AWS CLI

To retrieve the list of tags for a Lambda function

The following list-tags example displays the tags attached to the my-function Lambda function.

```
aws lambda list-tags \
```

Output:

```
{
  "Tags": {
    "Category": "Web Tools",
    "Department": "Sales"
  }
}
```

For more information, see Tagging Lambda Functions in the AWS Lambda Developer Guide.

- For API details, see ListTags in AWS CLI Command Reference.

list-versions-by-function

The following code example shows how to use list-versions-by-function.

AWS CLI

To retrieve a list of versions of a function

The following list-versions-by-function example displays the list of versions for the my-function Lambda function.
aws lambda list-versions-by-function \
   --function-name my-function

Output:

{
   "Versions": [
   {
      "TracingConfig": {
         "Mode": "PassThrough"
      },
      "Version": "$LATEST",
      "CodeSha256": "sU0cJ2/h0ZevwV/1TxCuQQk3gDZP3i8gUoqUUVRmY6E=",
      "FunctionName": "my-function",
      "VpcConfig": {
         "SubnetIds": [],
         "VpcId": "",
         "SecurityGroupIds": []
      },

Actions and scenarios

4457


For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see ListVersionsByFunction in AWS CLI Command Reference.

**publish-layer-version**

The following code example shows how to use publish-layer-version.

**AWS CLI**

**To create a Lambda layer version**

The following publish-layer-version example creates a new Python library layer version. The command retrieves the layer content a file named layer.zip in the specified S3 bucket.

```bash
aws lambda publish-layer-version \
    --layer-name my-layer \
    --description "My Python layer" \
    --license-info "MIT" \
    --content S3Bucket=lambda-layers-us-west-2-123456789012,S3Key=layer.zip \
    --compatible-runtimes python3.10 python3.11
```

Output:

```json
{
    "Content": {
        "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/
        snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?
        versionId=27iWyA73cCAYqyH...",
        "CodeSha256": "tv9jJ0+IPbXUXXuRKi7CwHzKtLDkDRJLB3cC3Z/ouXo=",
        "CodeSize": 169
    },
    "Description": "My Python layer",
    "CreatedDate": "2023-11-14T23:03:52.894+0000",
    "Version": 1,
    "LicenseInfo": "MIT",
    "CompatibleRuntimes": [
        "python3.10",
        "python3.11"
    ]
}
```
For more information, see [AWS Lambda Layers](https://docs.aws.amazon.com/lambda/latest/dg/using-layers.html) in the *AWS Lambda Developer Guide*.

### publish-version

The following code example shows how to use `publish-version`.

**AWS CLI**

**To publish a new version of a function**

The following `publish-version` example publishes a new version of the *my-function* Lambda function.

```bash
aws lambda publish-version \
  --function-name my-function
```

**Output:**

```json
{
  "TracingConfig": {
    "Mode": "PassThrough"
  },
  "CodeSha256": "dBG9m8SGdm1Ejw/JYX1hhvCrAv5TvxXsbL/RMr0fT/I=",
  "FunctionName": "my-function",
  "CodeSize": 294,
  "RevisionId": "f31d3d39-cc63-4520-97d4-43cd44c94c20",
  "MemorySize": 128,
  "Version": "2",
  "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-zgur6bf4",
  "Timeout": 3,
  "LastModified": "2019-09-23T18:32:33Z",
  "Handler": "my-function.handler",
  "Runtime": "nodejs10.x",
  "Description": ""
}
```
For more information, see [Configuring AWS Lambda Function Aliases](https://docs.aws.amazon.com/lambda/latest/dg/using-aliases.html) in the *AWS Lambda Developer Guide*.

- For API details, see [PublishVersion](https://docs.aws.amazon.com/cli/latest/reference/lambda/publish-version.html) in *AWS CLI Command Reference*.

**put-function-concurrency**

The following code example shows how to use `put-function-concurrency`.

**AWS CLI**

**To configure a reserved concurrency limit for a function**

The following `put-function-concurrency` example configures 100 reserved concurrent executions for the `my-function` function.

```bash
aws lambda put-function-concurrency
   --function-name my-function
   --reserved-concurrent-executions 100
```

**Output:**

```json
{
   "ReservedConcurrentExecutions": 100
}
```

For more information, see [Reserving Concurrency for a Lambda Function](https://docs.aws.amazon.com/lambda/latest/dg/reserving-concurrency.html) in the *AWS Lambda Developer Guide*.

- For API details, see [PutFunctionConcurrency](https://docs.aws.amazon.com/cli/latest/reference/lambda/put-function-concurrency.html) in *AWS CLI Command Reference*.

**put-function-event-invoke-config**

The following code example shows how to use `put-function-event-invoke-config`.

**AWS CLI**

**To configure error handling for asynchronous invocation**

The following `put-function-event-invoke-config` example sets a maximum event age of one hour and disables retries for the specified function.
aws lambda put-function-event-invoke-config \
   --function-name my-function \
   --maximum-event-age-in-seconds 3600 \
   --maximum-retry-attempts 0

Output:

```json
{
   "LastModified": 1573686021.479,
   "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-function:
   $LATEST",
   "MaximumRetryAttempts": 0,
   "MaximumEventAgeInSeconds": 3600,
   "DestinationConfig": {
      "OnSuccess": {},
      "OnFailure": {}
   }
}
```

- For API details, see [PutFunctionEventInvokeConfig](#) in AWS CLI Command Reference.

**put-provisioned-concurrency-config**

The following code example shows how to use `put-provisioned-concurrency-config`.

**AWS CLI**

**To allocate provisioned concurrency**

The following `put-provisioned-concurrency-config` example allocates 100 provisioned concurrency for the BLUE alias of the specified function.

```
aws lambda put-provisioned-concurrency-config \
   --function-name my-function \
   --qualifier BLUE \
   --provisioned-concurrent-executions 100
```

Output:

```json
{
   "Requested ProvisionedConcurrentExecutions": 100,
```
For API details, see PutProvisionedConcurrencyConfig in AWS CLI Command Reference.

**remove-layer-version-permission**

The following code example shows how to use remove-layer-version-permission.

**AWS CLI**

To delete layer-version permissions

The following remove-layer-version-permission example deletes permission for an account to configure a layer version.

```bash
aws lambda remove-layer-version-permission \
   --layer-name my-layer \
   --statement-id xaccount \
   --version-number 1
```

This command produces no output.

For more information, see AWS Lambda Layers in the AWS Lambda Developer Guide.

For API details, see RemoveLayerVersionPermission in AWS CLI Command Reference.

**remove-permission**

The following code example shows how to use remove-permission.

**AWS CLI**

To remove permissions from an existing Lambda function

The following remove-permission example removes permission to invoke a function named my-function.

```bash
aws lambda remove-permission \
   --function-name my-function \
```
This command produces no output.

For more information, see Using Resource-based Policies for AWS Lambda in the AWS Lambda Developer Guide.

- For API details, see RemovePermission in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To add tags to an existing Lambda function**

The following tag-resource example adds a tag with the key name DEPARTMENT and a value of Department A to the specified Lambda function.

```
aws lambda tag-resource \
  --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
  --tags "DEPARTMENT=Department A"
```

This command produces no output.

For more information, see Tagging Lambda Functions in the AWS Lambda Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove tags from an existing Lambda function**

The following untag-resource example removes the tag with the key name DEPARTMENT tag from the my-function Lambda function.

```
aws lambda untag-resource \
  --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
```
--tag-keys DEPARTMENT

This command produces no output.

For more information, see Tagging Lambda Functions in the AWS Lambda Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-alias

The following code example shows how to use update-alias.

AWS CLI

To update a function alias

The following update-alias example updates the alias named LIVE to point to version 3 of the my-function Lambda function.

```
aws lambda update-alias \
    --function-name my-function \
    --function-version 3 \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the AWS Lambda Developer Guide.

- For API details, see UpdateAlias in AWS CLI Command Reference.

update-event-source-mapping

The following code example shows how to use update-event-source-mapping.
AWS CLI

To update the mapping between an event source and an AWS Lambda function

The following update-event-source-mapping example updates the batch size to 8 in the specified mapping.

```
aws lambda update-event-source-mapping \
  --uuid "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
  --batch-size 8
```

Output:

```
{
  "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
  "StateTransitionReason": "USER_INITIATED",
  "LastModified": 1569284520.333,
  "BatchSize": 8,
  "State": "Updating",
  "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the AWS Lambda Developer Guide.

- For API details, see UpdateEventSourceMapping in AWS CLI Command Reference.

update-function-code

The following code example shows how to use update-function-code.

AWS CLI

To update the code of a Lambda function

The following update-function-code example replaces the code of the unpublished ($LATEST) version of the my-function function with the contents of the specified zip file.

```
aws lambda update-function-code \
  --function-name my-function \
```
--zip-file fileb://my-function.zip

Output:

```json
{
  "FunctionName": "my-function",
  "LastModified": "2019-09-26T20:28:40.438+0000",
  "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
  "MemorySize": 256,
  "Version": "$LATEST",
  "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
  "Timeout": 3,
  "Runtime": "nodejs10.x",
  "TracingConfig": {
    "Mode": "PassThrough"
  },
  "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
  "Description": "",
  "VpcConfig": {
    "SubnetIds": [],
    "VpcId": "",
    "SecurityGroupIds": []
  },
  "CodeSize": 304,
  "Handler": "index.handler"
}
```

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-update.html) in the *AWS Lambda Developer Guide*.

- For API details, see [UpdateFunctionCode](https://docs.aws.amazon.com/AmazonS3/latest/API/REST-PutObject-XML.html) in *AWS CLI Command Reference*.

**update-function-configuration**

The following code example shows how to use `update-function-configuration`.

**AWS CLI**

To modify the configuration of a function

The following `update-function-configuration` example modifies the memory size to be 256 MB for the unpublished ($LATEST) version of the `my-function` function.
aws lambda update-function-configuration \
  --function-name  my-function \
  --memory-size 256

Output:

{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "Handler": "index.handler"
}

For more information, see [AWS Lambda Function Configuration](https://docs.aws.amazon.com/lambda/latest/dg/configuration-code-sha256.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/lambda/latest/dg/).

update-function-event-invoke-config

The following code example shows how to use update-function-event-invoke-config.

AWS CLI

**To update an asynchronous invocation configuration**
The following `update-function-event-invoke-config` example adds an on-failure destination to the existing asynchronous invocation configuration for the specified function.

```bash
aws lambda update-function-event-invoke-config \
  --function-name my-function \ 
```

Output:

```json
{
    "LastModified": 1573687896.493,
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {
            "Destination": "arn:aws:sqs:us-east-2:123456789012:destination"
        }
    }
}
```

**License Manager examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with License Manager.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
**Topics**

- **Actions**

**Actions**

**create-license-configuration**

The following code example shows how to use `create-license-configuration`.

**AWS CLI**

**Example 1: To create a license configuration**

The following `create-license-configuration` example creates a license configuration with a hard limit of 10 cores.

```
aws license-manager create-license-configuration --name my-license-configuration \
   --license-counting-type Core \
   --license-count 10 \
   --license-count-hard-limit
```

Output:

```
{
   "LicenseConfigurationArn": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE111"
}
```

**Example 2: To create a license configuration**

The following `create-license-configuration` example creates a license configuration with a soft limit of 100 vCPUs. It uses a rule to enable vCPU optimization.

```
aws license-manager create-license-configuration --name my-license-configuration \
   --license-counting-type vCPU \
   --license-count 100 \
   --license-rules "#honorVcpuOptimization=true"
```

Output:

```
For API details, see CreateLicenseConfiguration in AWS CLI Command Reference.

delete-license-configuration

The following code example shows how to use delete-license-configuration.

AWS CLI

To delete a license configuration

The following delete-license-configuration example deletes the specified license configuration.

```
aws license-manager delete-license-configuration \
```

This command produces no output.

For API details, see DeleteLicenseConfiguration in AWS CLI Command Reference.

get-license-configuration

The following code example shows how to use get-license-configuration.

AWS CLI

To get license configuration information

The following get-license-configuration example displays details for the specified license configuration.

```
aws license-manager get-license-configuration \
```
Output:

```json
{
    "LicenseConfigurationId": "lic-38b658717b87478aa7c00883EXAMPLE",
    "Name": "my-license-configuration",
    "LicenseCountingType": "vCPU",
    "LicenseRules": [],
    "LicenseCountHardLimit": false,
    "ConsumedLicenses": 0,
    "Status": "AVAILABLE",
    "OwnerAccountId": "123456789012",
    "ConsumedLicenseSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
            "ConsumedLicenses": 0
        },
        {
            "ResourceType": "EC2_HOST",
            "ConsumedLicenses": 0
        },
        {
            "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
            "ConsumedLicenses": 0
        }
    ],
    "ManagedResourceSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
            "AssociationCount": 0
        },
        {
            "ResourceType": "EC2_HOST",
            "AssociationCount": 0
        },
        {
            "ResourceType": "EC2_AMI",
            "AssociationCount": 2
        },
        {
            "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
            "AssociationCount": 0
        }
    ]
}
```
• For API details, see `GetLicenseConfiguration` in *AWS CLI Command Reference*.

**get-service-settings**

The following code example shows how to use `get-service-settings`.

**AWS CLI**

**To get the License Manager settings**

The following `get-service-settings` example displays the service settings for License Manager in the current Region.

```bash
aws license-manager get-service-settings
```

The following shows example output if cross-account resource discovery is disabled.

```json
{
  "OrganizationConfiguration": {
    "EnableIntegration": false
  },
  "EnableCrossAccountsDiscovery": false
}
```

The following shows example output if cross-account resource discovery is enabled.

```json
{
  "S3BucketArn": "arn:aws:s3:::aws-license-manager-service-c22d6279-35c4-47c4-4bb",
  "OrganizationConfiguration": {
    "EnableIntegration": true
  },
  "EnableCrossAccountsDiscovery": true
}
```

• For API details, see `GetServiceSettings` in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

4472
**list-associations-for-license-configuration**

The following code example shows how to use `list-associations-for-license-configuration`.

**AWS CLI**

**To get associations for a license configuration**

The following `list-associations-for-license-configuration` example displays detailed information for the associations of the specified license configuration.

```bash
aws license-manager list-associations-for-license-configuration \
```

Output:

```json
{
    "LicenseConfigurationAssociations": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0",
            "ResourceType": "EC2_AMI",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1568825118.617
        },
        {
            "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-0abcdef1234567890",
            "ResourceType": "EC2_AMI",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1568825118.946
        }
    ]
}
```

- For API details, see [ListAssociationsForLicenseConfiguration](#) in *AWS CLI Command Reference*.

**list-license-configurations**

The following code example shows how to use `list-license-configurations`.
AWS CLI

Example 1: To list all of your license configurations

The following list-license-configurations example lists all your license configurations.

```bash
aws license-manager list-license-configurations
```

Output:

```json
{
  "LicenseConfigurations": [ 
    {
      "LicenseConfigurationId": "lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
      "LicenseConfigurationArn": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
      "Name": "my-license-configuration",
      "LicenseCountingType": "Core",
      "LicenseRules": [],
      "LicenseCount": 10,
      "LicenseCountHardLimit": true,
      "ConsumedLicenses": 0,
      "Status": "AVAILABLE",
      "OwnerAccountId": "123456789012",
      "ConsumedLicenseSummaryList": [ 
        {
          "ResourceType": "EC2_INSTANCE",
          "ConsumedLicenses": 0
        },
        {
          "ResourceType": "EC2_HOST",
          "ConsumedLicenses": 0
        },
        {
          "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
          "ConsumedLicenses": 0
        }
      ],
      "ManagedResourceSummaryList": [ 
        {
          "ResourceType": "EC2_INSTANCE",
          "AssociationCount": 0
        }
      ]
    }
  ]
}
```
Example 2: To list a specific license configuration

The following list-license-configureations example lists only the specified license configuration.

```bash
aws license-manager list-license-configurations \\
```

- For API details, see [ListLicenseConfigurations](#) in *AWS CLI Command Reference*.

list-license-specifications-for-resource

The following code example shows how to use list-license-specifications-for-resource.

**AWS CLI**

To list the license configurations for a resource

The following list-license-specifications-for-resource example lists the license configurations associated with the specified Amazon Machine Image (AMI).
aws license-manager list-license-specifications-for-resource \
   --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0

Output:

```
{
   "LicenseConfigurationArn": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE"
}
```

- For API details, see [ListLicenseSpecificationsForResource](#) in *AWS CLI Command Reference*.

**list-resource-inventory**

The following code example shows how to use `list-resource-inventory`.

**AWS CLI**

**To list resources in the resource inventory**

The following `list-resource-inventory` example lists the resources managed using Systems Manager inventory.

```bash
aws license-manager list-resource-inventory
```

Output:

```
{
   "ResourceInventoryList": [
   {
     "Platform": "Red Hat Enterprise Linux Server",
     "ResourceType": "EC2Instance",
     "PlatformVersion": "7.4",
     "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/i-05d3cdfb05bd36376",
     "ResourceId": "i-05d3cdfb05bd36376",
     "ResourceOwningAccountId": "1234567890129"
   },
   {
     "Platform": "Amazon Linux",
   }

   
```
For API details, see ListResourceInventory in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags for a license configuration

The following list-tags-for-resource example lists the tags for the specified license configuration.

```
aws license-manager list-tags-for-resource \
```

Output:

```
{
    "Tags": [
        {
```
For API details, see ListTagsForResource in AWS CLI Command Reference.

list-usage-for-license-configuration

The following code example shows how to use list-usage-for-license-configuration.

AWS CLI

To list the licenses in use for a license configuration

The following list-usage-for-license-configuration example lists information about the resources using licenses for the specified license configuration. For example, if the license type is vCPU, any instances consume one license per vCPU.

```
aws license-manager list-usage-for-license-configuration \
```

Output:

```
{
  "LicenseConfigurationUsageList": [
    {
      "ResourceType": "EC2_INSTANCE",
      "ResourceStatus": "running",
      "ResourceOwnerId": "123456789012",
      "AssociationTime": 1570892850.519,
      "ConsumedLicenses": 2
    }
  ]
}
```

For API details, see ListUsageForLicenseConfiguration in AWS CLI Command Reference.
tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add a tag a license configuration

The following `tag-resource` example adds the specified tag (key name and value) to the specified license configuration.

```
aws license-manager tag-resource \
  --tags Key=project,Value=lima \
```

This command produces no output.

- For API details, see `TagResource` in `AWS CLI Command Reference`.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a license configuration

The following `untag-resource` example removes the specified tag (key name and resource) from the specified license configuration.

```
aws license-manager untag-resource \
  --tag-keys project \
```

This command produces no output.

- For API details, see `UntagResource` in `AWS CLI Command Reference`.

update-license-configuration

The following code example shows how to use update-license-configuration.

---

Actions and scenarios 4479
**AWS CLI**

**To update a license configuration**

The following `update-license-configuration` example updates the specified license configuration to remove the hard limit.

```
aws license-manager update-license-configuration \
    --no-license-count-hard-limit \
    --license-configuration-arn arn:aws:license-manager:us-west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EX
```

This command produces no output.

The following `update-license-configuration` example updates the specified license configuration to change its status to DISABLED.

```
aws license-manager update-license-configuration \
    --license-configuration-status DISABLED \
    --license-configuration-arn arn:aws:license-manager:us-west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EX
```

This command produces no output.

- For API details, see [UpdateLicenseConfiguration](https://docs.aws.amazon.com/cli/latest/reference/license-manager/update-license-configuration.html) in *AWS CLI Command Reference*.

**update-license-specifications-for-resource**

The following code example shows how to use `update-license-specifications-for-resource`.

**AWS CLI**

**To update the license configurations for a resource**

The following `update-license-specifications-for-resource` example replaces the license configuration associated with the specified Amazon Machine Image (AMI) by removing one license configuration and adding another.

```
aws license-manager update-license-specifications-for-resource \
    --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0 \
```

Actions and scenarios 4480
This command produces no output.

- For API details, see UpdateLicenseSpecificationsForResource in AWS CLI Command Reference.

**update-service-settings**

The following code example shows how to use update-service-settings.

**AWS CLI**

**To update the License Manager settings**

The following update-service-settings example enables cross-account resource discovery for License Manager in the current AWS Region. The Amazon S3 bucket is the Resource Data Sync required for Systems Manager inventory.

```
aws license-manager update-service-settings \
--organization-configuration EnableIntegration=true \
--enable-cross-accounts-discovery \
--s3-bucket-arn arn:aws:s3:::aws-license-manager-service-abcd1234EXAMPLE
```

This command produces no output.

- For API details, see UpdateServiceSettings in AWS CLI Command Reference.

**Lightsail examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lightsail.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**allocate-static-ip**

The following code example shows how to use *allocate-static-ip*.

**AWS CLI**

**To create a static IP**

The following *allocate-static-ip* example creates the specified static IP, which can be attached to an instance.

```
aws lightsail allocate-static-ip \
  --static-ip-name StaticIp-1
```

**Output:**

```
{
  "operations": [
    {
      "id": "b5d06d13-2f19-4683-889f-dEXAMPLEed79",
      "resourceName": "StaticIp-1",
      "resourceType": "StaticIp",

      "status": "Succeeded",
      "statusChangedAt": 1571071325.274
    }
  ]
}
```
• For API details, see `AllocateStaticIp` in *AWS CLI Command Reference*.

**attach-disk**

The following code example shows how to use `attach-disk`.

**AWS CLI**

To attach a block storage disk to an instance

The following `attach-disk` example attaches disk Disk-1 to instance WordPress_Multisite-1 with the disk path of /dev/xvdf

```bash
aws lightsail attach-disk \
   --disk-name Disk-1 \
   --disk-path /dev/xvdf \
   --instance-name WordPress_Multisite-1
```

Output:

```json
{
   "operations": [
      {
         "id": "10a08267-19ce-43be-b913-6EXAMPLE7e80",

         "resourceType": "Instance",
         "createdAt": 1571071465.474,
         "location": {
```

Actions and scenarios

4483
For API details, see AttachDisk in AWS CLI Command Reference.

**attach-instances-to-load-balancer**

The following code example shows how to use attach-instances-to-load-balancer.

**AWS CLI**

**To attach instances to a load balancer**

The following attach-instances-to-load-balancer example attaches instances MEAN-1, MEAN-2, and MEAN-3 to the load balancer LoadBalancer-1.

```bash
aws lightsail attach-instances-to-load-balancer \
  --instance-names {"MEAN-1","MEAN-2","MEAN-3"} \ 
  --load-balancer-name LoadBalancer-1
```

**Output:**

```json
{

}
• For API details, see AttachInstancesToLoadBalancer in AWS CLI Command Reference.
attach-load-balancer-tls-certificate

The following code example shows how to use attach-load-balancer-tls-certificate.

**AWS CLI**

**To attach a TLS certificate to a load balancer**

The following `attach-load-balancer-tls-certificate` example attaches the load balancer TLS certificate Certificate2 to the load balancer LoadBalancer-1.

```bash
aws lightsail attach-load-balancer-tls-certificate \
  --certificate-name Certificate2 \ 
  --load-balancer-name LoadBalancer-1
```

**Output:**

```json
{
  "operations": [
    {
      "id": "cf1ad6e3-3cbb-4b8a-a7f2-3EXAMPLEa118",

      "resourceType": "LoadBalancerTlsCertificate",
      "createdAt": 1571072255.416,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
    }
  ]
}
```
• For API details, see AttachLoadBalancerTlsCertificate in AWS CLI Command Reference.

**attach-static-ip**

The following code example shows how to use attach-static-ip.

**AWS CLI**

**To attach a static IP to an instance**

The following attach-static-ip example attaches static IP StaticIp-1 to instance MEAN-1.

```
aws lightsail attach-static-ip \
  --static-ip-name StaticIp-1 \
  --instance-name MEAN-1
```

**Output:**

```
{
  "operations": [
  {
    "id": "45e6fa13-4808-4b8d-9292-bEXAMPLE20b2",
    "resourceName": "StaticIp-1",
    "resourceType": "StaticIp",
    "createdAt": 1571072569.375,
    "isTerminal": true,
    "operationDetails": "MEAN-1",
    "operationType": "AttachStaticIp",
    "status": "Succeeded",
    "statusChangedAt": 1571072569.375
  }],
}
```
For API details, see [AttachStaticIp](https://aws.amazon.com/sdk-for-python/v3/reference/) in *AWS CLI Command Reference*.

**close-instance-public-ports**

The following code example shows how to use `close-instance-public-ports`.

**AWS CLI**

**To close firewall ports for an instance**

The following `close-instance-public-ports` example closes TCP port 22 on instance MEAN-2.

```bash
aws lightsail close-instance-public-ports \
  --instance-name MEAN-2 \
  --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```json
{
  "operation": {
    ...
  }
}
```
For API details, see CloseInstancePublicPorts in AWS CLI Command Reference.

copy-snapshot

The following code example shows how to use copy-snapshot.

AWS CLI

Example 1: To copy a snapshot within the same AWS Region

The following copy-snapshot example copies instance snapshot MEAN-1-1571075291 as instance snapshot MEAN-1-Copy within the same AWS Region us-west-2.

```bash
aws lightsail copy-snapshot \
   --source-snapshot-name MEAN-1-1571075291 \
   --target-snapshot-name MEAN-1-Copy \
   --source-region us-west-2
```

Output:

```json
{
   "operations": [
      {
         "id": "ced16fc1-f401-4556-8d82-1EXAMPLEb982",
         "resourceName": "MEAN-1-Copy",
         "resourceType": "InstanceSnapshot",
         "createdAt": 1571072845.737,
         "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationDetails": "22/tcp",
         "operationType": "CloseInstancePublicPorts",
         "status": "Succeeded",
         "statusChangedAt": 1571072845.737
      }
   ]
}
```
For more information, see [Copying snapshots from one AWS Region to another in Amazon Lightsail](https://docs.aws.amazon.com/lightsail/latest/devguide/) in the *Lightsail Dev Guide*.

**Example 2: To copy a snapshot from one AWS Region to another**

The following `copy-snapshot` example copies instance snapshot `MEAN-1-1571075291` as instance snapshot `MEAN-1-1571075291-Copy` from AWS Region `us-west-2` to `us-east-1`.

```
aws lightsail copy-snapshot \
  --source-snapshot-name MEAN-1-1571075291 \
  --target-snapshot-name MEAN-1-1571075291-Copy \
  --source-region us-west-2 \
  --region us-east-1
```

**Output:**

```
{
   "operations": [
      {
         "id": "91116b79-119c-4451-b44a-dEXAMPLEd97b",
         "resourceName": "MEAN-1-1571075291-Copy",
         "resourceType": "InstanceSnapshot",
         "createdAt": 1571075695.069,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-east-1"
         },
         "isTerminal": false,
         "operationDetails": "us-west-2:MEAN-1-1571075291",
      }
   ]
}
```
For more information, see [Copying snapshots from one AWS Region to another in Amazon Lightsail](https://lightsail.aws.amazon.com/ lightsail/dev-guide) in the *Lightsail Dev Guide*.

**Example 3: To copy an automatic snapshot within the same AWS Region**

```
aws lightsail copy-snapshot
  --source-resource-name WordPress-1
  --restore-date 2019-10-14
  --target-snapshot-name WordPress-1-10142019
  --source-region us-west-2
```

**Output:**

```
{
  "operations": [
    {
      "id": "be3e6754-cd1d-48e6-ad9f-2EXAMPLE1805",
      "resourceName": "WordPress-1-10142019",
      "resourceType": "InstanceSnapshot",
      "createdAt": 1571082412.311,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationDetails": "us-west-2:WordPress-1",
      "operationType": "CopySnapshot",
      "status": "Started",
      "statusChangedAt": 1571082412.311
    }
  ]
}
```
For more information, see [Keeping automatic snapshots of instances or disks in Amazon Lightsail](https://lightsail.aws.amazon.com/leaf/keep-buckets.md) in the *Lightsail Dev Guide*.

**Example 4: To copy an automatic snapshot from one AWS Region to another**

The following copy-snapshot example copies automatic snapshot `2019-10-14` of instance `WordPress-1` as a manual snapshot `WordPress-1-10142019` from the AWS Region `us-west-2` to `us-east-1`.

```bash
aws lightsail copy-snapshot \
  --source-resource-name WordPress-1 \
  --restore-date 2019-10-14 \
  --target-snapshot-name WordPress-1-10142019 \
  --source-region us-west-2 \
  --region us-east-1
```

**Output:**

```json
{
  "operations": [
    {
      "id": "dffa128b-0b07-476e-b390-bEXAMPLE3775",
      "resourceName": "WordPress-1-10142019",
      "resourceType": "InstanceSnapshot",
      "createdAt": 1571082493.422,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-east-1"
      },
      "isTerminal": false,
      "operationDetails": "us-west-2:WordPress-1",
      "operationType": "CopySnapshot",
      "status": "Started",
      "statusChangedAt": 1571082493.422
    }
  ]
}
```

For more information, see [Keeping automatic snapshots of instances or disks in Amazon Lightsail](https://lightsail.aws.amazon.com/leaf/keep-buckets.md) in the *Lightsail Dev Guide*.

- For API details, see [CopySnapshot](https://docs.aws.amazon.com/cli/latest/reference/lightsail/copy-snapshot.html) in *AWS CLI Command Reference*. 
**create-disk-from-snapshot**

The following code example shows how to use `create-disk-from-snapshot`.

**AWS CLI**

To create a disk from a disk snapshot

The following `create-disk-from-snapshot` example creates a block storage disk named Disk-2 from the specified block storage disk snapshot. The disk is created in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```bash
aws lightsail create-disk-from-snapshot \
   --disk-name Disk-2 \
   --disk-snapshot-name Disk-1-1566839161 \
   --availability-zone us-west-2a \
   --size-in-gb 32
```

Output:

```json
{
   "operations": [
      {
         "id": "d42b605d-5ef1-4b4a-8791-7a3e8b66b5e7",
         "resourceName": "Disk-2",
         "resourceType": "Disk",
         "createdAt": 1569624941.471,
         "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationType": "CreateDiskFromSnapshot",
         "status": "Started",
         "statusChangedAt": 1569624941.791
      }
   ]
}
```

For more information, see [Creating a block storage disk from a snapshot in Amazon Lightsail](https://lightsail.aws.amazon.com/lightsail/developers/guides/block-storage-disks) in the Lightsail Developer Guide.

- For API details, see [CreateDiskFromSnapshot](https://docs.aws.amazon.com/cli/latest/reference/lightsail/create-disk-from-snapshot.html) in AWS CLI Command Reference.
**create-disk-snapshot**

The following code example shows how to use `create-disk-snapshot`.

**AWS CLI**

**Example 1: To create a snapshot of a disk**

The following `create-disk-snapshot` example creates a snapshot named `DiskSnapshot-1` of the specified block storage disk.

```bash
aws lightsail create-disk-snapshot \\
   --disk-name Disk-1 \\
   --disk-snapshot-name DiskSnapshot-1
```

**Output:**

```json
{
   "operations": [
      {
         "id": "fa74c6d2-03a3-4f42-a7c7-792f124d534b",
         "resourceName": "DiskSnapshot-1",
         "resourceType": "DiskSnapshot",
         "createdAt": 1569625129.739,
         "location": {

      "operationDetails": "WordPress-1",
      "operationType": "CreateDiskSnapshot",
      "status": "Started",
      "statusChangedAt": 1569625294.685
    },
    {
      "id": "0bb9f712-da3b-4d99-b508-3bf871d989e5",
      "resourceName": "WordPress-1",
      "resourceType": "Instance",
      "createdAt": 1569625294.685,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      }
    }
  ]
}
```
For more information, see Snapshots in Amazon Lightsail and Creating a snapshot of an instance root volume in Amazon Lightsail in the Lightsail Developer Guide.

- For API details, see CreateDiskSnapshot in AWS CLI Command Reference.

create-disk

The following code example shows how to use create-disk.

AWS CLI

To create a block storage disk

The following create-disk example creates a block storage disk Disk-1 in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk \\
    --disk-name Disk-1 \\
    --availability-zone us-west-2a \\
    --size-in-gb 32
```

Output:

```
{
    "operations": [
        {
            "id": "1c85e2ec-86ba-4697-b936-77f4d3dc013a",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569449220.36,
            "location": {
```
For API details, see CreateDisk in AWS CLI Command Reference.

create-domain-entry

The following code example shows how to use create-domain-entry.

AWS CLI

To create a domain entry (DNS record)

The following create-domain-entry example creates a DNS record (A) for the apex of the specified domain that points to an instance's IP address.

**Note:** Lightsail's domain-related API operations are available in only the us-east-1 Region. If your CLI profile is configured to use a different Region, you must include the --region us-east-1 parameter or the command fails.

```
aws lightsail create-domain-entry \
  --region us-east-1 \
  --domain-name example.com \
  --domain-entry name=example.com,type=A,target=192.0.2.0
```

Output:

```
{
    "operation": {
        "id": "5be4494d-56f4-41fc-8730-693dcd0ef9e2",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569865296.519,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": false,
        "operationType": "CreateDisk",
        "status": "Started",
        "statusChangedAt": 1569449220.588
    }
}
```
For more information, see DNS in Amazon Lightsail and Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail in the Lightsail Developer Guide.

- For API details, see CreateDomainEntry in AWS CLI Command Reference.

create-domain

The following code example shows how to use create-domain.

AWS CLI

To create a domain (DNS zone)

The following create-domain example creates a DNS zone for the specified domain.

Note: Lightsail's domain-related API operations are available in only the us-east-1 Region. If your CLI profile is configured to use a different Region, you must include the --region us-east-1 parameter or the command fails.

```bash
aws lightsail create-domain \
  --region us-east-1 \
  --domain-name example.com
```

Output:

```json
{
  "operation": {
    "id": "64e522c8-9ae1-4c05-9b65-3f237324dc34",
    "resourceName": "example.com",
    "resourceType": "Domain",
    "createdAt": 1569864291.92,
    "location": {
      "availabilityZone": "all",
```
For more information, see [DNS in Amazon Lightsail](https://lightsail.aws.amazon.com/portal/documentation/dns) and [Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail](https://lightsail.aws.amazon.com/portal/documentation/dns) in the *Lightsail Developer Guide*.

- For API details, see [CreateDomain](https://docs.aws.amazon.com/cli/latest/reference/lightsail/create-domain.html) in *AWS CLI Command Reference*.

### create-instance-snapshot

The following code example shows how to use `create-instance-snapshot`.

**AWS CLI**

**To create a snapshot of an instance**

The following `create-instance-snapshot` example creates a snapshot from the specified instance.

```bash
aws lightsail create-instance-snapshot \
  --instance-name WordPress-1 \
  --instance-snapshot-name WordPress-Snapshot-1
```

Output:

```json
{
  "operations": [
    {
      "id": "4c3db559-9dd0-41e7-89c0-2cb88c19786f",
      "resourceName": "WordPress-Snapshot-1",
      "resourceType": "InstanceSnapshot",
      "createdAt": 1569866438.48,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "status": "Succeeded",
      "statusChangedAt": 1569864292.109
    }
  ]
}
```
For API details, see `CreateInstanceSnapshot` in **AWS CLI Command Reference**.

### create-instances-from-snapshot

The following code example shows how to use `create-instances-from-snapshot`.

**AWS CLI**

To create an instance from a snapshot

The following `create-instances-from-snapshot` example creates an instance from the specified instance snapshot, in the specified AWS Region and Availability Zone, using the $10 USD bundle.

**Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source instance used to create the snapshot.

```bash
aws lightsail create-instances-from-snapshot \
    --instance-snapshot-name WordPress-1-1569866208 \
    --instance-names WordPress-2
```
--availability-zone us-west-2a \
--bundle-id medium_2_0

Output:

```json
{
  "operations": [
    {
      "id": "003f8271-b711-464d-b9b8-7f3806cb496e",
      "resourceName": "WordPress-2",
      "resourceType": "Instance",
      "createdAt": 1569865914.908,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateInstancesFromSnapshot",
      "status": "Started",
      "statusChangedAt": 1569865914.908
    }
  ]
}
```

• For API details, see [CreateInstancesFromSnapshot](aws-cli(command-reference)) in *AWS CLI Command Reference*.

**create-instances**

The following code example shows how to use `create-instances`.

**AWS CLI**

**Example 1: To create a single instance**

The following `create-instances` example creates an instance in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $3.50 USD bundle.

```bash
aws lightsail create-instances \
  --instance-names Instance-1 \
  --availability-zone us-west-2a \
  --blueprint-id wordpress_5_1_1_2 \
  --bundle-id nano_2_0
```
Example 2: To create multiple instances at one time

The following `create-instances` example creates three instances in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $3.50 USD bundle.

```bash
aws lightsail create-instances \
  --instance-names \"Instance1\",\"Instance2\",\"Instance3\" \n  --availability-zone us-west-2a \n  --blueprint-id wordpress_5_1_1_2 \n  --bundle-id nano_2_0
```

Output:

```json
{
  "operations": [
    {
      "id": "5492f015-9d2e-48c6-8eea-b516840e6903",
      "resourceName": "Instance1",
      "resourceType": "Instance",
      "createdAt": 1569448780.054,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateInstance",
      "status": "Started",
      "statusChangedAt": 1569447986.061
    }
  ]
}
```
"regionName": "us-west-2",
"isTerminal": false,
"operationType": "CreateInstance",
"status": "Started",
"statusChangedAt": 1569448780.054
},
{
  "id": "c58b5f46-2676-44c8-b95c-3ad375898515",
  "resourceName": "Instance2",
  "resourceType": "Instance",
  "createdAt": 1569448780.054,
  "location": {
    "availabilityZone": "us-west-2a",
    "regionName": "us-west-2"
  },
  "isTerminal": false,
  "operationType": "CreateInstance",
  "status": "Started",
  "statusChangedAt": 1569448780.054
},

  "resourceName": "Instance3",
  "resourceType": "Instance",
  "createdAt": 1569448780.054,
  "location": {
    "availabilityZone": "us-west-2a",
    "regionName": "us-west-2"
  },
  "isTerminal": false,
  "operationType": "CreateInstance",
  "status": "Started",
  "statusChangedAt": 1569448780.054
}
]

For API details, see CreateInstances in AWS CLI Command Reference.

create-key-pair

The following code example shows how to use create-key-pair.
AWS CLI

To create a key pair

The following create-key-pair example creates a key pair that you can use to authenticate and connect to an instance.

```bash
aws lightsail create-key-pair \
  --key-pair-name MyPersonalKeyPair
```

The output provides the private key base64 value that you can use to authenticate to instances that use the created key pair. Note: Copy and paste the private key base64 value to a safe location because you cannot retrieve it later.

```
{
  "keyPair": {
    "name": "MyPersonalKeyPair",
    "supportCode": "621291663362/MyPersonalKeyPair",
    "createdAt": 1569866556.567,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "resourceType": "KeyPair"
  },

Actions and scenarios 4505
For API details, see CreateKeyPair in AWS CLI Command Reference.

create-load-balancer-tls-certificate

The following code example shows how to use create-load-balancer-tls-certificate.

AWS CLI

To create a TLS certificate for a load balancer

The following create-load-balancer-tls-certificate example creates a TLS certificate that is attached to the specified load balancer. The certificate created applies to the specified domains. Note: Only two certificates can be created for a load balancer.

aws lightsail create-load-balancer-tls-certificate \
  --certificate-alternative-names abc.example.com \
  --certificate-domain-name example.com \
  --certificate-name MySecondCertificate \
  --load-balancer-name MyFirstLoadBalancer

Output:
• For API details, see CreateLoadBalancerTlsCertificate in AWS CLI Command Reference.

create-load-balancer

The following code example shows how to use create-load-balancer.
To create a load balancer

The following `create-load-balancer` example creates a load balancer with a TLS certificate. The TLS certificate applies to the specified domains, and routes traffic to instances on port 80.

```bash
aws lightsail create-load-balancer \
  --certificate-alternative-names www.example.com test.example.com \
  --certificate-domain-name example.com \
  --certificate-name Certificate-1 \
  --instance-port 80 \
  --load-balancer-name LoadBalancer-1
```

Output:

```json

For more information, see Lightsail load balancers in the Lightsail Developer Guide.

- For API details, see CreateLoadBalancer in AWS CLI Command Reference.

create-relational-database-from-snapshot

The following code example shows how to use create-relational-database-from-snapshot.

AWS CLI

To create a managed database from a snapshot

The following create-relational-database-from-snapshot example creates a managed database from the specified snapshot in the specified AWS Region and Availability Zone, using the $15 USD standard database bundle. **Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source database used to create the snapshot.

```bash
aws lightsail create-relational-database-from-snapshot \--relational-database-snapshot-name Database-Oregon-1-1566839359 
```
Output:

```json
{
  "operations": [
    {
      "id": "ad6d9193-9d5c-4ea1-97ae-8fe6de600b4c",
      "resourceName": "Database-1",
      "resourceType": "RelationalDatabase",
      "createdAt": 1569867916.938,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateRelationalDatabaseFromSnapshot",
      "status": "Started",
      "statusChangedAt": 1569867918.643
    }
  ]
}
```

- For API details, see [CreateRelationalDatabaseFromSnapshot](https://awscli.amazonaws.com/clireference/command/lightsail/create-relational-database-snapshot) in *AWS CLI Command Reference*.

### create-relational-database-snapshot

The following code example shows how to use `create-relational-database-snapshot`.

**AWS CLI**

**To create a snapshot of a managed database**

The following `create-relational-database-snapshot` example creates a snapshot of the specified managed database.

```bash
aws lightsail create-relational-database-snapshot \
  --relational-database-name Database1 \
  --relational-database-snapshot-name RelationalDatabaseSnapshot1
```
For API details, see [CreateRelationalDatabaseSnapshot](https://docs.aws.amazon.com/AWS CLI Command Reference) in *AWS CLI Command Reference*.

**create-relational-database**

The following code example shows how to use `create-relational-database`.
AWS CLI

To create a managed database

The following `create-relational-database` example creates a managed database in the specified AWS Region and Availability Zone, using the MySQL 5.6 database engine (`mysql_5_6`), and the $15 USD standard database bundle (`micro_1_0`). The managed database is pre-populated a master user name, and is not publicly accessible.

```
aws lightsail create-relational-database \
   --relational-database-name Database-1 \
   --availability-zone us-west-2a \
   --relational-database-blueprint-id mysql_5_6 \
   --relational-database-bundle-id micro_1_0 \
   --master-database-name dbmaster \
   --master-username user \
   --no-publicly-accessible
```

Output:

```
{
    "operations": [
        {
            "id": "b52bedee-73ed-4798-8d2a-9c12df89adcd",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569450017.244,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1569450018.637
        }
    ]
}
```

- For API details, see [CreateRelationalDatabase](#) in AWS CLI Command Reference.
delete-auto-snapshot

The following code example shows how to use delete-auto-snapshot.

AWS CLI

To delete an automatic snapshot

The following delete-auto-snapshot example deletes the automatic snapshot 2019-10-10 of instance WordPress-1.

```bash
aws lightsail delete-auto-snapshot \
   --resource-name WordPress-1 \
   --date 2019-10-10
```

Output:

```json
{
   "operations": [
      {
         "id": "31c36e09-3d52-46d5-b6d8-7EXAMPLE534a",
         "resourceName": "WordPress-1",
         "resourceType": "Instance",
         "createdAt": 1571088141.501,
         "location": {
            "availabilityZone": "us-west-2",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationDetails": "DeleteAutoSnapshot-2019-10-10",
         "operationType": "DeleteAutoSnapshot",
         "status": "Succeeded"
      }
   ]
}
```

For more information, see [Deleting automatic snapshots of instances or disks in Amazon Lightsail](https://lightsail.aws.amazon.com/developer/guides/snapshots) in the *Lightsail Dev Guide*.

- For API details, see [DeleteAutoSnapshot](https://docs.aws.amazon.com/cli/latest/reference/lightsail/delete-auto-snapshot.html) in *AWS CLI Command Reference*. 
delete-disk-snapshot

The following code example shows how to use delete-disk-snapshot.

AWS CLI

To delete a snapshot of a block storage disk

The following delete-disk-snapshot example deletes the specified snapshot of a block storage disk

```bash
aws lightsail delete-disk-snapshot \
    --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{
    "operations": [
    {
        "id": "d1e5766d-b81e-4595-ad5d-02afbccd5d",
        "resourceName": "DiskSnapshot-1",
        "resourceType": "DiskSnapshot",
        "createdAt": 1569873552.79,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationType": "DeleteDiskSnapshot",
        "status": "Succeeded",
        "statusChangedAt": 1569873552.79
    }
    ]
}
```

- For API details, see [DeleteDiskSnapshot](#) in [AWS CLI Command Reference](#).

delete-disk

The following code example shows how to use delete-disk.
AWS CLI

To delete a block storage disk

The following delete-disk example deletes the specified block storage disk.

```
aws lightsail delete-disk
   --disk-name Disk-1
```

Output:

```
{
   "operations": [
      {
         "id": "6378c70f-4d75-4f7a-ab66-730fca0bb2fc",
         "resourceName": "Disk-1",
         "resourceType": "Disk",
         "createdAt": 1569872887.864,
         "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
         },
         "isTerminal": true,
         "operationType": "DeleteDisk",
         "status": "Succeeded",
         "statusChangedAt": 1569872887.864
      }
   ]
}
```

- For API details, see [DeleteDisk in AWS CLI Command Reference](#).

delete-domain-entry

The following code example shows how to use delete-domain-entry.

AWS CLI

To delete a domain entry (DNS record)

The following delete-domain-entry example deletes the specified domain entry from an existing domain.
**Note:** Lightsail's domain-related API operations are available in only the us-east-1 Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```bash
aws lightsail delete-domain-entry
   --region us-east-1
   --domain-name example.com
   --domain-entry name=123.example.com,target=192.0.2.0,type=A
```

Output:

```json
{
   "operation": {
      "id": "06eacd01-d785-420e-8daa-823150c7dca1",
      "resourceName": "example.com",
      "resourceType": "Domain",
      "createdAt": 1569874157.005,
      "location": {
         "availabilityZone": "all",
         "regionName": "global"
      },
      "isTerminal": true,
      "operationType": "DeleteDomainEntry",
      "status": "Succeeded",
      "statusChangedAt": 1569874157.005
   }
}
```

- For API details, see [DeleteDomainEntry](https://docs.aws.amazon.com/cli/latest/reference/lightsail/delete-domain-entry.html) in *AWS CLI Command Reference*.

**delete-domain**

The following code example shows how to use `delete-domain`.

**AWS CLI**

To delete a domain (DNS zone)

The following `delete-domain` example deletes the specified domain and all of the entries in the domain (DNS records).
**Note:** Lightsail's domain-related API operations are available in only the us-east-1 Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain 
   --region us-east-1 
   --domain-name example.com
```

Output:

```json
{
   "operation": {
      "id": "fcef5265-5af1-4a46-a3d7-90b5e18b9b32",
      "resourceName": "example.com",
      "resourceType": "Domain",
      "createdAt": 1569873788.13,
      "location": {
         "availabilityZone": "all",
         "regionName": "global"
      },
      "isTerminal": true,
      "operationType": "DeleteDomain",
      "status": "Succeeded",
      "statusChangedAt": 1569873788.13
   }
}
```

- For API details, see [DeleteDomain](https://docs.aws.amazon.com/cli/latest/reference/lightsail/delete-domain.html) in *AWS CLI Command Reference*.

### delete-instance-snapshot

The following code example shows how to use `delete-instance-snapshot`.

**AWS CLI**

```
aws lightsail delete-instance-snapshot 
```

The following `delete-instance-snapshot` example deletes the specified snapshot of an instance.
Output:

```
{
    "operations": [
        {
            "id": "14dad182-976a-46c6-bfd4-9480482bf0ea",
            "resourceName": "WordPress-1-Snapshot-1",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1569874524.562,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteInstanceSnapshot",
            "status": "Succeeded",
            "statusChangedAt": 1569874524.562
        }
    ]
}
```

- For API details, see [DeleteInstanceSnapshot](https://awscli.amazonaws.com/#DeleteInstanceSnapshot) in *AWS CLI Command Reference*.

**delete-instance**

The following code example shows how to use `delete-instance`.

**AWS CLI**

**To delete an instance**

The following `delete-instance` example deletes the specified instance.

```
aws lightsail delete-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
```
Actions and scenarios

```json

```
For API details, see `DeleteInstance` in *AWS CLI Command Reference*.

### delete-key-pair

The following code example shows how to use `delete-key-pair`.

**AWS CLI**

**To delete a key pair**

The following `delete-key-pair` example deletes the specified key pair.

```
aws lightsail delete-key-pair \
    --key-pair-name MyPersonalKeyPair
```

**Output:**

```
{
    "operation": {
        "id": "81621463-4810-b866-6e801a5abbf",
        "resourceName": "MyPersonalKeyPair",

        "status": "Succeeded",
        "statusChangedAt": 1569874626.685
    }
}
```

For API details, see `DeleteKeyPair` in *AWS CLI Command Reference*.

### delete-known-host-keys

The following code example shows how to use `delete-known-host-keys`.

To delete known host keys from an instance

The following `delete-known-host-keys` example deletes the known host key from the specified instance.

```
aws lightsail delete-known-host-keys \
   --instance-name Instance-1
```

Output:

```
{
   "operations": [
       {
           "id": "c61afe9c-45a4-41e6-a97e-d212364da3f5",
           "resourceName": "Instance-1",
           "resourceType": "Instance",
           "createdAt": 1569874760.201,
           "location": {
               "availabilityZone": "us-west-2a",
               "regionName": "us-west-2"
           },
           "isTerminal": true,
           "operationType": "DeleteKnownHostKeys",
           "status": "Succeeded",
           "statusChangedAt": 1569874760.201
       }
   ]
}
```

For more information, see Troubleshooting connection issues with the Amazon Lightsail browser-based SSH or RDP client in the Lightsail Dev Guide.

- For API details, see `DeleteKnownHostKeys` in AWS CLI Command Reference.

delete-load-balancer-tls-certificate

The following code example shows how to use `delete-load-balancer-tls-certificate`.

AWS CLI

To delete a TLS certificate for a load balancer
The following `delete-load-balancer-tls-certificate` example deletes the specific TLS certificate from the specified load balancer.

```bash
aws lightsail delete-load-balancer-tls-certificate \
   --load-balancer-name MyFirstLoadBalancer \
   --certificate-name MyFirstCertificate
```

Output:

```json
{
   "operations": [
      {
         "id": "50bec274-e45e-4caa-8a69-b763ef636583",
         "resourceName": "MyFirstCertificate",
         "resourceType": "LoadBalancerTlsCertificate",
         "createdAt": 1569874989.48,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationType": "DeleteLoadBalancerTlsCertificate",
         "status": "Started",
         "statusChangedAt": 1569874989.48
      },
      {
         "id": "78c58cdc-a59a-4b27-8213-500638634a8f",
         "resourceName": "MyFirstLoadBalancer",
         "resourceType": "LoadBalancer",
         "createdAt": 1569874989.48,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationType": "DeleteLoadBalancerTlsCertificate",
         "status": "Started",
         "statusChangedAt": 1569874989.48
      }
   ]
}
```

- For API details, see [DeleteLoadBalancerTlsCertificate](#) in AWS CLI Command Reference.
**delete-load-balancer**

The following code example shows how to use `delete-load-balancer`.

**AWS CLI**

To delete a load balancer

The following `delete-load-balancer` example deletes the specified load balancer and any associated TLS certificates.

```bash
aws lightsail delete-load-balancer \\
    --load-balancer-name MyFirstLoadBalancer
```

Output:

```json
{
    "operations": [
        {
            "id": "a8c968c7-72a3-4680-a714-af8f03eea535",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",

```
The following code example shows how to use `delete-relational-database-snapshot`.

**AWS CLI**

To delete a snapshot of a managed database

The following `delete-relational-database-snapshot` example deletes the specified snapshot of a managed database.

```
aws lightsail delete-relational-database-snapshot \
   --relational-database-snapshot-name Database-Oregon-1-1566839359
```

Output:

```
{
   "operations": [
```
For API details, see DeleteRelationalDatabaseSnapshot in AWS CLI Command Reference.

delete-relational-database

The following code example shows how to use delete-relational-database.

AWS CLI

To delete a managed database

The following delete-relational-database example deletes the specified managed database.

```bash
aws lightsail delete-relational-database \\
   --relational-database-name Database-1
```

Output:

```json
{
   "operations": [
   {
      "id": "3b0c41c1-053d-46f0-92a3-14f76141dc86",
      "resourceName": "Database-1",
      "resourceType": "RelationalDatabase",
      "createdAt": 1569875293.58,
      "location": {
         "availabilityZone": "all",
         "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationType": "DeleteRelationalDatabase",
      "status": "Succeeded",
      "statusChangedAt": 1569875293.58
   }
   ]
}
```
For API details, see [DeleteRelationalDatabase](https://awscli.amazonaws.com/v2/documentation/api/action/RelationalDatabase/DeleteRelationalDatabase) in *AWS CLI Command Reference*.
**detach-static-ip**

The following code example shows how to use `detach-static-ip`.

**AWS CLI**

**To detach a static IP from an instance**

The following `detach-static-ip` example detaches static IP `StaticIp-1` from any attached instance.

```
aws lightsail detach-static-ip \
    --static-ip-name StaticIp-1
```

**Output:**

```
{
   "operations": [
       {
           "id": "2a43d8a3-9f2d-4fe7-bdd0-eEXAMPLE3cf3",

           "resourceType": "Instance",
           "createdAt": 1571088262.022,
           "location": {
               "availabilityZone": "us-west-2a",
               "regionName": "us-west-2"
           },
           "isTerminal": true,
```

Actions and scenarios 4527
For API details, see `DetachStaticIp` in *AWS CLI Command Reference*.

### get-active-names

The following code example shows how to use `get-active-names`.

**AWS CLI**

**To get active resource names**

The following `get-active-names` example returns the active resource names in the configured AWS Region.

```bash
aws lightsail get-active-names
```

Output:

```json
{
    "activeNames": [
        "WordPress-1",
        "StaticIp-1",
        "MEAN-1",
        "Plesk_Hosting_Stack_on_Ubuntu-1"
    ]
}
```

For API details, see `GetActiveNames` in *AWS CLI Command Reference*.

### get-auto-snapshots

The following code example shows how to use `get-auto-snapshots`.

```bash
aws lightsail get-auto-snapshots
```
AWS CLI

To get the available automatic snapshots for an instance

The following `get-auto-snapshots` example returns the available automatic snapshots for instance `WordPress-1`.

```
aws lightsail get-auto-snapshots \
   --resource-name WordPress-1
```

Output:

```
{
   "resourceName": "WordPress-1",
   "resourceType": "Instance",
   "autoSnapshots": [
      {
         "date": "2019-10-14",
         "createdAt": 1571033872.0,
         "status": "Success",
         "fromAttachedDisks": []
      },
      {
         "date": "2019-10-13",
         "createdAt": 1570947473.0,
         "status": "Success",
         "fromAttachedDisks": []
      },
      {
         "date": "2019-10-12",
         "createdAt": 1570861072.0,
         "status": "Success",
         "fromAttachedDisks": []
      },
      {
         "date": "2019-10-11",
         "createdAt": 1570774672.0,
         "status": "Success",
         "fromAttachedDisks": []
      }
   ]
}
```
For more information, see [Keeping automatic snapshots of instances or disks in Amazon Lightsail](https://lightsail.aws.amazon.com/ls/docs/devguide) in the *Lightsail Dev Guide*.

- For API details, see [GetAutoSnapshots](https://awscli.amazonaws.com/v2/documentation/api/2016/11.0.3/reference/command/get-autosnapshots.html) in *AWS CLI Command Reference*.

### get-blueprints

The following code example shows how to use `get-blueprints`.

#### AWS CLI

**To get the blueprints for new instances**

The following `get-blueprints` example displays details about all of the available blueprints that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-blueprints
```

**Output:**

```
{
   "blueprints": [
    {
      "blueprintId": "wordpress",
      "name": "WordPress",
      "group": "wordpress",
      "type": "app",
      "description": "Bitnami, the leaders in application packaging, and Automattic, the experts behind WordPress, have teamed up to offer this official WordPress image. This image is a pre-configured, ready-to-run image for running WordPress on Amazon Lightsail. WordPress is the world's most popular content management platform. Whether it's for an enterprise or small business website, or a personal or corporate blog, content authors can easily create content using its new Gutenberg editor, and developers can extend the base platform with additional features. Popular plugins like Jetpack, Akismet, All in One SEO Pack, WP Mail, Google Analytics for WordPress, and Amazon Polly are all pre-installed in this image. Let's Encrypt SSL certificates are supported through an auto-configuration script.",
      "isActive": true,
      "minPower": 0,
      "version": "5.2.2-3",
      "versionCode": "1",
      "productUrl": "https://aws.amazon.com/marketplace/pp/B00NN8Y43U"
    }
  ]
}```
LAMP with PHP 7.x certified by Bitnami greatly simplifies the development and deployment of PHP applications. It includes the latest versions of PHP 7.x, Apache and MySQL together with phpMyAdmin and popular PHP frameworks Zend, Symfony, CodeIgniter, CakePHP, Smarty, and Laravel. Other pre-configured components and PHP modules include FastCGI, ModSecurity, SQLite, Varnish, ImageMagick, xDebug, Xcache, OpenLDAP, Memcache, OAuth, PEAR, PECL, APC, GD and cURL. It is secure by default and supports multiple applications, each with its own virtual host and project directory. Let's Encrypt SSL certificates are supported through an auto-configuration script.

Node.js certified by Bitnami is a pre-configured, ready to run image for Node.js on Amazon EC2. It includes the latest version of Node.js, Apache, Python and Redis. The image supports multiple Node.js applications, each with its own virtual host and project directory. It is configured for production use and is secure by default, as all ports except HTTP, HTTPS and SSH ports are closed. Let's Encrypt SSL certificates are supported through an auto-configuration script. Developers benefit from instant access to a secure, update and consistent Node.js environment without having to manually install and configure multiple components and libraries.
• For API details, see GetBlueprints in AWS CLI Command Reference.

get-bundles

The following code example shows how to use get-bundles.

AWS CLI

To get the bundles for new instances

The following get-bundles example displays details about all of the available bundles that can be used to create new instances in Amazon Lightsail.

aws lightsail get-bundles

Output:

```json
{
    "bundles": [
        {
            "price": 3.5,
            "cpuCount": 1,
            "diskSizeInGb": 20,
            "bundleId": "nano_2_0",
            "instanceType": "nano",
            "isActive": true,
            "name": "Nano",
            "power": 300,
        }
    ]
}
```
For API details, see GetBundles in AWS CLI Command Reference.
get-cloud-formation-stack-records

The following code example shows how to use get-cloud-formation-stack-records.

AWS CLI

To get the CloudFormation stack records and their associated stacks

The following get-cloud-formation-stack-records example displays details about the CloudFormation stack records and their associated stacks used to create Amazon EC2 resources from exported Amazon Lightsail snapshots.

```bash
aws lightsail get-cloud-formation-stack-records
```

Output:

```json
{
  "cloudFormationStackRecords": [
    {
      "name": "CloudFormationStackRecord-588a4243-e2d1-490d-8200-3a7513ecbdf",
      "createdAt": 1565301666.586,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "resourceType": "CloudFormationStackRecord",
      "state": "Succeeded",
      "sourceInfo": [
        {
          "resourceType": "ExportSnapshotRecord",
          "name": "ExportSnapshotRecord-e02f23d7-0453-4aa9-9c95-91aa01a141dd",
        }
      ],
      "destinationInfo": {
        "id": "arn:aws:cloudformation:us-west-2:111122223333:stack/Lightsail-Stack-588a4243-e2d1-490d-8200-3EXAMPLEebdf/063203b0-ba28-11e9-838b-0EXAMPLEb00"
      }
    }
  ]
}
```
get-disk-snapshot

The following code example shows how to use get-disk-snapshot.

AWS CLI

To get information about a disk snapshot

The following get-disk-snapshot example displays details about the disk snapshot Disk-1-1566839161.

aws lightsail get-disk-snapshot \
  --disk-snapshot-name Disk-1-1566839161

Output:

```json
{
    "diskSnapshot": {
        "name": "Disk-1-1566839161",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:DiskSnapshot/e2d0fa53-8ee0-41a0-8e56-0EXAMPLE1051",
        "supportCode": "6EXAMPLE3362/snap-0EXAMPLE06100d09",
        "createdAt": 1566839163.749,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "DiskSnapshot",
        "tags": [],
        "sizeInGb": 8,
        "state": "completed",
        "progress": "100%",
        "fromDiskName": "Disk-1",
```

- For API details, see GetCloudFormationStackRecords in AWS CLI Command Reference.
For more information, see title in the *guide*.

- For API details, see [GetDiskSnapshot](#) in *AWS CLI Command Reference*.

**get-disk-snapshots**

The following code example shows how to use `get-disk-snapshots`.

**AWS CLI**

**To get information about all disk snapshots**

The following `get-disk-snapshots` example displays details about all of the disk snapshots in the configured AWS Region.

```bash
aws lightsail get-disk-snapshots
```

Output:

```json
{
    "diskSnapshots": [
        {
            "name": "Disk-2-1571090588",
            "supportCode": "6EXAMPLE3362/snap-0EXAMPLE1ca92a4",
            "createdAt": 1571090591.226,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "DiskSnapshot",
            "tags": [],
            "sizeInGb": 8,
            "state": "completed",
            "progress": "100%",
        }
    ]
}
```
get-disk

The following code example shows how to use get-disk.

AWS CLI

To get information about a block storage disk

The following get-disk example displays details about the disk Disk-1.

```
aws lightsail get-disk \
  --disk-name Disk-1
```
get-disks

The following code example shows how to use get-disks.

AWS CLI

To get information about all block storage disks

The following get-disks example displays details about all of the disks in the configured AWS Region.

```bash
aws lightsail get-disks
```
Output:

```json
{
  "disks": [
    {
      "name": "Disk-2",
      "arn": "arn:aws:lightsail:us-west-2:111122223333:Disk/6a343ff8-6341-422d-86e2-bEXAMPLE16c2",

    }
  ]
}
```
• For API details, see GetDisks in AWS CLI Command Reference.

get-domain

The following code example shows how to use get-domain.

AWS CLI

To get information about a domain

The following get-domain example displays details about the domain example.com.

Note: Lightsail's domain-related API operations are available in only the us-east-1 AWS Region. If your CLI profile is configured to use a different Region, you must include the --region us-east-1 parameter or the command fails.

```bash
aws lightsail get-domain \
   --domain-name example.com \
   --region us-east-1
```

Output:

```json
{
    "domain": {
        "name": "example.com",
        "arn": "arn:aws:lightsail:global:111122223333:Domain/28cda903-3f15-44b2-9baf-3EXAMPLEb304",
        "supportCode": "6EXAMPLE3362//hostedzone/ZEXAMPLEONGSC1",
        "createdAt": 1570728588.6,
        "location": {

**get-export-snapshot-record**

The following code example shows how to use `get-export-snapshot-record`.

**AWS CLI**

To get the records of snapshots exported to Amazon EC2

The following `get-export-snapshot-record` example displays details about Amazon Lightsail instance or disk snapshots exported to Amazon EC2.

```
aws lightsail get-export-snapshot-records
```

Output:

```
{
   "exportSnapshotRecords": [
      {
         "name": "ExportSnapshotRecord-d2da10ce-0b3c-4ae1-ab3a-2EXAMPLEa586",

    ]
  }
}
For API details, see GetExportSnapshotRecord in AWS CLI Command Reference.

get-instance-access-details

The following code example shows how to use get-instance-access-details.

AWS CLI

To get host key information for an instance

The following get-instance-access-details example displays host key information for instance WordPress_Multisite-1.

```bash
aws lightsail get-instance-access-details \
  --instance-name WordPress_Multisite-1
```

Output:

```json
{
  "accessDetails": {
    "certKey": "ssh-rsa-cert-v01@openssh.com AEXAMPLEaC1yc2EtY2VydC12MDFAb3BlbnNzaC5jb20AAAAgNf076Dt3ppMpd0fPxZVMmS491aEAYYH9cHqAJ3fnML8vEXAMPLE2eBWJyQvn7o1/ i0+s966h5sx8qUD791PB7qSUESd5VZGtorytjQ3njiwqe7EV5agzvb1lj26Fb37EKda9HVFC0pWbvky7Tyn9w29+xMfQM9xVz0rXZmx8uJid3pRgLCMTviofwQJU/ K1EXAMPLEAAAAAAAABAAAAALS00MzMDU4MzA40Dg1MTY2NjM40np6UW1ndK4UE1RS9STit0TG5Q5SEE9PQAAAAASAAAA++LiB+ozNbUA0cdNL9Y67x7qPv/R7XhTc21+2A+8+GuVpK/Kz9dqDMKNAEXAMPLE+YYN
```
Actions and scenarios

4550
For API details, see GetInstanceAccessDetails in AWS CLI Command Reference.
get-instance-metric-data

The following code example shows how to use get-instance-metric-data.

AWS CLI

To get metric data for an instance

The following get-instance-metric-data example returns the average percent of CPUUtilization every 7200 seconds (2 hours) between 1571342400 and 1571428800 for instance MEAN-1.

We recommend that you use a unix time converter to identify the start and end times.

```bash
aws lightsail get-instance-metric-data \
   --instance-name MEAN-1 \
   --metric-name CPUUtilization \
   --period 7200 \
   --start-time 1571342400 \
   --end-time 1571428800 \
   --unit Percent \
   --statistics Average
```

Output:

```json
{
   "metricName": "CPUUtilization",
   "metricData": [
      {
         "average": 0.26113718770120725,
         "timestamp": 1571342400.0,
         "unit": "Percent"
      },
      {
         "average": 0.26861268928111953,
         "timestamp": 1571392800.0,
         "unit": "Percent"
      },
      {
         "average": 0.28187475104748777,
         "timestamp": 1571378400.0,
         "unit": "Percent"
      }
   ]
}
```
{ 
   "average": 0.2651936960458352,
   "timestamp": 1571421600.0,
   "unit": "Percent"
},
{ 
   "average": 0.2561856213712188,
   "timestamp": 1571371200.0,
   "unit": "Percent"
},

   "timestamp": 1571364000.0,
   "unit": "Percent"
},
{ 
   "average": 0.26331929394825787,
   "timestamp": 1571400000.0,
   "unit": "Percent"
},
{ 
   "average": 0.2667092536656445,
   "timestamp": 1571349600.0,
   "unit": "Percent"
}

For API details, see `GetInstanceMetricData` in *AWS CLI Command Reference*.

**get-instance-port-states**

The following code example shows how to use `get-instance-port-states`.

**AWS CLI**

**To get firewall information for an instance**

The following `get-instance-port-states` example returns the firewall ports configured for instance MEAN-1.

```bash
aws lightsail get-instance-port-states \
   --instance-name MEAN-1
```

**Output:**

```json
{
   "portStates": [
      {
         "fromPort": 80,
         "toPort": 80,
         "protocol": "tcp",
         "state": "open"
      },
      {
         "fromPort": 22,
         "toPort": 22,
         "protocol": "tcp",
         "state": "open"
      },
      {
         "fromPort": 443,
         "toPort": 443,
         "protocol": "tcp",
         "state": "open"
      }
   ]
}
```
get-instance-snapshot

The following code example shows how to use get-instance-snapshot.

AWS CLI

To get information about a specified instance snapshot

The following get-instance-snapshot example displays details about the specified instance snapshot.

```bash
aws lightsail get-instance-snapshot \
    --instance-snapshot-name MEAN-1-1571419854
```

Output:

```json
{
    "instanceSnapshot": {
        "name": "MEAN-1-1571419854",
        "supportCode": "6EXAMPLE3362/ami-0EXAMPLE67a73020d",
        "createdAt": 1571419891.927,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "InstanceSnapshot",
        "tags": [],
        "state": "available",
        "fromAttachedDisks": [],
        "fromInstanceName": "MEAN-1",
        "fromInstanceArn": "arn:aws:lightsail:us-west-2:111122223333:Instance/bd470fc5-a68b-44c5-8dbc-8EXAMPLEbada",
        "fromBlueprintId": "mean_4_0_9",
        "isFromAutoSnapshot": false,
    }
}
```
For API details, see `GetInstanceSnapshot` in *AWS CLI Command Reference*.

**get-instance-snapshots**

The following code example shows how to use `get-instance-snapshots`.

**AWS CLI**

**To get information about all of your instance snapshots**

The following `get-instance-snapshots` example displays details about all of the instance snapshots in the configured AWS Region.

```bash
aws lightsail get-instance-snapshots
```

**Output:**

```json
{
   "instanceSnapshots": [
      {
         "name": "MEAN-1-1571421498",
         "arn": "arn:aws:lightsail:us-west-2:111122223333:InstanceSnapshot/a20e6ebe-b0ee-4ae4-a750-3EXAMPLEcb0c",
         "supportCode": "6EXAMPLE3362/ami-0EXAMPLEe33cabfa1",
         "createdAt": 1571421527.755,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "resourceType": "InstanceSnapshot",
         "tags": [
            {
               "key": "no_delete"
            }
         ],
         "state": "available",
         "fromAttachedDisks": [],
         "fromInstanceName": "MEAN-1",
         "sizeInGb": 80
      }
   ]
}
```
get-instance-state

The following code example shows how to use get-instance-state.

AWS CLI

To get information about the state of an instance

The following get-instance-state example returns the state of the specified instance.

For API details, see GetInstanceSnapshots in AWS CLI Command Reference.
aws lightsail get-instance-state \
--instance-name MEAN-1

Output:

```
{
   "state": {
      "code": 16,
      "name": "running"
   }
}
```

- For API details, see `GetInstanceState` in *AWS CLI Command Reference*.

**get-instance**

The following code example shows how to use `get-instance`.

**AWS CLI**

**To get information about an instance**

The following `get-instance` example displays details about the instance MEAN-1.

```
aws lightsail get-instance \
--instance-name MEAN-1
```

Output:

```
{
   "instance": {
      "name": "MEAN-1",
      "supportCode": "6EXAMPLE3362/i-05EXAMPLE407c97d3",
      "createdAt": 1570635023.124,
      "location": {
         "availabilityZone": "us-west-2a",
         "regionName": "us-west-2"
      },
      "resourceType": "Instance",
      "tags": []
   }
}
```

get-key-pair

The following code example shows how to use get-key-pair.

AWS CLI

To get information about a key pair

The following get-key-pair example displays details about the specified key pair.

```bash
aws lightsail get-key-pair \
   --key-pair-name MyKey1
```

Output:

```json
{
   "keyPair": {
      "name": "MyKey1",
      "arn": "arn:aws:lightsail:us-west-2:1112223333:KeyPair/19a4efdf-3054-43d6-91fd-eEXAMPLE21bf",
      "supportCode": "6EXAMPLE3362/MyKey1",
   }
}
```
For API details, see `GetKeyPair` in *AWS CLI Command Reference*.

get-key-pairs

The following code example shows how to use `get-key-pairs`.

**AWS CLI**

**To get information about all key pairs**

The following `get-key-pairs` example displays details about all of the key pairs in the configured AWS Region.

```
aws lightsail get-key-pairs
```

Output:

```json
{
   "keyPairs": [
      {
         "name": "MyKey1",
         "supportCode": "6EXAMPLE3362/MyKey1",

         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "resourceType": "KeyPair",
         "tags": [],
      }
   ]
}
```
• For API details, see GetKeyPairs in AWS CLI Command Reference.

get-load-balancer-tls-certificates

The following code example shows how to use get-load-balancer-tls-certificates.

AWS CLI

To get information about TLS certificates for a load balancer

The following get-load-balancer-tls-certificates example displays details about the TLS certificates for the specified load balancer.

```
aws lightsail get-load-balancer-tls-certificates \
   --load-balancer-name LoadBalancer-1
```

Output:

```
{
   "tlsCertificates": [
      {
         "name": "example-com",
         "arn": "arn:aws:lightsail:us-west-2:111122223333:LoadBalancerTlsCertificate/d7bf4643-6a02-4cd4-b3c4-fEXAMPLE9b4d",

            }
        }
    }
}
```
For API details, see GetLoadBalancer in AWS CLI Command Reference.

get-load-balancers

The following code example shows how to use get-load-balancers.

AWS CLI

To get information about all load balancers

The following get-load-balancers example displays details about all of the load balancers in the configured AWS Region.

aws lightsail get-load-balancers

Output:

```json
{
   "loadBalancers": [
      {
         "name": "LoadBalancer-1",
         "arn": "arn:aws:lightsail:us-west-2:111122223333:LoadBalancer/40486b2b-1ad0-4152-83e4-cEXAMPLE6f4b",
         "supportCode": "6EXAMPLE3362/arn:aws:elasticloadbalancing:us-west-2:333322221111:loadbalancer/app/bEXAMPLE128cb59d86f946a9395dd304/1EXAMPLE8dd9d77e",
         "createdAt": 1571677906.723,
         "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
         },
         "resourceType": "LoadBalancer",
```
• For API details, see [GetLoadBalancers](https://docs.aws.amazon.com/cli/latest/reference/elb/get-load-balancers.html) in *AWS CLI Command Reference*.

get-operation

The following code example shows how to use get-operation.
AWS CLI

To get information about a single operation

The following get-operation example displays details about the specified operation.

```bash
aws lightsail get-operation \
   --operation-id e5700e8a-daf2-4b49-bc01-3EXAMPLE910a
```

Output:

```json
{
   "operation": {
      "id": "e5700e8a-daf2-4b49-bc01-3EXAMPLE910a",
      "resourceName": "Instance-1",
      "resourceType": "Instance",
      "createdAt": 1571679872.404,
      "location": {
         "availabilityZone": "us-west-2a",
         "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationType": "CreateInstance",
      "status": "Succeeded",
      "statusChangedAt": 1571679890.304
   }
}
```

- For API details, see GetOperation in AWS CLI Command Reference.

get-operations-for-resource

The following code example shows how to use get-operations-for-resource.

AWS CLI

To get all operations for a resource

The following get-operations-for-resource example displays details about all operations for the specified resource.

```bash
aws lightsail get-operations-for-resource \
```
--resource-name LoadBalancer-1

Output:

```json
{
   "operations": [
      {
         "id": "e2973046-43f8-4252-a4b4-9EXAMPLE69ce",

]
}

- For API details, see [GetOperations](#) in [AWS CLI Command Reference](#).
get-regions

The following code example shows how to use get-regions.

AWS CLI

To get all AWS Regions for Amazon Lightsail

The following get-regions example displays details about all of the AWS Regions for Amazon Lightsail.

```bash
aws lightsail get-regions
```

Output:

```json
{
  "regions": [
    {
      "continentCode": "NA",
      "description": "This region is recommended to serve users in the eastern United States",
      "displayName": "Virginia",
      "name": "us-east-1",
      "availabilityZones": [],
      "relationalDatabaseAvailabilityZones": []
    },
    {
      "continentCode": "NA",
      "description": "This region is recommended to serve users in the eastern United States",
      "displayName": "Ohio",
      "name": "us-east-2",
      "availabilityZones": [],
      "relationalDatabaseAvailabilityZones": []
    },
    {
      "continentCode": "NA",
      "description": "This region is recommended to serve users in the northwestern United States, Alaska, and western Canada",
      "displayName": "Oregon",
      "name": "us-west-2",
      "availabilityZones": [],
      "relationalDatabaseAvailabilityZones": []
    }
  ]
}
```
• For API details, see `GetRegions` in *AWS CLI Command Reference*.

**get-relational-database-blueprints**

The following code example shows how to use `get-relational-database-blueprints`.

**AWS CLI**

To get the blueprints for new relational databases

The following `get-relational-database-blueprints` example displays details about all of the available relational database blueprints that can be used to create new relational databases in Amazon Lightsail.

```
aws lightsail get-relational-database-blueprints
```

Output:

```
{
   "blueprints": [
   {
    "blueprintId": "mysql_5_6",
    "engine": "mysql",
    "engineVersion": "5.6.44",
    "engineDescription": "MySQL Community Edition",
    "engineVersionDescription": "MySQL 5.6.44",
    "isEngineDefault": false
   },
   {
    "blueprintId": "mysql_5_7",
    "engine": "mysql",
    "engineVersion": "5.7.26",
    "engineDescription": "MySQL Community Edition",
    "engineVersionDescription": "MySQL 5.7.26",
    "isEngineDefault": true
   }
   ]
}
```
• For API details, see [GetRelationalDatabaseBlueprints](#) in *AWS CLI Command Reference*.

**get-relational-database-bundles**

The following code example shows how to use `get-relational-database-bundles`.

```json
{
  "blueprintId": "mysql_8_0",
  "engine": "mysql",
  "engineVersion": "8.0.16",
  "engineDescription": "MySQL Community Edition",
  "engineVersionDescription": "MySQL 8.0.16",
  "isEngineDefault": false
},
{
  "blueprintId": "postgres_9_6",
  "engine": "postgres",
  "engineVersion": "9.6.15",
  "engineDescription": "PostgreSQL",
  "engineVersionDescription": "PostgreSQL 9.6.15-R1",
  "isEngineDefault": false
},
{
  "blueprintId": "postgres_10",
  "engine": "postgres",
  "engineVersion": "10.10",
  "engineDescription": "PostgreSQL",
  "engineVersionDescription": "PostgreSQL 10.10-R1",
  "isEngineDefault": false
},
{
  "blueprintId": "postgres_11",
  "engine": "postgres",
  "engineVersion": "11.5",
  "engineDescription": "PostgreSQL",
  "engineVersionDescription": "PostgreSQL 11.5-R1",
  "isEngineDefault": true
}
}`
AWS Command Line Interface

AWS CLI

To get the bundles for new relational databases

The following `get-relational-database-bundles` example displays details about all of the available relational database bundles that can be used to create new relational databases in Amazon Lightsail. Note that the response does not include inactive bundles because the `--include-inactive` flag is not specified in the command. You cannot use inactive bundles to create new relational databases.

```bash
aws lightsail get-relational-database-bundles
```

Output:

```json
{
  "bundles": [
    {
      "bundleId": "micro_2_0",
      "name": "Micro",
      "price": 15.0,
      "ramSizeInGb": 1.0,
      "diskSizeInGb": 40,
      "transferPerMonthInGb": 100,

For more information, see [Creating a database in Amazon Lightsail](https://lightsail.aws.amazon.com/developers/guides/database-guide/index.html) in the *Amazon Lightsail Developer Guide*.

- For API details, see [GetRelationalDatabaseBundles](https://docs.aws.amazon.com/cli/latest/reference/lightsail/get-relational-database-bundles.html) in *AWS CLI Command Reference*.

**get-relational-database-events**

The following code example shows how to use get-relational-database-events.

**AWS CLI**

**To get the events for a relational database**

The following `get-relational-database-events` example displays details about events in the last 17 hours (1020 minutes) for the specified relational database.

```
aws lightsail get-relational-database-events \
  --relational-database-name Database-1 \
  --duration-in-minutes 1020
```

**Output:**

```
{
  ...
}
```
"relationalDatabaseEvents": [ 
  {
    "resource": "Database-1",
    "createdAt": 1571654146.553,
    "message": "Backing up Relational Database",
    "eventCategories": [
      "backup"
    ]
  },
  {
    "resource": "Database-1",

    ]
  }
]

• For API details, see GetRelationalDatabaseEvents in AWS CLI Command Reference.

get-relational-database-log-events

The following code example shows how to use get-relational-database-log-events.

AWS CLI

To get log events for a relational database

The following get-relational-database-log-events example displays details about the specified log between 1570733176 and 1571597176 for relational database Database1. The information returned is configured to start from head.

We recommend that you use a unix time converter to identify the start and end times.

aws lightsail get-relational-database-log-events \
  --relational-database-name Database1 \
  --log-stream-name error \
  --start-from-head \
  --start-time 1570733176 \
  --end-time 1571597176
Output:

```json
{
   "resourceLogEvents": [
      {
         "createdAt": 1570820267.0,
         "message": "2019-10-11 18:57:47 20969 [Warning] IP address '192.0.2.0' could not be resolved: Name or service not known"
      },
      {
         "createdAt": 1570860974.0,
         "message": "2019-10-12 06:16:14 20969 [Warning] IP address '8192.0.2.0' could not be resolved: Temporary failure in name resolution"
      },
      {
         "createdAt": 1570860977.0,
         "message": "2019-10-12 06:16:17 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
      },
      {
         "createdAt": 1570860979.0,
         "message": "2019-10-12 06:16:19 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
      },
      {
         "createdAt": 1570860981.0,
         "message": "2019-10-12 06:16:21 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
      },
      {
         "createdAt": 1570860982.0,
         "message": "2019-10-12 06:16:22 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
      },
      {
         "createdAt": 1570860984.0,
         "message": "2019-10-12 06:16:24 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
      },
      {
         "createdAt": 1570860986.0,
         "message": "2019-10-12 06:16:26 20969 [Warning] IP address '192.0.2.0' could not be resolved: Temporary failure in name resolution"
      }
   ]
}```
For API details, see `GetRelationalDatabaseLogEvents` in *AWS CLI Command Reference*.

**get-relational-database-log-streams**

The following code example shows how to use `get-relational-database-log-streams`.

**AWS CLI**

**To get the log streams for a relational database**

The following `get-relational-database-log-streams` example returns all of the available log streams for the specified relational database.

```bash
aws lightsail get-relational-database-log-streams \
  --relational-database-name Database1
```

**Output:**

```json
{
  "logStreams": [
    "audit",
    "error",
    "general",
    "slowquery"
  ]
}
```

For API details, see `GetRelationalDatabaseLogStreams` in *AWS CLI Command Reference*. 

Actions and scenarios
get-relational-database-master-user-password

The following code example shows how to use get-relational-database-master-user-password.

AWS CLI

To get the master user password for a relational database

The following get-relational-database-master-user-password example returns information about the master user password for the specified relational database.

```bash
aws lightsail get-relational-database-master-user-password \
--relational-database-name Database-1
```

Output:

```json
{
   "masterUserPassword": "VEXAMPLEec.9qv,:t<)Wkf)kwboM,>2",
   "createdAt": 1571259453.959
}
```

- For API details, see GetRelationalDatabaseMasterUserPassword in AWS CLI Command Reference.

get-relational-database-metric-data

The following code example shows how to use get-relational-database-metric-data.

AWS CLI

To get metric data for a relational database

The following get-relational-database-metric-data example returns the count sum of the metric DatabaseConnections over the period of 24 hours (86400 seconds) between 1570733176 and 1571597176 for relational database Database1.

We recommend that you use a unix time converter to identify the start and end times.

```bash
aws lightsail get-relational-database-metric-data \
--relational-database-name Database1 \
```
```bash
--metric-name DatabaseConnections \
--period 86400 \
--start-time 1570733176 \
--end-time 1571597176 \
--unit Count \
--statistics Sum
```

Output:

```json
{
  "metricName": "DatabaseConnections",
  "metricData": [
    {
      "sum": 1.0,
      "timestamp": 1571510760.0,
      "unit": "Count"
    },
    {
      "sum": 1.0,
      "timestamp": 1570733160.0,
      "unit": "Count"
    },
    {
      "sum": 1.0,
      "timestamp": 1570992360.0,
      "unit": "Count"
    },
    {
      "sum": 0.0,
      "timestamp": 1571251560.0,
      "unit": "Count"
    },
    {
      "sum": 721.0,
      "timestamp": 1570819560.0,
      "unit": "Count"
    },
    {
      "sum": 1.0,
      "timestamp": 1571078760.0,
      "unit": "Count"
    },
    {
```

Actions and scenarios
For API details, see GetRelationalDatabaseMetricData in AWS CLI Command Reference.

get-relational-database-parameters

The following code example shows how to use get-relational-database-parameters.

AWS CLI

To get parameters for a relational database

The following get-relational-database-parameters example returns information about all of the available parameters for the specified relational database.

```
aws lightsail get-relational-database-parameters \
   --relational-database-name Database-1
```

Output:

```
{
   "parameters": [
```
[{
  "allowedValues": "0,1",
  "applyMethod": "pending-reboot",
  "applyType": "dynamic",
  "dataType": "boolean",
  "description": "Automatically set all granted roles as active after the
  user has authenticated successfully.",
  "isModifiable": true,
  "parameterName": "activate_all_roles_on_login",
  "parameterValue": "0"
}]

[{
  "allowedValues": "0,1",
  "applyMethod": "pending-reboot",
  "applyType": "static",
  "dataType": "boolean",
  "description": "Controls whether user-defined functions that have only
  an xxx symbol for the main function can be loaded",
  "isModifiable": false,
  "parameterName": "allow-suspicious-udfs"
}]

[{
  "allowedValues": "0,1",
  "applyMethod": "pending-reboot",
  "applyType": "dynamic",
  "dataType": "boolean",
  "description": "Sets the autocommit mode",
  "isModifiable": true,
  "parameterName": "autocommit"
}]

[{
  "allowedValues": "0,1",
  "applyMethod": "pending-reboot",
  "applyType": "static",
  "dataType": "boolean",
  "description": "Controls whether the server autogenerates SSL key and
  certificate files in the data directory, if they do not already exist.",
  "isModifiable": false,
  "parameterName": "auto_generate_certs"
}]

...
For more information, see Updating database parameters in Amazon Lightsail in the Lightsail Dev Guide.

- For API details, see GetRelationalDatabaseParameters in AWS CLI Command Reference.

get-relational-database-snapshot

The following code example shows how to use get-relational-database-snapshot.

AWS CLI

To get information about a relational database snapshot

The following get-relational-database-snapshot example displays details about the specified relational database snapshot.

```bash
aws lightsail get-relational-database-snapshot \
    --relational-database-snapshot-name Database-1-1571350042
```

Output:

```
{
    "relationalDatabaseSnapshot": {
        "name": "Database-1-1571350042",
        "supportCode": "6EXAMPLE3362/ls-8EXAMPLE2ba7ad041451946fabc2ad19cfbd9eb2",
        "createdAt": 1571350046.238,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "RelationalDatabaseSnapshot",
        "tags": [],
        "engine": "mysql",
        "engineVersion": "8.0.16",
        "sizeInGb": 40,
        "state": "available",
        "fromRelationalDatabaseName": "Database-1",
    }
}
```
"fromRelationalDatabaseArn": "arn:aws:lightsail:us-west-2:111122223333:RelationalDatabase/7ea932b1-b85a-4bd5-9b3e-bEXAMPLE8cc4",
  "fromRelationalDatabaseBundleId": "micro_1_0",
  "fromRelationalDatabaseBlueprintId": "mysql_8_0"
}
}

- For API details, see GetRelationalDatabaseSnapshot in AWS CLI Command Reference.

get-relational-database-snapshots

The following code example shows how to use get-relational-database-snapshots.

AWS CLI

To get information about all relational database snapshots

The following get-relational-database-snapshots example displays details about all of the relational database snapshots in the configured AWS Region.

```
aws lightsail get-relational-database-snapshots
```

Output:

```json
{
  "relationalDatabaseSnapshots": [
    {
      "name": "Database-1-1571350042",
      "supportCode": "6EXAMPLE3362/ls-8EXAMPLE2ba7ad041451946fafc2ad19cfd9eb2",
      "createdAt": 1571350046.238,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "resourceType": "RelationalDatabaseSnapshot",
      "tags": [],
      "engine": "mysql",
      "engineVersion": "8.0.16",
      "sizeInGb": 40,
```
For API details, see GetRelationalDatabaseSnapshots in AWS CLI Command Reference.

get-relational-database

The following code example shows how to use get-relational-database.
AWS CLI

To get information about a relational database

The following get-relational-database example displays details about the specified relational database.

```bash
aws lightsail get-relational-database \
    --relational-database-name Database-1
```

Output:

```json
{
    "relationalDatabase": {
        "name": "Database-1",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:RelationalDatabase/7ea932b1-b85a-4bd5-9b3e-bEXAMPLE8cc4",

For API details, see GetRelationalDatabases in AWS CLI Command Reference.

get-static-ip

The following code example shows how to use get-static-ip.

AWS CLI

To get information about a static IP

The following get-static-ip example displays details about the specified static IP.

```bash
aws lightsail get-static-ip \
   --static-ip-name StaticIp-1
```

Output:

```
{
```
"staticIp": {
    "name": "StaticIp-1",
    "arn": "arn:aws:lightsail:us-west-2:111122223333:StaticIp/2257cd76-1f0e-4ac0-82e2-2EXAMPLE23ad",

    "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
    },
    "resourceType": "StaticIp",
    "ipAddress": "192.0.2.0",
    "isAttached": false
}
}

- For API details, see GetStaticIp in AWS CLI Command Reference.

get-static-ips

The following code example shows how to use get-static-ips.

AWS CLI

To get information about all static IPs

The following get-static-ips example displays details about all of the static IPs in the configured AWS Region.

aws lightsail get-static-ips

Output:

{
    "staticIps": [
        {
            "name": "StaticIp-1",
            "arn": "arn:aws:lightsail:us-west-2:111122223333:StaticIp/2257cd76-1f0e-4ac0-82e2-2EXAMPLE23ad",

            "createdAt": 1571071325.076,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            }
        }
    ]
}
For API details, see [GetStaticIps](aws_cli/command_reference) in *AWS CLI Command Reference*.

### is-vpc-peered

The following code example shows how to use is-vpc-peered.

#### AWS CLI

**To identify if your Amazon Lightsail virtual private cloud is peered**

The following is-vpc-peered example returns the peering status of the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```bash
aws lightsail is-vpc-peered \
   --region us-west-2
```

**Output:**
open-instance-public-ports

The following code example shows how to use open-instance-public-ports.

AWS CLI

To open firewall ports for an instance

The following open-instance-public-ports example opens TCP port 22 on the specified instance.

```
aws lightsail open-instance-public-ports \
  --instance-name MEAN-2 \
  --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
    "operation": {
        "id": "719744f0-a022-46f2-9f11-6EXAMPLE4642",
        "resourceName": "MEAN-2",
        "resourceType": "Instance",
        "createdAt": 1571072906.849,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "22/tcp",
        "operationType": "OpenInstancePublicPorts",
        "status": "Succeeded",
        "statusChangedAt": 1571072906.849
    }
}
```

• For API details, see OpenInstancePublicPorts in AWS CLI Command Reference.
**peer-vpc**

The following code example shows how to use peer-vpc.

**AWS CLI**

To peer the Amazon Lightsail virtual private cloud

The following peer-vpc example peers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```bash
aws lightsail peer-vpc \
  --region us-west-2
```

Output:

```json
{
  "operation": {
    "id": "787e846a-54ac-497f-bce2-9EXAMPLE5d91",
    "resourceName": "vpc-0EXAMPLEa5261efb3",
    "resourceType": "PeeredVpc",
    "createdAt": 1571694233.104,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "isTerminal": true,
    "operationDetails": "vpc-e2b3eb9b",
    "operationType": "PeeredVpc",
    "status": "Succeeded",
    "statusChangedAt": 1571694233.104
  }
}
```

- For API details, see [PeerVpc](#) in [AWS CLI Command Reference](#).

**reboot-instance**

The following code example shows how to use reboot-instance.

**AWS CLI**

To reboot an instance
The following reboot-instance example reboots the specified instance.

```bash
aws lightsail reboot-instance \
    --instance-name MEAN-1
```

Output:

```
{
   "operations": [
   {
      "id": "2b679f1c-8b71-4bb4-8e97-8EXAMPLEed93",
      "resourceName": "MEAN-1",
      "resourceType": "Instance",
      "createdAt": 1571694445.49,
      "location": {
         "availabilityZone": "us-west-2a",
         "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationDetails": "",
      "operationType": "RebootInstance",
      "status": "Succeeded",
      "statusChangedAt": 1571694445.49
   }
   ]
}
```

For API details, see [RebootInstance](https://docs.aws.amazon.com/cli/latest/reference/lightsail/reboot-instance.html) in *AWS CLI Command Reference*.

reboot-relational-database

The following code example shows how to use reboot-relational-database.

AWS CLI

To reboot a relational database

The following reboot-relational-database example reboots the specified relational database.

```bash
aws lightsail reboot-relational-database \
```
For API details, see `RebootRelationalDatabase` in *AWS CLI Command Reference*.

**release-static-ip**

The following code example shows how to use `release-static-ip`.

**AWS CLI**

**To delete a static IP**

The following `release-static-ip` example deletes the specified static IP.

```
aws lightsail release-static-ip
   --static-ip-name StaticIp-1
```

**Output:**

```
{
}
```
For API details, see ReleaseStaticIp in AWS CLI Command Reference.

**start-instance**

The following code example shows how to use `start-instance`.

**AWS CLI**

**To start an instance**

The following `start-instance` example starts the specified instance.

```
aws lightsail start-instance \
  --instance-name WordPress-1
```

**Output:**

```
{
  "operations": [
    {
      "id": "f88d2a93-7cea-4165-afce-2d688cb18f23",
      "resourceName": "WordPress-1",
      "resourceType": "Instance",
      "createdAt": 1571695583.463,
    }
  ]
}
```
start-relational-database

The following code example shows how to use start-relational-database.

AWS CLI

To start a relational database

The following start-relational-database example starts the specified relational database.

```bash
aws lightsail start-relational-database \ --relational-database-name Database-1
```

Output:

```
{
   "operations": [
       {
           "id": "4d5294ec-a38a-4fda-9e37-aEXAMPLE0d24",
           "resourceName": "Database-1",

           },
           "isTerminal": false,
           "operationType": "StartInstance",
           "status": "Started",
           "statusChangedAt": 1571695583.463
       }
   ]
}
```

For API details, see [StartInstance](aws CLI Command Reference).
For API details, see \texttt{StartRelationalDatabase} in \textit{AWS CLI Command Reference}.

\textbf{stop-instance}

The following code example shows how to use \texttt{stop-instance}.

\textbf{AWS CLI}

\textbf{To stop an instance}

The following \texttt{stop-instance} example stops the specified instance.

\begin{verbatim}
aws lightsail stop-instance \
  --instance-name WordPress-1
\end{verbatim}

Output:

\begin{verbatim}
{
   "operations": [
      {
         "id": "265357e2-2943-4d51-888a-1EXAMPLE7585",
         "resourceName": "WordPress-1",
         "resourceType": "Instance",
         "createdAt": 1571695471.134,
         "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationType": "StopInstance",
         "status": "Started",
         "statusChangedAt": 1571695471.134
      }
   ]
}
\end{verbatim}
For API details, see StopInstance in AWS CLI Command Reference.

stop-relational-database

The following code example shows how to use stop-relational-database.

AWS CLI

To stop a relational database

The following stop-relational-database example stops the specified relational database.

```
aws lightsail stop-relational-database \
  --relational-database-name Database-1
```

Output:

```
{
   "operations": [
      {
         "id": "cc559c19-4adb-41e4-b75b-5EXAMPLE4e61",
         "resourceName": "Database-1",
         "resourceType": "RelationalDatabase",
         "createdAt": 1571695526.29,
         "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
         },
         "isTerminal": false,
         "operationType": "StopRelationalDatabase",
         "status": "Started",
         "statusChangedAt": 1571695526.29
      }
   ]
}
```

For API details, see StopRelationalDatabase in AWS CLI Command Reference.

unpeer-vpc

The following code example shows how to use unpeer-vpc.
AWS CLI

To unpeer the Amazon Lightsail virtual private cloud

The following unpeer-vpc example unpeers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail unpeer-vpc --region us-west-2
```

Output:

```json
{
  "operation": {
    "id": "531aca64-7157-47ab-84c6-eEXAMPLEd898",
    "resourceName": "vpc-0EXAMPLEa5261efb3",
    "resourceType": "PeeredVpc",
    "createdAt": 1571694109.945,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "isTerminal": true,
    "operationDetails": "vpc-e2b3eb9b",
    "operationType": "UnpeeredVpc",
    "status": "Succeeded",
    "statusChangedAt": 1571694109.945
  }
}
```

- For API details, see [UnpeerVpc](#) in AWS CLI Command Reference.

Macie examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Macie.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**describe-buckets**

The following code example shows how to use `describe-buckets`.

**AWS CLI**

To query data about one or more S3 buckets that Amazon Macie monitors and analyzes for your account

The following `describe-buckets` example queries metadata for all S3 buckets whose names begin with `MY-S3` and are in the current AWS Region.

```
aws macie2 describe-buckets \\
  --criteria '{"bucketName":{"prefix":"my-S3"}}'
```

**Output:**

```json
{
  "buckets": [
    {
      "accountId": "123456789012",
      "allowsUnencryptedObjectUploads": "FALSE",

Actions

list-workspaces

The following code example shows how to use list-workspaces.

AWS CLI

To list workspaces for the account in the Region specified by the user credential

The following list-workspaces example lists Grafana workspaces for the account's Region.

```
aws grafana list-workspaces
```

Output:

```
{
    "workspaces": [
        {
            "authentication": {
                "providers": []
            }
        }
    }
}
```
For API details, see [ListWorkspaces](#) in *AWS CLI Command Reference*.

**MediaConnect examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaConnect.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

add-flow-outputs

The following code example shows how to use add-flow-outputs.

AWS CLI

To add outputs to a flow

The following add-flow-outputs example adds outputs to the specified flow.

```
aws mediaconnect add-flow-outputs \
  --outputs Description='NYC' \n    Destination=192.0.2.12,Name=NYC,Port=3333,Protocol=rtp-fec,SmoothingLatency=100 \n    Description='LA' \n    Destination=203.0.113.9,Name=LA,Port=4444,Protocol=rtp-fec,SmoothingLatency=100
```

Output:

```
{
  "Outputs": [
    {
      "Port": 3333,
```
"Name": "NYC",
"Description": "NYC stream",
"Destination": "192.0.2.12",
"Transport": {
    "Protocol": "rtp-fec",
    "SmoothingLatency": 100
  }
},
{
  "Port": 4444,
  "Name": "LA",
  "Description": "LA stream",
  "Destination": "203.0.113.9",
  "Transport": {
    "Protocol": "rtp-fec",
    "SmoothingLatency": 100
  }
}
],
}

For more information, see Adding Outputs to a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see AddFlowOutputs in AWS CLI Command Reference.

create-flow

The following code example shows how to use create-flow.

AWS CLI

To create a flow

The following create-flow example creates a flow with the specified configuration.

```
aws mediaconnect create-flow \
  --availability-zone us-west-2c \  
  --name ExampleFlow \  
```
Output:

```json
{
    "Flow": {
        "AvailabilityZone": "us-west-2c",
        "EgressIp": "54.245.71.21",
        "Source": {
            "IngestPort": 1055,
            "Transport": {
                "Protocol": "rtp",

            },
            "Description": "Example source, backup",
            "IngestIp": "54.245.71.21",
            "WhitelistCidr": "10.24.34.0/23",
            "Name": "mySource"
        },
        "Entitlements": [],
        "Name": "ExampleFlow",
        "Outputs": [],
        "Status": "STANDBY",
        "Description": "Example source, backup"
    }
}
```

For more information, see [Creating a Flow](https://aws.amazon.com/documentation/mc2-user-guide/) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [CreateFlow](https://docs.aws.amazon.com/cli/latest/reference/mediaconnect/create-flow.html) in *AWS CLI Command Reference*.

**delete-flow**

The following code example shows how to use `delete-flow`.

**AWS CLI**

To delete a flow
The following delete-flow example deletes the specified flow.

```bash
aws mediaconnect delete-flow \
```

Output:

```
{
   "Status": "DELETING"
}
```

For more information, see Deleting a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see DeleteFlow in AWS CLI Command Reference.

**describe-flow**

The following code example shows how to use describe-flow.

**AWS CLI**

**To view the details of a flow**

The following describe-flow example displays the specified flow's details, such as ARN, Availability Zone, status, source, entitlements, and outputs.

```bash
aws mediaconnect describe-flow \
```

Output:

```
{
   "Flow": {
      "EgressIp": "54.201.4.39",
      "AvailabilityZone": "us-west-2c",
      "Status": "ACTIVE",

For more information, see View the Details of a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see DescribeFlow in AWS CLI Command Reference.

grant-flow-entitlements

The following code example shows how to use grant-flow-entitlements.

**AWS CLI**

To grant an entitlement on a flow

The following grant-flow-entitlements example grants an entitlement to the specified existing flow to share your content with another AWS account.

```bash
aws mediaconnect grant-flow-entitlements \
  --entitlements Description='For AnyCompany',Encryption={"Algorithm=aes128,KeyType=static-key,RoleArn=arn:aws:iam::111122223333:role/MediaConnect-ASM,SecretArn=arn:aws:secretsmanager:us-west-2:111122223333:secret:mySecret1"},Name=AnyCompany_Entitlement,Subscribers=444455556666 Description='For Example Corp',Name=ExampleCorp,Subscribers=777788889999
```

Output:

```json
{
  "Entitlements": [
    {
      "Name": "AnyCompany_Entitlement",
```
For more information, see [Granting an Entitlement on a Flow](https://docs.aws.amazon.com/mediaconnect/latest/userguide/Granting-an-Entitlement-on-a-Flow.html) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [GrantFlowEntitlements](https://docs.aws.amazon.com/cli/latest/reference/mediaconnect/grant-flow-entitlements.html) in *AWS CLI Command Reference*.

### list-entitlements

The following code example shows how to use `list-entitlements`.

**AWS CLI**

**To view a list of entitlements**

The following `list-entitlements` example displays a list of all entitlements that have been granted to the account.
aws mediaconnect list-entitlements

Output:

```
{
   "Entitlements": [
   {
      "EntitlementName": "MyEntitlement"
   }
   ]
}
```

For more information, see ListEntitlements in the AWS Elemental MediaConnect API Reference.

- For API details, see ListEntitlements in AWS CLI Command Reference.

**list-flows**

The following code example shows how to use list-flows.

**AWS CLI**

To view a list of flows

The following list-flows example displays a list of flows.

```
aws mediaconnect list-flows
```

Output:

```
{
   "Flows": [
   {
      "Status": "STANDBY",
      "SourceType": "OWNED",
      "AvailabilityZone": "us-west-2a",
      "Description": "NYC awards show",
      "Name": "AwardsShow",
```
  }
  ,
  {
    "Status": "STANDBY",
    "SourceType": "OWNED",
    "AvailabilityZone": "us-west-2c",
    "Description": "LA basketball game",
    "Name": "BasketballGame",
  }
]}
}

For more information, see Viewing a List of Flows in the AWS Elemental MediaConnect User Guide.

- For API details, see ListFlows in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a MediaConnect resource

The following list-tags-for-resource example displays the tag keys and values associated with the specified MediaConnect resource.

```bash
aws mediaconnect list-tags-for-resource \
```

Output:

```json
{
  "Tags": {
    "region": "west",
    "stage": "prod"
  }
}
```
For more information, see ListTagsForResource, TagResource, UntagResource in the AWS Elemental MediaConnect API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**remove-flow-output**

The following code example shows how to use remove-flow-output.

**AWS CLI**

To remove an output from a flow

The following remove-flow-output example removes an output from the specified flow.

```
aws mediaconnect remove-flow-output \
```

Output:

```
{
   "OutputArn": "arn:aws:mediaconnect:us-east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC"
}
```

For more information, see Removing Outputs from a Flow in the AWS Elemental MediaConnect User Guide.

- For API details, see RemoveFlowOutput in AWS CLI Command Reference.

**revoke-flow-entitlement**

The following code example shows how to use revoke-flow-entitlement.
To revoke an entitlement

The following `revoke-flow-entitlement` example revokes an entitlement on the specified flow.

```bash
aws mediaconnect revoke-flow-entitlement \
```

Output:

```json
{
}
```

For more information, see [Revoking an Entitlement](https://docs.aws.amazon.com/mediaconnect/latest/userguide/) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [RevokeFlowEntitlement](https://docs.aws.amazon.com/cli/latest/reference/mediaconnect/revoke-flow-entitlement.html) in *AWS CLI Command Reference*.

**start-flow**

The following code example shows how to use `start-flow`.

**AWS CLI**

**To start a flow**

The following `start-flow` example starts the specified flow.

```bash
aws mediaconnect start-flow \
```
This command produces no output. Output:

```json
{
    "Status": "STARTING"
}
```

For more information, see [Starting a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [StartFlow](#) in *AWS CLI Command Reference*.

**stop-flow**

The following code example shows how to use stop-flow.

**AWS CLI**

**To stop a flow**

The following stop-flow example stops the specified flow.

```bash
aws mediaconnect stop-flow \
```

Output:

```json
{
    "Status": "STOPPING",
}
```

For more information, see [Stopping a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [StopFlow](#) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use tag-resource.
AWS CLI

To add tags to a MediaConnect resource

The following tag-resource example adds a tag with a key name and value to the specified MediaConnect resource.

```bash
aws mediaconnect tag-resource \
  --tags region=west
```

This command produces no output.

For more information, see ListTagsForResource, TagResource, UntagResource in the AWS Elemental MediaConnect API Reference.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a MediaConnect resource

The following untag-resource example remove the tag with the specified key name and its associated value from a MediaConnect resource.

```bash
aws mediaconnect untag-resource \
  --tag-keys region
```

This command produces no output.

For more information, see ListTagsForResource, TagResource, UntagResource in the AWS Elemental MediaConnect API Reference.

- For API details, see UntagResource in AWS CLI Command Reference.
**update-flow-entitlement**

The following code example shows how to use update-flow-entitlement.

**AWS CLI**

**To update an entitlement**

The following update-flow-entitlement example updates the specified entitlement with a new description and subscriber.

```bash
aws mediaconnect update-flow-entitlement
   --description 'For AnyCompany Affiliate'
   --subscribers 777788889999
```

**Output:**

```json
{
   "Entitlement": {
      "Name": "AnyCompany_Entitlement",
      "Description": "For AnyCompany Affiliate",
      "Encryption": {
         "KeyType": "static-key",
         "Algorithm": "aes128",
         "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
      },
      "Subscribers": [777788889999]
   }
}
```
For more information, see `Updating an Entitlement` in the *AWS Elemental MediaConnect User Guide*.

- For API details, see `UpdateFlowEntitlement` in *AWS CLI Command Reference*.

**update-flow-output**

The following code example shows how to use `update-flow-output`.

**AWS CLI**

**To update an output on a flow**

The following `update-flow-output` example update an output on the specified flow.

```bash
aws mediaconnect update-flow-output \
   --output-arn arn:aws:mediaconnect:us-east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5f678h:NYC \
   --port 3331
```

Output:

```json
{
   "Output": {
      "Name": "NYC",
      "Port": 3331,
      "Description": "NYC stream",
      "Transport": {
         "Protocol": "rtp-fec",
         "SmoothingLatency": 100
      },
      "Destination": "192.0.2.12"
   }
}
```

For more information, see `Updating Outputs on a Flow` in the *AWS Elemental MediaConnect User Guide*. 
update-flow-source

The following code example shows how to use update-flow-source.

AWS CLI

To update the source of an existing flow

The following update-flow-source example updates the source of an existing flow.

```bash
aws mediaconnect update-flow-source \
    --source-arn arn:aws:mediaconnect:us-east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource \
    --description 'Friday night show' \
    --ingest-port 3344 \
    --protocol rtp-fec \
    --whitelist-cidr 10.24.34.0/23
```

Output:

```json
{
    "Source": {
        "IngestIp": "34.210.136.56",
        "WhitelistCidr": "10.24.34.0/23",
        "Transport": {
            "Protocol": "rtp-fec"
        },
        "IngestPort": 3344,
        "Name": "ShowSource",
        "Description": "Friday night show",
        "SourceArn": "arn:aws:mediaconnect:us-east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource"
    }
}
```
For more information, see [Updating the Source of a Flow](#) in the [AWS Elemental MediaConnect User Guide](#).

- For API details, see [UpdateFlowSource](#) in [AWS CLI Command Reference](#).

### MediaConvert examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaConvert.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**cancel-job**

The following code example shows how to use `cancel-job`.

**AWS CLI**

**To cancel a job that is in a queue**

The following `cancel-job` example cancels the job with ID `1234567891234-abc123`. You can't cancel a job that the service has started processing.

```bash
aws mediaconvert cancel-job
   --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com
   --region region-name-1
   --id 1234567891234-abc123
```
To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see [Working with AWS Elemental MediaConvert Jobs](https://docs.aws.amazon.com/mediaconvert/latest/userguide/) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [CancelJob](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/cancel-job.html) in *AWS CLI Command Reference*.

### create-job-template

The following code example shows how to use `create-job-template`.

**AWS CLI**

**To create a job template**

The following `create-job-template` example creates a job template with the transcoding settings that are specified in the file `job-template.json` that resides on your system.

```bash
aws mediaconvert create-job-template \
   --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
   --region region-name-1 \
   --name JobTemplate1 \
   --cli-input-json file://~/job-template.json
```

If you create your job template JSON file by using `get-job-template` and then modifying the file, remove the JobTemplate object, but keep the Settings child object inside it. Also, make sure to remove the following key-value pairs: LastUpdated, Arn, Type, and CreatedAt. You can specify the category, description, name, and queue either in the JSON file or at the command line.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON specification for the job template that you created.

For more information, see [Working with AWS Elemental MediaConvert Job Templates](https://docs.aws.amazon.com/mediaconvert/latest/userguide/) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [CreateJobTemplate](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/create-job-template.html) in *AWS CLI Command Reference*. 
create-job

The following code example shows how to use create-job.

AWS CLI

**To create a job**

The following create-job example creates a transcoding job with the settings that are specified in a file job.json that resides on the system that you send the command from. This JSON job specification might specify each setting individually, reference a job template, or reference output presets.

```
aws mediaconvert create-job \
   --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
   --region region-name-1 \
   --cli-input-json file://~/job.json
```

You can use the AWS Elemental MediaConvert console to generate the JSON job specification by choosing your job settings, and then choosing **Show job JSON** at the bottom of the **Job** section.

To get your account-specific endpoint, use **describe-endpoints**, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON job specification that you sent with your request.

- For API details, see [CreateJob](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/create-job.html) in *AWS CLI Command Reference*.

create-preset

The following code example shows how to use create-preset.

AWS CLI

**To create a custom output preset**
The following `create-preset` example creates a custom output preset based on the output settings that are specified in the file `preset.json`. You can specify the category, description, and name either in the JSON file or at the command line.

```
aws mediaconvert create-preset \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --cli-input-json file://~/preset.json
```

If you create your preset JSON file by using `get-preset` and then modifying the output file, ensure that you remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see [Working with AWS Elemental MediaConvert Output Presets](link) in the [AWS Elemental MediaConvert User Guide](link).

- For API details, see [CreatePreset](link) in [AWS CLI Command Reference](link).

---

### create-queue

The following code example shows how to use `create-queue`.

**AWS CLI**

To create a custom queue

The following `create-queue` example creates a custom transcoding queue.

```
aws mediaconvert create-queue \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --name Queue1 \n    --description "Keep this queue empty unless job is urgent."
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

Output:
For more information, see Working with AWS Elemental MediaConvert Queues in the AWS Elemental MediaConvert User Guide.

- For API details, see CreateQueue in AWS CLI Command Reference.

**delete-job-template**

The following code example shows how to use delete-job-template.

**AWS CLI**

**To delete a job template**

The following delete-job-template example deletes the specified custom job template.

```
aws mediaconvert delete-job-template 
   --name "DASH Streaming" 
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run aws mediaconvert list-job-templates to confirm that your template was deleted.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the AWS Elemental MediaConvert User Guide.

- For API details, see DeleteJobTemplate in AWS CLI Command Reference.

**delete-preset**

The following code example shows how to use delete-preset.
AWS CLI

To delete a custom on-demand queue

The following delete-preset example deletes the specified custom preset.

```
aws mediaconvert delete-preset
   --name SimpleMP4
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-presets` to confirm that your preset was deleted.

For more information, see Working with AWS Elemental MediaConvert Output Presets in the AWS Elemental MediaConvert User Guide.

- For API details, see DeletePreset in AWS CLI Command Reference.

delete-queue

The following code example shows how to use delete-queue.

AWS CLI

To delete a custom on-demand queue

The following delete-queue example deletes the specified custom on-demand queue.

You can't delete your default queue. You can't delete a reserved queue that has an active pricing plan or that contains unprocessed jobs.

```
aws mediaconvert delete-queue
   --name Customer1
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-queues` to confirm that your queue was deleted.

For more information, see Working with AWS Elemental MediaConvert Queues in the AWS Elemental MediaConvert User Guide.

- For API details, see DeleteQueue in AWS CLI Command Reference.
**describe-endpoints**

The following code example shows how to use `describe-endpoints`.

**AWS CLI**

**To get your account-specific endpoint**

The following `describe-endpoints` example retrieves the endpoint that you need to send any other request to the service.

```bash
aws mediaconvert describe-endpoints
```

Output:

```json
{
    "Endpoints": [
        {
            "Url": "https://abcd1234.mediaconvert.region-name-1.amazonaws.com"
        }
    ]
}
```

For more information, see [Getting Started with MediaConvert Using the API](https://docs.aws.amazon.com/mediaconvert/latest/APIReference/getting-started-with-mediaconvert-using-the-api.html) in the *AWS Elemental MediaConvert API Reference*.

- For API details, see [DescribeEndpoints](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/describe-endpoints.html) in *AWS CLI Command Reference*.

**get-job-template**

The following code example shows how to use `get-job-template`.

**AWS CLI**

**To get details for a job template**

The following `get-job-template` example displays the JSON definition of the specified custom job template.

```bash
aws mediaconvert get-job-template \
  --name "DASH Streaming" \
  --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com
```
Output:

```
{
    "JobTemplate": {
        "StatusUpdateInterval": "SECONDS_60",
        "LastUpdated": 1568652998,
        "Description": "Create a DASH streaming ABR stack",
        "CreatedAt": 1568652998,
        "Priority": 0,
        "Name": "DASH Streaming",
        "Settings": {
            ...<truncated for brevity>...
        },
        "Type": "CUSTOM"
    }
}
```

**get-job**

The following code example shows how to use get-job.

**AWS CLI**

**To get details for a particular job**

The following example requests the information for the job with ID 1234567890987-1ab2c3, which in this example ended in an error.

```
aws mediaconvert get-job \
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
  --region region-name-1 \
  --id 1234567890987-1ab2c3
```

To get your account-specific endpoint, use describe-endpoints, or send the command without the endpoint. The service returns an error and your endpoint.
If your request is successful, the service returns a JSON file with job information, including job settings, any returned errors, and other job data, as follows:

```
{
    "Job": {
        "Status": "ERROR",
        "Queue": "arn:aws:mediaconvert:region-name-1:012345678998:queues/Queue1",
        "Settings": {
            ...
        },
        "ErrorMessage": "Unable to open input file [s3://my-input-bucket/file-name.mp4]: [Failed probe/open: [Failed to read data: AssumeRole failed]]",
        "ErrorCode": 1434,
        "Role": "arn:aws:iam::012345678998:role/MediaConvertServiceRole",
        "Arn": "arn:aws:mediaconvert:us-west-1:012345678998:jobs/1234567890987-1ab2c3",
        "UserMetadata": {},
        "Timing": {
            "FinishTime": 1517442131,
            "SubmitTime": 1517442103,
            "StartTime": 1517442104
        },
        "Id": "1234567890987-1ab2c3",
        "CreatedAt": 1517442103
    }
}
```

- For API details, see [GetJob](https://docs.aws.amazon.com/cli/2.2.005/cli-reference/globals/api/get-job.html) in *AWS CLI Command Reference*.

**get-preset**

The following code example shows how to use `get-preset`.

**AWS CLI**

**To get details for a particular preset**

The following `get-preset` example requests the JSON definition of the specified custom preset.
aws mediaconvert get-preset \
  --name SimpleMP4 \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com

Output:

```json
{
   "Preset": {
      "Description": "Creates basic MP4 file. No filtering or preprocessing."
      "LastUpdated": 1568843141,
      "Name": "SimpleMP4",
      "Settings": {
         "ContainerSettings": {
            "Mp4Settings": {
               "FreeSpaceBox": "EXCLUDE",
               "CslgAtom": "INCLUDE",
               "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
            },
            "Container": "MP4"
         },
         "AudioDescriptions": [
            {
               "LanguageCodeControl": "FOLLOW_INPUT",
               "AudioTypeControl": "FOLLOW_INPUT",
               "CodecSettings": {

get-queue

The following code example shows how to use get-queue.

AWS CLI

To get details for a queue

The following get-queue example retrieves the details of the specified custom queue.

```
aws mediaconvert get-queue \\n  --name Customer1 \\n  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
  "Queue": {
    "LastUpdated": 1526428502,
    "Type": "CUSTOM",
    "SubmittedJobsCount": 0,
    "Status": "ACTIVE",
    "PricingPlan": "ON_DEMAND",
    "CreatedAt": 1526428502,
    "ProgressingJobsCount": 0,
    "Name": "Customer1"
  }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the AWS Elemental MediaConvert User Guide.
For API details, see GetQueue in AWS CLI Command Reference.

list-job-templates

The following code example shows how to use list-job-templates.

**AWS CLI**

**Example 1: To list your custom job templates**

The following list-job-templates example lists all custom job templates in the current Region. To list the system job templates, see the next example.

```bash
aws mediaconvert list-job-templates \
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```json
{
   "JobTemplates": [
   {
      "Description": "Create a DASH streaming ABR stack",
      "Name": "DASH Streaming",
      "LastUpdated": 1568653007,
      "Priority": 0,
      "Settings": {
         ...<truncated for brevity>...
      },
      "Type": "CUSTOM",
      "StatusUpdateInterval": "SECONDS_60",
      "CreatedAt": 1568653007
   },
   {
      "Description": "Create a high-res file",
      "Name": "File",
      "LastUpdated": 1568653007,
      "Priority": 0,
      "Settings": {
         ...<truncated for brevity>...
      },
   }
]
}```
Example 2: To list the MediaConvert system job templates

The following list-job-templates example lists all system job templates.

```
aws mediaconvert list-job-templates \
    --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com \
    --list-by SYSTEM
```

Output:

```
{
    "JobTemplates": [
        {
            "CreatedAt": 1568321779,
            "Arn": "arn:aws:mediaconvert:us-east-1:123456789012:jobTemplates/System-Generic_Mp4_Hev1_Avc_Aac_Sdr_Qvbr",
            "Name": "System-Generic_Mp4_Hev1_Avc_Aac_Sdr_Qvbr",
            "Description": "GENERIC, MP4, AVC + HEV1(HEVC,SDR), AAC, SDR, QVBR",
            "Category": "GENERIC",
            "Settings": {
                "AdAvailOffset": 0,
                "OutputGroups": [
                    {
                        "Outputs": [
                            {
                                "Extension": "mp4",
                                "Preset": "System-Generic_Hd_Mp4_Avc_Aac_16x9_Sdr_1280x720p_30Hz_5Mbps_Qvbr_Vq9",
                                "NameModifier": "_Generic_Hd_Mp4_Avc_Aac_16x9_Sdr_1280x720p_30Hz_5000Kbps_Qvbr_Vq9"
                            },
                            {
                                "Extension": "mp4",
                                "Preset": "System-Generic_Hd_Mp4_Avc_Aac_16x9_Sdr_1920x1080p_30Hz_10Mbps_Qvbr_Vq9"
                            }
                        ]
                    }
                ]
            }
        }
    ]
}
```

For more information, see Working with AWS Elemental MediaConvert Job Templates in the AWS Elemental MediaConvert User Guide.

- For API details, see ListJobTemplates in AWS CLI Command Reference.

**list-jobs**

The following code example shows how to use `list-jobs`.

**AWS CLI**

**To get details for all jobs in a region**

The following example requests the information for all of your jobs in the specified region.

```bash
aws mediaconvert list-jobs \
   --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
   --region region-name-1
```

To get your account-specific endpoint, use describe-endpoints, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with AWS Elemental MediaConvert Jobs in the AWS Elemental MediaConvert User Guide.

- For API details, see ListJobs in AWS CLI Command Reference.

**list-presets**

The following code example shows how to use `list-presets`.

**AWS CLI**

**Example 1: To list your custom output presets**

The following list-presets example lists your custom output presets. To list the system presets, see the next example.
Example 2: To list the system output presets

The following list-presets example lists the available MediaConvert system presets. To list your custom presets, see the previous example.

```bash
aws mediaconvert list-presets \
   --list-by SYSTEM \
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
   "Presets": [
      {
         "Name": "SimpleMP4",
         "CreatedAt": 1568841521,

        }  
    ]  
}

For more information, see Working with AWS Elemental MediaConvert Output Presets in the AWS Elemental MediaConvert User Guide.

- For API details, see ListPresets in AWS CLI Command Reference.

**list-queues**

The following code example shows how to use list-queues.
AWS CLI

To list your queues

The following `list-queues` example lists all of your MediaConvert queues.

```
aws mediaconvert list-queues \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
  "Queues": [
    {
      "PricingPlan": "ON_DEMAND",
      "Type": "SYSTEM",
      "Status": "ACTIVE",
      "CreatedAt": 1503451595,
      "Name": "Default",

      "LastUpdated": 1564066204,
      "ReservationPlan": {
```
For more information, see [Working with AWS Elemental MediaConvert Queues](https://docs.aws.amazon.com/mediaconvert/latest/userguide/working-with-mediaconvert-queues.html) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [ListQueues](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/list-queues.html) in *AWS CLI Command Reference*.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To list the tags on a MediaConvert queue, job template, or output preset

The following `list-tags-for-resource` example lists the tags on the specified output preset.

```
aws mediaconvert list-tags-for-resource \
  --arn arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4 \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
  "ResourceTags": {
    "Tags": {
      "customer": "zippyVideo"
    },
  }
}```
For more information, see [Tagging AWS Elemental MediaConvert Queues, Job Templates, and Output Presets](https://docs.aws.amazon.com/mediaconvert/latest/userguide/working-with-queues-job-templates-presets.html) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### update-job-template

The following code example shows how to use `update-job-template`.

**AWS CLI**

**To change a job template**

The following `update-job-template` example replaces the JSON definition of the specified custom job template with the JSON definition in the provided file.

```bash
code
```

**Contents of `job-template-update.json`:**

```json
code
{
  "Description": "A simple job template that generates a single file output.",
  "Name": "SimpleFile",
  "Settings": {
    "OutputGroups": [
      {
        "Name": "File Group",
        "Outputs": [
          {
            "ContainerSettings": {
              "Container": "MP4",
              "Mp4Settings": {
                "CslgAtom": "INCLUDE",
                "FreeSpaceBox": "EXCLUDE",
                "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
              }
            }
          }
        ]
      }
    ]
  }
}
```

    }
  }
},
  "AfdSignaling": "NONE",
  "DropFrameTimecode": "ENABLED"}
The system returns the JSON payload that you send with your request, even when the request results in an error. Therefore, the JSON returned is not necessarily the new definition of the job template.

Because the JSON payload can be long, you might need to scroll up to see any error messages.
For more information, see [Working with AWS Elemental MediaConvert Job Templates](https://docs.aws.amazon.com/mediaconvert/latest/job-templates-reference/) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [UpdateJobTemplate](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/update-job-template.html) in *AWS CLI Command Reference*.

**update-preset**

The following code example shows how to use *update-preset*.

**AWS CLI**

**To change a preset**

The following *update-preset* example replaces the description for the specified preset.

```bash
aws mediaconvert update-preset \
   --name Customer1 \
   --description "New description text." \
   --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Output:

```
{
   "Preset": {
      "Settings": {
         ...
      },
      "Type": "CUSTOM",
      "LastUpdated": 1568938411,
      "Description": "New description text.",
      "Name": "SimpleMP4",
      "CreatedAt": 1568938240
   }
}
```

For more information, see [Working with AWS Elemental MediaConvert Output Presets](https://docs.aws.amazon.com/mediaconvert/latest/output-presets-reference/) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [UpdatePreset](https://docs.aws.amazon.com/cli/latest/reference/mediaconvert/update-preset.html) in *AWS CLI Command Reference*. 
**update-queue**

The following code example shows how to use update-queue.

**AWS CLI**

**To change a queue**

The following update-queue example pauses the specified queue, by changing its status to PAUSED.

```bash
aws mediaconvert update-queue \
--name Customer1 \
--status PAUSED \
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

**Output:**

```
{
   "Queue": {
      "LastUpdated": 1568839845,
      "Status": "PAUSED",
      "ProgressingJobsCount": 0,
      "CreatedAt": 1526428516,
      "Name": "Customer1",
      "SubmittedJobsCount": 0,
      "PricingPlan": "ON_DEMAND",
      "Type": "CUSTOM"
   }
}
```

**MediaLive examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaLive.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

create-channel

The following code example shows how to use create-channel.

AWS CLI

To create a channel

The following create-channel example creates a channel by passing in a JSON file that contains the parameters that you want to specify.

The channel in this example ingests an HLS PULL input that connects to a source that contains video, audio, and embedded captions. The channel creates one HLS output group with an Akamai server as the destination. The output group contains two outputs: one for the H.265 video and AAC audio, and one for the Web-VTT captions, in English only.

The JSON for this example channel includes the minimum required parameters for a channel that uses an HLS PULL input and that produces an HLS output group with Akamai as the destination. The JSON contains these main sections:

InputAttachments, which specifies one source for the audio, and one source for the captions. It does not specify a video selector, which means that MediaLive extracts the first video it finds in the source. Destinations, which contains the two IP addresses (URLs) for the single output group in this channel. These addresses require passwords. EncoderSettings, which contains subsections. AudioDescriptions, which specifies that the channel contains one audio output asset, which uses the source from InputAttachments, and produces audio in
AAC format. CaptionDescriptions, which specifies that the channel contains one captions output asset, which uses the source from InputAttachments, and produces captions in WebVTT format. VideoDescriptions, which specifies that the channel contains one video output asset, with the specified resolution. OutputGroups, which specifies the output groups. In this example there is one group named Akamai. The connection is made using HLS PUT. The output group contains two outputs. One output is for the video asset (named Video_high) and the audio asset (named Audio_EN). One output is for the captions asset (named WebVTT_EN).

In this example, some of the parameters contain no value or contain nested empty parameters. For example, OutputSettings for the Video_and_audio output contains several nested parameters that end at an empty parameter M3u8Settings. This parameter must be included, but you can omit one, several, or all its children, which means that the child will take its default value or be null.

All the parameters that apply to this example channel but that aren't specified in this file will either take the default value, be set to null, or take a unique value generated by MediaLive.

```
aws medialive create-channel \
--cli-input-json file://channel-in-hls-out-hls-akamai.json
```

Contents of `channel-in-hls-out-hls-akamai.json`:

    "StandardHlsSettings": {
      "M3u8Settings": {}
    },
    "NameModifier": "_2"
  },
  "Source": "EMBEDDED"
}

**Output:**

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

ARN for the channel. The last part of the ARN is the unique channel ID. EgressEndpoints is blank in this example channel because it used only for PUSH inputs. When it applies it shows the addresses on MediaLive that content is pushed to. OutputGroups, Outputs. These show all the parameters for the output group and outputs, including those that you didn't include but that are relevant to this channel. The parameters might be empty (perhaps indicating the parameter or feature is disabled in this channel configuration) or might show the default value that will apply. LogLevel is set to the default (DISABLED). Tags is set to the default (null). PipelinesRunningCount and State show the current status of the channel.

For more information, see [Creating a Channel from Scratch](https://docs.aws.amazon.com/mediacarousel/latest/API/Creating a Channel from Scratch) in the *AWS Elemental MediaLive User Guide*.

- For API details, see [CreateChannel](https://docs.aws.amazon.com/mediacarousel/latest/API/CreateChannel) in *AWS CLI Command Reference*.

**create-input**

The following code example shows how to use create-input.
AWS CLI

To create an input

The following `create-input` example creates an HLS PULL input by passing in a JSON file that contains the parameters that apply to this type of input. The JSON for this example input specifies two sources (addresses) to the input, in order to support redundancy in the ingest. These addresses require passwords.

```
aws medialive create-input \
   --cli-input-json file://input-hls-pull-news.json
```

Contents of `input-hls-pull-news.json`:

```
{
   "Name": "local_news",
   "RequestId": "cli000059",
   "Sources": [
      {
         "Url": "https://203.0.113.13/newschannel/anytownusa.m3u8",
         "Username": "examplecorp",
         "PasswordParam": "/medialive/examplecorp1"
      },
      {
         "Url": "https://198.51.100.54/fillervideos/oceanwaves.mp4",
         "Username": "examplecorp",
         "PasswordParam": "examplecorp2"
      }
   ],
   "Type": "URL_PULL"
}
```

Output:

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

- **Arn** for the input. The last part of the ARN is the unique input ID.
- **Attached Channels**, which is always empty for a newly created input.
- **Destinations**, which is empty in this example because it is used only with a PUSH input.
- **Id** for the input, the same as the ID in the ARN.
- **MediaConnectFlows**, which is empty in this example because it is used only with an input
of type MediaConnect.SecurityGroups, which is empty in this example because it is used only with a PUSH input. State of this input. Tags, which is empty (the default for this parameter).

For more information, see Creating an Input in the AWS Elemental MediaLive User Guide.
- For API details, see CreateInput in AWS CLI Command Reference.

MediaPackage examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-channel

The following code example shows how to use create-channel.

AWS CLI

To create a channel

The following create-channel command creates a channel named sportschannel in the current account.

```
aws mediapackage create-channel --id sportschannel
```

Output:
```json
{
  "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
  "HlsIngest": {
    "IngestEndpoints": [
      {
        "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
        "Password": "generatedwebdavpassword1",
        "Url": "https://f31c86aed53b815a.mediapackage.us-west-2.amazonaws.com/in/v2/6d345804ec3f46c9b454a91d4a80d0e0/6d345804ec3f46c9b454a91d4a80d0e0/channel",
        "Username": "generatedwebdavusername1"
      },
      {
        "Id": "2daa32878af24803b24183727211b8ff",
        "Password": "generatedwebdavpassword2",
        "Url": "https://6ebbe7e04c4b0afa.mediapackage.us-west-2.amazonaws.com/in/v2/6d345804ec3f46c9b454a91d4a80d0e0/2daa32878af24803b24183727211b8ff/channel",
        "Username": "generatedwebdavusername2"
      }
    ],
    "Id": "sportschannel",
    "Tags": {
      "region": "west"
    }
  }
}
```

For more information, see [Creating a Channel](https://docs.aws.amazon.com/media-package/latest/UserGuide/) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [CreateChannel](https://docs.aws.amazon.com/cli/latest/reference/mediapackage/create-channel.html) in *AWS CLI Command Reference*.

### create-origin-endpoint

The following code example shows how to use create-origin-endpoint.

**AWS CLI**

**To create an origin endpoint**

The following `create-origin-endpoint` command creates an origin endpoint named cmafsports with the package settings provided in a JSON file and specified endpoint settings.
aws mediapackage create-origin-endpoint \
   --channel-id sportschannel \
   --id cmafsports \
   --cmaf-package file://file/path/cmafpkg.json --description "cmaf output of sports" \
   --id cmaf_sports \
   --manifest-name sports_channel \
   --startover-window-seconds 300 \
   --tags region=west,media=sports \
   --time-delay-seconds 10

Output:

```json
{
    "Arn": "arn:aws:mediapackage:us-west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
    "ChannelId": "sportschannel",
    "CmafPackage": {
        "HlsManifests": [
            {
                "AdMarkers": "PASSTHROUGH",
                "Id": "cmaf_sports_endpoint",
                "IncludeIframeOnlyStream": true,
                "ManifestName": "index",
                "PlaylistType": "EVENT",
                "PlaylistWindowSeconds": 300,
                "ProgramDateTimeIntervalSeconds": 300,
                "Url": "https://c4af3793bf76b33c.mediapackage.us-west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/index.m3u8"
            }
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },
    "Description": "cmaf output of sports",
    "Id": "cmaf_sports",
    "ManifestName": "sports_channel",
    "StartoverWindowSeconds": 300,
    "Tags": {
        "region": "west",
        "media": "sports"
    }
}```
For more information, see Creating an Endpoint in the AWS Elemental MediaPackage User Guide.

- For API details, see CreateOriginEndpoint in AWS CLI Command Reference.

**delete-channel**

The following code example shows how to use delete-channel.

**AWS CLI**

**To delete a channel**

The following delete-channel command deletes the channel named test.

```
aws mediapackage delete-channel \
--id test
```

This command produces no output.

For more information, see Deleting a Channel in the AWS Elemental MediaPackage User Guide.

- For API details, see DeleteChannel in AWS CLI Command Reference.

**delete-origin-endpoint**

The following code example shows how to use delete-origin-endpoint.

**AWS CLI**

**To delete an origin endpoint**

The following delete-origin-endpoint command deletes the origin endpoint named tester2.

```
aws mediapackage delete-origin-endpoint \
--id tester2
```
For more information, see Deleting an Endpoint in the AWS Elemental MediaPackage User Guide.

- For API details, see DeleteOriginEndpoint in AWS CLI Command Reference.

describe-channel

The following code example shows how to use describe-channel.

AWS CLI

To describe a channel

The following describe-channel command displays all of the details of the channel named test.

```
aws mediapackage describe-channel \
   --id test
```

Output:

```
{
   "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/584797f1740548c389a273585dd22a63",
   "HlsIngest": {  
       "IngestEndpoints": [  
           {  
               "Id": "584797f1740548c389a273585dd22a63",
               "Password": "webdavgeneratedpassword1",
               "Url": "https://9be9c4405c474882.mediapackage.us-west-2.amazonaws.com/in/v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
               "Username": "webdavgeneratedusername1"
           },  
           {  
               "Id": "7d187c86616fd455f88aaa5a9f9c74442",
               "Password": "webdavgeneratedpassword2",
               "Url": "https://7bf454c57220328d.mediapackage.us-west-2.amazonaws.com/in/v2/584797f1740548c389a273585dd22a63/7d187c86616fd455f88aaa5a9f9c74442/channel",
               "Username": "webdavgeneratedusername2"
           }
       ]
   }
},
```
For more information, see Viewing Channel Details<https://docs.aws.amazon.com/mediapackage/latest/ug/channels-view.html> in the AWS Elemental MediaPackage User Guide

- For API details, see DescribeChannel in AWS CLI Command Reference.

**describe-origin-endpoint**

The following code example shows how to use describe-origin-endpoint.

**AWS CLI**

*To describe an origin endpoint*

The following describe-origin-endpoint command displays all of the details of the origin endpoint named cmaf_sports.

```
aws mediapackage describe-origin-endpoint \
   --id cmaf_sports
```

Output:

```
{
   "Arn": "arn:aws:mediapackage:us-west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
   "ChannelId": "sportschannel",
   "CmafPackage": {
      "HlsManifests": [
         {
            "AdMarkers": "NONE",
            "Id": "cmaf_sports_endpoint",
            "IncludeIframeOnlyStream": false,
            "PlaylistType": "EVENT",
            "PlaylistWindowSeconds": 60,
            "ProgramDateTimeIntervalSeconds": 0,
            "Url": "https://c4af3793bf76b33c.mediapackage.us-west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/index.m3u8"
         }
      ]
   }
}
```
For more information, see [Viewing a Single Endpoint](#) in the [AWS Elemental MediaPackage User Guide](#).

- For API details, see [DescribeOriginEndpoint](#) in [AWS CLI Command Reference](#).

### list-channels

The following code example shows how to use `list-channels`.

**AWS CLI**

**To list all channels**

The following `list-channels` command lists all of the channels that are configured on the current AWS account.

```
aws mediapackage list-channels
```

**Output:**

```
{
    "Channels": [
    {
        "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/584797f1740548c389a273585dd22a63",
        "HlsIngest": {
            "IngestEndpoints": [
```
For more information, see [Viewing Channel Details](#) in the **AWS Elemental MediaPackage User Guide**.

- For API details, see [ListChannels](#) in **AWS CLI Command Reference**.

### list-origin-endpoints

The following code example shows how to use `list-origin-endpoints`.

**AWS CLI**

**To list all origin-endpoints on a channel**

The following `list-origin-endpoints` command lists all of the origin endpoints that are configured on the channel named test.

```bash
aws mediapackage list-origin-endpoints \
  --channel-id test
```
Output:

```json
{
   "OriginEndpoints": [
   {
      "Arn": "arn:aws:mediapackage:us-west-2:111222333:origin_endpoints/247cff871f2845d3805129be22f2c0a2",
      "ChannelId": "test",
      "DashPackage": {
         "ManifestLayout": "FULL",
         "ManifestWindowSeconds": 60,

"Whitelist": []
}

For more information, see Viewing all Endpoints Associated with a Channel in the AWS Elemental MediaPackage User Guide.

- For API details, see ListOriginEndpoints in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list the tags assigned to a resource

The following list-tags-for-resource command lists the tags that are assigned to the specified resource.

```
aws mediapackage list-tags-for-resource \
  --resource-arn arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0
```

Output:

```json
{
```
For more information, see Tagging Resources in AWS Elemental MediaPackage in the AWS Elemental MediaPackage User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**rotate-ingest-endpoint-credentials**

The following code example shows how to use rotate-ingest-endpoint-credentials.

**AWS CLI**

**To rotate ingest credentials**

The following rotate-ingest-endpoint-credentials command rotates the WebDAV username and password for the specified ingest endpoint.

```bash
aws mediapackage rotate-ingest-endpoint-credentials \
    --id test \
    --ingest-endpoint-id 584797f1740548c389a273585dd22a63
```

**Output:**

```json
{
    "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/584797f1740548c389a273585dd22a63",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "584797f1740548c389a273585dd22a63",
                "Password": "webdavregeneratedpassword1",
                "Url": "https://9be9c4405c474882.mediapackage.us-west-2.amazonaws.com/in/v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
                "Username": "webdavregeneratedusername1"
            },
            {
                "Id": "7d187c8616fd455f88aaa5a0fcf74442",
                "Password": "webdavgeneratedpassword2",
```
For more information, see Rotating Credentials on an Input URL in the AWS Elemental MediaPackage User Guide.

- For API details, see RotateIngestEndpointCredentials in AWS CLI Command Reference.

### tag-resource

The following code example shows how to use tag-resource.

**AWS CLI**

**To add a tag to a resource**

The following tag-resource commands adds a region=west key and value pair to the specified resource.

```bash
aws mediapackage tag-resource \
   --resource-arn arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
   --tags region=west
```

This command produces no output.

For more information, see Tagging Resources in AWS Elemental MediaPackage in the AWS Elemental MediaPackage User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

### untag-resource

The following code example shows how to use untag-resource.
AWS CLI

To remove a tag from a resource

The following untag-resource command removes the tag with the key region from the specified channel.

```bash
aws mediapackage untag-resource \
  --resource-arn arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
  --tag-keys region
```

For more information, see Tagging Resources in AWS Elemental MediaPackage in the AWS Elemental MediaPackage User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-channel

The following code example shows how to use update-channel.

AWS CLI

To update a channel

The following update-channel command updates the channel named sportschannel to include the description 24x7 sports.

```bash
aws mediapackage update-channel \
  --id sportschannel \
  --description "24x7 sports"
```

Output:

```json
{
  "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
  "Description": "24x7 sports",
  "HlsIngest": {
    "IngestEndpoints": [
      {
        "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
        "Password": "generatedwebdavpassword1",
```
For more information, see Editing a Channel in the AWS Elemental MediaPackage User Guide.

- For API details, see UpdateChannel in AWS CLI Command Reference.

**update-origin-endpoint**

The following code example shows how to use update-origin-endpoint.

**AWS CLI**

To update an origin endpoint

The following update-origin-endpoint command updates the origin endpoint named cmaf_sports. It changes the time delay to 0 seconds.

```bash
aws mediapackage update-origin-endpoint
   --id cmaf_sports
   --time-delay-seconds 0
```

Output:

```json
{
   "Arn": "arn:aws:mediapackage:us-west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
}
```
For more information, see Editing an Endpoint in the AWS Elemental MediaPackage User Guide.

- For API details, see UpdateOriginEndpoint in AWS CLI Command Reference.

**MediaPackage VOD examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage VOD.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-asset

The following code example shows how to use create-asset.

AWS CLI

To create an asset

The following create-asset example creates an asset named Chicken_Asset in the current AWS account. The asset ingests the file 30sec_chicken.smil to MediaPackage.

```
aws mediapackage-vod create-asset \\
   --id chicken_asset \\
   --packaging-group-id hls_chicken_gp \\
   --source-role-arn arn:aws:iam::111122223333:role/EMP_Vod \\
   --source-arn arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil
```

Output:

```
{
   "Id":"chicken_asset",
   "PackagingGroupId":"hls_chicken_gp",
   "SourceArn":"arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
   "SourceRoleArn":"arn:aws:iam::111122223333:role/EMP_Vod",
   "EgressEndpoints":[
      {
         "PackagingConfigurationId":"New_config_1",
         "Url":"https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-vod.us-west-2.amazonaws.com/out/
      }
   ]
}```
create-packaging-configuration

The following code example shows how to use create-packaging-configuration.

AWS CLI

To create a packaging configuration

The following create-packaging-configuration example creates a packaging configuration named new_hls in the packaging group named hls_chicken. This example uses a file on disk named hls_pc.json to provide the details.

```
aws mediapackage-vod create-packaging-configuration \
  --id new_hls \
  --packaging-group-id hls_chicken \
  --hls-package file://hls_pc.json
```

Contents of hls_pc.json:

```
{
  "HlsManifests": [ 
    {
      "AdMarkers":"NONE",
      "IncludeIframeOnlyStream":false,
      "ManifestName":"string",
      "ProgramDateTimeIntervalSeconds":60,
    }
  ]
}
```

For more information, see Ingest an Asset in the AWS Elemental MediaPackage User Guide.
• For API details, see CreateAsset in AWS CLI Command Reference.
"RepeatExtXKey":true,
"StreamSelection":{
  "MaxVideoBitsPerSecond":1000,
  "MinVideoBitsPerSecond":0,
  "StreamOrder":"ORIGINAL"
}
],
"SegmentDurationSeconds":6,
"UseAudioRenditionGroup":false
}

Output:

{
  "Id":"new_hls",
  "PackagingGroupId":"hls_chicken",
  "HlsManifests":{
    "SegmentDurationSeconds":6,
    "UseAudioRenditionGroup":false,
    "HlsMarkers":[
      {
        "AdMarkers":"NONE",
        "IncludeIframeOnlyStream":false,
        "ManifestName":"string",
        "ProgramDateTimeIntervalSeconds":60,
        "RepeatExtXKey":true,
        "StreamSelection":{
          "MaxVideoBitsPerSecond":1000,
          "MinVideoBitsPerSecond":0,
          "StreamOrder":"ORIGINAL"
        }
      }
    ]
  }
}

For more information, see Creating a Packaging Configuration in the AWS Elemental MediaPackage User Guide.

- For API details, see CreatePackagingConfiguration in AWS CLI Command Reference.
create-packaging-group

The following code example shows how to use create-packaging-group.

AWS CLI

To create a packaging group

The following create-packaging-group example lists all of the packaging groups that are configured in the current AWS account.

```bash
aws mediapackage-vod create-packaging-group \
   --id hls_chicken
```

Output:

```json
{
   "Id": "hls_chicken"
}
```

For more information, see Creating a Packaging Group in the AWS Elemental MediaPackage User Guide.

- For API details, see CreatePackagingGroup in AWS CLI Command Reference.

delete-asset

The following code example shows how to use delete-asset.

AWS CLI

To delete an asset

The following delete-asset example deletes the asset named 30sec_chicken.

```bash
aws mediapackage-vod delete-asset \
   --id 30sec_chicken
```

This command produces no output.

For more information, see Deleting an Asset in the AWS Elemental MediaPackage User Guide.
For API details, see `DeleteAsset` in *AWS CLI Command Reference*.

**delete-packaging-configuration**

The following code example shows how to use `delete-packaging-configuration`.

**AWS CLI**

**To delete a packaging configuration**

The following `delete-packaging-configuration` example deletes the packaging configuration named **CMAF**.

```
aws mediapackage-vod delete-packaging-configuration \
  --id CMAF
```

This command produces no output.

For more information, see [Deleting a Packaging Configuration](https://docs.aws.amazon.com/mediapackage/latest/userguide/ deleted-packaging-configuration.html) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see `DeletePackagingConfiguration` in *AWS CLI Command Reference*.

**delete-packaging-group**

The following code example shows how to use `delete-packaging-group`.

**AWS CLI**

**To delete a packaging group**

The following `delete-packaging-group` example deletes the packaging group named **Dash_widevine**.

```
aws mediapackage-vod delete-packaging-group \
  --id Dash_widevine
```

This command produces no output.

For more information, see [Deleting a Packaging Group](https://docs.aws.amazon.com/mediapackage/latest/userguide/deleted-packaging-group.html) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see `DeletePackagingGroup` in *AWS CLI Command Reference*. 
describe-asset

The following code example shows how to use describe-asset.

AWS CLI

To describe an asset

The following describe-asset example displays all of the details of the asset named 30sec_chicken.

```
aws mediapackage-vod describe-asset \
  --id 30sec_chicken
```

Output:

```
{
  "Id":"30sec_chicken",
  "PackagingGroupId":"Packaging_group_1",
  "SourceArn":"arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
  "SourceRoleArn":"arn:aws:iam::111122223333:role/EMP_Vod",
  "EgressEndpoints":[
    {

  ]
}
```
For more information, see Viewing Asset Details in the AWS Elemental MediaPackage User Guide.

- For API details, see DescribeAsset in AWS CLI Command Reference.

describe-packaging-configuration

The following code example shows how to use describe-packaging-configuration.

AWS CLI

To describe a packaging configuration

The following describe-packaging-configuration example displays all of the details of the packaging configuration named DASH.

```bash
aws mediapackage-vod describe-packaging-configuration \
--id DASH
```

Output:

```json
{
   "Id":"DASH",
   "PackagingGroupId":"Packaging_group_1",
   "DashPackage": [
      {
          "SegmentDurationSeconds": "2"
      },
      {
          "DashManifests": {
              "ManifestName": "index",
              "MinBufferTimeSeconds": "30",
              "Profile": "NONE"
          }
      }
   ]
}
```
For more information, see [Viewing Packaging Configuration Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribePackagingConfiguration](#) in *AWS CLI Command Reference*.

**describe-packaging-group**

The following code example shows how to use `describe-packaging-group`.

**AWS CLI**

**To describe a packaging group**

The following `describe-packaging-group` example displays all of the details of the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod describe-packaging-group \
   --id Packaging_group_1
```

Output:

```
{
   "Id": "Packaging_group_1"
}
```

For more information, see [Viewing Packaging Group Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribePackagingGroup](#) in *AWS CLI Command Reference*.

**list-assets**

The following code example shows how to use `list-assets`.

**AWS CLI**

**To list all assets**

The following `list-assets` example lists all of the assets that are configured in the current AWS account.
aws mediapackage-vod list-assets

Output:

```json
{
    "Assets": [
        {
            "Id": "30sec_chicken",
            "PackagingGroupId": "Packaging_group_1",
            "SourceArn": "arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
            "SourceRoleArn": "arn:aws:iam::111122223333:role/EMP_Vod"
        }
    ]
}
```

For more information, see Viewing Asset Details in the AWS Elemental MediaPackage User Guide.
- For API details, see ListAssets in AWS CLI Command Reference.

**list-packaging-configurations**

The following code example shows how to use list-packaging-configurations.

**AWS CLI**

**To list all packaging configurations**

The following list-packaging-configurations example lists all of the packaging configurations that are configured on the packaging group named Packaging_group_1.

```
aws mediapackage-vod list-packaging-configurations \ 
--packaging-group-id Packaging_group_1
```

Output:

```json
{
    "PackagingConfigurations": [
        {
            "Id": "CMAF",

For more information, see Viewing Packaging Configuration Details in the AWS Elemental MediaPackage User Guide.

- For API details, see ListPackagingConfigurations in AWS CLI Command Reference.

`list-packaging-groups`

The following code example shows how to use list-packaging-groups.

**AWS CLI**

**To list all packaging groups**

The following list-packaging-groups example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod list-packaging-groups
```

Output:

```
{
   "PackagingGroups": [
   {
      "Id": "Dash_widevine"
   },
   {
      "Id": "Encrypted_HLS"
   },
   {
      "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/Packaging_group_1",
      "Id": "Packaging_group_1"
   }
   ]
}
```
For more information, see Viewing Packaging Group Details in the AWS Elemental MediaPackage User Guide.

- For API details, see ListPackagingGroups in AWS CLI Command Reference.

MediaStore Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore Data Plane.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**delete-object**

The following code example shows how to use delete-object.

**AWS CLI**

**To delete an object**

The following delete-object example deletes the specified object.

```
aws mediastore-data delete-object \
    --endpoint=https://aaabbbccddddee.data.mediastore.us-west-2.amazonaws.com \
    --path=/folder_name/README.md
```

This command produces no output.
For more information, see Deleting an Object in the AWS Elemental MediaStore User Guide.

- For API details, see DeleteObject in AWS CLI Command Reference.

describe-object

The following code example shows how to use describe-object.

AWS CLI

To view the headers for an object

The following describe-object example displays the headers for an object at the specified path.

```
aws mediastore-data describe-object \
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \
  --path events/baseball/setup.jpg
```

Output:

```
{
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentLength": "3860266",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f55555555555da6d3"
}
```

For more information, see Viewing the Details of an Object in the AWS Elemental MediaStore User Guide.

- For API details, see DescribeObject in AWS CLI Command Reference.

get-object

The following code example shows how to use get-object.

AWS CLI

Example 1: To download an entire object

The following get-object example downloads the specified object.
aws mediastore-data get-object \
   --endpoint https://aaabbbccddee.data.mediastore.us-west-2.amazonaws.com \
   --path events/baseball/setup.jpg setup.jpg

Output:

```
{
    "ContentType": "image/jpeg",
    "StatusCode": 200,
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f5555555555da6d3",
    "ContentLength": "3860266",
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT"
}
```

**Example 2: To download part of an object**

The following get-object example downloads the specified part of an object.

```bash
aws mediastore-data get-object \
   --endpoint https://aaabbbccddee.data.mediastore.us-west-2.amazonaws.com \
   --path events/baseball/setup.jpg setup.jpg \
   --range "bytes=0-100"
```

Output:

```
{
    "StatusCode": 206,
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentRange": "bytes 0-100/3860266",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f5555555555da6d3",
    "ContentLength": "101"
}
```

For more information, see [Downloading an Object](https://docs.aws.amazon.com/mediastore/latest/devguide/download-object.html) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetObject](https://docs.aws.amazon.com/cli/latest/reference/mediastore-data/get-object.html) in *AWS CLI Command Reference*.

**list-items**

The following code example shows how to use list-items.
AWS CLI

Example 1: To view a list of items (objects and folders) stored in a container

The following list-items example displays a list of items (objects and folders) stored in the specified container.

```
aws mediastore-data list-items \
    --endpoint https://aaabbbccccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{
    "Items": [
        {
            "Type": "OBJECT",
            "ContentLength": 3784,
            "Name": "setup.jpg",
            "ETag": "2aa333bb8d8d22d777e999c88d4aa9eeeee4dd89ff7f5555555555555da6d3",
            "ContentType": "image/jpeg",
            "LastModified": 1563571859.379
        },
        {
            "Type": "FOLDER",
            "Name": "events"
        }
    ]
}
```

Example 2: To view a list of items (objects and folders) stored in a folder

The following list-items example displays a list of items (objects and folders) stored in the specified folder.

```
aws mediastore-data list-items \
    --endpoint https://aaabbbccccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball
```

Output:

```
{
```

Actions and scenarios

4691
For more information, see [Viewing a List of Objects](#) in the [AWS Elemental MediaStore User Guide](#).

- For API details, see [ListItems](#) in [AWS CLI Command Reference](#).

**put-object**

The following code example shows how to use put-object.

**AWS CLI**

**Example 1: To upload an object to a container**

The following put-object example upload an object to the specified container.

```
aws mediastore-data put-object \
  --endpoint https://aaabbbccdde.data.mediastore.us-west-2.amazonaws.com \
  --body ReadMe.md \n  --path ReadMe.md \n  --cache-control "max-age=6, public" \n  --content-type binary/octet-stream
```

Output:

```
{
  "ContentSHA256": "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
  "StorageClass": "TEMPORAL",
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f5555555555555da6d3"
}```
Example 2: To upload an object to a folder within a container

The following put-object example upload an object to the specified folder within a container.

```
aws mediastore-data put-object \
    --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \
    --body ReadMe.md \
    --path /september-events/ReadMe.md \
    --cache-control "max-age=6, public" \
    --content-type binary/octet-stream
```

Output:

```
{
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f5555555555555da6d3",
    "ContentSHA256": "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
    "StorageClass": "TEMPORAL"
}
```

For more information, see [Uploading an Object](https://aws.amazon.com) in the AWS Elemental MediaStore User Guide.

- For API details, see [PutObject](https://aws.amazon.com) in [AWS CLI Command Reference](https://aws.amazon.com).

### MediaTailor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaTailor.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Actions

delete-playback-configuration

The following code example shows how to use delete-playback-configuration.

AWS CLI

To delete a configuration

The following delete-playback-configuration deletes a configuration named campaign_short.

```bash
aws mediatailor delete-playback-configuration \ 
--name campaign_short
```

This command produces no output.

For more information, see Deleting a Configuration in the AWS Elemental MediaTailor User Guide.
- For API details, see DeletePlaybackConfiguration in AWS CLI Command Reference.

get-playback-configuration

The following code example shows how to use get-playback-configuration.

AWS CLI

To describe a configuration

The following get-playback-configuration displays all of the details of the configuration named west_campaign.

```bash
aws mediatailor get-playback-configuration \ 
--name west_campaign
```

Output:
For more information, see Viewing a Configuration in the AWS Elemental MediaTailor User Guide.

- For API details, see GetPlaybackConfiguration in AWS CLI Command Reference.

list-playback-configurations

The following code example shows how to use list-playback-configurations.

AWS CLI

To list all configurations

The following list-playback-configurations displays all of the details of the configuration on the current AWS account.
aws mediatailor list-playback-configurations

Output:

```json
{
  "Items": [
    {
      "AdDecisionServerUrl": "http://your.ads.url",
      "CdnConfiguration": {},

    }
  ]
}
```
For more information, see Viewing a Configuration<https://docs.aws.amazon.com/mediatailor/latest/ug/configurations-view.html> in the AWS Elemental MediaTailor User Guide.

- For API details, see ListPlaybackConfigurations in AWS CLI Command Reference.

**put-playback-configuration**

The following code example shows how to use put-playback-configuration.

**AWS CLI**

**To create a configuration**

The following put-playback-configuration creates a configuration named campaign_short.

```bash
aws mediatailor put-playback-configuration \
  --name campaign_short \
  --ad-decision-server-url http://your.ad.url \
  --video-content-source-url http://video.bucket/index.m3u8
```
Output:

```json
{
    "AdDecisionServerUrl": "http://your.ads.url",
    "CdnConfiguration": {},
    "DashConfiguration": {
        "ManifestEndpointPrefix":
            "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/dash/1c3bf6aebc69778e0c167d0505a2bc57da2b1754/campaign_short/",

copy-snapshot

The following code example shows how to use copy-snapshot.

AWS CLI

To copy a snapshot

The following copy-snapshot example creates a copy of a snapshot.

```
aws memorydb copy-snapshot \
    --source-snapshot-name my-cluster-snapshot \
    --target-snapshot-name my-cluster-snapshot-copy
```

Output

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot-copy",
        "Status": "creating",
        "Source": "manual",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": "",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
```
"ParameterGroupName": "default.memorydb-redis6",
"SubnetGroupName": "my-sg",
"VpcId": "vpc-xx2574fc",
"SnapshotRetentionLimit": 0,
"SnapshotWindow": "04:30-05:30",
"NumShards": 2
}
}
}

For more information, see [Copying a snapshot](https://aws.amazon.com/memcached-user-guide/) in the *MemoryDB User Guide*.

- For API details, see [CopySnapshot](https://aws.amazon.com/cli/command-reference/) in *AWS CLI Command Reference*.

### create-acl

The following code example shows how to use create-acl.

**AWS CLI**

**To create an ACL**

The following `create-acl` example creates a new Access control list.

```
aws memorydb create-acl \
   --acl-name "new-acl-1" \ 
   --user-names "my-user"
```

**Output:**

```
{
   "ACL": {
      "Name": "new-acl-1",
      "Status": "creating",
      "UserNames": [ "my-user"
      ],
      "MinimumEngineVersion": "6.2",
      "Clusters": []
    
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/new-acl-1"
   }
}
```
For more information, see Authenticating users with Access Control Lists in the MemoryDB User Guide.

- For API details, see CreateAcl in AWS CLI Command Reference.

**create-cluster**

The following code example shows how to use create-cluster.

**AWS CLI**

**To create a cluster**

The following create-cluster example creates a new cluster.

```bash
aws memorydb create-cluster \
    --cluster-name my-new-cluster \
    --node-type db.r6g.large \
    --acl-name my-acl \
    --subnet-group my-sg
```

**Output:**

```
{
    "Cluster": {
        "Name": "my-new-cluster",
        "Status": "creating",
        "NumberOfShards": 1,
        "AvailabilityMode": "MultiAZ",
        "ClusterEndpoint": {
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SubnetGroupName": "my-sg",
        "TLSDisabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxxx:cluster/my-new-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "sat:10:00-sat:11:00",
        "SnapshotWindow": "07:30-08:30",
    }
}
"ACLName": "my-acl",
"AutoMinorVersionUpgrade": true
}

For more information, see Managing Clusters in the MemoryDB User Guide.

- For API details, see CreateCluster in AWS CLI Command Reference.

create-parameter-group

The following code example shows how to use create-parameter-group.

AWS CLI

To create a parameter group

The following create-parameter-group example creates a parameter group.

```
aws memorydb create-parameter-group \
   --parameter-group-name myRedis6x \
   --family memorydb_redis6 \
   --description "my-parameter-group"
```

Output:

```
{
   "ParameterGroup": {
      "Name": "myredis6x",
      "Family": "memorydb_redis6",
      "Description": "my-parameter-group",
      "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/myredis6x"
   }
}
```

For more information, see Creating a parameter group in the MemoryDB User Guide.

- For API details, see CreateParameterGroup in AWS CLI Command Reference.

create-snapshot

The following code example shows how to use create-snapshot.
AWS CLI

To create a snapshot

The following create-snapshot example creates a snapshot.

```bash
aws memorydb create-snapshot \
    --cluster-name my-cluster \
    --snapshot-name my-cluster-snapshot
```

Output:

```json
{
    "Snapshot": {
        "Name": "my-cluster-snapshot1",
        "Status": "creating",
        "Source": "manual",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": "",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862xxxxx",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see [Making manual snapshots](#) in the *MemoryDB User Guide*.

- For API details, see [CreateSnapshot](#) in *AWS CLI Command Reference*.

create-subnet-group

The following code example shows how to use create-subnet-group.
AWS CLI

To create a subnet group

The following `create-subnet-group` example creates a subnet group.

```
aws memorydb create-subnet-group \
    --subnet-group-name mysubnetgroup \
    --description "my subnet group" \ 
    --subnet-ids subnet-5623xxxx
```

Output:

```
{
    "SubnetGroup": {
        "Name": "mysubnetgroup",
        "Description": "my subnet group",
        "VpcId": "vpc-86257xxx",
        "Subnets": [
            {
                "Identifier": "subnet-5623xxxx",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"
    }
}
```

For more information, see Creating a subnet group in the MemoryDB User Guide.

- For API details, see CreateSubnetGroup in AWS CLI Command Reference.

create-user

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example creates a new user.
aws memorydb create-user \
--user-name user-name-1 \
--access-string "~objects:* ~items:* ~public:*" \
--authentication-mode \n   Passwords="enterapasswordhere",Type=password

Output:

{   "User": {     "Name": "user-name-1",     "Status": "active",     "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",     "ACLNames": [],     "MinimumEngineVersion": "6.2",     "Authentication": {       "Type": "password",       "PasswordCount": 1     },     "ARN": "arn:aws:memorydb:us-west-2:491658xxxxx:user/user-name-1"   } }

For more information, see [Authenticating users with Access Control Lists](#) in the MemoryDB User Guide.

- For API details, see [CreateUser](#) in AWS CLI Command Reference.

delete-acl

The following code example shows how to use delete-acl.

AWS CLI

To delete an ACL

The following delete-acl example deletes an Access control list.

aws memorydb delete-acl \
   --acl-name "new-acl-1"

Output:
For more information, see Authenticating users with Access Control Lists in the MemoryDB User Guide.

- For API details, see DeleteAcl in AWS CLI Command Reference.

**delete-cluster**

The following code example shows how to use delete-cluster.

**AWS CLI**

To delete a cluster

The following delete-cluster example deletes a cluster.

```bash
aws memorydb delete-cluster \
   --cluster-name my-new-cluster
```

Output:

```json
{
   "Cluster": {
      "Name": "my-new-cluster",
      "Status": "deleting",
      "NumberOfShards": 1,
      "ClusterEndpoint": {
         "Address": "clustercfg.my-new-cluster.xxxxx.memorydb.us-east-1.amazonaws.com",
```
For more information, see Deleting a cluster in the MemoryDB User Guide.

- For API details, see DeleteCluster in AWS CLI Command Reference.

delete-parameter-group

The following code example shows how to use delete-parameter-group.

AWS CLI

To delete a parameter group

The following delete-parameter-group example deletes a parameter group.

```bash
aws memorydb delete-parameter-group \\
    --parameter-group-name myRedis6x
```

Output:

```json
{
    "ParameterGroup": {
        "Name": "myredis6x",
        "Family": "memorydb_redis6",
        "Description": "my-parameter-group",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/myredis6x"
    }
}
```
For more information, see [Deleting a parameter group](http://aws.amazon.com) in the *MemoryDB User Guide*.

- For API details, see [DeleteParameterGroup](http://aws.amazon.com) in *AWS CLI Command Reference*.

### delete-snapshot

The following code example shows how to use `delete-snapshot`.

**AWS CLI**

#### To delete a snapshot

The following `delete-snapshot` example deletes a snapshot.

```bash
aws memorydb delete-snapshot \
   --snapshot-name my-cluster-snapshot
```

**Output:**

```json
{
   "Snapshot": {
      "Name": "my-cluster-snapshot",
      "Status": "deleting",
      "Source": "manual",
      "ClusterConfiguration": {
         "Name": "my-cluster",
         "Description": "",
         "NodeType": "db.r6g.large",
         "EngineVersion": "6.2",
         "MaintenanceWindow": "wed:03:00-wed:04:00",
         "Port": 6379,
         "ParameterGroupName": "default.memorydb-redis6",
         "SubnetGroupName": "my-sg",
         "VpcId": "vpc-862xxxxc",
         "SnapshotRetentionLimit": 0,
         "SnapshotWindow": "04:30-05:30",
         "NumShards": 2
      }
   }
}
```
For more information, see [Deleting a snapshot](#) in the *MemoryDB User Guide*.

- For API details, see [DeleteSnapshot](#) in *AWS CLI Command Reference*.

### delete-subnet-group

The following code example shows how to use delete-subnet-group.

**AWS CLI**

To delete a subnet group

The following `delete-subnet-group` example deletes a subnet.

```
aws memorydb delete-subnet-group \\
    --subnet-group-name mysubnetgroup
```

**Output:**

```
{
   "SubnetGroup": {
     "Name": "mysubnetgroup",
     "Description": "my subnet group",
     "VpcId": "vpc-86xxxx4fc",
     "Subnets": [
       {
         "Identifier": "subnet-56xxx61b",
         "AvailabilityZone": {
           "Name": "us-east-1a"
         }
       },
       {
         "Identifier": "subnet-56xxx61b",
         "AvailabilityZone": {
           "Name": "us-east-1b"
         }
       }
     ],
     "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"
   }
}
```

For more information, see [Deleting a subnet group](#) in the *MemoryDB User Guide*.
- For API details, see DeleteSubnetGroup in AWS CLI Command Reference.

**delete-user**

The following code example shows how to use delete-user.

**AWS CLI**

**To delete a user**

The following `delete-user` example deletes a user.

```bash
aws memorydb delete-user \\
    --user-name my-user
```

Output:

```json
{
    "User": {
        "Name": "my-user",
        "Status": "deleting",
        "AccessString": "on ~app::* resetchannels -@all +@read",
        "ACLNames": [
            "my-acl"
        ],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
        },
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the MemoryDB User Guide.

- For API details, see DeleteUser in AWS CLI Command Reference.

**describe-acls**

The following code example shows how to use describe-acls.
AWS CLI

To return a list of ACLs

The following describe-acls returns a list of ACLs.

```
aws memorydb describe-acls
```

Output:

```json
{
   "ACLs": [
       {
         "Name": "open-access",
         "Status": "active",
         "UserNames": ["default"],
         "MinimumEngineVersion": "6.2",
         "Clusters": [],
         "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/open-access"
       },
       {
         "Name": "my-acl",
         "Status": "active",
         "UserNames": [],
         "MinimumEngineVersion": "6.2",
         "Clusters": ["my-cluster"],
         "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxxx:acl/my-acl"
       }
   ]
}
```

For more information, see [Authenticating users with Access Control Lists](https://docs.aws.amazon.com/memorydb/latest/userguide/mdb-authenticate-users.html) in the MemoryDB User Guide.

- For API details, see [DescribeAcls](https://docs.aws.amazon.com/cli/latest/reference/memorydb/describe-acls.html) in AWS CLI Command Reference.

**describe-clusters**

The following code example shows how to use describe-clusters.
To return a list of clusters

The following describe-clusters returns a list of clusters.

```bash
aws memorydb describe-clusters
```

Output:

```json
{
  "Clusters": [
    {
      "Name": "my-cluster",
      "Status": "available",
      "NumberOfShards": 2,
      "ClusterEndpoint": {
        "Address": "clustercfg.my-cluster.llru6f.memorydb.us-east-1.amazonaws.com",
        "Port": 6379
      },
      "NodeType": "db.r6g.large",
      "EngineVersion": "6.2",
      "EnginePatchVersion": "6.2.6",
      "ParameterGroupName": "default.memorydb-redis6",
      "ParameterGroupStatus": "in-sync",
      "SecurityGroups": [
        {
          "SecurityGroupId": "sg-0a1434xxxxxc9fae",
          "Status": "active"
        }
      ],
      "SubnetGroupName": "pat-sg",
      "TLSEnabled": true,
      "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:cluster/my-cluster",
      "SnapshotRetentionLimit": 0,
      "MaintenanceWindow": "wed:03:00-wed:04:00",
      "SnapshotWindow": "04:30-05:30",
      "ACLName": "my-acl",
      "AutoMinorVersionUpgrade": true
    }
  ]
}
```
For more information, see Managing clusters in the MemoryDB User Guide.

- For API details, see DescribeClusters in AWS CLI Command Reference.

describe-engine-versions

The following code example shows how to use describe-engine-versions.

AWS CLI

To return a list of engine versions

The following describe-engine-versions` returns a list of engine versions.

```bash
aws memorydb describe-engine-versions
```

Output:

```json
{
    "EngineVersions": [
        {
            "EngineVersion": "6.2",
            "EnginePatchVersion": "6.2.6",
            "ParameterGroupFamily": "memorydb_redis6"
        }
    ]
}
```

For more information, see Engine versions and upgrading in the MemoryDB User Guide.

- For API details, see DescribeEngineVersions in AWS CLI Command Reference.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To return a list of events

The following describe-events` returns a list of events.

```bash
aws memorydb describe-events
```
Output:

```json
{
    "Events": [
        {
            "SourceName": "my-cluster",
            "SourceType": "cluster",
            "Message": "Increase replica count started for replication group my-cluster on 2022-07-22T14:09:01.440Z",
            "Date": "2022-07-22T07:09:01.443000-07:00"
        },
        {
            "SourceName": "my-user",
            "SourceType": "user",
            "Message": "Create user my-user operation completed.",
            "Date": "2022-07-22T07:00:02.975000-07:00"
        }
    ]
}
```

For more information, see [Monitoring events](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-parameter-groups

The following code example shows how to use `describe-parameter-groups`.

**AWS CLI**

**To return a list of parameter groups**

The following `describe-parameter-groups` returns a list of parameter groups.

```
aws memorydb describe-parameter-groups
```

Output:

```json
{
    "ParameterGroups": [
        {
            "Name": "default.memorydb-redis6",
            "Family": "memorydb_redis6",
```
"Description": "Default parameter group for memorydb_redis6",
"ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/
default.memorydb-redis6"
]
}

For more information, see Configuring engine parameters using parameter groups in the MemoryDB User Guide.

- For API details, see DescribeParameterGroups in AWS CLI Command Reference.

describe-parameters

The following code example shows how to use describe-parameters.

**AWS CLI**

**To return a list of parameters**

The following describe-parameters ` returns a list of parameters.

aws memorydb describe-parameters

Output:

```json
{
   "Parameters": [
   {
  "Name": "acllog-max-len",
  "Value": "128",
  "Description": "The maximum length of the ACL Log",
  "DataType": "integer",
  "AllowedValues": "1-10000",
  "MinimumEngineVersion": "6.2.4"
  },
  {
  "Name": "activedefrag",
  "Value": "no",
  "Description": "Enabled active memory defragmentation",
  "DataType": "string",
  "AllowedValues": "yes,no",
  "MinimumEngineVersion": "6.2.4"
  }
]
}
```

},
{

describe-snapshots

The following code example shows how to use describe-snapshots.

AWS CLI

To return a list of snapshots

The following describe-snapshots returns a list of snapshots.

```bash
aws memorydb describe-snapshots
```

Output:

```json
{
 "Snapshots": [
   {
     "Name": "my-cluster-snapshot",
     "Status": "available",
     "Source": "manual",
     "ClusterConfiguration": {

```
For more information, see [Snapshot and restore](#) in the MemoryDB User Guide.

- For API details, see [DescribeSnapshots](#) in AWS CLI Command Reference.

**describe-subnet-groups**

The following code example shows how to use describe-subnet-groups.

**AWS CLI**

**To return a list of subnet groups**

The following describe-subnet-groups ` returns a list of subnet groups.

```
aws memorydb describe-subnet-groups
```

**Output**

```json
{
    "SubnetGroups": [
        
        
        
    ]
}
```
For more information, see [Subnets and subnet groups](#) in the [MemoryDB User Guide](#).

- For API details, see [DescribeSubnetGroups](#) in [AWS CLI Command Reference](#).

### describe-users

The following code example shows how to use `describe-users`.

#### AWS CLI

**To return a list of users**

The following `aws memorydb describe-users` returns a list of users.

```
aws memorydb describe-users
```

**Output**

```
{
  "Users": [
    {
      "Name": "default",
      "Status": "active",
      "AccessString": "on ~* &* +@all",
      "ACLNames": [
        "open-access"
      ],
      "Name": "us-east-1b"
    },
    {
      "Identifier": "subnet-56xxf61b",
      "AvailabilityZone": {
        "Name": "us-east-1a"
      }
    }
  ],
  "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:subnetgroup/my-sg"
}
```
For more information, see [Authenticating users with Access Control Lists](#) in the MemoryDB User Guide.

- For API details, see [DescribeUsers](#) in AWS CLI Command Reference.

### failover-shard

The following code example shows how to use `failover-shard`.

**AWS CLI**

#### To fail over a shard

The following `failover-shard` fails over a shard.

```bash
aws memorydb failover-shard \
  --cluster-name my-cluster --shard-name 0001
```

Output:

```json
{
```
"Cluster": {
    "Name": "my-cluster",
    "Status": "available",
    "NumberOfShards": 2,
    "ClusterEndpoint": {
        "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-east-1.amazonaws.com",
        "Port": 6379
    },
    "NodeType": "db.r6g.large",
    "EngineVersion": "6.2",
    "EnginePatchVersion": "6.2.6",
    "ParameterGroupName": "default.memorydb-redis6",
    "ParameterGroupStatus": "in-sync",
    "SecurityGroups": [
        {
            "SecurityGroupId": "sg-0a143xxxxx45c9fae",
            "Status": "active"
        }
    ],
    "SubnetGroupName": "my-sg",
    "TLSEnabled": true,
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster",
    "SnapshotRetentionLimit": 0,
    "MaintenanceWindow": "wed:03:00-wed:04:00",
    "SnapshotWindow": "04:30-05:30",
    "AutoMinorVersionUpgrade": true
}
}

For more information, see Minimizing downtime with MultiAZ in the MemoryDB User Guide.

- For API details, see FailoverShard in AWS CLI Command Reference.

list-allowed-node-type-updates

The following code example shows how to use list-allowed-node-type-updates.

AWS CLI

To return a list of allowed node type updates

The following list-allowed-node-type-updates returns a list of available node type updates.
aws memorydb list-allowed-node-type-updates

Output:

```json
{
  "Cluster": {
    "Name": "my-cluster",
    "Status": "available",
    "NumberOfShards": 2,
    "ClusterEndpoint": {
      "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-east-1.amazonaws.com",
      "Port": 6379
    },
    "NodeType": "db.r6g.large",
    "EngineVersion": "6.2",
    "EnginePatchVersion": "6.2.6",
    "ParameterGroupName": "default.memorydb-redis6",
    "ParameterGroupStatus": "in-sync",
    "SecurityGroups": [
      {
        "SecurityGroupId": "sg-0a143xxxxx45c9fae",
        "Status": "active"
      }
    ],
    "SubnetGroupName": "my-sg",
    "TLSenabled": true,
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxxx:cluster/my-cluster",
    "SnapshotRetentionLimit": 0,
    "MaintenanceWindow": "wed:03:00-wed:04:00",
    "SnapshotWindow": "04:30-05:30",
    "AutoMinorVersionUpgrade": true
  }
}
```

For more information, see [Scaling](#) in the [MemoryDB User Guide](#).

- For API details, see [ListAllowedNodeTypeUpdates](#) in [AWS CLI Command Reference](#).

### list-tags

The following code example shows how to use list-tags.
AWS CLI

To return a list of tags

The following list-tags returns a list of tags.

```
aws memorydb list-tags \\
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the MemoryDB User Guide.

- For API details, see ListTags in AWS CLI Command Reference.

reset-parameter-group

The following code example shows how to use reset-parameter-group.

AWS CLI

To reset a parameter group

The following reset-parameter-group` resets a parameter group.

```
aws memorydb reset-parameter-group \\
    --parameter-group-name my-parameter-group \\
    --all-parameters
```

Output:

```
{
```
"ParameterGroup": {
    "Name": "my-parameter-group",
    "Family": "memorydb_redis6",
    "Description": "my parameter group",
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/my-parameter-group"
  }
}

For more information, see Configuring engine parameters using parameter groups in the MemoryDB User Guide.

• For API details, see ResetParameterGroup in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following tag-resource ` adds a tag to a resource.

```
aws memorydb tag-resource \
  --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster \
  --tags Key="mykey",Value="myvalue"
```

Output:

```
{
   "TagList": [
      {
         "Key": "mytag",
         "Value": "myvalue"
      },
      {
         "Key": "mykey",
         "Value": "myvalue"
      }
   ]
}
```
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To update an ACL

The following update-acl \` updates an ACL by adding a user.

```
aws memorydb untag-resource \
   --resource-arn arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster \
   --tag-keys mykey
```

Output:

```
{
   "TagList": [
       {
           "Key": "mytag",
           "Value": "myvalue"
       }
   ]
}
```

For more information, see Tagging resources in the MemoryDB User Guide.

• For API details, see UntagResource in AWS CLI Command Reference.

update-cluster

The following code example shows how to use update-cluster.

AWS CLI

To update a cluster

The following update-cluster \` updates the parameter group of a cluster to my-parameter-group.
aws memorydb update-cluster \
   --cluster-name my-cluster \
   --parameter-group-name my-parameter-group

Output:

```json
{
   "Cluster": {
      "Name": "my-cluster",
      "Status": "available",
      "NumberOfShards": 2,
      "AvailabilityMode": "MultiAZ",
      "ClusterEndpoint": {
         "Address": "clustercfg.my-cluster.llru6f.memorydb.us-east-1.amazonaws.com",
         "Port": 6379
      },
      "NodeType": "db.r6g.large",
      "EngineVersion": "6.2",
      "EnginePatchVersion": "6.2.6",
      "ParameterGroupName": "my-parameter-group",
      "ParameterGroupStatus": "in-sync",
      "SecurityGroups": [
         {
            "SecurityGroupId": "sg-0a143xxxxxc9fae",
            "Status": "active"
         }
      ],
      "SubnetGroupName": "pat-sg",
      "TLSEnabled": true,
      "ARN": "arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster",
      "SnapshotRetentionLimit": 0,
      "MaintenanceWindow": "wed:03:00-wed:04:00",
      "SnapshotWindow": "04:30-05:30",
      "ACLName": "my-acl",
      "AutoMinorVersionUpgrade": true
   }
}
```

For more information, see [Modifying a cluster](#) in the [MemoryDB User Guide](#).

- For API details, see [UpdateCluster](#) in [AWS CLI Command Reference](#).
update-parameter-group

The following code example shows how to use `update-parameter-group`.

**AWS CLI**

**To update a parameter group**

The following `update-parameter-group` updates a parameter group.

```
aws memorydb update-parameter-group \
       --parameter-group-name my-parameter-group \
       --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{
   "ParameterGroup": {
      "Name": "my-parameter-group",
      "Family": "memorydb_redis6",
      "Description": "my parameter group",
      "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/my-parameter-group"
   }
}
```

For more information, see [Modifying a parameter group](https://docs.aws.amazon.com/memorydb/latest/userguide/Modifying-Parameter-Groups.html) in the *MemoryDB User Guide*.

- For API details, see [UpdateParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/memorydb/update-parameter-group.html) in *AWS CLI Command Reference*.

update-subnet-group

The following code example shows how to use `update-subnet-group`.

**AWS CLI**

**To update a subnet group**

The following `update-subnet-group` updates a subnet group's subnet ID.

```
aws memorydb update-subnet-group \
       --subnet-group-name my-sg \
       --subnet-ids subnet-01f29d458f3xxxxx
```
For more information, see Subnets and subnet groups in the MemoryDB User Guide.

• For API details, see UpdateSubnetGroup in AWS CLI Command Reference.

update-user

The following code example shows how to use update-user.

AWS CLI

To update a user

The following update-user modifies a user's access string.

```
aws memorydb update-user \
  --user-name my-user \
  --access-string "off ~objects:* ~items:* ~public:* resetchannels -@all"
```

Output:

```
{
  "User": {
    "Name": "my-user",
    "Status": "modifying",
  ...
```
For more information, see [Authenticating users with Access Control Lists](#) in the [MemoryDB User Guide](#).

- For API details, see [UpdateUser](#) in [AWS CLI Command Reference](#).

### Amazon MSK examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon MSK.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

**create-cluster**

The following code example shows how to use create-cluster.
AWS CLI

To create an Amazon MSK cluster

The following create-cluster example creates an MSK cluster named MessagingCluster with three broker nodes. A JSON file named brokernodegroupinfo.json specifies the three subnets over which you want Amazon MSK to distribute the broker nodes. This example doesn't specify the monitoring level, so the cluster gets the DEFAULT level.

```bash
aws kafka create-cluster \
   --cluster-name "MessagingCluster" \
   --broker-node-group-info file://brokernodegroupinfo.json \
   --kafka-version "2.2.1" \
   --number-of-broker-nodes 3
```

Contents of brokernodegroupinfo.json:

```json
{
   "InstanceType": "kafka.m5.xlarge",
   "BrokerAZDistribution": "DEFAULT",
   "ClientSubnets": [
      "subnet-0123456789111abcd",
      "subnet-0123456789222abcd",
      "subnet-0123456789333abcd"
   ]
}
```

Output:

```json
{
   "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
   "ClusterName": "MessagingCluster",
   "State": "CREATING"
}
```

For more information, see Create an Amazon MSK Cluster in the Amazon Managed Streaming for Apache Kafka.

- For API details, see CreateCluster in AWS CLI Command Reference.
**create-configuration**

The following code example shows how to use `create-configuration`.

**AWS CLI**

**To create a custom Amazon MSK configuration**

The following `create-configuration` example creates a custom MSK configuration with the server properties that are specified in the input file.

```
aws kafka create-configuration \\
   --name "CustomConfiguration" \\
   --description "Topic autocreation enabled; Apache ZooKeeper timeout 2000 ms; Log rolling 604800000 ms." \\
   --kafka-versions "2.2.1" \\
   --server-properties file://configuration.txt
```

Contents of `configuration.txt`:

```
auto.create.topics.enable = true
zookeeper.connection.timeout.ms = 2000
log.roll.ms = 604800000
```

This command produces no output. Output:

```
{
   "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
   "CreationTime": "2019-10-09T15:26:05.548Z",
   "LatestRevision":
      {
         "CreationTime": "2019-10-09T15:26:05.548Z",
         "Description": "Topic autocreation enabled; Apache ZooKeeper timeout 2000 ms; Log rolling 604800000 ms.",
         "Revision": 1
      },
   "Name": "CustomConfiguration"
}
```

For more information, see [Amazon MSK Configuration Operations](https://docs.aws.amazon.com/msk/latest/developerguide/configure-configuration.html) in the [Amazon Managed Streaming for Apache Kafka Developer Guide](https://docs.aws.amazon.com/msk/latest/developerguide/).
• For API details, see CreateConfiguration in AWS CLI Command Reference.

**describe-cluster**

The following code example shows how to use describe-cluster.

**AWS CLI**

**To describe a cluster**

The following describe-cluster example describes an Amazon MSK cluster.

```bash
aws kafka describe-cluster \
   --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```json
{
   "ClusterInfo": {
      "BrokerNodeGroupInfo": {
         "BrokerAZDistribution": "DEFAULT",
         "ClientSubnets": ["subnet-cbfff283", "subnet-6746046b"],
         "InstanceType": "kafka.m5.large",
         "SecurityGroups": ["sg-f839b688"],
         "StorageInfo": {
            "EbsStorageInfo": {
               "VolumeSize": 100
            }
         }
      },
      "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
      "ClusterName": "demo-cluster-1",
      "CreationTime": "2020-07-09T02:31:36.223000+00:00",
      "CurrentBrokerSoftwareInfo": {
         "KafkaVersion": "2.2.1"
      }
   }
}
```
For more information, see Listing Amazon MSK Clusters in the Amazon Managed Streaming for Apache Kafka Developer Guide.

- For API details, see DescribeCluster in AWS CLI Command Reference.

**get-bootstrap-brokers**

The following code example shows how to use get-bootstrap-brokers.
AWS CLI

To get bootstrap brokers

The following `get-bootstrap-brokers` example retrieves the bootstrap broker information for an Amazon MSK cluster.

```
aws kafka get-bootstrap-brokers \
   --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{
   "BootstrapBrokerString": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-east-1.amazonaws.com:9092,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-east-1.amazonaws.com:9092",
   "BootstrapBrokerStringTls": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-east-1.amazonaws.com:9094,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-east-1.amazonaws.com:9094"
}
```

For more information, see [Getting the Bootstrap Brokers](https://aws.amazon.com/documentation/marketplace-kafka/) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [GetBootstrapBrokers](https://docs.aws.amazon.com/cli/latest/reference/kafka/get-bootstrap-brokers.html) in *AWS CLI Command Reference*.

**list-clusters**

The following code example shows how to use `list-clusters`.

AWS CLI

To list the available clusters

The following `list-clusters` example lists the Amazon MSK clusters in your AWS account.

```
aws kafka list-clusters
```

Output:

```
{
```
"ClusterInfoList": [
    {
        "BrokerNodeGroupInfo": {
            "BrokerAZDistribution": "DEFAULT",
            "ClientSubnets": [
                "subnet-cbfff283",
                "subnet-6746046b"
            ],
            "InstanceType": "kafka.m5.large",
            "SecurityGroups": [
                "sg-f839b688"
            ],
            "StorageInfo": {
                "EbsStorageInfo": {
                    "VolumeSize": 100
                }
            }
        },
        "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
        "ClusterName": "demo-cluster-1",
        "CreationTime": "2020-07-09T02:31:36.223000+00:00",
        "CurrentBrokerSoftwareInfo": {
            "KafkaVersion": "2.2.1"
        },
        "CurrentVersion": "K3AEGXETSR30VB",
        "EncryptionInfo": {
            "EncryptionAtRest": {
                "DataVolumeKMSKeyId": "arn:aws:kms:us-east-1:123456789012:key/a7ca56d5-0768-4b64-a670-339a9fbeb81e"
            },
            "EncryptionInTransit": {
                "ClientBroker": "TLS_PLAINTEXT",
                "InCluster": true
            }
        },
        "EnhancedMonitoring": "DEFAULT",
        "OpenMonitoring": {
            "Prometheus": {
                "JmxExporter": {
                    "EnabledInBroker": false
                },
                "NodeExporter": {
                    "EnabledInBroker": false
                }
            }
        }
    }
]
For more information, see Listing Amazon MSK Clusters in the Amazon Managed Streaming for Apache Kafka Developer Guide.

- For API details, see ListClusters in AWS CLI Command Reference.

**update-broker-storage**

The following code example shows how to use update-broker-storage.

**AWS CLI**

**To update the EBS storage for brokers**

The following update-broker-storage example updates the amount of EBS storage for all the brokers in the cluster. Amazon MSK sets the target storage amount for each broker to the amount specified in the example. You can get the current version of the cluster by describing the cluster or by listing all of the clusters.

```
aws kafka update-broker-storage \
   --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
   --current-version "K21V3IB1VIIZYYH" \
   --target-broker-ebs-volume-info "KafkaBrokerNodeId=ALL,VolumeSizeGB=1100"
```

The output returns an ARN for this update-broker-storage operation. To determine if this operation is complete, use the describe-cluster-operation command with this ARN as input.
For more information, see [Update the EBS Storage for Brokers](amazon-managed-streaming-for-apache-kafka-developer-guide) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [UpdateBrokerStorage](aws-cli-command-reference) in [AWS CLI Command Reference](aws-cli-command-reference).

### update-cluster-configuration

The following code example shows how to use `update-cluster-configuration`.

**AWS CLI**

#### To update the configuration of an Amazon MSK cluster

The following `update-cluster-configuration` example updates the configuration of the specified existing MSK cluster. It uses a custom MSK configuration.

```bash
aws kafka update-cluster-configuration \
  --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
  --configuration-info file://configuration-info.json \
  --current-version "K21V3IB1VIZYYH"
```

**Contents of configuration-info.json:**

```json
{
   "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
   "Revision": 1
}
```

The output returns an ARN for this `update-cluster-configuration` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.
{  
  "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
  "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-operation/V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-abcd-1234-bcde-33333EXAMPLE"
}

For more information, see Update the Configuration of an Amazon MSK Cluster in the Amazon Managed Streaming for Apache Kafka Developer Guide.

- For API details, see UpdateClusterConfiguration in AWS CLI Command Reference.

**Network Manager examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Network Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

**Actions**

associate-customer-gateway

The following code example shows how to use associate-customer-gateway.

**AWS CLI**

To associate a customer gateway
The following `associate-customer-gateway` example associates customer gateway `cgw-112233445566777889` in the specified global network with device `device-07f6fd08867abc123`.

```bash
aws networkmanager associate-customer-gateway \
  --global-network-id global-network-01231231231231231 \
  --device-id device-07f6fd08867abc123 \
  --region us-west-2
```

Output:

```
{
  "CustomerGatewayAssociation": {
    "GlobalNetworkId": "global-network-01231231231231231",
    "DeviceId": "device-07f6fd08867abc123",
    "State": "PENDING"
  }
}
```

For more information, see [Customer Gateway Associations](https://docs.aws.amazon.com/networkmanager/latest/userguide/transit-gateway-network-manager.html) in the Transit Gateway Network Manager Guide.

- For API details, see [AssociateCustomerGateway](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/associate-customer-gateway.html) in AWS CLI Command Reference.

**associate-link**

The following code example shows how to use `associate-link`.

**AWS CLI**

To associate a link

The following `associate-link` example associates link `link-11112222aaaabbbb1` with device `device-07f6fd08867abc123`. The link and device are in the specified global network.

```bash
aws networkmanager associate-link \
```
The following code example shows how to use `create-core-network`.

**AWS CLI**

To create a core network

The following `create-core-network` example creates a core network using an optional description and tags within an AWS Cloud WAN global network.

```
aws networkmanager create-core-network \
  --global-network-id global-network-0d59060f16a73bc41\ 
  --description "Main headquarters location"\ 
  --tags Key=Name,Value="New York City office"
```

Output:

```
{
  "LinkAssociation": {
    "GlobalNetworkId": "global-network-0d59060f16a73bc41",
    "DeviceId": "device-07f6fd08867abc123",
    "LinkId": "link-11112222aaaabbb1",
    "LinkAssociationState": "PENDING"
  }
}
```

For more information, see [Device and Link Associations](https://docs.aws.amazon.com/networkmanager/latest/userguide/device-and-link-associations.html) in the *Transit Gateway Network Manager Guide*.

- For API details, see [AssociateLink](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/associate-link.html) in *AWS CLI Command Reference*.
"CoreNetwork": {
    "GlobalNetworkId": "global-network-0d50060f16a73bc41",
    "CoreNetworkId": "core-network-0fab62fe438d94db6",
    "CoreNetworkArn": "arn:aws:networkmanager::987654321012:core-network/core-network-0fab62fe438d94db6",
    "Description": "Main headquarters location",
    "CreatedAt": "2022-01-10T19:53:59+00:00",
    "State": "AVAILABLE",
    "Tags": [
      {
        "Key": "Name",
        "Value": "New York City office"
      }
    ]
  }
}

For more information, see Core networks in the AWS Cloud WAN User Guide.

- For API details, see CreateCoreNetwork in AWS CLI Command Reference.

create-device

The following code example shows how to use create-device.

AWS CLI

To create a device

The following create-device example creates a device in the specified global network. The device details include a description, the type, vendor, model, and serial number.

```bash
aws networkmanager create-device
  --global-network-id global-network-01231231231231231 \ 
  --description "New York office device" \ 
  --type "office device" \ 
  --vendor "anycompany" \ 
  --model "abcabc" \ 
  --serial-number "1234" \ 
  --region us-west-2
```

Output:
For more information, see [Working with Devices](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [CreateDevice](#) in *AWS CLI Command Reference*.

### create-global-network

The following code example shows how to use `create-global-network`.

**AWS CLI**

**To create a global network**

The following `create-global-network` examples creates a new global network. The initial state upon creation is PENDING.

```bash
aws networkmanager create-global-network
```

**Output:**

```json
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-00a77fc0f722dae74",
        "GlobalNetworkArn": "arn:aws:networkmanager::987654321012:global-network/global-network-00a77fc0f722dae74",
        "CreatedAt": "2022-03-14T20:31:56+00:00",
        "State": "PENDING"
    }
}
```
create-link

The following code example shows how to use create-link.

AWS CLI

To create a link

The following create-link example creates a link in the specified global network. The link includes a description and details about the link type, bandwidth, and provider. The site ID indicates the site to which the link is associated.

```
aws networkmanager create-link \
    --global-network-id global-network-01231231231231231 \
    --description "VPN Link" \
    --type "broadband" \
    --bandwidth UploadSpeed=10,DownloadSpeed=20 \
    --provider "AnyCompany" \
    --site-id site-444555aaabbb11223 \
    --region us-west-2
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-network-01231231231231231/link-11112222aaaabbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 10,
            "DownloadSpeed": 20
```
create-site

The following code example shows how to use create-site.

AWS CLI

To create a site

The following create-site example creates a site in the specified global network. The site
details include a description and the location information.

```
aws networkmanager create-site \
    --global-network-id global-network-01231231231231231 \
    --description "New York head office" \
    --location Latitude=40.7128,Longitude=-74.0060 \
    --region us-west-2
```

Output:

```
{
   "Site": {
      "SiteId": "site-444555aaabbb11223",
      "SiteArn": "arn:aws:networkmanager::123456789012:site/global-network-01231231231231231/site-444555aaabbb11223",
      "GlobalNetworkId": "global-network-01231231231231231",
      "Description": "New York head office",
      "Location": {
         "Latitude": "40.7128",
         "Longitude": "-74.0060"
      },
      "CreatedAt": 1575554300.0,
      "Provider": "AnyCompany",
      "CreatedAt": 1575555811.0,
      "State": "PENDING"
   }
}
```
For more information, see Working with Sites in the Transit Gateway Network Manager Guide.

- For API details, see CreateSite in AWS CLI Command Reference.

**create-vpc-attachment**

The following code example shows how to use create-vpc-attachment.

**AWS CLI**

**To create a VPC attachment**

The following create-vpc-attachment example creates a VPC attachment with IPv6 support in a core network.

```bash
aws networkmanager create-vpc-attachment \
  --core-network-id core-network-0fab62fe438d94db6 \
  --vpc-arn arn:aws:ec2:us-east-1:987654321012:vpc/vpc-09f37f69e2786ebe8 \
  --subnet-arns arn:aws:ec2:us-east-1:987654321012:subnet/subnet-04ca4e010857e7bb7 \
  --Ipv6Support=true
```

**Output:**

```json
{
  "VpcAttachment": {
    "Attachment": {
      "CoreNetworkId": "core-network-0fab62fe438d94db6",
      "AttachmentId": "attachment-05e1da6ebe87a06e6",
      "OwnerAccountId": "987654321012",
      "AttachmentType": "VPC",
      "State": "CREATING",
      "EdgeLocation": "us-east-1",
      "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-09f37f69e2786ebe8",
      "Tags": [],
      "CreatedAt": "2022-03-10T20:59:14+00:00",
      "UpdatedAt": "2022-03-10T20:59:14+00:00"
    }
  }
}
```
For more information, see Create an attachment in the Cloud WAN User Guide.

- For API details, see CreateVpcAttachment in AWS CLI Command Reference.

**delete-attachment**

The following code example shows how to use delete-attachment.

**AWS CLI**

**To delete an attachment**

The following delete-attachment example deletes a Connect attachment.

```bash
aws networkmanager delete-attachment 
  --attachment-id attachment-01feddaeae26ab68c
```

Output:

```json
{
  "Attachment": {
    "CoreNetworkId": "core-network-0f4b0a9d5ee7761d1",
    "AttachmentId": "attachment-01feddaeae26ab68c",
    "OwnerAccountId": "987654321012",
    "AttachmentType": "CONNECT",
    "State": "DELETING",
    "EdgeLocation": "us-east-1",
    "ResourceArn": "arn:aws:networkmanager::987654321012:attachment/attachment-02c3964448fedf5aa",
    "CreatedAt": "2022-03-15T19:18:41+00:00",
    "UpdatedAt": "2022-03-15T19:28:59+00:00"
  }
}
```
For more information, see [Delete attachments](#) in the *Cloud WAN User Guide*.
- For API details, see [DeleteAttachment](#) in *AWS CLI Command Reference*.

delete-bucket-analytics-configuration

The following code example shows how to use delete-bucket-analytics-configuration.

**AWS CLI**

**To delete an analytics configuration for a bucket**

The following delete-bucket-analytics-configuration example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
  --bucket my-bucket \
  --id 1
```

This command produces no output.
- For API details, see [DeleteBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

delete-bucket-metrics-configuration

The following code example shows how to use delete-bucket-metrics-configuration.

**AWS CLI**

**To delete a metrics configuration for a bucket**

The following delete-bucket-metrics-configuration example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \
  --bucket my-bucket \
  --id 123
```

This command produces no output.
For API details, see `DeleteBucketMetricsConfiguration` in *AWS CLI Command Reference*.

**delete-core-network**

The following code example shows how to use `delete-core-network`.

**AWS CLI**

**To delete a core network**

The following `delete-core-network` example deletes a core network from a Cloud WAN global network.

```bash
aws networkmanager delete-core-network \\
--core-network-id core-network-0fab62fe438d94db6
```

Output:

```json
{
   "CoreNetwork": {
      "GlobalNetworkId": "global-network-0d59060f16a73bc41",
      "CoreNetworkId": "core-network-0fab62fe438d94db6",
      "Description": "Main headquarters location",
      "CreatedAt": "2021-12-09T18:31:11+00:00",
      "State": "DELETING",
      "Segments": [
         {
            "Name": "dev",
            "EdgeLocations": [
               "us-east-1"
            ],
            "SharedSegments": []
         }
      ],
      "Edges": [
         {
            "EdgeLocation": "us-east-1",
            "Asn": 64512,
            "InsideCidrBlocks": []
         }
      ]
   }
}
```
For more information, see [Core networks](#) in the *Cloud WAN User Guide*.

- For API details, see [DeleteCoreNetwork](#) in *AWS CLI Command Reference*.

### delete-device

The following code example shows how to use delete-device.

**AWS CLI**

**To delete a device**

The following delete-device example deletes the specified device from the specified global network.

```bash
aws networkmanager delete-device \
   --global-network-id global-network-01231231231231231 \
   --device-id device-07f6fd08867abc123 \
   --region us-west-2
```

**Output:**

```json
{
   "Device": {
      "DeviceId": "device-07f6fd08867abc123",
      "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123",
      "GlobalNetworkId": "global-network-01231231231231231",
      "Description": "New York office device",
      "Type": "office device",
      "Vendor": "anycompany",
      "Model": "abcabc",
      "SerialNumber": "1234",
      "SiteId": "site-444555aaabbb11223",
      "CreatedAt": 1575554005.0,
      "State": "DELETING"
   }
}
```

For more information, see [Working with Devices](#) in the *Transit Gateway Network Manager Guide*. 
delete-global-network

The following code example shows how to use delete-global-network.

AWS CLI

To delete a global network

The following delete-global-network example deletes a global network.

```bash
aws networkmanager delete-global-network \\
   --global-network-id global-network-052bedddccb193b6b
```

Output:

```json
{
   "GlobalNetwork": {
      "GlobalNetworkId": "global-network-052bedddccb193b6b",
      "CreatedAt": "2021-12-09T18:19:12+00:00",
      "State": "DELETING"
   }
}
```

For API details, see DeleteGlobalNetwork in AWS CLI Command Reference.

delete-link

The following code example shows how to use delete-link.

AWS CLI

To delete a link

The following delete-link example deletes the specified link from the specified global network.

```bash
aws networkmanager delete-link \\
```

For API details, see DeleteDevice in AWS CLI Command Reference.
Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-network-01231231231231231/link-11112222aaaabbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 20,
            "DownloadSpeed": 20
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "DELETING"
    }
}
```

For more information, see [Working with Links](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DeleteLink](#) in [AWS CLI Command Reference](#).

delete-public-access-block

The following code example shows how to use `delete-public-access-block`.

**AWS CLI**

**To delete the block public access configuration for a bucket**

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
    --bucket my-bucket
```
This command produces no output.

- For API details, see `DeletePublicAccessBlock` in *AWS CLI Command Reference*.

**delete-site**

The following code example shows how to use `delete-site`.

**AWS CLI**

**To delete a site**

The following `delete-site` example deletes the specified site (`site-444555aaabbb11223`) in the specified global network.

```bash
aws networkmanager delete-site \
  --global-network-id global-network-01231231231231231  \
  --site-id site-444555aaabbb11223 \
  --region us-west-2
```

**Output:**

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York head office",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554300.0,
        "State": "DELETING"
    }
}
```

For more information, see `Working with Sites` in the *Transit Gateway Network Manager Guide*.

- For API details, see `DeleteSite` in *AWS CLI Command Reference*. 

Actions and scenarios
deregister-transit-gateway

The following code example shows how to use deregister-transit-gateway.

AWS CLI

To deregister a transit gateway from a global network

The following deregister-transit-gateway example deregisters the specified transit gateway from the specified global network.

```bash
aws networkmanager deregister-transit-gateway \
  --global-network-id global-network-01231231231231231 \
  --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/tgw-123abc05e04123abc \
  --region us-west-2
```

Output:

```json
{
  "TransitGatewayRegistration": {
    "GlobalNetworkId": "global-network-01231231231231231",
    "State": {
      "Code": "DELETING"
    }
  }
}
```

For more information, see [Transit Gateway Registrations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DeregisterTransitGateway](#) in *AWS CLI Command Reference*.

describe-global-networks

The following code example shows how to use describe-global-networks.

AWS CLI

To describe your global networks
The following `describe-global-networks` example describes all of your global networks in your account.

```
aws networkmanager describe-global-networks \
   --region us-west-2
```

Output:

```
{
   "GlobalNetworks": [
   {
      "GlobalNetworkId": "global-network-01231231231231231",
      "Description": "Company 1 global network",
      "CreatedAt": 1575553525.0,
      "State": "AVAILABLE"
   }
   ]
}
```

### disassociate-customer-gateway

The following code example shows how to use `disassociate-customer-gateway`.

**AWS CLI**

**To disassociate a customer gateway**

The following `disassociate-customer-gateway` example disassociates the specified customer gateway (cgw-11223344556677889) from the specified global network.

```
aws networkmanager disassociate-customer-gateway \
   --global-network-id global-network-01231231231231231 \
   --region us-west-2
```

Output:
For more information, see [Customer Gateway Associations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DisassociateCustomerGateway](#) in *AWS CLI Command Reference*.

**disassociate-link**

The following code example shows how to use `disassociate-link`.

**AWS CLI**

**To disassociate a link**

The following `disassociate-link` example disassociates the specified link from device `device-07f6fd08867abc123` in the specified global network.

```bash
aws networkmanager disassociate-link \
   --global-network-id global-network-01231231231231231 \
   --device-id device-07f6fd08867abc123 \
   --link-id link-11112222aaaabbb1 \
   --region us-west-2
```

**Output:**

```json
{
   "LinkAssociation": {
      "GlobalNetworkId": "global-network-01231231231231231",
      "DeviceId": "device-07f6fd08867abc123",
      "LinkId": "link-11112222aaaabbb1",
      "LinkAssociationState": "DELETING"
   }
}
```
For more information, see [Device and Link Associations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DisassociateLink](#) in *AWS CLI Command Reference*.

### get-bucket-analytics-configuration

The following code example shows how to use `get-bucket-analytics-configuration`.

**AWS CLI**

To retrieve the analytics configuration for a bucket with a specific ID

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration 
  --bucket my-bucket 
  --id 1
```

**Output:**

```
{
    "AnalyticsConfiguration": {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
}
```

- For API details, see [GetBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

### get-bucket-metrics-configuration

The following code example shows how to use `get-bucket-metrics-configuration`.

**AWS CLI**

To retrieve the metrics configuration for a bucket with a specific ID

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.
aws s3api get-bucket-metrics-configuration
  --bucket my-bucket
  --id 123

Output:

```
{
  "MetricsConfiguration": {
    "Filter": {
      "Prefix": "logs"
    },
    "Id": "123"
  }
}
```

get-customer-gateway-associations

The following code example shows how to use get-customer-gateway-associations.

**AWS CLI**

**To get your customer gateway associations**

The following get-customer-gateway-associations example gets the customer gateway associations for the specified global network.

```
aws networkmanager get-customer-gateway-associations
  --global-network-id global-network-01231231231231231
  --region us-west-2
```

Output:

```
{
  "CustomerGatewayAssociations": [
    {
      "GlobalNetworkId": "global-network-01231231231231231",
      "DeviceId": "device-07f6fd08867abc123",
    }
  ]
```
get-devices

The following code example shows how to use get-devices.

**AWS CLI**

**To get your devices**

The following get-devices example gets the devices in the specified global network.

```bash
aws networkmanager get-devices \
   --global-network-id global-network-01231231231231231 \
   --region us-west-2
```

**Output:**

```json
{
   "Devices": [
      {
         "DeviceId": "device-07f6fd08867abc123",
         "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123",
         "GlobalNetworkId": "global-network-01231231231231231",
         "Description": "NY office device",
         "Type": "office device",
         "Vendor": "anycompany",
         "Model": "abcabc",
         "SerialNumber": "1234",
         "CreatedAt": 1575554005.0,
         "State": "AVAILABLE"
      }
   ]
}
```

- For API details, see [GetCustomerGatewayAssociations](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/get-customer-gateway-associations.html) in *AWS CLI Command Reference*.

- For API details, see [GetDevices](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/get-devices.html) in *AWS CLI Command Reference*. 
get-link-associations

The following code example shows how to use get-link-associations.

AWS CLI

To get your link associations

The following get-link-associations example gets the link associations in the specified global network.

```bash
aws networkmanager get-link-associations \
   --global-network-id global-network-01231231231231231 \
   --region us-west-2
```

Output:

```json
{
   "LinkAssociations": [
      {
         "GlobalNetworkId": "global-network-01231231231231231",
         "DeviceId": "device-07f6fd08867abc123",
         "LinkId": "link-11112222aaaabbbb1",
         "LinkAssociationState": "AVAILABLE"
      }
   ]
}
```

- For API details, see GetLinkAssociations in AWS CLI Command Reference.

get-links

The following code example shows how to use get-links.

AWS CLI

To get your links

The following get-links example gets the links in the specified global network.

```bash
aws networkmanager get-links \
   --global-network-id global-network-01231231231231231 \
```

Actions and scenarios
Output:

```
{
  "Links": [
    {
      "LinkId": "link-11112222aaaabbb1",
      "LinkArn": "arn:aws:networkmanager::123456789012:link/global-network-01231231231231231/link-11112222aaaabbb1",
      "GlobalNetworkId": "global-network-01231231231231231",
      "SiteId": "site-444555aaabbb11223",
      "Description": "VPN Link",
      "Type": "broadband",
      "Bandwidth": {
        "UploadSpeed": 10,
        "DownloadSpeed": 20
      },
      "Provider": "AnyCompany",
      "CreatedAt": 1575555811.0,
      "State": "AVAILABLE"
    }
  ]
}
```

- For API details, see [GetLinks](aws://cli/command-reference) in *AWS CLI Command Reference*.

**get-object-retention**

The following code example shows how to use `get-object-retention`.

**AWS CLI**

To retrieve the object retention configuration for an object

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \ 
  --bucket my-bucket-with-object-lock \ 
  --key doc1.rtf
```
Output:

```json
{
   "Retention": {
      "Mode": "GOVERNANCE",
      "RetainUntilDate": "2025-01-01T00:00:00.000Z"
   }
}
```

**get-public-access-block**

The following code example shows how to use `get-public-access-block`.

**AWS CLI**

To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```bash
aws s3api get-public-access-block --bucket my-bucket
```

Output:

```json
{
   "PublicAccessBlockConfiguration": {
      "IgnorePublicAcls": true,
      "BlockPublicPolicy": true,
      "BlockPublicAcls": true,
      "RestrictPublicBuckets": true
   }
}
```

**get-sites**

The following code example shows how to use `get-sites`.
**AWS CLI**

**To get your sites**

The following get-sites example gets the sites in the specified global network.

```bash
aws networkmanager get-sites \
   --global-network-id global-network-01231231231231231 \
   --region us-west-2
```

**Output:**

```json
{
   "Sites": [
      {
         "SiteId": "site-444555aaabbb11223",
         "SiteArn": "arn:aws:networkmanager::123456789012:site/global-network-01231231231231231/site-444555aaabbb11223",
         "GlobalNetworkId": "global-network-01231231231231231",
         "Description": "NY head office",
         "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
         },
         "CreatedAt": 1575554528.0,
         "State": "AVAILABLE"
      }
   ]
}
```

- For API details, see [GetSites](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/get-sites.html) in *AWS CLI Command Reference*.

**get-transit-gateway-registrations**

The following code example shows how to use get-transit-gateway-registrations.

**AWS CLI**

**To get your transit gateway registrations**

The following get-transit-gateway-registrations example gets the transit gateways that are registered to the specified global network.
aws networkmanager get-transit-gateway-registrations \ 
--global-network-id global-network-01231231231231231 \ 
--region us-west-2

Output:

```json
{
   "TransitGatewayRegistrations": [ 
      {
         "GlobalNetworkId": "global-network-01231231231231231",
         "State": {
            "Code": "AVAILABLE"
         }
      }
   ]
}
```

- For API details, see [GetTransitGatewayRegistrations](#) in [AWS CLI Command Reference](#).

**get-vpc-attachment**

The following code example shows how to use `get-vpc-attachment`.

**AWS CLI**

**To get an a VPC attachment**

The following `get-vpc-attachment` example returns information about a VPC attachment.

```
aws networkmanager get-vpc-attachment \ 
--attachment-id attachment-03b7ea450134787da
```

Output:

```json
{
   "VpcAttachment": {
      "Attachment": {
         "CoreNetworkId": "core-network-0522de1b226a5d7b3",
         "AttachmentId": "attachment-03b7ea450134787da",
```
"OwnerAccountId": "987654321012",
"AttachmentType": "VPC",
"State": "CREATING",
"EdgeLocation": "us-east-1",
"ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",
"Tags": [
  {
    "Key": "Name",
    "Value": "DevVPC"
  }
],
"CreatedAt": "2022-03-11T17:48:58+00:00",
"UpdatedAt": "2022-03-11T17:48:58+00:00"
},
"SubnetArns": [
  "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-2387ae02",
  "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-cda9dfffc"
],
"Options": {
  "Ipv6Support": false
}
}

For more information, see [Attachments](#) in the *Cloud WAN User Guide*.

- For API details, see [GetVpcAttachment](#) in *AWS CLI Command Reference*.

**list-bucket-analytics-configurations**

The following code example shows how to use `list-bucket-analytics-configurations`.

**AWS CLI**

**To retrieve a list of analytics configurations for a bucket**

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
  --bucket my-bucket
```
Output:

```json
{
   "AnalyticsConfigurationList": [
      {
         "StorageClassAnalysis": {},
         "Id": "1"
      }
   ],
   "IsTruncated": false
}
```

- For API details, see [ListBucketAnalyticsConfigurations](#) in [AWS CLI Command Reference](#).

### list-bucket-metrics-configurations

The following code example shows how to use `list-bucket-metrics-configurations`.

**AWS CLI**

To retrieve a list of metrics configurations for a bucket

The following `list-bucket-metrics-configurations` example retrieves a list of metrics configurations for the specified bucket.

```bash
aws s3api list-bucket-metrics-configurations \
   --bucket my-bucket
```

Output:

```json
{
   "IsTruncated": false,
   "MetricsConfigurationList": [
      {
         "Filter": {
            "Prefix": "logs"
         },
         "Id": "123"
      },
      {
         "Filter": {
```
The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags for a resource**

The following `list-tags-for-resource` example lists the tags for the specified device resource (`device-07f6fd08867abc123`).

```
aws networkmanager list-tags-for-resource \
  --resource-arn arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123 \
  --region us-west-2
```

**Output:**

```
{
    "TagList": [
        {
            "Key": "Network",
            "Value": "Northeast"
        }
    ]
}
```

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/networkmanager/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**put-bucket-metrics-configuration**

The following code example shows how to use `put-bucket-metrics-configuration`.

```json
"Prefix": "tmp"
},
"Id": "234"
]
}
```

- For API details, see [ListBucketMetricsConfigurations](https://docs.aws.amazon.com/cli/latest/reference/s3/list-bucket-metrics-configurations.html) in *AWS CLI Command Reference*.
AWS CLI

To set a metrics configuration for a bucket

The following put-bucket-metrics-configuration example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123 \
    --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see `PutBucketMetricsConfiguration` in AWS CLI Command Reference.

put-object-retention

The following code example shows how to use put-object-retention.

AWS CLI

To set an object retention configuration for an object

The following put-object-retention example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf \
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see `PutObjectRetention` in AWS CLI Command Reference.

put-public-access-block

The following code example shows how to use put-public-access-block.

AWS CLI

To set the block public access configuration for a bucket
The following put-public-access-block example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block
  --bucket my-bucket
  --public-access-block-configuration
  "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPublicBuckets=true"
```

This command produces no output.

- For API details, see [PutPublicAccessBlock](https://docs.aws.amazon.com/cli/latest/reference/s3api/put-public-access-block.html) in *AWS CLI Command Reference*.

**register-transit-gateway**

The following code example shows how to use `register-transit-gateway`.

**AWS CLI**

To register a transit gateway in a global network

The following `register-transit-gateway` example registers transit gateway `tgw-123abc05e04123abc` in the specified global network.

```
aws networkmanager register-transit-gateway
  --global-network-id global-network-01231231231231231
tgw-123abc05e04123abc
  --region us-west-2
```

Output:

```
{
  "TransitGatewayRegistration": {
    "GlobalNetworkId": "global-network-01231231231231231",
tgw-123abc05e04123abc",
    "State": {
      "Code": "PENDING"
    }
  }
}
```
For more information, see Transit Gateway Registrations in the Transit Gateway Network Manager Guide.

- For API details, see RegisterTransitGateway in AWS CLI Command Reference.

reject-attachment

The following code example shows how to use reject-attachment.

AWS CLI

To reject an attachment

The following reject-attachment example rejects a VPC attachment request.

```
aws networkmanager reject-attachment \\
   --attachment-id  attachment-03b7ea450134787da
```

Output:

```
{
   "Attachment": {
      "CoreNetworkId": "core-network-0522de1b226a5d7b3",
      "AttachmentId": "attachment-03b7ea450134787da",
      "OwnerAccountId": "987654321012",
      "AttachmentType": "VPC",
      "State": "AVAILABLE",
      "EdgeLocation": "us-east-1",
      "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",
      "CreatedAt": "2022-03-11T17:48:58+00:00",
      "UpdatedAt": "2022-03-11T17:51:25+00:00"
   }
}
```

For more information, see Attachment acceptance in the Cloud WAN User Guide.

- For API details, see RejectAttachment in AWS CLI Command Reference.

start-route-analysis

The following code example shows how to use start-route-analysis.
To start route analysis

The following start-route-analysis example starts the analysis between a source and destination, including the optional include-return-path.

```
aws networkmanager start-route-analysis \
   --global-network-id global-network-00aa0aaa0b0aaa000 \
   --source TransitGatewayAttachmentArn=arn:aws:ec2:us-east-1:503089527312:transit-gateway-attachment/tgw-attach-0d4a2d491bf68c093,IpAddress=10.0.0.0 \
   --destination TransitGatewayAttachmentArn=arn:aws:ec2:us-west-1:503089527312:transit-gateway-attachment/tgw-attach-002577f30bb181742,IpAddress=11.0.0.0 \
   --include-return-path
```

Output:

```json
{
   "RouteAnalysis": {
      "GlobalNetworkId": "global-network-00aa0aaa0b0aaa000",
      "OwnerAccountId": "111122223333",
      "RouteAnalysisId": "a1873de1-273c-470c-1a2bc2345678",
      "StartTimestamp": 1695760154.0,
      "Status": "RUNNING",
      "Source": {
         "IpAddress": "10.0.0.0"
      },
      "Destination": {
         "IpAddress": "11.0.0.0"
      },
      "IncludeReturnPath": true,
      "UseMiddleboxes": false
   }
}
```
For more information, see Route Analyzer in the AWS Global Networks for Transit Gateways User Guide.

- For API details, see StartRouteAnalysis in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To apply tags to a resource

The following tag-resource example applies the tag Network=Northeast to the device device-07f6fd08867abc123.

```
aws networkmanager tag-resource \
--resource-arn arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123 \
--tags Key=Network,Value=Northeast \
--region us-west-2
```

This command produces no output.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a resource

The following untag-resource example removes the tag with the key Network from the device device-07f6fd08867abc123.

```
aws networkmanager untag-resource \
--resource-arn arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123 \
--tag-keys Network \
--region us-west-2
```
This command produces no output.

- For API details, see UntagResource in AWS CLI Command Reference.

**update-device**

The following code example shows how to use update-device.

**AWS CLI**

**To update a device**

The following update-device example updates device device-07f6fd08867abc123 by specifying a site ID for the device.

```bash
aws networkmanager update-device \
   --global-network-id global-network-01231231231231231 \
   --device-id device-07f6fd08867abc123 \
   --site-id site-444555aaabb11223 \
   --region us-west-2
```

**Output:**

```
{
   "Device": {
       "DeviceId": "device-07f6fd08867abc123",
       "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-network-01231231231231231/device-07f6fd08867abc123",
       "GlobalNetworkId": "global-network-01231231231231231",
       "Description": "NY office device",
       "Type": "Office device",
       "Vendor": "anycompany",
       "Model": "abcabc",
       "SerialNumber": "1234",
       "SiteId": "site-444555aaabb11223",
       "CreatedAt": 1575554005.0,
       "State": "UPDATING"
   }
}
```

For more information, see Working with Devices in the Transit Gateway Network Manager Guide.

- For API details, see UpdateDevice in AWS CLI Command Reference.
**update-global-network**

The following code example shows how to use `update-global-network`.

**AWS CLI**

**To update a global network**

The following `update-global-network` example updates the description for global network `global-network-01231231231231231`.

```bash
aws networkmanager update-global-network \
   --global-network-id global-network-01231231231231231 \
   --description "Head offices" \
   --region us-west-2
```

**Output:**

```json
{
   "GlobalNetwork": {
      "GlobalNetworkId": "global-network-01231231231231231",
      "Description": "Head offices",
      "CreatedAt": 1575553525.0,
      "State": "UPDATING"
   }
}
```

For more information, see [Global Networks](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [UpdateGlobalNetwork](#) in *AWS CLI Command Reference*.

**update-link**

The following code example shows how to use `update-link`.

**AWS CLI**

**To update a link**

The following `update-link` example updates the bandwidth information for link `link-11112222aaaabbbb1`.

```bash
aws networkmanager update-link \
   --link-id link-11112222aaaabbbb1 \
   --bandwidth "100Mbps" \
   --region us-west-2
```
aws networkmanager update-link \
--global-network-id global-network-01231231231231231 \
--link-id link-11112222aaaabbbb1 \
--bandwidth UploadSpeed=20,DownloadSpeed=20 \
--region us-west-2

Output:

```
{
  "Link": {
    "LinkId": "link-11112222aaaabbbb1",
    "LinkArn": "arn:aws:networkmanager::123456789012:link/global-network-01231231231231231/link-11112222aaaabbbb1",
    "GlobalNetworkId": "global-network-01231231231231231",
    "SiteId": "site-444555aaabbb11223",
    "Description": "VPN Link",
    "Type": "broadband",
    "Bandwidth": {
      "UploadSpeed": 20,
      "DownloadSpeed": 20
    },
    "Provider": "AnyCompany",
    "CreatedAt": 1575555811.0,
    "State": "UPDATING"
  }
}
```

For more information, see [Working with Links](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [UpdateLink](#) in *AWS CLI Command Reference*.

**update-site**

The following code example shows how to use `update-site`.

**AWS CLI**

**To update a site**

The following `update-site` example updates the description for site site-444555aaabbb11223 in the specified global network.
aws networkmanager update-site \
   --global-network-id global-network-01231231231231231 \
   --site-id site-444555aaabbb11223 \
   --description "New York Office site" \
   --region us-west-2

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York Office site",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554528.0,
        "State": "UPDATING"
    }
}
```

For more information, see [Working with Sites](#) in the Transit Gateway Network Manager Guide.

- For API details, see [UpdateSite](#) in [AWS CLI Command Reference](#).

**Nimble Studio examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Nimble Studio.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
Topics

• Actions

Actions

get-eula

The following code example shows how to use get-eula.

AWS CLI

To get information about your studio

The following get-eula example lists the information about an EULA.

```
aws nimble get-eula \
   --eula-id "EULAId"
```

Output:

```
{
   "eula": {
      "content": "https://www.mozilla.org/en-US/MPL/2.0/",
      "createdAt": "2021-04-20T16:45:23+00:00",
      "eulaId": "gJZLygd-Srq_5NNbSfiaLg",
      "name": "Mozilla-FireFox",
      "updatedAt": "2021-04-20T16:45:23+00:00"
   }
}
```

For more information, see Accept the EULA in the Amazon Nimble Studio User Guide. • For API details, see GetEula in AWS CLI Command Reference.

get-launch-profile-details

The following code example shows how to use get-launch-profile-details.

AWS CLI

To list the available widgets
The following `get-launch-profile-details` example lists the details about a launch profile.

```
aws nimble get-launch-profile-details \
  --studio-id "StudioID" \
  --launch-profile-id "LaunchProfileID"
```

Output:

```
{
  "launchProfile": {
    "arn": "arn:aws:nimble:us-west-2:123456789012:launch-profile/yeG71DwNQeT7DrV7Q",

get-launch-profile

The following code example shows how to use get-launch-profile.

**AWS CLI**

**To list the available widgets**

The following get-launch-profile example lists information about a launch profile.

```
aws nimble get-launch-profile \
```
Output:

```json
{
    "launchProfile": {
        "arn": "arn:aws:nimble:us-west-2:123456789012:launch-profile/yeG71DwNQEiwNTRT7DrV7Q",
        "createdAt": "2022-01-27T21:18:59+00:00",

- For API details, see [GetLaunchProfile](#) in *AWS CLI Command Reference*.

**get-studio**

The following code example shows how to use `get-studio`.

**AWS CLI**

To get information about your studio
The following `get-studio` example lists the studios in your AWS account.

```bash
code
aws nimble get-studio \
   --studio-id "StudioID"
```

Output:

```json
{
   "studio": {
      "adminRoleArn": "arn:aws:iam::123456789012:role/studio-admin-role",
      "createdAt": "2022-01-27T20:29:35+00:00",
      "displayName": "studio-name",
      "homeRegion": "us-west-2",
      "ssoClientId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "state": "READY",
      "statusCode": "STUDIO_CREATED",
      "statusMessage": "The studio has been created successfully ",
      "studioEncryptionConfiguration": {
         "keyType": "AWS_OWNED_KEY"
      },
      "studioId": "us-west-2:stid-EXAMPLE11111",
      "studioName": "studio-name",
      "studioUrl": "https://studio-name.nimblestudio.us-west-2.amazonaws.com",
      "tags": {},
      "updatedAt": "2022-01-27T20:29:37+00:00",
      "userRoleArn": "arn:aws:iam::123456789012:role/studio-user-role"
   }
}
```

For more information, see [What is Amazon Nimble Studio?](#) in the [Amazon Nimble Studio User Guide](#).

- For API details, see [GetStudio](#) in [AWS CLI Command Reference](#).

### list-eula-acceptances

The following code example shows how to use `list-eula-acceptances`.

**AWS CLI**

To list the available widgets
The following `list-eula-acceptances` example lists the accepted EULAs in your AWS account.

```
aws nimble list-eula-acceptances
   --studio-id "StudioID"
```

Output:

```
{
   "eulaAcceptances": [
      {
         "acceptedAt": "2022-01-28T17:44:35+00:00",
         "acceptedBy": "92677b4b19-e9fd012a-94ad-4f16-9866-c69a63ab6486",

---

**list-studio-members**

The following code example shows how to use `list-studio-members`.

**AWS CLI**

**To list the available widgets**

The following `list-studio-members` example lists the available studio members in your AWS account.

```bash
aws nimble list-studio-members \
   --studio-id "StudioID"
```

**Output:**

```json
{
   "members": [
      {
         "identityStoreId": "d-EXAMPLE11111",
         "persona": "ADMINISTRATOR",
         "principalId": "EXAMPLE11111-e9fd012a-94ad-4f16-9866-c69a63ab6486"
      }
   ]
}
```

For more information, see [Adding studio users](#) in the *Amazon Nimble Studio User Guide*.

- For API details, see [ListStudioMembers](#) in *AWS CLI Command Reference*. 
list-studios

The following code example shows how to use list-studios.

AWS CLI

To list your studios

The following list-studios example lists the studios in your AWS account.

```bash
aws nimble list-studios
```

Output:

```json
{
   "studios": [
   {
       "adminRoleArn": "arn:aws:iam::123456789012:role/studio-admin-role",

OpenSearch Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with OpenSearch Service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

create-elasticsearch-domain

The following code example shows how to use *create-elasticsearch-domain*.

**AWS CLI**

To create an Amazon Elasticsearch Service domain

The following *create-elasticsearch-domain* command creates a new Amazon Elasticsearch Service domain within a VPC and restricts access to a single user. Amazon ES infers the VPC ID from the specified subnet and security group IDs.

```bash
aws es create-elasticsearch-domain
   --domain-name vpc-cli-example
   --elasticsearch-version 6.2
   --elasticsearch-cluster-config
   InstanceType=m4.large.elasticsearch,InstanceCount=1
   --ebs-options EBSEnabled=true,VolumeType=standard,VolumeSize=10
```
Output:

```json
{
   "DomainStatus": {
      "ElasticsearchClusterConfig": {
         "DedicatedMasterEnabled": false,
         "InstanceCount": 1,
         "ZoneAwarenessEnabled": false,
         "InstanceType": "m4.large.elasticsearch"
      },
      "DomainId": "123456789012/vpc-cli-example",
      "CognitoOptions": {
         "Enabled": false
      },
      "VPCOptions": {
         "SubnetIds": [
            "subnet-1a2a3a4a"
         ],
         "VPCId": "vpc-3a4a5a6a",
         "SecurityGroupIds": [
            "sg-2a3a4a5a"
         ],
         "AvailabilityZones": [
            "us-west-1c"
         ]
      },
      "Created": true,
      "Deleted": false,
      "EBSOptions": {
         "VolumeSize": 10,
         "VolumeType": "standard",
         "EBSEnabled": true
      },
      "Processing": true,
      "DomainName": "vpc-cli-example",
      "SnapshotOptions": {
         "AutomatedSnapshotStartHour": 0
      },
      "ElasticsearchVersion": "6.2",

For more information, see [Creating and Managing Amazon Elasticsearch Service Domains](https://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/index.html#es-create) in the Amazon Elasticsearch Service Developer Guide.

- For API details, see `DescribeElasticsearchDomains` in AWS CLI Command Reference.

### describe-reserved-elasticsearch-instances

The following code example shows how to use `describe-reserved-elasticsearch-instances`.

#### AWS CLI

**To view all reserved instances**

The following `describe-elasticsearch-domains` example provides a summary of all instances you have reserved in a region.

```bash
aws es describe-reserved-elasticsearch-instances
```

**Output:**

```json
{
   "ReservedElasticsearchInstances": [{
      "FixedPrice": 100.0,
      "ReservedElasticsearchInstanceOfferingId": "1a2a3a4a5-1a2a-3a4a-5a6a-1a2a3a4a5a6a",
      "ReservationName": "my-reservation",
      "PaymentOption": "PARTIAL_UPFRONT",
      "UsagePrice": 0.0,
      "ReservedElasticsearchInstanceId": "9a8a7a6a-5a4a-3a2a-1a0a-9a8a7a6a5a4a",
      "RecurringCharges": [{
         "RecurringChargeAmount": 0.603,
         "RecurringChargeFrequency": "Hourly"
      }],
      "State": "payment-pending",
      "StartTime": 1522872571.229,
   }
}
```
For more information, see Reserved Instances in the Amazon Elasticsearch Service Developer Guide.

- For API details, see DescribeReservedElasticsearchInstances in AWS CLI Command Reference.

**list-domain-names**

The following code example shows how to use list-domain-names.

**AWS CLI**

**To list all domains**

The following list-domain-names example provides a quick summary of all domains in the region.

```bash
aws es list-domain-names
```

Output:

```json
{
    "DomainNames": [
    {
        "DomainName": "cli-example-1"
    },
    {
        "DomainName": "cli-example-2"
    }
]
}
```

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the Amazon Elasticsearch Service Developer Guide.

- For API details, see ListDomainNames in AWS CLI Command Reference.
AWS OpsWorks examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS OpsWorks.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**assign-instance**

The following code example shows how to use `assign-instance`.

**AWS CLI**

**To assign a registered instance to a layer**

The following example assigns a registered instance to a custom layer.

```
aws opsworks --region us-east-1 assign-instance --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2 --layer-ids 26cf1d32-6876-42fa-bbf1-9cadc0bff938
```

**Output:** None.

**More Information**

For more information, see Assigning a Registered Instance to a Layer in the *AWS OpsWorks User Guide*. 

---

**Actions and scenarios** 4814
assign-volume

The following code example shows how to use assign-volume.

AWS CLI

To assign a registered volume to an instance

The following example assigns a registered Amazon Elastic Block Store (Amazon EBS) volume to an instance. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns when you register the volume with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID. Before you run assign-volume, you must first run update-volume to assign a mount point to the volume.

```bash
aws opsworks --region us-east-1 assign-volume --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2 --volume-id 26cf1d32-6876-42fa-bbf1-9cadc0bdf938
```

Output: None.

More Information

For more information, see Assigning Amazon EBS Volumes to an Instance in the AWS OpsWorks User Guide.

For API details, see AssignVolume in AWS CLI Command Reference.

associate-elastic-ip

The following code example shows how to use associate-elastic-ip.

AWS CLI

To associate an Elastic IP address with an instance

The following example associates an Elastic IP address with a specified instance.

```bash
aws opsworks --region us-east-1 associate-elastic-ip --instance-id dfe18b02-5327-493d-91a4-c5c0c448927f --elastic-ip 54.148.130.96
```
Output: None.

More Information

For more information, see Resource Management in the AWS OpsWorks User Guide.
- For API details, see AssociateElasticIp in AWS CLI Command Reference.

attach-elastic-load-balancer

The following code example shows how to use attach-elastic-load-balancer.

AWS CLI

To attach a load balancer to a layer

The following example attaches a load balancer, identified by its name, to a specified layer.

```
aws opsworks --region us-east-1 attach-elastic-load-balancer --elastic-load-balancer-name Java-LB --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

Output: None.

More Information

For more information, see Elastic Load Balancing in the AWS OpsWorks User Guide.
- For API details, see AttachElasticLoadBalancer in AWS CLI Command Reference.

create-app

The following code example shows how to use create-app.

AWS CLI

Example 1: To create an app

The following example creates a PHP app named SimplePHPApp from code stored in a GitHub repository. The command uses the shorthand form of the application source definition.

```
aws opsworks create-app \ 
  --region us-east-1 \ 
```
Example 2: To create an app with an attached database

The following example creates a JSP app from code stored in .zip archive in a public S3 bucket. It attaches an RDS DB instance to serve as the app's data store. The application and database sources are defined in separate JSON files that are in the directory from which you run the command.

```
aws opsworks create-app \
   --region us-east-1 \
   --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8 \
   --name SimpleJSP \
   --type java \
   --app-source file://appsource.json \
   --data-sources file://datasource.json
```

The application source information is in `appsource.json` and contains the following.

```
{
   "Type": "archive",
   "Url": "https://s3.amazonaws.com/opsworks-demo-assets/simplejsp.zip"
}
```

The database source information is in `datasource.json` and contains the following.

```
[
   {
      "Type": "RdsDbInstance",
   }
]
"DatabaseName": "mydb"
]

**Note:** For an RDS DB instance, you must first use `register-rds-db-instance` to register the instance with the stack. For MySQL App Server instances, set Type to `OpsworksMysqlInstance`. These instances are created by AWS OpsWorks, so they do not have to be registered.

Output:

```
{
  "AppId": "26a61ead-d201-47e3-b55c-2a7c666942f8"
}
```

For more information, see Adding Apps in the *AWS OpsWorks User Guide*.

- For API details, see CreateApp in *AWS CLI Command Reference*.

**create-deployment**

The following code example shows how to use `create-deployment`.

**AWS CLI**

**Example 1: To deploy apps and run stack commands**

The following examples show how to use the `create-deployment` command to deploy apps and run stack commands. Notice that the quote ("" characters in the JSON object that specifies the command are all preceded by escape characters (\). Without the escape characters, the command might return an invalid JSON error.

The following `create-deployment` example deploys an app to a specified stack.

```
aws opsworks create-deployment \
  --stack-id cfb7e082-ad1d-4599-8e81-de1c39ab45bf \
  --app-id 307be5c8-d55d-47b5-bd6e-7bd417c6c7eb \
  --command "{"Name":"deploy"}"
```

Output:
Example 2: To deploy a Rails App and Migrate the Database

The following `create-deployment` command deploys a Ruby on Rails app to a specified stack and migrates the database.

```bash
aws opsworks create-deployment \
    --stack-id cfb7e082-ad1d-4599-8e81-de1c39ab45bf \
    --app-id 307be5c8-d55d-47b5-bd6e-7bd417c6c7eb \
    --command "{"Name":"deploy", "Args":{"migrate":["true"]}}"
```

Output:

```json
{
    "DeploymentId": "5746c781-df7f-4c87-84a7-65a119880560"
}
```

For more information on deployment, see [Deploying Apps](https://aws.amazon.com/opsws) in the *AWS OpsWorks User Guide*.

Example 3: Run a Recipe

The following `create-deployment` command runs a custom recipe, `phpapp::appsetup`, on the instances in a specified stack.

```bash
aws opsworks create-deployment \
    --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \
    --command "{"Name":"execute_recipes", "Args":{"recipes":["phpapp::appsetup"]}}"
```

Output:

```json
{
    "DeploymentId": "5cbaa7b9-4e09-4e53-aa1b-314fbd106038"
}
```

For more information, see [Run Stack Commands](https://aws.amazon.com/opsws) in the *AWS OpsWorks User Guide*. 
**Example 4: Install Dependencies**

The following `create-deployment` command installs dependencies, such as packages or Ruby gems, on the instances in a specified stack.

```
aws opsworks create-deployment \
   --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \
   --command "{"Name":"install_dependencies"}"
```

Output:

```
{
   "DeploymentId": "aef5b255-8604-4928-81b3-9b0187f962ff"
}
```

For more information, see [Run Stack Commands](#) in the *AWS OpsWorks User Guide*.

- For API details, see [CreateDeployment](#) in *AWS CLI Command Reference*.

**create-instance**

The following code example shows how to use `create-instance`.

**AWS CLI**

**To create an instance**

The following `create-instance` command creates an m1.large Amazon Linux instance named `myinstance1` in a specified stack. The instance is assigned to one layer.

```
aws opsworks --region us-east-1 create-instance --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --layer-ids 5c8c272a-f2d5-42e3-8245-5bf3927cb65b --hostname myinstance1 --instance-type m1.large --os "Amazon Linux"
```

To use an autogenerated name, call `get-hostname-suggestion`, which generates a hostname based on the theme that you specified when you created the stack. Then pass that name to the `hostname` argument.

**Output:**
More Information

For more information, see Adding an Instance to a Layer in the AWS OpsWorks User Guide.

- For API details, see CreateInstance in AWS CLI Command Reference.

create-layer

The following code example shows how to use create-layer.

AWS CLI

To create a layer

The following create-layer command creates a PHP App Server layer named MyPHPLayer in a specified stack.

```
aws opsworks create-layer --region us-east-1 --stack-id f6673d70-32e6-4425-8999-265dd002fec7 --type php-app --name MyPHPLayer --shortname myphplayer
```

Output:

```
{
   "LayerId": "0b212672-6b4b-40e4-8a34-5a943cf2e07a"
}
```

More Information

For more information, see How to Create a Layer in the AWS OpsWorks User Guide.

- For API details, see CreateLayer in AWS CLI Command Reference.

create-server

The following code example shows how to use create-server.
To create a server

The following create-server example creates a new Chef Automate server named automate-06 in your default region. Note that defaults are used for most other settings, such as number of backups to retain, and maintenance and backup start times. Before you run a create-server command, complete prerequisites in Getting Started with AWS OpsWorks for Chef Automate in the AWS Opsworks for Chef Automate User Guide.

```bash
aws opsworks-cm create-server \
  --engine "ChefAutomate" \
  --instance-profile-arn "arn:aws:iam::012345678901:instance-profile/aws-opsworks-cm-ec2-role" \
  --instance-type "t2.medium" \
  --server-name "automate-06" \
  --service-role-arn "arn:aws:iam::012345678901:role/aws-opsworks-cm-service-role"
```

Output:

```json
{
  "Server": {
    "AssociatePublicIpAddress": true,
    "BackupRetentionCount": 10,
    "CreatedAt": "2019-12-29T13:38:47.520Z",
    "DisableAutomatedBackup": false,
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
    "Engine": "ChefAutomate",
    "EngineAttributes": [
      {
        "Name": "CHEF_AUTOMATE_ADMIN_PASSWORD",
        "Value": "1Example1"
      }
    ],
    "EngineModel": "Single",
    "EngineVersion": "2019-08",
    "InstanceProfileArn": "arn:aws:iam::012345678901:instance-profile/aws-opsworks-cm-ec2-role",
    "InstanceType": "t2.medium",
    "PreferredBackupWindow": "Sun:02:00",
    "PreferredMaintenanceWindow": "00:00",
    "SecurityGroupIds": [ "sg-12345678" ],
```
For more information, see `CreateServer` in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see `CreateServer` in *AWS CLI Command Reference*.

**create-stack**

The following code example shows how to use `create-stack`.

**AWS CLI**

**To create a stack**

The following `create-stack` command creates a stack named CLI Stack.

```
```

The `service-role-arn` and `default-instance-profile-arn` parameters are required. You typically use the ones that AWS OpsWorks creates for you when you create your first stack. To get the Amazon Resource Names (ARNs) for your account, go to the IAM console, choose Roles in the navigation panel, choose the role or profile, and choose the Summary tab.

**Output:**

```
{
   "StackId": "f6673d70-32e6-4425-8999-265dd002fec7"
}
```

**More Information**

For more information, see Create a New Stack in the *AWS OpsWorks User Guide*. 
create-user-profile

The following code example shows how to use `create-user-profile`.

**AWS CLI**

**To create a user profile**

You import an AWS Identity and Access Manager (IAM) user into AWS OpsWorks by calling `create-user-profile` to create a user profile. The following example creates a user profile for the cli-user-test IAM user, who is identified by Amazon Resource Name (ARN). The example assigns the user an SSH username of `myusername` and enables self management, which allows the user to specify an SSH public key.

```bash
aws opsworks --region us-east-1 create-user-profile --iam-user-arn arn:aws:iam::123456789102:user/cli-user-test --ssh-username myusername --allow-self-management
```

**Output:**

```json
{
   "IamUserArn": "arn:aws:iam::123456789102:user/cli-user-test"
}
```

**Tip:** This command imports an IAM user into AWS OpsWorks, but only with the permissions that are granted by the attached policies. You can grant per-stack AWS OpsWorks permissions by using the `set-permissions` command.

**More Information**

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see [CreateUserProfile](#) in *AWS CLI Command Reference*.

**delete-app**

The following code example shows how to use `delete-app`.

---

*Actions and scenarios* 4824
AWS CLI

To delete an app

The following example deletes a specified app, which is identified by its app ID. You can obtain an app ID by going to the app's details page on the AWS OpsWorks console or by running the describe-apps command.

```bash
aws opsworks delete-app --region us-east-1 --app-id 577943b9-2ec1-4baf-a7bf-1d347601edc5
```

Output: None.

More Information

For more information, see Apps in the AWS OpsWorks User Guide.

• For API details, see DeleteApp in AWS CLI Command Reference.

delete-instance

The following code example shows how to use delete-instance.

AWS CLI

To delete an instance

The following delete-instance example deletes a specified instance, which is identified by its instance ID. You can find an instance ID by opening the instance's details page in the AWS OpsWorks console, or by running the describe-instances command.

If the instance is online, you must first stop the instance by calling stop-instance, and then you must wait until the instance has stopped. Run describe-instances to check the instance status.

To remove the instance's Amazon EBS volumes or Elastic IP addresses, add the --delete-volumes or --delete-elastic-ip arguments, respectively.

```bash
aws opsworks delete-instance \
--region us-east-1 \
```
This command produces no output.

For more information, see Deleting AWS OpsWorks Instances in the AWS OpsWorks User Guide.

- For API details, see DeleteInstance in AWS CLI Command Reference.

delete-layer

The following code example shows how to use delete-layer.

AWS CLI

To delete a layer

The following example deletes a specified layer, which is identified by its layer ID. You can obtain a layer ID by going to the layer's details page on the AWS OpsWorks console or by running the describe-layers command.

**Note:** Before deleting a layer, you must use delete-instance to delete all of the layer's instances.

```
aws opsworks delete-layer --region us-east-1 --layer-id a919454e-b816-4598-b29a-5796afb498ed
```

Output: None.

More Information

For more information, see Deleting AWS OpsWorks Instances in the AWS OpsWorks User Guide.

- For API details, see DeleteLayer in AWS CLI Command Reference.

delete-stack

The following code example shows how to use delete-stack.

AWS CLI

To delete a stack
The following example deletes a specified stack, which is identified by its stack ID. You can obtain a stack ID by clicking **Stack Settings** on the AWS OpsWorks console or by running the `describe-stacks` command.

**Note:** Before deleting a layer, you must use `delete-app`, `delete-instance`, and `delete-layer` to delete all of the stack's apps, instances, and layers.

```bash
aws opsworks delete-stack --region us-east-1 --stack-id 154a9d89-7e9e-433b-8de8-617e53756c84
```

**Output:** None.

**More Information**

For more information, see Shut Down a Stack in the *AWS OpsWorks User Guide*.

- For API details, see **DeleteStack** in *AWS CLI Command Reference*.

---

**delete-user-profile**

The following code example shows how to use `delete-user-profile`.

**AWS CLI**

**To delete a user profile and remove an IAM user from AWS OpsWorks**

The following example deletes the user profile for a specified AWS Identity and Access Management (IAM) user, who is identified by Amazon Resource Name (ARN). The operation removes the user from AWS OpsWorks, but does not delete the IAM user. You must use the IAM console, CLI, or API for that task.

```bash
aws opsworks --region us-east-1 delete-user-profile --iam-user-arn arn:aws:iam::123456789102:user/cli-user-test
```

**Output:** None.

**More Information**

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see **DeleteUserProfile** in *AWS CLI Command Reference*. 
deregister-elastic-ip

The following code example shows how to use deregister-elastic-ip.

**AWS CLI**

**To deregister an Elastic IP address from a stack**

The following example deregisters an Elastic IP address, identified by its IP address, from its stack.

```bash
aws opsworks deregister-elastic-ip --region us-east-1 --elastic-ip 54.148.130.96
```

*Output:* None.

**More Information**

For more information, see Deregistering Elastic IP Addresses in the *AWS OpsWorks User Guide.*
- For API details, see [DeregisterElasticIp](https://aws.amazon.com) in *AWS CLI Command Reference.*

---

deregister-instance

The following code example shows how to use deregister-instance.

**AWS CLI**

**To deregister a registered instance from a stack**

The following deregister-instance command deregisters a registered instance from its stack.

```bash
aws opsworks --region us-east-1 deregister-instance --instance-id a4d6d1710-ded9-42a1-b08e-b043ad7af1e2
```

*Output:* None.

**More Information**

For more information, see Deregistering a Registered Instance in the *AWS OpsWorks User Guide.*
- For API details, see [DeregisterInstance](https://aws.amazon.com) in *AWS CLI Command Reference.*
deregister-rds-db-instance

The following code example shows how to use deregister-rds-db-instance.

AWS CLI

To deregister an Amazon RDS DB instance from a stack

The following example deregisters an RDS DB instance, identified by its ARN, from its stack.

```
```

Output: None.

More Information

For more information, see Deregistering Amazon RDS Instances in the AWS OpsWorks User Guide.

instance ID: clitestdb Master user: cluser Master PWD: some23!pwd DB Name: mydb

• For API details, see DeregisterRdsDbInstance in AWS CLI Command Reference.

deregister-volume

The following code example shows how to use deregister-volume.

AWS CLI

To deregister an Amazon EBS volume

The following example deregisters an EBS volume from its stack. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigned when you registered the volume with the stack, not the EC2 volume ID.

```
aws opsworks deregister-volume --region us-east-1 --volume-id 5c48ef52-3144-4bf5-beaa-fda4deb23d4d
```
Output: None.

More Information

For more information, see Deregistering Amazon EBS Volumes in the AWS OpsWorks User Guide.
- For API details, see `DeregisterVolume` in AWS CLI Command Reference.

describe-apps

The following code example shows how to use describe-apps.

AWS CLI

To describe apps

The following `describe-apps` command describes the apps in a specified stack.

```
aws opsworks describe-apps
   --stack-id 38ee91e2-abdc-4208-a107-0b7168b3cc7a
   --region us-east-1
```

Output:

```
{
   "Apps": [
   {
      "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
      "AppSource": {
         "Url": "https://s3-us-west-2.amazonaws.com/opsworks-demo-assets/simplejsp.zip",
         "Type": "archive"
      },
      "Name": "SimpleJSP",
      "EnableSsl": false,
      "SslConfiguration": {},
      "AppId": "daldecc1-0dff-43ea-ad7c-bb667cd87c8b",
      "Attributes": {
         "RailsEnv": null,
         "AutoBundleOnDeploy": "true",
         "DocumentRoot": "ROOT"
      },
      "Shortname": "simplejsp",
   }
   ]
}
```
For more information, see Apps in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeApps](#) in *AWS CLI Command Reference*.

### describe-commands

The following code example shows how to use `describe-commands`.

**AWS CLI**

**To describe commands**

The following `describe-commands` command describes the commands in a specified instance.

```bash
aws opsworks describe-commands \
  --instance-id 8c2673b9-3fe5-420d-9cfa-78d875ee7687 \
  --region us-east-1
```

**Output:**

```json
{
  "Commands": [
  {
    "Status": "successful",
    "CompletedAt": "2013-07-25T18:57:47+00:00",
    "InstanceId": "8c2673b9-3fe5-420d-9cfa-78d875ee7687",
    "DeploymentId": "6ed0df4c-9ef7-4812-8dac-d54a05be1029",
    "AcknowledgedAt": "2013-07-25T18:57:41+00:00",
    "LogUrl": "https://s3.amazonaws.com/<bucket-name>/logs/008c1a91-ec59-4d51-971d-3adff54b00cc?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1375394373&Signature=HkXil6UuNfxTCC37EPQa4G2E1E%3D&response-cache-control=private&response-content-encoding=gzip&response-content-type=text%2Fplain",
    "Type": "undeploy",
    "CommandId": "008c1a91-ec59-4d51-971d-3adff54b00cc",
    "CreatedAt": "2013-07-25T18:57:34+00:00",
    "ExitCode": 0
  }
  ]
}
```
For more information, see AWS OpsWorks Lifecycle Events in the AWS OpsWorks User Guide.

- For API details, see DescribeCommands in AWS CLI Command Reference.

describe-deployments

The following code example shows how to use describe-deployments.

AWS CLI

To describe deployments

The following describe-deployments command describes the deployments in a specified stack.

```
aws opsworks --region us-east-1 describe-deployments --stack-id 38ee91e2-abdc-4208-a107-0b7168b3cc7a
```

Output:

```
{
   "Deployments": [
      {
         "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
```

"Status": "successful",
"CompletedAt": "2013-07-25T18:57:49+00:00",

    "Command": {
        "Args": {},
        "Name": "deploy"
    },
    "InstanceIds": [
        "8c2673b9-3fe5-420d-9cfa-78d875ee7687",
        "9e588a25-35b2-4804-bd43-488f85ebe5b7"
    ],
    "Duration": 72,
    "CreatedAt": "2013-07-25T18:55:29+00:00"
}
]}

More Information

For more information, see Deploying Apps in the AWS OpsWorks User Guide.

- For API details, see DescribeDeployments in AWS CLI Command Reference.

describe-elastic-ips

The following code example shows how to use describe-elastic-ips.
AWS CLI

To describe Elastic IP instances

The following describe-elastic-ips command describes the Elastic IP addresses in a specified instance.

```bash
aws opsworks --region us-east-1 describe-elastic-ips --instance-id b62f3e04-e9eb-436c-a91f-d9e9a396b7b0
```

Output:

```json
{
   "ElasticIps": [
      {
         "Ip": "192.0.2.0",
         "Domain": "standard",
         "Region": "us-west-2"
      }
   ]
}
```

More Information

For more information, see Instances in the AWS OpsWorks User Guide.

- For API details, see DescribeElasticIps in AWS CLI Command Reference.

describe-elastic-load-balancers

The following code example shows how to use describe-elastic-load-balancers.

AWS CLI

To describe a stack's elastic load balancers

The following describe-elastic-load-balancers command describes a specified stack's load balancers.

```bash
aws opsworks --region us-west-2 describe-elastic-load-balancers --stack-id 6f4660e5-37a6-4e42-bfa0-1358ebd9c182
```
Output: This particular stack has one load balancer.

```
{
  "ElasticLoadBalancers": [
    {
      "SubnetIds": [
        "subnet-60e4ea04",
        "subnet-66e1c110"
      ],
      "Ec2InstanceIds": [],
      "ElasticBalancerName": "my-balancer",
      "Region": "us-west-2",
      "LayerId": "344973cb-bf2b-4cd0-8d93-51cd819bab04",
      "AvailabilityZones": [
        "us-west-2a",
        "us-west-2b"
      ],
      "VpcId": "vpc-b319f9d4",
      "StackId": "6f4660e5-37a6-4e42-bfa0-1358ebd9c182",
      "DnsName": "my-balancer-2094040179.us-west-2.elb.amazonaws.com"
    }
  ]
}
```

More Information

For more information, see Apps in the AWS OpsWorks User Guide.

- For API details, see DescribeElasticLoadBalancers in AWS CLI Command Reference.

describe-instances

The following code example shows how to use describe-instances.

AWS CLI

To describe instances

The following describe-instances command describes the instances in a specified stack:

```
aws opsworks --region us-east-1 describe-instances --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```
**Output:** The following output example is for a stack with two instances. The first is a registered EC2 instance, and the second was created by AWS OpsWorks.

```json
{
  "Instances": [
    {
      "StackId": "71c7ca72-55ae-4b6a-8ee1-a8dc7d3fa0f",
      "PrivateDns": "ip-10-31-39-66.us-west-2.compute.internal",
      "LayerIds": [
        "26cf1d32-6876-42fa-bbf1-9cadc0bff938"
      ],
      "EbsOptimized": false,
      "ReportedOs": {
        "Version": "14.04",
        "Name": "ubuntu",
        "Family": "debian"
      },
      "Status": "online",
      "InstanceId": "4d6d1710-ded9-42a1-b08e-b043ad7af1e2",
      "SshKeyName": "US-West-2",
      "InfrastructureClass": "ec2",
      "RootDeviceVolumeId": "vol-d08ec6c1",
      "SubnetId": "subnet-b8de0ddd",
      "InstanceType": "t1.micro",
      "CreatedAt": "2015-02-24T20:52:49+00:00",
      "AmiId": "ami-35501205",
      "Hostname": "ip-192-0-2-0",
      "Ec2InstanceId": "i-5cd23551",
      "PublicDns": "ec2-192-0-2-0.us-west-2.compute.amazonaws.com",
      "SecurityGroupIds": [
        "sg-c4d3f0a1"
      ],
      "Architecture": "x86_64",
      "RootDeviceType": "ebs",
      "InstallUpdatesOnBoot": true,
      "Os": "Custom",
      "VirtualizationType": "paravirtual",
      "AvailabilityZone": "us-west-2a",
      "PrivateIp": "10.31.39.66",
      "PublicIp": "192.0.2.06",
      "RegisteredBy": "arn:aws:iam::123456789102:user/AWS/OpsWorks/OpsWorks-EC2Register-i-5cd23551"
    }
  ]
}
```
More Information

For more information, see Instances in the AWS OpsWorks User Guide.
For API details, see `DescribeInstances` in *AWS CLI Command Reference*.

### describe-layers

The following code example shows how to use `describe-layers`.

#### AWS CLI

To describe a stack's layers

The following `describe-layers` command describes the layers in a specified stack:

```bash
aws opsworks --region us-east-1 describe-layers --stack-id 38ee91e2-abdc-4208-a107-0b7168b3cc7a
```

**Output:**

```json
{
   "Layers": [
   {
      "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
      "Type": "db-master",

**More Information**

For more information, see Layers in the *AWS OpsWorks User Guide*.
- For API details, see [DescribeLayers](#) in *AWS CLI Command Reference*.

**describe-load-based-auto-scaling**

The following code example shows how to use `describe-load-based-auto-scaling`.

**AWS CLI**

**To describe a layer's load-based scaling configuration**

The following example describes a specified layer's load-based scaling configuration. The layer is identified by its layer ID, which you can find on the layer's details page or by running `describe-layers`.

```bash
aws opsworks describe-load-based-auto-scaling --region us-east-1 --layer-ids 6bec29c9-c866-41a0-aba5-fa3e374ce2a1
```

**Output:** The example layer has a single load-based instance.

```json
{
   "LoadBasedAutoScalingConfigurations": [
      {
         "DownScaling": {
            "IgnoreMetricsTime": 10,
            "ThresholdsWaitTime": 10,
            "InstanceCount": 1,
            "CpuThreshold": 30.0
         },
         "Enable": true,
         "UpScaling": {
            "IgnoreMetricsTime": 5,
            "ThresholdsWaitTime": 5,
            "InstanceCount": 1,
            "CpuThreshold": 80.0
         }
      }
   ]
}
```
More Information

For more information, see How Automatic Load-based Scaling Works in the AWS OpsWorks User Guide.

- For API details, see DescribeLoadBasedAutoScaling in AWS CLI Command Reference.

describe-my-user-profile

The following code example shows how to use describe-my-user-profile.

AWS CLI

To obtain a user's profile

The following example shows how to obtain the profile of the AWS Identity and Access Management (IAM) user that is running the command.

```
aws opsworks --region us-east-1 describe-my-user-profile
```

Output: For brevity, most of the user's SSH public key is replaced by an ellipsis (...).

```
{
   "UserProfile": {
      "IamUserArn": "arn:aws:iam::123456789012:user/myusername",
      "SshPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABJQ...3LQ4aX9jpxQw== rsa-key-20141104",
      "Name": "myusername",
      "SshUsername": "myusername"
   }
}
```

More Information

For more information, see Importing Users into AWS OpsWorks in the AWS OpsWorks User Guide.

- For API details, see DescribeMyUserProfile in AWS CLI Command Reference.

describe-permissions

The following code example shows how to use describe-permissions.
To obtain a user's per-stack AWS OpsWorks permission level

The following example shows how to obtain an AWS Identity and Access Management (IAM) user's permission level on a specified stack.

```bash
aws opsworks --region us-east-1 describe-permissions --iam-user-arn arn:aws:iam::123456789012:user/cli-user-test --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06
```

**Output:**

```
{
   "Permissions": [
       {
           "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
           "IamUserArn": "arn:aws:iam::123456789012:user/cli-user-test",
           "Level": "manage",
           "AllowSudo": true,
           "AllowSsh": true
       }
   ]
}
```

**More Information**

For more information, see Granting Per-Stack Permissions Levels in the *AWS OpsWorks User Guide*.

- For API details, see [DescribePermissions](#) in *AWS CLI Command Reference*.

**describe-raid-arrays**

The following code example shows how to use `describe-raid-arrays`.

**AWS CLI**

**To describe RAID arrays**

The following example describes the RAID arrays attached to the instances in a specified stack.
aws opsworks --region us-east-1 describe-raid-arrays --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06

**Output:** The following is the output for a stack with one RAID array.

```json
{
   "RaidArrays": [
   {
      "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
      "AvailabilityZone": "us-west-2a",
      "Name": "Created for php-app1",
      "NumberOfDisks": 2,
      "InstanceId": "9f14adbc-ced5-43b6-bf01-e7d0db6cf2f7",
      "RaidLevel": 0,
      "VolumeType": "standard",
      "RaidArrayId": "f2d4e470-5972-4676-b1b8-bae41ec3e51c",
      "Device": "/dev/md0",
      "MountPoint": "/mnt/workspace",
      "CreatedAt": "2015-02-26T23:53:09+00:00",
      "Size": 100
   }
   ]
}
```

For more information, see EBS Volumes in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeRaidArrays](#) in *AWS CLI Command Reference*.

**describe-rds-db-instances**

The following code example shows how to use `describe-rds-db-instances`.

**AWS CLI**

**To describe a stack's registered Amazon RDS instances**

The following example describes the Amazon RDS instances registered with a specified stack.

```
aws opsworks --region us-east-1 describe-rds-db-instances --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06
```

**Output:** The following is the output for a stack with one registered RDS instance.
For more information, see Resource Management in the AWS OpsWorks User Guide.

- For API details, see **DescribeRdsDbInstances** in *AWS CLI Command Reference*.

**describe-stack-provisioning-parameters**

The following code example shows how to use `describe-stack-provisioning-parameters`.

**AWS CLI**

**To return the provisioning parameters for a stack**

The following `describe-stack-provisioning-parameters` example returns the provisioning parameters for a specified stack. Provisioning parameters include settings such as the agent installation location and public key that OpsWorks uses to manage the agent on instances in a stack.

```
aws opsworks describe-stack-provisioning-parameters \
  --stack-id 62744d97-6faf-4ecb-969b-a086fEXAMPLE
```

**Output:**

```
{
```

"Parameters": {
  "agent_installer_tgz": "opsworks-agent-installer.tgz",
  "assets_download_bucket": "opsworks-instance-assets-us-west-2.s3.amazonaws.com",
  "charlie_public_key": "-----BEGIN PUBLIC KEY-----PUBLIC_KEY_EXAMPLE
END PUBLIC KEY-----",
  "instance_service_endpoint": "opsworks-instance-service.us-west-2.amazonaws.com",
  "instance_service_port": "443",
  "instance_service_region": "us-west-2",
  "instance_service_ssl_verify_peer": "true",
  "instance_service_use_ssl": "true",
  "ops_works_endpoint": "opsworks.us-west-2.amazonaws.com",
  "ops_works_port": "443",
  "ops_works_region": "us-west-2",
  "ops_works_ssl_verify_peer": "true",
  "ops_works_use_ssl": "true",
  "verbose": "false",
  "wait_between_runs": "30"
}

For more information, see Run Stack Commands in the AWS OpsWorks User Guide.

- For API details, see DescribeStackProvisioningParameters in AWS CLI Command Reference.

**describe-stack-summary**

The following code example shows how to use `describe-stack-summary`.

**AWS CLI**

To describe a stack's configuration

The following `describe-stack-summary` command returns a summary of the specified stack's configuration.

```bash
aws opsworks --region us-east-1 describe-stack-summary --stack-id 8c428b08-ala1-46ce-a5f8-feddc43771b8
```

**Output:**
More Information

For more information, see Stacks in the AWS OpsWorks User Guide.
- For API details, see DescribeStackSummary in AWS CLI Command Reference.

describe-stacks

The following code example shows how to use describe-stacks.

AWS CLI

To describe stacks

The following describe-stacks command describes an account's stacks.

```bash
code example
aws opsworks --region us-east-1 describe-stacks
```

Output:

```json
{
   "Stacks": [
   {

More Information

For more information, see Stacks in the AWS OpsWorks User Guide.

- For API details, see DescribeStacks in AWS CLI Command Reference.

describe-timebased-auto-scaling

The following code example shows how to use describe-timebased-auto-scaling.

AWS CLI

To describe the time-based scaling configuration of an instance

The following example describes a specified instance's time-based scaling configuration. The instance is identified by its instance ID, which you can find on the instances's details page or by running describe-instances.

```
aws opsworks describe-time-based-auto-scaling --region us-east-1 --instance-ids 701f2ffe-5d8e-4187-b140-77b75f55de8d
```

Output: The example has a single time-based instance.

```json
{
   "TimeBasedAutoScalingConfigurations": [
      {
         "InstanceId": "701f2ffe-5d8e-4187-b140-77b75f55de8d",
         "AutoScalingSchedule": {
            "Monday": {
               "11": "on",
               "10": "on",
               "13": "on",
               "12": "on"
            },
            "Tuesday": {
               "11": "on",
               "10": "on",
               "13": "on",
               "12": "on"
            }
         }
      }
   ]
}```
More Information

For more information, see How Automatic Time-based Scaling Works in the AWS OpsWorks User Guide.

- For API details, see DescribeTimeBasedAutoScaling in AWS CLI Command Reference.

describe-user-profiles

The following code example shows how to use describe-user-profiles.

AWS CLI

To describe user profiles

The following describe-user-profiles command describes the account's user profiles.

```bash
aws opsworks --region us-east-1 describe-user-profiles
```

Output:

```json
{
   "UserProfiles": [
      {
         "IamUserArn": "arn:aws:iam::123456789012:user/someuser",
         "SshPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABJQAAAQEAk0uP7i80q3Cko...",
         "AllowSelfManagement": true,
         "Name": "someuser",
         "SshUsername": "someuser"
      },
      {
         "IamUserArn": "arn:aws:iam::123456789012:user/cli-user-test",
         "AllowSelfManagement": true,
         "Name": "cli-user-test",
         "SshUsername": "myusername"
      }
   ]
}
```
More Information

For more information, see Managing AWS OpsWorks Users in the *AWS OpsWorks User Guide*. For API details, see [DescribeUserProfiles](#) in *AWS CLI Command Reference*.

describe-volumes

The following code example shows how to use `describe-volumes`.

**AWS CLI**

**To describe a stack's volumes**

The following example describes a stack's EBS volumes.

```
aws opsworks --region us-east-1 describe-volumes --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```

**Output:**

```
{
  "Volumes": [
    {
      "Status": "in-use",
      "AvailabilityZone": "us-west-2a",
      "Name": "CLITest",
      "InstanceId": "dfe18b02-5327-493d-91a4-c5c0c448927f",
      "VolumeType": "standard",
      "VolumeId": "56b66fbd-e1a1-4aff-9227-70f77118d4c5",
      "Device": "/dev/sdi",
      "Ec2VolumeId": "vol-295c1638",
      "MountPoint": "/mnt/myvolume",
      "Size": 1
    }
  ]
}
```
More Information

For more information, see Resource Management in the AWS OpsWorks User Guide.
• For API details, see DescribeVolumes in AWS CLI Command Reference.

detach-elastic-load-balancer

The following code example shows how to use detach-elastic-load-balancer.

AWS CLI

To detach a load balancer from its layer

The following example detaches a load balancer, identified by its name, from its layer.

```bash
aws opsworks --region us-east-1 detach-elastic-load-balancer --elastic-load-balancer-name Java-LB --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

Output: None.

More Information

For more information, see Elastic Load Balancing in the AWS OpsWorks User Guide.
• For API details, see DetachElasticLoadBalancer in AWS CLI Command Reference.

disassociate-elastic-ip

The following code example shows how to use disassociate-elastic-ip.

AWS CLI

To disassociate an Elastic IP address from an instance

The following example disassociates an Elastic IP address from a specified instance.

```bash
aws opsworks --region us-east-1 disassociate-elastic-ip --elastic-ip 54.148.130.96
```

Output: None.
More Information

For more information, see Resource Management in the AWS OpsWorks User Guide.

- For API details, see DisassociateElasticIp in AWS CLI Command Reference.

get-hostname-suggestion

The following code example shows how to use get-hostname-suggestion.

AWS CLI

To get the next hostname for a layer

The following example gets the next generated hostname for a specified layer. The layer used for this example is a Java Application Server layer with one instance. The stack's hostname theme is the default, Layer_Dependent.

```
aws opsworks --region us-east-1 get-hostname-suggestion --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

**Output:**

```
{
   "Hostname": "java-app2",
   "LayerId": "888c5645-09a5-4d0e-95a8-812ef1db76a4"
}
```

More Information

For more information, see Create a New Stack in the AWS OpsWorks User Guide.

- For API details, see GetHostnameSuggestion in AWS CLI Command Reference.

reboot-instance

The following code example shows how to use reboot-instance.

AWS CLI

To reboot an instance
The following example reboots an instance.

```sh
code
aws opsworks --region us-east-1 reboot-instance --instance-id dfe18b02-5327-493d-91a4-c5c0c448927f
code
```

**Output**: None.

**More Information**

For more information, see Rebooting an Instance in the *AWS OpsWorks User Guide*.

- For API details, see `RebootInstance` in *AWS CLI Command Reference*.

---

**register-elastic-ip**

The following code example shows how to use `register-elastic-ip`.

**AWS CLI**

**To register an Elastic IP address with a stack**

The following example registers an Elastic IP address, identified by its IP address, with a specified stack.

**Note**: The Elastic IP address must be in the same region as the stack.

```sh
code
aws opsworks register-elastic-ip --region us-east-1 --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06 --elastic-ip 54.148.130.96
code
```

**Output**

```json
{
  "ElasticIp": "54.148.130.96"
}
```

**More Information**

For more information, see Registering Elastic IP Addresses with a Stack in the *OpsWorks User Guide*.

- For API details, see `RegisterElasticIp` in *AWS CLI Command Reference*. 
register-rds-db-instance

The following code example shows how to use register-rds-db-instance.

AWS CLI

To register an Amazon RDS instance with a stack

The following example registers an Amazon RDS DB instance, identified by its Amazon Resource Name (ARN), with a specified stack. It also specifies the instance's master username and password. Note that AWS OpsWorks does not validate either of these values. If either one is incorrect, your application will not be able to connect to the database.

```bash
aws opsworks register-rds-db-instance --region us-east-1 --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06 --rds-db-instance-arn arn:aws:rds:us-west-2:123456789012:db:clitestdb --db-user cliuser --db-password some23!pwd
```

Output: None.

More Information

For more information, see Registering Amazon RDS Instances with a Stack in the AWS OpsWorks User Guide.

- For API details, see RegisterRdsDbInstance in AWS CLI Command Reference.

register-volume

The following code example shows how to use register-volume.

AWS CLI

To register an Amazon EBS volume with a stack

The following example registers an Amazon EBS volume, identified by its volume ID, with a specified stack.

```bash
aws opsworks register-volume --region us-east-1 --stack-id d72553d4-8727-448c-9b00-f024f0ba1b06 --ec2-volume-id vol-295c1638
```

Output:
More Information

For more information, see Registering Amazon EBS Volumes with a Stack in the AWS OpsWorks User Guide.

- For API details, see RegisterVolume in AWS CLI Command Reference.

register

The following code example shows how to use register.

AWS CLI

To register instances with a stack

The following examples show a variety of ways to register instances with a stack that were created outside of AWS Opsworks. You can run register from the instance to be registered, or from a separate workstation. For more information, see Registering Amazon EC2 and On-premises Instances in the AWS OpsWorks User Guide.

Note: For brevity, the examples omit the region argument.

To register an Amazon EC2 instance

To indicate that you are registering an EC2 instance, set the --infrastructure-class argument to ec2.

The following example registers an EC2 instance with the specified stack from a separate workstation. The instance is identified by its EC2 ID, `i-12345678`. The example uses the workstation's default SSH username and attempts to log in to the instance using authentication techniques that do not require a password, such as a default private SSH key. If that fails, register queries for the password.

```
aws opsworks register --infrastructure-class=ec2 --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb i-12345678
```
The following example registers an EC2 instance with the specified stack from a separate workstation. It uses the --ssh-username and --ssh-private-key arguments to explicitly specify the SSH username and private key file that the command uses to log into the instance. ec2-user is the standard username for Amazon Linux instances. Use ubuntu for Ubuntu instances.

```
aws opsworks register --infrastructure-class=ec2 --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --ssh-username ec2-user --ssh-private-key ssh_private_key i-12345678
```

The following example registers the EC2 instance that is running the register command. Log in to the instance with SSH and run register with the --local argument instead of an instance ID or hostname.

```
aws opsworks register --infrastructure-class ec2 --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --local
```

**To register an on-premises instance**

To indicate that you are registering an on-premises instance, set the --infrastructure-class argument to on-premises.

The following example registers an existing on-premises instance with a specified stack from a separate workstation. The instance is identified by its IP address, 192.0.2.3. The example uses the workstation's default SSH username and attempts to log in to the instance using authentication techniques that do not require a password, such as a default private SSH key. If that fails, register queries for the password.

```
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb 192.0.2.3
```

The following example registers an on-premises instance with a specified stack from a separate workstation. The instance is identified by its hostname, host1. The --override-... arguments direct AWS OpsWorks to display webserver1 as the host name and 192.0.2.3 and 10.0.0.2 as the instance's public and private IP addresses, respectively.

```
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --override-hostname webserver1 --override-public-ip 192.0.2.3 --override-private-ip 10.0.0.2 host1
```
The following example registers an on-premises instance with a specified stack from a separate workstation. The instance is identified by its IP address. `register` logs into the instance using the specified SSH username and private key file.

```
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --ssh-username admin --ssh-private-key ssh_private_key 192.0.2.3
```

The following example registers an existing on-premises instance with a specified stack from a separate workstation. The command logs into the instance using a custom SSH command string that specifies the SSH password and the instance's IP address.

```
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --override-ssh "sshpass -p 'mypassword' ssh your-user@192.0.2.3"
```

The following example registers the on-premises instance that is running the `register` command. Log in to the instance with SSH and run `register` with the `--local` argument instead of an instance ID or hostname.

```
aws opsworks register --infrastructure-class on-premises --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb --local
```

**Output:** The following is typical output for registering an EC2 instance.

```
Warning: Permanently added '52.11.41.206' (ECDSA) to the list of known hosts.
% Total    % Received % Xferd  Average Speed   Time    Time     Time  Current

[Tue, 24 Feb 2015 20:48:37 +0000] opsworks-init: Checking if OS is supported
[Tue, 24 Feb 2015 20:48:37 +0000] opsworks-init: Running on supported OS
```
More Information

For more information, see Registering an Instance with an AWS OpsWorks Stack in the AWS OpsWorks User Guide.

- For API details, see Register in AWS CLI Command Reference.

**set-load-based-auto-scaling**

The following code example shows how to use set-load-based-auto-scaling.

**AWS CLI**

To set the load-based scaling configuration for a layer

The following example enables load-based scaling for a specified layer and sets the configuration for that layer. You must use create-instance to add load-based instances to the layer.

```
```

The example puts the upscaling threshold settings in a separate file in the working directory named upscale.json, which contains the following.

```json
{
```
The example puts the downscaling threshold settings in a separate file in the working directory named `downscale.json`, which contains the following.

```
{
    "InstanceCount": 2,
    "ThresholdsWaitTime": 3,
    "IgnoreMetricsTime": 3,
    "CpuThreshold": 85,
    "MemoryThreshold": 85,
    "LoadThreshold": 85
}
```

**Output**: None.

**More Information**

For more information, see Using Automatic Load-based Scaling in the *AWS OpsWorks User Guide*.

- For API details, see [SetLoadBasedAutoScaling](#) in *AWS CLI Command Reference*.

**set-permission**

The following code example shows how to use `set-permission`.

**AWS CLI**

**To grant per-stack AWS OpsWorks permission levels**

When you import an AWS Identity and Access Management (IAM) user into AWS OpsWorks by calling `create-user-profile`, the user has only those permissions that are granted by the attached IAM policies. You can grant AWS OpsWorks permissions by modifying a user's policies. However, it is often easier to import a user and then use the `set-permission` command to
grant the user one of the standard permission levels for each stack to which the user will need access.

The following example grants permission for the specified stack for a user, who is identified by Amazon Resource Name (ARN). The example grants the user a Manage permissions level, with sudo and SSH privileges on the stack's instances.

```
aws opsworks set-permission --region us-east-1 --stack-id 71c7ca72-55ae-4b6a-8ee1-a8dcded5fa0f --level manage --iam-user-arn arn:aws:iam::123456789102:user/cli-user-test --allow-ssh --allow-sudo
```

**Output:** None.

**More Information**

For more information, see Granting AWS OpsWorks Users Per-Stack Permissions in the *AWS OpsWorks User Guide*.

- For API details, see SetPermission in *AWS CLI Command Reference*.

**set-time-based-auto-scaling**

The following code example shows how to use `set-time-based-auto-scaling`.

**AWS CLI**

**To set the time-based scaling configuration for a layer**

The following example sets the time-based configuration for a specified instance. You must first use `create-instance` to add the instance to the layer.

```
aws opsworks --region us-east-1 set-time-based-auto-scaling --instance-id 69b6237c-08c0-4edb-a6af-78f3d01cedf2 --auto-scaling-schedule file://schedule.json
```

The example puts the schedule in a separate file in the working directory named `schedule.json`. For this example, the instance is on for a few hours around midday UTC (Coordinated Universal Time) on Monday and Tuesday.

```json
{
    "Monday": {
        "10": "on",
```
"10": "on",
"11": "on",
"12": "on",
"13": "on"
}]

Output: None.

More Information

For more information, see Using Automatic Time-based Scaling in the AWS OpsWorks User Guide.

- For API details, see SetTimeBasedAutoScaling in AWS CLI Command Reference.

start-instance

The following code example shows how to use start-instance.

AWS CLI

To start an instance

The following start-instance command starts a specified 24/7 instance.

```
aws opsworks start-instance --instance-id f705ee48-9000-4890-8bd3-20eb05825aaf
```

Output: None. Use describe-instances to check the instance's status.

Tip You can start every offline instance in a stack with one command by calling start-stack.

More Information

For more information, see Manually Starting, Stopping, and Rebooting 24/7 Instances in the AWS OpsWorks User Guide.

- For API details, see StartInstance in AWS CLI Command Reference.
**start-stack**

The following code example shows how to use `start-stack`.

**AWS CLI**

**To start a stack's instances**

The following example starts all of a stack's 24/7 instances. To start a particular instance, use `start-instance`.

```
aws opsworks --region us-east-1 start-stack --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```

**Output:** None.

**More Information**

For more information, see Starting an Instance in the *AWS OpsWorks User Guide*.
- For API details, see `StartStack` in *AWS CLI Command Reference*.

**stop-instance**

The following code example shows how to use `stop-instance`.

**AWS CLI**

**To stop an instance**

The following example stops a specified instance, which is identified by its instance ID. You can obtain an instance ID by going to the instance's details page on the AWS OpsWorks console or by running the `describe-instances` command.

```
aws opsworks stop-instance --region us-east-1 --instance-id 3a21cfac-4a1f-4ce2-a921-b2cfba6f7771
```

You can restart a stopped instance by calling `start-instance` or by deleting the instance by calling `delete-instance`.

**Output:** None.

**More Information**
For more information, see Stopping an Instance in the AWS OpsWorks User Guide.

- For API details, see StopInstance in AWS CLI Command Reference.

**stop-stack**

The following code example shows how to use stop-stack.

**AWS CLI**

To stop a stack's instances

The following example stops all of a stack's 24/7 instances. To stop a particular instance, use stop-instance.

```
aws opsworks --region us-east-1 stop-stack --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8
```

*Output: No output.*

**More Information**

For more information, see Stopping an Instance in the AWS OpsWorks User Guide.

- For API details, see StopStack in AWS CLI Command Reference.

**unassign-instance**

The following code example shows how to use unassign-instance.

**AWS CLI**

To unassign a registered instance from its layers

The following unassign-instance command unassigns an instance from its attached layers.

```
aws opsworks --region us-east-1 unassign-instance --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2
```

*Output: None.*

**More Information**
For more information, see Unassigning a Registered Instance in the AWS OpsWorks User Guide.

- For API details, see UnassignInstance in AWS CLI Command Reference.

**unassign-volume**

The following code example shows how to use unassign-volume.

**AWS CLI**

**To unassign a volume from its instance**

The following example unassigns a registered Amazon Elastic Block Store (Amazon EBS) volume from its instance. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns when you register the volume with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID.

```
aws opsworks --region us-east-1 unassign-volume --volume-id 8430177d-52b7-4948-9c62-e195af4703df
```

*Output:* None.

**More Information**

For more information, see Unassigning Amazon EBS Volumes in the AWS OpsWorks User Guide.

- For API details, see UnassignVolume in AWS CLI Command Reference.

**update-app**

The following code example shows how to use update-app.

**AWS CLI**

**To update an app**

The following example updates a specified app to change its name.

```
aws opsworks --region us-east-1 update-app --app-id 26a61ead-d201-47e3-b55c-2a7c666942f8 --app-id 26a61ead-d201-47e3-b55c-2a7c666942f8 --name NewAppName
```

*Output:* None.
More Information

For more information, see Editing Apps in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateApp](#) in *AWS CLI Command Reference*.

**update-elastic-ip**

The following code example shows how to use `update-elastic-ip`.

**AWS CLI**

**To update an Elastic IP address name**

The following example updates the name of a specified Elastic IP address.

```
aws opsworks --region us-east-1 update-elastic-ip --elastic-ip 54.148.130.96 --name NewIPName
```

*Output*: None.

**More Information**

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateElasticIp](#) in *AWS CLI Command Reference*.

**update-instance**

The following code example shows how to use `update-instance`.

**AWS CLI**

**To update an instance**

The following example updates a specified instance's type.

```
aws opsworks --region us-east-1 update-instance --instance-id dfe18b02-5327-493d-91a4-c5c0c448927f --instance-type c3.xlarge
```

*Output*: None.

**More Information**
For more information, see Editing the Instance Configuration in the *AWS OpsWorks User Guide*.  
- For API details, see [UpdateInstance](#) in *AWS CLI Command Reference*.

**update-layer**

The following code example shows how to use `update-layer`.

**AWS CLI**

**To update a layer**

The following example updates a specified layer to use Amazon EBS-optimized instances.

```
aws opsworks --region us-east-1 update-layer --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4 --use-ebs-optimized-instances
```

*Output*: None.

**More Information**

For more information, see Editing an OpsWorks Layer's Configuration in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateLayer](#) in *AWS CLI Command Reference*.

**update-my-user-profile**

The following code example shows how to use `update-my-user-profile`.

**AWS CLI**

**To update a user's profile**

The following example updates the development user's profile to use a specified SSH public key. The user's AWS credentials are represented by the development profile in the credentials file (`~/.aws/credentials`), and the key is in a .pem file in the working directory.

```
aws opsworks --region us-east-1 --profile development update-my-user-profile --ssh-public-key file://development_key.pem
```
**Output**: None.

**More Information**

For more information, see Editing AWS OpsWorks User Settings in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateMyUserProfile](#) in *AWS CLI Command Reference*.

**update-rds-db-instance**

The following code example shows how to use `update-rds-db-instance`.

**AWS CLI**

**To update a registered Amazon RDS DB instance**

The following example updates an Amazon RDS instance's master password value. Note that this command does not change the RDS instance's master password, just the password that you provide to AWS OpsWorks. If this password does not match the RDS instance's password, your application will not be able to connect to the database.

```sh
code
aws opsworks --region us-east-1 update-rds-db-instance --db-password 123456789
code
```

**Output**: None.

**More Information**

For more information, see Registering Amazon RDS Instances with a Stack in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateRdsDbInstance](#) in *AWS CLI Command Reference*.

**update-volume**

The following code example shows how to use `update-volume`.

**AWS CLI**

**To update a registered volume**
The following example updates a registered Amazon Elastic Block Store (Amazon EBS) volume's mount point. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns to the volume when you register it with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID:

```bash
aws opsworks --region us-east-1 update-volume --volume-id 8430177d-52b7-4948-9c62-e195af4703df --mount-point /mnt/myvol
```

**Output**: None.

**More Information**

For more information, see Assigning Amazon EBS Volumes to an Instance in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateVolume](#) in *AWS CLI Command Reference*.

**AWS OpsWorks CM examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS OpsWorks CM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**associate-node**

The following code example shows how to use *associate-node*. 
AWS CLI

To associate nodes

The following associate-node command associates a node named i-44de882p with a Chef Automate server named automate-06, meaning that the automate-06 server manages the node, and communicates recipe commands to the node through chef-client agent software that is installed on the node by the associate-node command. Valid node names are EC2 instance IDs:

```bash
aws opsworks-cm associate-node --server-name "automate-06" --node-name "i-43de882p" --engine-attributes "Name=CHEF_ORGANIZATION,Value='MyOrganization'
Name=CHEF_NODE_PUBLIC_KEY,Value='Public_key_contents'"
```

The output returned by the command resembles the following. Output:

```json
{
"NodeAssociationStatusToken": "AHUY8wFe4pdXtZC5DlJa55OLp5o14DH//rHRqHDXxwVoNBxcEy4V7R0N0Fymh7E/1HumOBPsemPQFE6dcGaiFk"
}
```

More Information

For more information, see Adding Nodes Automatically in AWS OpsWorks for Chef Automate in the AWS OpsWorks User Guide.

- For API details, see AssociateNode in AWS CLI Command Reference.

create-backup

The following code example shows how to use create-backup.

AWS CLI

To create backups

The following create-backup command starts a manual backup of a Chef Automate server named automate-06 in the us-east-1 region. The command adds a descriptive message to the backup in the --description parameter.

```bash
aws opsworks-cm create-backup \
```
The output shows you information similar to the following about the new backup.

Output:

```json
{
"Backups": [
{
"BackupArn": "string",
"BackupId": "automate-06-20160729133847520",
"BackupType": "MANUAL",
"CreatedAt": 2016-07-29T13:38:47.520Z,
"Description": "state of my infrastructure at launch",
"Engine": "Chef",
"EngineModel": "Single",
"EngineVersion": "12",
"InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/automate-06-1010V4U2WRM2",
"InstanceType": "m4.large",
"KeyName": "",
"PreferredBackupWindow": "",
"PreferredMaintenanceWindow": "",
"S3LogUrl": "https://s3.amazonaws.com/<bucket-name>/automate-06-20160729133847520",
"SecurityGroupIds": [ "sg-1a24c270" ],
"ServerName": "automate-06",
"ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-role.1114810729735",
"Status": "OK",
"StatusDescription": "",
"SubnetIds": [ "subnet-49436a18" ],
"ToolsVersion": "string",
"UserArn": "arn:aws:iam::1019881987024:user/opsworks-user"
}
],
}
```

For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the AWS OpsWorks User Guide.

- For API details, see CreateBackup in AWS CLI Command Reference.
create-server

The following code example shows how to use create-server.

AWS CLI

To create a server

The following `create-server` example creates a new Chef Automate server named `automate-06` in your default region. Note that defaults are used for most other settings, such as number of backups to retain, and maintenance and backup start times. Before you run a `create-server` command, complete prerequisites in Getting Started with AWS OpsWorks for Chef Automate in the AWS Opsworks for Chef Automate User Guide.

```bash
aws opsworks-cm create-server \
  --engine "Chef" \
  --engine-model "Single" \
  --engine-version "12" \
  --server-name "automate-06" \
  --instance-profile-arn "arn:aws:iam::1019881987024:instance-profile/aws-opsworks-cm-ec2-role" \
  --instance-type "t2.medium" \
  --key-pair "amazon-test" \
  --service-role-arn "arn:aws:iam::044726508045:role/aws-opsworks-cm-service-role"
```

The output shows you information similar to the following about the new server:

```json
{
  "Server": {
    "BackupRetentionCount": 10,
    "CreatedAt": 2016-07-29T13:38:47.520Z,
    "DisableAutomatedBackup": FALSE,
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
    "Engine": "Chef",
    "EngineAttributes": [
      {
        "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
        "Value": "1Password1"
      }
    ],
    "EngineModel": "Single",
    "EngineVersion": "12",
```
For more information, see [UpdateServer](#) in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [CreateServer](#) in *AWS CLI Command Reference*.

**delete-backup**

The following code example shows how to use delete-backup.

**AWS CLI**

**To delete backups**

The following delete-backup command deletes a manual or automated backup of a Chef Automate server, identified by the backup ID. This command is useful when you are approaching the maximum number of backups that you can save, or you want to minimize your Amazon S3 storage costs.:

`aws opsworks-cm delete-backup --backup-id "automate-06-2016-11-19T23:42:40.240Z"`

The output shows whether the backup deletion succeeded.

**More Information**
For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteBackup](#) in *AWS CLI Command Reference*.

**delete-server**

The following code example shows how to use `delete-server`.

**AWS CLI**

**To delete servers**

The following `delete-server` command deletes a Chef Automate server, identified by the server's name. After the server is deleted, it is no longer returned by `DescribeServer` requests.:

```
aws opsworks-cm delete-server --server-name "automate-06"
```

The output shows whether the server deletion succeeded.

**More Information**

For more information, see Delete an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteServer](#) in *AWS CLI Command Reference*.

**describe-account-attributes**

The following code example shows how to use `describe-account-attributes`.

**AWS CLI**

**To describe account attributes**

The following `describe-account-attributes` command returns information about your account's usage of AWS OpsWorks for Chef Automate resources.:

```
aws opsworks-cm describe-account-attributes
```
The output for each account attribute entry returned by the command resembles the following.

**Output:**

```json
{
   "Attributes": [
      {
         "Maximum": 5,
         "Name": "ServerLimit",
         "Used": 2
      }
   ]
}
```

**More Information**

For more information, see DescribeAccountAttributes in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [ DescribeAccountAttributes](aws_opsworks-cm) in [AWS CLI Command Reference](aws_opsworks-cm).

**describe-backups**

The following code example shows how to use `describe-backups`.

**AWS CLI**

**To describe backups**

The following `describe-backups` command returns information about all backups associated with your account in your default region.

```bash
aws opsworks-cm describe-backups
```

The output for each backup entry returned by the command resembles the following.

**Output:**

```json
{
   "Backups": [
      {
         "BackupArn": "string",
```
For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the AWS OpsWorks User Guide.

- For API details, see DescribeBackups in AWS CLI Command Reference.

**describe-events**

The following code example shows how to use describe-events.

**AWS CLI**

To describe events

The following describe-events example returns information about all events that are associated with the specified Chef Automate server.
aws opsworks-cm describe-events \
   --server-name 'automate-06'

The output for each event entry returned by the command resembles the following example:

```json
{
   "ServerEvents": [
      {
         "CreatedAt": 2016-07-29T13:38:47.520Z,
         "LogUrl": "https://s3.amazonaws.com/<bucket-name>/
         automate-06-20160729133847520",
         "Message": "Updates successfully installed.",
         "ServerName": "automate-06"
      }
   ]
}
```

For more information, see General Troubleshooting Tips in the AWS OpsWorks User Guide.

- For API details, see DescribeEvents in AWS CLI Command Reference.

describe-node-association-status

The following code example shows how to use describe-node-association-status.

AWS CLI

To describe node association status

The following describe-node-association-status command returns the status of a request to associate a node with a Chef Automate server named automate-06:

```bash
aws opsworks-cm describe-node-association-status --server-name "automate-06" --node-association-status-token "AflJKl+/
GoKLZJbDQEx0065CDi57b1Qe9nKM8jo5ok0pQ9x8DqApBN9/106sLdSvlfDEKkEx+eoCHvjoWHa0s="
```

The output for each account attribute entry returned by the command resembles the following. Output:

```json
{
   "NodeAssociationStatus": "IN_PROGRESS"
}```
More Information

For more information, see DescribeNodeAssociationStatus in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [DescribeNodeAssociationStatus](#) in *AWS CLI Command Reference*.

**describe-servers**

The following code example shows how to use `describe-servers`.

**AWS CLI**

**To describe servers**

The following `describe-servers` command returns information about all servers that are associated with your account, and in your default region:

```bash/aws opsworks-cm describe-servers
```

The output for each server entry returned by the command resembles the following. *Output:*

```json
{
  "Servers": [
    {
      "BackupRetentionCount": 8,
      "CreatedAt": "2016-07-29T13:38:47.520Z",
      "DisableAutomatedBackup": FALSE,
      "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
      "Engine": "Chef",
      "EngineAttributes": [
        {
          "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
          "Value": "1Password1"
        }
      ],
      "EngineModel": "Single",
      "EngineVersion": "12",
      "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/automate-06-1010V4UU2WRM2",
      ...
    }
  ]
}
```
"InstanceType": "m4.large",
"KeyPair": "",
"MaintenanceStatus": "SUCCESS",
"PreferredBackupWindow": "03:00",
"PreferredMaintenanceWindow": "Mon:09:00",
"SecurityGroupIds": ["sg-1a24c270"],
"ServerArn": "arn:aws:iam::1019881987024:instance/automate-06-1010V4U2WRM2",
"ServerName": "automate-06",
"ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-role.1114810729735",
"Status": "HEALTHY",
"StatusReason": "",
"SubnetIds": ["subnet-49436a18"]
}
]}

More Information

For more information, see DescribeServers in the AWS OpsWorks for Chef Automate API Guide.
- For API details, see DescribeServers in AWS CLI Command Reference.

disassociate-node

The following code example shows how to use disassociate-node.

AWS CLI

To disassociate nodes

The following disassociate-node command disassociates a node named i-44de882p, removing the node from management by a Chef Automate server named automate-06. Valid node names are EC2 instance IDs:

```
aws opsworks-cm disassociate-node --server-name "automate-06" --node-name "i-43de882p" --engine-attributes "Name=CHEF_ORGANIZATION,Value='MyOrganization'
Name=CHEF_NODE_PUBLIC_KEY,Value='Public_key_contents'"
```

The output returned by the command resembles the following. **Output:**

```json
{
```
More Information

For more information, see Delete an AWS OpsWorks for Chef Automate Server in the AWS OpsWorks User Guide.

- For API details, see DisassociateNode in AWS CLI Command Reference.

restore-server

The following code example shows how to use restore-server.

AWS CLI

To restore a server

The following restore-server command performs an in-place restoration of a Chef Automate server named automate-06 in your default region from a backup with an ID of automate-06-2016-11-22T16:13:27.998Z. Restoring a server restores connections to the nodes that the Chef Automate server was managing at the time that the specified backup was performed.

aws opsworks-cm restore-server --backup-id "automate-06-2016-11-22T16:13:27.998Z" --server-name "automate-06"

The output is the command ID only. Output:

(None)

More Information

For more information, see Restore a Failed AWS OpsWorks for Chef Automate Server in the AWS OpsWorks User Guide.

- For API details, see RestoreServer in AWS CLI Command Reference.

start-maintenance

The following code example shows how to use start-maintenance.
**To start maintenance**

The following `start-maintenance` example manually starts maintenance on the specified Chef Automate or Puppet Enterprise server in your default region. This command is useful if an earlier, automated maintenance attempt failed, and the underlying cause of maintenance failure has been resolved.

```bash
aws opsworks-cm start-maintenance \
   --server-name 'automate-06'
```

Output:

```
{
   "Server": {
      "AssociatePublicIpAddress": true,
      "BackupRetentionCount": 10,
      "ServerName": "automate-06",
      "CreatedAt": 1569229584.842,
      "CloudFormationStackArn": "arn:aws:cloudformation:us-west-2:123456789012:stack/aws-opsworks-cm-instance-automate-06-1606611794746/EXAMPLE0-31de-11eb-bdb0-0a5b0a1353b8",
      "DisableAutomatedBackup": false,
      "Endpoint": "automate-06-EXAMPLEvr8gjfk5f.us-west-2.opsworks-cm.io",
      "Engine": "ChefAutomate",
      "EngineModel": "Single",
      "EngineAttributes": [],
      "EngineVersion": "2020-07",
      "InstanceProfileArn": "arn:aws:iam::123456789012:instance-profile/aws-opsworks-cm-ec2-role",
      "InstanceType": "m5.large",
      "PreferredMaintenanceWindow": "Sun:01:00",
      "PreferredBackupWindow": "Sun:15:00",
      "SecurityGroupIds": [
         "sg-EXAMPLE"
      ],
      "ServiceRoleArn": "arn:aws:iam::123456789012:role/service-role/aws-opsworks-cm-service-role",
      "Status": "UNDER_MAINTENANCE",
      "SubnetIds": [
         "subnet-EXAMPLE"
      ]
   }
}
```
For more information, see System Maintenance (Puppet Enterprise servers) or System Maintenance (Chef Automate servers) in the AWS OpsWorks User Guide.

- For API details, see StartMaintenance in AWS CLI Command Reference.

update-server-engine-attributes

The following code example shows how to use update-server-engine-attributes.

AWS CLI

To update server engine attributes

The following update-server-engine-attributes command updates the value of the CHEF_PIVOTAL_KEY engine attribute for a Chef Automate server named automate-06. It is currently not possible to change the value of other engine attributes.

```bash
aws opsworks-cm update-server-engine-attributes \
  --attribute-name CHEF_PIVOTAL_KEY \
  --attribute-value "new key value" \
  --server-name "automate-06"
```

The output shows you information similar to the following about the updated server.

```json
{
  "Server": {
    "BackupRetentionCount": 2,
    "CreatedAt": 2016-07-29T13:38:47.520Z,
    "DisableAutomatedBackup": FALSE,
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
    "Engine": "Chef",
    "EngineAttributes": [
      {
        "Name": "CHEF_PIVOTAL_KEY",
        "Value": "new key value"
      }
    ]
  }
}
```
For more information, see UpdateServerEngineAttributes in the AWS OpsWorks for Chef Automate API Reference.

- For API details, see UpdateServerEngineAttributes in AWS CLI Command Reference.

**update-server**

The following code example shows how to use `update-server`.

**AWS CLI**

**To update a server**

The following `update-server` command updates the maintenance start time of the specified Chef Automate server in your default region. The `--preferred-maintenance-window` parameter is added to change the start day and time of server maintenance to Mondays at 9:15 a.m. UTC.:

```
aws opsworks-cm update-server
```
The output shows you information similar to the following about the updated server.

```
{
    "Server": {
        "BackupRetentionCount": 8,
        "CreatedAt": "2016-07-29T13:38:47.520Z",
        "DisableAutomatedBackup": TRUE,
        "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
        "Engine": "Chef",
        "EngineAttributes": [
            {
                "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
                "Value": "1Password1"
            }
        ],
        "EngineModel": "Single",
        "EngineVersion": "12",
        "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/automate-06-1010V4U2WRM2",
        "InstanceType": "m4.large",
        "KeyPair": "",
        "MaintenanceStatus": "OK",
        "PreferredBackupWindow": "Mon:09:15",
        "PreferredMaintenanceWindow": "03:00",
        "SecurityGroupIds": [ "sg-1a24c270" ],
        "ServerArn": "arn:aws:iam::1019881987024:instance/automate-06-1010V4U2WRM2",
        "ServerName": "automate-06",
        "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-role.1114810729735",
        "Status": "HEALTHY",
        "StatusReason": "",
        "SubnetIds": [ "subnet-49436a18" ]
    }
}
```

For more information, see [UpdateServer](#) in the [AWS OpsWorks for Chef Automate API Reference](#).

- For API details, see [UpdateServer](#) in [AWS CLI Command Reference](#).
Organizations examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Organizations.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**accept-handshake**

The following code example shows how to use *accept-handshake*.

**AWS CLI**

*To accept a handshake from another account*

Bill, the owner of an organization, has previously invited Juan's account to join his organization. The following example shows Juan's account accepting the handshake and thus agreeing to the invitation.

```
aws organizations accept-handshake --handshake-id h-examplehandshakeid111
```

The output shows the following:

```json
{
    "Handshake": {
        "Action": "INVITE",
    },
```
"Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
"RequestedTimestamp": 1481656459.257,
"ExpirationTimestamp": 1482952459.257,
"Id": "h-examplehandshakeid111",
"Parties": [
{
  "Id": "o-exampleorgid",
  "Type": "ORGANIZATION"
},
{
  "Id": "juan@example.com",
  "Type": "EMAIL"
}
],
"Resources": [
{
  "Resources": [
    {
      "Type": "MASTER_EMAIL",
      "Value": "bill@amazon.com"
    },
    {
      "Type": "MASTER_NAME",
      "Value": "Org Master Account"
    },
    {
      "Type": "ORGANIZATION_FEATURE_SET",
      "Value": "ALL"
    }
  ],
  "Type": "ORGANIZATION",
  "Value": "o-exampleorgid"
},
{
  "Type": "EMAIL",
  "Value": "juan@example.com"
}
],
"State": "ACCEPTED"
}

- For API details, see [AcceptHandshake](#) in [AWS CLI Command Reference](#).
attach-policy

The following code example shows how to use attach-policy.

AWS CLI

To attach a policy to a root, OU, or account

Example 1

The following example shows how to attach a service control policy (SCP) to an OU:

```bash
aws organizations attach-policy
   --policy-id p-examplepolicyid111
   --target-id ou-exampleroootid111-exampleouid111
```

Example 2

The following example shows how to attach a service control policy directly to an account:

```bash
aws organizations attach-policy
   --policy-id p-examplepolicyid111
   --target-id 333333333333
```

- For API details, see AttachPolicy in AWS CLI Command Reference.

cancel-handshake

The following code example shows how to use cancel-handshake.

AWS CLI

To cancel a handshake sent from another account

Bill previously sent an invitation to Susan's account to join his organization. He changes his mind and decides to cancel the invitation before Susan accepts it. The following example shows Bill's cancellation:

```bash
aws organizations cancel-handshake --handshake-id h-examplehandshakeid111
```
The output includes a handshake object that shows that the state is now CANCELED:

```
{
    "Handshake": {
        "Id": "h-examplehandshakeid111",
        "State": "CANCELED",
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
            },
            {
                "Id": "susan@example.com",
                "Type": "EMAIL"
            }
        ],
        "Resources": [
            {
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid",
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@example.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Master Account"
                    },
                    {
                        "Type": "ORGANIZATION_FEATURE_SET",
                        "Value": "CONSOLIDATED_BILLING"
                    }
                ]
            },
            {
                "Type": "EMAIL",
                "Value": "anika@example.com"
            },
            {
                "Type": "NOTES",
                "Value": "Sample notes"
            }
        ]
    }
}
```
For API details, see **CancelHandshake** in *AWS CLI Command Reference*.

### create-account

The following code example shows how to use `create-account`.

**AWS CLI**

To create a member account that is automatically part of the organization

The following example shows how to create a member account in an organization. The member account is configured with the name `Production Account` and the email address of susan@example.com. Organizations automatically creates an IAM role using the default name of `OrganizationAccountAccessRole` because the `roleName` parameter is not specified. Also, the setting that allows IAM users or roles with sufficient permissions to access account billing data is set to the default value of `ALLOW` because the `IamUserAccessToBilling` parameter is not specified. Organizations automatically sends Susan a "Welcome to AWS" email:

```
aws organizations create-account --email susan@example.com --account-name "Production Account"
```

The output includes a request object that shows that the status is now `IN_PROGRESS`:

```
{
   "CreateAccountStatus": {
      "State": "IN_PROGRESS",
      "Id": "car-examplecreateaccountrequestid111"
   }
}
```
You can later query the current status of the request by providing the Id response value to the describe-create-account-status command as the value for the create-account-request-id parameter.

For more information, see Creating an AWS Account in Your Organization in the *AWS Organizations Users Guide*.

- For API details, see [CreateAccount](#) in *AWS CLI Command Reference*.

### create-organization

The following code example shows how to use create-organization.

**AWS CLI**

**Example 1: To create a new organization**

Bill wants to create an organization using credentials from account 111111111111. The following example shows that the account becomes the master account in the new organization. Because he does not specify a features set, the new organization defaults to all features enabled and service control policies are enabled on the root.

```bash
aws organizations create-organization
```

The output includes an organization object with details about the new organization:

```json
{
  "Organization": {
    "AvailablePolicyTypes": [
      {
        "Status": "ENABLED",
        "Type": "SERVICE_CONTROL_POLICY"
      }
    ],
    "MasterAccountId": "111111111111",
    "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-exampleorgid/111111111111",
    "MasterAccountEmail": "bill@example.com",
    "FeatureSet": "ALL",
    "Id": "o-exampleorgid",
    "Arn": "arn:aws:organizations::111111111111:organization/o-exampleorgid"
  }
}
```
Example 2: To create a new organization with only consolidated billing features enabled

The following example creates an organization that supports only the consolidated billing features:

```
aws organizations create-organization --feature-set CONSOLIDATED_BILLING
```

The output includes an organization object with details about the new organization:

```
{
   "Organization": {
      "Arn": "arn:aws:organizations::111111111111:organization/o-exampleorgid",
      "AvailablePolicyTypes": [],
      "Id": "o-exampleorgid",
      "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-exampleorgid/111111111111",
      "MasterAccountEmail": "bill@example.com",
      "MasterAccountId": "111111111111",
      "FeatureSet": "CONSOLIDATED_BILLING"
   }
}
```

For more information, see Creating an Organization in the AWS Organizations Users Guide.

- For API details, see CreateOrganization in AWS CLI Command Reference.

create-organizational-unit

The following code example shows how to use create-organizational-unit.

**AWS CLI**

**To create an OU in a root or parent OU**

The following example shows how to create an OU that is named AccountingOU:

```
aws organizations create-organizational-unit --parent-id r-examplerootid111 --name AccountingOU
```
The output includes an organizationalUnit object with details about the new OU:

```
{
    "OrganizationalUnit": {
        "Id": "ou-examplerooid111-exampleouid111",
        "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-examplerooid111-exampleouid111",
        "Name": "AccountingOU"
    }
}
```

- For API details, see [CreateOrganizationalUnit](https://docs.aws.amazon.com/cli/latest/reference/organizations/create-organizational-unit.html) in *AWS CLI Command Reference*.

### create-policy

The following code example shows how to use `create-policy`.

**AWS CLI**

**Example 1: To create a policy with a text source file for the JSON policy**

The following example shows you how to create an service control policy (SCP) named AllowAllS3Actions. The policy contents are taken from a file on the local computer called policy.json.

```
aws organizations create-policy --content file://policy.json --name AllowAllS3Actions, --type SERVICE_CONTROL_POLICY --description "Allows delegation of all S3 actions"
```

The output includes a policy object with details about the new policy:

```
{
    "Policy": {
        "Content": "{"Version":"2012-10-17","Statement":[{"Effect":"Allow","Action":['s3:*'],"Resource":['*']}]},
        "PolicySummary": {
            "Arn": "arn:aws:organizations::o-exampleorgid:policy/service_control_policy/p-examplepolicyid111",
            "Description": "Allows delegation of all S3 actions",
            "Name": "AllowAllS3Actions",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```
Example 2: To create a policy with a JSON policy as a parameter

The following example shows you how to create the same SCP, this time by embedding the policy contents as a JSON string in the parameter. The string must be escaped with backslashes before the double quotes to ensure that they are treated as literals in the parameter, which itself is surrounded by double quotes:

```bash
aws organizations create-policy --content "{"Version": "2012-10-17", "Statement": [{"Effect": "Allow", "Action": ["s3:*"], "Resource": ["*"]}]}") --name AllowAllS3Actions --type SERVICE_CONTROL_POLICY --description "Allows delegation of all S3 actions"
```

For more information about creating and using policies in your organization, see Managing Organization Policies in the AWS Organizations User Guide.

- For API details, see CreatePolicy in AWS CLI Command Reference.

decline-handshake

The following code example shows how to use decline-handshake.

AWS CLI

To decline a handshake sent from another account

The following example shows that Susan, an admin who is the owner of account 222222222222, declines an invitation to join Bill's organization. The DeclineHandshake operation returns a handshake object, showing that the state is now DECLINED:

```bash
aws organizations decline-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that shows the new state of DECLINED:

```json
{
    "Handshake": {
        "Id": "h-examplehandshakeid111",
        "State": "DECLINED",
    }
}
"Resources": [ 
{
   "Type": "ORGANIZATION",
   "Value": "o-exampleorgid",
   "Resources": [
      {
         "Type": "MASTER_EMAIL",
         "Value": "bill@example.com"
      },
      {
         "Type": "MASTER_NAME",
         "Value": "Master Account"
      }
   ]
 },
{
   "Type": "EMAIL",
   "Value": "susan@example.com"
 },
{
   "Type": "NOTES",
   "Value": "This is an invitation to Susan's account to join the Bill's organization."
 }
],
"Parties": [ 
{
   "Type": "EMAIL",
   "Id": "susan@example.com"
 },
{
   "Type": "ORGANIZATION",
   "Id": "o-exampleorgid"
 }
],
"Action": "INVITE",
"RequestedTimestamp": 1470684478.687,
"ExpirationTimestamp": 1471980478.687,
"Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111"
}

- For API details, see DeclineHandshake in AWS CLI Command Reference.
delete-organization

The following code example shows how to use delete-organization.

**AWS CLI**

**To delete an organization**

The following example shows how to delete an organization. To perform this operation, you must be an admin of the master account in the organization. The example assumes that you previously removed all the member accounts, OUs, and policies from the organization:

```bash
aws organizations delete-organization
```

- For API details, see [DeleteOrganization](#) in *AWS CLI Command Reference*.

delete-organizational-unit

The following code example shows how to use delete-organizational-unit.

**AWS CLI**

**To delete an OU**

The following example shows how to delete an OU. The example assumes that you previously removed all accounts and other OUs from the OU:

```bash
aws organizations delete-organizational-unit --organizational-unit-id ou-examplerootid111-exampleouid111
```

- For API details, see [DeleteOrganizationalUnit](#) in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use delete-policy.

**AWS CLI**

**To delete a policy**
The following example shows how to delete a policy from an organization. The example assumes that you previously detached the policy from all entities:

```aws
aws organizations delete-policy --policy-id p-examplepolicyid111
```

- For API details, see [DeletePolicy](#) in *AWS CLI Command Reference*.

**describe-account**

The following code example shows how to use describe-account.

**AWS CLI**

**To get the details about an account**

The following example shows you how to request details about an account:

```aws
aws organizations describe-account --account-id 555555555555
```

The output shows an account object with the details about the account:

```
{
    "Account": {
        "Id": "555555555555",
        "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/555555555555",
        "Name": "Beta account",
        "Email": "anika@example.com",
        "JoinedMethod": "INVITED",
        "JoinedTimeStamp": 1481756563.134,
        "Status": "ACTIVE"
    }
}
```

- For API details, see [DescribeAccount](#) in *AWS CLI Command Reference*.

**describe-create-account-status**

The following code example shows how to use describe-create-account-status.
**AWS CLI**

**To get the latest status about a request to create an account**

The following example shows how to request the latest status for a previous request to create an account in an organization. The specified --request-id comes from the response of the original call to create-account. The account creation request shows by the status field that Organizations successfully completed the creation of the account.

**Command:**

```
aws organizations describe-create-account-status --create-account-request-id car-examplecreateaccountrequestid111
```

**Output:**

```
{
  "CreateAccountStatus": {
    "State": "SUCCEEDED",
    "AccountId": "555555555555",
    "AccountName": "Beta account",
    "RequestedTimestamp": 1470684478.687,
    "CompletedTimestamp": 1470684532.472,
    "Id": "car-examplecreateaccountrequestid111"
  }
}
```

- For API details, see [DescribeCreateAccountStatus](#) in *AWS CLI Command Reference*.

**describe-handshake**

The following code example shows how to use describe-handshake.

**AWS CLI**

**To get information about a handshake**

The following example shows you how to request details about a handshake. The handshake ID comes either from the original call to InviteAccountToOrganization, or from a call to ListHandshakesForAccount or ListHandshakesForOrganization:
aws organizations describe-handshake --handshake-id h-examplehandshakeid111

The output includes a handshake object that has all the details about the requested handshake:

```
{
    "Handshake": {
        "Id": "h-examplehandshakeid111",
        "State": "OPEN",
        "Resources": [
            {
                "Type": "ORGANIZATION",
                "Value": "o-exampleorgid",
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@example.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Master Account"
                    }
                ]
            },
            {
                "Type": "EMAIL",
                "Value": "anika@example.com"
            }
        ],
        "Parties": [
            {
                "Type": "ORGANIZATION",
                "Id": "o-exampleorgid"
            },
            {
                "Type": "EMAIL",
                "Id": "anika@example.com"
            }
        ],
        "Action": "INVITE",
        "RequestedTimestamp": 1470158698.046,
        "ExpirationTimestamp": 1471454698.046,
        "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111"
}
```
describe-organization

The following code example shows how to use describe-organization.

AWS CLI

To get information about the current organization

The following example shows you how to request details about an organization:

```bash
aws organizations describe-organization
```

The output includes an organization object that has the details about the organization:

```json
{
   "Organization": {
      "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-exampleorgid/111111111111",
      "MasterAccountEmail": "bill@example.com",
      "MasterAccountId": "111111111111",
      "Id": "o-exampleorgid",
      "FeatureSet": "ALL",
      "Arn": "arn:aws:organizations::111111111111:organization/o-exampleorgid",
      "AvailablePolicyTypes": [
         {
            "Status": "ENABLED",
            "Type": "SERVICE_CONTROL_POLICY"
         }
      ]
   }
}
```

• For API details, see DescribeOrganization in AWS CLI Command Reference.
describe-organizational-unit

The following code example shows how to use describe-organizational-unit.

AWS CLI

To get information about an OU

The following describe-organizational-unit example requests details about an OU.

```
aws organizations describe-organizational-unit \
    --organizational-unit-id ou-examplerootid111-exampleouid111
```

Output:

```
{
    "OrganizationalUnit": {
        "Name": "Accounting Group",
        "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-examplerootid111-exampleouid111",
        "Id": "ou-examplerootid111-exampleouid111"
    }
}
```

- For API details, see DescribeOrganizationalUnit in AWS CLI Command Reference.

describe-policy

The following code example shows how to use describe-policy.

AWS CLI

To get information about a policy

The following example shows how to request information about a policy:

```
aws organizations describe-policy --policy-id p-examplepolicyid111
```

The output includes a policy object that contains details about the policy:

```
{
    "Policy": {
```
For API details, see `DescribePolicy` in AWS CLI Command Reference.

**detach-policy**

The following code example shows how to use `detach-policy`.

**AWS CLI**

To detach a policy from a root, OU, or account

The following example shows how to detach a policy from an OU:

```
aws organizations detach-policy --target-id ou-examplerootid111-exampleouid111 --policy-id p-examplepolicyid111
```

For API details, see `DetachPolicy` in AWS CLI Command Reference.

**disable-policy-type**

The following code example shows how to use `disable-policy-type`.

**AWS CLI**

To disable a policy type in a root

The following example shows how to disable the service control policy (SCP) policy type in a root:
aws organizations disable-policy-type --root-id r-examplerootid111 --policy-type SERVICE_CONTROL_POLICY

The output shows that the PolicyTypes response element no longer includes SERVICE_CONTROL_POLICY:

```
{
   "Root": {
      "PolicyTypes": [],
      "Name": "Root",
      "Id": "r-examplerootid111",
      "Arn": "arn:aws:organizations::1111111111:root/o-exampleorgid/r-examplerootid111"
   }
}
```

- For API details, see [DisablePolicyType](https://docs.aws.amazon.com/cli/latest/reference/orgs/disable-policy-type.html) in *AWS CLI Command Reference*.

**enable-all-features**

The following code example shows how to use enable-all-features.

**AWS CLI**

**To enable all features in an organization**

This example shows the administrator asking all the invited accounts in the organization to approve enabled all features in the organization. AWS Organizations sends an email to the address that is registered with every invited member account asking the owner to approve the change to all features by accepting the handshake that is sent. After all invited member accounts accept the handshake, the organization administrator can finalize the change to all features, and those with appropriate permissions can create policies and apply them to roots, OUs, and accounts:

```
aws organizations enable-all-features
```

The output is a handshake object that is sent to all invited member accounts for approval:

```
{
   "Handshake": {
```

**Actions and scenarios**
For API details, see EnableAllFeatures in AWS CLI Command Reference.

**enable-policy-type**

The following code example shows how to use enable-policy-type.

**AWS CLI**

**To enable the use of a policy type in a root**

The following example shows how to enable the service control policy (SCP) policy type in a root:

```
aws organizations enable-policy-type --root-id r-examplerootid111 --policy-type SERVICE_CONTROL_POLICY
```

The output shows a root object with a policyTypes response element showing that SCPs are now enabled:

```
{
    
```

Actions and scenarios

4904
For API details, see **EnablePolicyType** in *AWS CLI Command Reference*.

### invite-account-to-organization

The following code example shows how to use `invite-account-to-organization`.

**AWS CLI**

**To invite an account to join an organization**

The following example shows the master account owned by bill@example.com inviting the account owned by juan@example.com to join an organization:

```bash
aws organizations invite-account-to-organization --target '{"Type": "EMAIL", "Id": "juan@example.com"}' --notes "This is a request for Juan's account to join Bill's organization."
```

The output includes a handshake structure that shows what is sent to the invited account:

```json
{
   "Handshake": {
      "Action": "INVITE",
      "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
      "ExpirationTimestamp": 1482952459.257,
      "Id": "h-examplehandshakeid111",
      "Parties": [
```
For API details, see InviteAccountToOrganization in AWS CLI Command Reference.

leave-organization

The following code example shows how to use leave-organization.
**AWS CLI**

**To leave an organization as a member account**

The following example shows the administrator of a member account requesting to leave the organization it is currently a member of:

```
aws organizations leave-organization
```

- For API details, see [LeaveOrganization](#) in *AWS CLI Command Reference*.

**list-accounts-for-parent**

The following code example shows how to use `list-accounts-for-parent`.

**AWS CLI**

**To retrieve a list of all of the accounts in a specified parent root or OU**

The following example shows how to request a list of the accounts in an OU:

```
aws organizations list-accounts-for-parent --parent-id ou-examplerootid111-exampleouid111
```

The output includes a list of account summary objects.

```json
{
    "Accounts": [
        {
            "Arn": "arn:aws:organizations::1111111111:account/o-exampleorgid/333333333333",
            "JoinedMethod": "INVITED",
            "JoinedTimestamp": 1481835795.536,
            "Id": "333333333333",
            "Name": "Development Account",
            "Email": "juan@example.com",
            "Status": "ACTIVE"
        },
        {
            "Arn": "arn:aws:organizations::1111111111:account/o-exampleorgid/444444444444",
            "JoinedMethod": "INVITED",
```
```
• For API details, see ListAccountsForParent in AWS CLI Command Reference.

list-accounts

The following code example shows how to use list-accounts.

AWS CLI

To retrieve a list of all of the accounts in an organization

The following example shows you how to request a list of the accounts in an organization:

```bash
aws organizations list-accounts
```

The output includes a list of account summary objects.

```json
{
   "Accounts": [
      {
         "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/111111111111",
         "JoinedMethod": "INVITED",
         "JoinedTimestamp": 1481830215.45,
         "Id": "111111111111",
         "Name": "Master Account",
         "Email": "bill@example.com",
         "Status": "ACTIVE"
      },
      {
         "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/222222222222",
         "JoinedMethod": "INVITED",
         "JoinedTimestamp": 1481835741.044,
         "Id": "222222222222",
         "Name": "Test Account",
         "Email": "anika@example.com",
         "Status": "ACTIVE"
      }
   ]
}
```
For API details, see ListAccounts in AWS CLI Command Reference.

list-children

The following code example shows how to use list-children.

AWS CLI

To retrieve the child accounts and OUs of a parent OU or root

The following example you how to list the root or OU that contains that account 444444444444:

aws organizations list-children --child-type ORGANIZATIONAL_UNIT --parent-id ou-exampleoid111-exampleouid111
The output shows the two child OUs that are contained by the parent:

```json
{
    "Children": [
        {
            "Id": "ou-examplerootid111-exampleouid111",
            "Type": "ORGANIZATIONAL_UNIT"
        },
        {
            "Id": "ou-examplerootid111-exampleouid222",
            "Type": "ORGANIZATIONAL_UNIT"
        }
    ]
}
```

- For API details, see [ListChildren](#) in [AWS CLI Command Reference](#).

**list-create-account-status**

The following code example shows how to use `list-create-account-status`.

**AWS CLI**

**Example 1: To retrieve a list of the account creation requests made in the current organization**

The following example shows how to request a list of account creation requests for an organization that have completed successfully:

```bash
aws organizations list-create-account-status --states SUCCEEDED
```

The output includes an array of objects with information about each request.

```json
{
    "CreateAccountStatuses": [
        {
            "AccountId": "444444444444",
            "AccountName": "Developer Test Account",
            "CompletedTimeStamp": 1481835812.143,
            "Id": "car-examplecreateaccountrequestid111",
            "RequestedTimeStamp": 1481829432.531,
        }
    ]
}
```
Example 2: To retrieve a list of the in progress account creation requests made in the current organization

The following example gets a list of in-progress account creation requests for an organization:

```
aws organizations list-create-account-status --states IN_PROGRESS
```

The output includes an array of objects with information about each request.

```
{
  "CreateAccountStatuses": [
    {
      "State": "IN_PROGRESS",
      "Id": "car-examplecreateaccountrequestid111",
      "RequestedTimeStamp": 1481829432.531,
      "AccountName": "Production Account"
    }
  ]
}
```

• For API details, see ListCreateAccountStatus in AWS CLI Command Reference.

**list-handshakes-for-account**

The following code example shows how to use list-handshakes-for-account.

**AWS CLI**

**To retrieve a list of the handshakes sent to an account**

The following example shows how to get a list of all handshakes that are associated with the account of the credentials that were used to call the operation:

```
aws organizations list-handshakes-for-account
```
The output includes a list of handshake structures with information about each handshake including its current state:

```json
{
    "Handshake": {
        "Action": "INVITE",
        "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
        "ExpirationTimestamp": 1482952459.257,
        "Id": "h-examplehandshakeid111",
        "Parties": [
            {
                "Id": "o-exampleorgid",
                "Type": "ORGANIZATION"
            },
            {
                "Id": "juan@example.com",
                "Type": "EMAIL"
            }
        ],
        "RequestedTimestamp": 1481656459.257,
        "Resources": [
            {
                "Resources": [
                    {
                        "Type": "MASTER_EMAIL",
                        "Value": "bill@amazon.com"
                    },
                    {
                        "Type": "MASTER_NAME",
                        "Value": "Org Master Account"
                    },
                    {
                        "Type": "ORGANIZATION_FEATURE_SET",
                        "Value": "FULL"
                    }
                ],
                "Type": "ORGANIZATION"
            }
            {
                "Type": "EMAIL",
                "Value": "juan@example.com"
            }
        ]
    }
}```
For API details, see `ListHandshakesForAccount` in *AWS CLI Command Reference*.

**list-handshakes-for-organization**

The following code example shows how to use `list-handshakes-for-organization`.

**AWS CLI**

To retrieve a list of the handshakes associated with an organization

The following example shows how to get a list of handshakes that are associated with the current organization:

```bash
aws organizations list-handshakes-for-organization
```

The output shows two handshakes. The first one is an invitation to Juan's account and shows a state of OPEN. The second is an invitation to Anika's account and shows a state of ACCEPTED:

```
{
   "Handshakes": [
      {
         "Action": "INVITE",
         "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
         "ExpirationTimestamp": 1482952459.257,
         "Id": "h-examplehandshakeid111",
         "Parties": [
            {
               "Id": "o-exampleorgid",
               "Type": "ORGANIZATION"
            },
            {
               "Id": "juan@example.com",
               "Type": "EMAIL"
            }
         ]
      }
   ],
   "State": "OPEN"
}
```
"RequestedTimestamp": 1481656459.257,
"Resources": [
    {
        "Resources": [
            {
                "Type": "MASTER_EMAIL",
                "Value": "bill@amazon.com"
            },
            {
                "Type": "MASTER_NAME",
                "Value": "Org Master Account"
            },
            {
                "Type": "ORGANIZATION_FEATURE_SET",
                "Value": "FULL"
            }
        ],
        "Type": "ORGANIZATION",
        "Value": "o-exampleorgid"
    },
    {
        "Type": "EMAIL",
        "Value": "juan@example.com"
    },
    {
        "Type": "NOTES",
        "Value": "This is an invitation to Juan's account to join Bill's organization."
    }
],
"State": "OPEN"
],
"Action": "INVITE",
"State": "ACCEPTED",
"Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
"ExpirationTimestamp": 1.471797437427E9,
"Id": "h-examplehandshakeid222",
"Parties": [
    {
        "Id": "o-exampleorgid",

For API details, see ListHandshakesForOrganization in AWS CLI Command Reference.

list-organizational-units-for-parent

The following code example shows how to use list-organizational-units-for-parent.
AWS CLI

To retrieve a list of the OUs in a parent OU or root

The following example shows you how to get a list of OUs in a specified root:

```bash
aws organizations list-organizational-units-for-parent --parent-id r-examplerooid111
```

The output shows that the specified root contains two OUs and shows details of each:

```json
{
    "OrganizationalUnits": [
        {
            "Name": "AccountingDepartment",
            "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-examplerooid111/ou-examplerooid111-exampleouid111"
        },
        {
            "Name": "ProductionDepartment",
            "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-examplerooid111/ou-examplerooid111-exampleouid222"
        }
    ]
}
```

- For API details, see [ListOrganizationalUnitsForParent](https://docs.aws.amazon.com/cli/latest/reference/organizations/list-organizational-units-for-parent.html) in *AWS CLI Command Reference*.

**list-parents**

The following code example shows how to use `list-parents`.

AWS CLI

To list the parent OUs or roots for an account or child OU

The following example shows you how to list the root or parent OU that contains that account `444444444444`:

```bash
aws organizations list-parents --child-id 444444444444
```

The output shows that the specified account is in the OU with specified ID:
For API details, see ListParents in AWS CLI Command Reference.

list-policies-for-target

The following code example shows how to use list-policies-for-target.

AWS CLI

To retrieve a list of the SCPs attached directly to an account

The following example shows how to get a list of all service control policies (SCPs), as specified by the Filter parameter, that are directly attached to an account:

```
aws organizations list-policies-for-target --filter SERVICE_CONTROL_POLICY --target-id 444444444444
```

The output includes a list of policy structures with summary information about the policies. The list does not include policies that apply to the account because of inheritance from its location in an OU hierarchy:

```json
{
   "Policies": [
   {
      "Type": "SERVICE_CONTROL_POLICY",
      "Name": "AllowAllEC2Actions",
      "AwsManaged": false,
      "Id": "p-examplepolicyid222",
      "Arn": "arn:aws:organizations::o-exampleorgid:policy/service_control_policy/p-examplepolicyid222",
      "Description": "Enables account admins to delegate permissions for any EC2 actions to users and roles in their accounts."
   }
   
   
   ]
}
```
For API details, see ListPoliciesForTarget in AWS CLI Command Reference.

**list-policies**

The following code example shows how to use list-policies.

**AWS CLI**

To retrieve a list of all policies in an organization of a certain type

The following example shows you how to get a list of SCPs, as specified by the filter parameter:

```bash
aws organizations list-policies --filter SERVICE_CONTROL_POLICY
```

The output includes a list of policies with summary information:

```
{
  "Policies": [
    {
      "Type": "SERVICE_CONTROL_POLICY",
      "Name": "AllowAllS3Actions",
      "AwsManaged": false,
      "Id": "p-examplepolicyid111",
      "Arn": "arn:aws:organizations::111111111111:policy/service_control_policy/p-examplepolicyid111",
      "Description": "Enables account admins to delegate permissions for any S3 actions to users and roles in their accounts."
    },
    {
      "Type": "SERVICE_CONTROL_POLICY",
      "Name": "AllowAllEC2Actions",
      "AwsManaged": false,
      "Id": "p-examplepolicyid222",
      "Arn": "arn:aws:organizations::111111111111:policy/service_control_policy/p-examplepolicyid222",
      "Description": "Enables account admins to delegate permissions for any EC2 actions to users and roles in their accounts."
    },
  ]
}
```
For API details, see ListPolicies in AWS CLI Command Reference.

list-roots

The following code example shows how to use list-roots.

AWS CLI

To retrieve a list of the roots in an organization

This example shows you how to get the list of roots for an organization:

```bash
aws organizations list-roots
```

The output includes a list of root structures with summary information:

```json
{
  "Roots": [
    {
      "Name": "Root",
      "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-examplerootid111",
      "Id": "r-examplerootid111",
      "PolicyTypes": [
        {
          "Status": "ENABLED",
          "Type": "SERVICE_CONTROL_POLICY"
        }
      ]
    }
  ]
}
```
list-targets-for-policy

The following code example shows how to use list-targets-for-policy.

AWS CLI

To retrieve a list of the roots, OUs, and accounts that a policy is attached to

The following example shows how to get a list of the roots, OUs, and accounts that the specified policy is attached to:

aws organizations list-targets-for-policy --policy-id p-FullAWSAccess

The output includes a list of attachment objects with summary information about the roots, OUs, and accounts the policy is attached to:

```json
{
    "Targets": [ 
        { 
            "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-examplerootid111",
            "Name": "Root",
            "TargetId": "r-examplerootid111",
            "Type": "ROOT"
        },
        { 
            "Arn": "arn:aws:organizations::111111111111:account/o-exampleorgid/333333333333;",
            "Name": "Developer Test Account",
            "TargetId": "333333333333",
            "Type": "ACCOUNT"
        },
        { 
            "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-examplerootid111-exampleouid111",
            "Name": "Accounting",
            "TargetId": "ou-examplerootid111-exampleouid111",
            "Type": "ORGANIZATIONAL_UNIT"
        }
    ]
}
```

• For API details, see ListRoots in AWS CLI Command Reference.
move-account

The following code example shows how to use move-account.

AWS CLI

To move an account between roots or OUs

The following example shows you how to move the master account in the organization from the root to an OU:

```bash
aws organizations move-account --account-id 333333333333 --source-parent-id r-examplerootid111 --destination-parent-id ou-examplerootid111-examleouid111
```

For API details, see MoveAccount in AWS CLI Command Reference.

remove-account-from-organization

The following code example shows how to use remove-account-from-organization.

AWS CLI

To remove an account from an organization as the master account

The following example shows you how to remove an account from an organization:

```bash
aws organizations remove-account-from-organization --account-id 333333333333
```

For API details, see RemoveAccountFromOrganization in AWS CLI Command Reference.

update-organizational-unit

The following code example shows how to use update-organizational-unit.
To rename an OU

This example shows you how to rename an OU: In this example, the OU is renamed "AccountingOU":

```bash
aws organizations update-organizational-unit --organizational-unit-id ou-examplerootid111-exampleouid111 --name AccountingOU
```

The output shows the new name:

```json
{
   "OrganizationalUnit": {
      "Id": "ou-examplerootid111-exampleouid111",
      "Name": "AccountingOU",
      "Arn": "arn:aws:organizations::1111111111:ou/o-exampleorgid/ou-examplerootid111-exampleouid111"
   }
}
```

- For API details, see `UpdateOrganizationalUnit` in *AWS CLI Command Reference*.

update-policy

The following code example shows how to use update-policy.

AWS CLI

**Example 1: To rename a policy**

The following update-policy example renames a policy and gives it a new description.

```bash
aws organizations update-policy \
   --policy-id p-examplepolicyid111 \
   --name Renamed-Policy \
   --description "This description replaces the original."
```

The output shows the new name and description.

```json
{
   "Policy": {
```

Actions and scenarios
Example 2: To replace a policy's JSON text content

The following example shows you how to replace the JSON text of the SCP in the previous example with a new JSON policy text string that allows S3 instead of EC2:

```bash
```

The output shows the new content:

```json
{
    "Policy": {
        "Content": "{"Version": "2012-10-17", "Statement": { "Effect": "Allow", "Action": "s3:*", "Resource": "*" } }",
        "PolicySummary": {
            "Arn": "arn:aws:organizations::123456789012:policy/o-exampleorgid/service_control_policy/p-examplepolicyid111",
            "AwsManaged": false,
            "Description": "This description replaces the original.",
            "Id": "p-examplepolicyid111",
            "Name": "Renamed-Policy",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```
AWS Outposts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Outposts.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

**Actions**

**get-outpost-instance-types**

The following code example shows how to use `get-outpost-instance-types`.

**AWS CLI**

**To get the instance types on your Outpost**

The following `get-outpost-instance-types` example gets the instance types for the specified Outpost.

```bash
aws outposts get-outpost-instance-types \
   --outpost-id op-0ab23c4567EXAMPLE
```

**Output:**

```json
{
   "InstanceTypes": [ ...
```
For more information, see Launch an instance on your Outpost in the AWS Outposts User Guide.

- For API details, see GetOutpostInstanceTypes in AWS CLI Command Reference.

get-outpost

The following code example shows how to use get-outpost.

**AWS CLI**

**To get Outpost details**

The following get-outpost example displays the details for the specified Outpost.

```
aws outposts get-outpost \
  --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
    "Outpost": {
        "OutpostId": "op-0ab23c4567EXAMPLE",
        "OwnerId": "123456789012",
        "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/op-0ab23c4567EXAMPLE",
    }
}
```
For more information, see Working with Outposts in the AWS Outposts User Guide.

- For API details, see GetOutpost in AWS CLI Command Reference.

**list-outposts**

The following code example shows how to use list-outposts.

**AWS CLI**

**To list Outposts**

The following list-outposts example lists the Outposts in your AWS account.

```bash
aws outposts list-outposts
```

**Output:**

```json
{
  "Outposts": [
    {
      "OutpostId": "op-0ab23c4567EXAMPLE",
      "OwnerId": "123456789012",
      "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/op-0ab23c4567EXAMPLE",
      "SiteId": "os-0ab12c3456EXAMPLE",
      "Name": "EXAMPLE",
      "Description": "example",
      "LifeCycleStatus": "ACTIVE",
      "AvailabilityZone": "us-west-2a",
      "AvailabilityZoneId": "usw2-az1",
      "Tags": {
        "Name": "EXAMPLE"
      }
    }
  ]
}
```
For more information, see Working with Outposts in the AWS Outposts User Guide.

- For API details, see ListOutposts in AWS CLI Command Reference.

**list-sites**

The following code example shows how to use list-sites.

**AWS CLI**

**To list sites**

The following list-sites example lists the available Outpost sites in your AWS account.

```
aws outposts list-sites
```

**Output:**

```
{
  "Sites": [
    {
      "SiteId": "os-0ab12c3456EXAMPLE",
      "AccountId": "123456789012",
      "Name": "EXAMPLE",
      "Description": "example",
      "Tags": {}
    }
  ]
}
```
For more information, see Working with Outposts in the AWS Outposts User Guide.

- For API details, see ListSites in AWS CLI Command Reference.

AWS Payment Cryptography examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

create-alias

The following code example shows how to use create-alias.

AWS CLI

To create an alias for a key

The following create-alias example creates an alias for a key.

```bash
aws payment-cryptography create-alias
   --alias-name alias/sampleAlias1
   --key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h
```
Output:

```json
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaif1l2h"
    }
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [CreateAlias](#) in *AWS CLI Command Reference*.

### create-key

The following code example shows how to use `create-key`.

#### AWS CLI

**To create a key**

The following `create-key` example generates a 2KEY TDES key you can use to generate and verify CVV/CVV2 values.

```bash
aws payment-cryptography create-key \
  --exportable \
  --key-attributes KeyAlgorithm=TDES_2KEY,\n  KeyUsage=TR31_C0_CARD_VERIFICATION_KEY,\n  KeyClass=SYMMETRIC_KEY,\n  KeyModesOfUse={Generate=true,Verify=true}
```

Output:

```json
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaif1l2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
```
For more information, see Generating keys in the AWS Payment Cryptography User Guide.

- For API details, see CreateKey in AWS CLI Command Reference.

**delete-alias**

The following code example shows how to use delete-alias.

**AWS CLI**

**To delete an alias**

The following delete-alias example deletes an alias. It does not affect the key.

```
aws payment-cryptography delete-alias \
  --alias-name alias/sampleAlias1
```

This command produces no output.

For more information, see About aliases in the AWS Payment Cryptography User Guide.

- For API details, see DeleteAlias in AWS CLI Command Reference.
delete-key

The following code example shows how to use delete-key.

AWS CLI

To delete a key

The following delete-key example schedules a key for deletion after 7 days, which is the default waiting period.

```bash
code
aws payment-cryptography delete-key \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h
```

Output:

```json
code
{
    "Key": {
        "CreateTimestamp": "1686801198",
        "DeletePendingTimestamp": "1687405998",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": true,
                "Sign": false,
                "Unwrap": false,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24"
    },
...
```
For more information, see Deleting keys in the AWS Payment Cryptography User Guide.

- For API details, see DeleteKey in AWS CLI Command Reference.

**export-key**

The following code example shows how to use export-key.

**AWS CLI**

**To export a key**

The following export-key example exports a key.

```bash
aws payment-cryptography export-key \
    --export-key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/lco3w6agsk7zgu2l \
    --key-material '{"Tr34KeyBlock": { \n        "CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-cryptography:us-west-2:123456789012:key/ftobshq7pvioc5fx", \n        "ExportToken": "export-token-cu4lg26ofcziixny", \n        "KeyBlockFormat": "X9_TR34_2012", \n        "WrappingKeyCertificate": file://wrapping-key-certificate.pem }}'
```

Contents of `wrapping-key-certificate.pem`:

```
LS0tLS1C...EXAMPLE=
```

Output:

```
{
    "WrappedKey": {
        "KeyMaterial": "308205A106092A864886F70D010702A08205923082058E0201013082031F06092A864886F70D010703A08203100...2FD4D2BABC69BDDBD6B17EB376FA9ADD83C2974292447E63F26D168E66A4558ED97E417BDE97837188DB4F414A2219BAC50A8D726CD54C3C1EXAMPLE",
        "WrappedKeyMaterialFormat": "TR34_KEY_BLOCK"
    }
}
```
For more information, see Export keys in the AWS Payment Cryptography User Guide.

- For API details, see ExportKey in AWS CLI Command Reference.

get-alias

The following code example shows how to use get-alias.

AWS CLI

To get an alias

The following get-alias example returns the ARN of the key associated with the alias.

```
aws payment-cryptography get-alias \
   --alias-name alias/sampleAlias1
```

Output:

```
{
   "Alias": {
      "AliasName": "alias/sampleAlias1",
      "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h"
   }
}
```

For more information, see About aliases in the AWS Payment Cryptography User Guide.

- For API details, see GetAlias in AWS CLI Command Reference.

get-key

The following code example shows how to use get-key.

AWS CLI

To get the metadata of a key
The following get-key example returns the metadata of the key associated with the alias. This operation does not return cryptographic material.

```
aws payment-cryptography get-key \
  --key-identifier alias/sampleAlias1
```

Output:

```
{
  "Key": {
    "CreateTimestamp": "1686800690",
    "DeletePendingTimestamp": "1687405998",
    "Enabled": true,
    "Exportable": true,
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/kwapwa6qaifllw2h",
    "KeyAttributes": {
      "KeyAlgorithm": "TDES_2KEY",
      "KeyClass": "SYMMETRIC_KEY",
      "KeyModesOfUse": {
        "Decrypt": false,
        "DeriveKey": false,
        "Encrypt": false,
        "Generate": true,
        "NoRestrictions": false,
        "Sign": false,
        "Unwrap": false,
        "Verify": true,
        "Wrap": false
      },
      "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
    },
    "KeyCheckValue": "F2E50F",
    "KeyCheckValueAlgorithm": "ANSI_X9_24",
    "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
    "KeyState": "DELETE_PENDING",
    "UsageStartTimestamp": "1686801190"
  }
}
```

For more information, see [Get keys](#) in the [AWS Payment Cryptography User Guide](#).

- For API details, see [GetKey](#) in *AWS CLI Command Reference*. 
AWS Command Line Interface

User Guide for Version 2

get-parameters-for-export
The following code example shows how to use get-parameters-for-export.
AWS CLI
To initialize the export process
The following get-parameters-for-export example generates a key pair, signs the key, and
then returns the certiﬁcate and certiﬁcate root.
aws payment-cryptography get-parameters-for-export \
--signing-key-algorithm RSA_2048 \
--key-material-type TR34_KEY_BLOCK

Output:

get-parameters-for-import

The following code example shows how to use get-parameters-for-import.

AWS CLI

To initialize the import process

The following get-parameters-for-import example generates a key pair, signs the key, and then returns the certificate and certificate root.

```bash
aws payment-cryptography get-parameters-for-import \
 --key-material-type TR34_KEY_BLOCK \
 --wrapping-key-algorithm RSA_2048
```

Output:

```json
{

### get-public-key-certificate

The following code example shows how to use `get-public-key-certificate`.

#### AWS CLI

**To return the public key**

The following `get-public-key-certificate` example returns the public key portion of a key pair.

```bash
aws payment-cryptography get-public-key-certificate
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
```
Output:

```json

**import-key**

The following code example shows how to use `import-key`.

---

Actions and scenarios 4938
AWS CLI

To import a TR-34 key

The following `import-key` example imports a TR-34 key.

```
aws payment-cryptography import-key \
   --key-material='{"Tr34KeyBlock": "\n   CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-cryptography:us-west-2:123456789012:key/rmm5wn2q564njnjm", \n   "ImportToken": "import-token-5ott6ho5nts7bbcg", \n   "KeyBlockFormat": "X9_TR34_2012", \n   "SigningKeyCertificate": file://signing-key-certificate.pem, \n   "WrappedKeyBlock": file://wrapped-key-block.pem }'}
```

Contents of `signing-key-certificate.pem`:

   "NoRestrictions": false,
   "Sign": false,
   "Unwrap": false,
   }}
}
For more information, see Import keys in the AWS Payment Cryptography User Guide.

- For API details, see ImportKey in AWS CLI Command Reference.

list-aliases

The following code example shows how to use list-aliases.

AWS CLI

To get a list of aliases

The following list-aliases example shows all of the aliases in your account in this Region.

```
aws payment-cryptography list-aliases
```

Output:

```
{
   "Aliases": [
   {
   "AliasName": "alias/sampleAlias1",
   "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h"
   },
   {
   "AliasName": "alias/sampleAlias2",
   "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h"
   }
   ]
}
```
For more information, see About aliases in the AWS Payment Cryptography User Guide.

- For API details, see ListAliases in AWS CLI Command Reference.

**list-keys**

The following code example shows how to use list-keys.

**AWS CLI**

**To get a list of keys**

The following list-keys example shows all of the keys in your account in this Region.

```bash
aws payment-cryptography list-keys
```

Output:

```json
{
  "Keys": [
    {
    "CreateTimestamp": "1666506840",
    "Enabled": false,
    "Exportable": true,
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
    "KeyAttributes": {
      "KeyAlgorithm": "TDES_3KEY",
      "KeyClass": "SYMMETRIC_KEY",
      "KeyModesOfUse": {
        "Decrypt": true,
        "DeriveKey": false,
        "Encrypt": true,
        "Generate": false,
        "NoRestrictions": false,
        "Sign": false,
        "Unwrap": true,
        "Verify": false,
        "Wrap": true
    }
  }
}]
```
The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To get the list of tags for a key**

The following `list-tags-for-resource` example gets the tags for a key.

```bash
aws payment-cryptography list-tags-for-resource
   --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
```

**Output:**

```json
{
   "Tags": [
      {
         "Key": "BIN",
         "Value": "20151120"
      },
      {
         "Key": "Project",
         "Value": "Production"
      }
   ]
}
```
For more information, see [Managing key tags with API operations](https://docs.aws.amazon.com/payment-cryptography/latest/userguide/ManagingKeyTags.html) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/payment-cryptography/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### `restore-key`

The following code example shows how to use `restore-key`.

#### AWS CLI

**To restore a key that is scheduled for deletion**

The following `restore-key` example cancels the deletion of a key.

```bash
aws payment-cryptography restore-key \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
```

**Output:**

```json
{
  "Key": {
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
    "KeyAttributes": {
      "KeyUsage": "TR31_V2_VISA_PIN_VERIFICATION_KEY",
      "KeyClass": "SYMMETRIC_KEY",
      "KeyAlgorithm": "TDES_3KEY",
      "KeyModesOfUse": {
        "Encrypt": false,
        "Decrypt": false,
        "Wrap": false,
        "Unwrap": false,
        "Generate": true,
        "Sign": false,
        "Verify": true,
        "DeriveKey": false,
        "NoRestrictions": false
      }
    }
  }
}
```
For more information, see [Deleting keys](#) in the [AWS Payment Cryptography User Guide](#).

- For API details, see [RestoreKey](#) in [AWS CLI Command Reference](#).

### start-key-usage

The following code example shows how to use `start-key-usage`.

**AWS CLI**

**To enable a key**

The following `start-key-usage` example enables a key to be used.

```bash
aws payment-cryptography start-key-usage \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h
```

**Output:**

```json
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/alsuwfxug3pgy6xh",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
```

Actions and scenarios
"Decrypt": true,
"DeriveKey": false,
"Encrypt": true,
"Generate": false,
"NoRestrictions": false,
"Sign": false,
"Unwrap": true,
"Verify": false,
"Wrap": true
},
"KeyUsage": "TR31_P1_PIN_GENERATION_KEY",
"KeyCheckValue": "369D",
"KeyCheckValueAlgorithm": "ANSI_X9_24",
"KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
"KeyState": "CREATE_COMPLETE",
"UsageStartTimestamp": "1686800690"
}
}

For more information, see [Enabling and disabling keys](#) in the AWS Payment Cryptography User Guide.

- For API details, see [StartKeyUsage](#) in AWS CLI Command Reference.

### stop-key-usage

The following code example shows how to use stop-key-usage.

**AWS CLI**

**To disable a key**

The following stop-key-usage example disables a key.

```bash
aws payment-cryptography stop-key-usage \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/\n  kwapwa6qaifllw2h
```

Output:

```json
{
  "Key": {
```
For more information, see Enabling and disabling keys in the AWS Payment Cryptography User Guide.

- For API details, see StopKeyUsage in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To tag a key

The following tag-resource example tags a key.
aws payment-cryptography tag-resource \ 
    --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h \ 
    --tags Key=sampleTag,Value=sampleValue

This command produces no output.

For more information, see Managing key tags in the AWS Payment Cryptography User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a key

The following untag-resource example removes a tag from a key.

aws payment-cryptography untag-resource \ 
    --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h \ 
    --tag-keys sampleTag

This command produces no output.

For more information, see Managing key tags in the AWS Payment Cryptography User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-alias

The following code example shows how to use update-alias.

AWS CLI

To update an alias

The following update-alias example associates the alias with a different key.

aws payment-cryptography update-alias \
```
--alias-name alias/sampleAlias1 \
--key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/tqv5yij6wtxx64pi
```

Output:

```
{
  "Alias": {
    "AliasName": "alias/sampleAlias1",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/tqv5yij6wtxx64pi"
  }
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide.*

- For API details, see [UpdateAlias](#) in *AWS CLI Command Reference.*

---

**AWS Payment Cryptography Data Plane examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography Data Plane.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

*decrypt-data*

The following code example shows how to use `decrypt-data`. 

---

---

---
**AWS CLI**

**To decrypt ciphertext**

The following decrypt-data example decrypts ciphertext data using a symmetric key. For this operation, the key must have KeyModesOfUse set to Decrypt and KeyUsage set to TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY.

```bash
aws payment-cryptography-data decrypt-data \
   --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h \
   --cipher-text 33612AB9D6929C3A828EB6030082B2BD \
   --decryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```json
{
   "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
   "KeyCheckValue": "71D7AE",
   "PlainText": "3132333431323334313233343132333431323334"
}
```

For more information, see [Decrypt data](https://docs.aws.amazon.com/payment-cryptography/latest/userguide/Decrypt.html) in the *AWS Payment Cryptography User Guide*.

- For API details, see [DecryptData](https://docs.aws.amazon.com/cli/latest/reference/payment-cryptography-data/decrypt-data.html) in *AWS CLI Command Reference*.

**encrypt-data**

The following code example shows how to use encrypt-data.

**AWS CLI**

**To encrypt data**

The following encrypt-data example encrypts plaintext data using a symmetric key. For this operation, the key must have KeyModesOfUse set to Encrypt and KeyUsage set to TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY.

```bash
aws payment-cryptography-data encrypt-data \
   --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h \
```
Output:

```
{
   "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
   "KeyCheckValue": "71D7AE",
   "CipherText": "33612AB9D6929C3A828EB6030082B2BD"
}
```

For more information, see Encrypt data in the AWS Payment Cryptography User Guide.  

- For API details, see EncryptData in AWS CLI Command Reference.

### generate-card-validation-data

The following code example shows how to use generate-card-validation-data.

#### AWS CLI

**To generate a CVV**

The following generate-card-validation-data example generates a CVV/CVV2.

```
aws payment-cryptography-data generate-card-validation-data \
   --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h \
   --primary-account-number=171234567890123 \
   --generation-attributes CardVerificationValue2={CardExpiryDate=0123}
```

Output:

```
{
   "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaifllw2h",
   "KeyCheckValue": "CADDA1",
   "ValidationData": "801"
}
```

For more information, see Generate card data in the AWS Payment Cryptography User Guide.
generate-mac

The following code example shows how to use generate-mac.

AWS CLI

To generate a MAC

The following generate-card-validation-data example generates a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key. The key must have KeyUsage set to TR31_M7_HMAC_KEY and KeyModesOfUse to Generate.

```bash
aws payment-cryptography-data generate-mac \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h \
  --message-data "3b313038383439303031303733393431353d3234303332336303030373030303f33" \
  --generation-attributes Algorithm=HMAC_SHA256
```

Output:

```json
{
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/kwapwa6qaif1lw2h",
  "KeyCheckValue": "2976E7",
  "Mac": "ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDD494F4A7AA470C"
}
```

For more information, see Generate MAC in the AWS Payment Cryptography User Guide.

• For API details, see GenerateMac in AWS CLI Command Reference.

generate-pin-data

The following code example shows how to use generate-pin-data.

AWS CLI

To generate a PIN
The following generate-card-validation-data example generates a new random PIN using the Visa PIN scheme.

```bash
aws payment-cryptography-data generate-pin-data \
  --generation-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2tsl45p5zjbh2 \
  --encryption-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt \
  --primary-account-number 171234567890123 \
  --pin-block-format ISO_FORMAT_0 \
  --generation-attributes VisaPin={PinVerificationKeyIndex=1}
```

Output:

```json
{
  "GenerationKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2tsl45p5zjbh2",
  "GenerationKeyCheckValue": "7F2363",
  "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt",
  "EncryptionKeyCheckValue": "7CC9E2",
  "EncryptedPinBlock": "AC17DC148BDA645E",
  "PinData": {
    "VerificationValue": "5507"
  }
}
```

For more information, see Generate PIN data in the AWS Payment Cryptography User Guide.

- For API details, see GeneratePinData in AWS CLI Command Reference.

re-encrypt-data

The following code example shows how to use re-encrypt-data.

**AWS CLI**

To re-encrypt data with a different key

The following re-encrypt-data example decrypts cipher text that was encrypted using an AES symmetric key and re-encrypts it using a Derived Unique Key Per Transaction (DUKPT) key.
The following code example shows how to use `translate-pin-data`.

**AWS CLI**

**To translate PIN data**

The following translate-pin-data example translates a PIN from PEK TDES encryption using ISO 0 PIN block to an AES ISO 4 PIN Block using the DUKPT algorithm.

```bash
aws payment-cryptography-data translate-pin-data \
    --encrypted-pin-block "AC17DC148BDA645E" \
    --incoming-translation-attributes=IsoFormat0='{PrimaryAccountNumber=171234567890123}'
```

For more information, see [Encrypt and decrypt data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ReEncryptData](#) in *AWS CLI Command Reference*. 
The following code example shows how to use verify-auth-request-cryptogram.

**AWS CLI**

To verify an auth request

The following verify-auth-request-cryptogram example verifies an Authorization Request Cryptogram (ARQC).

```
aws payment-cryptography-data verify-auth-request-cryptogram
    --auth-request-cryptogram F6E1BD1E6037FB3E
    --auth-response-attributes '{"ArpcMethod1": "{AuthResponseCode": "1111"}'}
    --key-identifier arn:aws:payment-cryptography:us-west-2:111122223333:key/pboipdfzd4mdklya
    --major-key-derivation-mode "EMV_OPTION_A"
    --session-key-derivation-attributes '{"EmvCommon":
        {"ApplicationTransactionCounter": "1234","PanSequenceNumber": "01","PrimaryAccountNumber": "471234567890123"}}'
    --transaction-data "123456789ABCDEF"
```
Output:

```json
{
    "AuthResponseValue": "D899B8C6F8F971AA",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/pboipdfzd4mdklya",
    "KeyCheckValue": "985792"
}
```

For more information, see Verify auth request (ARQC) cryptogram in the AWS Payment Cryptography User Guide.

- For API details, see VerifyAuthRequestCryptogram in AWS CLI Command Reference.

**verify-card-validation-data**

The following code example shows how to use `verify-card-validation-data`.

**AWS CLI**

**To validate a CVV**

The following `verify-card-validation-data` example validates a CVV/CVV2 for a PAN.

```bash
aws payment-cryptography-data verify-card-validation-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/tqv5yij6wt_xx64pi \
    --primary-account-number=171234567890123 \
    --verification-attributes CardVerificationValue2={CardExpiryDate=0123} \
    --validation-data 801
```

Output:

```json
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/tqv5yij6wt_xx64pi",
    "KeyCheckValue": "CADDA1"
}
```

For more information, see Verify card data in the AWS Payment Cryptography User Guide.

- For API details, see VerifyCardValidationData in AWS CLI Command Reference.
verify-mac

The following code example shows how to use verify-mac.

AWS CLI

To verify a MAC

The following verify-mac example verifies a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key.

```bash
aws payment-cryptography-data verify-mac \
    --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/qnobl51ghrzunce6 \
    --message-data "3b343038383439303031303733393431353d32343038323236303030373030303f33" \
    --verification-attributes='Algorithm=HMAC_SHA256' \
    --mac ED87F26E961C6D0DB78DA5038AA2BDEA0DCE03E5B5E96BDDD494F4A7AA470C
```

Output:

```json
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/qnobl51ghrzunce6",
    "KeyCheckValue": "2976E7",
}
```

For more information, see Verify MAC in the AWS Payment Cryptography User Guide.

- For API details, see VerifyMac in AWS CLI Command Reference.

verify-pin-data

The following code example shows how to use verify-pin-data.

AWS CLI

To verify a PIN

The following verify-pin-data example validates a PIN for a PAN.

```bash
aws payment-cryptography-data verify-pin-data \
```
Here is the example code that demonstrates how to verify PIN data using the AWS Command Line Interface (CLI) with Amazon Pinpoint:

```
--verification-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2tsl45p5zjbh2 \  
--encryption-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt \  
--primary-account-number 171234567890123 \  
--pin-block-format ISO_FORMAT_0 \  
--verification-attributes
VisaPin="{PinVerificationKeyIndex=1,VerificationValue=5507}" \  
--encrypted-pin-block AC17DC148BDA645E
```

Output:

```
{
  "VerificationKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2tsl45p5zjbh2",
  "VerificationKeyCheckValue": "7F2363",
  "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt",
  "EncryptionKeyCheckValue": "7CC9E2",
}
```

For more information, see [Verify PIN data](#) in the AWS Payment Cryptography User Guide.

- For API details, see [VerifyPinData](#) in [AWS CLI Command Reference](#).

### Amazon Pinpoint examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Pinpoint.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Actions

create-app

The following code example shows how to use create-app.

AWS CLI

Example 1: To create an application

The following create-app example creates a new application (project).

```
aws pinpoint create-app \
    --create-application-request Name=ExampleCorp
```

Output:

```json
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {}
    }
}
```

Example 2: To create an application that is tagged

The following create-app example creates a new application (project) and associates a tag (key and value) with the application.

```
aws pinpoint create-app \
    --create-application-request Name=ExampleCorp,tags={"Stack":"Test"}
```

Output:

```json
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
```
The following code example shows how to use `create-sms-template`.

**AWS CLI**

Creates a message template for messages that are sent through the SMS channel

The following `create-sms-template` example creates a SMS message template.

```
aws pinpoint create-sms-template \
  --template-name TestTemplate \
  --sms-template-request file://myfile.json \
  --region us-east-1
```

Contents of `myfile.json`:

```
{
  "Body": "hello\n how are you?\n food is good",
  "TemplateDescription": "Test SMS Template"
}
```

Output:

```
{
  "CreateTemplateMessageBody": {
    "Message": "Created",
    "RequestID": "8c36b17f-a0b0-400f-ac21-29e9b62a975d"
  }
}
```
For more information, see Amazon Pinpoint message templates in the Amazon Pinpoint User Guide.

- For API details, see CreateSmsTemplate in AWS CLI Command Reference.

**delete-app**

The following code example shows how to use delete-app.

**AWS CLI**

To delete an application

The following delete-app example deletes an application (project).

```shell
aws pinpoint delete-app \
    --application-id 810c7aab86d42fb2b56c8c966example
```

Output:

```json
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {}
    }
}
```

- For API details, see DeleteApp in AWS CLI Command Reference.

**get-apns-channel**

The following code example shows how to use get-apns-channel.

**AWS CLI**

To retrieve information about the status and settings of the APNs channel for an application

The following get-apns-channel example retrieves information about the status and settings of the APNs channel for an application.
```bash
aws pinpoint get-apns-channel \
   --application-id 9ab1068eb0a6461c86cce7f27ce0efd7 \
   --region us-east-1
```

**Output:**

```json
{
   "APNSChannelResponse": {
      "ApplicationId": "9ab1068eb0a6461c86cce7f27ce0efd7",
      "CreationDate": "2019-05-09T21:54:45.082Z",
      "DefaultAuthenticationMethod": "CERTIFICATE",
      "Enabled": true,
      "HasCredential": true,
      "HasTokenKey": false,
      "Id": "apns",
      "IsArchived": false,
      "LastModifiedDate": "2019-05-09T22:04:01.067Z",
      "Platform": "APNS",
      "Version": 2
   }
}
```

- For API details, see [GetApnsChannel](https://aws.amazon.com) in *AWS CLI Command Reference*.

**get-app**

The following code example shows how to use `get-app`.

**AWS CLI**

**To retrieve information about an application (project)**

The following `get-app` example retrieves information about an application (project).

```bash
aws pinpoint get-app \
   --application-id 810c7aab86d42fb2b56c8c966example \
   --region us-east-1
```

**Output:**

```json
{
```
• For API details, see `GetApp` in *AWS CLI Command Reference*.

**get-apps**

The following code example shows how to use `get-apps`.

**AWS CLI**

**To retrieve information about all of your applications**

The following `get-apps` example retrieves information about all of your applications (projects).

```
aws pinpoint get-apps
```

**Output:**

```
{
    "ApplicationsResponse": {
        "Item": [
        {
            "Arn": "arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
            "Id": "810c7aab86d42fb2b56c8c966example",
            "Name": "ExampleCorp",
            "tags": {
                "Year": "2019",
                "Stack": "Production"
            }
        },
        {
            "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
            "Id": "810c7aab86d42fb2b56c8c966example",
            "Name": "ExampleCorp",
            "tags": {
                "Year": "2019",
                "Stack": "Production"
            }
        }
    ]
}
```
The presence of the NextToken response value indicates that there is more output available. Call the command again and supply that value as the NextToken input parameter.

- For API details, see GetApps in AWS CLI Command Reference.

get-campaign

The following code example shows how to use get-campaign.

AWS CLI

To retrieve information about the status, configuration, and other settings for a campaign

The following get-campaign example retrieves information about the status, configuration, and other settings for a campaign.

```
aws pinpoint get-campaign \
  --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
  --campaign-id a1e63c6cc0eb43ed826ffcc3cc90b30d \
  --region us-east-1
```
Output:

```json
{
    "CampaignResponse": {
        "AdditionalTreatments": [],
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:apps/6e0b7591a90841d2b5d93fa11143e5a7/campaigns/a1e63c6cc0eb43ed826ffcc3cc90b30d",

        "TemplateConfiguration": {},
        "Version": 1
    }
}
```
For API details, see `GetCampaign` in *AWS CLI Command Reference*.

**get-campaigns**

The following code example shows how to use `get-campaigns`.

**AWS CLI**

To retrieves information about the status, configuration, and other settings for all the campaigns that are associated with an application

The following `get-campaigns` example retrieves information about the status, configuration, and other settings for all the campaigns that are associated with an application.

```
aws pinpoint get-campaigns \
   --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
   --region us-east-1
```

Output:

```json
{
   "CampaignsResponse": {
      "Item": [
      {
         "AdditionalTreatments": [],
         "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",

get-channels

The following code example shows how to use `get-channels`.

**AWS CLI**

To retrieves information about the history and status of each channel for an application

The following `get-channels` example retrieves information about the history and status of each channel for an application.

```bash
aws pinpoint get-channels \
   --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
   --region us-east-1
```

Output:
For API details, see GetChannels in AWS CLI Command Reference.
get-email-channel

The following code example shows how to use `get-email-channel`.

**AWS CLI**

To retrieve information about the status and settings of the Email channel for an application

The following `get-email-channel` example retrieves status and settings of the Email channel for an application.

```
aws pinpoint get-email-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```json
{
    "EmailChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:27:23.990Z",
        "Enabled": true,
        "FromAddress": "sender@example.com",
        "Id": "email",
        "Identity": "arn:aws:ses:us-east-1:AIDACKCEVSQ6C2EXAMPLE:identity/sender@example.com",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:27:23.990Z",
        "MessagesPerSecond": 1,
        "Platform": "EMAIL",
        "RoleArn": "arn:aws:iam::AIDACKCEVSQ6C2EXAMPLE:role/pinpoint-events",
        "Version": 1
    }
}
```

- For API details, see [GetEmailChannel](https://docs.aws.amazon.com/cli/latest/reference/pinpoint-get-email-channel.html) in *AWS CLI Command Reference*.

get-endpoint

The following code example shows how to use `get-endpoint`.
AWS CLI

To retrieve information about the settings and attributes of a specific endpoint for an application

The following `get-endpoint` example retrieves information about the settings and attributes of a specific endpoint for an application.

```
aws pinpoint get-endpoint \\
    --application-id 611e3e3cdd47474c9c1399a505665b91 \\
    --endpoint-id testendpoint \\
    --region us-east-1
```

Output:

```
{
    "EndpointResponse": {
        "Address": "+11234567890",
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "Attributes": {},
        "ChannelType": "SMS",
        "CohortId": "63",
        "EffectiveDate": "2021-08-06T00:04:51.763Z",
        "EndpointStatus": "ACTIVE",
        "Id": "testendpoint",
        "Location": {
            "Country": "USA"
        },
        "Metrics": {
            "SmsDelivered": 1.0
        },
        "OptOut": "ALL",
        "RequestId": "a204b1f2-7e26-48a7-9c80-b49a2143489d",
        "User": {
            "UserAttributes": {
                "Age": [
                    "24"
                ]
            },
            "UserId": "testuser"
        }
    }
}
```
get-gcm-channel

The following code example shows how to use `get-gcm-channel`.

**AWS CLI**

**To retrieve information about the status and settings of the GCM channel for an application**

The following `get-gcm-channel` example retrieves information about the status and settings of the GCM channel for an application.

```bash
aws pinpoint get-gcm-channel \
   --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
   --region us-east-1
```

Output:

```json
{
    "GCMChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:28:23.182Z",
        "Enabled": true,
        "HasCredential": true,
        "Id": "gcm",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:28:23.182Z",
        "Platform": "GCM",
        "Version": 1
    }
}
```

For API details, see [GetGcmChannel](https://docs.aws.amazon.com/cli/latest/reference/pinpoint/get-gcm-channel.html) in *AWS CLI Command Reference*.

get-sms-channel

The following code example shows how to use `get-sms-channel`.

**For API details, see [GetEndpoint](https://docs.aws.amazon.com/cli/latest/reference/pinpoint/get-endpoint.html) in *AWS CLI Command Reference***.
AWS CLI

To retrieve information about the status and settings of the SMS channel for an application

The following `get-sms-channel` example retrieves status and settings of the sms channel for an application.

```
aws pinpoint get-sms-channel \
   --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
   --region us-east-1
```

Output:

```
{
   "SMSChannelResponse": {
      "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
      "CreationDate": "2019-10-08T18:39:18.511Z",
      "Enabled": true,
      "Id": "sms",
      "IsArchived": false,
      "LastModifiedDate": "2019-10-08T18:39:18.511Z",
      "Platform": "SMS",
      "PromotionalMessagesPerSecond": 20,
      "TransactionalMessagesPerSecond": 20,
      "Version": 1
   }
}
```

- For API details, see [GetSmsChannel](#) in AWS CLI Command Reference.

get-sms-template

The following code example shows how to use `get-sms-template`.

AWS CLI

Retrieves the content and settings of a message template for messages that are sent through the SMS channel

The following `get-sms-template` example retrieves the content and settings of a SMS message template.
aws pinpoint get-sms-template \ 
   --template-name TestTemplate \ 
   --region us-east-1

Output:

```json
{
   "SMSTemplateResponse": {
      "Body": "hello\nhow are you?\nfood is good",
      "CreationDate": "2023-06-20T21:37:30.124Z",
      "LastModifiedDate": "2023-06-20T21:37:30.124Z",
      "tags": {},
      "TemplateDescription": "Test SMS Template",
      "TemplateName": "TestTemplate",
      "TemplateType": "SMS",
      "Version": "1"
   }
}
```

For more information, see [Amazon Pinpoint message templates](https://docs.aws.amazon.com/pinpoint/latest/api/amazon-pinpoint-message-templates.html) in the *Amazon Pinpoint User Guide*.

- For API details, see [GetSmsTemplate](https://docs.aws.amazon.com/cli/latest/reference/pinpoint/get-sms-template.html) in *AWS CLI Command Reference*.

### get-voice-channel

The following code example shows how to use `get-voice-channel`.

**AWS CLI**

To retrieve information about the status and settings of the voice channel for an application

The following `get-voice-channel` example retrieves status and settings of the voice channel for an application.

```
aws pinpoint get-voice-channel \ 
   --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \ 
   --region us-east-1

Output:
```
For API details, see [GetVoiceChannel](#) in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To retrieve a list of tags for a resource

The following `list-tags-for-resource` example retrieves all the tags (key names and values) that are associated with the specified resource.

```bash
aws pinpoint list-tags-for-resource \
   --resource-arn arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example
```

Output:

```json
{
   "TagsModel": { 
      "tags": { 
         "Year": "2019",
         "Stack": "Production"
      }
   }
}
```
For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>' in the Amazon Pinpoint Developer Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

phone-number-validate

The following code example shows how to use phone-number-validate.

**AWS CLI**

Retrieves information about a phone number

The following phone-number-validate retrieves information about a phone number.

```bash
aws pinpoint phone-number-validate \
   --number-validate-request PhoneNumber="+12065550142" \
   --region us-east-1
```

Output:

```json
{
   "NumberValidateResponse": {
      "Carrier": "ExampleCorp Mobile",
      "City": "Seattle",
      "CleansedPhoneNumberE164": "+12065550142",
      "CleansedPhoneNumberNational": "2065550142",
      "Country": "United States",
      "CountryCodeIso2": "US",
      "CountryCodeNumeric": "1",
      "OriginalPhoneNumber": "+12065550142",
      "PhoneType": "MOBILE",
      "PhoneTypeCode": 0,
      "Timezone": "America/Los_Angeles",
      "ZipCode": "98101"
   }
}
```

For more information, see Amazon Pinpoint SMS channel in the Amazon Pinpoint User Guide.

- For API details, see PhoneNumberValidate in AWS CLI Command Reference.
**send-messages**

The following code example shows how to use send-messages.

**AWS CLI**

**To send SMS message using the endpoint of an application**

The following send-messages example sends a direct message for an application with an endpoint.

```
aws pinpoint send-messages \
  --application-id 611e3e3cdd47474c9c1399a505665b91 \
  --message-request file://myfile.json \
  --region us-west-2
```

**Contents of myfile.json:**

```json
{
   "MessageConfiguration": {
      "SMSMessage": {
         "Body": "hello, how are you?"
      }
   },
   "Endpoints": {
      "testendpoint": {}
   }
}
```

**Output:**

```json
{
   "MessageResponse": {
      "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
      "EndpointResult": {
         "testendpoint": {
            "Address": "+12345678900",
            "DeliveryStatus": "SUCCESSFUL",
            "MessageId": "itnuqhai5alf1n6ahv3udc05n7hhddr6gb31q6g0",
            "StatusCode": 200,
            "StatusMessage": "MessageId: itnuqhai5alf1n6ahv3udc05n7hhddr6gb31q6g0"
         }
      }
   }
}
```
For more information, see Amazon Pinpoint SMS channel in the Amazon Pinpoint User Guide.

- For API details, see SendMessages in AWS CLI Command Reference.

**send-users-messages**

The following code example shows how to use send-users-messages.

**AWS CLI**

To send SMS message for an user of an application

The following send-users-messages example sends a direct message for an user of an application.

```bash
aws pinpoint send-users-messages \
   --application-id 611e3e3cdd47474c9c1399a5056665b91 \
   --send-users-message-request file://myfile.json \
   --region us-west-2
```

Contents of myfile.json:

```json
{
   "MessageConfiguration": {
      "SMSMessage": {
         "Body": "hello, how are you?"
      }
   },
   "Users": {
      "testuser": {}
   }
}
```

Output:

```json
{
}
```
"SendUsersMessageResponse": {
    "ApplicationId": "611e3e3cd47474c9c1399a505665b91",
    "RequestId": "e0b12cf5-2359-11e9-bb0b-d5fb91876b25",
    "Result": {
        "testuser": {
            "testuserendpoint": {
                "DeliveryStatus": "SUCCESSFUL",
                "MessageId": "7qu4hk5bqhd3i7i2n4pjf98qcu8b7p45ifsmo0",
                "StatusCode": 200,
                "StatusMessage": "MessageId: 7qu4hk5bqhd3i7i2n4pjf98qcu8b7p45ifsmo0",
                "Address": "+12345678900"
            }
        }
    }
}

For more information, see Amazon Pinpoint SMS channel in the Amazon Pinpoint User Guide.

- For API details, see SendUsersMessages in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a resource

The following example adds two tags (key names and values) to a resource.

```bash
aws pinpoint list-tags-for-resource \
    --resource-arn arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tags-model tags={Stack=Production,Year=2019}
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>' in the Amazon Pinpoint Developer Guide.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

Example 1: To remove a tag from a resource

The following untag-resource example removes the specified tag (key name and value) from a resource.

```bash
aws pinpoint untag-resource \
  --resource-arn arn:aws:mobiletargeting:us-west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
  --tag-keys Year
```

This command produces no output.

Example 2: To remove multiple tags from a resource

The following untag-resource example removes the specified tags (key names and values) from a resource.

```bash
aws pinpoint untag-resource \
  --resource-arn arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
  --tag-keys Year Stack
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>' in the Amazon Pinpoint Developer Guide.

For API details, see TagResource in AWS CLI Command Reference.

update-sms-channel

The following code example shows how to use update-sms-channel.

For API details, see UntagResource in AWS CLI Command Reference.
AWS CLI

To enable SMS channel or to update the status and settings of the SMS channel for an application.

The following `update-sms-channel` example enables SMS channel for an SMS channel for an application.

```bash
aws pinpoint update-sms-channel \
  --application-id 611e3e3cdd47474c9c1399a505665b91 \
  --sms-channel-request Enabled=true \
  --region us-west-2
```

Output:

```json
{
  "SMSChannelResponse": {
    "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
    "CreationDate": "2019-01-28T23:25:25.224Z",
    "Enabled": true,
    "Id": "sms",
    "IsArchived": false,
    "LastModifiedDate": "2023-05-18T23:22:50.977Z",
    "Platform": "SMS",
    "PromotionalMessagesPerSecond": 20,
    "TransactionalMessagesPerSecond": 20,
    "Version": 3
  }
}
```

For more information, see [Amazon Pinpoint SMS channel](https://docs.aws.amazon.com/amazonpinpoint/latest/developerguide/amazon-pinpoint-sms-channel.html) in the Amazon Pinpoint User Guide.

- For API details, see [UpdateSmsChannel](https://docs.aws.amazon.com/cli/latest/reference/pinpoint-update-sms-channel.html) in AWS CLI Command Reference.

Amazon Polly examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Polly.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

delete-lexicon

The following code example shows how to use delete-lexicon.

AWS CLI

To delete a lexicon

The following delete-lexicon example deletes the specified lexicon.

```
aws polly delete-lexicon \
   --name w3c
```

This command produces no output.

For more information, see Using the DeleteLexicon operation in the Amazon Polly Developer Guide.

- For API details, see DeleteLexicon in AWS CLI Command Reference.

get-lexicon

The following code example shows how to use get-lexicon.

AWS CLI

To retrieve the content of a lexicon

The following get-lexicon example retrieves the content of the specified pronunciation lexicon.
aws polly get-lexicon
--name w3c

Output:

```json
{
    "Lexicon": {
        "Content": "<?xml version="1.0" encoding="UTF-8"?>
<lexicon version="1.0" xmlns="http://www.w3.org/2005/01/pronunciation-lexicon"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
alphabet="ipa" xml:lang="en-US">
  <lexeme>
    <grapheme>W3C</grapheme>
    <alias>World Wide Web Consortium</alias>
  </lexeme>
</lexicon>
",
    "Name": "w3c"
},
    "LexiconAttributes": {
    "Alphabet": "ipa",
    "LanguageCode": "en-US",
    "LastModified": 1603908910.99,
    "LexemesCount": 1,
    "Size": 492
    }
}
```

For more information, see [Using the GetLexicon operation](https://docs.aws.amazon.com/polly/latest/dg/using-get-lexicon.html) in the *Amazon Polly Developer Guide*.

- For API details, see [GetLexicon](https://docs.aws.amazon.com/polly/latest/dg/api-reference-awscli.html) in *AWS CLI Command Reference*.

### get-speech-synthesis-task

The following code example shows how to use get-speech-synthesis-task.

**AWS CLI**

To get information about a speech synthesis task

The following get-speech-synthesis-task example retrieves information about the specified speech synthesis task.
aws polly get-speech-synthesis-task \
  --task-id 70b61c0f-57ce-4715-a247-cae8729dcce9

Output:

```json
{
  "SynthesisTask": {
    "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
    "TaskStatus": "completed",
    "OutputUri": "https://s3.us-west-2.amazonaws.com/my-s3-bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",

    "TextType": "text",
    "VoiceId": "Joanna"
  }
}
```

For more information, see [Creating long audio files](https://docs.aws.amazon.com/polly/latest/dg/creating-long-audio-files.html) in the *Amazon Polly Developer Guide*.

**list-lexicons**

The following code example shows how to use list-lexicons.

**AWS CLI**

**To list your lexicons**

The following `list-lexicons` example lists your pronunciation lexicons.

```bash
aws polly list-lexicons
```

Output:

```json
{
  "Lexicons": [
    {
      "Name": "w3c",
```
For more information, see [Using the ListLexicons operation](https://docs.aws.amazon.com/polly/latest/dg/API_ListLexicons.html) in the *Amazon Polly Developer Guide*.

- For API details, see [ListLexicons](https://docs.aws.amazon.com/cli/latest/reference/polly/list-lexicons.html) in *AWS CLI Command Reference*.

### list-speech-synthesis-tasks

The following code example shows how to use `list-speech-synthesis-tasks`.

**AWS CLI**

**To list your speech synthesis tasks**

The following `list-speech-synthesis-tasks` example lists your speech synthesis tasks.

```bash
aws polly list-speech-synthesis-tasks
```

**Output:**

```
{
   "SynthesisTasks": [
   {
   "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
   "TaskStatus": "completed",
   "OutputUri": "https://s3.us-west-2.amazonaws.com/my-s3-bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
   "CreationTime": 1603911042.689,
   "RequestCharacters": 1311,
   "OutputFormat": "mp3",
   "TextType": "text",
   }
   ]
}
```
For more information, see Creating long audio files in the Amazon Polly Developer Guide.

- For API details, see ListSpeechSynthesisTasks in AWS CLI Command Reference.

put-lexicon

The following code example shows how to use put-lexicon.

AWS CLI

To store a lexicon

The following put-lexicon example stores the specified pronunciation lexicon. The example.pls file specifies a W3C PLS-compliant lexicon.

```bash
aws polly put-lexicon \
   --name w3c \
   --content file://example.pls
```

Contents of example.pls

```xml
{
   <?xml version="1.0" encoding="UTF-8"?>
   <lexicon version="1.0"
      xmlns="http://www.w3.org/2005/01/pronunciation-lexicon"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation="http://www.w3.org/2005/01/pronunciation-lexicon
      http://www.w3.org/TR/2007/CR-pronunciation-lexicon-20071212/pls.xsd"
      alphabet="ipa"
      xml:lang="en-US">
      <lexeme>
         <grapheme>W3C</grapheme>
         <alias>World Wide Web Consortium</alias>
      </lexeme>
   </lexicon>
}
```
This command produces no output.

For more information, see [Using the PutLexicon operation](https://docs.aws.amazon.com/polly/latest/dg/put-lexicon.html) in the *Amazon Polly Developer Guide*.

- For API details, see [PutLexicon](https://docs.aws.amazon.com/cli/latest/reference/polly/put-lexicon.html) in *AWS CLI Command Reference*.

### start-speech-synthesis-task

The following code example shows how to use `start-speech-synthesis-task`.

**AWS CLI**

**To synthesize text**

The following `start-speech-synthesis-task` example synthesizes the text in `text_file.txt` and stores the resulting MP3 file in the specified bucket.

```bash
aws polly start-speech-synthesis-task \
  --output-format mp3 \
  --output-s3-bucket-name my-s3-bucket \
  --text file://text_file.txt \
  --voice-id Joanna
```

**Output:**

```json
{
  "SynthesisTask": {
    "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
    "TaskStatus": "scheduled",
    "OutputUri": "https://s3.us-east-2.amazonaws.com/my-s3-bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
    "CreationTime": 1603911042.689,
    "RequestCharacters": 1311,
    "OutputFormat": "mp3",
    "TextType": "text",
    "VoiceId": "Joanna"
  }
}
```

For more information, see [Creating long audio files](https://docs.aws.amazon.com/polly/latest/dg/creating-long-audio-files.html) in the *Amazon Polly Developer Guide*.

- For API details, see [StartSpeechSynthesisTask](https://docs.aws.amazon.com/cli/latest/reference/polly/start-speech-synthesis-task.html) in *AWS CLI Command Reference*. 

---

Actions and scenarios
AWS Price List examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Price List.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions
describe-services

The following code example shows how to use describe-services.

AWS CLI

To retrieve service metadata

This example retrieves the metadata for the Amazon EC2 service code.

Command:

```
aws pricing describe-services --service-code AmazonEC2 --format-version aws_v1 --max-items 1
```

Output:

```
{
   "Services": [
      {
         "ServiceCode": "AmazonEC2",
         "AttributeNames": [
```

get-attribute-values

The following code example shows how to use get-attribute-values.

AWS CLI

To retrieve a list of attribute values

The following get-attribute-values example retrieves a list of values available for the given attribute.

```bash
aws pricing get-attribute-values \
   --service-code AmazonEC2 \
   --attribute-name volumeType \
   --max-items 2
```

Output:
For API details, see GetAttributeValues in AWS CLI Command Reference.

get-products

The following code example shows how to use get-products.

AWS CLI

To retrieve a list of products

This example retrieves a list of products that match the given criteria.

Command:

```
aws pricing get-products --filters file://filters.json --format-version aws_v1 --max-results 1 --service-code AmazonEC2
```

filters.json:

```
[
{
    "Type": "TERM_MATCH",
    "Field": "ServiceCode",
    "Value": "AmazonEC2"
},
{
    "Type": "TERM_MATCH",
    "Field": "volumeType",
    "Value": "Provisioned IOPS"
}
]`
AWS Private CA examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Private CA.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

For API details, see [GetProducts](#) in **AWS CLI Command Reference**.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**create-certificate-authority-audit-report**

The following code example shows how to use `create-certificate-authority-audit-report`.

**AWS CLI**

**To create a certificate authority audit report**

The following `create-certificate-authority-audit-report` command creates an audit report for the private CA identified by the ARN.

```
```

- For API details, see [CreateCertificateAuthorityAuditReport](#) in *AWS CLI Command Reference*.

**create-certificate-authority**

The following code example shows how to use `create-certificate-authority`.

**AWS CLI**

**To create a private certificate authority**

The following `create-certificate-authority` command creates a private certificate authority in your AWS account.

```
aws acm-pca create-certificate-authority --certificate-authority-configuration file://C:\ca_config.txt --revocation-configuration file://C:\revoke_config.txt --certificate-authority-type "SUBORDINATE" --idempotency-token 98256344
```
For API details, see CreateCertificateAuthority in AWS CLI Command Reference.

**delete-certificate-authority**

The following code example shows how to use delete-certificate-authority.

**AWS CLI**

To delete a private certificate authority

The following delete-certificate-authority command deletes the certificate authority identified by the ARN.

```bash
```

For API details, see DeleteCertificateAuthority in AWS CLI Command Reference.

**describe-certificate-authority-audit-report**

The following code example shows how to use describe-certificate-authority-audit-report.

**AWS CLI**

To describe an audit report for a certificate authority

The following describe-certificate-authority-audit-report command lists information about the specified audit report for the CA identified by the ARN.

```bash
```

For API details, see DescribeCertificateAuthorityAuditReport in AWS CLI Command Reference.

**describe-certificate-authority**

The following code example shows how to use describe-certificate-authority.
**AWS CLI**

**To describe a private certificate authority**

The following `describe-certificate-authority` command lists information about the private CA identified by the ARN.

```shell
```

- For API details, see [DescribeCertificateAuthority](https://docs.aws.amazon.com/cli/latest/reference/acm-pca/describe-certificate-authority.html) in *AWS CLI Command Reference*.

**get-certificate-authority-certificate**

The following code example shows how to use `get-certificate-authority-certificate`.

**AWS CLI**

**To retrieve a certificate authority (CA) certificate**

The following `get-certificate-authority-certificate` command retrieves the certificate and certificate chain for the private CA specified by the ARN.

```shell
```

**get-certificate-authority-csr**

The following code example shows how to use `get-certificate-authority-csr`.

**AWS CLI**

**To retrieve the certificate signing request for a certificate authority**

The following `get-certificate-authority-csr` command retrieves the CSR for the private CA specified by the ARN.

- For API details, see GetCertificateAuthorityCsr in AWS CLI Command Reference.

get-certificate

The following code example shows how to use get-certificate.

AWS CLI

To retrieve an issued certificate

The following get-certificate example retrieves a certificate from the specified private CA.

aws acm-pca get-certificate \
   --certificate-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012/certificate/6707447683a9b7f4055627fffd55cebcc \
   --output text

Output:

-----BEGIN CERTIFICATE-----
MIIEczCCAvgAwIBAgIRAJuJ8f6ZVYL7gG/1S3qvMwDQYJKoZIhvcNAQELBQAw
...certificate body truncated for brevity....
KQNy73D6LtmdOebAyq10XidqyY411vK/H1eZrPaBmYNAbxU=
-----END CERTIFICATE-----

-----BEGIN CERTIFICATE-----
MIIEczCCAvgAwIBAgIRAJuJ8f6ZVYL7gG/1S3qvMwDQYJKoZIhvcNAQELBQAw
cTELMAkGA1UEBhMCVVMxExARBgNVBAgMCl/hc2/hbmdO0b24xEDAOBgNVBAcMBIN1
...certificate body truncated for brevity....
kdRGB6P2hpstDOUIwAoCboawWfA4ybJznf+jOqhAzln1RdKQRR8nODwpKt7H9w
dJ5nxSTk/fniJz86Dtp6n8s82wYdkN3cVfFeK72A9aTCOU=
-----END CERTIFICATE-----

The first part of the output is the certificate itself. The second part is the certificate chain that chains to the root CA certificate. Note that when you use the --output text option, a TAB
character is inserted between the two certificate pieces (that is the cause of the indented text). If you intend to take this output and parse the certificates with other tools, you might need to remove the TAB character so it is processed correctly.

- For API details, see `GetCertificate` in *AWS CLI Command Reference*.

**import-certificate-authority-certificate**

The following code example shows how to use `import-certificate-authority-certificate`.

**AWS CLI**

**To import your certificate authority certificate into ACM PCA**

The following `import-certificate-authority-certificate` command imports the signed private CA certificate for the CA specified by the ARN into ACM PCA.

```bash
```

- For API details, see `ImportCertificateAuthorityCertificate` in *AWS CLI Command Reference*.

**issue-certificate**

The following code example shows how to use `issue-certificate`.

**AWS CLI**

**To issue a private certificate**

The following `issue-certificate` command uses the private CA specified by the ARN to issue a private certificate.

```bash
```

- For API details, see `IssueCertificate` in *AWS CLI Command Reference*.
list-certificate-authorities

The following code example shows how to use list-certificate-authorities.

AWS CLI

To list your private certificate authorities

The following list-certificate-authorities command lists information about all of the private CAs in your account.

```
aws acm-pca list-certificate-authorities --max-results 10
```

- For API details, see [ListCertificateAuthorities](#) in *AWS CLI Command Reference*.

list-tags

The following code example shows how to use list-tags.

AWS CLI

To list the tags for your certificate authority

The following list-tags command lists the tags associated with the private CA specified by the ARN.

```
```

- For API details, see [ListTags](#) in *AWS CLI Command Reference*.

revoke-certificate

The following code example shows how to use revoke-certificate.

AWS CLI

To revoke a private certificate

The following revoke-certificate command revokes a private certificate from the CA identified by the ARN.

• For API details, see RevokeCertificate in AWS CLI Command Reference.

tag-certificate-authority

The following code example shows how to use tag-certificate-authority.

AWS CLI

To attach tags to a private certificate authority

The following tag-certificate-authority command attaches one or more tags to your private CA.

• For API details, see TagCertificateAuthority in AWS CLI Command Reference.

untag-certificate-authority

The following code example shows how to use untag-certificate-authority.

AWS CLI

To remove one or more tags from your private certificate authority

The following untag-certificate-authority command removes tags from the private CA identified by the ARN.

• For API details, see UntagCertificateAuthority in AWS CLI Command Reference.
update-certificate-authority

The following code example shows how to use update-certificate-authority.

AWS CLI

To update the configuration of your private certificate authority

The following update-certificate-authority command updates the status and configuration of the private CA identified by the ARN.

```
```

• For API details, see UpdateCertificateAuthority in AWS CLI Command Reference.

AWS Proton examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Proton.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

• Actions

Actions
cancel-service-instance-deployment

The following code example shows how to use cancel-service-instance-deployment.
To cancel a service instance deployment

The following cancel-service-instance-deployment example cancels a service instance deployment.

```
aws proton cancel-service-instance-deployment \
  --service-instance-name "instance-one" \
  --service-name "simple-svc"
```

Output:

```json
{
  "serviceInstance": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
    "createdAt": "2021-04-02T21:29:59.962000+00:00",

    "name": "instance-one",
    "serviceName": "simple-svc",
    "spec": "proton: ServiceSpec\npipeline:\n  my_sample_pipeline_optional_input: abc\n  my_sample_pipeline_required_input: '123'\ninstances:\n  name: my-instance\n  environment: MySimpleEnv\n  spec:\n    my_sample_service_instance_optional_input: def\n    my_sample_service_instance_required_input: '456'\n    environment: MySimpleEnv\n    spec:\n      my_sample_service_instance_required_input: '789'\n    "templateMajorVersion": "1",
    "templateMinorVersion": "1",
    "templateName": "svc-simple"
  }
}
```

For more information, see Update a service instance in the The AWS Proton Administrator Guide or Update a service instance in the The AWS Proton User Guide.

- For API details, see CancelServiceInstanceDeployment in AWS CLI Command Reference.
cancel-service-pipeline-deployment

The following code example shows how to use cancel-service-pipeline-deployment.

AWS CLI

**To cancel a service pipeline deployment**

The following cancel-service-pipeline-deployment example cancels a service pipeline deployment.

```bash
aws proton cancel-service-pipeline-deployment \
   --service-name "simple-svc"
```

Output:

```json
{
   "pipeline": {
      "createdAt": "2021-04-02T21:29:59.962000+00:00",
      "deploymentStatus": "CANCELLING",
      "lastDeploymentAttemptedAt": "2021-04-02T22:02:45.095000+00:00",
      "lastDeploymentSucceededAt": "2021-04-02T21:39:28.991000+00:00",
      "templateMajorVersion": "1",
      "templateMinorVersion": "1",
      "templateName": "svc-simple"
   }
}
```

For more information, see [Update a service pipeline](https://docs.aws.amazon.com/proton/latest/adminguide/service-pipelines-update.html) in the *The AWS Proton Administrator Guide* or [Update a service pipeline](https://docs.aws.amazon.com/proton/latest/userguide/service-pipelines-update.html) in the *The AWS Proton User Guide*.

- For API details, see [CancelServicePipelineDeployment](https://docs.aws.amazon.com/cli/latest/reference/proton/cancel-service-pipeline-deployment.html) in *AWS CLI Command Reference*.

create-service

The following code example shows how to use create-service.

AWS CLI

**To create a service**
The following `create-service` example creates a service with a service pipeline.

```bash
aws proton create-service \
    --name "MySimpleService" \
    --template-name "fargate-service" \
    --template-major-version "1" \
    --branch-name "mainline" \
    --repository-connection-arn "arn:aws:codestar-connections:region-id:account-id:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --repository-id "myorg/myapp" \
    --spec file://spec.yaml
```

Contents of `spec.yaml`:

```yaml
proton: ServiceSpec

pipeline:
  my_sample_pipeline_required_input: "hello"
  my_sample_pipeline_optional_input: "bye"

instances:
  - name: "acme-network-dev"
    environment: "ENV_NAME"
    spec:
      my_sample_service_instance_required_input: "hi"
      my_sample_service_instance_optional_input: "ho"
```

Output:

```json
{
  "service": {
    "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
    "createdAt": "2020-11-18T19:50:27.460000+00:00",
    "lastModifiedAt": "2020-11-18T19:50:27.460000+00:00",
    "name": "MySimpleService",
    "repositoryConnectionArn": "arn:aws:codestar-connections:region-id:123456789012connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "repositoryId": "myorg/myapp",
    "status": "CREATE_IN_PROGRESS",
    "templateName": "fargate-service"
  }
}
```
For more information, see Create a service in the *The AWS Proton Administrator Guide* and Create a service in the *The AWS Proton User Guide*.

- For API details, see CreateService in *AWS CLI Command Reference*.

**delete-service**

The following code example shows how to use delete-service.

**AWS CLI**

**To delete a service**

The following delete-service example deletes a service.

```bash
aws proton delete-service \
--name "simple-svc"
```

Output:

```json
{
   "service": {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
      "branchName": "mainline",
      "createdAt": "2020-11-28T22:40:50.512000+00:00",
      "description": "Edit by updating description",
      "lastModifiedAt": "2020-11-29T00:30:39.248000+00:00",
      "name": "simple-svc",
      "repositoryConnectionArn": "arn:aws:codestar-connections:region-id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "repositoryId": "myorg/myapp",
      "status": "DELETE_IN_PROGRESS",
      "templateName": "fargate-service"
   }
}
```

For more information, see Delete a service in the *The AWS Proton Administrator Guide*.

- For API details, see DeleteService in *AWS CLI Command Reference*.

**get-service-instance**

The following code example shows how to use get-service-instance.
AWS CLI

To get service instance details

The following get-service-instance example gets detail data for a service instance.

```
aws proton get-service-instance \
  --name "instance-one" \
  --service-name "simple-svc"
```

Output:

```
{
  "serviceInstance": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
    "createdAt": "2020-11-28T22:40:50.512000+00:00",
    "deploymentStatus": "SUCCEEDED",
    "environmentName": "simple-env",
    "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
    "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
    "name": "instance-one",
    "serviceName": "simple-svc",
    "spec": "proton: ServiceSpec\npipeline:\n  my_sample_pipeline_optional_input: hello world\n  my_sample_pipeline_required_input: pipeline up\ninstances:\n  my-sample-service_instance_instance: Ola\n    my_sample_service_instance_instance_optional_input: "Ola"
    "templateMajorVersion": "1",
    "templateMinorVersion": "0",
    "templateName": "svc-simple"
  }
}
```

For more information, see View service data in the The AWS Proton Administrator Guide or View service data in the The AWS Proton User Guide.

- For API details, see GetServiceInstance in AWS CLI Command Reference.

get-service

The following code example shows how to use get-service.
AWS CLI

To get service details

The following get-service example gets detail data for a service.

```bash
aws proton get-service \
  --name "simple-svc"
```

Output:

```json
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
        "branchName": "mainline",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "lastModifiedAt": "2020-11-28T22:44:51.207000+00:00",
        "name": "simple-svc",
        "pipeline": {
            "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "createdAt": "2020-11-28T22:40:50.512000+00:00",
            "deploymentStatus": "SUCCEEDED",

    }
```
For more information, see View service data in the The AWS Proton Administrator Guide or View service data in the The AWS Proton User Guide.

- For API details, see GetService in AWS CLI Command Reference.

### list-service-instances

The following code example shows how to use list-service-instances.

#### AWS CLI

**Example 1: To list all service instances**

The following list-service-instances example lists service instances.

```bash
aws proton list-service-instances
```

**Output:**

```json
{
   "serviceInstances": [
   {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
      "createdAt": "2020-11-28T22:40:50.512000+00:00",
      "deploymentStatus": "SUCCEEDED",
      "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
      "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
      "name": "instance-one",
      "serviceName": "simple-svc",
      "templateMajorVersion": "1",
      "templateMinorVersion": "0",
      "templateName": "fargate-service"
   }
   ]
}
```
For more information, see View service instance data in the The AWS Proton Administrator Guide or View service instance data in the The AWS Proton User Guide.

Example 2: To list the specified service instance

The following get-service-instance example gets a service instance.

```bash
aws proton get-service-instance \
    --name "instance-one" \
    --service-name "simple-svc"
```

Output:

```json
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "deploymentStatus": "SUCCEEDED",
        "environmentName": "simple-env",
        "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
        "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec
my_sample_pipeline_optional_input: hello world
my_sample_pipeline_required_input: pipeline up
instances:
  name: instance-one
environment: my-simple-env
  spec:
my_sample_service_instance_optional_input: Ola
my_sample_service_instance_required_input: Ciao",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see View service instance data in the The AWS Proton Administrator Guide or View service instance data in the The AWS Proton User Guide.

- For API details, see ListServiceInstances in AWS CLI Command Reference.

update-service-instance

The following code example shows how to use update-service-instance.
AWS CLI

To update a service instance to a new minor version

The following `update-service-instance` example updates a service instance to a new minor version of its service template that adds a new instance named "my-other-instance" with a new required input.

```bash
aws proton update-service-instance \
  --service-name "simple-svc" \
  --spec "file://service-spec.yaml " \
  --template-major-version "1" \
  --template-minor-version "1" \
  --deployment-type "MINOR_VERSION" \
  --name "instance-one"
```

Contents of `service-spec.yaml`:

```yaml
proton: ServiceSpec
pipeline:
  my_sample_pipeline_optional_input: "abc"
  my_sample_pipeline_required_input: "123"
instances:
  - name: "instance-one"
    environment: "simple-env"
    spec:
      my_sample_service_instance_optional_input: "def"
      my_sample_service_instance_required_input: "456"
  - name: "my-other-instance"
    environment: "simple-env"
    spec:
      my_sample_service_instance_required_input: "789"
```

Output:

```json
{
  "serviceInstance": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
    "createdAt": "2021-04-02T21:29:59.962000+00:00",
    "deploymentStatus": "IN_PROGRESS",
    "environmentName": "arn:aws:proton:region-id:123456789012:environment/simple-env",
```
For more information, see Update a service instance in the The AWS Proton Administrator Guide or Update a service instance in the The AWS Proton User Guide.

- For API details, see UpdateServiceInstance in AWS CLI Command Reference.

update-service-pipeline

The following code example shows how to use update-service-pipeline.

AWS CLI

To update a service pipeline

The following update-service-pipeline example updates a service pipeline to a new minor version of its service template.

```
aws proton update-service-pipeline \
  --service-name "simple-svc" \
  --spec "file://service-spec.yaml" \
  --template-major-version "1" \
  --template-minor-version "1" \
  --deployment-type "MINOR_VERSION"
```

Output:

```
{
  "pipeline": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "createdAt": "2021-04-02T21:29:59.962000+00:00",
    "deploymentStatus": "IN_PROGRESS",
    "lastDeploymentAttemptedAt": "2021-04-02T21:38:00.823000+00:00",
    "lastDeploymentSucceededAt": "2021-04-02T21:59.962000+00:00",
    "name": "instance-one",
    "serviceName": "simple-svc",
    "templateMajorVersion": "1",
    "templateMinorVersion": "0",
    "templateName": "svc-simple"
  }
}
```
For more information, see Update a service pipeline in the The AWS Proton Administrator Guide or Update a service pipeline in the The AWS Proton User Guide.

- For API details, see UpdateServicePipeline in AWS CLI Command Reference.

update-service

The following code example shows how to use update-service.

AWS CLI

To update a service

The following update-service example edits a service description.

```bash
aws proton update-service \\
  --name "MySimpleService" \\
  --description "Edit by updating description"
```

Output:

```json
{
  "service": {
    "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
    "branchName": "mainline",
    "createdAt": "2021-03-12T22:39:42.318000+00:00",
    "description": "Edit by updating description",
    "lastModifiedAt": "2021-03-12T22:44:21.975000+00:00",
  }
}
```
For more information, see Edit a service in the The AWS Proton Administrator Guide or Edit a service in the The AWS Proton User Guide.

- For API details, see UpdateService in AWS CLI Command Reference.

**QLDB examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with QLDB.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- [Actions](#)

**Actions**

**cancel-journal-kinesis-stream**

The following code example shows how to use cancel-journal-kinesis-stream.

**AWS CLI**

To cancel a journal stream
The following cancel-journal-kinesis-stream example cancels the specified journal stream from a ledger.

```
aws qldb cancel-journal-kinesis-stream 
   --ledger-name myExampleLedger 
   --stream-id 7ISCkqwe4y25YyHLzYUFAf
```

Output:

```
{
   "StreamId": "7ISCkqwe4y25YyHLzYUFAf"
}
```

For more information, see Streaming journal data from Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see CancelJournalKinesisStream in AWS CLI Command Reference.

create-ledger

The following code example shows how to use create-ledger.

AWS CLI

**Example 1: To create a ledger with default properties**

The following create-ledger example creates a ledger with the name myExampleLedger and the permissions mode STANDARD. The optional parameters for deletion protection and AWS KMS key are not specified, so they default to true and an AWS owned KMS key respectively.

```
aws qldb create-ledger 
   --name myExampleLedger 
   --permissions-mode STANDARD
```

Output:

```
{
   "State": "CREATING",
   "DeletionProtection": true,
```
Example 2: To create a ledger with deletion protection disabled, a customer managed KMS key, and specified tags

The following `create-ledger` example creates a ledger with the name `myExampleLedger2` and the permissions mode `STANDARD`. The deletion protection feature is disabled, the specified customer managed KMS key is used for encryption at rest, and the specified tags are attached to the resource.

```bash
aws qldb create-ledger \
    --name myExampleLedger2 \
    --permissions-mode STANDARD \
    --no-deletion-protection \
    --kms-key arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags IsTest=true,Domain=Test
```

Output:

```json
{
    "DeletionProtection": false,
    "CreationDateTime": 1568839543.557,
    "State": "CREATING",
    "Name": "myExampleLedger2",
    "PermissionsMode": "STANDARD",
    "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see CreateLedger in AWS CLI Command Reference.

**delete-ledger**

The following code example shows how to use `delete-ledger`.
AWS CLI

To delete a ledger

The following delete-ledger example deletes the specified ledger.

```bash
aws qldb delete-ledger \
   --name myExampleLedger
```

This command produces no output.

For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see DeleteLedger in AWS CLI Command Reference.

describe-journal-kinesis-stream

The following code example shows how to use describe-journal-kinesis-stream.

AWS CLI

To describe a journal stream

The following describe-journal-kinesis-stream example displays the details for the specified journal stream from a ledger.

```bash
aws qldb describe-journal-kinesis-stream \
   --ledger-name myExampleLedger \
   --stream-id 7ISCkqwe4y25YyHLzYUFAf
```

Output:

```json
{
   "Stream": {
      "LedgerName": "myExampleLedger",
      "CreationTime": 1591221984.677,
      "InclusiveStartTime": 1590710400.0,
      "ExclusiveEndTime": 1590796799.0,
      "RoleArn": "arn:aws:iam::123456789012:role/my-kinesis-stream-role",
      "StreamId": "7ISCkqwe4y25YyHLzYUFAf",
```
"Arn": "arn:aws:qldb:us-east-1:123456789012:stream/myExampleLedger/7ISCkqwe4y25YyHLzYUFAf",
"Status": "ACTIVE",
"KinesisConfiguration": {
    "AggregationEnabled": true
},
"StreamName": "myExampleLedger-stream"
}

For more information, see Streaming journal data from Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see DescribeJournalKinesisStream in AWS CLI Command Reference.

describe-journal-s3-export

The following code example shows how to use describe-journal-s3-export.

AWS CLI

To describe a journal export job

The following describe-journal-s3-export example displays the details for the specified export job from a ledger.

```
aws qldb describe-journal-s3-export \n   --name myExampleLedger \n   --export-id ADR2ONPKNSLINYGb4dp7yZ
```

Output:

```
{
    "ExportDescription": {
        "S3ExportConfiguration": {
            "Bucket": "awsExampleBucket",
            "Prefix": "ledgerexport1/",
            "EncryptionConfiguration": {
                "ObjectEncryptionType": "SSE_S3"
            }
        }
    }
}
```
For more information, see Exporting Your Journal in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see DescribeJournalS3Export in AWS CLI Command Reference.

**describe-ledger**

The following code example shows how to use describe-ledger.

**AWS CLI**

**To describe a ledger**

The following describe-ledger example displays the details for the specified ledger.

```bash
aws qldb describe-ledger \
   --name myExampleLedger
```

**Output:**

```json
{
   "CreationDateTime": 1568839243.951,
   "State": "ACTIVE",
   "Name": "myExampleLedger",
   "DeletionProtection": true,
   "PermissionsMode": "STANDARD",
   "EncryptionDescription": {
      "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
      "EncryptionStatus": "ENABLED"
   }
}
```
For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see DescribeLedger in AWS CLI Command Reference.

**export-journal-to-s3**

The following code example shows how to use export-journal-to-s3.

**AWS CLI**

**To export journal blocks to S3**

The following export-journal-to-s3 example creates an export job for journal blocks within a specified date and time range from a ledger with the name myExampleLedger. The export job writes the blocks into a specified Amazon S3 bucket.

```bash
code example
aws qldb export-journal-to-s3 \
  --name myExampleLedger \
  --inclusive-start-time 2019-09-18T00:00:00Z \
  --exclusive-end-time 2019-09-18T22:59:59Z \
  --role-arn arn:aws:iam::123456789012:role/my-s3-export-role \
  --s3-export-configuration file://my-s3-export-config.json
```

**Contents of my-s3-export-config.json:**

```json
{
    "Bucket": "awsExampleBucket",
    "Prefix": "ledgerexport1/",
    "EncryptionConfiguration": {
        "ObjectEncryptionType": "SSE_S3"
    }
}
```

**Output:**

```json
{
    "ExportId": "ADR2ONPKNS5LINYGb4dp7yZ"
}
```
get-block

The following code example shows how to use get-block.

AWS CLI

Example 1: To get a journal block and proof for verification using input files

The following get-block example requests a block data object and a proof from the specified ledger. The request is for a specified digest tip address and block address.

```bash
aws qldb get-block \
   --name vehicle-registration \
   --block-address file://myblockaddress.json \
   --digest-tip-address file://mydigesttipaddress.json
```

Contents of `myblockaddress.json`:

```json
{
   "IonText": "{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:100}"
}
```

Contents of `mydigesttipaddress.json`:

```json
{
   "IonText": "{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:123}"
}
```

Output:

```json
{
   "Block": {
      "IonText": "{blockAddress:{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:100},transactionId:"FnQeJBAicTX0Ah32ZnVtSX",blockTimestamp:2019-09-16T19:37:05.360Z,blockHash:
```
For more information, see [Data Verification in Amazon QLDB](https://docs.aws.amazon.com/qldb/latest/developerguide/data-verification.html) in the [Amazon QLDB Developer Guide](https://docs.aws.amazon.com/qldb/latest/developerguide/). 

**Example 2: To get a journal block and proof for verification using shorthand syntax**

The following `get-block` example requests a block data object and a proof from the specified ledger using shorthand syntax. The request is for a specified digest tip address and block address.

```
aws qldb get-block
  --name vehicle-registration
```

```json
{ "proof": "{ "IonText" : [ "{{aZsXw+4dN+oz5KliLh+7l8q2Ux/F0sY0VU8/9LX+Q2R7ZjcK5d1v7QnSN9h1lyzAN+gdY/9K70407+H2SDZoxJQyo1/45NsmjArB+jK/o1rNPprw1eGJ+syoA=y2CBGt4Z+QsR1l2u2e13kEY=}},

Actions and scenarios

5020
For more information, see Data Verification in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see GetBlock in AWS CLI Command Reference.

get-digest

The following code example shows how to use get-digest.

AWS CLI

To get a digest for a ledger

The following get-digest example requests a digest from the specified ledger at the latest committed block in the journal.

```bash
aws qldb get-digest 
   --name vehicle-registration
```

Output:

```json
{
   "Digest": "6m6BMXobbJKpMhahwVthAEsN6awgnHK62Qq5McGP1Gk=",
   "DigestTipAddress": {
      "IonText": "{strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:123}"
   }
}
```

For more information, see Data Verification in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see GetDigest in AWS CLI Command Reference.

get-revision

The following code example shows how to use get-revision.

AWS CLI

Example 1: To get a document revision and proof for verification using input files
The following get-revision example requests a revision data object and a proof from the specified ledger. The request is for a specified digest tip address, document ID, and block address of the revision.

```bash
aws qldb get-revision
  --name vehicle-registration
  --block-address file://myblockaddress.json
  --document-id JUJgkIcNbhS2goq8RqLuZ4
  --digest-tip-address file://mydigesttipaddress.json
```

Contents of `myblockaddress.json`:

```json
{
  "IonText": "{strandId:"KmA3ZZca7vAIiJAK95S5Iwl"},sequenceNo:100"
}
```

Contents of `mydigesttipaddress.json`:

```json
{
  "IonText": "{strandId:"KmA3ZZca7vAIiJAK95S5Iwl"},sequenceNo:123"
}
```

Output:

```json
{
  "Revision": {
    "IonText": "{blockAddress:{strandId:"KmA3ZZca7vAIiJAK95S5Iwl"},sequenceNo:100},hash:{mHVex/yjHAWjFPpwhBuH2GKXmKJjK2Fba9faqoUVNtg=},data:
    {VIN:"1N4AL11D75C109151",LicensePlateNumber:"LEWISR261LL",State:"WA"
    },PendingPenaltyTicketAmount:90.25,ValidFromDate:2017-08-21,ValidToDate:2020-05-11,Owners:

```
For more information, see [Data Verification in Amazon QLDB](https://docs.aws.amazon.com/qldb/latest/developerguide/index.html) in the *Amazon QLDB Developer Guide*.

**Example 2: To get a document revision and proof for verification using shorthand syntax**

The following `get-revision` example requests a revision data object and a proof from the specified ledger using shorthand syntax. The request is for a specified digest tip address, document ID, and block address of the revision.

```bash
aws qldb get-revision
   --name vehicle-registration
   --block-address 'IonText={strandId:"KmA3ZZca7vAIiJAK9S5Iwl",sequenceNo:100}''
   --document-id JUJgkIcNbhS2goq8RqLuZ4
   --digest-tip-address 'IonText={strandId:"KmA3ZZca7vAIiJAK9S5Iwl
   ",sequenceNo:123}''
```

**Output:**

```json
{
   "Revision": {
      "IonText": "{{blockAddress:{strandId:"KmA3ZZca7vAIiJAK9S5Iwl
   ",sequenceNo:100},hash:{{mHVex/yjHAWjFPwhBuHZGKXmKJk2FBa9faqoUVNtg=}},data:
   {VIN:"1N4AL11D75C109151",LicensePlateNumber:"LEWISR261IL",State:"WA
   ",PendingPenaltyTicketAmount:90.25,ValidFromDate:2017-08-21,ValidToDate:2020-05-11,Owners:

```
For more information, see Data Verification in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see GetRevision in AWS CLI Command Reference.

**list-journal-kinesis-streams-for-ledger**

The following code example shows how to use list-journal-kinesis-streams-for-ledger.

**AWS CLI**

**To list journal streams for a ledger**

The following list-journal-kinesis-streams-for-ledger example lists journal streams for the specified ledger.

```bash
aws qldb list-journal-kinesis-streams-for-ledger \
  --ledger-name myExampleLedger
```

**Output:**

```
{
  "Streams": [
    {
      "LedgerName": "myExampleLedger",
      "CreationTime": 1591221984.677,
      "InclusiveStartTime": 1590710400.0,
      "ExclusiveEndTime": 1590796799.0,
      "RoleArn": "arn:aws:iam::123456789012:role/my-kinesis-stream-role",
      "StreamId": "7ISCkqwe4y25YyHLzYUFAf",
      "Arn": "arn:aws:qldb:us-east-1:123456789012:stream/myExampleLedger/7ISCkqwe4y25YyHLzYUFAf",
      "Status": "ACTIVE",
      "KinesisConfiguration": {
        "AggregationEnabled": true
      }
    }
  ]
}
```
For more information, see [Streaming journal data from Amazon QLDB](https://aws.amazon.com/qldb/) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListJournalKinesisStreamsForLedger](https://docs.aws.amazon.com/cli/latest/reference/qldb/list-journal-kinesis-streams-for-ledger.html) in *AWS CLI Command Reference*.

**list-journal-s3-exports-for-ledger**

The following code example shows how to use `list-journal-s3-exports-for-ledger`.

**AWS CLI**

To list journal export jobs for a ledger

The following `list-journal-s3-exports-for-ledger` example lists journal export jobs for the specified ledger.

```bash
aws qldb list-journal-s3-exports-for-ledger
          --name myExampleLedger
```

Output:

```json
{
   "JournalS3Exports": [
       {
           "LedgerName": "myExampleLedger",
           "ExclusiveEndTime": 1568847599.0,
           "ExportCreationTime": 1568847801.418,
           "S3ExportConfiguration": {
               "Bucket": "awsExampleBucket",
               "Prefix": "ledgerexport1/",
               "EncryptionConfiguration": {
                   "ObjectEncryptionType": "SSE_S3"
               }
           },
           "ExportId": "ADR2ONPKN5LINYGb4dp7yZ",
           "RoleArn": "arn:aws:iam::123456789012:role/qldb-s3-export",
           "InclusiveStartTime": 1568764800.0,
           "Status": "IN_PROGRESS"
       }
   ]
}
```
For more information, see Exporting Your Journal in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see ListJournalS3ExportsForLedger in AWS CLI Command Reference.

list-journal-s3-exports

The following code example shows how to use list-journal-s3-exports.

AWS CLI

To list journal export jobs

The following list-journal-s3-exports example lists journal export jobs for all ledgers that are associated with the current AWS account and Region.

```
aws qldb list-journal-s3-exports
```

Output:

```json
{
   "JournalS3Exports": [
   {
      "Status": "IN_PROGRESS",
      "LedgerName": "myExampleLedger",
      "S3ExportConfiguration": {
         "EncryptionConfiguration": {
            "ObjectEncryptionType": "SSE_S3"
         },
         "Bucket": "awsExampleBucket",
         "Prefix": "ledgerexport1/"
      },
      "RoleArn": "arn:aws:iam::123456789012:role/my-s3-export-role",
      "ExportCreationTime": 1568847801.418,
      "ExportId": "ADR20NPKN5LNYGb4dp7yZ",
      "InclusiveStartTime": 1568764800.0,
      "ExclusiveEndTime": 1568847599.0
   },
   {
   }
}]
```
For more information, see Exporting Your Journal in Amazon QLDB in the Amazon QLDB Developer Guide.

- For API details, see ListJournalS3Exports in AWS CLI Command Reference.

### list-ledgers

The following code example shows how to use `list-ledgers`.

**AWS CLI**

**To list your available ledgers**

The following `list-ledgers` example lists all ledgers that are associated with the current AWS account and Region.

```bash
aws qldb list-ledgers
```

Output:

```json
{
    "Ledgers": [
        {
            "State": "ACTIVE",
            "CreationDateTime": 1568839243.951,
```
For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see ListLedgers in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list the tags attached to a ledger

The following list-tags-for-resource example lists all tags attached to the specified ledger.

```
aws qldb list-tags-for-resource \
```

Output:

```
{
  "Tags": {
    "IsTest": "true",
    "Domain": "Test"
  }
}
```

For more information, see Tagging Amazon QLDB Resources in the Amazon QLDB Developer Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.
stream-journal-to-kinesis

The following code example shows how to use stream-journal-to-kinesis.

AWS CLI

Example 1: To stream journal data to Kinesis Data Streams using input files

The following stream-journal-to-kinesis example creates a stream of journal data within a specified date and time range from a ledger with the name myExampleLedger. The stream sends the data to a specified Amazon Kinesis data stream.

```
aws qldb stream-journal-to-kinesis 
   --ledger-name myExampleLedger 
   --inclusive-start-time 2020-05-29T00:00:00Z 
   --exclusive-end-time 2020-05-29T23:59:59Z 
   --role-arn arn:aws:iam::123456789012:role/my-kinesis-stream-role 
   --kinesis-configuration file://my-kinesis-config.json 
   --stream-name myExampleLedger-stream
```

Contents of `my-kinesis-config.json`:

```
{
   "AggregationEnabled": true
}
```

Output:

```
{
   "StreamId": "7ISCkqwe4y25YyHLzYUFAf"
}
```

For more information, see Streaming journal data from Amazon QLDB in the Amazon QLDB Developer Guide.

Example 2: To stream journal data to Kinesis Data Streams using shorthand syntax

The following stream-journal-to-kinesis example creates a stream of journal data within a specified date and time range from a ledger with the name myExampleLedger. The stream sends the data to a specified Amazon Kinesis data stream.
The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a ledger**

The following `tag-resource` example adds a set of tags to a specified ledger.

```bash/aws qldb tag-resource \
   --resource-arn arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger \
   --tags IsTest=true,Domain=Test
```

This command produces no output.

For more information, see [Tagging Amazon QLDB Resources](https://docs.aws.amazon.com/qldb/latest/developerguide/tagging-qldb-resources.html) in the *Amazon QLDB Developer Guide*.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/qldb/tag-resource.html) in *AWS CLI Command Reference*.
untag-resource

The following code example shows how to use `untag-resource`.

**AWS CLI**

To remove tags from a resource

The following `untag-resource` example removes tags with the specified tag keys from a specified ledger.

```bash
aws qldb untag-resource \
   --resource-arn arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger \
   --tag-keys IsTest Domain
```

This command produces no output.

For more information, see [Tagging Amazon QLDB Resources](https://docs.aws.amazon.com/qldb/latest/developerguide/qldb-resources-tagging.html) in the *Amazon QLDB Developer Guide*.

- For API details, see [UntagResource](https://docs.aws.amazon.com/cli/latest/reference/qldb/untag-resource.html) in *AWS CLI Command Reference*.

update-ledger-permissions-mode

The following code example shows how to use `update-ledger-permissions-mode`.

**AWS CLI**

**Example 1: To update the permissions mode of a ledger to STANDARD**

The following `update-ledger-permissions-mode` example assigns the STANDARD permissions mode to the specified ledger.

```bash
aws qldb update-ledger-permissions-mode \
   --name myExampleLedger \
   --permissions-mode STANDARD
```

**Output:**

```json
{
   "Name": "myExampleLedger",
   "PermissionsMode": "STANDARD"
}
```
Example 2: To update the permissions mode of a ledger to ALLOW_ALL

The following update-ledger-permissions-mode example assigns the ALLOW_ALL permissions mode to the specified ledger.

```bash
aws qldb update-ledger-permissions-mode \
   --name myExampleLedger \
   --permissions-mode ALLOW_ALL
```

Output:

```json
{
   "Name": "myExampleLedger",
   "PermissionsMode": "ALLOW_ALL"
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see UpdateLedgerPermissionsMode in AWS CLI Command Reference.

update-ledger

The following code example shows how to use update-ledger.

AWS CLI

Example 1: To update the deletion protection property of a ledger

The following update-ledger example updates the specified ledger to disable the deletion protection feature.

```bash
aws qldb update-ledger \
   --name myExampleLedger \
   --no-deletion-protection
```

Output:

```json
{}
```
Example 2: To update the AWS KMS key of a ledger to a customer managed key

The following `update-ledger` example updates the specified ledger to use a customer managed KMS key for encryption at rest.

```bash
aws qldb update-ledger \
    --name myExampleLedger \
    --kms-key arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "CreationDateTime": 1568839243.951,
    "DeletionProtection": false,
    "Name": "myExampleLedger",
    "State": "ACTIVE",
    "EncryptionDescription": {
        "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "EncryptionStatus": "UPDATING"
    }
}
```

Example 3: To update the AWS KMS key of a ledger to an AWS owned key

The following `update-ledger` example updates the specified ledger to use an AWS owned KMS key for encryption at rest.

```bash
aws qldb update-ledger \
    --name myExampleLedger \
    --kms-key AWS_OWNED_KMS_KEY
```

Output:

```
For more information, see Basic Operations for Amazon QLDB Ledgers in the Amazon QLDB Developer Guide.

- For API details, see UpdateLedger in AWS CLI Command Reference.

**Amazon RDS examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

*add-option-to-option-group*

The following code example shows how to use add-option-to-option-group.
AWS CLI

To add an option to an option group

The following add-option-to-option-group example adds an option to the specified option group.

```
aws rds add-option-to-option-group \
   --option-group-name myoptiongroup \
   --options OptionName=OEM,Port=5500,DBSecurityGroupMemberships=default \
   --apply-immediately
```

Output:

```
{
   "OptionGroup": {
      "OptionGroupName": "myoptiongroup",
      "OptionGroupDescription": "Test Option Group",
      "EngineName": "oracle-ee",
      "MajorEngineVersion": "12.1",
      "Options": [
         {
            "OptionName": "Timezone",
            "OptionDescription": "Change time zone",
            "Persistent": true,
            "Permanent": false,
            "OptionSettings": [
               {
                  "Name": "TIME_ZONE",
                  "Value": "Australia/Sydney",
                  "DefaultValue": "UTC",
                  "Description": "Specifies the timezone the user wants to change the system time to",
                  "ApplyType": "DYNAMIC",
                  "DataType": "STRING",
                  "AllowedValues": "Africa/Cairo,Africa/Casablanca,Africa/Harare,Africa/Lagos,Africa/Luanda,Africa/Monrovia,Africa/Nairobi,Africa/Tripoli,Africa/Windhoek,Argentina/Araguaina,Argentina/Asuncion,Argentina/Bogota,America/Caracas,America/Chicago,America/Chihuahua,America/Cuiaba,America/Denver,America/Detroit,America/Fortaleza,America/Godthab,America/Guatemala,America/Halifax,America/Lima,America/Los_Angeles,America/Manaus,America/Matamoros,America/Mexico_City,America/Monterrey,America/Montevideo,America/New_York,America/Phoenix,America/Santiago,America/Sao_Paulo,America/Tijuana,

For more information, see Adding an Option to an Option Group in the Amazon RDS User Guide.

- For API details, see AddOptionToOptionGroup in AWS CLI Command Reference.

add-role-to-db-cluster

The following code example shows how to use add-role-to-db-cluster.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB cluster

The following add-role-to-db-cluster example associates a role with a DB cluster.

```
aws rds add-role-to-db-cluster \
  --db-cluster-identifier mydbcluster \
  --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the Amazon Aurora User Guide.

- For API details, see AddRoleToDbCluster in AWS CLI Command Reference.

add-role-to-db-instance

The following code example shows how to use add-role-to-db-instance.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following add-role-to-db-instance example adds the role to an Oracle DB instance named test-instance.

```
aws rds add-role-to-db-instance \
  --db-instance-identifier test-instance \
  --feature-name S3_INTEGRATION \
  --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.
For more information, see Prerequisites for Amazon RDS Oracle Integration with Amazon S3 in the Amazon RDS User Guide.

- For API details, see AddRoleToDbInstance in AWS CLI Command Reference.

add-source-identifier-to-subscription

The following code example shows how to use add-source-identifier-to-subscription.

AWS CLI

To add a source identifier to a subscription

The following add-source-identifier example adds another source identifier to an existing subscription.

```bash
aws rds add-source-identifier-to-subscription \
  --subscription-name my-instance-events \
  --source-identifier test-instance-repl
```

Output:

```json
{
   "EventSubscription": {
      "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
      "CustSubscriptionId": "my-instance-events",
      "Enabled": false,
      "Status": "modifying",
      "EventCategoriesList": ["backup", "recovery"],
      "CustomerAwsId": "123456789012",
      "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
      "SourceType": "db-instance",
      "SourceIdsList": ["test-instance", "test-instance-repl"
   ]
}
```
add-tags-to-resource

The following code example shows how to use add-tags-to-resource.

AWS CLI

To add tags to a resource

The following add-tags-to-resource example add tags to an RDS database.

aws rds add-tags-to-resource \
--resource-name arn:aws:rds:us-east-1:123456789012:db:database-mysql \
--tags "[{"Key": "Name","Value": "MyDatabase"},{"Key": "Environment
","Value": "test"]"

This command produces no output.

For more information, see Tagging Amazon RDS Resources in the Amazon RDS User Guide.

apply-pending-maintenance-action

The following code example shows how to use apply-pending-maintenance-action.

AWS CLI

To apply pending maintenance actions

The following apply-pending-maintenance-action example applies the pending maintenance actions for a DB cluster.

aws rds apply-pending-maintenance-action \
--resource-identifier arn:aws:rds:us-east-1:123456789012:cluster:my-db-cluster \
--apply-action system-update \
--opt-in-type immediate

Output:
For more information, see Maintaining a DB instance in the Amazon RDS User Guide and Maintaining an Amazon Aurora DB cluster in the Amazon Aurora User Guide.

- For API details, see ApplyPendingMaintenanceAction in AWS CLI Command Reference.

authorize-db-security-group-ingress

The following code example shows how to use authorize-db-security-group-ingress.

**AWS CLI**

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following authorize-db-security-group-ingress example configures the default security group with an ingress rule for the CIDR IP range 192.0.2.0/24.

```bash
aws rds authorize-db-security-group-ingress \
   --db-security-group-name default \
   --cidrip 192.0.2.0/24
```

Output:

```json
{
   "DBSecurityGroup": {
      "OwnerId": "123456789012",
      "DBSecurityGroupName": "default",
   }
}
```
"DBSecurityGroupDescription": "default",
"EC2SecurityGroups": [],
"IPRanges": [
  {
    "Status": "authorizing",
    "CIDRIP": "192.0.2.0/24"
  }
],
"DBSecurityGroupArn": "arn:aws:rds:us-east-1:111122223333:secgrp:default"
}
}

For more information, see Authorizing Network Access to a DB Security Group from an IP Range in the Amazon RDS User Guide.

- For API details, see AuthorizeDbSecurityGroupIngress in AWS CLI Command Reference.

**backtrack-db-cluster**

The following code example shows how to use backtrack-db-cluster.

**AWS CLI**

To backtrack an Aurora DB cluster

The following backtrack-db-cluster example backtracks the specified DB cluster sample-cluster to March 19, 2018, at 10 a.m.

```
aws rds backtrack-db-cluster --db-cluster-identifier sample-cluster --backtrack-to 2018-03-19T10:00:00+00:00
```

This command outputs a JSON block that acknowledges the change to the RDS resource.

- For API details, see BacktrackDbCluster in AWS CLI Command Reference.

**cancel-export-task**

The following code example shows how to use cancel-export-task.

**AWS CLI**

To cancel a snapshot export to Amazon S3
The following `cancel-export-task` example cancels an export task in progress that is exporting a snapshot to Amazon S3.

```bash
aws rds cancel-export-task \
   --export-task-identifier my-s3-export-1
```

Output:

```json
{
   "ExportTaskIdentifier": "my-s3-export-1",
   "SnapshotTime": "2019-03-24T20:01:09.815Z",
   "S3Bucket": "mybucket",
   "S3Prefix": "",
   "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/export-snap-S3-role",
   "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd0000-7bfd-4594-af38-aabbccddeeff",
   "Status": "CANCELING",
   "PercentProgress": 0,
   "TotalExtractedDataInGB": 0
}
```

For more information, see [Canceling a snapshot export task](https://docs.aws.amazon.com/rds/latest/userguide/CancelExportTask.html) in the *Amazon RDS User Guide* or [Canceling a snapshot export task](https://docs.aws.amazon.com/aurora/latest/userguide/CancelExportTask.html) in the *Amazon Aurora User Guide*.

- For API details, see [CancelExportTask](https://docs.aws.amazon.com/cli/latest/reference/rds/cancel-export-task.html) in *AWS CLI Command Reference*.

---

**copy-db-cluster-parameter-group**

The following code example shows how to use `copy-db-cluster-parameter-group`.

**AWS CLI**

**To copy a DB cluster parameter group**

The following `copy-db-cluster-parameter-group` example makes a copy of a DB cluster parameter group.

```bash
aws rds copy-db-cluster-parameter-group \
   --source-db-cluster-parameter-group-identifier mydbclusterpg \
```

---
'--target-db-cluster-parameter-group-identifier mydbclusterpgcopy \
--target-db-cluster-parameter-group-description "Copy of mydbclusterpg parameter group"

Output:

```json
{
  "DBClusterParameterGroup": {
    "DBClusterParameterGroupName": "mydbclusterpgcopy",
    "DBParameterGroupFamily": "aurora-mysql5.7",
    "Description": "Copy of mydbclusterpg parameter group"
  }
}
```

For more information, see [Copying a DB Cluster Parameter Group](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/Concepts.DBClusterParameterGroups.html) in the *Amazon Aurora User Guide*.

- For API details, see [CopyDbClusterParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/copy-db-cluster-parameter-group.html) in *AWS CLI Command Reference*.

### copy-db-cluster-snapshot

The following code example shows how to use `copy-db-cluster-snapshot`.

**AWS CLI**

**To copy a DB cluster snapshot**

The following `copy-db-cluster-snapshot` example creates a copy of a DB cluster snapshot, including its tags.

```bash
aws rds copy-db-cluster-snapshot \
  --target-db-cluster-snapshot-identifier myclustersnapshotcopy \
  --copy-tags
```

Output:

```json
{
}
```
"DBClusterSnapshot": {
    "AvailabilityZones": [
        "us-east-1a",
        "us-east-1b",
        "us-east-1e"
    ],
    "DBClusterSnapshotIdentifier": "myclustersnapshotcopy",
    "DBClusterIdentifier": "myaurora",
    "SnapshotCreateTime": "2019-06-04T09:16:42.649Z",
    "Engine": "aurora-mysql",
    "AllocatedStorage": 0,
    "Status": "available",
    "Port": 0,
    "VpcId": "vpc-6594f31c",
    "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
    "MasterUsername": "myadmin",
    "EngineVersion": "5.7.mysql_aurora.2.04.2",
    "LicenseModel": "aurora-mysql",
    "SnapshotType": "manual",
    "PercentProgress": 100,
    "StorageEncrypted": true,
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
    "IAMDatabaseAuthenticationEnabled": false
}

For more information, see Copying a Snapshot in the Amazon Aurora User Guide.

- For API details, see CopyDbClusterSnapshot in AWS CLI Command Reference.

copy-db-parameter-group

The following code example shows how to use copy-db-parameter-group.

AWS CLI

To copy a DB cluster parameter group

The following copy-db-parameter-group example makes a copy of a DB parameter group.

    aws rds copy-db-parameter-group \
### AWS Command Line Interface

#### --source-db-parameter-group-identifier mydbpg \
--target-db-parameter-group-identifier mydbpgcopy \
--target-db-parameter-group-description "Copy of mydbpg parameter group"

Output:

```
{
  "DBParameterGroup": {
    "DBParameterGroupName": "mydbpgcopy",
    "DBParameterGroupArn": "arn:aws:rds:us-east-1:814387698303:pg:mydbpgcopy",
    "DBParameterGroupFamily": "mysql5.7",
    "Description": "Copy of mydbpg parameter group"
  }
}
```

For more information, see [Copying a DB Parameter Group](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/DBParameterGroups.Copying.html) in the *Amazon RDS Users Guide*.

- For API details, see [CopyDbParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/copy-db-parameter-group.html) in *AWS CLI Command Reference*.

#### copy-db-snapshot

The following code example shows how to use `copy-db-snapshot`.

**AWS CLI**

#### To copy a DB snapshot

The following `copy-db-snapshot` example creates a copy of a DB snapshot.

```
aws rds copy-db-snapshot \
  --source-db-snapshot-identifier rds:database-mysql-2019-06-06-08-38 \
  --target-db-snapshot-identifier mydbsnapshotcopy
```

Output:

```
{
  "DBSnapshot": {
    "VpcId": "vpc-6594f31c",
    "Status": "creating",
    "Encrypted": true,
  }
}
```
For more information, see [Copying a Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/) in the Amazon RDS User Guide.

- For API details, see [CopyDbSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/copy-db-snapshot.html) in AWS CLI Command Reference.

**copy-option-group**

The following code example shows how to use `copy-option-group`.

**AWS CLI**

**To copy an option group**

The following `copy-option-group` example makes a copy of an option group.

```
aws rds copy-option-group
    --source-option-group-identifier myoptiongroup
    --target-option-group-identifier new-option-group
    --target-option-group-description "My option group copy"
```
create-blue-green-deployment

The following code example shows how to use create-blue-green-deployment.

**AWS CLI**

**Example 1: To create a blue/green deployment for an RDS for MySQL DB instance**

The following create-blue-green-deployment example creates a blue/green deployment for a MySQL DB instance.

```bash
aws rds create-blue-green-deployment \\
   --blue-green-deployment-name bgd-cli-test-instance \\
   --source arn:aws:rds:us-east-1:123456789012:db:my-db-instance \\
   --target-engine-version 8.0 \\
   --target-db-parameter-group-name mysql-80-group
```

**Output:**

```json
{
   "BlueGreenDeployment": {
      "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
      "BlueGreenDeploymentName": "bgd-cli-test-instance",
   }
}
```
"SwitchoverDetails": [
    {

    }
],
"Status": "PROVISIONING",
"CreateTime": "2022-02-25T21:18:51.183000+00:00"
}

For more information, see [Creating a blue/green deployment](https://docs.aws.amazon.com/rds/latest/userguide/aurora-mysql-blue-green-deployment.html) in the *Amazon RDS User Guide*.

**Example 2: To create a blue/green deployment for an Aurora MySQL DB cluster**
The following `create-blue-green-deployment` example creates a blue/green deployment for an Aurora MySQL DB cluster.

```bash
aws rds create-blue-green-deployment
   --blue-green-deployment-name my-blue-green-deployment
   --source arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster
   --target-engine-version 8.0
   --target-db-cluster-parameter-group-name ams-80-binlog-enabled
   --target-db-parameter-group-name mysql-80-cluster-group
```

Output:

```
{
   "BlueGreenDeployment": {
      "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
      "BlueGreenDeploymentName": "my-blue-green-deployment",
      "SwitchoverDetails": [
         {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster",
            "Status": "PROVISIONING"
         },
         {
            "Status": "PROVISIONING"
         },
         {
            "Status": "PROVISIONING"
         },
         {
            "Status": "PROVISIONING"
         },
         {
            "Status": "PROVISIONING"
         }
      ]
   }
}
```
For more information, see Creating a blue/green deployment in the Amazon Aurora User Guide.

- For API details, see CreateBlueGreenDeployment in AWS CLI Command Reference.

create-db-cluster-endpoint

The following code example shows how to use create-db-cluster-endpoint.

AWS CLI

To create a custom DB cluster endpoint
The following `create-db-cluster-endpoint` example creates a custom DB cluster endpoint and associate it with the specified Aurora DB cluster.

```
aws rds create-db-cluster-endpoint \
  --db-cluster-endpoint-identifier mycustomendpoint \
  --endpoint-type reader \
  --db-cluster-identifier mydbcluster \
  --static-members dbinstance1 dbinstance2
```

Output:

```
{
  "DBClusterEndpointIdentifier": "mycustomendpoint",
  "DBClusterIdentifier": "mydbcluster",
  "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
  "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-east-1.rds.amazonaws.com",
  "Status": "creating",
  "EndpointType": "CUSTOM",
  "CustomEndpointType": "READER",
  "StaticMembers": [
    "dbinstance1",
    "dbinstance2"
  ],
  "ExcludedMembers": [],
  "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-endpoint:mycustomendpoint"
}
```

For more information, see [Amazon Aurora Connection Management](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/rds-create-dbcluster-endpoint.html) in the [Amazon Aurora User Guide](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/).

- For API details, see [CreateDbClusterEndpoint](https://docs.aws.amazon.com/cli/latest/reference/rds/create-db-cluster-endpoint.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/rds/create-db-cluster-endpoint.html).

### create-db-cluster-parameter-group

The following code example shows how to use `create-db-cluster-parameter-group`.

**AWS CLI**

To create a DB cluster parameter group
The following `create-db-cluster-parameter-group` example creates a DB cluster parameter group.

```
aws rds create-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterparametergroup \
    --db-parameter-group-family aurora5.6 \
    --description "My new cluster parameter group"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBClusterParameterGroupName": "mydbclusterparametergroup",
        "DBParameterGroupFamily": "aurora5.6",
        "Description": "My new cluster parameter group",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:cluster-pg:mydbclusterparametergroup"
    }
}
```

For more information, see [Creating a DB Cluster Parameter Group](https://docs.aws.amazon.com/AmazonAurora/latest/USER-GUIDE/) in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbClusterParameterGroup](https://docs.aws.amazon.com/AmazonRDS/latest/APIReference/API_CreateDbClusterParameterGroup.html) in *AWS CLI Command Reference*.

### `create-db-cluster-snapshot`

The following code example shows how to use `create-db-cluster-snapshot`.

**AWS CLI**

**To create a DB cluster snapshot**

The following `create-db-cluster-snapshot` example creates a DB cluster snapshot.

```
aws rds create-db-cluster-snapshot \
    --db-cluster-identifier mydbcluster \
    --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{
}
```
"DBClusterSnapshot": {
   "AvailabilityZones": [
      "us-east-1a",
      "us-east-1b",
      "us-east-1e"
   ],
   "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
   "DBClusterIdentifier": "mydbcluster",
   "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",
   "Engine": "aurora-mysql",
   "AllocatedStorage": 1,
   "Status": "creating",
   "Port": 0,
   "VpcId": "vpc-6594f31c",
   "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
   "MasterUsername": "myadmin",
   "EngineVersion": "5.7.mysql_aurora.2.04.2",
   "LicenseModel": "aurora-mysql",
   "SnapshotType": "manual",
   "PercentProgress": 0,
   "StorageEncrypted": true,
   "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
   "IAMDatabaseAuthenticationEnabled": false
"
}

For more information, see **Creating a DB Cluster Snapshot** in the *Amazon Aurora User Guide*.

* For API details, see **CreateDbClusterSnapshot** in *AWS CLI Command Reference*.

**create-db-cluster**

The following code example shows how to use create-db-cluster.

AWS CLI

**Example 1: To create a MySQL 5.7--compatible DB cluster**

The following create-db-cluster example creates a MySQL 5.7-compatible DB cluster using the default engine version. Replace the sample password `secret99` with a secure password.

When you use the console to create a DB cluster, Amazon RDS automatically creates the writer
DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```bash
aws rds create-db-cluster \
  --db-cluster-identifier sample-cluster \
  --engine aurora-mysql \
  --engine-version 5.7 \
  --master-username admin \
  --master-user-password secret99 \
  --db-subnet-group-name default \
  --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
  "DBCluster": {
    "DBSubnetGroup": "default",
    "VpcSecurityGroups": [
      {
        "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
        "Status": "active"
      }
    ],
    "AllocatedStorage": 1,
    "AssociatedRoles": [],
    "PreferredBackupWindow": "09:12-09:42",
    "ClusterCreateTime": "2023-02-27T23:21:33.048Z",
    "DeletionProtection": false,
    "IAMDatabaseAuthenticationEnabled": false,
    "ReadReplicaIdentifiers": [],
    "Engine": "aurora-mysql",
    "StorageEncrypted": false,
    "MultiAZ": false,
    "PreferredMaintenanceWindow": "mon:04:31-mon:05:01",
    "HttpEndpointEnabled": false,
    "BackupRetentionPeriod": 1,
    "DbClusterResourceId": "cluster-ANPAJ4AE5446DAEXAMPLE",
    "DBClusterIdentifier": "sample-cluster",
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1b",
    ]
  }
}```
Example 2: To create a PostgreSQL--compatible DB cluster

The following create-db-cluster example creates a PostgreSQL-compatible DB cluster using the default engine version. Replace the example password secret99 with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the create-db-instance AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-pg-cluster \
    --engine aurora-postgresql \
    --master-username master \
    --master-user-password secret99 \
    --db-subnet-group-name default \
    --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
    "DBCluster": {
        "Endpoint": "sample-pg-cluster.cluster-cnpexample.us-east-1.rds.amazonaws.com",
        "HttpEndpointEnabled": false,
        "DBClusterMembers": []
    }
}
```
"EngineMode": "provisioned",
"CopyTagsToSnapshot": false,
"HostedZoneId": "Z2R2ITUGPM61AM",
"IAMDatabaseAuthenticationEnabled": false,
"AllocatedStorage": 1,
"VpcSecurityGroups": [
    {
        "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
        "Status": "active"
    }
],
"DeletionProtection": false,
"StorageEncrypted": false,

    "us-east-1a",
    "us-east-1b",
    "us-east-1c"
],
"ReadReplicaIdentifiers": [],
"DBSubnetGroup": "default"
}

For more information, see Creating an Amazon Aurora DB cluster in the Amazon Aurora User Guide.
create-db-instance-read-replica

The following code example shows how to use create-db-instance-read-replica.

AWS CLI

To create a DB instance read replica

This example creates a read replica of an existing DB instance named test-instance. The read replica is named test-instance-repl.

```
aws rds create-db-instance-read-replica \
  --db-instance-identifier test-instance-repl \
  --source-db-instance-identifier test-instance
```

Output:

```
{
  "DBInstance": {
    "IAMDatabaseAuthenticationEnabled": false,
    "MonitoringInterval": 0,
    "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
    "DBInstanceIdentifier": "test-instance-repl",
    ...some output truncated...
  }
}
```

create-db-instance

The following code example shows how to use create-db-instance.

AWS CLI

To create a DB instance

The following create-db-instance example uses the required options to launch a new DB instance.
aws rds create-db-instance \
--db-instance-identifier test-mysql-instance \
--db-instance-class db.t3.micro \
--engine mysql \
--master-username admin \
--master-user-password secret99 \
--allocated-storage 20

Output:

{
  "DBInstance": {
    "DBInstanceIdentifier": "test-mysql-instance",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "mysql",
    "DBInstanceStatus": "creating",
    "MasterUsername": "admin",
    "AllocatedStorage": 20,
    "PreferredBackupWindow": "12:55-13:25",
    "BackupRetentionPeriod": 1,
    "DBSecurityGroups": [],
    "VpcSecurityGroups": [
      {
        "VpcSecurityGroupId": "sg-12345abc",
        "Status": "active"
      }
    ],
    "DBParameterGroups": [
      {
        "DBParameterGroupName": "default.mysql5.7",
        "ParameterApplyStatus": "in-sync"
      }
    ],
    "DBSubnetGroup": {
      "DBSubnetGroupName": "default",
      "DBSubnetGroupDescription": "default",
      "VpcId": "vpc-2ff2ff2f",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-########",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2c"
          }
        }
      ]
    }
  }
}

```json
},
    "SubnetStatus": "Active"
},
    {
        "SubnetIdentifier": "subnet-############",
        "SubnetAvailabilityZone": {
            "Name": "us-west-2d"
        },
        "SubnetStatus": "Active"
    },
    {
        "SubnetIdentifier": "subnet-############",
        "SubnetAvailabilityZone": {
            "Name": "us-west-2a"
        },
        "SubnetStatus": "Active"
    },
    {
        "SubnetIdentifier": "subnet-############",
        "SubnetAvailabilityZone": {

For more information, see Creating an Amazon RDS DB Instance in the Amazon RDS User Guide.

- For API details, see CreateDBInstance in AWS CLI Command Reference.

create-db-parameter-group

The following code example shows how to use create-db-parameter-group.

AWS CLI

To create a DB parameter group

The following create-db-parameter-group example creates a DB parameter group.

```
aws rds create-db-parameter-group \
    --db-parameter-group-name mydbparametergroup \
    --db-parameter-group-family MySQL5.6 \
    --description "My new parameter group"
```

Output:

```
{
    "DBParameterGroup": {
        "DBParameterGroupName": "mydbparametergroup",
        "DBParameterGroupFamily": "mysql5.6",
        "Description": "My new parameter group",
        "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:mydbparametergroup"
    }
}
```
For more information, see [Creating a DB Parameter Group](#) in the *Amazon RDS User Guide*.

- For API details, see [CreateDBParameterGroup](#) in *AWS CLI Command Reference*.

**create-db-proxy-endpoint**

The following code example shows how to use `create-db-proxy-endpoint`.

**AWS CLI**

**To create a DB proxy endpoint for an RDS database**

The following `create-db-proxy-endpoint` example creates a DB proxy endpoint.

```bash
aws rds create-db-proxy-endpoint \
   --db-proxy-name proxyExample \
   --db-proxy-endpoint-name "proxyep1" \ 
   --vpc-subnet-ids subnetgroup1 subnetgroup2
```

**Output:**

```json
{
   "DBProxyEndpoint": {
      "DBProxyEndpointName": "proxyep1",
      "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-0123a01b12345c0ab",
      "DBProxyName": "proxyExample",
      "Status": "creating",
      "VpcId": "vpc-1234567",
      "VpcSecurityGroupIds": [
         "sg-1234",
         "sg-5678"
      ],
      "VpcSubnetIds": [
         "subnetgroup1",
         "subnetgroup2"
      ],
      "Endpoint": "proxyep1.endpoint.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
      "CreateDate": "2023-04-05T16:09:33.452000+00:00",
      "CreateTime": "2023-04-05T16:09:33.452000+00:00",
      "DeleteTime": "null",
      "Expiration": "null"
   }
}
```
The following code example shows how to use `create-db-proxy`.

**AWS CLI**

To create a DB proxy for an RDS database

The following `create-db-proxy` example creates a DB proxy.

```
aws rds create-db-proxy \
    --db-proxy-name proxyExample \
    --engine-family MYSQL \
    --auth Description="proxydescription1",AuthScheme="SECRETS",SecretArn="arn:aws:secretsmanager:us-west-2:123456789123:secret:secretName-1234f",IAMAuth="DISABLED",ClientPasswordAuthType="MYSQL_NATIVE_PASSWORD" \
    --role-arn arn:aws:iam::123456789123:role/ProxyRole \
    --vpc-subnet-ids subnetgroup1 subnetgroup2
```

**Output:**

```
{
    "DBProxy": {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",
        "EngineFamily": "MYSQL",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupId": ["sg-1234", "sg-5678", "sg-9101"]
    }
}
```
create-db-security-group

The following code example shows how to use create-db-security-group.

AWS CLI

To create an Amazon RDS DB security group

The following create-db-security-group command creates a new Amazon RDS DB security group:

```
aws rds create-db-security-group --db-security-group-name mysecgroup --db-security-group-description "My Test Security Group"
```
In the example, the new DB security group is named `mysecgroup` and has a description.

Output:

```
{
   "DBSecurityGroup": {
      "OwnerId": "123456789012",
      "DBSecurityGroupName": "mysecgroup",
      "DBSecurityGroupDescription": "My Test Security Group",
      "VpcId": "vpc-a1b2c3d4",
      "EC2SecurityGroups": [],
      "IPRanges": [],
   }
}
```

- For API details, see [CreateDbSecurityGroup](#) in *AWS CLI Command Reference*.

**create-db-shard-group**

The following code example shows how to use `create-db-shard-group`.

**AWS CLI**

**Example 1: To create an Aurora PostgreSQL primary DB cluster**

The following `create-db-cluster` example creates an Aurora PostgreSQL SQL primary DB cluster that's compatible with Aurora Serverless v2 and Aurora Limitless Database.

```
aws rds create-db-cluster \
   --db-cluster-identifier my-sv2-cluster \
   --engine aurora-postgresql \
   --engine-version 15.2-limitless \
   --storage-type aurora-iopt1 \
   --serverless-v2-scaling-configuration MinCapacity=2,MaxCapacity=16 \
   --enable-limitless-database \
   --master-username myuser \
   --master-user-password mypassword \
   --enable-cloudwatch-logs-exports postgresql
```

Output:
{
   "DBCluster": {
      "AllocatedStorage": 1,
      "AvailabilityZones": [
         "us-east-2b",
         "us-east-2c",

         "postgresql"
      ],
      "Engine Mode": "provisioned"
   }
}
Example 2: To create the primary (writer) DB instance

The following `create-db-instance` example creates an Aurora Serverless v2 primary (writer) DB instance. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```bash
aws rds create-db-instance \
  --db-instance-identifier my-sv2-instance \
  --db-cluster-identifier my-sv2-cluster \
  --engine aurora-postgresql \
  --db-instance-class db.serverless
```

Output:

```json
{
  "DBInstance": {
    "DBInstanceIdentifier": "my-sv2-instance",
    "DBInstanceClass": "db.serverless",
  }
}
```
"Engine": "aurora-postgresql",
"DBInstanceStatus": "creating",
"MasterUsername": "myuser",
"AllocatedStorage": 1,
"PreferredBackupWindow": "06:05-06:35",
"BackupRetentionPeriod": 1,
"DBSecurityGroups": [],
"VpcSecurityGroups": [
    {
        "VpcSecurityGroupId": "sg-########",
        "Status": "active"
    }
],
"DBParameterGroups": [
    {
        "DBParameterGroupName": "default.aurora-postgresql15",
        "ParameterApplyStatus": "in-sync"
    }
],
"DBSubnetGroup": {
    "DBSubnetGroupName": "default",
    "DBSubnetGroupDescription": "default",
    "VpcId": "vpc-########",

Example 3: To create the DB shard group

The following create-db-shard-group example creates a DB shard group in your Aurora PostgreSQL primary DB cluster.

```
aws rds create-db-shard-group \
   --db-shard-group-identifier my-db-shard-group \
   --db-cluster-identifier my-sv2-cluster \
   --max-acu 768
```

Output:

```
{
  "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
  "DBShardGroupIdentifier": "my-db-shard-group",
  "DBClusterIdentifier": "my-sv2-cluster",
  "MaxACU": 768.0,
  "ComputeRedundancy": 0,
  "Status": "creating",
  "PubliclyAccessible": false,
  "Endpoint": "my-sv2-cluster.limitless-cekyexample.us-east-2.rds.amazonaws.com"
}
```

For more information, see Using Aurora Serverless v2 in the Amazon Aurora User Guide.

- For API details, see CreateDbShardGroup in AWS CLI Command Reference.

create-db-snapshot

The following code example shows how to use create-db-snapshot.
AWS CLI

To create a DB snapshot

The following `create-db-snapshot` example creates a DB snapshot.

```bash
aws rds create-db-snapshot \
   --db-instance-identifier database-mysql \
   --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBInstanceIdentifier": "database-mysql",
        "Engine": "mysql",
        "AllocatedStorage": 100,
        "Status": "creating",
        "Port": 3306,
        "AvailabilityZone": "us-east-1b",

        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
    }
}
```

For more information, see [Creating a DB Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_CreateSnapshot.html) in the *Amazon RDS User Guide*.

- For API details, see [CreateDBSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/create-db-snapshot.html) in *AWS CLI Command Reference*. 

Actions and scenarios
create-db-subnet-group

The following code example shows how to use create-db-subnet-group.

AWS CLI

To create a DB subnet group

The following create-db-subnet-group example creates a DB subnet group called mysubnetgroup using existing subnets.

```bash
aws rds create-db-subnet-group \
    --db-subnet-group-name mysubnetgroup \
    --db-subnet-group-description "test DB subnet group" \
    --subnet-ids
    ['"subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaa","subnet-00f5b198bc0abcdef"]
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "mysubnetgroup",
        "DBSubnetGroupDescription": "test DB subnet group",
        "VpcId": "vpc-0f08e7610a1b2c3d4",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-070dd7ecb3aaaaaa",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
                "SubnetAvailabilityZone": {
```
For more information, see Creating a DB Instance in a VPC in the Amazon RDS User Guide.

• For API details, see CreateDbSubnetGroup in AWS CLI Command Reference.

create-event-subscription

The following code example shows how to use create-event-subscription.

AWS CLI

To create an event subscription

The following create-event-subscription example creates a subscription for backup and recovery events for DB instances in the current AWS account. Notifications are sent to an Amazon Simple Notification Service topic, specified by --sns-topic-arn.

```
aws rds create-event-subscription \  
  --subscription-name my-instance-events \  
  --source-type db-instance \  
  --event-categories '["backup","recovery"]' \  
  --sns-topic-arn arn:aws:sns:us-east-1:123456789012:interesting-events
```

Output:

```
{
  "EventSubscription": {
    "Status": "creating",
    "CustSubscriptionId": "my-instance-events",
    "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
    "EventCategoriesList": [
      "backup",
      "recovery"
    ],
```
"SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
"CustomerAwsId": "123456789012",
"SourceType": "db-instance",
"Enabled": true
}

- For API details, see CreateEventSubscription in AWS CLI Command Reference.

create-global-cluster

The following code example shows how to use create-global-cluster.

AWS CLI

To create a global DB cluster

The following create-global-cluster example creates a new Aurora MySQL-compatible global DB cluster.

```bash
aws rds create-global-cluster \
   --global-cluster-identifier myglobalcluster \
   --engine aurora-mysql
```

Output:

```json
{
   "GlobalCluster": {
      "GlobalClusterIdentifier": "myglobalcluster",
      "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
      "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:myglobalcluster",
      "Status": "available",
      "Engine": "aurora-mysql",
      "EngineVersion": "5.7.mysql_aurora.2.07.2",
      "StorageEncrypted": false,
      "DeletionProtection": false,
      "GlobalClusterMembers": []
   }
}
```
For more information, see Creating an Aurora global database in the Amazon Aurora User Guide.

- For API details, see CreateGlobalCluster in AWS CLI Command Reference.

create-option-group

The following code example shows how to use create-option-group.

AWS CLI

To Create an Amazon RDS option group

The following create-option-group command creates a new Amazon RDS option group for Oracle Enterprise Edition version 11.2, is named `MyOptionGroup` and includes a description.

```bash
aws rds create-option-group \
  --option-group-name MyOptionGroup \
  --engine-name oracle-ee \
  --major-engine-version 11.2 \
  --option-group-description "Oracle Database Manager Database Control"
```

Output:

```json
{
  "OptionGroup": {
    "OptionGroupName": "myoptiongroup",
    "OptionGroupDescription": "Oracle Database Manager Database Control",
    "EngineName": "oracle-ee",
    "MajorEngineVersion": "11.2",
    "Options": [],
    "AllowsVpcAndNonVpcInstanceMemberships": true,
  }
}
```

- For API details, see CreateOptionGroup in AWS CLI Command Reference.

delete-blue-green-deployment

The following code example shows how to use delete-blue-green-deployment.
Example 1: To delete resources in green environment for an RDS for MySQL DB instance

The following delete-blue-green-deployment example deletes the resources in a green environment for an RDS for MySQL DB instance.

```
aws rds delete-blue-green-deployment \
  --blue-green-deployment-identifier bgd-v53303651eexfake \
  --delete-target
```

Output:

```
{
  "BlueGreenDeployment": {
    "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
    "BlueGreenDeploymentName": "bgd-cli-test-instance",
    "SwitchoverDetails": [
      {
        "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",

For more information, see [Deleting a blue/green deployment](#) in the *Amazon RDS User Guide*.

**Example 2: To delete resources in green environment for an Aurora MySQL DB cluster**

The following delete-blue-green-deployment example deletes the resources in a green environment for an Aurora MySQL DB cluster.

```bash
aws rds delete-blue-green-deployment \
  --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
  --delete-target
```

Output:
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-wi89nwglcscfake",
        "BlueGreenDeploymentName": "my-blue-green-deployment",

        ]
    }
}
For more information, see [Deleting a blue/green deployment](#) in the *Amazon Aurora User Guide*. For API details, see [DeleteBlueGreenDeployment](#) in *AWS CLI Command Reference*.

**delete-db-cluster-endpoint**

The following code example shows how to use `delete-db-cluster-endpoint`.

**AWS CLI**

To delete a custom DB cluster endpoint:
The following `delete-db-cluster-endpoint` example deletes the specified custom DB cluster endpoint.

```bash
aws rds delete-db-cluster-endpoint \
   --db-cluster-endpoint-identifier mycustomendpoint
```

Output:

```
{
   "DBClusterEndpointIdentifier": "mycustomendpoint",
   "DBClusterIdentifier": "mydbcluster",
   "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
   "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-east-1.rds.amazonaws.com",
   "Status": "deleting",
   "EndpointType": "CUSTOM",
   "CustomEndpointType": "READER",
   "StaticMembers": [
      "dbinstance1",
      "dbinstance2",
      "dbinstance3"
   ],
   "ExcludedMembers": [],
   "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the Amazon Aurora User Guide.

- For API details, see DeleteDbClusterEndpoint in AWS CLI Command Reference.

**delete-db-cluster-parameter-group**

The following code example shows how to use `delete-db-cluster-parameter-group`.

**AWS CLI**

**To delete a DB cluster parameter group**

The following `delete-db-cluster-parameter-group` example deletes the specified DB cluster parameter group.
aws rds delete-db-cluster-parameter-group \
   --db-cluster-parameter-group-name mydbclustermetadata

This command produces no output.

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the Amazon Aurora User Guide.

- For API details, see DeleteDbClusterParameterGroup in AWS CLI Command Reference.

delete-db-cluster-snapshot

The following code example shows how to use delete-db-cluster-snapshot.

AWS CLI

To delete a DB cluster snapshot

The following delete-db-cluster-snapshot example deletes the specified DB cluster snapshot.

aws rds delete-db-cluster-snapshot \
   --db-cluster-snapshot-identifier mydbclustersnapshot

Output:

```json
{
   "DBClusterSnapshot": {
      "AvailabilityZones": [
         "us-east-1a",
         "us-east-1b",
         "us-east-1e"
      ],
      "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
      "DBClusterIdentifier": "mydbcluster",
      "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",
      "Engine": "aurora-mysql",
      "AllocatedStorage": 0,
      "Status": "available",
      "Port": 0,
      "VpcId": "vpc-6594f31c",
```

Actions and scenarios 5080
For more information, see [Deleting a Snapshot](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbClusterSnapshot](#) in *AWS CLI Command Reference*.

**delete-db-cluster**

The following code example shows how to use `delete-db-cluster`.

**AWS CLI**

**Example 1: To delete a DB instance in a DB cluster**

The following `delete-db-instance` example deletes the final DB instance in a DB cluster. You can't delete a DB cluster if it contains DB instances that aren't in the **deleting** state. You can't take a final snapshot when deleting a DB instance in a DB cluster.

```bash
aws rds delete-db-instance \
    --db-instance-identifier database-3
```

Output:

```json
{
    "DBInstance": {
        "DBInstanceIdentifier": "database-3",
        "DBInstanceClass": "db.r4.large",
        "Engine": "aurora-postgresql",
        "DBInstanceStatus": "deleting",
```
For more information, see [Deleting a DB Instance in an Aurora DB Cluster](#) in the *Amazon Aurora User Guide*.

**Example 2: To delete a DB cluster**

The following `delete-db-cluster` example deletes the DB cluster named `mycluster` and takes a final snapshot named `mycluster-final-snapshot`. The status of the DB cluster is **available** while the snapshot is being taken. To follow the progress of the deletion, use the `describe-db-clusters` CLI command.

```bash
aws rds delete-db-cluster \
    --db-cluster-identifier mycluster \
    --no-skip-final-snapshot \
    --final-db-snapshot-identifier mycluster-final-snapshot
```

Output:

```json
{
    "DBCluster": {
        "AllocatedStorage": 20,
        "AvailabilityZones": [
            "eu-central-1b",
            "eu-central-1c",
            "eu-central-1a"
        ],
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "mycluster",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default-vpc-aa11bb22",
        "Status": "available",

        ...output omitted...
    }
}
```
For more information, see Aurora Clusters with a Single DB Instance in the Amazon Aurora User Guide.

- For API details, see DeleteDbCluster in AWS CLI Command Reference.

delete-db-instance-automated-backup

The following code example shows how to use delete-db-instance-automated-backup.

AWS CLI

To delete a replicated automated backup from a Region

The following delete-db-instance-automated-backup example deletes the automated backup with the specified Amazon Resource Name (ARN).

```
aws rds delete-db-instance-automated-backup \
  --db-instance-automated-backups-arn "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
```

Output:

```
{
  "DBInstanceAutomatedBackup": {
    "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
    "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
    "Region": "us-east-1",
    "DBInstanceIdentifier": "new-orcl-db",
    "RestoreWindow": {},
    "AllocatedStorage": 20,
    "Status": "deleting",
    "Port": 1521,
    "AvailabilityZone": "us-east-1b",
    "VpcId": "vpc-########",
    "InstanceCreateTime": "2020-12-04T15:28:31Z",
    "MasterUsername": "admin",
    "Engine": "oracle-se2",
    "EngineVersion": "12.1.0.2.v21",
    "LicenseModel": "bring-your-own-license",
    "OptionGroupName": "default:oracle-se2-12-1",
    "Encrypted": false,
    "StorageType": "gp2",
}
```
For more information, see Deleting replicated backups in the Amazon RDS User Guide.

- For API details, see DeleteDbInstanceAutomatedBackup in AWS CLI Command Reference.

**delete-db-instance**

The following code example shows how to use delete-db-instance.

**AWS CLI**

To delete a DB instance

The following delete-db-instance example deletes the specified DB instance after creating a final DB snapshot named test-instance-final-snap.

```
aws rds delete-db-instance \
  --db-instance-identifier test-instance \
  --final-db-snapshot-identifier test-instance-final-snap
```

Output:

```
{
  "DBInstance": {
    "DBInstanceIdentifier": "test-instance",
    "DBInstanceStatus": "deleting",
    ...some output truncated...
  }
}
```

- For API details, see DeleteDBInstance in AWS CLI Command Reference.

**delete-db-parameter-group**

The following code example shows how to use delete-db-parameter-group.
AWS CLI

To delete a DB parameter group

The following command example deletes a DB parameter group.

```
aws rds delete-db-parameter-group \
   --db-parameter-group-name mydbparametergroup
```

This command produces no output.

For more information, see Working with DB Parameter Groups in the Amazon RDS User Guide. For API details, see DeleteDBParameterGroup in AWS CLI Command Reference.

delete-db-proxy-endpoint

The following code example shows how to use delete-db-proxy-endpoint.

AWS CLI

To delete a DB proxy endpoint for an RDS database

The following delete-db-proxy-endpoint example deletes a DB proxy endpoint for the target database.

```
aws rds delete-db-proxy-endpoint \
   --db-proxy-endpoint-name proxyEP1
```

Output:

```
{
   "DBProxyEndpoint": {
     "DBProxyEndpointName": "proxyEP1",
     "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-0123a01b12345c0ab",
     "DBProxyName": "proxyExample",
     "Status": "deleting",
     "VpcId": "vpc-1234567",
     "VpcSecurityGroupIds": ["sg-1234",
```
For more information, see Deleting a proxy endpoint in the Amazon RDS User Guide and Deleting a proxy endpoint in the Amazon Aurora User Guide.

- For API details, see DeleteDbProxyEndpoint in AWS CLI Command Reference.

**delete-db-proxy**

The following code example shows how to use delete-db-proxy.

**AWS CLI**

**To delete a DB proxy for an RDS database**

The following delete-db-proxy example deletes a DB proxy.

```
aws rds delete-db-proxy --db-proxy-name proxyExample
```

**Output:**

```
{
    "DBProxy": {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",
        "Status": "deleting",
        "EngineFamily": "PostgreSQL",
    }
}
```
"VpcId": "vpc-1234567",
"VpcSecurityGroupIds": [ 
  "sg-1234",
  "sg-5678"
],
"VpcSubnetIds": [ 
  "subnetgroup1",
  "subnetgroup2"
],
"Auth": "[
  {
    "Description": "proxydescription`",
    "AuthScheme": "SECRETS",
    "IAMAuth": "DISABLED"
  }
],
"RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",
"Endpoint": "proxyExample.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
"RequireTLS": false,
"IdleClientTimeout": 1800,
"DebuggingLogging": false,
"CreatedDate": "2023-04-05T16:09:33.452000+00:00",
"UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
}

For more information, see Deleting an RDS Proxy in the Amazon RDS User Guide and Deleting an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see DeleteDbProxy in AWS CLI Command Reference.

**delete-db-security-group**

The following code example shows how to use delete-db-security-group.

**AWS CLI**

**To delete a DB security group**

The following delete-db-security-group example deletes a DB security group named mysecuritygroup.
aws rds delete-db-security-group \
   --db-security-group-name mysecuritygroup

This command produces no output.

For more information, see Working with DB security groups (EC2-Classic platform) in the Amazon RDS User Guide.

- For API details, see DeleteDbSecurityGroup in AWS CLI Command Reference.

delete-db-shard-group

The following code example shows how to use delete-db-shard-group.

AWS CLI

Example 1: To delete a DB shard group unsuccessfully

The following delete-db-shard-group example shows the error that occurs when you try to delete a DB shard group before deleting all of your databases and schemas.

aws rds delete-db-shard-group \
   --db-shard-group-identifier limitless-test-shard-grp

Output:

An error occurred (InvalidDBShardGroupState) when calling the DeleteDBShardGroup operation: Unable to delete the DB shard group limitless-test-db-shard-group. Delete all of your Limitless Database databases and schemas, then try again.

Example 2: To delete a DB shard group successfully

The following delete-db-shard-group example deletes a DB shard group after you've deleted all of your databases and schemas, including the public schema.

aws rds delete-db-shard-group \
   --db-shard-group-identifier limitless-test-shard-grp

Output:

{
For more information, see [Deleting Aurora DB clusters and DB instances](https://docs.aws.amazon.com/AmazonRDS/latest/AuroraUserGuide/userguide-deleting-cluster.html) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbShardGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/delete-db-shard-group.html) in *AWS CLI Command Reference*.

### delete-db-snapshot

The following code example shows how to use `delete-db-snapshot`.

**AWS CLI**

**To delete a DB snapshot**

The following `delete-db-snapshot` example deletes the specified DB snapshot.

```bash
aws rds delete-db-snapshot
 --db-snapshot-identifier mydbsnapshot
```

**Output:**

```json
{
   "DBSnapshot": {
      "DBSnapshotIdentifier": "mydbsnapshot",
      "DBInstanceIdentifier": "database-mysql",
      "SnapshotCreateTime": "2019-06-18T22:08:40.702Z",
      "Engine": "mysql",
      "AllocatedStorage": 100,
      "Status": "deleted",
      "Port": 3306,
      "AvailabilityZone": "us-east-1b",
      "VpcId": "vpc-6594f31c",
      "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
   }
}
```
"MasterUsername": "admin",
"EngineVersion": "5.6.40",
"LicenseModel": "general-public-license",
"SnapshotType": "manual",
"Iops": 1000,
"OptionGroupName": "default:mysql-5-6",
"PercentProgress": 100,
"StorageType": "io1",
"Encrypted": true,
"KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
"DBSnapshotArn": "arn:aws:rds:us-east-1:123456789012:snapshot:mydbsnapshot",
"IAMDatabaseAuthenticationEnabled": false,
"ProcessorFeatures": [],
"DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
}
}

For more information, see [Deleting a Snapshot](amazon-rds-user-guide) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDbSnapshot](aws-cli-command-reference) in *AWS CLI Command Reference*.

**delete-db-subnet-group**

The following code example shows how to use `delete-db-subnet-group`.

**AWS CLI**

**To delete a DB subnet group**

The following `delete-db-subnet-group` example deletes the DB subnet group called `mysubnetgroup`.

```
aws rds delete-db-subnet-group --db-subnet-group-name mysubnetgroup
```

This command produces no output.

For more information, see [Working with a DB Instance in a VPC](amazon-rds-user-guide) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDbSubnetGroup](aws-cli-command-reference) in *AWS CLI Command Reference*.

**delete-event-subscription**

The following code example shows how to use `delete-event-subscription`.

**Actions and scenarios**
AWS CLI

To delete an event subscription

The following delete-event-subscription example deletes the specified event subscription.

```bash
aws rds delete-event-subscription --subscription-name my-instance-events
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "Enabled": false,
        "SourceIdsList": [
            "test-instance"
        ],
        "SourceType": "db-instance",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "CustSubscriptionId": "my-instance-events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "Status": "deleting"
    }
}
```

• For API details, see [DeleteEventSubscription](#) in *AWS CLI Command Reference*.

delete-global-cluster

The following code example shows how to use delete-global-cluster.

AWS CLI

To delete a global DB cluster
The following delete-global-cluster example deletes an Aurora MySQL-compatible global DB cluster. The output shows the cluster that you're deleting, but subsequent describe-global-clusters commands don't list that DB cluster.

```
aws rds delete-global-cluster \
   --global-cluster-identifier myglobalcluster
```

Output:

```
{
   "GlobalCluster": {
      "GlobalClusterIdentifier": "myglobalcluster",
      "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
      "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:myglobalcluster",
      "Status": "available",
      "Engine": "aurora-mysql",
      "EngineVersion": "5.7.mysql_aurora.2.07.2",
      "StorageEncrypted": false,
      "DeletionProtection": false,
      "GlobalClusterMembers": []
   }
}
```

For more information, see [Deleting an Aurora global database](amazonauroraguides) in the Amazon Aurora User Guide.

- For API details, see [DeleteGlobalCluster](awscli) in [AWS CLI Command Reference](awscli).

**delete-option-group**

The following code example shows how to use delete-option-group.

**AWS CLI**

**To delete an option group**

The following delete-option-group example deletes the specified option group.

```
aws rds delete-option-group \
   --option-group-name myoptiongroup
```
This command produces no output.

For more information, see Deleting an Option Group in the Amazon RDS User Guide.

• For API details, see DeleteOptionGroup in AWS CLI Command Reference.

deregister-db-proxy-targets

The following code example shows how to use deregister-db-proxy-targets.

AWS CLI

To deregister a DB proxy target from database target group

The following deregister-db-proxy-targets example removes the association between the proxy proxyExample and its target.

```bash
aws rds deregister-db-proxy-targets \
   --db-proxy-name proxyExample \
   --db-instance-identifiers database-1
```

This command produces no output.

For more information, see Deleting an RDS Proxy in the Amazon RDS User Guide and Deleting an RDS Proxy in the Amazon Aurora User Guide.

• For API details, see DeregisterDbProxyTargets in AWS CLI Command Reference.

describe-account-attributes

The following code example shows how to use describe-account-attributes.

AWS CLI

To describe account attributes

The following describe-account-attributes example retrieves the attributes for the current AWS account.

```bash
aws rds describe-account-attributes
```
Output:

```json
{
    "AccountQuotas": [
        {
            "Max": 40,
            "Used": 4,
            "AccountQuotaName": "DBInstances"
        },
        {
            "Max": 40,
            "Used": 0,
            "AccountQuotaName": "ReservedDBInstances"
        },
        {
            "Max": 100000,
            "Used": 40,
            "AccountQuotaName": "AllocatedStorage"
        },
        {
            "Max": 25,
            "Used": 0,
            "AccountQuotaName": "DBSecurityGroups"
        },
        {
            "Max": 20,
            "Used": 0,
            "AccountQuotaName": "AuthorizationsPerDBSecurityGroup"
        },
        {
            "Max": 50,
            "Used": 1,
            "AccountQuotaName": "DBParameterGroups"
        },
        {
            "Max": 100,
            "Used": 3,
            "AccountQuotaName": "ManualSnapshots"
        },
        {
            "Max": 20,
            "Used": 0,
            "AccountQuotaName": "EventSubscriptions"
        }
    ]
}
```
For API details, see `DescribeAccountAttributes` in AWS CLI Command Reference.

describe-blue-green-deployments

The following code example shows how to use `describe-blue-green-deployments`. 
Example 1: To describe a blue/green deployment of an RDS DB instance after creation completes

The following `describe-blue-green-deployment` example retrieves the details of a blue/green deployment after creation completes.

```
aws rds describe-blue-green-deployments \
   --blue-green-deployment-identifier bgd-v53303651eexfake
```

Output:

```
{
   "BlueGreenDeployments": [
       {
           "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
           "BlueGreenDeploymentName": "bgd-cli-test-instance",
           "SwitchoverDetails": [
               {

**Example 3: To describe a blue/green deployment for an Aurora MySQL cluster after switchover**

The following `describe-blue-green-deployment` example retrieves the details about a blue/green deployment after the green environment is promoted to be the production environment.
aws rds describe-blue-green-deployments \
   --blue-green-deployment-identifier bgd-wi89nwzglccsfake

Output:

```json
{
   "BlueGreenDeployments": [
      {
         "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
         "BlueGreenDeploymentName": "my-blue-green-deployment",
         "SwitchoverDetails": [
            {
               "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster-old1",
               "TargetMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster",
               "Status": "SWITCHOVER_COMPLETED"
            },
            {
               "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-1",
               "Status": "SWITCHOVER_COMPLETED"
            },
            {
               "Status": "SWITCHOVER_COMPLETED"
            },
            {

### describe-certificates

The following code example shows how to use `describe-certificates`.

**AWS CLI**

**To describe certificates**

The following `describe-certificates` example retrieves the details of the certificate associated with the user's default region.

```bash
aws rds describe-certificates
```

**Output:**

```json
{
  "Certificates": [
    {
      "CertificateIdentifier": "rds-ca-ecc384-g1",
      "CertificateType": "CA",
      "Thumbprint": "2ee3dcc06e50192559b13929e73484354f23387d",
      "ValidFrom": "2021-05-24T22:06:59+00:00",
      "ValidTill": "2121-05-24T23:06:59+00:00",
      "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-ecc384-g1",
      "CustomerOverride": false
    },
    {
      "CertificateIdentifier": "rds-ca-rsa4096-g1",
      "CertificateType": "CA",
      "Thumbprint": "789abcdf012345678901234567890123",
      "ValidFrom": "2021-05-24T22:06:59+00:00",
      "ValidTill": "2121-05-24T23:06:59+00:00",
      "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-rsa4096-g1",
      "CustomerOverride": false
    }
  ]
}
```
For more information, see Using SSL/TLS to encrypt a connection to a DB instance in the Amazon RDS User Guide and Using SSL/TLS to encrypt a connection to a DB cluster in the Amazon Aurora User Guide.

- For API details, see DescribeCertificates in AWS CLI Command Reference.

describe-db-cluster-backtracks

The following code example shows how to use describe-db-cluster-backtracks.

AWS CLI

To describe backtracks for a DB cluster
The following `describe-db-cluster-backtracks` example retrieves details about the specified DB cluster.

```bash
aws rds describe-db-cluster-backtracks \\
   --db-cluster-identifier mydbcluster
```

Output:

```
{
   "DBClusterBacktracks": [
   {
      "DBClusterIdentifier": "mydbcluster",
      "BacktrackIdentifier": "2f5f5294-0dd2-44c9-9f50-EXAMPLE",
      "BacktrackTo": "2021-02-12T04:59:22Z",
      "BacktrackedFrom": "2021-02-12T14:37:31.640Z",
      "BacktrackRequestCreationTime": "2021-02-12T14:36:18.819Z",
      "Status": "COMPLETED"
   },
   {
      "DBClusterIdentifier": "mydbcluster",
      "BacktrackIdentifier": "3c7a6421-af2a-4ea3-ae95-EXAMPLE",
      "BacktrackTo": "2021-02-11T22:53:46Z",
      "BacktrackedFrom": "2021-02-12T00:09:27.006Z",
      "BacktrackRequestCreationTime": "2021-02-12T14:36:18.819Z",
      "Status": "COMPLETED"
   }
   ]
}
```

For more information, see [Backtracking an Aurora DB cluster](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/Amazon-Aurora-backtracking.html) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbClusterBacktracks](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-cluster-backtracks.html) in *AWS CLI Command Reference*.

### describe-db-cluster-endpoints

The following code example shows how to use `describe-db-cluster-endpoints`.

**AWS CLI**

**Example 1: To describe DB cluster endpoints**
The following `describe-db-cluster-endpoints` example retrieves details for your DB cluster endpoints. The most common kinds of Aurora clusters have two endpoints. One endpoint has type `WRITER`. You can use this endpoint for all SQL statements. The other endpoint has type `READER`. You can use this endpoint only for SELECT and other read-only SQL statements.

```
aws rds describe-db-cluster-endpoints
```

Output:

```
{
   "DBClusterEndpoints": [
   {
      "DBClusterIdentifier": "my-database-1",
      "Endpoint": "my-database-1.cluster-cnpexample.us-east-1.rds.amazonaws.com",
      "Status": "creating",
      "EndpointType": "WRITER"
   },
   {
      "DBClusterIdentifier": "my-database-1",
      "Endpoint": "my-database-1.cluster-ro-cnpexample.us-east-1.rds.amazonaws.com",
      "Status": "creating",
      "EndpointType": "READER"
   },
   {
      "DBClusterIdentifier": "mydbcluster",
      "Endpoint": "mydbcluster.cluster-cnpexamle.us-east-1.rds.amazonaws.com",
      "Status": "available",
      "EndpointType": "WRITER"
   },
   {
      "DBClusterIdentifier": "mydbcluster",
      "Endpoint": "mydbcluster.cluster-ro-cnpexample.us-east-1.rds.amazonaws.com",
      "Status": "available",
      "EndpointType": "READER"
   }
   ]
}
```
Example 2: To describe DB cluster endpoints of a single DB cluster

The following `describe-db-cluster-endpoints` example retrieves details for the DB cluster endpoints of a single specified DB cluster. Aurora Serverless clusters have only a single endpoint with a type of WRITER.

```
aws rds describe-db-cluster-endpoints \
    --db-cluster-identifier serverless-cluster
```

Output:

```
{
    "DBClusterEndpoints": [ 
        {
            "Status": "available",
            "Endpoint": "serverless-cluster.cluster-cnpexample.us-east-1.rds.amazonaws.com",
            "DBClusterIdentifier": "serverless-cluster",
            "EndpointType": "WRITER"
        }
    ]
}
```

For more information, see `Amazon Aurora Connection Management` in the `Amazon Aurora User Guide`.

- For API details, see `DescribeDbClusterEndpoints` in `AWS CLI Command Reference`.

describe-db-cluster-parameter-groups

The following code example shows how to use `describe-db-cluster-parameter-groups`.

AWS CLI

To describe DB cluster parameter groups

The following `describe-db-cluster-parameter-groups` example retrieves details for your DB cluster parameter groups.

```
aws rds describe-db-cluster-parameter-groups
```

Output:
For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the Amazon Aurora User Guide.
describe-db-cluster-parameters

The following code example shows how to use describe-db-cluster-parameters.

AWS CLI

Example 1: To describe the parameters in a DB cluster parameter group

The following describe-db-cluster-parameters example retrieves details about the parameters in a DB cluster parameter group.

```bash
aws rds describe-db-cluster-parameters \
   --db-cluster-parameter-group-name mydbclusterpg
```

Output:

```json
{
   "Parameters": [
   {
       "ParameterName": "allow-suspicious-udfs",
       "Description": "Controls whether user-defined functions that have only an xxx symbol for the main function can be loaded",
       "Source": "engine-default",
       "ApplyType": "static",
       "DataType": "boolean",
       "AllowedValues": "0,1",
       "IsModifiable": false,
       "ApplyMethod": "pending-reboot",
       "SupportedEngineModes": ["provisioned"
       ]
   },
   {
       "ParameterName": "aurora_lab_mode",
       "ParameterValue": "0",
       "Description": "Enables new features in the Aurora engine.",
       "Source": "engine-default",
       "ApplyType": "static",
       "DataType": "boolean",
       "AllowedValues": "0,1",
       "IsModifiable": true,
   }
]}
```
Example 2: To list only the parameter names in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves only the names of the parameters in a DB cluster parameter group.

```bash
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName}'
```

Output:

```json
[
    {
        "ParameterName": "allow-suspicious-udfs"
    },
    {
        "ParameterName": "aurora_binlog_read_buffer_size"
    },
    {
        "ParameterName": "aurora_binlog_replication_max_yield_seconds"
    },
    {
        "ParameterName": "aurora_binlog_use_large_read_buffer"
    },
    {
        "ParameterName": "aurora_lab_mode"
    },
    ...
]
```

Example 3: To describe only the modifiable parameters in a DB cluster parameter group
The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
   --db-cluster-parameter-group-name default.aurora-mysql5.7 \
   --query 'Parameters[].[ParameterName,IsModifiable] | 
       [?IsModifiable == `true`]'
```

Output:

```
[
   {
      "ParameterName": "aurora_binlog_read_buffer_size",
      "IsModifiable": true
   },
   {
      "ParameterName": "aurora_binlog_replication_max_yield_seconds",
      "IsModifiable": true
   },
   {
      "ParameterName": "aurora_binlog_use_large_read_buffer",
      "IsModifiable": true
   },
   {
      "ParameterName": "aurora_lab_mode",
      "IsModifiable": true
   },
   ...
]
```

**Example 4: To describe only the modifiable Boolean parameters in a DB cluster parameter group**

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group and that have a Boolean data type.

```
aws rds describe-db-cluster-parameters \
   --db-cluster-parameter-group-name default.aurora-mysql5.7 \
   --query 'Parameters[].[ParameterName,IsModifiable] | 
       [?IsModifiable == `true`]'
```
--query 'Parameters[].
{ParameterName:ParameterName,DataType:DataType,IsModifiable:IsModifiable} | [?
DataType == `boolean`] | [?IsModifiable == `true`]'

Output:

```
[
    {
        "DataType": "boolean",
        "ParameterName": "aurora_binlog_use_large_read_buffer",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "aurora_lab_mode",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "autocommit",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "automatic_sp_privileges",
        "IsModifiable": true
    },
    ...
    some output truncated...
]
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the Amazon Aurora User Guide.

- For API details, see DescribeDbClusterParameters in AWS CLI Command Reference.

describe-db-cluster-snapshot-attributes

The following code example shows how to use describe-db-cluster-snapshot-attributes.

AWS CLI

To describe the attribute names and values for a DB cluster snapshot
The following `describe-db-cluster-snapshot-attributes` example retrieves details of the attribute names and values for the specified DB cluster snapshot.

```shell
aws rds describe-db-cluster-snapshot-attributes \
   --db-cluster-snapshot-identifier myclustersnapshot
```

Output:

```
{
   "DBClusterSnapshotAttributesResult": {
      "DBClusterSnapshotIdentifier": "myclustersnapshot",
      "DBClusterSnapshotAttributes": [ 
         {
            "AttributeName": "restore",
            "AttributeValues": [ 
               "123456789012"
            ]
         }
      ]
   }
}
```

For more information, see [Sharing a DB Cluster Snapshot](https://docs.aws.amazon.com/AmazonAurora/latest/UG/db-cluster-snapshots.html) in the Amazon Aurora User Guide. For API details, see [DescribeDbClusterSnapshotAttributes](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-cluster-snapshot-attributes.html) in AWS CLI Command Reference.

describe-db-cluster-snapshots

The following code example shows how to use `describe-db-cluster-snapshots`.

AWS CLI

**To describe a DB cluster snapshot for a DB cluster**

The following `describe-db-cluster-snapshots` example retrieves the details for the DB cluster snapshots for the specified DB cluster.

```shell
aws rds describe-db-cluster-snapshots \
   --db-cluster-identifier mydbcluster
```

Output:

```json
{
   "DBClusterSnapshots": [
   {

}
```
For more information, see Creating a DB Cluster Snapshot in the Amazon Aurora User Guide.

- For API details, see DescribeDbClusterSnapshots in AWS CLI Command Reference.

describe-db-clusters

The following code example shows how to use describe-db-clusters.

AWS CLI

Example 1: To describe a DB cluster

The following describe-db-clusters example retrieves the details of the specified DB cluster.

aws rds describe-db-clusters
  --db-cluster-identifier mydbcluster

Output:

{
  "DBClusters": [
    {
      "AllocatedStorage": 1,
      "AvailabilityZones": [
        "us-east-1a",
        "us-east-1b",
        "us-east-1c"
      ],

    "IsClusterWriter": false,
Example 2: To list certain attributes of all DB clusters

The following describe-db-clusters example retrieves only the DBClusterIdentifier, Endpoint, and ReaderEndpoint attributes of all your DB clusters in the current AWS Region.
Example 3: To list DB clusters with a specific attribute

The following describe-db-clusters example retrieves only the DBClusterIdentifier and Engine attributes of your DB clusters that use the aurora-postgresql DB engine.

```bash
aws rds describe-db-clusters \
   --query 'DBClusters[].{DBClusterIdentifier:DBClusterIdentifier,Engine:Engine} | [?Engine == `aurora-postgresql`]'
```

Output:

```json
[
  {
    "Endpoint": "cluster-57-2020-05-01-2270.cluster-cnpexample.us-east-1.rds.amazonaws.com",
    "ReaderEndpoint": "cluster-57-2020-05-01-2270.cluster-ro-cnpexample.us-east-1.rds.amazonaws.com",
    "DBClusterIdentifier": "cluster-57-2020-05-01-2270"
  },

    "DBClusterIdentifier": "pg2-cluster"
  }
]
```
For more information, see Amazon Aurora DB Clusters in the Amazon Aurora User Guide.

- For API details, see DescribeDbClusters in AWS CLI Command Reference.

describe-db-engine-versions

The following code example shows how to use describe-db-engine-versions.

AWS CLI

To describe the DB engine versions for the MySQL DB engine

The following describe-db-engine-versions example displays details about each of the DB engine versions for the specified DB engine.

```bash
aws rds describe-db-engine-versions \
  --engine mysql
```

Output:

```json
{
  "DBEngineVersions": [
    {
      "Engine": "mysql",
      "EngineVersion": "5.5.46",
      "DBParameterGroupFamily": "mysql5.5",
      "DBEngineDescription": "MySQL Community Edition",
      "DBEngineVersionDescription": "MySQL 5.5.46",
      "ValidUpgradeTarget": [
        {
          "Engine": "mysql",
          "EngineVersion": "5.5.53",
          "Description": "MySQL 5.5.53",
          "AutoUpgrade": false,
          "IsMajorVersionUpgrade": false
```
For more information, see **What Is Amazon Relational Database Service (Amazon RDS)?** in the *Amazon RDS User Guide*.

- For API details, see **DescribeDBEngineVersions** in *AWS CLI Command Reference*.

### describe-db-instance-automated-backups

The following code example shows how to use describe-db-instance-automated-backups.

**AWS CLI**

**To describe the automated backups for a DB instance**

The following describe-db-instance-automated-backups example displays details about the automated backups for the specified DB instance. The details include replicated automated backups in other AWS Regions.

```bash
aws rds describe-db-instance-automated-backups \
  --db-instance-identifier new-orcl-db
```

Output:

```json
{
  "DBInstanceAutomatedBackups": [
    
  ]
}
```
For more information, see Finding information about replicated backups in the Amazon RDS User Guide.

- For API details, see DescribeDbInstanceAutomatedBackups in AWS CLI Command Reference.

describe-db-instances

The following code example shows how to use describe-db-instances.

AWS CLI

To describe a DB instance

The following describe-db-instances example retrieves details about the specified DB instance.
aws rds describe-db-instances \
  --db-instance-identifier mydbinstancecf

Output:

```
{
   "DBInstances": [ 
   {
      "DBInstanceIdentifier": "mydbinstancecf",
      "DBInstanceClass": "db.t3.small",
      "Engine": "mysql",
      "DBInstanceStatus": "available",
      "MasterUsername": "masterawsuser",
      "Endpoint": {
         "Address": "mydbinstancecf.abcexample.us-east-1.rds.amazonaws.com",
         "Port": 3306,
         "HostedZoneId": "Z2R2ITUGPM6lAM"
      }
   }
   ...some output truncated...
   ]
}
```

- For API details, see [DescribeDBInstances](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-instances.html) in *AWS CLI Command Reference*.

**describe-db-log-files**

The following code example shows how to use `describe-db-log-files`.

**AWS CLI**

**To describe the log files for a DB instance**

The following `describe-db-log-files` example retrieves details about the log files for the specified DB instance.

```
aws rds describe-db-log-files -\n  -db-instance-identifier test-instance
```

Output:
For API details, see [DescribeDbLogFiles](https://aws.amazon.com/cli/) in [AWS CLI Command Reference](https://aws.amazon.com/cli/).

**describe-db-parameter-groups**

The following code example shows how to use describe-db-parameter-groups.
AWS CLI

To describe your DB parameter group

The following describe-db-parameter-groups example retrieves details about your DB parameter groups.

```bash
aws rds describe-db-parameter-groups
```

Output:

```json
{
    "DBParameterGroups": [
        {
            "DBParameterGroupName": "default.aurora-mysql5.7",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Default parameter group for aurora-mysql5.7",
            "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora-mysql5.7"
        },
        {
            "DBParameterGroupName": "default.aurora-postgresql9.6",
            "DBParameterGroupFamily": "aurora-postgresql9.6",
            "Description": "Default parameter group for aurora-postgresql9.6",
            "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora-postgresql9.6"
        },
        {
            "DBParameterGroupName": "default.aurora5.6",
            "DBParameterGroupFamily": "aurora5.6",
            "Description": "Default parameter group for aurora5.6",
            "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora5.6"
        },
        {
            "DBParameterGroupName": "default.mariadb10.1",
            "DBParameterGroupFamily": "mariadb10.1",
            "Description": "Default parameter group for mariadb10.1",
            "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.mariadb10.1"
        }
    ]
}
```
For more information, see [Working with DB Parameter Groups](#) in the *Amazon RDS User Guide*.
- For API details, see [DescribeDBParameterGroups](#) in *AWS CLI Command Reference*.

**describe-db-parameters**

The following code example shows how to use `describe-db-parameters`.

**AWS CLI**

To describe the parameters in a DB parameter group

The following `describe-db-parameters` example retrieves the details of the specified DB parameter group.

```
aws rds describe-db-parameters \\
   --db-parameter-group-name mydbpg
```

Output:

```
{
   "Parameters": [
     {
       "ParameterName": "allow-suspicious-udfs",
       "Description": "Controls whether user-defined functions that have only an xxx symbol for the main function can be loaded",
       "Source": "engine-default",
       "ApplyType": "static",
       "DataType": "boolean",
       "AllowedValues": "0,1",
       "IsModifiable": false,
       "ApplyMethod": "pending-reboot"
     },
     {
       "ParameterName": "auto_generate_certs",
       "Description": "Controls whether the server autogenerates SSL key and certificate files in the data directory, if they do not already exist.",
       "Source": "engine-default",
       "ApplyType": "static",
       "DataType": "boolean",
       "AllowedValues": "0,1",
```
For more information, see [Working with DB Parameter Groups](#) in the Amazon RDS User Guide.

- For API details, see [DescribeDBParameters](#) in AWS CLI Command Reference.

### describe-db-proxies

The following code example shows how to use describe-db-proxies.

**AWS CLI**

**To describe a DB proxy for an RDS database**

The following `describe-db-proxies` example returns information about DB proxies.

```bash
aws rds describe-db-proxies
```

**Output:**

```json
{
   "DBProxies": [
      {
         "DBProxyName": "proxyExample1",
         "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",
         "Status": "available",
         "EngineFamily": "PostgreSQL",
         "VpcId": "vpc-1234567",
         "VpcSecurityGroupIds": [
            "sg-1234"
         ],
         "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
         ],
         "Auth": "[""
      }
   ]
}
```
<table>
<thead>
<tr>
<th>DBProxyName</th>
<th>DBProxyArn</th>
<th>Status</th>
<th>EngineFamily</th>
<th>VpcId</th>
<th>VpcSecurityGroupIds</th>
<th>VpcSubnetIds</th>
<th>Auth</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxyExample1</td>
<td>arn:aws:rds:us-east-1:123456789012:db-proxy:prx-1234a12b23456clab</td>

</tr>
<tr>
<td>proxyExample2</td>
<td>arn:aws:rds:us-east-1:123456789012:db-proxy:prx-1234a12b23456clab</td>
<td>available</td>
<td>PostgreSQL</td>
<td>sg-1234</td>
<td>[sg-1234]</td>
<td>[subnetgroup1, subnetgroup2]</td>
<td>[</td>
</tr>
</tbody>
</table>
For more information, see Viewing an RDS Proxy in the Amazon RDS User Guide and Viewing an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see DescribeDbProxies in AWS CLI Command Reference.

describe-db-proxy-endpoints

The following code example shows how to use describe-db-proxy-endpoints.

AWS CLI

To describe a DB proxy endpoints

The following describe-db-proxy-endpoints example returns information about DB proxy endpoints.

```bash
aws rds describe-db-proxy-endpoints
```

Output:

```json
{
   "DBProxyEndpoints": [
      {
         "DBProxyEndpointName": "proxyEndpoint1",
         "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-0123a01b12345c0ab",
         "DBProxyName": "proxyExample",
         "Status": "available",
         "VpcId": "vpc-1234567",
         "VpcSecurityGroupIds": [
            "sg-1234"
         ],
         "VpcSubnetIds": [
            "subnetgroup1",
...]
      }
   ]
}
```
For more information, see Viewing a proxy endpoint in the Amazon RDS User Guide and Creating a proxy endpoint in the Amazon Aurora User Guide.

- For API details, see DescribeDbProxyEndpoints in AWS CLI Command Reference.

descrIBE-dB-proXY-target-groups

The following code example shows how to use describe-db-proxy-target-groups.

AWS CLI

To describe a DB proxy endpoints
The following `describe-db-proxy-target-groups` example returns information about DB proxy target groups.

```bash
aws rds describe-db-proxy-target-groups \
    --db-proxy-name proxyExample
```

**Output:**

```json
{
    "TargetGroups": [
        {
            "DBProxyName": "proxyExample",
            "TargetGroupName": "default",
            "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-tg-0123a01b12345c0ab",
            "IsDefault": true,
            "Status": "available",
            "ConnectionPoolConfig": {
                "MaxConnectionsPercent": 100,
                "MaxIdleConnectionsPercent": 50,
                "ConnectionBorrowTimeout": 120,
                "SessionPinningFilters": []
            },
            "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
            "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
        }
    ]
}
```

For more information, see Viewing an RDS Proxy in the Amazon RDS User Guide and Viewing an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see DescribeDbProxyTargetGroups in AWS CLI Command Reference.

`describe-db-proxy-targets`

The following code example shows how to use `describe-db-proxy-targets`.

**AWS CLI**

To describe DB proxy targets
The following `describe-db-proxy-targets` example returns information about DB proxy targets.

```
aws rds describe-db-proxy-targets \
   --db-proxy-name proxyExample
```

Output:

```
{
   "Targets": [
      {
         "Endpoint": "database1.ab0cd1efghij.us-east-1.rds.amazonaws.com",
         "TrackedClusterId": "database1",
         "RdsResourceId": "database1-instance-1",
         "Port": 3306,
         "Type": "RDS_INSTANCE",
         "Role": "READ_WRITE",
         "TargetHealth": {
            "State": "UNAVAILABLE",
            "Reason": "PENDING_PROXY_CAPACITY",
            "Description": "DBProxy Target is waiting for proxy to scale to desired capacity"
         }
      }
   ]
}
```

For more information, see Viewing an RDS proxy in the Amazon RDS User Guide and Viewing an RDS proxy in the Amazon Aurora User Guide.

- For API details, see DescribeDbProxyTargets in AWS CLI Command Reference.

**describe-db-recommendations**

The following code example shows how to use `describe-db-recommendations`.

**AWS CLI**

**Example 1: To list all DB recommendations**

The following `describe-db-recommendations` example lists all DB recommendations in your AWS account.
aws rds describe-db-recommendations

Output:

```json
{
    "DBRecommendations": [
        {
            "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",
            "TypeId": "config_recommendation::old_minor_version",

Example 3: To list DB recommendations for a specified DB instance

The following describe-db-recommendations example lists all DB recommendations for a specified DB instance.

```bash
aws rds describe-db-recommendations \
  --filters Name=dbi-resource-id,Values=database-1
```

Output:

```json
{
  "DBRecommendations": [
    {
      "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",
      "TypeId": "config_recommendation::old_minor_version",

**Example 4: To list all active DB recommendations**

The following describe-db-recommendations example lists all active DB recommendations in your AWS account.

```
aws rds describe-db-recommendations \
   --filters Name=status,Values=active
```

Output:

```
{
   "DBRecommendations": [
      {
         "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",

- For API details, see DescribeDbRecommendations in AWS CLI Command Reference.

**describe-db-security-groups**

The following code example shows how to use describe-db-security-groups.

**AWS CLI**

**To list DB security groups**

The following describe-db-security-groups example lists DB security groups.

```bash
aws rds describe-db-security-groups
```

**Output:**

```json
{
   "DBSecurityGroups": [
   {
   "OwnerId": "123456789012",
   }
   ]
}
```

**describe-db-shard-groups**

The following code example shows how to use `describe-db-shard-groups`.

**AWS CLI**

**Example 1: To describe DB shard groups**

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups.

```bash
aws rds describe-db-shard-groups
```

**Output:**

```json
{
   "DBShardGroups": [
   
   ]
}
```
For more information, see Amazon Aurora DB Clusters in the Amazon Aurora User Guide.

- For API details, see DescribeDbShardGroups in AWS CLI Command Reference.

**describe-db-snapshot-attributes**

The following code example shows how to use describe-db-snapshot-attributes.

**AWS CLI**

To describe the attribute names and values for a DB snapshot

The following describe-db-snapshot-attributes example describes the attribute names and values for a DB snapshot.

```bash
aws rds describe-db-snapshot-attributes \  --db-snapshot-identifier mydbsnapshot
```

Output:
{  
"DBSnapshotAttributesResult": {  
"DBSnapshotIdentifier": "mydbsnapshot",  
"DBSnapshotAttributes": [  
{  
   "AttributeName": "restore",  
   "AttributeValues": [  
      "123456789012",  
      "210987654321"  
   ]  
  }  
]  
}  
}  

**For API details, see [DescribeDbSnapshotAttributes](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-snapshots.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-snapshots.html).**

**describe-db-snapshots**

The following code example shows how to use describe-db-snapshots.

**AWS CLI**

**Example 1: To describe a DB snapshot for a DB instance**

The following `describe-db-snapshots` example retrieves the details of a DB snapshot for a DB instance.

```bash
aws rds describe-db-snapshots \  
   --db-snapshot-identifier mydbsnapshot
```

**Output:**

```json
{
   "DBSnapshots": [  
   {  
      "DBSnapshotIdentifier": "mydbsnapshot",  
      "DBInstanceIdentifier": "mysqldb",  
      "SnapshotCreateTime": "2018-02-08T22:28:08.598Z",  
      "Engine": "mysql",
```
For more information, see Creating a DB Snapshot in the Amazon RDS User Guide.

**Example 2: To find the number of manual snapshots taken**

The following describe-db-snapshots example uses the \( \text{length} \) operator in the \( \text{--query} \) option to return the number of manual snapshots that have been taken in a particular AWS Region.

```
aws rds describe-db-snapshots \\n  --snapshot-type manual \\n  --query "length(*[].{DBSnapshots:SnapshotType})" \\n  --region eu-central-1
```

Output:

```
35
```

For more information, see Creating a DB Snapshot in the Amazon RDS User Guide.

- For API details, see DescribeDBSnapshots in AWS CLI Command Reference.
describe-db-subnet-groups

The following code example shows how to use describe-db-subnet-groups.

**AWS CLI**

**To describe a DB subnet group**

The following describe-db-subnet-groups example retrieves the details of the specified DB subnet group.

```
aws rds describe-db-subnet-groups
```

**Output:**

```
{
  "DBSubnetGroups": [
    {
      "DBSubnetGroupName": "mydbsubnetgroup",
      "DBSubnetGroupDescription": "My DB Subnet Group",
      "VpcId": "vpc-971c12ee",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-d8c8e7f4",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          },
          "SubnetStatus": "Active"
        },
        {
          "SubnetIdentifier": "subnet-718fdc7d",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1f"
          },
          "SubnetStatus": "Active"
        },
        {
          "SubnetIdentifier": "subnet-cbc8e7e7",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          },
          "SubnetStatus": "Active"
        }
      ]
    }
  ]
}
```
For more information, see [Amazon Virtual Private Cloud VPCs and Amazon RDS](https://docs.aws.amazon.com/rds/latest/userguide/RDS-Virtual-Private-Cloud-VPCs.html) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDbSubnetGroups](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-subnet-groups.html) in *AWS CLI Command Reference*.

**describe-engine-default-cluster-parameters**

The following code example shows how to use `describe-engine-default-cluster-parameters`.

**AWS CLI**

**To describe the default engine and system parameter information for the Aurora database engine**

The following `describe-engine-default-cluster-parameters` example retrieves the details of the default engine and system parameter information for Aurora DB clusters with MySQL 5.7 compatibility.

```bash
aws rds describe-engine-default-cluster-parameters \
   --db-parameter-group-family aurora-mysql5.7
```

**Output:**

```json
{
   "EngineDefaults": {
      "Parameters": [ ...
```
For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the Amazon Aurora User Guide.

- For API details, see DescribeEngineDefaultClusterParameters in AWS CLI Command Reference.

### describe-engine-default-parameters

The following code example shows how to use describe-engine-default-parameters.

**AWS CLI**

To describe the default engine and system parameter information for the database engine

The following describe-engine-default-parameters example retrieves details for the default engine and system parameter information for MySQL 5.7 DB instances.

```bash
aws rds describe-engine-default-parameters \
  --db-parameter-group-family mysql5.7
```

Output:

```json
{
  "EngineDefaults": {
    "Parameters": [
      {
        "ParameterName": "allow-suspicious-udfs",
      }
    ]
  }
}
```
For more information, see Working with DB Parameter Groups in the Amazon RDS User Guide.

- For API details, see DescribeEngineDefaultParameters in AWS CLI Command Reference.

**describe-event-categories**

The following code example shows how to use describe-event-categories.

**AWS CLI**

**To describe event categories**

The following describe-event-categories example retrieves details about the event categories for all available event sources.

```bash
aws rds describe-event-categories
```

**Output:**

```json
{
  "EventCategoriesMapList": [
    {
      "SourceType": "db-instance",
      "EventCategories": [
        "deletion",
        "read replica",
        "failover",
        "restoration",
        "maintenance",
        "low storage",
      ]
    }
  ]
}
```
"configuration change",
"backup",
"creation",
"availability",
"recovery",
"failure",
"backtrack",
"notification"
]
},
{
  "SourceType": "db-security-group",
  "EventCategories": [
    "configuration change",
    "failure"
  ]
},
{
  "SourceType": "db-parameter-group",
  "EventCategories": [
    "configuration change"
  ]
},
{
  "SourceType": "db-snapshot",
  "EventCategories": [
    "deletion",
    "creation",
    "restoration",
    "notification"
  ]
},
{
  "SourceType": "db-cluster",
  "EventCategories": [
    "failover",
    "failure",
    "notification"
  ]
},
{
  "SourceType": "db-cluster-snapshot",
  "EventCategories": [
    "backup"
  ]
}
For API details, see `DescribeEventCategories` in AWS CLI Command Reference.

**describe-event-subscriptions**

The following code example shows how to use `describe-event-subscriptions`.

### AWS CLI

**To describe event subscriptions**

This example describes all of the Amazon RDS event subscriptions for the current AWS account.

```bash
aws rds describe-event-subscriptions
```

**Output:**

```json
{
   "EventSubscriptionsList": [
     {
        "EventCategoriesList": [
         "backup",
         "recovery"
        ],
        "Enabled": true,
        "Status": "creating",
        "SourceType": "db-instance",
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "my-instance-events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events"
     },
     ...some output truncated...
   ]
}
```
• For API details, see DescribeEventSubscriptions in AWS CLI Command Reference.

**describe-events**

The following code example shows how to use describe-events.

**AWS CLI**

**To describe events**

The following describe-events example retrieves details for the events that have occurred for the specified DB instance.

```bash
aws rds describe-events \
  --source-identifier test-instance \
  --source-type db-instance
```

**Output:**

```json
{
  "Events": [
    {
      "SourceType": "db-instance",
      "SourceIdentifier": "test-instance",
      "EventCategories": [
        "backup"
      ],
      "Message": "Backing up DB instance",
      "Date": "2018-07-31T23:09:23.983Z",
      "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"
    },
    {
      "SourceType": "db-instance",
      "SourceIdentifier": "test-instance",
      "EventCategories": [
        "backup"
      ],
      "Message": "Finished DB Instance backup",
      "Date": "2018-07-31T23:15:13.049Z",
      "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"
    }
  ]
}
```
• For API details, see DescribeEvents in AWS CLI Command Reference.

**describe-export-tasks**

The following code example shows how to use describe-export-tasks.

**AWS CLI**

To describe snapshot export tasks

The following describe-export-tasks example returns information about snapshot exports to Amazon S3.

```
aws rds describe-export-tasks
```

Output:

```json
{
   "ExportTasks": [
     {
       "ExportTaskIdentifier": "test-snapshot-export",
       "SnapshotTime": "2020-03-02T18:26:28.163Z",
       "TaskStartTime": "2020-03-02T18:57:56.896Z",
       "TaskEndTime": "2020-03-02T19:10:31.985Z",
       "S3Bucket": "mybucket",
       "S3Prefix": ",",
       "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
       "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-aabccddeeff",
       "Status": "COMPLETE",
       "PercentProgress": 100,
       "TotalExtractedDataInGB": 0
     },
     {
       "ExportTaskIdentifier": "my-s3-export",
       "SnapshotTime": "2020-03-27T20:48:42.023Z",
       "TaskStartTime": "2020-03-27T20:48:42.023Z",
       "TaskEndTime": "2020-03-27T20:48:42.023Z",
       "S3Bucket": "mybucket",
       "S3Prefix": ",",
       "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
       "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-aabccddeeff",
       "Status": "COMPLETE",
       "PercentProgress": 100,
       "TotalExtractedDataInGB": 0
     }
   ]
}
```

- For API details, see [DescribeExportTasks](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-export-tasks.html) in *AWS CLI Command Reference*.

### describe-global-clusters

The following code example shows how to use `describe-global-clusters`.

**AWS CLI**

**To describe global DB clusters**

The following `describe-global-clusters` example lists Aurora global DB clusters in the current AWS Region.

```
aws rds describe-global-clusters
```

**Output:**

```
{
    "GlobalClusters": [
     {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f5982077e3b5aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": false,
```
For more information, see Managing an Aurora global database in the Amazon Aurora User Guide.

- For API details, see DescribeGlobalClusters in AWS CLI Command Reference.

**describe-option-group-options**

The following code example shows how to use describe-option-group-options.

### AWS CLI

**To describe all available options**

The following describe-option-group-options example lists two options for an Oracle Database 19c instance.

```bash
aws rds describe-option-group-options \
  --engine-name oracle-ee \
  --major-engine-version 19 \
  --max-items 2
```

**Output:**

```json
{
  "OptionGroupOptions": [
    {
      "Name": "APEX",
      "Description": "Oracle Application Express Runtime Environment",
      "EngineName": "oracle-ee",
      "MajorEngineVersion": "19",
      "PortRequired": false,
      "OptionsDependedOn": [],
      "OptionsConflictsWith": [],
      "Persistent": false,
      "Permanent": false,
      "RequiresAutoMinorEngineVersionUpgrade": false,
    }
  ]
}
```
For more information, see [Listing the Options and Option Settings for an Option Group](https://docs.aws.amazon.com/lambda/latest/dg/option-group.html) in the Amazon RDS User Guide.

- For API details, see [DescribeOptionGroupOptions](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-option-group-options.html) in AWS CLI Command Reference.

describe-option-groups

The following code example shows how to use `describe-option-groups`:
AWS CLI

To describe the available option groups

The following describe-option-groups example lists the options groups for an Oracle Database 19c instance.

```bash
aws rds describe-option-groups \
   --engine-name oracle-ee \
   --major-engine-version 19
```

Output:

```json
{
   "OptionGroupsList": [
   {
       "OptionGroupName": "default:oracle-ee-19",
       "OptionGroupDescription": "Default option group for oracle-ee 19",
       "EngineName": "oracle-ee",
       "MajorEngineVersion": "19",
       "Options": [],
       "AllowsVpcAndNonVpcInstanceMemberships": true,
   }
   ]
}
```

For more information, see Listing the Options and Option Settings for an Option Group in the Amazon RDS User Guide.

- For API details, see DescribeOptionGroups in AWS CLI Command Reference.

describe-orderable-db-instance-options

The following code example shows how to use describe-orderable-db-instance-options.

AWS CLI

To describe orderable DB instance options

The following describe-orderable-db-instance-options example retrieves details about the orderable options for a DB instances running the MySQL DB engine.
aws rds describe-orderable-db-instance-options \
   --engine mysql

Output:

```json
{
   "OrderableDBInstanceOptions": [
      {
         "MinStorageSize": 5,
         "ReadReplicaCapable": true,
         "MaxStorageSize": 6144,
         "AvailabilityZones": [
            {
               "Name": "us-east-1a"
            },
            {
               "Name": "us-east-1b"
            },
            {
               "Name": "us-east-1c"
            },
            {
               "Name": "us-east-1d"
            }
         ],
         "SupportsIops": false,
         "AvailableProcessorFeatures": [],
         "MultiAZCapable": true,
         "DBInstanceClass": "db.m1.large",
         "Vpc": true,
         "StorageType": "gp2",
         "LicenseModel": "general-public-license",
         "EngineVersion": "5.5.46",
         "SupportsStorageEncryption": false,
         "SupportsEnhancedMonitoring": true,
         "Engine": "mysql",
         "SupportsIAMDatabaseAuthentication": false,
         "SupportsPerformanceInsights": false
      }
   ]
}...
```
describe-pending-maintenance-actions

The following code example shows how to use describe-pending-maintenance-actions.

AWS CLI

To list resources with at least one pending maintenance action

The following describe-pending-maintenance-actions example lists the pending maintenance action for a DB instance.

```bash
aws rds describe-pending-maintenance-actions
```

Output:

```
{
   "PendingMaintenanceActions": [
       {
           "PendingMaintenanceActionDetails": [
               {
                   "Action": "system-update",
                   "Description": "Upgrade to Aurora PostgreSQL 2.4.2"
               }
           ]
       }
   ]
}
```

For more information, see Maintaining a DB Instance in the Amazon RDS User Guide.

describe-reserved-db-instances-offerings

The following code example shows how to use describe-reserved-db-instances-offerings.

• For API details, see DescribeOrderableDBInstanceOptions in AWS CLI Command Reference.

• For API details, see DescribePendingMaintenanceActions in AWS CLI Command Reference.
To describe reserved DB instance offerings

The following describe-reserved-db-instances-offerings example retrieves details about reserved DB instance options for oracle.

```
aws rds describe-reserved-db-instances-offerings \
   --product-description oracle
```

Output:

```
{
   "ReservedDBInstancesOfferings": [
   {
      "CurrencyCode": "USD",
      "UsagePrice": 0.0,
      "ProductDescription": "oracle-se2(li)",
      "ReservedDBInstancesOfferingId": "005bdee3-9ef4-4182-aa0c-58ef7cb6c2f8",
      "MultiAZ": true,
      "DBInstanceClass": "db.m4.xlarge",
      "OfferingType": "Partial Upfront",
      "RecurringCharges": [
         {

```

- For API details, see DescribeReservedDbInstancesOfferings in AWS CLI Command Reference.

describe-reserved-db-instances

The following code example shows how to use describe-reserved-db-instances.
AWS CLI

To describe reserved DB instances

The following `describe-reserved-db-instances` example retrieves details about any reserved DB instances in the current AWS account.

```bash
aws rds describe-reserved-db-instances
```

Output:

```json
{
   "ReservedDBInstances": [
      {
         "ReservedDBInstanceId": "myreservedinstance",
         "ReservedDBInstancesOfferingId": "12ab34cd-59af-4b2c-a660-1abcdef23456",
         "DBInstanceClass": "db.t3.micro",
         "Duration": 31536000,
         "FixedPrice": 0.0,
         "UsagePrice": 0.0,
         "CurrencyCode": "USD",
         "DBInstanceCount": 1,
         "ProductDescription": "sqlserver-ex(li)",
         "OfferingType": "No Upfront",
         "MultiAZ": false,
         "State": "payment-pending",
         "RecurringCharges": [
            {
               "RecurringChargeAmount": 0.014,
               "RecurringChargeFrequency": "Hourly"
            }
         ],
         "LeaseId": "a1b2c3d4-6b69-4a59-be89-5e11aa446666"
      }
   ]
}
```

For more information, see [Reserved DB Instances for Amazon RDS](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/using-dbinstances-reserved.html) in the [Amazon RDS User Guide](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/).
describe-source-regions

The following code example shows how to use describe-source-regions.

AWS CLI

To describe source Regions

The following describe-source-regions example retrieves details about all source AWS Regions. It also shows that automated backups can be replicated only from US West (Oregon) to the destination AWS Region, US East (N. Virginia).

```bash
aws rds describe-source-regions \
  --region us-east-1
```

Output:

```json
{
  "SourceRegions": [
    {
      "RegionName": "af-south-1",
      "Endpoint": "https://rds.af-south-1.amazonaws.com",
      "Status": "available",
      "SupportsDBInstanceAutomatedBackupsReplication": false
    },
    {
      "RegionName": "ap-east-1",
      "Endpoint": "https://rds.ap-east-1.amazonaws.com",
      "Status": "available",
      "SupportsDBInstanceAutomatedBackupsReplication": false
    },
    {
      "RegionName": "ap-northeast-1",
      "Endpoint": "https://rds.ap-northeast-1.amazonaws.com",
      "Status": "available",
      "SupportsDBInstanceAutomatedBackupsReplication": false
    },
    {
      "RegionName": "ap-northeast-2",
      "Endpoint": "https://rds.ap-northeast-2.amazonaws.com",
      "Status": "available",
      "SupportsDBInstanceAutomatedBackupsReplication": true
    }
  ]
}
```

}
```
For more information, see [Finding information about replicated backups](#) in the [Amazon RDS User Guide](#).

- For API details, see [DescribeSourceRegions](#) in [AWS CLI Command Reference](#).

**describe-valid-db-instance-modifications**

The following code example shows how to use `describe-valid-db-instance-modifications`.

**AWS CLI**

**To describe valid modifications for a DB instance**

The following `describe-valid-db-instance-modifications` example retrieves details about the valid modifications for the specified DB instance.

```
aws rds describe-valid-db-instance-modifications \
   --db-instance-identifier test-instance
```

**Output:**
{ "ValidDBInstanceModificationsMessage": {
    "ValidProcessorFeatures": [],
    "Storage": [
        {
            "StorageSize": [
                {
                    "Step": 1,
                    "To": 20,
                    "From": 20
                },
                {
                    "Step": 1,
                    "To": 6144,
                    "From": 22
                }
            ],
            "ProvisionedIops": [
                {

                }
            ],
            "StorageType": "gp2"
        }
    ]
}
{ "StorageSize": [ { "Step": 1, "To": 20, "From": 20 } ], "ProvisionedIops": [ { "Step": 1, "To": 0, "From": 0 } ], "IopsToStorageRatio": [ { "To": 0.0, "From": 0.0 } ], "StorageType": "magnetic" }
download-db-log-file-portion

The following code example shows how to use download-db-log-file-portion.

AWS CLI

To download a DB log file

The following download-db-log-file-portion example downloads only the latest part of your log file, saving it to a local file named tail.txt.

```
aws rds download-db-log-file-portion \
--db-instance-identifier test-instance \
--log-file-name log.txt \
--output text > tail.txt
```

To download the entire file, you need to include the --starting-token 0 parameter. The following example saves the output to a local file named full.txt.

```
aws rds download-db-log-file-portion \
--db-instance-identifier test-instance \
--log-file-name log.txt \
--starting-token 0 \
--output text > full.txt
```

The saved file might contain blank lines. They appear at the end of each part of the log file while being downloaded. This generally doesn't cause any trouble in your log file analysis.

- For API details, see DownloadDbLogFilePortion in AWS CLI Command Reference.

generate-auth-token

The following code example shows how to use generate-auth-token.

AWS CLI

To generate an authentication token

The following generate-db-auth-token example generates an authentication token for use with IAM database authentication.

Actions and scenarios
aws rds generate-db-auth-token \
  --hostname aurmysql-test.cdgmuqiadpid.us-west-2.rds.amazonaws.com \
  --port 3306 \
  --region us-east-1 \
  --username jane_doe

Output:

aurmysql-test.cdgmuqiadpid.us-west-2.rds.amazonaws.com:3306/?
Action=connect&DBUser=jane_doe&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIESZCNJ3OEXAMPLE%2F20180731%2Fus-east-1%2Frd...ec6e3f427191fa41aeEXAMPLE

- For API details, see GenerateAuthToken in AWS CLI Command Reference.

generate-db-auth-token

The following code example shows how to use generate-db-auth-token.

AWS CLI

To generate an IAM authentication token

The following generate-db-auth-token example generates IAM authentication token to connect to a database.

aws rds generate-db-auth-token \
  --hostname mydb.123456789012.us-east-1.rds.amazonaws.com \
  --port 3306 \
  --region us-east-1 \
  --username db_user

Output:

mydb.123456789012.us-east-1.rds.amazonaws.com:3306/?
Action=connect&DBUser=db_user&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIEXAMPLE%2F20210123%2Fus-east-1%2Frd...88987EXAMPLE1EXAMPLE2EXAMPLE3EXAMPLE4EXAMPLE5EXAMPLE6
For more information, see Connecting to your DB instance using IAM authentication in the Amazon RDS User Guide and Connecting to your DB cluster using IAM authentication in the Amazon Aurora User Guide.

- For API details, see GenerateDbAuthToken in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

To list tags on an Amazon RDS resource

The following list-tags-for-resource example lists all tags on a DB instance.

```bash
aws rds list-tags-for-resource \
   --resource-name arn:aws:rds:us-east-1:123456789012:db:orcl1
```

Output:

```json
{
   "TagList": [
      {
         "Key": "Environment",
         "Value": "test"
      },
      {
         "Key": "Name",
         "Value": "MyDatabase"
      }
   ]
}
```

For more information, see Tagging Amazon RDS Resources in the Amazon RDS User Guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**modify-certificates**

The following code example shows how to use modify-certificates.

Actions and scenarios
**AWS CLI**

**To temporarily override the system-default SSL/TLS certificate for new DB instances**

The following `modify-certificates` example temporarily overrides the system-default SSL/TLS certificate for new DB instances.

```
aws rds modify-certificates \
  --certificate-identifier rds-ca-2019
```

Output:

```
{
  "Certificate": {
    "CertificateIdentifier": "rds-ca-2019",
    "CertificateType": "CA",
    "Thumbprint": "EXAMPLE123456789012",
    "ValidFrom": "2019-09-19T18:16:53Z",
    "ValidTill": "2024-08-22T17:08:50Z",
    "CustomerOverride": true,
    "CustomerOverrideValidTill": "2024-08-22T17:08:50Z"
  }
}
```

For more information, see [Rotating your SSL/TLS certificate](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_SSLCONFIG.html) in the *Amazon RDS User Guide* and [Rotating your SSL/TLS certificate](https://docs.aws.amazon.com/Aurora/latest/aurora-mysql-userguide/ssl.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyCertificates](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-certificates.html) in *AWS CLI Command Reference*.

**modify-current-db-cluster-capacity**

The following code example shows how to use `modify-current-db-cluster-capacity`.

**AWS CLI**

**To scale the capacity of an Aurora Serverless DB cluster**

The following `modify-current-db-cluster-capacity` example scales the capacity of an Aurora Serverless DB cluster to 8.

```
aws rds modify-current-db-cluster-capacity \
  --db-cluster-identifier mydbcluster \
```

Actions and scenarios
--capacity 8

Output:

```
{
    "DBClusterIdentifier": "mydbcluster",
    "PendingCapacity": 8,
    "CurrentCapacity": 1,
    "SecondsBeforeTimeout": 300,
    "TimeoutAction": "ForceApplyCapacityChange"
}
```

For more information, see [Scaling Aurora Serverless v1 DB cluster capacity manually](https://docs.aws.amazon.com/AmazonAurora/latest/SADF/ Scaling Aurora Serverless v1 DB cluster capacity manually) in the [Amazon Aurora User Guide](https://docs.aws.amazon.com/AmazonAurora/latest/SADF/Amazon Aurora User Guide).

- For API details, see [ModifyCurrentDbClusterCapacity](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-cluster-endpoint.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/rds/).

### modify-db-cluster-endpoint

The following code example shows how to use `modify-db-cluster-endpoint`.

**AWS CLI**

**To modify a custom DB cluster endpoint**

The following `modify-db-cluster-endpoint` example modifies the specified custom DB cluster endpoint.

```
aws rds modify-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint \
    --static-members dbinstance1 dbinstance2 dbinstance3
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-east-1.rds.amazonaws.com",
    "Status": "modifying",
    "EndpointType": "CUSTOM",
```
"CustomEndpointType": "READER",
"StaticMembers": [
  "dbinstance1",
  "dbinstance2",
  "dbinstance3"
],
"ExcludedMembers": [],
"DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-endpoint:mycustomendpoint"
}

For more information, see [Amazon Aurora Connection Management](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/chap conexión.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbClusterEndpoint](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-cluster-endpoint.html) in *AWS CLI Command Reference*.

**modify-db-cluster-parameter-group**

The following code example shows how to use modify-db-cluster-parameter-group.

**AWS CLI**

**To modify parameters in a DB cluster parameter group**

The following modify-db-cluster-parameter-group example modifies the values of parameters in a DB cluster parameter group.

```
aws rds modify-db-cluster-parameter-group \
  --db-cluster-parameter-group-name mydbclusterpg \
  --parameters
  "ParameterName=server_audit_logging,ParameterValue=1,ApplyMethod=immediate" \
  "ParameterName=server_audit_logs_upload,ParameterValue=1,ApplyMethod=immediate"
```

**Output:**

```
{
  "DBClusterParameterGroupName": "mydbclusterpg"
}
```

For more information, see [Working with DB parameter groups and DB cluster parameter groups](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/Working-with-parameter-groups.html) in the *Amazon Aurora User Guide*. 
modify-db-cluster-snapshot-attribute

The following code example shows how to use modify-db-cluster-snapshot-attribute.

AWS CLI

To modify a DB cluster snapshot attribute

The following modify-db-cluster-snapshot-attribute example makes changes to the specified DB cluster snapshot attribute.

```bash
aws rds modify-db-cluster-snapshot-attribute \
   --db-cluster-snapshot-identifier myclustersnapshot \
   --attribute-name restore \
   --values-to-add 123456789012
```

Output:

```json
{
   "DBClusterSnapshotAttributesResult": {
      "DBClusterSnapshotIdentifier": "myclustersnapshot",
      "DBClusterSnapshotAttributes": [
         {
            "AttributeName": "restore",
            "AttributeValues": [
               "123456789012"
            ]
         }
      ]
   }
}
```

For more information, see Restoring from a DB Cluster Snapshot in the Amazon Aurora User Guide.

modify-db-cluster

The following code example shows how to use modify-db-cluster.
Example 1: To modify a DB cluster

The following `modify-db-cluster` example changes the master user password for the DB cluster named `cluster-2` and sets the backup retention period to 14 days. The `--apply-immediately` parameter causes the changes to be made immediately, instead of waiting until the next maintenance window.

```bash
aws rds modify-db-cluster \
    --db-cluster-identifier cluster-2 \
    --backup-retention-period 14 \
    --master-user-password newpassword99 \
    --apply-immediately
```

Output:

```json
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "eu-central-1b",
            "eu-central-1c",
            "eu-central-1a"
        ],
        "BackupRetentionPeriod": 14,
        "DatabaseName": ",",
        "DBClusterIdentifier": "cluster-2",
        "DBClusterParameterGroup": "default.aurora5.6",
        "DBSubnetGroup": "default-vpc-2305ca49",
        "Status": "available",
        "EarliestRestorableTime": "2020-06-03T02:07:29.637Z",
        "Endpoint": "cluster-2.cluster-############.eu-central-1.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-2.cluster-ro-############.eu-central-1.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora",
        "EngineVersion": "5.6.10a",
        "LatestRestorableTime": "2020-06-04T15:11:25.748Z",
        "Port": 3306,
        "MasterUsername": "admin",
        "PreferredBackupWindow": "01:55-02:25",
    }
}
```
For more information, see [Modifying an Amazon Aurora DB Cluster](https://docs.aws.amazon.com/AmazonRDS/latest/AuroraUserGuide/chap MODIFY Cluster.html) in the *Amazon Aurora User Guide*.

**Example 2: To associate VPC security group with a DB cluster**

The following `modify-db-instance` example associates a specific VPC security group and removes DB security groups from a DB cluster.

```
aws rds modify-db-cluster \
   --db-cluster-identifier dbName \
   --vpc-security-group-ids sg-20a5c047 
```
--vpc-security-group-ids sg-ID

Output:

```json
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2b",
            "us-west-2a"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "dbName",
        "DBClusterParameterGroup": "default.aurora-mysql8.0",
        "DBSubnetGroup": "default",
        "Status": "available",

        "PreferredMaintenanceWindow": "thu:08:54-thu:09:24",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [
            {
                "DBInstanceIdentifier": "dbName-instance-1",
                "IsClusterWriter": true,
                "DBClusterParameterGroupStatus": "in-sync",
                "PromotionTier": 1
            }
        ],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-ID",
                "Status": "active"
            }
        ]
    }
}```
modify-db-instance

The following code example shows how to use `modify-db-instance`.

**AWS CLI**

**Example 1: To modify a DB instance**

The following `modify-db-instance` example associates an option group and a parameter group with a compatible Microsoft SQL Server DB instance. The `--apply-immediately` parameter causes the option and parameter groups to be associated immediately, instead of waiting until the next maintenance window.

```bash
aws rds modify-db-instance \
   --db-instance-identifier database-2 \
   --option-group-name test-se-2017 \
   --db-parameter-group-name test-sqlserver-se-2017 \
   --apply-immediately
```

Output:

```json
{
   "DBInstance": {
      "DBInstanceIdentifier": "database-2",
      "DBInstanceClass": "db.r4.large",
      "Engine": "sqlserver-se",
      "DBInstanceStatus": "available",
      ...
```

For more information, see [Controlling access with security groups](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/security-group-overview.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbCluster](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-cluster.html) in *AWS CLI Command Reference*. 

---

**modify-db-instance**

For more information, see [Controlling access with security groups](https://docs.aws.amazon.com/AmazonAurora/latest/UserGuide/security-group-overview.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbCluster](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-cluster.html) in *AWS CLI Command Reference*.

For more information, see Modifying an Amazon RDS DB Instance in the Amazon RDS User Guide.

**Example 2: To associate VPC security group with a DB instance**

The following `modify-db-instance` example associates a specific VPC security group and removes DB security groups from a DB instance:

```
aws rds modify-db-instance \
  --db-instance-identifier dbName \
```

--vpc-security-group-ids sg-ID

Output:

```
{
  "DBInstance": {
    "DBInstanceIdentifier": "dbName",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "mysql",
    "DBInstanceStatus": "available",
    "MasterUsername": "admin",
    "Endpoint": {
      "Address": "dbName.abcdefghijk.us-west-2.rds.amazonaws.com",
      "Port": 3306,
      "HostedZoneId": "ABCDEFGHIJK1234"
    },
    "AllocatedStorage": 20,
    "InstanceCreateTime": "2024-02-15T00:37:58.793000+00:00",
    "PreferredBackupWindow": "11:57-12:27",
    "BackupRetentionPeriod": 7,
    "DBSecurityGroups": [],
    "VpcSecurityGroups": [
      {
        "VpcSecurityGroupId": "sg-ID",
        "Status": "active"
      }
    ],
    ... output omitted ...
  },
  "MultiAZ": false,
  "EngineVersion": "8.0.35",
  "AutoMinorVersionUpgrade": true,
  "Read ReplicaDBInstanceIdentifiers": [],
  "LicenseModel": "general-public-license",
  ... output omitted ...
}
```

For more information, see [Controlling access with security groups](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/Concepts.VPC.html) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDBInstance](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-instance.html) in *AWS CLI Command Reference*. 
modify-db-parameter-group

The following code example shows how to use modify-db-parameter-group.

AWS CLI

To modify a DB parameter group

The following modify-db-parameter-group example changes the value of the clr enabled parameter in a DB parameter group. The --apply-immediately parameter causes the DB parameter group to be modified immediately, instead of waiting until the next maintenance window.

```bash
aws rds modify-db-parameter-group \
  --db-parameter-group-name test-sqlserver-se-2017 \
  --parameters "ParameterName='clr enabled',ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{
  "DBParameterGroupName": "test-sqlserver-se-2017"
}
```

For more information, see Modifying Parameters in a DB Parameter Group in the Amazon RDS User Guide.

- For API details, see ModifyDBParameterGroup in AWS CLI Command Reference.

modify-db-proxy-endpoint

The following code example shows how to use modify-db-proxy-endpoint.

AWS CLI

To modify a DB proxy endpoint for an RDS database

The following modify-db-proxy-endpoint example modifies a DB proxy endpoint proxyEndpoint to set the read-timeout to 65 seconds.

```bash
aws rds modify-db-proxy-endpoint \
  --db-proxy-endpoint-name proxyEndpoint \
...
```
Output:

```json
{
  "DBProxyEndpoint": {
    "DBProxyEndpointName": "proxyEndpoint",
    "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-endpoint:prx-endpoint-0123a01b12345c0ab",
    "DBProxyName": "proxyExample",
    "Status": "available",
    "VpcId": "vpc-1234567",
    "VpcSecurityGroupIds": [
      "sg-1234"
    ],
    "VpcSubnetIds": [
      "subnetgroup1",
      "subnetgroup2"
    ],
    "Endpoint": "proxyEndpoint.endpoint.proxyExample-ab0cd1efghij.us-east-1.rds.amazonaws.com",
    "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
    "TargetRole": "READ_WRITE",
    "IsDefault": "false"
  }
}
```

For more information, see Modifying a proxy endpoint in the Amazon RDS User Guide and Modifying a proxy endpoint in the Amazon Aurora User Guide.

• For API details, see ModifyDbProxyEndpoint in AWS CLI Command Reference.

modify-db-proxy-target-group

The following code example shows how to use modify-db-proxy-target-group.

AWS CLI

To modify a DB proxy endpoints

The following modify-db-proxy-target-group example modifies a DB proxy target group to set the maximum connections to 80 percent and maximum idle connections to 10 percent.
aws rds modify-db-proxy-target-group
   --target-group-name default
   --db-proxy-name proxyExample
   --connection-pool-config MaxConnectionsPercent=80,MaxIdleConnectionsPercent=10

Output:

```
{
   "DBProxyTargetGroup": {
      "DBProxyName": "proxyExample",
      "TargetGroupName": "default",
      "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-tg-0123a01b12345c0ab",
      "IsDefault": true,
      "Status": "available",
      "ConnectionPoolConfig": {
         "MaxConnectionsPercent": 80,
         "MaxIdleConnectionsPercent": 10,
         "ConnectionBorrowTimeout": 120,
         "SessionPinningFilters": []
      },
      "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
      "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
   }
}
```

For more information, see Modifying an RDS Proxy in the Amazon RDS User Guide and Modifying an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see ModifyDbProxyTargetGroup in AWS CLI Command Reference.

**modify-db-proxy**

The following code example shows how to use modify-db-proxy.

**AWS CLI**

To modify a DB proxy for an RDS database

The following modify-db-proxy example modifies a DB proxy named proxyExample to require SSL for its connections.
aws rds modify-db-proxy
   --db-proxy-name proxyExample
   --require-tls

Output:

{
   "DBProxy": {
      "DBProxyName": "proxyExample",
      "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",
      "Status": "modifying",
      "EngineFamily": "PostgreSQL",
      "VpcId": "sg-1234567",
      "VpcSecurityGroupIds": ["sg-1234"],
      "VpcSubnetIds": ["subnetgroup1", "subnetgroup2"],
      "Auth": [
         {
            "Description": "proxydescription1",
            "AuthScheme": "SECRETS",
            "IAMAuth": "DISABLED"
         }
      ],
      "RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",
      "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
      "RequireTLS": true,
      "IdleClientTimeout": 1800,
      "DebuggingLogging": false,
      "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
      "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
   }
}
For more information, see Modify an RDS Proxy in the Amazon RDS User Guide and Creating an RDS Proxy in the Amazon Aurora User Guide.

- For API details, see ModifyDbProxy in AWS CLI Command Reference.

modify-db-shard-group

The following code example shows how to use modify-db-shard-group.

AWS CLI

Example 1: To modify a DB shard group

The following modify-db-shard-group example changes the maximum capacity of a DB shard group.

```
aws rds modify-db-shard-group \
   --db-shard-group-identifier my-db-shard-group \
   --max-acu 1000
```

Output:

```
{
   "DBShardGroups": [
      {
         "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
         "DBShardGroupIdentifier": "my-db-shard-group",
         "DBClusterIdentifier": "my-sv2-cluster",
         "MaxACU": 768.0,
         "ComputeRedundancy": 0,
         "Status": "available",
         "PubliclyAccessible": false,
         "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
      }
   ]
}
```

For more information, see Amazon Aurora DB Clusters in the Amazon Aurora User Guide.

Example 2: To describe your DB shard groups
The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `modify-db-shard-group` command. The maximum capacity of the DB shard group `my-db-shard-group` is now 1000 Aurora capacity units (ACUs).

```bash
aws rds describe-db-shard-groups
```

**Output:**

```
{
   "DBShardGroups": [
   {
      "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
      "DBShardGroupIdentifier": "limitless-test-shard-grp",
      "DBClusterIdentifier": "limitless-test-cluster",
      "MaxACU": 768.0,
      "ComputeRedundancy": 0,
      "Status": "available",
      "PubliclyAccessible": true,
      "Endpoint": "limitless-test-cluster.limitless-cekyexample.us-east-2.rds.amazonaws.com"
   },
   {
      "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
      "DBShardGroupIdentifier": "my-db-shard-group",
      "DBClusterIdentifier": "my-sv2-cluster",
      "MaxACU": 1000.0,
      "ComputeRedundancy": 0,
      "Status": "available",
      "PubliclyAccessible": false,
      "Endpoint": "my-sv2-cluster.limitless-cekyexample.us-east-2.rds.amazonaws.com"
   }
   ]
}
```

For more information, see [Amazon Aurora DB Clusters](https://docs.aws.amazon.com/AmazonAurora/latest/ug/db-clusters.html) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbShardGroup](https://docs.aws.amazon.com/AmazonRDS/latest/AuroraUserGuide/chap_cli.html) in *AWS CLI Command Reference*.

**modify-db-snapshot-attribute**

The following code example shows how to use `modify-db-snapshot-attribute`.

```bash
```

```
AWS CLI

Example 1: To enable two AWS accounts to restore a DB snapshot

The following `modify-db-snapshot-attribute` example grants permission to two AWS accounts, with the identifiers 111122223333 and 444455556666, to restore the DB snapshot named `mydbsnapshot`.

```bash
aws rds modify-db-snapshot-attribute \
  --db-snapshot-identifier mydbsnapshot \
  --attribute-name restore \
  --values-to-add "111122223333","444455556666"
```

Output:

```json
{
  "DBSnapshotAttributesResult": {
    "DBSnapshotIdentifier": "mydbsnapshot",
    "DBSnapshotAttributes": [ 
      {
        "AttributeName": "restore",
        "AttributeValues": [ 
          "111122223333",
          "444455556666"
        ]
      }
    ]
  }
}
```

Example 2: To prevent an AWS account from restoring a DB snapshot

The following `modify-db-snapshot-attribute` example removes permission from a particular AWS account to restore the DB snapshot named `mydbsnapshot`. When specifying a single account, the account identifier can't be surrounded by quotations marks or braces.

```bash
aws rds modify-db-snapshot-attribute \
  --db-snapshot-identifier mydbsnapshot \
  --attribute-name restore \
  --values-to-remove 444455556666
```
Output:

```
{
   "DBSnapshotAttributesResult": {
      "DBSnapshotIdentifier": "mydbsnapshot",
      "DBSnapshotAttributes": [
         {
            "AttributeName": "restore",
            "AttributeValues": [
               "111122223333"
            ]
         }
      ]
   }
}
```

For more information, see [Sharing a Snapshot](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/rds-sharing-snapshots.html) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDbSnapshotAttribute](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-snapshot-attribute.html) in *AWS CLI Command Reference*.

### modify-db-snapshot-attributes

The following code example shows how to use `modify-db-snapshot-attributes`.

**AWS CLI**

**To modify a DB snapshot attribute**

The following `modify-db-snapshot-attribute` example permits two AWS account identifiers, 111122223333 and 444455556666, to restore the DB snapshot named `mydbsnapshot`.

```
aws rds modify-db-snapshot-attribute \
   --db-snapshot-identifier mydbsnapshot \
   --attribute-name restore \
   --values-to-add '"111122223333","444455556666"'
```

Output:

```
{
   "DBSnapshotAttributesResult": {
      "DBSnapshotIdentifier": "mydbsnapshot",
```
modify-db-snapshot

The following code example shows how to use modify-db-snapshot.

AWS CLI

To modify a DB snapshot

The following modify-db-snapshot example upgrades a PostgreSQL 10.6 snapshot named db5-snapshot-upg-test to PostgreSQL 11.7. The new DB engine version is shown after the snapshot has finished upgrading and its status is available.

```bash
aws rds modify-db-snapshot \
--db-snapshot-identifier db5-snapshot-upg-test \
--engine-version 11.7
```

Output:

```json
{
   "DBSnapshot": {
      "DBSnapshotIdentifier": "db5-snapshot-upg-test",
      "DBInstanceIdentifier": "database-5",
      "SnapshotCreateTime": "2020-03-27T20:49:17.092Z",
      "Engine": "postgres",
      "AllocatedStorage": 20,
      "Status": "upgrading",
      "Port": 5432,
   }
}
```
modify-db-subnet-group

The following code example shows how to use modify-db-subnet-group.

AWS CLI

To modify a DB subnet group

The following modify-db-subnet-group example adds a subnet with the ID subnet-08e41f9e230222222 to the DB subnet group named mysubnetgroup. To keep the existing subnets in the subnet group, include their IDs as values in the --subnet-ids option. Make sure to have subnets with at least two different Availability Zones in the DB subnet group.

```
aws rds modify-db-subnet-group \ 
   --db-subnet-group-name mysubnetgroup \ 
   --subnet-ids 
   '"subnet-08e41f9e230222222"'
```

Output:
For more information, see [Step 3: Create a DB Subnet Group](#) in the [Amazon RDS User Guide](#).
The following code example shows how to use modify-event-subscription.

**AWS CLI**

To modify an event subscription

The following modify-event-subscription example disables the specified event subscription, so that it no longer publishes notifications to the specified Amazon Simple Notification Service topic.

```bash
aws rds modify-event-subscription \
  --subscription-name my-instance-events \
  --no-enabled
```

Output:

```
{
  "EventSubscription": {
    "EventCategoriesList": [
      "backup",
      "recovery"
    ],
    "CustomerAwsId": "123456789012",
    "SourceType": "db-instance",
    "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
    "CustSubscriptionId": "my-instance-events",
    "Status": "modifying",
    "Enabled": false
  }
}
```

For API details, see [ModifyEventSubscription](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-event-subscription.html) in *AWS CLI Command Reference*.
modify-global-cluster

The following code example shows how to use modify-global-cluster.

AWS CLI

To modify a global DB cluster

The following modify-global-cluster example enables deletion protection for an Aurora MySQL-compatible global DB cluster.

```bash
aws rds modify-global-cluster \
   --global-cluster-identifier myglobalcluster \
   --deletion-protection
```

Output:

```
{
   "GlobalCluster": {
      "GlobalClusterIdentifier": "myglobalcluster",
      "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
      "GlobalClusterArn": "arn:aws:rds::123456789012:global-cluster:myglobalcluster",
      "Status": "available",
      "Engine": "aurora-mysql",
      "EngineVersion": "5.7.mysql_aurora.2.07.2",
      "StorageEncrypted": false,
      "DeletionProtection": true,
      "GlobalClusterMembers": []
   }
}
```

For more information, see Managing an Aurora global database in the Amazon Aurora User Guide.

- For API details, see ModifyGlobalCluster in AWS CLI Command Reference.

promote-read-replica-db-cluster

The following code example shows how to use promote-read-replica-db-cluster.
To promote a DB cluster read replica

The following `promote-read-replica-db-cluster` example promotes the specified read replica to become a standalone DB cluster.

```bash
aws rds promote-read-replica-db-cluster \
   --db-cluster-identifier mydbcluster-1
```

Output:

```json
{
   "DBCluster": {
      "AllocatedStorage": 1,
      "AvailabilityZones": [
         "us-east-1a",
         "us-east-1b",
         "us-east-1c"
      ],
      "BackupRetentionPeriod": 1,
      "DatabaseName": "",
      "DBClusterIdentifier": "mydbcluster-1",
      ...some output truncated...
   }
}
```

For more information, see [Promoting a read replica to be a DB cluster](https://docs.aws.amazon.com/AmazonAurora/latest/USER-GUIDE/) in the *Amazon Aurora User Guide*.

- For API details, see [PromoteReadReplicaDbCluster](https://docs.aws.amazon.com/cli/latest/reference/rds/promote-read-replica-db-cluster.html) in *AWS CLI Command Reference*.

**promote-read-replica**

The following code example shows how to use `promote-read-replica`.

**AWS CLI**

To promote a read replica

The following `promote-read-replica` example promotes the specified read replica to become a standalone DB instance.
aws rds promote-read-replica \
   --db-instance-identifier test-instance-repl

Output:

```
{
   "DBInstance": {
      "StorageType": "standard",
      "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
      "DBInstanceStatus": "modifying",
      ...
   }
}
```

• For API details, see [PromoteReadReplica](#) in [AWS CLI Command Reference](#).

**purchase-reserved-db-instance**

The following code example shows how to use `purchase-reserved-db-instance`.

**AWS CLI**

**To purchase a reserved DB instance offering**

The following `purchase-reserved-db-instances-offering` example purchases a reserved DB instance offering. The `reserved-db-instances-offering-id` must be a valid offering ID, as returned by the `describe-reserved-db-instances-offering` command.

```
aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id 438012d3-4a52-4cc7-b2e3-8dff72e0e706
```

• For API details, see [PurchaseReservedDbInstance](#) in [AWS CLI Command Reference](#).

**purchase-reserved-db-instances-offerings**

The following code example shows how to use `purchase-reserved-db-instances-offerings`.

**AWS CLI**

**Example 1: To find a reserved DB instance to purchase**
The following `describe-reserved-db-instances-offerings` example lists the available reserved MySQL DB instances with the `db.t2.micro` instance class and a duration of one year. The offering ID is required for purchasing a reserved DB instance.

```
aws rds describe-reserved-db-instances-offerings \
    --product-description mysql \
    --db-instance-class db.t2.micro \
    --duration 1
```

Output:

```json
{
    "ReservedDBInstancesOfferings": [
        {
            "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
            "DBInstanceClass": "db.t2.micro",
            "Duration": 31536000,
            "FixedPrice": 51.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "ProductDescription": "mysql",
            "OfferingType": "Partial Upfront",
            "MultiAZ": false,
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.006,
                    "RecurringChargeFrequency": "Hourly"
                }
            ]
        }
    ]
}
```

For more information, see [Reserved DB Instances for Amazon RDS](https://docs.aws.amazon.com/rds/latest/userguide) in the [Amazon RDS User Guide](https://docs.aws.amazon.com/rds/latest/userguide).

**Example 2: To purchase a reserved DB instance**

The following `purchase-reserved-db-instances-offering` example shows how to buy the reserved DB instance offering from the previous example.
aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id 8ba30be1-b9ec-447f-8f23-6114e3f4c7b4

Output:

```json
{
   "ReservedDBInstance": {
      "ReservedDBInstanceId": "ri-2020-06-29-16-54-57-670",
      "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
      "DBInstanceClass": "db.t2.micro",
      "StartTime": "2020-06-29T16:54:57.670Z",
      "Duration": 31536000,
      "FixedPrice": 51.0,
      "UsagePrice": 0.0,
      "CurrencyCode": "USD",
      "DBInstanceCount": 1,
      "ProductDescription": "mysql",
      "OfferingType": "Partial Upfront",
      "MultiAZ": false,
      "State": "payment-pending",
      "RecurringCharges": [
         {
            "RecurringChargeAmount": 0.006,
            "RecurringChargeFrequency": "Hourly"
         }
      ],
   }
}
```

For more information, see [Reserved DB Instances for Amazon RDS](http://aws.amazon.com/rds) in the *Amazon RDS User Guide*.

- For API details, see [PurchaseReservedDbInstancesOfferings](http://aws.amazon.com/cli) in *AWS CLI Command Reference*.

### reboot-db-instance

The following code example shows how to use `reboot-db-instance`.

**AWS CLI**

To reboot a DB instance
The following `reboot-db-instance` example starts a reboot of the specified DB instance.

```bash
aws rds reboot-db-instance \
  --db-instance-identifier test-mysql-instance
```

Output:

```json
{
  "DBInstance": {
    "DBInstanceIdentifier": "test-mysql-instance",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "mysql",
    "DBInstanceStatus": "rebooting",
    "MasterUsername": "admin",
    "Endpoint": {
      "Address": "test-mysql-instance.############.us-west-2.rds.amazonaws.com",
      "Port": 3306,
      "HostedZoneId": "Z1PVIF0EXAMPLE"
    }
  }
}
```

For more information, see [Rebooting a DB Instance](https://docs.aws.amazon.com/AmazonRDS/UserGuide) in the Amazon RDS User Guide.

- For API details, see [RebootDBInstance](https://docs.aws.amazon.com/AWSCLI/latest指挥Manual/RebootDBInstance.html) in *AWS CLI Command Reference*.

### reboot-db-shard-group

The following code example shows how to use `reboot-db-shard-group`.

**AWS CLI**

**Example 1: To reboot a DB shard group**

The following `reboot-db-shard-group` example reboots a DB shard group.

```bash
aws rds reboot-db-shard-group \
```

--db-shard-group-identifier my-db-shard-group

Output:

```json
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 1000.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see [Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance](https://docs.aws.amazon.com/aurora/latest/userguide) in the *Amazon Aurora User Guide*.

**Example 2: To describe your DB shard groups**

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `reboot-db-shard-group` command. The DB shard group `my-db-shard-group` is now rebooting.

```bash
aws rds describe-db-shard-groups
```

Output:

```json
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
```
For more information, see Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance in the Amazon Aurora User Guide.

- For API details, see RebootDbShardGroup in AWS CLI Command Reference.

**register-db-proxy-targets**

The following code example shows how to use register-db-proxy-targets.

**AWS CLI**

**To register a DB proxy with a database**

The following register-db-proxy-targets example creates the association between a database and a proxy.

```bash
aws rds register-db-proxy-targets \
   --db-proxy-name proxyExample \
   --db-cluster-identifiers database-5
```

Output:

```json
{
}
```
"DBProxyTargets": [
  {
    "RdsResourceId": "database-5",
    "Port": 3306,
    "Type": "TRACKED_CLUSTER",
    "TargetHealth": {
      "State": "REGISTERING"
    }
  },
  {
    "Endpoint": "database-5instance-1.ab0cd1efghij.us-east-1.rds.amazonaws.com",
    "RdsResourceId": "database-5",
    "Port": 3306,
    "Type": "RDS_INSTANCE",
    "TargetHealth": {
      "State": "REGISTERING"
    }
  }
]

For more information, see Creating an RDS proxy in the Amazon RDS User Guide and Creating an RDS proxy in the Amazon Aurora User Guide.

- For API details, see RegisterDbProxyTargets in AWS CLI Command Reference.

**remove-from-global-cluster**

The following code example shows how to use remove-from-global-cluster.

**AWS CLI**

To detach an Aurora secondary cluster from an Aurora global database cluster

The following remove-from-global-cluster example detaches an Aurora secondary cluster from an Aurora global database cluster. The cluster changes from being read-only to a standalone cluster with read-write capability.

```
aws rds remove-from-global-cluster \
  --region us-west-2 \
  --global-cluster-identifier myglobalcluster \
```
Output:

```json
{
   "GlobalCluster": {
      "GlobalClusterIdentifier": "myglobalcluster",
      "GlobalClusterResourceId": "cluster-abc123def456gh",
      "Status": "available",
      "Engine": "aurora-postgresql",
      "EngineVersion": "10.11",
      "StorageEncrypted": true,
      "DeletionProtection": false,
      "GlobalClusterMembers": [
         {
            "Readers": [
            ],
            "IsWriter": true
         },
         {
            "Readers": [],
            "IsWriter": false,
            "GlobalWriteForwardingStatus": "disabled"
         }
      ]
   }
}
```

For more information, see [Removing a cluster from an Amazon Aurora global database](https://docs.aws.amazon.com/aurora/latest/userguide/rds-aurora-create-cluster-general.html) in the Amazon Aurora User Guide.

- For API details, see [RemoveFromGlobalCluster](https://docs.aws.amazon.com/cli/latest/reference/rds/remove-from-global-cluster.html) in AWS CLI Command Reference.

**remove-option-from-option-group**

The following code example shows how to use `remove-option-from-option-group`.
AWS CLI

To delete an option from an option group

The following `remove-option-from-option-group` example removes the OEM option from `myoptiongroup`.

```
aws rds remove-option-from-option-group \
   --option-group-name myoptiongroup \
   --options OEM \
   --apply-immediately
```

Output:

```
{
   "OptionGroup": {
      "OptionGroupName": "myoptiongroup",
      "OptionGroupDescription": "Test",
      "EngineName": "oracle-ee",
      "MajorEngineVersion": "19",
      "Options": [],
      "AllowsVpcAndNonVpcInstanceMemberships": true,
      "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:myoptiongroup"
   }
}
```

For more information, see Removing an Option from an Option Group in the Amazon Aurora User Guide.

- For API details, see RemoveOptionFromOptionGroup in AWS CLI Command Reference.

remove-role-from-db-cluster

The following code example shows how to use `remove-role-from-db-cluster`.

AWS CLI

To disassociate an AWS Identity and Access Management (IAM) role from a DB cluster

The following `remove-role-from-db-cluster` example removes a role from a DB cluster.

```
aws rds remove-role-from-db-cluster \
```
This command produces no output.

For more information, see [Associating an IAM role with an Amazon Aurora MySQL DB cluster](#) in the [Amazon Aurora User Guide](#).

- For API details, see [RemoveRoleFromDbCluster](#) in [AWS CLI Command Reference](#).

### remove-role-from-db-instance

The following code example shows how to use `remove-role-from-db-instance`.

**AWS CLI**

To disassociate an AWS Identity and Access Management (IAM) role from a DB instance

The following `remove-role-from-db-instance` example removes the role named `rds-s3-integration-role` from an Oracle DB instance named `test-instance`.

```bash
aws rds remove-role-from-db-instance \
   --db-instance-identifier test-instance \
   --feature-name S3_INTEGRATION \
   --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.

For more information, see [Disabling RDS SQL Server Integration with S3](#) in the [Amazon RDS User Guide](#).

- For API details, see [RemoveRoleFromDbInstance](#) in [AWS CLI Command Reference](#).

### remove-source-identifier-from-subscription

The following code example shows how to use `remove-source-identifier-from-subscription`.

**AWS CLI**

To remove a source identifier from a subscription
The following `remove-source-identifier` example removes the specified source identifier from an existing subscription.

```
aws rds remove-source-identifier-from-subscription \
   --subscription-name my-instance-events \
   --source-identifier test-instance-repl
```

Output:

```
{
   "EventSubscription": {
      "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
      "EventCategoriesList": ["backup", "recovery"],
      "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
      "Status": "modifying",
      "CustSubscriptionId": "my-instance-events",
      "CustomerAwsId": "123456789012",
      "SourceIdsList": ["test-instance"],
      "SourceType": "db-instance",
      "Enabled": false
   }
}
```

- For API details, see [RemoveSourceIdentifierFromSubscription](https://docs.aws.amazon.com/cli/latest/reference/rds/remove-source-identifier-from-subscription.html) in *AWS CLI Command Reference*.

**remove-tags-from-resource**

The following code example shows how to use `remove-tags-from-resource`.

**AWS CLI**

To remove tags from a resource

The following `remove-tags-from-resource` example removes tags from a resource.
This command produces no output.

For more information, see Tagging Amazon RDS resources in the Amazon RDS User Guide and Tagging Amazon RDS resources in the Amazon Aurora User Guide.

- For API details, see RemoveTagsFromResource in AWS CLI Command Reference.

reset-db-cluster-parameter-group

The following code example shows how to use reset-db-cluster-parameter-group.

AWS CLI

Example 1: To reset all parameters to their default values

The following reset-db-cluster-parameter-group example resets all parameter values in a customer-created DB cluster parameter group to their default values.

```
aws rds reset-db-cluster-parameter-group \
   --db-cluster-parameter-group-name mydbclpg \
   --reset-all-parameters
```

Output:

```
{
   "DBClusterParameterGroupName": "mydbclpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the Amazon Aurora User Guide.

Example 2: To reset specific parameters to their default values

The following reset-db-cluster-parameter-group example resets the parameter values for specific parameters to their default values in a customer-created DB cluster parameter group.

```
aws rds reset-db-cluster-parameter-group \
```
The following code example shows how to use `reset-db-parameter-group`.

**AWS CLI**

**Example 1: To reset all parameters to their default values**

The following `reset-db-parameter-group` example resets all parameter values in a customer-created DB parameter group to their default values.

```
aws rds reset-db-parameter-group \
    --db-parameter-group-name mypg \
    --reset-all-parameters
```

Output:

```
{
    "DBParameterGroupName": "mypg"
}
```

**Example 2: To reset specific parameters to their default values**

```bash
--db-cluster-parameter-group-name mydbclpgy \ 
--parameters "ParameterName=max_connections,ApplyMethod=immediate" \ 
    "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclpg"
}
```
The following `reset-db-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB parameter group.

```bash
aws rds reset-db-parameter-group
   --db-parameter-group-name mypg
   --parameters "ParameterName=max_connections,ApplyMethod=immediate"
   "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```json
{
   "DBParameterGroupName": "mypg"
}
```

For more information, see [Working with DB parameter groups](https://docs.aws.amazon.com/rds/userguide/rds-parameter-groups.html) in the Amazon RDS User Guide and [Working with DB parameter groups and DB cluster parameter groups](https://docs.aws.amazon.com/aurora/userguide/aurora-parameter-groups.html) in the Amazon Aurora User Guide.

- For API details, see [ResetDbParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/rds/reset-db-parameter-group.html) in AWS CLI Command Reference.

### restore-db-cluster-from-s3

The following code example shows how to use `restore-db-cluster-from-s3`.

**AWS CLI**

**To restore an Amazon Aurora DB cluster from Amazon S3**

The following `restore-db-cluster-from-s3` example restores an Amazon Aurora MySQL version 5.7-compatible DB cluster from a MySQL 5.7 DB backup file in Amazon S3.

```bash
aws rds restore-db-cluster-from-s3
   --db-cluster-identifier cluster-s3-restore
   --engine aurora-mysql
   --master-username admin
   --master-user-password mypassword
   --s3-bucket-name mybucket
   --s3-prefix test-backup
   --s3-ingestion-role-arn arn:aws:iam::123456789012:role/service-role/TestBackup
   --source-engine mysql
   --source-engine-version 5.7.28
```
Output:

```json
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "cluster-s3-restore",
        "DBClusterParameterGroup": "default.aurora-mysql5.7",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "cluster-s3-restore.cluster-co3xyzabc123.us-west-2.rds.amazonaws.com",

        "IAMDatabaseAuthenticationEnabled": false,
        "EngineMode": "provisioned",
        "DeletionProtection": false,
    }
}
```
"HttpEndpointEnabled": false,
"CopyTagsToSnapshot": false,
"CrossAccountClone": false,
"DomainMemberships": []
}

For more information, see [Migrating Data from MySQL by Using an Amazon S3 Bucket](#) in the [Amazon Aurora User Guide](#).

- For API details, see [RestoreDbClusterFromS3](#) in [AWS CLI Command Reference](#).

**restore-db-cluster-from-snapshot**

The following code example shows how to use `restore-db-cluster-from-snapshot`.

**AWS CLI**

**To restore a DB cluster from a snapshot**

The following `restore-db-cluster-from-snapshot` restores an Aurora PostgreSQL DB cluster compatible with PostgreSQL version 10.7 from a DB cluster snapshot named `test-instance-snapshot`.

```bash
aws rds restore-db-cluster-from-snapshot 
    --db-cluster-identifier newdbcluster 
    --snapshot-identifier test-instance-snapshot 
    --engine aurora-postgresql 
    --engine-version 10.7
```

**Output:**

```json
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 7,
        "DatabaseName": "",
```

"CopyTagsToSnapshot": false,
"CrossAccountClone": false,
"DomainMemberships": []
}]
}

For more information, see [Restoring from a DB Cluster Snapshot](https://docs.aws.amazon.com/AmazonAuroraUserGuide/restore-db-cluster-from-snapshot.html) in the Amazon Aurora User Guide.

- For API details, see [RestoreDbClusterFromSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-cluster-from-snapshot.html) in AWS CLI Command Reference.
**restore-db-cluster-to-point-in-time**

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

**AWS CLI**

**To restore a DB cluster to a specified time**

The following `restore-db-cluster-to-point-in-time` example restores the DB cluster named `database-4` to the latest possible time. Using copy-on-write as the restore type restores the new DB cluster as a clone of the source DB cluster.

```bash
aws rds restore-db-cluster-to-point-in-time \
    --source-db-cluster-identifier database-4 \
    --db-cluster-identifier sample-cluster-clone \
    --restore-type copy-on-write \
    --use-latest-restorable-time
```

**Output:**

```json
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 7,
        "DatabaseName": "",
        "DBClusterIdentifier": "sample-cluster-clone",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "sample-cluster-clone.cluster-############.us-west-2.rds.amazonaws.com",
        "ReaderEndpoint": "sample-cluster-clone.cluster-ro-############.us-west-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
        "EngineVersion": "10.7",
        "Port": 5432,
    }
}
```
For more information, see [Restoring a DB Cluster to a Specified Time](https://docs.aws.amazon.com/AmazonAurora/latest/UG/RestoringDBCluster.html) in the *Amazon Aurora User Guide*.

- For API details, see [RestoreDbClusterToPointInTime](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-cluster-point-in-time.html) in *AWS CLI Command Reference*.

### restore-db-instance-from-db-snapshot

The following code example shows how to use `restore-db-instance-from-db-snapshot`.

**AWS CLI**

**To restore a DB instance from a DB snapshot**
The following `restore-db-instance-from-db-snapshot` example creates a new DB instance named `db7-new-instance` with the `db.t3.small` DB instance class from the specified DB snapshot. The source DB instance from which the snapshot was taken uses a deprecated DB instance class, so you can't upgrade it.

```bash
aws rds restore-db-instance-from-db-snapshot \
  --db-instance-identifier db7-new-instance \
  --db-snapshot-identifier db7-test-snapshot \
  --db-instance-class db.t3.small
```

Output:

```json
{
  "DBInstance": {
    "DBInstanceIdentifier": "db7-new-instance",
    "DBInstanceClass": "db.t3.small",
    "Engine": "mysql",
    "DBInstanceStatus": "creating",
    ...
  }
}
```

For more information, see [Restoring from a DB Snapshot](https://docs.aws.amazon.com/rds/latest/userguide/) in the Amazon RDS User Guide.

- For API details, see [RestoreDbInstanceFromDbSnapshot](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-instance-from-db-snapshot.html) in AWS CLI Command Reference.
**restore-db-instance-from-s3**

The following code example shows how to use `restore-db-instance-from-s3`.

**AWS CLI**

**To restore a DB instance from a backup in Amazon S3**

The following `restore-db-instance-from-s3` example creates a new DB instance named `restored-test-instance` from an existing backup in the `my-backups` S3 bucket.

```bash
aws rds restore-db-instance-from-s3 \
    --db-instance-identifier restored-test-instance \
    --allocated-storage 250 --db-instance-class db.m4.large --engine mysql \
    --master-username master --master-user-password secret99 \
    --s3-bucket-name my-backups --s3-ingestion-role-arn arn:aws:iam::123456789012:role/my-role \
    --source-engine mysql --source-engine-version 5.6.27
```

- For API details, see [RestoreDbInstanceFromS3](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-instance-from-s3.html) in AWS CLI Command Reference.

**restore-db-instance-to-point-in-time**

The following code example shows how to use `restore-db-instance-to-point-in-time`.

**AWS CLI**

**Example 1: To restore a DB instance to a point in time**

The following `restore-db-instance-to-point-in-time` example restores `test-instance` to a new DB instance named `restored-test-instance`, as of the specified time.

```bash
aws rds restore-db-instance-to-point-in-time \
    --source-db-instance-identifier test-instance \
    --target-db-instance restored-test-instance \
    --restore-time 2018-07-30T23:45:00.000Z
```

**Output:**

```json
{
}
```
For more information, see [Restoring a DB instance to a specified time](https://docs.aws.amazon.com/rds/latest/userguide/) in the *Amazon RDS User Guide*.

### Example 2: To restore a DB instance to a specified time from a replicated backup

The following `restore-db-instance-to-point-in-time` example restores an Oracle DB instance to the specified time from a replicated automated backup.

```bash
aws rds restore-db-instance-to-point-in-time
  --target-db-instance-identifier myorclinstance-from-replicated-backup 
  --restore-time 2020-12-08T18:45:00.000Z
```

**Output:**

```json
{
  "DBInstance": {
    "DBInstanceIdentifier": "myorclinstance-from-replicated-backup",

```
For more information, see [Restoring to a specified time from a replicated backup](https://docs.aws.amazon.com/rds/latest/userguide/RDS-Monitoring.html) in the *Amazon RDS User Guide*.

- For API details, see [RestoreDbInstanceToPointInTime](https://docs.aws.amazon.com/cli/latest/reference/rds/restore-db-instance-to-point-in-time.html) in *AWS CLI Command Reference*.

### start-activity-stream

The following code example shows how to use `start-activity-stream`.

**AWS CLI**

**To start a database activity stream**

The following `start-activity-stream` example starts an asynchronous activity stream to monitor an Aurora cluster named `my-pg-cluster`.

```bash
aws rds start-activity-stream \
  --region us-east-1 \
  --mode async \
  --kms-key-id arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-h123-456i789jk0l1 \
  --resource-arn arn:aws:rds:us-east-1:1234567890123:cluster:my-pg-cluster \
  --apply-immediately
```

**Output:**

```json
{
  "KmsKeyId": "arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-h123-456i789jk0l1",
  "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFCHIJJKLMNOPQRSTUVWXYZ",
  "Status": "starting",
}
```
For more information, see Starting a database activity stream in the Amazon Aurora User Guide.

- For API details, see StartActivityStream in AWS CLI Command Reference.

start-db-cluster

The following code example shows how to use start-db-cluster.

AWS CLI

To start a DB cluster

The following start-db-cluster example starts a DB cluster and its DB instances.

```bash
aws rds start-db-cluster \
    --db-cluster-identifier mydbcluster
```

Output:

```json
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1e",
            "us-east-1b"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "mydb",
        "DBClusterIdentifier": "mydbcluster",
        ...some output truncated...
    }
}
```

For more information, see Stopping and starting an Amazon Aurora DB cluster in the Amazon Aurora User Guide.

- For API details, see StartDbCluster in AWS CLI Command Reference.
start-db-instance-automated-backups-replication

The following code example shows how to use `start-db-instance-automated-backups-replication`.

AWS CLI

To enable cross-Region automated backups

The following `start-db-instance-automated-backups-replication` example replicates automated backups from a DB instance in the US East (N. Virginia) Region to US West (Oregon). The backup retention period is 14 days.

```bash
aws rds start-db-instance-automated-backups-replication \
   --region us-west-2 \
   --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db" \
   --backup-retention-period 14
```

Output:

```
{
   "DBInstanceAutomatedBackup": {
      "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
      "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
      "Region": "us-east-1",
      "DB InstanceIdentifier": "new-orcl-db",
      "RestoreWindow": {},
      "AllocatedStorage": 20,
      "Status": "pending",
      "Port": 1521,
      "InstanceCreateTime": "2020-12-04T15:28:31Z",
      "MasterUsername": "admin",
      "Engine": "oracle-se2",
      "EngineVersion": "12.1.0.2.v21",
      "LicenseModel": "bring-your-own-license",
      "OptionGroupName": "default:oracle-se2-12-1",
      "Encrypted": false,
      "StorageType": "gp2",
      "IAMDatabaseAuthenticationEnabled": false,
      "BackupRetentionPeriod": 14,
      "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
   }
}```
start-db-instance

The following code example shows how to use start-db-instance.

AWS CLI

To start a DB instance

The following start-db-instance example starts the specified DB instance.

```
aws rds start-db-instance \
   --db-instance-identifier test-instance
```

Output:

```json
{
   "DBInstance": {
      "DBInstanceStatus": "starting",
      ...some output truncated...
   }
}
```
aws rds start-export-task 
   --export-task-identifier my-s3-export 
   --s3-bucket-name mybucket 
   --iam-role-arn arn:aws:iam::123456789012:role/service-role/ExportRole 
   --kms-key-id arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-
   aabbccddeeff

Output:

```json
{
    "ExportTaskIdentifier": "my-s3-export",
    "SnapshotTime": "2020-03-27T20:48:42.023Z",
    "S3Bucket": "mybucket",
    "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-
    aabbccddeeff",
    "Status": "STARTING",
    "PercentProgress": 0,
    "TotalExtractedDataInGB": 0
}
```

For more information, see [Exporting a Snapshot to an Amazon S3 Bucket](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/using-snapshots.exporting.html) in the Amazon RDS User Guide.

- For API details, see [StartExportTask](https://docs.aws.amazon.com/cli/latest/reference/rds/start-export-task.html) in AWS CLI Command Reference.

### stop-activity-stream

The following code example shows how to use `stop-activity-stream`.

**AWS CLI**

**To stop a database activity stream**

The following `stop-activity-stream` example stops an activity stream in an Aurora cluster named my-pg-cluster.

```bash
aws rds stop-activity-stream 
   --region us-east-1 
```

Actions and scenarios
The following code example shows how to use `stop-db-cluster`.

**AWS CLI**

**To stop a DB cluster**

The following `stop-db-cluster` example stops a DB cluster and its DB instances.

```
aws rds stop-db-cluster \
  --db-cluster-identifier mydbcluster
```

Output:

```
{
  "DBCluster": {
    "AllocatedStorage": 1,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1e",
      "us-east-1b"
    ],
    "BackupRetentionPeriod": 1,
    "DatabaseName": "mydb",
    "DBClusterIdentifier": "mydbcluster",
```
For more information, see [Stopping and starting an Amazon Aurora DB cluster](amazonauroraguide.html) in the *Amazon Aurora User Guide*.

- For API details, see [StopDbCluster](awscmd Reference) in *AWS CLI Command Reference*.

**stop-db-instance-automated-backups-replication**

The following code example shows how to use `stop-db-instance-automated-backups-replication`.

**AWS CLI**

**To stop replicating automated backups**

The following `stop-db-instance-automated-backups-replication` ends replication of automated backups to the US West (Oregon) Region. Replicated backups are retained according to the set backup retention period.

```bash
aws rds stop-db-instance-automated-backups-replication \
  --region us-west-2 \
```

**Output:**

```json
{
  "DBInstanceAutomatedBackup": {
    "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
    "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
    "Region": "us-east-1",
    "DBInstanceIdentifier": "new-orcl-db",
    "RestoreWindow": {
      "LatestTime": "2020-12-07T19:59:57Z"
    },
    "AllocatedStorage": 20,
    "Status": "replicating",
    "Port": 1521,
    "InstanceCreateTime": "2020-12-04T15:28:31Z",
```
For more information, see [Stopping automated backup replication](https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_StopDBInstanceAutomatedBackupsReplication.html) in the *Amazon RDS User Guide*.

- For API details, see [StopDbInstanceAutomatedBackupsReplication](https://docs.aws.amazon.com/cli/latest/reference/rds/stop-db-instance-automated-backups-replication.html) in *AWS CLI Command Reference*.

**stop-db-instance**

The following code example shows how to use `stop-db-instance`.

### AWS CLI

**To stop a DB instance**

The following `stop-db-instance` example stops the specified DB instance.

```bash
aws rds stop-db-instance \    --db-instance-identifier test-instance
```

**Output:**

```json
{
   "DBInstance": {
      "DBInstanceStatus": "stopping",
      ...some output truncated...
   }
}
```
switchover-blue-green-deployment

The following code example shows how to use switchover-blue-green-deployment.

**AWS CLI**

**Example 1: To switch a blue/green deployment for an RDS DB instance**

The following switchover-blue-green-deployment example promotes the specified green environment as the new production environment.

```bash
aws rds switchover-blue-green-deployment \
  --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
  --switchover-timeout 300
```

Output:

```
{
   "BlueGreenDeployment": {
      "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
      "BlueGreenDeploymentName": "bgd-cli-test-instance",
      "SwitchoverDetails": [
         {

For more information, see [Switching a blue/green deployment](#) in the [Amazon RDS User Guide](#).

**Example 2: To promote a blue/green deployment for an Aurora MySQL DB cluster**

The following switchover-blue-green-deployment example promotes the specified green environment as the new production environment.
aws rds switchover-blue-green-deployment
   --blue-green-deployment-identifier bgd-wi89nwzglccsfake
   --switchover-timeout 300

Output:

```json
{
   "BlueGreenDeployment": {
      "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
      "BlueGreenDeploymentName": "my-blue-green-deployment",
      "Target": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster-green-3ud8z6",
      "SwitchoverDetails": [
         {

            "TargetMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster-green-3ud8z6",
            "Status": "AVAILABLE"
         },
         {
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-1-green-bvxc73",
            "Status": "AVAILABLE"
         },
         {
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-2-green-7wc4ie",
            "Status": "AVAILABLE"
         },
         {
            "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-aurora-mysql-cluster-3-green-p4xxkz",
            "Status": "AVAILABLE"
         }
      ]
   }
}```
For more information, see [Switching a blue/green deployment](#) in the *Amazon Aurora User Guide*.

- For API details, see [SwitchoverBlueGreenDeployment](#) in *AWS CLI Command Reference*. 
Amazon RDS Data Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Data Service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**batch-execute-statement**

The following code example shows how to use batch-execute-statement.

**AWS CLI**

To execute a batch SQL statement

The following batch-execute-statement example executes a batch SQL statement over an array of data with a parameter set.

```bash
aws rds-data batch-execute-statement \
    --database "mydb" \
    --sql "insert into mytable values (:id, :val)" \
    --parameter-sets "[[{"name":"id"}, {"value": {"longValue": 1}}],{"name":"id"}, {"value": {"longValue": 2}}],{"name":"id"}, {"value": {"longValue": 3}}]"
```

5230
This command produces no output.

For more information, see Using the Data API for Aurora Serverless in the Amazon RDS User Guide.

- For API details, see BatchExecuteStatement in AWS CLI Command Reference.

**begin-transaction**

The following code example shows how to use begin-transaction.

**AWS CLI**

**To start a SQL transaction**

The following begin-transaction example starts a SQL transaction.

```
aws rds-data begin-transaction \
    --database "mydb" \
```

Output:

```
{
    "transactionId": "ABC1234567890xyz"
}
```

For more information, see Using the Data API for Aurora Serverless in the Amazon RDS User Guide.

- For API details, see BeginTransaction in AWS CLI Command Reference.

**commit-transaction**

The following code example shows how to use commit-transaction.

**AWS CLI**

**To commit a SQL transaction**

The following commit-transaction example ends the specified SQL transaction and commits the changes that you made as part of it.
Example 1: To execute a SQL statement that is part of a transaction

The following execute-statement example runs a SQL statement that is part of a transaction.

```
aws rds-data execute-statement \
   --database "mydb" \
   --sql "update mytable set quantity=5 where id=201" \
   --transaction-id "ABC1234567890xyz"
```

Output:

```
{
   "numberOfRecordsUpdated": 1
}
```

Example 2: To execute a SQL statement with parameters
The following execute-statement example runs a SQL statement with parameters.

```bash
aws rds-data execute-statement \
    --resource-arn "arn:aws:rds:us-east-1:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-east-1:123456789012:secret:mysecret" \
    --sql "insert into mytable values (:id, :val)" \
    --parameters "[{"name": "id", "value": {"longValue": 1}},{"name": "val", "value": {"stringValue": "value1"}}]"
```

Output:

```
{
    "numberOfRecordsUpdated": 1
}
```

For more information, see Using the Data API for Aurora Serverless in the Amazon RDS User Guide.

- For API details, see ExecuteStatement in AWS CLI Command Reference.

**rollback-transaction**

The following code example shows how to use rollback-transaction.

**AWS CLI**

**To roll back a SQL transaction**

The following rollback-transaction example rolls back the specified SQL transaction.

```bash
aws rds-data rollback-transaction \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "transactionStatus": "Rollback Complete"
}
```
For more information, see Using the Data API for Aurora Serverless in the Amazon RDS User Guide.

- For API details, see RollbackTransaction in AWS CLI Command Reference.

Amazon RDS Performance Insights examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Performance Insights.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

describe-dimension-keys

The following code example shows how to use describe-dimension-keys.

**AWS CLI**

**To describe dimension keys**

This example requests the names of all wait events. The data is summarized by event name, and the aggregate values of those events over the specified time period.

**Command:**

```bash
aws pi describe-dimension-keys --service-type RDS --identifier db-LKCG0BK26374TPTDFXOIWVCPMP --start-time 1527026400 --end-time 1527080400 --metric db.load.avg --group-by '{"Group":"db.wait_event"}'
```
Output:

```json
{
   "AlignedEndTime": 1.5270804E9,
   "AlignedStartTime": 1.5270264E9,
   "Keys": [
      {
         "Dimensions": {
            "db.wait_event.name": "wait/synch/mutex/innodb/aurora_lock_thread_slot_futex"
         },
         "Total": 0.05906906851195666
      },
      {
         "Dimensions": {
            "db.wait_event.name": "wait/io/aurora_redo_log_flush"
         },
         "Total": 0.015824722186149193
      },
      {
         "Dimensions": {

         },
         "Total": 2.317312337515171E-4
      }
   ]
}
```
For API details, see [DescribeDimensionKeys](#) in [AWS CLI Command Reference](#).

### get-resource-metrics

The following code example shows how to use `get-resource-metrics`.

#### AWS CLI

**To get resource metrics**

This example requests data points for the `db.wait_event` dimension group, and for the `db.wait_event.name` dimension within that group. In the response, the relevant data points are grouped by the requested dimension (`db.wait_event.name`).

**Command:**

```bash
aws pi get-resource-metrics --service-type RDS --identifier db-LKCGOBK26374TPTDFXOIWVCPPM --start-time 1527026400 --end-time 1527080400 --period-in-seconds 300 --metric db.load.avg --metric-queries file://metric-queries.json
```

The arguments for `--metric-queries` are stored in a JSON file, `metric-queries.json`. Here are the contents of that file:

```json
[
  {
    "Metric": "db.load.avg",
    "GroupBy": {
    "Group": "db.wait_event"
  }
  }
]
```
Output:

```json
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Identifier": "db-LKCGOBK26374TPTDFXOIVCPPM",
    "MetricList": [
        {
            "Key": {
                "Metric": "db.load.avg"
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 1.3533333333333333
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.88

```
Amazon Redshift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Redshift.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

accept-reserved-node-exchange

The following code example shows how to use accept-reserved-node-exchange.

AWS CLI

To accept reserved node exchange

The following accept-reserved-node-exchange example accepts exchange of a DC1 reserved node for a DC2 reserved node.

```
aws redshift accept-reserved-node-exchange /
  --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE /
  --target-reserved-node-offering-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:
For more information, see [Upgrading Reserved Nodes With the AWS CLI](https://docs.aws.amazon.com/redshift/latest/gsg/upgrade-released-node.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [AcceptReservedNodeExchange](https://docs.aws.amazon.com/cli/latest/reference/redshift/accept-reserved-node-exchange.html) in *AWS CLI Command Reference*.

### authorize-cluster-security-group-ingress

The following code example shows how to use `authorize-cluster-security-group-ingress`.

**AWS CLI**

Authorizing Access to an EC2 Security Group

This example authorizes access to a named Amazon EC2 security group.

```
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-owner-id 123445677890
```
Authorizing Access to a CIDR range
This example authorizes access to a CIDR range. Command:

```bash
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see `AuthorizeClusterSecurityGroupIngress` in *AWS CLI Command Reference*.

**authorize-snapshot-access**

The following code example shows how to use `authorize-snapshot-access`.

**AWS CLI**

Authorize an AWS Account to Restore a Snapshot
This example authorizes the AWS account 444455556666 to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format. Command:

```bash
aws redshift authorize-snapshot-access --snapshot-id my-snapshot-id --account-with-restore-access 444455556666
```

Result:

```json
{
    "Snapshot": {
        "Status": "available",
        "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
        "EstimatedSecondsToCompletion": 0,
        "AvailabilityZone": "us-east-1a",
        "ClusterVersion": "1.0",
        "MasterUsername": "adminuser",
        "Encrypted": false,
        "OwnerAccount": "1112223344",
        "BackupProgressInMegabytes": 11.0,
        "ElapsedTimeInSeconds": 0,
        "DBName": "dev",
        "CurrentBackupRateInMegabytesPerSecond": 0.1534,
        "ActualIncrementalBackupSizeInMegabytes": 11.0,
        "SnapshotType": "manual",
        "NodeType": "dw.hs1.xlarge",
        "ClusterIdentifier": "mycluster",
    }
}
```
For API details, see AuthorizeSnapshotAccess in AWS CLI Command Reference.

**batch-delete-cluster-snapshots**

The following code example shows how to use batch-delete-cluster-snapshots.

**AWS CLI**

To delete a set of cluster snapshots

The following batch-delete-cluster-snapshots example deletes a set of manual cluster snapshots.

```shell
aws redshift batch-delete-cluster-snapshots \
  --identifiers SnapshotIdentifier=mycluster-2019-11-06-14-12 \
  SnapshotIdentifier=mycluster-2019-11-06-14-20
```

Output:

```json
{
  "Resources": [
    "mycluster-2019-11-06-14-12",
    "mycluster-2019-11-06-14-20"
  ]
}
```

For more information, see Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

For API details, see BatchDeleteClusterSnapshots in AWS CLI Command Reference.

**batch-modify-cluster-snapshots**

The following code example shows how to use batch-modify-cluster-snapshots.
**AWS CLI**

**To modify a set of cluster snapshots**

The following `batch-modify-cluster-snapshots` example modifies the settings for a set of cluster snapshots.

```bash
code example
aws redshift batch-modify-cluster-snapshots \
   --manual-snapshot-retention-period 30
```

**Output:**

```json
{
   "Resources": [
      "mycluster-2019-11-06-16-31",
      "mycluster-2019-11-06-16-32"
   ],
   "Errors": [],
   "ResponseMetadata": {
      "RequestId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
      "HTTPStatusCode": 200,
      "HTTPHeaders": {
         "x-amzn-requestid": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
         "content-type": "text/xml",
         "content-length": "480",
         "date": "Sat, 07 Dec 2019 00:36:09 GMT",
         "connection": "keep-alive"
      },
      "RetryAttempts": 0
   }
}
```

For more information, see Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

- For API details, see BatchModifyClusterSnapshots in AWS CLI Command Reference.

**cancel-resize**

The following code example shows how to use cancel-resize.
AWS CLI

To cancel resize of a cluster

The following cancel-resize example cancels a classic resize operation for a cluster.

```bash
aws redshift cancel-resize \
  --cluster-identifier mycluster
```

Output:

```json
{
  "TargetNodeType": "dc2.large",
  "TargetNumberOfNodes": 2,
  "TargetClusterType": "multi-node",
  "Status": "CANCELLING",
  "ResizeType": "ClassicResize",
  "TargetEncryptionType": "NONE"
}
```

For more information, see Resizing Clusters in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

- For API details, see CancelResize in AWS CLI Command Reference.

**copy-cluster-snapshot**

The following code example shows how to use copy-cluster-snapshot.

**AWS CLI**

Get a Description of All Cluster Versions

This example returns a description of all cluster versions. By default, the output is in JSON format. Command:

```bash
```

Result:

```json
{
  "Snapshot": {
```

Actions and scenarios
For API details, see [CopyClusterSnapshot](aws.amazon.com/cli/latest/reference/redshift/copy-cluster-snapshot) in *AWS CLI Command Reference*.

**create-cluster-parameter-group**

The following code example shows how to use `create-cluster-parameter-group`.

**AWS CLI**

Create a Cluster Parameter Group

This example creates a new cluster parameter group.

Command:

```bash
aws redshift create-cluster-parameter-group --parameter-group-name myclusterparametergroup --parameter-group-family redshift-1.0 --description "My first cluster parameter group"
```

Result:

```json
{
   "ClusterParameterGroup": {
      "ParameterGroupFamily": "redshift-1.0",
      "Description": "My first cluster parameter group",
      "ParameterGroupName": "myclusterparametergroup"
   }
}
```
For API details, see [CreateClusterParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/redshift/create-cluster-parameter-group) in *AWS CLI Command Reference*.

**create-cluster-security-group**

The following code example shows how to use `create-cluster-security-group`.

**AWS CLI**

Creating a Cluster Security Group

This example creates a new cluster security group. By default, the output is in JSON format.

Command:

```bash
aws redshift create-cluster-security-group --cluster-security-group-name mysecuritygroup --description "This is my cluster security group"
```

Result:

```json
{
   "create_cluster_security_group_response": {
      "create_cluster_security_group_result": {
         "cluster_security_group": {
            "description": "This is my cluster security group",
            "owner_id": "300454760768",
            "cluster_security_group_name": "mysecuritygroup",
            "ec2_security_groups": [],
            "ip_ranges": []
         }
      },
      "response_metadata": {
         "request_id": "5df486a0-343a-11e2-b0d8-d15d0ef48549"
      }
   }
}
```

You can also obtain the same information in text format using the `--output text` option.

Command:

```bash
--output text
```

---

**Actions and scenarios**

5245
option.Command:

```
aws redshift create-cluster-security-group --cluster-security-group-name mysecuritygroup --description "This is my cluster security group" --output text
```

Result:

```
This is my cluster security group   300454760768    mysecuritygroup
a0c0bfab-343a-11e2-95d2-c3dc9fe8ab57
```

- For API details, see [CreateClusterSecurityGroup](#) in *AWS CLI Command Reference*.

### create-cluster-snapshot

The following code example shows how to use `create-cluster-snapshot`.

**AWS CLI**

Create a Cluster Snapshot

This example creates a new cluster snapshot. By default, the output is in JSON format.

Command:

```
aws redshift create-cluster-snapshot --cluster-identifier mycluster --snapshot-identifier my-snapshot-id
```

Result:

```
{
   "Snapshot": {
      "Status": "creating",
      "AvailabilityZone": "us-east-1a",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "SnapshotType": "manual",
      "NodeType": "dw.hs1.xlarge",
      "ClusterIdentifier": "mycluster",
      "Port": 5439,
      "NumberOfNodes": "2",
      "SnapshotIdentifier": "my-snapshot-id"
   }
}
```
create-cluster-subnet-group

The following code example shows how to use create-cluster-subnet-group.

AWS CLI

Create a Cluster Subnet Group
This example creates a new cluster subnet group.

Command:

```bash
aws redshift create-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup --description "My subnet group" --subnet-ids subnet-763fdd1c
```

Result:

```json
{
    "ClusterSubnetGroup": {
        "Subnets": [
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-763fdd1c",
                "SubnetAvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "VpcId": "vpc-7e3fdd14",
        "SubnetGroupStatus": "Complete",
        "Description": "My subnet group",
        "ClusterSubnetGroupName": "mysubnetgroup"
    },
    "ResponseMetadata": {
        "RequestId": "500b8ce2-698f-11e2-9790-fd67517fb6fd"
    }
}
```

For API details, see [CreateClusterSubnetGroup] in AWS CLI Command Reference.

• For API details, see [CreateClusterSnapshot] in AWS CLI Command Reference.
create-cluster

The following code example shows how to use create-cluster.

AWS CLI

Create a Cluster with Minimal Parameters

This example creates a cluster with the minimal set of parameters. By default, the output is in JSON format.

Command:

```
aws redshift create-cluster --node-type dw1.xlarge --number-of-nodes 2 --master-username adminuser --master-user-password TopSecret1 --cluster-identifier mycluster
```

Result:

```
{
    "Cluster": {
        "NodeType": "dw1.xlarge",
        "ClusterVersion": "1.0",
        "PubliclyAccessible": "true",
        "MasterUsername": "adminuser",
        "ClusterParameterGroups": [
            {
                "ParameterApplyStatus": "in-sync",
                "ParameterGroupName": "default.redshift-1.0"
            }
        ],
        "ClusterSecurityGroups": [
            {
                "Status": "active",
                "ClusterSecurityGroupName": "default"
            }
        ],
        "AllowVersionUpgrade": true,
        "VpcSecurityGroups": [],
        "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ClusterStatus": "creating",
        "ClusterIdentifier": "mycluster",
        "DBName": "dev",
        "NumberOfNodes": 2,
        "PendingModifiedValues": {
            "MasterUserPassword": "\****"
        }
    },
    "ResponseMetadata": {
        "RequestId": "0e3f8a3d-4e3d-4f0a-a48a-b7fa375c9750"} 
```
create-event-subscription

The following code example shows how to use create-event-subscription.

AWS CLI

To create a notification subscription for an event

The following create-event-subscription example creates an event notification subscription.

```bash
aws redshift create-event-subscription \
   --subscription-name mysubscription \
   --sns-topic-arn arn:aws:sns:us-west-2:123456789012:MySNStopic \
   --source-type cluster \n   --source-ids mycluster
```

Output:

```json
{}
  "EventSubscription": {
    "CustomerAwsId": "123456789012",
    "CustSubscriptionId": "mysubscription",
    "Status": "active",
    "SubscriptionCreationTime": "2019-12-09T20:05:19.365Z",
    "SourceType": "cluster",
    "SourceIdsList": [
      "mycluster"
    ],
    "EventCategoriesList": [],
    "Severity": "INFO",
    "Enabled": true,
    "Tags": []
  }
}
```
For more information, see Subscribing to Amazon Redshift Event Notifications in the Amazon Redshift Cluster Management Guide.

- For API details, see CreateEventSubscription in AWS CLI Command Reference.

create-hsm-client-certificate

The following code example shows how to use create-hsm-client-certificate.

AWS CLI

To create an HSM client certificate

The following create-hsm-client-certificate example generates an HSM client certificate that a cluster can use to connect to an HSM.

```bash
aws redshift create-hsm-client-certificate \
   --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```json
{
   "HsmClientCertificate": {
      "HsmClientCertificateIdentifier": "myhsmclientcert",
      "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----
MIICiEMQCCGZwAwIBAgITAwRDAQH/MA0GCSqGSIb3DQEBAQUAA4GAIh

Actions and scenarios 5250
```
For more information, see Amazon Redshift API Permissions Reference in the Amazon Redshift Cluster Management Guide.

- For API details, see CreateHsmClientCertificate in AWS CLI Command Reference.

create-hsm-configuration

The following code example shows how to use create-hsm-configuration.

AWS CLI

To create an HSM configuration

The following create-hsm-configuration example creates the specified HSM configuration that contains information required by a cluster to store and use database encryption keys in a hardware security module (HSM).

```bash
aws redshift create-hsm-configuration /
    --hsm-configuration-identifier myhsmconnection
    --description "My HSM connection"
    --hsm-ip-address 192.0.2.09
    --hsm-partition-name myhsmpartition /
    --hsm-partition-password A1b2c3d4 /
    --hsm-server-public-certificate myhsmclientcert
```

Output:

```
{
    "HsmConfiguration": {
        "HsmConfigurationIdentifier": "myhsmconnection",
        "Description": "My HSM connection",
        "HsmIpAddress": "192.0.2.09",
        "HsmPartitionName": "myhsmpartition",
        "Tags": []
    }
}
```

- For API details, see CreateHsmConfiguration in AWS CLI Command Reference.

create-snapshot-copy-grant

The following code example shows how to use create-snapshot-copy-grant.
AWS CLI

**To create a snapshot copy grant**

The following `create-snapshot-copy-grant` example creates a snapshot copy grant and encrypts copied snapshots in a destination AWS Region.

```
aws redshift create-snapshot-copy-grant \
   --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{
   "SnapshotCopyGrant": {
      "SnapshotCopyGrantName": "mysnapshotcopygrantname",
      "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/bPxRfih3yCo8nvbEXAMPLEKEY",
      "Tags": []
   }
}
```

For more information, see [Amazon Redshift Database Encryption](https://docs.aws.amazon.com/redshift/latest/guides/encryption.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateSnapshotCopyGrant](https://docs.aws.amazon.com/redshift/latest/sdk/api/index.html) in *AWS CLI Command Reference*.

**create-snapshot-schedule**

The following code example shows how to use `create-snapshot-schedule`.

**AWS CLI**

**To create snapshot schedule**

The following `create-snapshot-schedule` example creates a snapshot schedule with the specified description and a rate of every 12 hours.

```
aws redshift create-snapshot-schedule \
   --schedule-definitions "rate(12 hours)" \
   --schedule-identifier mysnapshotschedule \
   --schedule-description "My schedule description"
```
Output:

```json
{
    "ScheduleDefinitions": [
        "rate(12 hours)"
    ],
    "ScheduleIdentifier": "mysnapshotschedule",
    "ScheduleDescription": "My schedule description",
    "Tags": []
}
```

For more information, see [Automated Snapshot Schedules](https://docs.aws.amazon.com/redshift/latest/guides/scheduled-snapshots.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateSnapshotSchedule](https://docs.aws.amazon.com/cli/latest/reference/redshift/create-snapshot-schedule.html) in *AWS CLI Command Reference*.

### create-tags

The following code example shows how to use `create-tags`.

**AWS CLI**

**To create tags for a cluster**

The following `create-tags` example adds the specified tag key/value pair to the specified cluster.

```bash
aws redshift create-tags \
  --tags "Key"="mytags","Value"="tag1"
```

This command does not produce any output.

For more information, see [Tagging Resources in Amazon Redshift](https://docs.aws.amazon.com/redshift/latest/guides/cluster-management.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateTags](https://docs.aws.amazon.com/cli/latest/reference/redshift/create-tags.html) in *AWS CLI Command Reference*.

### delete-cluster-parameter-group

The following code example shows how to use `delete-cluster-parameter-group`.

### Actions and scenarios
AWS CLI

Delete a Cluster Parameter Group
This example deletes a cluster parameter group. Command:

```bash
aws redshift delete-cluster-parameter-group --parameter-group-name myclusterparametergroup
```

- For API details, see [DeleteClusterParameterGroup](#) in *AWS CLI Command Reference*.

delete-cluster-security-group

The following code example shows how to use delete-cluster-security-group.

AWS CLI

Delete a Cluster Security Group
This example deletes a cluster security group. Command:

```bash
aws redshift delete-cluster-security-group --cluster-security-group-name mysecuritygroup
```

- For API details, see [DeleteClusterSecurityGroup](#) in *AWS CLI Command Reference*.

delete-cluster-snapshot

The following code example shows how to use delete-cluster-snapshot.

AWS CLI

Delete a Cluster Snapshot
This example deletes a cluster snapshot. Command:

```bash
aws redshift delete-cluster-snapshot --snapshot-identifier my-snapshot-id
```

- For API details, see [DeleteClusterSnapshot](#) in *AWS CLI Command Reference*.

delete-cluster-subnet-group

The following code example shows how to use delete-cluster-subnet-group.

AWS CLI

Delete a Cluster subnet Group
This example deletes a cluster subnet group. Command:
aws redshift delete-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup

Result:

```
{
    "ResponseMetadata": {
        "RequestId": "253fbffd-6993-11e2-bc3a-47431073908a"
    }
}
```

- For API details, see [DeleteClusterSubnetGroup](https://aws.amazon.com/cli/command-reference/) in *AWS CLI Command Reference*.

### delete-cluster

The following code example shows how to use delete-cluster.

**AWS CLI**

Delete a Cluster with No Final Cluster Snapshot

This example deletes a cluster, forcing data deletion so no final cluster snapshot is created.

Command:

```bash
aws redshift delete-cluster --cluster-identifier mycluster --skip-final-cluster-snapshot
```

Delete a Cluster, Allowing a Final Cluster Snapshot

This example deletes a cluster, but specifies a final cluster snapshot.

Command:

```bash
aws redshift delete-cluster --cluster-identifier mycluster --final-cluster-snapshot-identifier myfinalsnapshot
```

- For API details, see [DeleteCluster](https://aws.amazon.com/cli/command-reference/) in *AWS CLI Command Reference*.

### delete-event-subscription

The following code example shows how to use delete-event-subscription.

**AWS CLI**

To delete event subscription
The following delete-event-subscription example deletes the specified event notification subscription.

```
aws redshift delete-event-subscription \
   --subscription-name mysubscription
```

This command does not produce any output.

For more information, see [Subscribing to Amazon Redshift Event Notifications](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteEventSubscription](#) in *AWS CLI Command Reference*.

**delete-hsm-client-certificate**

The following code example shows how to use `delete-hsm-client-certificate`.

**AWS CLI**

**To delete HSM client certificate**

The following `delete-hsm-client-certificate` example deletes an HSM client certificate.

```
aws redshift delete-hsm-client-certificate \
   --hsm-client-certificate-identifier myhsmclientcert
```

This command does not produce any output.

For more information, see [Amazon Redshift API Permissions Reference](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteHsmClientCertificate](#) in *AWS CLI Command Reference*.

**delete-hsm-configuration**

The following code example shows how to use `delete-hsm-configuration`.

**AWS CLI**

**To delete an HSM configuration**
The following delete-hsm-configuration example deletes the specified HSM configuration from the current AWS account.

```bash
aws redshift delete-hsm-configuration /
    --hsm-configuration-identifier myhsmconnection
```

This command does not produce any output.

- For API details, see `DeleteHsmConfiguration` in *AWS CLI Command Reference*.

delete-scheduled-action

The following code example shows how to use delete-scheduled-action.

**AWS CLI**

**To delete scheduled action**

The following delete-scheduled-action example deletes the specified scheduled action.

```bash
aws redshift delete-scheduled-action \
    --scheduled-action-name myscheduledaction
```

This command does not produce any output.

- For API details, see `DeleteScheduledAction` in *AWS CLI Command Reference*.

delete-snapshot-copy-grant

The following code example shows how to use delete-snapshot-copy-grant.

**AWS CLI**

**To delete snapshot copy grant**

The following delete-snapshot-copy-grant example deletes the specified snapshot copy grant.

```bash
aws redshift delete-snapshot-copy-grant \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

This command does not produce any output.
For more information, see Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

- For API details, see DeleteSnapshotCopyGrant in AWS CLI Command Reference.

### delete-snapshot-schedule

The following code example shows how to use delete-snapshot-schedule.

**AWS CLI**

**To delete snapshot schedule**

The following delete-snapshot-schedule example deletes the specified snapshot schedule. You must disassociate clusters before deleting the schedule.

```bash
aws redshift delete-snapshot-schedule \
   --schedule-identifier mysnapshotschedule
```

This command does not produce any output.

For more information, see Automated Snapshot Schedules in the Amazon Redshift Cluster Management Guide.

- For API details, see DeleteSnapshotSchedule in AWS CLI Command Reference.

### delete-tags

The following code example shows how to use delete-tags.

**AWS CLI**

**To delete tags from a cluster**

The following delete-tags example deletes the tags with the specified key names from the specified cluster.

```bash
aws redshift delete-tags \
   --tag-keys "clustertagkey" "clustertagvalue"
```

This command does not produce any output.
For more information, see [Tagging Resources in Amazon Redshift](https://docs.aws.amazon.com/redshift/latest/gsg/pg41-taggingsources.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteTags](https://docs.aws.amazon.com/cli/latest/reference/redshift/delete-tags.html) in *AWS CLI Command Reference*.

### describe-account-attributes

The following code example shows how to use `describe-account-attributes`.

**AWS CLI**

**To describe attributes of an AWS account**

The following `describe-account-attributes` example displays the attributes attached to the calling AWS account.

```bash
aws redshift describe-account-attributes
```

**Output:**

```json
{
   "AccountAttributes": [
      {
         "AttributeName": "max-defer-maintenance-duration",
         "AttributeValues": [
            {
               "AttributeValue": "45"
            }
         ]
      }
   ]
}
```

- For API details, see [DescribeAccountAttributes](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-account-attributes.html) in *AWS CLI Command Reference*.

### describe-cluster-db-revisions

The following code example shows how to use `describe-cluster-db-revisions`.

**AWS CLI**

**To describe DB revisions for a cluster**
The following `describe-cluster-db-revisions` example displays the details of an array of `ClusterDbRevision` objects for the specified cluster.

```bash
aws redshift describe-cluster-db-revisions \
  --cluster-identifier mycluster
```

Output:

```json
{
  "ClusterDbRevisions": [
    {
      "ClusterIdentifier": "mycluster",
      "CurrentDatabaseRevision": "11420",
      "DatabaseRevisionReleaseDate": "2019-11-22T16:43:49.597Z",
      "RevisionTargets": []
    }
  ]
}
```

- For API details, see [DescribeClusterDbRevisions](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-cluster-db-revisions.html) in *AWS CLI Command Reference*.

### describe-cluster-parameter-groups

The following code example shows how to use `describe-cluster-parameter-groups`.

#### AWS CLI

Get a Description of All Cluster Parameter Groups

This example returns a description of all cluster parameter groups for the account, with column headers. By default, the output is in JSON format.

**Command**:

```
aws redshift describe-cluster-parameter-groups
```

**Result**:

```json
{
  "ParameterGroups": [
    {
      "ParameterGroupFamily": "redshift-1.0",
      "Description": "My first cluster parameter group",
    }
  ]
}
```
You can also obtain the same information in text format using the `--output text` option.

Command:

```
--output text
```

```
aws redshift describe-cluster-parameter-groups --output text
```

Result:

```
redshift-1.0        My first cluster parameter group        myclusterparametergroup
RESPONSEMETADATA    9e665a36-64cc-11e2-8f7d-3b939af52818
```

- For API details, see `DescribeClusterParameterGroups` in AWS CLI Command Reference.

**describe-cluster-parameters**

The following code example shows how to use `describe-cluster-parameters`.

**AWS CLI**

Retrieve the Parameters for a Specified Cluster Parameter Group

This example retrieves the parameters for the named parameter group. By default, the output is in JSON format.

Command:

```
aws redshift describe-cluster-parameters --parameter-group-name
myclusterparametergroup
```

Result:

```
{
    "Parameters": [
```
The AWS Command Line Interface User Guide for Version 2 contains documentation on how to set the display format for date and time values using the `datestyle` parameter.

```json
{
    "Description": "Sets the display format for date and time values.",
    "DataType": "string",
    "IsModifiable": true,
    "Source": "engine-default",
    "ParameterValue": "ISO, MDY",
    "ParameterName": "datestyle"
}
{
    "Description": "Sets the number of digits displayed for floating-point values",
    "DataType": "integer",
    "IsModifiable": true,
    "AllowedValues": "-15-2",
    "Source": "engine-default",
    "ParameterValue": "0",
    "ParameterName": "extra_float_digits"
}
(...remaining output omitted...)
```

You can also obtain the same information in text format using the `--output text` option.

**Command:**

```bash
aws redshift describe-cluster-parameters --parameter-group-name myclusterparametergroup --output text
```

**Result:**

```
RESPONSEMETADATA cdac40aa-64cc-11e2-9e70-918437dd236d
Sets the display format for date and time values. string True engine-default
ISO, MDY datestyle
Sets the number of digits displayed for floating-point values integer True
-15-2 engine-default 0 extra_float_digits
This parameter applies a user-defined label to a group of queries that are run
during the same session. string True engine-default default query_group
require ssl for all databaseconnections boolean True true,false engine-
default false require_ssl
```
Sets the schema search order for names that are not schema-qualified.  
string
True    engine-default $user, public search_path
Aborts any statement that takes over the specified number of milliseconds.  
integer
True    engine-default 0 statement_timeout
wlm json configuration      string  True    engine-default
\[{"query_concurrency":5}]      wlm_json_configuration

- For API details, see DescribeClusterParameters in AWS CLI Command Reference.

describe-cluster-security-groups

The following code example shows how to use describe-cluster-security-groups.

AWS CLI

Get a Description of All Cluster Security Groups
This example returns a description of all cluster security groups for the account. By default, the output is in JSON format. Command:

```bash
aws redshift describe-cluster-security-groups
```

Result:

```json
{
   "ClusterSecurityGroups": [
   {
      "OwnerId": "100447751468",
      "Description": "default",
      "ClusterSecurityGroupName": "default",
      "EC2SecurityGroups": 
[],
      "IPRanges": [
      {
         "Status": "authorized",
         "CIDRIP": "0.0.0.0/0"
      }
      ]
   },
   {
      "OwnerId": "100447751468",
      "Description": "This is my cluster security group",
      "ClusterSecurityGroupName": "mysecuritygroup",
      "EC2SecurityGroups": 
[],
      "IPRanges": 
[]
```

Actions and scenarios 5263
describe-cluster-snapshots

The following code example shows how to use describe-cluster-snapshots.

AWS CLI

Get a Description of All Cluster Snapshots

This example returns a description of all cluster snapshots for the account. By default, the output is in JSON format.

Command:

```
aws redshift describe-cluster-snapshots
```

Result:

```
{
  "Snapshots": [
    {
      "Status": "available",
      "SnapshotCreateTime": "2013-07-17T22:02:22.852Z",
      "EstimatedSecondsToCompletion": -1,
      "AvailabilityZone": "us-east-1a",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "Encrypted": false,
      "OwnerAccount": "111122223333",
      "BackupProgressInMegabytes": 20.0,
      "ElapsedTimeInSeconds": 0,
      "DBName": "dev",
      "CurrentBackupRateInMegabytesPerSecond": 0.0,
      "ActualIncrementalBackupSizeInMegabytes": 20.0
    }
  ]
}
```
"NumberOfNodes": "2",
"SnapshotIdentifier": "cm:mycluster-2013-01-22-22-04-18"
},
{
  "EstimatedSecondsToCompletion": 0,
  "OwnerAccount": "111122223333",
  "CurrentBackupRateInMegabytesPerSecond": 0.1534,
  "ActualIncrementalBackupSizeInMegabytes": 11.0,
  "NumberOfNodes": "2",
  "Status": "available",
  "ClusterVersion": "1.0",
  "MasterUsername": "adminuser",
  "AccountsWithRestoreAccess": [
    {
      "AccountID": "444455556666"
    }
  ],
  "TotalBackupSizeInMegabytes": 20.0,
  "DBName": "dev",
  "BackupProgressInMegabytes": 11.0,
  "ElapsedTimeInSeconds": 0,
  "ClusterIdentifier": "mycluster",
  "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
  "AvailabilityZone": "us-east-1a",
  "NodeType": "dw.hs1.xlarge",
  "Encrypted": false,
  "SnapshotType": "manual",
  "Port": 5439,
  "SnapshotIdentifier": "my-snapshot-id"
}]
(...remaining output omitted...)

- For API details, see [DescribeClusterSnapshots](#) in *AWS CLI Command Reference*.

describe-cluster-subnet-groups

The following code example shows how to use `describe-cluster-subnet-groups`.

**AWS CLI**

Get a Description of All Cluster Subnet Groups

This example returns a description of all cluster subnet groups. By default, the output is in JSON format.

Command:
aws redshift describe-cluster-subnet-groups

Result:

```json
{
  "ClusterSubnetGroups": [
    {
      "Subnets": [
        {
          "SubnetStatus": "Active",
          "SubnetIdentifier": "subnet-763fdd1c",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          }
        }
      ],
      "VpcId": "vpc-7e3fdd14",
      "SubnetGroupStatus": "Complete",
      "Description": "My subnet group",
      "ClusterSubnetGroupName": "mysubnetgroup"
    }
  ],
  "ResponseMetadata": {
    "RequestId": "37fa8c89-6990-11e2-8f75-ab4018764c77"
  }
}
```

**describe-cluster-tracks**

The following code example shows how to use `describe-cluster-tracks`.

**AWS CLI**

To describe cluster tracks

The following `describe-cluster-tracks` example displays details of the available maintenance tracks.

```bash
aws redshift describe-cluster-tracks
```
Output:

```json
{
    "MaintenanceTracks": [
        {
            "MaintenanceTrackName": "current",
            "DatabaseVersion": "1.0.11420",
            "UpdateTargets": [
                {
                    "MaintenanceTrackName": "preview_features",
                    "DatabaseVersion": "1.0.11746",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        }
                    ]
                },
                {
                    "MaintenanceTrackName": "trailing",
                    "DatabaseVersion": "1.0.11116",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        },
                        {
                            "OperationName": "modify-cluster"
                        }
                    ]
                }
            ]
        }
    ]
}
```

For more information, see [Choosing Cluster Maintenance Tracks](https://docs.aws.amazon.com/redshift/latestmonton_managementguide/chngcmtnttracks.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeClusterTracks](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-cluster-tracks.html) in *AWS CLI Command Reference*. 
**describe-cluster-versions**

The following code example shows how to use `describe-cluster-versions`.

### AWS CLI

Get a Description of All Cluster Versions

This example returns a description of all cluster versions. By default, the output is in JSON format.

Command:

```
aws redshift describe-cluster-versions
```

Result:

```
{
   "ClusterVersions": [
   {
      "ClusterVersion": "1.0",
      "Description": "Initial release",
      "ClusterParameterGroupFamily": "redshift-1.0"
   },
   "ResponseMetadata": {
      "RequestId": "16a53de3-64cc-11e2-bec0-17624ad140dd"
   }
}
```

- For API details, see [DescribeClusterVersions](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-cluster-versions.html) in *AWS CLI Command Reference*.

**describe-clusters**

The following code example shows how to use `describe-clusters`.

### AWS CLI

Get a Description of All Clusters

This example returns a description of all clusters for the account. By default, the output is in JSON format.

Command:

```
aws redshift describe-clusters
```

Result:

```
{
}
```
"Clusters": [
  {
    "NodeType": "dw.hs1.xlarge",
    "Endpoint": {
      "Port": 5439,
      "Address": "mycluster.coqoranqslhmsn.us-east-1.redshift.amazonaws.com"
    },
    "ClusterVersion": "1.0",
    "PubliclyAccessible": "true",
    "MasterUsername": "adminuser",
    "ClusterParameterGroups": [
      {
        "ParameterApplyStatus": "in-sync",
        "ParameterGroupName": "default.redshift-1.0"
      }
    ],
    "ClusterSecurityGroups": [
      {
        "Status": "active",
        "ClusterSecurityGroupName": "default"
      }
    ],
    "AllowVersionUpgrade": true,
    "VpcSecurityGroups": [],
    "AvailabilityZone": "us-east-1a",
    "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
    "AutomatedSnapshotRetentionPeriod": 1,
    "ClusterStatus": "available",
    "ClusterIdentifier": "mycluster",
    "DBName": "dev",
    "NumberOfNodes": 2,
    "PendingModifiedValues": {} 
  }
],
"ResponseMetadata": {
  "RequestId": "65b71cac-64df-11e2-8f5b-e90bd6c77476"
}
}
For API details, see DescribeClusters in AWS CLI Command Reference.

describe-default-cluster-parameters

The following code example shows how to use describe-default-cluster-parameters.

AWS CLI

Get a Description of Default Cluster Parameters

This example returns a description of the default cluster parameters for the redshift-1.0 family. By default, the output is in JSON format.

Command:

```
aws redshift describe-default-cluster-parameters --parameter-group-family redshift-1.0
```

Result:

```
{
  "DefaultClusterParameters": {
    "ParameterGroupFamily": "redshift-1.0",
    "Parameters": [
      {
        "Description": "Sets the display format for date and time values.",
        "DataType": "string",
        "IsModifiable": true,
        "Source": "engine-default",
        "ParameterValue": "ISO, MDY",
        "ParameterName": "datestyle"
      }
    ]
  }
}
```
To see a list of valid parameter group families, use the describe-cluster-parameter-groups command.

describe-cluster-parameter-groups command.

- For API details, see DescribeDefaultClusterParameters in AWS CLI Command Reference.

describe-event-categories

The following code example shows how to use describe-event-categories.

AWS CLI

To describe event categories for a cluster

The following describe-event-categories example displays details for the event categories for a cluster.

```
aws redshift describe-event-categories \
  --source-type cluster
```

Output:

```
{
```
"EventCategoriesMapList": [
    {
        "SourceType": "cluster",
        "Events": [
            {
                "EventId": "REDSHIFT-EVENT-2000",
                "EventCategories": [
                    "management"
                ],
                "EventDescription": "Cluster <cluster name> created at <time in UTC>.",
                "Severity": "INFO"
            },
            {
                "EventId": "REDSHIFT-EVENT-2001",
                "EventCategories": [
                    "management"
                ],
                "EventDescription": "Cluster <cluster name> deleted at <time in UTC>.",
                "Severity": "INFO"
            },
            {
                "EventId": "REDSHIFT-EVENT-3625",
                "EventCategories": [
                    "monitoring"
                ],
                "EventDescription": "The cluster <cluster name> can't be resumed with its previous elastic network interface <ENI id>. We will allocate a new elastic network interface and associate it with the cluster node.",
                "Severity": "INFO"
            }
        ]
    }
]

- For API details, see [DescribeEventCategories](#) in AWS CLI Command Reference.

**describe-event-subscriptions**

The following code example shows how to use describe-event-subscriptions.
To describe event subscriptions

The following `describe-event-subscriptions` example displays event notification subscriptions for the specified subscription.

```bash
aws redshift describe-event-subscriptions \
  --subscription-name mysubscription
```

Output:

```json
{
  "EventSubscriptionsList": [
    {
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "mysubscription",
      "Status": "active",
      "SourceIdsList": [],
      "EventCategoriesList": [
        "management"
      ],
      "Severity": "ERROR",
      "Enabled": true,
      "Tags": []
    }
  ]
}
```

For more information, see [Subscribing to Amazon Redshift Event Notifications](https://docs.aws.amazon.com/redshift/latest/gsg/subscribing-to-event-notifications.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeEventSubscriptions](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-event-subscriptions.html) in AWS CLI Command Reference.

**describe-events**

The following code example shows how to use `describe-events`.

Actions and scenarios
AWS CLI

Describe All Events

This example returns all events. By default, the output is in JSON format. Command:

```
aws redshift describe-events
```

Result:

```json
{
   "Events": [
      {
         "Date": "2013-01-22T19:17:03.640Z",
         "SourceIdentifier": "myclusterparametergroup",
         "Message": "Cluster parameter group myclusterparametergroup has been created."
      },
      {
         "SourceType": "cluster-parameter-group"
      }
   ],
   "ResponseMetadata": {
      "RequestId": "9f056111-64c9-11e2-9390-ff04f2c1e638"
   }
}
```

You can also obtain the same information in text format using the `--output text` option. Command:

```
--output text
```

Command:

```
aws redshift describe-events --output text
```

Result:

```
2013-01-22T19:17:03.640Z  myclusterparametergroup Cluster parameter group myclusterparametergroup has been created.  cluster-parameter-group
RESPONSEMETADATA  8e5fe765-64c9-11e2-bce3-e56f52c50e17
```

- For API details, see [DescribeEvents](#) in AWS CLI Command Reference.
**describe-hsm-client-certificates**

The following code example shows how to use `describe-hsm-client-certificates`.

**AWS CLI**

**To describe HSM client certificates**

The following `describe-hsm-client-certificates` example displays details for the specified HSM client certificate.

```bash
aws redshift describe-hsm-client-certificates \
  --hsm-client-certificate-identifier myhsmclientcert
```

**Output:**

```json
{
  "HsmClientCertificates": [
    {
      "HsmClientCertificateIdentifier": "myhsmclientcert",
      "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----
EXAMPLECafICCQD6m70Rw0x0jANBkgkqkhiG9w0BAQUFADCBiDELMakGA1UEBhMC
VVMxCzAJBgNVBAEiRERAYDQGHEwdTWF0dGx1MQ8wDQYDVQFKEwZBbWF6
b24xFDAASgNBVAsTC01BTSDBdb25zEXAMPIExEAYDVQQDe1UXNsQ2lsYWMxHAd
BgkqhkiG9w0BCQEiEQQDE1UXNsQ2lsYWMxHAd
-----END CERTIFICATE-----"
    }
  ],
  "Tags": []
}
```

For more information, see [Amazon Redshift API Permissions Reference](https://docs.aws.amazon.com/redshift/latest/dg/API_PermissionsReference.html) in the *Amazon Redshift Cluster Management Guide*. 
describe-hsm-configurations

The following code example shows how to use describe-hsm-configurations.

AWS CLI

To describe HSM configurations

The following describe-hsm-configurations example displays details for the available HSM configurations for the calling AWS account.

```bash
aws redshift describe-hsm-configurations /
   --hsm-configuration-identifier myhsmconnection
```

Output:

```json
{
   "HsmConfigurations": [
   {
   "HsmConfigurationIdentifier": "myhsmconnection",
   "Description": "My HSM connection",
   "HsmIpAddress": "192.0.2.09",
   "HsmPartitionName": "myhsmpartition",
   "Tags": []
   }
   ]
}
```

• For API details, see DescribeHsmConfigurations in AWS CLI Command Reference.

describe-logging-status

The following code example shows how to use describe-logging-status.

AWS CLI

To describe logging status for a cluster

The following describe-logging-status example displays whether information, such as queries and connection attempts, is being logged for a cluster.
aws redshift describe-logging-status \
   --cluster-identifier mycluster

Output:

{
   "LoggingEnabled": false
}

For more information, see Database Audit Logging in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeLoggingStatus in AWS CLI Command Reference.

describe-node-configuration-options

The following code example shows how to use describe-node-configuration-options.

AWS CLI

To describe node configuration options

The following describe-node-configuration-options example displays the properties of possible node configurations such as node type, number of nodes, and disk usage for the specified cluster snapshot.

aws redshift describe-node-configuration-options \
   --action-type restore-cluster \
   --snapshot-identifier rs:mycluster-2019-12-09-16-42-43

Output:

{  
   "NodeConfigurationOptionList": [
      {
         "NodeType": "dc2.large",
         "NumberOfNodes": 2,
         "EstimatedDiskUtilizationPercent": 19.61
      },
      {
         "NodeType": "dc2.large",
         "NumberOfNodes": 2,
         "EstimatedDiskUtilizationPercent": 19.61
      }
   ]
}
For more information, see Purchasing Amazon Redshift Reserved Nodes in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeNodeConfigurationOptions in AWS CLI Command Reference.

**describe-orderable-cluster-options**

The following code example shows how to use describe-orderable-cluster-options.

**AWS CLI**

Describing All Orderable Cluster Options

This example returns descriptions of all orderable cluster options. By default, the output is in JSON format.

Command:

```
aws redshift describe-orderable-cluster-options
```

Result:

```
{
    "OrderableClusterOptions": [
        {
            "NodeType": "dw.hs1.8xlarge",
            "AvailabilityZones": [
                { "Name": "us-east-1a" },
                { "Name": "us-east-1b" },
                { "Name": "us-east-1c" } ]
        }
    ]
}
```
You can also obtain the same information in text format using the --output text option. Command:

```bash
aws redshift describe-orderable-cluster-options --output text
```

**Result:**

<table>
<thead>
<tr>
<th>NodeType</th>
<th>ClusterVersion</th>
<th>ClusterType</th>
<th>AvailabilityZones</th>
</tr>
</thead>
<tbody>
<tr>
<td>dw.hs1.8xlarge</td>
<td>1.0</td>
<td>multi-node</td>
<td>us-east-1a</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>us-east-1b</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>us-east-1c</td>
</tr>
<tr>
<td>dw.hs1.xlarge</td>
<td>1.0</td>
<td>multi-node</td>
<td>us-east-1a</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>us-east-1b</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>us-east-1c</td>
</tr>
</tbody>
</table>

Actions and scenarios
For API details, see `DescribeOrderableClusterOptions` in *AWS CLI Command Reference*.

**describe-reserved-node-offerings**

The following code example shows how to use `describe-reserved-node-offerings`.

**AWS CLI**

*Describe Reserved Node Offerings* This example shows all of the reserved node offerings that are available for purchase.

**Command:**

```bash
aws redshift describe-reserved-node-offerings
```

**Result:**

```json
{
  "ReservedNodeOfferings": [
  {
    "OfferingType": "Heavy Utilization",
    "FixedPrice": "",
    "NodeType": "dw.hs1.xlarge",
    "UsagePrice": "",
    "RecurringCharges": [
    {
      "RecurringChargeAmount": "",
      "RecurringChargeFrequency": "Hourly"
    } ],
    "Duration": 31536000,
    "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
  },
  {
    "OfferingType": "Heavy Utilization",
    "FixedPrice": "",
    "NodeType": "dw.hs1.8xlarge",
    "UsagePrice": "",
    "RecurringCharges": [
    {
      "RecurringChargeAmount": "",
      "RecurringChargeFrequency": "Hourly"
    } ],
    "Duration": 31536000,
    "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
  }
}
```
If you want to purchase a reserved node offering, you can call `purchase-reserved-node-offering` using a valid `ReservedNodeOfferingId`.

For API details, see `DescribeReservedNodeOfferings` in `AWS CLI Command Reference`.

**describe-reserved-nodes**

The following code example shows how to use `describe-reserved-nodes`.

**AWS CLI**

Command:

```bash
aws redshift describe-reserved-nodes
```

Result:

```json
{
}
```
For API details, see [DescribeReservedNodes](#) in [AWS CLI Command Reference](#).

**describe-resize**

The following code example shows how to use describe-resize.

**AWS CLI**

Describe Resize

This example describes the latest resize of a cluster. The request was for 3 nodes of type `dw.hs1.8xlarge`.

Command:

```bash
aws redshift describe-resize --cluster-identifier mycluster
```

Result:

```json
{
  "Status": "NONE",
  "TargetClusterType": "multi-node",
  "ReservedNodes": [
    {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": "",
      "NodeType": "dw.hs1.xlarge",
      "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c",
      "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
      "UsagePrice": "",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": "",
          "RecurringChargeFrequency": "Hourly"
        }
      ],
      "NodeCount": 1,
      "State": "payment-pending",
      "StartTime": "2013-02-13T17:08:39.051Z",
      "Duration": 31536000
    }
  ]
}
```
"TargetNode-Type": "dw.hs1.8xlarge",
"ResponseMetadata": {
    "RequestId": "9f52b0b4-7733-11e2-aa9b-318b2909bd27"
},
"TargetNumberOfNodes": "3"
}

- For API details, see [DescribeResume](#) in [AWS CLI Command Reference](#).

**describe-scheduled-actions**

The following code example shows how to use `describe-scheduled-actions`.

**AWS CLI**

**To describe scheduled actions**

The following `describe-scheduled-actions` example displays details for any currently scheduled actions.

```bash
aws redshift describe-scheduled-actions
```

**Output:**

```json
{
    "ScheduledActions": [
        {
            "ScheduledActionName": "resizecluster",
            "TargetAction": {
                "ResizeCluster": {
                    "ClusterIdentifier": "mycluster",
                    "NumberOfNodes": 4,
                    "Classic": false
                }
            },
            "Schedule": "at(2019-12-10T00:07:00)",
            "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
            "State": "ACTIVE",
            "NextInvocations": [
                "2019-12-10T00:07:00Z"
            ]
        }
    ]
}
```
describe-snapshot-copy-grants

The following code example shows how to use describe-snapshot-copy-grants.

**AWS CLI**

**To describe snapshot copy grants**

The following describe-snapshot-copy-grants example displays details for the specified cluster snapshot copy grant.

```bash
aws redshift describe-snapshot-copy-grants \\
   --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```json
{
   "SnapshotCopyGrants": [
      {
         "SnapshotCopyGrantName": "mysnapshotcopygrantname",
         "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/bPxRfh3yCo8nVbEXAMPLEKEY",
         "Tags": []
      }
   ]
}
```

For more information, see [Amazon Redshift Database Encryption](https://docs.aws.amazon.com/redshift/latest/userguide/encryption.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeSnapshotCopyGrants](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-snapshot-copy-grants.html) in *AWS CLI Command Reference*.

describe-snapshot-schedules

The following code example shows how to use describe-snapshot-schedules.

```bash
aws redshift describe-snapshot-schedules
```

For more information, see [Amazon Redshift Database Encryption](https://docs.aws.amazon.com/redshift/latest/userguide/encryption.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeSnapshotCopyGrants](https://docs.aws.amazon.com/cli/latest/reference/redshift/describe-snapshot-copy-grants.html) in *AWS CLI Command Reference*. 
AWS CLI

To describe snapshot schedules

The following describe-snapshot-schedules example displays details for the specified cluster snapshot schedule.

```
aws redshift describe-snapshot-schedules \
   --cluster-identifier mycluster \
   --schedule-identifier mysnapshotschedule
```

Output:

```
{
   "SnapshotSchedules": [
      {
         "ScheduleDefinitions": [
            "rate(12 hours)"
         ],
         "ScheduleIdentifier": "mysnapshotschedule",
         "ScheduleDescription": "My schedule description",
         "Tags": [],
         "AssociatedClusterCount": 1,
         "AssociatedClusters": [
            {
               "ClusterIdentifier": "mycluster",
               "ScheduleAssociationState": "ACTIVE"
            }
         ]
      }
   ]
}
```

For more information, see Automated Snapshot Schedules in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeSnapshotSchedules in AWS CLI Command Reference.

describe-storage

The following code example shows how to use describe-storage.
AWS CLI

To describe storage

The following describe-storage example displays details about the backup storage and provisional storage sizes for the account.

aws redshift describe-storage

Output:

```
{
  "TotalBackupSizeInMegaBytes": 193149.0,
  "TotalProvisionedStorageInMegaBytes": 655360.0
}
```

For more information, see Managing Snapshot Storage in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeStorage in AWS CLI Command Reference.

describe-table-restore-status

The following code example shows how to use describe-table-restore-status.

AWS CLI

To describe status of table restore requests from a cluster snapshot

The following describe-table-restore-status example displays details for table restore requests made for the specified cluster.

aws redshift describe-table-restore-status /
   --cluster-identifier mycluster

Output:

```
{
  "TableRestoreStatusDetails": [
    {
      "TableRestoreRequestId": "z1116630-0e80-46f4-ba86-bd9670411ebd",
      "Status": "IN_PROGRESS",
    }
  ]
}
```
For more information, see **Restoring a Table from a Snapshot** in the *Amazon Redshift Cluster Management Guide*.

- For API details, see **DescribeTableRestoreStatus** in *AWS CLI Command Reference*.

**describe-tags**

The following code example shows how to use `describe-tags`.

**AWS CLI**

**To describe tags**

The following `describe-tags` example displays the resources the specified cluster associated with the specified tag names and values.

```bash
aws redshift describe-tags 
   --tag-keys clustertagkey 
   --tag-values clustertagvalue
```

**Output:**

```json
{
   "TaggedResources": [
      {
         "Tag": {
            "Key": "clustertagkey",
            "Value": "clustertagvalue"
         }
      }
   ]
}
```
  "ResourceType": "cluster"
}
]
}

For more information, see Tagging Resources in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

- For API details, see DescribeTags in AWS CLI Command Reference.

**disable-snapshot-copy**

The following code example shows how to use disable-snapshot-copy.

**AWS CLI**

**To disable snapshot copy for a cluster**

The following disable-snapshot-copy example disables the automatic copy of a snapshot for the specified cluster.

```bash
aws redshift disable-snapshot-copy \
  --cluster-identifier mycluster
```

Output:

```json
{
  "Cluster": {
    "ClusterIdentifier": "mycluster",
    "NodeType": "dc2.large",
    "ClusterStatus": "available",
    "ClusterAvailabilityStatus": "Available",

The following code example shows how to use `enable-snapshot-copy`.

**AWS CLI**

**To enable snapshot copy for a cluster**

The following `enable-snapshot-copy` example enables the automatic copy of a snapshot for the specified cluster.

```
aws redshift enable-snapshot-copy
   --cluster-identifier mycluster
   --destination-region us-west-1
```

**Output:**

```
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",

- For API details, see EnableSnapshotCopy in AWS CLI Command Reference.

get-cluster-credentials

The following code example shows how to use get-cluster-credentials.

AWS CLI

To get cluster credentials for an AWS account

The following get-cluster-credentials example retrieves temporary credentials that enable access to an Amazon Redshift database.

aws redshift get-cluster-credentials \
  --db-user adminuser --db-name dev \
  --cluster-identifier mycluster

Output:

{
  "DbUser": "IAM:adminuser",
  "DbPassword": "AMAFUyyuros/QjxPTtgcsuQsqzIasdzJEN04aCtWDzXx109dGumpkBtvEeqFly/
EXAMPLE==",
  "Expiration": "2019-12-10T17:25:05.770Z"
}

For more information, see Generating IAM Database Credentials Using the Amazon Redshift CLI or API in the Amazon Redshift Cluster Management Guide.

- For API details, see GetClusterCredentials in AWS CLI Command Reference.
get-reserved-node-exchange-offerings

The following code example shows how to use get-reserved-node-exchange-offerings.

AWS CLI

To get reserved node exchange offerings

The following get-reserved-node-exchange-offerings example retrieves an array of DC2 ReservedNodeOfferings that match the specified DC1 reserved node.

```bash
aws redshift get-reserved-node-exchange-offerings \
  --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```json
{
  "ReservedNodeOfferings": [
    {
      "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
      "NodeType": "dc2.large",
      "Duration": 31536000,
      "FixedPrice": 0.0,
      "UsagePrice": 0.0,
      "CurrencyCode": "USD",
      "OfferingType": "All Upfront",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": 0.0,
          "RecurringChargeFrequency": "Hourly"
        }
      ],
      "ReservedNodeOfferingType": "Regular"
    }
  ]
}
```

For more information, see [Upgrading Reserved Nodes With the AWS CLI](https://docs.aws.amazon.com/redshift/latest/gsg/upgradingReservedNodes.html) in the Amazon Redshift Cluster Management Guide.

modify-cluster-iam-roles

The following code example shows how to use modify-cluster-iam-roles.

AWS CLI

To modify the IAM role for a cluster

The following modify-cluster-iam-roles example removes the specified AWS IAM role from the specified cluster.

```
aws redshift modify-cluster-iam-roles \
   --cluster-identifier mycluster \
   --remove-iam-roles arn:aws:iam::123456789012:role/myRedshiftRole
```

Output:

```
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",
      "ClusterStatus": "available",
      "ClusterAvailabilityStatus": "Available",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "Endpoint": {
         "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
         "Port": 5439
      },
      "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
      "AutomatedSnapshotRetentionPeriod": 3,
      "ManualSnapshotRetentionPeriod": -1,
      "ClusterSecurityGroups": [],
      "VpcSecurityGroups": [
         {
            "VpcSecurityGroupId": "sh-f9b731sd",
            "Status": "active"
         }
      ],
      "ClusterParameterGroups": [
         {
            "ParameterGroupName": "default.redshift-1.0",
            "ParameterApplyStatus": "in-sync"
         }
      ]
   }
}
```
For more information, see Using Identity-Based Policies (IAM Policies) for Amazon Redshift in the Amazon Redshift Cluster Management Guide.

- For API details, see ModifyClusterIamRoles in AWS CLI Command Reference.
**modify-cluster-maintenance**

The following code example shows how to use `modify-cluster-maintenance`.

### AWS CLI

**To modify cluster maintenance**

The following `modify-cluster-maintenance` example defers the maintenance of the specified cluster by 30 days.

```bash
aws redshift modify-cluster-maintenance \
   --cluster-identifier mycluster \
   --defer-maintenance \
   --defer-maintenance-duration 30
```

**Output:**

```json
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",
      "ClusterStatus": "available",
      "ClusterAvailabilityStatus": "Available",
      "MasterUsername": "adminuser",
      "DBName": "dev",

modify-cluster-parameter-group

The following code example shows how to use modify-cluster-parameter-group.

AWS CLI

Modify a parameter in a parameter group

The following modify-cluster-parameter-group example modifies the wlm_json_configuration parameter for workload management. It accepts the parameters from a file that contains the JSON contents shown below.

```bash
aws redshift modify-cluster-parameter-group 
  --parameter-group-name myclusterparametergroup 
  --parameters file://modify_pg.json
```

Contents of modify_pg.json:

```json
[
  {
    "ParameterName": "wlm_json_configuration",
    "ParameterValue": "[{"user_group":"example_user_group1","query_group":"example_query_group1", "query_concurrency":7},{"query_concurrency":5}]"
  }
]
```

Output:

```json
{
  "ParameterGroupStatus": "Your parameter group has been updated but changes won't get applied until you reboot the associated Clusters.",
  "ParameterGroupName": "myclusterparametergroup",
  "ResponseMetadata": {
    "RequestId": "09974cc0-64cd-11e2-bea9-49e0ce183f07"
  }
}
```
modify-cluster-snapshot-schedule

The following code example shows how to use modify-cluster-snapshot-schedule.

AWS CLI

To modify cluster snapshot schedule

The following modify-cluster-snapshot-schedule example removes the specified snapshot schedule from the specified cluster.

```
aws redshift modify-cluster-snapshot-schedule \
    --cluster-identifier mycluster \
    --schedule-identifier mysnapshotschedule \
    --disassociate-schedule
```

This command does not produce any output.

For more information, see Automated Snapshot Schedules in the Amazon Redshift Cluster Management Guide.

modify-cluster-snapshot

The following code example shows how to use modify-cluster-snapshot.

AWS CLI

To modify cluster snapshot

The following modify-cluster-snapshot example sets the manual retention period setting for the specified cluster snapshot to value of 10 days.

```
aws redshift modify-cluster-snapshot \
    --snapshot-identifier mycluster-2019-11-06-16-32 \
    --manual-snapshot-retention-period 10
```

Output:
For more information, see Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

- For API details, see ModifyClusterSnapshot in AWS CLI Command Reference.
**modify-cluster-subnet-group**

The following code example shows how to use `modify-cluster-subnet-group`.

### AWS CLI

Modify the Subnets in a Cluster Subnet Group

This example shows how to modify the list of subnets in a cache subnet group. By default, the output is in JSON format.

**Command:**

```bash
aws redshift modify-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup --subnet-ids subnet-763fdd1 subnet-ac830e9
```

**Result:**

```json
{
  "ClusterSubnetGroup": {
    "Subnets": [
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-763fdd1c",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1a"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-ac830e9",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1b"
        }
      }
    ],
    "VpcId": "vpc-7e3fdd14",
    "SubnetGroupStatus": "Complete",
    "Description": "My subnet group",
    "ClusterSubnetGroupName": "mysubnetgroup"
  },
  "ResponseMetadata": {
    "RequestId": "8da93e89-8372-f936-93a8-873918938197a"
  }
}
```

- For API details, see [ModifyClusterSubnetGroup](https://docs.aws.amazon.com/cli/latest/reference/redshift/modify-cluster-subnet-group.html) in *AWS CLI Command Reference*. 
**modify-cluster**

The following code example shows how to use `modify-cluster`.

**AWS CLI**

Associate a Security Group with a Cluster

This example shows how to associate a cluster security group with the specified cluster. Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --cluster-security-groups mysecuritygroup
```

Modify the Maintenance Window for a Cluster

This shows how to change the weekly preferred maintenance window for a cluster to be the minimum four hour window starting Sundays at 11:15 PM, and ending Mondays at 3:15 AM. Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --preferred-maintenance-window Sun:23:15-Mon:03:15
```

Change the Master Password for the Cluster

This example shows how to change the master password for a cluster. Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --master-user-password A1b2c3d4
```

- For API details, see [ModifyCluster](https://docs.aws.amazon.com/AWS Command Reference) in *AWS CLI Command Reference*.

**modify-event-subscription**

The following code example shows how to use `modify-event-subscription`.

**AWS CLI**

**To modify event subscription**

The following `modify-event-subscription` example disables the specified event notification subscription.

```
aws redshift modify-event-subscription \
   --subscription-name mysubscription \
   --no-enabled
```
modify-scheduled-action

The following code example shows how to use `modify-scheduled-action`.

**AWS CLI**

**To modify scheduled action**

The following `modify-scheduled-action` example adds a description to the specified existing scheduled action.

```
aws redshift modify-scheduled-action \
  --scheduled-action-name myscheduledaction \ 
  --scheduled-action-description "My scheduled action"
```

**Output:**

```
{

```

For more information, see [Subscribing to Amazon Redshift Event Notifications](https://docs.aws.amazon.com/redshift/latest/gsg/subscribing-to-events.html) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifyEventSubscription](https://docs.aws.amazon.com/cli/latest/reference/redshift/modify-scheduled-action.html) in *AWS CLI Command Reference*. 

---

**modify-scheduled-action**

The following code example shows how to use `modify-scheduled-action`.

**AWS CLI**

**To modify scheduled action**

The following `modify-scheduled-action` example adds a description to the specified existing scheduled action.

```
aws redshift modify-scheduled-action \
  --scheduled-action-name myscheduledaction \ 
  --scheduled-action-description "My scheduled action"
```

**Output:**

```
{
```
"ScheduledActionName": "myscheduledaction",
"TargetAction": {
    "ResizeCluster": {
      "ClusterIdentifier": "mycluster",
      "NumberOfNodes": 2,
      "Classic": false
    }
  },
  "Schedule": "at(2019-12-25T00:00:00)",
  "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
  "ScheduledActionDescription": "My scheduled action",
  "State": "ACTIVE",
  "NextInvocations": [
    "2019-12-25T00:00:00Z"
  ]
}

**modify-snapshot-copy-retention-period**

The following code example shows how to use `modify-snapshot-copy-retention-period`.

**AWS CLI**

**To modify snapshot copy retention period**

The following `modify-snapshot-copy-retention-period` example modifies the number of days to retain snapshots for the specified cluster in the destination AWS Region after they are copied from the source AWS Region.

```
aws redshift modify-snapshot-copy-retention-period \
  --cluster-identifier mycluster \
  --retention-period 15
```

**Output:**

```
{
  "Cluster": {
    "ClusterIdentifier": "mycluster",
    "NodeType": "dc2.large",
    "ClusterStatus": "available",
```

For more information, see Snapshot Schedule Format in the Amazon Redshift Cluster Management Guide.

- For API details, see ModifySnapshotCopyRetentionPeriod in AWS CLI Command Reference.

modify-snapshot-schedule

The following code example shows how to use modify-snapshot-schedule.

AWS CLI

To modify snapshot schedule

The following modify-snapshot-schedule example modifies the rate of the specified snapshot schedule to every 10 hours.

```bash
aws redshift modify-snapshot-schedule \
  --schedule-identifier mysnapshotschedule \
  --schedule-definitions "rate(10 hours)"
```

Output:

```json
{
  "ScheduleDefinitions": [
```
"rate(10 hours)
],
"ScheduleIdentifier": "mysnapshotschedule",
"ScheduleDescription": "My schedule description",
"Tags": []
}

For more information, see [Snapshot Schedule Format](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifySnapshotSchedule](#) in *AWS CLI Command Reference*.

**purchase-reserved-node-offering**

The following code example shows how to use `purchase-reserved-node-offering`.

**AWS CLI**

Purchase a Reserved Node

This example shows how to purchase a reserved node offering. The `reserved-node-offering-id` is obtained by calling `describe-reserved-node-offerings`. Command:

```
aws redshift purchase-reserved-node-offering --reserved-node-offering-id ceb6a579-cf4c-4343-be8b-d832c45ab51c
```

Result:

```
{
   "ReservedNode": {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": ",",
      "NodeType": "dw.hs1.xlarge",
      "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
      "UsagePrice": ",",
      "RecurringCharges": [
         {
            "RecurringChargeAmount": ",",
            "RecurringChargeFrequency": "Hourly"
         }
      ],
      "NodeCount": 1,
```
For API details, see [PurchaseReservedNodeOffering](https://docs.aws.amazon.com/cli/latest/reference/redshift/purchase-reserved-node-offering) in *AWS CLI Command Reference*.

### reboot-cluster

The following code example shows how to use `reboot-cluster`.

**AWS CLI**

Reboot a Cluster
This example reboots a cluster. By default, the output is in JSON format.

**Command:**

```bash
aws redshift reboot-cluster --cluster-identifier mycluster
```

**Result:**

```json
{
   "Cluster": {
      "NodeType": "dw.hs1.xlarge",
      "Endpoint": {
         "Port": 5439,
         "Address": "mycluster.coqoarplqhsn.us-east-1.redshift.amazonaws.com"
      },
      "ClusterVersion": "1.0",
      "PubliclyAccessible": "true",
      "MasterUsername": "adminuser",
      "ClusterParameterGroups": [
         {
            "ParameterApplyStatus": "in-sync",
            "ParameterGroupName": "default.redshift-1.0"
         }
      ],
      "ClusterSecurityGroups": [
      ]
   }
}
```
aws redshift reset-cluster-parameter-group --parameter-group-name myclusterparametergroup --reset-all-parameters

For API details, see `ResetClusterParameterGroup` in AWS CLI Command Reference.

**resize-cluster**

The following code example shows how to use `resize-cluster`.

```
aws redshift resize-cluster --instance-identifier mycluster --node-type large
```

For API details, see `ResizeCluster` in AWS CLI Command Reference.
AWS CLI

To resize cluster

The following `resize-cluster` example resizes the specified cluster.

```
aws redshift resize-cluster \
   --cluster-identifier mycluster \
   --cluster-type multi-node \
   --node-type dc2.large \
   --number-of-nodes 6 \n   --classic
```

Output:

```
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",
      "ClusterStatus": "resizing",
      "ClusterAvailabilityStatus": "Modifying",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "Endpoint": {

  }
],
"NextMaintenanceWindowStartTime": "2020-01-11T16:00:00Z",
"ResizeInfo": {
  "ResizeType": "ClassicResize",
  "AllowCancelResize": true
}
For more information, see Resizing a Cluster in the Amazon Redshift Cluster Management Guide.

- For API details, see ResizeCluster in AWS CLI Command Reference.

**restore-from-cluster-snapshot**

The following code example shows how to use restore-from-cluster-snapshot.

**AWS CLI**

Restore a Cluster From a Snapshot

This example restores a cluster from a snapshot.

Command:

```
aws redshift restore-from-cluster-snapshot --cluster-identifier mycluster-clone --snapshot-identifier my-snapshot-id
```

Result:

```json
{
    "Cluster": {
        "NodeType": "dw.hs1.xlarge",
        "ClusterVersion": "1.0",
        "PubliclyAccessible": "true",
        "MasterUsername": "adminuser",
        "ClusterParameterGroups": [
            {
                "ParameterApplyStatus": "in-sync",
                "ParameterGroupName": "default.redshift-1.0"
            }
        ],
        "ClusterSecurityGroups": [
            {
                "Status": "active",
                "ClusterSecurityGroupName": "default"
            }
        ],
        "AllowVersionUpgrade": true,
        "VpcSecurityGroups": [],
        "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
        "AutomatedSnapshotRetentionPeriod": 1,
        "ClusterStatus": "creating",
        "ClusterIdentifier": "mycluster-clone",
        "DBName": "dev",
        "NumberOfNodes": 2,
    }
}
```
For API details, see `RestoreFromClusterSnapshot` in *AWS CLI Command Reference*.

**restore-table-from-cluster-snapshot**

The following code example shows how to use `restore-table-from-cluster-snapshot`.

**AWS CLI**

**To restore table from a cluster snapshot**

The following `restore-table-from-cluster-snapshot` example creates a new table from the specified table in the specified cluster snapshot.

```bash
```

**Output:**

```
{
  "TableRestoreStatus": {
    "TableRestoreRequestId": "a123a12b-abc1-1a1a-a123-a1234ab12345",
    "Status": "PENDING",
    "RequestTime": "2019-12-20T00:20:16.402Z",
    "ClusterIdentifier": "mycluster",
    "SnapshotIdentifier": "mycluster-2019-11-19-16-17",
    "SourceDatabaseName": "dev",
    "SourceSchemaName": "public",
    "SourceTableName": "mytable",
  }
}
```
"TargetDatabaseName": "dev",
"TargetSchemaName": "public",
"NewTableName": "mytable-clone"
}
}

For more information, see Restoring a Table from a Snapshot in the Amazon Redshift Cluster Management Guide.

- For API details, see RestoreTableFromClusterSnapshot in AWS CLI Command Reference.

**revoke-cluster-security-group-ingress**

The following code example shows how to use revoke-cluster-security-group-ingress.

**AWS CLI**

Revoke Access from an EC2 Security Group
This example revokes access to a named Amazon EC2 security group.

Command:

```bash
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-owner-id 123445677890
```

Revoking Access to a CIDR range
This example revokes access to a CIDR range.

Command:

```bash
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see RevokeClusterSecurityGroupIngress in AWS CLI Command Reference.

**revoke-snapshot-access**

The following code example shows how to use revoke-snapshot-access.

**AWS CLI**

Revoke the Authorization of an AWS Account to Restore a Snapshot
This example revokes the authorization of the AWS account 444455556666 to restore the snapshot my-snapshot-id. By default, the output is in JSON format.

Command:
aws redshift revoke-snapshot-access --snapshot-id my-snapshot-id --account-with-restore-access 444455556666

Result:

```json
{
  "Snapshot": {
    "Status": "available",
    "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
    "EstimatedSecondsToCompletion": 0,
    "AvailabilityZone": "us-east-1a",
    "ClusterVersion": "1.0",
    "MasterUsername": "adminuser",
    "Encrypted": false,
    "OwnerAccount": "111122223333",
    "BackupProgressInMegabytes": 11.0,
    "ElapsedTimeInSeconds": 0,
    "Port": 5439,
    "NumberOfNodes": 2,
    "SnapshotIdentifier": "my-snapshot-id"
  }
}
```

- For API details, see [RevokeSnapshotAccess](aws cli command reference) in *AWS CLI Command Reference*.

**rotate-encryption-key**

The following code example shows how to use `rotate-encryption-key`.

**AWS CLI**

To rotate encryption key for a cluster
The following `rotate-encryption-key` example rotates the encryption key for the specified cluster.

```
aws redshift rotate-encryption-key \
   --cluster-identifier mycluster
```

Output:

```
{
   "Cluster": {
      "ClusterIdentifier": "mycluster",
      "NodeType": "dc2.large",
      "ClusterStatus": "rotating-keys",
      "ClusterAvailabilityStatus": "Modifying",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "Endpoint": {
         "Address": "mycluster.cmeaswqeuue.us-west-2.redshift.amazonaws.com",
         "Port": 5439
      },
      "ClusterCreateTime": "2019-12-10T19:25:45.886Z",
      "AutomatedSnapshotRetentionPeriod": 30,
      "ManualSnapshotRetentionPeriod": -1,
      "ClusterSecurityGroups": [],
      "VpcSecurityGroups": [
         {
            "VpcSecurityGroupId": "sh-a1a123ab",
            "Status": "active"
         }
      ],
      "ClusterParameterGroups": [
         {
            "ParameterGroupName": "default.redshift-1.0",
            "ParameterApplyStatus": "in-sync"
         }
      ],
      "ClusterSubnetGroupName": "default",
      "VpcId": "vpc-1a1b1c1d1",
      "AvailabilityZone": "us-west-2a",
      "PreferredMaintenanceWindow": "sat:16:00-sat:16:30",
      "PendingModifiedValues": {},
      "ClusterVersion": "1.0",
      "AllowVersionUpgrade": true,
```

Actions and scenarios
For more information, see Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

- For API details, see RotateEncryptionKey in AWS CLI Command Reference.

Amazon Rekognition examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Rekognition.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions
**Actions**

**compare-faces**

The following code example shows how to use compare-faces.

For more information, see [Comparing faces in images](#).

**AWS CLI**

**To compare faces in two images**

The following compare-faces command compares faces in two images stored in an Amazon S3 bucket.

```bash
aws rekognition compare-faces \
    --source-image '{"S3Object":{"Bucket": "MyImageS3Bucket","Name": "source.jpg"}}' \
    --target-image '{"S3Object":{"Bucket": "MyImageS3Bucket","Name": "target.jpg"}}'
```

**Output:**

```json
{
    "UnmatchedFaces": [],
    "FaceMatches": [
        {
            "Face": {
                "BoundingBox": {
                    "Width": 0.12368916720151901,

```
For more information, see Comparing Faces in Images in the Amazon Rekognition Developer Guide.

- For API details, see CompareFaces in AWS CLI Command Reference.
**create-collection**

The following code example shows how to use `create-collection`.

For more information, see [Creating a collection](#).

**AWS CLI**

**To create a collection**

The following `create-collection` command creates a collection with the specified name.

```bash
aws rekognition create-collection \
   --collection-id "MyCollection"
```

**Output:**

```
{
   "FaceModelVersion": "4.0",
   "StatusCode": 200
}
```

For more information, see [Creating a Collection](#) in the Amazon Rekognition Developer Guide.

- For API details, see [CreateCollection](#) in AWS CLI Command Reference.

**create-stream-processor**

The following code example shows how to use `create-stream-processor`.

**AWS CLI**

**To create a new stream processor**

The following `create-stream-processor` example creates a new stream processor with the specified configuration.

```bash
aws rekognition create-stream-processor --name my-stream-processor\ 
```
--role-arn arn:aws:iam::123456789012:role/AmazonRekognitionDetect\
--settings '{"FaceSearch":
{"CollectionId":"MyCollection","FaceMatchThreshold":85.5}}'

Output:

{
}

For more information, see [Working with Streaming Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [CreateStreamProcessor](#) in [AWS CLI Command Reference](#).

### delete-collection

The following code example shows how to use `delete-collection`.

For more information, see [Deleting a collection](#).

**AWS CLI**

**To delete a collection**

The following `delete-collection` command deletes the specified collection.

```bash
aws rekognition delete-collection \
   --collection-id MyCollection
```

Output:

```json
{
   "StatusCode": 200
}
```

For more information, see [Deleting a Collection](#) in the *Amazon Rekognition Developer Guide*. 

---

Actions and scenarios

---
• For API details, see DeleteCollection in AWS CLI Command Reference.

delete-faces

The following code example shows how to use delete-faces.

For more information, see Deleting faces from a collection.

AWS CLI

To delete faces from a collection

The following delete-faces command deletes the specified face from a collection.

```
aws rekognition delete-faces \
   --collection-id MyCollection \
   --face-ids '"0040279c-0178-436e-b70a-e61b074e96b0"'
```

Output:

```
{
   "DeletedFaces": [
      "0040279c-0178-436e-b70a-e61b074e96b0"
   ]
}
```

For more information, see Deleting Faces from a Collection in the Amazon Rekognition Developer Guide.

• For API details, see DeleteFaces in AWS CLI Command Reference.

delete-stream-processor

The following code example shows how to use delete-stream-processor.

AWS CLI

To delete a stream processor

The following delete-stream-processor command deletes the specified stream processor.

```
aws rekognition delete-stream-processor \
```

Actions and scenarios

5322
This command produces no output.

For more information, see Working with Streaming Videos in the Amazon Rekognition Developer Guide.

- For API details, see DeleteStreamProcessor in AWS CLI Command Reference.

describe-collection

The following code example shows how to use describe-collection.

For more information, see Describing a collection.

AWS CLI

To describe a collection

The following describe-collection example displays the details about the specified collection.

```
aws rekognition describe-collection \\
   --collection-id MyCollection
```

Output:

```
{
   "FaceCount": 200,
   "CreationTimestamp": 1569444828.274,
   "FaceModelVersion": "4.0"
}
```

For more information, see Describing a Collection in the Amazon Rekognition Developer Guide.

- For API details, see DescribeCollection in AWS CLI Command Reference.

describe-stream-processor

The following code example shows how to use describe-stream-processor.
**AWS CLI**

**To get information about a stream processor**

The following `describe-stream-processor` command displays details about the specified stream processor.

```
aws rekognition describe-stream-processor \
  --name my-stream-processor
```

**Output:**

```json
{
    "Status": "STOPPED",
    "Name": "my-stream-processor",
    "LastUpdateTimestamp": 1532449292.712,
    "Settings": {
        "FaceSearch": {
            "FaceMatchThreshold": 80.0,
            "CollectionId": "my-collection"
        }
    },
    "RoleArn": "arn:aws:iam::123456789012:role/AmazonRekognitionDetectStream",
    "Output": {
        "KinesisDataStream": {
        }
    },
    "Input": {
        "KinesisVideoStream": {
        }
    },
    "CreationTimestamp": 1532449292.712
}
```

For more information, see [Working with Streaming Videos](https://docs.aws.amazon.com/AmazonRekognition/latest/devguide/WorkingWithStreamingVideos.html) in the *Amazon Rekognition Developer Guide*. 
For API details, see `DescribeStreamProcessor` in *AWS CLI Command Reference*.

---

**detect-faces**

The following code example shows how to use detect-faces.

For more information, see [Detecting faces in an image](#).

**AWS CLI**

**To detect faces in an image**

The following `detect-faces` command detects faces in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-faces \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"MyFriend.jpg"}}' \
    --attributes "ALL"
```

**Output:**

```json
{

detect-labels

The following code example shows how to use detect-labels.

For more information, see Detecting labels in an image.

AWS CLI

To detect a label in an image

The following detect-labels example detects scenes and objects in an image stored in an Amazon S3 bucket.

```
aws rekognition detect-labels \
    --image '{"S3Object":{"Bucket":"bucket","Name":"image"}}'
```

Output:

```
{
    "Labels": [
        {
            "Instances": [],
            "Confidence": 99.15271759033203,

The following code example shows how to use `detect-moderation-labels`.

For more information, see [Detecting inappropriate images](#)

**AWS CLI**

**To detect unsafe content in an image**

The following `detect-moderation-labels` command detects unsafe content in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-moderation-labels --image "S3Object={Bucket=MyImageS3Bucket,Name=gun.jpg}"
```

**Output:**

```json
{
   "ModerationModelVersion": "3.0",
   "ModerationLabels": [
      {
         "Confidence": 97.29618072509766,
         "ParentName": "Violence",
         "Name": "Weapon Violence"
      },
      {
         "Confidence": 97.29618072509766,
         "ParentName": "",
         "Name": "Weapon Violence"
      }
   ]
}
```
detect-text

The following code example shows how to use detect-text.

For more information, see Detecting text in an image.

AWS CLI

To detect text in an image

The following detect-text command detects text in the specified image.

```
aws rekognition detect-text \
  --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePicture.jpg"}}'
```

Output:

```

• For API details, see DetectText in AWS CLI Command Reference.

disassociate-faces

The following code example shows how to use disassociate-faces.

AWS CLI

```
aws rekognition disassociate-faces --face-ids list-of-face-ids
   --user-id user-id --collection-id collection-name --region region-name
```

• For API details, see DisassociateFaces in AWS CLI Command Reference.

get-celebrity-info

The following code example shows how to use get-celebrity-info.

AWS CLI

To get information about a celebrity
The following `get-celebrity-info` command displays information about the specified celebrity. The `id` parameter comes from a previous call to `recognize-celebrities`.

```bash
aws rekognition get-celebrity-info --id nnnnnnn
```

Output:

```json
{
   "Name": "Celeb A",
   "Urls": [
      "www.imdb.com/name/aaaaaaaaa"
   ]
}
```

For more information, see [Getting Information About a Celebrity](https://docs.aws.amazon.com/rekognition/latest/dg/celebrity.html) in the *Amazon Rekognition Developer Guide*.

- For API details, see [GetCelebrityInfo](https://docs.aws.amazon.com/cli/latest/api/rekognition/get-celebrity-info.html) in *AWS CLI Command Reference*.

### get-celebrity-recognition

The following code example shows how to use `get-celebrity-recognition`.

**AWS CLI**

**To get the results of a celebrity recognition operation**

The following `get-celebrity-recognition` command displays the results of a celebrity recognition operation that you started previously by calling `start-celebrity-recognition`.

```bash
aws rekognition get-celebrity-recognition  \
   --job-id 1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```json
{
   "NextToken": "3D01ClxlCiT31VsRDkA03IybLb/h5AtDWSGuhYi+NlFIJwwPtAkuKzDhL2rV3GcwmNt77+12",
   "Celebrities": [

### get-label-detection

The following code example shows how to use `get-label-detection`.

**AWS CLI**

**To get the results of an objects and scenes detection operation**

The following `get-label-detection` command displays the results of an objects and scenes detection operation that you started previously by calling `start-label-detection`.
aws rekognition get-label-detection \
   --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef

Output:

```json
{
   "Labels": [
   {
      "Timestamp": 0,
      "Label": {
         "Instances": [],
         "Confidence": 50.19071578979492,
         "Parents": [
            {
               "Name": "Person"
            },
            {
               "Name": "Crowd"
            }
         ],
         "Name": "Audience"
      }
   },
   {
      "Timestamp": 0,
      "Label": {
         "Instances": [],
         "Confidence": 55.74115753173828,
         "Parents": [
            {
               "Name": "Room"
            },
            {
               "Name": "Indoors"
            },
            {
               "Name": "School"
            }
         ],
         "Name": "Classroom"
      }
   }
   ],
}
"JobStatus": "SUCCEEDED",
"LabelModelVersion": "2.0",
"VideoMetadata": {
   "Format": "QuickTime / MOV",
   "FrameRate": 29.970617294311523,

For more information, see Detecting Labels in a Video in the Amazon Rekognition Developer Guide.

- For API details, see GetLabelDetection in AWS CLI Command Reference.

get-person-tracking

The following code example shows how to use get-person-tracking.

AWS CLI

To get the results of a people pathing operation

The following get-person-tracking command displays the results of a people pathing operation that you started previously by calling start-person-tracking.

```
aws rekognition get-person-tracking \
   --job-id 1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{
   "Persons": [
      {
         "Timestamp": 500,
         "Person": {
            "BoundingBox": {
```
For more information, see People Pathing in the Amazon Rekognition Developer Guide.

- For API details, see GetPersonTracking in AWS CLI Command Reference.

**index-faces**

The following code example shows how to use index-faces.

For more information, see Adding faces to a collection.
AWS CLI

To add faces to a collection

The following `index-faces` command adds the faces found in an image to the specified collection.

```
aws rekognition index-faces \
  --image '"S3Object":{"Bucket":"MyVideoS3Bucket","Name":"MyPicture.jpg"}" \ 
  --collection-id MyCollection \ 
  --max-faces 1 \ 
  --quality-filter "AUTO" \ 
  --detection-attributes "ALL" \ 
  --external-image-id "MyPicture.jpg"
```

Output:

```
{
  "FaceRecords": [
    {
      "FaceDetail": {
        "Confidence": 99.993408203125,

For more information, see Adding Faces to a Collection in the Amazon Rekognition Developer Guide.

• For API details, see IndexFaces in AWS CLI Command Reference.

list-collections

The following code example shows how to use list-collections.

For more information, see Listing collections.

AWS CLI

To list the available collections

The following list-collections command lists the available collections in the AWS account.

aws rekognition list-collections

Output:

```json
{
   "FaceModelVersions": [
      "2.0",
      "3.0",
      "3.0",
      "3.0",
      "4.0",
      "5.0"
   ],
   "UnindexedFaces": [],
   "FaceModelVersion": "3.0",
   "OrientationCorrection": "ROTATE_0"
}
```
For more information, see [Listing Collections](#) in the [Amazon Rekognition Developer Guide](#).

- For API details, see [ListCollections](#) in [AWS CLI Command Reference](#).

### list-faces

The following code example shows how to use list-faces.

For more information, see [Listing faces in a collection](#).

#### AWS CLI

**To list the faces in a collection**

The following `list-faces` command lists the faces in the specified collection.

```bash
aws rekognition list-faces \
   --collection-id MyCollection
```

**Output:**

```json
{
   "FaceModelVersion": "3.0",
   ...
}
```
"Faces": [
   {

For more information, see [Listing Faces in a Collection](https://docs.aws.amazon.com/rekognition/latest/devguide) in the *Amazon Rekognition Developer Guide*.

- For API details, see [ListFaces](https://docs.aws.amazon.com/cli/latest/reference/rekognition/list-faces.html) in *AWS CLI Command Reference*. 
list-stream-processors

The following code example shows how to use list-stream-processors.

AWS CLI

To list the stream processors in your account

The following list-stream-processors command lists the stream processors in your account and the state of each.

```
aws rekognition list-stream-processors
```

Output:

```
{
   "StreamProcessors": [
   {
      "Status": "STOPPED",
      "Name": "my-stream-processor"
   }
   ]
}
```

For more information, see Working with Streaming Videos in the Amazon Rekognition Developer Guide.

- For API details, see ListStreamProcessors in AWS CLI Command Reference.

recognize-celebrities

The following code example shows how to use recognize-celebrities.

For more information, see Recognizing celebrities in an image.

AWS CLI

To recognize celebrities in an image

The following recognize-celebrities command recognizes celebrities in the specified image stored in an Amazon S3 bucket.
aws rekognition recognize-celebrities \
    --image "S3Object={Bucket=MyImageS3Bucket,Name=moviestars.jpg}"

Output:

{
    "UnrecognizedFaces": [

For more information, see Recognizing Celebrities in an Image in the Amazon Rekognition Developer Guide.

- For API details, see RecognizeCelebrities in AWS CLI Command Reference.

**search-faces-by-image**

The following code example shows how to use `search-faces-by-image`.

For more information, see Searching for a face (image).

**AWS CLI**

To search for faces in a collection that match the largest face in an image.

The following `search-faces-by-image` command searches for faces in a collection that match the largest face in the specified image:

```
aws rekognition search-faces-by-image \
  --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePerson.jpg"}}' \
  --collection-id MyFaceImageCollection
```

```json
{

**search-faces**

The following code example shows how to use search-faces.

For more information, see Searching for a face (face ID).

**AWS CLI**

To search for faces in a collection that match a face ID.

The following search-faces command searches for faces in a collection that match the specified face ID.

```
aws rekognition search-faces \
   --face-id 8d3cfc70-4ba8-4b36-9644-90fba29c2dac \
   --collection-id MyCollection
```

Output:

For more information, see [Searching for a Face Using Its Face ID](https://docs.aws.amazon.com/rekognition/latest/dg/search-faces.html) in the Amazon Rekognition Developer Guide.

- For API details, see [SearchFaces](https://docs.aws.amazon.com/cli/latest/reference/rekognition/search-faces.html) in AWS CLI Command Reference.

**start-celebrity-recognition**

The following code example shows how to use `start-celebrity-recognition`.

**AWS CLI**

**To start the recognition of celebrities in a stored video**

The following start-celebrity-recognition command starts a job to look for celebrities in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-celebrity-recognition \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}" 
```

Output:
start-content-moderation

The following code example shows how to use start-content-moderation.

AWS CLI

To start the recognition of unsafe content in a stored video

The following start-content-moderation command starts a job to detect unsafe content in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-content-moderation \
  --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Unsafe Stored Videos in the Amazon Rekognition Developer Guide.

- For API details, see StartContentModeration in AWS CLI Command Reference.

start-face-detection

The following code example shows how to use start-face-detection.

AWS CLI

To detect faces in a video
The following start-face-detection command starts a job to detect faces in the specified video file stored in an Amazon S3 bucket.

```bash
aws rekognition start-face-detection
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```json
{
   "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [Detecting Faces in a Stored Video](https://docs.aws.amazon.com/Rekognition/latest/DeveloperGuide/detect-faces-in-stored-video.html) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartFaceDetection](https://docs.aws.amazon.com/cli/latest/reference/rekognition/start-face-detection.html) in *AWS CLI Command Reference*.

**start-face-search**

The following code example shows how to use start-face-search.

**AWS CLI**

**To search for faces in a collection that match faces detected in a video**

The following start-face-search command starts a job to search for faces in a collection that match faces detected in the specified video file in an Amazon S3 bucket.

```bash
aws rekognition start-face-search \
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}" \
   --collection-id collection
```

Output:

```json
{
   "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [Searching Stored Videos for Faces](https://docs.aws.amazon.com/Rekognition/latest/DeveloperGuide/search-stored-videos-facedetected.html) in the *Amazon Rekognition Developer Guide*.
start-label-detection

The following code example shows how to use start-label-detection.

AWS CLI

To detect objects and scenes in a video

The following start-label-detection command starts a job to detect objects and scenes in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-label-detection \
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
   "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Labels in a Video in the Amazon Rekognition Developer Guide.

* For API details, see StartLabelDetection in AWS CLI Command Reference.

start-person-tracking

The following code example shows how to use start-person-tracking.

AWS CLI

To start the pathing of people in a stored video

The following start-person-tracking command starts a job to track the paths that people take in the specified video file stored in an Amazon S3 bucket:

```
aws rekognition start-person-tracking \
   --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```
Output:

```json
{
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [People Pathing](#) in the [Amazon Rekognition Developer Guide](#).

- For API details, see [StartPersonTracking](#) in [AWS CLI Command Reference](#).

### start-stream-processor

The following code example shows how to use `start-stream-processor`.

#### AWS CLI

**To start a stream processor**

The following `start-stream-processor` command starts the specified video stream processor.

```
aws rekognition start-stream-processor \
  --name my-stream-processor
```

This command produces no output.

For more information, see [Working with Streaming Videos](#) in the [Amazon Rekognition Developer Guide](#).

- For API details, see [StartStreamProcessor](#) in [AWS CLI Command Reference](#).

### stop-stream-processor

The following code example shows how to use `stop-stream-processor`.

#### AWS CLI

**To stop a running stream processor**

The following `stop-stream-processor` command stops the specified running stream processor.
aws rekognition stop-stream-processor \
  --name my-stream-processor

This command produces no output.

For more information, see Working with Streaming Videos in the Amazon Rekognition Developer Guide.
• For API details, see StopStreamProcessor in AWS CLI Command Reference.

AWS RAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RAM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

• Actions

Actions

accept-resource-share-invitation

The following code example shows how to use accept-resource-share-invitation.

AWS CLI

To accept a resource share invitation

The following accept-resource-share-invitation example accepts the specified resource share invitation. Principals in the invited account can immediately start using the resources in the share.
aws ram accept-resource-share-invitation \
   --resource-share-invitation-arn arn:aws:ram:us-west-2:11111111111:resource-
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE

Output:

```json
{
   "resourceShareInvitation": {
      "resourceShareInvitationArn": "arn:aws:ram:us-west-2:11111111111:resource-
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE",
      "resourceShareName": "MyLicenseShare",
      "resourceShareArn": "arn:aws:ram:us-west-2:11111111111:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE",
      "senderAccountId": "111111111111",
      "receiverAccountId": "222222222222",
      "invitationTimestamp": "2021-09-22T15:07:35.620000-07:00",
      "status": "ACCEPTED"
   }
}
```

- For API details, see [AcceptResourceShareInvitation](https://docs.aws.amazon.com/cli/latest/reference/ram/accept-resource-share-invitation.html) in *AWS CLI Command Reference*.

**associate-resource-share-permission**

The following code example shows how to use `associate-resource-share-permission`.

**AWS CLI**

To associate a RAM managed permission with a resource share

The following `associate-resource-share-permission` example replaces the existing managed permission for the relevant resource type with the specified managed permission. Access to all resources of the relevant resource type is governed by the new permission.

```bash
aws ram associate-resource-share-permission \
   --permission-arn arn:aws:ram::aws:permission/AWSRAMPermissionGlueDatabaseReadWrite \
   --replace \
   --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE
```
associate-resource-share

The following code example shows how to use associate-resource-share.

AWS CLI

Example 1: To associate a resource with a resource share

The following associate-resource-share example adds a license configuration to the specified resource share.

```bash
code
aws ram associate-resource-share
```

Output:

```json
{
  "resourceShareAssociations": [
    {
      "associationType": "RESOURCE",
      "status": "ASSOCIATING",
      "external": false
    }
  ]
}
```
Example 2: To associate a principal with a resource share

The following `associate-resource-share` example grants access for the specified resource share to all accounts in the specified organizational unit.

```bash
aws ram associate-resource-share \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
  --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-rEXAMPLE
```

Output:

```
{
  "resourceShareAssociations": [
    {
      "status": "ASSOCIATING",
      "associationType": "PRINCIPAL",
      "associatedEntity": "arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-rEXAMPLE",
      "external": false,
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE"
    }
  ]
}
```

- For API details, see [AssociateResourceShare](https://docs.aws.amazon.com/cli/latest/reference/ram/associate-resource-share.html) in *AWS CLI Command Reference*.

create-resource-share

The following code example shows how to use `create-resource-share`.

**AWS CLI**

Example 1: To create a resource share

The following `create-resource-share` example creates an empty resource share with the specified name. You must separately add resources, principals, and permissions to the share.

```bash
aws ram create-resource-share \
```
--name MyNewResourceShare

Output:

```json
{
  "resourceShare": {
    "name": "MyNewResourceShare",
    "owningAccountId": "123456789012",
    "allowExternalPrincipals": true,
    "status": "ACTIVE",
    "creationTime": 1634586271.302,
    "lastUpdatedTime": 1634586271.302
  }
}
```

**Example 2: To create a resource share with AWS accounts as principals**

The following `create-resource-share` example creates a resource share and grants access to the specified AWS account (222222222222). If the specified principals are not part of the same AWS Organization, then invitations are sent and must be accepted before access is granted.

```
aws ram create-resource-share \
  --name MyNewResourceShare \
  --principals 222222222222
```

**Example 3: To create a resource share restricted to your AWS Organization**

The following `create-resource-share` example creates a resource share that is restricted to accounts in the AWS Organization that your account is a member of, and adds the specified OU as a principal. All accounts in that OU can use the resources in the resource share.

```
aws ram create-resource-share \
  --name MyNewResourceShare \
  --no-allow-external-principals \
  --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-rEXAMPLE
```

Output:
For API details, see CreateResourceShare in AWS CLI Command Reference.

**delete-resource-share**

The following code example shows how to use delete-resource-share.

**AWS CLI**

To delete a resource share

The following delete-resource-share example deletes the specified resource share.

```bash
aws ram delete-resource-share \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

The following output indicates success:

```json
{
    "returnValue": true
}
```

For API details, see DeleteResourceShare in AWS CLI Command Reference.

**disassociate-resource-share-permission**

The following code example shows how to use disassociate-resource-share-permission.
**AWS CLI**

**To remove a RAM managed permission for a resource type from a resource share**

The following `disassociate-resource-share-permission` example removes the RAM managed permission for Glue databases from the specified resource share.

```bash
aws ram disassociate-resource-share-permission \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
  --permission-arn arn:aws:ram::aws:permission/AWSRAMPermissionGlueDatabaseReadWrite
```

Output:

```json
{
  "returnValue": true
}
```

- For API details, see [DisassociateResourceSharePermission] in [AWS CLI Command Reference].

**disassociate-resource-share**

The following code example shows how to use `disassociate-resource-share`.

**AWS CLI**

**To remove a resource from a resource share**

The following `disassociate-resource-share` example removes the specified resource, in this case a VPC subnet, from the specified resource share. Any principals with access to the resource share can no longer perform operations on that resource.

```bash
aws ram disassociate-resource-share \
  --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1fEXAMPLE \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```json
{

}
```
"resourceShareAssociations": [
  "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
  "associationType": "RESOURCE",
  "status": "DISASSOCIATING",
  "external": false
]
}

- For API details, see DisassociateResourceShare in AWS CLI Command Reference.

enable-sharing-with-aws-organization

The following code example shows how to use enable-sharing-with-aws-organization.

AWS CLI

To enable resource sharing across AWS Organizations

The following enable-sharing-with-aws-organization example enables resource sharing across your organization and organizational units.

aws ram enable-sharing-with-aws-organization

The following output indicates success.

{
   "returnValue": true
}

- For API details, see EnableSharingWithAwsOrganization in AWS CLI Command Reference.

get-permission

The following code example shows how to use get-permission.

AWS CLI

To retrieve the details for a RAM managed permission
The following `get-permission` example displays the details for the default version of the specified RAM managed permission.

```bash
aws ram get-permission \
   --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase
```

Output:

```json
{
    "permission": {
        "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
        "version": "2",
        "defaultVersion": true,
        "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
        "resourceType": "glue:Database",
        "permission": "{\"Effect\":\"Allow\",\"Action\":[\"glue:GetTable",
        \"glue:UpdateTable\", \"glue:DeleteTable\", \"glue:BatchDeleteTable",
        \"glue:BatchDeleteTableVersion\", \"glue:GetTableVersion\", \"glue:GetTableVersions",
        \"glue:GetPartition\", \"glue:GetPartitions\", \"glue:BatchGetPartition",
        \"glue:BatchCreatePartition\", \"glue:CreatePartition\", \"glue:UpdatePartition",
        \"glue:BatchDeletePartition\", \"glue:DeletePartition\", \"glue:GetTables\",
        \"glue:SearchTables\"]},",
        "creationTime": 1624912434.431,
        "lastUpdatedTime": 1624912434.431,
        "isResourceTypeDefault": false
    }
}
```

- For API details, see `GetPermission` in *AWS CLI Command Reference*.

**get-resource-policies**

The following code example shows how to use `get-resource-policies`.

**AWS CLI**

**To get the policies for a resource**

The following `get-resource-policies` example displays the resource-based permission policies for the specified resource associated with a resource share.
aws ram get-resource-policies \

Output:

```json
{
  "policies": [
    {
      "Version": "2008-10-17",
      "Statement": [{
        "Sid": "RamStatement1",
        "Effect": "Allow",
        "Principal": {"AWS": []},
        "Action": ["ec2:RunInstances",
                   "ec2:CreateNetworkInterface",
                   "ec2:DescribeSubnets"],
        "Resource": 
                   "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1fEXAMPLE"
      }]
    }
  ]
}
```

### get-resource-share-associations

The following code example shows how to use `get-resource-share-associations`.

#### AWS CLI

**Example 1: To list all resource associations for all resource types**

The following `get-resource-share-associations` example lists the resource associations for all resource types across all of your resource shares.

```bash
aws ram get-resource-share-associations \
   --association-type RESOURCE
```

**Output:**

```json
{
  "resourceShareAssociations": [
    {
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
    }
  ]
}
```
Example 2: To list principal associations for a resource share

The following `get-resource-share-associations` example lists only the principal associations for only the specified resource share.

```
aws ram get-resource-share-associations \
   --resource-share-arns arn:aws:ram:us-west-2:123456789012:resource-share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE \ 
   --association-type PRINCIPAL
```

Output:

```
{
   "resourceShareAssociations": [
      {
         "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
         "resourceShareName": "MyNewResourceShare",
         "associatedEntity": "arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-rEXAMPLE",
      }
   ]
}
```
For API details, see [GetResourceShareAssociations](#) in [AWS CLI Command Reference](#).

**get-resource-share-invitations**

The following code example shows how to use `get-resource-share-invitations`.

**AWS CLI**

To list your resource share invitations

The following `get-resource-share-invitations` example lists your current resource share invitations.

```bash
aws ram get-resource-share-invitations
```

Output:

```json
{
    "resourceShareInvitations": [
        {
            "resourceShareInvitationArn": "arn:aws:ram:us-west2-1:111111111111:resource-share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE",
            "resourceShareName": "project-resource-share",
            "senderAccountId": "111111111111",
            "receiverAccountId": "222222222222",
            "invitationTimestamp": 1565312166.258,
            "status": "PENDING"
        }
    ]
}
```
For API details, see `GetResourceShareInvitations` in *AWS CLI Command Reference*.

**get-resource-shares**

The following code example shows how to use `get-resource-shares`.

**AWS CLI**

**Example 1: To list resource shares you own and share with others**

The following `get-resource-shares` example lists the resource shares that created and are sharing with others.

```bash
aws ram get-resource-shares \
   --resource-owner SELF
```

**Output:**

```json
{
   "resourceShares": [
      {
         "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/3ab63985-99d9-1cd2-7d24-75e93EXAMPLE",
         "name": "my-resource-share",
         "owningAccountId": "123456789012",
         "allowExternalPrincipals": false,
         "status": "ACTIVE",
         "tags": [
            {
               "key": "project",
               "value": "lima"
            }
         ],
         "creationTime": 1565295733.282,
         "lastUpdatedTime": 1565295733.282
      },
      {
         "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
         "name": "example-resource-share",
         "owningAccountId": "123456789012",
         "allowExternalPrincipals": true,
         "status": "ACTIVE",
         "tags": [
            {
               "key": "project",
               "value": "example"
            }
         ],
         "creationTime": 1565295733.282,
         "lastUpdatedTime": 1565295733.282
      }
   ]
}
```
Example 2: To list resource shares owned by others and shared with you

The following get-resource-shares example lists the resource shares that others created and shared with you. In this example, there are none.

```bash
aws ram get-resource-shares \
  --resource-owner OTHER-ACCOUNTS
```

Output:

```json
{
  "resourceShares": []
}
```

- For API details, see [GetResourceShares](#) in [AWS CLI Command Reference](#).

**list-pending-invitation-resources**

The following code example shows how to use list-pending-invitation-resources.

**AWS CLI**

**To list the resources that are available in a pending resource share**

The following list-pending-invitation-resources example lists all of the resources that are in the resource share associated with the specified invitation.

```bash
aws ram list-pending-invitation-resources \
  --resource-share-invitation-arn arn:aws:ram:us-west-2:123456789012:resource-share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE
```
Output:

```json
{
    "resources": [
        {
            "arn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-04a555b0e6EXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
            "creationTime": 1634676051.269,
            "lastUpdatedTime": 1634676052.07,
            "status": "AVAILABLE",
            "type": "ec2:Subnet"
        },
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "creationTime": 1624912434.431,
            "lastUpdatedTime": 1624912434.431,
            "status": "AVAILABLE",
            "type": "license-manager:LicenseConfiguration"
        }
    ]
}
```

- For API details, see [ListPendingInvitationResources](https://docs.aws.amazon.com/cli/latest/reference/ram/list-pending-invitation-resources.html) in *AWS CLI Command Reference*.

### list-permissions

The following code example shows how to use `list-permissions`.

**AWS CLI**

To list the available RAM managed permissions

The following `list-permissions` example lists all of the RAM managed permissions available for only the AWS Glue database resource type.

```
aws ram list-permissions \
    --resource-type glue:Database
```
Output:

```json
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionGlueDatabase",
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMDefaultPermissionGlueDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1592007820.935,
            "lastUpdatedTime": 1592007820.935,
            "isResourceTypeDefault": true
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1624912413.323,
            "lastUpdatedTime": 1624912413.323,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueDatabaseReadWrite",
            "resourceType": "glue:Database",
            "creationTime": 1624912417.4,
            "lastUpdatedTime": 1624912417.4,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1624912417.4,
            "lastUpdatedTime": 1624912417.4,
            "isResourceTypeDefault": false
        }
    ]
}
```
The following list-permissions example displays the available RAM managed permissions for all resource types.

```
aws ram list-permissions
```

Output:

```
{
   "permissions": [
      {
         "version": "1",
         "defaultVersion": true,
         "name": "AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
         "resourceType": "acm-pca:CertificateAuthority",
         "creationTime": 1623264861.085,
         "lastUpdatedTime": 1623264861.085,
         "isResourceTypeDefault": false
      },
      {
         "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionAppMesh",
         "version": "1",
         "defaultVersion": true,
         "name": "AWSRAMDefaultPermissionAppMesh",
         "resourceType": "appmesh:Mesh",
         "creationTime": 1589307188.584,
         "lastUpdatedTime": 1589307188.584,
         "isResourceTypeDefault": true
      },
      ...TRUNCATED FOR BREVITY...
      {
         "arn": "arn:aws:ram::aws:permission/AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
         "version": "1",
```
For API details, see ListPermissions in AWS CLI Command Reference.

list-principals

The following code example shows how to use list-principals.

AWS CLI

To list principals with access to a resource

The following list-principals example displays a list of the principals that can access resources of the specified type through any resource shares.

```
aws ram list-principals \
  --resource-type ec2:Subnet
```

Output:

```
{
  "principals": [
    {
      "id": "arn:aws:organizations::123456789012:ou/o-gx7EXAMPLE/ou-29c5-zEXAMPLE",
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
      "creationTime": 1565298209.737,
      "lastUpdatedTime": 1565298211.019,
      "external": false
    }
  ]
}
```
list-resource-share-permissions

The following code example shows how to use list-resource-share-permissions.

AWS CLI

To list all of the RAM managed permissions currently attached to a resource share

The following list-resource-share-permissions example lists all of the RAM managed permissions that are attached to the specified resource share.

```bash
aws ram list-resource-share-permissions \
```

Output:

```json
{
   "permissions": [
      {
         "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionLicenseConfiguration",
         "version": "1",
         "resourceType": "license-manager:LicenseConfiguration",
         "status": "ASSOCIATED",
         "lastUpdatedTime": 1632342984.234
      },
      {
         "arn": "arn:aws:ram::aws:permission/AWSRAMPermissionGlueDatabaseReadWrite",
         "version": "2",
         "resourceType": "glue:Database",
         "status": "ASSOCIATED",
         "lastUpdatedTime": 1632512462.297
      }
   ]
}
```

• For API details, see ListResourceSharePermissions in AWS CLI Command Reference.
list-resource-types

The following code example shows how to use list-resource-types.

AWS CLI

To list the resource types that are supported by AWS RAM

The following list-resource-types example lists all of the resource types currently supported by AWS RAM.

```bash
aws ram list-resource-types
```

Output:

```json
{
   "resourceTypes": [
   {
      "resourceType": "route53resolver:FirewallRuleGroup",
      "serviceName": "route53resolver"
   },
   {
      "resourceType": "ec2:LocalGatewayRouteTable",
      "serviceName": "ec2"
   },
   ...
   "resourceType": "ec2:Subnet",
   "serviceName": "ec2"
   },
   {
      "resourceType": "ec2:TransitGatewayMulticastDomain",
      "serviceName": "ec2"
   }
   ]
}
```

- For API details, see ListResourceTypes in AWS CLI Command Reference.

list-resources

The following code example shows how to use list-resources.
AWS CLI

To list the resources associated with a resource share

The following list-resources example lists all resources in the specified resource share that are of the specified resource type.

```
aws ram list-resources \
   --resource-type ec2:Subnet \
   --resource-owner SELF \
   --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
   "resources": [
   {
      "arn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1f4e15235",
      "type": "ec2:Subnet",
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
      "creationTime": 1565301545.023,
      "lastUpdatedTime": 1565301545.947
   }
   ]
}
```

- For API details, see [ListResources](#) in *AWS CLI Command Reference*.

promote-resource-share-created-from-policy

The following code example shows how to use promote-resource-share-created-from-policy.

AWS CLI

To promote a resource-policy based resource share to full functionality in AWS RAM
The following `promote-resource-share-created-from-policy` example takes a resource share that you created implicitly by attaching a resource-based policy, and converts it to be fully functional with the AWS RAM console and its CLI and API operations.

```

Output:

```json
{
   "returnValue": true
}
```

### reject-resource-share-invitation

The following code example shows how to use `reject-resource-share-invitation`.

**AWS CLI**

#### To reject a resource share invitation

The following `reject-resource-share-invitation` example rejects the specified resource share invitation.

```

Output:

```json
"resourceShareInvitations": [
   {
      "resourceShareInvitationArn": "arn:aws:ram:us-west2-1:111111111111:resource-share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE",
      "resourceShareName": "project-resource-share",
```
  "senderAccountId": "111111111111",
  "receiverAccountId": "222222222222",
  "invitationTimestamp": 1565319592.463,
  "status": "REJECTED"
]}

### tag-resource

The following code example shows how to use tag-resource.

**AWS CLI**

**To add tags to a resource share**

The following tag-resource example adds a tag key `project` and associated value `lima` to the specified resource share.

```bash
aws ram tag-resource \
  --tags key=project,value=lima \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE
```

This command produces no output.

### untag-resource

The following code example shows how to use untag-resource.

**AWS CLI**

**To remove tags from a resource share**

The following untag-resource example removes the `project` tag key and associated value from the specified resource share.
aws ram untag-resource \
   --tag-keys project \
   --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE

This command produces no output.

- For API details, see [UntagResource](#) in [AWS CLI Command Reference](#).

**update-resource-share**

The following code example shows how to use update-resource-share.

**AWS CLI**

**To update a resource share**

The following update-resource-share example changes the specified resource share to allow external principals that are not in an AWS Organization.

aws ram update-resource-share \
   --allow-external-principals \
   --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE

Output:

```json
{
   "resourceShare": {
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
      "name": "my-resource-share",
      "owningAccountId": "123456789012",
      "allowExternalPrincipals": true,
      "status": "ACTIVE",
      "creationTime": 1565295733.282,
      "lastUpdatedTime": 1565303080.023
   }
}
```

- For API details, see [UpdateResourceShare](#) in [AWS CLI Command Reference](#).
Resource Explorer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Explorer.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**associate-default-view**

The following code example shows how to use `associate-default-view`.

**AWS CLI**

To set a Resource Explorer view as the default for its AWS Region

The following `associate-default-view` example sets a view, as specified by its ARN, to be the default view for the AWS Region in which you call the operation.

```bash
aws resource-explorer-2 associate-default-view \
```

Output:

```json
{
   "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```
For more information, see Setting a default view in an AWS Region in the AWS Resource Explorer Users Guide.

- For API details, see AssociateDefaultView in AWS CLI Command Reference.

**batch-get-view**

The following code example shows how to use batch-get-view.

**AWS CLI**

To retrieve details about multiple Resource Explorer views

The following batch-get-view example displays the details about two views specified by their ARNs. Use spaces to separate the multiple ARNs in the --view-arn parameter.

```
aws resource-explorer-2 batch-get-view \
    --view-arns arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222, \
    arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

**Output:**

```
{
   "Views": [
      {
         "Filters": {
            "FilterString": "service:ec2"
         },
         "IncludedProperties": [
            {
               "Name": "tags"
            }
         ],
         "LastUpdatedAt": "2022-07-13T21:33:45.249000+00:00",
         "Owner": "123456789012",
         "Scope": "arn:aws:iam::123456789012:root",
         "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
      },
      {
      }
   ]
}
```
For more information about views, see About Resource Explorer views in the AWS Resource Explorer Users Guide.

- For API details, see BatchGetView in AWS CLI Command Reference.

create-index

The following code example shows how to use create-index.

AWS CLI

To turn on Resource Explorer in an AWS Region by creating an index

The following create-index example creates a local index in the AWS Region in which the operation is called. The AWS CLI automatically generates a random client-token parameter value and includes it in the call to AWS if you don't specify a value.

```bash
aws resource-explorer-2 create-index --region us-east-1
```

Output:

```json
{

After you create a local index, you can convert it into the aggregator index for the account by running the `update-index-type` command.

For more information, see Turning on Resource Explorer in an AWS Region to index your resources in the AWS Resource Explorer Users Guide.

- For API details, see `CreateIndex` in AWS CLI Command Reference.

**create-view**

The following code example shows how to use `create-view`.

**AWS CLI**

**Example 1: To create an unfiltered view for the index in an AWS Region**

The following `create-view` example creates a view in the specified AWS Region that returns all results in the Region without any filtering. The view includes the optional Tags field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
  --view-name My-Main-View \ 
  --included-properties Name=tags \ 
  --region us-east-1
```

**Output:**

```json
{
  "View": {
    "Filters": {
      "FilterString": ""
    },
    "IncludedProperties": [
      {
        "Name": "tags"
      }
    ]
  }
}
```
Example 2: To create a view that returns only resources associated with Amazon EC2

The following `create-view` creates a view in AWS Region `us-east-1` that returns only those resources in the Region that are associated with the Amazon EC2 service. The view includes the optional Tags field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```bash
aws resource-explorer-2 create-view \
    --view-name My-EC2-Only-View \
    --included-properties Name=tags \
    --filters FilterString="service:ec2" \
    --region us-east-1
```

Output:

```json
{
    "View": {
        "Filters": {
            "FilterString": "service:ec2"
        },
        "IncludedProperties": [
            {
                "Name": "tags"
            }
        ],
        "LastUpdatedAt": "2022-07-13T21:35:09.059Z",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
    }
}
```
For more information, see [Creating views for search](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/creating-views-for-search.html) in the *AWS Resource Explorer Users Guide*.

- For API details, see [CreateView](https://docs.aws.amazon.com/cli/latest/reference/resource-explorer-2/createview.html) in *AWS CLI Command Reference*.

### delete-index

The following code example shows how to use `delete-index`.

**AWS CLI**

**To turn off Resource Explorer in an AWS Region by deleting its index**

The following `delete-index` example deletes the specified Resource Explorer index in the AWS Region in which you make the request.

```
aws resource-explorer-2 delete-index \
```

**Output:**

```
{
    "State": "DELETING"
}
```

- For API details, see [DeleteIndex](https://docs.aws.amazon.com/cli/latest/reference/resource-explorer-2/deleteindex.html) in *AWS CLI Command Reference*.

### delete-view

The following code example shows how to use `delete-view`.

**AWS CLI**

**To delete a Resource Explorer view**
The following delete-view example deletes a view specified by its ARN.

```
```

Output:

```
{
  "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Deleting views in the AWS Resource Explorer Users Guide.

- For API details, see DeleteView in AWS CLI Command Reference.

**disassociate-default-view**

The following code example shows how to use disassociate-default-view.

**AWS CLI**

**To remove the default Resource Explorer view for an AWS Region**

The following disassociate-default-view removes the default Resource Explorer view for the AWS Region in which you call the operation. After performing this operation, all search operations in the Region must explicitly specify a view or the operation fails.

```
aws resource-explorer-2 disassociate-default-view
```

This command produces no output.

For more information, see Setting a default view in an AWS Region in the AWS Resource Explorer Users Guide.

- For API details, see DisassociateDefaultView in AWS CLI Command Reference.

**get-default-view**

The following code example shows how to use get-default-view.
AWS CLI

To retrieve the Resource Explorer view that is the default view for its AWS Region

The following `get-default-view` example retrieves the ARN of the view that is the default for the AWS Region in which you call the operation.

```
aws resource-explorer-2 get-default-view
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/default-view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Setting a default view in an AWS Region in the AWS Resource Explorer Users Guide.

- For API details, see `GetDefaultView` in AWS CLI Command Reference.

get-index

The following code example shows how to use `get-index`.

AWS CLI

**Example 1: To retrieve the details for a Resource Explorer aggregator index**

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains the aggregator index for the account, the output lists the Regions that replicate data into this Region's index.

```
aws resource-explorer-2 get-index \
  --region us-east-1
```

Output:

```
{
    "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
...
```
Example 2: To retrieve the details for a Resource Explorer local index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains a local index, the output lists the Region to which it replicates data from this Region's index.

```bash
aws resource-explorer-2 get-index \
   --region us-west-2
```

Output:

```json
{
   "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
   "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
   "ReplicatingTo": [
      "us-west-2"
   ],
   "State": "ACTIVE",
   "Tags": {},
   "Type": "LOCAL"
}
```

For more information about indexes, see [Checking which AWS Regions have Resource Explorer turned on](https://docs.aws.amazon.com/AWSResourceExplorer/latest/ug/turn-on.html) in the *AWS Resource Explorer Users Guide*.

- For API details, see [GetIndex](https://docs.aws.amazon.com/cli/latest/reference/resource-explorer-2/get-index.html) in *AWS CLI Command Reference*.

**get-view**

The following code example shows how to use `get-view`.
AWS CLI

To retrieve details about a Resource Explorer view

The following `get-view` example displays the details about a view specified by its ARN.

```bash
aws resource-explorer-2 get-view \
```

Output:

```
{
  "Tags" : {},
  "View" : {
    "Filters" : {
      "FilterString" : "service:ec2"
    },
    "IncludedProperties" : [
      { "Name" : "tags" }
    ],
    "LastUpdatedAt" : "2022-07-13T21:33:45.249Z",
    "Owner" : "123456789012",
    "Scope" : "arn:aws:iam::123456789012:root",
  }
}
```

For more information about views, see [About Resource Explorer views](#) in the [AWS Resource Explorer Users Guide](#).

- For API details, see [GetView](#) in [AWS CLI Command Reference](#).

list-indexes

The following code example shows how to use `list-indexes`.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes
The following list-indexes example lists the indexes for all Regions where Resource Explorer has an index. The response specifies the type of each index, its AWS Region, and its ARN.

```bash
code
aws resource-explorer-2 list-indexes
```

Output:

```json
{
    "Indexes": [
      {
        "Region": "us-west-2",
        "Type": "AGGREGATOR"
      },
      {
        "Region": "us-east-1",
        "Type": "LOCAL"
      },
      {
        "Region": "us-east-2",
        "Type": "LOCAL"
      },
      {
        "Region": "us-west-1",
        "Type": "LOCAL"
      }
    ]
}
```

For more information about indexes, see [Checking which AWS Regions have Resource Explorer turned on](#) in the [AWS Resource Explorer Users Guide](#).

- For API details, see [ListIndexes](#) in [AWS CLI Command Reference](#).
list-supported-resource-types

The following code example shows how to use list-supported-resource-types.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes

The following list-supported-resource-types example lists all of the resource types currently supported by Resource Explorer. The example response includes a NextToken value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 list-supported-resource-types \
    --max-items 10
```

Output:

```
{
    "ResourceTypes": [
        {
            "ResourceType": "cloudfront:cache-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:distribution",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:function",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:origin-access-identity",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:origin-request-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:realtime-log-config",
            "Service": "cloudfront"
        }
    ]
}
```
To get the next part of the output, call the operation again, and pass the previous call's `NextToken` response value as the value for `--starting-token`. Repeat until `NextToken` is absent from the response.

```
aws resource-explorer-2 list-supported-resource-types \
  --max-items 10 \
  --starting-token eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0=
```

Output:

```
{
  "ResourceTypes": [
  {
    "ResourceType": "cloudwatch:metric-stream",
    "Service": "cloudwatch"
  },
  {
    "ResourceType": "dynamodb:table",
    "Service": "dynamodb"
  }
  ],
  "NextToken": "eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0="
}
```
For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the AWS Resource Explorer Users Guide.

- For API details, see ListSupportedResourceTypes in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.
### AWS CLI

#### To list the tags attached to a Resource Explorer view or index

The following `list-tags-for-resource` example lists the tag key and value pairs attached to view with the specified ARN. You must call the operation from the AWS Region that contains the resource.

```
aws resource-explorer-2 list-tags-for-resource \
```

Output:

```
{
   "Tags": {
      "application": "MainCorpApp",
      "department": "1234"
   }
}
```

For more information about tagging views, see [Tagging views for access control](#) in the AWS Resource Explorer Users Guide.

- For API details, see [ListTagsForResource](#) in AWS CLI Command Reference.

#### list-views

The following code example shows how to use `list-views`.

### AWS CLI

#### To list the Resource Explorer views available in an AWS Region

The following `list-views` example lists all of the views available in the Region in which you invoke the operation.

```
aws resource-explorer-2 list-views
```

Output:
For more information about views, see About Resource Explorer views in the AWS Resource Explorer Users Guide.

- For API details, see ListViews in AWS CLI Command Reference.

search

The following code example shows how to use search.

AWS CLI

Example 1: To search using the default view

The following search example displays all resources in the specified that are associated with the service. The search uses the default view for the Region. The example response includes a NextToken value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 search \
   --query-string "service:iam"
```

Output:

```
{
   "Count": {
      "Complete": true,
      "TotalResources": 55
   },
   "NextToken": "AG9VOEF1KLEXAMPLEOhJHVwo5chEXAMPLER5XiEpNrgsEXAMPLE...b0CmOFOryHEXAMPLE",
   "Resources": []
}
```
Example 2: To search using a specified view

The following search example search displays all resources ("*") in the specified AWS Region that are visible through the specified view. The results include only resources associated with Amazon EC2 because of the filters attached to the view.

```
aws resource-explorer-2 search \
    -- query-string "*" \
```

Output:

```
HTTP/1.1 200 OK
Date: Tue, 01 Nov 2022 20:00:59 GMT
Content-Type: application/json
Content-Length: <PayloadSizeBytes>

]
tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a Resource Explorer view

The following tag-resource example adds the tag key "environment" with the value "production" to the view with the specified ARN.

```
aws resource-explorer-2 tag-resource \
    --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222 \
    --tags environment=production
```

This command produces no output.
For more information, see Tagging views for access control in the AWS Resource Explorer Users Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a Resource Explorer view

The following untag-resource example removes any tag with the key name "environment" from the view with the specified ARN.

```
aws resource-explorer-2 untag-resource \
  --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View//EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \
  --tag-keys environment
```

This command produces no output.

For more information, see Tagging views for access control in the AWS Resource Explorer Users Guide.
- For API details, see UntagResource in AWS CLI Command Reference.

update-index-type

The following code example shows how to use update-index-type.

AWS CLI

To change the type of a Resource Explorer index

The following update-index-type example converts the specified index from type local to type aggregator to turn on the ability to search for resources across all AWS Regions in the account. You must send the request to the AWS Region that contains the index you want to update.

```
aws resource-explorer-2 update-index-type \
```

Actions and scenarios
Output:

```json
{
    "Arn":"arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111",
    "LastUpdatedAt":"2022-07-13T18:41:58.799Z",
    "State":"updating",
    "Type":"aggregator"
}
```

For more information about changing an index's type, see [Turning on cross-Region search by creating an aggregator index](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [UpdateIndexType](#) in *AWS CLI Command Reference*.

**update-view**

The following code example shows how to use `update-view`.

### AWS CLI

**Example 1: To update the IncludedProperties field for a Resource Explorer view**

The following `update-view` example updates the specified view by adding `tags` to the optional `IncludedProperties`. After running this operation, search operations that use this view include information about the tags attached to the resources that appear in the results.

```bash
aws resource-explorer-2 update-view \
  --included-properties Name=tags \
  --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```json
{
```
Example 2: To update the filters attached to a view

The following `update-view` example updates the specified view to use a filter that limits results to only resource types that are associated with the Amazon EC2 service.

```
aws resource-explorer-2 update-view \
  --filters FilterString="service:ec2" \
  --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```
{
  "View": {
    "Filters": {
      "FilterString": "service:ec2"
    },
    "IncludedProperties": [],
    "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
    "Owner": "123456789012",
    "Scope": "arn:aws:iam::123456789012:root",
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
  }
}
```
For more information about views, see About Resource Explorer views in the AWS Resource Explorer Users Guide.

- For API details, see UpdateView in AWS CLI Command Reference.

Resource Groups examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups.

Actions are code excerpts from larger programs and must be run in context. While actions show how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

create-group

The following code example shows how to use create-group.

AWS CLI

Example 1: To create a tag-based resource group

The following create-group example creates a tag-based resource group of Amazon EC2 instances in the current region. It's based on a query for resources that are tagged with the key Name, and the value WebServers. The group name is tbq-WebServer. The query is in a separate JSON file that is passed to the command.

```bash
aws resource-groups create-group \
   --name tbq-WebServer \
   --resource-query file://query.json
```
Contents of query.json:

```
{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters": [{"Key": "Name", "Values": ["WebServers"]}]"
}
```

Output:

```
{
    "Group": {
        "Name": "tbq-WebServer"
    },
    "ResourceQuery": {
        "Type": "TAG_FILTERS_1_0",
        "Query": "{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters": [{"Key": "Name", "Values": ["WebServers"]}]"
    }
}
```

Example 2: To create a CloudFormation stack-based resource group

The following create-group example creates an AWS CloudFormation stack-based resource group named sampleCFNstackgroup. The query includes all resources in the specified CloudFormation stack that are supported by AWS Resource Groups.

```
aws resource-groups create-group \
    --name cbq-CFNstackgroup \
    --resource-query file://query.json
```

Contents of query.json:

```
{
    "Type": "CLOUDFORMATION_STACK_1_0",
    "Query": "{"ResourceTypeFilters": ["AWS::AllSupported"], "StackIdentifier": "arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-z39z-11z8-97z5-500z212zz6fz"}"
}
```
Output:

```
{
    "Group": {
        "Name": "cbq-CFNstackgroup"
    },
    "ResourceQuery": {
        "Type": "CLOUDFORMATION_STACK_1_0",
        "Query": "{"ResourceTypeFilters": ["AWS::AllSupported"], "StackIdentifier": "arn:aws:cloudformation:us-east-2:123456789012:stack/MyCFNStack/1415z9z0-z39z-11z8-97z5-500z212zz6fz"}"
    }
}
```

For more information, see [Create Groups](https://docs.aws.amazon.com/resource-groups/latest/userguide/aws-resource-groups-create-groups.html) in the [AWS Resource Groups User Guide](https://docs.aws.amazon.com/resource-groups/latest/userguide/aws-resource-groups.html).

- For API details, see [CreateGroup](https://docs.aws.amazon.com/cli/latest/reference/resource-groups/create-group.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/resource-groups/create-group.html).

### delete-group

The following code example shows how to use `delete-group`.

**AWS CLI**

**To update the description for a resource group**

The following `delete-group` example updates the specified resource group.

```
aws resource-groups delete-group \
   --group-name tbq-WebServer
```

**Output:**

```
{
    "Group": {
        "Name": "tbq-WebServer"
    }
}
```
For more information, see Delete Groups in the AWS Resource Groups User Guide.

- For API details, see DeleteGroup in AWS CLI Command Reference.

### get-group-query

The following code example shows how to use get-group-query.

**AWS CLI**

**To get the query attached to a resource group**

The following get-group-query example displays query attached to the specified resource group.

```bash
aws resource-groups get-group-query
  --group-name tbq-WebServer
```

**Output:**

```json
{
  "GroupQuery": {
    "GroupName": "tbq-WebServer",
    "ResourceQuery": {
      "Type": "TAG_FILTERS_1_0",
      "Query": "{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters": [{"Key": "Name", "Values": ["WebServers"]}]}
    }
  }
}
```

- For API details, see GetGroupQuery in AWS CLI Command Reference.

### get-group

The following code example shows how to use get-group.

**AWS CLI**

**To get information about a resource group**
The following `get-group` example displays details about the specified resource group. To get the query attached to the group, use `get-group-query`.

```bash
aws resource-groups get-group \
--group-name tbq-WebServer
```

Output:

```json
{
   "Group": {
      "Name": "tbq-WebServer",
      "Description": "A tag-based query resource group of WebServers."
   }
}
```

- For API details, see [GetGroup](https://docs.aws.amazon.com/cli/latest/reference/resource-groups/get-group.html) in *AWS CLI Command Reference*.

**get-tags**

The following code example shows how to use `get-tags`.

**AWS CLI**

**To retrieve the tags attached to a resource group**

The following `get-tags` example displays the tag key and value pairs attached to the specified resource group (the group itself, not its members).

```bash
aws resource-groups get-tags \
```

Output:

```json
{
   "Tags": {
      "QueryType": "tags",
      "QueryResources": "ec2-instances"
   }
}
```
For API details, see GetTags in AWS CLI Command Reference.

list-group-resources

The following code example shows how to use list-group-resources.

AWS CLI

To list all of the resources in a resource group

Example 1: The following list-resource-groups example lists all of the resources that are part of the specified resource group.

```bash
aws resource-groups list-group-resources
   --group-name tbq-WebServer
```

Output:

```json
{
   "ResourceIdentifiers": [
      {
         "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/i-09f77fa38c12345ab",
         "ResourceType": "AWS::EC2::Instance"
      }
   ]
}
```

Example 2: The following example lists all of the resources in the group that also have a 'resource-type' of the 'AWS::EC2::Instance'.

```bash
aws resource-groups list-group-resources --group-name tbq-WebServer --filters
   Name=resource-type,Values=AWS::EC2::Instance
```

For API details, see ListGroupResources in AWS CLI Command Reference.

list-groups

The following code example shows how to use list-groups.
AWS CLI

To list the available resource groups

The following list-groups example displays a list of all of the resource groups.

aws resource-groups list-groups

Output:

```json
{
   "GroupIdentifiers": [ 
      {
         "GroupName": "tbq-WebServer",
      },
      {
         "GroupName": "cbq-CFNStackQuery",
         "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-CFNStackQuery"
      }
   ],
   "Groups": [ 
      {
         "Name": "tbq-WebServer"
      },
      {
         "Name": "cbq-CFNStackQuery"
      }
   ]
}
```

- For API details, see ListGroups in AWS CLI Command Reference.

list-resource-groups

The following code example shows how to use list-resource-groups.
AWS CLI

To list all of the resources in a resource group

The following list-resource-groups example lists all of the resources that are part of the specified resource group.

```bash
aws resource-groups list-group-resources \
   --group-name tbq-WebServer
```

Output:

```json
{
   "ResourceIdentifiers": [
      {
        "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/i-09f77fa38c12345ab",
        "ResourceType": "AWS::EC2::Instance"
      }
   ]
}
```

- For API details, see ListResourceGroups in AWS CLI Command Reference.

put-group-configuration

The following code example shows how to use put-group-configuration.

AWS CLI

To attach a service configuration to a resource group

Example 1: The following put-group-configuration example specifies that the resource group is to contain only Amazon EC2 capacity reservations for instances in the C5 or M5 families.

```bash
aws resource-groups put-group-configuration \
   --group MyTestGroup \
   --configuration file://config.json
```

Contents of config.json:
This command produces no output if successful.

**search-resources**

The following code example shows how to use `search-resources`.

**AWS CLI**

To find resources that match a query
The following search-resources example retrieves a list of all AWS resources that match the specified query.

```
aws resource-groups search-resources \
  --resource-query file://query.json
```

Contents of query.json:

```
{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters": [{"Key": "Patch Group", "Values": ["Dev"]}]}
}
```

Output:

```
{
    "ResourceIdentifiers": [
    {
        "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/i-01a23bc45d6780ef",
        "ResourceType": "AWS::EC2::Instance"
    }
    ]
}
```

- For API details, see [SearchResources](https://docs.aws.amazon.com/cli/latest/reference/resource-groups/search-resources.html) in *AWS CLI Command Reference*.

**tag**

The following code example shows how to use tag.

**AWS CLI**

**To attach a tag to a resource group**

The following tag example attaches the specified tag key and value pairs to the specified resource group (the group itself, not its members).

```
aws resource-groups tag \
  --tags QueryType=tags,QueryResources=ec2-instances \
```
Output:

```json
{
    "Tags": {
        "QueryType": "tags",
        "QueryResources": "ec2-instances"
    }
}
```

For more information, see Manage tags in the AWS Resource Groups User Guide.

- For API details, see Tag in AWS CLI Command Reference.

**untag**

The following code example shows how to use untag.

**AWS CLI**

**To remove tags from a resource group**

The following untags example removes any tag with the specified key from the resource group itself, not its members.

```bash
aws resource-groups untag \
  --keys QueryType
```

Output:

```json
{
    "Keys": [
        "QueryType"
    ]
}
```

For more information, see Manage tags in the AWS Resource Groups User Guide.

- For API details, see Untag in AWS CLI Command Reference.
**update-group-query**

The following code example shows how to use `update-group-query`.

**AWS CLI**

**Example 1: To update the query for a tag-based resource group**

The following `update-group-query` example updates the query attached to the specified tag-based resource group.

```
aws resource-groups update-group-query \
   --group-name tbq-WebServer \
   --resource-query '{"Type":"TAG_FILTERS_1_0", "Query":\"\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":[{"Key":"Name", "Values\":[\"WebServers\"]}]\"}"
```

Output:

```
{
   "Group": {
      "Name": "tbq-WebServer"
   },
   "ResourceQuery": {
      "Type": "TAG_FILTERS_1_0",
      "Query": "\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":[{"Key":"Name", "Values\":[\"WebServers\"]}]\"
   }
}
```

For more information, see [Update Groups](http://aws.amazon.com) in the *AWS Resource Groups User Guide*.

**Example 2: To update the query for a CloudFormation stack-based resource group**

The following `update-group-query` example updates the query attached to the specified AWS CloudFormation stack-based resource group.

```
aws resource-groups update-group-query \
   --group-name cbq-CFNstackgroup \
   --resource-query '{"Type": "CLOUDFORMATION_STACK_1_0", "Query": "\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier\":
```

Actions and scenarios
For more information, see Update Groups in the AWS Resource Groups User Guide.

For API details, see UpdateGroupQuery in AWS CLI Command Reference.

update-group

The following code example shows how to use update-group.

AWS CLI

To update the description for a resource group

The following update-group example updates the description for the specified resource group.

```
aws resource-groups update-group \
  --group-name tbq-WebServer \
  --description "Resource group for all web server resources."
```

Output:

```
{
    "Group": {
```

Actions and scenarios 5452
  "Name": "tbq-WebServer"
  "Description": "Resource group for all web server resources."
}  
}  

For more information, see Update Groups in the AWS Resource Groups User Guide.

- For API details, see UpdateGroup in AWS CLI Command Reference.

Resource Groups Tagging API examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups Tagging API.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

get-resources

The following code example shows how to use get-resources.

AWS CLI

To get a list of tagged resources

The following get-resources example displays a list of resources in the account that are tagged with the specified key name and value.
aws resourcegroupstaggingapi get-resources \
--tag-filters Key=Environment,Values=Production \
--tags-per-page 100

Output:

```
{
  "ResourceTagMappingList": [
    {
      "Tags": [
        {
          "Key": "Environment",
          "Value": "Production"
        }
      ]
    }
  ]
}
```

For more information, see GetResources in the Resource Groups Tagging API Reference.

- For API details, see GetResources in AWS CLI Command Reference.

get-tag-keys

The following code example shows how to use get-tag-keys.

AWS CLI

To get a list of all tag keys

The following get-tag-keys example retrieves the list of all tag key names used by resources in the account.

aws resourcegroupstaggingapi get-tag-keys

Output:

```
{
```
"TagKeys": [  "Environment",  "CostCenter",  "Department"
]

For more information, see [GetTagKeys](#) in the *Resource Groups Tagging API Reference*.
- For API details, see [GetTagKeys](#) in *AWS CLI Command Reference*.

**get-tag-values**

The following code example shows how to use `get-tag-values`.

**AWS CLI**

*To get a list of all tag values*

The following `get-tag-values` example displays all of the values used for the specified key for all resources in the

```
aws resourcegroupstaggingapi get-tag-values \  
    --key=Environment
```

**Output:**

```
{
   "TagValues": [  
      "Alpha",  
      "Gamma",  
      "Production"
   ]
}
```

For more information, see [GetTagValues](#) in the *Resource Groups Tagging API Reference*.
- For API details, see [GetTagValues](#) in *AWS CLI Command Reference*.

**tag-resources**

The following code example shows how to use `tag-resources`.

Actions and scenarios
AWS CLI

To attach a tag to a resource

The following `tag-resources` example tags the specified resource with a key name and value.

```shell
aws resourcegroupstaggingapi tag-resources \
   --resource-arn-list arn:aws:s3:::MyProductionBucket \
   --tags Environment=Production,CostCenter=1234
```

Output:

```json
{
   "FailedResourcesMap": {}
}
```

For more information, see `TagResources` in the Resource Groups Tagging API Reference.
- For API details, see `TagResources` in AWS CLI Command Reference.

untag-resources

The following code example shows how to use `untag-resources`.

AWS CLI

To remove a tag from a resource

The following `untag-resources` example removes the specified tag keys and any associated values from the specified resource.

```shell
aws resourcegroupstaggingapi untag-resources \
   --resource-arn-list arn:aws:s3:::awsexamplebucket \
   --tag-keys Environment CostCenter
```

Output:

```json
{
   "FailedResourcesMap": {}
}
```
For more information, see UntagResources in the Resource Groups Tagging API Reference.

- For API details, see UntagResources in AWS CLI Command Reference.

AWS RoboMaker examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RoboMaker.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**batch-describe-simulation-job**

The following code example shows how to use batch-describe-simulation-job.

**AWS CLI**

**To batch describe simulation jobs**

The following batch-describe-simulation-job example retrieves details for the three specified simulation jobs.

**Command:**

```bash
aws robomaker batch-describe-simulation-job
arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-g8h6tglmb1gw
```
Output:

```json
{
    "jobs": [
        {
            "status": "Completed",
            "lastUpdatedAt": 1548959178.0,
            "failureBehavior": "Continue",

For API details, see BatchDescribeSimulationJob in AWS CLI Command Reference.

cancel-simulation-job

The following code example shows how to use cancel-simulation-job.

AWS CLI

To cancel a simulation job

The following cancel-simulation-job example cancels the specified simulation job.

```bash
aws robomaker cancel-simulation-job \
```
create-deployment-job

The following code example shows how to use create-deployment-job.

AWS CLI

To create a deployment job

This example creates a deployment job for fleet MyFleet. It includes an environment variable named "ENVIRONMENT". It also attaches a tag named "Region".

Command:

```
aws robomaker create-deployment-job --deployment-config
    concurrentDeploymentPercentage=20,failureThresholdPercentage=25
    --tags Region=West --deployment-application-configs
    ,applicationVersion=1,launchConfig="environmentVariables={ENVIRONMENT=Beta}" applicationVersion=1
```

Output:

```
{
    "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/sim-0974h36s4v0t",
    "status": "Pending",
    "deploymentApplicationConfigs": [
        {
            "applicationVersion": "1",
            "launchConfig": {
                "packageName": "voice_interaction_robot",
                "launchFile": "await_commands.launch",
                "environmentVariables": {
                    "ENVIRONMENT": "Beta"
                }
            }
        }
    ]
}
```
create-fleet

The following code example shows how to use create-fleet.

AWS CLI

To create a fleet

This example creates a fleet. It attaches a tag named Region.

Command:

```bash
aws robomaker create-fleet --name MyFleet --tags Region=East
```

Output:

```
{
   "name": "MyFleet",
   "createdAt": 1550771394.0,
   "tags": {
      "Region": "East"
   }
}
```

• For API details, see CreateDeploymentJob in AWS CLI Command Reference.

• For API details, see CreateFleet in AWS CLI Command Reference.
create-robot-application-version

The following code example shows how to use create-robot-application-version.

AWS CLI

To create a robot application version

This example creates a robot application version.

Command:

```bash
```

Output:

```json
{
    "name": "MyRobotApplication",
    "version": "1",
    "sources": [
        {
            "s3Bucket": "my-bucket",
            "s3Key": "my-robot-application.tar.gz",
            "etag": "f8cf5526f1c6e7b3a72c3ed3f79c5493-70",
            "architecture": "ARMHF"
        }
    ],
    "robotSoftwareSuite": {
        "name": "ROS",
        "version": "Kinetic"
    },
    "lastUpdatedAt": 1551201873.0,
    "revisionId": "9986bb8d-a695-4ab4-8810-9f4a74d1aa00",
    "tags": {}
}
```

- For API details, see [CreateRobotApplicationVersion](#CreateRobotApplicationVersion) in AWS CLI Command Reference.
create-robot-application

The following code example shows how to use create-robot-application.

AWS CLI

To create a robot application

This example creates a robot application.

Command:

```bash
aws robomaker create-robot-application --name MyRobotApplication --sources
    s3Bucket=my-bucket,s3Key=my-robot-application.tar.gz,architecture=X86_64 --robot-
    software-suite name=ROS,version=Kinetic
```

Output:

```json
{
        MyRobotApplication/1551201873931",
    "name": "MyRobotApplication",
    "version": "$LATEST",
    "sources": [
        {
            "s3Bucket": "my-bucket",
            "s3Key": "my-robot-application.tar.gz",
            "architecture": "ARMHF"
        }
    ],
    "robotSoftwareSuite": {
        "name": "ROS",
        "version": "Kinetic"
    },
    "lastUpdatedAt": 1551201873.0,
    "revisionId": "1f3cb539-9239-4841-a656-d3efcffa07e1",
    "tags": {}
}
```

- For API details, see CreateRobotApplication in AWS CLI Command Reference.
create-robot

The following code example shows how to use create-robot.

AWS CLI

To create a robot

This example creates a robot. It uses the ARMHF architecture. It also attaches a tag named Region.

Command:

```bash
aws robomaker create-robot --name MyRobot --architecture ARMHF --greengrass-group-id 0f728a3c-7dbf-4a3e-976d-d16a8360caba --tags Region=East
```

Output:

```json
{
    "name": "MyRobot",
    "createdAt": 1550772325,
    "greengrassGroupId": "0f728a3c-7dbf-4a3e-976d-d16a8360caba",
    "architecture": "ARMHF",
    "tags": {
        "Region": "East"
    }
}
```

- For API details, see CreateRobot in AWS CLI Command Reference.

create-simulation-application-version

The following code example shows how to use create-simulation-application-version.

AWS CLI

To create a simulation application version

This example creates a robot application version.

Command:
aws robomaker create-simulation-application-version --application
MySimulationApplication/1551203427605

Output:

```json
{
    MyRobotApplication/1551203427605",
    "name": "MyRobotApplication",
    "version": "1",
    "sources": [
        {
            "s3Bucket": "my-bucket",
            "s3Key": "my-simulation-application.tar.gz",
            "etag": "00d8a94ff113856688c4fce618ae0f45-94",
            "architecture": "X86_64"
        }
    ],
    "simulationSoftwareSuite": {
        "name": "Gazebo",
        "version": "7"
    },
    "robotSoftwareSuite": {
        "name": "ROS",
        "version": "Kinetic"
    },
    "renderingEngine": {
        "name": "OGRE",
        "version": "1.x"
    },
    "lastUpdatedAt": 1551203853.0,
    "revisionId": "ee753e53-519c-4d37-895d-65e79bcd1914",
    "tags": {}
}
```

- For API details, see CreateSimulationApplicationVersion in AWS CLI Command Reference.

**create-simulation-application**

The following code example shows how to use create-simulation-application.
AWS CLI

To create a simulation application

This example creates a simulation application.

Command:

```bash
aws robomaker create-simulation-application --name MyRobotApplication --sources
  s3Bucket=my-bucket,s3Key=my-simulation-application.tar.gz,architecture=ARMHF
  --robot-software-suite name=ROS,version=Kinetic --simulation-software-suite
  name=Gazebo,version=7 --rendering-engine name=OGRE,version=1.x
```

Output:

```json
{
      MyRobotApplication/1551203301792",
  "name": "MyRobotApplication",
  "version": "$LATEST",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-simulation-application.tar.gz",
      "architecture": "X86_64"
    }
  ],
  "simulationSoftwareSuite": {
    "name": "Gazebo",
    "version": "7"
  },
  "robotSoftwareSuite": {
    "name": "ROS",
    "version": "Kinetic"
  },
  "renderingEngine": {
    "name": "OGRE",
    "version": "1.x"
  },
  "lastUpdatedAt": 1551203301.0,
  "revisionId": "ee753e53-519c-4d37-895d-65e79bcd1914",
  "tags": {}
}
```
create-simulation-job

The following code example shows how to use create-simulation-job.

AWS CLI

To create a simulation job

This example creates a simulation job. It uses a robot application and a simulation application.

Command:

```bash
```

Output:

```json
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-w7m68wpr05h8",
  "status": "Pending",
  "lastUpdatedAt": 1551213837.0,
  "failureBehavior": "Fail",
  "clientRequestToken": "b283ccce-e468-43ee-8642-be76a9d69f15",
  "maxJobDurationInSeconds": 3600,
  "simulationTimeMillis": 0,
  "iamRole": "arn:aws:iam::111111111111:role/MySimulationRole",
  "robotApplications": [
    {
      "applicationVersion": "$LATEST",
      "launchConfig": {
        "packageName": "hello_world_robot",
```
"launchFile": "rotate.launch"
}
]
,
"simulationApplications": [
{
  "applicationVersion": "$LATEST",
  "launchConfig": {
    "packageName": "hello_world_simulation",
    "launchFile": "empty_world.launch"
  }
}
],
"tags": {
  "Region": "North"
}
]

• For API details, see [CreateSimulationJob](https://awscli.amazonaws.com/v2/documentation/api/as/2018-06-20/service/robomaker.html#CreateSimulationJob) in *AWS CLI Command Reference*.

### delete-fleet

The following code example shows how to use delete-fleet.

**AWS CLI**

**To delete a fleet**

This example deletes a fleet.

**Command:**

```
```

• For API details, see [DeleteFleet](https://awscli.amazonaws.com/v2/documentation/api/as/2018-06-20/service/robomaker.html#DeleteFleet) in *AWS CLI Command Reference*.

### delete-robot-application

The following code example shows how to use delete-robot-application.
AWS CLI

To delete a robot application

This example deletes a robot application.

Command:

```
```

- For API details, see [DeleteRobotApplication](#) in [AWS CLI Command Reference](#).

delete-robot

The following code example shows how to use delete-robot.

AWS CLI

To delete a robot

This example deletes a robot.

Command:

```
```

- For API details, see [DeleteRobot](#) in [AWS CLI Command Reference](#).

delete-simulation-application

The following code example shows how to use delete-simulation-application.

AWS CLI

To delete a simulation application

This example deletes a simulation application.

Command:

- For API details, see DeleteSimulationApplication in AWS CLI Command Reference.

deregister-robot

The following code example shows how to use deregister-robot.

AWS CLI

**To deregister a robot from a fleet**

This example deregisters a robot from a fleet.

Command:

```
```

Output:

```
{
}
```

- For API details, see DeregisterRobot in AWS CLI Command Reference.

describe-deployment-job

The following code example shows how to use describe-deployment-job.

AWS CLI

**To describe a deployment job**

The following describe-deployment-job example retrieves the details about the specified deployment job.
aws robomaker describe-deployment-job \

Output:

```
{
   "status": "InProgress",
   "deploymentConfig": {
      "concurrentDeploymentPercentage": 20,
      "failureThresholdPercentage": 25
   },
   "deploymentApplicationConfigs": [
      {
         "applicationVersion": "1",
         "launchConfig": {
            "packageName": "hello_world_robot",
            "launchFile": "rotate.launch"
         }
      }
   ],
   "createdAt": 1551218369.0,
   "robotDeploymentSummary": [
      {
         "deploymentStartTime": 1551218376.0,
         "status": "Deploying",
         "progressDetail": {}
      }
   ],
   "tags": {}
}
```

- For API details, see [DescribeDeploymentJob](https://docs.aws.amazon.com/cli/latest/reference/robomaker/describe-deployment-job.html) in *AWS CLI Command Reference*. 
**describe-fleet**

The following code example shows how to use describe-fleet.

**AWS CLI**

To describe a fleet

The following describe-fleet example retrieves the details for the specified fleet.

```bash
code example
aws robomaker describe-fleet \
```

Output:

```json
{
   "name": "MyFleet",
   "robots": [
      {
         "createdAt": 1540834232.0
      },
      {
         "createdAt": 1540829698.0
      }
   ],
   "createdAt": 1539894765.0,
   "lastDeploymentStatus": "Succeeded",
   "lastDeploymentTime": 1551218369.0,
   "tags": {}  
}
```

- For API details, see [DescribeFleet](https://docs.aws.amazon.com/cli/latest/reference/robomaker/describe-fleet.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/robomaker/describe-fleet.html).
describe-robot-application

The following code example shows how to use describe-robot-application.

AWS CLI

To describe a robot application

This example describes a robot application.

Command:

```bash
```

Output:

```json
{
   "name": "MyRobotApplication",
   "version": "$LATEST",
   "sources": [ {
      "s3Bucket": "my-bucket",
      "s3Key": "my-robot-application.tar.gz",
      "architecture": "X86_64"
   } ],
   "robotSoftwareSuite": { "name": "ROS", "version": "Kinetic" },
   "revisionId": "e72efe0d-f44f-4333-b604-f6fa5c6bb50b",
   "lastUpdatedAt": 1551203485.0,
   "tags": {} }`

• For API details, see [DescribeRobotApplication](#) in [AWS CLI Command Reference](#).

describe-robot

The following code example shows how to use describe-robot.
To describe a robot

This example describes a robot.

Command:

```bash
```

Output:

```json
{
   "name": "MyRobot",
   "status": "Available",
   "greengrassGroupId": "0f728a3c-7dbf-4a3e-976d-d16a8360caba",
   "createdAt": 1550772325.0,
   "architecture": "ARMHF",
   "tags": {
      "Region": "East"
   }
}
```

- For API details, see [DescribeRobot](https://docs.aws.amazon.com/cli/latest/reference/robomaker/describe-robot.html) in AWS CLI Command Reference.

describe-simulation-application

The following code example shows how to use describe-simulation-application.

AWS CLI

To describe a simulation application

This example describes a simulation application.

Command:

```bash
```
Output:

```json
{
  "name": "MySimulationApplication",
  "version": "$LATEST",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-simulation-application.tar.gz",
      "architecture": "X86_64"
    }
  ],
  "simulationSoftwareSuite": {
    "name": "Gazebo",
    "version": "7"
  },
  "robotSoftwareSuite": {
    "name": "ROS",
    "version": "Kinetic"
  },
  "renderingEngine": {
    "name": "OGRE",
    "version": "1.x"
  },
  "revisionId": "783674ab-b7b8-42d9-b01f-9373907987e5",
  "lastUpdatedAt": 1551203427.0,
  "tags": {}
}
```

- For API details, see [DescribeSimulationApplication](https://docs.aws.amazon.com/cli/latest/reference/robomaker/describe-simulation-application.html) in *AWS CLI Command Reference*.

**describe-simulation-job**

The following code example shows how to use `describe-simulation-job`.

**AWS CLI**

To describe a simulation job

This example describes a simulation job.
Command:

```
```

Output:

```
{
    "status": "Running",

**list-deployment-jobs**

The following code example shows how to use `list-deployment-jobs`.

**AWS CLI**

**To list deployment jobs**

The following `list-deployment-jobs` example retrieves a list of deployment jobs.

```
aws robomaker list-deployment-jobs
```

Output:

```
{
    "deploymentJobs": [
        {
            "status": "InProgress",
            "deploymentApplicationConfigs": [
                {
                    "applicationVersion": "1",
                    "launchConfig": {
                        "packageName": "hello_world_robot",
                        "launchFile": "rotate.launch",
                        "environmentVariables": {
                            "ENVIRONMENT": "Desert"
                        }
                    }
                }
            ],
            "deploymentConfig": {
                "concurrentDeploymentPercentage": 20,
            }
        }
    ]
}
```
For API details, see ListDeploymentJobs in AWS CLI Command Reference.

list-fleets

The following code example shows how to use list-fleets.

AWS CLI

To list fleets

This example lists fleets. A maximum of 20 fleets will be returned.
Command:

```
aws robomaker list-fleets --max-items 20
```

Output:

```
{
   "fleetDetails": [
   {
   "name": "Trek",
   "createdAt": 1539894765.0,
   "lastDeploymentStatus": "Failed",
   "lastDeploymentTime": 1544719763.0
   }
   ]
}
```

- For API details, see [ListFleets](#) in AWS CLI Command Reference.

**list-robot-applications**

The following code example shows how to use `list-robot-applications`.

**AWS CLI**

**To list robot applications**

This example lists robot applications. Results are limited to 20 robot applications.

Command:

```
aws robomaker list-robot-applications --max-results 20
```

Output:

```
{
```
"robotApplicationSummaries": [
    {
      "name": "MyRobot",
      "version": "$LATEST",
      "lastUpdatedAt": 1546540372.0
    },
    {
      "name": "AnotherRobot",
      "version": "$LATEST",
      "lastUpdatedAt": 1546541208.0
    },
    {
      "name": "MySuperRobot",
      "version": "$LATEST",
      "lastUpdatedAt": 1547663517.0
    }
  ]

- For API details, see [ListRobotApplications](https://docs.aws.amazon.com/cli/latest/reference/robomaker/list-robot-applications.html) in *AWS CLI Command Reference*.

**list-robots**

The following code example shows how to use list-robots.

**AWS CLI**

**To list robots**

This example lists robots. A maximum of 20 robots will be returned.

**Command:**

```bash
aws robomaker list-robots --max-results 20
```

**Output:**
```json
{
    "robots": [
    {
        "name": "Robot100",
        "status": "Available",
        "createdAt": 1544035373.0,
        "architecture": "X86_64"
    },
    {
        "name": "Robot101",
        "status": "Available",
        "createdAt": 1542146976.0,
        "architecture": "X86_64"
    },
    {
        "name": "Robot102",
        "status": "Available",
        "createdAt": 1540834232.0,
        "architecture": "X86_64",
        "lastDeploymentJob": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/deployment-jb007b75g15f",
        "lastDeploymentTime": 1550689533.0
    },
    {
        "name": "MyRobot",
        "status": "Registered",
        "createdAt": 1540829698.0,
        "architecture": "X86_64"
    }
    ]
}
```

- For API details, see [ListRobots](https://docs.aws.amazon.com/cli/latest/reference/robomaker/list-robots.html) in *AWS CLI Command Reference*. 
**list-simulation-applications**

The following code example shows how to use `list-simulation-applications`.

**AWS CLI**

**To list simulation applications**

This example lists simulation applications. A maximum of 20 simulation applications will be returned.

Command:

```bash
aws robomaker list-simulation-applications --max-results 20
```

Output:

```json
{
   "simulationApplicationSummaries": [
      {
         "name": "AWSRoboMakerObjectTracker-1548959046124_NPvyfcatq",
         "version": "$LATEST",
         "lastUpdatedAt": 1548959170.0
      },
      {
         "name": "RoboMakerHelloWorldSimulation",
         "version": "$LATEST",
         "lastUpdatedAt": 1546541198.0
      },
      {
         "name": "RoboMakerObjectTrackerSimulation",
         "version": "$LATEST",
         "lastUpdatedAt": 1545847405.0
      },
      {
         "name": "RoboMakerVoiceInteractionSimulation",
```
• For API details, see ListSimulationApplications in AWS CLI Command Reference.

list-simulation-jobs

The following code example shows how to use list-simulation-jobs.

AWS CLI

To list simulation jobs

This example lists simulation jobs.

Command:

aws robomaker list-simulation-jobs

Output:

```json
{
    "simulationJobSummaries": [
        {
```
"lastUpdatedAt": 1548959178.0,
"status": "Completed",
"simulationApplicationNames": [
   "AWSRoboMakerObjectTracker-1548959046124_NPvyfcatq"
],
"robotApplicationNames": [
   null
],
],
{
   "lastUpdatedAt": 1543514088.0,
   "status": "Canceled",
   "simulationApplicationNames": [
      "AWSRoboMakerPersonDetection-1543513948280_T8rHW2_lu"
   ],
   "robotApplicationNames": [
      "AWSRoboMakerPersonDetection-1543513948280_EYaMT0mYb"
   ]
},
{
   "lastUpdatedAt": 1543508858.0,
   "status": "Canceled",
   "simulationApplicationNames": [
      "AWSRoboMakerCloudWatch-1543504747391_lFF9ZQyx6"
   ],
   "robotApplicationNames": [
      "AWSRoboMakerCloudWatch-1543504747391_axbYa3S3K"
   ]
},
{
   "lastUpdatedAt": 1543504862.0,
   "status": "Completed",
   "simulationApplicationNames": [
      "AWSRoboMakerCloudWatch-1543504747391_lFF9ZQyx6"
   ],
   "robotApplicationNames": [
      "AWSRoboMakerCloudWatch-1543504747391_axbYa3S3K"
   ]
}
• For API details, see ListSimulationJobs in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a resource**

This example lists tags for an AWS RoboMaker resource.

**Command:**

Output:

```json
{
   "tags": {
      "Region": "North",
      "Stage": "Initial"
   }
}
```

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/robomaker/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**register-robot**

The following code example shows how to use `register-robot`.

**AWS CLI**

**To register a robot**

This example registers a robot to a fleet.

Command:

```bash
```

Output:

```json
{
}
```

- For API details, see [RegisterRobot](https://docs.aws.amazon.com/cli/latest/reference/robomaker/register-robot.html) in *AWS CLI Command Reference*. 
**restart-simulation-job**

The following code example shows how to use `restart-simulation-job`.

**AWS CLI**

**To restart a simulation**

This example restarts a simulation.

Command:

```bash
```

- For API details, see [RestartSimulationJob](#) in [AWS CLI Command Reference](#).

**sync-deployment-job**

The following code example shows how to use `sync-deployment-job`.

**AWS CLI**

**To sync a deployment job**

This example synchronizes a deployment job.

Command:

```bash
```

Output:

```json
{
  "status": "Pending",
  "deploymentConfig": {
    "concurrentDeploymentPercentage": 20,
```

Actions and scenarios

```json
{
   "failureThresholdPercentage": 25,
   "deploymentApplicationConfigs": [
      {
         "applicationVersion": "1",
         "launchConfig": {
            "packageName": "hello_world_simulation",
            "launchFile": "empty_world.launch"
         }
      }
   ],
   "createdAt": 1551286954.0
}
```

- For API details, see [SyncDeploymentJob](https://docs.aws.amazon.com/AWS CLI Command Reference) in *AWS CLI Command Reference*.

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a resource**

This example tags a resource. It attaches two tags: Region and Stage.

Command:

```
```

- For API details, see [TagResource](https://docs.aws.amazon.com/AWS CLI Command Reference) in *AWS CLI Command Reference*.

### untag-resource

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To untag a resource**
This example removes a tag from a resource. It removes the Region tag.

Command:

```
```

**update-robot-application**

The following code example shows how to use `update-robot-application`.

**AWS CLI**

**To update a robot application**

This example updates a robot application.

Command:

```
```

Output:

```
{
    "name": "MyRobotApplication",
    "version": "$LATEST",
    "sources": [
        {
            "s3Bucket": "my-bucket",
            "s3Key": "my-robot-application.tar.gz",
            "architecture": "X86_64"
        }
    ],
    "robotSoftwareSuite": {
        "name": "ROS",
        "version": "Kinetic"
    }
}
```
For API details, see `UpdateRobotApplication` in *AWS CLI Command Reference*.

**update-simulation-application**

The following code example shows how to use `update-simulation-application`.

**AWS CLI**

**To update a simulation application**

This example updates a simulation application.

**Command:**

```bash
aws robomaker update-simulation-application --application
MySimulationApplication/1551203427605 --sources s3Bucket=my-bucket,s3Key=my-
simulation-application.tar.gz,architecture=X86_64 --robot-software-suite
name=ROS,version=Kinetic --simulation-software-suite name=Gazebo,version=7 --
rendering-engine name=OGRE,version=1.x
```

**Output:**

```json
{
MySimulationApplication/1551203427605",
   "name": "MySimulationApplication",
   "version": "$LATEST",
   "sources": [
      {
         "s3Bucket": "my-bucket",
         "s3Key": "my-simulation-application.tar.gz",
         "architecture": "X86_64"
      }
   ],
}
"simulationSoftwareSuite": {
  "name": "Gazebo",
  "version": "7"
},
"robotSoftwareSuite": {
  "name": "ROS",
  "version": "Kinetic"
},
"renderingEngine": {
  "name": "OGRE",
  "version": "1.x"
},
"lastUpdatedAt": 1551289361.0,
"revisionId": "4a22cb5d-93c5-4cef-9311-52bdd119b79e"
}

- For API details, see [UpdateSimulationApplication](#) in *AWS CLI Command Reference*.

### Route 53 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

**Actions**

*change-resource-record-sets*

The following code example shows how to use *change-resource-record-sets*.
AWS CLI

To create, update, or delete a resource record set

The following `change-resource-record-sets` command creates a resource record set using the `hosted-zone-id Z1R8UBAEXAMPLE` and the JSON-formatted configuration in the file `C:\awscli\route53\change-resource-record-sets.json`:

```
aws route53 change-resource-record-sets --hosted-zone-id Z1R8UBAEXAMPLE --change-batch file://C:\awscli\route53\change-resource-record-sets.json
```

For more information, see POST ChangeResourceRecordSets in the Amazon Route 53 API Reference.

The configuration in the JSON file depends on the kind of resource record set you want to create:

- Basic
- Weighted Alias
- Weighted Alias
- Latency
- Latency Alias
- Failover
- Failover Alias

**Basic Syntax:**

```
{
   "Comment": "optional comment about the changes in this change batch request",
   "Changes": [
      {
         "Action": "CREATE"|"DELETE"|"UPSERT",
         "ResourceRecordSet": {
            "Name": "DNS domain name",
            "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
            "TTL": time to live in seconds,
            "ResourceRecords": [
               {
                  "Value": "applicable value for the record type"
               },
               {...}
            ]
         }
      },
      {...}
   ]
}
```
Weighted Syntax:

```json
{
  "Comment": "optional comment about the changes in this change batch request",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "DNS domain name",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
        "SetIdentifier": "unique description for this resource record set",
        "Weight": value between 0 and 255,
        "TTL": time to live in seconds,
        "ResourceRecords": [
          {
            "Value": "applicable value for the record type"
          },
          {...}
        ],
        "HealthCheckId": "optional ID of an Amazon Route 53 health check"
      }
    },
    {...}
  ]
}
```

Alias Syntax:

```json
{
  "Comment": "optional comment about the changes in this change batch request",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "DNS domain name",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
        "AliasTarget": {
          "HostedZoneId": "hosted zone ID for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or Amazon Route 53 hosted zone",
          "DNSName": "DNS domain name for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or another resource record set in this hosted zone",
          "EvaluateTargetHealth": true|false
        }
      }
    }
  ]
}
```
Weighted Alias Syntax:

```
{
    "Comment": "optional comment about the changes in this change batch request",
    "Changes": [
        {
            "Action": "CREATE"|"DELETE"|"UPSERT",
            "ResourceRecordSet": {
                "Name": "DNS domain name",
                "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
                "SetIdentifier": "unique description for this resource record set",
                "Weight": value between 0 and 255,
                "AliasTarget": {
                    "HostedZoneId": "hosted zone ID for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or Amazon Route 53 hosted zone",
                    "DNSName": "DNS domain name for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or another resource record set in this hosted zone",
                    "EvaluateTargetHealth": true|false
                },
                "HealthCheckId": "optional ID of an Amazon Route 53 health check"
            }
        },
        {...}
    ]
}
```

Latency Syntax:

```
{
    "Comment": "optional comment about the changes in this change batch request",
    "Changes": [
        {
            "Action": "CREATE"|"DELETE"|"UPSERT",
            "ResourceRecordSet": {
```
"Name": "DNS domain name",
"Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
"SetIdentifier": "unique description for this resource record set",
"Region": "Amazon EC2 region name",
"TTL": time to live in seconds,
"ResourceRecords": [
  {
    "Value": "applicable value for the record type"
  },
  {...}
],
"HealthCheckId": "optional ID of an Amazon Route 53 health check"
},
{...

Latency Alias Syntax:

{
  "Comment": "optional comment about the changes in this change batch request",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "DNS domain name",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
        "SetIdentifier": "unique description for this resource record set",
        "Region": "Amazon EC2 region name",
        "AliasTarget": {
          "HostedZoneId": "hosted zone ID for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or Amazon Route 53 hosted zone",
          "DNSName": "DNS domain name for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or another resource record set in this hosted zone",
          "EvaluateTargetHealth": true|false
        },
        "HealthCheckId": "optional ID of an Amazon Route 53 health check"
      }
    },
    {...}
  ]
Failover Syntax:

```json
{
    "Comment": "optional comment about the changes in this change batch request",
    "Changes": [
        {
            "Action": "CREATE"|"DELETE"|"UPSERT",
            "ResourceRecordSet": {
                "Name": "DNS domain name",
                "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
                "SetIdentifier": "unique description for this resource record set",
                "Failover": "PRIMARY" | "SECONDARY",
                "TTL": time to live in seconds,
                "ResourceRecords": [
                    {
                        "Value": "applicable value for the record type"
                    },
                    {...}
                ],
                "HealthCheckId": "ID of an Amazon Route 53 health check"
            }
        },
        {...}
    ]
}
```

Failover Alias Syntax:

```json
{
    "Comment": "optional comment about the changes in this change batch request",
    "Changes": [
        {
            "Action": "CREATE"|"DELETE"|"UPSERT",
            "ResourceRecordSet": {
                "Name": "DNS domain name",
                "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
                "SetIdentifier": "unique description for this resource record set",
                "Failover": "PRIMARY" | "SECONDARY",
                "AliasTarget": {
                    "HostedZoneId": "hosted zone ID for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or Amazon Route 53 hosted zone",
                    "Value": "applicable value for the record type"
                }
            }
        },
        {...}
    ]
}
```
"DNSName": "DNS domain name for your CloudFront distribution, Amazon S3 bucket, Elastic Load Balancing load balancer, or another resource record set in this hosted zone",
  "EvaluateTargetHealth": true|false
},
  "HealthCheckId": "optional ID of an Amazon Route 53 health check"
},
{...
]

- For API details, see ChangeResourceRecordSets in AWS CLI Command Reference.

**change-tags-for-resource**

The following code example shows how to use change-tags-for-resource.

**AWS CLI**

The following command adds a tag named owner to a healthcheck resource specified by ID:

```bash
aws route53 change-tags-for-resource --resource-type healthcheck --resource-id 6233434j-18c1-34433-ba8e-3443434 --add-tags Key=owner,Value=myboss
```

The following command removes a tag named owner from a hosted zone resource specified by ID:

```bash
aws route53 change-tags-for-resource --resource-type hostedzone --resource-id Z1523434445 --remove-tag-keys owner
```

- For API details, see ChangeTagsForResource in AWS CLI Command Reference.

**create-health-check**

The following code example shows how to use create-health-check.

**AWS CLI**

To create a health check
The following `create-health-check` command creates a health check using the caller reference `2014-04-01-18:47` and the JSON-formatted configuration in the file `C:\awscli\route53\create-health-check.json`:

```
aws route53 create-health-check --caller-reference 2014-04-01-18:47 --health-check-config file://C:\awscli\route53\create-health-check.json
```

**JSON syntax:**

```json
{
    "IPAddress": "IP address of the endpoint to check",
    "Port": port on the endpoint to check--required when Type is "TCP",
    "Type": "HTTP"|"HTTPS"|"HTTP_STR_MATCH"|"HTTPS_STR_MATCH"|"TCP",
    "ResourcePath": "path of the file that you want Amazon Route 53 to request--all Types except TCP",
    "FullyQualifiedDomainName": "domain name of the endpoint to check--all Types except TCP",
    "SearchString": "if Type is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to search for in the response body from the specified resource",
    "RequestInterval": 10 | 30,
    "FailureThreshold": integer between 1 and 10
}
```

To add the health check to a Route 53 resource record set, use the `change-resource-record-sets` command.

For more information, see Amazon Route 53 Health Checks and DNS Failover in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateHealthCheck](#) in *AWS CLI Command Reference*.

### create-hosted-zone

The following code example shows how to use `create-hosted-zone`.

**AWS CLI**

**To create a hosted zone**

The following `create-hosted-zone` command adds a hosted zone named `example.com` using the caller reference `2014-04-01-18:47`. The optional comment includes a space, so it must be enclosed in quotation marks:
aws route53 create-hosted-zone --name example.com --caller-reference 2014-04-01-18:47 --hosted-zone-config Comment="command-line version"

For more information, see Working with Hosted Zones in the Amazon Route 53 Developer Guide. For API details, see CreateHostedZone in AWS CLI Command Reference.

delete-health-check

The following code example shows how to use delete-health-check.

AWS CLI

To delete a health check

The following delete-health-check command deletes the health check with a health-check-id of e75b48d9-547a-4c3d-88a5-ae4002397608:

aws route53 delete-health-check --health-check-id e75b48d9-547a-4c3d-88a5-ae4002397608

For API details, see DeleteHealthCheck in AWS CLI Command Reference.

delete-hosted-zone

The following code example shows how to use delete-hosted-zone.

AWS CLI

To delete a hosted zone

The following delete-hosted-zone command deletes the hosted zone with an id of Z36KTIQEXAMPLE:

aws route53 delete-hosted-zone --id Z36KTIQEXAMPLE

For API details, see DeleteHostedZone in AWS CLI Command Reference.

get-change

The following code example shows how to use get-change.
AWS CLI

To get the status of a change to resource record sets

The following get-change command gets the status and other information about the change-resource-record-sets request that has an Id of /change/CWPIK4URU2I5S:

```
aws route53 get-change --id /change/CWPIK4URU2I5S
```

- For API details, see GetChange in AWS CLI Command Reference.

get-health-check

The following code example shows how to use get-health-check.

AWS CLI

To get information about a health check

The following get-health-check command gets information about the health check that has a health-check-id of 02ec8401-9879-4259-91fa-04e66d094674:

```
aws route53 get-health-check --health-check-id 02ec8401-9879-4259-91fa-04e66d094674
```

- For API details, see GetHealthCheck in AWS CLI Command Reference.

get-hosted-zone

The following code example shows how to use get-hosted-zone.

AWS CLI

To get information about a hosted zone

The following get-hosted-zone command gets information about the hosted zone with an id of Z1R8UBAEXAMPLE:

```
aws route53 get-hosted-zone --id Z1R8UBAEXAMPLE
```
list-health-checks

The following code example shows how to use list-health-checks.

AWS CLI

To list the health checks associated with the current AWS account

The following list-health-checks command lists detailed information about the first 100 health checks that are associated with the current AWS account:

```bash
aws route53 list-health-checks
```

If you have more than 100 health checks, or if you want to list them in groups smaller than 100, include the --max-items parameter. For example, to list health checks one at a time, use the following command:

```bash
aws route53 list-health-checks --max-items 1
```

To view the next health check, take the value of NextToken from the response to the previous command, and include it in the --starting-token parameter, for example:

```bash
aws route53 list-health-checks --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

- For API details, see ListHealthChecks in AWS CLI Command Reference.

list-hosted-zones-by-name

The following code example shows how to use list-hosted-zones-by-name.

AWS CLI

The following command lists up to 100 hosted zones ordered by domain name:

```bash
aws route53 list-hosted-zones-by-name
```
The following command lists hosted zones ordered by name, beginning with `www.example.com`:

```
aws route53 list-hosted-zones-by-name --dns-name www.example.com
```

Output:

```json
{
   "HostedZones": [
   {
      "ResourceRecordSetCount": 2,
      "CallerReference": "test20150527-1",
      "Config": {
         "Comment": "test",
         "PrivateZone": false
      },
      "Id": "/hostedzone/Z3P5QSUBK4P0TI",
      "Name": "www.example.com."
   },
   {
      "ResourceRecordSetCount": 2,
      "CallerReference": "test20150527-2",
      "Config": {
         "Comment": "test2",
         "PrivateZone": false
      },
      "Id": "/hostedzone/Z119WBBTVP5WFZ",
      "Name": "2.example.com."
   }
   ],
   "IsTruncated": false,
   "MaxItems": "100"
}
```
For API details, see ListHostedZonesByName in AWS CLI Command Reference.

list-hosted-zones

The following code example shows how to use list-hosted-zones.

AWS CLI

To list the hosted zones associated with the current AWS account

The following list-hosted-zones command lists summary information about the first 100 hosted zones that are associated with the current AWS account:

```bash
aws route53 list-hosted-zones
```

If you have more than 100 hosted zones, or if you want to list them in groups smaller than 100, include the --max-items parameter. For example, to list hosted zones one at a time, use the following command:

```bash
aws route53 list-hosted-zones --max-items 1
```

To view information about the next hosted zone, take the value of NextToken from the response to the previous command, and include it in the --starting-token parameter, for example:

```bash
aws route53 list-hosted-zones --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

For API details, see ListHostedZones in AWS CLI Command Reference.
list-query-logging-configs

The following code example shows how to use `list-query-logging-configs`.

**AWS CLI**

**To list query logging configurations**

The following `list-query-logging-configs` example lists information about the first 100 query logging configurations in your AWS account, for the hosted zone Z10X3WQEXAMPLE.

```bash
aws route53 list-query-logging-configs 
    --hosted-zone-id Z10X3WQEXAMPLE
```

Output:

```json
{
    "QueryLoggingConfigs": [
        {
            "Id": "964ff34e-ae03-4f06-80a2-9683cexample",
            "HostedZoneId": "Z10X3WQEXAMPLE",
        }
    ]
}
```

For more information, see [Logging DNS queries](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListQueryLoggingConfigs](https://docs.aws.amazon.com/cli/latest/reference/route53/list-query-logging-configs.html) in *AWS CLI Command Reference*.

list-resource-record-sets

The following code example shows how to use `list-resource-record-sets`.

**AWS CLI**

**To list the resource record sets in a hosted zone**

The following `list-resource-record-sets` command lists summary information about the first 100 resource record sets in a specified hosted zone.
If the hosted zone contains more than 100 resource record sets, or if you want to list them in groups smaller than 100, include the --max-items parameter. For example, to list resource record sets one at a time, use the following command:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1
```

To view information about the next resource record set in the hosted zone, take the value of NextToken from the response to the previous command, and include it in the --starting-token parameter, for example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

To view all the resource record sets of a particular name, use the --query parameter to filter them out. For example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --query "ResourceRecordSets[?Name == 'example.domain.']."
```

- For API details, see [ListResourceRecordSets] in AWS CLI Command Reference.

**Route 53 domain registration examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 domain registration.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.
• Actions

Actions

check-domain-availability

The following code example shows how to use check-domain-availability.

AWS CLI

To determine whether you can register a domain name with Route 53

The following check-domain-availability command returns information about whether the domain name example.com is available to be registered using Route 53.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains check-domain-availability \\
    --region us-east-1 \\
    --domain-name example.com
```

Output:

```
{
    "Availability": "UNAVAILABLE"
}
```

Route 53 supports a large number of top-level domains (TLDs), such as .com and .jp, but we don't support all available TLDs. If you check the availability of a domain and Route 53 doesn't support the TLD, check-domain-availability returns the following message.

```
An error occurred (UnsupportedTLD) when calling the CheckDomainAvailability operation: <top-level domain> tld is not supported.
```

For a list of the TLDs that you can use when registering a domain with Route 53, see Domains That You Can Register with Amazon Route 53 in the Amazon Route 53 Developer Guide. For more information about registering domains with Amazon Route 53, see Registering a New Domain in the Amazon Route 53 Developer Guide.

• For API details, see CheckDomainAvailability in AWS CLI Command Reference.
**check-domain-transferability**

The following code example shows how to use check-domain-transferability.

**AWS CLI**

To determine whether a domain can be transferred to Route 53

The following check-domain-transferability command returns information about whether you can transfer the domain name example.com to Route 53.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```bash
aws route53domains check-domain-transferability \
   --region us-east-1 \
   --domain-name example.com
```

Output:

```
{
   "Transferability": {
      "Transferable": "UNTRANSFERABLE"
   }
}
```

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the Amazon Route 53 Developer Guide.

- For API details, see CheckDomainTransferability in AWS CLI Command Reference.

**delete-tags-for-domain**

The following code example shows how to use delete-tags-for-domain.

**AWS CLI**

To delete tags for a domain

The following delete-tags-for-domain command deletes three tags from the specified domain. Note that you specify only the tag key, not the tag value.
This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains delete-tags-for-domain \
  --region us-east-1 \
  --domain-name example.com \
  --tags-to-delete accounting-key hr-key engineering-key
```

This command produces no output.

To confirm that the tags were deleted, you can run `list-tags-for-domain`. For more information, see [Tagging Amazon Route 53 Resources](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/tagging.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DeleteTagsForDomain](https://docs.aws.amazon.com/Route53/latest/APIReference/API_DeleteTagsForDomain.html) in *AWS CLI Command Reference*.

---

**disable-domain-auto-renew**

The following code example shows how to use disable-domain-auto-renew.

**AWS CLI**

**To disable automatic renewal of a domain**

The following disable-domain-auto-renew command configures Route 53 to *not* automatically renew the domain example.com before registration for the domain expires.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains disable-domain-auto-renew \
  --region us-east-1 \
  --domain-name example.com
```

This command produces no output.

To confirm that the setting was changed, you can run `get-domain-detail`. If automatic renewal is disabled, the value of `AutoRenew` is `False`. For more information about automatic renewal, see [Renewing Registration for a Domain](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DisableDomainAutoRenew](https://docs.aws.amazon.com/Route53/latest/APIReference/API_DisableDomainAutoRenew.html) in *AWS CLI Command Reference*. 
disable-domain-transfer-lock

The following code example shows how to use disable-domain-transfer-lock.

**AWS CLI**

To disable the transfer lock on a domain

The following disable-domain-transfer-lock command removes the transfer lock on the domain example.com so that the domain can be transferred to another registrar. This command changes the clientTransferProhibited status.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains disable-domain-transfer-lock \
  --region us-east-1 \
  --domain-name example.com
```

Output:

```
{
  "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the transfer lock has been changed, you can run `get-domain-detail` . When the transfer lock is disabled, the value of StatusList does not include clientTransferProhibited.

For more information about the transfer process, see [Transferring a Domain from Amazon Route 53 to Another Registrar](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DisableDomainTransferLock](#) in *AWS CLI Command Reference*.

enable-domain-auto-renew

The following code example shows how to use enable-domain-auto-renew.

**AWS CLI**

To enable automatic renewal of a domain

|
The following enable-domain-auto-renew command configures Route 53 to automatically renew the domain example.com before registration for the domain expires.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```bash
aws route53domains enable-domain-auto-renew \
  --region us-east-1 \
  --domain-name example.com
```

This command produces no output. To confirm that the setting was changed, you can run `get-domain-detail`. If automatic renewal is enabled, the value of AutoRenew is True.

For more information about automatic renewal, see Renewing Registration for a Domain <https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html in the Amazon Route 53 Developer Guide>.

• For API details, see EnableDomainAutoRenew in AWS CLI Command Reference.

**enable-domain-transfer-lock**

The following code example shows how to use enable-domain-transfer-lock.

**AWS CLI**

**To enable the transfer lock on a domain**

The following enable-domain-transfer-lock command locks the specified domain so that it can't be transferred to another registrar. This command changes the clientTransferProhibited status.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```bash
aws route53domains enable-domain-transfer-lock \
  --region us-east-1 \
  --domain-name example.com
```

Output:

```json
{
}
```
To confirm that the transfer lock has been changed, you can run `get-domain-detail`. When the transfer lock is enabled, the value of `StatusList` includes `clientTransferProhibited`.

For more information about the transfer process, see [Transferring a Domain from Amazon Route 53 to Another Registrar](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/transfer-domain-between-registries.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [EnableDomainTransferLock](https://docs.aws.amazon.com/cli/latest/reference/route53domains/enable-domain-transfer-lock.html) in *AWS CLI Command Reference*.

### get-contact-reachability-status

The following code example shows how to use `get-contact-reachability-status`.

**AWS CLI**

To determine whether the registrant contact has responded to a confirmation email

The following `get-contact-reachability-status` command returns information about whether the registrant contact for the specified domain has responded to a confirmation email.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```bash
aws route53domains get-contact-reachability-status \
  --region us-east-1 \
  --domain-name example.com
```

Output:

```json
{
   "domainName": "example.com",
   "status": "DONE"
}
```

For more information, see [Resending Authorization and Confirmation Emails](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/resend-authorization-and-confirmation-emails.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetContactReachabilityStatus](https://docs.aws.amazon.com/cli/latest/reference/route53domains/get-contact-reachability-status.html) in *AWS CLI Command Reference*. 
get-domain-detail

The following code example shows how to use get-domain-detail.

AWS CLI

To get detailed information about a specified domain

The following get-domain-detail command displays detailed information about the specified domain.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains get-domain-detail \
   --region us-east-1 \
   --domain-name example.com
```

Output:

```json
{
   "DomainName": "example.com",
   "Nameservers": [
      {
         "Name": "ns-2048.awsdns-64.com",
         "GlueIps": []
      },
      {
         "Name": "ns-2049.awsdns-65.net",
         "GlueIps": []
      },
      {
         "Name": "ns-2050.awsdns-66.org",
         "GlueIps": []
      },
      {
         "Name": "ns-2051.awsdns-67.co.uk",
         "GlueIps": []
      }
   ],
   "AutoRenew": true,
   "AdminContact": {
      "FirstName": "Saanvi",
```

Actions and scenarios

For API details, see [GetDomainDetail](https://awscli.amazonaws.com/manual/awscmdref.html#get-domain-detail) in AWS CLI Command Reference.

**get-domain-suggestions**

The following code example shows how to use `get-domain-suggestions`.

**AWS CLI**

To get a list of suggested domain names

The following `get-domain-suggestions` command displays a list of suggested domain names based on the domain name `example.com`. The response includes only domain names that are available. This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```bash
aws route53domains get-domain-suggestions
  --region us-east-1
  --domain-name example.com
  --suggestion-count 10
  --only-available
```

**Output:**

```json
{
  "SuggestionsList": [
    {
      "DomainName": "egzaampal.com",
      "Availability": "AVAILABLE"
    },
    {
      "DomainName": "example.com",
      "Availability": "AVAILABLE"
    }
  ]
}
```
For API details, see GetDomainSuggestions in AWS CLI Command Reference.

get-operation-detail

The following code example shows how to use get-operation-detail.

AWS CLI

To get the current status of an operation
Some domain registration operations operate asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status. The following get-operation-detail command returns the status of the specified operation.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains get-operation-detail
  --region us-east-1
  --operation-id edbd8d63-7fe7-4343-9bc5-54033example
```

Output:

```
{
  "OperationId": "edbd8d63-7fe7-4343-9bc5-54033example",
  "Status": "SUCCESSFUL",
  "DomainName": "example.com",
  "Type": "DOMAIN_LOCK",
  "SubmittedDate": 1573749367.864
}
```

- For API details, see `GetOperationDetail` in *AWS CLI Command Reference*.

**list-domains**

The following code example shows how to use list-domains.

**AWS CLI**

To list the domains that are registered with the current AWS account

The following list-domains command lists summary information about the domains that are registered with the current AWS account.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains list-domains
```
Output:

```
{
  "Domains": [
    {
      "DomainName": "example.com",
      "AutoRenew": true,
      "TransferLock": true,
      "Expiry": 1602712345.0
    },
    {
      "DomainName": "example.net",
      "AutoRenew": true,
      "TransferLock": true,
      "Expiry": 1602723456.0
    },
    {
      "DomainName": "example.org",
      "AutoRenew": true,
      "TransferLock": true,
      "Expiry": 1602734567.0
    }
  ]
}
```

- For API details, see ListDomains in AWS CLI Command Reference.

**list-operations**

The following code example shows how to use list-operations.

**AWS CLI**

To list the status of operations that return an operation ID

Some domain registration operations run asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status. The following list-operations command lists summary information, including the status, about the current domain-registration operations.
This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

`aws route53domains list-operations --region us-east-1`

Output:

```json
{
  "Operations": [
    {

```

The output includes all the operations that return an operation ID and that you have performed on all the domains that you have ever registered using the current AWS account. If you want to get only the operations that you submitted after a specified date, you can include the `submitted-since` parameter and specify a date in Unix format and Coordinated Universal Time (UTC).
Time (UTC). The following command gets the status of all operations that were submitted after 12:00 am UTC on January 1, 2020.

```
aws route53domains list-operations \
   --submitted-since 1577836800
```

- For API details, see ListOperations in AWS CLI Command Reference.

**list-tags-for-domain**

The following code example shows how to use list-tags-for-domain.

**AWS CLI**

**To list tags for a domain**

The following list-tags-for-domain command lists the tags that are currently associated with the specified domain.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains list-tags-for-domain \
   --region us-east-1 \
   --domain-name example.com
```

Output:

```
{
   "TagList": [
      {
         "Key": "key1",
         "Value": "value1"
      },
      {
         "Key": "key2",
         "Value": "value2"
      }
   ]
}
```
For more information, see Tagging Amazon Route 53 Resources in the Amazon Route 53 Developer Guide.

- For API details, see ListTagsForDomain in AWS CLI Command Reference.

**register-domain**

The following code example shows how to use register-domain.

**AWS CLI**

**To register a domain**
