- For API details, see [DeleteReplicationTask](#) in *AWS CLI Command Reference*.

describe-account-attributes

The following code example shows how to use describe-account-attributes.

**AWS CLI**

**To describe account attributes**

The following describe-account-attributes example lists the attributes for your AWS account.

```
aws dms describe-account-attributes
```

**Output:**

```json
{
   "AccountQuotas": [
   {
      "AccountQuotaName": "ReplicationInstances",
      "Used": 1,
      "Max": 20
   },
   {
```
"AccountQuotaName": "AllocatedStorage",
"Used": 5,
"Max": 10000
},

...remaining output omitted...

],
"UniqueAccountIdentifier": "cqahfbfy5xee"
}

- For API details, see [DescribeAccountAttributes](#) in *AWS CLI Command Reference*.

describe-certificates

The following code example shows how to use describe-certificates.

**AWS CLI**

To list the available certificates

The following describe-certificates example lists the available certificates in your AWS account.

```bash
aws dms describe-certificates
```

Output:

```json
{
   "Certificates": [
      {
         "CertificateIdentifier": "my-cert",
         "CertificateCreationDate": 1543259542.506,
         "CertificatePem": "-----BEGIN CERTIFICATE-----
MIID9DCCAtygAwIBAgIBQjANBgkqhkiG9w0BAQ ...U"

         ... remaining output omitted ...

      }
   ]
}
```
For more information, see Using SSL in the AWS Database Migration Service User Guide.

- For API details, see DescribeCertificates in AWS CLI Command Reference.

**describe-connections**

The following code example shows how to use describe-connections.

**AWS CLI**

**To describe connections**

The following describe-connections example lists the connections that you have tested between a replication instance and an endpoint.

```bash
aws dms describe-connections
```

**Output:**

```json
{
    "Connections": [
        {
            "Status": "successful",
            "ReplicationInstanceIdentifier": "test",
            "EndpointIdentifier": "testsrc1",
            "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:6UTDJGB0US3VI3SUWA66XFJCJQ"
        }
    ]
}
```

For more information, see Creating Source and Target Endpoints in the AWS Database Migration Service User Guide.

- For API details, see DescribeConnections in AWS CLI Command Reference.

**describe-endpoint-types**

The following code example shows how to use describe-endpoint-types.
AWS CLI

To list the available endpoint types

The following `describe-endpoint-types` example lists the MySQL endpoint types that are available.

```bash
aws dms describe-endpoint-types \\
   --filters "Name=engine-name,Values=mysql"
```

Output:

```json
{
   "SupportedEndpointTypes": [
      {
         "EngineName": "mysql",
         "SupportsCDC": true,
         "EndpointType": "source",
         "EngineDisplayName": "MySQL"
      },
      {
         "EngineName": "mysql",
         "SupportsCDC": true,
         "EndpointType": "target",
         "EngineDisplayName": "MySQL"
      }
   ]
}
```

For more information, see Working with AWS DMS Endpoints <https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html> in the AWS Database Migration Service User Guide.

- For API details, see `DescribeEndpointTypes` in AWS CLI Command Reference.

describe-endpoints

The following code example shows how to use `describe-endpoints`.

AWS CLI

To describe endpoints
The following describe-endpoints example lists the endpoints in your AWS account.

```
aws dms describe-endpoints
```

Output:

```
{
   "Endpoints": [
   {
      "Username": "dms",
      "Status": "active",
      "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:SF2W0FLWYWKVEOHID2EKLP3SJI",
      "ServerName": "ec2-52-32-48-61.us-west-2.compute.amazonaws.com",
      "EndpointType": "SOURCE",
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/94d5c4e7-4e4c-44be-b58a-c8da7adf57cd",
      "DatabaseName": "test",
      "EngineName": "mysql",
      "EndpointIdentifier": "pri100",
      "Port": 8193
   },
   {
      "Username": "admin",
      "Status": "active",
      "ServerName": "test.example.com",
      "EndpointType": "SOURCE",
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/2431021b-1cf2-a2d4-77b2-59a9e4bce323",
      "DatabaseName": "EMPL",
      "EngineName": "oracle",
      "EndpointIdentifier": "test",
      "Port": 1521
   }
   ]
}
```

For more information, see Working with AWS DMS Endpoints in the AWS Database Migration Service User Guide.

- For API details, see DescribeEndpoints in AWS CLI Command Reference.
describe-event-categories

The following code example shows how to use describe-event-categories.

AWS CLI

To describe event categories

The following describe-event-categories example lists the available event categories.

aws dms describe-event-categories

Output:

```json
{
    "EventCategoryGroupList": [
        {
            "SourceType": "replication-instance",
            "EventCategories": [
                "low storage",
                "configuration change",
                "maintenance",
                "deletion",
                "creation",
                "failover",
                "failure"
            ]
        },
        {
            "SourceType": "replication-task",
            "EventCategories": [
                "configuration change",
                "state change",
                "deletion",
                "creation",
                "failure"
            ]
        }
    ]
}
```

For more information, see Working with Events and Notifications in the AWS Database Migration Service User Guide.

Actions and scenarios
describe-event-subscriptions

The following code example shows how to use describe-event-subscriptions.

AWS CLI

To describe event subscriptions

The following describe-event-subscriptions example lists the event subscriptions to an Amazon SNS topic.

```bash
aws dms describe-event-subscriptions
```

Output:

```json
{
   "EventSubscriptionsList": [ 
       {
           "CustomerAwsId": "123456789012",
           "CustSubscriptionId": "my-dms-events",
           "Status": "deleting",
           "Enabled": true
       }
   ]
}
```

For more information, see Working with Events and Notifications in the AWS Database Migration Service User Guide.

For API details, see DescribeEventSubscriptions in AWS CLI Command Reference.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To list DMS events
The following `describe-events` example lists the events that originated from a replication instance.

```bash
aws dms describe-events 
   --source-type "replication-instance"
```

Output:

```
{
   "Events": [ 
   {
       "SourceIdentifier": "my-repl-instance",
       "SourceType": "replication-instance",
       "Message": "Replication application shutdown",
       "EventCategories": [],
       "Date": 1590771645.776
   }
   ]
}
```

For more information, see [Working with Events and Notifications](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

**describe-orderable-replication-instances**

The following code example shows how to use `describe-orderable-replication-instances`.

**AWS CLI**

**To describe orderable replication instances**

The following `describe-orderable-replication-instances` example lists replication instance types that you can order.

```bash
aws dms describe-orderable-replication-instances
```

Output:

```
{
}
```
"OrderableReplicationInstances": [
  {
    "EngineVersion": "3.3.2",
    "ReplicationInstanceClass": "dms.c4.2xlarge",
    "StorageType": "gp2",
    "MinAllocatedStorage": 5,
    "MaxAllocatedStorage": 6144,
    "DefaultAllocatedStorage": 100,
    "IncludedAllocatedStorage": 100,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1b",
      "us-east-1c",
      "us-east-1d",
      "us-east-1e",
      "us-east-1f"
    ]
  },
  {
    "EngineVersion": "3.3.2",
    "ReplicationInstanceClass": "dms.c4.4xlarge",
    "StorageType": "gp2",
    "MinAllocatedStorage": 5,
    "MaxAllocatedStorage": 6144,
    "DefaultAllocatedStorage": 100,
    "IncludedAllocatedStorage": 100,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1b",
      "us-east-1c",
      "us-east-1d",
      "us-east-1e",
      "us-east-1f"
    ]
  },
  ...
  ...remaining output omitted...
}

For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeOrderableReplicationInstances in AWS CLI Command Reference.
describe-refresh-schemas-status

The following code example shows how to use describe-refresh-schemas-status.

AWS CLI

To list the refresh status for an endpoint

The following describe-refresh-schemas-status example returns the status of a previous refresh request.

```bash
aws dms describe-refresh-schemas-status \
```

Output:

```json
{
   "RefreshSchemasStatus": {
      "Status": "successful",
      "LastRefreshDate": 1590786544.605
   }
}
```

- For API details, see DescribeRefreshSchemasStatus in AWS CLI Command Reference.

describe-replication-instances

The following code example shows how to use describe-replication-instances.

AWS CLI

To describe replication instances

The following describe-replication-instances example lists the replication instances in your AWS account.

```bash
aws dms describe-replication-instances
```
Output:

```json
{
    "ReplicationInstances": [
        {
            "ReplicationInstanceIdentifier": "my-repl-instance",
            "ReplicationInstanceClass": "dms.t2.micro",
            "ReplicationInstanceStatus": "available",
            "AllocatedStorage": 5,
            "InstanceCreateTime": 1590011235.952,
            "VpcSecurityGroups": [
                {
                    "VpcSecurityGroupId": "sg-f839b688",
                    "Status": "active"
                }
            ],
            "AvailabilityZone": "us-east-1e",
            "ReplicationSubnetGroup": {
                "ReplicationSubnetGroupIdentifier": "default",
                "ReplicationSubnetGroupDescription": "default",
                "VpcId": "vpc-136a4c6a",
                "SubnetGroupStatus": "Complete",
                "Subnets": [
                    {
                        "SubnetIdentifier": "subnet-da327bf6",
                        "SubnetAvailabilityZone": {
                            "Name": "us-east-1a"
                        },
                        "SubnetStatus": "Active"
                    },
                    {
                        "SubnetIdentifier": "subnet-42599426",
                        "SubnetAvailabilityZone": {
                            "Name": "us-east-1d"
                        },
                        "SubnetStatus": "Active"
                    },
                    {
                        "SubnetIdentifier": "subnet-bac383e0",

For more information, see Working with an AWS DMS Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationInstances in AWS CLI Command Reference.

**describe-replication-subnet-groups**

The following code example shows how to use describe-replication-subnet-groups.

**AWS CLI**

To display the available subnet groups

The following describe-replication-subnet-groups example lists the available subnet groups.

```bash
aws dms describe-replication-subnet-groups
  --filter "Name=replication-subnet-group-id,Values=my-subnet-group"
```

Output:

```json
{
  "ReplicationSubnetGroups": [
    {
      "ReplicationSubnetGroupIdentifier": "my-subnet-group",
      "ReplicationSubnetGroupDescription": "my subnet group",
      "VpcId": "vpc-136a4c6a",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-da327bf6",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          },
          "SubnetStatus": "Active"
        },
        {
          "SubnetIdentifier": "subnet-bac383e0",
```
For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see DescribeReplicationSubnetGroups in AWS CLI Command Reference.

describe-replication-task-assessment-results

The following code example shows how to use describe-replication-task-assessment-results.

AWS CLI

To list the results of replication task assessment

The following describe-replication-task-assessment-results example lists the results of a prior task assessment.

```
aws dms describe-replication-task-assessment-results
```

Output:

```
{
    "ReplicationTaskAssessmentResults": [
        {
            "SubnetAvailabilityZone": {
                "Name": "us-east-1c",
                "SubnetStatus": "Active"
            },
            "SubnetIdentifier": "subnet-d7c825e8",
            "SubnetAvailabilityZone": {
                "Name": "us-east-1e",
                "SubnetStatus": "Active"
            }
        }
    ]
}
```
For more information, see [Creating a Task Assessment Report](https://docs.aws.amazon.com/dms/latest/userguide/using-dbms-assessment.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeReplicationTaskAssessmentResults](https://docs.aws.amazon.com/cli/latest/reference/dms/describe-replication-task-assessment-results.html) in *AWS CLI Command Reference*.

**describe-replication-tasks**

The following code example shows how to use `describe-replication-tasks`.

**AWS CLI**

**To describe a replication task**

The following `describe-replication-tasks` example describes current replication tasks.

```
aws dms describe-replication-tasks
```

**Output:**

```
{
  "ReplicationTasks": [
    {
      "ReplicationTaskIdentifier": "moveit2",
      "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFKCZEHZBFGAGZT3QEC5U",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70U85NM2LCVZF73PGJRNUE",
      "MigrationType": "full-load",
      "TableMappings": ...output omitted...
    }
  ]
}
```
"ReplicationTaskSettings": ...output omitted...,
"Status": "stopped",
"StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
"ReplicationTaskCreationDate": 1590524772.505,
"ReplicationTaskStartDate": 1590619805.212,
"ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII",
"ReplicationTaskStats": {
    "FullLoadProgressPercent": 100,
    "ElapsedTimeMillis": 0,
    "TablesLoaded": 0,

    "TablesQueued": 0,
    "TablesErrored": 0,
    "FreshStartDate": 1590619811.528,
    "StartDate": 1590619811.528,
    "StopDate": 1590619842.068
}
]
}
}
}

For more information, see [Working with AWS DMS Tasks](https://docs.aws.amazon.com/dms/latest/userguide/Working-with-DMS-Tasks.html) in the [AWS Database Migration Service User Guide](https://docs.aws.amazon.com/dms/latest/userguide/).

describe-schemas

The following code example shows how to use `describe-schemas`.

**AWS CLI**

**To describe database schemas**

The following `describe-schemas` example lists the available tables at an endpoint.

```bash
aws dms describe-schemas \
```

Output:
For more information, see [This is the topic title](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeSchemas](#) in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags for a resource**

The following `list-tags-for-resource` example lists the tags for a replication instance.

```
aws dms list-tags-for-resource \
   --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE
```

**Output:**

```json
{
   "TagList": [
      {
         "Key": "Project",
         "Value": "dbMigration"
      },
      {
         "Key": "Environment",
         "Value": "PROD"
      }
   ]
}
```

For more information, see [Tagging Resources](#) in the *AWS Database Migration Service User Guide*. 
• For API details, see `ListTagsForResource` in *AWS CLI Command Reference*.

**modify-endpoint**

The following code example shows how to use `modify-endpoint`.

**AWS CLI**

**To modify an endpoint**

The following `modify-endpoint` example adds an extra connection attribute to an endpoint.

```
aws dms modify-endpoint \
   --endpoint-arn "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U" \
   --extra-connection-attributes "compressionType=GZIP"
```

**Output:**

```
{
   "Endpoint": {
      "EndpointIdentifier": "src-endpoint",
      "EndpointType": "SOURCE",
      "EngineName": "s3",
      "EngineDisplayName": "Amazon S3",
      "ExtraConnectionAttributes": "compressionType=GZIP;csvDelimiter=,;csvRowDelimiter=\n;",
      "Status": "active",
      "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U",
      "SslMode": "none",
      "ServiceAccessRoleArn": "arn:aws:iам::123456789012:role/my-s3-access-role",
      "S3Settings": {
         "ServiceAccessRoleArn": "arn:aws:iам::123456789012:role/my-s3-access-role",
         "CsvRowDelimiter": "\n",
         "CsvDelimiter": ",",
         "BucketFolder": "",
         "BucketName": "",
         "CompressionType": "GZIP",
         "EnableStatistics": true
      }
   }
}
```
modify-event-subscription

The following code example shows how to use modify-event-subscription.

**AWS CLI**

**To modify an event subscription**

The following modify-event-subscription example changes the source type of an event subscription.

```bash
aws dms modify-event-subscription \
  --subscription-name "my-dms-events" \
  --source-type replication-task
```

Output:

```json
{
   "EventSubscription": {
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "my-dms-events",
      "Status": "modifying",
      "SubscriptionCreationTime": "2020-05-29 17:04:40.262",
      "SourceType": "replication-task",
      "Enabled": true
   }
}
```

For more information, see Working with Events and Notifications in the *AWS Database Migration Service User Guide*. 
modify-replication-instance

The following code example shows how to use modify-replication-instance.

AWS CLI

To modify a replication instance

The following modify-replication-instance example modifies a replication instance so that it uses a Multi-AZ deployment.

```bash
aws dms modify-replication-instance \
   --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNU \
   --multi-az
```

Output:

```json
{
   "ReplicationInstance": {
      "ReplicationInstanceIdentifier": "my-repl-instance",
      "ReplicationInstanceClass": "dms.t2.micro",
      "ReplicationInstanceStatus": "available",
      "AllocatedStorage": 5,
      "InstanceCreateTime": 1590011235.952,

      ...output omitted...

      "PendingModifiedValues": {
         "MultiAZ": true
      },
      "MultiAZ": false,
      "EngineVersion": "3.3.2",
      "AutoMinorVersionUpgrade": true,
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/f7bc0f8e-1a3a-4ace-9fae-e8494fa3921a",

      ...output omitted...
   }
}
```
modify-replication-subnet-group

The following code example shows how to use modify-replication-subnet-group.

AWS CLI

**To modify a subnet group**

The following modify-replication-subnet-group example changes the lists of subnets associated with a subnet group.

```bash
aws dms modify-replication-subnet-group \
   --replication-subnet-group-identifier my-subnet-group \
   --subnet-id subnet-da327bf6 subnet-bac383e0
```

**Output:**

```
{
   "ReplicationSubnetGroup": {
      "ReplicationSubnetGroupId": "my-subnet-group",
      "ReplicationSubnetGroupDescription": "my subnet group",
      "VpcId": "vpc-136a4c6a",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
         {
            "SubnetIdentifier": "subnet-da327bf6",
            "SubnetAvailabilityZone": {
               "Name": "us-east-1a"
            },
            "SubnetStatus": "Active"
         },
         {
            "SubnetIdentifier": "subnet-bac383e0",
            "SubnetAvailabilityZone": {
               "Name": "us-east-1c"
            }
         }
      ]
   }
}
```
For more information, see Setting Up a Network for a Replication Instance in the AWS Database Migration Service User Guide.

- For API details, see ModifyReplicationSubnetGroup in AWS CLI Command Reference.

modify-replication-task

The following code example shows how to use modify-replication-task.

AWS CLI

To modify a replication task

The following modify-replication-task example changes the table mappings for a task.

```bash
aws dms modify-replication-task \
   --replication-task-arn "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
   --table-mappings file://table-mappings.json
```

Contents of table-mappings.json:

```json
{
   "rules": [
   {
      "rule-type": "selection",
      "rule-id": "1",
      "rule-name": "1",
      "object-locator": {
         "schema-name": "prodrep",
         "table-name": "ACCT_%"
      },
      "rule-action": "include",
      "filters": []
   }
   ]
}
```
Output:

```
{

  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM45FKCZEHYZBFGAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3O7UO5MB5LCVF73PJRNU",
    "MigrationType": "full-load",
    "TableMappings": "...output omitted...",
    "ReplicationTaskSettings": "...output omitted...",
    "Status": "modifying",
    "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
    "ReplicationTaskCreationDate": 1590524772.505,
    "ReplicationTaskStartDate": 1590789424.653,
    "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZIINA4SFII"
  }
}
```

For more information, see [Working with AWS DMS Tasks](https://docs.aws.amazon.com/dms/latest/ug/dms-task-working-with-dms-tasks.html) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyReplicationTask](https://docs.aws.amazon.com/cli/latest/reference/dms/modify-replication-task.html) in *AWS CLI Command Reference*.

**reboot-replication-instance**

The following code example shows how to use `reboot-replication-instance`.

**AWS CLI**

To reboot a replication instance

The following `reboot-replication-instance` example reboots a replication instance.

```
aws dms reboot-replication-instance \
```
The following code example shows how to use refresh-schemas.

### AWS CLI

**To refresh database schemas**

The following refresh-schemas example requests that AWS DMS refresh the list of schemas at an endpoint.

```bash
code
aws dms refresh-schemas \
   --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE \
```

**Output:**

```json
{
   "RefreshSchemasStatus": {
      "ReplicationInstance": {
         "ReplicationInstanceIdentifier": "my-repl-instance",
         "ReplicationInstanceClass": "dms.t2.micro",
         "ReplicationInstanceStatus": "rebooting",
         "AllocatedStorage": 5,
         "InstanceCreateTime": 1590011235.952,
         // ... output omitted ...
      }
   }
}
```
"ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM7OUB5NM2LCVZF7JPGJRNUE",
"Status": "refreshing",
"LastRefreshDate": 159019949.103
}

- For API details, see RefreshSchemas in AWS CLI Command Reference.

reload-tables

The following code example shows how to use reload-tables.

AWS CLI

To refresh the list of tables available at an endpoint

The following reload-tables example reloads the list of available tables at an endpoint.

```bash
aws dms reload-tables \
   --replication-task-arn "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHJIA45FII" \
   --tables-to-reload "SchemaName=prodrep,TableName=ACCT_BAL"
```

Output:

```json
{
   "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHJIA45FII"
}
```

- For API details, see ReloadTables in AWS CLI Command Reference.

remove-tags-from-resource

The following code example shows how to use remove-tags-from-resource.

AWS CLI

To remove tags from a replication instance
The following `remove-tags-from-resource` example removes tags from a replication instance.

```bash
aws dms remove-tags-from-resource \
  --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVF7JPGJRNUE \
  --tag-keys Environment Project
```

This command produces no output.

For more information, see [Tagging Resources](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [RemoveTagsFromResource](#) in *AWS CLI Command Reference*.

### start-replication-task

The following code example shows how to use `start-replication-task`.

#### AWS CLI

**To start a replication task**

The following command-name example lists the available widgets in your AWS account.

```bash
aws dms start-replication-task \
  --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII \
  --start-replication-task-type reload-target
```

**Output:**

```json
{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:E0M4SFKCEYHZBFAGAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVF7JPGJRNUE",
    "MigrationType": "full-load",
    "TableMappings": ...output omitted...,
    "ReplicationTaskSettings": ...output omitted...,
```
"Status": "starting",
"ReplicationTaskCreationDate": 1590524772.505,
"ReplicationTaskStartDate": 1590619805.212,
"ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
}
}

For more information, see Working with AWS DMS Tasks in the AWS Database Migration Service User Guide.

- For API details, see StartReplicationTask in AWS CLI Command Reference.

**start-replication-task-assessment**

The following code example shows how to use start-replication-task-assessment.

**AWS CLI**

**To start a task assessment**

The following start-replication-task-assessment example starts a replication task assessment.

```
aws dms start-replication-task-assessment \
   --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
   "ReplicationTask": {
      "ReplicationTaskIdentifier": "moveit2",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZFD7JPGJRNUE",
      "MigrationType": "full-load",
      "TableMappings": "...output omitted...",
      "ReplicationTaskSettings": "...output omitted...",
```

```
"Status": "testing",
"StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
"ReplicationTaskCreationDate": 1590524772.505,
"ReplicationTaskStartDate": 1590789988.677,
"ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
}

For more information, see Creating a Task Assessment Report in the AWS Database Migration Service User Guide.

- For API details, see StartReplicationTaskAssessment in AWS CLI Command Reference.

**stop-replication-task**

The following code example shows how to use `stop-replication-task`.

**AWS CLI**

**To stop a task**

The following `stop-replication-task` example stops a task.

```
aws dms stop-replication-task \
   --replication-task-arn arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{
   "ReplicationTask": {
      "ReplicationTaskIdentifier": "moveit2",
      "TargetEndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:EOM4SFCKZ5EYHZBFAGZT3QEC5U",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZ7F7JPGJRNUE",
      "MigrationType": "full-load",
      "TableMappings": ...output omitted...
   },
   "Status": "stopping",
   "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
   "ReplicationTaskCreationDate": 1590524772.505,
   "ReplicationTaskStartDate": 1590789988.677,
   "ReplicationTaskArn": "arn:aws:dms:us-east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
}
For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [StopReplicationTask](#) in *AWS CLI Command Reference*.

**test-connection**

The following code example shows how to use `test-connection`.

**AWS CLI**

**To test a connection to an endpoint**

The following `test-connection` example tests whether an endpoint can be accessed from a replication instance.

```
aws dms test-connection \
  --replication-instance-arn arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE \
```

Output:

```
{
    "Connection": {
        "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:T3OM70UB5NM2LCVZF7JPGJRNUE",
        "Status": "testing",
        "EndpointIdentifier": "src-database-1",
        "ReplicationInstanceIdentifier": "my-repl-instance"
    }
}
```
Amazon DocumentDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon DocumentDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

add-tags-to-resource

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add one or more tags to a specified resource

The following add-tags-to-resource example adds three tags to sample-cluster. One tag (CropB) has a key name but no value.

```bash
aws docdb add-tags-to-resource \
  --tags Key="CropA",Value="Apple" Key="CropB" Key="CropC",Value="Corn"
```

This command produces no output.
For more information, see Tagging Amazon DocumentDB Resources in the Amazon DocumentDB Developer Guide.

- For API details, see AddTagsToResource in AWS CLI Command Reference.

**apply-pending-maintenance-action**

The following code example shows how to use apply-pending-maintenance-action.

**AWS CLI**

To have pending maintenance actions take place during the next maintenance window

The following apply-pending-maintenance-action example causes all system-update actions to be performed during the next scheduled maintenance window.

```bash
aws docdb apply-pending-maintenance-action \
--apply-action system-update \
--opt-in-type next-maintenance
```

This command produces no output.

For more information, see Applying Amazon DocumentDB Updates in the Amazon DocumentDB Developer Guide.

- For API details, see ApplyPendingMaintenanceAction in AWS CLI Command Reference.

**copy-db-cluster-parameter-group**

The following code example shows how to use copy-db-cluster-parameter-group.

**AWS CLI**

To duplicate an existing DB cluster parameter group

The following copy-db-cluster-parameter-group example makes a copy of the parameter group custom-docdb3-6 named custom-docdb3-6-copy. When making the copy it adds tags to the new parameter group.

```bash
aws docdb copy-db-cluster-parameter-group \
```
--source-db-cluster-parameter-group-identifier custom-docdb3-6 \
--target-db-cluster-parameter-group-identifier custom-docdb3-6-copy \
--target-db-cluster-parameter-group-description "Copy of custom-docdb3-6" \
--tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"

Output:

```
{
   "DBClusterParameterGroup": {
      "DBParameterGroupFamily": "docdb3.6",
      "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:12345678901:cluster-pg:custom-docdb3-6-copy",
      "DBClusterParameterGroupName": "custom-docdb3-6-copy",
      "Description": "Copy of custom-docdb3-6"
   }
}
```

For more information, see Copying an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see CopyDbClusterParameterGroup in AWS CLI Command Reference.

**copy-db-cluster-snapshot**

The following code example shows how to use `copy-db-cluster-snapshot`.

**AWS CLI**

**To create a copy of a snapshot**

The following copy-db-cluster-snapshot example makes a copy of sample-cluster-snapshot named sample-cluster-snapshot-copy. The copy has all the tags of the original plus a new tag with the key name CopyNumber.

```
aws docdb copy-db-cluster-snapshot \
--source-db-cluster-snapshot-identifier sample-cluster-snapshot \
--target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \
--copy-tags \
--tags Key="CopyNumber",Value="1"
```

This command produces no output.
For more information, see [Copying a Cluster Snapshot](https://docs.aws.amazon.com/documentdb/latest/developerguide/copy-cluster-snapshot.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CopyDbClusterSnapshot](https://docs.aws.amazon.com/cli/latest/reference/docdb/copy-db-cluster-snapshot.html) in *AWS CLI Command Reference*.

### create-db-cluster

The following code example shows how to use `create-db-cluster`.

**AWS CLI**

**To create an Amazon DocumentDB cluster**

The following `create-db-cluster` example creates an Amazon DocumentDB cluster named `sample-cluster` with the preferred maintenance window on Sundays between 20:30 and 11:00.

```bash
aws docdb create-db-cluster \
   --db-cluster-identifier sample-cluster \
   --engine docdb \
   --master-username master-user \
   --master-user-password password \
   --preferred-maintenance-window Sun:20:30-Sun:21:00
```

**Output:**

```json
{
   "DBCluster": {
      "DBClusterParameterGroup": "default.docdb3.6",
      "AssociatedRoles": [],
      "DBSubnetGroup": "default",
      "ClusterCreateTime": "2019-03-18T18:06:34.616Z",
      "Status": "creating",
      "Port": 27017,
      "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
      "HostedZoneId": "ZNKXH85TT8WVW",
      "DBClusterMembers": [],
      "Engine": "docdb",
      "DBClusterIdentifier": "sample-cluster",
      "PreferredBackupWindow": "10:12-10:42",
      "AvailabilityZones": [
         "us-west-2d",
         "us-west-2f",
      ]
   }
}
```
"us-west-2e",
  "MasterUsername": "master-user",
  "BackupRetentionPeriod": 1,
  "ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
  "VpcSecurityGroups": [
    {
      "VpcSecurityGroupId": "sg-77186e0d",
      "Status": "active"
    }
  ],
  "StorageEncrypted": false,
  "DbClusterResourceId": "cluster-L3R4YR5BUYDP4GLMTJ2WF5GH5Q",
  "MultiAZ": false,
  "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
  "EngineVersion": "3.6.0"
}

For more information, see [Creating an Amazon DocumentDB Cluster](amazon_documentdb_developer_guide) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbCluster](aws_cli_command_reference) in *AWS CLI Command Reference*.

**create-db-cluster-parameter-group**

The following code example shows how to use create-db-cluster-parameter-group.

**AWS CLI**

To create an Amazon DocumentDB cluster parameter group

The following `create-db-cluster-parameter-group` example creates the DB cluster parameter group `sample-parameter-group` using the `docdb3.6` family.

```
aws docdb create-db-cluster-parameter-group \
  --db-cluster-parameter-group-name sample-parameter-group \
  --db-parameter-group-family docdb3.6 \
  --description "Sample parameter group based on docdb3.6"
```
Output:

```json
{
    "DBClusterParameterGroup": {
        "Description": "Sample parameter group based on docdb3.6",
        "DBParameterGroupFamily": "docdb3.6",
        "DBClusterParameterGroupName": "sample-parameter-group"
    }
}
```

For more information, see [Creating an Amazon DocumentDB Cluster Parameter Group](https://docs.aws.amazon.com/documentdb/latest/developerguide/creating-cluster-parameter-group.html) in the Amazon DocumentDB Developer Guide.

create-db-cluster-snapshot

The following code example shows how to use `create-db-cluster-snapshot`.

**AWS CLI**

To create a manual Amazon DocumentDB cluster snapshot

The following `create-db-cluster-snapshot` example creates an Amazon DB cluster snapshot named sample-cluster-snapshot.

```
aws docdb create-db-cluster-snapshot \
    --db-cluster-identifier sample-cluster \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```json
{
    "DBClusterSnapshot": {
        "MasterUsername": "master-user",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2b",
```
The following code example shows how to use `create-db-instance`.

**AWS CLI**

To create an Amazon DocumentDB cluster instance

The following `create-db-instance` example code creates the instance `sample-cluster-instance-2` in the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb create-db-instance \
  --db-cluster-identifier sample-cluster \
  --db-instance-class db.r4.xlarge \
  --db-instance-identifier sample-cluster-instance-2 \
  --engine docdb
```

For more information, see [Creating a Manual Cluster Snapshot](https://docs.aws.amazon.com/documentdb/latest/developerguide/creating-manual-cluster-snapshot.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbClusterSnapshot](https://docs.aws.amazon.com/cli/latest/reference/docdb/create-db-cluster-snapshot.html) in *AWS CLI Command Reference*. 
Output:

```json
{
    "DBInstance": {
        "DBInstanceStatus": "creating",
        "PendingModifiedValues": {
            "PendingCloudwatchLogsExports": {
                "LogTypesToEnable": [
                    "audit"
                ]
            }
        },
        "PubliclyAccessible": false,
        "PreferredBackupWindow": "00:00-00:30",
        "PromotionTier": 1,
        "EngineVersion": "3.6.0",
        "BackupRetentionPeriod": 3,
        "DBInstanceIdentifier": "sample-cluster-instance-2",
        "PreferredMaintenanceWindow": "tue:10:28-tue:10:58",
        "StorageEncrypted": false,
        "Engine": "docdb",
        "DBClusterIdentifier": "sample-cluster",
        "DBSubnetGroup": {
            "Subnets": [
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2a"
                    },
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-4e26d263"
                },
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2c"
                    },
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-afc329f4"
                },
                {
                    "SubnetAvailabilityZone": {
                        "Name": "us-west-2d"
                    },
                    "SubnetStatus": "Active",
                    "SubnetIdentifier": "subnet-53ab3636"
                }
            ]
        }
    }
}
```
```json
{
    "SubnetAvailabilityZone": {
        "Name": "us-west-2b"
    },
    "SubnetStatus": "Active",
    "SubnetIdentifier": "subnet-991cb8d0"
},
"DBSubnetGroupDescription": "default",
"SubnetGroupStatus": "Complete",
"VpcId": "vpc-91280df6",
"DBSubnetGroupName": "default"
},
"DBInstanceClass": "db.r4.xlarge",
"VpcSecurityGroups": [
    {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
    }
],
"DbiResourceId": "db-XEKJLEMGRV5ZKCARUVA4H03ITE"
}
```

For more information, see [Adding an Amazon DocumentDB Instance to a Cluster](https://docs.aws.amazon.com/documentdb/latest/developerguide/cluster-creating-instances.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbInstance](https://docs.aws.amazon.com/cli/latest/reference/rds/create-db-instance.html) in *AWS CLI Command Reference*.

### create-db-subnet-group

The following code example shows how to use `create-db-subnet-group`.

**AWS CLI**

To create an Amazon DocumentDB subnet group

The following `create-db-subnet-group` example creates an Amazon DocumentDB subnet group named `sample-subnet-group`.
aws docdb create-db-subnet-group \
  --db-subnet-group-description "a sample subnet group" \
  --db-subnet-group-name sample-subnet-group \
  --subnet-ids "subnet-29ab1025" "subnet-991cb8d0" "subnet-53ab3636"

Output:

```json
{
    "DBSubnetGroup": {
        "SubnetGroupStatus": "Complete",
        "DBSubnetGroupName": "sample-subnet-group",
        "DBSubnetGroupDescription": "a sample subnet group",
        "VpcId": "vpc-91280df6",
        "Subnets": [
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-53ab3636",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                }
            },
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-991cb8d0",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                }
            },
            {
                "SubnetStatus": "Active",
                "SubnetIdentifier": "subnet-29ab1025",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2c"
                }
            }
        ]
    }
}
```
For more information, see [Creating an Amazon DocumentDB Subnet Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbSubnetGroup](#) in *AWS CLI Command Reference*.

### delete-db-cluster

The following code example shows how to use `delete-db-cluster`.

#### AWS CLI

**To delete an Amazon DocumentDB cluster**

The following `delete-db-cluster` example deletes the Amazon DocumentDB cluster `sample-cluster`. No backup of the cluster is made prior to deleting it. NOTE: You must delete all instances associated with the cluster before you can delete it.

```
aws docdb delete-db-cluster \
  --db-cluster-identifier sample-cluster \
  --skip-final-snapshot
```

**Output:**

```
{
  "DBCluster": {
    "DBClusterIdentifier": "sample-cluster",
    "DBSubnetGroup": "default",
    "EngineVersion": "3.6.0",
    "Engine": "docdb",
    "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",
    "StorageEncrypted": false,
    "Port": 27017,
    "VpcSecurityGroups": [
      {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
      }
    ],
    "MultiAZ": false,
    "MasterUsername": "master-user",
  }
}
For more information, see [Deleting an Amazon DocumentDB Cluster](https://docs.aws.amazon.com/documentdb/latest/developer-guide/working-with-parameters.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DeleteDbCluster](https://docs.aws.amazon.com/cli/latest/reference/docdb/delete-db-cluster.html) in *AWS CLI Command Reference*.

### delete-db-cluster-parameter-group

The following code example shows how to use `delete-db-cluster-parameter-group`.

**AWS CLI**

#### To delete an Amazon DocumentDB cluster parameter group

The following `delete-db-cluster-parameter-group` example deletes the Amazon DocumentDB parameter group *sample-parameter-group*.

```bash
aws docdb delete-db-cluster-parameter-group \
  --db-cluster-parameter-group-name sample-parameter-group
```

This command produces no output.
For more information, see Deleting an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbClusterParameterGroup in AWS CLI Command Reference.

**delete-db-cluster-snapshot**

The following code example shows how to use delete-db-cluster-snapshot.

**AWS CLI**

**To delete an Amazon DocumentDB cluster snapshot**

The following delete-db-cluster-snapshot example deletes the Amazon DocumentDB cluster snapshot sample-cluster-snapshot.

```bash
aws docdb delete-db-cluster-snapshot \
--db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
  "DBClusterSnapshot": {
    "DBClusterIdentifier": "sample-cluster",
    "AvailabilityZones": [
      "us-west-2a",
      "us-west-2b",
      "us-west-2c",
      "us-west-2d"
    ],
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
    "VpcId": "vpc-91280df6",
    "EngineVersion": "3.6.0",
    "Engine": "docdb",
    "Status": "available",
    "MasterUsername": "master-user",
    "PercentProgress": 100,
    "StorageEncrypted": false,
    "SnapshotType": "manual",
  }
}```
For more information, see Deleting a Cluster Snapshot in the Amazon DocumentDB Developer Guide.

- For API details, see DeleteDbClusterSnapshot in AWS CLI Command Reference.

**delete-db-instance**

The following code example shows how to use delete-db-instance.

**AWS CLI**

**To delete an Amazon DocumentDB instance**

The following delete-db-instance example deletes the Amazon DocumentDB instance sample-cluster-instance-2.

```bash
aws docdb delete-db-instance \
    --db-instance-identifier sample-cluster-instance-2
```

**Output:**

```
{
    "DBInstance": { 
        "DBSubnetGroup": { 
            "Subnets": [ 
                { 
                    "SubnetAvailabilityZone": { 
                        "Name": "us-west-2a"
                    }, 
                    "SubnetStatus": "Active", 
                    "SubnetIdentifier": "subnet-4e26d263"
                }, 
                { 
                    "SubnetAvailabilityZone": { 
                        "Name": "us-west-2c"
                    }, 
                    "SubnetStatus": "Active", 
                    "SubnetIdentifier": "subnet-afc329f4"
                } 
            ]
        }
    }
}
```
{
  "SubnetAvailabilityZone": {
    "Name": "us-west-2d"
  },
  "SubnetStatus": "Active",
  "SubnetIdentifier": "subnet-53ab3636"
},
{
  "SubnetAvailabilityZone": {
    "Name": "us-west-2b"
  },
  "SubnetStatus": "Active",
  "SubnetIdentifier": "subnet-991cb8d0"
}
],

}
}

For more information, seeDeleting an Amazon DocumentDB Instance in the Amazon DocumentDB Developer Guide.

• For API details, see DeleteDbInstance in AWS CLI Command Reference.

dele/db-subnet-group

The following code example shows how to use delete-db-subnet-group.

AWS CLI

To delete an Amazon DocumentDB subnet group

The following delete-db-subnet-group example deletes the Amazon DocumentDB subnet group sample-subnet-group.

```bash
aws docdb delete-db-subnet-group \
   --db-subnet-group-name sample-subnet-group
```

This command produces no output.

For more information, see Deleting an Amazon DocumentDB Subnet Group in the Amazon DocumentDB Developer Guide.

• For API details, see DeleteDbSubnetGroup in AWS CLI Command Reference.

describe-db-cluster-parameter-groups

The following code example shows how to use describe-db-cluster-parameter-groups.
AWS CLI

To see the details of one or more Amazon DocumentDB cluster parameter groups

The following describe-db-cluster-parameter-groups example displays details for the Amazon DocumentDB cluster parameter group custom3-6-param-grp.

```bash
aws docdb describe-db-cluster-parameter-groups \
  --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```json
{
  "DBClusterParameterGroups": [
    {
      "DBParameterGroupFamily": "docdb3.6",
      "Description": "Custom docdb3.6 parameter group",
      "DBClusterParameterGroupName": "custom3-6-param-grp"
    }
  ]
}
```

For more information, see Viewing Amazon DocumentDB Cluster Parameter Groups in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbClusterParameterGroups in AWS CLI Command Reference.

describe-db-cluster-parameters

The following code example shows how to use describe-db-cluster-parameters.

AWS CLI

To view the detailed parameter list for an Amazon DocumentDB cluster parameter group.

The following describe-db-cluster-parameters example lists the parameters for the Amazon DocumentDB parameter group custom3-6-param-grp.

```bash
aws docdb describe-db-cluster-parameters \
  --db-cluster-parameter-group-name custom3-6-param-grp
```
Output:

```json
{
  "Parameters": [
    {
      "DataType": "string",
      "ParameterName": "audit_logs",
      "IsModifiable": true,
      "ApplyMethod": "pending-reboot",
      "Source": "system",
      "ApplyType": "dynamic",
      "AllowedValues": "enabled,disabled",
      "Description": "Enables auditing on cluster.",
      "ParameterValue": "disabled"
    },
    {
      "DataType": "string",
      "ParameterName": "tls",
      "IsModifiable": true,
      "ApplyMethod": "pending-reboot",
      "Source": "system",
      "ApplyType": "static",
      "AllowedValues": "disabled,enabled",
      "Description": "Config to enable/disable TLS",
      "ParameterValue": "enabled"
    },
    {
      "DataType": "string",
      "ParameterName": "ttl_monitor",
      "IsModifiable": true,
      "ApplyMethod": "pending-reboot",
      "Source": "user",
      "ApplyType": "dynamic",
      "AllowedValues": "disabled,enabled",
      "Description": "Enables TTL Monitoring",
      "ParameterValue": "enabled"
    }
  ]
}
```

For more information, see [Viewing Amazon DocumentDB Cluster Parameters](https://docs.aws.amazon.com/documentdb/latest/developerguide/cluster-parameters-view.html) in the [Amazon DocumentDB Developer Guide](https://docs.aws.amazon.com/documentdb/latest/developerguide/).  

describe-db-cluster-snapshot-attributes

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

**AWS CLI**

To list an Amazon DocumentDB snapshot attribute names and values

The following `describe-db-cluster-snapshot-attributes` example lists the attribute names and values for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```bash
aws docdb describe-db-cluster-snapshot-attributes \
    --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```json
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": []
            }
        ],
        "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
    }
}
```

For more information, see [DescribeDBClusterSnapshotAttributes](https://docs.aws.amazon.com/AmazonDocumentDB/latest/developerguide/docdb-cluster-snapshots.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbClusterSnapshotAttributes](https://docs.aws.amazon.com/cli/latest/reference/docdb/describe-db-cluster-snapshot-attributes.html) in *AWS CLI Command Reference*.

describe-db-cluster-snapshots

The following code example shows how to use `describe-db-cluster-snapshots`.

**AWS CLI**

To describe Amazon DocumentDB snapshots

The following `describe-db-cluster-snapshots` example displays details for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.
The following code example shows how to use `describe-db-clusters`.

```
aws docdb describe-db-cluster-snapshots \
   --db-cluster-snapshot-identifier sample-cluster-snapshot
```

**Output:**

```json
{
   "DBClusterSnapshots": [
       {
           "AvailabilityZones": [
               "us-west-2a",
               "us-west-2b",
               "us-west-2c",
               "us-west-2d"
           ],
           "Status": "available",
           "SnapshotType": "manual",
           "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
           "DBClusterIdentifier": "sample-cluster",
           "MasterUsername": "master-user",
           "StorageEncrypted": false,
           "VpcId": "vpc-91280df6",
           "EngineVersion": "3.6.0",
           "PercentProgress": 100,
           "Port": 0,
           "Engine": "docdb",
           "ClusterCreateTime": "2019-03-15T20:29:58.836Z"
       }
   ]
}
```

For more information, see [DescribeDBClusterSnapshots](https://docs.aws.amazon.com/documentdb/latest/developerguide/DescribeDBClusterSnapshots.html) in the [Amazon DocumentDB Developer Guide](https://docs.aws.amazon.com/documentdb/latest/developerguide/).

- For API details, see [DescribeDbClusterSnapshots](https://awscli.amazonaws.com/v2/documentation/api/current/reference/security-iam/all.html) in [AWS CLI Command Reference](https://awscli.amazonaws.com/v2/documentation/api/).
To get detailed information about one or more Amazon DocumentDB clusters.

The following `describe-db-clusters` example displays details for the Amazon DocumentDB cluster `sample-cluster`. By omitting the `--db-cluster-identifier` parameter you can get information of up to 100 clusters.

```
aws docdb describe-db-clusters
   --db-cluster-identifier sample-cluster
```

Output:

```
{
   "DBClusters": [
   {
      "DBClusterParameterGroup": "default.docdb3.6",
      "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
      "PreferredBackupWindow": "00:00-00:30",
      "DBClusterIdentifier": "sample-cluster",
      "LatestRestorableTime": "2019-03-18T20:28:03.239Z",
      "MasterUsername": "master-user",
      "DBClusterMembers": [
         {
            "PromotionTier": 1,
            "DBClusterParameterGroupStatus": "in-sync",
            "IsClusterWriter": false,
            "DBInstanceIdentifier": "sample-cluster"
         },
         {
            "PromotionTier": 1,
            "DBClusterParameterGroupStatus": "in-sync",
            "IsClusterWriter": true,
            "DBInstanceIdentifier": "sample-cluster2"
         }
      ],
      "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
      "VpcSecurityGroups": [
         {
            "VpcSecurityGroupId": "sg-77186e0d",
            "Status": "active"
         }
      ]
   }
```
For more information, see [Describing Amazon DocumentDB Clusters](https://docs.aws.amazon.com/documentdb/userguide/) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbClusters](https://docs.aws.amazon.com/cli/latest/reference/rds/describe-db-clusters.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/index.html).

### describe-db-engine-versions

The following code example shows how to use `describe-db-engine-versions`.

**AWS CLI**

**To list available Amazon DocumentDB engine versions**
The following `describe-db-engine-versions` example lists all available Amazon DocumentDB engine versions.

```
aws docdb describe-db-engine-versions \
   --engine docdb
```

Output:

```
{
   "DBEngineVersions": [
      {
         "DBEngineVersionDescription": "DocDB version 1.0.200837",
         "DBParameterGroupFamily": "docdb3.6",
         "EngineVersion": "3.6.0",
         "ValidUpgradeTarget": [],
         "DBEngineDescription": "Amazon DocumentDB (with MongoDB compatibility)",
         "SupportsLogExportsToCloudwatchLogs": true,
         "Engine": "docdb",
         "ExportableLogTypes": [
            "audit"
         ]
      }
   ]
}
```

For more information, see [DescribeDBEngineVersions](https://docs.aws.amazon.com/documentdb/latest/developerguide/DescribeDBEngineVersions.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbEngineVersions](https://awscli.amazonaws.com/clipping/latest/) in *AWS CLI Command Reference*.

### describe-db-instances

The following code example shows how to use `describe-db-instances`.

**AWS CLI**

To find information about provisioned Amazon DocumentDB instances

The following `describe-db-instances` example displays details for about the Amazon DocumentDB instance `sample-cluster-instance`. By omitting the `--db-instance-identifier` parameter you get information on up to 100 instances.
aws docdb describe-db-instances
   --db-instance-identifier sample-cluster-instance

Output:

```json
{
   "DBInstances": [
   {
      "Endpoint": {
         "HostedZoneId": "ZNKXH85TT8WVW",
         "Address": "sample-cluster-instance.corcjozrlsfc.us-west-2.docdb.amazonaws.com",
         "Port": 27017
      },
      "PreferredBackupWindow": "00:00-00:30",
      "DBInstanceStatus": "available",
      "DBInstanceClass": "db.r4.large",
      "EnabledCloudwatchLogsExports": ["audit"],
      "DBInstanceIdentifier": "sample-cluster-instance",
      "DBSubnetGroup": {
         "Subnets": ["subnet-4e26d263", "subnet-afc329f4", "subnet-53ab3636"]
      }
   }
   ]
}```
For more information, see Describing Amazon DocumentDB Instances in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeDbInstances in AWS CLI Command Reference.
describe-db-subnet-groups

The following code example shows how to use `describe-db-subnet-groups`.

AWS CLI

To retrieve a list of Amazon DocumentDB subnet descriptions

The following `describe-db-subnet-groups` example describes details for the Amazon DocumentDB subnet named default.

```
aws docdb describe-db-subnet-groups \
  --db-subnet-group-name default
```

Output:

```
{
  "DBSubnetGroups": [
    {
      "VpcId": "vpc-91280df6",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-4e26d263",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2a"
          }
        },
        {
          "SubnetIdentifier": "subnet-afc329f4",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2c"
          }
        },
        {
          "SubnetIdentifier": "subnet-53ab3636",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2d"
          }
        }
      ]
    }
  
```
For more information, see [Describing Subnet Groups](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbSubnetGroups](#) in *AWS CLI Command Reference*.

### describe-engine-default-cluster-parameters

The following code example shows how to use `describe-engine-default-cluster-parameters`.

**AWS CLI**

*To describe the default engine and system parameter information for Amazon DocumentDB*

The following `describe-engine-default-cluster-parameters` example displays details for the default engine and system parameter information for the Amazon DocumentDB parameter group docdb3.6.

```
aws docdb describe-engine-default-cluster-parameters \
--db-parameter-group-family docdb3.6
```

**Output:**

```
{
  "EngineDefaults": {
    "DBParameterGroupFamily": "docdb3.6",

  
```
"Parameters": [

{
  "ApplyType": "dynamic",
  "ParameterValue": "disabled",
  "Description": "Enables auditing on cluster.",
  "Source": "system",
  "DataType": "string",
  "MinimumEngineVersion": "3.6.0",
  "AllowedValues": "enabled,disabled",
  "ParameterName": "audit_logs",
  "IsModifiable": true
},

{
  "ApplyType": "static",
  "ParameterValue": "enabled",
  "Description": "Config to enable/disable TLS",
  "Source": "system",
  "DataType": "string",
  "MinimumEngineVersion": "3.6.0",
  "AllowedValues": "disabled,enabled",
  "ParameterName": "tls",
  "IsModifiable": true
},

{
  "ApplyType": "dynamic",
  "ParameterValue": "enabled",
  "Description": "Enables TTL Monitoring",
  "Source": "system",
  "DataType": "string",
  "MinimumEngineVersion": "3.6.0",
  "AllowedValues": "disabled,enabled",
  "ParameterName": "ttl_monitor",
  "IsModifiable": true
}
]

For more information, see [DescribeEngineDefaultClusterParameters](#) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeEngineDefaultClusterParameters](#) in AWS CLI Command Reference.
describe-event-categories

The following code example shows how to use describe-event-categories.

AWS CLI

To describe all Amazon DocumentDB event categories

The following describe-event-categories example lists all categories for the Amazon DocumentDB event source type db-instance.

```bash
aws docdb describe-event-categories \
   --source-type db-cluster
```

Output:

```json
{
   "EventCategoriesMapList": [
      {
         "SourceType": "db-cluster",
         "EventCategories": [
            "failover",
            "maintenance",
            "notification",
            "failure"
         ]
      }
   ]
}
```

For more information, see [Viewing Event Categories](#) in the Amazon DocumentDB Developer Guide.

- For API details, see [DescribeEventCategories](#) in AWS CLI Command Reference.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To list Amazon DocumentDB events
The following `describe-events` example list all the Amazon DocumentDB events for the last 24 hours (1440 minutes).

```
aws docdb describe-events
    --duration 1440
```

This command produces no output. Output:

```
{
    "Events": [
        {
            "EventCategories": [
                "failover"
            ],
            "Message": "Started cross AZ failover to DB instance: sample-cluster",
            "Date": "2019-03-18T21:36:29.807Z",

- For API details, see DescribeEvents in AWS CLI Command Reference.

**describe-orderable-db-instance-options**

The following code example shows how to use describe-orderable-db-instance-options.

**AWS CLI**

To find the Amazon DocumentDB instance options you can order

The following describe-orderable-db-instance-options example lists all instance options for Amazon DocumentDB for a region.

```bash
aws docdb describe-orderable-db-instance-options \
   --engine docdb \ 
   --region us-east-1
```
Output:

```
{
  "OrderableDBInstanceOptions": [
  {
    "Vpc": true,
    "AvailabilityZones": [
      {
        "Name": "us-east-1a"
      },
      {
        "Name": "us-east-1b"
      },
      {
        "Name": "us-east-1c"
      },
      {
        "Name": "us-east-1d"
      }
    ],
    "EngineVersion": "3.6.0",

  ],
  "EngineVersion": "3.6.0",
  "DBInstanceClass": "db.r4.large",
  "LicenseModel": "na",
  "Engine": "docdb"
}]}
For more information, see Adding an Amazon DocumentDB Instance to a Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see DescribeOrderableDbInstanceOptions in AWS CLI Command Reference.

**describe-pending-maintenance-actions**

The following code example shows how to use describe-pending-maintenance-actions.

**AWS CLI**

To list your pending Amazon DocumentDB maintenance actions

The following describe-pending-maintenance-actions example lists all your pending Amazon DocumentDB maintenance actions.

```
aws docdb describe-pending-maintenance-actions
```

Output:

```json
{
   "PendingMaintenanceActions": []
}
```

For more information, see Maintaining Amazon DocumentDB in the Amazon DocumentDB Developer Guide.

- For API details, see DescribePendingMaintenanceActions in AWS CLI Command Reference.

**failover-db-cluster**

The following code example shows how to use failover-db-cluster.

**AWS CLI**

To force an Amazon DocumentDB cluster to failover to a replica

The following failover-db-cluster example causes the primary instance in the Amazon DocumentDB cluster sample-cluster to failover to a replica.
aws docdb failover-db-cluster \
   --db-cluster-identifier sample-cluster

Output:

{
   "DBCluster": {
      "AssociatedRoles": [],
      "DBClusterIdentifier": "sample-cluster",
      "EngineVersion": "3.6.0",
      "DBSubnetGroup": "default",
      "MasterUsername": "master-user",
      "EarliestRestorableTime": "2019-03-15T20:30:47.020Z",
      "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
      "AvailabilityZones": ["us-west-2a", "us-west-2c", "us-west-2b"],
      "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
      "PreferredBackupWindow": "00:00-00:30",
      "Port": 27017,
      "VpcSecurityGroups": [
         {"VpcSecurityGroupId": "sg-77186e0d", "Status": "active"}
      ],
      "StorageEncrypted": false,
      "MultiAZ": true,
      "Status": "available",
      "DBClusterMembers": [
         {"DBClusterParameterGroupStatus": "in-sync",
          "IsClusterWriter": false,
          "DBInstanceIdentifier": "sample-cluster",
          "PromotionTier": 1
         },
         {"DBClusterParameterGroupStatus": "in-sync",
          "IsClusterWriter": false,
          "DBInstanceIdentifier": "sample-cluster",
          "PromotionTier": 1
         }
      ]
   }
}
For more information, see Amazon DocumentDB Failover in the Amazon DocumentDB Developer Guide.

- For API details, see FailoverDbCluster in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list all the tags on an Amazon DocumentDB resource

The following list-tags-for-resource example lists all tags on the Amazon DocumentDB cluster sample-cluster.

```bash
aws docdb list-tags-for-resource \
```

Output:

```json
{
   "TagList": [
```

For more information, see [Listing Tags on an Amazon DocumentDB Resource](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

### modify-db-cluster

The following code example shows how to use `modify-db-cluster`.

**AWS CLI**

**To modify an Amazon DocumentDB cluster**

The following `modify-db-cluster` example modifies the Amazon DocumentDB cluster `sample-cluster` by making the retention period for automatic backups 7 days, and changing the preferred windows for both backups and maintenance. All changes are applied at the next maintenance window.

```bash
aws docdb modify-db-cluster \
  --db-cluster-identifier sample-cluster \
  --no-apply-immediately \
  --backup-retention-period 7 \
  --preferred-backup-window 18:00-18:30 \
  --preferred-maintenance-window sun:20:00-sun:20:30
```

**Output:**

```json
{
}
```
"DBCluster": {
  "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
  "DBClusterMembers": [
    {
      "DBClusterParameterGroupStatus": "in-sync",
      "DBInstanceIdentifier": "sample-cluster",
      "IsClusterWriter": true,
      "PromotionTier": 1
    },
    {
      "DBClusterParameterGroupStatus": "in-sync",
      "DBInstanceIdentifier": "sample-cluster2",
      "IsClusterWriter": false,
      "PromotionTier": 2
    }
  ],
  "HostedZoneId": "ZNKXH85TT8WVW",
  "StorageEncrypted": false,
  "PreferredBackupWindow": "18:00-18:30",
  "MultiAZ": true,
  "EngineVersion": "3.6.0",
  "MasterUsername": "master-user",
  "ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
  "DBSubnetGroup": "default",
  "EarliestRestorableTime": "2019-03-15T20:30:47.020Z",
  "PreferredMaintenanceWindow": "sun:20:00-sun:20:30",
  "AssociatedRoles": [],
  "EnabledCloudwatchLogsExports": ["audit"],
  "Engine": "docdb",
  "DBClusterParameterGroup": "default.docdb3.6",
  "BackupRetentionPeriod": 7,
  "DBClusterIdentifier": "sample-cluster",
  "AvailabilityZones": ["us-west-2a", "us-west-2c", "us-west-2b"],
  "Status": "available"}
modify-db-cluster-parameter-group

The following code example shows how to use modify-db-cluster-parameter-group.

AWS CLI

To modify an Amazon DocumentDB DB cluster parameter group

The following modify-db-cluster-parameter-group example modifies the Amazon DocumentDB cluster parameter group custom3-6-param-grp by setting the two parameters audit_logs and ttl_monitor to enabled. The changes are applied at the next reboot.

```
aws docdb modify-db-cluster-parameter-group  
  --db-cluster-parameter-group-name custom3-6-param-grp  
  --parameters  
    ParameterName=audit_logs,ParameterValue=enabled,ApplyMethod=pending-reboot  
    ParameterName=ttl_monitor,ParameterValue=enabled,ApplyMethod=pending-reboot
```

Output:

```
{
  "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```
For more information, see Modifying an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see ModifyDbClusterParameterGroup in AWS CLI Command Reference.

modify-db-cluster-snapshot-attribute

The following code example shows how to use modify-db-cluster-snapshot-attribute.

AWS CLI

Example 1: To add an attribute to an Amazon DocumentDB snapshot

The following modify-db-cluster-snapshot-attribute example adds four attribute values to an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
  --db-cluster-snapshot-identifier sample-cluster-snapshot \
  --attribute-name restore \
  --values-to-add all 123456789011 123456789012 123456789013
```

Output:

```
{
   "DBClusterSnapshotAttributesResult": {
      "DBClusterSnapshotAttributes": [
         {
            "AttributeName": "restore",
            "AttributeValues": [
               "all",
               "123456789011",
               "123456789012",
               "123456789013"
            ]
         }
      ],
      "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
   }
}
```

Example 2: To remove attributes from an Amazon DocumentDB snapshot
The following modify-db-cluster-snapshot-attribute example removes two attribute values from an Amazon DocumentDB cluster snapshot.

```bash
aws docdb modify-db-cluster-snapshot-attribute 
  --db-cluster-snapshot-identifier sample-cluster-snapshot 
  --attribute-name restore 
  --values-to-remove 123456789012 all
```

Output:

```json
{
  "DBClusterSnapshotAttributesResult": {
    "DBClusterSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": [
          "123456789011",
          "123456789013"
        ]
      }
    ],
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
  }
}
```

For more information, see [ModifyDBClusterSnapshotAttribute](https://docs.aws.amazon.com/documentdb/latest/developerguide/) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbClusterSnapshotAttribute](https://docs.aws.amazon.com/cli/latest/reference/docdb/modify-db-cluster-snapshot-attribute.html) in *AWS CLI Command Reference*.

### modify-db-instance

The following code example shows how to use modify-db-instance.

#### AWS CLI

**To modify an Amazon DocumentDB instance**

The following modify-db-instance example modifies the Amazon DocumentDB instance `sample-cluster2` by changing its instance class to `db.r4.4xlarge` and its promotion tier to 5. The changes are applied immediately but can only be seen after the instances status is available.
aws docdb modify-db-instance
   --db-instance-identifier sample-cluster2
   --apply-immediately
   --db-instance-class db.r4.4xlarge
   --promotion-tier 5

Output:

{
   "DBInstance": {
      "EngineVersion": "3.6.0",
      "StorageEncrypted": false,
      "DBInstanceClass": "db.r4.large",
      "PreferredMaintenanceWindow": "mon:08:39-mon:09:09",
      "AutoMinorVersionUpgrade": true,
      "VpcSecurityGroups": [
         {
            "VpcSecurityGroupId": "sg-77186e0d",
            "Status": "active"
         }
      ],
      "PreferredBackupWindow": "18:00-18:30",
      "EnabledCloudwatchLogsExports": ["audit"],
      "AvailabilityZone": "us-west-2f",
      "DBInstanceIdentifier": "sample-cluster2",
      "InstanceCreateTime": "2019-03-15T20:36:06.338Z",
      "Engine": "docdb",
      "BackupRetentionPeriod": 7,
      "DBSubnetGroup": {
         "DBSubnetGroupName": "default",
         "DBSubnetGroupDescription": "default",
         "SubnetGroupStatus": "Complete",
         "Subnets": [
            {
               "SubnetIdentifier": "subnet-4e26d263",
               "SubnetAvailabilityZone": {
                  "Name": "us-west-2a"
               },
               "SubnetStatus": "Active"
            }
         ]
      }
   }
}
"SubnetIdentifier": "subnet-afc329f4",
"SubnetAvailabilityZone": {
  "Name": "us-west-2c"
},
"SubnetStatus": "Active"
},
{
  "SubnetIdentifier": "subnet-53ab3636",
  "SubnetAvailabilityZone": {
    "Name": "us-west-2d"
  },
  "SubnetStatus": "Active"
},
{
  "SubnetIdentifier": "subnet-991cb8d0",
  "SubnetAvailabilityZone": {
    "Name": "us-west-2b"
  },
  "SubnetStatus": "Active"
}
],
"VpcId": "vpc-91280df6"
},
"PromotionTier": 2,
"Endpoint": {
  "Address": "sample-cluster2.corcjozrlsfc.us-west-2.docdb.amazonaws.com",
  "HostedZoneId": "ZNKXH85TT8WVW",
  "Port": 27017
},
"DbiResourceId": "db-A2GIKUV6KPOHITGGKI2NHVISZA",
"DBClusterIdentifier": "sample-cluster",
"PendingModifiedValues": {
  "DBInstanceClass": "db.r4.4xlarge"
},
"PubliclyAccessible": false,
"DBInstanceStatus": "available"
}
}

For more information, see [Modifying an Amazon DocumentDB Instance](https://docs.aws.amazon.com/documentdb/latest/developerguide/modifying-db-instance.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbInstance](https://docs.aws.amazon.com/cli/latest/reference/rds/modify-db-instance.html) in *AWS CLI Command Reference*. 
modify-db-subnet-group

The following code example shows how to use modify-db-subnet-group.

AWS CLI

To modify an Amazon DocumentDB subnet group

The following modify-db-subnet-group example modifies the subnet group sample-subnet-group by adding the specified subnets and a new description.

```
aws docdb modify-db-subnet-group \
  --db-subnet-group-name sample-subnet-group \
  --subnet-ids subnet-b3806e8f subnet-53ab3636 subnet-991cb8d0 \
  --db-subnet-group-description "New subnet description"
```

Output:

```
{
  "DBSubnetGroup": {
    "DBSubnetGroupName": "sample-subnet-group",
    "SubnetGroupStatus": "Complete",
    "VpcId": "vpc-91280df6",
    "DBSubnetGroupDescription": "New subnet description",
    "Subnets": [
      {
        "SubnetIdentifier": "subnet-b3806e8f",
        "SubnetStatus": "Active",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2a"
        }
      },
      {
        "SubnetIdentifier": "subnet-53ab3636",
        "SubnetStatus": "Active",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2c"
        }
      },
      {
        "SubnetIdentifier": "subnet-991cb8d0",
      }
    ]
  }
}
```
For more information, see [Modifying an Amazon DocumentDB Subnet Group](https://docs.aws.amazon.com/documentdb/latest/developerguide/documentdb.update-subnetgroup.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbSubnetGroup](https://docs.aws.amazon.com/cli/latest/reference/docdb/modify-db-subnet-group.html) in *AWS CLI Command Reference*.

### reboot-db-instance

The following code example shows how to use `reboot-db-instance`.

**AWS CLI**

**To reboot an Amazon DocumentDB instance**

The following `reboot-db-instance` example reboots the Amazon DocumentDB instance `sample-cluster2`.

```bash
aws docdb reboot-db-instance \
  --db-instance-identifier sample-cluster2
```

This command produces no output. Output:

```
{
  "DBInstance": {
    "PreferredBackupWindow": "18:00-18:30",
    "DBInstanceIdentifier": "sample-cluster2",
    "VpcSecurityGroups": [
      {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
      }
    ],
    "DBSubnetGroup": {
      "VpcId": "vpc-91280df6",
      "Subnets": [
```
{
    "SubnetStatus": "Active",
    "SubnetAvailabilityZone": {
        "Name": "us-west-2a"
    },
    "SubnetIdentifier": "subnet-4e26d263"
},
{
    "SubnetStatus": "Active",
    "SubnetAvailabilityZone": {
        "Name": "us-west-2c"
    },
    "SubnetIdentifier": "subnet-afc329f4"
},
{
    "SubnetStatus": "Active",
    "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
    },
    "SubnetIdentifier": "subnet-53ab3636"
},
{
    "SubnetStatus": "Active",
    "SubnetAvailabilityZone": {

**remove-tags-from-resource**

The following code example shows how to use remove-tags-from-resource.

**AWS CLI**

**To remove tags from an Amazon DocumentDB resource**

The following remove-tags-from-resource example removes the tag with the key named B from the Amazon DocumentDB cluster sample-cluster.

```bash
aws docdb remove-tags-from-resource \
   --tag-keys B
```

This command produces no output.

For more information, see [Removing Tags from an Amazon DocumentDB Resource](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RemoveTagsFromResource](#) in *AWS CLI Command Reference*.

Actions and scenarios 1834
reset-db-cluster-parameter-group

The following code example shows how to use reset-db-cluster-parameter-group.

AWS CLI

To reset the specified parameter value to its defaults in an Amazon DocumentDB parameter group

The following reset-db-cluster-parameter-group example resets the parameter ttl_monitor in the Amazon DocumentDB parameter group custom3-6-param-grp to its default value.

```
aws docdb reset-db-cluster-parameter-group \\
    --db-cluster-parameter-group-name custom3-6-param-grp \\
    --parameters ParameterName=ttl_monitor,ApplyMethod=immediate
```

Output:

```
{
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see title in the Amazon DocumentDB Developer Guide.

To reset specified or all parameter values to their defaults in an Amazon DocumentDB parameter group

The following reset-db-cluster-parameter-group example resets all parameters in the Amazon DocumentDB parameter group custom3-6-param-grp to their default value.

```
aws docdb reset-db-cluster-parameter-group \\
    --db-cluster-parameter-group-name custom3-6-param-grp \\
    --reset-all-parameters
```

Output:

```
{
    "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```
For more information, see Resetting an Amazon DocumentDB Cluster Parameter Group in the Amazon DocumentDB Developer Guide.

- For API details, see ResetDbClusterParameterGroup in AWS CLI Command Reference.

**restore-db-cluster-from-snapshot**

The following code example shows how to use restore-db-cluster-from-snapshot.

**AWS CLI**

**To restore an Amazon DocumentDB cluster from an automatic or manual snapshot**

The following restore-db-cluster-from-snapshot example creates a new Amazon DocumentDB cluster named sample-cluster-2019-03-16-00-01-restored from the snapshot rds:sample-cluster-2019-03-16-00-01.

```
aws docdb restore-db-cluster-from-snapshot \
   --db-cluster-identifier sample-cluster-2019-03-16-00-01-restored \
   --engine docdb \
   --snapshot-identifier rds:sample-cluster-2019-03-16-00-01
```

**Output:**

```
{
   "DBCluster": {
      "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
      "HostedZoneId": "ZNKXH85TT8VWV",

For more information, see [Restoring from a Cluster Snapshot](https://docs.aws.amazon.com/documentdb/latest/developerguide/restoring-cluster-snapshot.html) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RestoreDbClusterFromSnapshot](https://docs.aws.amazon.com/cli/latest/reference/docdb/restore-db-cluster-from-snapshot.html) in *AWS CLI Command Reference*.

### restore-db-cluster-to-point-in-time

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

**AWS CLI**

**To restore an Amazon DocumentDB cluster to a point-in-time from a manual snapshot**

The following `restore-db-cluster-to-point-in-time` example uses the `sample-cluster-snapshot` to create a new Amazon DocumentDB cluster, `sample-cluster-pit`, using the latest restorable time.

```
aws docdb restore-db-cluster-to-point-in-time
   --db-cluster-identifier sample-cluster-pit
```
--use-latest-restorable-time

Output:

```
{
    "DBCluster": {
        "StorageEncrypted": false,
        "BackupRetentionPeriod": 3,
        "MasterUsername": "master-user",
        "HostedZoneId": "ZNKXH85TT8WVW",
        "PreferredBackupWindow": "00:00-00:30",
        "MultiAZ": false,
        "DBClusterIdentifier": "sample-cluster-pit",
        "DBSubnetGroup": "default",
        "AssociatedRoles": [],
        "DBClusterParameterGroup": "default.docdb3.6",
        "DBClusterMembers": [],
        "Status": "creating",
        "AvailabilityZones": [
            "us-west-2a",
            "us-west-2d",
            "us-west-2b"
        ],
        "ReaderEndpoint": "sample-cluster-pit.cluster-ro-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "Port": 27017,
        "Engine": "docdb",
        "EngineVersion": "3.6.0",
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-77186e0d",
                "Status": "active"
            }
        ],
        "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
        "Endpoint": "sample-cluster-pit.cluster-corcjozrlsfc.us-west-2.docdb.amazonaws.com",
        "DbClusterResourceId": "cluster-NLCABBXOSE2QPO4GOLZIFWELPM",
    }
}
```
For more information, see **Restoring a Snapshot to a Point in Time** in the *Amazon DocumentDB Developer Guide*.

- For API details, see **RestoreDbClusterToPointInTime** in *AWS CLI Command Reference*.

### start-db-cluster

The following code example shows how to use `start-db-cluster`.

**AWS CLI**

**To start a stopped Amazon DocumentDB cluster**

The following `start-db-cluster` example starts the specified Amazon DocumentDB cluster.

```
aws docdb start-db-cluster \
  --db-cluster-identifier sample-cluster
```

**Output:**

```json
{
  "DBCluster": {
    "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
    "HostedZoneId": "ZNKXH85TT8WVW",
    "Engine": "docdb",
    "DBClusterMembers": [],
    "MultiAZ": false,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1c",
      "us-east-1f"
    ],
    "StorageEncrypted": false,
    "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-corcjozrlsfc.us-east-1.docdb.amazonaws.com",
    "Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-corcjozrlsfc.us-east-1.docdb.amazonaws.com",
    "Port": 27017,
    "PreferredBackupWindow": "00:00-00:30",
    "DBSubnetGroup": "default",
    "DBClusterIdentifier": "sample-cluster-2019-03-16-00-01-restored",
    "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
  }
}
```
For more information, see Stopping and Starting an Amazon DocumentDB Cluster in the Amazon DocumentDB Developer Guide.

• For API details, see StartDbCluster in AWS CLI Command Reference.

**stop-db-cluster**

The following code example shows how to use stop-db-cluster.

**AWS CLI**

To stop a running Amazon DocumentDB cluster

The following stop-db-cluster example stops the specified Amazon DocumentDB cluster.

```
aws docdb stop-db-cluster \\
   --db-cluster-identifier sample-cluster
```

Output:

```
{
   "DBCluster": {
       "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
       "HostedZoneId": "ZNKXH85TT8WVW",
}
```
"Engine": "docdb",
"DBClusterMembers": [],
"MultiAZ": false,
"AvailabilityZones": [
  "us-east-1a",
  "us-east-1c",
  "us-east-1f"
],
"StorageEncrypted": false,
"ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-corcjozrlsfc.us-east-1.docdb.amazonaws.com",
"Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-corcjozrlsfc.us-east-1.docdb.amazonaws.com",
"Port": 27017,
"PreferredBackupWindow": "00:00-00:30",
"DBSubnetGroup": "default",
"DBClusterIdentifier": "sample-cluster-2019-03-16-00-01-restored",
"PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
"DBClusterParameterGroup": "default.docdb3.6",
"DbClusterResourceId": "cluster-XOO46Q3RH4LWSYNH3NMZKPISU",
"MasterUsername": "master-user",
"EngineVersion": "3.6.0",
"BackupRetentionPeriod": 3,
"AssociatedRoles": [],
"Status": "creating",
"VpcSecurityGroups": [
  {
    "Status": "active",
    "VpcSecurityGroupId": "sg-77186e0d"
  }
]
}

For more information, see Stopping and Starting an Amazon DocumentDB Cluster in the Amazon DocumentDB Developer Guide.

- For API details, see StopDbCluster in AWS CLI Command Reference.
DynamoDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

Create a table

The following code example shows how to create a DynamoDB table.

AWS CLI

Example 1: To create a table with tags

The following create-table example uses the specified attributes and key schema to create a table named MusicCollection. This table uses provisioned throughput and is encrypted at rest using the default AWS owned CMK. The command also applies a tag to the table, with a key of Owner and a value of blueTeam.

```
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S \n  AttributeName=SongTitle,AttributeType=S \n  --key-schema AttributeName=Artist,KeyType=HASH \n  AttributeName=SongTitle,KeyType=RANGE \n  --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \n  --tags Key=Owner,Value=blueTeam
```
Output:

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "Artist",
            "AttributeType": "S"
         },
         {
            "AttributeName": "SongTitle",
            "AttributeType": "S"
         }
      ],
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "WriteCapacityUnits": 5,
         "ReadCapacityUnits": 5
      },
      "TableSizeBytes": 0,
      "TableName": "MusicCollection",
      "TableStatus": "CREATING",
      "KeySchema": [
         {
            "KeyType": "HASH",
            "AttributeName": "Artist"
         },
         {
            "KeyType": "RANGE",
            "AttributeName": "SongTitle"
         }
      ],
      "ItemCount": 0,
      "CreationDateTime": "2020-05-26T16:04:41.627000-07:00",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
   }
}
```

For more information, see [Basic Operations for Tables](#) in the [Amazon DynamoDB Developer Guide](#).

**Example 2: To create a table in On-Demand Mode**
The following example creates a table called MusicCollection using on-demand mode, rather than provisioned throughput mode. This is useful for tables with unpredictable workloads.

```bash
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH AttributeName=SongTitle,KeyType=RANGE \
  --billing-mode PAY_PER_REQUEST
```

Output:

```
{
    "TableDescription": {
        "AttributeDefinitions": [
        {
            "AttributeName": "Artist",
            "AttributeType": "S"
        },
        {
            "AttributeName": "SongTitle",
            "AttributeType": "S"
        }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
    {
        "AttributeName": "Artist",
        "KeyType": "HASH"
    },
    {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
    }
    ],
    "TableStatus": "CREATING",
    "CreationDateTime": "2020-05-27T11:44:10.807000-07:00",
    "ProvisionedThroughput": {
        "NumberOfDecreasesToday": 0,
        "ReadCapacityUnits": 0,
        "WriteCapacityUnits": 0
    }
}
```
Example 3: To create a table and encrypt it with a Customer Managed CMK

The following example creates a table named MusicCollection and encrypts it using a customer managed CMK.

```
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S \n  AttributeName=SongTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH \n  AttributeName=SongTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
  --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=abcd1234-abcd-1234-a123-ab1234a1b234
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "BillingModeSummary": {
      "BillingMode": "PAY_PER_REQUEST"
    }
  }
}
```
"TableName": "MusicCollection",
"KeySchema": [
  {
    "AttributeName": "Artist",
    "KeyType": "HASH"
  },
  {
    "AttributeName": "SongTitle",
    "KeyType": "RANGE"
  }
],
"TableStatus": "CREATING",
"CreationDateTime": "2020-05-27T11:12:16.431000-07:00",
"ProvisionedThroughput": {
  "NumberOfDecreasesToday": 0,
  "ReadCapacityUnits": 5,
  "WriteCapacityUnits": 5
},
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"SSEDescription": {
  "Status": "ENABLED",
  "SSEType": "KMS",
  "KMSMasterKeyArn": "arn:aws:kms:us-west-2:123456789012:key/abcd1234-abcd-1234-a123-ab1234a1b234"
}
}

For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

Example 4: To create a table with a Local Secondary Index

The following example uses the specified attributes and key schema to create a table named MusicCollection with a Local Secondary Index named AlbumTitleIndex.

aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S AttributeName=SongTitle,AttributeType=S AttributeName=AlbumTitle,AttributeType=S
--key-schema AttributeName=Artist,KeyType=HASH
AttributeName=SongTitle,KeyType=RANGE \
--provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
--local-secondary-indexes \
"[
  {
    "IndexName": "AlbumTitleIndex",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "AlbumTitle",
        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "INCLUDE",
      "NonKeyAttributes": [
        "Genre",
        "Year"
      ]
    }
  }
]"

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "AlbumTitle",
        "KeyType": "RANGE"
      }
    ]
  }
}
```
"AttributeName": "SongTitle",
 "KeyType": "RANGE"
],
"TableStatus": "CREATING",
"CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
"ProvisionedThroughput": {
 "NumberOfDecreasesToday": 0,
 "ReadCapacityUnits": 10,
 "WriteCapacityUnits": 5
 },
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"LocalSecondaryIndexes": [
 {
 "IndexName": "AlbumTitleIndex",
 "KeySchema": [
 { "AttributeName": "Artist",
 "KeyType": "HASH"
 },
 { "AttributeName": "AlbumTitle",
 "KeyType": "RANGE"
 }
 ],
 "Projection": { "ProjectionType": "INCLUDE",
 "NonKeyAttributes": [
 "Genre",
 "Year"
 ]
 },
 "IndexSizeBytes": 0,
 "ItemCount": 0,
 "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/index/AlbumTitleIndex"
 }]
}
For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

**Example 5: To create a table with a Global Secondary Index**

The following example creates a table named GameScores with a Global Secondary Index called GameTitleIndex. The base table has a partition key of UserId and a sort key of GameTitle, allowing you to find an individual user's best score for a specific game efficiently, whereas the GSI has a partition key of GameTitle and a sort key of TopScore, allowing you to quickly find the overall highest score for a particular game.

```bash
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S \n  AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N \
  --key-schema AttributeName=UserId,KeyType=HASH \n  AttributeName=GameTitle,KeyType=RANGE \n  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \n  --global-secondary-indexes \
    "[ 
      { 
        "IndexName": "GameTitleIndex", \n        "KeySchema": [ \n          {"AttributeName":"GameTitle","KeyType":"HASH"}, \n          {"AttributeName":"TopScore","KeyType":"RANGE"} \n        ], \n        "Projection": { \n          "ProjectionType": "INCLUDE", \n          "NonKeyAttributes": ["UserId"] \n        }, \n        "ProvisionedThroughput": { \n          "ReadCapacityUnits": 10, \n          "WriteCapacityUnits": 5 \n        } \n      } 
    ]"
```

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [ 
```
{
    "AttributeName": "GameTitle",
    "AttributeType": "S"
},
{
    "AttributeName": "TopScore",
    "AttributeType": "N"
},
{
    "AttributeName": "UserId",
    "AttributeType": "S"
}
],
"TableName": "GameScores",
"KeySchema": [
    {
        "AttributeName": "UserId",
        "KeyType": "HASH"
    },
    {
        "AttributeName": "GameTitle",
        "KeyType": "RANGE"
    }
],
"TableStatus": "CREATING",
"CreationDateTime": "2020-05-26T17:28:15.602000-07:00",

"GlobalSecondaryIndexes": [
    {
        "IndexName": "GameTitleIndex",
        "KeySchema": [
            {
                "AttributeName": "GameTitle",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            }
        ]
    }
]
For more information, see Basic Operations for Tables in the Amazon DynamoDB Developer Guide.

**Example 6: To create a table with multiple Global Secondary Indexes at once**

The following example creates a table named GameScores with two Global Secondary Indexes. The GSI schemas are passed via a file, rather than on the command line.

```
aws dynamodb create-table
  --table-name GameScores
  --attribute-definitions AttributeName=UserId,AttributeType=S
  AttributeName=GameTitle,AttributeType=S
  AttributeName=TopScore,AttributeType=N
  AttributeName=Date,AttributeType=S
  --key-schema AttributeName=UserId,KeyType=HASH
  AttributeName=GameTitle,KeyType=RANGE
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5
  --global-secondary-indexes file://gsi.json
```
Contents of gsi.json:

```json
[
  {
    "IndexName": "GameTitleIndex",
    "KeySchema": [
      {
        "AttributeName": "GameTitle",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "TopScore",
        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "ALL"
    },
    "ProvisionedThroughput": {
      "ReadCapacityUnits": 10,
      "WriteCapacityUnits": 5
    }
  },
  {
    "IndexName": "GameDateIndex",
    "KeySchema": [
      {
        "AttributeName": "GameTitle",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "Date",
        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "ALL"
    },
    "ProvisionedThroughput": {
      "ReadCapacityUnits": 5,
      "WriteCapacityUnits": 5
    }
  }
]
```
Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Date",
        "AttributeType": "S"
      },
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "TopScore",
        "AttributeType": "N"
      },

    "ItemCount": 0,
    "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores/index/GameTitleIndex"
  },
  {
    "IndexName": "GameDateIndex",
    "KeySchema": [
      {
        "AttributeName": "GameTitle",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "Date",
        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "ALL"
Example 7: To create a table with Streams enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Both new and old images of each item will be written to the stream.

```bash
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S \
                  AttributeName=GameTitle,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH \
                  AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --stream-specification StreamEnabled=TRUE,StreamViewType=NEW_AND_OLD_IMAGES
```

Output:

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "UserId",
        "AttributeType": "S"
      }
    ],
    "ProvisionedThroughput": {
      "ReadCapacityUnits": 5,
      "WriteCapacityUnits": 5
    },
    "IndexSizeBytes": 0,
    "ItemCount": 0,
    "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores/index/GameDateIndex"
  }
}
```
Example 8: To create a table with Keys-Only Stream enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Only the key attributes of modified items are written to the stream.
aws dynamodb create-table \
   --table-name GameScores \
   --attribute-definitions AttributeName=UserId,AttributeType=S \
   AttributeName=GameTitle,AttributeType=S \
   --key-schema AttributeName=UserId,KeyType=HASH \
   AttributeName=GameTitle,KeyType=RANGE \
   --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
   --stream-specification StreamEnabled=TRUE,StreamViewType=KEYS_ONLY

Output:

{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "GameTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "UserId",
            "AttributeType": "S"
         }
      ],
      "TableName": "GameScores",
      "KeySchema": [
         {
            "AttributeName": "UserId",
            "KeyType": "HASH"
         },
         {
            "AttributeName": "GameTitle",
            "KeyType": "RANGE"
         }
      ],
      "TableStatus": "CREATING",
      "CreationDateTime": "2023-05-25T18:45:34.140000+00:00",
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "ReadCapacityUnits": 10,
         "WriteCapacityUnits": 5
      },
      "TableSizeBytes": 0,
      "ItemCount": 0,
      "TableMeta"
   }
}
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"StreamSpecification": {
    "StreamEnabled": true,
    "StreamViewType": "KEYS_ONLY"
},
"LatestStreamLabel": "2023-05-25T18:45:34.140",
"DeletionProtectionEnabled": false
}

For more information, see Change data capture for DynamoDB Streams in the Amazon DynamoDB Developer Guide.

Example 9: To create a table with the Standard Infrequent Access class

The following example creates a table called GameScores and assigns the Standard-Infrequent Access (DynamoDB Standard-IA) table class. This table class is optimized for storage being the dominant cost.

```bash
aws dynamodb create-table \
    --table-name GameScores \
    --attribute-definitions AttributeName=UserId,AttributeType=S\n    AttributeName=GameTitle,AttributeType=S \
    --key-schema AttributeName=UserId,KeyType=HASH\n    AttributeName=GameTitle,KeyType=RANGE \
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
    --table-class STANDARD_INFREQUENT_ACCESS
```

Output:

```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "ProvisionedThroughput": {
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableStatus": "ACTIVE",
        "StreamSpecification": {
            "StreamEnabled": true,
            "StreamViewType": "KEYS_ONLY"
        },
        "LatestStreamLabel": "2023-05-25T18:45:34.140",
        "DeletionProtectionEnabled": false
    }
}
```
For more information, see [Table classes](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/tables.html) in the *Amazon DynamoDB Developer Guide*.

**Example 10: To Create a table with Delete Protection enabled**

The following example creates a table called GameScores and enables deletion protection.

```bash
aws dynamodb create-table
    --table-name GameScores
    --attribute-definitions AttributeName=UserId,AttributeType=S
    AttributeName=GameTitle,AttributeType=S
    --key-schema AttributeName=UserId,KeyType=HASH
    AttributeName=GameTitle,KeyType=RANGE
    --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5
```
Output:

```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "GameTitle",
                "AttributeType": "S"
            },
            {
                "AttributeName": "UserId",
                "AttributeType": "S"
            }
        ],
        "TableName": "GameScores",
        "KeySchema": [
            {
                "AttributeName": "UserId",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "GameTitle",
                "KeyType": "RANGE"
            }
        ],
        "TableStatus": "CREATING",
        "CreationDateTime": "2023-05-25T23:02:17.093000+00:00",
        "ProvisionedThroughput": {
            "NumberOfDecreasesToday": 0,
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 5
        },
        "TableSizeBytes": 0,
        "ItemCount": 0,
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DeletionProtectionEnabled": true
    }
}
```

For more information, see [Using deletion protection](#) in the *Amazon DynamoDB Developer Guide*. 

---

**Actions and scenarios**

1860
Delete a table

The following code example shows how to delete a DynamoDB table.

AWS CLI

To delete a table

The following delete-table example deletes the MusicCollection table.

```
aws dynamodb delete-table
   --table-name MusicCollection
```

Output:

```
{
   "TableDescription": {
      "TableStatus": "DELETING",
      "TableSizeBytes": 0,
      "ItemCount": 0,
      "TableName": "MusicCollection",
      "ProvisionedThroughput": {
         "NumberOfDecreasesToday": 0,
         "WriteCapacityUnits": 5,
         "ReadCapacityUnits": 5
      }
   }
}
```

For more information, see Deleting a Table in the Amazon DynamoDB Developer Guide.

Delete an item from a table

The following code example shows how to delete an item from a DynamoDB table.

AWS CLI

Example 1: To delete an item
The following delete-item example deletes an item from the MusicCollection table and requests details about the item that was deleted and the capacity used by the request.

```bash
aws dynamodb delete-item \
  --table-name MusicCollection \
  --key file://key.json \
  --return-values ALL_OLD \
  --return-consumed-capacity TOTAL \
  --return-item-collection-metrics SIZE
```

Contents of key.json:

```json
{
  "Artist": {"S": "No One You Know"},
  "SongTitle": {"S": "Scared of My Shadow"}
}
```

Output:

```json
{
  "Attributes": {
    "AlbumTitle": {
      "S": "Blue Sky Blues"
    },
    "Artist": {
      "S": "No One You Know"
    },
    "SongTitle": {
      "S": "Scared of My Shadow"
    }
  },
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 2.0
  },
  "ItemCollectionMetrics": {
    "ItemCollectionKey": {
      "Artist": {
        "S": "No One You Know"
      }
    },
    "SizeEstimateRangeGB": [
```

Actions and scenarios
For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.

Example 2: To delete an item conditionally

The following example deletes an item from the ProductCatalog table only if its ProductCategory is either Sporting Goods or Gardening Supplies and its price is between 500 and 600. It returns details about the item that was deleted.

```bash
aws dynamodb delete-item
  --table-name ProductCatalog
  --key '{"Id":{"N":"456"}}'
  --condition-expression "(ProductCategory IN (:cat1, :cat2)) and (#P between :lo and :hi)"
  --expression-attribute-names file://names.json
  --expression-attribute-values file://values.json
  --return-values ALL_OLD
```

Contents of names.json:

```json
{
  "#P": "Price"
}
```

Contents of values.json:

```json
{
  ":cat1": {"S": "Sporting Goods"},
  ":cat2": {"S": "Gardening Supplies"},
  ":lo": {"N": "500"},
  ":hi": {"N": "600"}
}
```

Output:

```json
{
}
"Attributes": {
  "Id": {
    "N": "456"
  },
  "Price": {
    "N": "550"
  },
  "ProductCategory": {
    "S": "Sporting Goods"
  }
}

For more information, see [Writing an Item](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteItem](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/delete-item.html) in *AWS CLI Command Reference*.

### Get a batch of items

The following code example shows how to get a batch of DynamoDB items.

**AWS CLI**

**To retrieve multiple items from a table**

The following batch-get-items example reads multiple items from the MusicCollection table using a batch of three GetItem requests, and requests the number of read capacity units consumed by the operation. The command returns only the AlbumTitle attribute.

```bash
aws dynamodb batch-get-item \
  --request-items file://request-items.json \
  --return-consumed-capacity TOTAL
```

**Contents of request-items.json:**

```json
{
  "MusicCollection": {
    "Keys": [
    {
      "Artist": {"S": "No One You Know"},
      "SongTitle": {"S": "Call Me Today"}
    },
    ...
  }
}
```
```
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
},
{
    "Artist": {"S": "No One You Know"},
    "SongTitle": {"S": "Scared of My Shadow"}
}
,"ProjectionExpression":"AlbumTitle"
}
```

Output:
```
{
    "Responses": {
        "MusicCollection": [
            {
                "AlbumTitle": {"S": "Somewhat Famous"
            },
        },
        {
            "AlbumTitle": {"S": "Blue Sky Blues"
        },
        {
            "AlbumTitle": {"S": "Louder Than Ever"
        }
    ],
    "UnprocessedKeys": {},
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 1.5
        }
    ]
}
```
For more information, see Batch Operations in the Amazon DynamoDB Developer Guide.

- For API details, see BatchGetItem in AWS CLI Command Reference.

Get an item from a table

The following code example shows how to get an item from a DynamoDB table.

AWS CLI

**Example 1: To read an item in a table**

The following get-item example retrieves an item from the MusicCollection table. The table has a hash-and-range primary key (Artist and SongTitle), so you must specify both of these attributes. The command also requests information about the read capacity consumed by the operation.

```bash
aws dynamodb get-item \
  --table-name MusicCollection \
  --key file://key.json \
  --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```json
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:

```json
{
    "Item": {
        "AlbumTitle": {
            "S": "Songs About Life"
        },
        "SongTitle": {
            "S": "Happy Day"
        },
        "Artist": {
            "S": "Acme Band"
        }
    }
}
```
For more information, see Reading an Item in the Amazon DynamoDB Developer Guide.

Example 2: To read an item using a consistent read

The following example retrieves an item from the MusicCollection table using strongly consistent reads.

```bash
aws dynamodb get-item \
    --table-name MusicCollection \ 
    --key file://key.json \ 
    --consistent-read \ 
    --return-consumed-capacity TOTAL
```

Contents of key.json:

```json
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

Output:

```json
{
    "Item": {
        "AlbumTitle": {
            "S": "Songs About Life"
        },
        "SongTitle": {
            "S": "Happy Day"
        },
        "Artist": {
            "S": "Acme Band"
        }
    },
    "ConsumedCapacity": {
```
For more information, see [Reading an Item](#) in the Amazon DynamoDB Developer Guide.

**Example 3: To retrieve specific attributes of an item**

The following example uses a projection expression to retrieve only three attributes of the desired item.

```bash
aws dynamodb get-item
   --table-name ProductCatalog
   --key '{"Id": {"N": "102"}}'
   --projection-expression "#T, #C, #P"
   --expression-attribute-names file://names.json
```

Contents of `names.json`:

```json
{
   "#T": "Title",
   "#C": "ProductCategory",
   "#P": "Price"
}
```

Output:

```json
{
   "Item": {
      "Price": {
         "N": "20"
      },
      "Title": {
         "S": "Book 102 Title"
      },
      "ProductCategory": {
         "S": "Book"
      }
   }
}
```
Get information about a table

The following code example shows how to get information about a DynamoDB table.

**AWS CLI**

To describe a table

The following describe-table example describes the MusicCollection table.

```
aws dynamodb describe-table \
   --table-name MusicCollection
```

Output:

```json
{
   "Table": {
      "AttributeDefinitions": [
         {
           "AttributeName": "Artist",
           "AttributeType": "S"
         },
         {
           "AttributeName": "SongTitle",
           "AttributeType": "S"
         }
      ],
      "ProvisionedThroughput": {
        "NumberOfDecreasesToday": 0,
        "WriteCapacityUnits": 5,
        "ReadCapacityUnits": 5
      },
      "TableSizeBytes": 0,
      "TableName": "MusicCollection",
      "TableStatus": "ACTIVE",
      "KeySchema": [
        {
          "KeyType": "HASH",
          "AttributeName": "Artist"
        }
      ]
   }
}
```
List tables

The following code example shows how to list DynamoDB tables.

**AWS CLI**

**Example 1: To list tables**

The following `list-tables` example lists all of the tables associated with the current AWS account and Region.

```bash
aws dynamodb list-tables
```

Output:

```json
{
    "TableNames": [
        "Forum",
        "ProductCatalog",
        "Reply",
        "Thread"
    ]
}
```

For more information, see [Listing Table Names](#) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To limit page size**
The following example returns a list of all existing tables, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-tables \
   --page-size 1
```

Output:

```
{
   "TableNames": [
       "Forum",
       "ProductCatalog",
       "Reply",
       "Thread"
   ]
}
```

For more information, see [Listing Table Names](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

**Example 3: To limit the number of items returned**

The following example limits the number of items returned to 2. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-tables \
   --max-items 2
```

Output:

```
{
   "TableNames": [
       "Forum",
       "ProductCatalog"
   ],
   "NextToken":
       "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEfghijK7LM51n0pqRSTuv3WxY3ZabC5dEFghI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Listing Table Names](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*. 

---

*Actions and scenarios*
Example 4: To retrieve the next page of results

The following command uses the NextToken value from a previous call to the list-tables command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```
aws dynamodb list-tables \
  --starting-token abCDeFGhiJK1mn0PqrSTuvwxYZ1aBcdEFghijK7LM51n0pqRSTuv3Wx3Y3abC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
  "TableNames": [
    "Reply",
    "Thread"
  ]
}
```

For more information, see Listing Table Names in the Amazon DynamoDB Developer Guide.
- For API details, see ListTables in AWS CLI Command Reference.

Put an item in a table

The following code example shows how to put an item in a DynamoDB table.

**AWS CLI**

Example 1: To add an item to a table

The following put-item example adds a new item to the MusicCollection table.

```
aws dynamodb put-item \
  --table-name MusicCollection \
  --item file://item.json \
  --return-consumed-capacity TOTAL \
  --return-item-collection-metrics SIZE
```

Contents of item.json:

```
{
```
Output:

```json
{
   "ConsumedCapacity": {
      "TableName": "MusicCollection",
      "CapacityUnits": 1.0
   },
   "ItemCollectionMetrics": {
      "ItemCollectionKey": {
         "Artist": {
            "S": "No One You Know"
         }
      },
      "SizeEstimateRangeGB": [
         0.0,
         1.0
      ]
   }
}
```

For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To conditionally overwrite an item in a table**

The following `put-item` example overwrites an existing item in the `MusicCollection` table only if that existing item has an `AlbumTitle` attribute with a value of `Greatest Hits`. The command returns the previous value of the item.

```
aws dynamodb put-item \
   --table-name MusicCollection \
   --item file://item.json \
   --condition-expression "#A = :A" \
   --expression-attribute-names file://names.json \
   --expression-attribute-values file://values.json \
   --return-values ALL_OLD
```

Contents of `item.json`:
{  
  "Artist": {"S": "No One You Know"},  
  "SongTitle": {"S": "Call Me Today"},  
  "AlbumTitle": {"S": "Somewhat Famous"}  
}

Contents of names.json:

{
  "#A": "AlbumTitle"
}

Contents of values.json:

{
  ":A": {"S": "Greatest Hits"}
}

Output:

{
  "Attributes": {
  "AlbumTitle": {
  "S": "Greatest Hits"
  },  
  "Artist": {
  "S": "No One You Know"
  },  
  "SongTitle": {
  "S": "Call Me Today"
  }
}

If the key already exists, you should see the following output:

A client error (ConditionalCheckFailedException) occurred when calling the PutItem operation: The conditional request failed.

For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.
Query a table

The following code example shows how to query a DynamoDB table.

AWS CLI

Example 1: To query a table

The following query example queries items in the MusicCollection table. The table has a hash-and-range primary key (Artist and SongTitle), but this query only specifies the hash key value. It returns song titles by the artist named "No One You Know".

```bash
aws dynamodb query \
  --table-name MusicCollection \
  --projection-expression "SongTitle" \
  --key-condition-expression "Artist = :v1" \
  --expression-attribute-values file://expression-attributes.json \
  --return-consumed-capacity TOTAL
```

Contents of expression-attributes.json:

```json
{
  "v1": {"S": "No One You Know"}
}
```

Output:

```json
{
  "Items": [
    {
      "SongTitle": {
        "S": "Call Me Today"
      },
      "SongTitle": {
        "S": "Scared of My Shadow"
      }
    }
  ],
  "Count": 2,
  "LastEvaluatedKey": null,
  "ResponseMetadata": {
    "HTTPStatusCode": 200,
    "RequestId": "7CDABC1234567890",
    "RetryAttempts": 0
  }
}
```
Example 2: To query a table using strongly consistent reads and traverse the index in descending order

The following example performs the same query as the first example, but returns results in reverse order and uses strongly consistent reads.

```
aws dynamodb query \
    --table-name MusicCollection \
    --projection-expression "SongTitle" \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
    --consistent-read \
    --no-scan-index-forward \
    --return-consumed-capacity TOTAL
```

Contents of `expression-attributes.json`:

```
{
   ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
    "Items": [
        {
            "SongTitle": {
                "S": "Scared of My Shadow"
            }
        },
        {
            "SongTitle": {
```

For more information, see [Working with Queries in DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/queries.html) in the *Amazon DynamoDB Developer Guide*. 

---

**Actions and scenarios**
For more information, see [Working with Queries in DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/Working-with-Queries.html) in the *Amazon DynamoDB Developer Guide*.

**Example 3: To filter out specific results**

The following example queries the `MusicCollection` but excludes results with specific values in the `AlbumTitle` attribute. Note that this does not affect the `ScannedCount` or `ConsumedCapacity`, because the filter is applied after the items have been read.

```bash
aws dynamodb query \
  --table-name MusicCollection \
  --key-condition-expression "#n1 = :v1" \
  --filter-expression "NOT (#n2 IN (:v2, :v3))" \
  --expression-attribute-names file://names.json \n  --expression-attribute-values file://values.json \n  --return-consumed-capacity TOTAL
```

Contents of `values.json`:

```json
{
  "v1": {"S": "No One You Know"},
  "v2": {"S": "Blue Sky Blues"},
  "v3": {"S": "Greatest Hits"}
}
```

Contents of `names.json`:

```json
{
  "#n1": "Artist",
```
Output:

```json
{
  "Items": [
    {
      "AlbumTitle": {
        "S": "Somewhat Famous"
      },
      "Artist": {
        "S": "No One You Know"
      },
      "SongTitle": {
        "S": "Call Me Today"
      }
    }
  ],
  "Count": 1,
  "ScannedCount": 2,
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 0.5
  }
}
```

For more information, see [Working with Queries in DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/working-with-queries.html) in the *Amazon DynamoDB Developer Guide*.

**Example 4: To retrieve only an item count**

The following example retrieves a count of items matching the query, but does not retrieve any of the items themselves.

```bash
aws dynamodb query
  --table-name MusicCollection
  --select COUNT
  --key-condition-expression "Artist = :v1"
  --expression-attribute-values file://expression-attributes.json
```

Contents of `expression-attributes.json`:
Example 5: To query an index

The following example queries the local secondary index AlbumTitleIndex. The query returns all attributes from the base table that have been projected into the local secondary index. Note that when querying a local secondary index or global secondary index, you must also provide the name of the base table using the `table-name` parameter.

```
aws dynamodb query \
    --table-name MusicCollection \
    --index-name AlbumTitleIndex \
    --key-condition-expression "Artist = :v1" \
    --expression-attribute-values file://expression-attributes.json \
    --select ALL_PROJECTED_ATTRIBUTES \
    --return-consumed-capacity INDEXES
```

Contents of `expression-attributes.json`:

```json
{
    "v1": {"S": "No One You Know"}
}
```

Output:

```json
{
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": null
}
```

For more information, see [Working with Queries in DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/queries.html) in the *Amazon DynamoDB Developer Guide*.
"Items": [
    {
        "AlbumTitle": {
            "S": "Blue Sky Blues"
        },
        "Artist": {
            "S": "No One You Know"
        },
        "SongTitle": {
            "S": "Scared of My Shadow"
        }
    },
    {
        "AlbumTitle": {
            "S": "Somewhat Famous"
        },
        "Artist": {
            "S": "No One You Know"
        },
        "SongTitle": {
            "S": "Call Me Today"
        }
    }
],
"Count": 2,
"ScannedCount": 2,
"ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 0.5,
    "Table": {
        "CapacityUnits": 0.0
    },
    "LocalSecondaryIndexes": {
        "AlbumTitleIndex": {
            "CapacityUnits": 0.5
        }
    }
}

For more information, see Working with Queries in DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see Query in AWS CLI Command Reference.
### Scan a table

The following code example shows how to scan a DynamoDB table.

**AWS CLI**

**To scan a table**

The following scan example scans the entire MusicCollection table, and then narrows the results to songs by the artist "No One You Know". For each item, only the album title and song title are returned.

```bash
aws dynamodb scan \
   --table-name MusicCollection \
   --filter-expression "Artist = :a" \
   --projection-expression "#ST, #AT" \
   --expression-attribute-names file://expression-attribute-names.json \
   --expression-attribute-values file://expression-attribute-values.json
```

**Contents of expression-attribute-names.json:**

```json
{
    "#ST": "SongTitle",
    "#AT": "AlbumTitle"
}
```

**Contents of expression-attribute-values.json:**

```json
{
    ":a": {
        "S": "No One You Know"
    }
}
```

**Output:**

```json
{
    "Count": 2,
    "Items": [
        {
            "SongTitle": {
                "S": "Call Me Today"
            }
        }
    ]
}
```
For more information, see Working with Scans in DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see Scan in AWS CLI Command Reference.

Update an item in a table

The following code example shows how to update an item in a DynamoDB table.

**AWS CLI**

**Example 1: To update an item in a table**

The following update-item example updates an item in the MusicCollection table. It adds a new attribute (Year) and modifies the AlbumTitle attribute. All of the attributes in the item, as they appear after the update, are returned in the response.

```bash
aws dynamodb update-item \
  --table-name MusicCollection \
  --key file://key.json \
  --update "SET #Y = :y, #AT = :t" \
  --expression-attribute-names file://expression-attribute-names.json \
  --expression-attribute-values file://expression-attribute-values.json \
  --return-values ALL_NEW \
```
--return-consumed-capacity TOTAL \  
--return-item-collection-metrics SIZE

Contents of key.json:

{
    "Artist": {"S": "Acme Band"},  
    "SongTitle": {"S": "Happy Day"}
}

Contents of expression-attribute-names.json:

{
    "#Y":"Year", 
    "#AT":"AlbumTitle"
}

Contents of expression-attribute-values.json:

{
    ":y":{"N": "2015"}, 
    ":t":{"S": "Louder Than Ever"}
}

Output:

{
    "Attributes": {
        "AlbumTitle": { 
            "S": "Louder Than Ever"
        },
        "Awards": { 
            "N": "10"
        },
        "Artist": { 
            "S": "Acme Band"
        },
        "Year": { 
            "N": "2015"
        },
        "SongTitle": {
            "S": "Happy Day"
        }
    }
}
For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

**Example 2: To update an item conditionally**

The following example updates an item in the `MusicCollection` table, but only if the existing item does not already have a `Year` attribute.

```bash
aws dynamodb update-item \
  --table-name MusicCollection \
  --key file://key.json \
  --update-expression "SET #Y = :y, #AT = :t"  \
  --expression-attribute-names file://expression-attribute-names.json \
  --expression-attribute-values file://expression-attribute-values.json  \
  --condition-expression "attribute_not_exists(#Y)"
```

**Contents of key.json:**

```json
{
    "Artist": {"S": "Acme Band"},
    "SongTitle": {"S": "Happy Day"}
}
```

**Contents of expression-attribute-names.json:**

```json
{
}
```

Contents of expression-attribute-values.json:

```json
{
  "#Y": "Year",
  "#AT": "AlbumTitle"
}
```

Contents of expression-attribute-values.json:

```json
{
  ":y": {"N": "2015"},
  ":t": {"S": "Louder Than Ever"}
}
```

If the item already has a Year attribute, DynamoDB returns the following output.

An error occurred (ConditionalCheckFailedException) when calling the UpdateItem operation: The conditional request failed

For more information, see Writing an Item in the Amazon DynamoDB Developer Guide.
- For API details, see UpdateItem in AWS CLI Command Reference.

**Write a batch of items**

The following code example shows how to write a batch of DynamoDB items.

**AWS CLI**

**To add multiple items to a table**

The following batch-write-item example adds three new items to the MusicCollection table using a batch of three PutItem requests. It also requests information about the number of write capacity units consumed by the operation and any item collections modified by the operation.

```
aws dynamodb batch-write-item \
  --request-items file://request-items.json \
  --return-consumed-capacity INDEXES \
  --return-item-collection-metrics SIZE
```

Contents of request-items.json:

```json
{
  "#Y": "Year",
  "#AT": "AlbumTitle"
}
```
{
    "MusicCollection": [
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "No One You Know"},
                    "SongTitle": {"S": "Call Me Today"},
                    "AlbumTitle": {"S": "Somewhat Famous"}
                }
            }
        },
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "Acme Band"},
                    "SongTitle": {"S": "Happy Day"},
                    "AlbumTitle": {"S": "Songs About Life"}
                }
            }
        },
        {
            "PutRequest": {
                "Item": {
                    "Artist": {"S": "No One You Know"},
                    "SongTitle": {"S": "Scared of My Shadow"},
                    "AlbumTitle": {"S": "Blue Sky Blues"}
                }
            }
        }
    ]
}

Output:

{
    "UnprocessedItems": {},
    "ItemCollectionMetrics": {
        "MusicCollection": [
            {
                "ItemCollectionKey": {
                    "Artist": {"S": "No One You Know"
                }
            }
        ]
    }
}
For more information, see Batch Operations in the Amazon DynamoDB Developer Guide.

- For API details, see BatchWriteItem in AWS CLI Command Reference.

create-backup

The following code example shows how to use create-backup.
**AWS CLI**

**To create a backup for an existing DynamoDB table**

The following `create-backup` example creates a backup of the `MusicCollection` table.

```bash
aws dynamodb create-backup \
  --table-name MusicCollection \
  --backup-name MusicCollectionBackup
```

Output:

```json
{
  "BackupDetails": {
    "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
    "BackupName": "MusicCollectionBackup",
    "BackupSizeBytes": 0,
    "BackupStatus": "CREATING",
    "BackupType": "USER",
    "BackupCreationDateTime": 1576616366.715
  }
}
```

For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/backup.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateBackup](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/create-backup.html) in *AWS CLI Command Reference*.

**create-global-table**

The following code example shows how to use `create-global-table`.

**AWS CLI**

**To create a global table**

The following `create-global-table` example creates a global table from two identical tables in the specified, separate AWS Regions.

```bash
aws dynamodb create-global-table \
  --global-table-name GlobalMusicCollection \
  --global-key-partition-key MusicID --global-key-attribute-name MusicID
```

For more information, see [Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/gs-intro.html) in the *Amazon DynamoDB Developer Guide*.
### delete-backup

The following code example shows how to use `delete-backup`.

**AWS CLI**

**To delete an existing DynamoDB backup**

The following `delete-backup` example deletes the specified existing backup.

```
aws dynamodb delete-backup \
   --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a
```
Output:

```json
{
   "BackupDescription": {
      "BackupDetails": {
         "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
         "BackupName": "MusicCollectionBackup",
         "BackupSizeBytes": 0,
         "BackupStatus": "DELETED",
         "BackupType": "USER",
         "BackupCreationDateTime": 1576616366.715
      },
      "SourceTableDetails": {
         "TableName": "MusicCollection",
         "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",
         "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
         "TableSizeBytes": 0,
         "KeySchema": [
            {
               "AttributeName": "Artist",
               "KeyType": "HASH"
            },
            {
               "AttributeName": "SongTitle",
               "KeyType": "RANGE"
            }
         ],
         "TableCreationDateTime": 1576615228.571,
         "ProvisionedThroughput": {
            "ReadCapacityUnits": 5,
            "WriteCapacityUnits": 5
         },
         "ItemCount": 0,
         "BillingMode": "PROVISIONED"
      },
      "SourceTableFeatureDetails": {}
   }
}
```

For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/dynamodb-backup-restore.html) in the *Amazon DynamoDB Developer Guide*. 
describe-backup

The following code example shows how to use describe-backup.

AWS CLI

To get information about an existing backup of a table

The following describe-backup example displays information about the specified existing backup.

```bash
aws dynamodb describe-backup \
    --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a
```

Output:

```json
{
    "BackupDescription": {
        "BackupDetails": {
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a",
            "BackupName": "MusicCollectionBackup",
            "BackupSizeBytes": 0,
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupCreationDateTime": 1576616366.715
        },
        "SourceTableDetails": {
            "TableName": "MusicCollection",
            "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "TableSizeBytes": 0,
            "KeySchema": [
                {
                    "AttributeName": "Artist",
                    "KeyType": "HASH"
                },
                {
                    "AttributeName": "Table",
                    "KeyType": "HASH"
                }
            ]
        }
    }
}```
The following code example shows how to use `describe-continuous-backups`.

**AWS CLI**

To get information about continuous backups for a DynamoDB table

The following `describe-continuous-backups` example displays details about the continuous backup settings for the MusicCollection table.

```
aws dynamodb describe-continuous-backups \
   --table-name MusicCollection
```

Output:

```
{
   "ContinuousBackupsDescription": {
       "ContinuousBackupsStatus": "ENABLED",
       "PointInTimeRecoveryDescription": {
           "PointInTimeRecoveryStatus": "DISABLED"
       }
   }
}
```
For more information, see Point-in-Time Recovery for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeContinuousBackups in AWS CLI Command Reference.

describe-contributor-insights

The following code example shows how to use describe-contributor-insights.

AWS CLI

To view Contributor Insights settings for a DynamoDB table

The following describe-contributor-insights example displays the Contributor Insights settings for the MusicCollection table and the AlbumTitle-index global secondary index.

```bash
aws dynamodb describe-contributor-insights 
   --table-name MusicCollection 
   --index-name AlbumTitle-index
```

Output:

```json
{
   "TableName": "MusicCollection",
   "IndexName": "AlbumTitle-index",
   "ContributorInsightsRuleList": [
      "DynamoDBContributorInsights-PKC-MusicCollection-1576629651520",
      "DynamoDBContributorInsights-SKC-MusicCollection-1576629651520",
      "DynamoDBContributorInsights-PKT-MusicCollection-1576629651520",
      "DynamoDBContributorInsights-SKT-MusicCollection-1576629651520"
   ],
   "ContributorInsightsStatus": "ENABLED",
   "LastUpdateDateTime": 1576629654.78
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeContributorInsights in AWS CLI Command Reference.
describe-endpoints

The following code example shows how to use describe-endpoints.

**AWS CLI**

**To view regional endpoint information**

The following describe-endpoints example displays details about the endpoints for the current AWS Region.

```
aws dynamodb describe-endpoints
```

**Output:**

```
{
  "Endpoints": [
    {
      "Address": "dynamodb.us-west-2.amazonaws.com",
      "CachePeriodInMinutes": 1440
    }
  ]
}
```

For more information, see [Amazon DynamoDB Endpoints and Quotas](https://docs.aws.amazon.com/AmazonDynamoDB/latest/developerguide/Amazon-DynamoDB-Endpoints.html) in the *AWS General Reference*.

- For API details, see [DescribeEndpoints](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-endpoints.html) in *AWS CLI Command Reference*.

describe-global-table

The following code example shows how to use describe-global-table.

**AWS CLI**

**To display information about a DynamoDB global table**

The following describe-global-table example displays details about the MusicCollection global table.

```
aws dynamodb describe-global-table \
    --global-table-name MusicCollection
```
Output:

```
{
    "GlobalTableDescription": {
        "ReplicationGroup": [
            {
                "RegionName": "us-east-2"
            },
            {
                "RegionName": "us-east-1"
            }
        ],
        "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",
        "CreationDateTime": 1576625818.532,
        "GlobalTableStatus": "ACTIVE",
        "GlobalTableName": "MusicCollection"
    }
}
```

For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/dynamodb-global-tables.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeGlobalTable](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-global-table.html) in *AWS CLI Command Reference*.

### describe-global-table-settings

The following code example shows how to use `describe-global-table-settings`.

**AWS CLI**

#### To get information about a DynamoDB global table's settings

The following `describe-global-table-settings` example displays the settings for the `MusicCollection` global table.

```
aws dynamodb describe-global-table-settings \
    --global-table-name MusicCollection
```

Output:

```
{
    "GlobalTableName": "MusicCollection",
    "ReplicaSettings": [
```
For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeGlobalTableSettings](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-global-table-settings.html) in *AWS CLI Command Reference*.

### describe-limits

The following code example shows how to use `describe-limits`.

**AWS CLI**

**To view provisioned-capacity limits**

The following `describe-limits` example displays provisioned-capacity limits for your account in the current AWS Region.

```
aws dynamodb describe-limits
```
describe-table-replica-auto-scaling

The following code example shows how to use describe-table-replica-auto-scaling.

AWS CLI

To view auto scaling settings across replicas of a global table

The following describe-table-replica-auto-scaling example displays auto scaling settings across replicas of the MusicCollection global table.

```
aws dynamodb describe-table-replica-auto-scaling \
  --table-name MusicCollection
```

Output:

```json
{
  "TableAutoScalingDescription": {
    "TableName": "MusicCollection",
    "TableStatus": "ACTIVE",
    "Replicas": [
      {
        "RegionName": "us-east-1",
        "GlobalSecondaryIndexes": [],
        "ReplicaProvisionedReadCapacityAutoScalingSettings": {
          "MinimumUnits": 5,
          "MaximumUnits": 40000,
          "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
```
"ScalingPolicies": [
    {
        "PolicyName": "DynamoDBReadCapacityUtilization:table/MusicCollection",
        "TargetTrackingScalingPolicyConfiguration": {
            "TargetValue": 70.0
        }
    },
    {
        "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
        "TargetTrackingScalingPolicyConfiguration": {
            "TargetValue": 70.0
        }
    }
],
"ReplicaProvisionedWriteCapacityAutoScalingSettings": {
    "MinimumUnits": 5,
    "MaximumUnits": 40000,
    "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/awsservice-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
    "ScalingPolicies": [
        {
            "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
            "TargetTrackingScalingPolicyConfiguration": {
                "TargetValue": 70.0
            }
        }
    ],
    "ReplicaStatus": "ACTIVE"
},
{
    "RegionName": "us-east-2",
    "GlobalSecondaryIndexes": [],
    "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "MinimumUnits": 5,
        "MaximumUnits": 40000,
        "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/awsservice-role/dynamodb.application-autoscaling.amazonaws.com/AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
        "ScalingPolicies": [
            {
                "PolicyName": "DynamoDBReadCapacityUtilization:table/MusicCollection",
                "TargetTrackingScalingPolicyConfiguration": {
                    "TargetValue": 70.0
                }
            }
        ]
    }
}
For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/DynamoDB-Glобальные-таблицы.html) in the *Amazon DynamoDB Developer Guide*. For API details, see [DescribeTableReplicaAutoScaling](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/describe-time-to-live.html) in *AWS CLI Command Reference*.

**describe-time-to-live**

The following code example shows how to use `describe-time-to-live`.

**AWS CLI**

To view Time to Live settings for a table

The following `describe-time-to-live` example displays Time to Live settings for the `MusicCollection` table.

```
aws dynamodb describe-time-to-live \
--table-name MusicCollection
```
Output:

```json
{
    "TimeToLiveDescription": {
        "TimeToLiveStatus": "ENABLED",
        "AttributeName": "ttl"
    }
}
```

For more information, see Time to Live in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeTimeToLive in AWS CLI Command Reference.

**list-backups**

The following code example shows how to use `list-backups`.

**AWS CLI**

**Example 1: To list all existing DynamoDB backups**

The following `list-backups` example lists all of your existing backups.

```
aws dynamodb list-backups
```

Output:

```json
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
            "BackupName": "MusicCollectionBackup1",
            "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 170
        }
    ]
}
```
For more information, see [On-Demand Backup and Restore for DynamoDB](https://docs.aws.amazon.com/dynamodb/latest/developerguide/Backup-and-Restore.html) in the *Amazon DynamoDB Developer Guide*. 

**Example 2: To list user-created backups in a specific time range**

The following example lists only backups of the `MusicCollection` table that were created by the user (not those automatically created by DynamoDB) with a creation date between January 1, 2020 and March 1, 2020.

```
aws dynamodb list-backups \
   --table-name MusicCollection \
   --time-range-lower-bound 1577836800 \
   --time-range-upper-bound 1583020800 \
   --backup-type USER
```

**Output:**

```
{
   "BackupSummaries": [
   {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
      "BackupName": "MusicCollectionBackup2",
      "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 400
   }
   ]
}
```
"BackupName": "MusicCollectionBackup1",
"BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
"BackupStatus": "AVAILABLE",
"BackupType": "USER",
"BackupSizeBytes": 170
]
}

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 3: To limit page size**

The following example returns a list of all existing backups, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```bash
aws dynamodb list-backups \
--page-size 1
```

**Output:**

```json
{
   "BackupSummaries": [
   {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
      "BackupName": "MusicCollectionBackup1",
      "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 170
   },
   {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```
For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 4: To limit the number of items returned**

The following example limits the number of items returned to 1. The response includes a NextToken value with which to retrieve the next page of results.

```bash
aws dynamodb list-backups --max-items 1
```

Output:

```
{
   "BackupSummaries": [
   {
       "TableName": "MusicCollection",
       "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
       "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
       "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-a1bcd234",
       "BackupName": "MusicCollectionBackup1",
       "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
       "BackupStatus": "AVAILABLE",
       "BackupType": "USER",
       "BackupSizeBytes": 170
   }
   ]
}
```
For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

Example 5: To retrieve the next page of results

The following command uses the NextToken value from a previous call to the list-backups command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```bash
aws dynamodb list-backups \
    --starting-token
abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output

```json
{
    "BackupSummaries": [
        {
            "TableName": "MusicCollection",
            "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
            "BackupName": "MusicCollectionBackup2",
            "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
            "BackupStatus": "AVAILABLE",
            "BackupType": "USER",
            "BackupSizeBytes": 400
        }
    ]
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see ListBackups in AWS CLI Command Reference.
list-contributor-insights

The following code example shows how to use list-contributor-insights.

AWS CLI

Example 1: To view a list of Contributor Insights summaries

The following list-contributor-insights example displays a list of Contributor Insights summaries.

```
aws dynamodb list-contributor-insights
```

Output:

```
{
   "ContributorInsightsSummaries": [
      {
         "TableName": "MusicCollection",
         "IndexName": "AlbumTitle-index",
         "ContributorInsightsStatus": "ENABLED"
      },
      {
         "TableName": "ProductCatalog",
         "ContributorInsightsStatus": "ENABLED"
      },
      {
         "TableName": "Forum",
         "ContributorInsightsStatus": "ENABLED"
      },
      {
         "TableName": "Reply",
         "ContributorInsightsStatus": "ENABLED"
      },
      {
         "TableName": "Thread",
         "ContributorInsightsStatus": "ENABLED"
      }
   ]
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.
**Example 2: To limit the number of items returned**

The following example limits the number of items returned to 4. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-contributor-insights \
--max-results 4
```

Output:

```
{
   "ContributorInsightsSummaries": [
    {
        "TableName": "MusicCollection",
        "IndexName": "AlbumTitle-index",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "ProductCatalog",
        "ContributorInsightsStatus": "ENABLED"
    },
    {
        "TableName": "Forum",
        "ContributorInsightsStatus": "ENABLED"
    }
    ],
   "NextToken": "abCDeFGhiJKlmnOPqrSTuvwxyZl1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFghI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/CloudWatch-Contributor-Insights.html) in the *Amazon DynamoDB Developer Guide*.

**Example 3: To retrieve the next page of results**

The following command uses the `NextToken` value from a previous call to the `list-contributor-insights` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-contributor-insights \
```

Actions and scenarios

--next-token
abCDeFghiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LMnoPQ6RST9

Output:

```
{
    "ContributorInsightsSummaries": [
        {
            "TableName": "Reply",
            "ContributorInsightsStatus": "ENABLED"
        },
        {
            "TableName": "Thread",
            "ContributorInsightsStatus": "ENABLED"
        }
    ]
}
```

- For API details, see [ListContributorInsights](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/list-contributor-insights.html) in *AWS CLI Command Reference*.

list-global-tables

The following code example shows how to use list-global-tables.

AWS CLI

To list existing DynamoDB global tables

The following list-global-tables example lists all of your existing global tables.

```bash
aws dynamodb list-global-tables
```

Output:

```
{
    "GlobalTables": [
        {
```
For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see ListGlobalTables in AWS CLI Command Reference.

list-tags-of-resource

The following code example shows how to use list-tags-of-resource.

AWS CLI

Example 1: To list tags of a DynamoDB resource

The following list-tags-of-resource example displays tags for the MusicCollection table.

```
aws dynamodb list-tags-of-resource \
```

Output:

```
{
  "Tags": [
    {
      "Key": "Owner",
      "Value": "blueTeam"
    },
    {
      "Key": "Environment",
      "Value": "Production"
    }
  ]
}
```
For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 2: To limit the number of tags returned**

The following example limits the number of tags returned to 1. The response includes a NextToken value with which to retrieve the next page of results.

```bash
aws dynamodb list-tags-of-resource \
--resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
--max-items 1
```

Output:

```json
{
  "Tags": [
    {
      "Key": "Owner",
      "Value": "blueTeam"
    }
  ],
  "NextToken": "abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

**Example 3: To retrieve the next page of results**

The following command uses the NextToken value from a previous call to the list-tags-of-resource command to retrieve another page of results. Since the response in this case does not include a NextToken value, we know that we have reached the end of the results.

```bash
aws dynamodb list-tags-of-resource \
--resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
--starting-token abCDeFGhiJKlmnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```
Output:

```json
{
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ]
}
```

For more information, see [Tagging for DynamoDB](https://docs.aws.amazon.com/AmazonDynamoDB/latest/DeveloperGuide/Tagging.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListTagsOfResource](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/list-tags-of-resource.html) in *AWS CLI Command Reference*.

### restore-table-from-backup

The following code example shows how to use `restore-table-from-backup`.

**AWS CLI**

**To restore a DynamoDB table from an existing backup**

The following `restore-table-from-backup` example restores the specified table from an existing backup.

```bash
aws dynamodb restore-table-from-backup \\
    --target-table-name MusicCollection \\
    --backup-arnarn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01576616366715-b4e58d3a
```

Output:

```json
{
    "TableDescription": {
        "AttributeDefinitions": [
            {
                "AttributeName": "Artist",
                "AttributeType": "S"
            },
            {
                "AttributeName": "SongTitle",
                "AttributeType": "S"
            }
        ]
    }
}
```

For more information, see On-Demand Backup and Restore for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see RestoreTableFromBackup in AWS CLI Command Reference.
The following code example shows how to use `restore-table-to-point-in-time`.

**AWS CLI**

*To restore a DynamoDB table to a point in time*

The following `restore-table-to-point-in-time` example restores the MusicCollection table to the specified point in time.

```
aws dynamodb restore-table-to-point-in-time \
  --source-table-name MusicCollection \ 
  --target-table-name MusicCollectionRestore \ 
  --restore-date-time 1576622404.0
```

**Output:**

```json
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollectionRestore",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
      }
    ],
    "TableStatus": "CREATING",
    "CreationDateTime": 1576623311.86,
```
"ProvisionedThroughput": {
  "NumberOfDecreasesToday": 0,
  "ReadCapacityUnits": 5,
  "WriteCapacityUnits": 5
},
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollectionRestore",

"BillingModeSummary": {
  "BillingMode": "PROVISIONED"
},
"RestoreSummary": {
  "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
  "RestoreDateTime": 1576622404.0,
  "RestoreInProgress": true
}

For more information, see Point-in-Time Recovery for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see RestoreTableToPointInTime in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a DynamoDB resource

The following tag-resource example adds a tag key/value pair to the MusicCollection table.

```
aws dynamodb tag-resource \  --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \  --tags Key=Owner,Value=blueTeam
```

This command produces no output.
For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

**transact-get-items**

The following code example shows how to use transact-get-items.

**AWS CLI**

To retrieve multiple items atomically from one or more tables

The following transact-get-items example retrieves multiple items atomically.

```bash
aws dynamodb transact-get-items \
   --transact-items file://transact-items.json \
   --return-consumed-capacity TOTAL
```

Contents of `transact-items.json`:

```json
[
  {
    "Get": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "TableName": "MusicCollection"
    }
  },
  {
    "Get": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection"
    }
  }
]
```

**Output:**

```json
Actions and scenarios
```

---

1914
For more information, see Managing Complex Workflows with DynamoDB Transactions in the Amazon DynamoDB Developer Guide.

- For API details, see TransactGetItems in AWS CLI Command Reference.
transact-write-items

The following code example shows how to use transact-write-items.

AWS CLI

Example 1: To write items atomically to one or more tables

The following transact-write-items example updates one item and deletes another. The operation fails if either operation fails, or if either item contains a Rating attribute.

```bash
aws dynamodb transact-write-items \
    --transact-items file://transact-items.json \
    --return-consumed-capacity TOTAL \ 
    --return-item-collection-metrics SIZE
```

Contents of the transact-items.json file:

```json
[
  {
    "Update": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "UpdateExpression": "SET AlbumTitle = :newval",
      "ExpressionAttributeValues": {
        ":newval": {"S": "Updated Album Title"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  },
  {
    "Delete": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  }
]
```
Output:

```json
{
    "ConsumedCapacity": [
        {
            "TableName": "MusicCollection",
            "CapacityUnits": 10.0,
            "WriteCapacityUnits": 10.0
        }
    ],
    "ItemCollectionMetrics": {
        "MusicCollection": [
            {
                "ItemCollectionKey": {
                    "Artist": {
                        "S": "No One You Know"
                    }
                },
                "SizeEstimateRangeGB": [0.0, 1.0]
            },
            {
                "ItemCollectionKey": {
                    "Artist": {
                        "S": "Acme Band"
                    }
                },
                "SizeEstimateRangeGB": [0.0, 1.0]
            }
        ]
    }
}
```

For more information, see [Managing Complex Workflows with DynamoDB Transactions](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/transactions.html) in the [Amazon DynamoDB Developer Guide](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/).
Example 2: To write items atomically using a client request token

The following command uses a client request token to make the call to transact-write-items idempotent, meaning that multiple calls have the same effect as one single call.

```bash
aws dynamodb transact-write-items \
   --transact-items file://transact-items.json \
   --client-request-token abc123
```

Contents of the `transact-items.json` file:

```json
[
  {
    "Update": {
      "Key": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      "UpdateExpression": "SET AlbumTitle = :newval",
      "ExpressionAttributeValues": {
        ":newval": {"S": "Updated Album Title"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  },
  {
    "Delete": {
      "Key": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      "TableName": "MusicCollection",
      "ConditionExpression": "attribute_not_exists(Rating)"
    }
  }
]
```

This command produces no output.

For more information, see Managing Complex Workflows with DynamoDB Transactions in the Amazon DynamoDB Developer Guide.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a DynamoDB resource

The following untag-resource example removes the tag with the key Owner from the MusicCollection table.

```
aws dynamodb untag-resource \
  --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
  --tag-keys Owner
```

This command produces no output.

For more information, see Tagging for DynamoDB in the Amazon DynamoDB Developer Guide.

update-continuous-backups

The following code example shows how to use update-continuous-backups.

AWS CLI

To update continuous backup settings for a DynamoDB table

The following update-continuous-backups example enables point-in-time recovery for the MusicCollection table.

```
aws dynamodb update-continuous-backups \
  --table-name MusicCollection \
  --point-in-time-recovery-specification PointInTimeRecoveryEnabled=true
```

Output:

```
{
}
```
"ContinuousBackupsDescription": {
    "ContinuousBackupsStatus": "ENABLED",
    "PointInTimeRecoveryDescription": {
        "PointInTimeRecoveryStatus": "ENABLED",
        "EarliestRestorableDateTime": 1576622404.0,
        "LatestRestorableDateTime": 1576622404.0
    }
}

For more information, see Point-in-Time Recovery for DynamoDB in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateContinuousBackups in AWS CLI Command Reference.

**update-contributor-insights**

The following code example shows how to use update-contributor-insights.

**AWS CLI**

**To enable Contributor Insights on a table**

The following update-contributor-insights example enables Contributor Insights on the MusicCollection table and the AlbumTitle-index global secondary index.

```
aws dynamodb update-contributor-insights \
    --table-name MusicCollection \
    --index-name AlbumTitle-index \
    --contributor-insights-action ENABLE
```

Output:

```
{
    "TableName": "MusicCollection",
    "IndexName": "AlbumTitle-index",
    "ContributorInsightsStatus": "ENABLING"
}
```

For more information, see Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB in the Amazon DynamoDB Developer Guide.
update-global-table

The following code example shows how to use update-global-table.

AWS CLI

To update a DynamoDB global table

The following update-global-table example adds a replica in the specified Region to the MusicCollection global table.

aws dynamodb update-global-table \
   --global-table-name MusicCollection \
   --replica-updates Create={RegionName=eu-west-1}

Output:

```json
{
   "GlobalTableDescription": {
      "ReplicationGroup": [
         {
            "RegionName": "eu-west-1"
         },
         {
            "RegionName": "us-east-2"
         },
         {
            "RegionName": "us-east-1"
         }
      ],
      "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/MusicCollection",
      "CreationDateTime": 1576625818.532,
      "GlobalTableStatus": "ACTIVE",
      "GlobalTableName": "MusicCollection"
   }
}
```

For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

• For API details, see UpdateGlobalTable in AWS CLI Command Reference.
update-global-table-settings

The following code example shows how to use update-global-table-settings.

AWS CLI

To update provisioned write capacity settings on a DynamoDB global table

The following update-global-table-settings example sets the provisioned write capacity of the MusicCollection global table to 15.

```bash
aws dynamodb update-global-table-settings \
  --global-table-name MusicCollection \
  --global-table-provisioned-write-capacity-units 15
```

Output:

```json
{
  "GlobalTableName": "MusicCollection",
  "ReplicaSettings": [
    {
      "RegionName": "eu-west-1",
      "ReplicaStatus": "UPDATING",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      },
      "ReplicaProvisionedWriteCapacityUnits": 10,
      "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      }
    },
    {
      "RegionName": "us-east-1",
      "ReplicaStatus": "UPDATING",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      },
      "ReplicaProvisionedWriteCapacityUnits": 10,
      "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      }
    }
  ]
}
```
For more information, see [DynamoDB Global Tables](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateGlobalTableSettings](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/update-global-table-settings.html) in *AWS CLI Command Reference*.

### update-table

The following code example shows how to use `update-table`.

**AWS CLI**

**Example 1: To modify a table's billing mode**

The following `update-table` example increases the provisioned read and write capacity on the `MusicCollection` table.

```bash
aws dynamodb update-table \
--table-name MusicCollection \
--billing-mode PROVISIONED \
--provisioned-throughput ReadCapacityUnits=15,WriteCapacityUnits=10
```

**Output:**

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "AlbumTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "SongTitle",
            "AttributeType": "S"
         }
      ],
      "AttributeMap": {
         "AlbumTitle": "String"
      },
      "GlobalSecondaryIndexUpdates": [
         {
            "UpdateAction": "CREATE",
            "IndexName": "Index1",
            "ProvisionedThroughput": {
               "ReadCapacityUnits": 10,
               "WriteCapacityUnits": 5
            },
            "Projection": {
               "ProjectionType": "KEYS_ONLY"
            },
            "TableIdentifier": {
               "KeyId": "KeyId1",
               "SortKey": "SortKey1"
            }
         }
      ],
      "IndexUpdates": [
         {
            "UpdateAction": "CREATE",
            "IndexName": "Index2",
            "ProvisionedThroughput": {
               "ReadCapacityUnits": 5,
               "WriteCapacityUnits": 5
            },
            "Projection": {
               "ProjectionType": "KEYS_ONLY"
            },
            "TableIdentifier": {
               "KeyId": "KeyId2",
               "SortKey": "SortKey2"
            }
         }
      ]
   }
}
```
"AttributeName": "Artist",
"AttributeType": "S"
},
{
    "AttributeName": "SongTitle",
    "AttributeType": "S"
}
],
"TableName": "MusicCollection",
"KeySchema": [
    {
        "AttributeName": "Artist",
        "KeyType": "HASH"
    },

}
}

For more information, see Updating a Table in the Amazon DynamoDB Developer Guide.

Example 2: To create a global secondary index
The following example adds a global secondary index to the MusicCollection table.

```bash
aws dynamodb update-table
   --table-name MusicCollection
   --attribute-definitions AttributeName=AlbumTitle,AttributeType=S
   --global-secondary-index-updates file://gsi-updates.json
```

Contents of `gsi-updates.json`:

```json
[
   {
      "Create": {
         "IndexName": "AlbumTitle-index",
         "KeySchema": [
            {
              "AttributeName": "AlbumTitle",
              "KeyType": "HASH"
            }
         ],
         "ProvisionedThroughput": {
            "ReadCapacityUnits": 10,
            "WriteCapacityUnits": 10
         },
         "Projection": {
            "ProjectionType": "ALL"
         }
      }
   }
]
```

Output:

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "AlbumTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "Artist",
            "AttributeType": "S"
         }
      ]
   }
```

For more information, see Updating a Table in the Amazon DynamoDB Developer Guide.

**Example 3: To enable DynamoDB Streams on a table**

The following command enables DynamoDB Streams on the MusicCollection table.

```
aws dynamodb update-table \
--table-name MusicCollection \
--stream-specification StreamEnabled=true,StreamViewType=NEW_IMAGE
```

Output:

```json
{
   "TableDescription": {
      "AttributeDefinitions": [
         {
            "AttributeName": "AlbumTitle",
            "AttributeType": "S"
         },
         {
            "AttributeName": "Artist",
            "AttributeType": "S"
         },
         {
            "AttributeName": "SongTitle",
            "AttributeType": "S"
         }
      ],
      "AttributeUpdateCount": 0
   }
}
```
"TableName": "MusicCollection",
"KeySchema": [
  {
    "AttributeName": "Artist",
    "KeyType": "HASH"
  },
  {
    "AttributeName": "SongTitle",
    "KeyType": "RANGE"
  }

**Example 4: To enable server-side encryption**

The following example enables server-side encryption on the MusicCollection table.

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --sse-specification Enabled=true,SSEType=KMS
```

Output:

```json
{
    "TableDescription": {

For more information, see [Updating a Table](https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/AmazonDynamoDB.Updating.ATable.html) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateTable](https://docs.aws.amazon.com/cli/latest/reference/dynamodb/update-table.html) in *AWS CLI Command Reference*.

**update-table-replica-auto-scaling**

The following code example shows how to use `update-table-replica-auto-scaling`.

**AWS CLI**

To update auto scaling settings across replicas of a global table
The following `update-table-replica-auto-scaling` example updates write capacity auto scaling settings across replicas of the specified global table.

```bash
aws dynamodb update-table-replica-auto-scaling \
  --table-name MusicCollection \
  --provisioned-write-capacity-auto-scaling-update file://auto-scaling-policy.json
```

Contents of `auto-scaling-policy.json`:

```json
{
    "MinimumUnits": 10,
    "MaximumUnits": 100,
    "AutoScalingDisabled": false,
    "ScalingPolicyUpdate": {
        "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
        "TargetTrackingScalingPolicyConfiguration": {
            "TargetValue": 80
        }
    }
}
```

Output:

```json
{
    "TableAutoScalingDescription": {
        "TableName": "MusicCollection",
        "TableStatus": "ACTIVE",
        "Replicas": [
            {

For more information, see DynamoDB Global Tables in the Amazon DynamoDB Developer Guide.

- For API details, see UpdateTableReplicaAutoScaling in AWS CLI Command Reference.

**update-time-to-live**

The following code example shows how to use update-time-to-live.

**AWS CLI**

To update Time to Live settings on a table

The following update-time-to-live example enables Time to Live on the specified table.

```
aws dynamodb update-time-to-live \
  --table-name MusicCollection \
  --time-to-live-specification Enabled=true,AttributeName=ttl
```

Output:

```
{
  "TimeToLiveSpecification": {
    "Enabled": true,
    "AttributeName": "ttl"
  }
}
```

For more information, see Time to Live in the Amazon DynamoDB Developer Guide.
DynamoDB Streams examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB Streams.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

*describe-stream*

The following code example shows how to use `describe-stream`.

**AWS CLI**

To get information about a DynamoDB stream

The following `describe-stream` command displays information about the specific DynamoDB stream.

```bash
aws dynamodbstreams describe-stream \
```

Output:

```
{
```
For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see DescribeStream in AWS CLI Command Reference.
get-records

The following code example shows how to use get-records.

AWS CLI

To get records from a Dynamodb stream

The following get-records command retrieves records using the specified Amazon DynamoDB shard iterator.

```
aws dynamodbstreams get-records \
   --shard-iterator "arn:aws:dynamodb:us-west-1:123456789012:table/Music/\nstream/2019-10-22T18:02:01.576|1|\nAAAAAAAAGgM3YZ89vLZZxjmoQeo33r9M4x3+zmmTLSiL86MfrF4+B4EbsByi52InVmiONmy6xVW4IRcIIbs1z07MNID\n+CjNP1qJnyRSAf0wWmKhL1/KNParWSfz2odf780o0O0bIDIWRMKt7+Hyzh9SD\nhFxFAWR5C7QI0XPC8mRBFni0azfrVCjJK8/jsjCzsqNyXZzJbh+GXCoxYN\n+Kpmg4ny1EAsYhbGL35muvHFHoHjcyynbsczBwAXNFThDwRAyvoTmc8XhHKtAWUBJ1aVd8ZPtQwDsThCmDRIYdmTRGC\nw/1EG5O5ha1qNP+V14+tuhz2TRnhnJo/pny9G1/yGpce97mWsPSr5KPwy+Dtcm5BHays\n+PVYHITaTliInFlT\n+LCwva1QH3MY3b8A05Z800wjpktm60iQtMeDwN4NX6FrcxR34JoFKGsR8XkHVJzz2x1xqS1J12ycpNTyHndusw=="
```

Output:

```

### get-shard-iterator

The following code example shows how to use `get-shard-iterator`.

**AWS CLI**

**To get a shard iterator**

The following `get-shard-iterator` command retrieves a shard iterator for the specified shard.
aws dynamodbstreams get-shard-iterator \
   --stream-arn arn:aws:dynamodb:us-west-1:12356789012:table/Music/\n   stream/2019-10-22T18:02:01.576 \n   --shard-id shardId-0000001571780995058-40810d86 \n   --shard-iterator-type LATEST

Output:

```
{
   stream/2019-10-22T18:02:01.576|1|
   AAAIAIAAAAgM3YZ89vLZZxjmoQeo33r9M4x3+zmmTlsIL86MfrF4+B4EbsByi52InVmiONmy6xVW4lRcIIbs1z07MNID

}
```

For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see GetShardIterator in AWS CLI Command Reference.

list-streams

The following code example shows how to use list-streams.

AWS CLI

To list DynamoDB streams

The following list-streams command lists all existing Amazon DynamoDB streams within the default AWS Region.

```
aws dynamodbstreams list-streams
```

Output:

```
{
```
For more information, see Capturing Table Activity with DynamoDB Streams in the Amazon DynamoDB Developer Guide.

- For API details, see ListStreams in AWS CLI Command Reference.

Amazon EC2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

Add tags to resources

The following code example shows how to add tags to Amazon EC2 resources.

AWS CLI

Example 1: To add a tag to a resource
The following `create-tags` example adds the tag `Stack=production` to the specified image, or overwrites an existing tag for the AMI where the tag key is `Stack`.

```bash
aws ec2 create-tags \
  --resources ami-1234567890abcdef0 \
  --tags Key=Stack,Value=production
```

For more information, see [This is the topic title](https://aws.amazon.com) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 2: To add tags to multiple resources**

The following `create-tags` example adds (or overwrites) two tags for an AMI and an instance. One of the tags has a key (`webserver`) but no value (value is set to an empty string). The other tag has a key (`stack`) and a value (`Production`).

```bash
aws ec2 create-tags \
  --resources ami-1a2b3c4d i-1234567890abcdef0 \
  --tags Key=webserver,Value=   Key=stack,Value=Production
```

For more information, see [This is the topic title](https://aws.amazon.com) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 3: To add tags containing special characters**

The following `create-tags` example adds the tag `[Group]=test` for an instance. The square brackets ([ and ]) are special characters, and must be escaped. The following examples also use the line continuation character appropriate for each environment.

If you are using Windows, surround the element that has special characters with double quotes (`"`), and then precede each double quote character with a backslash (`\`) as follows:

```bash
aws ec2 create-tags ^
  --resources i-1234567890abcdef0 ^
  --tags Key="[Group]",Value=test
```

If you are using Windows PowerShell, surround the element the value that has special characters with double quotes (`"`), precede each double quote character with a backslash (`\`), and then surround the entire key and value structure with single quotes (`'`) as follows:
If you are using Linux or OS X, surround the element that has special characters with double quotes ("), and then surround the entire key and value structure with single quotes (') as follows:

```bash
aws ec2 create-tags \
    --resources i-1234567890abcdef0 \
    --tags 'Key="[Group]\",Value=test'
```

For more information, see This is the topic title in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see CreateTags in AWS CLI Command Reference.

### Allocate an Elastic IP address

The following code example shows how to allocate an Elastic IP address for Amazon EC2.

#### AWS CLI

**Example 1: To allocate an Elastic IP address from Amazon's address pool**

The following `allocate-address` example allocates an Elastic IP address. Amazon EC2 selects the address from Amazon's address pool.

```bash
aws ec2 allocate-address
```

**Output:**

```
{
    "PublicIp": "70.224.234.241",
    "AllocationId": "eipalloc-01435ba59eEXAMPLE",
    "PublicIpv4Pool": "amazon",
    "NetworkBorderGroup": "us-west-2",
    "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the Amazon EC2 User Guide.
Example 2: To allocate an Elastic IP address and associate it with a network border group

The following `allocate-address` example allocates an Elastic IP address and associates it with the specified network border group.

```bash
aws ec2 allocate-address \
   --network-border-group us-west-2-lax-1
```

Output:

```json
{
   "PublicIp": "70.224.234.241",
   "AllocationId": "eipalloc-e03dd489ceEXAMPLE",
   "PublicIpv4Pool": "amazon",
   "NetworkBorderGroup": "us-west-2-lax-1",
   "Domain": "vpc"
}
```

For more information, see Elastic IP addresses in the Amazon EC2 User Guide.

Example 3: To allocate an Elastic IP address from an address pool that you own

The following `allocate-address` example allocates an Elastic IP address from an address pool that you have brought to your Amazon Web Services account. Amazon EC2 selects the address from the address pool.

```bash
aws ec2 allocate-address \
   --public-ipv4-pool ipv4pool-ec2-1234567890abcdef0
```

Output:

```json
{
   "AllocationId": "eipalloc-02463d08ceEXAMPLE",
   "NetworkBorderGroup": "us-west-2",
   "CustomerOwnedIp": "18.218.95.81",
   "CustomerOwnedIpv4Pool": "ipv4pool-ec2-1234567890abcdef0",
   "Domain": "vpc",
   "NetworkBorderGroup": "us-west-2",
}
```

For more information, see Elastic IP addresses in the Amazon EC2 User Guide.
Actions and scenarios

- For API details, see `AllocateAddress` in *AWS CLI Command Reference*.

**Associate an Elastic IP address with an instance**

The following code example shows how to associate an Elastic IP address with an Amazon EC2 instance.

**AWS CLI**

**To associate an Elastic IP addresses in EC2-Classic**

This example associates an Elastic IP address with an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 associate-address --instance-id i-07ffe74c7330ebf53 --public-ip 198.51.100.0
```

**To associate an Elastic IP address in EC2-VPC**

This example associates an Elastic IP address with an instance in a VPC.

Command:

```bash
aws ec2 associate-address --instance-id i-0b263919b6498b123 --allocation-id eipalloc-64d5890a
```

Output:

```json
{
   "AssociationId": "eipassoc-2bebb745"
}
```

This example associates an Elastic IP address with a network interface.

Command:

```bash
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d
```
This example associates an Elastic IP with a private IP address that's associated with a network interface.

Command:

```
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d --private-ip-address 10.0.0.85
```

- For API details, see [AssociateAddress](#AssociateAddress) in AWS CLI Command Reference.

Create a Amazon Virtual Private Cloud (Amazon VPC)

The following code example shows how to create a Amazon Virtual Private Cloud (Amazon VPC).

**AWS CLI**

**Example 1: To create a VPC**

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and a Name tag.

```
aws ec2 create-vpc 
   --cidr-block 10.0.0.0/16 
   --tag-specification ResourceType=vpc,Tags=[[Key=Name,Value=MyVpc]]
```

**Output:**

```
{
   "Vpc": {
      "CidrBlock": "10.0.0.0/16",
      "DhcpOptionsId": "dopt-5EXAMPLE",
      "State": "pending",
      "VpcId": "vpc-0a60eb65b4EXAMPLE",
      "OwnerId": "123456789012",
      "InstanceTenancy": "default",
      "Ipv6CidrBlockAssociationSet": [],
      "CidrBlockAssociationSet": [
         {
            "AssociationId": "vpc-cidr-assoc-07501b79ecEXAMPLE",
            "CidrBlock": "10.0.0.0/16",
            "CidrBlockState": {
```
Example 2: To create a VPC with dedicated tenancy

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and dedicated tenancy.

```bash
code
aws ec2 create-vpc \
   --cidr-block 10.0.0.0/16 \
   --instance-tenancy dedicated
```

Output:

```json
{
   "Vpc": {
      "CidrBlock": "10.0.0.0/16",
      "DhcpOptionsId": "dopt-19edf471",
      "State": "pending",
      "VpcId": "vpc-0a53287fa4EXAMPLE",
      "OwnerId": "111122223333",
      "InstanceTenancy": "dedicated",
      "Ipv6CidrBlockAssociationSet": [],
      "CidrBlockAssociationSet": [
         {
            "AssociationId": "vpc-cidr-assoc-00b24cc1c2EXAMPLE",
            "CidrBlock": "10.0.0.0/16",
            "CidrBlockState": {
               "State": "associated"
            }
         }
      ]
   }
}
```
Example 3: To create a VPC with an IPv6 CIDR block

The following `create-vpc` example creates a VPC with an Amazon-provided IPv6 CIDR block.

```bash
aws ec2 create-vpc \
    --cidr-block 10.0.0.0/16 \
    --amazon-provided-ipv6-cidr-block
```

Output:

```json
{
    "Vpc": {
        "CidrBlock": "10.0.0.0/16",
        "DhcpOptionsId": "dopt-dEXAMPLE",
        "State": "pending",
        "VpcId": "vpc-0fc5e3406bEXAMPLE",
        "OwnerId": "123456789012",
        "InstanceTenancy": "default",
        "Ipv6CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-068432c60bEXAMPLE",
                "Ipv6CidrBlock": "",
                "Ipv6CidrBlockState": {
                    "State": "associating"
                },
                "Ipv6Pool": "Amazon",
                "NetworkBorderGroup": "us-west-2"
            }
        ],
        "CidrBlockAssociationSet": [
            {
                "AssociationId": "vpc-cidr-assoc-0669f8f9f5EXAMPLE",
                "CidrBlock": "10.0.0.0/16",
                "CidrBlockState": {
                    "State": "associated"
                }
            }
        ],
        "IsDefault": false
    }
}
```
Example 4: To create a VPC with a CIDR from an IPAM pool

The following `create-vpc` example creates a VPC with a CIDR from an Amazon VPC IP Address Manager (IPAM) pool.

Linux and macOS:

```bash
aws ec2 create-vpc \
   --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 \
   --tag-specifications ResourceType=vpc,Tags='[[Key=Environment,Value="Preprod"],
   {Key=Owner,Value="Build Team"}]
```

Windows:

```bash
aws ec2 create-vpc ^
   --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 ^
   --tag-specifications ResourceType=vpc,Tags=[{Key=Environment,Value="Preprod"},
   {Key=Owner,Value="Build Team"}]
```

Output:

```json
{
   "Vpc": {
      "CidrBlock": "10.0.1.0/24",
      "DhcpOptionsId": "dopt-2afccf50",
      "State": "pending",
      "VpcId": "vpc-010e1791024eb0af9",
      "OwnerId": "123456789012",
      "InstanceTenancy": "default",
      "Ipv6CidrBlockAssociationSet": [],
      "CidrBlockAssociationSet": []
   }
}
```
Create a launch template

The following code example shows how to create an Amazon EC2 launch template.

**AWS CLI**

**Example 1: To create a launch template**

The following create-launch-template example creates a launch template that specifies the subnet in which to launch the instance, assigns a public IP address and an IPv6 address to the instance, and creates a tag for the instance.

```bash
aws ec2 create-launch-template \
  --launch-template-name TemplateForWebServer \
  --version-description WebVersion1 \
  --launch-template-data '"
  "NetworkInterfaces": [
  {{"AssociatePublicIpAddress":true,"DeviceIndex":0,"Ipv6AddressCount":1,"SubnetId":"subnet-7b16de0c"}}
  ],
  "ImageId":"ami-8c1be5f6",
  "InstanceType":"t2.small",
  "TagSpecifications": [
  {{"ResourceType":"instance","Tags":[{"Key":"purpose","Value":"webserver"}]}}
  ]
  }
  '
```

Output:

```json
{
  "LaunchTemplate": {

  }
  }
}
```
For more information, see Launching an Instance from a Launch Template in the *Amazon Elastic Compute Cloud User Guide*. For information about quoting JSON-formatted parameters, see Quoting Strings in the *AWS Command Line Interface User Guide*.

**Example 2: To create a launch template for Amazon EC2 Auto Scaling**

The following `create-launch-template` example creates a launch template with multiple tags and a block device mapping to specify an additional EBS volume when an instance launches. Specify a value for `Groups` that corresponds to security groups for the VPC that your Auto Scaling group will launch instances into. Specify the VPC and subnets as properties of the Auto Scaling group.

```bash
aws ec2 create-launch-template
  --launch-template-name TemplateForAutoScaling
  --version-description AutoScalingVersion1
  --launch-template-data '{"NetworkInterfaces": [{"DeviceIndex":0,"AssociatePublicIpAddress":true,"Groups": ["sg-7c227019,sg-903004f8"],"DeleteOnTermination":true}],"ImageId":"ami-b42209de","InstanceType":"m4.large","TagSpecifications": [{"ResourceType":"instance","Tags": [{"Key":"environment","Value":"production"}, {"Key":"purpose","Value":"webserver"} ]}, {"ResourceType":"volume","Tags": [{"Key":"environment","Value":"production"}, {"Key":"cost-center","Value":"cc123"} ]}],"BlockDeviceMappings": [{"DeviceName":"/dev/sda1","Ebs": {"VolumeSize":100}}]}' --region us-east-1
```

Output:

```json
{
  "LaunchTemplate": {
    "LatestVersionNumber": 1,
    "LaunchTemplateId": "lt-0123c79c33a54e0abc",
    "LaunchTemplateName": "TemplateForAutoScaling",
    "DefaultVersionNumber": 1,
  }
}
```
For more information, see Creating a Launch Template for an Auto Scaling Group in the *Amazon EC2 Auto Scaling User Guide*. For information about quoting JSON-formatted parameters, see Quoting Strings in the *AWS Command Line Interface User Guide*.

**Example 3: To create a launch template that specifies encryption of EBS volumes**

The following `create-launch-template` example creates a launch template that includes encrypted EBS volumes created from an unencrypted snapshot. It also tags the volumes during creation. If encryption by default is disabled, you must specify the "Encrypted" option as shown in the following example. If you use the "KmsKeyId" option to specify a customer managed CMK, you also must specify the "Encrypted" option even if encryption by default is enabled.

```bash
aws ec2 create-launch-template \
   --launch-template-name TemplateForEncryption \
   --launch-template-data file://config.json
```

**Contents of config.json:**

```json
{
   "BlockDeviceMappings":[
      {
         "DeviceName":"/dev/sda1",
         "Ebs":{
            "VolumeType":"gp2",
            "DeleteOnTermination":true,
            "SnapshotId":"snap-066877671789bd71b",
            "Encrypted":true,
            "KmsKeyId":"arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef"
         }
      },
      {
         "DeviceName":"/dev/sdb1",
         "Ebs":{
            "VolumeType":"gp2",
            "DeleteOnTermination":true,
            "SnapshotId":"snap-066877671789bd71b",
            "Encrypted":true,
            "KmsKeyId":"arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef"
         }
      }
   ],
   "ImageId":"ami-00068cd7555f543d5",
   "InstanceType":"c5.large",
   "TagSpecifications":[
```
For more information, see Restoring an Amazon EBS Volume from a Snapshot and Encryption by Default in the Amazon Elastic Compute Cloud User Guide.

- For API details, see CreateLaunchTemplate in AWS CLI Command Reference.

Create a route table

The following code example shows how to create route table and associate with Amazon EC2 subnet.

AWS CLI

To create a route table

This example creates a route table for the specified VPC.

Command:
Create a security group

The following code example shows how to create an Amazon EC2 security group.

**AWS CLI**

To create a security group for EC2-Classic

This example creates a security group named MySecurityGroup.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group"
```

Output:

```json
{

}
```
To create a security group for EC2-VPC

This example creates a security group named MySecurityGroup for the specified VPC.

Command:

```bash
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group" --vpc-id vpc-1a2b3c4d
```

Output:

```json
{
   "GroupId": "sg-903004f8"
}
```

For more information, see Using Security Groups in the AWS Command Line Interface User Guide.

- For API details, see CreateSecurityGroup in AWS CLI Command Reference.

Create a security key pair

The following code example shows how to create a security key pair for Amazon EC2.

AWS CLI

To create a key pair

This example creates a key pair named MyKeyPair.

Command:

```bash
aws ec2 create-key-pair --key-name MyKeyPair
```

The output is an ASCII version of the private key and key fingerprint. You need to save the key to a file.

For more information, see Using Key Pairs in the AWS Command Line Interface User Guide.
Create a subnet

The following code example shows how to create an Amazon EC2 subnet.

AWS CLI

**Example 1: To create a subnet with an IPv4 CIDR block only**

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 CIDR block.

```bash
aws ec2 create-subnet \
    --vpc-id vpc-081ec835f3EXAMPLE \ 
    --cidr-block 10.0.0.0/24 \ 
    --tag-specifications ResourceType=subnet,Tags=[[Key=Name,Value=my-ipv4-only-subnet]]
```

Output:

```json
{
    "Subnet": {
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az2",
        "AvailableIpAddressCount": 251,
        "CidrBlock": "10.0.0.0/24",
        "DefaultForAz": false,
        "MapPublicIpOnLaunch": false,
        "State": "available",
        "SubnetId": "subnet-0e99b93155EXAMPLE",
        "VpcId": "vpc-081ec835f3EXAMPLE",
        "OwnerId": "123456789012",
        "AssignIpv6AddressOnCreation": false,
        "Ipv6CidrBlockAssociationSet": [],
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-ipv4-only-subnet"
            }
        ],
        "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0e99b93155EXAMPLE"
    }
}
```
Example 2: To create a subnet with both IPv4 and IPv6 CIDR blocks

The following create-subnet example creates a subnet in the specified VPC with the specified IPv4 and IPv6 CIDR blocks.

```bash
aws ec2 create-subnet \
  --vpc-id vpc-081ec835f3EXAMPLE \n  --cidr-block 10.0.0.0/24 \n  --ipv6-cidr-block 2600:1f16:cfe:3660::/64 \n  --tag-specifications ResourceType=subnet,Tags=[[Key=Name,Value=my-ipv4-ipv6-subnet]]
```

Output:

```json
{
  "Subnet": {
    "AvailabilityZone": "us-west-2a",
    "AvailabilityZoneId": "usw2-az2",
    "AvailableIpAddressCount": 251,
    "CidrBlock": "10.0.0.0/24",
    "DefaultForAz": false,
    "MapPublicIpOnLaunch": false,
    "State": "available",
    "SubnetId": "subnet-0736441d8EXAMPLE",
    "VpcId": "vpc-081ec835f3EXAMPLE",
    "OwnerId": "123456789012",
    "AssignIpv6AddressOnCreation": false,
    "Ipv6CidrBlockAssociationSet": [
      {
        "AssociationId": "subnet-cidr-assoc-06c5f904499f6f623",
        "Ipv6CidrBlock": "2600:1f16:cfe:3660::/64",
        "Ipv6CidrBlockState": {
          "State": "associating"
        }
      }
    ],
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-ipv4-ipv6-subnet"
      }
    ]
  }
}
```
Example 3: To create a subnet with an IPv6 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv6 CIDR block.

```bash
aws ec2 create-subnet \
  --vpc-id vpc-081ec835f3EXAMPLE \
  --ipv6-native \
  --ipv6-cidr-block 2600:1f16:115:200::/64 \
  --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv6-only-subnet}]
```

Output:

```json
{
  "Subnet": {
    "AvailabilityZone": "us-west-2a",
    "AvailabilityZoneId": "usw2-az2",
    "AvailableIpAddressCount": 0,
    "DefaultForAz": false,
    "MapPublicIpOnLaunch": false,
    "State": "available",
    "SubnetId": "subnet-03f720e7deEXAMPLE",
    "VpcId": "vpc-081ec835f3EXAMPLE",
    "OwnerId": "123456789012",
    "AssignIpv6AddressOnCreation": true,
    "Ipv6CidrBlockAssociationSet": [
      {
        "AssociationId": "subnet-cidr-assoc-01ef639edde556709",
        "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
        "Ipv6CidrBlockState": {
          "State": "associating"
        }
      }
    ],
    "Tags": [
```
Create and run an instance

The following code example shows how to create and run an Amazon EC2 instance.

AWS CLI

**Example 1: To launch an instance into a default subnet**

The following run-instances example launches a single instance of type t2.micro into the default subnet for the current Region and associates it with the default subnet for the default VPC for the Region. The key pair is optional if you do not plan to connect to your instance using SSH (Linux) or RDP (Windows).

```bash
aws ec2 run-instances \
   --image-id ami-0abcdef1234567890 \
   --instance-type t2.micro \
   --key-name MyKeyPair
```

**Output:**

```
{
   "Instances": [
      {
         "AmiLaunchIndex": 0,
         "ImageId": "ami-0abcdef1234567890",
         "InstanceId": "i-1231231230abcdef0",
         "InstanceType": "t2.micro",
         "KeyName": "MyKeyPair",
         "LaunchTime": "2018-05-10T08:05:20.000Z",
      }
   ]
}
```

For more information, see [VPCs and subnets](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateSubnet](#) in *AWS CLI Command Reference*.

Example 2: To launch an instance into a non-default subnet and add a public IP address

The following `run-instances` example requests a public IP address for an instance that you're launching into a nondefault subnet. The instance is associated with the specified security group.

```bash
aws ec2 run-instances \
--image-id ami-0abcdef1234567890 \
--instance-type t2.micro \
--subnet-id subnet-08fc749671b2d077c \
--security-group-ids sg-0b0384b66d7d692f9 \
--associate-public-ip-address \
--key-name MyKeyPair
```

For an example of the output for `run-instances`, see Example 1.

Example 3: To launch an instance with additional volumes

The following `run-instances` example uses a block device mapping, specified in `mapping.json`, to attach additional volumes at launch. A block device mapping can specify EBS volumes, instance store volumes, or both EBS volumes and instance store volumes.

```bash
aws ec2 run-instances \
--image-id ami-0abcdef1234567890 \
--instance-type t2.micro \
--subnet-id subnet-08fc749671b2d077c \
--security-group-ids sg-0b0384b66d7d692f9 \
--key-name MyKeyPair \
--block-device-mappings file://mapping.json
```

Contents of `mapping.json`. This example adds `/dev/sdh` an empty EBS volume with a size of 100 GiB.

```json
[
  {
```
"DeviceName": "/dev/sdh",
  "Ebs":{ 
    "VolumeSize": 100
  }
}
]

Contents of mapping.json. This example adds ephemeral1 as an instance store volume.

[ 
  { 
    "DeviceName": "/dev/sdc",
    "VirtualName": "ephemeral1"
  }
]

For an example of the output for run-instances, see Example 1.

For more information about block device mappings, see Block device mapping in the Amazon EC2 User Guide.

Example 4: To launch an instance and add tags on creation

The following run-instances example adds a tag with a key of webserver and value of production to the instance. The command also applies a tag with a key of cost-center and a value of cc123 to any EBS volume that's created (in this case, the root volume).

```bash
aws ec2 run-instances \
   --image-id ami-0abcdef1234567890 \
   --instance-type t2.micro \
   --count 1 \
   --subnet-id subnet-08fc749671b2d077c \
   --key-name MyKeyPair \
   --security-group-ids sg-0b0384b66d6d692f9 \
   --tag-specifications
      ResourceType=instance,Tags=[[Key=webserver,Value=production]]' 
      ResourceType=volume,Tags=[[Key=cost-center,Value=cc123]]'
```

For an example of the output for run-instances, see Example 1.

Example 5: To launch an instance with user data
The following `run-instances` example passes user data in a file called `my_script.txt` that contains a configuration script for your instance. The script runs at launch.

```bash
aws ec2 run-instances 
    --image-id ami-0abcdef1234567890 
    --instance-type t2.micro 
    --count 1 
    --subnet-id subnet-08fc749671b2d077c 
    --key-name MyKeyPair 
    --security-group-ids sg-0b0384b66d7d692f9 
    --user-data file://my_script.txt
```

For an example of the output for `run-instances`, see Example 1.

For more information about instance user data, see [Working with instance user data](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/working-with-instance-user-data.html) in the *Amazon EC2 User Guide*.

**Example 6: To launch a burstable performance instance**

The following `run-instances` example launches a t2.micro instance with the unlimited credit option. When you launch a T2 instance, if you do not specify `--credit-specification`, the default is the standard credit option. When you launch a T3 instance, the default is the unlimited credit option.

```bash
aws ec2 run-instances 
    --image-id ami-0abcdef1234567890 
    --instance-type t2.micro 
    --count 1 
    --subnet-id subnet-08fc749671b2d077c 
    --key-name MyKeyPair 
    --security-group-ids sg-0b0384b66d7d692f9 
    --credit-specification CpuCredits=unlimited
```

For an example of the output for `run-instances`, see Example 1.

- For API details, see [RunInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/run-instances.html) in *AWS CLI Command Reference*. 
Delete a launch template

The following code example shows how to delete an Amazon EC2 launch template.

**AWS CLI**

**To delete a launch template**

This example deletes the specified launch template.

Command:

```
aws ec2 delete-launch-template --launch-template-id lt-0abcd290751193123
```

Output:

```
{
   "LaunchTemplate": {
      "LatestVersionNumber": 2,
      "LaunchTemplateId": "lt-0abcd290751193123",
      "LaunchTemplateName": "TestTemplate",
      "DefaultVersionNumber": 2,
      "CreatedBy": "arn:aws:iam::123456789012:root",
      "CreateTime": "2017-11-23T16:46:25.000Z"
   }
}
```

• For API details, see [DeleteLaunchTemplate](#) in *AWS CLI Command Reference*.

Delete a security group

The following code example shows how to delete an Amazon EC2 security group.

**AWS CLI**

**[EC2-Classic] To delete a security group**

This example deletes the security group named MySecurityGroup. If the command succeeds, no output is returned.

Command:
aws ec2 delete-security-group --group-name MySecurityGroup

[EC2-VPC] To delete a security group

This example deletes the security group with the ID sg-903004f8. Note that you can't reference a security group for EC2-VPC by name. If the command succeeds, no output is returned.

Command:

aws ec2 delete-security-group --group-id sg-903004f8

For more information, see Using Security Groups in the AWS Command Line Interface User Guide.

• For API details, see DeleteSecurityGroup in AWS CLI Command Reference.

Delete a security key pair

The following code example shows how to delete an Amazon EC2 security key pair.

AWS CLI

To delete a key pair

The following delete-key-pair example deletes the specified key pair.

aws ec2 delete-key-pair \
   --key-name my-key-pair

Output:

{
   "Return": true,
   "KeyPairId": "key-03c8d3aceb53b507"
}

For more information, see Create and delete key pairs in the AWS Command Line Interface User Guide.

• For API details, see DeleteKeyPair in AWS CLI Command Reference.
Delete a snapshot

The following code example shows how to delete an Amazon EBS snapshot.

AWS CLI

To delete a snapshot

This example command deletes a snapshot with the snapshot ID of snap-1234567890abcdef0. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-snapshot --snapshot-id snap-1234567890abcdef0
```

- For API details, see `DeleteSnapshot` in `AWS CLI Command Reference`.

Describe Availability Zones

The following code example shows how to describe Amazon EC2 Availability Zones.

AWS CLI

To describe your Availability Zones

The following example `describe-availability-zones` displays details for the Availability Zones that are available to you. The response includes Availability Zones only for the current Region. In this example, it uses the profiles default `us-west-2` (Oregon) Region.

Command:

```
aws ec2 describe-availability-zones
```

Output:

```
{
    "AvailabilityZones": [
    {
        "State": "available",
        "OptInStatus": "opt-in-not-required",
        "Messages": [],
        "RegionName": "us-west-2",
        "ZoneName": "us-west-2a",
        "ZoneId": "usw2-az1",
```
"GroupName": "us-west-2",
"NetworkBorderGroup": "us-west-2"
},
{
  "State": "available",
  "OptInStatus": "opt-in-not-required",
  "Messages": [],
  "RegionName": "us-west-2",
  "ZoneName": "us-west-2b",
  "ZoneId": "usw2-az2",
  "GroupName": "us-west-2",
  "NetworkBorderGroup": "us-west-2"
},
{
  "State": "available",
  "OptInStatus": "opt-in-not-required",
  "Messages": [],
  "RegionName": "us-west-2",
  "ZoneName": "us-west-2c",
  "ZoneId": "usw2-az3",
  "GroupName": "us-west-2",
  "NetworkBorderGroup": "us-west-2"
},
{
  "State": "available",
  "OptInStatus": "opt-in-not-required",
  "Messages": [],
  "RegionName": "us-west-2",
  "ZoneName": "us-west-2d",
  "ZoneId": "usw2-az4",
  "GroupName": "us-west-2",
  "NetworkBorderGroup": "us-west-2"
},
{
  "State": "available",
  "OptInStatus": "opted-in",
  "Messages": [],
  "RegionName": "us-west-2",
  "ZoneName": "us-west-2-lax-1a",
  "ZoneId": "usw2-lax1-az1",
  "GroupName": "us-west-2-lax-1",
  "NetworkBorderGroup": "us-west-2-lax-1"
}]
}
Describe Regions

The following code example shows how to describe Amazon EC2 Regions.

AWS CLI

Example 1: To describe all of your enabled Regions

The following describe-regions example describes all of the Regions that are enabled for your account.

```bash
aws ec2 describe-regions
```

Output:

```json
{
    "Regions": [
       {
           "Endpoint": "ec2.eu-north-1.amazonaws.com",
           "RegionName": "eu-north-1",
           "OptInStatus": "opt-in-not-required"
       },
       {
           "Endpoint": "ec2.ap-south-1.amazonaws.com",
           "RegionName": "ap-south-1",
           "OptInStatus": "opt-in-not-required"
       },
       {
           "Endpoint": "ec2.eu-west-3.amazonaws.com",
           "RegionName": "eu-west-3",
           "OptInStatus": "opt-in-not-required"
       },
       {
           "Endpoint": "ec2.eu-west-2.amazonaws.com",
           "RegionName": "eu-west-2",
           "OptInStatus": "opt-in-not-required"
       }
    ]
}
```

For API details, see `DescribeAvailabilityZones` in `AWS CLI Command Reference`. 

Actions and scenarios
"Endpoint": "ec2.eu-west-1.amazonaws.com",
"RegionName": "eu-west-1",
"OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
  "RegionName": "ap-northeast-3",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
  "RegionName": "ap-northeast-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
  "RegionName": "ap-northeast-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.sa-east-1.amazonaws.com",
  "RegionName": "sa-east-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ca-central-1.amazonaws.com",
  "RegionName": "ca-central-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
  "RegionName": "ap-southeast-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
  "RegionName": "ap-southeast-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.eu-central-1.amazonaws.com",
  "RegionName": "eu-central-1",
  "OptInStatus": "opt-in-not-required"
},
For more information, see [Regions and Zones](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/) in the *Amazon EC2 User Guide*.

**Example 2: To describe enabled Regions with an endpoint whose name contains a specific string**

The following `describe-regions` example describes all Regions that you have enabled that have the string "us" in the endpoint.

```
aws ec2 describe-regions \
   --filters "Name=endpoint,Values=*us*"
```

**Output:**

```json
{
   "Regions": [
   {
      "Endpoint": "ec2.us-east-1.amazonaws.com",
      "RegionName": "us-east-1"
   },
   {
      "Endpoint": "ec2.us-east-2.amazonaws.com",
      "RegionName": "us-east-2"
   },
   {
      "Endpoint": "ec2.us-west-1.amazonaws.com",
      "RegionName": "us-west-1"
   },
   {
      "Endpoint": "ec2.us-west-2.amazonaws.com",
      "RegionName": "us-west-2"
   }
   ]
}
```
"Endpoint": "ec2.us-east-2.amazonaws.com",
"RegionName": "us-east-2"
},
{
 "Endpoint": "ec2.us-west-1.amazonaws.com",
 "RegionName": "us-west-1"
},
{
 "Endpoint": "ec2.us-west-2.amazonaws.com",
 "RegionName": "us-west-2"
}
]
}

For more information, see Regions and Zones in the Amazon EC2 User Guide.

Example 3: To describe all Regions

The following describe-regions example describes all available Regions, including Regions that are disabled.

aws ec2 describe-regions \
--all-regions

Output:

{
 "Regions": [
 {
  "Endpoint": "ec2.eu-north-1.amazonaws.com",
  "RegionName": "eu-north-1",
  "OptInStatus": "opt-in-not-required"
 },
 {
  "Endpoint": "ec2.ap-south-1.amazonaws.com",
  "RegionName": "ap-south-1",
  "OptInStatus": "opt-in-not-required"
 },
 {
  "Endpoint": "ec2.eu-west-3.amazonaws.com",
  "RegionName": "eu-west-3",
  "OptInStatus": "opt-in-not-required"
 }
]
{
  "Endpoint": "ec2.eu-west-2.amazonaws.com",
  "RegionName": "eu-west-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.eu-west-1.amazonaws.com",
  "RegionName": "eu-west-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
  "RegionName": "ap-northeast-3",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.me-south-1.amazonaws.com",
  "RegionName": "me-south-1",
  "OptInStatus": "not-opted-in"
},
{
  "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
  "RegionName": "ap-northeast-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
  "RegionName": "ap-northeast-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.sa-east-1.amazonaws.com",
  "RegionName": "sa-east-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ca-central-1.amazonaws.com",
  "RegionName": "ca-central-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-east-1.amazonaws.com",
  "RegionName": "ap-east-1",
  "OptInStatus": "not-opted-in"
}
<table>
<thead>
<tr>
<th>Endpoint</th>

<td>opt-in-not-required</td>
</tr>
<tr>
<td>ec2.us-east-2.amazonaws.com</td>
<td>us-east-2</td>
<td>opt-in-not-required</td>
</tr>
<tr>
<td>ec2.us-west-1.amazonaws.com</td>
<td>us-west-1</td>
<td>opt-in-not-required</td>
</tr>
<tr>
<td>ec2.us-west-2.amazonaws.com</td>
<td>us-west-2</td>
<td>opt-in-not-required</td>
</tr>
</tbody>
</table>

For more information, see [Regions and Zones](#) in the *Amazon EC2 User Guide*.

**Example 4: To list the Region names only**
The following `describe-regions` example uses the `--query` parameter to filter the output and return only the names of the Regions as text.

```
aws ec2 describe-regions \
  --all-regions \ 
  --query "Regions[].{Name:RegionName}" \ 
  --output text
```

Output:

```
eu-north-1
ap-south-1
eu-west-3
eu-west-2
eu-west-1
ap-northeast-3
ap-northeast-2
me-south-1
ap-northeast-1
sa-east-1
ca-central-1
ap-east-1
ap-southeast-1
ap-southeast-2
eu-central-1
us-east-1
us-east-2
us-west-1
us-west-2
```

For more information, see [Regions and Zones](https://docs.aws.amazon.com/AWSECS/latest/UserGuide/Regions.html) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeRegions](https://docs.aws.amazon.com/AWSCLI/latest/UserGuide/CLI-EC2-DescribeRegions.html) in *AWS CLI Command Reference*.

**Describe instance status**

The following code example shows how to describe the status of Amazon EC2 instances.

**AWS CLI**

To describe the status of an instance
The following `describe-instance-status` example describes the current status of the specified instance.

```
aws ec2 describe-instance-status
   --instance-ids i-1234567890abcdef0
```

Output:

```
{
   "InstanceStatuses": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "InstanceState": {
            "Code": 16,
            "Name": "running"
         },
         "AvailabilityZone": "us-east-1d",
         "SystemStatus": {
            "Status": "ok",
            "Details": [
               {
                  "Status": "passed",
                  "Name": "reachability"
               }
            ]
         },
         "InstanceStatus": {
            "Status": "ok",
            "Details": [
               {
                  "Status": "passed",
                  "Name": "reachability"
               }
            ]
         }
      }
   ]
}
```

For more information, see Monitor the status of your instances in the Amazon EC2 User Guide.

- For API details, see `DescribeInstanceStatus` in AWS CLI Command Reference.
Describe instances

The following code example shows how to describe Amazon EC2 instances.

AWS CLI

Example 1: To describe an instance

The following describe-instances example describes the specified instance.

```bash
aws ec2 describe-instances \\
   --instance-ids i-1234567890abcdef0
```

Output:

```json
{
   "Reservations": [
      {
         "Groups": [],
         "Instances": [
            {
               "AmiLaunchIndex": 0,
               "ImageId": "ami-0abcdef1234567890",
               "InstanceId": "i-1234567890abcdef0",

Actions and scenarios 1983
Example 2: To filter for instances with the specified type

The following `describe-instances` example uses filters to scope the results to instances of the specified type.

```
aws ec2 describe-instances \
   --filters Name=instance-type,Values=m5.large
```

For example output, see Example 1.

For more information, see [List and filter using the CLI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/list-and-filter-cli.html) in the *Amazon EC2 User Guide*.

Example 3: To filter for instances with the specified type and Availability Zone

The following `describe-instances` example uses multiple filters to scope the results to instances with the specified type that are also in the specified Availability Zone.

```
aws ec2 describe-instances \
   --filters Name=instance-type,Values=t2.micro,t3.micro Name=availability-zone,Values=us-east-2c
```

For example output, see Example 1.

**Example 4: To filter for instances with the specified type and Availability Zone using a JSON file**

The following `describe-instances` example uses a JSON input file to perform the same filtering as the previous example. When filters get more complicated, they can be easier to specify in a JSON file.

```
aws ec2 describe-instances \
   --filters file://filters.json
```

**Contents of `filters.json`:**

```
[
    {
        "Name": "instance-type",
        "Values": ["t2.micro", "t3.micro"]
    }
]
```
For example output, see Example 1.

**Example 5: To filter for instances with the specified Owner tag**

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag key (Owner), regardless of the tag value.

```bash
aws ec2 describe-instances \
  --filters "Name=tag-key,Values=Owner"
```

For example output, see Example 1.

**Example 6: To filter for instances with the specified my-team tag value**

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag value (my-team), regardless of the tag key.

```bash
aws ec2 describe-instances \
  --filters "Name=tag-value,Values=my-team"
```

For example output, see Example 1.

**Example 7: To filter for instances with the specified Owner tag and my-team value**

The following `describe-instances` example uses tag filters to scope the results to instances that have the specified tag (Owner=my-team).

```bash
aws ec2 describe-instances \
  --filters "Name=tag:Owner,Values=my-team"
```

For example output, see Example 1.

**Example 8: To display only instance and subnet IDs for all instances**

```bash
aws ec2 describe-instances \
```
The following `describe-instances` examples use the `--query` parameter to display only the instance and subnet IDs for all instances, in JSON format.

Linux and macOS:

```bash
aws ec2 describe-instances
   --query 'Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}'
   --output json
```

Windows:

```bash
aws ec2 describe-instances
   --query "Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}" ^
   --output json
```

Output:

```json
[
  {
    "Instance": "i-057750d42936e468a",
    "Subnet": "subnet-069beee9b12030077"
  },
  {
    "Instance": "i-001efd250faaa6ffa",
    "Subnet": "subnet-0b715c6b7db68927a"
  },
  {
    "Instance": "i-027552a73f021f3bd",
    "Subnet": "subnet-0250c25a1f4e15235"
  }
  ...
]
```

Example 9: To filter instances of the specified type and only display their instance IDs

The following `describe-instances` example uses filters to scope the results to instances of the specified type and the `--query` parameter to display only the instance IDs.

```bash
aws ec2 describe-instances
   --filters "Name=instance-type,Values=t2.micro"
   --query "Reservations[*].Instances[*].[InstanceId]"
```
Example 10: To filter instances of the specified type and only display their instance IDs, Availability Zone, and the specified tag value

The following describe-instances examples display the instance ID, Availability Zone, and the value of the Name tag for instances that have a tag with the name tag-key, in table format.

Linux and macOS:

```bash
aws ec2 describe-instances
   --filters Name=tag-key,Values=Name
   --query 'Reservations[*].Instances[*].
   {Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key==`Name`][0].Value}'
   --output table
```

Windows:

```bash
aws ec2 describe-instances ^
   --filters Name=tag-key,Values=Name ^
   --query "Reservations[*].Instances[*].
   {Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key=='Name'][0].Value}" ^
   --output table
```

Output:

```
-------------------------------------------------------------
| DescribeInstances |
```
Example 11: To describe instances in a partition placement group

The following describe-instances example describes the specified instance. The output includes the placement information for the instance, which contains the placement group name and the partition number for the instance.

```
aws ec2 describe-instances \
  --instance-ids i-0123a456700123456 \
  --query "Reservations[*].Instances[*].Placement"
```

Output:

```
[
  [
    {
      "AvailabilityZone": "us-east-1c",
      "GroupName": "HDFS-Group-A",
      "PartitionNumber": 3,
      "Tenancy": "default"
    }
  ]
]
```

For more information, see [Describing instances in a placement group](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-placement-group.html) in the *Amazon EC2 User Guide*.

Example 12: To filter to instances with the specified placement group and partition number

The following describe-instances example filters the results to only those instances with the specified placement group and partition number.

```
aws ec2 describe-instances \
```
The following shows only the relevant information from the output.

```
"Instances": [
    {
      "InstanceId": "i-0123a456700123456",
      "InstanceType": "r4.large",
      "Placement": {
        "AvailabilityZone": "us-east-1c",
        "GroupName": "HDFS-Group-A",
        "PartitionNumber": 7,
        "Tenancy": "default"
      }
    },
    {
      "InstanceId": "i-9876a543210987654",
      "InstanceType": "r4.large",
      "Placement": {
        "AvailabilityZone": "us-east-1c",
        "GroupName": "HDFS-Group-A",
        "PartitionNumber": 7,
        "Tenancy": "default"
      }
    }
],
```

For more information, see [Describing instances in a placement group](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide) in the *Amazon EC2 User Guide*.

**Example 13: To filter to instances that are configured to allow access to tags from instance metadata**

The following `describe-instances` example filters the results to only those instances that are configured to allow access to instance tags from instance metadata.

```
aws ec2 describe-instances \
  --filters "Name=metadata-options.instance-metadata-tags,Values=enabled" \
  --query "Reservations[*].Instances[*].InstanceId" \
  --output text
```

The following shows the expected output.
Describe snapshots

The following code example shows how to describe Amazon EBS snapshots.

AWS CLI

Example 1: To describe a snapshot

The following describe-snapshots example describes the specified snapshot.

aws ec2 describe-snapshots \
  --snapshot-ids snap-1234567890abcdef0

Output:

```json
{
  "Snapshots": [
    {
      "Description": "This is my snapshot",
      "Encrypted": false,
      "VolumeId": "vol-049df61146c4d7901",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2019-02-28T21:28:32.000Z",
      "Progress": "100%",
      "OwnerId": "012345678910",
      "SnapshotId": "snap-01234567890abcdef",
      "Tags": [
        {
          "Key": "Stack",
          "Value": "test"
        }
      ]
    }
  ]
}
```
For more information, see Amazon EBS snapshots in the Amazon EC2 User Guide.

**Example 2: To describe snapshots based on filters**

The following describe-snapshots example uses filters to scope the results to snapshots owned by your AWS account that are in the pending state. The example uses the --query parameter to display only the snapshot IDs and the time the snapshot was started.

```bash
aws ec2 describe-snapshots \
  --owner-ids self \
  --filters Name=status,Values=pending \
  --query "Snapshots[*].{ID:SnapshotId,Time:StartTime}"
```

Output:

```
[
  {
    "ID": "snap-1234567890abcdef0",
    "Time": "2019-08-04T12:48:18.000Z"
  },
  {
    "ID": "snap-066877671789bd71b",
    "Time": "2019-08-04T02:45:16.000Z"
  },
  ...
]
```

The following describe-snapshots example uses filters to scope the results to snapshots created from the specified volume. The example uses the --query parameter to display only the snapshot IDs.

```bash
aws ec2 describe-snapshots \
  --filters Name=volume-id,Values=049df61146c4d7901 \
  --query "Snapshots[*].[SnapshotId]" \
  --output text
```
Output:

```
snap-1234567890abcdef0
snap-08637175a712c3fb9
...
```

For additional examples using filters, see [Listing and filtering your resources](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/listing-and-filtering-resources.html) in the *Amazon EC2 User Guide*.

**Example 3: To describe snapshots based on tags**

The following `describe-snapshots` example uses tag filters to scope the results to snapshots that have the tag `Stack=Prod`.

```
aws ec2 describe-snapshots \
  --filters Name=tag:Stack,Values=prod
```

For an example of the output for `describe-snapshots`, see Example 1.

For additional examples using tag filters, see [Working with tags](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/working-with-tags.html) in the *Amazon EC2 User Guide*.

**Example 4: To describe snapshots based on age**

The following `describe-snapshots` example uses JMESPath expressions to describe all snapshots created by your AWS account before the specified date. It displays only the snapshot IDs.

```
aws ec2 describe-snapshots \
  --owner-ids 012345678910 \
  --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]"
```

For additional examples using filters, see [Listing and filtering your resources](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/listing-and-filtering-resources.html) in the *Amazon EC2 User Guide*.

**Example 5: To view only archived snapshots**

The following `describe-snapshots` example lists only snapshots that are stored in the archive tier.

```
aws ec2 describe-snapshots \
```
--filters "Name=storage-tier,Values=archive"

Output:

```
{
   "Snapshots": [
      {
        "Description": "Snap A",
        "Encrypted": false,
        "VolumeId": "vol-01234567890aaaaa",
        "State": "completed",
        "VolumeSize": 8,
        "StartTime": "2021-09-07T21:00:00.000Z",
        "Progress": "100%",
        "OwnerId": "123456789012",
        "SnapshotId": "snap-01234567890aaaaa",
        "StorageTier": "archive",
        "Tags": []
      },
      ...
   ]
}
```

For more information, see View archived snapshots in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshots in AWS CLI Command Reference.

### Disable detailed monitoring

The following code example shows how to disable detailed monitoring on an Amazon EC2 instance.

**AWS CLI**

**To disable detailed monitoring for an instance**

This example command disables detailed monitoring for the specified instance.

**Command:**

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

**Output:**
Disassociate an Elastic IP address from an instance

The following code example shows how to disassociate an Elastic IP address from an Amazon EC2 instance.

AWS CLI

To disassociate an Elastic IP addresses in EC2-Classic

This example disassociates an Elastic IP address from an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-address --public-ip 198.51.100.0
```

To disassociate an Elastic IP address in EC2-VPC

This example disassociates an Elastic IP address from an instance in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-address --association-id eipassoc-2bebb745
```

• For API details, see DisassociateAddress in AWS CLI Command Reference.
Enable monitoring

The following code example shows how to enable monitoring for a running Amazon EC2 instance.

AWS CLI

To enable detailed monitoring for an instance

This example command enables detailed monitoring for the specified instance.

Command:

```
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
   "InstanceMonitorings": [ 
   {
      "InstanceId": "i-1234567890abcdef0",
      "Monitoring": {
         "State": "pending"
      }
   }
   ]
}
```

- For API details, see MonitorInstances in AWS CLI Command Reference.

Get data about Amazon Machine Images

The following code example shows how to get data about Amazon Machine Images (AMIs).

AWS CLI

Example 1: To describe an AMI

The following describe-images example describes the specified AMI in the specified Region.

```
aws ec2 describe-images \
   --region us-east-1 \
```
--image-ids ami-1234567890EXAMPLE

Output:

```json
{
   "Images": [
       {
           "VirtualizationType": "hvm",
           "Description": "Provided by Red Hat, Inc.",
           "PlatformDetails": "Red Hat Enterprise Linux",
           "EnaSupport": true,
           "Hypervisor": "xen",
           "State": "available",
           "SriovNetSupport": "simple",
           "ImageId": "ami-1234567890EXAMPLE",
           "UsageOperation": "RunInstances:0010",
           "BlockDeviceMappings": [
               {
                   "DeviceName": "/dev/sda1",
                   "Ebs": {
                       "SnapshotId": "snap-11122233444aaabb",
                       "DeleteOnTermination": true,
                       "VolumeType": "gp2",
                       "VolumeSize": 10,
                       "Encrypted": false
                   }
               }
           ],
           "Architecture": "x86_64",
           "ImageLocation": "123456789012/RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-GP2",
           "RootDeviceType": "ebs",
           "OwnerId": "123456789012",
           "RootDeviceName": "/dev/sda1",
           "CreationDate": "2019-05-10T13:17:12.000Z",
           "Public": true,
           "ImageType": "machine",
           "Name": "RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-GP2"
       }
   ]
}
```

Example 2: To describe AMIs based on filters

The following describe-images example describes Windows AMIs provided by Amazon that are backed by Amazon EBS.

```
aws ec2 describe-images \
  --owners amazon \
  --filters "Name=platform,Values=windows" "Name=root-device-type,Values=ebs"
```

For an example of the output for describe-images, see Example 1.

For additional examples using filters, see Listing and filtering your resources in the Amazon EC2 User Guide.

Example 3: To describe AMIs based on tags

The following describe-images example describes all AMIs that have the tag Type=Custom. The example uses the --query parameter to display only the AMI IDs.

```
aws ec2 describe-images \
  --filters "Name=tag:Type,Values=Custom" \
  --query 'Images[*].[ImageId]' \
  --output text
```

Output:

```
ami-1234567890EXAMPLE
ami-0abcdef1234567890
```

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribelImages in AWS CLI Command Reference.

Get data about a security group

The following code example shows how to get data about an Amazon EC2 security group.

AWS CLI

Example 1: To describe a security group
The following `describe-security-groups` example describes the specified security group.

```
aws ec2 describe-security-groups \
   --group-ids sg-903004f8
```

Output:

```
{
   "SecurityGroups": [
       {
           "IpPermissionsEgress": [
               {
                   "IpProtocol": "-1",
                   "IpRanges": [
                       {
                           "CidrIp": "0.0.0.0/0"
                       }
                   ],
                   "UserIdGroupPairs": [],
                   "PrefixListIds": []
               }
           ],
           "Description": "My security group",
           "Tags": [
               {
                   "Value": "SG1",
                   "Key": "Name"
               }
           ],
           "IpPermissions": [
               {
                   "IpProtocol": "-1",
                   "IpRanges": [],
                   "UserIdGroupPairs": [
                       {
                           "UserId": "123456789012",
                           "GroupId": "sg-903004f8"
                       }
                   ],
                   "PrefixListIds": []
               },
               {
                   "PrefixListIds": []
               }
           ]
       }
   ]
}
```
Example 2: To describe security groups that have specific rules

The following describe-security-groups example uses filters to scope the results to security groups that have a rule that allows SSH traffic (port 22) and a rule that allows traffic from all addresses (0.0.0.0/0). The example uses the --query parameter to display only the names of the security groups. Security groups must match all filters to be returned in the results; however, a single rule does not have to match all filters. For example, the output returns a security group with a rule that allows SSH traffic from a specific IP address and another rule that allows HTTP traffic from all addresses.

```
aws ec2 describe-security-groups \
   --filters Name=ip-permission.from-port,Values=22 Name=ip-permission.to-port,Values=22 Name=ip-permission.cidr,Values='0.0.0.0/0' \
   --query "SecurityGroups[*].[GroupName]" \
   --output text
```

Output:

```
default
my-security-group
web-servers
```
Example 3: To describe security groups based on tags

The following `describe-security-groups` example uses filters to scope the results to security groups that include `test` in the security group name, and that have the tag `Test=To-delete`. The example uses the `--query` parameter to display only the names and IDs of the security groups.

```bash
aws ec2 describe-security-groups \
  --filters Name=group-name,Values=*test* Name=tag:Test,Values=To-delete \
  --query "SecurityGroups[*].{Name:GroupName,ID:GroupId}"
```

Output:

```
[
  {
    "Name": "testfornewinstance",
    "ID": "sg-33bb22aa"
  },
  {
    "Name": "newgrouptest",
    "ID": "sg-1a2b3c4d"
  }
]
```

For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeSecurityGroups in AWS CLI Command Reference.

Get data about instance types

The following code example shows how to get data about Amazon EC2 instance types.

AWS CLI

Example 1: To describe an instance type

The following `describe-instance-types` example displays details for the specified instance type.
aws ec2 describe-instance-types \
--instance-types t2.micro

Output:

{
    "InstanceTypes": [
        {
            "InstanceType": "t2.micro",
            "CurrentGeneration": true,
            "FreeTierEligible": true,
            "SupportedUsageClasses": [
                "on-demand",
                "spot"
            ],
            "SupportedRootDeviceTypes": [
                "ebs"
            ],
            "BareMetal": false,
            "Hypervisor": "xen",
            "ProcessorInfo": {
                "SupportedArchitectures": [
                    "i386",
                    "x86_64"
                ],
                "SustainedClockSpeedInGhz": 2.5
            },
            "VCpuInfo": {
                "DefaultVCpus": 1,
                "DefaultCores": 1,
                "DefaultThreadsPerCore": 1,
                "ValidCores": [1],
                "ValidThreadsPerCore": [1]
            },
            "MemoryInfo": {
                "SizeInMiB": 1024
            },
            "InstanceStorageSupported": false,
            "EbsInfo": {
            }
        }
    ]
}
For more information, see [Instance Types](#) in *(Amazon Elastic Compute Cloud User Guide for Linux Instances)*.

**Example 2: To filter the available instance types**

You can specify a filter to scope the results to instance types that have a specific characteristic. The following `describe-instance-types` example lists the instance types that support hibernation.

```
aws ec2 describe-instance-types \
   --filters Name=hibernation-supported,Values=true --query 'InstanceTypes[*].InstanceType'
```

**Output:**

```
[  "m5.8xlarge",  "r3.large",]
```
Get data about the instance profile associated with an instance

The following code example shows how to get data about the instance profile associated with an Amazon EC2 instance.

AWS CLI

To describe IAM instance profile associations

This example describes all of your IAM instance profile associations.

Command:

```
aws ec2 describe-iam-instance-profile-associations
```

Output:

```
{
   "IamInstanceProfileAssociations": [
   {
      "InstanceId": "i-09eb09efa73ec1dee",
      "State": "associated",
      "AssociationId": "iip-assoc-0db249b1f25fa24b8",
   }
   ]
}
```
"IamInstanceProfile": {
    "Id": "AIPAJVQN4F5WVLGCJDRGM",
    "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
}
},
{
    "InstanceId": "i-0402909a2f4dffd14",
    "State": "associating",
    "AssociationId": "iip-assoc-0d1ec06278d29f44a",
    "IamInstanceProfile": {
        "Id": "AGJAJVQN4F5WVLGCJABCM",
        "Arn": "arn:aws:iam::123456789012:instance-profile/user1-role"
    }
}
]

• For API details, see DescribeIamInstanceProfileAssociations in AWS CLI Command Reference.

Get details about Elastic IP addresses

The following code example shows how to get details about Elastic IP addresses.

**AWS CLI**

**Example 1: To retrieve details about all of your Elastic IP addresses**

The following describe addresses example displays details about your Elastic IP addresses.

```bash
aws ec2 describe-addresses
```

**Output:**

```json
{
    "Addresses": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PublicIp": "198.51.100.0",
            "PublicIpv4Pool": "amazon",
            "Domain": "standard"
        },
        {
            "Domain": "vpc",
```
Example 2: To retrieve details your Elastic IP addresses for EC2-VPC

The following describe-addresses example displays details about your Elastic IP addresses for use with instances in a VPC.

```
aws ec2 describe-addresses \
   --filters "Name=domain,Values=vpc"
```

Output:

```json
{
   "Addresses": [
      {
         "Domain": "vpc",
         "PublicIpv4Pool": "amazon",
         "InstanceId": "i-1234567890abcdef0",
         "NetworkInterfaceId": "eni-12345678",
         "AssociationId": "eipassoc-12345678",
         "NetworkInterfaceOwnerId": "123456789012",
         "PublicIp": "203.0.113.0",
         "AllocationId": "eipalloc-12345678",
         "PrivateIpAddress": "10.0.1.241"
      }
   ]
}
```

Example 3: To retrieve details about an Elastic IP address specified by allocation ID

The following describe-addresses example displays details about the Elastic IP address with the specified allocation ID, which is associated with an instance in EC2-VPC.
aws ec2 describe-addresses \
--allocation-ids eipalloc-282d9641

Output:

```json
{
    "Addresses": [
        {
            "Domain": "vpc",
            "PublicIpv4Pool": "amazon",
            "InstanceId": "i-1234567890abcdef0",
            "NetworkInterfaceId": "eni-1a2b3c4d",
            "AssociationId": "eipassoc-123abc12",
            "NetworkInterfaceOwnerId": "1234567891012",
            "PublicIp": "203.0.113.25",
            "AllocationId": "eipalloc-282d9641",
            "PrivateIpAddress": "10.251.50.12"
        }
    ]
}
```

**Example 4: To retrieve details about an Elastic IP address specified by its VPC private IP address**

The following `describe-addresses` example displays details about the Elastic IP address associated with a particular private IP address in EC2-VPC.

```bash
aws ec2 describe-addresses \
--filters "Name=private-ip-address,Values=10.251.50.12"
```

**Example 5: To retrieve details about Elastic IP addresses in EC2-Classic**

The following `describe-addresses` example displays details about your Elastic IP addresses for use in EC2-Classic.

```bash
aws ec2 describe-addresses \
--filters "Name=domain,Values=standard"
```

Output:

```json
{
    
}
```
Example 6: To retrieve details about an Elastic IP addresses specified by its public IP address

The following describe-addresses example displays details about the Elastic IP address with the value 203.0.110.25, which is associated with an instance in EC2-Classic.

```bash
aws ec2 describe-addresses \
   --public-ips 203.0.110.25
```

Output:

```json
{
   "Addresses": [
       {
           "InstanceId": "i-1234567890abcdef0",
           "PublicIp": "203.0.110.25",
           "PublicIpv4Pool": "amazon",
           "Domain": "standard"
       }
   ]
}
```

- For API details, see [DescribeAddresses](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-addresses.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-addresses.html).

Get the default VPC

The following code example shows how to get the default VPC of the current account.

AWS CLI

**Example 1: To describe all of your VPCs**

The following describe-vpcs example retrieves details about your VPCs.
```json
{
   "Vpcs": [
      {
         "CidrBlock": "30.1.0.0/16",
         "DhcpOptionsId": "dopt-19edf471",
         "State": "available",
         "VpcId": "vpc-0e9801d129EXAMPLE",
         "OwnerId": "111122223333",
         "InstanceTenancy": "default",
         "CidrBlockAssociationSet": [
            {
               "AssociationId": "vpc-cidr-assoc-062c64cfafEXAMPLE",
               "CidrBlock": "30.1.0.0/16",
               "CidrBlockState": {
                  "State": "associated"
               }
            }
         ],
         "IsDefault": false,
         "Tags": [
            {
               "Key": "Name",
               "Value": "Not Shared"
            }
         ]
      },
      {
         "CidrBlock": "10.0.0.0/16",
         "DhcpOptionsId": "dopt-19edf471",
         "State": "available",
         "VpcId": "vpc-06e4ab6c6cEXAMPLE",
         "OwnerId": "222222222222",
         "InstanceTenancy": "default",
         "CidrBlockAssociationSet": [
            {
               "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
               "CidrBlock": "10.0.0.0/16",
               "CidrBlockState": {
                  "State": "associated"
               }
            }
         ]
      }
   ]
}
```
Example 2: To describe a specified VPC

The following `describe-vpcs` example retrieves details for the specified VPC.

```
aws ec2 describe-vpcs \
  --vpc-ids vpc-06e4ab6c6cEXAMPLE
```

Output:

```
{
  "Vpcs": [
    {
      "CidrBlock": "10.0.0.0/16",
      "DhcpOptionsId": "dopt-19edf471",
      "State": "available",
      "VpcId": "vpc-06e4ab6c6cEXAMPLE",
      "OwnerId": "111122223333",
      "InstanceTenancy": "default",
      "CidrBlockAssociationSet": [
        {
          "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
          "CidrBlock": "10.0.0.0/16",
          "CidrBlockState": {
            "State": "associated"
          }
        }
      ],
      "IsDefault": false,
      "Tags": [
      
      ]
    }
  ]
}
```
• For API details, see DescribeVpcs in AWS CLI Command Reference.

Get the default subnets for a VPC

The following code example shows how to get the default subnets for a VPC.

AWS CLI

Example 1: To describe all your subnets

The following describe-subnets example displays the details of your subnets.

aws ec2 describe-subnets

Output:

```json
{
   "Subnets": [
   {
      "AvailabilityZone": "us-east-1d",
      "AvailabilityZoneId": "use1-az2",
      "AvailableIpAddressCount": 4089,
      "CidrBlock": "172.31.80.0/20",
      "DefaultForAz": true,
      "MapPublicIpOnLaunch": false,
      "MapCustomerOwnedIpOnLaunch": true,
      "State": "available",
      "SubnetId": "subnet-0bb1c79de3EXAMPLE",
      "VpcId": "vpc-0ee975135dEXAMPLE",
      "OwnerId": "111122223333",
      "AssignIpv6AddressOnCreation": false,
      "Ipv6CidrBlockAssociationSet": [],
      "CustomerOwnedIpv4Pool": "pool-2EXAMPLE",
```
"SubnetArn": "arn:aws:ec2:us-east-2:111122223333:subnet/subnet-0bb1c79de3EXAMPLE",
"EnableDns64": false,
"Ipv6Native": false,
"PrivateDnsNameOptionsOnLaunch": {
    "HostnameType": "ip-name",
    "EnableResourceNameDnsARecord": false,
    "EnableResourceNameDnsAAAARecord": false
}
},
{
    "AvailabilityZone": "us-east-1d",
    "AvailabilityZoneId": "use1-az2",
    "AvailableIpAddressCount": 4089,
    "CidrBlock": "172.31.80.0/20",
    "DefaultForAz": true,
    "MapPublicIpOnLaunch": true,
    "MapCustomerOwnedIpOnLaunch": false,
    "State": "available",
    "SubnetId": "subnet-8EXAMPLE",
    "VpcId": "vpc-3EXAMPLE",
    "OwnerId": "1111222233333",
    "AssignIpv6AddressOnCreation": false,
    "Ipv6CidrBlockAssociationSet": [],
    "Tags": [
        {
            "Key": "Name",
            "Value": "MySubnet"
        }
    ],
    "EnableDns64": false,
    "Ipv6Native": false,
    "PrivateDnsNameOptionsOnLaunch": {
        "HostnameType": "ip-name",
        "EnableResourceNameDnsARecord": false,
        "EnableResourceNameDnsAAAARecord": false
    }
}
For more information, see Working with VPCs and Subnets in the AWS VPC User Guide.

Example 2: To describe the subnets of a specific VPC

The following describe-subnets example uses a filter to retrieve details for the subnets of the specified VPC.

```
aws ec2 describe-subnets \
   --filters "Name=vpc-id,Values=vpc-3EXAMPLE"
```

Output:

```
{
   "Subnets": [
      {
         "AvailabilityZone": "us-east-1d",
         "AvailabilityZoneId": "use1-az2",
         "AvailableIpAddressCount": 4089,
         "CidrBlock": "172.31.80.0/20",
         "DefaultForAz": true,
         "MapPublicIpOnLaunch": true,
         "MapCustomerOwnedIpOnLaunch": false,
         "State": "available",
         "SubnetId": "subnet-8EXAMPLE",
         "VpcId": "vpc-3EXAMPLE",
         "OwnerId": "111122223333",
         "AssignIpv6AddressOnCreation": false,
         "Ipv6CidrBlockAssociationSet": [],
         "Tags": [
            {
               "Key": "Name",
               "Value": "MySubnet"
            }
         ],
         "EnableDns64": false,
         "Ipv6Native": false,
         "PrivateDnsNameOptionsOnLaunch": {
            "HostnameType": "ip-name",
            "EnableResourceNameDnsARecord": false,
            "EnableResourceNameDnsAAAARecord": false
         }
      }
   ]
}
```
Example 3: To describe the subnets with a specific tag

The following describe-subnets example uses a filter to retrieve the details of those subnets with the tag CostCenter=123 and the --query parameter to display the subnet IDs of the subnets with this tag.

```
aws ec2 describe-subnets \
   --filters "Name=tag:CostCenter,Values=123" \
   --query "Subnets[*].SubnetId" \
   --output text
```

Output:

```
subnet-0987a87c8b37348ef
subnet-02a95061c45f372ee
subnet-03f720e7de2788d73
```

For more information, see Working with VPCs and Subnets in the Amazon VPC User Guide.

- For API details, see DescribeSubnets in AWS CLI Command Reference.

List security key pairs

The following code example shows how to list Amazon EC2 security key pairs.

AWS CLI

**To display a key pair**

The following describe-key-pairs example displays information about the specified key pair.

```
aws ec2 describe-key-pairs \
   --key-names my-key-pair
```
Output:

```json
{
   "KeyPairs": [
   {
      "KeyPairId": "key-0b94643da6EXAMPLE",
      "KeyName": "my-key-pair",
      "KeyType": "rsa",
      "Tags": [],
       }
   ]
}
```

For more information, see [Describe public keys](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-key-pair-public-key.html) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeKeyPairs](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-key-pairs.html) in *AWS CLI Command Reference*.

**Reboot an instance**

The following code example shows how to reboot an Amazon EC2 instance.

**AWS CLI**

**To reboot an Amazon EC2 instance**

This example reboots the specified instance. If the command succeeds, no output is returned.

**Command:**

```
aws ec2 reboot-instances --instance-ids i-1234567890abcdef5
```

For more information, see Reboot Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [RebootInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/reboot-instances.html) in *AWS CLI Command Reference*.

**Release an Elastic IP address**

The following code example shows how to release an Elastic IP address.
To release an Elastic IP addresses for EC2-Classic

This example releases an Elastic IP address for use with instances in EC2-Classic. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 release-address --public-ip 198.51.100.0
```

To release an Elastic IP address for EC2-VPC

This example releases an Elastic IP address for use with instances in a VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 release-address --allocation-id eipalloc-64d5890a
```

For API details, see `ReleaseAddress` in *AWS CLI Command Reference*.

Replace the instance profile associated with an instance

The following code example shows how to replace the instance profile associated with an Amazon EC2 instance.

AWS CLI

To replace an IAM instance profile for an instance

This example replaces the IAM instance profile represented by the association `iip-assoc-060bae234aac2e7fa` with the IAM instance profile named `AdminRole`.

```bash
aws ec2 replace-iam-instance-profile-association \
  --iam-instance-profile Name=AdminRole \
  --association-id iip-assoc-060bae234aac2e7fa
```

Output:

```json
{
}
```
"IamInstanceProfileAssociation": {
  "InstanceId": "i-087711ddaf98f9489",
  "State": "associating",
  "AssociationId": "iip-assoc-0b215292fab192820",
  "IamInstanceProfile": {
    "Id": "AIPAJLNLDX3AMY2WYYAY",
    "Arn": "arn:aws:iam::123456789012:instance-profile/AdminRole"
  }
}

• For API details, see ReplaceIamInstanceProfileAssociation in AWS CLI Command Reference.

Set inbound rules for a security group

The following code example shows how to set inbound rules for an Amazon EC2 security group.

AWS CLI

Example 1: To add a rule that allows inbound SSH traffic

The following authorize-security-group-ingress example adds a rule that allows inbound traffic on TCP port 22 (SSH).

```
aws ec2 authorize-security-group-ingress \
  --group-id sg-1234567890abcdef0 \
  --protocol tcp \
  --port 22 \
  --cidr 203.0.113.0/24
```

Output:

```json
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-01afa97ef3e1bedfc",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 22,
      }]
}```
Example 2: To add a rule that allows inbound HTTP traffic from another security group

The following authorize-security-group-ingress example adds a rule that allows inbound access on TCP port 80 from the source security group sg-1a2b3c4d. The source group must be in the same VPC or in a peer VPC (requires a VPC peering connection). Incoming traffic is allowed based on the private IP addresses of instances that are associated with the source security group (not the public IP address or Elastic IP address).

```bash
aws ec2 authorize-security-group-ingress \
   --group-id sg-1234567890abcdef0 \
   --protocol tcp \
   --port 80 \
   --source-group sg-1a2b3c4d
```

Output:

```json
{
   "Return": true,
   "SecurityGroupRules": [
       {
           "SecurityGroupRuleId": "sgr-01f4be99110f638a7",
           "GroupId": "sg-1234567890abcdef0",
           "GroupOwnerId": "123456789012",
           "IsEgress": false,
           "IpProtocol": "tcp",
           "FromPort": 80,
           "ToPort": 80,
           "ReferencedGroupInfo": {
               "GroupId": "sg-1a2b3c4d",
               "UserId": "123456789012"
           }
       }
   ]
}
```

Example 3: To add multiple rules in the same call
The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add two inbound rules, one that enables inbound access on TCP port 3389 (RDP) and the other that enables ping/ICMP.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="[{CidrIp=172.31.0.0/16}]" IpProtocol=icmp,FromPort=-1,ToPort=-1,IpRanges="[{CidrIp=172.31.0.0/16}]"
```

Output:

```
{
   "Return": true,
   "SecurityGroupRules": [
   {
      "SecurityGroupRuleId": "sgr-00e06e5d3690f29f3",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "CidrIpv4": "172.31.0.0/16"
   },
   {
      "SecurityGroupRuleId": "sgr-0a133dd4493944b87",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv4": "172.31.0.0/16"
   }
   ]
}
```

Example 4: To add a rule for ICMP traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows the ICMP message **Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4)** from anywhere.
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions
IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges="[{CidrIp=0.0.0.0/0}]"

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupId": "sgr-0de3811019069b787",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "icmp",
            "FromPort": 3,
            "ToPort": 4,
            "CidrIpv4": "0.0.0.0/0"
        }
    ]
}
```

**Example 5: To add a rule for IPv6 traffic**

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows SSH access (port 22) from the IPv6 range 2001:db8:1234:1a00::/64.

aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions
IpProtocol=tcp,FromPort=22,ToPort=22,Ipv6Ranges="[{CidrIpv6=2001:db8:1234:1a00::/64}]"

Output:

```
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupId": "sgr-0455bc68b60805563",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": "tcp",
            "FromPort": 22,
            "ToPort": 22,
```

Actions and scenarios

2019
Example 6: To add a rule for ICMPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows ICMPv6 traffic from anywhere.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmpv6,Ipv6Ranges="[{CidrIpv6=::/0}]"
```

Output:

```
{
   "Return": true,
   "SecurityGroupRules": [
   {
      "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "icmpv6",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv6": ":/0"
   }
   ]
}
```

Example 7: Add a rule with a description

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows RDP traffic from the specified IPv4 address range. The rule includes a description to help you identify it later.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="[[CidrIp=203.0.113.0/24,Description='RDP access from NY office']]"
```

Output:

```
{
   "Return": true,
   "SecurityGroupRules": [
   {
      "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "IpRanges": "[[CidrIp=203.0.113.0/24,Description='RDP access from NY office']]"
   }
   ]
}
```
Example 8: To add an inbound rule that uses a prefix list

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows all traffic for the CIDR ranges in the specified prefix list.

```bash
aws ec2 authorize-security-group-ingress --group-id sg-04a351bfe432d4e71 --ip-permissions IpProtocol=all,PrefixListIds="[{PrefixListId=pl-002dc3ec097de1514}]"
```

Output:

```json
{
    "Return": true,
    "SecurityGroupRules": [
        {
            "SecurityGroupRuleId": "sgr-09c74b32f677c6c7c",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "123456789012",
            "IsEgress": false,
            "IpProtocol": ":",
            "FromPort": -1,
            "ToPort": -1,
            "PrefixListId": "pl-0721453c7ac4ec009"
        }
    ]
}
```
Start an instance

The following code example shows how to start an Amazon EC2 instance.

**AWS CLI**

**To start an Amazon EC2 instance**

This example starts the specified Amazon EBS-backed instance.

Command:

```bash
aws ec2 start-instances --instance-ids i-1234567890abcdef0
```

Output:

```json
{
 "StartingInstances": [
  {
   "InstanceId": "i-1234567890abcdef0",
   "CurrentState": {
    "Code": 0,
    "Name": "pending"
   },
   "PreviousState": {
    "Code": 80,
    "Name": "stopped"
   }
  }
 ]
}
```

For more information, see Stop and Start Your Instance in the *Amazon Elastic Compute Cloud User Guide*.

• For API details, see [StartInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/start-instances.html) in *AWS CLI Command Reference*.
Stop an instance

The following code example shows how to stop an Amazon EC2 instance.

AWS CLI

Example 1: To stop an Amazon EC2 instance

The following stop-instances example stops the specified Amazon EBS-backed instance.

```bash
aws ec2 stop-instances \
  --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "StoppingInstances": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "CurrentState": {
        "Code": 64,
        "Name": "stopping"
      },
      "PreviousState": {
        "Code": 16,
        "Name": "running"
      }
    }
  ]
}
```

For more information, see [Stop and Start Your Instance](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/stop-start-instances.html) in the *Amazon Elastic Compute Cloud User Guide*.

Example 2: To hibernate an Amazon EC2 instance

The following stop-instances example hibernates Amazon EBS-backed instance if the instance is enabled for hibernation and meets the hibernation prerequisites. After the instance is put into hibernation the instance is stopped.

```bash
aws ec2 stop-instances \
```
--instance-ids i-1234567890abcdef0 \
--hibernate

Output:

```json
{
   "StoppingInstances": [
   {
      "CurrentState": {
         "Code": 64,
         "Name": "stopping"
      },
      "InstanceId": "i-1234567890abcdef0",
      "PreviousState": {
         "Code": 16,
         "Name": "running"
      }
   }
   ]
}
```

For more information, see [Hibernate your On-Demand Linux instance](#) in the [Amazon Elastic Cloud Compute User Guide](#).

- For API details, see [StopInstances](#) in [AWS CLI Command Reference](#).

**Terminate an instance**

The following code example shows how to terminate an Amazon EC2 instance.

**AWS CLI**

*To terminate an Amazon EC2 instance*

This example terminates the specified instance.

**Command:**

```
aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
```

**Output:**
For more information, see Using Amazon EC2 Instances in the *AWS Command Line Interface User Guide*.

- For API details, see [TerminateInstances](#) in *AWS CLI Command Reference*.

**accept-address-transfer**

The following code example shows how to use `accept-address-transfer`.

**AWS CLI**

**To accept an Elastic IP address transferred to your account**

The following `accept-address-transfer` example accepts the transfer of the specified Elastic IP address to your account.

```
aws ec2 accept-address-transfer \
    --address 100.21.184.216
```

**Output:**

```json
{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
    }
}
```
For more information, see [Transfer Elastic IP addresses](https://docs.aws.amazon.com/vpc/latest/userguide/transfer-addresses.html) in the *Amazon VPC User Guide*.

- For API details, see [AcceptAddressTransfer](https://docs.aws.amazon.com/cli/latest/reference/ec2/accept-address-transfer.html) in *AWS CLI Command Reference*.

### accept-reserved-instances-exchange-quote

The following code example shows how to use `accept-reserved-instances-exchange-quote`.

**AWS CLI**

To perform a Convertible Reserved Instance exchange

This example performs an exchange of the specified Convertible Reserved Instances.

Command:

```bash
aws ec2 accept-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=b747b472-423c-48f3-8cee-679bcexample
```

Output:

```json
{
  "ExchangeId": "riex-e68ed3c1-8bc8-4c17-af77-811afexample"
}
```

- For API details, see [AcceptReservedInstancesExchangeQuote](https://docs.aws.amazon.com/cli/latest/reference/ec2/accept-reserved-instances-exchange-quote.html) in *AWS CLI Command Reference*.

### accept-transit-gateway-peering-attachment

The following code example shows how to use `accept-transit-gateway-peering-attachment`.

Actions and scenarios
To accept a transit gateway peering attachment

The following accept-transit-gateway-peering-attachment example accepts the specified transit gateway peering attachment. The --region parameter specifies the Region that the accepter transit gateway is located in.

```bash
code
aws ec2 accept-transit-gateway-peering-attachment \
  --transit-gateway-attachment-id tgw-attach-4455667788aabbcccd \
  --region us-east-2
```

Output:

```json
{
  "TransitGatewayPeeringAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
    "RequesterTgwInfo": {
      "TransitGatewayId": "tgw-123abc05e04123abc",
      "OwnerId": "123456789012",
      "Region": "us-west-2"
    },
    "AccepterTgwInfo": {
      "TransitGatewayId": "tgw-11223344aabbcc112",
      "OwnerId": "123456789012",
      "Region": "us-east-2"
    },
    "State": "pending",
    "CreationTime": "2019-12-09T11:38:31.000Z"
  }
}
```

For more information, see [Transit Gateway Peering Attachments](#) in the Transit Gateways Guide. For API details, see [AcceptTransitGatewayPeeringAttachment](#) in AWS CLI Command Reference.

accept-transit-gateway-vpc-attachment

The following code example shows how to use accept-transit-gateway-vpc-attachment.

AWS CLI

To accept a request to attach a VPC to a transit gateway.
The following `accept-transit-gateway-vpc-attachment` example accepts the request for the specified attachment.

```bash
aws ec2 accept-transit-gateway-vpc-attachment \
    --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```json
{
    "TransitGatewayVpcAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "VpcId": "vpc-07e8fffd50fEXAMPLE",
        "VpcOwnerId": "123456789012",
        "State": "pending",
        "SubnetIds": ["subnet-0752213d59EXAMPLE"]
    }
}
```

For more information, see [Transit Gateway Attachments to a VPC](#) in the [Transit Gateways Guide](#).

- For API details, see [AcceptTransitGatewayVpcAttachment](#) in [AWS CLI Command Reference](#).

### accept-vpc-endpoint-connections

The following code example shows how to use `accept-vpc-endpoint-connections`.

#### AWS CLI

**To accept an interface endpoint connection request**

This example accepts the specified endpoint connection request for the specified endpoint service.

**Command:**

```bash
```
aws ec2 accept-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --vpc-endpoint-ids vpce-0c1308d7312217abc

Output:

```json
{
   "Unsuccessful": []
}
```

- For API details, see [AcceptVpcEndpointConnections](https://docs.aws.amazon.com/cli/latest/reference/ec2/accept-vpc-endpoint-connections.html) in *AWS CLI Command Reference*.

### accept-vpc-peering-connection

The following code example shows how to use `accept-vpc-peering-connection`.

**AWS CLI**

**To accept a VPC peering connection**

This example accepts the specified VPC peering connection request.

**Command:**

```bash
aws ec2 accept-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

**Output:**

```json
{
   "VpcPeeringConnection": {
      "Status": {
         "Message": "Provisioning",
         "Code": "provisioning"
      },
      "Tags": [],
      "AccepterVpcInfo": {
         "OwnerId": "444455556666",
         "VpcId": "vpc-4445555666",
         "CidrBlock": "10.0.1.0/28"
      },
      "VpcPeeringConnectionId": "pcx-1a2b3c4d",
      "RequesterVpcInfo": {
         "OwnerId": "444455556666",
```
"VpcId": "vpc-111abc45",
"CidrBlock": "10.0.0.0/28"
}
}
}

For API details, see AcceptVpcPeeringConnection in AWS CLI Command Reference.

advertise-byoip-cidr

The following code example shows how to use advertise-byoip-cidr.

AWS CLI

To advertise an address range

The following advertise-byoip-cidr example advertises the specified public IPv4 address range.

```
aws ec2 advertise-byoip-cidr \
    --cidr 203.0.113.25/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "203.0.113.25/24",
        "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
        "State": "provisioned"
    }
}
```

For API details, see AdvertiseByoipCidr in AWS CLI Command Reference.

allocate-hosts

The following code example shows how to use allocate-hosts.

AWS CLI

Example 1: To allocate a Dedicated Host
The following `allocate-hosts` example allocates a single Dedicated Host in the eu-west-1a Availability Zone, onto which you can launch `m5.large` instances. By default, the Dedicated Host accepts only target instance launches, and does not support host recovery.

```
aws ec2 allocate-hosts \
  --instance-type m5.large \
  --availability-zone eu-west-1a \
  --quantity 1
```

Output:

```
{
  "HostIds": [
    "h-07879acf49EXAMPLE"
  ]
}
```

**Example 2: To allocate a Dedicated Host with auto-placement and host recovery enabled**

The following `allocate-hosts` example allocates a single Dedicated Host in the eu-west-1a Availability Zone with auto-placement and host recovery enabled.

```
aws ec2 allocate-hosts \
  --instance-type m5.large \
  --availability-zone eu-west-1a \
  --auto-placement on \
  --host-recovery on \
  --quantity 1
```

Output:

```
{
  "HostIds": [
    "h-07879acf49EXAMPLE"
  ]
}
```

**Example 3: To allocate a Dedicated Host with tags**

The following `allocate-hosts` example allocates a single Dedicated Host and applies a tag with a key named purpose and a value of production.
aws ec2 allocate-hosts \
   --instance-type m5.large \
   --availability-zone eu-west-1a \
   --quantity 1 \
   --tag-specifications 'ResourceType=dedicated-host,Tags={Key=purpose,Value=production}'

Output:

```
{
   "HostIds": [
      "h-07879acf49EXAMPLE"
   ]
}
```

For more information, see Allocating Dedicated Hosts in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see AllocateHosts in AWS CLI Command Reference.

allocate-ipam-pool-cidr

The following code example shows how to use allocate-ipam-pool-cidr.

**AWS CLI**

**To allocate a CIDR from an IPAM pool**

The following allocate-ipam-pool-cidr example allocates a CIDR from an IPAM pool.

(Linux):

```
aws ec2 allocate-ipam-pool-cidr \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --netmask-length 24
```

(Windows):

```
aws ec2 allocate-ipam-pool-cidr ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
```
--netmask-length 24

Output:

```json
{
   "IpamPoolAllocation": {
      "Cidr": "10.0.0.0/24",
      "IpamPoolAllocationId": "ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfbd",
      "ResourceType": "custom",
      "ResourceOwner": "123456789012"
   }
}
```

For more information, see [Manually allocate a CIDR to a pool to reserve IP address space](https://docs.aws.amazon.com/AmazonVPCIPAM/latest/UserGuide/ipam-manually-allocate-cidr.html) in the *Amazon VPC IPAM User Guide*.

- For API details, see `AllocateIpamPoolCidr` in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ec2/allocate-ipam-pool-cidr.html).

---

**apply-security-groups-to-client-vpn-target-network**

The following code example shows how to use `apply-security-groups-to-client-vpn-target-network`.

**AWS CLI**

**To apply security groups to a target network for a Client VPN endpoint**

The following `apply-security-groups-to-client-vpn-target-network` example applies security group `sg-01f6e627a89f4db32` to the association between the specified target network and Client VPN endpoint.

```
aws ec2 apply-security-groups-to-client-vpn-target-network \
  --security-group-ids sg-01f6e627a89f4db32 \
  --vpc-id vpc-0e2110c2f324332e0 \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
   "SecurityGroupIds": [
   
```
For more information, see Target Networks in the AWS Client VPN Administrator Guide.

- For API details, see ApplySecurityGroupsToClientVpnTargetNetwork in AWS CLI Command Reference.

### assign-ipv6-addresses

The following code example shows how to use assign-ipv6-addresses.

**AWS CLI**

**To assign specific IPv6 addresses to a network interface**

This example assigns the specified IPv6 addresses to the specified network interface.

**Command:**

```
```

**Output:**

```
{
    "AssignedIpv6Addresses": [
        "2001:db8:1234:1a00:3304:8879:34cf:4071",
        "2001:db8:1234:1a00:9691:9503:25ad:1761"
    ],
    "NetworkInterfaceId": "eni-38664473"
}
```

**To assign IPv6 addresses that Amazon selects to a network interface**

This example assigns two IPv6 addresses to the specified network interface. Amazon automatically assigns these IPv6 addresses from the available IPv6 addresses in the IPv6 CIDR block range of the subnet.

**Command:**

```
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473
```
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473 --ipv6-address-count 2

Output:

{
    "AssignedIpv6Addresses": [
        "2001:db8:1234:1a00:3304:8879:34cf:4071",
        "2001:db8:1234:1a00:9691:9503:25ad:1761"
    ],
    "NetworkInterfaceId": "eni-38664473"
}

- For API details, see AssignIpv6Addresses in AWS CLI Command Reference.

assign-private-ip-addresses

The following code example shows how to use assign-private-ip-addresses.

AWS CLI

**To assign a specific secondary private IP address a network interface**

This example assigns the specified secondary private IP address to the specified network interface. If the command succeeds, no output is returned.

Command:

aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82

**To assign secondary private IP addresses that Amazon EC2 selects to a network interface**

This example assigns two secondary private IP addresses to the specified network interface. Amazon EC2 automatically assigns these IP addresses from the available IP addresses in the CIDR block range of the subnet the network interface is associated with. If the command succeeds, no output is returned.

Command:
assign-private-nat-gateway-address

The following code example shows how to use assign-private-nat-gateway-address.

**AWS CLI**

To assign private IP addresses to your private NAT gateway

The following assign-private-nat-gateway-address example assigns two private IP addresses to the specified private NAT gateway.

```bash
aws ec2 assign-private-nat-gateway-address \
   --nat-gateway-id nat-1234567890abcdef0 \
   --private-ip-address-count 2
```

Output:

```json
{
   "NatGatewayId": "nat-1234567890abcdef0",
   "NatGatewayAddresses": [
      {
         "NetworkInterfaceId": "eni-0065a61b324d1897a",
         "IsPrimary": false,
         "Status": "assigning"
      },
      {
         "NetworkInterfaceId": "eni-0065a61b324d1897a",
         "IsPrimary": false,
         "Status": "assigning"
      }
   ]
}
```

For more information, see [NAT gateways](https://docs.aws.amazon.com/vpc/latest/userguide/NAT-gateways.html) in the Amazon VPC User Guide.

• For API details, see [AssignPrivateNatGatewayAddress](https://docs.aws.amazon.com/cli/latest/reference/ec2/assign-private-nat-gateway-address.html) in AWS CLI Command Reference.
associate-client-vpn-target-network

The following code example shows how to use associate-client-vpn-target-network.

**AWS CLI**

**To associate a target network with a Client VPN endpoint**

The following associate-client-vpn-target-network example associates a subnet with the specified Client VPN endpoint.

```
aws ec2 associate-client-vpn-target-network \
    --subnet-id subnet-0123456789abcabca \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "AssociationId": "cvpn-assoc-12312312312312312",
    "Status": {
        "Code": "associating"
    }
}
```

For more information, see Target Networks in the AWS Client VPN Administrator Guide. For API details, see AssociateClientVpnTargetNetwork in AWS CLI Command Reference.

associate-dhcp-options

The following code example shows how to use associate-dhcp-options.

**AWS CLI**

**To associate a DHCP options set with your VPC**

This example associates the specified DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 associate-dhcp-options --dhcp-options-id dopt-d9070ebb --vpc-id vpc-a01106c2
```
To associate the default DHCP options set with your VPC

This example associates the default DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 associate-dhcp-options --dhcp-options-id default --vpc-id vpc-a01106c2
```

- For API details, see `AssociateDhcpOptions` in *AWS CLI Command Reference*.

**associate-iam-instance-profile**

The following code example shows how to use `associate-iam-instance-profile`.

**AWS CLI**

To associate an IAM instance profile with an instance

This example associates an IAM instance profile named `admin-role` with instance `i-123456789abcdef123`.

Command:

```bash
aws ec2 associate-iam-instance-profile --instance-id i-123456789abcdef123 --iam-instance-profile Name=admin-role
```

Output:

```json
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-123456789abcdef123",
        "State": "associating",
        "AssociationId": "iip-assoc-0e773651a163c209",
        "IamInstanceProfile": {
            "Id": "AIPAJBLK7RKJKWDXVHIEC",
            "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
        }
    }
}
```

- For API details, see `AssociateIamInstanceProfile` in *AWS CLI Command Reference*. 
associate-instance-event-window

The following code example shows how to use associate-instance-event-window.

**AWS CLI**

**Example 1: To associate one or more instances with an event window**

The following associate-instance-event-window example associates one or more instances with an event window.

```
aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id i ew-0abcdef1234567890 \
  --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [
        "i-1234567890abcdef0",
        "i-0598c7d356eba48d7"
      ],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

**Example 2: To associate instance tags with an event window**

The following associate-instance-event-window example associates instance tags with an event window. Enter an instance-event-window-id parameter to specify the event
window. To associate instance tags, specify the association-target parameter, and for the parameter value, specify one or more tags.

```
aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Output:

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [
                {
                    "Key": "k2",
                    "Value": "v2"
                },
                {
                    "Key": "k1",
                    "Value": "v1"
                }
            ],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

**Example 3: To associate a Dedicated Host with an event window**

The following `associate-instance-event-window` example associates a Dedicated Host with an event window. Enter an `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one of more Dedicated Host IDs.
aws ec2 associate-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --association-target "DedicatedHostIds=h-029fa35a02b99801d"

Output:

```json
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": [
                "h-029fa35a02b99801d"
            ],
            "State": "creating"
        }
    },
    "State": "creating"
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

- For API details, see [AssociateInstanceEventWindow](#) in [AWS CLI Command Reference](#).

**associate-nat-gateway-address**

The following code example shows how to use associate-nat-gateway-address.

**AWS CLI**

To associate an Elastic IP address with a public NAT gateway

The following associate-nat-gateway-address example associates the specified Elastic IP address with the specified public NAT gateway. AWS automatically assigns a secondary private IPv4 address.

```
aws ec2 associate-nat-gateway-address \
   --nat-gateway-id nat-1234567890abcdef0 \
```
Output:

```json
{
    "NatGatewayId": "nat-1234567890abcdef0",
    "NatGatewayAddresses": [
        {
            "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
            "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
            "IsPrimary": false,
            "Status": "associating"
        }
    ]
}
```

For more information, see [NAT gateways in the Amazon VPC User Guide](https://docs.aws.amazon.com/vpc/latest/userguide/nat-gateways.html).

- For API details, see [AssociateNatGatewayAddress](https://docs.aws.amazon.com/cli/latest/reference/ec2/associatenatgatewayaddress.html) in *AWS CLI Command Reference*.

**associate-route-table**

The following code example shows how to use `associate-route-table`.

**AWS CLI**

**To associate a route table with a subnet**

This example associates the specified route table with the specified subnet.

**Command:**

```
aws ec2 associate-route-table --route-table-id rtb-22574640 --subnet-id subnet-9d4a7b6c
```

**Output:**

```json
{
    "AssociationId": "rtbassoc-781d0d1a"
}
```

- For API details, see [AssociateRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/associateroutetable.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**
associate-subnet-cidr-block

The following code example shows how to use `associate-subnet-cidr-block`.

**AWS CLI**

**To associate an IPv6 CIDR block with a subnet**

This example associates an IPv6 CIDR block with the specified subnet.

Command:

```
aws ec2 associate-subnet-cidr-block --subnet-id subnet-5f46ec3b --ipv6-cidr-block 2001:db8:1234:1a00::/64
```

Output:

```
{
   "SubnetId": "subnet-5f46ec3b",
   "Ipv6CidrBlockAssociation": {
      "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
      "AssociationId": "subnet-cidr-assoc-3aa54053",
      "Ipv6CidrBlockState": {
         "State": "associating"
      }
   }
}
```

- For API details, see [AssociateSubnetCidrBlock](#) in AWS CLI Command Reference.

associate-transit-gateway-multicast-domain

The following code example shows how to use `associate-transit-gateway-multicast-domain`.

**AWS CLI**

**To associate a transit gateway with a multicast domain**

The following `associate-transit-gateway-multicast-domain` example associates the specified subnet and attachment with the specified multicast domain.

```
aws ec2 associate-transit-gateway-multicast-domain \
```
```bash
--transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
--transit-gateway-attachment-id tgw-attach-028c1dd0f8f5cbe8e \
--subnet-ids subnet-000de86e3b49c932a \
--transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```json
{
   "Associations": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
      "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8f5cbe8e",
      "ResourceId": "vpc-01128d2c240c09bd5",
      "ResourceType": "vpc",
      "Subnets": [
         {
            "SubnetId": "subnet-000de86e3b49c932a",
            "State": "associating"
         }
      ]
   }
}
```

For more information, see [Managing multicast domains](transit-gateways-guide) in the *Transit Gateways Guide*.

- For API details, see [AssociateTransitGatewayMulticastDomain](aws-cli-command-reference) in *AWS CLI Command Reference*.

**associate-transit-gateway-route-table**

The following code example shows how to use associate-transit-gateway-route-table.

**AWS CLI**

**To associate a transit gateway route table with a transit gateway attachment**

The following example associates the specified transit gateway route table with the specified VPC attachment.

```bash
aws ec2 associate-transit-gateway-route-table \
   --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
   --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:
For more information, see [Associate a Transit Gateway Route Table](#) in the [AWS Transit Gateways Guide](#).

- For API details, see [AssociateTransitGatewayRouteTable](#) in [AWS CLI Command Reference](#).

### associate-vpc-cidr-block

The following code example shows how to use `associate-vpc-cidr-block`.

#### AWS CLI

**Example 1: To associate an Amazon-provided IPv6 CIDR block with a VPC**

The following `associate-vpc-cidr-block` example associates an IPv6 CIDR block with the specified VPC:

```bash
aws ec2 associate-vpc-cidr-block 
  --amazon-provided-ipv6-cidr-block 
  --ipv6-cidr-block-network-border-group us-west-2-lax-1 
  --vpc-id vpc-8EXAMPLE
```

**Output:**

```
{
    "Ipv6CidrBlockAssociation": {
        "AssociationId": "vpc-cidr-assoc-0838ce7d9dEXAMPLE",
        "Ipv6CidrBlockState": {
            "State": "associating"
        },
        "NetworkBorderGroup": "us-west-2-lax-1"
    },
    "VpcId": "vpc-8EXAMPLE"
}
```
Example 2: To associate an additional IPv4 CIDR block with a VPC

The following `associate-vpc-cidr-block` example associates the IPv4 CIDR block 10.2.0.0/16 with the specified VPC.

```bash
aws ec2 associate-vpc-cidr-block \
  --vpc-id vpc-1EXAMPLE \
  --cidr-block 10.2.0.0/16
```

Output:

```json
{
  "CidrBlockAssociation": {
    "AssociationId": "vpc-cidr-assoc-2EXAMPLE",
    "CidrBlock": "10.2.0.0/16",
    "CidrBlockState": {
      "State": "associating"
    }
  },
  "VpcId": "vpc-1EXAMPLE"
}
```

- For API details, see [AssociateVpcCidrBlock](https://docs.aws.amazon.com/cli/latest/reference/ec2/associate-vpc-cidr-block.html) in *AWS CLI Command Reference*.

attach-classic-link-vpc

The following code example shows how to use `attach-classic-link-vpc`.

**AWS CLI**

**To link (attach) an EC2-Classical instance to a VPC**

This example links instance `i-1234567890abcdef0` to VPC `vpc-88888888` through the VPC security group `sg-12312312`.

Command:

```bash
aws ec2 attach-classic-link-vpc --instance-id i-1234567890abcdef0 --vpc-id vpc-88888888 --groups sg-12312312
```
• For API details, see AttachClassicLinkVpc in AWS CLI Command Reference.

attach-internet-gateway

The following code example shows how to use attach-internet-gateway.

AWS CLI

To attach an internet gateway to your VPC

The following attach-internet-gateway example attaches the specified internet gateway to the specific VPC.

```
aws ec2 attach-internet-gateway \\
   --internet-gateway-id igw-0d0fb496b3EXAMPLE \\
   --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the Amazon VPC User Guide.

• For API details, see AttachInternetGateway in AWS CLI Command Reference.

attach-network-interface

The following code example shows how to use attach-network-interface.

AWS CLI

Example 1: To attach a network interface to an instance

The following attach-network-interface example attaches the specified network interface to the specified instance.

```
aws ec2 attach-network-interface \\
   --network-interface-id eni-0dc56a8d4640ad10a \
```
Output:

```
{
    "AttachmentId": "eni-attach-01a8fc87363f07cf9"
}
```

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

**Example 2: To attach a network interface to an instance with multiple network cards**

The following attach-network-interface example attaches the specified network interface to the specified instance and network card.

```bash
aws ec2 attach-network-interface \
    --network-interface-id eni-07483b1897541ad83 \
    --instance-id i-01234567890abcdef \
    --network-card-index 1 \
    --device-index 1
```

Output:

```
{
    "AttachmentId": "eni-attach-0fbd7ee87a88cd06c"
}
```

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

- For API details, see AttachNetworkInterface in AWS CLI Command Reference.

attach-verified-access-trust-provider

The following code example shows how to use attach-verified-access-trust-provider.

**AWS CLI**

**To attach a trust provider to an instance**

The following attach-verified-access-trust-provider example attaches the specified Verified Access trust provider to the specified Verified Access instance.
aws ec2 attach-verified-access-trust-provider \
   --verified-access-instance-id vai-0ce000c0b7643abea \
   --verified-access-trust-provider-id vatp-0bb32de759a3e19e7

Output:

```json
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T19:00:38",
      "LastUpdatedTime": "2023-08-25T19:00:38"
   },
   "VerifiedAccessInstance": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "",
      "VerifiedAccessTrustProviders": [
         {
            "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
            "TrustProviderType": "user",
            "UserTrustProviderType": "iam-identity-center"
         }
      ],
      "CreationTime": "2023-08-25T18:27:56",
      "LastUpdatedTime": "2023-08-25T18:27:56"
   }
}
```

For more information, see [Verified Access instances](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-instances.html) in the *AWS Verified Access User Guide*.

- For API details, see [AttachVerifiedAccessTrustProvider](https://docs.aws.amazon.com/cli/latest/reference/ec2/attach-verified-access-trust-provider.html) in *AWS CLI Command Reference*.

### attach-volume

The following code example shows how to use `attach-volume`.

**AWS CLI**

To attach a volume to an instance

---

*Actions and scenarios* 2049
This example command attaches a volume (vol-1234567890abcdef0) to an instance (i-01474ef662b89480) as /dev/sdf.

Command:

```
aws ec2 attach-volume --volume-id vol-1234567890abcdef0 --instance-id i-01474ef662b89480 --device /dev/sdf
```

Output:

```
{
    "AttachTime": "YYYY-MM-DDTHH:MM:SS.000Z",
    "InstanceId": "i-01474ef662b89480",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "attaching",
    "Device": "/dev/sdf"
}
```

- For API details, see [AttachVolume](https://docs.aws.amazon.com/cli/latest/reference/ec2/attach-volume.html) in [AWS CLI Command Reference](https).

**attach-vpn-gateway**

The following code example shows how to use `attach-vpn-gateway`.

**AWS CLI**

**To attach a virtual private gateway to your VPC**

The following `attach-vpn-gateway` example attaches the specified virtual private gateway to the specified VPC.

```
aws ec2 attach-vpn-gateway \
    --vpn-gateway-id vgw-9a4cacf3 \
    --vpc-id vpc-a01106c2
```

Output:

```
{
    "VpcAttachment": {
        "State": "attaching",
```
"VpcId": "vpc-a01106c2"

For API details, see AttachVpnGateway in AWS CLI Command Reference.

authorize-client-vpn-ingress

The following code example shows how to use authorize-client-vpn-ingress.

AWS CLI

To add an authorization rule for a Client VPN endpoint

The following authorize-client-vpn-ingress example adds an ingress authorization rule that permits all clients to access the internet (0.0.0.0/0).

```bash
aws ec2 authorize-client-vpn-ingress \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --target-network-cidr 0.0.0.0/0 \
  --authorize-all-groups
```

Output:

```json
{
  "Status": {
    "Code": "authorizing"
  }
}
```

For more information, see Authorization Rules in the AWS Client VPN Administrator Guide.

authorize-security-group-egress

The following code example shows how to use authorize-security-group-egress.

AWS CLI

To add a rule that allows outbound traffic to a specific address range
This example command adds a rule that grants access to the specified address ranges on TCP port 80.

Command (Linux):

```bash
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
   IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges='[CidrIp=10.0.0.0/16]'
```

Command (Windows):

```bash
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
   IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[CidrIp=10.0.0.0/16]
```

To add a rule that allows outbound traffic to a specific security group

This example command adds a rule that grants access to the specified security group on TCP port 80.

Command (Linux):

```bash
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
   IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs='[GroupId=sg-4b51a32f]'
```

Command (Windows):

```bash
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
   IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs=[GroupId=sg-4b51a32f]
```

- For API details, seeAuthorizeSecurityGroupEgressinAWS CLI Command Reference.

**bundle-instance**

The following code example shows how to use bundle-instance.

**AWS CLI**

**To bundle an instance**

This example bundles instance i-1234567890abcdef0 to a bucket called bundletasks.
Before you specify values for your access key IDs, review and follow the guidance in Best Practices for Managing AWS Access Keys.
Command:

```
aws ec2 bundle-instance --instance-id i-1234567890abcdef0 --bucket bundletasks --prefix winami --owner-akid AK12AJEXAMPLE --owner-sak example123example
```

Output:

```
{
    "BundleTask": {
        "UpdateTime": "2015-09-15T13:30:35.000Z",
        "InstanceId": "i-1234567890abcdef0",
        "Storage": {
            "S3": {
                "Prefix": "winami",
                "Bucket": "bundletasks"
            }
        },
        "State": "pending",
        "StartTime": "2015-09-15T13:30:35.000Z",
        "BundleId": "bun-294e041f"
    }
}
```

- For API details, see BundleInstance in AWS CLI Command Reference.

cancel-bundle-task

The following code example shows how to use cancel-bundle-task.

**AWS CLI**

**To cancel a bundle task**

This example cancels bundle task bun-2a4e041c.

Command:

```
aws ec2 cancel-bundle-task --bundle-id bun-2a4e041c
```

Output:
• For API details, see [CancelBundleTask](#) in *AWS CLI Command Reference*.

cancel-capacity-reservation

The following code example shows how to use `cancel-capacity-reservation`.

**AWS CLI**

*To cancel a capacity reservation*

The following `cancel-capacity-reservation` example cancels the specified capacity reservation.

```bash
aws ec2 cancel-capacity-reservation \
  --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```json
{
  "Return": true
}
```

For more information, see [Canceling a Capacity Reservation](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*. 
cancel-capacity-reservation-fleets

The following code example shows how to use cancel-capacity-reservation-fleets.

AWS CLI

To cancel a Capacity Reservation Fleet

The following cancel-capacity-reservation-fleets example cancels the specified Capacity Reservation Fleet and the capacity it reserves. When you cancel a Fleet, its status changes to cancelled, and it can no longer create new Capacity Reservations. Additionally, all of the individual Capacity Reservations in the Fleet are cancelled, and the instances that were previously running in the reserved capacity continue to run normally in shared capacity.

```bash
aws ec2 cancel-capacity-reservation-fleets \
--capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```json
{
   "SuccessfulFleetCancellations": [
      {
         "CurrentFleetState": "cancelling",
         "PreviousFleetState": "active",
         "CapacityReservationFleetId": "crf-abcdef01234567890"
      }
   ],
   "FailedFleetCancellations": []
}
```

For more information about Capacity Reservation Fleets, see Capacity Reservation Fleets in the Amazon EC2 User Guide.

- For API details, see CancelCapacityReservationFleets in AWS CLI Command Reference.

cancel-conversion-task

The following code example shows how to use cancel-conversion-task.
**AWS CLI**

**To cancel an active conversion of an instance or a volume**

This example cancels the upload associated with the task ID import-i-fh95npoc. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 cancel-conversion-task --conversion-task-id import-i-fh95npoc
```

- For API details, see [CancelConversionTask](#) in *AWS CLI Command Reference*.

**cancel-export-task**

The following code example shows how to use `cancel-export-task`.

**AWS CLI**

**To cancel an active export task**

This example cancels an active export task with the task ID export-i-fgelt0i7. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 cancel-export-task --export-task-id export-i-fgelt0i7
```

- For API details, see [CancelExportTask](#) in *AWS CLI Command Reference*.

**cancel-image-launch-permission**

The following code example shows how to use `cancel-image-launch-permission`.

**AWS CLI**

**To cancel having an AMI shared with your Amazon Web Services account**

The following `cancel-image-launch-permission` example removes your account from the specified AMI's launch permissions.

```bash
aws ec2 cancel-image-launch-permission \
```
--image-id ami-0123456789example \n--region us-east-1

Output:

{
   "Return": true
}

For more information, see Cancel having an AMI shared with your Amazon Web Services account in the Amazon EC2 User Guide.

- For API details, see CancelImageLaunchPermission in AWS CLI Command Reference.

cancel-import-task

The following code example shows how to use cancel-import-task.

AWS CLI

To cancel an import task

The following cancel-import-task example cancels the specified import image task.

aws ec2 cancel-import-task \n   --import-task-id import-ami-1234567890abcdef0

Output:

{
   "ImportTaskId": "import-ami-1234567890abcdef0",
   "PreviousState": "active",
   "State": "deleting"
}

- For API details, see CancelImportTask in AWS CLI Command Reference.

cancel-reserved-instances-listing

The following code example shows how to use cancel-reserved-instances-listing.
AWS CLI

To cancel a Reserved Instance listing

The following `cancel-reserved-instances-listing` example cancels the specified Reserved Instance listing.

```bash
aws ec2 cancel-reserved-instances-listing \
    --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

- For API details, see [CancelReservedInstancesListing](https://docs.aws.amazon.com/cli/latest/reference/ec2/cancel-reserved-instances-listing.html) in *AWS CLI Command Reference*.

cancel-spot-fleet-requests

The following code example shows how to use `cancel-spot-fleet-requests`.

AWS CLI

**Example 1: To cancel a Spot fleet request and terminate the associated instances**

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request and terminates the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --terminate-instances
```

Output:

```json
{
    "SuccessfulFleetRequests": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "CurrentSpotFleetRequestState": "cancelled_terminating",
            "PreviousSpotFleetRequestState": "active"
        }
    ],
    "UnsuccessfulFleetRequests": []
}
```

For more information, see [Cancel a Spot Fleet request](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-fleet-cancel.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.
Example 2: To cancel a Spot fleet request without terminating the associated instances

The following cancel-spot-fleet-requests example cancels a Spot Fleet request without terminating the associated On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --no-terminate-instances
```

Output:

```
{
    "SuccessfulFleetRequests": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "CurrentSpotFleetRequestState": "cancelled_running",
            "PreviousSpotFleetRequestState": "active"
        }
    ],
    "UnsuccessfulFleetRequests": []
}
```

For more information, see Cancel a Spot Fleet request in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see CancelSpotFleetRequests in AWS CLI Command Reference.

cancel-spot-instance-requests

The following code example shows how to use cancel-spot-instance-requests.

AWS CLI

To cancel Spot Instance requests

This example command cancels a Spot Instance request.

Command:

```
aws ec2 cancel-spot-instance-requests --spot-instance-request-ids sir-08b93456
```
Output:

```json
{
    "CancelledSpotInstanceRequests": [
        {
            "State": "cancelled",
            "SpotInstanceRequestId": "sir-08b93456"
        }
    ]
}
```

• For API details, see [CancelSpotInstanceRequests](#) in *AWS CLI Command Reference*.

**confirm-product-instance**

The following code example shows how to use `confirm-product-instance`.

**AWS CLI**

**To confirm the product instance**

This example determines whether the specified product code is associated with the specified instance.

Command:

```
aws ec2 confirm-product-instance --product-code 774F4FF8 --instance-id i-1234567890abcdef0
```

Output:

```json
{
    "OwnerId": "123456789012"
}
```

• For API details, see [ConfirmProductInstance](#) in *AWS CLI Command Reference*.

**copy-fpga-image**

The following code example shows how to use `copy-fpga-image`.

```
```
AWS CLI

To copy an Amazon FPGA image

This example copies the specified AFI from the us-east-1 region to the current region (eu-west-1).

Command:

```bash
aws ec2 copy-fpga-image --name copy-afi --source-fpga-image-id afi-0d123e123bfc85abc --source-region us-east-1 --region eu-west-1
```

Output:

```
{
    "FpgaImageId": "afi-06b12350a123fbabc"
}
```

- For API details, see [CopyFpgaImage](#) in *AWS CLI Command Reference*.

copy-image

The following code example shows how to use `copy-image`.

AWS CLI

**Example 1: To copy an AMI to another Region**

The following `copy-image` example command copies the specified AMI from the us-west-2 Region to the us-east-1 Region and adds a short description.

```bash
aws ec2 copy-image \
  --region us-east-1 \
  --name ami-name \
  --source-region us-west-2 \
  --source-image-id ami-066877671789bd71b \
  --description "This is my copied image."
```

Output:

```
{
}
```
"ImageId": "ami-0123456789abcdefg"
}

For more information, see Copy an AMI in the Amazon EC2 User Guide.

Example 2: To copy an AMI to another Region and encrypt the backing snapshot

The following copy-image command copies the specified AMI from the us-west-2 Region to the current Region and encrypts the backing snapshot using the specified KMS key.

```
aws ec2 copy-image \
    --source-region us-west-2 \
    --name ami-name \
    --source-image-id ami-066877671789bd71b \
    --encrypted \
    --kms-key-id alias/my-kms-key
```

Output:

```
{
    "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see Copy an AMI in the Amazon EC2 User Guide.

Example 3: To include your user-defined AMI tags when copying an AMI

The following copy-image command uses the --copy-image-tags parameter to copy your user-defined AMI tags when copying the AMI.

```
aws ec2 copy-image \
    --region us-east-1 \
    --name ami-name \
    --source-region us-west-2 \
    --source-image-id ami-066877671789bd71b \
    --description "This is my copied image." \
    --copy-image-tags
```

Output:

```
{
```

Actions and scenarios

2062
For more information, see Copy an AMI in the Amazon EC2 User Guide.

- For API details, see CopyImage in AWS CLI Command Reference.

**copy-snapshot**

The following code example shows how to use copy-snapshot.

**AWS CLI**

**Example 1: To copy a snapshot to another Region**

The following copy-snapshot example command copies the specified snapshot from the us-west-2 Region to the us-east-1 Region and adds a short description.

```
aws ec2 copy-snapshot \
  --region us-east-1 \
  --source-region us-west-2 \
  --source-snapshot-id snap-066877671789bd71b \
  --description "This is my copied snapshot."
```

Output:

```
{
  "SnapshotId": "snap-066877671789bd71b"
}
```

For more information, see Copy an Amazon EBS snapshot in the Amazon EC2 User Guide.

**Example 2: To copy an unencrypted snapshot and encrypt the new snapshot**

The following copy-snapshot command copies the specified unencrypted snapshot from the us-west-2 Region to the current Region and encrypts the new snapshot using the specified KMS key.

```
aws ec2 copy-snapshot \
  --source-region us-west-2 \
  --source-snapshot-id snap-066877671789bd71b \
  --encrypted
```
--kms-key-id alias/my-kms-key

Output:

{
   "SnapshotId": "snap-066877671789bd71b"
}

For more information, see Copy an Amazon EBS snapshot in the Amazon EC2 User Guide.

- For API details, see CopySnapshot in AWS CLI Command Reference.

create-capacity-reservation

The following code example shows how to use create-capacity-reservation.

AWS CLI

**Example 1: To create a Capacity Reservation**

The following create-capacity-reservation example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three t2.medium instances running a Linux/Unix operating system. By default, the capacity reservation is created with open instance matching criteria and no support for ephemeral storage, and it remains active until you manually cancel it.

```
aws ec2 create-capacity-reservation \
   --availability-zone eu-west-1a \
   --instance-type t2.medium \
   --instance-platform Linux/UNIX \
   --instance-count 3
```

Output:

```
{
   "CapacityReservation": {
   "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
   "EndDateType": "unlimited",
   "AvailabilityZone": "eu-west-1a",
   "InstanceMatchCriteria": "open",
   "EphemeralStorage": false,
   
   
```
Example 2: To create a Capacity Reservation that automatically ends at a specified date/time

The following `create-capacity-reservation` example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three `m5.large` instances running a Linux/Unix operating system. This capacity reservation automatically ends on 08/31/2019 at 23:59:59.

```bash
aws ec2 create-capacity-reservation \
   --availability-zone eu-west-1a \
   --instance-type m5.large \
   --instance-platform Linux/UNIX \
   --instance-count 3 \
   --end-date-type limited \
   --end-date 2019-08-31T23:59:59Z
```

Output:

```
{
   "CapacityReservation": {
      "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
      "EndDateType": "limited",
      "AvailabilityZone": "eu-west-1a",
      "EndDate": "2019-08-31T23:59:59.000Z",
      "InstanceMatchCriteria": "open",
      "EphemeralStorage": false,
      "CreateDate": "2019-08-16T10:15:53.000Z",
      "AvailableInstanceCount": 3,
      "InstancePlatform": "Linux/UNIX",
      "TotalInstanceCount": 3,
      "State": "active",
   }
}
```
Example 3: To create a Capacity Reservation that accepts only targeted instance launches

The following `create-capacity-reservation` example creates a capacity reservation that accepts only targeted instance launches.

```bash
aws ec2 create-capacity-reservation \
    --availability-zone eu-west-1a \
    --instance-type m5.large \
    --instance-platform Linux/UNIX \
    --instance-count 3 \
    --instance-match-criteria targeted
```

Output:

```json
{
    "CapacityReservation": {
        "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
        "EndDateType": "unlimited",
        "AvailabilityZone": "eu-west-1a",
        "InstanceMatchCriteria": "targeted",
        "EphemeralStorage": false,
        "CreateDate": "2019-08-16T10:21:57.000Z",
        "AvailableInstanceCount": 3,
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 3,
        "State": "active",
        "Tenancy": "default",
        "EbsOptimized": false,
        "InstanceType": "m5.large"
    }
}
```

For more information, see [Creating a Capacity Reservation](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/elastic-capacity-reservations.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CreateCapacityReservation](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-capacity-reservation.html) in *AWS CLI Command Reference*. 
create-capacity-reservation-fleet

The following code example shows how to use create-capacity-reservation-fleet.

AWS CLI

To create a Capacity Reservation Fleet

The following create-capacity-reservation-fleet example creates a Capacity Reservation Fleet for the instance type specified in the request, up to the specified total target capacity. The number of instances for which the Capacity Reservation Fleet reserves capacity depends on the total target capacity and instance type weights that you specify in the request. Specify the instance types to use and a priority for each of the designated instance types.

```bash
aws ec2 create-capacity-reservation-fleet
--total-target-capacity 24
--allocation-strategy prioritized
--instance-match-criteria open
--tenancy default
--end-date 2022-12-31T23:59:59.000Z
--instance-type-specifications file://instanceTypeSpecification.json
```

Contents of instanceTypeSpecification.json:

```
[
  {
    "InstanceType": "m5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "Weight": 3.0,
    "AvailabilityZone": "us-east-1a",
    "EbsOptimized": true,
    "Priority": 1
  }
]
```

Output:

```
{
  "Status": "submitted",
  "TotalFulfilledCapacity": 0.0,
  "CapacityReservationFleetId": "crf-abcdef01234567890",
  "TotalTargetCapacity": 24
}
```
For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/CapacityReservationFleets.html) in the *Amazon EC2 User Guide*.

For more information about instance type weight and total target capacity, see [Instance type weight](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-types.html) and [Total target capacity](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/instance-types.html) in the *Amazon EC2 User Guide*.

- For API details, see [CreateCapacityReservationFleet](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-capacity-reservation-fleet.html) in the *AWS CLI Command Reference*.

### create-carrier-gateway

The following code example shows how to use `create-carrier-gateway`.

**AWS CLI**

**To create a carrier gateway**

The following `create-carrier-gateway` example creates a carrier gateway for the specified VPC.

```bash
aws ec2 create-carrier-gateway \
   --vpc-id vpc-0c529aEXAMPLE1111
```

**Output:**

```json
{
   "CarrierGateway": {
      "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
      "VpcId": "vpc-0c529aEXAMPLE1111",
      "State": "pending",
      "OwnerId": "123456789012"
   }
}
```

For more information, see [Carrier gateways](https://docs.aws.amazon.com/aws-wavelength/latest/userguide/carrier-gateways.html) in the *AWS Wavelength User Guide*.

- For API details, see [CreateCarrierGateway](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-carrier-gateway.html) in the *AWS CLI Command Reference*. 

---

Actions and scenarios
create-client-vpn-endpoint

The following code example shows how to use create-client-vpn-endpoint.

**AWS CLI**

**To create a Client VPN endpoint**

The following create-client-vpn-endpoint example creates a Client VPN endpoint that uses mutual authentication and specifies a value for the client CIDR block.

```bash
aws ec2 create-client-vpn-endpoint \
    --client-cidr-block "172.31.0.0/16" \
    --server-certificate-arn arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
    --authentication-options Type=certificate-authentication,MutualAuthentication={ClientRootCertificateChainArn=arn:aws:acm:ap-south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE} \
    --connection-log-options Enabled=false
```

**Output:**

```json
{
    "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
    "Status": {
        "Code": "pending-associate"
    },
    "DnsName": "cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-south-1.amazonaws.com"
}
```

For more information, see [Client VPN Endpoints](https://docs.aws.amazon.com/clientvpn/latest/adminguide/client-vpn-endpoints.html) in the *AWS Client VPN Administrator Guide*.

- For API details, see [CreateClientVpnEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-client-vpn-endpoint.html) in *AWS CLI Command Reference*.

create-client-vpn-route

The following code example shows how to use create-client-vpn-route.

**AWS CLI**

**To create a route for a Client VPN endpoint**
The following `create-client-vpn-route` example adds a route to the internet (0.0.0.0/0) for the specified subnet of the Client VPN endpoint.

```bash
aws ec2 create-client-vpn-route \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
   --destination-cidr-block 0.0.0.0/0 \ 
   --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
   "Status": {
      "Code": "creating"
   }
}
```

For more information, see [Routes](#) in the [AWS Client VPN Administrator Guide](#).

- For API details, see [CreateClientVpnRoute](#) in [AWS CLI Command Reference](#).

---

create-coip-cidr

The following code example shows how to use `create-coip-cidr`.

**AWS CLI**

**To create a range of customer-owned IP (CoIP) addresses**

The following `create-coip-cidr` example creates the specified range of CoIP addresses in the specified CoIP pool.

```bash
aws ec2 create-coip-cidr \
   --cidr 15.0.0.0/24 \
   --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{
   "CoipCidr": {
      "Cidr": "15.0.0.0/24",
      ...
   }
}
```
create-coip-pool

The following code example shows how to use create-coip-pool.

AWS CLI

To create a pool of customer-owned IP (CoIP) addresses

The following create-coip-pool example creates a CoIP pool for CoIP addresses in the specified local gateway route table.

```
aws ec2 create-coip-pool \
   --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
   "CoipPool": {
      "PoolId": "ipv4pool-coip-1234567890abcdefg",
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
   }
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see CreateCoipCidr in AWS CLI Command Reference.

create-customer-gateway

The following code example shows how to use create-customer-gateway.
To create a customer gateway

This example creates a customer gateway with the specified IP address for its outside interface.

Command:

```
aws ec2 create-customer-gateway --type ipsec.1 --public-ip 12.1.2.3 --bgp-asn 65534
```

Output:

```
{
   "CustomerGateway": {
      "CustomerGatewayId": "cgw-0e11f167",
      "IpAddress": "12.1.2.3",
      "State": "available",
      "Type": "ipsec.1",
      "BgpAsn": "65534"
   }
}
```

- For API details, see CreateCustomerGateway in AWS CLI Command Reference.

create-default-subnet

The following code example shows how to use create-default-subnet.

AWS CLI

To create a default subnet

This example creates a default subnet in Availability Zone us-east-2a.

Command:

```
aws ec2 create-default-subnet --availability-zone us-east-2a
```

```json
{
   "Subnet": {
      "AvailabilityZone": "us-east-2a",
```
null

For API details, see [CreateDefaultSubnet](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-default-subnet) in *AWS CLI Command Reference*.

### create-default-vpc

The following code example shows how to use create-default-vpc.

**AWS CLI**

**To create a default VPC**

This example creates a default VPC.

Command:

```
aws ec2 create-default-vpc
```

Output:

```
{
  "Vpc": {
    "VpcId": "vpc-8eaae5ea",
    "InstanceTenancy": "default",
    "Tags": [],
    "Ipv6CidrBlockAssociationSet": [],
    "State": "pending",
    "DhcpOptionsId": "dopt-af0c32c6",
    "CidrBlock": "172.31.0.0/16",
    "IsDefault": true
  }
}
```
create-dhcp-options

The following code example shows how to use create-dhcp-options.

AWS CLI

To create a set of DHCP options

The following create-dhcp-options example creates a set of DHCP options that specifies the domain name, the domain name servers, and the NetBIOS node type.

```bash
aws ec2 create-dhcp-options \
    --dhcp-configuration \
        "Key=domain-name-servers,Values=10.2.5.1,10.2.5.2" \
        "Key=domain-name,Values=example.com" \
        "Key=netbios-node-type,Values=2"
```

Output:

```json
{
    "DhcpOptions": {
        "DhcpConfigurations": [
            {
                "Key": "domain-name",
                "Values": [
                    {
                        "Value": "example.com"
                    }
                ]
            },
            {
                "Key": "domain-name-servers",
                "Values": [
                    {
                        "Value": "10.2.5.1"
                    },
                    {
                        "Value": "10.2.5.2"
                    }
                ]
            }
        ]
    }
}
```
For API details, see CreateDhcpOptions in AWS CLI Command Reference.

create-egress-only-internet-gateway

The following code example shows how to use create-egress-only-internet-gateway.

AWS CLI

To create an egress-only Internet gateway

This example creates an egress-only Internet gateway for the specified VPC.

Command:

```bash
aws ec2 create-egress-only-internet-gateway --vpc-id vpc-0c62a468
```

Output:

```json
{
   "EgressOnlyInternetGateway": {
      "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
      "Attachments": [
         {
            "State": "attached",
            "VpcId": "vpc-0c62a468"
         }
      ]
   }
}
```
create-fleet

The following code example shows how to use `create-fleet`.

**AWS CLI**

**Example 1: To create an EC2 Fleet that launches Spot Instances as the default purchasing model**

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `spot`, which results in the fleet launching 2 Spot Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```bash
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

**Contents of file_name.json:**

```json
{
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateId": "lt-0e8c754449b27161c",
        "Version": "1"
      }
    },
    {
      "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
```
Example 2: To create an EC2 Fleet that launches On-Demand Instances as the default purchasing model

The following create-fleet example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is on-demand, which results in the fleet launching 2 On-Demand Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
--cli-input-json file://file_name.json
```

Contents of file_name.json:

```json
{
   "LaunchTemplateConfigs": [
   {
      "LaunchTemplateSpecification": {
      "LaunchTemplateId": "lt-0e8c754449b27161c",
      "Version": "1"
      }
   },
   "TargetCapacitySpecification": {
      "TotalTargetCapacity": 2,
      "DefaultTargetCapacityType": "on-demand"
   }
}
```
Example 3: To create an EC2 Fleet that launches On-Demand Instances as the primary capacity

The following `create-fleet` example creates an EC2 Fleet that specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing model is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfil the total target capacity. The purchasing model for the difference is calculated as `TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType`, which results in the fleet launching 1 Spot Instance.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```bash
aws ec2 create-fleet \
   --cli-input-json file://file_name.json
```

Contents of `file_name.json`:

```json
{
   "LaunchTemplateConfigs": [
   {
      "LaunchTemplateSpecification": {
         "LaunchTemplateId": "lt-0e8c75449b27161c",
         "Version": "1"
      }
   },
   ]

   "TargetCapacitySpecification": {
      "TotalTargetCapacity": 2,
      "OnDemandTargetCapacity": 1,
      "DefaultTargetCapacityType": "spot"
   }
}
```
Example 4: To create an EC2 Fleet that launches Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is lowest-price, is used. The following `create-fleet` example creates an EC2 Fleet using the lowest-price allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing model is spot. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

Contents of file_name.json:

```json
{
  "LaunchTemplateConfigs": [
  {
    "LaunchTemplateSpecification": {
      "LaunchTemplateId": "lt-0e8c754449b27161c",
      "Version": "1"
    },
    "Overrides": [
      {
        "InstanceType": "c4.large",
        "WeightedCapacity": 1,
        "SubnetId": "subnet-a4f6c5d3"
      },
      {
        "InstanceType": "c3.large",
        "WeightedCapacity": 1,
```

Output:

```
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```
Output:

```json
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

- For API details, see [CreateFleet](https://aws.amazon.com) in *AWS CLI Command Reference*.

**create-flow-logs**

The following code example shows how to use `create-flow-logs`.

**AWS CLI**

**Example 1: To create a flow log**

The following `create-flow-logs` example creates a flow log that captures all rejected traffic for the specified network interface. The flow logs are delivered to a log group in CloudWatch Logs using the permissions in the specified IAM role.

```bash
aws ec2 create-flow-logs \
  --resource-type NetworkInterface \
  --resource-ids eni-11223344556677889 \
  --traffic-type REJECT \
  --log-group-name my-flow-logs
```
For more information, see VPC Flow Logs in the Amazon VPC User Guide.

Example 2: To create a flow log with a custom format

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--log-format` parameter specifies a custom format for the flow log records. To run this command on Windows, change the single quotes (') to double quotes (").

```bash
aws ec2 create-flow-logs
   --resource-type VPC
   --resource-ids vpc-001122333444556677
   --traffic-type ALL
   --log-destination-type s3
   --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/
   --log-format '${version} ${vpc-id} ${subnet-id} ${instance-id} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${protocol} ${tcp-flags} ${type} ${pkt-srcaddr} ${pkt-dstaddr}'
```

For more information, see VPC Flow Logs in the Amazon VPC User Guide.

Example 3: To create a flow log with a one-minute maximum aggregation interval

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--max-aggregation-interval` parameter specifies a maximum aggregation interval of 60 seconds (1 minute).

```bash
aws ec2 create-flow-logs
   --resource-type VPC
```

For more information, see VPC Flow Logs in the Amazon VPC User Guide.

- For API details, see CreateFlowLogs in AWS CLI Command Reference.

create-fpga-image

The following code example shows how to use create-fpga-image.

AWS CLI

To create an Amazon FPGA image

This example creates an AFI from the specified tarball in the specified bucket.

Command:

aws ec2 create-fpga-image --name my-afi --description test-afi --input-storage-location Bucket=my-fpga-bucket,Key=dcp/17_12_22-103226.Developer_CL.tar --logs-storage-location Bucket=my-fpga-bucket,Key=logs

Output:

{
   "FpgaImageId": "afi-0d123e123bfc85abc",
   "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc"
}

- For API details, see CreateFpgaImage in AWS CLI Command Reference.

create-image

The following code example shows how to use create-image.

AWS CLI

Example 1: To create an AMI from an Amazon EBS-backed instance

```
The following `create-image` example creates an AMI from the specified instance.

```bash
aws ec2 create-image \
  --instance-id i-1234567890abcdef0 \
  --name "My server" \
  --description "An AMI for my server"
```

Output:

```json
{
  "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see [Specifying a block device mapping for an AMI](amazon-ec2-user-guide) in the *Amazon EC2 User Guide*.

**Example 2: To create an AMI from an Amazon EBS-backed instance without reboot**

The following `create-image` example creates an AMI and sets the `--no-reboot` parameter, so that the instance is not rebooted before the image is created.

```bash
aws ec2 create-image \
  --instance-id i-1234567890abcdef0 \
  --name "My server" \
  --no-reboot
```

Output:

```json
{
  "ImageId": "ami-abcdef01234567890"
}
```

For more information about specifying a block device mapping for your AMI, see [Specifying a block device mapping for an AMI](amazon-ec2-user-guide) in the *Amazon EC2 User Guide*.

**Example 3: To tag an AMI and snapshots on creation**

The following `create-image` example creates an AMI, and tags the AMI and the snapshots with the same tag `cost-center=cc123`

```bash
aws ec2 create-image \
```
--instance-id i-1234567890abcdef0 \
--name "My server" \
--tag-specifications "ResourceType=image,Tags=[{Key=cost-center,Value=cc123}]" 
"ResourceType=snapshot,Tags=[{Key=cost-center,Value=cc123}]"

Output:

{
   "ImageId": "ami-abcdef01234567890"
}

For more information about tagging your resources on creation, see Add tags on resource creation in the Amazon EC2 User Guide.

- For API details, see CreateImage in AWS CLI Command Reference.

create-instance-connect-endpoint

The following code example shows how to use create-instance-connect-endpoint.

AWS CLI

To create an EC2 Instance Connect Endpoint

The following create-instance-connect-endpoint example creates an EC2 Instance Connect Endpoint in the specified subnet.

aws ec2 create-instance-connect-endpoint \
   --region us-east-1 \
   --subnet-id subnet-0123456789example

Output:

{
   "VpcId": "vpc-0123abcd",
   "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
   "AvailabilityZone": "us-east-1a",
   "NetworkInterfaceIds": [
      "eni-0123abcd"
   ],
   "PreserveClientIp": true,
The following code example shows how to use create-instance-event-window.

**AWS CLI**

**Example 1: To create an event window with a time range**

The following `create-instance-event-window` example creates an event window with a time range. You can't also specify the `cron-expression` parameter.

```bash
aws ec2 create-instance-event-window \
  --region us-east-1 \
  --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
  --tag-specifications "ResourceType=instance-event-window,Tags=\{[Key=K1,Value=V1]\}" \
  --name myEventWindowName
```

Output:

```json
{
}
```

```
"InstanceEventWindow": {
   "InstanceEventWindowId": "iew-0abcdef1234567890",
   "TimeRanges": [
      {
         "StartWeekDay": "monday",
         "StartHour": 2,
         "EndWeekDay": "wednesday",
         "EndHour": 8
      }
   ],
   "Name": "myEventWindowName",
   "State": "creating",
   "Tags": [
      {
         "Key": "K1",
         "Value": "V1"
      }
   ]
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

**Example 2: To create an event window with a cron expression**

The following `create-instance-event-window` example creates an event window with a cron expression. You can't also specify the `time-range` parameter.

```
aws ec2 create-instance-event-window \
   --region us-east-1 \
   --cron-expression "* 21-23 * * 2,3" \
   --tag-specifications "ResourceType=instance-event-window,Tags=[[Key=K1,Value=V1]]" \
   --name myEventWindowName
```

**Output:**

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
```
For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see [CreateInstanceEventWindow](<url>) in *AWS CLI Command Reference*.

### create-instance-export-task

The following code example shows how to use `create-instance-export-task`.

**AWS CLI**

**To export an instance**

This example command creates a task to export the instance i-1234567890abcdef0 to the Amazon S3 bucket myexportbucket.

**Command:**

```bash
aws ec2 create-instance-export-task --description "RHEL5 instance" --instance-id i-1234567890abcdef0 --target-environment vmware --export-to-s3-task DiskImageFormat=vmdk,ContainerFormat=ova,S3Bucket=myexportbucket,S3Prefix=RHEL5
```

**Output:**

```
{
   "ExportTask": {
      "State": "active",
      "InstanceExportDetails": {
         "InstanceId": "i-1234567890abcdef0",
         "TargetEnvironment": "vmware"
      }
   }
}
```
For API details, see `CreateInstanceExportTask` in AWS CLI Command Reference.

create-internet-gateway

The following code example shows how to use `create-internet-gateway`.

**AWS CLI**

**To create an internet gateway**

The following `create-internet-gateway` example creates an internet gateway with the tag Name=my-igw.

```bash
aws ec2 create-internet-gateway \
    --tag-specifications ResourceType=internet-gateway,Tags=([{Key=Name,Value=my-igw}]
```

**Output:**

```
{
    "InternetGateway": {
        "Attachments": [],
        "InternetGatewayId": "igw-0d0fb496b3994d755",
        "OwnerId": "123456789012",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-igw"
            }
        ]
    }
}
```
The following code example shows how to use `create-ipam`.

**AWS CLI**

### To create an IPAM

The following `create-ipam` example creates an IPAM.

(Linux):

```bash
code
aws ec2 create-ipam \
  --description "Example description" \
  --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" \
  --tag-specifications 'ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

(Windows):

```bash
code
aws ec2 create-ipam ^
  --description "Example description" ^
  --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^
  --tag-specifications ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]
```

**Output:**

```
code
{
  "Ipam": {
    "OwnerId": "123456789012",
    "IpamId": "ipam-036486dfa6af58ee0",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
    "IpamRegion": "us-east-1",
    "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
    "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
    "ScopeCount": 2,
```
For more information, see Create an IPAM in the Amazon VPC IPAM User Guide.

- For API details, see CreateIpam in AWS CLI Command Reference.

create-ipam-pool

The following code example shows how to use create-ipam-pool.

AWS CLI

To create an IPAM pool

The following create-ipam-pool example creates an IPAM pool.

(Linux):

```bash
aws ec2 create-ipam-pool
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38
   --address-family ipv4
   --auto-import
   --allocation-min-netmask-length 16
   --allocation-max-netmask-length 26
```
(Windows):

```
aws ec2 create-ipam-pool ^
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --address-family ipv4 ^
    --auto-import ^
    --allocation-min-netmask-length 16 ^
    --allocation-max-netmask-length 26 ^
    --allocation-default-netmask-length 24 ^
    --allocation-resource-tags 'Key=Environment,Value=Preprod' ^
    --tag-specifications ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod pool"}]
```

Output:

```
{
    "IpamPool": {
        "OwnerId": "123456789012",
        "IpamPoolId": "ipam-pool-0533048da7d823723",
        "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-pool-0533048da7d823723",
        "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
        "IpamScopeType": "private",
        "IpamArn": "arn:aws:ec2::123456789012:ipam/08440e7a3acde3908",
        "IpamRegion": "us-east-1",
        "Locale": "None",
        "PoolDepth": 1,
        "State": "create-in-progress",
        "AutoImport": true,
        "AddressFamily": "ipv4",
        "AllocationMinNetmaskLength": 16,
        "AllocationMaxNetmaskLength": 26,
        "AllocationDefaultNetmaskLength": 24,
        "AllocationResourceTags": [
            {
                "Key": "Environment",
                "Value": "Preprod"
            }
        ]
    }
}
```
For more information, see Plan for IP address provisioning in the Amazon VPC IPAM User Guide.

- For API details, see createlampPool in AWS CLI Command Reference.

create-ipam-scope

The following code example shows how to use create-ipam-scope.

AWS CLI

To create an IPAM scope

The following create-ipam-scope example creates an IPAM scope.

(Linux):

```bash
aws ec2 create-ipam-scope \
   --ipam-id ipam-08440e7a3acde3908 \
   --description "Example description" \
   --tagSpecifications ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name value"}]
```

(Windows):

```bash
aws ec2 create-ipam-scope ^
   --ipam-id ipam-08440e7a3acde3908 ^
   --description "Example description" ^
   --tagSpecifications ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name value"}]
```

Output:
For more information, see [Create additional scopes](https://docs.aws.amazon.com/vpc-ipam/latest/userguide/ipam-create-scope.html) in the *Amazon VPC IPAM User Guide*.

- For API details, see [CreateIpamScope](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-ipam-scope.html) in *AWS CLI Command Reference*.

---

**create-launch-template-version**

The following code example shows how to use `create-launch-template-version`.

**AWS CLI**

**To create a launch template version**

This example creates a new launch template version based on version 1 of the launch template and specifies a different AMI ID.

**Command:**

```
aws ec2 create-launch-template-version --launch-template-id lt-0abcd290751193123 --version-description WebVersion2 --source-version 1 --launch-template-data '{"ImageId":"ami-c998b6b2"}'
```
Output:

```json
{
    "LaunchTemplateVersion": {
        "VersionDescription": "WebVersion2",
        "LaunchTemplateId": "lt-0abcd290751193123",
        "LaunchTemplateName": "WebServers",
        "VersionNumber": 2,
        "CreatedBy": "arn:aws:iam::123456789012:root",
        "LaunchTemplateData": {
            "ImageId": "ami-c998b6b2",
            "InstanceType": "t2.micro",
            "NetworkInterfaces": [
                {
                    "Ipv6Addresses": [
                        {
                            "Ipv6Address": "2001:db8:1234:1a00::123"
                        }
                    ],
                    "DeviceIndex": 0,
                    "SubnetId": "subnet-7b16de0c",
                    "AssociatePublicIpAddress": true
                }
            ],
            "DefaultVersion": false,
            "CreateTime": "2017-12-01T13:35:46.000Z"
        }
    }
}
```

- For API details, see [CreateLaunchTemplateVersion](#) in *AWS CLI Command Reference*.

**create-local-gateway-route**

The following code example shows how to use `create-local-gateway-route`.

**AWS CLI**

**To create a static route for a local gateway route table**

The following `create-local-gateway-route` example creates the specified route in the specified local gateway route table.
aws ec2 create-local-gateway-route
   --destination-cidr-block 0.0.0.0/0 \
   --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE

Output:

```
{
   "Route": {
      "DestinationCidrBlock": "0.0.0.0/0",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
      "Type": "static",
      "State": "deleted",
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
   }
}
```

- For API details, see CreateLocalGatewayRoute in AWS CLI Command Reference.

create-local-gateway-route-table

The following code example shows how to use create-local-gateway-route-table.

AWS CLI

**To create a local gateway route table**

The following create-local-gateway-route-table example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 create-local-gateway-route-table \
   --local-gateway-id lgw-1a2b3c4d5e6f7g8h9 \
   --mode direct-vpc-routing
```

Output:

```
{
   "LocalGatewayRouteTable": {
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
```

Actions and scenarios 2095
"LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
"OwnerId": "111122223333",
"State": "pending",
"Tags": [],
"Mode": "direct-vpc-routing"
}
}

For more information, see [Local gateway route tables](https://docs.aws.amazon.com/Outposts/latest/UserGuide/local-gateway-route-tables.html) in the *AWS Outposts User Guide*.

- For API details, see [CreateLocalGatewayRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-local-gateway-route-table.html) in *AWS CLI Command Reference*.

### create-local-gateway-route-table-virtual-interface-group-association

The following code example shows how to use `create-local-gateway-route-table-virtual-interface-group-association`.

**AWS CLI**

**To associate a local gateway route table with a virtual interfaces (VIFs) group**

The following `create-local-gateway-route-table-virtual-interface-group-association` example creates an association between the specified local gateway route table and VIF group.

```bash
aws ec2 create-local-gateway-route-table-virtual-interface-group-association \
  --local-gateway-route-table-id lgw-rtb-exampleidabcd1234 \
  --local-gateway-virtual-interface-group-id lgw-vif-grp-exampleid0123abcd
```

**Output:**

```json
{
  "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-grp-assoc-exampleid12345678",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
    "LocalGatewayId": "lgw-exampleid11223344",
    "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
  }
}
```
For more information, see VIF group associations in the **AWS Outposts User Guide**.

- For API details, see [CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-local-gateway-route-table-vpc-association.html) in *AWS CLI Command Reference*.

### create-local-gateway-route-table-vpc-association

The following code example shows how to use `create-local-gateway-route-table-vpc-association`.

**AWS CLI**

**To associate a VPC with a route table**

The following `create-local-gateway-route-table-vpc-association` example associates the specified VPC with the specified local gateway route table.

```bash
aws ec2 create-local-gateway-route-table-vpc-association \
  --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
  --vpc-id vpc-07ef66ac71EXAMPLE
```

**Output:**

```json
{
  "LocalGatewayRouteTableVpcAssociation": {
    "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0ee765bcc8EXAMPLE",
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
    "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
    "VpcId": "vpc-07ef66ac71EXAMPLE",
    "State": "associated"
  }
}
```

- For API details, see [CreateLocalGatewayRouteTableVpcAssociation](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-local-gateway-route-table-vpc-association.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

2097
create-managed-prefix-list

The following code example shows how to use create-managed-prefix-list.

AWS CLI

To create a prefix list

The following create-managed-prefix-list example creates an IPv4 prefix list with a maximum of 10 entries, and creates 2 entries in the prefix list.

```bash
aws ec2 create-managed-prefix-list \
  --address-family IPv4 \
  --max-entries 10 \n  --entries Cidr=10.0.0.0/16,Description=vpc-a Cidr=10.2.0.0/16,Description=vpc-b \n  --prefix-list-name vpc-cidrs
```

Output:

```json
{
    "PrefixList": {
        "PrefixListId": "pl-0123456abcabcabc1",
        "AddressFamily": "IPv4",
        "State": "create-in-progress",
        "PrefixListName": "vpc-cidrs",
        "MaxEntries": 10,
        "Version": 1,
        "Tags": [],
        "OwnerId": "123456789012"
    }
}
```

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see CreateManagedPrefixList in AWS CLI Command Reference.

create-nat-gateway

The following code example shows how to use create-nat-gateway.
Example 1: To create a public NAT gateway

The following `create-nat-gateway` example creates a public NAT gateway in the specified subnet and associates the Elastic IP address with the specified allocation ID. When you create a public NAT gateway, you must associate an Elastic IP address.

```
aws ec2 create-nat-gateway \\
   --subnet-id subnet-0250c25a1fEXAMPLE \\
   --allocation-id eipalloc-09ad461b0dEXAMPLE
```

Output:

```
{
   "NatGateway": {
      "CreateTime": "2021-12-01T22:22:38.000Z",
      "NatGatewayAddresses": [
         {
            "AllocationId": "eipalloc-09ad461b0dEXAMPLE"
         }
      ],
      "NatGatewayId": "nat-0c61bf8a12EXAMPLE",
      "State": "pending",
      "SubnetId": "subnet-0250c25a1fEXAMPLE",
      "VpcId": "vpc-0a60eb65b4EXAMPLE",
      "ConnectivityType": "public"
   }
}
```

For more information, see [NAT gateways](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/gateway.html) in the *Amazon VPC User Guide*.

Example 2: To create a private NAT gateway

The following `create-nat-gateway` example creates a private NAT gateway in the specified subnet. A private NAT gateway does not have an associated Elastic IP address.

```
aws ec2 create-nat-gateway \\
   --subnet-id subnet-0250c25a1fEXAMPLE \\
   --connectivity-type private
```

Output:
For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateNatGateway](#) in *AWS CLI Command Reference*.

### create-network-acl

The following code example shows how to use `create-network-acl`.

**AWS CLI**

**To create a network ACL**

This example creates a network ACL for the specified VPC.

**Command:**

```bash
aws ec2 create-network-acl --vpc-id vpc-a01106c2
```

**Output:**

```json
{
   "NetworkAcl": {
      "Associations": [],
      "NetworkAclId": "acl-5fb85d36",
      "VpcId": "vpc-a01106c2",
      "Tags": [],
      "Entries": [
```
For API details, see CreateNetworkAcl in AWS CLI Command Reference.

create-network-acl-entry

The following code example shows how to use create-network-acl-entry.

AWS CLI

To create a network ACL entry

This example creates an entry for the specified network ACL. The rule allows ingress traffic from any IPv4 address (0.0.0.0/0) on UDP port 53 (DNS) into any associated subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 0.0.0.0/0 --rule-action allow
```

This example creates a rule for the specified network ACL that allows ingress traffic from any IPv6 address (::/0) on TCP port 80 (HTTP).
Command:

```bash
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 120 --protocol tcp --port-range From=80,To=80 --ipv6-cidr-block ::/0 --rule-action allow
```

- For API details, see [CreateNetworkAclEntry](#) in [AWS CLI Command Reference](#).

### create-network-insights-access-scope

The following code example shows how to use `create-network-insights-access-scope`.

**AWS CLI**

**To create a Network Access Scope**

The following `create-network-insights-access-scope` example creates a Network Access Scope.

```bash
aws ec2 create-network-insights-access-scope \
   --cli-input-json file://access-scope-file.json
```

**Contents of access-scope-file.json:**

```json
{
    "MatchPaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "Resources": [
                        "vpc-abcd12e3"
                    ],
                }
            },
        }
    ],
    "ExcludePaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "ResourceTypes": [
                        "AWS::EC2::InternetGateway"
                    ],
                }
            }
        }
    ]
}
```
Output:

```json
{
    "NetworkInsightsAccessScope": {
        "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
        "CreatedDate": "2022-01-25T19:20:28.796000+00:00",
        "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"
    },
    "NetworkInsightsAccessScopeContent": {
        "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
        "MatchPaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "Resources": [
                            "vpc-abcd12e3"
                        ]
                    }
                }
            }
        ],
        "ExcludePaths": [
            {
                "Source": {
                    "ResourceStatement": {
                        "ResourceTypes": [
                            "AWS::EC2::InternetGateway"
                        ]
                    }
                }
            }
        ]
    }
}
```
For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see CreateNetworkInsightsAccessScope in AWS CLI Command Reference.

create-network-insights-path

The following code example shows how to use create-network-insights-path.

**AWS CLI**

To create a path

The following create-network-insights-path example creates a path. The source is the specified internet gateway and the destination is the specified EC2 instance. To determine whether the destination is reachable using the specified protocol and port, analyze the path using the start-network-insights-analysis command.

```
aws ec2 create-network-insights-path \
    --source igw-0797ccc6c9d73b0e5 \
    --destination i-0495d385ad28331c7 \
    --destination-port 22 \
    --protocol TCP
```

Output:

```
{
    "NetworkInsightsPaths": {
        "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
        "CreateDate": "2021-01-20T22:43:46.933Z",
        "Source": "igw-0797ccc6c9d73b0e5",
        "Destination": "i-0495d385ad28331c7",
        "Protocol": "tcp"
    }
}
```

For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide.

- For API details, see CreateNetworkInsightsPath in AWS CLI Command Reference.
create-network-interface

The following code example shows how to use `create-network-interface`.

**AWS CLI**

**Example 1: To specify an IPv4 address for a network interface**

The following `create-network-interface` example creates a network interface for the specified subnet with the specified primary IPv4 address.

```bash
aws ec2 create-network-interface \
  --subnet-id subnet-00a24d0d67acf6333 \
  --description "my network interface" \
  --groups sg-09dfba7ed20cda78b \
  --private-ip-address 10.0.8.17
```

Output:

```json
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
    "Description": "my network interface",
    "Groups": [
      {
        "GroupName": "my-security-group",
        "GroupId": "sg-09dfba7ed20cda78b"
      }
    ],
    "InterfaceType": "interface",
    "Ipv6Addresses": [],
    "MacAddress": "06:6a:0f:9a:49:37",
    "NetworkInterfaceId": "eni-0492b355f0cf3b3f8",
    "OwnerId": "123456789012",
    "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.17",
    "PrivateIpAddresses": [
      {
        "Primary": true,
        "PrivateDnsName": "ip-10-0-8-17.us-west-2.compute.internal",
        "PrivateIpAddress": "10.0.8.17"
      }
    ]
  }
}
```
Example 2: To create a network interface with an IPv4 address and an IPv6 address

The following `create-network-interface` example creates a network interface for the specified subnet with an IPv4 address and an IPv6 address that are selected by Amazon EC2.

```
aws ec2 create-network-interface \
  --subnet-id subnet-00a24d0d67acf6333 \
  --description "my dual stack network interface" \
  --ipv6-address-count 1 \
  --groups sg-09dfba7ed20cda78b
```

Output:

```
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
    "Description": "my dual stack network interface",
    "Groups": [
      {
        "GroupName": "my-security-group",
        "GroupId": "sg-09dfba7ed20cda78b"
      }
    ],
    "InterfaceType": "interface",
    "Ipv6Addresses": [
      {
        "Ipv6Address": "2600:1f13:cf3:650:a1dc:237c:393a:4ba7",
        "IsPrimaryIpv6": false
      }
    ],
    "MacAddress": "06:b8:68:d2:b2:2d",
    "NetworkInterfaceId": "eni-05da417453f9a84bf",
  }
}
```
Example 3: To create a network interface with connection tracking configuration options

The following create-network-interface example creates a network interface and configures the idle connection tracking timeouts.

```
aws ec2 create-network-interface \
   --subnet-id subnet-00a24d0d67acf6333 \
   --groups sg-02e57dcbfe0331c1b \
   --connection-tracking-specification TcpEstablishedTimeout=86400,UdpTimeout=60
```

Output:

```
{
   "NetworkInterface": {
       "AvailabilityZone": "us-west-2a",
       "ConnectionTrackingConfiguration": {
           "TcpEstablishedTimeout": 86400,
           "UdpTimeout": 60
       },
       "Description": "",
       "Groups": [
   ```
Example 4: To create an Elastic Fabric Adapter

The following `create-network-interface` example creates an EFA.

```bash
aws ec2 create-network-interface \
  --interface-type efa \
  --subnet-id subnet-00a24d0d67ac6333 \
  --description "my efa" \
  --groups sg-02e57dbcf0331c1b
```

Output:

```json
{
  "NetworkInterface": {

  }
}
```
"AvailabilityZone": "us-west-2a",
"Description": "my efa",
"Groups": [
  {
    "GroupName": "my-efa-sg",
    "GroupId": "sg-02e57dbcfe0331c1b"
  }
],
"InterfaceType": "efa",
"Ipv6Addresses": [],
"MacAddress": "06:d7:a4:f7:4d:57",
"NetworkInterfaceId": "eni-034acc2885e862b65",
"OwnerId": "123456789012",
"PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
"PrivateIpAddress": "10.0.8.180",
"PrivateIpAddresses": [
  {
    "Primary": true,
    "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.180"
  }
],
"RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
"RequesterManaged": false,
"SourceDestCheck": true,
"Status": "pending",
"SubnetId": "subnet-00a24d0d67acf6333",
"TagSet": [],
"VpcId": "vpc-02723a0f3eeb9d57b"
}

For more information, see Elastic network interfaces in the Amazon EC2 User Guide.

- For API details, see CreateNetworkInterface in AWS CLI Command Reference.

create-network-interface-permission

The following code example shows how to use create-network-interface-permission.

AWS CLI

To create a network interface permission
This example grants permission to account 123456789012 to attach network interface eni-1a2b3c4d to an instance.

Command:

```bash
aws ec2 create-network-interface-permission --network-interface-id eni-1a2b3c4d --aws-account-id 123456789012 --permission INSTANCE-ATTACH
```

Output:

```json
{
  "InterfacePermission": {
    "PermissionState": {
      "State": "GRANTED"
    },
    "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
    "NetworkInterfaceId": "eni-1a2b3c4d",
    "Permission": "INSTANCE-ATTACH",
    "AwsAccountId": "123456789012"
  }
}
```

- For API details, see [CreateNetworkInterfacePermission](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-network-interface-permission.html) in *AWS CLI Command Reference*.

### create-placement-group

The following code example shows how to use create-placement-group.

**AWS CLI**

#### To create a placement group

This example command creates a placement group with the specified name.

Command:

```bash
aws ec2 create-placement-group --group-name my-cluster --strategy cluster
```

#### To create a partition placement group

This example command creates a partition placement group named HDFS-Group-A with five partitions.
Command:

```bash
aws ec2 create-placement-group --group-name HDFS-Group-A --strategy partition --partition-count 5
```

- For API details, see `CreatePlacementGroup` in *AWS CLI Command Reference*.

**create-replace-root-volume-task**

The following code example shows how to use `create-replace-root-volume-task`.

**AWS CLI**

**Example 1: To restore a root volume to its initial launch state**

The following `create-replace-root-volume-task` example restores the root volume of instance `i-0123456789abcdefa` to its initial launch state.

```bash
aws ec2 create-replace-root-volume-task \
   --instance-id i-0123456789abcdefa
```

Output:

```json
{
   "ReplaceRootVolumeTask":
   {
      "InstanceId": "i-0123456789abcdefa",
      "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
      "TaskState": "pending",
      "StartTime": "2022-03-14T15:06:38Z",
      "Tags": []
   }
}
```

For more information, see [Replace a root volume](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/G229.html) in the *Amazon Elastic Compute Cloud User Guide*.

**Example 2: To restore a root volume to a specific snapshot**

The following `create-replace-root-volume-task` example restores the root volume of instance `i-0123456789abcdefa` to snapshot `snap-0abcdef1234567890`.

Actions and scenarios
aws ec2 create-replace-root-volume-task \
  --instance-id i-0123456789abcdefa \
  --snapshot-id snap-0abcdef1234567890

Output:

{
  "ReplaceRootVolumeTask":
  {
    "InstanceId": "i-0123456789abcdefa",
    "ReplaceRootVolumeTaskId": "replacevol-0555566667777abcd",
    "TaskState": "pending",
    "StartTime": "2022-03-14T15:16:28Z",
    "Tags": []
  }
}

For more information, see Replace a root volume in the Amazon Elastic Compute Cloud User Guide.

- For API details, see CreateReplaceRootVolumeTask in AWS CLI Command Reference.

create-reserved-instances-listing

The following code example shows how to use create-reserved-instances-listing.

AWS CLI

To list a Reserved Instance in the Reserved Instance Marketplace

The following create-reserved-instances-listing example creates a listing for the specified Reserved Instance in the Reserved Instance Marketplace.

aws ec2 create-reserved-instances-listing \
  --reserved-instances-id 5ec28771-05ff-4b9b-aa31-9e57dexample \
  --instance-count 3 \
  --price-schedules CurrencyCode=USD,Price=25.50 \
  --client-token 550e8400-e29b-41d4-a716-446655440000

- For API details, see CreateReservedInstancesListing in AWS CLI Command Reference.
**create-restore-image-task**

The following code example shows how to use `create-restore-image-task`.

**AWS CLI**

**To restore an AMI from an S3 bucket**

The following `create-restore-image-task` example restores an AMI from an S3 bucket. Use the values for `S3ObjectKey` and `Bucket` from the `describe-store-image-tasks` output, specify the object key of the AMI and the name of the S3 bucket to which the AMI was copied, and specify the name for the restored AMI. The name must be unique for AMIs in the Region for this account. The restored AMI will receive a new AMI ID.

```bash
aws ec2 create-restore-image-task \
    --object-key ami-1234567890abcdef0.bin \
    --bucket my-ami-bucket \
    --name "New AMI Name"
```

**Output:**

```json
{
   "ImageId": "ami-0eab20fe36f83e1a8"
}
```

- For API details, see [CreateRestoreImageTask](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_CreateRestoreImageTask.html) in *AWS CLI Command Reference*.

**create-route**

The following code example shows how to use `create-route`.

**AWS CLI**

**To create a route**

This example creates a route for the specified route table. The route matches all IPv4 traffic (0.0.0.0/0) and routes it to the specified Internet gateway. If the command succeeds, no output is returned.
Command:

```bash
aws ec2 create-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0 --gateway-id igw-c0a643a9
```

This example command creates a route in route table rtb-g8ff4ea2. The route matches traffic for the IPv4 CIDR block 10.0.0.0/16 and routes it to VPC peering connection, pcx-111aaa22. This route enables traffic to be directed to the peer VPC in the VPC peering connection. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 create-route --route-table-id rtb-g8ff4ea2 --destination-cidr-block 10.0.0.0/16 --vpc-peering-connection-id pcx-1a2b3c4d
```

This example creates a route in the specified route table that matches all IPv6 traffic (::/0) and routes it to the specified egress-only Internet gateway.

Command:

```bash
aws ec2 create-route --route-table-id rtb-dce620b8 --destination-ipv6-cidr-block ::/0 --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

- For API details, see CreateRoute in AWS CLI Command Reference.

create-snapshot

The following code example shows how to use create-snapshot.

AWS CLI

**To create a snapshot**

This example command creates a snapshot of the volume with a volume ID of vol-1234567890abcdef0 and a short description to identify the snapshot.

Command:

```bash
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description "This is my root volume snapshot"
```
To create a snapshot with tags

This example command creates a snapshot and applies two tags: purpose=prod and costcenter=123.

Command:
```
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description 'Prod backup' --tag-specifications 'ResourceType=snapshot,Tags=[{Key=purpose,Value=prod},{Key=costcenter,Value=123}]
```

Output:
```
{
    "Description": "Prod backup",
    "Tags": [
        {
            "Value": "prod",
            "Key": "purpose"
        },
        {
            "Value": "123",
            "Key": "costcenter"
        }
    ],
    "Encrypted": false,
    "VolumeId": "vol-1234567890abcdef0",
    "State": "pending",
    "VolumeSize": 8,
    "StartTime": "2018-02-28T21:06:01.000Z",
    "Progress": ",",
    "OwnerId": "012345678910",
    "SnapshotId": "snap-066877671789bd71b"
}
```
The following code example shows how to use `create-snapshots`.

**AWS CLI**

**Example 1: To create a multi-volume snapshot**

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance.

```bash
aws ec2 create-snapshots \
  --instance-specification InstanceId=i-1234567890abcdef0 \
  --description "This is snapshot of a volume from my-instance"
```

**Output:**

```json
{
  "Snapshots": [
    {
      "Description": "This is a snapshot of a volume from my-instance",
      "Tags": [],
      "Encrypted": false,
      "VolumeId": "vol-0a01d2d5a34697479",
      "State": "pending",
      "VolumeSize": 16,
      "StartTime": "2019-08-05T16:58:19.000Z",
      "Progress": "",
      "OwnerId": "123456789012",
      "SnapshotId": "snap-07f30e3909aa0045e"
    },
    {
      "Description": "This is a snapshot of a volume from my-instance",
    }
  ]
}
```
Example 2: To create a multi-volume snapshot with tags from the source volume

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and copies the tags from each volume to its corresponding snapshot.

```
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \
    --copy-tags-from-source volume \
    --description "This is snapshot of a volume from my-instance"
```

Output:

```json
{
    "Snapshots": [
    {
        "Description": "This is a snapshot of a volume from my-instance",
        "Tags": [
            {
                "Key": "Name",
                "Value": "my-volume"
            }
        ],
        "Encrypted": false,
        "VolumeId": "vol-02d0d4947008cb1a2",
        "State": "pending",
        "VolumeSize": 20,
        "StartTime": "2019-08-05T16:53:04.000Z",
        "Progress": "",
        "OwnerId": "123456789012",
        "SnapshotId": "snap-0ec2b602264aad48"
    },
    ...
    ]
}
```
Example 3: To create a multi-volume snapshot not including the root volume

The following `create-snapshots` example creates a snapshot of all volumes attached to the specified instance except for the root volume.

```bash
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0,ExcludeBootVolume=true
```

See example 1 for sample output.

Example 4: To create a multi-volume snapshot and add tags

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and adds two tags to each snapshot.

```bash
aws ec2 create-snapshots \
    --instance-specification InstanceId=i-1234567890abcdef0 \n    --tag-specifications 'ResourceType=snapshot,Tags=[{Key=Name,Value=backup}, \n    {Key=costcenter,Value=123}]'
```

See example 1 for sample output.

- For API details, see [CreateSnapshots](https://docs.aws.amazon.com/AWSCLI/latest/userguide/cli-aws-ec2-createsnapshots.html) in *AWS CLI Command Reference*.

create-spot-datafeed-subscription

The following code example shows how to use `create-spot-datafeed-subscription`.

AWS CLI

To create a Spot Instance data feed

The following `create-spot-datafeed-subscription` example creates a Spot Instance data feed.

```bash
aws ec2 create-spot-datafeed-subscription \
```
The data feed is stored in the Amazon S3 bucket that you specified. The file names for this data feed have the following format.

```
my-bucket.s3.amazonaws.com/spot-data-feed/123456789012.YYYY-MM-DD-HH.n.abcd1234.gz
```

- For API details, see [CreateSpotDatafeedSubscription](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-spot-datafeed-subscription.html) in AWS CLI Command Reference.

---

### create-store-image-task

The following code example shows how to use create-store-image-task.

**AWS CLI**

#### To store an AMI in an S3 bucket

The following create-store-image-task example stores an AMI in an S3 bucket. Specify the ID of the AMI and the name of the S3 bucket in which to store the AMI.

```
aws ec2 create-store-image-task \
   --image-id ami-1234567890abcdef0 \
   --bucket my-ami-bucket
```

**Output:**

```
{
}
```
For more information, see Store and restore an AMI using S3 in the Amazon EC2 User Guide.

- For API details, see CreateStoreImageTask in AWS CLI Command Reference.

**create-subnet-cidr-reservation**

The following code example shows how to use create-subnet-cidr-reservation.

**AWS CLI**

**To create a subnet CIDR reservation**

The following create-subnet-cidr-reservation example creates a subnet CIDR reservation for the specified subnet and CIDR range.

```
aws ec2 create-subnet-cidr-reservation \
  --subnet-id subnet-03c51e2eEXAMPLE \ 
  --reservation-type prefix \ 
  --cidr 10.1.0.20/26
```

**Output:**

```
{
  "SubnetCidrReservation": {
    "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
    "SubnetId": "subnet-03c51e2e6cEXAMPLE",
    "Cidr": "10.1.0.16/28",
    "ReservationType": "prefix",
    "OwnerId": "123456789012"
  }
}
```

For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.

- For API details, see CreateSubnetCidrReservation in AWS CLI Command Reference.

**create-traffic-mirror-filter**

The following code example shows how to use create-traffic-mirror-filter.

To create a Traffic Mirror Filter

The following `create-traffic-mirror-filter` example creates a Traffic Mirror filter. After you create the filter, use `create-traffic-mirror-filter-rule` to add rules to the filter.

```bash
aws ec2 create-traffic-mirror-filter \
  --description "TCP Filter"
```

Output:

```
{
  "ClientToken": "28908518-100b-4987-8233-8c744EXAMPLE",
  "TrafficMirrorFilter": {
    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
    "Description": "TCP Filter",
    "EgressFilterRules": [],
    "IngressFilterRules": [],
    "Tags": [],
    "NetworkServices": []
  }
}
```

For more information, see `Create a Traffic Mirror Filter` in the AWS Traffic Mirroring Guide.

- For API details, see `CreateTrafficMirrorFilter` in AWS CLI Command Reference.

create-traffic-mirror-filter-rule

The following code example shows how to use `create-traffic-mirror-filter-rule`.

AWS CLI

To create a filter rule for incoming TCP traffic

The following `create-traffic-mirror-filter-rule` example creates a rule that you can use to mirror all incoming TCP traffic. Before you run this command, use `create-traffic-mirror-filter` to create the Traffic Mirror filter.

```bash
aws ec2 create-traffic-mirror-filter-rule \
  --description "TCP Rule" \
  --destination-cidr-block 0.0.0.0/0 \
```
--protocol 6 \  
--rule-action accept \  
--rule-number 1 \  
--source-cidr-block 0.0.0.0/0 \  
--traffic-direction ingress \  
--traffic-mirror-filter-id tmf-04812ff784b25ae67

Output:

```
{
    "TrafficMirrorFilterRule": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "TrafficMirrorFilterId": "tmf-04812ff784b25ae67",
        "TrafficMirrorFilterRuleId": "tmfr-02d20d996673f3732",
        "SourceCidrBlock": "0.0.0.0/0",
        "TrafficDirection": "ingress",
        "Description": "TCP Rule",
        "RuleNumber": 1,
        "RuleAction": "accept",
        "Protocol": 6
    },
    "ClientToken": "4752b573-40a6-4eac-a8a4-a72058761219"
}
```

For more information, see [Create a Traffic Mirror Filter](https://docs.aws.amazon.com/traffic-mirroring/latest/guide/create-filter.html) in the *AWS Traffic Mirroring Guide*.

- For API details, see [CreateTrafficMirrorFilterRule](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-traffic-mirror-filter-rule.html) in *AWS CLI Command Reference*.

---

**create-traffic-mirror-session**

The following code example shows how to use `create-traffic-mirror-session`.

**AWS CLI**

To create a Traffic Mirror Session

The following `create-traffic-mirror-session` command creates a traffic mirror sessions for the specified source and target for 25 bytes of the packet.

```
aws ec2 create-traffic-mirror-session \  
    --description "example session" \  
    --traffic-mirror-target-id tmt-07f75d8feeEXAMPLE \  
    --network-interface-id eni-070203f901EXAMPLE \  
```
--session-number 1 \
--packet-length 25 \
--traffic-mirror-filter-id tmf-04812ff784EXAMPLE

Output:

```
{
    "TrafficMirrorSession": {
        "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
        "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
        "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
        "NetworkInterfaceId": "eni-070203f901EXAMPLE",
        "OwnerId": "111122223333",
        "PacketLength": 25,
        "SessionNumber": 1,
        "VirtualNetworkId": 7159709,
        "Description": "example session",
        "Tags": []
    },
    "ClientToken": "5236cffc-ee13-4a32-bb5b-388d9da09d96"
}
```

For more information, see Create a Traffic Mirror Session in the AWS Traffic Mirroring Guide.

- For API details, see CreateTrafficMirrorSession in AWS CLI Command Reference.

**create-traffic-mirror-target**

The following code example shows how to use create-traffic-mirror-target.

**AWS CLI**

**To create a a Network Load Balancer Traffic Mirror target**

The following create-traffic-mirror-target example creates a Network Load Balancer Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target \
    --description "Example Network Load Balancer Target" \
```

Output:
To create a network Traffic Mirror target

The following `create-traffic-mirror-target` example creates a network interface Traffic Mirror target.

```bash
aws ec2 create-traffic-mirror-target --description "Network interface target" --network-interface-id eni-eni-01f6f631eEXAMPLE
```

Output:

```json
{
  "TrafficMirrorTarget": {
    "Description": "Network interface target",
    "NetworkInterfaceId": "eni-01f6f631eEXAMPLE",
    "TrafficMirrorTargetId": "tmt-02dcdbe2abEXAMPLE"
  },
  "ClientToken": "5289a345-0358-4e62-93d5-47ef3061d65e"
}
```

For more information, see [Create a Traffic Mirror Target](https://docs.aws.amazon.com/TrafficMirroring/latest/tmg-guide/create-traffic-mirror-target.html) in the *AWS Traffic Mirroring Guide*.

- For API details, see [CreateTrafficMirrorTarget](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-traffic-mirror-target.html) in *AWS CLI Command Reference*.

**create-transit-gateway**

The following code example shows how to use `create-transit-gateway`.

```json
{
  "TrafficMirrorTarget": {
    "Type": "network-load-balancer",
    "Tags": [],
    "Description": "Example Network Load Balancer Target",
    "OwnerId": "111122223333",
    "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:724145273726:loadbalancer/net/NLB/7cdec873EXAMPLE",
    "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE"
  },
  "ClientToken": "d5c090f5-8a0f-49c7-8281-72c796a21f72"
}
```
**AWS CLI**

**To create a transit gateway**

The following `create-transit-gateway` example creates a transit gateway.

```bash
code
aws ec2 create-transit-gateway \
   --description MyTGW \
   --options \
   AmazonSideAsn=64516,AutoAcceptSharedAttachments=enable,DefaultRouteTableAssociation=enable,
   DefaultRouteTablePropagation=enable,\n   VpnEcmpSupport=enable,DnsSupport=enable
```

Output:

```json
{  
   "TransitGateway": {  
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",  
      "State": "pending",  
      "OwnerId": "111122223333",  
      "Description": "MyTGW",  
      "CreationTime": "2019-07-10T14:02:12.000Z",  
      "Options": {  
         "AmazonSideAsn": 64516,  
         "AutoAcceptSharedAttachments": "enable",  
         "DefaultRouteTableAssociation": "enable",  
         "AssociationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",  
         "DefaultRouteTablePropagation": "enable",  
         "PropagationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",  
         "VpnEcmpSupport": "enable",  
         "DnsSupport": "enable"
      }
   }
}
```

For more information, see [Create a transit gateway](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGateway](#) in *AWS CLI Command Reference*.

**create-transit-gateway-connect**

The following code example shows how to use `create-transit-gateway-connect`.
AWS CLI

To create a transit gateway Connect attachment

The following create-transit-gateway-connect example creates a Connect attachment, with the "gre" protocol, for the specified attachment.

```
aws ec2 create-transit-gateway-connect \
   --transport-transit-gateway-attachment-id tgw-attach-0a89069f57EXAMPLE \
   --options "Protocol=gre"
```

Output:

```
{
   "TransitGatewayConnect": {
      "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
      "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
      "State": "pending",
      "CreationTime": "2021-03-09T19:59:17+00:00",
      "Options": {
         "Protocol": "gre"
      }
   }
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayConnect in AWS CLI Command Reference.

create-transit-gateway-connect-peer

The following code example shows how to use create-transit-gateway-connect-peer.

AWS CLI

To create a Transit Gateway Connect peer

The following create-transit-gateway-connect-peer example creates a Connect peer.

```
aws ec2 create-transit-gateway-connect-peer \
```
--transit-gateway-attachment-id tgw-attach-0f0927767cEXAMPLE \
--peer-address 172.31.1.11 \
--inside-cidr-blocks 169.254.6.0/29

Output:

```json
{
   "TransitGatewayConnectPeer": {
      "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
      "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
      "State": "pending",
      "CreationTime": "2021-10-13T03:35:17.000Z",
      "ConnectPeerConfiguration": {
         "TransitGatewayAddress": "10.0.0.234",
         "PeerAddress": "172.31.1.11",
         "InsideCidrBlocks": [
            "169.254.6.0/29"
         ],
         "Protocol": "gre",
         "BgpConfigurations": [
            {
               "TransitGatewayAsn": 64512,
               "PeerAsn": 64512,
               "TransitGatewayAddress": "169.254.6.2",
               "PeerAddress": "169.254.6.1",
               "BgpStatus": "down"
            },
            {
               "TransitGatewayAsn": 64512,
               "PeerAsn": 64512,
               "TransitGatewayAddress": "169.254.6.3",
               "PeerAddress": "169.254.6.1",
               "BgpStatus": "down"
            }
         ]
      }
   }
}
```

- For API details, see [CreateTransitGatewayConnectPeer](https://docs.aws.amazon.com/cli/latest/reference/gateway/create-transit-gateway-connect-peer.html) in *AWS CLI Command Reference*.
create-transit-gateway-multicast-domain

The following code example shows how to use create-transit-gateway-multicast-domain.

AWS CLI

Example 1: To create an IGMP multicast domain

The following create-transit-gateway-multicast-domain example creates a multicast domain for the specified transit gateway. With static sources disabled, any instances in subnets associated with the multicast domain can send multicast traffic. If at least one member uses the IGMP protocol, you must enable IGMPv2 support.

```bash
aws ec2 create-transit-gateway-multicast-domain \
   --transit-gateway-id tgw-0bf0bffeEXAMPLE \
   --options StaticSourcesSupport=disable,Igmpv2Support=enable
```

Output:

```
{
   "TransitGatewayMulticastDomain": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c9e29e2a7EXAMPLE",
      "TransitGatewayId": "tgw-0bf0bffeEXAMPLE",
      "OwnerId": "123456789012",
      "Options": {
         "Igmpv2Support": "enable",
         "StaticSourcesSupport": "disable",
         "AutoAcceptSharedAssociations": "disable"
      },
      "State": "pending",
      "CreationTime": "2021-09-29T22:17:13.000Z"
   }
}
```

Example 2: To create a static multicast domain

The following create-transit-gateway-multicast-domain example creates a multicast domain for the specified transit gateway. With static sources enabled, you must statically add sources.

```bash
aws ec2 create-transit-gateway-multicast-domain \
   --transit-gateway-id tgw-0bf0bffeEXAMPLE \
   --options StaticSourcesSupport=enable,Igmpv2Support=disable
```
aws ec2 create-transit-gateway-multicast-domain \
  --transit-gateway-id tgw-0bf0bffeфаEXAMPLE \
  --options StaticSourcesSupport=enable,Igmpv2Support=disable

Output:

```
{
    "TransitGatewayMulticastDomain": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
        "TransitGatewayId": "tgw-0bf0bffeфаEXAMPLE",
        "OwnerId": "123456789012",
        "Options": {
            "Igmpv2Support": "disable",
            "StaticSourcesSupport": "enable",
            "AutoAcceptSharedAssociations": "disable"
        },
        "State": "pending",
        "CreationTime": "2021-09-29T22:20:19.000Z"
    }
}
```

For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayMulticastDomain in AWS CLI Command Reference.

create-transit-gateway-peering-attachment

The following code example shows how to use create-transit-gateway-peering-attachment.

AWS CLI

To create a transit gateway peering attachment

The following create-transit-gateway-peering-attachment example creates a peering attachment request between the two specified transit gateways.

```
aws ec2 create-transit-gateway-peering-attachment \
  --transit-gateway-id tgw-123abc05e04123abc \
```
AWS Command Line Interface

--peer-transit-gateway-id tgw-11223344aabbcc112 \
--peer-account-id 123456789012 \
--peer-region us-east-2

Output:

```json
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "initiatingRequest",
        "CreationTime": "2019-12-09T11:38:05.000Z"
    }
}
```

For more information, see [Transit Gateway Peering Attachments](#) in the [Transit Gateways Guide](#).

- For API details, see [CreateTransitGatewayPeeringAttachment](#) in [AWS CLI Command Reference](#).

create-transit-gateway-policy-table

The following code example shows how to use `create-transit-gateway-policy-table`.

**AWS CLI**

**To create a transit gateway policy table**

The following `create-transit-gateway-policy-table` example creates a transit gateway policy table for the specified transit gateway.

```bash
aws ec2 create-transit-gateway-policy-table \
    --transit-gateway-id tgw-067f8505c18f0bd6e
```

Output:
The following code example shows how to use `create-transit-gateway-prefix-list-reference`.

**AWS CLI**

To create a reference to a prefix list

The following `create-transit-gateway-prefix-list-reference` example creates a reference to the specified prefix list in the specified transit gateway route table.

```
aws ec2 create-transit-gateway-prefix-list-reference \
--transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
--prefix-list-id pl-11111122222222333 \
--transit-gateway-attachment-id tgw-attach-aaaaaabbbbb11111
```

Output:

```
{
    "TransitGatewayPrefixListReference": {
        "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
        "PrefixListId": "pl-11111122222222333",
        "PrefixListOwnerId": "123456789012",
        "State": "pending",
        "Blackhole": false,
        "TransitGatewayAttachment": {
            "TransitGatewayAttachmentId": "tgw-attach-aaaaaabbbbb11111",
        };
    }
}
```
For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see CreateTransitGatewayPrefixListReference in AWS CLI Command Reference.

create-transit-gateway-route

The following code example shows how to use create-transit-gateway-route.

AWS CLI

To create a transit gateway route

The following create-transit-gateway-route example creates a route, with the specified destination, for the specified route table.

```
aws ec2 create-transit-gateway-route \
    --destination-cidr-block 10.0.2.0/24 \
    --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
    --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```
{
   "Route": {
      "DestinationCidrBlock": "10.0.2.0/24",
      "TransitGatewayAttachments": [
         {
            "ResourceId": "vpc-0065acced4EXAMPLE",
            "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
            "ResourceType": "vpc"
         }
      ],
      "Type": "static",
      "State": "active"
   }
}
```
For more information, see [Transit gateway route tables](https://docs.aws.amazon.com/itTRANSIT_GATEWAYS_GUIDE/latest/userguide/transit-gateway-route-tables.html) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayRoute](https://docs.aws.amazon.com/itAWS_CLI.Command_REFERENCE/latest/userguide/create-transit-gateway-route.html) in *AWS CLI Command Reference*.

### create-transit-gateway-route-table

The following code example shows how to use `create-transit-gateway-route-table`.

#### AWS CLI

**To create a Transit Gateway Route Table**

The following `create-transit-gateway-route-table` example creates a route table for the specified transit gateway.

```bash
aws ec2 create-transit-gateway-route-table \
   --transit-gateway-id tgw-0262a0e521EXAMPLE
```

Output:

```json
{
   "TransitGatewayRouteTable": {
      "TransitGatewayRouteTableId": "tgw-rtb-0960981be7EXAMPLE",
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
      "State": "pending",
      "DefaultAssociationRouteTable": false,
      "DefaultPropagationRouteTable": false,
      "CreationTime": "2019-07-10T19:01:46.000Z"
     }
}
```

For more information, see [Create a transit gateway route table](https://docs.aws.amazon.com/itTRANSIT_GATEWAYS_GUIDE/latest/userguide/create-transit-gateway-route-table.html) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayRouteTable](https://docs.aws.amazon.com/itAWS_CLI.Command_REFERENCE/latest/userguide/create-transit-gateway-route-table.html) in *AWS CLI Command Reference*.

### create-transit-gateway-vpc-attachment

The following code example shows how to use `create-transit-gateway-vpc-attachment`.

#### AWS CLI

**Example 1: To associate a transit gateway with a VPC**
The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC.

```
aws ec2 create-transit-gateway-vpc-attachment \
  --transit-gateway-id tgw-0262a0e521EXAMPLE \
  --vpc-id vpc-07e8ffdf50f49335df \
  --subnet-id subnet-0752213d59EXAMPLE
```

Output:

```
{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8ffdf50fEXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [
      "subnet-0752213d59EXAMPLE"
    ],
    "CreationTime": "2019-07-10T17:33:46.000Z",
    "Options": {
      "DnsSupport": "enable",
      "Ipv6Support": "disable"
    }
  }
}
```

For more information, see [Create a transit gateway attachment to a VPC](#) in the *Transit Gateways Guide*.

**Example 2: To associate a transit gateway with multiple subnets in a VPC**

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC and subnets.

```
aws ec2 create-transit-gateway-vpc-attachment \
  --transit-gateway-id tgw-02f776b1a7EXAMPLE \
  --vpc-id vpc-3EXAMPLE \
  --subnet-ids "subnet-dEXAMPLE" "subnet-6EXAMPLE"
```

Output:
For more information, see [Create a transit gateway attachment to a VPC](#) in the [Transit Gateways Guide](#).

- For API details, see [CreateTransitGatewayVpcAttachment](#) in [AWS CLI Command Reference](#).

**create-verified-access-endpoint**

The following code example shows how to use `create-verified-access-endpoint`.

**AWS CLI**

**To create a Verified Access endpoint**

The following `create-verified-access-endpoint` example creates a Verified Access endpoint for the specified Verified Access group. The specified network interface and security group must belong to the same VPC.

```bash
aws ec2 create-verified-access-endpoint \
  --verified-access-group-id vagr-0dbe967baf14b7235 \
  --endpoint-type network-interface \
  --attachment-type vpc \
  --domain-certificate-arn arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE
```
--application-domain example.com 
--endpoint-domain-prefix my-ava-app 
--security-group-ids sg-004915970c4c8f13a 
--network-interface-options
NetworkInterfaceId=eni-0aec70418c8d87a0f,Protocol=https,Port=443 
--tag-specifications ResourceType=verified-access-endpoint,Tags=[{Key=Name,Value=my-va-endpoint}]

Output:

```json
{
  "VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
    "ApplicationDomain": "example.com",
    "EndpointType": "network-interface",
    "AttachmentType": "vpc",
    "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
    "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
    "SecurityGroupIds": [
      "sg-004915970c4c8f13a"
    ],
    "NetworkInterfaceOptions": {
      "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
      "Protocol": "https",
      "Port": 443
    },
    "Status": {
      "Code": "pending"
    },
    "Description": "",
    "CreationTime": "2023-08-25T20:54:43",
    "LastUpdatedTime": "2023-08-25T20:54:43",
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-va-endpoint"
      }
    ]
  }
}
```
create-verified-access-group

The following code example shows how to use create-verified-access-group.

AWS CLI

To create a Verified Access group

The following create-verified-access-group example creates a Verified Access group for the specified Verified Access instance.

```
aws ec2 create-verified-access-group \
   --verified-access-instance-id vai-0ce000c0b7643abea \ 
   --tag-specifications ResourceType=verified-access-group,Tags= [{Key=Name,Value=my-va-group}]
```

Output:

```
{
   "VerifiedAccessGroup": {
     "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
     "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
     "Description": "",
     "Owner": "123456789012",
     "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
     "CreationTime": "2023-08-25T19:55:19",
     "LastUpdatedTime": "2023-08-25T19:55:19",
     "Tags": [
       {
         "Key": "Name",
         "Value": "my-va-group"
       }
     ]
   }
}```
For more information, see [Verified Access groups](#) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessGroup](#) in *AWS CLI Command Reference*.

### create-verified-access-instance

The following code example shows how to use `create-verified-access-instance`.

**AWS CLI**

**To create a Verified Access instance**

The following `create-verified-access-instance` example creates a Verified Access instance with a Name tag.

```bash
aws ec2 create-verified-access-instance \\
   --tag-specifications ResourceType=verified-access-instance,Tags=[[Key=Name,Value=my-va-instance]]
```

**Output:**

```json
{
  "VerifiedAccessInstance": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "Description": "",
    "VerifiedAccessTrustProviders": [],
    "CreationTime": "2023-08-25T18:27:56",
    "LastUpdatedTime": "2023-08-25T18:27:56",
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-va-instance"
      }
    ]
  }
}
```

For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessInstance](#) in *AWS CLI Command Reference*. 
**create-verified-access-trust-provider**

The following code example shows how to use `create-verified-access-trust-provider`.

**AWS CLI**

**To create a Verified Access trust provider**

The following `create-verified-access-trust-provider` example sets up a Verified Access trust provider using AWS Identity Center.

```bash
aws ec2 create-verified-access-trust-provider \
   --trust-provider-type user \
   --user-trust-provider-type iam-identity-center \
   --policy-reference-name idc \
   --tag-specifications ResourceType=verified-access-trust-provider,Tags=[[Key=Name,Value=my-va-trust-provider]]
```

**Output:**

```json
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T18:40:36",
      "LastUpdatedTime": "2023-08-25T18:40:36",
      "Tags": [
         {
            "Key": "Name",
            "Value": "my-va-trust-provider"
         }
      ]
   }
}
```

For more information, see [Trust providers for Verified Access](https://docs.aws.amazon.com/verified-access-user-guide/latest/userguide/trust_providers.html) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessTrustProvider](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-verified-access-trust-provider.html) in *AWS CLI Command Reference*. 
**create-volume**

The following code example shows how to use create-volume.

**AWS CLI**

**To create an empty General Purpose SSD (gp2) volume**

The following create-volume example creates an 80 GiB General Purpose SSD (gp2) volume in the specified Availability Zone. Note that the current Region must be us-east-1, or you can add the --region parameter to specify the Region for the command.

```bash
aws ec2 create-volume \
   --volume-type gp2 \ 
   --size 80 \ 
   --availability-zone us-east-1a
```

Output:

```json
{
   "AvailabilityZone": "us-east-1a",
   "Tags": [],
   "Encrypted": false,
   "VolumeType": "gp2",
   "VolumeId": "vol-1234567890abcdef0",
   "State": "creating",
   "Iops": 240,
   "SnapshotId": "",
   "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
   "Size": 80
}
```

If you do not specify a volume type, the default volume type is gp2.

```bash
aws ec2 create-volume \
   --size 80 \ 
   --availability-zone us-east-1a
```

**Example 2: To create a Provisioned IOPS SSD (io1) volume from a snapshot**

The following create-volume example creates a Provisioned IOPS SSD (io1) volume with 1000 provisioned IOPS in the specified Availability Zone using the specified snapshot.
aws ec2 create-volume \
  --volume-type io1 \
  --iops 1000 \
  --snapshot-id snap-066877671789bd71b \
  --availability-zone us-east-1a

Output:

{
  "AvailabilityZone": "us-east-1a",
  "Tags": [],
  "Encrypted": false,
  "VolumeType": "io1",
  "VolumeId": "vol-1234567890abcdef0",
  "State": "creating",
  "Iops": 1000,
  "SnapshotId": "snap-066877671789bd71b",
  "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
  "Size": 500
}

Example 3: To create an encrypted volume

The following `create-volume` example creates an encrypted volume using the default CMK for EBS encryption. If encryption by default is disabled, you must specify the `--encrypted` parameter as follows.

aws ec2 create-volume \
  --size 80 \
  --encrypted \
  --availability-zone us-east-1a

Output:

{
  "AvailabilityZone": "us-east-1a",
  "Tags": [],
  "Encrypted": true,
  "VolumeType": "gp2",
  "VolumeId": "vol-1234567890abcdef0",
  "State": "creating",
}
If encryption by default is enabled, the following example command creates an encrypted volume, even without the --encrypted parameter.

```bash
aws ec2 create-volume \
  --size 80 \
  --availability-zone us-east-1a
```

If you use the --kms-key-id parameter to specify a customer managed CMK, you must specify the --encrypted parameter even if encryption by default is enabled.

```bash
aws ec2 create-volume \
  --volume-type gp2 \
  --size 80 \
  --encrypted \n  --kms-key-id 0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE \n  --availability-zone us-east-1a
```

**Example 4: To create a volume with tags**

The following `create-volume` example creates a volume and adds two tags.

```bash
aws ec2 create-volume \
  --availability-zone us-east-1a \
  --volume-type gp2 \
  --size 80 \
  --tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production}, {Key=cost-center,Value=cc123}]'
```

- For API details, see [CreateVolume](https://docs.aws.amazon.com/cli/latest/reference/ec2/create-volume.html) in *AWS CLI Command Reference*.

**create-vpc-endpoint**

The following code example shows how to use `create-vpc-endpoint`.
AWS CLI

Example 1: To create a gateway endpoint

The following create-vpc-endpoint example creates a gateway VPC endpoint between VPC vpc-1a2b3c4d and Amazon S3 in the us-east-1 region, and associates route table rtb-11aa22bb with the endpoint.

```
aws ec2 create-vpc-endpoint \
    --vpc-id vpc-1a2b3c4d \
    --service-name com.amazonaws.us-east-1.s3 \
    --route-table-ids rtb-11aa22bb
```

Output:

```
{
    "VpcEndpoint": {
        "PolicyDocument": "{"Version":"2008-10-17","Statement":[{"Sid":"","Effect":"Allow","Principal":"*","Action":"*","Resource":"*"}]",
        "VpcId": "vpc-1a2b3c4d",
        "State": "available",
        "ServiceName": "com.amazonaws.us-east-1.s3",
        "RouteTableIds": [
            "rtb-11aa22bb"
        ],
        "VpcEndpointId": "vpc-1a2b3c4d",
        "CreationTimestamp": "2015-05-15T09:40:50Z"
    }
}
```

For more information, see Creating a gateway endpoint in the AWSPrivateLink Guide.

Example 2: To create an interface endpoint

The following create-vpc-endpoint example creates an interface VPC endpoint between VPC vpc-1a2b3c4d and Amazon S3 in the us-east-1 region. The command creates the endpoint in subnet subnet-1a2b3c4d, associates it with security group sg-1a2b3c4d, and adds a tag with a key of "Service" and a Value of "S3".

```
aws ec2 create-vpc-endpoint \
    --vpc-id vpc-1a2b3c4d \
```
--vpc-endpoint-type Interface \n--service-name com.amazonaws.us-east-1.s3 \n--subnet-ids subnet-7b16de0c \n--security-group-id sg-1a2b3c4d \n--tag-specifications ResourceType=vpc-endpoint,Tags=VpcEndpoint	VpcEndpointId=x-1a2b3c4d5e6f1a2b3,VpcEndpointType=Interface,VpcId=x-1a2b3c4d,ServiceName=com.amazonaws.us-east-1.s3,State=pending,RouteTableIds=[],SubnetIds=[subnet-1a2b3c4d],Groups=[],PrivateDnsEnabled=false,RequesterManaged=false,NetworkInterfaceIds=[eni-0b16f0581c8ac6877],DnsEntries=[],CreationTimestamp="2021-03-05T14:46:16.030000+00:00"
For more information, see Creating an interface endpoint in the User Guide for AWSPrivateLink.

**Example 3: To create a Gateway Load Balancer endpoint**

The following create-vpc-endpoint example creates a Gateway Load Balancer endpoint between VPC vpc-111122223333aabbc and and a service that is configured using a Gateway Load Balancer.

```
aws ec2 create-vpc-endpoint \
  --service-name com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123 \
  --vpc-endpoint-type GatewayLoadBalancer \
  --vpc-id vpc-111122223333aabbc \
  --subnet-ids subnet-0011aabbcc2233445
```

Output:

```
{
  "VpcEndpoint": {
    "VpcEndpointId": "vpce-aabbaabbaabbaabba",
    "VpcEndpointType": "GatewayLoadBalancer",
    "VpcId": "vpc-111122223333aabbc",
    "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
    "State": "pending",
    "SubnetIds": [
      "subnet-0011aabbcc2233445"
    ],
    "RequesterManaged": false,
    "NetworkInterfaceIds": [
      "eni-01010120203030405"
    ],
    "CreationTimestamp": "2020-11-11T08:06:03.522Z",
    "OwnerId": "123456789012"
  }
}
For more information, see Gateway Load Balancer endpoints in the User Guide for AWS PrivateLink.

- For API details, see CreateVpcEndpoint in AWS CLI Command Reference.

create-vpc-endpoint-connection-notification

The following code example shows how to use create-vpc-endpoint-connection-notification.

**AWS CLI**

To create an endpoint connection notification

This example creates a notification for a specific endpoint service that alerts you when interface endpoints have connected to your service and when endpoints have been accepted for your service.

Command:

```bash
```

Output:

```json
{
    "ConnectionNotification": {
        "ConnectionNotificationState": "Enabled",
        "ConnectionNotificationType": "Topic",
        "ServiceId": "vpce-svc-1237881c0d25a3abc",
        "ConnectionEvents": [
            "Accept",
            "Connect"
        ],
        "ConnectionNotificationId": "vpce-nfn-008776de7e03f5abc",
    }
}
```
create-vpc-endpoint-service-configuration

The following code example shows how to use create-vpc-endpoint-service-configuration.

AWS CLI

Example 1: To create an endpoint service configuration for an interface endpoint

The following create-vpc-endpoint-service-configuration example creates a VPC endpoint service configuration using the Network Load Balancer nlb-vpce. This example also specifies that requests to connect to the service through an interface endpoint must be accepted.

```bash
aws ec2 create-vpc-endpoint-service-configuration
   --network-load-balancer-arns arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532
   --acceptance-required
```

Output:

```json
{
   "ServiceConfiguration": {
      "ServiceType": [
         {
            "ServiceType": "Interface"
         }
      ],
      "NetworkLoadBalancerArns": [
         "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532"
      ],
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-03d5ebb7d9579a2b3",
      "ServiceState": "Available",
      "ServiceId": "vpce-svc-03d5ebb7d9579a2b3",
   }
}
```
Example 2: To create an endpoint service configuration for a Gateway Load Balancer endpoint

The following create-vpc-endpoint-service-configuration example creates a VPC endpoint service configuration using the Gateway Load Balancer GWLBService. Requests to connect to the service through a Gateway Load Balancer endpoint are automatically accepted.

```bash
aws ec2 create-vpc-endpoint-service-configuration \
   --gateway-load-balancer-arns arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/GWLBService/123123123123abcc \
   --no-acceptance-required
```

Output:

```json
{
   "ServiceConfiguration": {
      "ServiceType": [
         {
            "ServiceType": "GatewayLoadBalancer"
         }
      ],
      "ServiceId": "vpce-svc-123123a1c43abc123",
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
      "ServiceState": "Available",
      "AvailabilityZones": [
         "us-east-1d"
      ],
      "AcceptanceRequired": false,
      "ManagesVpcEndpoints": false,
      "GatewayLoadBalancerArns": [
         "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/GWLBService/123123123123abcc"
      ]
   }
}
```
create-vpc-peering-connection

The following code example shows how to use create-vpc-peering-connection.

AWS CLI

To create a VPC peering connection between your VPCs

This example requests a peering connection between your VPCs vpc-1a2b3c4d and vpc-11122233.

Command:

```bash
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233
```

Output:

```json
{
   "VpcPeeringConnection": {
      "Status": {
         "Message": "Initiating Request to 444455556666",
         "Code": "initiating-request"
      },
      "Tags": [],
      "RequesterVpcInfo": {
         "OwnerId": "444455556666",
         "VpcId": "vpc-1a2b3c4d",
         "CidrBlock": "10.0.0.0/28"
      },
      "VpcPeeringConnectionId": "pcx-111aaa111",
      "ExpirationTime": "2014-04-02T16:13:36.000Z",
      "AccepterVpcInfo": {
         "OwnerId": "444455556666",
         "VpcId": "vpc-11122233",
         "CidrBlock": "10.0.0.0/28"
      }
   }
}
```
To create a VPC peering connection with a VPC in another account

This example requests a peering connection between your VPC (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012.

Command:

```bash
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-owner-id 123456789012
```

To create a VPC peering connection with a VPC in a different region

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) in your account in the us-west-2 region.

Command:

```bash
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-region us-west-2
```

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012 that's in the us-west-2 region.

Command:

```bash
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id vpc-11122233 --peer-owner-id 123456789012 --peer-region us-west-2
```

- For API details, see [CreateVpcPeeringConnection](#) in AWS CLI Command Reference.

create-vpn-connection

The following code example shows how to use create-vpn-connection.
Example 1: To create a VPN connection with dynamic routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway, and applies tags to the VPN connection. The output includes the configuration information for your customer gateway device, in XML format.

```bash
aws ec2 create-vpn-connection \
   --type ipsec.1 \
   --customer-gateway-id cgw-001122334455aabbcc \
   --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
   --tag-specification 'ResourceType=vpn-connection,Tags=[{Key=Name,Value=BGP-VPN}]'
```

Output:

```
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-001122334455aabbcc",
      "Category": "VPN",
      "State": "pending",
      "VpnConnectionId": "vpn-123123123123123abcaab",
      "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
      "Options": {
         "EnableAcceleration": false,
         "StaticRoutesOnly": false,
         "LocalIpv4NetworkCidr": "0.0.0.0/0",
         "RemoteIpv4NetworkCidr": "0.0.0.0/0",
         "TunnelInsideIpVersion": "ipv4",
         "TunnelOptions": [
            {},
            {}]
      },
      "Routes": [],
      "Tags": [
         {
            "Key": "Name",
            "Value": "BGP-VPN"
         }
      ]
   }
}
```
For more information, see [How AWS Site-to-Site VPN works](https://aws.amazon.com/solutions/vpn) in the *AWS Site-to-Site VPN User Guide*.

**Example 2: To create a VPN connection with static routing**

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The options specify static routing. The output includes the configuration information for your customer gateway device, in XML format.

```bash
aws ec2 create-vpn-connection \
  --type ipsec.1 \
  --customer-gateway-id cgw-001122334455aabbc \
  --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
  --options "{"StaticRoutesOnly":true}"
```

**Output:**

```json
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "..configuration information...",
        "CustomerGatewayId": "cgw-001122334455aabbc",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-123123123123abcab",
        "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
        "Options": {
            "EnableAcceleration": false,
            "StaticRoutesOnly": true,
            "LocalIpv4NetworkCidr": "0.0.0.0/0",
            "RemoteIpv4NetworkCidr": "0.0.0.0/0",
            "TunnelInsideIpVersion": "ipv4",
            "TunnelOptions": [
                {},
                {}]
        }
    }
}
```
For more information, see [How AWS Site-to-Site VPN works](https://aws.amazon.com/documentation/sitetosite-vpn/) in the [AWS Site-to-Site VPN User Guide](https://aws.amazon.com/documentation/sitetosite-vpn/).

**Example 3: To create a VPN connection and specify your own inside CIDR and pre-shared key**

The following `create-vpn-connection` example creates a VPN connection and specifies the inside IP address CIDR block and a custom pre-shared key for each tunnel. The specified values are returned in the `CustomerGatewayConfiguration` information.

```bash
code
aws ec2 create-vpn-connection \
  --type ipsec.1 \
  --customer-gateway-id cgw-001122334455aabbc \
  --vpn-gateway-id vgw-1a1a1a1a1a2b2b2 \
  --options 
  TunnelOptions='[{TunnelInsideCidr=169.254.12.0/30,PreSharedKey=ExamplePreSharedKey1},
  {TunnelInsideCidr=169.254.13.0/30,PreSharedKey=ExamplePreSharedKey2}]'
```

Output:

```json
{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "..configuration information...",
    "CustomerGatewayId": "cgw-001122334455aabbc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-123123123123abcab",
    "VpnGatewayId": "vgw-1a1a1a1a1a2b2b2",
    "Options": {
      "EnableAcceleration": false,
      "StaticRoutesOnly": false,
      "LocalIpv4NetworkCidr": "0.0.0.0/0",
      "RemoteIpv4NetworkCidr": "0.0.0.0/0",
      "TunnelInsideIpVersion": "ipv4",
      "TunnelOptions": [
        {
          "OutsideIpAddress": "203.0.113.3",
          "TunnelInsideCidr": "169.254.12.0/30",
```
"PreSharedKey": "ExamplePreSharedKey1"
},
{
    "OutsideIpAddress": "203.0.113.5",
    "TunnelInsideCidr": "169.254.13.0/30",
    "PreSharedKey": "ExamplePreSharedKey2"
}
],
"Routes": [
"Tags": []
}
}

For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/siteto-site/latest/dg/how-aws-site-to-site-vpn-works.html) in the *AWS Site-to-Site VPN User Guide*.

**Example 4: To create a VPN connection that supports IPv6 traffic**

The following `create-vpn-connection` example creates a VPN connection that supports IPv6 traffic between the specified transit gateway and specified customer gateway. The tunnel options for both tunnels specify that AWS must initiate the IKE negotiation.

```
aws ec2 create-vpn-connection \
    --type ipsec.1 \
    --transit-gateway-id tgw-12312312312312312 \
    --customer-gateway-id cgw-001122334455aabb \
    --options TunnelInsideIpVersion=ipv6,TunnelOptions=[{StartupAction=start},
    {StartupAction=start}]
```

**Output:**

```
{
    "VpnConnection": { 
        "CustomerGatewayConfiguration": "..configuration information...",
        "CustomerGatewayId": "cgw-001122334455aabb",
        "Category": "VPN",
        "State": "pending",
        "VpnConnectionId": "vpn-111111111122222222",
        "TransitGatewayId": "tgw-12312312312312312",
        "Options": { 
            "EnableAcceleration": false,
```
For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpn/latest/sitetosite-vpn/how-site-to-site-vpn-works.html) in the [AWS Site-to-Site VPN User Guide](https://docs.aws.amazon.com/vpn/latest/sitetosite-vpn/).

### create-vpn-connection-route

The following code example shows how to use `create-vpn-connection-route`.

**AWS CLI**

To create a static route for a VPN connection

This example creates a static route for the specified VPN connection. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 create-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

**create-vpn-gateway**

The following code example shows how to use `create-vpn-gateway`.

**AWS CLI**

**To create a virtual private gateway**

This example creates a virtual private gateway.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1
```

Output:

```
{
    "VpnGateway": {
        "AmazonSideAsn": 64512,
        "State": "available",
        "Type": "ipsec.1",
        "VpnGatewayId": "vgw-944cafe3",
        "VpcAttachments": []
    }
}
```

**To create a virtual private gateway with a specific Amazon-side ASN**

This example creates a virtual private gateway and specifies the Autonomous System Number (ASN) for the Amazon side of the BGP session.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1 --amazon-side-asn 65001
```

Output:

```
{
    "VpnGateway": {
        "AmazonSideAsn": 65001,
        "State": "available",
        "Type": "ipsec.1",
```
"VpnGatewayId": "vgw-9a4cacf3",
"VpcAttachments": []
}
}

- For API details, see CreateVpnGateway in AWS CLI Command Reference.

delete-carrier-gateway

The following code example shows how to use delete-carrier-gateway.

AWS CLI

To delete your carrier gateway

The following delete-carrier-gateway example deletes the specified carrier gateway.

aws ec2 delete-carrier-gateway \
   --carrier-gateway-id cagw-0465cdEXAMPLE1111

Output:

{
   "CarrierGateway": {
      "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
      "VpcId": "vpc-0c529aEXAMPLE1111",
      "State": "deleting",
      "OwnerId": "123456789012"
   }
}

For more information, see Carrier gateways in the Amazon Virtual Private Cloud User Guide.

- For API details, see DeleteCarrierGateway in AWS CLI Command Reference.

delete-client-vpn-endpoint

The following code example shows how to use delete-client-vpn-endpoint.

AWS CLI

To delete a Client VPN endpoint
The following `delete-client-vpn-endpoint` example deletes the specified Client VPN endpoint.

```bash
aws ec2 delete-client-vpn-endpoint
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
    "Status": {
        "Code": "deleting"
    }
}
```

For more information, see [Client VPN Endpoints](https://docs.aws.amazon.com/vpc/latest/clientvpn行政指南.html) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DeleteClientVpnEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-client-vpn-endpoint.html) in *AWS CLI Command Reference*.

**delete-client-vpn-route**

The following code example shows how to use `delete-client-vpn-route`.

**AWS CLI**

**To delete a route for a Client VPN endpoint**

The following `delete-client-vpn-route` example deletes the `0.0.0.0/0` route for the specified subnet of a Client VPN endpoint.

```bash
aws ec2 delete-client-vpn-route
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
  --destination-cidr-block 0.0.0.0/0
  --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```json
{
    "Status": {
        "Code": "deleting"
    }
}
```
For more information, see Routes in the AWS Client VPN Administrator Guide.

- For API details, see DeleteClientVpnRoute in AWS CLI Command Reference.

delete-coip-cidr

The following code example shows how to use delete-coip-cidr.

AWS CLI

To delete a range of customer-owned IP (CoIP) addresses

The following delete-coip-cidr example deletes the specified range of CoIP addresses in the specified CoIP pool.

```bash
aws ec2 delete-coip-cidr 
   --cidr 14.0.0.0/24 
   --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```json
{
   "CoipCidr": {
      "Cidr": "14.0.0.0/24",
      "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"
   }
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DeleteCoipCidr in AWS CLI Command Reference.

delete-coip-pool

The following code example shows how to use delete-coip-pool.

AWS CLI

To delete a pool of customer-owned IP (CoIP) addresses
The following delete-coip-pool example deletes a CoIP pool of CoIP addresses.

```bash
aws ec2 delete-coip-pool
   --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```json
{
   "CoipPool": {
      "PoolId": "ipv4pool-coip-1234567890abcdefg",
      "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
   }
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DeleteCoipPool in AWS CLI Command Reference.

**delete-customer-gateway**

The following code example shows how to use delete-customer-gateway.

**AWS CLI**

**To delete a customer gateway**

This example deletes the specified customer gateway. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-customer-gateway --customer-gateway-id cgw-0e11f167
```

- For API details, see DeleteCustomerGateway in AWS CLI Command Reference.

**delete-dhcp-options**

The following code example shows how to use delete-dhcp-options.
AWS CLI

To delete a DHCP options set

This example deletes the specified DHCP options set. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-dhcp-options --dhcp-options-id dopt-d9070ebb
```

- For API details, see [DeleteDhcpOptions](https://aws.amazon.com/cli) in *AWS CLI Command Reference*.

delete-egress-only-internet-gateway

The following code example shows how to use `delete-egress-only-internet-gateway`.

AWS CLI

To delete an egress-only Internet gateway

This example deletes the specified egress-only Internet gateway.

Command:

```
aws ec2 delete-egress-only-internet-gateway --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

Output:

```
{
   "ReturnCode": true
}
```

- For API details, see [DeleteEgressOnlyInternetGateway](https://aws.amazon.com/cli) in *AWS CLI Command Reference*.

delete-fleets

The following code example shows how to use `delete-fleets`.
Example 1: To delete an EC2 Fleet and terminate the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet and terminates the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 delete-fleets \
   --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
   --terminate-instances
```

Output:

```json
{
   "SuccessfulFleetDeletions": [
       {
           "CurrentFleetState": "deleted_terminating",
           "PreviousFleetState": "active",
           "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
       }
   ],
   "UnsuccessfulFleetDeletions": []
}
```

For more information, see [Delete an EC2 Fleet](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/AmazonEC2CLIDeleteFleets.html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To delete an EC2 Fleet without terminating the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet without terminating the associated On-Demand Instances and Spot Instances.

```bash
aws ec2 delete-fleets \
   --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
   --no-terminate-instances
```

Output:

```json
{
   "SuccessfulFleetDeletions": [
       {

```
"CurrentFleetState": "deleted_running",
"PreviousFleetState": "active",
"FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}],
"UnsuccessfulFleetDeletions": []
}

For more information, see [Delete an EC2 Fleet](https://docs.aws.amazon.com/elasticache/latest/mdb/(deleting-ec2-fleets).html) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DeleteFleets](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-fleets.html) in *AWS CLI Command Reference*.

### delete-flow-logs

The following code example shows how to use `delete-flow-logs`.

**AWS CLI**

**To delete a flow log**

The following `delete-flow-logs` example deletes the specified flow log.

```bash
aws ec2 delete-flow-logs --flow-log-id fl-1123345567789
```

**Output:**

```json
{
  "Unsuccessful": []
}
```

- For API details, see [DeleteFlowLogs](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-flow-logs.html) in *AWS CLI Command Reference*.

### delete-fpga-image

The following code example shows how to use `delete-fpga-image`.

**AWS CLI**

**To delete an Amazon FPGA image**

This example deletes the specified AFI.
Command:

```bash
aws ec2 delete-fpga-image --fpga-image-id afi-06b12350a123fbabc
```

Output:

```json
{
   "Return": true
}
```

- For API details, see [DeleteFpgaImage](#) in [AWS CLI Command Reference](#).

**delete-instance-connect-endpoint**

The following code example shows how to use `delete-instance-connect-endpoint`.

**AWS CLI**

**To delete an EC2 Instance Connect Endpoint**

The following `delete-instance-connect-endpoint` example deletes the specified EC2 Instance Connect Endpoint.

```bash
aws ec2 delete-instance-connect-endpoint \\
   --instance-connect-endpoint-id eice-03f5e49b83924bbc7
```

Output:

```json
{
   "InstanceConnectEndpoint": {
      "OwnerId": "111111111111",
      "InstanceConnectEndpointId": "eice-0123456789example",
      "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
      "State": "delete-in-progress",
      "StateMessage": ",",
      "NetworkInterfaceIds": [],
      "VpcId": "vpc-0123abcd",
      "AvailabilityZone": "us-east-1d",
      "CreatedAt": "2023-02-07T12:05:37+00:00",
      "SubnetId": "subnet-0123abcd"
   }
}
```
For more information, see Remove EC2 Instance Connect Endpoint in the Amazon EC2 User Guide.

- For API details, see DeleteInstanceConnectEndpoint in AWS CLI Command Reference.

delete-instance-event-window

The following code example shows how to use delete-instance-event-window.

AWS CLI

Example 1: To delete an event window

The following delete-instance-event-window example deletes an event window.

```bash
aws ec2 delete-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890
```

Output:

```
{
   "InstanceEventWindowState": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "State": "deleting"
   }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

Example 2: To force delete an event window

The following delete-instance-event-window example force deletes an event window if the event window is currently associated with targets.

```bash
aws ec2 delete-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
```

Actions and scenarios
--force-delete

Output:

```json
{
    "InstanceEventWindowState": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "State": "deleting"
    }
}
```

For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see DeleteInstanceEventWindow in AWS CLI Command Reference.

**delete-internet-gateway**

The following code example shows how to use delete-internet-gateway.

**AWS CLI**

**To delete an internet gateway**

The following delete-internet-gateway example deletes the specified internet gateway.

```bash
aws ec2 delete-internet-gateway \
    --internet-gateway-id igw-0d0fb496b3EXAMPLE
```

This command produces no output.

For more information, see Internet gateways in the Amazon VPC User Guide.

- For API details, see DeleteInternetGateway in AWS CLI Command Reference.

**delete-ipam**

The following code example shows how to use delete-ipam.

**AWS CLI**

**To delete an IPAM**
The following delete-ipam example deletes an IPAM.

```bash
aws ec2 delete-ipam \
  --ipam-id ipam-036486dfa6af58ee0
```

Output:

```json
{
  "Ipam": {
    "OwnerId": "123456789012",
    "IpamId": "ipam-036486dfa6af58ee0",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
    "IpamRegion": "us-east-1",
    "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
    "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
    "ScopeCount": 2,
    "OperatingRegions": [
      {
        "RegionName": "us-east-1"
      },
      {
        "RegionName": "us-east-2"
      },
      {
        "RegionName": "us-west-1"
      }
    ],
    "State": "delete-in-progress"
  }
}
```

For more information, see Delete an IPAM in the Amazon VPC IPAM User Guide.

- For API details, see Deletelipam in AWS CLI Command Reference.

**delete-ipam-scope**

The following code example shows how to use delete-ipam-scope.
The following delete-ipam-scope example deletes an IPAM.

```
aws ec2 delete-ipam-scope \
   --ipam-scope-id ipam-scope-01c1ebab2b63bd7e4
```

Output:

```
{
   "IpamScope": {
       "OwnerId": "123456789012",
       "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
       "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-01c1ebab2b63bd7e4",
       "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
       "IpamRegion": "us-east-1",
       "IpamScopeType": "private",
       "IsDefault": false,
       "Description": "Example description",
       "PoolCount": 0,
       "State": "delete-in-progress"
   }
}
```

For more information, see [Delete a scope](http://aws.amazon.com) in the Amazon VPC IPAM User Guide.

- For API details, see [DeleteIpamScope](http://aws.amazon.com) in AWS CLI Command Reference.

---

**delete-launch-template-versions**

The following code example shows how to use delete-launch-template-versions.

**AWS CLI**

**To delete a launch template version**

This example deletes the specified launch template version.

**Command:**

```
aws ec2 delete-launch-template-versions --launch-template-id lt-0abcd290751193123 --versions 1
```
Output:

```
{
    "UnsuccessfullyDeletedLaunchTemplateVersions": [],
    "SuccessfullyDeletedLaunchTemplateVersions": [
    {
        "LaunchTemplateName": "TestVersion",
        "VersionNumber": 1,
        "LaunchTemplateId": "lt-0abcd290751193123"
    }
    ]
}
```

- For API details, see [DeleteLaunchTemplateVersions](#) in AWS CLI Command Reference.

### delete-local-gateway-route

The following code example shows how to use `delete-local-gateway-route`.

**AWS CLI**

#### To delete a route from a local gateway route table

The following `delete-local-gateway-route` example deletes the specified route from the specified local gateway route table.

```
aws ec2 delete-local-gateway-route \ 
    --destination-cidr-block 0.0.0.0/0 \ 
    --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
    "Route": {
        "DestinationCidrBlock": "0.0.0.0/0",
        "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
        "Type": "static",
        "State": "deleted",
        "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
    }
}
```
For API details, see `DeleteLocalGatewayRoute` in *AWS CLI Command Reference*.

### delete-local-gateway-route-table

The following code example shows how to use `delete-local-gateway-route-table`.

**AWS CLI**

**To delete a local gateway route table**

The following `delete-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```bash
aws ec2 delete-local-gateway-route-table \
  --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

**Output:**

```json
{
  "LocalGatewayRouteTable": {
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
    "OwnerId": "111122223333",
    "State": "deleting",
    "Tags": [],
    "Mode": "direct-vpc-routing"
  }
}
```

For more information, see [Local gateway route tables](https://docs.aws.amazon.com/AWSE Outposts User Guide) in the *AWS Outposts User Guide*.

For API details, see `DeleteLocalGatewayRouteTable` in *AWS CLI Command Reference*.

### delete-local-gateway-route-table-virtual-interface-group-association

The following code example shows how to use `delete-local-gateway-route-table-virtual-interface-group-association`.

...
AWS CLI

To disassociate a local gateway route table from a virtual interfaces (VIFs) group

The following delete-local-gateway-route-table-virtual-interface-group-association example deletes the association between the specified local gateway route table and VIF group.

```bash
aws ec2 delete-local-gateway-route-table-virtual-interface-group-association \
   --local-gateway-route-table-virtual-interface-group-association-id lgw-vif-grp-assoc-exampleid12345678
```

Output:

```json
{
   "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
      "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-exampleid12345678",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
      "LocalGatewayId": "lgw-exampleid11223344",
      "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
      "OwnerId": "111122223333",
      "State": "disassociating",
      "Tags": []
   }
}
```

For more information, see [VIF group associations](#) in the [AWS Outposts User Guide](#).

- For API details, see [DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation](#) in [AWS CLI Command Reference](#).

delte-local-gateway-route-table-vpc-association

The following code example shows how to use delete-local-gateway-route-table-vpc-association.

AWS CLI

To disassociate a local gateway route table from a VPC
The following `delete-local-gateway-route-table-vpc-association` example deletes the association between the specified local gateway route table and VPC.

```bash
aws ec2 delete-local-gateway-route-table-vpc-association \
--local-gateway-route-table-vpc-association-id vpc-example0123456789
```

Output:

```
{
  "LocalGatewayRouteTableVpcAssociation": {
    "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-abcd1234wxyz56789",
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:555555555555:local-gateway-route-table/lgw-rtb-abcdefg1234567890",
    "LocalGatewayId": "lgw-exampleid01234567",
    "VpcId": "vpc-example0123456789",
    "OwnerId": "555555555555",
    "State": "disassociating"
  }
}
```

For more information, see [VPC associations](https://docs.aws.amazon.com/AWSECD出色s/2019-11-15/APIReference/API_DeleteLocalGatewayRouteTableVpcAssociation.html) in the *AWS Outposts User Guide*.

- For API details, see [DeleteLocalGatewayRouteTableVpcAssociation](https://awscli.amazonaws.com/v2/documentation/api/current/reference/services/ec2/operation/DeleteLocalGatewayRouteTableVpcAssociation.html) in *AWS CLI Command Reference*.

### delete-managed-prefix-list

The following code example shows how to use `delete-managed-prefix-list`.

**AWS CLI**

**To delete a prefix list**

The following `delete-managed-prefix-list` example deletes the specified prefix list.

```bash
aws ec2 delete-managed-prefix-list \
--prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
}
```
"PrefixList": {
    "PrefixListId": "pl-0123456abcabc1",
    "AddressFamily": "IPv4",
    "State": "delete-in-progress",
    "PrefixListName": "test",
    "MaxEntries": 10,
    "Version": 1,
    "OwnerId": "123456789012"
}

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see DeleteManagedPrefixList in AWS CLI Command Reference.

**delete-nat-gateway**

The following code example shows how to use `delete-nat-gateway`.

**AWS CLI**

**To delete a NAT gateway**

This example deletes NAT gateway `nat-04ae55e711cec5680`.

Command:

```
aws ec2 delete-nat-gateway --nat-gateway-id nat-04ae55e711cec5680
```

Output:

```
{
    "NatGatewayId": "nat-04ae55e711cec5680"
}
```

- For API details, see DeleteNatGateway in AWS CLI Command Reference.

**delete-network-acl**

The following code example shows how to use `delete-network-acl`.

Actions and scenarios
AWS CLI

To delete a network ACL

This example deletes the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl --network-acl-id acl-5fb85d36
```

- For API details, see `DeleteNetworkAcl` in *AWS CLI Command Reference*.

delete-network-acl-entry

The following code example shows how to use delete-network-acl-entry.

AWS CLI

To delete a network ACL entry

This example deletes ingress rule number 100 from the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100
```

- For API details, see `DeleteNetworkAclEntry` in *AWS CLI Command Reference*.

delete-network-insights-access-scope

The following code example shows how to use delete-network-insights-access-scope.

AWS CLI

To delete a Network Access Scope

The following delete-network-insights-access-scope example deletes the specified Network Access Scope.
aws ec2 delete-network-insights-access-scope \ 
   --network-insights-access-scope-id nis-123456789abc01234

Output:

```
{
   "NetworkInsightsAccessScopeId": "nis-123456789abc01234"
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see DeleteNetworkInsightsAccessScope in AWS CLI Command Reference.

delete-network-insights-access-scope-analysis

The following code example shows how to use delete-network-insights-access-scope-analysis.

AWS CLI

To delete a Network Access Scope analysis

The following delete-network-insights-access-scope-analysis example deletes the specified Network Access Scope analysis.

aws ec2 delete-network-insights-access-scope-analysis \ 
   --network-insights-access-scope-analysis-id nisa-01234567891abcdef

Output:

```
{
   "NetworkInsightsAccessScopeAnalysisId": "nisa-01234567891abcdef"
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see DeleteNetworkInsightsAccessScopeAnalysis in AWS CLI Command Reference.
delete-network-insights-analysis

The following code example shows how to use delete-network-insights-analysis.

**AWS CLI**

**To delete a path analysis**

The following delete-network-insights-analysis example deletes the specified analysis.

```
aws ec2 delete-network-insights-analysis \
   --network-insights-analysis-id nia-02207aa13eb480c7a
```

Output:

```
{
   "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a"
}
```

For more information, see [Getting started using the AWS CLI](#) in the *Reachability Analyzer Guide*.

- For API details, see [DeleteNetworkInsightsAnalysis](#) in *AWS CLI Command Reference*.

delete-network-insights-path

The following code example shows how to use delete-network-insights-path.

**AWS CLI**

**To delete a path**

The following delete-network-insights-path example deletes the specified path. Before you can delete a path, you must delete all its analyses using the delete-network-insights-analysis command.

```
aws ec2 delete-network-insights-path \
   --network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
}
```
For more information, see Getting started using the AWS CLI in the Reachability Analyzer Guide. • For API details, see DeleteNetworkInsightsPath in AWS CLI Command Reference.

delete-network-interface

The following code example shows how to use delete-network-interface.

AWS CLI

To delete a network interface

This example deletes the specified network interface. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 delete-network-interface --network-interface-id eni-e5aa89a3
```

• For API details, see DeleteNetworkInterface in AWS CLI Command Reference.

delete-network-interface-permission

The following code example shows how to use delete-network-interface-permission.

AWS CLI

To delete a network interface permission

This example deletes the specified network interface permission.

Command:

```bash
aws ec2 delete-network-interface-permission --network-interface-permission-id eni-perm-06fd19020ede149ea
```

Output:

```json
{
}
```
For API details, see `DeleteNetworkInterfacePermission` in *AWS CLI Command Reference*.

**delete-placement-group**

The following code example shows how to use `delete-placement-group`.

**AWS CLI**

To delete a placement group

This example command deletes the specified placement group.

Command:

```bash
aws ec2 delete-placement-group --group-name my-cluster
```

For API details, see `DeletePlacementGroup` in *AWS CLI Command Reference*.

**delete-queued-reserved-instances**

The following code example shows how to use `delete-queued-reserved-instances`.

**AWS CLI**

To delete a queued purchase

The following `delete-queued-reserved-instances` example deletes the specified Reserved Instance, which was queued for purchase.

```bash
aws ec2 delete-queued-reserved-instances \
    --reserved-instances-ids af9f760e-6f91-4559-85f7-4980eexample
```

Output:

```json
{
    "SuccessfulQueuedPurchaseDeletions": [
        {
```
For API details, see `DeleteQueuedReservedInstances` in *AWS CLI Command Reference*.

**delete-route**

The following code example shows how to use `delete-route`.

**AWS CLI**

To delete a route

This example deletes the specified route from the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-route --route-table-id rtb-22574640 --destination-cidr-block 0.0.0.0/0
```

For API details, see `DeleteRoute` in *AWS CLI Command Reference*.

**delete-route-table**

The following code example shows how to use `delete-route-table`.

**AWS CLI**

To delete a route table

This example deletes the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-route-table --route-table-id rtb-22574640
```

For API details, see `DeleteRouteTable` in *AWS CLI Command Reference*. 
delete-spot-datafeed-subscription

The following code example shows how to use delete-spot-datafeed-subscription.

AWS CLI

To cancel a Spot Instance data feed subscription

This example command deletes a Spot data feed subscription for the account. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-spot-datafeed-subscription
```

- For API details, see DeleteSpotDatafeedSubscription in AWS CLI Command Reference.

delete-subnet

The following code example shows how to use delete-subnet.

AWS CLI

To delete a subnet

This example deletes the specified subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-subnet --subnet-id subnet-9d4a7b6c
```

- For API details, see DeleteSubnet in AWS CLI Command Reference.

delete-subnet-cidr-reservation

The following code example shows how to use delete-subnet-cidr-reservation.

AWS CLI

To delete a subnet CIDR reservation

The following delete-subnet-cidr-reservation example deletes the specified subnet CIDR reservation.
aws ec2 delete-subnet-cidr-reservation \
   --subnet-cidr-reservation-id scr-044f977c4eEXAMPLE

Output:

{  
   "DeletedSubnetCidrReservation": {  
      "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",  
      "SubnetId": "subnet-03c51e2e6cEXAMPLE",  
      "Cidr": "10.1.0.16/28",  
      "ReservationType": "prefix",  
      "OwnerId": "123456789012"  
   }  
}

For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.

- For API details, see DeleteSubnetCidrReservation in AWS CLI Command Reference.

delelete-tags

The following code example shows how to use delete-tags.

AWS CLI

**Example 1: To delete a tag from a resource**

The following delete-tags example deletes the tag Stack=Test from the specified image. When you specify both a value and a key name, the tag is deleted only if the tag's value matches the specified value.

aws ec2 delete-tags \
   --resources ami-1234567890abcdef0 \
   --tags Key=Stack,Value=Test

It's optional to specify the value for a tag. The following delete-tags example deletes the tag with the key name purpose from the specified instance, regardless of the tag value for the tag.

aws ec2 delete-tags \
   --resources i-1234567890abcdef0 \
   --tags Key=purpose
If you specify the empty string as the tag value, the tag is deleted only if the tag's value is the empty string. The following `delete-tags` example specifies the empty string as the tag value for the tag to delete.

```
aws ec2 delete-tags \
   --resources i-1234567890abcdef0 \
   --tags Key=Name,Value=
```

**Example 2: To delete a tag from multiple resources**

The following `delete-tags` example deletes the tag `Purpose=Test` from both an instance and an AMI. As shown in the previous example, you can omit the tag value from the command.

```
aws ec2 delete-tags \
   --resources i-1234567890abcdef0 ami-1234567890abcdef0 \
   --tags Key=Purpose
```

- For API details, see [DeleteTags](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/delete-tags.html) in *AWS CLI Command Reference*.

### delete-traffic-mirror-filter

The following code example shows how to use `delete-traffic-mirror-filter`.

**AWS CLI**

#### To delete a traffic mirror filter

The following `delete-traffic-mirror-filter` example deletes the specified traffic mirror filter.

```
aws ec2 delete-traffic-mirror-filter \
   --traffic-mirror-filter-id tmf-0be0b25fcdEXAMPLE
```

**Output:**

```
{
   "TrafficMirrorFilterId": "tmf-0be0b25fcdEXAMPLE"
}
```

For more information, see [Delete a Traffic Mirror Filter](https://docs.aws.amazon.com/traffic-mirroring/latest/userguide/traffic-mirroring-cli-reference.html) in the *AWS Traffic Mirroring Guide*. 
For API details, see `DeleteTrafficMirrorFilter` in `AWS CLI Command Reference`.

**delete-traffic-mirror-filter-rule**

The following code example shows how to use `delete-traffic-mirror-filter-rule`.

**AWS CLI**

To delete a traffic mirror filter rule

The following `delete-traffic-mirror-filter-rule` example deletes the specified traffic mirror filter rule.

```bash
aws ec2 delete-traffic-mirror-filter-rule \
  --traffic-mirror-filter-rule-id tmfr-081f71283bEXAMPLE
```

Output:

```json
{
  "TrafficMirrorFilterRuleId": "tmfr-081f71283bEXAMPLE"
}
```

For more information, see `Modify Your Traffic Mirror Filter Rules` in the `AWS Traffic Mirroring Guide`.

For API details, see `DeleteTrafficMirrorFilterRule` in `AWS CLI Command Reference`.

**delete-traffic-mirror-session**

The following code example shows how to use `delete-traffic-mirror-session`.

**AWS CLI**

To delete a traffic mirror session

The following `delete-traffic-mirror-session` example deletes the specified traffic mirror-session.

```bash
aws ec2 delete-traffic-mirror-session \
  --traffic-mirror-session-id tms-0af3141ce5EXAMPLE
```
For more information, see [Delete a Traffic Mirror Session](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [DeleteTrafficMirrorSession](#) in *AWS CLI Command Reference*.

### delete-traffic-mirror-target

The following code example shows how to use `delete-traffic-mirror-target`.

**AWS CLI**

**To delete a traffic mirror target**

The following `delete-traffic-mirror-target` example deletes the specified traffic mirror target.

```bash
code example output
aws ec2 delete-traffic-mirror-target \
   --traffic-mirror-target-id tmt-060f48ce9EXAMPLE
```

**Output:**

```json
{
   "TrafficMirrorTargetId": "tmt-060f48ce9EXAMPLE"
}
```

For more information, see [Delete a Traffic Mirror Target](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [DeleteTrafficMirrorTarget](#) in *AWS CLI Command Reference*.

### delete-transit-gateway

The following code example shows how to use `delete-transit-gateway`.

**AWS CLI**

**To delete a transit gateway**

```bash
code example output
```
The following `delete-transit-gateway` example deletes the specified transit gateway.

```bash
aws ec2 delete-transit-gateway \
   --transit-gateway-id tgw-01f04542b2EXAMPLE
```

Output:

```json
{
   "TransitGateway": {
      "TransitGatewayId": "tgw-01f04542b2EXAMPLE",
      "State": "deleting",
      "OwnerId": "123456789012",
      "Description": "Example Transit Gateway",
      "CreationTime": "2019-08-27T15:04:35.000Z",
      "Options": {
         "AmazonSideAsn": 64515,
         "AutoAcceptSharedAttachments": "disable",
         "DefaultRouteTableAssociation": "enable",
         "AssociationDefaultRouteTableId": "tgw-rtb-0ce7a6948fEXAMPLE",
         "DefaultRouteTablePropagation": "enable",
         "PropagationDefaultRouteTableId": "tgw-rtb-0ce7a6948fEXAMPLE",
         "VpnEcmpSupport": "enable",
         "DnsSupport": "enable"
      }
   }
}
```

For more information, see [Delete a transit gateway](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGateway](#) in *AWS CLI Command Reference*.

### delete-transit-gateway-connect

The following code example shows how to use `delete-transit-gateway-connect`.

**AWS CLI**

**To delete a transit gateway Connect attachment**

The following `delete-transit-gateway-connect` example deletes the specified Connect attachment.
aws ec2 delete-transit-gateway-connect \
   --transit-gateway-attachment-id tgw-attach-037012e5dcEXAMPLE

Output:

```json
{
   "TransitGatewayConnect": {
      "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
      "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
      "State": "deleting",
      "CreationTime": "2021-03-09T19:59:17+00:00",
      "Options": {
         "Protocol": "gre"
      }
   }
}
```

**delete-transit-gateway-connect-peer**

The following code example shows how to use delete-transit-gateway-connect-peer.

**AWS CLI**

**To delete a Transit Gateway Connect peer**

The following delete-transit-gateway-connect-peer example deletes the specified Connect peer.

```
aws ec2 delete-transit-gateway-connect-peer \
   --transit-gateway-connect-peer-id tgw-connect-peer-0666adbac4EXAMPLE
```

Output:

```json
{
   "TransitGatewayConnectPeer": {
```

Actions and scenarios
"TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
"TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
"State": "deleting",
"CreationTime": "2021-10-13T03:35:17.000Z",
"ConnectPeerConfiguration": {
    "TransitGatewayAddress": "10.0.0.234",
    "PeerAddress": "172.31.1.11",
    "InsideCidrBlocks": ["169.254.6.0/29"],
    "Protocol": "gre",
    "BgpConfigurations": [
        {
            "TransitGatewayAsn": 64512,
            "PeerAsn": 64512,
            "TransitGatewayAddress": "169.254.6.2",
            "PeerAddress": "169.254.6.1",
            "BgpStatus": "down"
        },
        {
            "TransitGatewayAsn": 64512,
            "PeerAsn": 64512,
            "TransitGatewayAddress": "169.254.6.3",
            "PeerAddress": "169.254.6.1",
            "BgpStatus": "down"
        }
    ]
}
}

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DeleteTransitGatewayConnectPeer in AWS CLI Command Reference.

delete-transit-gateway-multicast-domain

The following code example shows how to use delete-transit-gateway-multicast-domain.

AWS CLI

To delete a transit gateway multicast domain
The following `delete-transit-gateway-multicast-domain` example deletes the specified multicast domain.

```
aws ec2 delete-transit-gateway-multicast-domain \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
   "TransitGatewayMulticastDomain": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-02bb79002bEXAMPLE",
      "TransitGatewayId": "tgw-0d88d2d0d5EXAMPLE",
      "State": "deleting",
      "CreationTime": "2019-11-20T22:02:03.000Z"
   }
}
```

For more information, see [Managing multicast domains](https://docs.aws.amazon.com/ Transit Gateways Guide) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayMulticastDomain](https://docs.aws.amazon.com/AWSCommandLineReference/latest/reference/delete-transit-gateway-multicast-domain.html) in *AWS CLI Command Reference*.

### delete-transit-gateway-peering-attachment

The following code example shows how to use `delete-transit-gateway-peering-attachment`.

**AWS CLI**

**To delete a transit gateway peering attachment**

The following `delete-transit-gateway-peering-attachment` example deletes the specified transit gateway peering attachment.

```
aws ec2 delete-transit-gateway-peering-attachment \
   --transit-gateway-attachment-id tgw-attach-4455667788aabbccd
```

Output:

```
{
   "TransitGatewayPeeringAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
```

---

Actions and scenarios 2188
"RequesterTgwInfo": {
    "TransitGatewayId": "tgw-123abc05e04123abc",
    "OwnerId": "123456789012",

},
"State": "deleting",
"CreationTime": "2019-12-09T11:38:31.000Z"
}
}

For more information, see [Transit Gateway Peering Attachments](https://docs.aws.amazon.com/eks/latest/userguide/transit-gateway-peering-attachment.html) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayPeeringAttachment](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-transit-gateway-peering-attachment.html) in *AWS CLI Command Reference*.

/delete-transit-gateway-policy-table

The following code example shows how to use `delete-transit-gateway-policy-table`.

**AWS CLI**

**To delete a transit gateway policy table**

The following `delete-transit-gateway-policy-table` example deletes the specified transit gateway policy table.

```bash
aws ec2 delete-transit-gateway-policy-table \
    --transit-gateway-policy-table-id tgw-ptb-0a16f134b78668a81
```

**Output:**

```json
{
    "TransitGatewayPolicyTables": [
        {
            "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
            "TransitGatewayId": "tgw-067f8505c18f0bd6e",
            "State": "deleting",
            "CreationTime": "2023-11-28T16:36:43+00:00",
            "Tags": []
        }
    ]
}
```
For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see DeleteTransitGatewayPolicyTable in AWS CLI Command Reference.

delete-transit-gateway-prefix-list-reference

The following code example shows how to use delete-transit-gateway-prefix-list-reference.

AWS CLI

To delete a prefix list reference

The following delete-transit-gateway-prefix-list-reference example deletes the specified prefix list reference.

```
aws ec2 delete-transit-gateway-prefix-list-reference \
   --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
   --prefix-list-id pl-11111122222222333
```

Output:

```
{
   "TransitGatewayPrefixListReference": {
      "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
      "PrefixListId": "pl-11111122222222333",
      "PrefixListOwnerId": "123456789012",
      "State": "deleting",
      "Blackhole": false,
      "TransitGatewayAttachment": {
         "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
         "ResourceType": "vpc",
         "ResourceId": "vpc-112233445566aabbc"
      }
   }
}
```

For more information, see Prefix list references in the Transit Gateways Guide.
For API details, see DeleteTransitGatewayPrefixListReference in AWS CLI Command Reference.

delete-transit-gateway-route

The following code example shows how to use delete-transit-gateway-route.

AWS CLI

To delete a CIDR block from a route table

The following delete-transit-gateway-route example deletes the CIDR block from the specified transit gateway route table.

```bash
aws ec2 delete-transit-gateway-route \
   --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
   --destination-cidr-block 10.0.2.0/24
```

Output:

```json
{
   "Route": {
      "DestinationCidrBlock": "10.0.2.0/24",
      "TransitGatewayAttachments": [
         {
            "ResourceId": "vpc-0065acced4EXAMPLE",
            "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
            "ResourceType": "vpc"
         }
      ],
      "Type": "static",
      "State": "deleted"
   }
}
```

For more information, see Delete a static route in the Transit Gateways Guide.

For API details, see DeleteTransitGatewayRoute in AWS CLI Command Reference.

disable-transit-gateway-route-table

The following code example shows how to use disable-transit-gateway-route-table.
AWS CLI

To delete a transit gateway route table

The following delete-transit-gateway-route-table example deletes the specified transit gateway route table.

```bash
aws ec2 delete-transit-gateway-route-table \
  --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE
```

Output:

```json
{
  "TransitGatewayRouteTable": {
    "TransitGatewayRouteTableId": "tgw-rtb-0b6f6aaa01EXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "State": "deleting",
    "DefaultAssociationRouteTable": false,
    "DefaultPropagationRouteTable": false,
    "CreationTime": "2019-07-17T20:27:26.000Z"
  }
}
```

For more information, see [Delete a transit gateway route table](https://docs.aws.amazon.com/TransitGateways/latest/APIReference/API_DeleteTransitGatewayRouteTable.html) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-transit-gateway-route-table.html) in *AWS CLI Command Reference*.

---

delete-transit-gateway-vpc-attachment

The following code example shows how to use delete-transit-gateway-vpc-attachment.

AWS CLI

To delete a transit gateway VPC attachment

The following delete-transit-gateway-vpc-attachment example deletes the specified VPC attachment.

```bash
aws ec2 delete-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-0d2c54bdbEXAMPLE
```

Output:
For more information, see Delete a VPC attachment in the Transit Gateways Guide.

• For API details, see DeleteTransitGatewayVpcAttachment in AWS CLI Command Reference.

delete-verified-access-endpoint

The following code example shows how to use delete-verified-access-endpoint.

AWS CLI

To delete a Verified Access endpoint

The following delete-verified-access-endpoint example deletes the specified Verified Access endpoint.

```bash
aws ec2 delete-verified-access-endpoint \ 
  --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```json
{
  "VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
    "ApplicationDomain": "example.com",
    "EndpointType": "network-interface",
    "AttachmentType": "vpc",
    "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
  }
}
```
"EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
  "SecurityGroupIds": [
    "sg-004915970c4c8f13a"
  ],
  "NetworkInterfaceOptions": {
    "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
    "Protocol": "https",
    "Port": 443
  },
  "Status": {
    "Code": "deleting"
  },
  "Description": "Testing Verified Access",
  "CreationTime": "2023-08-25T20:54:43",
  "LastUpdatedTime": "2023-08-25T22:46:32"
}]

For more information, see Verified Access endpoints in the AWS Verified Access User Guide.

- For API details, see DeleteVerifiedAccessEndpoint in AWS CLI Command Reference.

delete-verified-access-group

The following code example shows how to use delete-verified-access-group.

AWS CLI

To delete a Verified Access group

The following delete-verified-access-group example deletes the specified Verified Access group.

```bash
aws ec2 delete-verified-access-group \
    --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```json
{
    "VerifiedAccessGroup": {
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
```
"VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
"Description": "Testing Verified Access",
"Owner": "123456789012",
"VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
"CreationTime": "2023-08-25T18:27:56",
"LastUpdatedTime": "2023-08-26T00:58:31"
}
}

For more information, see Verified Access groups in the AWS Verified Access User Guide.

- For API details, see DeleteVerifiedAccessGroup in AWS CLI Command Reference.

delete-verified-access-instance

The following code example shows how to use delete-verified-access-instance.

AWS CLI

To delete a Verified Access instance

The following delete-verified-access-instance example deletes the specified Verified Access instance.

aws ec2 delete-verified-access-instance \
   --verified-access-instance-id vai-0ce000c0b7643abea

Output:

{
   "VerifiedAccessInstance": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "VerifiedAccessTrustProviders": [],
      "CreationTime": "2023-08-25T18:27:56",
      "LastUpdatedTime": "2023-08-26T01:00:18"
   }
}

For more information, see Verified Access instances in the AWS Verified Access User Guide.
For API details, see [DeleteVerifiedAccessInstance](#) in [AWS CLI Command Reference](#).

**delete-verified-access-trust-provider**

The following code example shows how to use `delete-verified-access-trust-provider`.

**AWS CLI**

**To delete a Verified Access trust provider**

The following `delete-verified-access-trust-provider` example deletes the specified Verified Access trust provider.

```bash
aws ec2 delete-verified-access-trust-provider \
--verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "Testing Verified Access",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T18:40:36",
      "LastUpdatedTime": "2023-08-25T18:40:36"
   }
}
```

For more information, see [Trust providers for Verified Access](#) in the [AWS Verified Access User Guide](#).

For API details, see [DeleteVerifiedAccessTrustProvider](#) in [AWS CLI Command Reference](#).

**delete-volume**

The following code example shows how to use `delete-volume`.

**AWS CLI**

**To delete a volume**
This example command deletes an available volume with the volume ID of vol-049df61146c4d7901. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-volume --volume-id vol-049df61146c4d7901
```

• For API details, see DeleteVolume in AWS CLI Command Reference.

delete-vpc

The following code example shows how to use delete-vpc.

AWS CLI

To delete a VPC

This example deletes the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpc --vpc-id vpc-a01106c2
```

• For API details, see DeleteVpc in AWS CLI Command Reference.

delete-vpc-endpoint-connection-notifications

The following code example shows how to use delete-vpc-endpoint-connection-notifications.

AWS CLI

To delete an endpoint connection notification

This example deletes the specified endpoint connection notification.

Command:

```
aws ec2 delete-vpc-endpoint-connection-notifications --connection-notification-ids vpce-nfn-008776de7e03f5abc
```
Output:

```json
{
    "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpointConnectionNotifications](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/delete-vpc-endpoint-connection-notifications.html) in *AWS CLI Command Reference*.

### delete-vpc-endpoint-service-configurations

The following code example shows how to use `delete-vpc-endpoint-service-configurations`.

**AWS CLI**

**To delete an endpoint service configuration**

This example deletes the specified endpoint service configuration.

**Command:**

```bash
aws ec2 delete-vpc-endpoint-service-configurations --service-ids vpce-svc-03d5ebb7d9579a2b3
```

**Output:**

```json
{
    "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpointServiceConfigurations](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/delete-vpc-endpoint-service-configurations.html) in *AWS CLI Command Reference*.

### delete-vpc-endpoints

The following code example shows how to use `delete-vpc-endpoints`.

**AWS CLI**

**To delete an endpoint**

```bash
aws ec2 delete-vpc-endpoints --vpc-ids vpc-03d5ebb7d9579a2b3
```
This example deletes endpoints vpce-aa22bb33 and vpce-1a2b3c4d. If the command is partially successful or unsuccessful, a list of unsuccessful items is returned. If the command succeeds, the returned list is empty.

Command:

```bash
aws ec2 delete-vpc-endpoints --vpc-endpoint-ids vpce-aa22bb33 vpce-1a2b3c4d
```

Output:

```json
{
    "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpoints](#) in *AWS CLI Command Reference*.

### delete-vpc-peering-connection

The following code example shows how to use `delete-vpc-peering-connection`.

**AWS CLI**

**To delete a VPC peering connection**

This example deletes the specified VPC peering connection.

Command:

```bash
aws ec2 delete-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```json
{
    "Return": true
}
```

- For API details, see [DeleteVpcPeeringConnection](#) in *AWS CLI Command Reference*.

### delete-vpn-connection

The following code example shows how to use `delete-vpn-connection`.
To delete a VPN connection

This example deletes the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-connection --vpn-connection-id vpn-40f41529
```

For API details, see [DeleteVpnConnection](#) in *AWS CLI Command Reference*.

delete-vpn-connection-route

The following code example shows how to use delete-vpn-connection-route.

AWS CLI

To delete a static route from a VPN connection

This example deletes the specified static route from the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

For API details, see [DeleteVpnConnectionRoute](#) in *AWS CLI Command Reference*.

delete-vpn-gateway

The following code example shows how to use delete-vpn-gateway.

AWS CLI

To delete a virtual private gateway

This example deletes the specified virtual private gateway. If the command succeeds, no output is returned.
Command:

```
aws ec2 delete-vpn-gateway --vpn-gateway-id vgw-9a4cacf3
```

- For API details, see `DeleteVpnGateway` in *AWS CLI Command Reference*.

**deprovision-byoip-cidr**

The following code example shows how to use `deprovision-byoip-cidr`.

**AWS CLI**

**To remove an IP address range from use**

The following example removes the specified address range from use with AWS.

```
aws ec2 deprovision-byoip-cidr \
    --cidr 203.0.113.25/24
```

**Output:**

```json
{
   "ByoipCidr": {
       "Cidr": "203.0.113.25/24",
       "State": "pending-deprovision"
   }
}
```

- For API details, see `DeprovisionByoipCidr` in *AWS CLI Command Reference*.

**deprovision-ipam-pool-cidr**

The following code example shows how to use `deprovision-ipam-pool-cidr`.

**AWS CLI**

**To deprovision an IPAM pool CIDR**

The following `deprovision-ipam-pool-cidr` example deprovisions a CIDR provisioned to an IPAM pool.
(Linux):

```bash
aws ec2 deprovision-ipam-pool-cidr \
    --ipam-pool-id ipam-pool-02ec043a19bbe5d08 \
    --cidr 11.0.0.0/16
```

(Windows):

```bash
aws ec2 deprovision-ipam-pool-cidr ^
    --ipam-pool-id ipam-pool-02ec043a19bbe5d08 ^
    --cidr 11.0.0.0/16
```

Output:

```json
{
   "IpamPoolCidr": {
      "Cidr": "11.0.0.0/16",
      "State": "pending-deprovision"
   }
}
```

For more information, see [Deprovision pool CIDRs](https://docs.aws.amazon.com/vpc-ipam/latest/userguide/ipam-api.html) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DeprovisionIpamPoolCidr](https://docs.aws.amazon.com/cli/latest/reference/ec2/deregister-image.html) in *AWS CLI Command Reference*.

### deregister-image

The following code example shows how to use `deregister-image`.

**AWS CLI**

**To deregister an AMI**

This example deregisters the specified AMI. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 deregister-image --image-id ami-4fa54026
```

- For API details, see [DeregisterImage](https://docs.aws.amazon.com/cli/latest/reference/ec2/deregister-image.html) in *AWS CLI Command Reference*. 

---

*Actions and scenarios*
deregister-instance-event-notification-attributes

The following code example shows how to use deregister-instance-event-notification-attributes.

**AWS CLI**

**Example 1: To remove all tags from event notifications**

The following deregister-instance-event-notification-attributes example removes IncludeAllTagsOfInstance=true, which has the effect of setting IncludeAllTagsOfInstance to false.

```bash
aws ec2 deregister-instance-event-notification-attributes \
--instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```json
{
   "InstanceTagAttribute": {
      "InstanceTagKeys": [],
      "IncludeAllTagsOfInstance": true
   }
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 2: To remove specific tags from event notifications**

The following deregister-instance-event-notification-attributes example removes the specified tag from the tags included in event notifications. To describe the remaining tags included in event notifications, use describe-instance-event-notification-attributes.

```bash
aws ec2 deregister-instance-event-notification-attributes \
--instance-tag-attribute InstanceTagKeys="tag-key2"
```

Output:

```json
{
}
```
"InstanceTagAttribute": {  
    "InstanceTagKeys": [  
        "tag-key2"  
    ],  
    "IncludeAllTagsOfInstance": false  
}  
}

For more information, see Scheduled events for your instances in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DeregisterInstanceEventNotificationAttributes in AWS CLI Command Reference.

deregister-transit-gateway-multicast-group-members

The following code example shows how to use deregister-transit-gateway-multicast-group-members.

AWS CLI

To deregister group members from a multicast group

This example deregisters the specified network interface group member from the transit gateway multicast group.

```bash
aws ec2 deregister-transit-gateway-multicast-group-members 
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE 
   --group-ip-address 224.0.1.0 
   --network-interface-ids eni-0e246d3269EXAMPLE
```

Output:

```
{
    "DeregisteredMulticastGroupMembers": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
        "RegisteredNetworkInterfaceIds": [  
            "eni-0e246d3269EXAMPLE"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```
For more information, see **Deregister Members from a Multicast Group** in the *AWS Transit Gateways Users Guide*.

- For API details, see **DeregisterTransitGatewayMulticastGroupMembers** in *AWS CLI Command Reference*.

---

deregister-transit-gateway-multicast-group-source

The following code example shows how to use `deregister-transit-gateway-multicast-group-source`.

**AWS CLI**

**To deregister a source from the transit gateway multicast group**

This example deregisters the specified network interface group source from the multicast group.

```shell
aws ec2 register-transit-gateway-multicast-group-sources \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --group-ip-address 224.0.1.0 \
  --network-interface-ids eni-07f290fc3c090cbae
```

**Output:**

```json
{
  "DeregisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "DeregisteredNetworkInterfaceIds": [
      "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}
```

For more information, see **Deregister Sources from a Multicast Group** in the *AWS Transit Gateways User Guide*.

- For API details, see **DeregisterTransitGatewayMulticastGroupSource** in *AWS CLI Command Reference*.
describe-account-attributes

The following code example shows how to use describe-account-attributes.

AWS CLI

To describe all the attributes for your AWS account

This example describes the attributes for your AWS account.

Command:

```
aws ec2 describe-account-attributes
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "vpc-max-security-groups-per-interface",
            "AttributeValues": [
                {
                    "AttributeValue": "5"
                }
            ]
        },
        {
            "AttributeName": "max-instances",
            "AttributeValues": [
                {
                    "AttributeValue": "20"
                }
            ]
        },
        {
            "AttributeName": "supported-platforms",
            "AttributeValues": [
                {
                    "AttributeValue": "EC2"
                },
                {
                    "AttributeValue": "VPC"
                }
            ]
        }
    ]
}
```
To describe a single attribute for your AWS account

This example describes the supported-platforms attribute for your AWS account.

Command:

```bash
aws ec2 describe-account-attributes --attribute-names supported-platforms
```

Output:

```json
{
    "AccountAttributes": [
        {
            "AttributeName": "supported-platforms",
            "AttributeValues": [
                {
                    "AttributeValue": "Linux"
                },
                {
                    "AttributeValue": "Windows"
                }
            ]
        }
    ]
}
```
For API details, see **DescribeAccountAttributes** in *AWS CLI Command Reference*.

### describe-address-transfers

The following code example shows how to use describe-address-transfers.

**AWS CLI**

**To describe an Elastic IP address transfer**

The following describe-address-transfers example describes the Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 describe-address-transfers \
  --allocation-ids eipalloc-09ad461b0d03f6aaf
```

**Output:**

```
{
  "AddressTransfers": [
    {
      "PublicIp": "100.21.184.216",
      "AllocationId": "eipalloc-09ad461b0d03f6aaf",
      "TransferAccountId": "123456789012",
      "TransferOfferExpirationTimestamp": "2023-02-22T22:51:01.000Z",
      "AddressTransferStatus": "pending"
    }
  ]
}
```

For more information, see [Transfer Elastic IP addresses](#) in the *Amazon VPC User Guide*. 

---

**For API details, see **DescribeAccountAttributes** in *AWS CLI Command Reference*.**
describe-addresses-attribute

The following code example shows how to use describe-addresses-attribute.

**AWS CLI**

**To view the attributes of the domain name associated with an elastic IP address**

The following describe-addresses-attribute examples return the attributes of the domain name associated with the elastic IP address.

**Linux:**

```bash
aws ec2 describe-addresses-attribute \
    --allocation-ids eipalloc-abcdef01234567890 \
    --attribute domain-name
```

**Windows:**

```bash
aws ec2 describe-addresses-attribute ^
    --allocation-ids eipalloc-abcdef01234567890 ^
    --attribute domain-name
```

**Output:**

```json
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.com."
        }
    ]
}
```

To view the attributes of an elastic IP address, you must have first associated a domain name with the elastic IP address. For more information, see **Use reverse DNS for email applications** in the *Amazon EC2 User Guide* or **modify-address-attribute** in the **AWS CLI Command Reference**.

- For API details, see **DescribeAddressTransfers** in **AWS CLI Command Reference**.
- For API details, see **DescribeAddressesAttribute** in **AWS CLI Command Reference**.
describe-aggregate-id-format

The following code example shows how to use describe-aggregate-id-format.

AWS CLI

**To describe the longer ID format settings for all resource types in a Region**

The following describe-aggregate-id-format example describes the overall long ID format status for the current Region. The Deadline value indicates that the deadlines for these resources to permanently switch from the short ID format to the long ID format expired. The UseLongIdsAggregated value indicates that all IAM users and IAM roles are configured to use long ID format for all resource types.

```bash
aws ec2 describe-aggregate-id-format
```

**Output:**

```json
{
  "UseLongIdsAggregated": true,
  "Statuses": [
    {
      "Deadline": "2018-08-13T02:00:00.000Z",
      "Resource": "network-interface-attachment",
      "UseLongIds": true
    },
    {
      "Deadline": "2016-12-13T02:00:00.000Z",
      "Resource": "instance",
      "UseLongIds": true
    },
    {
      "Deadline": "2018-08-13T02:00:00.000Z",
      "Resource": "elastic-ip-association",
      "UseLongIds": true
    },
    ...
  ]
}
```

- For API details, see [DescribeAggregateIdFormat](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-aggregate-id-format.html) in *AWS CLI Command Reference*.
describe-aws-network-performance-metric-subscription

The following code example shows how to use describe-aws-network-performance-metric-subscription.

AWS CLI

To describe your metric subscriptions

The following describe-aws-network-performance-metric-subscriptions example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
   "Subscriptions": [
   {
      "Source": "us-east-1",
      "Destination": "eu-west-1",
      "Metric": "aggregate-latency",
      "Statistic": "p50",
      "Period": "five-minutes"
   }
   ]
}
```

For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see DescribeAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

describe-aws-network-performance-metric-subscriptions

The following code example shows how to use describe-aws-network-performance-metric-subscriptions.

AWS CLI

To describe your metric subscriptions
The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```bash
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```json
{
  "Subscriptions": [
    {
      "Source": "us-east-1",
      "Destination": "eu-west-1",
      "Metric": "aggregate-latency",
      "Statistic": "p50",
      "Period": "five-minutes"
    }
  ]
}
```

For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see `DescribeAwsNetworkPerformanceMetricSubscriptions` in AWS CLI Command Reference.

**describe-bundle-tasks**

The following code example shows how to use `describe-bundle-tasks`.

**AWS CLI**

To describe your bundle tasks

This example describes all of your bundle tasks.

**Command:**

```bash
aws ec2 describe-bundle-tasks
```

**Output:**

```json
{
}
```
For API details, see [DescribeBundleTasks](#) in *AWS CLI Command Reference*.

**describe-byoip-cidrs**

The following code example shows how to use `describe-byoip-cidrs`.

**AWS CLI**

To describe your provisioned address ranges

The following `describe-byoip-cidrs` example displays details about the public IPv4 address ranges that you provisioned for use by AWS.

```bash
aws ec2 describe-byoip-cidrs
```

**Output:**

```json
{
   "ByoipCidrs": [
      {
         "Cidr": "203.0.113.25/24",
         "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
         "State": "provisioned"
      }
   ]
}
```
For API details, see [DescribeByoipCidrs](#) in *AWS CLI Command Reference.*

**describe-capacity-reservation-fleets**

The following code example shows how to use `describe-capacity-reservation-fleets`.

**AWS CLI**

**To view a Capacity Reservation Fleet**

The following `describe-capacity-reservation-fleets` example lists configuration and capacity information for the specified Capacity Reservation Fleet. It also lists details about the individual Capacity Reservations that are inside the Fleet:

```
aws ec2 describe-capacity-reservation-fleets \
  --capacity-reservation-fleet-ids crf-abcdef01234567890
```

**Output:**

```
{
   "CapacityReservationFleets": [ 
       {
           "Status": "active",
           "EndDate": "2022-12-31T23:59:59.000Z",
           "InstanceMatchCriteria": "open",
           "Tags": [],
           "CapacityReservationFleetId": "crf-abcdef01234567890",
           "Tenancy": "default",
           "InstanceTypeSpecifications": [ 
               {
                   "CapacityReservationId": "cr-1234567890abcdef0",
                   "AvailabilityZone": "us-east-1a",
                   "FulfilledCapacity": 5.0,
                   "Weight": 1.0,
                   "CreateDate": "2022-07-02T08:34:33.398Z",
                   "InstancePlatform": "Linux/UNIX",
                   "TotalInstanceCount": 5,
                   "Priority": 1,
                   "EbsOptimized": true,
```
For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/capacity-reservation-fleet.html) in the Amazon EC2 User Guide.

- For API details, see [DescribeCapacityReservationFleets](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_DescribeCapacityReservationFleets.html) in AWS CLI Command Reference.

### describe-capacity-reservations

The following code example shows how to use describe-capacity-reservations.

**AWS CLI**

**Example 1: To describe one or more of your capacity reservations**

The following `describe-capacity-reservations` example displays details about all of your capacity reservations in the current AWS Region.

```bash
aws ec2 describe-capacity-reservations
```

**Output:**

```json
{
   "CapacityReservations": [
      {
         "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
         "EndDateType": "unlimited",
         "AvailabilityZone": "eu-west-1a",
         "InstanceMatchCriteria": "open",
         "Tags": [],
         "EphemeralStorage": false,
         "CreateDate": "2019-08-16T09:03:18.000Z",
         "AvailableInstanceCount": 1,
      }
   ]
}
```
Example 2: To describe one or more of your capacity reservations

The following `describe-capacity-reservations` example displays details about the specified capacity reservation.

```
aws ec2 describe-capacity-reservations \
    --capacity-reservation-ids cr-1234abcd56EXAMPLE
```

Output:

```json
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-1234abcd56EXAMPLE",
            "EndDateType": "unlimited",
            "AvailabilityZone": "eu-west-1a",
            "InstanceMatchCriteria": "open",
            "Tags": [],
            "EphemeralStorage": false,
            "CreateDate": "2019-08-07T11:34:19.000Z",
            "AvailableInstanceCount": 3,
            "InstancePlatform": "Linux/UNIX",
            "TotalInstanceCount": 3,
            "State": "cancelled",
            "Tenancy": "default",
            "EbsOptimized": true,
            "InstanceType": "m5.large"
        }
    ]
}
```
For more information, see Viewing a Capacity Reservation in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeCapacityReservations in AWS CLI Command Reference.

**describe-carrier-gateways**

The following code example shows how to use describe-carrier-gateways.

**AWS CLI**

To describe all carrier gateways

The following describe-carrier-gateways example lists all your carrier gateways.

```bash
aws ec2 describe-carrier-gateways
```

Output:

```json
{
   "CarrierGateways": [
    {
     "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
     "VpcId": "vpc-0c529aEXAMPLE",
     "State": "available",
     "OwnerId": "123456789012",
     "Tags": [
      {
      
      }
    ]
  ]
}
```
For more information, see Carrier gateways<https://docs.aws.amazon.com/vpc/latest/userguide/Carrier_Gateway.html> in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see [DescribeCarrierGateways](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-carrier-gateways.html) in *AWS CLI Command Reference*.

**describe-classic-link-instances**

The following code example shows how to use `describe-classic-link-instances`.

**AWS CLI**

**To describe linked EC2-Classic instances**

This example lists all of your linked EC2-Classic instances.

Command:

```
aws ec2 describe-classic-link-instances
```

Output:

```json
{
   "Instances": [
      {
         "InstanceId": "i-1234567890abcdef0",
         "VpcId": "vpc-88888888",
         "Groups": [
            {
               "GroupId": "sg-11122233"
            }
         ],
         "Tags": [
            {
               "Value": "ClassicInstance",
               "Key": "Name"
            }
```
This example lists all of your linked EC2-Classic instances, and filters the response to include only instances that are linked to VPC vpc-88888888.

Command:

```
aws ec2 describe-classic-link-instances --filter "Name=vpc-id,Values=vpc-88888888"
```

Output:

```
{
    "Instances": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "VpcId": "vpc-88888888",
            "Groups": [
                {
                    "GroupId": "sg-11122233"
                }
            ],
            "Tags": [
                {
                    "Value": "ClassicInstance",
                    "Key": "Name"
                }
            ]
        }
    ]
}
```
describe-client-vpn-authorization-rules

The following code example shows how to use describe-client-vpn-authorization-rules.

AWS CLI

To describe the authorization rules for a Client VPN endpoint

The following describe-client-vpn-authorization-rules example displays details about the authorization rules for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-authorization-rules \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "AuthorizationRules": [
    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "GroupId": "",
      "AccessAll": true,
      "DestinationCidr": "0.0.0.0/0",
      "Status": {
        "Code": "active"
      }
    }
  ]
}
```

For more information, see Authorization Rules in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClassicLinkInstances in AWS CLI Command Reference.
describe-client-vpn-connections

The following code example shows how to use describe-client-vpn-connections.

AWS CLI

To describe the connections to a Client VPN endpoint

The following describe-client-vpn-connections example displays details about the client connections to the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-connections \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
    "Connections": [
    {
        "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
        "Timestamp": "2019-08-12 07:58:34",
        "ConnectionId": "cvpn-connection-0e03eb24267165acd",
        "ConnectionEstablishedTime": "2019-08-12 07:57:14",
        "IngressBytes": "32302",
        "EgressBytes": "5696",
        "IngressPackets": "332",
        "EgressPackets": "67",
        "ClientIp": "172.31.0.225",
        "CommonName": "client1.domain.tld",
        "Status": {
            "Code": "terminated"
        },
        "ConnectionEndTime": "2019-08-12 07:58:34"
    },
    {
        "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
        "Timestamp": "2019-08-12 08:02:54",
        "ConnectionId": "cvpn-connection-00668867a40f18253",
        "ConnectionEstablishedTime": "2019-08-12 08:02:53",
        "IngressBytes": "2951",
        "EgressBytes": "2611",
        "IngressPackets": "9",
        "EgressPackets": "6",
```
For more information, see [Client Connections](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnConnections](#) in *AWS CLI Command Reference*.

**describe-client-vpn-endpoints**

The following code example shows how to use `describe-client-vpn-endpoints`.

**AWS CLI**

**To describe your Client VPN endpoints**

The following `describe-client-vpn-endpoints` example displays details about all of your Client VPN endpoints.

```bash
aws ec2 describe-client-vpn-endpoints
```

**Output:**

```json
{
  "ClientVpnEndpoints": [
    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "Description": "Endpoint for Admin access",
      "Status": {
        "Code": "available"
      },
      "CreationTime": "2020-11-13T11:37:27",
      "DnsName": "*.cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-south-1.amazonaws.com",
      "ClientCidrBlock": "172.31.0.0/16",
      "DnsServers": ["8.8.8.8"
```
"SplitTunnel": false,
"VpnProtocol": "openvpn",

"ClientConnectOptions": {
  "Enabled": false
}
]
**describe-client-vpn-routes**

The following code example shows how to use `describe-client-vpn-routes`.

**AWS CLI**

**To describe the routes for a Client VPN endpoint**

The following `describe-client-vpn-routes` example displays details about the routes for the specified Client VPN endpoint.

```bash
aws ec2 describe-client-vpn-routes \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
   "Routes": [
      {
         "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
         "DestinationCidr": "10.0.0.0/16",
         "TargetSubnet": "subnet-0123456789abcabca",
         "Type": "Nat",
         "Origin": "associate",
         "Status": {
            "Code": "active"
         },
         "Description": "Default Route"
      },
      {
         "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
         "DestinationCidr": "0.0.0.0/0",
         "TargetSubnet": "subnet-0123456789abcabca",
         "Type": "Nat",
         "Origin": "add-route",
         "Status": {
            "Code": "active"
         }
      }
   ]
}
```

For more information, see [Routes](#) in the *AWS Client VPN Administrator Guide*.
describe-client-vpn-target-networks

The following code example shows how to use describe-client-vpn-target-networks.

AWS CLI

To describe the target networks for a Client VPN endpoint

The following describe-client-vpn-target-networks example displays details about the target networks for the specified Client VPN endpoint.

```bash
aws ec2 describe-client-vpn-target-networks \
--client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
   "ClientVpnTargetNetworks": [
      {
         "AssociationId": "cvpn-assoc-012e837060753dc3d",
         "VpcId": "vpc-11111222222333333",
         "TargetNetworkId": "subnet-0123456789abcabca",
         "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
         "Status": {
            "Code": "associating"
         },
         "SecurityGroups": [
            "sg-012345678910abcab"
         ]
      }
   ]
}
```

For more information, see Target Networks in the AWS Client VPN Administrator Guide.

- For API details, see DescribeClientVpnTargetNetworks in AWS CLI Command Reference.

describe-coip-pools

The following code example shows how to use describe-coip-pools.
AWS CLI

To describe customer-owned IP address pools

The following describe-coip-pools example describes the customer-owned IP address pools in your AWS account.

```
aws ec2 describe-coip-pools
```

Output:

```
{
   "CoipPools": [
      {
         "PoolId": "ipv4pool-coip-123a45678bEXAMPLE",
         "PoolCidrs": ["0.0.0.0/0"],
         "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
      }
   ]
}
```

For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see DescribeCoipPools in AWS CLI Command Reference.

describe-conversion-tasks

The following code example shows how to use describe-conversion-tasks.

AWS CLI

To view the status of a conversion task

This example returns the status of a conversion task with the ID import-i-ffvko9js.

Command:

```
aws ec2 describe-conversion-tasks --conversion-task-ids import-i-ffvko9js
```
Output:

```json
{
   "ConversionTasks": [
      {
         "ConversionTaskId": "import-i-ffvko9js",
         "ImportInstance": {
            "InstanceId": "i-1234567890abcdef0",
            "Volumes": [
               {
                  "Volume": {
                     "Id": "vol-049df61146c4d7901",
                     "Size": 16
                  },
                  "Status": "completed",
                  "Image": {
                     "Size": 1300687360,
                     "ImportManifestUrl": "https://s3.amazonaws.com/myimportbucket/411443cd-d620-4f1c-9d66-13144EXAMPLE/RHEL5.vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=140EXAMPLE&Signature=XYNhznHNgCqsjDxL9wRL%2FJvEXAMPLE",
                     "Format": "VMDK"
                  },
                  "BytesConverted": 1300682960,
                  "AvailabilityZone": "us-east-1d"
               }
            ]
         },
         "State": "completed"
      }
   ]
}
```

• For API details, see DescribeConversionTasks in AWS CLI Command Reference.

describe-customer-gateways

The following code example shows how to use describe-customer-gateways.

AWS CLI

To describe your customer gateways
This example describes your customer gateways.

Command:

```bash
aws ec2 describe-customer-gateways
```

Output:

```json
{
   "CustomerGateways": [
      {
         "CustomerGatewayId": "cgw-b4dc3961",
         "IpAddress": "203.0.113.12",
         "State": "available",
         "Type": "ipsec.1",
         "BgpAsn": "65000"
      },
      {
         "CustomerGatewayId": "cgw-0e11f167",
         "IpAddress": "12.1.2.3",
         "State": "available",
         "Type": "ipsec.1",
         "BgpAsn": "65534"
      }
   ]
}
```

**To describe a specific customer gateway**

This example describes the specified customer gateway.

Command:

```bash
aws ec2 describe-customer-gateways --customer-gateway-ids cgw-0e11f167
```

Output:

```json
{
   "CustomerGateways": [
      {
         "CustomerGatewayId": "cgw-0e11f167",
         "IpAddress": "12.1.2.3",
```

```json...
```
For API details, see [DescribeCustomerGateways](#) in *AWS CLI Command Reference*.

**describe-dhcp-options**

The following code example shows how to use `describe-dhcp-options`.

**AWS CLI**

**Example 1: To describe your DHCP options**

The following `describe-dhcp-options` example retrieves details about your DHCP options.

```
aws ec2 describe-dhcp-options
```

Output:

```
{
   "DhcpOptions": [
   {
      "DhcpConfigurations": [
      {
         "Key": "domain-name",
         "Values": [
            {
               "Value": "us-east-2.compute.internal"
            }
         ]
      },
      {
         "Key": "domain-name-servers",
         "Values": [
            {
               "Value": "AmazonProvidedDNS"
            }
         ]
      }
   ]
```

Actions and scenarios
For more information, see Working with DHCP Option Sets in the AWS VPC User Guide.

Example 2: To describe your DHCP options and filter the output

The following describe-dhcp-options example describes your DHCP options and uses a filter to return only DHCP options that have example.com for the domain name server. The example uses the --query parameter to display only the configuration information and ID in the output.

```bash
aws ec2 describe-dhcp-options \
  --filters Name=key,Values=domain-name-servers Name=value,Values=example.com \
  --query "DhcpOptions[*].[DhcpConfigurations,DhcpOptionsId]"
```

Output:
For more information, see Working with DHCP Option Sets in the AWS VPC User Guide.

- For API details, see DescribeDhcpOptions in AWS CLI Command Reference.

**describe-egress-only-internet-gateways**

The following code example shows how to use describe-egress-only-internet-gateways.

**AWS CLI**

**To describe your egress-only Internet gateways**

This example describes your egress-only Internet gateways.

**Command:**

```bash
aws ec2 describe-egress-only-internet-gateways
```

**Output:**
```json
{
    "EgressOnlyInternetGateways": [
        {
            "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
            "Attachments": [
                {
                    "State": "attached",
                    "VpcId": "vpc-0c62a468"
                }
            ]
        }
    ]
}
```

- For API details, see [DescribeEgressOnlyInternetGateways](#) in *AWS CLI Command Reference*.

**describe-elastic-gpus**

The following code example shows how to use describe-elastic-gpus.

**AWS CLI**

**To describe an Elastic GPU**

Command:

```
aws ec2 describe-elastic-gpus --elastic-gpu-ids egpu-12345678901234567890abcdefghijkl
```

- For API details, see [DescribeElasticGpus](#) in *AWS CLI Command Reference*.

**describe-export-image-tasks**

The following code example shows how to use describe-export-image-tasks.

**AWS CLI**

**To monitor an export image task**

The following `describe-export-image-tasks` example checks the status of the specified export image task. The resulting image file in Amazon S3 is `my-export-bucket/exports/export-ami-1234567890abcdef0.vmdk`. 
aws ec2 describe-export-image-tasks \
   --export-image-task-ids export-ami-1234567890abcdef0

Output for an export image task that is in progress.

```json
{
   "ExportImageTasks": [
      {
         "ExportImageTaskId": "export-ami-1234567890abcdef0",
         "Progress": "21",
         "S3ExportLocation": {
            "S3Bucket": "my-export-bucket",
            "S3Prefix": "exports/"
         },
         "Status": "active",
         "StatusMessage": "updating"
      }
   ]
}
```

Output for an export image task that is completed.

```json
{
   "ExportImageTasks": [
      {
         "ExportImageTaskId": "export-ami-1234567890abcdef0",
         "S3ExportLocation": {
            "S3Bucket": "my-export-bucket",
            "S3Prefix": "exports/"
         },
         "Status": "completed"
      }
   ]
}
```

For more information, see [Export a VM from an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/VM-Export-Overview.html) in the *VM Import/Export User Guide*.
- For API details, see [DescribeExportImageTasks](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-export-image-tasks.html) in *AWS CLI Command Reference*.

**describe-export-tasks**

The following code example shows how to use `describe-export-tasks`.
AWS CLI

To list details about an instance export task

This example describes the export task with ID export-i-fh8sjjsq.

Command:

```
aws ec2 describe-export-tasks --export-task-ids export-i-fh8sjjsq
```

Output:

```
{
   "ExportTasks": [
   {
      "State": "active",
      "InstanceExportDetails": {
         "InstanceId": "i-1234567890abcdef0",
         "TargetEnvironment": "vmware"
      },
      "ExportToS3Task": {
         "S3Bucket": "myexportbucket",
         "S3Key": "RHEL5export-i-fh8sjjsq.ova",
         "DiskImageFormat": "vmdk",
         "ContainerFormat": "ova"
      },
      "Description": "RHEL5 instance",
      "ExportTaskId": "export-i-fh8sjjsq"
   }
   ]
}
```

- For API details, see [DescribeExportTasks](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-export-tasks.html) in *AWS CLI Command Reference*.

**describe-fast-launch-images**

The following code example shows how to use `describe-fast-launch-images`.

**AWS CLI**

To describe the details for Windows AMIs that are configured for faster launching
The following `describe-fast-launch-images` example describes the details for each of the AMIs in your account that are configured for faster launching, including the resource type, the snapshot configuration, the launch template details, the maximum number of parallel launches, the AMI owner ID, the state of the fast launch configuration, the reason the state was changed, and the time that the state change occurred.

```
aws ec2 describe-fast-launch-images
```

Output:

```
{
   "FastLaunchImages": [
    {
       "ImageId": "ami-01234567890abcedf",
       "ResourceType": "snapshot",
       "SnapshotConfiguration": {},
       "LaunchTemplate": {
         "LaunchTemplateId": "lt-01234567890abcedf",
         "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-a8c6215d-94e6-441b-9272-dbd1f87b07e2",
         "Version": "1"
       },
       "MaxParallelLaunches": 6,
       "OwnerId": "0123456789123",
       "State": "enabled",
       "StateTransitionReason": "Client.UserInitiated",
       "StateTransitionTime": "2022-01-27T22:20:06.552000+00:00"
    }
   ]
}
```

For more information about configuring a Windows AMI for faster launching, see [Configure your AMI for faster launching](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/AMIGuide.html) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeLaunchImages](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-launch-images.html) in *AWS CLI Command Reference*.

### describe-fast-snapshot-restores

The following code example shows how to use `describe-fast-snapshot-restores`.

```
AWS CLI

To describe fast snapshot restores

The following describe-fast-snapshot-restores example displays details for all fast snapshot restores with a state of disabled.

```
aws ec2 describe-fast-snapshot-restores \
    --filters Name=state,Values=disabled
```

Output:

```
{
    "FastSnapshotRestores": [
        {
            "SnapshotId": "snap-1234567890abcdef0",
            "AvailabilityZone": "us-west-2c",
            "State": "disabled",
            "StateTransitionReason": "Client.UserInitiated - Lifecycle state transition",
            "OwnerId": "123456789012",
            "EnablingTime": "2020-01-25T23:57:49.596Z",
            "OptimizingTime": "2020-01-25T23:58:25.573Z",
            "DisablingTime": "2020-01-26T00:40:56.069Z",
            "DisabledTime": "2020-01-26T00:41:27.390Z"
        }
    ]
}
```

The following describe-fast-snapshot-restores example describes all fast snapshot restores.

```
aws ec2 describe-fast-snapshot-restores
```

- For API details, see [DescribeFastSnapshotRestores](#) in *AWS CLI Command Reference*.

describe-fleet-history

The following code example shows how to use describe-fleet-history.
AWS CLI

To describe EC2 Fleet history

The following describe-fleet-history example returns the history for the specified EC2 Fleet starting at the specified time. The output is for an EC2 Fleet with two running instances.

```
aws ec2 describe-fleet-history \
  --fleet-id fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
  --start-time 2020-09-01T00:00:00Z
```

Output:

```
{
  "HistoryRecords": [
    {
      "EventInformation": {
        "EventSubType": "submitted"
      },
      "EventType": "fleetRequestChange",
      "Timestamp": "2020-09-01T18:26:05.000Z"
    },
    {
      "EventInformation": {
        "EventSubType": "active"
      },
      "EventType": "fleetRequestChange",
      "Timestamp": "2020-09-01T18:26:15.000Z"
    },
    {
      "EventInformation": {
        "EventDescription": "t2.small, ami-07c8bc5c1ce9598c3, ...",
        "EventSubType": "progress"
      },
      "EventType": "fleetRequestChange",
      "Timestamp": "2020-09-01T18:26:17.000Z"
    },
    {
      "EventInformation": {
        "EventDescription": "{\"instanceType\":\"t2.small\", ...}"
      },
      "EventSubType": "launched",
      "InstanceId": "i-083a1c446e66085d2"
    }
  ]
}
```
For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeFleetHistory in AWS CLI Command Reference.

describe-fleet-instances

The following code example shows how to use describe-fleet-instances.

AWS CLI

To describe the running instances for an EC2 Fleet

The following describe-fleet-instances example describes the running instances for the specified EC2 Fleet.

```bash
aws ec2 describe-fleet-instances
--fleet-id 12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```json
{
    "ActiveInstances": [
        {
            "EventType": "instanceChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "{"instanceType":"t2.small"", ...}",
                "EventSubType": "launched",
                "InstanceId": "i-090db02406cc3c2d6"
            },
            "EventType": "instanceChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        }
    ],
    "LastEvaluatedTime": "2020-09-01T19:10:19.000Z",
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
    "StartTime": "2020-08-31T23:53:20.000Z"
}
```
For more information, see [Managing an EC2 Fleet](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/using-ebs-storage.html) in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see [DescribeFleetInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-fleet-instances.html) in AWS CLI Command Reference.

**describe-fleets**

The following code example shows how to use `describe-fleets`.

**AWS CLI**

**To describe an EC2 Fleet**

The following `describe-fleets` example describes the specified EC2 Fleet.

```bash
aws ec2 describe-fleets
  --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

**Output:**

```json
{
  "Fleets": [
    {
      "ActivityStatus": "pending_fulfillment",
      "CreateTime": "2020-09-01T18:26:05.000Z",

For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

• For API details, see DescribeFleets in AWS CLI Command Reference.

describe-flow-logs

The following code example shows how to use describe-flow-logs.

AWS CLI

Example 1: To describe all of your flow logs
The following `describe-flow-logs` example displays details for all of your flow logs.

```bash
aws ec2 describe-flow-logs
```

Output:

```json
{
    "FlowLogs": [
    {
        "DeliverLogsPermissionArn": "arn:aws:iam::123456789012:role/flow-logs-role",
        "DeliverLogsStatus": "SUCCESS",
        "FlowLogId": "fl-aabbccdd112323445",
        "MaxAggregationInterval": 600,
        "FlowLogStatus": "ACTIVE",
        "LogGroupName": "FlowLogGroup",
        "ResourceId": "subnet-12345678901234567",
        "TrafficType": "ALL",
        "LogDestinationType": "cloud-watch-logs",
        "LogFormat": "${version} ${account-id} ${interface-id} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${protocol} ${packets} ${bytes} ${start} ${end} ${action} ${log-status}"
    },
    {
        "CreationTime": "2020-02-04T15:22:29.986Z",
        "DeliverLogsStatus": "SUCCESS",
        "FlowLogId": "fl-01234567890123456",
        "MaxAggregationInterval": 60,
        "FlowLogStatus": "ACTIVE",
        "ResourceId": "vpc-00112233445566778",
        "TrafficType": "ACCEPT",
        "LogDestinationType": "s3",
        "LogDestination": "arn:aws:s3:::my-flow-log-bucket/custom",
        "LogFormat": "${version} ${vpc-id} ${subnet-id} ${instance-id} ${interface-id} ${account-id} ${type} ${srcaddr} ${dstaddr} ${srcport} ${dstport} ${pkt-srcaddr} ${pkt-dstaddr} ${protocol} ${bytes} ${packets} ${start} ${end} ${action} ${tcp-flags} ${log-status}"
    }
    
    ]
}
```

**Example 2: To describe a subset of your flow logs**
The following `describe-flow-logs` example uses a filter to display details for only those flow logs that are in the specified log group in Amazon CloudWatch Logs.

```
aws ec2 describe-flow-logs \\
   --filter "Name=log-group-name,Values=MyFlowLogs"
```

- For API details, see [DescribeFlowLogs](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-flow-logs.html) in *AWS CLI Command Reference*.

### describe-fpga-image-attribute

The following code example shows how to use `describe-fpga-image-attribute`.

**AWS CLI**

**To describe the attributes of an Amazon FPGA image**

This example describes the load permissions for the specified AFI.

**Command:**

```
aws ec2 describe-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --attribute loadPermission
```

**Output:**

```
{
   "FpgaImageAttribute": {
      "FpgaImageId": "afi-0d123e123bfc85abc",
      "LoadPermissions": [
         {
            "UserId": "123456789012"
         }
      ]
   }
}
```

- For API details, see [DescribeFpgaImageAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-fpga-image-attribute.html) in *AWS CLI Command Reference*.

### describe-fpga-images

The following code example shows how to use `describe-fpga-images`.

---

Actions and scenarios
AWS CLI

To describe Amazon FPGA images

This example describes AFIs that are owned by account 123456789012.

Command:

```
aws ec2 describe-fpga-images --filters Name=owner-id,Values=123456789012
```

Output:

```
{
   "FpgaImages": [
      {
         "UpdateTime": "2017-12-22T12:09:14.000Z",
         "Name": "my-afi",
         "PciId": {
            "SubsystemVendorId": "0xfedd",
            "VendorId": "0x1d0f",
            "DeviceId": "0xf000",
            "SubsystemId": "0x1d51"
         },
         "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc",
         "Public": false,
         "State": {
            "Code": "available"
         },
         "ShellVersion": "0x071417d3",
         "OwnerId": "123456789012",
         "FpgaImageId": "afi-0d123e123bfc85abc",
         "CreateTime": "2017-12-22T11:43:33.000Z",
         "Description": "my-afi"
      }
   ]
}
```

For API details, see `DescribeFpgaImages` in AWS CLI Command Reference.

describe-host-reservation-offerings

The following code example shows how to use describe-host-reservation-offerings.
To describe Dedicated Host Reservation offerings

This example describes the Dedicated Host Reservations for the M4 instance family that are available to purchase.

Command:

```
aws ec2 describe-host-reservation-offerings --filter Name=instance-family,Values=m4
```

Output:

```
{
    "OfferingSet": [
        {
            "HourlyPrice": "1.499",
            "OfferingId": "hro-03f707bf363b6b324",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        },
        {
            "HourlyPrice": "1.045",
            "OfferingId": "hro-0ef9181cabdef7a02",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "UpfrontPrice": "0.000",
            "Duration": 94608000
        },
        {
            "HourlyPrice": "0.714",
            "OfferingId": "hro-04567a15500b92a51",
            "InstanceFamily": "m4",
            "PaymentOption": "PartialUpfront",
            "UpfrontPrice": "6254.000",
            "Duration": 31536000
        },
        {
            "HourlyPrice": "0.484",
            "OfferingId": "hro-0d5d7a9d23ed7f3bfe",
            "InstanceFamily": "m4",
            "PaymentOption": "NoUpfront",
            "UpfrontPrice": "0.000",
            "Duration": 31536000
        }
    ]
}
```
• For API details, see DescribeHostReservationOfferings in AWS CLI Command Reference.

describe-host-reservations

The following code example shows how to use describe-host-reservations.

AWS CLI

To describe Dedicated Host Reservations in your account

This example describes the Dedicated Host Reservations in your account.

Command:

```
aws ec2 describe-host-reservations
```

Output:

```
{
```
The following code example shows how to use `describe-hosts`.

**AWS CLI**

*To view details about Dedicated Hosts*

The following `describe-hosts` example displays details for the available Dedicated Hosts in your AWS account.

```bash
aws ec2 describe-hosts --filter "Name=state,Values=available"
```

**Output:**

```json
{
    "Hosts": [
        {
            "HostId": "h-07879acf49EXAMPLE",
            "Tags": [

```
For more information, see Viewing Dedicated Hosts in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see DescribeHosts in AWS CLI Command Reference.

describe-id-format

The following code example shows how to use describe-id-format.

AWS CLI

Example 1: To describe the ID format of a resource
The following `describe-id-format` example describes the ID format for security groups.

```bash
aws ec2 describe-id-format 
   --resource security-group
```

In the following example output, the Deadline value indicates that the deadline for this resource type to permanently switch from the short ID format to the long ID format expired at 00:00 UTC on August 15, 2018.

```json
{
   "Statuses": [
      {
         "Deadline": "2018-08-15T00:00:00.000Z",
         "Resource": "security-group",
         "UseLongIds": true
      }
   ]
}
```

**Example 2: To describe the ID format for all resources**

The following `describe-id-format` example describes the ID format for all resource types. All resource types that supported the short ID format were switched to use the long ID format.

```bash
aws ec2 describe-id-format
```

- For API details, see [DescribeIdFormat](https://docs.aws.amazon.com/AWSCommandLineReference/latest/clireference/acli_cmdref_describe-id-format.html) in *AWS CLI Command Reference*.

### describe-identity-id-format

The following code example shows how to use `describe-identity-id-format`.

**AWS CLI**

**To describe the ID format for an IAM role**

The following `describe-identity-id-format` example describes the ID format received by instances created by the IAM role `EC2Role` in your AWS account.

```bash
aws ec2 describe-identity-id-format 
```
--principal-arn arn:aws:iam::123456789012:role/my-iam-role \
--resource instance

The following output indicates that instances created by this role receive IDs in long ID format.

```
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00Z",
            "Resource": "instance",
            "UseLongIds": true
        }
    ]
}
```

**To describe the ID format for an IAM user**

The following `describe-identity-id-format` example describes the ID format received by snapshots created by the IAM user AdminUser in your AWS account.

```
aws ec2 describe-identity-id-format \
    --principal-arn arn:aws:iam::123456789012:user/AdminUser \
    --resource snapshot
```

The output indicates that snapshots created by this user receive IDs in long ID format.

```
{
    "Statuses": [
        {
            "Deadline": "2016-12-15T00:00:00Z",
            "Resource": "snapshot",
            "UseLongIds": true
        }
    ]
}
```

- For API details, see [DescribeIdentityIdFormat](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-identity-id-format.html) in *AWS CLI Command Reference*.

**describe-image-attribute**

The following code example shows how to use `describe-image-attribute`.

---

**Actions and scenarios** 2249
**AWS CLI**

**To describe the launch permissions for an AMI**

This example describes the launch permissions for the specified AMI.

Command:

```bash
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute launchPermission
```

Output:

```json
{
   "LaunchPermissions": [
      {
         "UserId": "123456789012"
      }
   ],
   "ImageId": "ami-5731123e",
}
```

**To describe the product codes for an AMI**

This example describes the product codes for the specified AMI. Note that this AMI has no product codes.

Command:

```bash
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute productCodes
```

Output:

```json
{
   "ProductCodes": [],
   "ImageId": "ami-5731123e",
}
```

- For API details, see [DescribeImageAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-image-attribute.html) in *AWS CLI Command Reference*. 
describe-import-image-tasks

The following code example shows how to use describe-import-image-tasks.

AWS CLI

To monitor an import image task

The following describe-import-image-tasks example checks the status of the specified import image task.

```
aws ec2 describe-import-image-tasks --import-task-ids import-ami-1234567890abcdef0
```

Output for an import image task that is in progress.

```
{
   "ImportImageTasks": [
   {
      "ImportTaskId": "import-ami-1234567890abcdef0",
      "Progress": "28",
      "SnapshotDetails": [
      {
         "DiskImageSize": 705638400.0,
         "Format": "ova",
         "Status": "completed",
         "UserBucket": {
            "S3Bucket": "my-import-bucket",
            "S3Key": "vms/my-server-vm.ova"
         }
      }
   ],
   "Status": "active",
   "StatusMessage": "converting"
   }
   ]
}
```

Output for an import image task that is completed. The ID of the resulting AMI is provided by ImageId.

```
{
   "ImageId": "ami-1234567890abcdef0"
}
```
"ImportImageTasks": [
  {
    "ImportTaskId": "import-ami-1234567890abcdef0",
    "ImageId": "ami-1234567890abcdef0",
    "SnapshotDetails": [
      {
        "DiskImageSize": 705638400.0,
        "Format": "ova",
        "SnapshotId": "snap-1234567890abcdef0"
      },
      {
        "DiskImageSize": 705638400.0,
        "Format": "ova",
        "SnapshotId": "snap-1234567890abcdef0"
      },
      {
        "DiskImageSize": 705638400.0,
        "Format": "ova",
        "SnapshotId": "snap-1234567890abcdef0"
      }
    ],
    "Status": "completed"
  }
]

• For API details, see DescribeImportImageTasks in AWS CLI Command Reference.

describe-import-snapshot-tasks

The following code example shows how to use describe-import-snapshot-tasks.

AWS CLI

To monitor an import snapshot task

The following describe-import-snapshot-tasks example checks the status of the specified import snapshot task.

aws ec2 describe-import-snapshot-tasks \  --import-task-ids import-snap-1234567890abcdef0

Output for an import snapshot task that is in progress:

```json
{
  "ImportSnapshotTasks": [
```
Output for an import snapshot task that is completed. The ID of the resulting snapshot is provided by SnapshotId.

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "My server VMDK",
      "ImportTaskId": "import-snap-1234567890abcdef0",
      "SnapshotTaskDetail": {
        "Description": "My server VMDK",
        "DiskImageSize": "705638400.0",
        "Format": "VMDK",
        "Progress": "42",
        "Status": "active",
        "StatusMessage": "downloading/ converting",
        "UserBucket": {
          "S3Bucket": "my-import-bucket",
          "S3Key": "vms/my-server-vm.vmdk"
        }
      }
    }
  ]
}
```

- For API details, see [DescribeImportSnapshotTasks](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-import-snapshot-tasks.html) in *AWS CLI Command Reference*. 
describe-instance-attribute

The following code example shows how to use describe-instance-attribute.

AWS CLI

To describe the instance type

This example describes the instance type of the specified instance.

Command:

```bash
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute instanceType
```

Output:

```json
{
   "InstanceId": "i-1234567890abcdef0"
   "InstanceType": {
      "Value": "t1.micro"
   }
}
```

To describe the disableApiTermination attribute

This example describes the disableApiTermination attribute of the specified instance.

Command:

```bash
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute disableApiTermination
```

Output:

```json
{
   "InstanceId": "i-1234567890abcdef0"
   "DisableApiTermination": {
      "Value": "false"
   }
}
```

To describe the block device mapping for an instance
This example describes the `blockDeviceMapping` attribute of the specified instance.

Command:

```bash
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute blockDeviceMapping
```

Output:

```json
{
    "InstanceId": "i-1234567890abcdef0",
    "BlockDeviceMappings": [
        {
            "DeviceName": "/dev/sda1",
            "Ebs": {
                "Status": "attached",
                "DeleteOnTermination": true,
                "VolumeId": "vol-049df61146c4d7901",
                "AttachTime": "2013-05-17T22:42:34.000Z"
            }
        },
        {
            "DeviceName": "/dev/sdf",
            "Ebs": {
                "Status": "attached",
                "DeleteOnTermination": false,
                "VolumeId": "vol-049df61146c4d7901",
                "AttachTime": "2013-09-10T23:07:00.000Z"
            }
        }
    ]
}
```

- For API details, see [DescribeInstanceAttribute](#) in [AWS CLI Command Reference](#).

### describe-instance-connect-endpoints

The following code example shows how to use `describe-instance-connect-endpoints`.

#### AWS CLI

To describe an EC2 Instance Connect Endpoint
The following `describe-instance-connect-endpoints` example describes the specified EC2 Instance Connect Endpoint.

```bash
aws ec2 describe-instance-connect-endpoints
    --region us-east-1
    --instance-connect-endpoint-ids eice-0123456789example
```

Output:

```json
{
    "InstanceConnectEndpoints": [
    {
        "OwnerId": "111111111111",
        "InstanceConnectEndpointId": "eice-0123456789example",
        "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
        "State": "create-complete",
        "StateMessage": ",",
        "DnsName": "eice-0123456789example.b67b86ba.ec2-instance-connect-endpoint.us-east-1.amazonaws.com",
        "NetworkInterfaceIds": [
            "eni-0123456789example"
        ],
        "VpcId": "vpc-0123abcd",
        "AvailabilityZone": "us-east-1",
        "CreatedAt": "2023-02-07T12:05:37+00:00",
        "SubnetId": "subnet-0123abcd",
        "Tags": []
    }
    ]
}
```

For more information, see [Create an EC2 Instance Connect Endpoint](https://docs.aws.amazon.com/ec2/userguide/instance-connect-endpoints.html) in the Amazon EC2 User Guide.

- For API details, see [DescribeInstanceConnectEndpoints](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-connect-endpoints.html) in AWS CLI Command Reference.

describe-instance-credit-specifications

The following code example shows how to use `describe-instance-credit-specifications`.
AWS CLI

To describe the credit option for CPU usage of one or more instances

The following describe-instance-credit-specifications example describes the CPU credit option for the specified instance.

```bash
aws ec2 describe-instance-credit-specifications --instance-ids i-1234567890abcdef0
```

Output:

```json
{
  "InstanceCreditSpecifications": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "CpuCredits": "unlimited"
    }
  ]
}
```

For more information, see Work with burstable performance instances in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceCreditSpecifications in AWS CLI Command Reference.

describe-instance-event-notification-attributes

The following code example shows how to use describe-instance-event-notification-attributes.

AWS CLI

To describe the tags for scheduled event notifications

The following describe-instance-event-notification-attributes example describes the tags to appear in scheduled event notifications.

```bash
aws ec2 describe-instance-event-notification-attributes
```

Output:
The following code example shows how to use `describe-instance-event-windows`.

**AWS CLI**

**Example 1: To describe all event windows**

The following `describe-instance-event-windows` example describes all event windows in the specified Region.

```bash
aws ec2 describe-instance-event-windows \
   --region us-east-1
```

**Output:**

```json
{
   "InstanceEventWindows": [
      {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
          "InstanceIds": [
            "i-1234567890abcdef0",
            "i-0598c7d356eba48d7"
          ],
          "Tags": [],
          "DedicatedHostIds": []
        }
      }
   ]
}
```
Example 2: To describe a specific event window

The following `describe-instance-event-windows` example describes a specific event by using the `instance-event-window` parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \
  --region us-east-1 \
  --instance-event-window-ids iew-0abcdef1234567890
```

Output:

```
{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
        "InstanceIds": [
          "i-1234567890abcdef0",
          "i-0598c7d356eba48d7"
        ],
        "Tags": [],
        "DedicatedHostIds": []
      },
      "State": "active",
      "Tags": []
    }
  ],
  "NextToken": "9d624e0c-388b-4862-a31e-a85c64fc1d4a"
}
```

Example 3: To describe event windows that match one or more filters
The following `describe-instance-event-windows` example describes event windows that match one or more filters using the `filter` parameter. The `instance-id` filter is used to describe all of the event windows that are associated with the specified instance. When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the tags of the instance or Dedicated Host ID (if the instance is a Dedicated Host).

```bash
aws ec2 describe-instance-event-windows \
  --region us-east-1 \
  --filters Name=instance-id,Values=i-1234567890abcdef0 \
  --max-results 100 \ 
  --next-token <next-token-value>
```

Output:

```json
{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0dbc0adb66f235982",
      "TimeRanges": [
        {
          "StartWeekDay": "sunday",
          "StartHour": 2,
          "EndWeekDay": "sunday",
          "EndHour": 8
        }
      ],
      "Name": "myEventWindowName",
      "AssociationTarget": {
        "InstanceIds": [],
        "Tags": [],
        "DedicatedHostIds": [
          "h-0140d9a7ecbd102dd"
        ]
      },
      "State": "active",
      "Tags": []
    }
  ]
}
```
In the example output, the instance is on a Dedicated Host, which is associated with the event window.

For event window constraints, see Considerations in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceEventWindows in AWS CLI Command Reference.

describe-instance-topology

The following code example shows how to use describe-instance-topology.

AWS CLI

To describe the instance topology of all your instances

The following describe-instance-topology example describes the topology of all your instances that match the supported instance types for this command.

```bash
aws ec2 describe-instance-topology \
   --region us-west-2
```

Output:

```json
{
   "Instances": [
      {
         "InstanceId": "i-1111111111example",
         "InstanceType": "p4d.24xlarge",
         "GroupName": "my-ml-cpg",
         "NetworkNodes": [
            "nn-1111111111example",
            "nn-2222222222example",
            "nn-3333333333example"
         ],
         "ZoneId": "usw2-az2",
         "AvailabilityZone": "us-west-2a"
      },
      {
         "InstanceId": "i-2222222222example",
         "InstanceType": "p4d.24xlarge",
         "NetworkNodes": [
            "nn-1111111111example",
            "nn-2222222222example",
            "nn-3333333333example"
         ],
         "ZoneId": "usw2-az2",
         "AvailabilityZone": "us-west-2a"
      }
   ]
}
```
For more information, including more examples, see Amazon EC2 instance topology in the Amazon EC2 User Guide.

- For API details, see DescribeInstanceTopology in AWS CLI Command Reference.

describe-instance-type-offerings

The following code example shows how to use describe-instance-type-offerings.

AWS CLI

Example 1: To list the instance types offered in a Region
The following `describe-instance-type-offerings` example lists the instance types offered in the Region configured as the default Region for the AWS CLI.

```bash
aws ec2 describe-instance-type-offerings
```

To list the instance types offered in a different Region, specify the Region using the `--region` parameter.

```bash
aws ec2 describe-instance-type-offerings \
   --region us-east-2
```

Output:

```json
{
   "InstanceTypeOfferings": [
      {
         "InstanceType": "m5.2xlarge",
         "LocationType": "region",
         "Location": "us-east-2"
      },
      {
         "InstanceType": "t3.micro",
         "LocationType": "region",
         "Location": "us-east-2"
      },
      ...
   ]
}
```

Example 2: To list the instance types offered in an Availability Zone

The following `describe-instance-type-offerings` example lists the instance types offered in the specified Availability Zone. The Availability Zone must be in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
   --location-type availability-zone \
   --filters Name=location,Values=us-east-2a \
   --region us-east-2
```

Example 3: To check whether an instance type is supported
The following `describe-instance-type-offerings` command indicates whether the c5.xlarge instance type is supported in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
   --filters Name=instance-type,Values=c5.xlarge \n   --region us-east-2
```

The following `describe-instance-type-offerings` example lists all C5 instance types that are supported in the specified Region.

```bash
aws ec2 describe-instance-type-offerings \
   --filters Name=instance-type,Values=c5* \n   --query "InstanceTypeOfferings[].InstanceType" \n   --region us-east-2
```

Output:

```
["c5d.12xlarge", "c5d.9xlarge", "c5n.xlarge", "c5.xlarge", "c5d.metal", "c5n.metal", "c5.large", "c5d.2xlarge", "c5n.4xlarge", "c5.2xlarge", "c5n.large", "c5n.9xlarge", "c5d.large", "c5.18xlarge", "c5d.18xlarge", "c5.12xlarge", "c5n.18xlarge", "c5.metal", "c5d.4xlarge", "c5.24xlarge", "c5d.xlarge", "c5n.2xlarge", "c5d.24xlarge", "c5.9xlarge",]```
The following code example shows how to use `describe-internet-gateways`.

**AWS CLI**

To describe an internet gateway

The following `describe-internet-gateways` example describes the specified internet gateway.

```
aws ec2 describe-internet-gateways \
  --internet-gateway-ids igw-0d0fb496b3EXAMPLE
```

**Output:**

```json
{
  "InternetGateways": [
    {
      "Attachments": [
        {
          "State": "available",
          "VpcId": "vpc-0a6eb65b4EXAMPLE"
        }
      ],
      "InternetGatewayId": "igw-0d0fb496b3EXAMPLE",

      "Tags": [
        {
          "Key": "Name",
          "Value": "my-igw"
        }
      ]
    }
  ]
}
```
For more information, see Internet gateways in the Amazon VPC User Guide.

- For API details, see DescribeInternetGateways in AWS CLI Command Reference.

**describe-ipam-pools**

The following code example shows how to use describe-ipam-pools.

**AWS CLI**

**To view the details for an IPAM pool**

The following describe-ipam-pools example shows the details for pools.

(Windows):

```bash
aws ec2 describe-ipam-pools
   --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-scope-02fc38cd4c48e7d38
```

Output:

```json
{
   "IpamPools": [
      {
         "OwnerId": "123456789012",
         "IpamPoolId": "ipam-pool-02ec043a19b6e5d08",
         "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-pool-02ec043a19b6e5d08",
         "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-scope-02fc38cd4c48e7d38",
         "IpamScopeType": "private",
         "IpamArn": "arn:aws:ec2::123456789012:ipam-ipam-08440e7a3acde3908",
         "IpamRegion": "us-east-1",
         "Locale": "None",
         "PoolDepth": 1,
         "State": "create-complete",
      }
   ]
}
```
For API details, see DescribeIpamPools in AWS CLI Command Reference.

describe-ipam-scopes

The following code example shows how to use describe-ipam-scopes.

AWS CLI

To view the details for an IPAM scope

The following describe-ipam-scopes example shows the details for scopes.

```
aws ec2 describe-ipam-scopes \
  --filters Name=owner-id,Values=123456789012 Name=ipam-id,Values=ipam-08440e7a3acde3908
```

Output:

```
{
    "IpamScopes": [
        {
            "OwnerId": "123456789012",
            "AddressFamily": "ipv4",

describe-ipams

The following code example shows how to use describe-ipams.

AWS CLI

To view the details for an IPAM

The following describe-ipams example shows the details of an IPAM.

```bash
aws ec2 describe-ipams \
   --filters Name=owner-id,Values=123456789012
```

Output:

```
{
   "Ipams": [
       {
         "OwnerId": "123456789012",
         "IpamId": "ipam-08440e7a3acde3908",
         "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
         "IpamRegion": "us-east-1",

               "RegionName": "us-east-2"
             },
             {
               "RegionName": "us-west-1"
             }
         ],
         "State": "create-complete",
         "Tags": [
             {
               
```
For API details, see [DescripIv6Pools](#) in *AWS CLI Command Reference*.

**describe-ipv6-pools**

The following code example shows how to use `describe-ipv6-pools`.

**AWS CLI**

**To describe your IPv6 address pools**

The following `describe-ipv6-pools` example displays details for all of your IPv6 address pools.

```bash
code example
aws ec2 describe-ipv6-pools
```

**Output:**

```json
{
    "Ipv6Pools": [
        {
            "PoolId": "ipv6pool-ec2-012345abc12345abc",
            "PoolCidrBlocks": [
                {
                    "Cidr": "2001:db8:123::/48"
                }
            ],
            "Tags": [
                {
                    "Key": "pool-1",
                    "Value": "public"
                }
            ]
        }
    ]
}
```
• For API details, see [DescribeIpv6Pools](#) in *AWS CLI Command Reference*.

**describe-launch-template-versions**

The following code example shows how to use `describe-launch-template-versions`.

**AWS CLI**

**To describe launch template versions**

This example describes the versions of the specified launch template.

Command:

```
aws ec2 describe-launch-template-versions --launch-template-id lt-068f72b72934aff71
```

Output:

```json
{
   "LaunchTemplateVersions": [
      {
         "LaunchTemplateId": "lt-068f72b72934aff71",
         "LaunchTemplateName": "Webservers",
         "VersionNumber": 3,
         "CreatedBy": "arn:aws:iam::123456789102:root",
         "LaunchTemplateData": {
            "KeyName": "kp-us-east",
            "ImageId": "ami-6057e21a",
            "InstanceType": "t2.small",
            "NetworkInterfaces": [
               {
                  "SubnetId": "subnet-7b16de0c",
                  "DeviceIndex": 0,
                  "Groups": [
                     "sg-7c227019"
                  ]
               }
            ]
         },
         "DefaultVersion": false,
         "CreateTime": "2017-11-20T13:19:54.000Z"
      }
   ]
}```
For API details, see `DescribeLaunchTemplateVersions` in *AWS CLI Command Reference*.

**describe-launch-templates**

The following code example shows how to use `describe-launch-templates`.

**AWS CLI**

**To describe launch templates**

This example describes your launch templates.

**Command:**

```bash
aws ec2 describe-launch-templates
```

**Output:**

```json
{
   "LaunchTemplates": [
   {
       "LatestVersionNumber": 2,
       "LaunchTemplateId": "lt-0e06d290751193123",
       "LaunchTemplateName": "TemplateForWebServer",
       "DefaultVersionNumber": 2,
       "CreatedBy": "arn:aws:iam::123456789012:root",
       "CreateTime": "2017-11-27T09:30:23.000Z"
   },
   {
       "LatestVersionNumber": 6,
       "LaunchTemplateId": "lt-0c45b5e061ec98456",
       "LaunchTemplateName": "DBServersTemplate",
       "DefaultVersionNumber": 1,
       "CreatedBy": "arn:aws:iam::123456789012:root",
       "CreateTime": "2017-11-20T09:25:22.000Z"
   }
]}
```
For API details, see DescribeLaunchTemplates in AWS CLI Command Reference.

describe-local-gateway-route-table-virtual-interface-group-associations

The following code example shows how to use describe-local-gateway-route-table-virtual-interface-group-associations.

AWS CLI

To describe associations between virtual interface groups and local gateway route tables

The following describe-local-gateway-route-table-virtual-interface-group-associations example describes the associations between virtual interface groups and local gateway route tables in your AWS account.

aws ec2 describe-local-gateway-route-table-virtual-interface-group-associations

Output:

```json
{
  
}
```
For more information, see Working with local gateways in the AWS Outposts User Guide.

- For API details, see DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations in AWS CLI Command Reference.

describe-local-gateway-route-table-vpc-associations

The following code example shows how to use describe-local-gateway-route-table-vpc-associations.

AWS CLI

To describe the associations between VPCs and local gateway route tables

The following describe-local-gateway-route-table-vpc-associations example displays information about the specified association between VPCs and local gateway route tables.

```bash
aws ec2 describe-local-gateway-route-table-vpc-associations \
--local-gateway-route-table-vpc-association-ids lgw-vpc-assoc-0e0f27af15EXAMPLE
```

Output:

```
{
    "LocalGatewayRouteTableVpcAssociation": {
```

"LocalGatewayRouteTableVirtualInterfaceGroupAssociations": [
{
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-07145b276bEXAMPLE",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
    "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
    "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-gateway-route-table/lgw-rtb-059615ef7dEXAMPLE",
    "OwnerId": "123456789012",
    "State": "associated",
    "Tags": []
  }
]
"LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0e0f27af1EXAMPLE",
"LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
"LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
"VpcId": "vpc-0efe9bde08EXAMPLE",
"State": "associated"
}
}

For more information, see Local gateway route tables in the Outposts User Guide.

- For API details, see DescribeLocalGatewayRouteTableVpcAssociations in AWS CLI Command Reference.

describe-local-gateway-route-tables

The following code example shows how to use describe-local-gateway-route-tables.

**AWS CLI**

To describe your Local Gateway Route Tables

The following describe-local-gateway-route-tables example displays details about the local gateway route tables.

```
aws ec2 describe-local-gateway-route-tables
```

Output:

```
{
   "LocalGatewayRouteTables": [
      {
         "LocalGatewayRouteTableId": "lgw-rtb-059615ef7deEXAMPLE",
         "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
         "State": "available"
      }
   ]
}
```

- For API details, see DescribeLocalGatewayRouteTables in AWS CLI Command Reference.
The following code example shows how to use `describe-local-gateway-virtual-interface-groups`.

**AWS CLI**

To describe local gateway virtual interface groups

The following `describe-local-gateway-virtual-interface-groups` example describes the local gateway virtual interface groups in your AWS account.

```bash
aws ec2 describe-local-gateway-virtual-interface-groups
```

**Output:**

```json
{
   "LocalGatewayVirtualInterfaceGroups": [
      {
         "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
         "LocalGatewayVirtualInterfaceIds": [
            "lgw-vif-01a23bc4d5EXAMPLE",
            "lgw-vif-543ab21012EXAMPLE"
         ],
         "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
         "OwnerId": "123456789012",
         "Tags": []
      }
   ]
}
```

For more information, see [Working with local gateways](https://docs.aws.amazon.com/AmazonOutposts/latest/UserGuide/working-local-gateways.html) in the *AWS Outposts User Guide*.

- For API details, see [DescribeLocalGatewayVirtualInterfaceGroups](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-local-gateway-virtual-interface-groups.html) in *AWS CLI Command Reference*.

The following code example shows how to use `describe-local-gateway-virtual-interfaces`.

```bash
```
AWS CLI

To describe local gateway virtual interfaces

The following `describe-local-gateway-virtual-interfaces` example describes the local gateway virtual interfaces in your AWS account.

```bash
aws ec2 describe-local-gateway-virtual-interfaces
```

Output:

```json
{
   "LocalGatewayVirtualInterfaces": [
      {
         "LocalGatewayVirtualInterfaceId": "lgw-vif-01a23bc4d5EXAMPLE",
         "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
         "Vlan": 2410,
         "LocalAddress": "0.0.0.0/0",
         "PeerAddress": "0.0.0.0/0",
         "LocalBgpAsn": 65010,
         "PeerBgpAsn": 65000,
         "OwnerId": "123456789012",
         "Tags": []
      },
      {
         "LocalGatewayVirtualInterfaceId": "lgw-vif-543ab21012EXAMPLE",
         "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
         "Vlan": 2410,

         "PeerBgpAsn": 65000,
         "OwnerId": "123456789012",
         "Tags": []
      }
   ]
}
```

- For API details, see [DescribeLocalGatewayVirtualInterfaces](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-local-gateway-virtual-interfaces.html) in *AWS CLI Command Reference*. 
describe-local-gateways

The following code example shows how to use describe-local-gateways.

AWS CLI

To describe your Local Gateways

The following describe-local-gateways example displays details for the local gateways that are available to you.

aws ec2 describe-local-gateways

Output:

```
{
    "LocalGateways": [
        {
            "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
            "OwnerId": "123456789012",
            "State": "available"
        }
    ]
}
```

- For API details, see [DescribeLocalGateways](#) in [AWS CLI Command Reference](#).

describe-managed-prefix-lists

The following code example shows how to use describe-managed-prefix-lists.

AWS CLI

To describe managed prefix lists

The following describe-managed-prefix-lists example describes the prefix lists owned by AWS account 123456789012.

```bash
aws ec2 describe-managed-prefix-lists \ 
  --filters Name=owner-id,Values=123456789012
```
Output:

```
{
  "PrefixLists": [
    {
      "PrefixListId": "pl-11223344556677aab",
      "AddressFamily": "IPv6",
      "State": "create-complete",
      "PrefixListName": "vpc-ipv6-cidrs",
      "MaxEntries": 25,
      "Version": 1,
      "Tags": [],
      "OwnerId": "123456789012"
    },
    {
      "PrefixListId": "pl-0123456abcabcabc1",
      "AddressFamily": "IPv4",
      "State": "active",
      "PrefixListName": "vpc-cidrs",
      "MaxEntries": 10,
      "Version": 1,
      "Tags": [],
      "OwnerId": "123456789012"
    }
  ]
}
```

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see DescribeManagedPrefixLists in AWS CLI Command Reference.

describe-moving-addresses

The following code example shows how to use describe-moving-addresses.

AWS CLI

To describe your moving addresses
This example describes all of your moving Elastic IP addresses.

Command:

aws ec2 describe-moving-addresses

Output:

```json
{
   "MovingAddressStatuses": [
      {
         "PublicIp": "198.51.100.0",
         "MoveStatus": "MovingToVpc"
      }
   ]
}
```

This example describes all addresses that are moving to the EC2-VPC platform.

Command:

aws ec2 describe-moving-addresses --filters Name=moving-status,Values=MovingToVpc

- For API details, see [DescribeMovingAddresses](#) in AWS CLI Command Reference.

**describe-nat-gateways**

The following code example shows how to use describe-nat-gateways.

**AWS CLI**

**Example 1: To describe a public NAT gateway**

The following describe-nat-gateways example describes the specified public NAT gateway.

```
aws ec2 describe-nat-gateways \
   --nat-gateway-id nat-01234567890abcdef
```

Output:

```json
{
   "NatGateways": [
```
Example 2: To describe a private NAT gateway

The following describe-nat-gateways example describes the specified private NAT gateway.

```
aws ec2 describe-nat-gateways
```
Output:

```json
{
    "NatGateways": [
        {
            "CreateTime": "2023-08-25T00:50:05.000Z",
            "NatGatewayAddresses": [
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.240",

                    "Status": "succeeded"
                },
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.33",
                    "IsPrimary": false,
                    "Status": "succeeded"
                },
                {
                    "NetworkInterfaceId": "eni-0065a61b324d1897a",
                    "PrivateIp": "10.0.20.197",
                    "IsPrimary": false,
                    "Status": "succeeded"
                }
            ],
            "NatGatewayId": "nat-1234567890abcdef0",
            "State": "available",
            "SubnetId": "subnet-08fc749671EXAMPLE",
            "VpcId": "vpc-098eb5ef58EXAMPLE",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "private-nat"
                }
            ],
            "ConnectivityType": "private"
        }
    ]
}
```
For more information, see **NAT gateways** in the *Amazon VPC User Guide*.

- For API details, see **DescribeNatGateways** in *AWS CLI Command Reference*.

**describe-network-acls**

The following code example shows how to use `describe-network-acls`.

**AWS CLI**

**To describe your network ACLs**

The following `describe-network-acls` example retrieves details about your network ACLs.

```bash
aws ec2 describe-network-acls
```

**Output:**

```json
{
  "NetworkAcls": [
    {
      "Associations": [
        {
          "NetworkAclAssociationId": "aclassoc-0c1679dc41EXAMPLE",
          "NetworkAclId": "acl-0ea1f54ca7EXAMPLE",
          "SubnetId": "subnet-0931fc2fa5EXAMPLE"
        }
      ],
      "Entries": [
        {
          "CidrBlock": "0.0.0.0/0",
          "Egress": true,
          "Protocol": "-1",
          "RuleAction": "allow",
          "RuleNumber": 100
        },
        {
          "CidrBlock": "0.0.0.0/0",
          "Egress": true,
          "Protocol": "-1",
          "RuleAction": "deny",
          "RuleNumber": 32767
        }
      ]
    }
  ]
}
```
{
    "CidrBlock": "0.0.0.0/0",
    "Egress": false,

"Tags": [],
"VpcId": "vpc-03914afb3eEXAMPLE",
"OwnerId": "111122223333"
}
```
The following code example shows how to use `describe-network-insights-access-scope-analyses`.

**AWS CLI**

To describe Network Insights access scope analyses

The following `describe-network-insights-access-scope-analyses` example describes the access scope analysis in your AWS account.

```
aws ec2 describe-network-insights-access-scope-analyses \
   --region us-east-1
```

Output:

```
{
   "NetworkInsightsAccessScopeAnalyses": [
       {
           "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111",
           "NetworkInsightsAccessScopeId": "nis-123456789222",
           "Status": "succeeded",
           "StartDate": "2022-01-25T19:45:36.842000+00:00",
           "FindingsFound": "true",
           "Tags": []
       }
   ]
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/networkaccess/latest/userguide/getting-started-using-the-aws-cli.html) in the Network Access Analyzer Guide.
describe-network-insights-access-scopes

The following code example shows how to use describe-network-insights-access-scopes.

AWS CLI

To describe Network Insights access scopes

The following describe-network-insights-access-scopes example describes the access-scope analyses in your AWS account.

```
aws ec2 describe-network-insights-access-scopes \
  --region us-east-1
```

Output:

```
{
    "NetworkInsightsAccessScopes": [
    {
        "NetworkInsightsAccessScopeId": "nis-123456789111",
        "CreatedDate": "2021-11-29T21:12:41.416000+00:00",
        "UpdatedDate": "2021-11-29T21:12:41.416000+00:00",
        "Tags": []
    }
    ]
}
```

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

For API details, see DescribeNetworkInsightsAccessScopeAnalyses in AWS CLI Command Reference.

describe-network-insights-analyses

The following code example shows how to use describe-network-insights-analyses.
AWS CLI

To view the results of a path analysis

The following describe-network-insights-analyses example describes the specified analysis. In this example, the source is an internet gateway, the destination is an EC2 instance, and the protocol is TCP. The analysis succeeded (Status is succeeded) and the path is not reachable (NetworkPathFound is false). The explanation code ENI_SG_RULES_MISMATCH indicates that the security group for the instance does not contain a rule that allows traffic on the destination port.

```
aws ec2 describe-network-insights-analyses \
    --network-insights-analysis-ids nia-02207aa13eb480c7a
```

Output:

```json
{
    "NetworkInsightsAnalyses": [
        {
            "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
            "NetworkInsightsPathId": "nip-0b26f224f1d11fa8",
            "StartDate": "2021-01-20T22:58:37.495Z",
            "Status": "succeeded",
            "NetworkPathFound": false,
            "Explanations": [
                {
                    "Direction": "ingress",
                    "ExplanationCode": "ENI_SG_RULES_MISMATCH",
                    "NetworkInterface": {
                        "Id": "eni-0a25edef15a6cc08c",
                        "Arn": "arn:aws:ec2:us-east-1:123456789012:network-interface/eni-0a25edef15a6cc08c"
                    },
                    "SecurityGroups": [
                        {
                            "Id": "sg-02f0d35a850ba727f",
                            "Arn": "arn:aws:ec2:us-east-1:123456789012:security-group_sg-02f0d35a850ba727f"
                        }
                    ]
                }
            ]
        }
    ]
}
```
For more information, see [Getting started using the AWS CLI](#) in the *Reachability Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsAnalyses](#) in *AWS CLI Command Reference*.

### describe-network-insights-paths

The following code example shows how to use `describe-network-insights-paths`.

**AWS CLI**

#### To describe a path

The following `describe-network-insights-paths` example describes the specified path.

```
aws ec2 describe-network-insights-paths \
  --network-insights-path-ids nip-0b26f224f1d131fa8
```

**Output:**

```
{
  "NetworkInsightsPaths": [
    {
      "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
      "CreatedDate": "2021-01-20T22:43:46.933Z",
    }
  ]
}
```
For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/CLI/latest/userguide/ getting-started.html) in the *Reachability Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsPaths](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-network-insights-paths.html) in *AWS CLI Command Reference*.

### describe-network-interface-attribute

The following code example shows how to use `describe-network-interface-attribute`.

**AWS CLI**

**To describe the attachment attribute of a network interface**

This example command describes the attachment attribute of the specified network interface.

**Command:**

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute attachment
```

**Output:**

```
{
   "NetworkInterfaceId": "eni-686ea200",
   "Attachment": {
      "Status": "attached",
      "DeviceIndex": 0,
      "AttachTime": "2015-05-21T20:02:20.000Z",
      "InstanceId": "i-1234567890abcdef0",
      "DeleteOnTermination": true,
      "AttachmentId": "eni-attach-43348162",
      "InstanceOwnerId": "123456789012"
   }
}
```

**To describe the description attribute of a network interface**
This example command describes the description attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute description
```

Output:

```
{
   "NetworkInterfaceId": "eni-686ea200",
   "Description": {
      "Value": "My description"
   }
}
```

To describe the groupSet attribute of a network interface

This example command describes the groupSet attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute groupSet
```

Output:

```
{
   "NetworkInterfaceId": "eni-686ea200",
   "Groups": [
      {
         "GroupName": "my-security-group",
         "GroupId": "sg-903004f8"
      }
   ]
}
```

To describe the sourceDestCheck attribute of a network interface

This example command describes the sourceDestCheck attribute of the specified network interface.
Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute sourceDestCheck
```

Output:

```
{
  "NetworkInterfaceId": "eni-686ea200",
  "SourceDestCheck": {
    "Value": true
  }
}
```

**describe-network-interface-permissions**

The following code example shows how to use `describe-network-interface-permissions`.

**AWS CLI**

To describe your network interface permissions

This example describes all of your network interface permissions.

Command:

```
aws ec2 describe-network-interface-permissions
```

Output:

```
{
  "NetworkInterfacePermissions": [
    {
      "PermissionState": {
        "State": "GRANTED"
      },
      "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
      "NetworkInterfaceId": "eni-b909511a",
      "Permission": "INSTANCE-ATTACH",
      "AwsAccountId": "123456789012"
    }
  ]
}
```
For API details, see `DescribeNetworkInterfacePermissions` in *AWS CLI Command Reference*.

**describe-network-interfaces**

The following code example shows how to use `describe-network-interfaces`.

**AWS CLI**

**To describe your network interfaces**

This example describes all your network interfaces.

**Command:**

```
aws ec2 describe-network-interfaces
```

**Output:**

```json
{
    "NetworkInterfaces": [
        {
            "Status": "in-use",
            "MacAddress": "02:2f:8f:b0:cf:75",
            "SourceDestCheck": true,
            "VpcId": "vpc-a01106c2",
            "Description": "my network interface",
            "Association": {
                "PublicIp": "203.0.113.12",
                "AssociationId": "eipassoc-0fbb766a",
                "PublicDnsName": "ec2-203-0-113-12.compute-1.amazonaws.com",
                "IpOwnerId": "123456789012"
            },
            "NetworkInterfaceId": "eni-e5aa89a3",
            "PrivateIpAddresses": [
                {
                    "PrivateDnsName": "ip-10-0-1-17.ec2.internal",
                    "Association": {
                        "PublicIp": "203.0.113.12",
                        "AssociationId": "eipassoc-0fbb766a",
```
"PublicDnsName": "ec2-203-0-113-12.compute-1.amazonaws.com",
"IpOwnerId": "123456789012"
],
"Primary": true,
"PrivateIpAddress": "10.0.1.17"
}
],
"RequesterManaged": false,
"Ipv6Addresses": [],
"PrivateDnsName": "ip-10-0-1-17.ec2.internal",
"AvailabilityZone": "us-east-1d",
"Attachment": {
  "Status": "attached",
  "DeviceIndex": 1,
  "AttachTime": "2013-11-30T23:36:42.000Z",
  "InstanceId": "i-1234567890abcdef0",
  "DeleteOnTermination": false,
  "AttachmentId": "eni-attach-66c4350a",
  "InstanceOwnerId": "123456789012"
},
"Groups": [
  {
    "GroupName": "default",
    "GroupId": "sg-8637d3e3"
  }
],
"SubnetId": "subnet-b61f49f0",
"OwnerId": "123456789012",
"TagSet": [],
"PrivateIpAddress": "10.0.1.17"
],
{
  "Status": "in-use",
  "MacAddress": "02:58:f5:ef:4b:06",
  "SourceDestCheck": true,
  "VpcId": "vpc-a01106c2",
  "Description": "Primary network interface",
  "Association": {
    "PublicIp": "198.51.100.0",
    "IpOwnerId": "amazon"
  },
  "NetworkInterfaceId": "eni-f9ba99bf",
  "PrivateIpAddresses": [
  
  ]}
This example describes network interfaces that have a tag with the key `Purpose` and the value `Prod`.

Command:

```bash
aws ec2 describe-network-interfaces --filters Name=tag:Purpose,Values=Prod
```

Output:
{  
  "NetworkInterfaces": [  
    {  
      "Status": "available",  
      "MacAddress": "12:2c:bd:f9:bf:17",  
      "SourceDestCheck": true,  
      "VpcId": "vpc-8941ebec",  
      "Description": "ProdENI",  
      "NetworkInterfaceId": "eni-b9a5ac93",  
      "PrivateIpAddresses": [  
        {  
          "PrivateDnsName": "ip-10-0-1-55.ec2.internal",  
          "Primary": true,  
          "PrivateIpAddress": "10.0.1.55"  
        },  
        {  
          "PrivateDnsName": "ip-10-0-1-117.ec2.internal",  
          "Primary": false,  
          "PrivateIpAddress": "10.0.1.117"  
        }  
      ],  
      "RequesterManaged": false,  
      "PrivateDnsName": "ip-10-0-1-55.ec2.internal",

      "Ipv6Addresses": [],  
      "Groups": [  
        {  
          "GroupName": "MySG",  
          "GroupId": "sg-905002f5"  
        }  
      ],  
      "SubnetId": "subnet-31d6c219",  
      "OwnerId": "123456789012",  
      "TagSet": [  
        {  
          "Value": "Prod",  
          "Key": "Purpose"  
        }  
      ],  
      "PrivateIpAddress": "10.0.1.55"  
    }  
  ]  
}
For API details, see DescribeNetworkInterfaces in AWS CLI Command Reference.

describe-placement-groups

The following code example shows how to use describe-placement-groups.

AWS CLI

To describe your placement groups

This example command describes all of your placement groups.

Command:

```
aws ec2 describe-placement-groups
```

Output:

```
{
   "PlacementGroups": [
   {
      "GroupName": "my-cluster",
      "State": "available",
      "Strategy": "cluster"
   },
   ...
   ]
}
```

For API details, see DescribePlacementGroups in AWS CLI Command Reference.

describe-prefix-lists

The following code example shows how to use describe-prefix-lists.

AWS CLI

To describe prefix lists

This example lists all available prefix lists for the region.

Command:
aws ec2 describe-prefix-lists

Output:

```
{
    "PrefixLists": [
        {
            "PrefixListName": "com.amazonaws.us-east-1.s3",
            "Cidrs": [
                "54.231.0.0/17"
            ],
            "PrefixListId": "pl-63a5400a"
        }
    ]
}
```

- For API details, see [DescribePrefixLists](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-prefix-lists.html) in *AWS CLI Command Reference*.

**describe-principal-id-format**

The following code example shows how to use `describe-principal-id-format`.

**AWS CLI**

**To describe the ID format for IAM users and roles with long ID format enabled**

The following `describe-principal-id-format` example describes the ID format for the root user, all IAM roles, and all IAM users with long ID format enabled.

```
aws ec2 describe-principal-id-format \
    --resource instance
```

Output:

```
{
    "Principals": [
        {
            "Arn": "arn:aws:iam::123456789012:root",
            "Statuses": [
                {
                    "Status": "LONG_FORMAT_ENABLED"
                }
            ]
        }
    ]
}
```
For API details, see DescribePrincipalIdFormat in AWS CLI Command Reference.

describe-public-ipv4-pools

The following code example shows how to use describe-public-ipv4-pools.

AWS CLI

To describe your public IPv4 address pools

The following describe-public-ipv4-pools example displays details about the address pools that were created when you provisioned public IPv4 address ranges using Bring Your Own IP Addresses (BYOIP).

aws ec2 describe-public-ipv4-pools

Output:

```json
{
  "PublicIpv4Pools": [
    {
      "PoolId": "ipv4pool-ec2-1234567890abcdef0",
    }]
}
"PoolAddressRanges": [ 
  { 
    "FirstAddress": "203.0.113.0",
    "LastAddress": "203.0.113.255",
    "AddressCount": 256,
    "AvailableAddressCount": 256
  } 
],
"TotalAddressCount": 256,
"TotalAvailableAddressCount": 256
]

- For API details, see [DescribePublicIpv4Pools](#) in *AWS CLI Command Reference*.

describe-replace-root-volume-tasks

The following code example shows how to use describe-replace-root-volume-tasks.

**AWS CLI**

**Example 1: To view information about a specific root volume replacement task**

The following describe-replace-root-volume-tasks example describes root volume replacement task replacevol-0111122223333abcd.

```
aws ec2 describe-replace-root-volume-tasks \
  --replace-root-volume-task-ids replacevol-0111122223333abcd
```

Output:

```
{
  "ReplaceRootVolumeTasks": [ 
    { 
      "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
      "Tags": [],
      "InstanceId": "i-0123456789abcdefa",
      "TaskState": "succeeded",
      "StartTime": "2022-03-14T15:16:28Z",
      "CompleteTime": "2022-03-14T15:16:52Z"
    }
  ]
}
```

**Example 2: To view information about all root volume replacement tasks for a specific instance**

The following `describe-replace-root-volume-tasks` example describes all of the root volume replacement tasks for instance i-0123456789abcdefa.

```bash
aws ec2 describe-replace-root-volume-tasks \   --filters Name=instance-id,Values=i-0123456789abcdefa
```

Output:

```json
{
  "ReplaceRootVolumeTasks": [
    {
      "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
      "Tags": [],
      "InstanceId": "i-0123456789abcdefa",
      "TaskState": "succeeded",
      "StartTime": "2022-03-14T15:06:38Z",
      "CompleteTime": "2022-03-14T15:07:03Z"
    },
    {
      "ReplaceRootVolumeTaskId": "replacevol-0444455555555abcd",
      "Tags": [],
      "InstanceId": "i-0123456789abcdefa",
      "TaskState": "succeeded",
      "StartTime": "2022-03-14T15:16:28Z",
      "CompleteTime": "2022-03-14T15:16:52Z"
    }
  ]
}
```

- For API details, see [DescribeReplaceRootVolumeTasks](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-replace-root-volume-tasks.html) in *AWS CLI Command Reference*. 
**describe-reserved-instances**

The following code example shows how to use `describe-reserved-instances`.

**AWS CLI**

**To describe your Reserved Instances**

This example command describes the Reserved Instances that you own.

Command:

```
aws ec2 describe-reserved-instances
```

Output:

```json
{
   "ReservedInstances": [
      {
         "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342fexample",
         "OfferingType": "No Upfront",
         "AvailabilityZone": "us-west-1c",
         "End": "2016-08-14T21:34:34.000Z",
         "ProductDescription": "Linux/UNIX",
         "UsagePrice": 0.00,
         "RecurringCharges": [
            {
               "Amount": 0.104,
               "Frequency": "Hourly"
            }
         ],
         "Start": "2015-08-15T21:34:35.086Z",
         "State": "active",
         "FixedPrice": 0.0,
         "CurrencyCode": "USD",
         "Duration": 31536000,
         "InstanceTenancy": "default",
         "InstanceType": "m3.medium",
         "InstanceCount": 2
      },
      ...
   ]
}
```
To describe your Reserved Instances using filters

This example filters the response to include only three-year, t2.micro Linux/UNIX Reserved Instances in us-west-1c.

Command:

```
aws ec2 describe-reserved-instances --filters Name=duration,Values=94608000
    Name=instance-type,Values=t2.micro
    Name=product-description,Values=Linux/UNIX
    Name=availability-zone,Values=us-east-1e
```

Output:

```
{
    "ReservedInstances": [
        {
            "ReservedInstancesId": "f127bd27-edb7-44c9-a0eb-0d7e09259af0",
            "OfferingType": "All Upfront",
            "AvailabilityZone": "us-east-1e",
            "End": "2018-03-26T21:34:34.000Z",
            "ProductDescription": "Linux/UNIX",
            "UsagePrice": 0.00,
            "RecurringCharges": [],
            "Start": "2015-03-27T21:34:35.848Z",
            "State": "active",
            "FixedPrice": 151.0,
            "CurrencyCode": "USD",
            "Duration": 94608000,
            "InstanceTenancy": "default",
            "InstanceType": "t2.micro",
            "InstanceCount": 1
        }
    ]
}
```

For more information, see Using Amazon EC2 Instances in the AWS Command Line Interface User Guide.

- For API details, see DescribeReservedInstances in AWS CLI Command Reference.

describe-reserved-instances-listings

The following code example shows how to use describe-reserved-instances-listings.
AWS CLI

To describe a Reserved Instance listing

The following describe-reserved-instances-listings example retrieves information about the specified Reserved Instance listing.

```
aws ec2 describe-reserved-instances-listings \
  --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

This command produces no output.

- For API details, see `DescribeReservedInstancesListings` in AWS CLI Command Reference.

describe-reserved-instances-modifications

The following code example shows how to use describe-reserved-instances-modifications.

AWS CLI

To describe Reserved Instances modifications

This example command describes all the Reserved Instances modification requests that have been submitted for your account.

Command:

```
aws ec2 describe-reserved-instances-modifications
```

Output:

```
{
  "ReservedInstancesModifications": [
    {
      "Status": "fulfilled",
      "ModificationResults": [
        {
          "ReservedInstancesId": "93bbbca2-62f1-4d9d-b225-16bada29e6c7",
          "TargetConfiguration": {
            "AvailabilityZone": "us-east-1b",
            "InstanceType": "m1.large",
          }
        }
      ]
    }
  ]
}
```
"InstanceCount": 3
}
},
{
"ReservedInstancesId": "1ba8e2e3-aabb-46c3-bcf5-3fe2fda922e6",
"TargetConfiguration": {
   "AvailabilityZone": "us-east-1d",
   "InstanceType": "m1.xlarge",
   "InstanceCount": 1
}
}
],
"EffectiveDate": "2015-08-12T17:00:00.000Z",
"CreateDate": "2015-08-12T17:52:52.630Z",
"UpdateDate": "2015-08-12T18:08:06.698Z",
"ClientToken": "c9adb218-3222-4889-8216-0cf0e52dc37e",
"ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687",
"ReservedInstancesIds": [
    {
      "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342f5bd7c02"
    }
]
}

**describe-reserved-instances-offerings**

The following code example shows how to use `describe-reserved-instances-offerings`.

**AWS CLI**

**To describe Reserved Instances offerings**

This example command describes all Reserved Instances available for purchase in the region.

**Command:**

```
aws ec2 describe-reserved-instances-offerings
```
Output:

```json
{
    "ReservedInstancesOfferings": [
    {
        "OfferingType": "Partial Upfront",
        "AvailabilityZone": "us-east-1b",
        "InstanceTenancy": "default",
        "PricingDetails": [],
        "ProductDescription": "Red Hat Enterprise Linux",
        "UsagePrice": 0.0,
        "RecurringCharges": [
            {
                "Amount": 0.088,
                "Frequency": "Hourly"
            }
        ],
        "Marketplace": false,
        "CurrencyCode": "USD",
        "FixedPrice": 631.0,
        "Duration": 94608000,
        "ReservedInstancesOfferingId": "9a06095a-bdc6-47fe-a94a-2a382f016040",
        "InstanceType": "c1.medium"
    },
    {
        "OfferingType": "Partial Upfront",
        "AvailabilityZone": "us-east-1b",
        "InstanceTenancy": "default",
        "PricingDetails": [],
        "ProductDescription": "Linux/UNIX",
        "UsagePrice": 0.0,
        "RecurringCharges": [
            {
                "Amount": 0.028,
                "Frequency": "Hourly"
            }
        ],
        "Marketplace": false,
        "CurrencyCode": "USD",
        "FixedPrice": 631.0,
        "Duration": 94608000,
        "ReservedInstancesOfferingId": "bfbefc6c-0d10-418d-b144-7258578d329d",
        "InstanceType": "c1.medium"
    }
    ]
}
```
To describe your Reserved Instances offerings using options

This example lists Reserved Instances offered by AWS with the following specifications: t1.micro instance types, Windows (Amazon VPC) product, and Heavy Utilization offerings.

Command:

```
aws ec2 describe-reserved-instances-offerings --no-include-marketplace --instance-type "t1.micro" --product-description "Windows (Amazon VPC)" --offering-type "no upfront"
```

Output:

```
{
   "ReservedInstancesOfferings": [
   {
      "OfferingType": "No Upfront",
      "AvailabilityZone": "us-east-1b",
      "InstanceTenancy": "default",
      "PricingDetails": [],
      "ProductDescription": "Windows",
      "UsagePrice": 0.0,
      "RecurringCharges": [
         {
            "Amount": 0.015,
            "Frequency": "Hourly"
         }
      ],
      "Marketplace": false,
      "CurrencyCode": "USD",
      "FixedPrice": 0.0,
      "Duration": 31536000,
      "ReservedInstancesOfferingId": "c48ab04e-fe69-4f94-8e39-a23842292823",
      "InstanceType": "t1.micro"
   },
   ...
   
   {
      "OfferingType": "No Upfront",
      "AvailabilityZone": "us-east-1d",
      ...
   }
   
   ...
   
   ...
   }
```
"InstanceTenancy": "default",
"PricingDetails": [],
"ProductDescription": "Windows (Amazon VPC)",
"UsagePrice": 0.0,
"RecurringCharges": [
  {
    "Amount": 0.015,
    "Frequency": "Hourly"
  }
],
"Marketplace": false,
"CurrencyCode": "USD",
"FixedPrice": 0.0,
"Duration": 31536000,
"ReservedInstancesOfferingId": "3a98bf7d-2123-42d4-b4f5-8dbec4b06dc6",
"InstanceType": "t1.micro"
}
}

• For API details, see DescribeReservedInstancesOfferings in AWS CLI Command Reference.

describe-route-tables

The following code example shows how to use describe-route-tables.

AWS CLI

To describe your route tables

The following describe-route-tables example retrieves the details about your route tables

aws ec2 describe-route-tables

Output:

{
  "RouteTables": [
    {
      "Associations": [
        {
          "Main": true,
          "RouteTableAssociationId": "rtbassoc-0df3f54e06EXAMPLE",

"VpcId": "vpc-0065acced4EXAMPLE",
"OwnerId": "111122223333"
}]
}

For more information, see Working with Route Tables in the AWS VPC User Guide.

- For API details, see DescribeRouteTables in AWS CLI Command Reference.
describe-scheduled-instance-availability

The following code example shows how to use `describe-scheduled-instance-availability`.

**AWS CLI**

**To describe an available schedule**

This example describes a schedule that occurs every week on Sunday, starting on the specified date.

Command:

```bash
aws ec2 describe-scheduled-instance-availability --recurrence
  Frequency=Weekly,Interval=1,OccurrenceDays=[1] --first-slot-start-time-range
  EarliestTime=2016-01-31T00:00:00Z,LatestTime=2016-01-31T04:00:00Z
```

Output:

```
{
  "ScheduledInstanceAvailabilitySet": [
    {
      "AvailabilityZone": "us-west-2b",
      "TotalScheduledInstanceHours": 1219,
      "PurchaseToken": "eyJ2IjoiMSIsInMiOi...
      "MinTermDurationInDays": 366,
      "AvailableInstanceCount": 20,
      "Recurrence": {
        "OccurrenceDaySet": [1],
        "Interval": 1,
        "Frequency": "Weekly",
        "OccurrenceRelativeToEnd": false
      },
      "Platform": "Linux/UNIX",
      "FirstSlotStartTime": "2016-01-31T00:00:00Z",
      "MaxTermDurationInDays": 366,
      "SlotDurationInHours": 23,
      "NetworkPlatform": "EC2-VPC",
      "InstanceType": "c4.large",
      "HourlyPrice": "0.095"
    }
  ]
}```
To narrow the results, you can add filters that specify the operating system, network, and instance type.

Command:

--filters Name=platform,Values=Linux/UNIX Name=network-platform,Values=EC2-VPC Name=instance-type,Values=c4.large

- For API details, see `DescribeScheduledInstanceAvailability` in *AWS CLI Command Reference*.

**describe-scheduled-instances**

The following code example shows how to use `describe-scheduled-instances`.

**AWS CLI**

**To describe your Scheduled Instances**

This example describes the specified Scheduled Instance.

Command:

```
aws ec2 describe-scheduled-instances --scheduled-instance-ids sci-1234-1234-1234-1234-123456789012
```

Output:

```
{
  "ScheduledInstanceSet": [
    {
      "AvailabilityZone": "us-west-2b",
      "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
      "HourlyPrice": "0.095",
      "CreateDate": "2016-01-25T21:43:38.612Z",
      "Recurrence": {
        "OccurrenceDaySet": [1],
      },
    }]
}
```
This example describes all your Scheduled Instances.

Command:

```
aws ec2 describe-scheduled-instances
```

- For API details, see [DescribeScheduledInstances](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-scheduled-instances.html) in AWS CLI Command Reference.

describe-security-group-references

The following code example shows how to use describe-security-group-references.

AWS CLI

**To describe security group references**

This example describes the security group references for sg-bbbbb2222. The response indicates that security group sg-bbbbb2222 is being referenced by a security group in VPC vpc-aaaaaaaa.

Command:

```
aws ec2 describe-security-group-references --group-id sg-bbbbb22222
```
Output:

```json
{
   "SecurityGroupsReferenceSet": [
      {
         "ReferencingVpcId": "vpc-aaaaaaaa",
         "GroupId": "sg-bbbbb22222",
         "VpcPeeringConnectionId": "pcx-b04deed9"
      }
   }
}
```

- For API details, see [DescribeSecurityGroupReferences](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-security-group-rules.html) in *AWS CLI Command Reference*.

**describe-security-group-rules**

The following code example shows how to use `describe-security-group-rules`.

**AWS CLI**

**Example 1: To describe the security group rules for a security group**

The following `describe-security-group-rules` example describes the security group rules of a specified security group. Use the filters option to scope the results to a specific security group.

```bash
aws ec2 describe-security-group-rules \   --filters Name="group-id",Values="sg-1234567890abcdef0"
```

**Output:**

```json
{
   "SecurityGroupRules": [
      {
         "SecurityGroupRuleId": "sgr-abcdef01234567890",
         "GroupId": "sg-1234567890abcdef0",
         "GroupOwnerId": "111122223333",
         "IsEgress": false,
         "IpProtocol": "-1",
         "FromPort": -1,
         "ToPort": -1,
         "ReferencedGroupInfo": {
```
Example 2: To describe a security group rule

The following `describe-security-group-rules` example describes the specified security group rule.

```bash
aws ec2 describe-security-group-rules \
  --security-group-rule-ids sgr-cdef01234567890ab
```

Output:

```json
{
    "SecurityGroupRules": [
        {
            "GroupId": "sg-1234567890abcdef0",
            "UserId": "111122223333",
            "Tags": []
        },
        {
            "SecurityGroupRuleId": "sgr-cdef01234567890ab",
            "GroupId": "sg-1234567890abcdef0",
            "GroupOwnerId": "111122223333",
            "IsEgress": true,
            "IpProtocol": ":-1",
            "FromPort": -1,
            "ToPort": -1,
            "CidrIpv6": "::/0",
            "Tags": []
        }
    ]
}
```
"SecurityGroupRuleId": "sgr-cdef01234567890ab",
"GroupId": "sg-1234567890abcdef0",
"GroupOwnerId": "111122223333",
"IsEgress": true,
"IpProtocol": "-1",
"FromPort": -1,
"ToPort": -1,
"CidrIpv4": "0.0.0.0/0",
"Tags": []
}
]
]

For more information, see Security group rules in the Amazon VPC User Guide.

- For API details, see DescribeSecurityGroupRules in AWS CLI Command Reference.

describe-snapshot-attribute

The following code example shows how to use describe-snapshot-attribute.

AWS CLI

To describe the snapshot attributes for a snapshot

The following describe-snapshot-attribute example lists the accounts with which a snapshot is shared.

```
aws ec2 describe-snapshot-attribute \
   --snapshot-id snap-01234567890abcedf \
   --attribute createVolumePermission
```

Output:

```
{
   "SnapshotId": "snap-01234567890abcedf",
   "CreateVolumePermissions": [ 
   {
      "UserId": "123456789012"
   }
   ]
}
```
For more information, see Share an Amazon EBS snapshot in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshotAttribute in AWS CLI Command Reference.

**describe-snapshot-tier-status**

The following code example shows how to use describe-snapshot-tier-status.

**AWS CLI**

To view archival information about an archived snapshot

The following describe-snapshot-tier-status example provides archival information about an archived snapshot.

```bash
aws ec2 describe-snapshot-tier-status \
   --filters "Name=snapshot-id, Values=snap-01234567890abcedf"
```

Output:

```
{
   "SnapshotTierStatuses": [
   
   {
   "Status": "completed",
   "ArchivalCompleteTime": "2021-09-15T17:33:16.147Z",
   "LastTieringProgress": 100,
   "Tags": [],
   "VolumeId": "vol-01234567890abcedf",
   "LastTieringOperationState": "archival-completed",
   "StorageTier": "archive",
   "OwnerId": "123456789012",
   "SnapshotId": "snap-01234567890abcedf",
   "LastTieringStartTime": "2021-09-15T16:44:37.574Z"
   }
   ]
}
```

For more information, see View archived snapshots in the Amazon Elastic Compute Cloud User Guide.

- For API details, see DescribeSnapshotTierStatus in AWS CLI Command Reference.
**describe-spot-datafeed-subscription**

The following code example shows how to use `describe-spot-datafeed-subscription`.

**AWS CLI**

**To describe Spot Instance datafeed subscription for an account**

This example command describes the data feed for the account.

Command:

```bash/aws ec2 describe-spot-datafeed-subscription
```

Output:

```
{
    "SpotDatafeedSubscription": {
        "OwnerId": "123456789012",
        "Prefix": "spotdata",
        "Bucket": "my-s3-bucket",
        "State": "Active"
    }
}
```

**describe-spot-fleet-instances**

The following code example shows how to use `describe-spot-fleet-instances`.

**AWS CLI**

**To describe the Spot Instances associated with a Spot fleet**

This example command lists the Spot instances associated with the specified Spot fleet.

Command:

```bash/aws ec2 describe-spot-fleet-instances --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

Actions and scenarios
• For API details, see DescribeSpotFleetInstances in AWS CLI Command Reference.

**describe-spot-fleet-request-history**

The following code example shows how to use describe-spot-fleet-request-history.

**AWS CLI**

**To describe Spot fleet history**

This example command returns the history for the specified Spot fleet starting at the specified time.

Command:

```
aws ec2 describe-spot-fleet-request-history --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE --start-time 2015-05-26T00:00:00Z
```

The following example output shows the successful launches of two Spot Instances for the Spot fleet.

Output:

```
{
   "HistoryRecords": [
   {
     "EventInformation": {
        "EventSubType": "submitted"
     }
   }
    ...
    
}```
For API details, see `DescribeSpotFleetRequestHistory` in AWS CLI Command Reference.

**describe-spot-fleet-requests**

The following code example shows how to use `describe-spot-fleet-requests`.

AWS CLI

To describe your Spot fleet requests
This example describes all of your Spot fleet requests.

Command:

`aws ec2 describe-spot-fleet-requests`

Output:

```json
{
   "SpotFleetRequestConfigs": [
      {
         "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
         "SpotFleetRequestConfig": {
            "TargetCapacity": 20,
            "LaunchSpecifications": [
               {
                  "EbsOptimized": false,
                  "NetworkInterfaces": [
                     {
                        "SubnetId": "subnet-a61dafcf",
                        "DeviceIndex": 0,
                        "DeleteOnTermination": false,
                        "AssociatePublicIpAddress": true,
                        "SecondaryPrivateIpAddressCount": 0
                     }
                  ],
                  "InstanceType": "cc2.8xlarge",
                  "ImageId": "ami-1a2b3c4d"
               },
               {
                  "EbsOptimized": false,
                  "NetworkInterfaces": [
                     {
                        "SubnetId": "subnet-a61dafcf",
                        "DeviceIndex": 0,
                        "DeleteOnTermination": false,
                        "AssociatePublicIpAddress": true,
                        "SecondaryPrivateIpAddressCount": 0
                     }
                  ],
                  "InstanceType": "r3.8xlarge",
                  "ImageId": "ami-1a2b3c4d"
               }
            ]
         }
      }
   ]
}
```
To describe a Spot fleet request

This example describes the specified Spot fleet request.

Command:

```
aws ec2 describe-spot-fleet-requests --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```
Output:

```json
{
    "SpotFleetRequestConfigs": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "SpotFleetRequestConfig": {
                "TargetCapacity": 20,
                "LaunchSpecifications": [
                    {
                        "EbsOptimized": false,
                        "NetworkInterfaces": [
                            {
                                "SubnetId": "subnet-a61dafcf",
                                "DeviceIndex": 0,
                                "DeleteOnTermination": false,
                                "AssociatePublicIpAddress": true,
                                "SecondaryPrivateIpAddressCount": 0
                            }
                        ],
                        "InstanceType": "cc2.8xlarge",
                        "ImageId": "ami-1a2b3c4d"
                    },
                    {
                        "EbsOptimized": false,
                        "NetworkInterfaces": [
                            {
                                "SubnetId": "subnet-a61dafcf",
                                "DeviceIndex": 0,
                                "DeleteOnTermination": false,
                                "AssociatePublicIpAddress": true,
                                "SecondaryPrivateIpAddressCount": 0
                            }
                        ],
                        "InstanceType": "r3.8xlarge",
                        "ImageId": "ami-1a2b3c4d"
                    }
                ],
                "SpotPrice": "0.05",
                "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role"
            }
        }
    ],
    "SpotFleetRequestState": "active"
}
```
For API details, see `DescribeSpotFleetRequests` in `AWS CLI Command Reference`.

**describe-spot-instance-requests**

The following code example shows how to use `describe-spot-instance-requests`.

**AWS CLI**

**Example 1: To describe a Spot Instance request**

The following `describe-spot-instance-requests` example describes the specified Spot Instance request.

```
aws ec2 describe-spot-instance-requests \
  --spot-instance-request-ids sir-08b93456
```

Output:

```
{
  "SpotInstanceRequests": [
    {
      "CreateTime": "2018-04-30T18:14:55.000Z",
      "InstanceId": "i-1234567890abcdef1",

]"}

Example 2: To describe Spot Instance requests based on filters

The following describe-spot-instance-requests example uses filters to scope the results to Spot Instance requests with the specified instance type in the specified Availability Zone. The example uses the --query parameter to display only the instance IDs.
aws ec2 describe-spot-instance-requests \
   --filters Name=launch.instance-type,Values=m3.medium Name=launched-availability-zone,Values=us-east-2a \
   --query "SpotInstanceRequests[*].[InstanceId]" \
   --output text

Output:

i-057750d42936e468a
i-001efd250faaa6ffa
i-027552a73f021f3bd
...

For additional examples using filters, see [Listing and filtering your resources](#) in the Amazon Elastic Compute Cloud User Guide.

**Example 3: To describe Spot Instance requests based on tags**

The following `describe-spot-instance-requests` example uses tag filters to scope the results to Spot Instance requests that have the tag `cost-center=cc123`.

aws ec2 describe-spot-instance-requests \
   --filters Name=tag:cost-center,Values=cc123

For an example of the output for `describe-spot-instance-requests`, see Example 1.

For additional examples using tag filters, see [Working with tags](#) in the Amazon EC2 User Guide.

- For API details, see [DescribeSpotInstanceRequests](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-spot-instance-requests.html) in AWS CLI Command Reference.

**describe-spot-price-history**

The following code example shows how to use `describe-spot-price-history`.

**AWS CLI**

**To describe Spot price history**

This example command returns the Spot Price history for m1.xlarge instances for a particular day in January.

Command:
aws ec2 describe-spot-price-history --instance-types m1.xlarge --start-time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10

Output:

```
{
    "SpotPriceHistory": [ [ "Timestamp": "2014-01-06T07:10:55.000Z",
                         "ProductDescription": "SUSE Linux",
                         "InstanceType": "m1.xlarge",
                         "SpotPrice": "0.087000",
                         "AvailabilityZone": "us-west-1b"
                      ],
                      [ "Timestamp": "2014-01-06T07:10:55.000Z",
                        "ProductDescription": "SUSE Linux",
                        "InstanceType": "m1.xlarge",
                        "SpotPrice": "0.087000",
                        "AvailabilityZone": "us-west-1c"
                      ],
                      [ "Timestamp": "2014-01-06T05:42:36.000Z",
                        "ProductDescription": "SUSE Linux (Amazon VPC)",
                        "InstanceType": "m1.xlarge",
                        "SpotPrice": "0.087000",
                        "AvailabilityZone": "us-west-1a"
                      ],
                      ...
        ]
}
```

To describe Spot price history for Linux/UNIX Amazon VPC

This example command returns the Spot Price history for m1.xlarge, Linux/UNIX Amazon VPC instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --product-description "Linux/UNIX (Amazon VPC)" --start-time 2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```
Output:

```json
{
    "SpotPriceHistory": [
        {
            "Timestamp": "2014-01-06T04:32:53.000Z",
            "ProductDescription": "Linux/UNIX (Amazon VPC)",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.080000",
            "AvailabilityZone": "us-west-1a"
        },
        {
            "Timestamp": "2014-01-05T11:28:26.000Z",
            "ProductDescription": "Linux/UNIX (Amazon VPC)",
            "InstanceType": "m1.xlarge",
            "SpotPrice": "0.080000",
            "AvailabilityZone": "us-west-1c"
        }
    ]
}
```

- For API details, see [DescribeSpotPriceHistory](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-spot-price-history.html) in *AWS CLI Command Reference*.

### describe-stale-security-groups

The following code example shows how to use `describe-stale-security-groups`.

**AWS CLI**

To describe stale security groups

This example describes stale security group rules for `vpc-11223344`. The response shows that `sg-5fa68d3a` in your account has a stale ingress SSH rule that references `sg-279ab042` in the peer VPC, and that `sg-fe6fba9a` in your account has a stale egress SSH rule that references `sg-ef6fba8b` in the peer VPC.

**Command:**

```
aws ec2 describe-stale-security-groups --vpc-id vpc-11223344
```

**Output:**

```json
{
  "StaleSecurityGroupSet": [
    {
      "VpcId": "vpc-11223344",
      "StaleIpPermissionsEgress": [
        {
          "ToPort": 22,
          "FromPort": 22,
          "UserIdGroupPairs": [
            {
              "VpcId": "vpc-7a20e51f",
              "GroupId": "sg-ef6fba8b",
              "VpcPeeringConnectionId": "pcx-b04deed9",
              "PeeringStatus": "active"
            }
          ],
          "IpProtocol": "tcp"
        }
      ],
      "GroupName": "MySG1",
      "StaleIpPermissions": [],
      "GroupId": "sg-fe6fba9a",
      "Description": "MySG1"
    },
    {
      "VpcId": "vpc-11223344",
      "StaleIpPermissionsEgress": [],
      "GroupName": "MySG2",
      "StaleIpPermissions": [
        {
          "ToPort": 22,
          "FromPort": 22,
          "UserIdGroupPairs": [
            {
              "VpcId": "vpc-7a20e51f",
              "GroupId": "sg-279ab042",
              "Description": "Access from pcx-b04deed9",
              "VpcPeeringConnectionId": "pcx-b04deed9",
              "PeeringStatus": "active"
            }
          ],
          "IpProtocol": "tcp"
        }
      }
    }
  }
}
```
• For API details, see **DescribeStaleSecurityGroups** in *AWS CLI Command Reference*.

describe-store-image-tasks

The following code example shows how to use `describe-store-image-tasks`.

**AWS CLI**

To describe the progress of an AMI store task

The following `describe-store-image-tasks` example describes the progress of an AMI store task.

```bash
aws ec2 describe-store-image-tasks
```

Output:

```
{
   "AmiId": "ami-1234567890abcdef0",
   "Bucket": "my-ami-bucket",
   "ProgressPercentage": 17,
   "S3ObjectKey": "ami-1234567890abcdef0.bin",
   "StoreTaskState": "In Progress",
   "StoreTaskFailureReason": null,
   "TaskStartTime": "2022-01-01T01:01:01.001Z"
}
```

For more information about storing and restoring an AMI using S3, see *Store and restore an AMI using S3* <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-store-restore.html> in the *Amazon EC2 User Guide*.

• For API details, see **DescribeStoreImageTasks** in *AWS CLI Command Reference*. 
describe-tags

The following code example shows how to use describe-tags.

AWS CLI

Example 1: To describe all tags for a single resource

The following describe-tags example describes the tags for the specified instance.

```bash
aws ec2 describe-tags \
    --filters "Name=resource-id,Values=i-1234567890abcdef8"
```

Output:

```json
{
    "Tags": [
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Test",
            "Key": "Stack"
        },
        {
            "ResourceType": "instance",
            "ResourceId": "i-1234567890abcdef8",
            "Value": "Beta Server",
            "Key": "Name"
        }
    ]
}
```

Example 2: To describe all tags for a resource type

The following describe-tags example describes the tags for your volumes.

```bash
aws ec2 describe-tags \
    --filters "Name=resource-type,Values=volume"
```

Output:

```json
{
    "Tags": [
```
Example 3: To describe all your tags

The following `describe-tags` example describes the tags for all your resources.

```
aws ec2 describe-tags
```

Example 4: To describe the tags for your resources based on a tag key

The following `describe-tags` example describes the tags for your resources that have a tag with the key `Stack`.

```
aws ec2 describe-tags \
   --filters Name=key,Values=Stack
```

Output:

```json
{
   "Tags": [
      {
         "ResourceType": "volume",
         "ResourceId": "vol-027552a73f021f3b",
         "Value": "Production",
         "Key": "Stack"
      },
      {
         "ResourceType": "instance",
         "ResourceId": "i-1234567890abcdef8",
```
**Example 5: To describe the tags for your resources based on a tag key and tag value**

The following `describe-tags` example describes the tags for your resources that have the tag `Stack=Test`.

```
aws ec2 describe-tags \
  --filters Name=key,Values=Stack Name=value,Values=Test
```

Output:

```
{
  "Tags": [
    {
      "ResourceType": "image",
      "ResourceId": "ami-3ac336533f021f3bd",
      "Value": "Test",
      "Key": "Stack"
    },
    {
      "ResourceType": "instance",
      "ResourceId": "i-1234567890abcdef8",
      "Value": "Test",
      "Key": "Stack"
    }
  ]
}
```

The following `describe-tags` example uses alternate syntax to describe resources with the tag `Stack=Test`.

```
aws ec2 describe-tags \
  --filters "Name=tag:Stack,Values=Test"
```

The following `describe-tags` example describes the tags for all your instances that have a tag with the key `Purpose` and no value.
aws ec2 describe-tags
  --filters "Name=resource-type,Values=instance" "Name=key,Values=Purpose"
"Name=value,Values="

Output:

{   "Tags": [       {           "ResourceType": "instance",           "ResourceId": "i-1234567890abcdef5",           "Value": null,           "Key": "Purpose"       }   ]}

- For API details, see DescribeTags in AWS CLI Command Reference.

describe-traffic-mirror-filters

The following code example shows how to use describe-traffic-mirror-filters.

AWS CLI

To view your traffic mirror filters

The following describe-traffic-mirror-filters example displays details for all of your traffic mirror filters.

aws ec2 describe-traffic-mirror-filters

Output:

{
  "TrafficMirrorFilters": [
    {
      "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
      "IngressFilterRules": [
        {
          "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
          "TrafficMirrorFilterRuleAction": "mirror",
          "TrafficMirrorFilterRuleDescription": "Example Traffic Mirror Filter Rule Description"
        }
      ]
    }
  ]
}
For more information, see View your traffic mirror filters in the Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorFilters in AWS CLI Command Reference.

describe-traffic-mirror-sessions

The following code example shows how to use describe-traffic-mirror-sessions.

AWS CLI

To describe a Traffic Mirror Session

The following describe-traffic-mirror-sessions example displays details of your Traffic Mirror sessions.

```bash
aws ec2 describe-traffic-mirror-sessions
```

Output:

```json
{
    "TrafficMirrorSessions": [
    {
        "Tags": [],
        "VirtualNetworkId": 42,
        "OwnerId": "111122223333",
```
For more information, see View Traffic Mirror Session Details in the AWS Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorSessions in AWS CLI Command Reference.

**describe-traffic-mirror-targets**

The following code example shows how to use `describe-traffic-mirror-targets`.

**AWS CLI**

**To describe a traffic mirror target**

The following `describe-traffic-mirror-targets` example displays information about the specified traffic mirror target.

```
aws ec2 describe-traffic-mirror-targets \
```
Output:

```json
{
  "TrafficMirrorTargets": [
    {
      "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
      "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:111122223333:loadbalancer/net/NLB/7cdec873fEXAMPLE",
      "Type": "network-load-balancer",
      "Description": "Example Network Load Balancer target",
      "OwnerId": "111122223333",
      "Tags": []
    }
  ]
}
```

For more information, see Traffic mirror targets in the Amazon VPC Traffic Mirroring Guide.

- For API details, see DescribeTrafficMirrorTargets in AWS CLI Command Reference.

**describe-transit-gateway-attachments**

The following code example shows how to use describe-transit-gateway-attachments.

**AWS CLI**

**To view your transit gateway attachments**

The following describe-transit-gateway-attachments example displays details for your transit gateway attachments.

```bash
aws ec2 describe-transit-gateway-attachments
```

Output:

```json
{
  "TransitGatewayAttachments": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    }
  ]
}
```
"TransitGatewayOwnerId": "123456789012",

For more information, see [Work with transit gateways](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/Transit-Gateways.html) in the *Transit Gateways Guide.*

- For API details, see [DescribeTransitGatewayAttachments](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-transit-gateway-attachments.html) in *AWS CLI Command Reference.*

### describe-transit-gateway-connect-peers

The following code example shows how to use `describe-transit-gateway-connect-peers`.

#### AWS CLI

To describe a Transit Gateway Connect peer

The following `describe-transit-gateway-connect-peers` example describes the specified Connect peer.

```bash
aws ec2 describe-transit-gateway-connect-peers \
  --transit-gateway-connect-peer-ids tgw-connect-peer-0666adbac4EXAMPLE
```

Output:

```json
{
}
```
"TransitGatewayConnectPeers": [ 
  { 
    "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE", 
    "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE", 
    "State": "available", 
    "CreationTime": "2021-10-13T03:35:17.000Z", 
    "ConnectPeerConfiguration": { 
      "TransitGatewayAddress": "10.0.0.234", 
      "PeerAddress": "172.31.1.11", 
      "InsideCidrBlocks": [ 
        "169.254.6.0/29" 
      ], 
      "Protocol": "gre", 
      "BgpConfigurations": [ 
        { 
          "TransitGatewayAsn": 64512, 
          "PeerAsn": 64512, 
          "TransitGatewayAddress": "169.254.6.2", 
          "PeerAddress": "169.254.6.1", 
          "BgpStatus": "down" 
        }, 
        { 
          "TransitGatewayAsn": 64512, 
          "PeerAsn": 64512, 
          "TransitGatewayAddress": "169.254.6.3", 
          "PeerAddress": "169.254.6.1", 
          "BgpStatus": "down" 
        } 
      ], 
      "Tags": [] 
    } 
  } 
} 

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayConnectPeers in AWS CLI Command Reference.

describe-transit-gateway-connects

The following code example shows how to use describe-transit-gateway-connects.
AWS CLI

To describe a transit gateway Connect attachment

The following describe-transit-gateway-connects example describes the specified Connect attachment.

```bash
aws ec2 describe-transit-gateway-connects \
    --transit-gateway-attachment-ids tgw-attach-037012e5dcEXAMPLE
```

Output:

```json
{
    "TransitGatewayConnects": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
            "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
            "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
            "State": "available",
            "CreationTime": "2021-03-09T19:59:17+00:00",
            "Options": {
                "Protocol": "gre"
            },
            "Tags": []
        }
    ]
}
```

For more information, see Transit gateway Connect attachments and Transit Gateway Connect peers in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayConnects in AWS CLI Command Reference.

describe-transit-gateway-multicast-domains

The following code example shows how to use describe-transit-gateway-multicast-domains.

AWS CLI

To describe your transit gateway multicast domains
The following `describe-transit-gateway-multicast-domains` example displays details for all of your transit gateway multicast domains.

```bash
aws ec2 describe-transit-gateway-multicast-domains
```

Output:

```
{
    "TransitGatewayMulticastDomains": [
        {
            "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
            "TransitGatewayId": "tgw-0bf0bffeфаEXAMPLE",
            "OwnerId": "123456789012",
            "Options": {
                "Igmpv2Support": "disable",
                "StaticSourcesSupport": "enable",
                "AutoAcceptSharedAssociations": "disable"
            },
            "State": "available",
            "CreationTime": "2019-12-10T18:32:50+00:00",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "mc1"
                }
            ]
        }
    ]
}
```

For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see DescribeTransitGatewayMulticastDomains in AWS CLI Command Reference.

**describe-transit-gateway-peering-attachments**

The following code example shows how to use `describe-transit-gateway-peering-attachments`.

Actions and scenarios
AWS CLI

To describe your transit gateway peering attachments

The following `describe-transit-gateway-peering-attachments` example displays details for all of your transit gateway peering attachments.

```
aws ec2 describe-transit-gateway-peering-attachments
```

Output:

```
{
    "TransitGatewayPeeringAttachments": [
    {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",
            "Region": "us-west-2"
        },
        "AccepterTgwInfo": {
            "TransitGatewayId": "tgw-11223344aabbcc112",
            "OwnerId": "123456789012",
            "Region": "us-east-2"
        },
        "State": "pendingAcceptance",
        "CreationTime": "2019-12-09T11:38:05.000Z",
        "Tags": []
    }
    ]
}
```

For more information, see [Transit Gateway Peering Attachments](#) in the [Transit Gateways Guide](#).

- For API details, see [DescribeTransitGatewayPeeringAttachments](#) in [AWS CLI Command Reference](#).

describe-transit-gateway-policy-tables

The following code example shows how to use `describe-transit-gateway-policy-tables`.

Actions and scenarios
AWS CLI

To describe a transit gateway policy table

The following describe-transit-gateway-policy-tables example describes the specified transit gateway policy table.

```bash
aws ec2 describe-transit-gateway-policy-tables \
   --transit-gateway-policy-table-ids tgw-ptb-0a16f134b78668a81
```

Output:

```json
{
   "TransitGatewayPolicyTables": [
      {
         "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
         "TransitGatewayId": "tgw-067f8505c18f0bd6e",
         "State": "available",
         "CreationTime": "2023-11-28T16:36:43+00:00",
         "Tags": []
      }
   ]
}
```

For more information, see Transit gateway policy tables in the Transit Gateway User Guide.

- For API details, see DescribeTransitGatewayPolicyTables in AWS CLI Command Reference.

describe-transit-gateway-route-tables

The following code example shows how to use describe-transit-gateway-route-tables.

AWS CLI

To describe your transit gateway route tables

The following describe-transit-gateway-route-tables example displays details for your transit gateway route tables.

```bash
aws ec2 describe-transit-gateway-route-tables
```
Output:

```json
{
  "TransitGatewayRouteTables": [
    {
      "TransitGatewayRouteTableId": "tgw-rtb-0ca78a549EXAMPLE",
      "TransitGatewayId": "tgw-0bc99abffEXAMPLE",
      "State": "available",
      "DefaultAssociationRouteTable": true,
      "DefaultPropagationRouteTable": true,
      "CreationTime": "2018-11-28T14:24:49.000Z",
      "Tags": []
    },
    {
      "TransitGatewayRouteTableId": "tgw-rtb-0e8f48f148EXAMPLE",
      "TransitGatewayId": "tgw-0043d2bb4EXAMPLE",
      "State": "available",
      "DefaultAssociationRouteTable": true,
      "DefaultPropagationRouteTable": true,
      "CreationTime": "2018-11-28T14:00:00Z",
      "Tags": []
    }
  ]
}
```

For more information, see [View transit gateway route tables](https://docs.aws.amazon.com/TransitGateways/latest/APIReference/auditlog.html) in the *Transit Gateways Guide*.  
- For API details, see [DescribeTransitGatewayRouteTables](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-transit-gateway-route-tables.html) in *AWS CLI Command Reference*.

describe-transit-gateway-vpc-attachments

The following code example shows how to use `describe-transit-gateway-vpc-attachments`.

**AWS CLI**

To describe your transit gateway VPC attachments

The following `describe-transit-gateway-vpc-attachments` example displays details for your transit gateway VPC attachments.

```bash/aws ec2 describe-transit-gateway-vpc-attachments```
Output:

```json
{
    "TransitGatewayVpcAttachments": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-0a08e88308EXAMPLE",
            "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
            "VpcId": "vpc-0f501f7ee8EXAMPLE",
            "VpcOwnerId": "111122223333",
            "State": "available",
            "SubnetIds": [
                "subnet-045d586432EXAMPLE",
                "subnet-0a0ad478a6EXAMPLE"
            ],
            "CreationTime": "2019-02-13T11:04:02.000Z",
            "Options": {
                "DnsSupport": "enable",
                "Ipv6Support": "disable"
            },
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "attachment name"
                }
            ]
        }
    ]
}
```

For more information, see [View your VPC attachments](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayVpcAttachments](#) in *AWS CLI Command Reference*.

**describe-transit-gateways**

The following code example shows how to use `describe-transit-gateways`.

**AWS CLI**

To describe your transit gateways

The following `describe-transit-gateways` example retrieves details about your transit gateways.
```
aws ec2 describe-transit-gateways

Output:

```
{
    "TransitGateways": [
    {
        "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
        "State": "available",
        "OwnerId": "111122223333",
        "Description": "MyTGW",
        "CreationTime": "2019-07-10T14:02:12.000Z",
        "Options": {
            "AmazonSideAsn": 64516,
            "AutoAcceptSharedAttachments": "enable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
            "VpnEcmpSupport": "enable",
            "DnsSupport": "enable"
        },
        "Tags": []
    },
    {
        "TransitGatewayId": "tgw-0fb8421e2dEXAMPLE",
        "State": "available",

        "Options": {
            "AmazonSideAsn": 65412,
            "AutoAcceptSharedAttachments": "disable",
            "DefaultRouteTableAssociation": "enable",
            "AssociationDefaultRouteTableId": "tgw-rtb-06a241a3d8EXAMPLE",
            "DefaultRouteTablePropagation": "enable",
            "PropagationDefaultRouteTableId": "tgw-rtb-06a241a3d8EXAMPLE",
            "VpnEcmpSupport": "enable",
            "DnsSupport": "enable"
        }
    }
    ]
}```
"Tags": [  
  {  
    "Key": "Name",
    "Value": "TGW1"
  }  
],

- For API details, see [DescribeTransitGateways](https://awscli.amazonaws.com/v2/documentation/api/2015-10-05/transit-gateways.html#awscli-command-describe-transit-gateways) in *AWS CLI Command Reference*.

**describe-verified-access-endpoints**

The following code example shows how to use `describe-verified-access-endpoints`.

**AWS CLI**

**To describe a Verified Access endpoint**

The following `delete-verified-access-endpoints` example describes the specified Verified Access endpoint.

```bash
aws ec2 describe-verified-access-endpoints \
    --verified-access-endpoint-ids vae-066fac616d4d546f2
```

**Output:**

```json
{
    "VerifiedAccessEndpoints": [
      {
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
        "ApplicationDomain": "example.com",
        "EndpointType": "network-interface",
        "AttachmentType": "vpc",
        "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
        "EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",
```
For more information, see Verified Access endpoints in the AWS Verified Access User Guide.

- For API details, see DescribeVerifiedAccessEndpoints in AWS CLI Command Reference.

describe-verified-access-groups

The following code example shows how to use describe-verified-access-groups.

AWS CLI

To describe a Verified Access group

The following describe-verified-access-groups example describes the specified Verified Access group.

```bash
aws ec2 describe-verified-access-groups \
    --verified-access-group-ids vagr-0dbe967baf14b7235
```

Output:
For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/userguide/) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessGroups](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-verified-access-instance-logging-configurations.html) in *AWS CLI Command Reference*.

### describe-verified-access-instance-logging-configurations

The following code example shows how to use describe-verified-access-instance-logging-configurations.

**AWS CLI**

To describe the logging configuration for a Verified Access instance

The following describe-verified-access-instance-logging-configurations example describes the logging configuration for the specified Verified Access instance.

```
aws ec2 describe-verified-access-instance-logging-configurations \ 
  --verified-access-instance-ids vai-0ce000c0b7643abead
```

Output:
For more information, see [Verified Access logs](#) in the [AWS Verified Access User Guide](#).

- For API details, see [DescribeVerifiedAccessInstanceLoggingConfigurations](#) in [AWS CLI Command Reference](#).

**describe-verified-access-instances**

The following code example shows how to use describe-verified-access-instances.

**AWS CLI**

**To describe a Verified Access instance**

The following describe-verified-access-instances example describes the specified Verified Access instance.

```bash
aws ec2 describe-verified-access-instances
```
Output:

```json
{
  "VerifiedAccessInstances": [
    {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "VerifiedAccessTrustProviders": [
        {
          "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
          "TrustProviderType": "user",
          "UserTrustProviderType": "iam-identity-center"
        }
      ],
      "CreationTime": "2023-08-25T18:27:56",
      "LastUpdatedTime": "2023-08-25T19:03:32",
      "Tags": [
        {
          "Key": "Name",
          "Value": "my-ava-instance"
        }
      ]
    }
  ]
}
```

For more information, see Verified Access instances in the AWS Verified Access User Guide.

- For API details, see DescribeVerifiedAccessInstances in AWS CLI Command Reference.

**describe-verified-access-trust-providers**

The following code example shows how to use describe-verified-access-trust-providers.

**AWS CLI**

**To describe a Verified Access trust provider**

The following describe-verified-access-trust-providers example describes the specified Verified Access trust provider.
aws ec2 describe-verified-access-trust-providers \
   --verified-access-trust-provider-ids vatp-0bb32de759a3e19e7

Output:

```json
{
   "VerifiedAccessTrustProviders": [
      {
         "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
         "Description": "Testing Verified Access",
         "TrustProviderType": "user",
         "UserTrustProviderType": "iam-identity-center",
         "PolicyReferenceName": "idc",
         "CreationTime": "2023-08-25T19:00:38",

            }
         ]
      }
   ]
}
```

For more information, see Trust providers for Verified Access in the AWS Verified Access User Guide.

- For API details, see DescribeVerifiedAccessTrustProviders in AWS CLI Command Reference.

describe-volume-attribute

The following code example shows how to use describe-volume-attribute.

AWS CLI

To describe a volume attribute

This example command describes the autoEnableIo attribute of the volume with the ID vol-049df61146c4d7901.

Command:
aws ec2 describe-volume-attribute --volume-id vol-049df61146c4d7901 --attribute autoEnableIO

Output:

```
{
    "AutoEnableIO": {
        "Value": false
    },
    "VolumeId": "vol-049df61146c4d7901"
}
```

- For API details, see DescribeVolumeAttribute in AWS CLI Command Reference.

**describe-volume-status**

The following code example shows how to use describe-volume-status.

**AWS CLI**

To describe the status of a single volume

This example command describes the status for the volume vol-1234567890abcdef0.

Command:

```
aws ec2 describe-volume-status --volume-ids vol-1234567890abcdef0
```

Output:

```
{
    "VolumeStatuses": [
        {
            "VolumeStatus": {
                "Status": "ok",
                "Details": [
                    {
                        "Status": "passed",
                        "Name": "io-enabled"
                    },
                    {
                        "Status": "not-applicable",
                        "Name": "io-enabled"
                    }
                ]
            }
        }
    ]
}
```
To describe the status of impaired volumes

This example command describes the status for all volumes that are impaired. In this example output, there are no impaired volumes.

Command:

```
aws ec2 describe-volume-status --filters Name=volume-status.status,Values=impaired
```

Output:

```
{
   "VolumeStatuses": []
}
```

If you have a volume with a failed status check (status is impaired), see Working with an Impaired Volume in the Amazon EC2 User Guide.

- For API details, see DescribeVolumeStatus in AWS CLI Command Reference.

describe-volumes

The following code example shows how to use describe-volumes.

AWS CLI

**Example 1: To describe a volume**

The following describe-volumes example describes the specified volumes in the current Region.
aws ec2 describe-volumes \
  --volume-ids vol-049df61146c4d7901 vol-1234567890abcdef0

Output:

```json
{
  "Volumes": [
    {
      "AvailabilityZone": "us-east-1a",
      "Attachments": [
        {
          "AttachTime": "2013-12-18T22:35:00.000Z",
          "InstanceId": "i-1234567890abcdef0",
          "VolumeId": "vol-049df61146c4d7901",
          "State": "attached",
          "DeleteOnTermination": true,
          "Device": "/dev/sda1"
        }
      ],
      "Encrypted": true,
      "KmsKeyId": "arn:aws:kms:us-east-2a:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513eEXAMPLE",
      "VolumeType": "gp2",
      "VolumeId": "vol-049df61146c4d7901",
      "State": "in-use",
      "Iops": 100,
      "SnapshotId": "snap-1234567890abcdef0",
      "CreateTime": "2019-12-18T22:35:00.084Z",
      "Size": 8
    },
    {
      "AvailabilityZone": "us-east-1a",
      "Attachments": [],
      "Encrypted": false,
      "VolumeType": "gp2",
      "VolumeId": "vol-1234567890abcdef0",
      "State": "available",
      "Iops": 300,
      "SnapshotId": "",
      "CreateTime": "2020-02-27T00:02:41.791Z",
      "Size": 100
    }
  ]
}
```
Example 2: To describe volumes that are attached to a specific instance

The following `describe-volumes` example describes all volumes that are both attached to the specified instance and set to delete when the instance terminates.

```
aws ec2 describe-volumes \
  --region us-east-1 \
  --filters Name=attachment.instance-id,Values=i-1234567890abcdef0 Name=attachment.delete-on-termination,Values=true
```

For an example of the output for `describe-volumes`, see Example 1.

Example 3: To describe available volumes in a specific Availability Zone

The following `describe-volumes` example describes all volumes that have a status of `available` and are in the specified Availability Zone.

```
aws ec2 describe-volumes \
  --filters Name=status,Values=available Name=availability-zone,Values=us-east-1a
```

For an example of the output for `describe-volumes`, see Example 1.

Example 4: To describe volumes based on tags

The following `describe-volumes` example describes all volumes that have the tag key `Name` and a value that begins with `Test`. The output is then filtered with a query that displays only the tags and IDs of the volumes.

```
aws ec2 describe-volumes \
  --filters Name=tag:Name,Values=Test* \
  --query "Volumes[*].{ID:VolumeId,Tag:Tags}"
```

Output:

```
[
  {
    "Tag": [
      {
        "Value": "Test2",
      }
    ]
  }
]
For additional examples using tag filters, see Working with tags in the Amazon EC2 User Guide.

- For API details, see DescribeVolumes in AWS CLI Command Reference.

describe-volumes-modifications

The following code example shows how to use describe-volumes-modifications.

AWS CLI

To describe the modification status for a volume

The following describe-volumes-modifications example describes the volume modification status of the specified volume.

```bash
aws ec2 describe-volumes-modifications \
   --volume-ids vol-1234567890abcdef0
```

Output:

```json
{
   "VolumeModification": {
      "TargetSize": 150,
      "TargetVolumeType": "io1",
      "ModificationState": "optimizing",
      "VolumeId": "vol-1234567890abcdef0",
      "TargetIops": 100,
```

```json
"Key": "Name"
}
,
"ID": "vol-1234567890abcdef0"
,
{
   "Tag": [
      {
         "Value": "Test1",
         "Key": "Name"
      }
   ],
   "ID": "vol-049df61146c4d7901"
}
]
describe-vpc-attribute

The following code example shows how to use describe-vpc-attribute.

AWS CLI

**To describe the enableDnsSupport attribute**

This example describes the enableDnsSupport attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

Command:

```bash
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsSupport
```

Output:

```json
{
   "VpcId": "vpc-a01106c2",
   "EnableDnsSupport": {
      "Value": true
   }
}
```

**To describe the enableDnsHostnames attribute**

This example describes the enableDnsHostnames attribute. This attribute indicates whether the instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not.

Command:
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsHostnames

Output:

```
{
    "VpcId": "vpc-a01106c2",
    "EnableDnsHostnames": {
        "Value": true
    }
}
```

- For API details, see [DescribeVpcAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpc-attribute.html) in *AWS CLI Command Reference*.

**describe-vpc-classic-link**

The following code example shows how to use `describe-vpc-classic-link`.

**AWS CLI**

To describe the ClassicLink status of your VPCs

This example lists the ClassicLink status of vpc-88888888.

Command:

```
aws ec2 describe-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
    "Vpcs": [
        {
            "ClassicLinkEnabled": true,
            "VpcId": "vpc-88888888",
            "Tags": [
                {
                    "Value": "classiclinkvpc",
                    "Key": "Name"
                }
            ]
        }
    ]
}
```
This example lists only VPCs that are enabled for ClassicLink (the filter value of is-classic-link-enabled is set to true).

Command:

```
aws ec2 describe-vpc-classic-link --filter "Name=is-classic-link-enabled,Values=true"
```

- For API details, see `DescribeVpcClassicLink` in *AWS CLI Command Reference*.

**describe-vpc-classic-link-dns-support**

The following code example shows how to use `describe-vpc-classic-link-dns-support`.

**AWS CLI**

**To describe ClassicLink DNS support for your VPCs**

This example describes the ClassicLink DNS support status of all of your VPCs.

Command:

```
aws ec2 describe-vpc-classic-link-dns-support
```

Output:

```
{
   "Vpcs": [
   {
      "VpcId": "vpc-88888888",
      "ClassicLinkDnsSupported": true
   },
   {
      "VpcId": "vpc-1a2b3c4d",
      "ClassicLinkDnsSupported": false
   }
   ]
}
```

- For API details, see `DescribeVpcClassicLinkDnsSupport` in *AWS CLI Command Reference*. 
describe-vpc-endpoint-connection-notifications

The following code example shows how to use describe-vpc-endpoint-connection-notifications.

**AWS CLI**

**To describe endpoint connection notifications**

The following describe-vpc-endpoint-connection-notifications example describes all of your endpoint connection notifications.

```bash
aws ec2 describe-vpc-endpoint-connection-notifications
```

**Output:**

```json
{
   "ConnectionNotificationSet": [
      {
         "ConnectionNotificationState": "Enabled",
         "ConnectionNotificationType": "Topic",
         "ConnectionEvents": [
            "Accept",
            "Reject",
            "Delete",
            "Connect"
         ],
         "ConnectionNotificationId": "vpce-nfn-04bcb952bc8af7abc",
         "ConnectionNotificationArn": "arn:aws:sns:us-east-1:123456789012:VpceNotification",
         "VpcEndpointId": "vpce-0324151a02f327123"
      }
   ]
}
```

- For API details, see [DescribeVpcEndpointConnectionNotifications](#) in *AWS CLI Command Reference*.

**describe-vpc-endpoint-connections**

The following code example shows how to use describe-vpc-endpoint-connections.
**AWS CLI**

**To describe VPC endpoint connections**

This example describes the interface endpoint connections to your endpoint service and filters the results to display endpoints that are **PendingAcceptance**.

**Command:**

```bash
aws ec2 describe-vpc-endpoint-connections --filters Name=vpc-endpoint-state,Values=pendingAcceptance
```

**Output:**

```json
{
   "VpcEndpointConnections": [
      {
         "VpcEndpointId": "vpce-0abed31004e618123",
         "ServiceId": "vpce-svc-0abced088d20def56",
         "CreationTimestamp": "2017-11-30T10:00:24.350Z",
         "VpcEndpointState": "pendingAcceptance",
         "VpcEndpointOwner": "123456789012"
      }
   ]
}
```

- For API details, see [DescribeVpcEndpointConnections](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpc-endpoint-connections.html) in *AWS CLI Command Reference*.

**describe-vpc-endpoint-service-configurations**

The following code example shows how to use `describe-vpc-endpoint-service-configurations`.

**AWS CLI**

**To describe endpoint service configurations**

The following `describe-vpc-endpoint-service-configurations` example describes your endpoint service configurations.

```bash
aws ec2 describe-vpc-endpoint-service-configurations
```
Output:

```json
{
    "ServiceConfigurations": [
        {
            "ServiceType": [
                {
                    "ServiceType": "GatewayLoadBalancer"
                }
            ],
            "ServiceId": "vpce-svc-012d33a1c4321cabc",
            "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-012d33a1c4321cabc",
            "ServiceState": "Available",
            "AvailabilityZones": [
                "us-east-1d"
            ],

}
]
]

For more information, see VPC endpoint services in the Amazon VPC User Guide.

- For API details, see DescribeVpcEndpointServiceConfigurations in AWS CLI Command Reference.

describe-vpc-endpoint-service-permissions

The following code example shows how to use describe-vpc-endpoint-service-permissions.

AWS CLI

To describe endpoint service permissions

This example describes the permissions for the specified endpoint service.

Command:

```
aws ec2 describe-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3
```

Output:

```
{
  "AllowedPrincipals": [ 
    {
      "PrincipalType": "Account",
      "Principal": "arn:aws:iam::123456789012:root"
    }
  ]
}
```
describe-vpc-endpoint-services

The following code example shows how to use describe-vpc-endpoint-services.

AWS CLI

**Example 1: To describe all VPC endpoint services**

The following "describe-vpc-endpoint-services" example lists all VPC endpoint services for an AWS Region.

```bash
aws ec2 describe-vpc-endpoint-services
```

Output:

```json
{
  "ServiceDetails": [
    {
      "ServiceType": [
        {
          "ServiceType": "Gateway"
        }
      ],

}

For more information, see View available AWS service names in the User Guide for AWSPrivateLink.

**Example 2: To describe the details about an endpoint service**

The following "describe-vpc-endpoint-services" example lists the details of the Amazon S3 interface endpoint service

```bash
aws ec2 describe-vpc-endpoint-services \
   --filter "Name=service-type,Values=Interface" Name=service-name,Values=com.amazonaws.us-east-1.s3
```

**Output:**

```json
{
   "ServiceDetails": [
   {
      "ServiceName": "com.amazonaws.us-east-1.s3",
      "ServiceId": "vpce-svc-081d84efcdEXAMPLE",
      "ServiceType": [
         {
            "ServiceType": "Interface"
         }
      ],
      "AvailabilityZones": [
         "us-east-1a",
         "us-east-1b",
         "us-east-1c",
```
For more information, see View available AWS service names in the User Guide for AWS PrivateLink.

- For API details, see DescribeVpcEndpointServices in AWS CLI Command Reference.

describe-vpc-endpoints

The following code example shows how to use describe-vpc-endpoints.

AWS CLI

To describe your VPC endpoints

The following describe-vpc-endpoints example displays details for all of your VPC endpoints.

```bash
aws ec2 describe-vpc-endpoints
```

Output:

```
{
    "VpcEndpoints": [
        {
```
"PolicyDocument": "{"Version":"2008-10-17","Statement":[{"Effect":"Allow","Principal":"*","Action":"*","Resource":"*"}]},

For more information, see VPC endpoints in the Amazon VPC User Guide.

• For API details, see DescribeVpcEndpoints in AWS CLI Command Reference.
describe-vpc-peering-connections

The following code example shows how to use describe-vpc-peering-connections.

AWS CLI

To describe your VPC peering connections

This example describes all of your VPC peering connections.

Command:

```
aws ec2 describe-vpc-peering-connections
```

Output:

```
{
   "VpcPeeringConnections": [
   {
      "Status": {
         "Message": "Active",
         "Code": "active"
      },
      "Tags": [
      {
         "Value": "Peering-1",
         "Key": "Name"
      }
      ],
      "AccepterVpcInfo": {
         "OwnerId": "111122223333",
         "VpcId": "vpc-1a2b3c4d",
         "CidrBlock": "10.0.1.0/28"
      },
      "VpcPeeringConnectionId": "pcx-11122233",
      "RequesterVpcInfo": {
         "PeeringOptions": {
            "AllowEgressFromLocalVpcToRemoteClassicLink": false,
            "AllowEgressFromLocalClassicLinkToRemoteVpc": false
         },
         "OwnerId": "444455556666",
         "VpcId": "vpc-123abc45",
         "CidrBlock": "192.168.0.0/16"
      }
   }
  ]
}
```
To describe specific VPC peering connections

This example describes all of your VPC peering connections that are in the pending-acceptance state.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=status-code,Values=pending-acceptance
```

This example describes all of your VPC peering connections that have the tag Owner=Finance.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=tag:Owner,Values=Finance
```
This example describes all of the VPC peering connections you requested for the specified VPC, vpc-1a2b3c4d.

Command:

```bash
aws ec2 describe-vpc-peering-connections --filters Name=requester-vpc-info.vpc-id,Values=vpc-1a2b3c4d
```

- For API details, see `DescribeVpcPeeringConnections` in `AWS CLI Command Reference`.

### describe-vpn-connections

The following code example shows how to use `describe-vpn-connections`.

#### AWS CLI

**Example 1: To describe your VPN connections**

The following `describe-vpn-connections` example describes all of your Site-to-Site VPN connections.

```bash
aws ec2 describe-vpn-connections
```

**Output:**

```json
{
    "VpnConnections": [
        {
            "CustomerGatewayConfiguration": "...configuration information...",
            "CustomerGatewayId": "cgw-01234567abcde1234",
            "Category": "VPN",
            "State": "available",
            "Type": "ipsec.1",
            "VpnConnectionId": "vpn-1122334455aabbccd",
            "TransitGatewayId": "tgw-00112233445566aab",
            "Options": {
                "EnableAcceleration": false,
                "StaticRoutesOnly": true,
                "LocalIpv4NetworkCidr": "0.0.0.0/0",
                "RemoteIpv4NetworkCidr": "0.0.0.0/0",
                "TunnelInsideIpVersion": "ipv4"
            }
        }
    ]
}
```
For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpn/latest/siteto-site-vpn) in the [AWS Site-to-Site VPN User Guide](https://docs.aws.amazon.com/vpn/latest/siteto-site-vpn).

**Example 2: To describe your available VPN connections**

The following `describe-vpn-connections` example describes your Site-to-Site VPN connections with a state of available.

```bash
aws ec2 describe-vpn-connections \
--filters "Name=state,Values=available"
```

For more information, see [How AWS Site-to-Site VPN works](https://docs.aws.amazon.com/vpn/latest/siteto-site-vpn) in the [AWS Site-to-Site VPN User Guide](https://docs.aws.amazon.com/vpn/latest/siteto-site-vpn).

**describe-vpn-gateways**

The following code example shows how to use `describe-vpn-gateways`.

**AWS CLI**

**To describe your virtual private gateways**

This example describes your virtual private gateways.

Command:

```
aws ec2 describe-vpn-gateways
```

Output:

```json
{
   "VpnGateways": [
       {
           "State": "available",
           "Type": "ipsec.1",
           "VpnGatewayId": "vgw-f211f09b",
           "VpcAttachments": [
               {
                   "State": "attached",
                   "VpcId": "vpc-98eb5ef5"
               }
           ]
       },
       {
           "State": "available",
           "Type": "ipsec.1",
           "VpnGatewayId": "vgw-9a4caf3",
           "VpcAttachments": [
               {
                   "State": "attaching",
                   "VpcId": "vpc-a01106c2"
               }
           ]
       }
   ]
}
```
• For API details, see [DescribeVpnGateways](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-vpn-gateways) in *AWS CLI Command Reference*.

**detach-classic-link-vpc**

The following code example shows how to use `detach-classic-link-vpc`.

**AWS CLI**

**To unlink (detach) an EC2-Classic instance from a VPC**

This example unlinks instance i-0598c7d356eba48d7 from VPC vpc-88888888.

**Command:**

```bash
aws ec2 detach-classic-link-vpc --instance-id i-0598c7d356eba48d7 --vpc-id vpc-88888888
```

**Output:**

```json
{
   "Return": true
}
```

• For API details, see [DetachClassicLinkVpc](https://docs.aws.amazon.com/cli/latest/reference/ec2/detach-classic-link-vpc) in *AWS CLI Command Reference*.

**detach-internet-gateway**

The following code example shows how to use `detach-internet-gateway`.

**AWS CLI**

**To detach an internet gateway from your VPC**

The following `detach-internet-gateway` example detaches the specified internet gateway from the specific VPC.

```bash
aws ec2 detach-internet-gateway \\
   --internet-gateway-id igw-0d0fb496b3EXAMPLE \\
   --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.
For more information, see Internet gateways in the Amazon VPC User Guide.

- For API details, see DetachInternetGateway in AWS CLI Command Reference.

**detach-network-interface**

The following code example shows how to use detach-network-interface.

**AWS CLI**

**To detach a network interface from your instance**

This example detaches the specified network interface from the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 detach-network-interface --attachment-id eni-attach-66c4350a
```

- For API details, see DetachNetworkInterface in AWS CLI Command Reference.

**detach-verified-access-trust-provider**

The following code example shows how to use detach-verified-access-trust-provider.

**AWS CLI**

**To detach a trust provider from an instance**

The following detach-verified-access-trust-provider example detaches the specified Verified Access trust provider from the specified Verified Access instance.

```
aws ec2 detach-verified-access-trust-provider \\
   --verified-access-instance-id vai-0ce000c0b7643abea \\
   --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
   "VerifiedAccessTrustProvider": {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "Testing Verified Access",
   }
}```
For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [DetachVerifiedAccessTrustProvider](#) in *AWS CLI Command Reference*.

detach-volume

The following code example shows how to use `detach-volume`.

**AWS CLI**

To detach a volume from an instance

This example command detaches the volume (vol-049df61146c4d7901) from the instance it is attached to.

Command:

```
aws ec2 detach-volume --volume-id vol-1234567890abcdef0
```

Output:

```json
{
    "AttachTime": "2014-02-27T19:23:06.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "VolumeId": "vol-049df61146c4d7901",
    "State": "detaching",
    "Device": "/dev/sdb"
}
```
• For API details, see `DetachVolume` in *AWS CLI Command Reference*.

detach-vpn-gateway

The following code example shows how to use `detach-vpn-gateway`.

**AWS CLI**

*To detach a virtual private gateway from your VPC*

This example detaches the specified virtual private gateway from the specified VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 detach-vpn-gateway --vpn-gateway-id vgw-9a4cacf3 --vpc-id vpc-a01106c2
```

• For API details, see `DetachVpnGateway` in *AWS CLI Command Reference*.

disable-address-transfer

The following code example shows how to use `disable-address-transfer`.

**AWS CLI**

*To disable an Elastic IP address transfer*

The following `disable-address-transfer` example disables Elastic IP address transfer for the specified Elastic IP address.

```bash
aws ec2 disable-address-transfer \  --allocation-id eipalloc-09ad461b0d03f6aaf
```

Output:

```json
{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
    }
}
```
"AddressTransferStatus": "disabled"
}
}

For more information, see Transfer Elastic IP addresses in the Amazon VPC User Guide.

- For API details, see DisableAddressTransfer in AWS CLI Command Reference.

disable-aws-network-performance-metric-subscription

The following code example shows how to use disable-aws-network-performance-metric-subscription.

**AWS CLI**

To disable a metric subscription

The following disable-aws-network-performance-metric-subscription example disables the monitoring of aggregate network latency between the specified source and destination Regions.

```bash
aws ec2 disable-aws-network-performance-metric-subscription \
   --source us-east-1 \
   --destination eu-west-1 \
   --metric aggregate-latency \
   --statistic p50
```

Output:

```
{
   "Output": true
}
```

For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see DisableAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

disable-ebs-encryption-by-default

The following code example shows how to use disable-ebs-encryption-by-default.
AWS CLI

To disable EBS encryption by default

The following `disable-ebs-encryption-by-default` example disables EBS encryption by default for your AWS account in the current Region.

```bash
aws ec2 disable-ebs-encryption-by-default
```

Output:

```json
{
    "EbsEncryptionByDefault": false
}
```

- For API details, see [DisableEbsEncryptionByDefault](#) in [AWS CLI Command Reference](#).

disable-fast-launch

The following code example shows how to use `disable-fast-launch`.

AWS CLI

To discontinue fast launching for an image

The following `disable-fast-launch` example discontinues fast launching on the specified AMI, and cleans up existing pre-provisioned snapshots.

```bash
aws ec2 disable-fast-launch \
    --image-id ami-01234567890abcedf
```

Output:

```json
{
    "ImageId": "ami-01234567890abcedf",
    "ResourceType": "snapshot",
    "SnapshotConfiguration": {},
    "LaunchTemplate": {
        "LaunchTemplateId": "lt-01234567890abcedf",
        "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-a8c6215d-94e6-441b-9272-dbd1f87b07e2",
    }
}
```
The following code example shows how to use `disable-fast-snapshot-restores`.

**AWS CLI**

**To disable fast snapshot restore**

The following `disable-fast-snapshot-restores` example disables fast snapshot restore for the specified snapshot in the specified Availability Zone.

```bash
aws ec2 disable-fast-snapshot-restores \
    --availability-zones us-east-2a \
    --source-snapshot-ids snap-1234567890abcdef0
```

**Output:**

```json
{
    "Successful": [
    {
        "SnapshotId": "snap-1234567890abcdef0",
        "AvailabilityZone": "us-east-2a",
        "State": "disabling",
        "StateTransitionReason": "Client.UserInitiated",
        "OwnerId": "123456789012",
        "EnablingTime": "2020-01-25T23:57:49.602Z"
    }
    ]
}
```
"Unsuccessful": []
]
}

- For API details, see [DisableFastSnapshotRestores](#) in *AWS CLI Command Reference*.

**disable-image**

The following code example shows how to use `disable-image`.

**AWS CLI**

**To disable an AMI**

The following `disable-image` example disables the specified AMI.

```bash
aws ec2 disable-image \\
    --image-id ami-1234567890abcdef0
```

Output:

```json
{
    "Return": "true"
}
```

For more information, see [Disable an AMI](#) in the *Amazon EC2 User Guide*.

- For API details, see [DisableImage](#) in *AWS CLI Command Reference*.

**disable-image-block-public-access**

The following code example shows how to use `disable-image-block-public-access`.

**AWS CLI**

**To disable block public access for AMIs in the specified Region**

The following `disable-image-block-public-access` example disables block public access for AMIs at the account level in the specified Region.

```bash
aws ec2 disable-image-block-public-access \\
    --region us-east-1
```
Output:

```json
{
    "ImageBlockPublicAccessState": "unblocked"
}
```

For more information, see [Block public access to your AMIs](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/amazon-ec2-block-public-access.html) in the *Amazon EC2 User Guide*.

- For API details, see [DisableImageBlockPublicAccess](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-image-block-public-access.html) in *AWS CLI Command Reference*.

### disable-image-deprecation

The following code example shows how to use `disable-image-deprecation`.

**AWS CLI**

**To cancel the deprecation of an AMI**

The following `disable-image-deprecation` example cancels the deprecation of an AMI, which removes the `DeprecationTime` field from the `describe-images` output. You must be the AMI owner to perform this procedure.

```bash
aws ec2 disable-image-deprecation \
  --image-id ami-1234567890abcdef0
```

Output:

```json
{
    "RequestID": "11aabb229-4eac-35bd-99ed-be587EXAMPLE",
    "Return": "true"
}
```

For more information, see [Deprecate an AMI](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami) in the *Amazon EC2 User Guide*.

- For API details, see [DisableImageDeprecation](https://docs.aws.amazon.com/cli/latest/reference/ec2/disable-image-deprecation.html) in *AWS CLI Command Reference*.

### disable-serial-console-access

The following code example shows how to use `disable-serial-console-access`.

Actions and scenarios
AWS CLI

To disable access to the EC2 serial console for your account

The following `disable-serial-console-access` example disables account access to the serial console.

```bash
aws ec2 disable-serial-console-access
```

Output:

```json
{
  "SerialConsoleAccessEnabled": false
}
```

For more information, see EC2 Serial Console in the Amazon EC2 User Guide.

- For API details, see DisableSerialConsoleAccess in AWS CLI Command Reference.

disable-transit-gateway-route-table-propagation

The following code example shows how to use `disable-transit-gateway-route-table-propagation`.

AWS CLI

To disable a transit gateway attachment to propagate routes to the specified propagation route table

The following `disable-transit-gateway-route-table-propagation` example disables the specified attachment to propagate routes to the specified propagation route table.

```bash
aws ec2 disable-transit-gateway-route-table-propagation \
  --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \
  --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```json
{
  "Propagation": {
    ...
  }
```
"TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
"ResourceId": "vpc-4d7de228",
"ResourceType": "vpc",
"TransitGatewayRouteTableId": "tgw-rtb-0a823edbdeEXAMPLE",
"State": "disabled"
}
}

For more information, see Transit gateway route tables in the Transit Gateways Guide.

- For API details, see DisableTransitGatewayRouteTablePropagation in AWS CLI Command Reference.

disable-vgw-route-propagation

The following code example shows how to use disable-vgw-route-propagation.

AWS CLI

To disable route propagation

This example disables the specified virtual private gateway from propagating static routes to the specified route table. If the command succeeds, no output is returned.

Command:

aws ec2 disable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3

- For API details, see DisableVgwRoutePropagation in AWS CLI Command Reference.

disable-vpc-classic-link

The following code example shows how to use disable-vpc-classic-link.

AWS CLI

To disable ClassicLink for a VPC

This example disables ClassicLink for vpc-8888888.

Command:
aws ec2 disable-vpc-classic-link --vpc-id vpc-88888888

Output:

```json
{
   "Return": true
}
```

- For API details, see DisableVpcClassicLink in AWS CLI Command Reference.

### disable-vpc-classic-link-dns-support

The following code example shows how to use `disable-vpc-classic-link-dns-support`.

**AWS CLI**

**To disable ClassicLink DNS support for a VPC**

This example disables ClassicLink DNS support for vpc-88888888.

Command:

```
aws ec2 disable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```json
{
   "Return": true
}
```

- For API details, see DisableVpcClassicLinkDnsSupport in AWS CLI Command Reference.

### disassociate-client-vpn-target-network

The following code example shows how to use disassociate-client-vpn-target-network.

**AWS CLI**

**To disassociate a network from a Client VPN endpoint**

Actions and scenarios
The following `disassociate-client-vpn-target-network` example disassociates the target network that's associated with the `cvpn-assoc-12312312312312312` association ID for the specified Client VPN endpoint.

```
aws ec2 disassociate-client-vpn-target-network \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --association-id cvpn-assoc-12312312312312312
```

Output:

```
{
  "AssociationId": "cvpn-assoc-12312312312312312",
  "Status": {
    "Code": "disassociating"
  }
}
```

For more information, see [Target Networks](https://aws.amazon.com.cn/client-vpn/latest/admin/index.html) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DisassociateClientVpnTargetNetwork](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-client-vpn-target-network.html) in *AWS CLI Command Reference*.

### disassociate-iam-instance-profile

The following code example shows how to use `disassociate-iam-instance-profile`.

**AWS CLI**

**To disassociate an IAM instance profile**

This example disassociates an IAM instance profile with the association ID `iip-assoc-05020b59952902f5f`.

Command:

```
aws ec2 disassociate-iam-instance-profile --association-id iip-assoc-05020b59952902f5f
```

Output:

```
{
}
```
"IamInstanceProfileAssociation": {
    "InstanceId": "i-123456789abcdef0",  
    "State": "disassociating",  
    "AssociationId": "iip-assoc-05020b59952902f5f", 
    "IamInstanceProfile": { 
        "Id": "AIPA5IVIHMFFYY2DKV5Y",  
        "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
    }
}  

• For API details, see DisassociateIamInstanceProfile in AWS CLI Command Reference.

disassociate-instance-event-window

The following code example shows how to use disassociate-instance-event-window.

AWS CLI

Example 1: To disassociate one or more instances from an event window

The following disassociate-instance-event-window example disassociates one or more instances from an event window. Specify the instance-event-window-id parameter to specify the event window. To disassociate instances, specify the association-target parameter, and for the parameter values, specify one or more instance IDs.

aws ec2 disassociate-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \ 
   --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"

Output:

{
    "InstanceEventWindow": { 
        "InstanceEventWindowId": "iew-0abcdef1234567890", 
        "Name": "myEventWindowName", 
        "CronExpression": "* 21-23 * * 2,3", 
        "AssociationTarget": { 
            "InstanceIds": [], 
            "Tags": []
        }
    }
}
For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

**Example 2: To disassociate instance tags from an event window**

The following `disassociate-instance-event-window` example disassociates instance tags from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate instance tags, specify the `association-target` parameter, and for the parameter values, specify one or more tags.

```
aws ec2 disassociate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceTags=[[Key=k2,Value=v2],[Key=k1,Value=v1]]"
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the [Amazon EC2 User Guide](#).

**Example 3: To disassociate a Dedicated Host from an event window**
The following `disassociate-instance-event-window` example disassociates a Dedicated Host from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate a Dedicated Host, specify the `association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```bash
aws ec2 disassociate-instance-event-window
   --region us-east-1 
   --instance-event-window-id iew-0abcdef1234567890 
   --association-target DedicatedHostIds=h-029fa35a02b99801d
```

Output:

```json
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
         "InstanceIds": [],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating"
   }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see [DisassociateInstanceEventWindow](#) in AWS CLI Command Reference.

disassociate-nat-gateway-address

The following code example shows how to use `disassociate-nat-gateway-address`.

**AWS CLI**

To disassociate an Elastic IP address from a public NAT gateway

The following `disassociate-nat-gateway-address` example disassociates the specified Elastic IP address from the specified public NAT gateway.
The following code example shows how to use `disassociate-route-table`.

**AWS CLI**

**To disassociate a route table**

This example disassociates the specified route table from the specified subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-route-table --association-id rtbassoc-781d0d1a
```

- For API details, see [DisassociateRouteTable](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-route-table.html) in *AWS CLI Command Reference*.  

For more information, see [NAT gateways](https://docs.aws.amazon.com/vpc/latest/userguide/nat-gateways.html) in the *Amazon VPC User Guide*. 

- For API details, see [DisassociateNatGatewayAddress](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-nat-gateway-address.html) in *AWS CLI Command Reference*.  

---

```bash
aws ec2 disassociate-nat-gateway-address 
   --nat-gateway-id nat-1234567890abcdef0 
   --association-ids eipassoc-0f96bdca17EXAMPLE
```

Output:

```json
{
   "NatGatewayId": "nat-1234567890abcdef0",
   "NatGatewayAddresses": [
   {
      "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
      "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
      "PrivateIp": "10.0.0.74",
      "PublicIp": "3.211.231.218",
      "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
      "IsPrimary": false,
      "Status": "disassociating"
   }
   ]
}
```
**disassociate-subnet-cidr-block**

The following code example shows how to use `disassociate-subnet-cidr-block`.

**AWS CLI**

To disassociate an IPv6 CIDR block from a subnet

This example disassociates an IPv6 CIDR block from a subnet using the association ID for the CIDR block.

Command:

```
aws ec2 disassociate-subnet-cidr-block --association-id subnet-cidr-assoc-3aa54053
```

Output:

```
{
    "SubnetId": "subnet-5f46ec3b",
    "Ipv6CidrBlockAssociation": { 
        "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
        "AssociationId": "subnet-cidr-assoc-3aa54053",
        "Ipv6CidrBlockState": { 
            "State": "disassociating"
        } 
    }
}
```

- For API details, see [DisassociateSubnetCidrBlock](#) in *AWS CLI Command Reference*.

**disassociate-transit-gateway-multicast-domain**

The following code example shows how to use `disassociate-transit-gateway-multicast-domain`.

**AWS CLI**

To disassociate subnets from a multicast domain

The following `disassociate-transit-gateway-multicast-domain` example disassociates a subnet from the specified multicast domain.
aws ec2 disassociate-transit-gateway-multicast-domain \
   --transit-gateway-attachment-id tgw-attach-070e571cd1EXAMPLE \
   --subnet-id subnet-000de86e3bEXAMPLE \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE

Output:

{
   "Associations": {
   "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
   "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
   "ResourceId": "vpc-7EXAMPLE",
   "ResourceType": "vpc",
   "Subnets": [
   {
   "SubnetId": "subnet-000de86e3bEXAMPLE",
   "State": "disassociating"
   }
   ]
   }
}

For more information, see Working with multicast in the Transit Gateways Guide.

- For API details, see DisassociateTransitGatewayMulticastDomain in AWS CLI Command Reference.

disassociate-transit-gateway-route-table

The following code example shows how to use disassociate-transit-gateway-route-table.

AWS CLI

To disassociate a transit gateway route table from a resource attachment

The following disassociate-transit-gateway-route-table example disassociates the specified attachment from the transit gateway route table.

aws ec2 disassociate-transit-gateway-route-table \
   --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \

Output:

```
{
   "Association": {
   "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
   "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
   "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
   "ResourceType": "direct-connect-gateway",
   "State": "disassociating"
   }
}
```

For more information, see [Transit gateway route tables](Transit%20gateways%20guide) in the *Transit Gateways Guide*.

- For API details, see [DisassociateTransitGatewayRouteTable](AWS%20CLI%20Command%20Reference) in *AWS CLI Command Reference*.

**disassociate-vpc-cidr-block**

The following code example shows how to use `disassociate-vpc-cidr-block`.

**AWS CLI**

**To disassociate an IPv6 CIDR block from a VPC**

This example disassociates an IPv6 CIDR block from a VPC using the association ID for the CIDR block.

**Command:**

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-eca54085
```

**Output:**

```
{
   "Ipv6CidrBlockAssociation": {
   "Ipv6CidrBlock": "2001:db8:1234:1a00::/56",
   "AssociationId": "vpc-cidr-assoc-eca54085",
   "Ipv6CidrBlockState": {
   "State": "disassociating"
   }
   }
}
```
To disassociate an IPv4 CIDR block from a VPC

This example disassociates an IPv4 CIDR block from a VPC.

Command:

```bash
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-0287ac6b
```

Output:

```json
{
    "CidrBlockAssociation": {
        "AssociationId": "vpc-cidr-assoc-0287ac6b",
        "CidrBlock": "172.18.0.0/16",
        "CidrBlockState": {
            "State": "disassociating"
        }
    },
    "VpcId": "vpc-27621243"
}
```

- For API details, see [DisassociateVpcCidrBlock](https://docs.aws.amazon.com/cli/latest/reference/ec2/disassociate-vpc-cidr-block.html) in AWS CLI Command Reference.

enable-address-transfer

The following code example shows how to use `enable-address-transfer`.

**AWS CLI**

**To enable an Elastic IP address transfer**

The following `enable-address-transfer` example enables Elastic IP address transfer for the specified Elastic IP address to the specified account.

```bash
aws ec2 enable-address-transfer \
    --allocation-id eipalloc-09ad461b0d03f6aaf \
```
--transfer-account-id 123456789012

Output:

```
{
    "AddressTransfer": {
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "TransferAccountId": "123456789012",
        "TransferOfferExpirationTimestamp": "2023-02-22T20:51:01.000Z",
        "AddressTransferStatus": "pending"
    }
}
```

For more information, see [Transfer Elastic IP addresses](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/elastic-ip-addresses-transfer.html) in the *Amazon VPC User Guide*.

- For API details, see [EnableAddressTransfer](https://docs.aws.amazon.com/cli/latest/reference/ec2/enable-address-transfer.html) in *AWS CLI Command Reference*.

### enable-aws-network-performance-metric-subscription

The following code example shows how to use `enable-aws-network-performance-metric-subscription`.

**AWS CLI**

**To enable a metric subscription**

The following `enable-aws-network-performance-metric-subscription` example enables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 enable-aws-network-performance-metric-subscription \
    --source us-east-1 \
    --destination eu-west-1 \
    --metric aggregate-latency \
    --statistic p50
```

Output:

```
{
    "Output": true
}
```
For more information, see Manage subscriptions in the Infrastructure Performance User Guide.

- For API details, see EnableAwsNetworkPerformanceMetricSubscription in AWS CLI Command Reference.

**enable-ebs-encryption-by-default**

The following code example shows how to use enable-ebs-encryption-by-default.

**AWS CLI**

**To enable EBS encryption by default**

The following enable-ebs-encryption-by-default example enables EBS encryption by default for your AWS account in the current Region.

```bash
aws ec2 enable-ebs-encryption-by-default
```

**Output:**

```json
{
  "EbsEncryptionByDefault": true
}
```

- For API details, see EnableEbsEncryptionByDefault in AWS CLI Command Reference.

**enable-fast-launch**

The following code example shows how to use enable-fast-launch.

**AWS CLI**

**To start fast launching for an image**

The following enable-fast-launch example starts fast launching on the specified AMI and sets the maximum number of parallel instances to launch to 6. The type of resource to use to pre-provision the AMI is set to snapshot, which is also the default value.

```bash
aws ec2 enable-fast-launch \
```
For more information about configuring a Windows AMI for faster launching, see Configure your AMI for faster launching in the Amazon EC2 User Guide.

- For API details, see EnableFastLaunch in AWS CLI Command Reference.

**enable-fast-snapshot-restores**

The following code example shows how to use enable-fast-snapshot-restores.

**AWS CLI**

**To enable fast snapshot restore**

The following enable-fast-snapshot-restores example enables fast snapshot restore for the specified snapshot in the specified Availability Zones.

```
aws ec2 enable-fast-snapshot-restores \
  --availability-zones us-east-2a us-east-2b \
  --source-snapshot-ids snap-1234567890abcdef0
```

Output:
For API details, see `EnableFastSnapshotRestores` in *AWS CLI Command Reference*.

### enable-image

The following code example shows how to use `enable-image`.

#### AWS CLI

**To enable an AMI**

The following `enable-image` example enables the specified AMI.

```bash
aws ec2 enable-image \
    --image-id ami-1234567890abcdef0
```

**Output:**

```json
{
    "Return": "true"
}
```
The following code example shows how to use `enable-image-block-public-access`.

**AWS CLI**

To enable block public access for AMIs in the specified Region

The following enable-image-block-public-access example enables block public access for AMIs at the account level in the specified Region.

```bash
aws ec2 enable-image-block-public-access \
   --region us-east-1 \
   --image-block-public-access-state block-new-sharing
```

Output:

```
{
   "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see [Block public access to your AMIs](https://docs.aws.amazon.com/AWSEC2-userguide/) in the *Amazon EC2 User Guide*.

- For API details, see [EnableImageBlockPublicAccess](https://docs.aws.amazon.com/AWSEC2/latest/userguide/) in *AWS CLI Command Reference*.

**enable-image-deprecation**

The following code example shows how to use `enable-image-deprecation`.

**AWS CLI**

**Example 1: To deprecate an AMI**

The following enable-image-deprecation example deprecates an AMI on a specific date and time. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute. You must be the AMI owner to perform this procedure.
aws ec2 enable-image-deprecation
   --image-id ami-1234567890abcdef0 \
   --deprecate-at "2022-10-15T13:17:12.000Z"

Output:

```json
{
   "RequestID": "59dbff89-35bd-4eac-99ed-be587EXAMPLE",
   "Return": "true"
}
```

For more information, see Deprecate an AMI <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami> in the Amazon EC2 User Guide.

- For API details, see `EnableImageDeprecation` in AWS CLI Command Reference.

---

enable-ipam-organization-admin-account

The following code example shows how to use enable-ipam-organization-admin-account.

**AWS CLI**

To integrate with AWS Organizations and delegate a member account as the IPAM account

The following enable-ipam-organization-admin-account example integrates IPAM with AWS Organizations and delegates a member account as the IPAM account.

```
aws ec2 enable-ipam-organization-admin-account \
   --delegated-admin-account-id 320805250157
```

Output:

```json
{
   "Success": true
}
```

For more information, see Integrate IPAM with AWS Organizations in the Amazon VPC IPAM User Guide.

- For API details, see `EnableIpamOrganizationAdminAccount` in AWS CLI Command Reference.
enable-reachability-analyzer-organization-sharing

The following code example shows how to use enable-reachability-analyzer-organization-sharing.

**AWS CLI**

**To enable trusted access for Reachability Analyzer**

The following enable-reachability-analyzer-organization-sharing example enables trusted access for Reachability Analyzer.

```
aws ec2 enable-reachability-analyzer-organization-sharing
```

This command produces no output.

For more information, see [Cross-account analyses](#) in the *Reachability Analyzer User Guide*.

- For API details, see [EnableReachabilityAnalyzerOrganizationSharing](#) in *AWS CLI Command Reference*.

enable-serial-console-access

The following code example shows how to use enable-serial-console-access.

**AWS CLI**

**To enable access to the serial console for your account**

The following enable-serial-console-access example enables account access to the serial console.

```
aws ec2 enable-serial-console-access
```

Output:

```
{
    "SerialConsoleAccessEnabled": true
}
```
For more information, see EC2 Serial Console in the Amazon EC2 User Guide.

- For API details, see EnableSerialConsoleAccess in AWS CLI Command Reference.

enable-transit-gateway-route-table-propagation

The following code example shows how to use enable-transit-gateway-route-table-propagation.

AWS CLI

To enable a transit gateway attachment to propagate routes to the specified propagation route table

The following enable-transit-gateway-route-table-propagation example enables the specified attachment to propagate routes to the specified propagation route table.

```bash
aws ec2 enable-transit-gateway-route-table-propagation \
    --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAMPLE \
    --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{
    "Propagation": {
        "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
        "ResourceId": "vpc-4d7de228",
        "ResourceType": "vpc",
        "TransitGatewayRouteTableId": "tgw-rtb-0a823edbeEXAMPLE",
        "State": "disabled"
    }
}
```

For more information, see Transit gateway route tables in the Transit Gateways Guide.

- For API details, see EnableTransitGatewayRouteTablePropagation in AWS CLI Command Reference.

enable-vgw-route-propagation

The following code example shows how to use enable-vgw-route-propagation.
AWS CLI

To enable route propagation

This example enables the specified virtual private gateway to propagate static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 enable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id vgw-9a4cacf3
```

- For API details, see `EnableVgwRoutePropagation` in AWS CLI Command Reference.

enable-volume-io

The following code example shows how to use enable-volume-io.

AWS CLI

To enable I/O for a volume

This example enables I/O on volume `vol-1234567890abcdef0`.

Command:

```bash
aws ec2 enable-volume-io --volume-id vol-1234567890abcdef0
```

Output:

```json
{
   "Return": true
}
```

- For API details, see `EnableVolumelo` in AWS CLI Command Reference.

enable-vpc-classic-link

The following code example shows how to use enable-vpc-classic-link.
AWS CLI

To enable a VPC for ClassicLink

This example enables vpc-8888888 for ClassicLink.

Command:

```
aws ec2 enable-vpc-classic-link --vpc-id vpc-8888888
```

Output:

```
{
   "Return": true
}
```

enable-vpc-classic-link-dns-support

The following code example shows how to use enable-vpc-classic-link-dns-support.

AWS CLI

To enable ClassicLink DNS support for a VPC

This example enables ClassicLink DNS support for vpc-8888888.

Command:

```
aws ec2 enable-vpc-classic-link-dns-support --vpc-id vpc-8888888
```

Output:

```
{
   "Return": true
}
```

export-client-vpn-client-certificate-revocation-list

The following code example shows how to use `export-client-vpn-client-certificate-revocation-list`.

AWS CLI

To export a client certificate revocation list

The following `export-client-vpn-client-certificate-revocation-list` example exports the client certificate revocation list for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```bash
aws ec2 export-client-vpn-client-certificate-revocation-list \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --output text
```

Output:

```

For more information, see [Client Certificate Revocation Lists](https://docs.aws.amazon.com/vpc/latest/userguide/client-certificate-revocation-lists.html) in the *AWS Client VPN Administrator Guide*.

export-client-vpn-client-configuration

The following code example shows how to use export-client-vpn-client-configuration.

AWS CLI

To export the client configuration

The following export-client-vpn-client-configuration example exports the client configuration for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-configuration \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \ 
   --output text
```

Output:

```

```

Actions and scenarios
For more information, see Client VPN Endpoints in the AWS Client VPN Administrator Guide.

- For API details, see ExportClientVpnClientConfiguration in AWS CLI Command Reference.

**export-image**

The following code example shows how to use export-image.

**AWS CLI**

**To export a VM from an AMI**

The following export-image example exports the specified AMI to the specified bucket in the specified format.

```
aws ec2 export-image \
   --image-id ami-1234567890abcdef0 \
   --disk-image-format VMDK \
   --s3-export-location S3Bucket=my-export-bucket,S3Prefix=exports/
```

Output:

```
{
    "DiskImageFormat": "vmdk",
    "ExportImageTaskId": "export-ami-1234567890abcdef0",
    "ImageId": "ami-1234567890abcdef0",
    "RoleName": "vmimport",
    "Progress": "0",
    "S3ExportLocation": {
        "S3Bucket": "my-export-bucket",
        "S3Prefix": "exports/
    },
    "Status": "active",
    "StatusMessage": "validating"
}
```
• For API details, see ExportImage in AWS CLI Command Reference.

get-associated-ipv6-pool-cidrs

The following code example shows how to use get-associated-ipv6-pool-cidrs.

**AWS CLI**

**To get the associations for an IPv6 address pool**

The following get-associated-ipv6-pool-cidrs example gets the associations for the specified IPv6 address pool.

```
aws ec2 get-associated-ipv6-pool-cidrs 
   --pool-id ipv6pool-ec2-012345abc12345abc
```

Output:

```
{
   "Ipv6CidrAssociations": [ 
      { 
         "Ipv6Cidr": "2001:db8:1234:1a00::/56",
         "AssociatedResource": "vpc-111111222222333ab"
      }
   ]
}
```

• For API details, see GetAssociatedIpv6PoolCidrs in AWS CLI Command Reference.

get-aws-network-performance-data

The following code example shows how to use get-aws-network-performance-data.

**AWS CLI**

**To get network performance data**

The following get-aws-network-performance-data example retrieves data about the network performance between the specified Regions in the specified time period.
aws ec2 get-aws-network-performance-data \
   --start-time 2022-10-26T12:00:00.000Z \
   --end-time 2022-10-26T12:30:00.000Z \
   --data-queries Id=my-query,Source=us-east-1,Destination=eu-west-1,Metric=aggregate-latency,Statistic=p50,Period=five-minutes

Output:

```json
{
   "DataResponses": [
      {
         "Id": "my-query",
         "Source": "us-east-1",
         "Destination": "eu-west-1",
         "Metric": "aggregate-latency",
         "Statistic": "p50",
         "Period": "five-minutes",
         "MetricPoints": [
            {
               "StartDate": "2022-10-26T12:00:00+00:00",
               "EndDate": "2022-10-26T12:05:00+00:00",
               "Value": 62.44349,
               "Status": "OK"
            },
            {
               "StartDate": "2022-10-26T12:05:00+00:00",
               "EndDate": "2022-10-26T12:10:00+00:00",
               "Value": 62.483498,
               "Status": "OK"
            },
            {
               "StartDate": "2022-10-26T12:10:00+00:00",
               "EndDate": "2022-10-26T12:15:00+00:00",
               "Value": 62.51248,
               "Status": "OK"
            },
            {
               "StartDate": "2022-10-26T12:15:00+00:00",
               "EndDate": "2022-10-26T12:20:00+00:00",
               "Value": 62.635475,
               "Status": "OK"
            }
         ]
      }
   ]
}
```
For more information, see Monitor network performance in the Infrastructure Performance User Guide.

- For API details, see GetAwsNetworkPerformanceData in AWS CLI Command Reference.

**get-capacity-reservation-usage**

The following code example shows how to use get-capacity-reservation-usage.

**AWS CLI**

**To view capacity reservation usage across AWS accounts**

The following get-capacity-reservation-usage example displays usage information for the specified capacity reservation.

```
aws ec2 get-capacity-reservation-usage \ 
   --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:
{  
    "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
    "InstanceUsages": [
        {
            "UsedInstanceCount": 1,
            "AccountId": "123456789012"
        }
    ],
    "AvailableInstanceCount": 4,
    "TotalInstanceCount": 5,
    "State": "active",
    "InstanceType": "t2.medium"
}

For more information, see Viewing Shared Capacity Reservation Usage in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see GetCapacityReservationUsage in AWS CLI Command Reference.

get-coip-pool-usage

The following code example shows how to use get-coip-pool-usage.

AWS CLI

To get customer-owned IP address pool usage

The following get-coip-pool-usage example gets the usage details for the specified customer-owned IP address pool.

aws ec2 get-coip-pool-usage \
    --pool-id ipv4pool-coip-123a45678bEXAMPLE

Output:

{  
    "CoipPoolId": "ipv4pool-coip-123a45678bEXAMPLE",
    "CoipAddressUsages": [
        {
            "CoIp": "0.0.0.0"
        },
    
```
For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.

- For API details, see GetCoipPoolUsage in AWS CLI Command Reference.

get-console-output

The following code example shows how to use get-console-output.

AWS CLI

**Example 1: To get the console output**

The following get-console-output example gets the console output for the specified Linux instance.

```
aws ec2 get-console-output \
   --instance-id i-1234567890abcdef0
```

Output:

```
{
   "InstanceId": "i-1234567890abcdef0",
   "Output": "..."
}
```

For more information, see Instance console output in the Amazon EC2 User Guide.
Example 2: To get the latest console output

The following `get-console-output` example gets the latest console output for the specified Linux instance.

```bash
aws ec2 get-console-output \
   --instance-id i-1234567890abcdef0 \
   --latest \
   --output text
```

Output:

```
aws ec2 get-console-output
--instance-id i-1234567890abcdef0
--latest
--output text
```

```
i-1234567890abcdef0 [ 0.000000] Command line: root=LABEL=/ console=tty1
   console=ttyS0 selinux=0 nvme_core.io_timeout=4294967295
   [ 0.000000] x86/fpu: Supporting XSAVE feature 0x001: 'x87 floating point
   registers'
   [ 0.000000] x86/fpu: Supporting XSAVE feature 0x002: 'SSE registers'
   [ 0.000000] x86/fpu: Supporting XSAVE feature 0x004: 'AVX registers'

   DataSourceEc2. Up 21.50 seconds
   Amazon Linux AMI release 2018.03
   Kernel 4.14.26-46.32.amzn1.x
```

For more information, see Instance console output in the Amazon EC2 User Guide.

- For API details, see GetConsoleOutput in AWS CLI Command Reference.

get-console-screenshot

The following code example shows how to use `get-console-screenshot`.

AWS CLI

To retrieve a screenshot of a running instance

The following `get-console-screenshot` example retrieves a screenshot of the specified instance in .jpg format. The screenshot is returned as a Base64-encoded string.

```bash
aws ec2 get-console-screenshot \
   --instance-id i-1234567890abcdef0
```

Actions and scenarios
Output:

```json
{
    "ImageData": "997987/8kgj49ikjhewkwwe0008084EXAMPLE",
    "InstanceId": "i-1234567890abcdef0"
}
```

- For API details, see `GetConsoleScreenshot` in *AWS CLI Command Reference*.

**get-default-credit-specification**

The following code example shows how to use `get-default-credit-specification`.

**AWS CLI**

**To describe the default credit option**

The following `get-default-credit-specification` example describes the default credit option for T2 instances.

```bash
aws ec2 get-default-credit-specification \
    --instance-family t2
```

Output:

```json
{
    "InstanceFamilyCreditSpecification": {
        "InstanceFamily": "t2",
        "CpuCredits": "standard"
    }
}
```

- For API details, see `GetDefaultCreditSpecification` in *AWS CLI Command Reference*.

**get-ebs-default-kms-key-id**

The following code example shows how to use `get-ebs-default-kms-key-id`.

**AWS CLI**

**To describe your default CMK for EBS encryption**
The following `get-ebs-default-kms-key-id` example describes the default CMK for EBS encryption for your AWS account.

```bash
aws ec2 get-ebs-default-kms-key-id
```

The output shows the default CMK for EBS encryption, which is an AWS managed CMK with the alias `alias/aws/ebs`.

```
{
    "KmsKeyId": "alias/aws/ebs"
}
```

The following output shows a custom CMK for EBS encryption.

```
{
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see [GetEbsDefaultKmsKeyId](#) in *AWS CLI Command Reference*.

### get-ebs-encryption-by-default

The following code example shows how to use `get-ebs-encryption-by-default`.

**AWS CLI**

**To describe whether EBS encryption by default is enabled**

The following `get-ebs-encryption-by-default` example indicates whether EBS encryption by default is enabled for your AWS account in the current Region.

```bash
aws ec2 get-ebs-encryption-by-default
```

The following output indicates that EBS encryption by default is disabled.

```
{
    "EbsEncryptionByDefault": false
}
```
The following output indicates that EBS encryption by default is enabled.

```json
{
   "EbsEncryptionByDefault": true
}
```

- For API details, see [GetEbsEncryptionByDefault](#) in [AWS CLI Command Reference](#).

---

**get-flow-logs-integration-template**

The following code example shows how to use `get-flow-logs-integration-template`.

**AWS CLI**

**To create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena**

The following `get-flow-logs-integration-template` examples create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena.

Linux:

```bash
aws ec2 get-flow-logs-integration-template \
   --flow-log-id fl-1234567890abcdef0 \
   --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET \
   --integrate-services
   AthenaIntegrations=
     
     

Windows:

```bash
aws ec2 get-flow-logs-integration-template ^
   --flow-log-id fl-1234567890abcdef0 ^
   --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET ^
   --integrate-services
   AthenaIntegrations=
     
     
```
Output:

```
{
   "Result": "https://DOC-EXAMPLE-BUCKET.s3.us-east-2.amazonaws.com/VPCFlowLogsIntegrationTemplate_f1-1234567890abcdef0_Wed%20Jul%2021%2000%3A57%3A56%20UTC%202021.yml"
}
```

For information on using CloudFormation templates, see [Working with AWS CloudFormation templates](#) in the [AWS CloudFormation User Guide](#).

For information on using Amazon Athena and flow logs, see [Query flow logs using Amazon Athena](#) in the [Amazon Virtual Private Cloud User Guide](#).

- For API details, see [GetFlowLogsIntegrationTemplate](#) in [AWS CLI Command Reference](#).

**get-groups-for-capacity-reservation**

The following code example shows how to use `get-groups-for-capacity-reservation`.

**AWS CLI**

**To list the resource groups with a Capacity Reservation**

The following `get-groups-for-capacity-reservation` example lists the resource groups to which the specified Capacity Reservation was added.

```
aws ec2 get-groups-for-capacity-reservation \
   --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
   "CapacityReservationsGroup": [
      {
         "OwnerId": "123456789012"
      }
   ]
}
```
For more information, see Working with Capacity Reservations in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see GetGroupsForCapacityReservation in AWS CLI Command Reference.

get-host-reservation-purchase-preview

The following code example shows how to use get-host-reservation-purchase-preview.

AWS CLI

To get a purchase preview for a Dedicated Host Reservation

This example provides a preview of the costs for a specified Dedicated Host Reservation for the specified Dedicated Host in your account.

Command:

```bash
aws ec2 get-host-reservation-purchase-preview --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```json
{
  "TotalHourlyPrice": "1.499",
  "Purchase": [
    {
      "HourlyPrice": "1.499",
      "InstanceFamily": "m4",
      "PaymentOption": "NoUpfront",
      "HostIdSet": [
        "h-013abcd2a00cbd123"
      ],
      "UpfrontPrice": "0.000",
      "Duration": 31536000
    }
  ],
  "TotalUpfrontPrice": "0.000"
}
```

- For API details, see GetHostReservationPurchasePreview in AWS CLI Command Reference.
get-image-block-public-access-state

The following code example shows how to use get-image-block-public-access-state.

AWS CLI

To get the block public access state for AMIs in the specified Region

The following get-image-block-public-access-state example gets the block public access state for AMIs at the account level in the specified Region.

```bash
aws ec2 get-image-block-public-access-state \
   --region us-east-1
```

Output:

```json
{
   "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see [Block public access to your AMIs](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/block-public-access.html) in the *Amazon EC2 User Guide*.

- For API details, see [GetImageBlockPublicAccessState](https://docs.aws.amazon.com/AWSCommandReference/index.html) in *AWS CLI Command Reference*.

get-instance-types-from-instance-requirements

The following code example shows how to use get-instance-types-from-instance-requirements.

AWS CLI

To preview the instance types that match specified attributes

The following get-instance-types-from-instance-requirements example first generates a list of all of the possible attributes that can be specified using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to customize the attributes for which to preview matched instance types.

To generate all possible attributes and save the output directly to a JSON file, use the following command.
aws ec2 get-instance-types-from-instance-requirements \
--region us-east-1 \
--generate-cli-skeleton input > attributes.json

Output:

```json
{
    "DryRun": true,
    "ArchitectureTypes": [
        "x86_64_mac"
    ],
    "VirtualizationTypes": [
        "paravirtual"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 0,
            "Max": 0
        },
        "MemoryMiB": {
            "Min": 0,
            "Max": 0
        },
        "CpuManufacturers": [
            "intel"
        ],
        "MemoryGiBPerVCpu": {
            "Min": 0.0,
            "Max": 0.0
        },
        "ExcludedInstanceTypes": [],
        "InstanceGenerations": [
            "current"
        ],
        "SpotMaxPricePercentageOverLowestPrice": 0,
        "OnDemandMaxPricePercentageOverLowestPrice": 0,
        "BareMetal": "included",
        "BurstablePerformance": "excluded",
        "RequireHibernateSupport": true,
        "NetworkInterfaceCount": {
            "Min": 0,
            "Max": 0
        }
    }
}
```
Configure the JSON file. You must provide values for ArchitectureTypes, VirtualizationTypes, VcpuCount, and MemoryMiB. You can omit the other attributes. When omitted, default values are used. For a description of each attribute and their default values, see get-instance-types-from-instance-requirements <https://docs.aws.amazon.com/cli/latest/reference/ec2/get-instance-types-from-instance-requirements.html>.
Preview the instance types that have the attributes specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter. In the following request, the output is formatted as a table.

```bash
aws ec2 get-instance-types-from-instance-requirements \
   --cli-input-json file://attributes.json \
   --output table
```

Contents of `attributes.json` file:

```json
{
    "ArchitectureTypes": [
        "x86_64"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 4,
            "Max": 6
        },
        "MemoryMiB": {
            "Min": 2048
        },
        "InstanceGenerations": [
            "current"
        ]
    }
}
```

Output:

```
<table>
<thead>
<tr>
<th>GetInstanceTypesFromInstanceRequirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceTypes</td>
</tr>
<tr>
<td>----------------------------------------</td>
</tr>
<tr>
<td>InstanceType</td>
</tr>
<tr>
<td>----------------------------------------</td>
</tr>
<tr>
<td>c4.xlarge</td>
</tr>
</tbody>
</table>
```
get-instance-uefi-data

The following code example shows how to use get-instance-uefi-data.

AWS CLI

To retrieve UEFI data from an instance

The following get-instance-uefi-data example retrieves UEFI data from an instance. If the output is empty, the instance does not contain UEFI data.

```
aws ec2 get-instance-uefi-data \
   --instance-id i-0123456789example
```

Output:

```
{
   "InstanceId": "i-0123456789example",
   "UefiData": "QU1aT1VFRkkf+uLXAAAAAHj5a7fZ9+3dBzxXb/.
   <snipped>
   AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAD4L/J/A0Dshho="
}
```

For more information, see UEFI Secure Boot in the Amazon EC2 User Guide.

• For API details, see GetInstanceUefiData in AWS CLI Command Reference.
get-ipam-address-history

The following code example shows how to use get-ipam-address-history.

AWS CLI

To get the history of a CIDR

The following get-ipam-address-history example gets the history of a CIDR.

(Linux):

```
aws ec2 get-ipam-address-history \
    --cidr 10.0.0.0/16 \
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
    --start-time 2021-12-08T01:00:00.000Z \
    --end-time 2021-12-10T01:00:00.000Z
```

(Windows):

```
aws ec2 get-ipam-address-history ^
    --cidr 10.0.0.0/16 ^
    --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
    --start-time 2021-12-08T01:00:00.000Z ^
    --end-time 2021-12-10T01:00:00.000Z
```

Output:

```
{
    "HistoryRecords": [
        {
            "ResourceOwnerId": "123456789012",
            "ResourceRegion": "us-west-1",
            "ResourceType": "vpc",
            "ResourceId": "vpc-06cbefa9ee907e1c0",
            "ResourceCidr": "10.0.0.0/16",
            "ResourceName": "Demo",
            "ResourceComplianceStatus": "unmanaged",
            "ResourceOverlapStatus": "overlapping",
            "VpcId": "vpc-06cbefa9ee907e1c0",
            "SampledStartTime": "2021-12-08T19:54:57.675000+00:00"
        }
    ]
}
```
For more information, see [View the history of IP addresses](#) in the Amazon VPC IPAM User Guide.

- For API details, see [GetIpamAddressHistory](#) in AWS CLI Command Reference.

### get-ipam-pool-allocations

The following code example shows how to use `get-ipam-pool-allocations`.

#### AWS CLI

**To get the CIDRs allocated from an IPAM pool**

The following `get-ipam-pool-allocations` example gets the CIDRs allocated from an IPAM pool.

(Linux):
aws ec2 get-ipam-pool-allocations \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --filters Name=ipam-pool-allocation-id,Values=ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220

(Windows):

aws ec2 get-ipam-pool-allocations ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --filters Name=ipam-pool-allocation-id,Values=ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220

Output:

```json
{
   "IpamPoolAllocations": [
      {
         "Cidr": "10.0.0.0/16",
         "IpamPoolAllocationId": "ipam-pool-alloc-0e6186d73999e47389266a5d6991e6220",
         "ResourceType": "custom",
         "ResourceOwner": "123456789012"
      }
   ]
}
```

- For API details, see [GetIpamPoolAllocations](#) in *AWS CLI Command Reference*.

**get-ipam-pool-cidrs**

The following code example shows how to use `get-ipam-pool-cidrs`.

**AWS CLI**

**To get the CIDRs provisioned to an IPAM pool**

The following `get-ipam-pool-cidrs` example gets the CIDRs provisioned to an IPAM pool.

(Windows):

aws ec2 get-ipam-pool-cidrs \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --filters Name=ipam-pool-cidr

Output:

```json
{
   "IpamPoolCidrs": [
      {
         "Cidr": "10.0.0.0/16",
         "IpamPoolCidrId": "ipam-pool-cidr-0e6186d73999e47389266a5d6991e6220",
         "ResourceType": "custom",
         "ResourceOwner": "123456789012"
      }
   ]
}
```
get-ipam-pool-cidrs

The following code example shows how to use `get-ipam-pool-cidrs`.

AWS CLI

To get the CIDRs allocated to a resource

The following `get-ipam-resource-cidrs` example gets the CIDRs allocated to a resource.

(Windows):

```bash
aws ec2 get-ipam-resource-cidrs ^
   --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
   --filters Name=management-state,Values=unmanaged
```

Output:

```json
{
   "IpamPoolCidr": {
      "Cidr": "10.0.0.0/24",
      "State": "provisioned"
   }
}
```

Output:

```json
{
    "IpamResourceId": [
        {
            "IpamId": "ipam-08440e7a3acde3908",
            "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
            "ResourceRegion": "us-east-2",
            "ResourceOwnerId": "123456789012",
            "ResourceId": "vpc-621b8709",
            "ResourceName": "Default AWS VPC",
            "ResourceCidr": "172.33.0.0/16",
            "ResourceType": "vpc",
            "ResourceTags": [
                {
                    "Key": "Environment",
                    "Value": "Test"
                },
                {
                    "Key": "Name",
                    "Value": "Default AWS VPC"
                }
            ],
            "IpUsage": 0.0039,
            "ComplianceStatus": "unmanaged",
            "ManagementState": "unmanaged",
            "OverlapStatus": "nonoverlapping",
            "VpcId": "vpc-621b8709"
        }
    ]
}
```

For more information, see Monitor CIDR usage by resource in the Amazon VPC IPAM User Guide.

- For API details, see GetIpamResourceId in AWS CLI Command Reference.

**get-launch-template-data**

The following code example shows how to use get-launch-template-data.

**AWS CLI**

To get instance data for a launch template
This example gets data about the specified instance and uses the --query option to return the contents in LaunchTemplateData. You can use the output as a base to create a new launch template or launch template version.

Command:

```
aws ec2 get-launch-template-data --instance-id i-0123d646e8048babc --query 'LaunchTemplateData'
```

Output:

```
{
   "Monitoring": {},
   "ImageId": "ami-8c1be5f6",
   "BlockDeviceMappings": [
      {
         "DeviceName": "/dev/xvda",
         "Ebs": {
            "DeleteOnTermination": true
         }
      }
   ],
   "EbsOptimized": false,
   "Placement": {
      "Tenancy": "default",
      "GroupName": "",
      "AvailabilityZone": "us-east-1a"
   },
   "InstanceType": "t2.micro",
   "NetworkInterfaces": [
      {
         "Description": "",
         "NetworkInterfaceId": "eni-35306abc",
         "PrivateIpAddresses": [
            {
               "Primary": true,
               "PrivateIpAddress": "10.0.0.72"
            }
         ],
         "SubnetId": "subnet-7b16de0c",
         "Groups": ["sg-7c227019"
      ]
   ]
}
```
"Ipv6Addresses": [  
  {  
    "Ipv6Address": "2001:db8:1234:1a00::123"  
  }  
],  
"PrivateIpAddress": "10.0.0.72"
}
]

- For API details, see `GetLaunchTemplateData` in *AWS CLI Command Reference*.

**get-managed-prefix-list-associations**

The following code example shows how to use `get-managed-prefix-list-associations`.

**AWS CLI**

**To get prefix list associations**

The following `get-managed-prefix-list-associations` example gets the resources that are associated with the specified prefix list.

```
aws ec2 get-managed-prefix-list-associations \
  --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
  "PrefixListAssociations": [  
    {  
      "ResourceId": "sg-0abc123456abc12345",
      "ResourceOwner": "123456789012"
    }
  ]
}
```

For more information, see *Managed prefix lists* in the *Amazon VPC User Guide*.

- For API details, see `GetManagedPrefixListAssociations` in *AWS CLI Command Reference*.
**get-managed-prefix-list-entries**

The following code example shows how to use `get-managed-prefix-list-entries`.

**AWS CLI**

To get the entries for a prefix list

The following `get-managed-prefix-list-entries` gets the entries for the specified prefix list.

```
aws ec2 get-managed-prefix-list-entries \
  --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{
   "Entries": [
      {
         "Cidr": "10.0.0.0/16",
         "Description": "vpc-a"
      },
      {
         "Cidr": "10.2.0.0/16",
         "Description": "vpc-b"
      }
   ]
}
```

For more information, see [Managed prefix lists](https://docs.aws.amazon.com/vpc/latest/userguide/managed-prefix-lists.html) in the *Amazon VPC User Guide*.

- For API details, see [GetManagedPrefixListEntries](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-managed-prefix-list-entries.html) in *AWS CLI Command Reference*.

**get-network-insights-access-scope-analysis-findings**

The following code example shows how to use `get-network-insights-access-scope-analysis-findings`.

**AWS CLI**

To get the findings of Network Insights access scope analysis
The following `get-network-insights-access-scope-analysis-findings` example gets the selected scope analysis findings in your AWS account.

```bash
aws ec2 get-network-insights-access-scope-analysis-findings \
  --region us-east-1 \n  --network-insights-access-scope-analysis-id nis \n  --nis-123456789111
```

Output:

```json
{
  "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
  "AnalysisFindings": [
    {
      "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
      "NetworkInsightsAccessScopeId": "nis-123456789111",
      "FindingComponents": [
        {
          "SequenceNumber": 1,
          "Component": {
            "Id": "eni-02e3d42d5ccee62d",
            "Arn": "arn:aws:ec2:us-east-1:936459623503:network-interface/eni-02e3d32d9ccee61d"
          }
        },
        "OutboundHeader": {
          "DestinationAddresses": [
            "0.0.0.0/5",
            "11.0.0.0/8",
            "12.0.0.0/6",
            "128.0.0.0/3",
            "16.0.0.0/4",
            "160.0.0.0/5",
            "168.0.0.0/6",
            "172.0.0.0/12",
            "8.0.0.0/7"
          ],
          "DestinationPortRanges": [
            {
              "From": 0,

            }
          ],
          "Protocol": "6",
          "SourceAddresses": [
```

Actions and scenarios

2436
For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see GetNetworkInsightsAccessScopeAnalysisFindings in AWS CLI Command Reference.

get-network-insights-access-scope-content

The following code example shows how to use get-network-insights-access-scope-content.

AWS CLI

To get Network Insights access scope content

The following get-network-insights-access-scope-content example gets the content of the selected scope analysis ID in your AWS account.

aws ec2 get-network-insights-access-scope-content \
   --region us-east-1 \
   --network-insights-access-scope-id nis-12345678922

Output:

```json
{
   "NetworkInsightsAccessScopeContent": {
```
"NetworkInsightsAccessScopeId": "nis-123456789222",
"MatchPaths": [
  {
    "Source": {
      "ResourceStatement": {
        "ResourceTypes": [
          "AWS::EC2::NetworkInterface"
        ]
      }
    },
    "Destination": {
      "ResourceStatement": {
        "ResourceTypes": [
          "AWS::EC2::InternetGateway"
        ]
      }
    }
  }
]

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](https://docs.aws.amazon.com/cecl/latest/reference/Getting-started-network-access-analyzer-access-scope.html) in the Network Access Analyzer Guide.

get-password-data

The following code example shows how to use get-password-data.

**AWS CLI**

**To get the encrypted password**

This example gets the encrypted password.

Command:

```
aws ec2 get-password-data --instance-id i-1234567890abcdef0
```

Output:
To get the decrypted password

This example gets the decrypted password.

Command:

```
aws ec2 get-password-data --instance-id i-1234567890abcdef0 --priv-launch-key C:\Keys\MyKeyPair.pem
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "Timestamp": "2013-08-30T23:18:05.000Z",
    "PasswordData": "&ViJ652e*u"
}
```

get-reserved-instances-exchange-quote

The following code example shows how to use `get-reserved-instances-exchange-quote`.

AWS CLI

**To get a quote for exchanging a Convertible Reserved Instance**

This example gets the exchange information for the specified Convertible Reserved Instances.

Command:
aws ec2 get-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=6fea5434-b379-434c-b07b-a7abexample

Output:

```json
{
  "CurrencyCode": "USD",
  "ReservedInstanceValueSet": [ {
    "ReservedInstanceId": "7b8750c3-397e-4da4-bbcb-a45ebexample",
    "ReservationValue": { 
      "RemainingUpfrontValue": "0.000000",
      "HourlyPrice": "0.027800",
      "RemainingTotalValue": "730.556200"
    }
  } ],
  "PaymentDue": "424.983828",
  "TargetConfigurationValueSet": [
    {
      "TargetConfiguration": { 
        "InstanceCount": 5,
        "OfferingId": "6fea5434-b379-434c-b07b-a7abexample"
      },
      "ReservationValue": { 
        "RemainingUpfrontValue": "424.983828",
        "HourlyPrice": "0.016000",
        "RemainingTotalValue": "845.447828"
      }
    }
  ],

  "ReservedInstanceValueRollup": { 
    "RemainingUpfrontValue": "0.000000",
    "HourlyPrice": "0.027800",
    "RemainingTotalValue": "730.556200"
  },
  "TargetConfigurationValueRollup": { 
    "RemainingUpfrontValue": "424.983828",
    "HourlyPrice": "0.016000",
    "RemainingTotalValue": "845.447828"
  }
}
```
get-serial-console-access-status

The following code example shows how to use `get-serial-console-access-status`.

**AWS CLI**

To view the status of account access to the serial console

The following `get-serial-console-access-status` example determines whether serial console access is enabled for your account.

```
aws ec2 get-serial-console-access-status
```

Output:

```
{
   "SerialConsoleAccessEnabled": true
}
```

For more information, see [EC2 Serial Console](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/ec2-serial-console.html) in the *Amazon EC2 User Guide*.

- For API details, see [GetSerialConsoleAccessStatus](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-serial-console-access-status.html) in *AWS CLI Command Reference*.

get-spot-placement-scores

The following code example shows how to use `get-spot-placement-scores`.

**AWS CLI**

To calculate the Spot placement score for specified requirements

The following `get-spot-placement-scores` example first generates a list of all of the possible parameters that can be specified for the Spot placement score configuration using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to configure the requirements to use to calculate the Spot placement score.
To generate all possible parameters that can be specified for the Spot placement score configuration, and save the output directly to a JSON file.

```bash
aws ec2 get-spot-placement-scores \
    --region us-east-1 \ 
    --generate-cli-skeleton input > attributes.json
```

Output:

```json
{
    "InstanceTypes": [""
],

    "TargetCapacity": 0,

    "TargetCapacityUnitType": "vcpu",

    "SingleAvailabilityZone": true,

    "RegionNames": [

"AcceleratorTotalMemoryMiB": {
  "Min": 0,
  "Max": 0
}
Configure the JSON file. You must provide a value for `TargetCapacity`. For a description of each parameter and their default values, see Calculate the Spot placement score (AWS CLI) <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-placement-score.html#calculate-sps-cli>.

Calculate the Spot placement score for the requirements specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter.

```
aws ec2 get-spot-placement-scores
   --region us-east-1
   --cli-input-json file://attributes.json
```

Output if `SingleAvailabilityZone` is set to `false` or omitted (if omitted, it defaults to `false`). A scored list of Regions is returned.

```
"Recommendation": [
    {
      "Region": "us-east-1",
      "Score": 7
    },
    {
      "Region": "us-west-1",
      "Score": 5
    },
    ...
]
```

Output if `SingleAvailabilityZone` is set to `true`. A scored list of `SingleAvailability Zones` is returned.

```
"Recommendation": [
    {
      "Region": "us-east-1",
      "AvailabilityZoneId": "use1-az1",
      "Score": 8
    },
]
```
For more information about calculating a Spot placement score, and for example configurations, see Calculate a Spot placement score in the Amazon EC2 User Guide.

- For API details, see GetSpotPlacementScores in AWS CLI Command Reference.

get-subnet-cidr-reservations

The following code example shows how to use get-subnet-cidr-reservations.

AWS CLI

To get information about a subnet CIDR reservation

The following get-subnet-cidr-reservations example displays information about the specified subnet CIDR reservation.

```bash
aws ec2 get-subnet-cidr-reservations \
   --subnet-id subnet-03c51e2e6cEXAMPLE
```

Output:

```json
{
   "SubnetIpv4CidrReservations": [
      {
         "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
         "SubnetId": "subnet-03c51e2e6cEXAMPLE",
         "Cidr": "10.1.0.16/28",
         "ReservationType": "prefix",
         "OwnerId": "123456789012"
      }
   ],
   "SubnetIpv6CidrReservations": []
}
```

For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.
get-transit-gateway-attachment-propagations

The following code example shows how to use get-transit-gateway-attachment-propagations.

AWS CLI

To list the route tables to which the specified resource attachment propagates routes

The following get-transit-gateway-attachment-propagations example lists the route table to which the specified resource attachment propagates routes.

```
aws ec2 get-transit-gateway-attachment-propagations \
  --transit-gateway-attachment-id tgw-attach-09fbd47dfEXAMPLE
```

Output:

```
{
  "TransitGatewayAttachmentPropagations": [
    {
      "TransitGatewayRouteTableId": "tgw-rtb-0882c61b97EXAMPLE",
      "State": "enabled"
    }
  ]
}
```

For more information, see Transit gateway route tables in the Transit Gateways Guide.

- For API details, see GetTransitGatewayAttachmentPropagations in AWS CLI Command Reference.

get-transit-gateway-multicast-domain-associations

The following code example shows how to use get-transit-gateway-multicast-domain-associations.

AWS CLI

To view the information about the transit gateway multicast domain associations

- For API details, see GetTransitGatewayAttachmentPropagations in AWS CLI Command Reference.
The following `get-transit-gateway-multicast-domain-associations` example returns the associations for the specified multicast domain.

```
aws ec2 get-transit-gateway-multicast-domain-associations \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```json
{
   "MulticastDomainAssociations": [
   {
      "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8EXAMPLE",
      "ResourceId": "vpc-01128d2c24EXAMPLE",
      "ResourceType": "vpc",
      "Subnet": {
         "SubnetId": "subnet-000de86e3bEXAMPLE",
         "State": "associated"
      }
   },
   {
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
      "ResourceId": "vpc-7EXAMPLE",
      "ResourceType": "vpc",
      "Subnet": {
         "SubnetId": "subnet-4EXAMPLE",
         "State": "associated"
      }
   },
   {
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
      "ResourceId": "vpc-7EXAMPLE",
      "ResourceType": "vpc",
      "Subnet": {
         "SubnetId": "subnet-5EXAMPLE",
         "State": "associated"
      }
   },
   {
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
      "ResourceId": "vpc-7EXAMPLE",
      "ResourceType": "vpc",
      "Subnet": {
         "SubnetId": "subnet-aEXAMPLE",
      }
   }
   ]
}```
For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see GetTransitGatewayMulticastDomainAssociations in AWS CLI Command Reference.

get-transit-gateway-prefix-list-references

The following code example shows how to use get-transit-gateway-prefix-list-references.

AWS CLI

To get prefix list references in a transit gateway route table

The following get-transit-gateway-prefix-list-references example gets the prefix list references for the specified transit gateway route table, and filters by the ID of a specific prefix list.

```
aws ec2 get-transit-gateway-prefix-list-references \
  --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
  --filters Name=prefix-list-id,Values=pl-111112222222333
```

Output:

```
{
   "TransitGatewayPrefixListReferences": [
      {
```
For more information, see Prefix list references in the Transit Gateways Guide.

- For API details, see GetTransitGatewayPrefixListReferences in AWS CLI Command Reference.

get-transit-gateway-route-table-associations

The following code example shows how to use get-transit-gateway-route-table-associations.

AWS CLI

To get information about the associations for the specified transit gateway route table

The following get-transit-gateway-route-table-associations example displays information about the associations for the specified transit gateway route table.

```
aws ec2 get-transit-gateway-route-table-associations \
  --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE
```

Output:

```
{
    "Associations": [
        {
            "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
            "ResourceId": "vpc-4d7de228",
            "ResourceType": "vpc",
            "State": "associating"
        }
    ]
}
```
For more information, see Transit gateway route tables in the Transit Gateways Guide.

• For API details, see GetTransitGatewayRouteTableAssociations in AWS CLI Command Reference.

get-transit-gateway-route-table-propagations

The following code example shows how to use get-transit-gateway-route-table-propagations.

AWS CLI

To display information about the route table propagations for the specified transit gateway route table

The following get-transit-gateway-route-table-propagations example returns the route table propagations for the specified route table.

```bash
aws ec2 get-transit-gateway-route-table-propagations \
   --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
```

Output:

```json
{
   "TransitGatewayRouteTablePropagations": [
      {
         "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
         "ResourceId": "vpc-3EXAMPLE",
         "ResourceType": "vpc",
         "State": "enabled"
      },
      {
         "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
         "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
         "ResourceType": "direct-connect-gateway",
         "State": "enabled"
      },
      {
         "TransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
```
For more information, see Transit gateway route tables in the Transit Gateways Guide.

- For API details, see GetTransitGatewayRouteTablePropagations in AWS CLI Command Reference.

get-verified-access-endpoint-policy

The following code example shows how to use get-verified-access-endpoint-policy.

AWS CLI

To get the Verified Access policy of an endpoint

The following get-verified-access-endpoint-policy example gets the Verified Access policy of the specified endpoint.

```
aws ec2 get-verified-access-endpoint-policy \
   --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
   "PolicyEnabled": true,
   "PolicyDocument": "permit(principal,action,resource)\nwhen
   {\n       context.identity.groups.contains("finance") &&\n       context.identity.email_verified == true\n   }"
}
```

For more information, see Verified Access policies in the AWS Verified Access User Guide.

- For API details, see GetVerifiedAccessEndpointPolicy in AWS CLI Command Reference.

get-verified-access-group-policy

The following code example shows how to use get-verified-access-group-policy.
AWS CLI

To get the Verified Access policy of a group

The following `get-verified-access-group-policy` example gets the Verified Access policy of the specified group.

```
aws ec2 get-verified-access-group-policy \
  --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```
{
  "PolicyEnabled": true,
  "PolicyDocument": "permit(principal,action,resource)\nwhen
  {\n    context.identity.groups.contains("finance") &&\n    context.identity.email_verified == true\n  };
}
```

For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-groups.html) in the *AWS Verified Access User Guide*.

- For API details, see [GetVerifiedAccessGroupPolicy](https://docs.aws.amazon.com/cli/latest/reference/ec2/get-verified-access-group-policy.html) in *AWS CLI Command Reference*.

get-vpn-connection-device-sample-configuration

The following code example shows how to use `get-vpn-connection-device-sample-configuration`.

AWS CLI

To download a sample configuration file

The following `get-vpn-connection-device-sample-configuration` example downloads the specified sample configuration file. To list the gateway devices with a sample configuration file, call the `get-vpn-connection-device-types` command.

```
aws ec2 get-vpn-connection-device-sample-configuration \
  --vpn-connection-id vpn-123456789abc01234 \
  --vpn-connection-device-type-id 5fb390ba
```

Output:
For more information, see [Download the configuration file](#) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [GetVpnConnectionDeviceSampleConfiguration](#) in *AWS CLI Command Reference*.

### get-vpn-connection-device-types

The following code example shows how to use `get-vpn-connection-device-types`.

**AWS CLI**

To list gateway devices with a sample configuration file

The following `get-vpn-connection-device-types` example lists the gateway devices from Palo Alto Networks that have sample configuration files.

```
aws ec2 get-vpn-connection-device-types \\
   --query "VpnConnectionDeviceTypes[?Vendor==`Palo Alto Networks`]"
```

Output:

```
[
   {  
      "VpnConnectionDeviceTypeId": "754a6372",
      "Vendor": "Palo Alto Networks",
      "Platform": "PA Series",
      "Software": "PANOS 4.1.2"
   },  
   {  
      "VpnConnectionDeviceTypeId": "9612cbed",
      "Vendor": "Palo Alto Networks",
      "Platform": "PA Series",
      "Software": "PANOS 4.1.2+ (GUI)"
   },  
   {  
```
For more information, see [Download the configuration file](#) in the [AWS Site-to-Site VPN user Guide](#).

- For API details, see [GetVpnConnectionDeviceTypes](#) in [AWS CLI Command Reference](#).

**import-client-vpn-client-certificate-revocation-list**

The following code example shows how to use `import-client-vpn-client-certificate-revocation-list`.

**AWS CLI**

**To import a client certificate revocation list**

The following `import-client-vpn-client-certificate-revocation-list` example imports a client certificate revocation list to the Client VPN endpoint by specifying the location of the file on the local computer.

```bash
aws ec2 import-client-vpn-client-certificate-revocation-list \
    --certificate-revocation-list file:///path/to/crl.pem \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```json
{
    "Return": true
}
```

For more information, see [Client Certificate Revocation Lists](#) in the [AWS Client VPN Administrator Guide](#).

- For API details, see [ImportClientVpnClientCertificateRevocationList](#) in [AWS CLI Command Reference](#).
import-image

The following code example shows how to use import-image.

AWS CLI

To import a VM image file as an AMI

The following import-image example imports the specified OVA.

```bash
aws ec2 import-image \
   --disk-containers Format=ova,UserBucket="{S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.ova}"
```

Output:

```json
{
   "ImportTaskId": "import-ami-1234567890abcdef0",
   "Progress": "2",
   "SnapshotDetails": [
   {
      "DiskImageSize": 0.0,
      "Format": "ova",
      "UserBucket": {
         "S3Bucket": "my-import-bucket",
         "S3Key": "vms/my-server-vm.ova"
      }
   }
   ],
   "Status": "active",
   "StatusMessage": "pending"
}
```

• For API details, see `ImportImage` in AWS CLI Command Reference.

import-key-pair

The following code example shows how to use import-key-pair.

AWS CLI

To import a public key
First, generate a key pair with the tool of your choice. For example, use this ssh-keygen command:

**Command:**

```
ssh-keygen -t rsa -C "my-key" -f ~/.ssh/my-key
```

**Output:**

```
Generating public/private rsa key pair.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/ec2-user/.ssh/my-key.
Your public key has been saved in /home/ec2-user/.ssh/my-key.pub.
...
```

This example command imports the specified public key.

**Command:**

```
aws ec2 import-key-pair --key-name "my-key" --public-key-material fileb://~/.ssh/my-key.pub
```

**Output:**

```
{
   "KeyName": "my-key",
}
```

- For API details, see [ImportKeyPair](#) in *AWS CLI Command Reference*.

**import-snapshot**

The following code example shows how to use `import-snapshot`.

**AWS CLI**

**To import a snapshot**

The following `import-snapshot` example imports the specified disk as a snapshot.
aws ec2 import-snapshot
  --description "My server VMDK" \
  --disk-container Format=VMDK,UserBucket={S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.vmdk}

Output:

```
{
  "Description": "My server VMDK",
  "ImportTaskId": "import-snap-1234567890abcdef0",
  "SnapshotTaskDetail": {
    "Description": "My server VMDK",
    "DiskImageSize": "0.0",
    "Format": "VMDK",
    "Progress": "3",
    "Status": "active",
    "StatusMessage": "pending"
    "UserBucket": {
      "S3Bucket": "my-import-bucket",
      "S3Key": "vms/my-server-vm.vmdk"
    }
  }
}
```

• For API details, see ImportSnapshot in AWS CLI Command Reference.

list-images-in-recycle-bin

The following code example shows how to use list-images-in-recycle-bin.

AWS CLI

To list the images in the Recycle Bin

The following list-images-in-recycle-bin example lists all of the images that are currently retained in the Recycle Bin.

aws ec2 list-images-in-recycle-bin

Output:
For more information, see [Recover AMIs from the Recycle Bin](https://docs.aws.amazon.com/elasticloadbalancing/latest/classic/configure-recovery.html) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [ListImagesInRecycleBin](https://docs.aws.amazon.com/cli/latest/reference/eb/list-images-in-recycle-bin.html) in *AWS CLI Command Reference*.

### list-snapshots-in-recycle-bin

The following code example shows how to use list-snapshots-in-recycle-bin.

**AWS CLI**

**To view snapshots in the Recycle Bin**

The following list-snapshots-in-recycle-bin example lists information about snapshots in the Recycle Bin, including the snapshot ID, a description of the snapshot, The ID of the volume from which the snapshot was created, the date and time when the snapshot was deleted and it entered the Recycle Bin, and the date and time when the retention period expires.

```bash
aws ec2 list-snapshots-in-recycle-bin \ 
    --snapshot-id snap-0123456789abcdef
```

**Output:**

```json
{
    "SnapshotRecycleBinInfo": [
        {
            "Description": "Monthly data backup snapshot",
            "RecycleBinEnterTime": "2022-12-01T13:00:00.000Z",
            "RecycleBinExitTime": "2022-12-01T13:00:00.000Z",
            "Name": "Name_01",
            "ImageId": "ami-01122233444abcd"
        }
    ]
}
```
For more information about Recycle Bin for Amazon EBS, see Recover snapshots from the Recycle Bin in the Amazon EC2 User Guide.

• For API details, see ListSnapshotsInRecycleBin in AWS CLI Command Reference.

modify-address-attribute

The following code example shows how to use modify-address-attribute.

AWS CLI

To modify the domain name attribute associated with an elastic IP address

The following modify-address-attribute examples modify the domain name attribute of an elastic IP address.

Linux:

aws ec2 modify-address-attribute \
   --allocation-id eipalloc-abcdef01234567890 \
   --domain-name example.com

Windows:

aws ec2 modify-address-attribute ^
   --allocation-id eipalloc-abcdef01234567890 ^
   --domain-name example.com

Output:

{
   "Addresses": [
      {
         "PublicIp": "192.0.2.0",
         "AllocationId": "eipalloc-abcdef01234567890",
      }
   ]
}
"PtrRecord": "example.net."
"PtrRecordUpdate": {
    "Value": "example.com.",
    "Status": "PENDING"
}
}
]

To monitor the pending change and to view the modified attributes of an elastic IP address, see `describe-addresses-attribute` in the AWS CLI Command Reference.

- For API details, see `ModifyAddressAttribute` in AWS CLI Command Reference.

**modify-availability-zone-group**

The following code example shows how to use `modify-availability-zone-group`.

**AWS CLI**

**To enable a zone group**

The following `modify-availability-zone-group` example enables the specified zone group.

```
aws ec2 modify-availability-zone-group \
    --group-name us-west-2-lax-1 \
    --opt-in-status opted-in
```

Output:

```
{
    "Return": true
}
```

For more information, see Regions and Zones in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see `ModifyAvailabilityZoneGroup` in AWS CLI Command Reference.

**modify-capacity-reservation**

The following code example shows how to use `modify-capacity-reservation`.
Example 1: To change the number of instances reserved by an existing capacity reservation

The following modify-capacity-reservation example changes the number of instances for which the capacity reservation reserves capacity.

```
aws ec2 modify-capacity-reservation
   --capacity-reservation-id cr-1234abcd56EXAMPLE \
   --instance-count 5
```

Output:

```
{
   "Return": true
}
```

Example 2: To change the end date and time for an existing capacity reservation

The following modify-capacity-reservation example modifies an existing capacity reservation to end at the specified date and time.

```
aws ec2 modify-capacity-reservation
   --capacity-reservation-id cr-1234abcd56EXAMPLE \
   --end-date-type limited \
   --end-date 2019-08-31T23:59:59Z
```

For more information, see Modifying a Capacity Reservation in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see ModifyCapacityReservation in AWS CLI Command Reference.

modify-capacity-reservation-fleet

The following code example shows how to use modify-capacity-reservation-fleet.

AWS CLI

Example 1: To modify the total target capacity of a Capacity Reservation Fleet

The following modify-capacity-reservation-fleet example modifies the total target capacity of the specified Capacity Reservation Fleet. When you modify the total target capacity
of a Capacity Reservation Fleet, the Fleet automatically creates new Capacity Reservations, or modifies or cancels existing Capacity Reservations in the Fleet to meet the new total target capacity. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```
aws ec2 modify-capacity-reservation-fleet \
  --capacity-reservation-fleet-id crf-01234567890abcedf \
  --total-target-capacity 160
```

Output:

```
{
  "Return": true
}
```

**Example 2: To modify the end date of a Capacity Reservation Fleet**

The following `modify-capacity-reservation-fleet` example modifies the end date of the specified Capacity Reservation Fleet. When you modify the end date for the Fleet, the end dates for all of the individual Capacity Reservations are updated accordingly. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```
aws ec2 modify-capacity-reservation-fleet \
  --capacity-reservation-fleet-id crf-01234567890abcedf \
  --end-date 2022-07-04T23:59:59.000Z
```

Output:

```
{
  "Return": true
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/CapacityReservationFleets.html) in the [Amazon EC2 User Guide](https).

- For API details, see [ModifyCapacityReservationFleet](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-capacity-reservation-fleet.html) in [AWS CLI Command Reference](https).

**modify-client-vpn-endpoint**

The following code example shows how to use `modify-client-vpn-endpoint`.
**AWS CLI**

**To modify a Client VPN endpoint**

The following `modify-client-vpn-endpoint` example enables client connection logging for the specified Client VPN endpoint.

```bash
aws ec2 modify-client-vpn-endpoint \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
   --connection-log-options Enabled=true,CloudwatchLogGroup=ClientVPNLogs
```

Output:

```
{
   "Return": true
}
```

For more information, see [Client VPN Endpoints](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [ModifyClientVpnEndpoint](#) in *AWS CLI Command Reference*.

**modify-default-credit-specification**

The following code example shows how to use `modify-default-credit-specification`.

**AWS CLI**

**To modify the default credit option**

The following `modify-default-credit-specification` example modifies the default credit option for T2 instances.

```bash
aws ec2 modify-default-credit-specification \
   --instance-family t2 \
   --cpu-credits unlimited
```

Output:

```
{
   "InstanceFamilyCreditSpecification": {
```

Actions and scenarios
"InstanceFamily": "t2",
  "CpuCredits": "unlimited"
}
}

- For API details, see [ModifyDefaultCreditSpecification](#) in AWS CLI Command Reference.

modify-ebs-default-kms-key-id

The following code example shows how to use modify-ebs-default-kms-key-id.

**AWS CLI**

To set your default CMK for EBS encryption

The following modify-ebs-default-kms-key-id example sets the specified CMK as the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 modify-ebs-default-kms-key-id \
  --kms-key-id alias/my-cmk
```

Output:

```
{
  "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see [ModifyEbsDefaultKmsKeyId](#) in AWS CLI Command Reference.

modify-fleet

The following code example shows how to use modify-fleet.

**AWS CLI**

To scale an EC2 Fleet

The following modify-fleet example modifies the target capacity of the specified EC2 Fleet. If the specified value is greater than the current capacity, the EC2 Fleet launches additional
instances. If the specified value is less than the current capacity, the EC2 Fleet cancels any open requests and if the termination policy is terminate, the EC2 fleet terminates any instances that exceed the new target capacity.

```
aws ec2 modify-fleet \
   --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \ 
   --target-capacity-specification TotalTargetCapacity=5
```

Output:

```
{
   "Return": true
}
```

For more information, see Managing an EC2 Fleet in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see ModifyFleet in AWS CLI Command Reference.

**modify-fpga-image-attribute**

The following code example shows how to use modify-fpga-image-attribute.

AWS CLI

**To modify the attributes of an Amazon FPGA image**

This example adds load permissions for account ID 123456789012 for the specified AFI.

Command:

```
aws ec2 modify-fpga-image-attribute --attribute loadPermission --fpga-image-id afi-0d123e123bfc85abc --load-permission Add=[[UserId=123456789012]]
```

Output:

```
{
   "FpgaImageAttribute": {
      "FpgaImageId": "afi-0d123e123bfc85abc",
      "LoadPermissions": [
```
modify-hosts

The following code example shows how to use modify-hosts.

AWS CLI

Example 1: To enable auto-placement for a Dedicated Host

The following modify-hosts example enables auto-placement for a Dedicated Host so that it accepts any untargeted instance launches that match its instance type configuration.

```bash
aws ec2 modify-hosts \
   --host-id h-06c2f189b4EXAMPLE \n   --auto-placement on
```

Output:

```json
{
   "Successful": [  
      "h-06c2f189b4EXAMPLE"
   ],
   "Unsuccessful": []
}
```

Example 2: To enable host recovery for a Dedicated Host

The following modify-hosts example enables host recovery for the specified Dedicated Host.

```bash
aws ec2 modify-hosts \
   --host-id h-06c2f189b4EXAMPLE \n   --host-recovery on
```
modify-id-format

The following code example shows how to use modify-id-format.

**AWS CLI**

**To enable the longer ID format for a resource**

The following modify-id-format example enables the longer ID format for the instance resource type.

```
aws ec2 modify-id-format \
  --resource instance \
  --use-long-ids
```

**To disable the longer ID format for a resource**

The following modify-id-format example disables the longer ID format for the instance resource type.

```
aws ec2 modify-id-format \
  --resource instance \
  --no-use-long-ids
```

The following modify-id-format example enables the longer ID format for all supported resource types that are within their opt-in period.
aws ec2 modify-id-format
   --resource all-current
   --use-long-ids

- For API details, see ModifyIdFormat in AWS CLI Command Reference.

**modify-identity-id-format**

The following code example shows how to use modify-identity-id-format.

**AWS CLI**

**To enable an IAM role to use longer IDs for a resource**

The following modify-identity-id-format example enables the IAM role EC2Role in your AWS account to use long ID format for the instance resource type.

aws ec2 modify-identity-id-format
   --principal-arn arn:aws:iam::123456789012:role/EC2Role
   --resource instance
   --use-long-ids

**To enable an IAM user to use longer IDs for a resource**

The following modify-identity-id-format example enables the IAM user AdminUser in your AWS account to use the longer ID format for the volume resource type.

aws ec2 modify-identity-id-format
   --principal-arn arn:aws:iam::123456789012:user/AdminUser
   --resource volume
   --use-long-ids

The following modify-identity-id-format example enables the IAM user AdminUser in your AWS account to use the longer ID format for all supported resource types that are within their opt-in period.

aws ec2 modify-identity-id-format
   --principal-arn arn:aws:iam::123456789012:user/AdminUser
   --resource all-current
**modify-image-attribute**

The following code example shows how to use `modify-image-attribute`.

**AWS CLI**

**Example 1: To make an AMI public**

The following `modify-instance-attribute` example makes the specified AMI public.

```bash
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{Group=all}]"
```

This command produces no output.

**Example 2: To make an AMI private**

The following `modify-instance-attribute` example makes the specified AMI private.

```bash
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Remove=[{Group=all}]"
```

This command produces no output.

**Example 3: To grant launch permission to an AWS account**

The following `modify-instance-attribute` example grants launch permissions to the specified AWS account.

```bash
aws ec2 modify-image-attribute \
    --image-id ami-5731123e \
    --launch-permission "Add=[{UserId=123456789012}]"
```

This command produces no output.

- For API details, see [ModifyIdentityIdFormat](#) in *AWS CLI Command Reference*. 
Example 4: To remove launch permission from an AWS account

The following modify-instance-attribute example removes launch permissions from the specified AWS account.

```
aws ec2 modify-image-attribute 
   --image-id ami-5731123e 
   --launch-permission "Remove=[{UserId=123456789012}]"
```

- For API details, see ModifyImageAttribute in AWS CLI Command Reference.

modify-instance-attribute

The following code example shows how to use modify-instance-attribute.

AWS CLI

Example 1: To modify the instance type

The following modify-instance-attribute example modifies the instance type of the specified instance. The instance must be in the stopped state.

```
aws ec2 modify-instance-attribute 
   --instance-id i-1234567890abcdef0 
   --instance-type "{"Value": "m1.small"}"
```

This command produces no output.

Example 2: To enable enhanced networking on an instance

The following modify-instance-attribute example enables enhanced networking for the specified instance. The instance must be in the stopped state.

```
aws ec2 modify-instance-attribute 
   --instance-id i-1234567890abcdef0 
   --sriov-net-support simple
```

This command produces no output.

Example 3: To modify the sourceDestCheck attribute
The following `modify-instance-attribute` example sets the `sourceDestCheck` attribute of the specified instance to `true`. The instance must be in a VPC.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --source-dest-check "{"Value": true}"
```

This command produces no output.

**Example 4: To modify the `deleteOnTermination` attribute of the root volume**

The following `modify-instance-attribute` example sets the `deleteOnTermination` attribute for the root volume of the specified Amazon EBS-backed instance to `false`. By default, this attribute is `true` for the root volume.

**Command:**

```
aws ec2 modify-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --block-device-mappings "[{"DeviceName": "/dev/sda1","Ebs": {"DeleteOnTermination":false}}]"
```

This command produces no output.

**Example 5: To modify the user data attached to an instance**

The following `modify-instance-attribute` example adds the contents of the file `UserData.txt` as the `UserData` for the specified instance.

**Contents of original file `UserData.txt`:**

```
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

The contents of the file must be base64 encoded. The first command converts the text file to base64 and saves it as a new file.

**Linux/macOS version of the command:**

```
base64 UserData.txt > UserData.base64.txt
```
This command produces no output.

Windows version of the command:

```
certutil -encode UserData.txt tmp.b64 && findstr /v /c:- tmp.b64 > UserData.base64.txt
```

Output:

```
Input Length = 67
Output Length = 152
CertUtil: -encode command completed successfully.
```

Now you can reference that file in the CLI command that follows:

```
aws ec2 modify-instance-attribute \
    --instance-id=i-09b5a14dbca622e76 \
    --attribute userData --value file://UserData.base64.txt
```

This command produces no output.

For more information, see User Data and the AWS CLI in the EC2 User Guide.

- For API details, see ModifyInstanceAttribute in AWS CLI Command Reference.

modify-instance-capacity-reservation-attributes

The following code example shows how to use modify-instance-capacity-reservation-attributes.

AWS CLI

**Example 1: To modify an instance's capacity reservation targeting settings**

The following modify-instance-capacity-reservation-attributes example modifies a stopped instance to target a specific capacity reservation.

```
aws ec2 modify-instance-capacity-reservation-attributes \
    --instance-id i-EXAMPLE8765abcd4e \
    --capacity-reservation-specification 'CapacityReservationTarget={CapacityReservationId= cr-1234abcd56EXAMPLE }'
```
Example 2: To modify an instance's capacity reservation targeting settings

The following modify-instance-capacity-reservation-attributes example modifies a stopped instance that targets the specified capacity reservation to launch in any capacity reservation that has matching attributes (instance type, platform, Availability Zone) and that has open instance matching criteria.

```bash
aws ec2 modify-instance-capacity-reservation-attributes \
--instance-id i-EXAMPLE8765abcd4e \
--capacity-reservation-specification 'CapacityReservationPreference=open'
```

Output:

```json
{
   "Return": true
}
```

- For API details, see [ModifyInstanceCapacityReservationAttributes](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-capacity-reservation-attributes.html) in *AWS CLI Command Reference*.

modify-instance-credit-specification

The following code example shows how to use modify-instance-credit-specification.

**AWS CLI**

**To modify the credit option for CPU usage of an instance**

This example modifies the credit option for CPU usage of the specified instance in the specified region to "unlimited". Valid credit options are "standard" and "unlimited".

**Command:**
aws ec2 modify-instance-credit-specification --instance-credit-specification
  "InstanceId=i-1234567890abcdef0,CpuCredits=unlimited"

Output:

```
{
   "SuccessfulInstanceCreditSpecifications": [
      {
         "InstanceId": "i-1234567890abcdef0"
      }
   ],
   "UnsuccessfulInstanceCredit Specifications": []
}
```

- For API details, see [ModifyInstanceCreditSpecification](#) in *AWS CLI Command Reference*.

modify-instance-event-start-time

The following code example shows how to use modify-instance-event-start-time.

AWS CLI

To modify the event start time for an instance

The following modify-instance-event-start-time command shows how to modify the event start time for the specified instance. Specify the event ID by using the --instance-event-id parameter. Specify the new date and time by using the --not-before parameter.

```
aws ec2 modify-instance-event-start-time --instance-id i-1234567890abcdef0
  --instance-event-id instance-event-0abcdef1234567890 --not-before
  2019-03-25T10:00:00.000
```

Output:

```
"Event": {
   "InstanceEventId": "instance-event-0abcdef1234567890",
   "Code": "system-reboot",
   "Description": "scheduled reboot",
   "NotAfter": "2019-03-25T12:00:00.000Z",
   "NotBefore": "2019-03-25T10:00:00.000Z",
}
```
modify-instance-event-window

The following code example shows how to use `modify-instance-event-window`.

**AWS CLI**

Example 1: To modify the time range of an event window

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```bash
aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

Output:

```json
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
        "EndWeekDay": "wednesday",
        "EndHour": 8
      }
    ],
    "Name": "myEventWindowName",
    "AssociationTarget": {
      "InstanceIds": [
      
    ]
  }
}
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

Example 2: To modify a set of time ranges for an event window

The following modify-instance-event-window example modifies the time range of an event window. Specify the time-range parameter to modify the time range. You can't also specify the cron-expression parameter.

```
aws ec2 modify-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --time-range \
     '[["StartWeekDay": "monday", "StartHour": 2, "EndWeekDay": "wednesday", "EndHour": 8}, 
      {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday", "EndHour": 8}]
```

Output:

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
```
For event window constraints, see Considerations in the Scheduled Events section of the Amazon EC2 User Guide.

**Example 3: To modify the cron expression of an event window**

The following modify-instance-event-window example modifies the cron expression of an event window. Specify the cron-expression parameter to modify the cron expression. You can't also specify the time-range parameter.

```
aws ec2 modify-instance-event-window 
   --region us-east-1 
   --instance-event-window-id iew-0abcdef1234567890 
   --cron-expression "* 21-23 * * 2,3"
```
Output:

```json
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
         "InstanceIds": [
            "i-0abcdef1234567890",
            "i-0be35f9acb8ba01f0"
         ],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating",
      "Tags": [
         {
            "Key": "K1",
            "Value": "V1"
         }
      ]
   }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the Amazon EC2 User Guide.

- For API details, see [ModifyInstanceEventWindow](#) in AWS CLI Command Reference.

modify-instance-maintenance-options

The following code example shows how to use modify-instance-maintenance-options.

AWS CLI

**Example 1: To disable the recovery behavior of an instance**

The following modify-instance-maintenance-options example disables simplified automatic recovery for a running or stopped instance.

```
aws ec2 modify-instance-maintenance-options \
   --instance-id i-0abcdef1234567890 \
```
--auto-recovery disabled

Output:

```
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "disabled"
}
```

For more information, see **Recover your instance** in the *Amazon EC2 User Guide for Linux Instances*.

**Example 2: To set the recovery behavior of an instance to default**

The following `modify-instance-maintenance-options` example sets the automatic recovery behavior to default which enables simplified automatic recovery for supported instance types.

```
aws ec2 modify-instance-maintenance-options \
    --instance-id i-0abcdef1234567890 \ 
    --auto-recovery default
```

Output:

```
{
    "InstanceId": "i-0abcdef1234567890",
    "AutoRecovery": "default"
}
```

For more information, see **Recover your instance** in the *Amazon EC2 User Guide for Linux Instances*.

- For API details, see **ModifyInstanceMaintenanceOptions** in *AWS CLI Command Reference*.

**modify-instance-metadata-options**

The following code example shows how to use `modify-instance-metadata-options`.

**AWS CLI**

**Example 1: To enable IMDSv2**

```
The following `modify-instance-metadata-options` example configures the use of IMDSv2 on the specified instance.

```
aws ec2 modify-instance-metadata-options \
   --instance-id i-1234567898abcdef0 \
   --http-tokens required \
   --http-endpoint enabled
```

Output:

```json
{
   "InstanceId": "i-1234567898abcdef0",
   "InstanceMetadataOptions": {
      "State": "pending",
      "HttpTokens": "required",
      "HttpPutResponseHopLimit": 1,
      "HttpEndpoint": "enabled"
   }
}
```

For more information, see Instance metadata and user data in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

**Example 2: To disable instance metadata**

The following `modify-instance-metadata-options` example disables the use of all versions of instance metadata on the specified instance.

```
aws ec2 modify-instance-metadata-options \
   --instance-id i-1234567898abcdef0 \
   --http-endpoint disabled
```

Output:

```json
{
   "InstanceId": "i-1234567898abcdef0",
   "InstanceMetadataOptions": {
      "State": "pending",
      "HttpTokens": "required",
      "HttpPutResponseHopLimit": 1,
      "HttpEndpoint": "enabled"
   }
}
```
For more information, see [Instance metadata and user data](http://example.com) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

**Example 3: To enable instance metadata IPv6 endpoint for your instance**

The following `modify-instance-metadata-options` example shows you how to turn on the IPv6 endpoint for the instance metadata service.

```bash
aws ec2 modify-instance-metadata-options \
  --instance-id i-1234567898abcdef0 \
  --http-protocol-ipv6 enabled \
  --http-endpoint enabled
```

Output:

```json
{
  "InstanceId": "i-1234567898abcdef0",
  "InstanceMetadataOptions": {
    "State": "pending",
    "HttpTokens": "required",
    "HttpPutResponseHopLimit": 1,
    "HttpEndpoint": "enabled",
    "HttpProtocolIpv6": "enabled"
  }
}
```

By default, the IPv6 endpoint is disabled. This is true even if you have launched an instance into an IPv6-only subnet. The IPv6 endpoint for IMDS is only accessible on instances built on the Nitro System. For more information, see [Instance metadata and user data](http://example.com) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyInstanceMetadataOptions](http://example.com) in *AWS CLI Command Reference*.

modify-instance-placement

The following code example shows how to use `modify-instance-placement`.
AWS CLI

Example 1: To remove an instance's affinity with a Dedicated Host

The following modify-instance-placement example removes an instance's affinity with a Dedicated Host and enables it to launch on any available Dedicated Host in your account that supports its instance type.

```bash
aws ec2 modify-instance-placement \
   --instance-id i-0e6ddf6187EXAMPLE \
   --affinity default
```

Output:

```
{
   "Return": true
}
```

Example 2: To establish affinity between an instance and the specified Dedicated Host

The following modify-instance-placement example establishes a launch relationship between an instance and a Dedicated Host. The instance is only able to run on the specified Dedicated Host.

```bash
aws ec2 modify-instance-placement \
   --instance-id i-0e6ddf6187EXAMPLE \
   --affinity host \
   --host-id i-0e6ddf6187EXAMPLE
```

Output:

```
{
   "Return": true
}
```

For more information, see Modifying Instance Tenancy and Affinity in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

Example 3: To move an instance to a placement group
The following `modify-instance-placement` example moves an instance to a placement group, stop the instance, modify the instance placement, and then restart the instance.

```bash
aws ec2 stop-instances \
   --instance-ids i-0123a456700123456

aws ec2 modify-instance-placement \
   --instance-id i-0123a456700123456 \
   --group-name MySpreadGroup

aws ec2 start-instances \
   --instance-ids i-0123a456700123456
```

For more information, see [Changing the Placement Group for an Instance](https://docs.aws.amazon.com/AmazonElasticComputeCloud/latest/UserGuide/changing-placement-group.html) in the *Amazon Elastic Compute Cloud Users Guide*.

**Example 4: To remove an instance from a placement group**

The following `modify-instance-placement` example removes an instance from a placement group by stopping the instance, modifying the instance placement, and then restarting the instance. The following example specifies an empty string (""") for the placement group name to indicate that the instance is not to be located in a placement group.

Stop the instance:

```bash
aws ec2 stop-instances \
   --instance-ids i-0123a456700123456
```

Modify the placement (Windows Command Prompt, Linux, and macOS):

```bash
aws ec2 modify-instance-placement \
   --instance-id i-0123a456700123456 \
   --group-name ""
```

Modify the placement (Windows PowerShell):

```bash
aws ec2 modify-instance-placement `\n   --instance-id i-0123a456700123456 `\n   --group-name """
```
Restart the instance:

```bash
aws ec2 start-instances \
   --instance-ids i-0123a456700123456
```

Output:

```json
{
   "Return": true
}
```

- For API details, see [ModifyInstancePlacement](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-instance-placement.html) in *AWS CLI Command Reference*.

modify-ipam

The following code example shows how to use `modify-ipam`.

AWS CLI

**To modify an IPAM**

The following `modify-ipam` example modifies an IPAM by adding an Operating Region.

(Linux):

```bash
aws ec2 modify-ipam \
    --ipam-id ipam-08440e7a3acde3908 \
    --add-operating-regions RegionName=us-west-2
```

(Windows):

```bash
aws ec2 modify-ipam ^
    --ipam-id ipam-08440e7a3acde3908 ^
    --add-operating-regions RegionName=us-west-2
```

Output:
• For API details, see ModifyIpam in AWS CLI Command Reference.

modify-ipam-pool

The following code example shows how to use modify-ipam-pool.

AWS CLI

To modify an IPAM pool

The following modify-ipam-pool example modifies an IPAM pool.

(Linux):

```bash
aws ec2 modify-ipam-pool
```
Example:

```
--ipam-pool-id ipam-pool-0533048da7d823723 \
--add-allocation-resource-tags "Key=Owner,Value=Build Team" \
--clear-allocation-default-netmask-length \
--allocation-min-netmask-length 14
```

(Window):

```
aws ec2 modify-ipam-pool ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --add-allocation-resource-tags "Key=Owner,Value=Build Team" ^
   --clear-allocation-default-netmask-length ^
   --allocation-min-netmask-length 14
```

Output:

```json
{
   "IpamPool": {
      "OwnerId": "123456789012",
      "IpamPoolId": "ipam-pool-0533048da7d823723",
      "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-0533048da7d823723",
      "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
      "IpamScopeType": "private",
      "IpamArn": "arn:aws:ipam-08440e7a3acde3908",
      "IpamRegion": "us-east-1",
      "Locale": "None",
      "PoolDepth": 1,
      "State": "modify-complete",
      "AutoImport": true,
      "AddressFamily": "ipv4",
      "AllocationMinNetmaskLength": 14,
      "AllocationMaxNetmaskLength": 26,
      "AllocationResourceTags": [
         {
            "Key": "Environment",
            "Value": "Preprod"
         },
         {
            "Key": "Owner",
            "Value": "Build Team"
         }
      ]
   }
}```
For more information, see [Edit a pool](#) in the [Amazon VPC IPAM User Guide](#).

- For API details, see [ModifyIpamPool](#) in [AWS CLI Command Reference](#).

**modify-ipam-resource-cidr**

The following code example shows how to use `modify-ipam-resource-cidr`.

**AWS CLI**

**To modify the CIDR allocated to a resource**

The following `modify-ipam-resource-cidr` example modifies a resource CIDR.

(Windows):

```powershell
aws ec2 modify-ipam-resource-cidr ^
  --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
  --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 ^
  --resource-id vpc-010e1791024eb0af9 ^
  --resource-cidr 10.0.1.0/24 ^
  --resource-region us-east-1 ^
  --monitored
```

Output:

```json
{
  "IpamResourceCidr": {
```
modify-launch-template

The following code example shows how to use modify-launch-template.

AWS CLI

To change the default launch template version

This example specifies version 2 of the specified launch template as the default version.
Command:

```
aws ec2 modify-launch-template --launch-template-id lt-0abcd290751193123 --default-version 2
```

Output:

```
{
  "LaunchTemplate": {
    "LatestVersionNumber": 2,
    "LaunchTemplateId": "lt-0abcd290751193123",
    "LaunchTemplateName": "WebServers",
    "DefaultVersionNumber": 2,
    "CreatedBy": "arn:aws:iam::123456789012:root",
    "CreateTime": "2017-12-01T13:35:46.000Z"
  }
}
```

- For API details, see [ModifyLaunchTemplate](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-launch-template.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/ec2/).

modify-managed-prefix-list

The following code example shows how to use modify-managed-prefix-list.

**AWS CLI**

**To modify a prefix list**

The following modify-managed-prefix-list example adds an entry to the specified prefix list.

```
aws ec2 modify-managed-prefix-list \
    --prefix-list-id pl-0123456abcabcabc1 \
    --add-entries Cidr=10.1.0.0/16,Description=vpc-c \
    --current-version 1
```

Output:

```
{
  "PrefixList": {
    "PrefixListId": "pl-0123456abcabcabc1",
```
"AddressFamily": "IPv4",
"State": "modify-in-progress",
"PrefixListName": "vpc-cidrs",
"MaxEntries": 10,
"Version": 1,
"OwnerId": "123456789012"
}
}

For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see ModifyManagedPrefixList in AWS CLI Command Reference.

modify-network-interface-attribute

The following code example shows how to use modify-network-interface-attribute.

AWS CLI

**To modify the attachment attribute of a network interface**

This example command modifies the attachment attribute of the specified network interface.

Command:

```bash
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --attachment AttachmentId=eni-attach-43348162,DeleteOnTermination=false
```

**To modify the description attribute of a network interface**

This example command modifies the description attribute of the specified network interface.

Command:

```bash
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --description "My description"
```

**To modify the groupSet attribute of a network interface**
This example command modifies the groupSet attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --groups sg-903004f8 sg-1a2b3c4d
```

To modify the sourceDestCheck attribute of a network interface

This example command modifies the sourceDestCheck attribute of the specified network interface.

Command:

```
```

- For API details, see [ModifyNetworkInterfaceAttribute](#) in *AWS CLI Command Reference*.

modify-private-dns-name-options

The following code example shows how to use modify-private-dns-name-options.

**AWS CLI**

**To modify the options for instance hostnames**

The following modify-private-dns-name-options example disables the option to respond to DNS queries for instance hostnames with DNS A records.

```
aws ec2 modify-private-dns-name-options \
   --instance-id i-1234567890abcdef0 \
   --no-enable-resource-name-dns-a-record
```

Output:

```
{
  "Return": true
}
```
modify-reserved-instances

The following code example shows how to use modify-reserved-instances.

AWS CLI

To modify Reserved Instances

This example command moves a Reserved Instance to another Availability Zone in the same region.

Command:

```bash
aws ec2 modify-reserved-instances --reserved-instances-ids b847fa93-e282-4f55-b59a-1342f5bd7c02 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=10
```

Output:

```json
{
   "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687"
}
```

To modify the network platform of Reserved Instances

This example command converts EC2-Classic Reserved Instances to EC2-VPC.

Command:

```bash
aws ec2 modify-reserved-instances --reserved-instances-ids f127bd27-edb7-44c9-a0eb-0d7e09259af0 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-VPC,InstanceCount=5
```

Output:

```json
{
   "ReservedInstancesModificationId": "rimod-82fa9020-668f-4fb6-945d-61537009d291"
}
```
To modify the instance size of Reserved Instances

This example command modifies a Reserved Instance that has 10 m1.small Linux/UNIX instances in us-west-1c so that 8 m1.small instances become 2 m1.large instances, and the remaining 2 m1.small become 1 m1.medium instance in the same Availability Zone. Command:

```bash
aws ec2 modify-reserved-instances --reserved-instances-ids 1ba8e2e3-3556-4264-949e-63ee671405a9 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=2,InstanceType=m1.large AvailabilityZone=us-west-1c,Platform=EC2-Classic,InstanceCount=1,InstanceType=m1.medium
```

Output:

```json
{
  "ReservedInstancesModificationId": "rimod-acc5f240-080d-4717-b3e3-1c6b11fa00b6"
}
```

For more information, see Modifying the Instance Size of Your Reservations in the Amazon EC2 User Guide.

- For API details, see `ModifyReservedInstances` in AWS CLI Command Reference.

modify-security-group-rules

The following code example shows how to use `modify-security-group-rules`.

AWS CLI

To modify a security group rules to update the rule description, the IP protocol, and the CidrIpv4 address range

The following `modify-security-group-rules` example updates the description, the IP protocol, and the IPV4 CIDR range of a specified security group rule. Use the `security-group-rules` parameter to enter the updates for the specified security group rules. `-1` specifies all protocols.
aws ec2 modify-security-group-rules \
    --group-id sg-1234567890abcdef0 \
    --security-group-rules SecurityGroupRuleId=sgr-abcdef01234567890,SecurityGroupRule='{Description=test,IpProtocol=-1,CidrIpv4=0.0.0.0/0}'

Output:

```json
{
    "Return": true
}
```

For more information about security group rules, see Security group rules in the Amazon EC2 User Guide.

- For API details, see ModifySecurityGroupRules in AWS CLI Command Reference.

modify-snapshot-attribute

The following code example shows how to use modify-snapshot-attribute.

AWS CLI

**Example 1: To modify a snapshot attribute**

The following modify-snapshot-attribute example updates the createVolumePermission attribute for the specified snapshot, removing volume permissions for the specified user.

```bash
aws ec2 modify-snapshot-attribute \
    --snapshot-id snap-1234567890abcdef0 \
    --attribute createVolumePermission \
    --operation-type remove \
    --user-ids 123456789012
```

**Example 2: To make a snapshot public**

The following modify-snapshot-attribute example makes the specified snapshot public.

```bash
aws ec2 modify-snapshot-attribute \
    --snapshot-id snap-1234567890abcdef0 \
    --attribute createVolumePermission \
```
modify-snapshot-tier

The following code example shows how to use modify-snapshot-tier.

AWS CLI

**Example 1: To archive a snapshot**

The following modify-snapshot-tier example archives the specified snapshot.

```
aws ec2 modify-snapshot-tier \
   --snapshot-id snap-01234567890abcedf \
   --storage-tier archive
```

Output:

```
{
   "SnapshotId": "snap-01234567890abcedf",
   "TieringStartTime": "2021-09-15T16:44:37.574Z"
}
```

The TieringStartTime response parameter indicates the date and time at which the archive process was started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

For more information about snapshot archiving, see [Archive Amazon EBS snapshots](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ArchiveEBSSnapshots.html) in the Amazon EC2 User Guide.

This example command updates the target capacity of the specified Spot fleet request.

Command:
```
aws ec2 modify-spot-fleet-request --target-capacity 20 --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:
```
{
   "Return": true
}
```

This example command decreases the target capacity of the specified Spot fleet request without terminating any Spot Instances as a result.

Command:
```
aws ec2 modify-spot-fleet-request --target-capacity 10 --excess-capacity-termination-policy NoTermination --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:
```
{
   "Return": true
}
```

- For API details, see [ModifySpotFleetRequest](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-spot-fleet-request.html) in *AWS CLI Command Reference*.

modify-subnet-attribute

The following code example shows how to use `modify-subnet-attribute`

**AWS CLI**

**To change a subnet's public IPv4 addressing behavior**

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned a public IPv4 address. If the command succeeds, no output is returned.
Command:

```bash
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --map-public-ip-on-launch
```

To change a subnet's IPv6 addressing behavior

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned an IPv6 address from the range of the subnet.

Command:

```bash
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --assign-ipv6-address-on-creation
```

For more information, see IP Addressing in Your VPC in the AWS Virtual Private Cloud User Guide.

- For API details, see ModifySubnetAttribute in AWS CLI Command Reference.

modify-traffic-mirror-filter-network-services

The following code example shows how to use modify-traffic-mirror-filter-network-services.

**AWS CLI**

**To add network services to a Traffic Mirror filter**

The following modify-traffic-mirror-filter-network-services example adds the Amazon DNS network services to the specified filter.

```bash
aws ec2 modify-traffic-mirror-filter-network-services \
   --traffic-mirror-filter-id tmf-04812ff784EXAMPLE \
   --add-network-service amazon-dns
```

Output:

```json
{
```
"TrafficMirrorFilter": {
  "Tags": [
    {
      "Key": "Name",
      "Value": "Production"
    }
  ],
  "EgressFilterRules": [],
  "NetworkServices": [
    "amazon-dns"
  ],

      "TrafficMirrorFilterRuleId": "tmf-04812ff784EXAMPLE"
    }
  ]
}

For more information, see [Modify Traffic Mirror Filter Network Services](aws.amazon.com) in the [AWS Traffic Mirroring Guide](aws.amazon.com).

- For API details, see [ModifyTrafficMirrorFilterNetworkServices](aws.amazon.com) in [AWS CLI Command Reference](aws.amazon.com).

### modify-traffic-mirror-filter-rule

The following code example shows how to use `modify-traffic-mirror-filter-rule`.

**AWS CLI**

To modify a traffic mirror filter rule

The following `modify-traffic-mirror-filter-rule` example modifies the description of the specified traffic mirror filter rule.
aws ec2 modify-traffic-mirror-filter-rule \
   --traffic-mirror-filter-rule-id tmfr-0ca76e0e08EXAMPLE \
   --description "TCP Rule"

Output:

```json
{
   "TrafficMirrorFilterRule": {
      "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
      "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
      "TrafficDirection": "ingress",
      "RuleNumber": 100,
      "RuleAction": "accept",
      "Protocol": 6,
      "DestinationCidrBlock": "10.0.0.0/24",
      "SourceCidrBlock": "10.0.0.0/24",
      "Description": "TCP Rule"
   }
}
```

For more information, see Modify Your Traffic Mirror Filter Rules in the AWS Traffic Mirroring Guide.

- For API details, see ModifyTrafficMirrorFilterRule in AWS CLI Command Reference.

modify-traffic-mirror-session

The following code example shows how to use modify-traffic-mirror-session.

AWS CLI

To modify a traffic mirror session

The following modify-traffic-mirror-session example changes the traffic mirror session description and the number of packets to mirror.

```
aws ec2 modify-traffic-mirror-session \
   --description "Change packet length" \
   --traffic-mirror-session-id tms-08a33b1214EXAMPLE \
   --remove-fields "packet-length"
```
Output:

```json
{
   "TrafficMirrorSession": {
      "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
      "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
      "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
      "NetworkInterfaceId": "eni-070203f901EXAMPLE",
      "OwnerId": "111122223333",
      "SessionNumber": 1,
      "VirtualNetworkId": 7159709,
      "Description": "Change packet length",
      "Tags": []
   }
}
```

For more information, see [Modify your traffic mirror session](#) in the *Traffic Mirroring Guide*.

- For API details, see [ModifyTrafficMirrorSession](#) in *AWS CLI Command Reference*.

`modify-transit-gateway`

The following code example shows how to use `modify-transit-gateway`.

**AWS CLI**

**To modify a transit gateway**

The following `modify-transit-gateway` example modifies the specified transit gateway by enabling ECMP support for VPN attachments.

```
aws ec2 modify-transit-gateway \
   --transit-gateway-id tgw-111111222222aaaaa \
   --options VpnEcmpSupport=enable
```

Output:

```json
{
   "TransitGateway": {
      "TransitGatewayId": "tgw-111111222222aaaaa",
      "TransitGatewayArn": "64512",
```

Actions and scenarios 2500
The following code example shows how to use modify-transit-gateway-prefix-list-reference.

**AWS CLI**

To modify a reference to a prefix list

The following modify-transit-gateway-prefix-list-reference example modifies the prefix list reference in the specified route table by changing the attachment to which traffic is routed.

```
aws ec2 modify-transit-gateway-prefix-list-reference 
   --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 
   --prefix-list-id pl-1111112222223333 
   --transit-gateway-attachment-id tgw-attach-aabbccdaabbccaab
```

Output:

```
{
   "TransitGatewayPrefixListReference": {
   
```

For more information, see Transit gateways in the Transit Gateways Guide.

- For API details, see ModifyTransitGateway in AWS CLI Command Reference.

modify-transit-gateway-prefix-list-reference
modify-transit-gateway-vpc-attachment

The following code example shows how to use modify-transit-gateway-vpc-attachment.

AWS CLI

To modify a transit gateway VPC attachment

The following modify-transit-gateway-vpc-attachment example adds a subnet to the specified transit gateway VPC attachment.

```
aws ec2 modify-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE \
  --add-subnet-ids subnet-0e51f45802EXAMPLE
```

Output:

```
{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-09fbd47ddfEXAMPLE",
    "TransitGatewayId": "tgw-0560315ccfEXAMPLE",
    "VpcId": "vpc-5ecc927",
    "VpcOwnerId": "111122223333",
    "State": "modifying",
    "SubnetIds": [
      "subnet-0e51f45802EXAMPLE"
    ]
  }
}
```
For more information, see Transit gateway attachments to a VPC in the Transit Gateways Guide.

- For API details, see ModifyTransitGatewayVpcAttachment in AWS CLI Command Reference.

**modify-verified-access-endpoint**

The following code example shows how to use modify-verified-access-endpoint.

**AWS CLI**

**To modify the configuration of a Verified Access endpoint**

The following modify-verified-access-endpoint example adds the specified description to the specified Verified Access endpoint.

```
aws ec2 modify-verified-access-endpoint \
  --verified-access-endpoint-id vae-066fac616d4d546f2 \
  --description "Testing Verified Access"
```

Output:

```
{
  "VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
    "ApplicationDomain": "example.com",
    "EndpointType": "network-interface",
    "AttachmentType": "vpc",
    "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
```
"EndpointDomain": "my-ava-app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-east-2.amazonaws.com",

"SecurityGroupIds": [
    "sg-004915970c4c8f13a"
],

"NetworkInterfaceOptions": {
    "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
    "Protocol": "https",
    "Port": 443
},

"Status": {
    "Code": "updating"
},

"Description": "Testing Verified Access",

"CreationTime": "2023-08-25T20:54:43",

"LastUpdatedTime": "2023-08-25T22:46:32"
}

For more information, see [Verified Access endpoints](https://docs.aws.amazon.com/verified-access/latest/endpointdoc/endpoint-tasks.html) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-verified-access-endpoint-policy.html) in *AWS CLI Command Reference*.

### modify-verified-access-endpoint-policy

The following code example shows how to use `modify-verified-access-endpoint-policy`.

**AWS CLI**

To configure the Verified Access policy for an endpoint

The following `modify-verified-access-endpoint-policy` example adds the specified Verified Access policy to the specified Verified Access endpoint.

```bash
aws ec2 modify-verified-access-endpoint-policy \
  --verified-access-endpoint-id vae-066fac616d4d546f2 \
  --policy-enabled \
  --policy-document file://policy.txt
```

**Contents of policy.txt:**

```plaintext
permit(principal, action, resource)
```
when {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true
};

Output:

{
    "PolicyEnabled": true,
    "PolicyDocument": "permit(principal,action,resource)\nwhen
\n    context.identity.groups.contains("finance") &&\n    context.identity.email_verified == true\n";
}

For more information, see [Verified Access policies](#) in the [AWS Verified Access User Guide](#).

- For API details, see [ModifyVerifiedAccessEndpointPolicy](#) in [AWS CLI Command Reference](#).

modify-verified-access-group

The following code example shows how to use modify-verified-access-group.

AWS CLI

**To modify the configuration of a Verified Access group**

The following modify-verified-access-group example adds the specified description to the specified Verified Access group.

```
aws ec2 modify-verified-access-group \
    --verified-access-group-id vagr-0dbe967baf14b7235 \
    --description "Testing Verified Access"
```

Output:

```json
{
    "VerifiedAccessGroup": {
        "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
        "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
        "Description": "Testing Verified Access",
        "Owner": "123456789012",
```
"VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-access-group/vagr-0dbe967baf14b7235",
  "CreationTime": "2023-08-25T19:55:19",
  "LastUpdatedTime": "2023-08-25T22:17:25"
} }

For more information, see [Verified Access groups](https://docs.aws.amazon.com/verified-access/latest/userguide/verified-access-groups.html) in the [AWS Verified Access User Guide](https://docs.aws.amazon.com/verified-access/latest/userguide/).

### modify-verified-access-group-policy

The following code example shows how to use `modify-verified-access-group-policy`.

**AWS CLI**

**To configure a Verified Access policy for a group**

The following modify-verified-access-group-policy example adds the specified Verified Access policy to the specified Verified Access group.

```
aws ec2 modify-verified-access-group-policy \
  --verified-access-group-id vagr-0dbe967baf14b7235 \
  --policy-enabled \
  --policy-document file://policy.txt
```

Contents of `policy.txt`:

```
permit(principal, action, resource)
when {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true
};
```

Output:

```
{
  "PolicyEnabled": true,
  "PolicyDocument": "permit(principal, action, resource)\nwhen {
    context.identity.groups.contains("finance") &&
    context.identity.email_verified == true\n}"
}
```
For more information, see [Verified Access groups](#) in the [AWS Verified Access User Guide](#).

- For API details, see [ModifyVerifiedAccessGroupPolicy](#) in [AWS CLI Command Reference](#).

modify-verified-access-instance

The following code example shows how to use `modify-verified-access-instance`.

**AWS CLI**

**To modify the configuration of a Verified Access instance**

The following modify-verified-access-instance example adds the specified description to the specified Verified Access instance.

```
aws ec2 modify-verified-access-instance \
   --verified-access-instance-id vai-0ce000c0b7643abea \
   --description "Testing Verified Access"
```

Output:

```
{
   "VerifiedAccessInstance": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "VerifiedAccessTrustProviders": [
         {
            "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
            "TrustProviderType": "user",
            "UserTrustProviderType": "iam-identity-center"
         }
      ],
      "CreationTime": "2023-08-25T18:27:56",
      "LastUpdatedTime": "2023-08-25T22:41:04"
   }
}
```

For more information, see [Verified Access instances](#) in the [AWS Verified Access User Guide](#).

- For API details, see [ModifyVerifiedAccessInstance](#) in [AWS CLI Command Reference](#).
modify-verified-access-instance/logging-configuration

The following code example shows how to use modify-verified-access-instance-logging-configuration.

AWS CLI

**To enable logging for a Verified Access instance**

The following modify-verified-access-instance-logging-configuration example enables access logging for the specified Verified Access instance. The logs will be delivered to the specified CloudWatch Logs log group.

```bash
aws ec2 modify-verified-access-instance-logging-configuration \
   --verified-access-instance-id vai-0ce000c0b7643abea \
   --access-logs CloudWatchLogs={Enabled=true,LogGroup=my-log-group}
```

Output:

```json
{
   "LoggingConfiguration": {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "AccessLogs": {
         "S3": {
            "Enabled": false
         },
         "CloudWatchLogs": {
            "Enabled": true,
            "DeliveryStatus": {
               "Code": "success"
            },
            "LogGroup": "my-log-group"
         },
         "KinesisDataFirehose": {
            "Enabled": false
         },
         "LogVersion": "ocsf-1.0.0-rc.2",
         "IncludeTrustContext": false
      }
   }
}
```

For more information, see [Verified Access logs](https://docs.aws.amazon.com/verified-access/latest/ug/logs.html) in the *AWS Verified Access User Guide*. 
modify-verified-access-trust-provider

The following code example shows how to use modify-verified-access-trust-provider.

AWS CLI

To modify the configuration of a Verified Access trust provider

The following modify-verified-access-trust-provider example adds the specified description to the specified Verified Access trust provider.

```
aws ec2 modify-verified-access-trust-provider \
  --verified-access-trust-provider-id vatp-0bb32de759a3e19e7 \
  --description "Testing Verified Access"
```

Output:

```
{
  "VerifiedAccessTrustProvider": {
    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
    "Description": "Testing Verified Access",
    "TrustProviderType": "user",
    "UserTrustProviderType": "iam-identity-center",
    "PolicyReferenceName": "idc",
    "CreationTime": "2023-08-25T19:00:38",
    "LastUpdatedTime": "2023-08-25T19:18:21"
  }
}
```

For more information, see Trust providers for Verified Access in the AWS Verified Access User Guide.

modify-volume

The following code example shows how to use modify-volume.

• For API details, see ModifyVerifiedAccessInstanceLoggingConfiguration in AWS CLI Command Reference.

• For API details, see ModifyVerifiedAccessTrustProvider in AWS CLI Command Reference.
AWS CLI

Example 1: To modify a volume by changing its size

The following `modify-volume` example changes the size of the specified volume to 150GB.

Command:

```bash
aws ec2 modify-volume --size 150 --volume-id vol-1234567890abcdef0
```

Output:

```json
{
   "VolumeModification": {
      "TargetSize": 150,
      "TargetVolumeType": "io1",
      "ModificationState": "modifying",
      "VolumeId": "vol-1234567890abcdef0",
      "TargetIops": 100,
      "StartTime": "2019-05-17T11:27:19.000Z",
      "Progress": 0,
      "OriginalVolumeType": "io1",
      "OriginalIops": 100,
      "OriginalSize": 100
   }
}
```

Example 2: To modify a volume by changing its type, size, and IOPS value

The following `modify-volume` example changes the volume type to Provisioned IOPS SSD, sets the target IOPS rate to 10000, and sets the volume size to 350GB.

```bash
aws ec2 modify-volume \
   --volume-type io1 \
   --iops 10000 \
   --size 350 \
   --volume-id vol-1234567890abcdef0
```

Output:

```json
{
   "VolumeModification": {
   }
}
```
modify-volume-attribute

The following code example shows how to use modify-volume-attribute.

AWS CLI

To modify a volume attribute

This example sets the autoEnableIo attribute of the volume with the ID vol-1234567890abcdef0 to true. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 modify-volume-attribute --volume-id vol-1234567890abcdef0 --auto-enable-io
```

modify-vpc-attribute

The following code example shows how to use modify-vpc-attribute.

AWS CLI

To modify the enableDnsSupport attribute

This example modifies the enableDnsSupport attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is true, the Amazon DNS server resolves DNS
hostnames for your instances to their corresponding IP addresses; otherwise, it does not. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-support "{"Value ":false}"
```

To modify the enableDnsHostnames attribute

This example modifies the enableDnsHostnames attribute. This attribute indicates whether instances launched in the VPC get DNS hostnames. If this attribute is true, instances in the VPC get DNS hostnames; otherwise, they do not. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-hostnames "{"Value ":false}"
```

- For API details, see ModifyVpcAttribute in AWS CLI Command Reference.

modify-vpc-endpoint

The following code example shows how to use modify-vpc-endpoint.

AWS CLI

To modify a gateway endpoint

This example modifies gateway endpoint vpce-1a2b3c4d by associating route table rtb-aaa222bb with the endpoint, and resetting the policy document.

Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-1a2b3c4d --add-route-table-ids rtb-aaa222bb --reset-policy
```

Output:

```
{
    "Return": true
}
```
**To modify an interface endpoint**

This example modifies interface endpoint vpce-0fe5b17a0707d6fa5 by adding subnet subnet-d6fcaa8d to the endpoint.

Command:

```bash
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-0fe5b17a0707d6fa5 --add-subnet-id subnet-d6fcaa8d
```

Output:

```
{
  "Return": true
}
```

- For API details, see [ModifyVpcEndpoint](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-vpc-endpoint.html) in *AWS CLI Command Reference*.

### modify-vpc-endpoint-connection-notification

The following code example shows how to use `modify-vpc-endpoint-connection-notification`.

**AWS CLI**

**To modify an endpoint connection notification**

This example changes the SNS topic for the specified endpoint connection notification.

Command:

```bash
```

Output:

```
{
  "ReturnValue": true
}
```
modify-vpc-endpoint-service-configuration

The following code example shows how to use `modify-vpc-endpoint-service-configuration`.

**AWS CLI**

**To modify an endpoint service configuration**

This example changes the acceptance requirement for the specified endpoint service.

Command:

```bash
aws ec2 modify-vpc-endpoint-service-configuration --service-id vpce-svc-09222513e6e77dc86 --no-acceptance-required
```

Output:

```
{
   "ReturnValue": true
}
```

**modify-vpc-endpoint-service-payer-responsibility**

The following code example shows how to use `modify-vpc-endpoint-service-payer-responsibility`.

**AWS CLI**

**To modify the payer responsibility**

The following `modify-vpc-endpoint-service-payer-responsibility` example modifies the payer responsibility of the specified endpoint service.
aws ec2 modify-vpc-endpoint-service-payer-responsibility \
  --service-id vpce-svc-071afff70666e61e0 \
  --payer-responsibility ServiceOwner

This command produces no output.

modify-vpc-endpoint-service-permissions

The following code example shows how to use `modify-vpc-endpoint-service-permissions`.

**AWS CLI**

**To modify endpoint service permissions**

This example adds permission for an AWS account to connect to the specified endpoint service.

**Command:**

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals ['"arn:aws:iam::123456789012:root"]
```

**Output:**

```
{
   "ReturnValue": true
}
```

This example adds permission for a specific IAM user (admin) to connect to the specified endpoint service.

**Command:**

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-svc-03d5ebb7d9579a2b3 --add-allowed-principals ['"arn:aws:iam::123456789012:user/admin"]
```

- For API details, see [ModifyVpcEndpointServicePermissions](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-vpc-endpoint-service-permissions.html) in *AWS CLI Command Reference*. 
modify-vpc-peering-connection-options

The following code example shows how to use modify-vpc-peering-connection-options.

AWS CLI

To enable communication over a VPC peering connection from your local ClassicLink connection

In this example, for peering connection pcx-aaaabbb, the owner of the requester VPC modifies the VPC peering connection options to enable a local ClassicLink connection to communicate with the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --requester-peering-connection-options
AllowEgressFromLocalClassicLinkToRemoteVpc=true
```

Output:

```
{
   "RequesterPeeringConnectionOptions": {
      "AllowEgressFromLocalClassicLinkToRemoteVpc": true
   }
}
```

To enable communication over a VPC peering connection from your local VPC to a remote ClassicLink connection

In this example, the owner of the accepter VPC modifies the VPC peering connection options to enable the local VPC to communicate with the ClassicLink connection in the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --accepter-peering-connection-options
AllowEgressFromLocalVpcToRemoteClassicLink=true
```

Output:
To enable DNS resolution support for the VPC peering connection

In this example, the owner of the requester VPC modifies the VPC peering connection options for `pcx-aaaabbbb` to enable the local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

Command:

```
```

Output:

```
{
   "RequesterPeeringConnectionOptions": {
      "AllowDnsResolutionFromRemoteVpc": true
   }
}
```

- For API details, see [ModifyVpcPeeringConnectionOptions](#) in *AWS CLI Command Reference*.

**modify-vpc-tenancy**

The following code example shows how to use `modify-vpc-tenancy`.

**AWS CLI**

**To modify the tenancy of a VPC**

This example modifies the tenancy of VPC `vpc-1a2b3c4d` to `default`.

Command:

```
aws ec2 modify-vpc-tenancy --vpc-id vpc-1a2b3c4d --instance-tenancy default
```
modify-vpn-connection

The following code example shows how to use modify-vpn-connection.

AWS CLI

To modify a VPN connection

The following modify-vpn-connection example changes the target gateway for VPN connection vpn-12345678901234567 to virtual private gateway vgw-11223344556677889:

```bash
aws ec2 modify-vpn-connection \
    --vpn-connection-id vpn-12345678901234567 \
    --vpn-gateway-id vgw-11223344556677889
```

Output:

```json
{
    "VpnConnection": {
        "CustomerGatewayConfiguration": "...configuration information...",
        "CustomerGatewayId": "cgw-aabbcdddee1122334",
        "Category": "VPN",
        "State": "modifying",
        "Type": "ipsec.1",
        "VpnConnectionId": "vpn-12345678901234567",
        "VpnGatewayId": "vgw-11223344556677889",
        "Options": {
            "StaticRoutesOnly": false
        },
        "VgwTelemetry": [
            { "AcceptedRouteCount": 0,
              "LastStatusChange": "2019-07-17T07:34:00.000Z",
              "OutsideIpAddress": "18.210.3.222",
```
"Status": "DOWN",
"StatusMessage": "IPSEC IS DOWN"
},

    "StatusMessage": "IPSEC IS DOWN"
}
]
}

For API details, see ModifyVpnConnection in AWS CLI Command Reference.

modify-vpn-connection-options

The following code example shows how to use modify-vpn-connection-options.

AWS CLI

To modify your VPN connection options

The following modify-vpn-connection-options example modifies the local IPv4 CIDR on the customer gateway side of the specified VPN connection.

```
aws ec2 modify-vpn-connection-options \
    --vpn-connection-id vpn-112234455aabbccd \
    --local-ipv4-network-cidr 10.0.0.0/16
```

Output:

```json
{
    "VpnConnections": [
        {
            "CustomerGatewayConfiguration": "...configuration information...",
            "CustomerGatewayId": "cgw-01234567abcde1234",
            "Category": "VPN",
            "State": "modifying",
            "Type": "ipsec.1",
            "VpnConnectionId": "vpn-112234455aabbccd",
```
"TransitGatewayId": "tgw-00112233445566aab",
"Options": {
  "EnableAcceleration": false,
  "StaticRoutesOnly": true,
  "LocalIpv4NetworkCidr": "10.0.0.0/16",
  "RemoteIpv4NetworkCidr": "0.0.0.0/0",
  "TunnelInsideIpVersion": "ipv4"
},
"Routes": [],
"Tags": [
  {
    "Key": "Name",
    "Value": "CanadaVPN"
  }
],
"VgwTelemetry": [
  {
    "AcceptedRouteCount": 0,
    "LastStatusChange": "2020-07-29T10:35:11.000Z",
    "OutsideIpAddress": "203.0.113.3",
    "Status": "DOWN",
    "StatusMessage": ""
  },
  {
    "AcceptedRouteCount": 0,
    "LastStatusChange": "2020-09-02T09:09:33.000Z",
    "OutsideIpAddress": "203.0.113.5",
    "Status": "UP",
    "StatusMessage": ""
  }
]
}]

For more information, see [Modifying Site-to-Site VPN connection options](https://docs.aws.amazon.com/siteto-site/latest/userguide/modify-vpn-connection-options.html) in the [AWS Site-to-Site VPN User Guide](https://docs.aws.amazon.com/siteto-site/latest/userguide/).

AWS CLI

To rotate a VPN tunnel certificate

The following `modify-vpn-tunnel-certificate` example rotates the certificate for the specified tunnel for a VPN connection

```bash
aws ec2 modify-vpn-tunnel-certificate \
   --vpn-tunnel-outside-ip-address 203.0.113.17 \
   --vpn-connection-id vpn-12345678901234567
```

Output:

```json
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": ...configuration information..., 
      "CustomerGatewayId": "cgw-aabbccdde1122334", 
      "Category": "VPN", 
      "State": "modifying", 
      "Type": "ipsec.1", 
      "VpnConnectionId": "vpn-12345678901234567", 
      "VpnGatewayId": "vgw-11223344556677889", 
      "Options": {
         "StaticRoutesOnly": false
      },
      "VgwTelemetry": [
         {
            "AcceptedRouteCount": 0,
            "LastStatusChange": "2019-09-11T17:27:14.000Z",
            "OutsideIpAddress": "203.0.113.17",
            "Status": "DOWN",
            "StatusMessage": "IPSEC IS DOWN",
            "CertificateArn": "arn:aws:acm:us-east-1:123456789101:certificate/c544d8ce-20b8-4fff-98b0-example"
         },
         {
            "AcceptedRouteCount": 0,
            "LastStatusChange": "2019-09-11T17:26:47.000Z",
            "OutsideIpAddress": "203.0.114.18",
            "Status": "DOWN",
            "StatusMessage": "IPSEC IS DOWN",
            "CertificateArn": "arn:aws:acm:us-east-1:123456789101:certificate/5ab64566-761b-4ad3-b259-example"
         }
      ]
   }
}
```
• For API details, see ModifyVpnTunnelCertificate in AWS CLI Command Reference.

modify-vpn-tunnel-options

The following code example shows how to use modify-vpn-tunnel-options.

AWS CLI

To modify the tunnel options for a VPN connection

The following modify-vpn-tunnel-options example updates the Diffie-Hellman groups that are permitted for the specified tunnel and VPN connection.

```bash
aws ec2 modify-vpn-tunnel-options \
   --vpn-connection-id vpn-12345678901234567 \
   --vpn-tunnel-outside-ip-address 203.0.113.17 \
   --tunnel-options Phase1DHGroupNumbers=[{Value=14},{Value=15},{Value=16}, {Value=17},{Value=18}],Phase2DHGroupNumbers=[{Value=14},{Value=15},{Value=16}, {Value=17},{Value=18}]
```

Output:

```json
{
   "VpnConnection": {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-aabbccdde1122334",
      "Category": "VPN",
      "State": "available",
      "Type": "ipsec.1",
      "VpnConnectionId": "vpn-12345678901234567",
      "VpnGatewayId": "vgw-11223344556677889",
      "Options": {
         "StaticRoutesOnly": false,
         "TunnelOptions": [ 
            {
               "OutsideIpAddress": "203.0.113.17",
               "Phase1DHGroupNumbers": [ 
```
{
    "Value": 14
},
{
    "Value": 15
},
{
    "Value": 16
},
{
    "Value": 17
},
{
    "Value": 18
}
],
"Phase2DHGroupNumbers": [
    {
        "Value": 14
    },
    {
        "Value": 15
    },
    {
        "Value": 16
    },
    {
        "Value": 17
    },
    {
        "Value": 18
    }
],
"OutsideIpAddress": "203.0.114.19"
]
},
{
    "OutsideIpAddress": "203.0.113.17"
}
]
,"VgwTelemetry": [
    {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2019-09-10T21:56:54.000Z",
        "OutsideIpAddress": "203.0.113.17",

For API details, see [ModifyVpnTunnelOptions](https://awscli.amazonaws.com/v2/documentation/api/reference/ec2/modify-vpn-tunnel-options.html) in *AWS CLI Command Reference*.

**move-address-to-vpc**

The following code example shows how to use move-address-to-vpc.

**AWS CLI**

**To move an address to EC2-VPC**

This example moves Elastic IP address 54.123.4.56 to the EC2-VPC platform.

**Command:**

```bash
aws ec2 move-address-to-vpc --public-ip 54.123.4.56
```

**Output:**

```
{
   "Status": "MoveInProgress"
}
```

For API details, see [MoveAddressToVpc](https://awscli.amazonaws.com/v2/documentation/api/reference/ec2/move-address-to-vpc.html) in *AWS CLI Command Reference*.

**move-byoip-cidr-to-ipam**

The following code example shows how to use move-byoip-cidr-to-ipam.
AWS CLI

To transfer a BYOIP CIDR to IPAM

The following `move-byoip-cidr-to-ipam` example transfers a BYOIP CIDR to IPAM.

(Windows):

```bash
aws ec2 move-byoip-cidr-to-ipam ^
    --region us-west-2 ^
    --ipam-pool-id ipam-pool-0a03d430ca3f5c035 ^
    --ipam-pool-owner 111111111111 ^
    --cidr 130.137.249.0/24
```

Output:

```json
{
    "ByoipCidr": {
        "Cidr": "130.137.249.0/24",
        "State": "pending-transfer"
    }
}
```

For more information, see Tutorial: Transfer an existing BYOIP IPv4 CIDR to IPAM in the Amazon VPC IPAM User Guide.

- For API details, see `MoveByoipCidrToIpam` in AWS CLI Command Reference.

network-insights-access-scope

The following code example shows how to use `network-insights-access-scope`.

AWS CLI

To create Network Insights access scopes
The following `create-network-insights-access-scope` example creates a network insights access scope in your AWS account.

```bash
aws ec2 create-network-insights-access-scope \
   --cli-input-json file://access-scope-file.json
```

Contents of `access-scope-file.json`:

```json
{
   "MatchPaths": [
      {
         "Source": {
            "ResourceStatement": {
              "Resources": [
                "vpc-abcd12e3"
              ]
            }
         }
      }
   ],
   "ExcludePaths": [
      {
         "Source": {
            "ResourceStatement": {
              "ResourceTypes": [
                "AWS::EC2::InternetGateway"
              ]
            }
         }
      }
   ]
}
```

Output:

```json
{
   "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111"
}
"NetworkInsightsAccessScope": {
   "NetworkInsightsAccessScopeId": "nis-123456789222",
}
  "CreatedDate": "2022-01-25T19:20:28.796000+00:00",
  "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"
},
"NetworkInsightsAccessScopeContent": {
  "NetworkInsightsAccessScopeId": "nis-04c0c0fbca737c404",
  "MatchPaths": [
    {
      "Source": {
        "ResourceStatement": {
          "Resources": [
            "vpc-abcd12e3"
          ]
        }
      }
    }
  ],
  "ExcludePaths": [
    {
      "Source": {
        "ResourceStatement": {
          "ResourceTypes": [
            "AWS::EC2::InternetGateway"
          ]
        }
      }
    }
  ]
}

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see NetworkInsightsAccessScope in AWS CLI Command Reference.

**provision-byoip-cidr**

The following code example shows how to use provision-byoip-cidr.
AWS CLI

To provision an address range

The following provision-byoip-cidr example provisions a public IP address range for use with AWS.

```bash
aws ec2 provision-byoip-cidr \
   --cidr 203.0.113.25/24 \
   --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "State": "pending-provision"
   }
}
```

For more information about creating the messages strings for the authorization context, see Bring Your Own IP Addresses in the Amazon EC2 User Guide.

- For API details, see ProvisionByoipCidr in AWS CLI Command Reference.

provision-ipam-pool-cidr

The following code example shows how to use provision-ipam-pool-cidr.

AWS CLI

To provision a CIDR to an IPAM pool

The following provision-ipam-pool-cidr example provisions a CIDR to an IPAM pool.

(Linux):

```bash
aws ec2 provision-ipam-pool-cidr \
   --ipam-pool-id ipam-pool-0533048da7d823723 \
   --cidr 10.0.0.0/24
```

(Windows):
aws ec2 provision-ipam-pool-cidr ^
   --ipam-pool-id ipam-pool-0533048da7d823723 ^
   --cidr 10.0.0.0/24

Output:

```
{
   "IpamPoolCidr": {
      "Cidr": "10.0.0.0/24",
      "State": "pending-provision"
   }
}
```

For more information, see Provision CIDRs to a pool in the Amazon VPC IPAM User Guide.

- For API details, see ProvisionIpamPoolCidr in AWS CLI Command Reference.

purchase-host-reservation

The following code example shows how to use purchase-host-reservation.

**AWS CLI**

**To purchase a Dedicated Host Reservation**

This example purchases the specified Dedicated Host Reservation offering for the specified Dedicated Host in your account.

Command:

```
aws ec2 purchase-host-reservation --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```
{
   "TotalHourlyPrice": "1.499",
   "Purchase": [
      {
         "HourlyPrice": "1.499",
         "InstanceFamily": "m4",
      }
   ]
}
```
• For API details, see PurchaseHostReservation in AWS CLI Command Reference.

purchase-reserved-instances-offering

The following code example shows how to use purchase-reserved-instances-offering.

AWS CLI

To purchase a Reserved Instance offering

This example command illustrates a purchase of a Reserved Instances offering, specifying an offering ID and instance count.

Command:

```
aws ec2 purchase-reserved-instances-offering --reserved-instances-offering-id ec06327e-dd07-46ee-9398-75b5fexample --instance-count 3
```

Output:

```
{
    "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"
}
```

• For API details, see PurchaseReservedInstancesOffering in AWS CLI Command Reference.

purchase-scheduled-instances

The following code example shows how to use purchase-scheduled-instances.
AWS CLI

To purchase a Scheduled Instance

This example purchases a Scheduled Instance.

Command:

```bash
aws ec2 purchase-scheduled-instances --purchase-requests file://purchase-request.json
```

Purchase-request.json:

```json
[
{
  "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
  "InstanceCount": 1
}
]
```

Output:

```json
{
  "ScheduledInstanceSet": [
    {
      "AvailabilityZone": "us-west-2b",
      "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
      "HourlyPrice": "0.095",
      "CreateDate": "2016-01-25T21:43:38.612Z",
      "Recurrence": {
        "OccurrenceDaySet": [1],
        "Interval": 1,
        "Frequency": "Weekly",
        "OccurrenceRelativeToEnd": false,
        "OccurrenceUnit": ""
      },
      "Platform": "Linux/UNIX",
      "TermEndDate": "2017-01-31T09:00:00Z",
      "InstanceCount": 1,
      "SlotDurationInHours": 32,
      "TermStartDate": "2016-01-31T09:00:00Z"
    }
  ]
}
```
For API details, see PurchaseScheduledInstances in AWS CLI Command Reference.

register-image

The following code example shows how to use register-image.

AWS CLI

Example 1: To register an AMI using a manifest file

The following register-image example registers an AMI using the specified manifest file in Amazon S3.

```bash
aws ec2 register-image \
   --name my-image \
   --image-location my-s3-bucket/myimage/image.manifest.xml
```

Output:

```json
{
   "ImageId": "ami-1234567890EXAMPLE"
}
```

For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

Example 2: To register an AMI using a snapshot of a root device

The following register-image example registers an AMI using the specified snapshot of an EBS root volume as device /dev/xvda. The block device mapping also includes an empty 100 GiB EBS volume as device /dev/xvdf.

```bash
aws ec2 register-image \
   --name my-image \
   --image-snapshot my-s3-bucket/myimage/snapshot-ami-123456789 TIMESTAMP
```

Output:

```json
{
   "ImageId": "ami-1234567890EXAMPLE"
}
```
--root-device-name /dev/xvda \
--block-device-mappings DeviceName=/dev/xvda,Ebs={SnapshotId=snap-0db2cf683925d191f} DeviceName=/dev/xvdf,Ebs={VolumeSize=100}

Output:

{
   "ImageId": "ami-1a2b3c4d5eEXAMPLE"
}

For more information, see Amazon Machine Images (AMI) in the Amazon EC2 User Guide.

- For API details, see RegisterImage in AWS CLI Command Reference.

register-instance-event-notification-attributes

The following code example shows how to use register-instance-event-notification-attributes.

AWS CLI

Example 1: To include all tags in event notifications

The following register-instance-event-notification-attributes example includes all tags in event notifications.

```
aws ec2 register-instance-event-notification-attributes \
   --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{
   "InstanceTagAttribute": {
      "InstanceTagKeys": [],
      "IncludeAllTagsOfInstance": true
   }
}
```

For more information, see Scheduled events for your instances in the Amazon Elastic Compute Cloud User Guide for Linux Instances.
Example 2: To include specific tags in event notifications

The following register-instance-event-notification-attributes example includes the specified tags in event notifications. You cannot specify tags if IncludeAllTagsOfInstance is true.

```
aws ec2 register-instance-event-notification-attributes \\
  --instance-tag-attribute InstanceTagKeys="tag-key1","tag-key2"
```

Output:

```
{
   "InstanceTagAttribute": {
      "InstanceTagKeys": [
         "tag-key1",
         "tag-key2"
      ],
      "IncludeAllTagsOfInstance": false
   }
}
```

For more information, see Scheduled events for your instances in the Amazon Elastic Compute Cloud User Guide for Linux Instances.

- For API details, see RegisterInstanceEventNotificationAttributes in AWS CLI Command Reference.

register-transit-gateway-multicast-group-sources

The following code example shows how to use register-transit-gateway-multicast-group-sources.

AWS CLI

To register a source with a transit gateway multicast group.

The following register-transit-gateway-multicast-group-sources example registers the specified network interface group source with a multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \\
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
```

Actions and scenarios
AWS Command Line Interface

User Guide for Version 2

--group-ip-address 224.0.1.0 \n--network-interface-ids eni-07f290fc3c090cbae

Output:

```
{
  "RegisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "RegisteredNetworkInterfaceIds": [
      "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}
```

For more information, see [Register Sources with a Multicast Group](https://docs.aws.amazon.com/transitgw/latest/userguide/register-multicast-group-sources.html) in the *AWS Transit Gateways User Guide*.

- For API details, see [RegisterTransitGatewayMulticastGroupSources](https://docs.aws.amazon.com/cli/latest/reference/ec2/register-transit-gateway-multicast-group-members.html) in *AWS CLI Command Reference*.

register-transit-gateway-multicast-group-members

The following code example shows how to use `register-transit-gateway-multicast-group-members`.

**AWS CLI**

To view the information about the transit gateway multicast domain associations

The following `register-transit-gateway-multicast-group-members` example returns the associations for the specified multicast domain.

```
aws ec2 register-transit-gateway-multicast-group-members \
--transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
--group-ip-address 224.0.1.0 \
--network-interface-ids eni-0e246d32695012e81
```

Output:

```
{
```

Actions and scenarios

2535
"RegisteredMulticastGroupMembers": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "RegisteredNetworkInterfaceIds": [
        "eni-0e246d32695012e81"
    ],
    "GroupIpAddress": "224.0.1.0"
}
}

For more information, see Managing multicast domains in the Transit Gateways User Guide.

- For API details, see RegisterTransitGatewayMulticastGroupMembers in AWS CLI Command Reference.

register-transit-gateway-multicast-group-sources

The following code example shows how to use register-transit-gateway-multicast-group-sources.

AWS CLI

To register a source with a transit gateway multicast group.

The following register-transit-gateway-multicast-group-sources example registers the specified network interface group source with a multicast group.

```bash
aws ec2 register-transit-gateway-multicast-group-sources \
    --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
    --group-ip-address 224.0.1.0 \
    --network-interface-ids eni-07f290fc3c090cbb
```

Output:

```json
{
    "RegisteredMulticastGroupSources": {
        "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
        "RegisteredNetworkInterfaceIds": [
            "eni-07f290fc3c090cbb"
        ],
        "GroupIpAddress": "224.0.1.0"
    }
}
```
For more information, see Managing multicast domains in the Transit Gateways Guide.

- For API details, see RegisterTransitGatewayMulticastGroupSources in AWS CLI Command Reference.

### reject-transit-gateway-peering-attachment

The following code example shows how to use reject-transit-gateway-peering-attachment.

**AWS CLI**

**To reject a transit gateway peering attachment**

The following reject-transit-gateway-peering-attachment example rejects the specified transit gateway peering attachment request. The --region parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 reject-transit-gateway-peering-attachment \
    --transit-gateway-attachment-id tgw-attach-4455667788aabbcccd \
    --region us-east-2
```

**Output:**

```
{
    "TransitGatewayPeeringAttachment": {
        "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbcccd",
        "RequesterTgwInfo": {
            "TransitGatewayId": "tgw-123abc05e04123abc",
            "OwnerId": "123456789012",

}
reject-transit-gateway-vpc-attachment

The following code example shows how to use reject-transit-gateway-vpc-attachment.

AWS CLI

To reject a transit gateway VPC attachment

The following reject-transit-gateway-vpc-attachment example rejects the specified transit gateway VPC attachment.

```
aws ec2 reject-transit-gateway-vpc-attachment \\
   --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```
{
   "TransitGatewayVpcAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
      "VpcId": "vpc-07e8ffd50fEXAMPLE",
      "VpcOwnerId": "111122223333",
      "State": "pending",
      "SubnetIds": [
         "subnet-0752213d59EXAMPLE"
      ],
      "CreationTime": "2019-07-10T17:33:46.000Z",
      "Options": {
         "DnsSupport": "enable",
         "Ipv6Support": "disable"
      }
   }
}
```

For more information, see Transit gateway attachments to a VPC in the Transit Gateways Guide.

- For API details, see RejectTransitGatewayVpcAttachment in AWS CLI Command Reference.
reject-transit-gateway-vpc-attachments

The following code example shows how to use `reject-transit-gateway-vpc-attachments`.

**AWS CLI**

**To reject a transit gateway VPC attachment**

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```bash
aws ec2 reject-transit-gateway-vpc-attachment \
   --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```json
{
   "TransitGatewayVpcAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
      "VpcId": "vpc-07e8ffdd50fEXAMPLE",
      "VpcOwnerId": "111122223333",
      "State": "pending",
      "SubnetIds": ["subnet-0752213d59EXAMPLE"],
      "CreationTime": "2019-07-10T17:33:46.000Z",
      "Options": {
         "DnsSupport": "enable",
         "Ipv6Support": "disable"
      }
   }
}
```

For more information, see [Transit gateway attachments to a VPC](#) in the *Transit Gateways Guide*.
- For API details, see [RejectTransitGatewayVpcAttachments](#) in *AWS CLI Command Reference*.

reject-vpc-endpoint-connections

The following code example shows how to use `reject-vpc-endpoint-connections`.
AWS CLI

**To reject an interface endpoint connection request**

This example rejects the specified endpoint connection request for the specified endpoint service.

**Command:**

```bash
aws ec2 reject-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --vpc-endpoint-ids vpce-0c1308d7312217abc
```

**Output:**

```json
{
   "Unsuccessful": []
}
```

- For API details, see [RejectVpcEndpointConnections](https://docs.aws.amazon.com/cli/latest/api/reject-vpc-endpoint-connections.html) in *AWS CLI Command Reference*.

**reject-vpc-peering-connection**

The following code example shows how to use `reject-vpc-peering-connection`.

**AWS CLI**

**To reject a VPC peering connection**

This example rejects the specified VPC peering connection request.

**Command:**

```bash
aws ec2 reject-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

**Output:**

```json
{
   "Return": true
}
```

- For API details, see [RejectVpcPeeringConnection](https://docs.aws.amazon.com/cli/latest/api/reject-vpc-peering-connection.html) in *AWS CLI Command Reference*.
**release-hosts**

The following code example shows how to use `release-hosts`.

**AWS CLI**

**To release a Dedicated host from your account**

To release a Dedicated host from your account. Instances that are on the host must be stopped or terminated before the host can be released.

Command:

```bash
aws ec2 release-hosts --host-id=h-0029d6e3cacf1b3da
```

Output:

```json
{
   "Successful": [
      "h-0029d6e3cacf1b3da"
   ],
   "Unsuccessful": []
}
```

• For API details, see [ReleaseHosts](#) in *AWS CLI Command Reference*.

**replace-network-acl-association**

The following code example shows how to use `replace-network-acl-association`.

**AWS CLI**

**To replace the network ACL associated with a subnet**

This example associates the specified network ACL with the subnet for the specified network ACL association.

Command:

```bash
aws ec2 replace-network-acl-association --association-id aclassoc-e5b95c8c --network-acl-id acl-5fb85d36
```
Output:

```
{
  "NewAssociationId": "aclassoc-3999875b"
}
```

- For API details, see [ReplaceNetworkAclAssociation](#) in *AWS CLI Command Reference*.

### replace-network-acl-entry

The following code example shows how to use `replace-network-acl-entry`.

**AWS CLI**

**To replace a network ACL entry**

This example replaces an entry for the specified network ACL. The new rule 100 allows ingress traffic from 203.0.113.12/24 on UDP port 53 (DNS) into any associated subnet.

Command:

```
aws ec2 replace-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 203.0.113.12/24 --rule-action allow
```

- For API details, see [ReplaceNetworkAclEntry](#) in *AWS CLI Command Reference*.

### replace-route

The following code example shows how to use `replace-route`.

**AWS CLI**

**To replace a route**

This example replaces the specified route in the specified route table. The new route matches the specified CIDR and sends the traffic to the specified virtual private gateway. If the command succeeds, no output is returned.

Command:
aws ec2 replace-route --route-table-id rtb-22574640 --destination-cidr-block 10.0.0.0/16 --gateway-id vgw-9a4cacf3

- For API details, see `ReplaceRoute` in *AWS CLI Command Reference*.

**replace-route-table-association**

The following code example shows how to use `replace-route-table-association`.

**AWS CLI**

**To replace the route table associated with a subnet**

This example associates the specified route table with the subnet for the specified route table association.

Command:

```bash
aws ec2 replace-route-table-association --association-id rtbassoc-781d0d1a --route-table-id rtb-22574640
```

Output:

```json
{
   "NewAssociationId": "rtbassoc-3a1f0f58"
}
```

- For API details, see `ReplaceRouteTableAssociation` in *AWS CLI Command Reference*.

**replace-transit-gateway-route**

The following code example shows how to use `replace-transit-gateway-route`.

**AWS CLI**

**To replace the specified route in the specified transit gateway route table**

The following `replace-transit-gateway-route` example replaces the route in the specified transit gateway route table.

aws ec2 replace-transit-gateway-route \
   --destination-cidr-block 10.0.2.0/24 \
   --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE \
   --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAMPLE

Output:

```json
{
   "Route": {
      "DestinationCidrBlock": "10.0.2.0/24",
      "TransitGatewayAttachments": [
         {
            "ResourceId": "vpc-4EXAMPLE",
            "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
            "ResourceType": "vpc"
         }
      ],
      "Type": "static",
      "State": "active"
   }
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [ReplaceTransitGatewayRoute](#) in AWS CLI Command Reference.

**report-instance-status**

The following code example shows how to use `report-instance-status`.

**AWS CLI**

**To report status feedback for an instance**

This example command reports status feedback for the specified instance.

Command:

```
aws ec2 report-instance-status --instances i-1234567890abcdef0 --status impaired --reason-codes unresponsive
```

- For API details, see [ReportInstanceStatus](#) in AWS CLI Command Reference.
**request-spot-fleet**

The following code example shows how to use `request-spot-fleet`.

**AWS CLI**

*To request a Spot fleet in the subnet with the lowest price*

This example command creates a Spot fleet request with two launch specifications that differ only by subnet. The Spot fleet launches the instances in the specified subnet with the lowest price. If the instances are launched in a default VPC, they receive a public IP address by default. If the instances are launched in a nondefault VPC, they do not receive a public IP address by default.

Note that you can't specify different subnets from the same Availability Zone in a Spot fleet request.

**Command:**

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

**Config.json:**

```json
{
   "SpotPrice": "0.04",
   "TargetCapacity": 2,
   "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
   "LaunchSpecifications": [
       {
           "ImageId": "ami-1a2b3c4d",
           "KeyName": "my-key-pair",
           "SecurityGroups": [
               {
                   "GroupId": "sg-1a2b3c4d"
               }
           ],
           "InstanceType": "m3.medium",
           "SubnetId": "subnet-1a2b3c4d, subnet-3c4d5e6f",
           "IamInstanceProfile": {
               "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
           }
       }
   ]
}
```
Output:

```
{
    "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

**To request a Spot fleet in the Availability Zone with the lowest price**

This example command creates a Spot fleet request with two launch specifications that differ only by Availability Zone. The Spot fleet launches the instances in the specified Availability Zone with the lowest price. If your account supports EC2-VPC only, Amazon EC2 launches the Spot instances in the default subnet of the Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the Availability Zone.

**Command:**

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

**Config.json:**

```
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "Placement": {
                "AvailabilityZone": "us-west-2a, us-west-2b"
            },
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-profile"
            }
        }
    ]
}
```
To launch Spot instances in a subnet and assign them public IP addresses

This example command assigns public addresses to instances launched in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
    "SpotPrice": "0.04",
    "TargetCapacity": 2,
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "InstanceType": "m3.medium",
            "NetworkInterfaces": [
                {
                    "DeviceIndex": 0,
                    "SubnetId": "subnet-1a2b3c4d",
                    "Groups": [ "sg-1a2b3c4d" ],
                    "AssociatePublicIpAddress": true
                }
            ],
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::880185128111:instance-profile/my-iam-role"
            }
        }
    ]
}
```

To request a Spot fleet using the diversified allocation strategy
This example command creates a Spot fleet request that launches 30 instances using the diversified allocation strategy. The launch specifications differ by instance type. The Spot fleet distributes the instances across the launch specifications such that there are 10 instances of each type.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        }
    ]
}
```

For more information, see Spot Fleet Requests in the Amazon Elastic Compute Cloud User Guide.

- For API details, see RequestSpotFleet in AWS CLI Command Reference.

request-spot-instances

The following code example shows how to use request-spot-instances.
AWS CLI

To request Spot Instances

This example command creates a one-time Spot Instance request for five instances in the specified Availability Zone. If your account supports EC2-VPC only, Amazon EC2 launches the instances in the default subnet of the specified Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the specified Availability Zone.

Command:

```
aws ec2 request-spot-instances --spot-price "0.03" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
   "ImageId": "ami-1a2b3c4d",
   "KeyName": "my-key-pair",
   "SecurityGroupIds": [ "sg-1a2b3c4d" ],
   "InstanceType": "m3.medium",
   "Placement": {
      "AvailabilityZone": "us-west-2a"
   },
   "IamInstanceProfile": {
      "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
   }
}
```

Output:

```
{
   "SpotInstanceRequests": [
      {
         "Status": {
            "UpdateTime": "2014-03-25T20:54:21.000Z",
            "Code": "pending-evaluation",
            "Message": "Your Spot request has been submitted for review, and is pending evaluation."
         },
         "ProductDescription": "Linux/UNIX",
         "SpotInstanceRequestId": "sir-df6f405d",
```
"State": "open",
"LaunchSpecification": {
  "Placement": {
    "AvailabilityZone": "us-west-2a"
  },
  "ImageId": "ami-1a2b3c4d",
  "KeyName": "my-key-pair",
  "SecurityGroups": [
    {
      "GroupName": "my-security-group",
      "GroupId": "sg-1a2b3c4d"
    }
  ],
  "Monitoring": {
    "Enabled": false
  },
  "IamInstanceProfile": {
    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  },
  "InstanceType": "m3.medium"
},
"Type": "one-time",
"CreateTime": "2014-03-25T20:54:20.000Z",
"SpotPrice": "0.050000"
}

This example command creates a one-time Spot Instance request for five instances in the specified subnet. Amazon EC2 launches the instances in the specified subnet. If the VPC is a nondefault VPC, the instances do not receive a public IP address by default.

Command:

```
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
  "ImageId": "ami-1a2b3c4d",
}
"SecurityGroupIds": [ "sg-1a2b3c4d" ],
"InstanceType": "m3.medium",
"SubnetId": "subnet-1a2b3c4d",
"IamInstanceProfile": {
  "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
}
}

Output:

{
  "SpotInstanceRequests": [
    {
      "Status": {
        "UpdateTime": "2014-03-25T22:21:58.000Z",
        "Code": "pending-evaluation",
        "Message": "Your Spot request has been submitted for review, and is pending evaluation."
      },
      "ProductDescription": "Linux/UNIX",
      "SpotInstanceRequestId": "sir-df6f405d",
      "State": "open",
      "LaunchSpecification": {
        "Placement": {
          "AvailabilityZone": "us-west-2a"
        }
      },
      "ImageId": "ami-1a2b3c4d",
      "SecurityGroups": [
        {
          "GroupName": "my-security-group",
          "GroupId": "sg-1a2b3c4d"
        }
      ],
      "SubnetId": "subnet-1a2b3c4d",
      "Monitoring": {
        "Enabled": false
      },
      "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
      },
      "InstanceType": "m3.medium",
      "Type": "one-time",
    }
  ]
}
This example assigns a public IP address to the Spot Instances that you launch in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 1 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
   "ImageId": "ami-1a2b3c4d",
   "KeyName": "my-key-pair",
   "InstanceType": "m3.medium",
   "NetworkInterfaces": [
      {
         "DeviceIndex": 0,
         "SubnetId": "subnet-1a2b3c4d",
         "Groups": [ "sg-1a2b3c4d" ],
         "AssociatePublicIpAddress": true
      }
   ],
   "IamInstanceProfile": {
      "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
   }
}
```

- For API details, see [RequestSpotInstances](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/ec2/request-spot-instances.html) in [AWS CLI Command Reference](https).

**reset-address-attribute**

The following code example shows how to use `reset-address-attribute`.
**AWS CLI**

**To reset the domain name attribute associated with an elastic IP address**

The following reset-address-attribute examples reset the domain name attribute of an elastic IP address.

Linux:

```
aws ec2 reset-address-attribute \
  --allocation-id eipalloc-abcdef01234567890 \
  --attribute domain-name
```

Windows:

```
aws ec2 reset-address-attribute ^
  --allocation-id eipalloc-abcdef01234567890 ^
  --attribute domain-name
```

Output:

```
{
  "Addresses": [
    {
      "PublicIp": "192.0.2.0",
      "AllocationId": "eipalloc-abcdef01234567890",
      "PtrRecord": "example.com."
      "PtrRecordUpdate": {
        "Value": "example.net.",
        "Status": "PENDING"
      }
    }
  ]
}
```

To monitor the pending change, see [describe-addresses-attribute](#) in the [AWS CLI Command Reference](#).

- For API details, see [ResetAddressAttribute](#) in [AWS CLI Command Reference](#).

**reset-ebs-default-kms-key-id**

The following code example shows how to use reset-ebs-default-kms-key-id.
**AWS CLI**

**To reset your default CMK for EBS encryption**

The following `reset-ebs-default-kms-key-id` example resets the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 reset-ebs-default-kms-key-id
```

Output:

```
{
   "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513eEXAMPLE"
}
```

- For API details, see [ResetEbsDefaultKmsKeyId](https://docs.aws.amazon.com/cli/latest/reference/ec2/reset-ebs-default-kms-key-id.html) in *AWS CLI Command Reference*.

**reset-fpga-image-attribute**

The following code example shows how to use `reset-fpga-image-attribute`.

**AWS CLI**

**To reset the attributes of an Amazon FPGA image**

This example resets the load permissions for the specified AFI.

Command:

```
aws ec2 reset-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --attribute loadPermission
```

Output:

```
{
   "Return": true
}
```

- For API details, see [ResetFpgaImageAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/reset-fpga-image-attribute.html) in *AWS CLI Command Reference*. 

reset-image-attribute

The following code example shows how to use reset-image-attribute.

**AWS CLI**

**To reset the launchPermission attribute**

This example resets the `launchPermission` attribute for the specified AMI to its default value. By default, AMIs are private. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-image-attribute --image-id ami-5731123e --attribute launchPermission
```

- For API details, see [ResetImageAttribute](aws CLI Command Reference).

reset-instance-attribute

The following code example shows how to use reset-instance-attribute.

**AWS CLI**

**To reset the sourceDestCheck attribute**

This example resets the `sourceDestCheck` attribute of the specified instance. The instance must be in a VPC. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute sourceDestCheck
```

**To reset the kernel attribute**

This example resets the `kernel` attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute kernel
```
To reset the ramdisk attribute

This example resets the ramdisk attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute ramdisk
```

- For API details, see ResetInstanceAttribute in AWS CLI Command Reference.

reset-network-interface-attribute

The following code example shows how to use reset-network-interface-attribute.

AWS CLI

To reset a network interface attribute

The following reset-network-interface-attribute example resets the value of the source/destination checking attribute to true.

```bash
aws ec2 reset-network-interface-attribute 
  --network-interface-id eni-686ea200 
  --source-dest-check
```

This command produces no output.

- For API details, see ResetNetworkInterfaceAttribute in AWS CLI Command Reference.

reset-snapshot-attribute

The following code example shows how to use reset-snapshot-attribute.

AWS CLI

To reset a snapshot attribute

This example resets the create volume permissions for snapshot snap-1234567890abcdef0. If the command succeeds, no output is returned.
Command:

```
aws ec2 reset-snapshot-attribute --snapshot-id snap-1234567890abcdef0 --attribute createVolumePermission
```

- For API details, see [ResetSnapshotAttribute](https://docs.aws.amazon.com/cli/latest/reference/ec2/reset-snapshot-attribute.html) in *AWS CLI Command Reference*.

**restore-address-to-classic**

The following code example shows how to use `restore-address-to-classic`.

**AWS CLI**

**To restore an address to EC2-Classic**

This example restores Elastic IP address 198.51.100.0 to the EC2-Classic platform.

Command:

```
aws ec2 restore-address-to-classic --public-ip 198.51.100.0
```

Output:

```
{
   "Status": "MoveInProgress",
   "PublicIp": "198.51.100.0"
}
```

- For API details, see [RestoreAddressToClassic](https://docs.aws.amazon.com/cli/latest/reference/ec2/restore-address-to-classic.html) in *AWS CLI Command Reference*.

**restore-image-from-recycle-bin**

The following code example shows how to use `restore-image-from-recycle-bin`.

**AWS CLI**

**To restore an image from the Recycle Bin**

The following `restore-image-from-recycle-bin` example restores AMI ami-0111222333444abcd from the Recycle Bin.
aws ec2 restore-image-from-recycle-bin \
   --image-id ami-01122233444abcd

Output:

{
   "Return": true
}

For more information, see Recover AMIs from the Recycle Bin in the Amazon Elastic Compute Cloud User Guide.

- For API details, see RestoreImageFromRecycleBin in AWS CLI Command Reference.

**restore-managed-prefix-list-version**

The following code example shows how to use restore-managed-prefix-list-version.

**AWS CLI**

us-west-2**To restore a prefix list version**

The following restore-managed-prefix-list-version restores the entries from version 1 of the specified prefix list.

aws ec2 restore-managed-prefix-list-version \
   --prefix-list-id pl-0123456abcabcabc1 \
   --current-version 2 \
   --previous-version 1

Output:

{
   "PrefixList": {
      "PrefixListId": "pl-0123456abcabcabc1",
      "AddressFamily": "IPv4",
      "State": "restore-in-progress",
      "PrefixListName": "vpc-cidrs",
      "MaxEntries": 10,
   }
}
For more information, see Managed prefix lists in the Amazon VPC User Guide.

- For API details, see RestoreManagedPrefixListVersion in AWS CLI Command Reference.

restore-snapshot-from-recycle-bin

The following code example shows how to use restore-snapshot-from-recycle-bin.

AWS CLI

**To restore snapshots from the Recycle Bin**

The following restore-snapshot-from-recycle-bin example restores a snapshot from the Recycle Bin. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

```bash
aws ec2 restore-snapshot-from-recycle-bin 
--snapshot-id snap-01234567890abcdef
```

This command produces no output.

For more information about Recycle Bin for Amazon EBS, see Recover snapshots from the Recycle Bin in the Amazon EC2 User Guide.

- For API details, see RestoreSnapshotFromRecycleBin in AWS CLI Command Reference.

restore-snapshot-tier

The following code example shows how to use restore-snapshot-tier.

AWS CLI

**Example 1: To permanently restore an archived snapshot**

The following restore-snapshot-tier example permanently restores the specified snapshot. Specify the --snapshot-id and include the permanent-restore option.
aws ec2 restore-snapshot-tier \
   --snapshot-id snap-01234567890abcedf \
   --permanent-restore

Output:

```json
{
   "SnapshotId": "snap-01234567890abcedf",
   "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

**Example 2: To temporarily restore an archived snapshot**

The following `restore-snapshot-tier` example temporarily restores the specified snapshot. Omit the `--permanent-restore` option. Specify the `--snapshot-id` and, for `temporary-restore-days`, specify the number of days for which to restore the snapshot. `temporary-restore-days` must be specified in days. The allowed range is 1 to 180. If you do not specify a value, it defaults to 1 day.

```bash
aws ec2 restore-snapshot-tier \
   --snapshot-id snap-01234567890abcedf \
   --temporary-restore-days 5
```

Output:

```json
{
   "SnapshotId": "snap-01234567890abcedf",
   "RestoreDuration": 5,
   "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

**Example 3: To modify the restore period**
The following `restore-snapshot-tier` example changes the restore period for the specified snapshot to 10 days.

```
aws ec2 restore-snapshot-tier
   --snapshot-id snap-01234567890abcedf
   --temporary-restore-days 10
```

Output:

```
{
   "SnapshotId": "snap-01234567890abcedf",
   "RestoreDuration": 10,
   "IsPermanentRestore": false
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

**Example 4: To modify the restore type**

The following `restore-snapshot-tier` example changes the restore type for the specified snapshot from temporary to permanent.

```
aws ec2 restore-snapshot-tier
   --snapshot-id snap-01234567890abcedf
   --permanent-restore
```

Output:

```
{
   "SnapshotId": "snap-01234567890abcedf",
   "IsPermanentRestore": true
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html> in the Amazon EC2 User Guide.

- For API details, see [RestoreSnapshotTier](https://docs.aws.amazon.com/cli/latest/reference/ec2/restore-snapshot-tier.html) in AWS CLI Command Reference.
revoke-client-vpn-ingress

The following code example shows how to use `revoke-client-vpn-ingress`.

AWS CLI

**To revoke an authorization rule for a Client VPN endpoint**

The following `revoke-client-vpn-ingress` example revokes a rule for internet access (0.0.0.0/0) for all groups.

```bash
aws ec2 revoke-client-vpn-ingress \
   --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
   --target-network-cidr 0.0.0.0/0 --revoke-all-groups
```

Output:

```
{
   "Status": {
      "Code": "revoking"
   }
}
```

For more information, see Authorization Rules in the *AWS Client VPN Administrator Guide*.

- For API details, see RevokeClientVpnIngress in *AWS CLI Command Reference*.

revoke-security-group-egress

The following code example shows how to use `revoke-security-group-egress`.

AWS CLI

**Example 1: To remove the rule that allows outbound traffic to a specific address range**

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified address ranges on TCP port 80.

```bash
aws ec2 revoke-security-group-egress \
   --group-id sg-026c12253ce15eff7 \
```

Actions and scenarios 2562
--ip-permissions
[[IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]}

This command produces no output.

For more information, see Security groups in the Amazon EC2 User Guide.

Example 2: To remove the rule that allows outbound traffic to a specific security group

The following revoke-security-group-egress example command removes the rule that grants access to the specified security group on TCP port 80.

```
aws ec2 revoke-security-group-egress 
    --group-id sg-026c12253ce15eff7 
    --ip-permissions '[["IpProtocol": "tcp", "FromPort": 443, "ToPort": 443,"UserIdGroupPairs": [{"GroupId": "sg-06df23a01ff2df86d"}]]]'
```

This command produces no output.

For more information, see Security groups in the Amazon EC2 User Guide.

- For API details, see RevokeSecurityGroupEgress in AWS CLI Command Reference.

revoke-security-group-ingress

The following code example shows how to use revoke-security-group-ingress.

AWS CLI

Example 1: To remove a rule from a security group

The following revoke-security-group-ingress example removes TCP port 22 access for the 203.0.113.0/24 address range from the specified security group for a default VPC.

```
aws ec2 revoke-security-group-ingress 
    --group-name mySecurityGroup 
    --protocol tcp 
    --port 22 
    --cidr 203.0.113.0/24
```

This command produces no output if it succeeds.
For more information, see Security groups in the Amazon EC2 User Guide.

**Example 2: To remove a rule using the IP permissions set**

The following revoke-security-group-ingress example uses the ip-permissions parameter to remove an inbound rule that allows the ICMP message Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4).

```bash
aws ec2 revoke-security-group-ingress \
   --group-id sg-026c12253ce15eff7 \
   --ip-permissions
   IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[[CidrIp=0.0.0.0/0]]
```

This command produces no output if it succeeds.

For more information, see Security groups in the Amazon EC2 User Guide.

- For API details, see RevokeSecurityGroupIngress in AWS CLI Command Reference.

**run-scheduled-instances**

The following code example shows how to use run-scheduled-instances.

**AWS CLI**

**To launch a Scheduled Instance**

This example launches the specified Scheduled Instance in a VPC.

**Command:**

```bash
aws ec2 run-scheduled-instances --scheduled-instance-id
sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification
file://launch-specification.json
```

**Launch-specification.json:**

```json
{
   "ImageId": "ami-12345678",
```
"KeyName": "my-key-pair",
"InstanceType": "c4.large",
"NetworkInterfaces": [  
    {  
      "DeviceIndex": 0,
      "SubnetId": "subnet-12345678",
      "AssociatePublicIpAddress": true,
      "Groups": ["sg-12345678"]
    }
  ],
"IamInstanceProfile": {  
    "Name": "my-iam-role"
  }
]

Output:

{
  "InstanceIdSet": [  
    "i-1234567890abcdef0"
  ]
}

This example launches the specified Scheduled Instance in EC2-Classic.

Command:

```
aws ec2 run-scheduled-instances --scheduled-instance-id sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification file://launch-specification.json
```

Launch-specification.json:

```
{
  "ImageId": "ami-12345678",
  "KeyName": "my-key-pair",
  "SecurityGroupIds": ["sg-12345678"],
  "InstanceType": "c4.large",
  "Placement": {  
    "AvailabilityZone": "us-west-2b"
  }
  "IamInstanceProfile": {  
```
"Name": "my-iam-role"
}
}

Output:

{
  "InstanceIdSet": [
    "i-1234567890abcdef0"
  ]
}

- For API details, see RunScheduledInstances in AWS CLI Command Reference.

search-local-gateway-routes

The following code example shows how to use search-local-gateway-routes.

AWS CLI

To search for routes in a local gateway route table

The following search-local-gateway-routes example searches for static routes in the specified local gateway route table.

```bash
aws ec2 search-local-gateway-routes \
  --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
  --filters "Name=type,Values=static"
```

Output:

```json
{
  "Route": {
    "DestinationCidrBlock": "0.0.0.0/0",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
    "Type": "static",
    "State": "deleted",
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
  }
}
```
• For API details, see `SearchLocalGatewayRoutes` in AWS CLI Command Reference.

search-transit-gateway-multicast-groups

The following code example shows how to use search-transit-gateway-multicast-groups.

**AWS CLI**

To search one or more transit gateway multicast groups and return the group membership information

The following search-transit-gateway-multicast-groups example returns the group membership of the specified multicast group.

```bash
aws ec2 search-transit-gateway-multicast-groups \
   --transit-gateway-multicast-domain-id tgw-mcast-domain-000fb24d04EXAMPLE
```

Output:

```
{
   "MulticastGroups": [
   {
      "GroupIpAddress": "224.0.1.0",
      "TransitGatewayAttachmentId": "tgw-attach-0372e72386EXAMPLE",
      "SubnetId": "subnet-0187aff814EXAMPLE",
      "ResourceId": "vpc-0065acced4EXAMPLE",
      "ResourceType": "vpc",
      "NetworkInterfaceId": "eni-03847706f6EXAMPLE",
      "GroupMember": false,
      "GroupSource": true,
      "SourceType": "static"
   }
   ]
}
```

For more information, see Managing multicast groups in the Transit Gateways Guide.

• For API details, see `SearchTransitGatewayMulticastGroups` in AWS CLI Command Reference.

search-transit-gateway-routes

The following code example shows how to use search-transit-gateway-routes.
AWS CLI

To search for routes in the specified transit gateway route table

The following `search-transit-gateway-routes` example returns all the routes that are of type `static` in the specified route table.

```
aws ec2 search-transit-gateway-routes \
   --transit-gateway-route-table-id tgw-rtb-0a823edbeEXAMPLE \
   --filters "Name=type,Values=static"
```

Output:

```
{
   "Routes": [
      {
          "DestinationCidrBlock": "10.0.2.0/24",
          "TransitGatewayAttachments": [
              {
                  "ResourceId": "vpc-4EXAMPLE",
                  "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                  "ResourceType": "vpc"
              }
          ],
          "Type": "static",
          "State": "active"
      },
      {
          "DestinationCidrBlock": "10.1.0.0/24",
          "TransitGatewayAttachments": [
              {
                  "ResourceId": "vpc-4EXAMPLE",
                  "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
                  "ResourceType": "vpc"
              }
          ],
          "Type": "static",
          "State": "active"
      }
   ],
   "AdditionalRoutesAvailable": false
}
```
For more information, see Transit gateway route tables in the Transit Gateways Guide.
• For API details, see SearchTransitGatewayRoutes in AWS CLI Command Reference.

send-diagnostic-interrupt

The following code example shows how to use send-diagnostic-interrupt.

AWS CLI

To send a diagnostic interrupt

The following send-diagnostic-interrupt example sends a diagnostic interrupt to the specified instance.

```bash
aws ec2 send-diagnostic-interrupt \
  --instance-id i-1234567890abcdef0
```

This command produces no output.
• For API details, see SendDiagnosticInterrupt in AWS CLI Command Reference.

start-network-insights-access-scope-analysis

The following code example shows how to use start-network-insights-access-scope-analysis.

AWS CLI

To start a Network Insights access scope analysis

The following start-network-insights-access-scope-analysis example starts the scope analysis in your AWS account.

```bash
aws ec2 start-network-insights-access-scope-analysis \
  --region us-east-1 \
  --network-insights-access-scope-id nis-123456789111
```

Output:

```json
{
```
"NetworkInsightsAccessScopeAnalysis": {
    "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
    "NetworkInsightsAccessScopeId": "nis-123456789111",
    "Status": "running",
    "StartDate": "2022-01-26T00:47:06.814000+00:00"
}

For more information, see Getting started with Network Access Analyzer using the AWS CLI in the Network Access Analyzer Guide.

- For API details, see StartNetworkInsightsAccessScopeAnalysis in AWS CLI Command Reference.

**start-network-insights-analysis**

The following code example shows how to use start-network-insights-analysis.

**AWS CLI**

To analyze a path

The following start-network-insights-analysis example analyzes the path between the source and destination. To view the results of the path analysis, use the describe-network-insights-analyses command.

```
aws ec2 start-network-insights-analysis \
   --network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
    "NetworkInsightsAnalysis": {
        "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
        "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
        "StartDate": "2021-01-20T22:58:37.495Z",
        "Status": "running"
    }
}
```
For more information, see [Getting started using the AWS CLI](https://docs.aws.amazon.com/cli/latest/userguide/getting-started.html) in the *Reachability Analyzer Guide*.

- For API details, see [StartNetworkInsightsAnalysis](https://docs.aws.amazon.com/cli/latest/reference/ec2/start-network-insights-analysis.html) in *AWS CLI Command Reference*.

### start-vpc-endpoint-service-private-dns-verification

The following code example shows how to use `start-vpc-endpoint-service-private-dns-verification`.

**AWS CLI**

**To initiate the DNS verification process**

The following `start-vpc-endpoint-service-private-dns-verification` example initiates the DNS verification process for the specified endpoint service.

```bash
aws ec2 start-vpc-endpoint-service-private-dns-verification
  --service-id vpce-svc-071afff70666e61e0
```

This command produces no output.

For more information, see [Manage DNS names](https://docs.aws.amazon.com/AWSPortal/latest/UserGuide/private-link-list-eligible-endpoints-manage-dns-resolution.html) in the *AWS PrivateLink User Guide*.

- For API details, see [StartVpcEndpointServicePrivateDnsVerification](https://docs.aws.amazon.com/cli/latest/reference/ec2/start-vpc-endpoint-service-private-dns-verification.html) in *AWS CLI Command Reference*.

### terminate-client-vpn-connections

The following code example shows how to use `terminate-client-vpn-connections`.

**AWS CLI**

**To terminate a connection to a Client VPN endpoint**

The following `terminate-client-vpn-connections` example terminates the specified connection to the Client VPN endpoint.

```bash
aws ec2 terminate-client-vpn-connections
  --client-vpn-endpoint-id vpn-endpoint-123456789123abcde
```
--connection-id cvpn-connection-04edd76f5201e0cb8

Output:

```
{
    "ClientVpnEndpointId": "vpn-endpoint-123456789123abcde",
    "ConnectionStatuses": [
        {
            "ConnectionId": "cvpn-connection-04edd76f5201e0cb8",
            "PreviousStatus": {
                "Code": "active"
            },
            "CurrentStatus": {
                "Code": "terminating"
            }
        }
    ]
}
```

For more information, see [Client Connections](#) in the [*AWS Client VPN Administrator Guide*](#).

- For API details, see [TerminateClientVpnConnections](#) in [*AWS CLI Command Reference*](#).

**unassign-ipv6-addresses**

The following code example shows how to use unassign-ipv6-addresses.

**AWS CLI**

**To unassign an IPv6 address from a network interface**

This example unassigns the specified IPv6 address from the specified network interface.

**Command:**

```
aws ec2 unassign-ipv6-addresses --ipv6-addresses
2001:db8:1234:1a00:3304:8879:34cf:4071 --network-interface-id eni-23c49b68
```

**Output:**

```python
{
```
For API details, see UnassignIpv6Addresses in AWS CLI Command Reference.

unassign-private-ip-addresses

The following code example shows how to use unassign-private-ip-addresses.

AWS CLI

To unassign a secondary private IP address from a network interface

This example unassigns the specified private IP address from the specified network interface. If the command succeeds, no output is returned.

Command:

```bash
aws ec2 unassign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```

For API details, see UnassignPrivateIpAddresses in AWS CLI Command Reference.

unassign-private-nat-gateway-address

The following code example shows how to use unassign-private-nat-gateway-address.

AWS CLI

To unassign a private IP address from your private NAT gateway

The following unassign-private-nat-gateway-address example unassigns the specified IP address from the specified private NAT gateway.

```bash
aws ec2 unassign-private-nat-gateway-address
   --nat-gateway-id nat-1234567890abcdef0
   --private-ip-addresses 10.0.20.197
```
Output:

```json
{
    "NatGatewayId": "nat-0ee3edd182361f662",
    "NatGatewayAddresses": [
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "PrivateIp": "10.0.20.197",
            "IsPrimary": false,
            "Status": "unassigning"
        }
    ]
}
```

For more information, see [NAT gateways](https://docs.aws.amazon.com/vpc/latest/userguide/nat-gateways.html) in the Amazon VPC User Guide.

**update-security-group-rule-descriptions-egress**

The following code example shows how to use `update-security-group-rule-descriptions-egress`.

**AWS CLI**

**To update the description of an outbound security group rule**

The following `update-security-group-rule-descriptions-egress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'Outbound HTTP access to server 2' replaces any existing description for the rule.

```bash
aws ec2 update-security-group-rule-descriptions-egress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=203.0.113.0/24,Description="Outbound HTTP access to server 2"}]
```

Output:

```json
{
}
```
update-security-group-rule-descriptions-ingress

The following code example shows how to use `update-security-group-rule-descriptions-ingress`.

**AWS CLI**

**Example 1: To update the description of an inbound security group rule with a CIDR source**

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'SSH access from ABC office' replaces any existing description for the rule.

```bash
aws ec2 update-security-group-rule-descriptions-ingress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions
    IpProtocol=tcp,FromPort=22,ToPort=22,IpRanges='[{CidrIp=203.0.113.0/16,Description="SSH access from corpnet"}]
```

Output:

```json
{
    "Return": true
}
```

For more information, see [Security group rules](#) in the Amazon EC2 User Guide.

**Example 2: To update the description of an inbound security group rule with a prefix list source**

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and prefix list. The description 'SSH access from ABC office' replaces any existing description for the rule.

```bash
aws ec2 update-security-group-rule-descriptions-ingress \
    --group-id sg-02f0d35a850ba727f \
    --ip-permissions
    IpProtocol=tcp,FromPort=22,ToPort=22,IpRanges='[{CidrIp=203.0.113.0/16,Description="SSH access from corpnet"}]
```

Output:

```json
{
    "Return": true
}
```

For more information, see [Security group rules](#) in the Amazon EC2 User Guide.
aws ec2 update-security-group-rule-descriptions-ingress \
   --group-id sg-02f0d35a850ba727f \
   --ip-permissions
   IpProtocol=tcp,FromPort=22,ToPort=22,PrefixListIds='[{{PrefixListId=pl-12345678,Description="SSH access from corpnet"}}]'

Output:

```
{
   "Return": true
}
```

### withdraw-byoip-cidr

The following code example shows how to use `withdraw-byoip-cidr`.

**AWS CLI**

**To stop advertising an address range**

The following `withdraw-byoip-cidr` example stops advertising the specified address range.

```bash
aws ec2 withdraw-byoip-cidr 
   --cidr 203.0.113.25/24
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "203.0.113.25/24",
      "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
      "State": "advertised"
   }
}
```

- For API details, see [WithdrawByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/ec2/withdraw-byoip-cidr.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**
Amazon EC2 Instance Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2 Instance Connect.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

*send-ssh-public-key*

The following code example shows how to use *send-ssh-public-key*.

**AWS CLI**

To send a an SSH public key to an instance

The following *send-ssh-public-key* example sends the specified SSH public key to the specified instance. The key is used to authenticate the specified user.

```
aws ec2-instance-connect send-ssh-public-key \
    --instance-id i-1234567890abcdef0 \
    --instance-os-user ec2-user \
    --availability-zone us-east-2b \
    --ssh-public-key file://path/my-rsa-key.pub
```

This command produces no output.

- For API details, see [SendSshPublicKey](https://docs.aws.amazon.com/cli/latest/reference/ec2-instance-connect/send-ssh-public-key.html) in *AWS CLI Command Reference*. 
Amazon ECR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

List the image IDs

The following code example shows how to list the image IDs for a repository.

AWS CLI

To list the images in a repository

The following list-images example displays a list of the images in the cluster-autoscaler repository.

```
aws ecr list-images \
   --repository-name cluster-autoscaler
```

Output:

```
{
   "imageIds": [
   {
      "imageDigest": "sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",
```
List your repositories

The following code example shows how to list your repositories.

**AWS CLI**

To describe the repositories in a registry

This example describes the repositories in the default registry for an account.

Command:

```
aws ecr describe-repositories
```

Output:

```
{
  "repositories": [
    {
      "registryId": "012345678910",
      "repositoryName": "ubuntu",
      "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/ubuntu"
    },
    {
      "registryId": "012345678910",
      "repositoryName": "test",
      "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/test"
    }
  ]
}
```
• For API details, see DescribeRepositories in AWS CLI Command Reference.

**batch-check-layer-availability**

The following code example shows how to use `batch-check-layer-availability`.

**AWS CLI**

To check the availability of a layer

The following batch-check-layer-availability example checks the availability of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```bash
aws ecr batch-check-layer-availability \
  --repository-name cluster-autoscaler \
  --layer-digests sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```json
{
  "layers": [
    {
      "layerDigest": "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed",
      "layerAvailability": "AVAILABLE",
      "layerSize": 2777,
      "mediaType": "application/vnd.docker.container.image.v1+json"
    }
  ],
  "failures": []
}
```

• For API details, see BatchCheckLayerAvailability in AWS CLI Command Reference.
**batch-delete-image**

The following code example shows how to use batch-delete-image.

**AWS CLI**

**Example 1: To delete an image**

The following batch-delete-image example deletes an image with the tag `precise` in the specified repository in the default registry for an account.

```
aws ecr batch-delete-image \
    --repository-name ubuntu \
    --image-ids imageTag=precise
```

Output:

```
{
    "failures": [],
    "imageIds": [
        {
            "imageTag": "precise",
            "imageDigest": "sha256:19665f1e6d1e504117a1743c0a3d3753086354a38375961f2e665416ef4b1b2f"
        }
    ]
}
```

**Example 2: To delete multiple images**

The following batch-delete-image example deletes all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-delete-image \
    --repository-name MyRepository \
    --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
    "imageIds": [
        {
```
For more information, see [Deleting an Image](#) in the *Amazon ECR User Guide*.

- For API details, see [BatchDeleteImage](#) in *AWS CLI Command Reference*.

### batch-get-image

The following code example shows how to use `batch-get-image`.

**AWS CLI**

**Example 1: To get an image**

The following batch-get-image example gets an image with the tag `v1.13.6` in a repository called `cluster-autoscaler` in the default registry for an account.

```bash
aws ecr batch-get-image \
  --repository-name cluster-autoscaler \
  --image-ids imageTag=v1.13.6
```

**Output:**

```
{
   "images": [
      {
         "registryId": "012345678910",
         "repositoryName": "cluster-autoscaler",
         "imageId": {
            "imageDigest": "sha256:4a1c6567c38904384ebc64e35b7eدد8451110c299e3368d221006487d97e5",
            "imageTag": "v1.13.6"
         }
      }
   ],
   "failures": []
}
```
Example 2: To get multiple images

The following batch-get-image example displays details of all images tagged with prod and team1 in the specified repository.

```bash
aws ecr batch-get-image \
   --repository-name MyRepository \
   --image-ids imageTag=prod imageTag=team1
```

Output:

```json
{
   "images": [
      {
         "registryId": "123456789012",
         "repositoryName": "MyRepository",
         "imageId": {
            "imageDigest": "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed"
         }
      }
   ]
}
```
The following code example shows how to use `complete-layer-upload`.

### AWS CLI

#### To complete an image layer upload

The following `complete-layer-upload` example completes an image layer upload to the `layer-test` repository.

```bash
aws ecr complete-layer-upload \
  --repository-name layer-test \
  --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \
  --layer-digests 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9:48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e
```

Output:

```json
{
  "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
}
```

For more information, see [Images](https://docs.aws.amazon.com/AmazonECR/latest/userguide/images.html) in the *Amazon ECR User Guide*.

- For API details, see [BatchGetImage](https://docs.aws.amazon.com/cli/latest/reference/ecr/batch-get-image.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

2584
create-repository

The following code example shows how to use create-repository.

AWS CLI

Example 1: To create a repository

The following create-repository example creates a repository inside the specified namespace in the default registry for an account.

```bash
aws ecr create-repository \
    --repository-name project-a/nginx-web-app
```

Output:

```json
{
    "repository": {
        "registryId": "123456789012",
        "repositoryName": "sample-repo",
        "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/nginx-web-app"
    }
}
```

For more information, see Creating a Repository in the Amazon ECR User Guide.

Example 2: To create a repository configured with image tag immutability

The following create-repository example creates a repository configured for tag immutability in the default registry for an account.

```bash
aws ecr create-repository \
    --repository-name sample-repo \
```

For API details, see CompleteLayerUpload in AWS CLI Command Reference.
--image-tag-mutability IMMUTABLE

Output:

```
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/sample-repo",
    "imageTagMutability": "IMMUTABLE"
  }
}
```

For more information, see Image Tag Mutability in the Amazon ECR User Guide.

**Example 3: To create a repository configured with a scanning configuration**

The following `create-repository` example creates a repository configured to perform a vulnerability scan on image push in the default registry for an account.

```
aws ecr create-repository \
  --repository-name sample-repo \
  --image-scanning-configuration scanOnPush=true
```

Output:

```
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/sample-repo",
    "imageScanningConfiguration": { 
      "scanOnPush": true
    }
  }
}
```

For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see CreateRepository in AWS CLI Command Reference.
delete-lifecycle-policy

The following code example shows how to use delete-lifecycle-policy.

AWS CLI

To delete the lifecycle policy for a repository

The following delete-lifecycle-policy example deletes the lifecycle policy for the hello-world repository.

```
aws ecr delete-lifecycle-policy \
   --repository-name hello-world
```

Output:

```
{
   "registryId": "012345678910",
   "repositoryName": "hello-world",
   "lifecyclePolicyText": "{"rules":[{"rulePriority":1,"description":"Remove untagged images."},"selection":{"tagStatus":"untagged","countType":"sinceImagePushed","countUnit":"days","countNumber":10},"action":{"type":"expire"}}],"lastEvaluatedAt": 0.0
}
```

- For API details, see DeleteLifecyclePolicy in AWS CLI Command Reference.

delete-repository

The following code example shows how to use delete-repository.

AWS CLI

To delete a repository

The following delete-repository example command force deletes the specified repository in the default registry for an account. The --force flag is required if the repository contains images.

```
aws ecr delete-repository \
   --repository-name ubuntu \
```
--force

Output:

```json
{
   "repository": {
      "registryId": "123456789012",
      "repositoryName": "ubuntu",
      "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/ubuntu"
   }
}
```

For more information, see Deleting a Repository in the Amazon ECR User Guide.

- For API details, see DeleteRepository in AWS CLI Command Reference.

**delete-repository-policy**

The following code example shows how to use delete-repository-policy.

**AWS CLI**

To delete the repository policy for a repository

The following delete-repository-policy example deletes the repository policy for the cluster-autoscaler repository.

```bash
aws ecr delete-repository-policy \
   --repository-name cluster-autoscaler
```

Output:

```json
{
   "registryId": "012345678910",
   "repositoryName": "cluster-autoscaler",
   "policyText": 
      "\"Version\": \"2008-10-17\", \n      \"Statement\": [ \n      { \n      \"Sid\": \"allow public pull\", \n      \"Effect\": \"Allow\", \n      \"Principal\": \"*\", \n      \"Action\": [ \n      \"ecr:BatchCheckLayerAvailability\", \n      \"ecr:BatchGetImage\", \n      \"ecr:GetDownloadUrlForLayer\" ]\n      } ]\n}"
```

- For API details, see DeleteRepositoryPolicy in AWS CLI Command Reference.
describe-image-scan-findings

The following code example shows how to use describe-image-scan-findings.

AWS CLI

To describe the scan findings for an image

The following describe-image-scan-findings example returns the image scan findings for an image using the image digest in the specified repository in the default registry for an account.

```
aws ecr describe-image-scan-findings \
   --repository-name sample-repo \ 
   --image-id \
imageDigest=sha256:74b2c688c700ec95a93e478c7db959737c148df3f6eb5ea706a90318726e885e6
```

Output:

```
{
   "imageScanFindings": {
      "findings": [
         {
           "name": "CVE-2019-5188",
           "description": "A code execution vulnerability exists in the directory rehashing functionality of E2fsprogs e2fsck 1.45.4. A specially crafted ext4 directory can cause an out-of-bounds write on the stack, resulting in code execution. An attacker can corrupt a partition to trigger this vulnerability.",
           "severity": "MEDIUM",
           "attributes": [
             {
               "key": "package_version",
               "value": "1.44.1-1ubuntu1.1"
             },
             {
               "key": "package_name",
               "value": "e2fsprogs"
             },
             {
               "key": "CVSS2_VECTOR",
               "value": "AV:L/AC:L/Au:N/C:P/I:P/A:P"
             }
           ]
         }
      ]
   }
}
```
For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see DescribeImageScanFindings in AWS CLI Command Reference.

describe-images

The following code example shows how to use describe-images.

AWS CLI

To describe an image in a repository

The following describe-images example displays details about an image in the cluster-autoscaler repository with the tag v1.13.6.

```
aws ecr describe-images \
  --repository-name cluster-autoscaler \
  --image-ids imageTag=v1.13.6
```
• For API details, see [DescribeImages](https://docs.aws.amazon.com/cli/latest/reference/ecr/describe-images.html) in *AWS CLI Command Reference*.

**get-authorization-token**

The following code example shows how to use `get-authorization-token`.

### AWS CLI

**To get an authorization token for your default registry**

The following `get-authorization-token` example command gets an authorization token for your default registry.

```bash
gs ecr get-authorization-token
```

**Output:**

```
{
    "authorizationData": [
    {
      "authorizationToken": "QVdTOkN...",
      "expiresAt": 1448875853.241,
      "proxyEndpoint": "https://123456789012.dkr.ecr.us-west-2.amazonaws.com"
    }
    ]
}
```
get-download-url-for-layer

The following code example shows how to use `get-download-url-for-layer`.

**AWS CLI**

**To get the download URL of a layer**

The following `get-download-url-for-layer` example displays the download URL of a layer with the digest `sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed` in the `cluster-autoscaler` repository.

```
aws ecr get-download-url-for-layer \
   --repository-name cluster-autoscaler \ 
   --layer-digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
   "layerDigest": "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed"
}
```

For API details, see [GetDownloadUrlForLayer](#) in *AWS CLI Command Reference*.

get-lifecycle-policy

The following code example shows how to use `get-lifecycle-policy`.

• For API details, see [GetAuthorizationToken](#) in *AWS CLI Command Reference*. 
AWS CLI

To retrieve a lifecycle policy

The following `get-lifecycle-policy` example displays details of the lifecycle policy for the specified repository in the default registry for the account.

```
aws ecr get-lifecycle-policy \
   --repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
   "registryId": "123456789012",
   "repositoryName": "project-a/amazon-ecs-sample",
   "lifecyclePolicyText": "{"rules":[{"rulePriority":1,"description":"Expire images older than 14 days","selection":{"tagStatus":"untagged","countType":"sinceImagePushed","countUnit":"days","countNumber":14},"action":{"type":"expire"}}],"lastEvaluatedAt": 1504295007.0
}
```

For more information, see Lifecycle Policies in the Amazon ECR User Guide.
- For API details, see GetLifecyclePolicy in AWS CLI Command Reference.

get-lifecycle-policy-preview

The following code example shows how to use `get-lifecycle-policy-preview`.

AWS CLI

To retrieve details for a lifecycle policy preview

The following `get-lifecycle-policy-preview` example retrieves the result of a lifecycle policy preview for the specified repository in the default registry for an account.

Command:

```
aws ecr get-lifecycle-policy-preview \
   --repository-name "project-a/amazon-ecs-sample"
```
Output:

```
{
    "registryId": "012345678910",
    "repositoryName": "project-a/amazon-ecs-sample",
    "lifecyclePolicyText": "{\n        "rules": [{\n            "rulePriority": 1,\n            "description": "Expire images older than 14 days",
            "selection": {\n                "tagStatus": "untagged",
                "countType": "sinceImagePushed",
                "countUnit": "days",
                "countNumber": 14
            },\n            "action": {\n                "type": "expire"
            }
        }],\n        "status": "COMPLETE",
        "previewResults": [],
        "summary": {
            "expiringImageTotalCount": 0
        }
    }
}
```

For more information, see [Lifecycle Policies](https://docs.aws.amazon.com/AmazonECR/latest/userguide/lifecycle-policies.html) in the *Amazon ECR User Guide*.

- For API details, see [GetLifecyclePolicyPreview](https://docs.aws.amazon.com/cli/latest/reference/ecr/get-lifecycle-policy-preview.html) in *AWS CLI Command Reference*.

### get-login

The following code example shows how to use get-login.

**AWS CLI**

**To retrieve a Docker login command to your default registry**

This example prints a command that you can use to log in to your default Amazon ECR registry.

**Command:**

```
aws ecr get-login
```

**Output:**

```
docker login -u AWS -p <password> -e none https://
/aws_account_id>.dkr.ecr.<region>.amazonaws.com
```
### To log in to another account's registry

This example prints one or more commands that you can use to log in to Amazon ECR registries associated with other accounts.

**Command:**

```bash/aws ecr get-login --registry-ids 012345678910 023456789012
```

**Output:**

```
docker login -u <username> -p <token-1> -e none <endpoint-1>
docker login -u <username> -p <token-2> -e none <endpoint-2>
```

- For API details, see [GetLogin](https://docs.aws.amazon.com/cli/latest/reference/ecr/get-login.html) in *AWS CLI Command Reference*.

### get-login-password

The following code example shows how to use `get-login-password`.

**AWS CLI**

#### To retrieve a password to authenticate to a registry

The following `get-login-password` displays a password that you can use with a container client of your choice to authenticate to any Amazon ECR registry that your IAM principal has access to.

```bash
/aws ecr get-login-password
```

**Output:**

```
<password>
```

To use with the Docker CLI, pipe the output of the `get-login-password` command to the `docker login` command. When retrieving the password, ensure that you specify the same Region that your Amazon ECR registry exists in.

```bash
/aws ecr get-login-password \ --region <region> \
```
For more information, see [Registry Authentication](#) in the *Amazon ECR User Guide*.

- For API details, see [GetLoginPassword](#) in *AWS CLI Command Reference*.

### get-repository-policy

The following code example shows how to use `get-repository-policy`.

**AWS CLI**

**To retrieve the repository policy for a repository**

The following `get-repository-policy` example displays details about the repository policy for the `cluster-autoscaler` repository.

```bash
aws ecr get-repository-policy \
   --repository-name cluster-autoscaler
```

**Output:**

```
{
    "registryId": "012345678910",
    "repositoryName": "cluster-autoscaler",
    "policyText": "{\n      "Version" : "2008-10-17",
      "Statement" : [ {\n        "Sid" : "allow public pull",
        "Effect" : "Allow",
        "Principal" : "*",
        "Action" : [ "ecr:BatchCheckLayerAvailability", "ecr:BatchGetImage",
        "ecr:GetDownloadUrlForLayer" ]\n      } ]\n    }
}
```

- For API details, see [GetRepositoryPolicy](#) in *AWS CLI Command Reference*.

### initiate-layer-upload

The following code example shows how to use `initiate-layer-upload`.

**AWS CLI**

**To initiate an image layer upload**
The following `initiate-layer-upload` example initiates an image layer upload to the layer-test repository.

```bash
aws ecr initiate-layer-upload \
   --repository-name layer-test
```

Output:

```
{
   "partSize": 10485760,
   "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9"
}
```

- For API details, see `InitiateLayerUpload` in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

To list the tags for repository

The following `list-tags-for-resource` example displays a list of the tags associated with the hello-world repository.

```bash
aws ecr list-tags-for-resource \
```

Output:

```
{
   "tags": [
      {
         "Key": "Stage",
         "Value": "Integ"
      }
   ]
}
```

- For API details, see `ListTagsForResource` in *AWS CLI Command Reference*. 
**put-image**

The following code example shows how to use `put-image`.

**AWS CLI**

**To retag an image with its manifest**

The following `put-image` example creates a new tag in the `hello-world` repository with an existing image manifest.

```bash
aws ecr put-image \
    --repository-name hello-world \
    --image-tag 2019.08 \
    --image-manifest file://hello-world.manifest.json
```

**Contents of `hello-world.manifest.json`:**

```json
{
    "schemaVersion": 2,
    "mediaType": "application/vnd.docker.distribution.manifest.v2+json",
    "config": {
        "mediaType": "application/vnd.docker.container.image.v1+json",
        "size": 5695,
        "digest": "sha256:cea5fe7701b7db3dd1c372f3cea6f43cdda444fcc488f530829145e426d8b980"
    },
    "layers": [
        {
            "mediaType": "application/vnd.docker.image.rootfs.diff.tar.gzip",

The following code example shows how to use `put-image-scanning-configuration`.

**AWS CLI**

To update the image scanning configuration for a repository

The following `put-image-scanning-configuration` example updates the image scanning configuration for the specified repository.

```bash
aws ecr put-image-scanning-configuration \
  --repository-name sample-repo \
  --image-scanning-configuration scanOnPush=true
```

Output:

```json
{
  "registryId": "012345678910",
...
}
```
For more information, see Image Scanning in the Amazon ECR User Guide.

- For API details, see PutImageScanningConfiguration in AWS CLI Command Reference.

**put-image-tag-mutability**

The following code example shows how to use put-image-tag-mutability.

**AWS CLI**

**To update the image tag mutability setting for a repository**

The following put-image-tag-mutability example configures the specified repository for tag immutability. This prevents all image tags within the repository from being overwritten.

```bash
aws ecr put-image-tag-mutability \
   --repository-name hello-repository \
   --image-tag-mutability IMMUTABLE
```

**Output:**

```json
{
   "registryId": "012345678910",
   "repositoryName": "sample-repo",
   "imageTagMutability": "IMMUTABLE"
}
```

For more information, see Image Tag Mutability in the Amazon ECR User Guide.

- For API details, see PutImageTagMutability in AWS CLI Command Reference.

**put-lifecycle-policy**

The following code example shows how to use put-lifecycle-policy.
AWS CLI

To create a lifecycle policy

The following `put-lifecycle-policy` example creates a lifecycle policy for the specified repository in the default registry for an account.

```bash
aws ecr put-lifecycle-policy \
  --repository-name "project-a/amazon-ecs-sample" \
  --lifecycle-policy-text "file://policy.json"
```

Contents of `policy.json`:

```json
{
  "rules": [
    {
      "rulePriority": 1,
      "description": "Expire images older than 14 days",
      "selection": {
        "tagStatus": "untagged",
        "countType": "sinceImagePushed",
        "countUnit": "days",
        "countNumber": 14
      },
      "action": {
        "type": "expire"
      }
    }
  ]
}
```

Output:

```json
{
  "registryId": "<aws_account_id>",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{"rules": [{"rulePriority": 1, "description": "Expire images older than 14 days", "selection": {"tagStatus": "untagged", "countType": "sinceImagePushed", "countUnit": "days", "countNumber": 14}, "action": {"type": "expire"}]},"
}
```
For more information, see Lifecycle Policies in the Amazon ECR User Guide.

- For API details, see PutLifecyclePolicy in AWS CLI Command Reference.

**set-repository-policy**

The following code example shows how to use set-repository-policy.

**AWS CLI**

**To set the repository policy for a repository**

The following set-repository-policy example attaches a repository policy contained in a file to the cluster-autoscaler repository.

```
aws ecr set-repository-policy \
   --repository-name cluster-autoscaler \
   --policy-text file://my-policy.json
```

**Contents of my-policy.json:**

```json
{
   "Version": "2008-10-17",
   "Statement": [
      {
         "Sid": "allow public pull",
         "Effect": "Allow",
         "Principal": "*",
         "Action": [
            "ecr:BatchCheckLayerAvailability",
            "ecr:BatchGetImage",
            "ecr:GetDownloadUrlForLayer"
         ]
      }
   ]
}
```

**Output:**

```json
{
   "registryId": "012345678910",
   "repositoryName": "cluster-autoscaler",
   "policyText": "file://my-policy.json"
}
```
"repositoryName": "cluster-autoscaler",
"policyText": "{
  "Version" : "2008-10-17",
  "Statement" : [ {
    "Sid" : "allow public pull",
    "Effect" : "Allow",
    "Principal" : "*",
    "Action" : [ "ecr:BatchCheckLayerAvailability", "ecr:BatchGetImage ", "ecr:GetDownloadUrlForLayer" ]
  } ]
}"

• For API details, see SetRepositoryPolicy in AWS CLI Command Reference.

**start-image-scan**

The following code example shows how to use start-image-scan.

**AWS CLI**

To start an image vulnerability scan

The following start-image-scan example starts an image scan for and specified by the image digest in the specified repository.

```
aws ecr start-image-scan \
  --repository-name sample-repo \
  --image-id \
  imageDigest=sha256:74b2c688c700ec95a93e478c959737c148df3fbf5ea706abe0318726eb885e6
```

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "sample-repo",
  "imageId": {
    "imageDigest": "sha256:74b2c688c700ec95a93e478c959737c148df3fbf5ea706abe0318726eb885e6"
  },
  "imageScanStatus": {
    "status": "IN_PROGRESS"
  }
}
```

For more information, see Image Scanning in the Amazon ECR User Guide.

• For API details, see StartImageScan in AWS CLI Command Reference.
**start-lifecycle-policy-preview**

The following code example shows how to use `start-lifecycle-policy-preview`.

**AWS CLI**

**To create a lifecycle policy preview**

The following `start-lifecycle-policy-preview` example creates a lifecycle policy preview defined by a JSON file for the specified repository.

```bash
aws ecr start-lifecycle-policy-preview \
  --repository-name "project-a/amazon-ecs-sample" \
  --lifecycle-policy-text "file://policy.json"
```

Contents of `policy.json`:

```json
{
  "rules": [
    {
      "rulePriority": 1,
      "description": "Expire images older than 14 days",
      "selection": {
        "tagStatus": "untagged",
        "countType": "sinceImagePushed",
        "countUnit": "days",
        "countNumber": 14
      },
      "action": {
        "type": "expire"
      }
    }
  ]
}
```

Output:

```json
{
  "registryId": "012345678910",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{
    "rules": [
      {
        "rulePriority": 1,
        "description": "Expire images older than 14 days",
        "selection": {
          "tagStatus": "untagged",
          "countType": "sinceImagePushed",
          "countUnit": "days",
          "countNumber": 14
        },
        "action": {
          "type": "expire"
        }
      }
    ]
  }
}
```

```json
{
    "countType": "sinceImagePushed",
    "countUnit": "days",
    "countNumber": 14
}
```

```json
{
    "action": {
        "type": "expire"
    }
}
```

```
{
    "status": "IN_PROGRESS"
}
```

- For API details, see [StartLifecyclePolicyPreview](#) in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a repository**

The following `tag-resource` example sets a tag with key `Stage` and value `Integ` on the `hello-world` repository.

```bash
aws ecr tag-resource \
    --tags Key=Stage,Value=Integ
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To untag a repository**

The following `untag-resource` example removes the tag with the key `Stage` from the `hello-world` repository.

```bash
aws ecr untag-resource \
    --tag-keys Stage
```
This command produces no output.

- For API details, see UntagResource in AWS CLI Command Reference.

**upload-layer-part**

The following code example shows how to use upload-layer-part.

**AWS CLI**

**To upload a layer part**

This following upload-layer-part uploads an image layer part to the layer-test repository.

```bash
aws ecr upload-layer-part \
  --repository-name layer-test \
  --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \n  --part-first-byte 0 \n  --part-last-byte 8323314 \n  --layer-part-blob file:///var/lib/docker/image/overlay2/layerdb/sha256/ff986b10a018b48074e6d3a98b39aad8ccc002cda912d4148c0f92b3729323e/layer.b64
```

Output:

```json
{
  "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
  "registryId": "012345678910",
  "lastByteReceived": 8323314,
  "repositoryName": "layer-test"
}
```

- For API details, see UploadLayerPart in AWS CLI Command Reference.

**Amazon ECS examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**Create a cluster**

The following code example shows how to create an Amazon ECS cluster.

**AWS CLI**

**Example 1: To create a new cluster**

The following `create-cluster` example creates a cluster.

```bash
aws ecs create-cluster \
   --cluster-name MyCluster
```

**Output:**

```json
{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "ACTIVE",
      "registeredContainerInstancesCount": 0,
      "pendingTasksCount": 0,
      "runningTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "tags": []
   }
}
```

For more information, see [Creating a Cluster](#) in the *Amazon ECS Developer Guide*. 
Example 2: To create a new cluster using capacity providers

The following `create-cluster` example creates a cluster and associates two existing capacity providers with it. The `create-capacity-provider` command is used to create a capacity provider. Specifying a default capacity provider strategy is optional, but recommended. In this example, we create a cluster named `MyCluster` and associate the `MyCapacityProvider1` and `MyCapacityProvider2` capacity providers with it. A default capacity provider strategy is specified that spreads the tasks evenly across both capacity providers.

```
aws ecs create-cluster --cluster-name MyCluster --capacity-providers MyCapacityProvider1 MyCapacityProvider2 --default-capacity-provider-strategy capacityProvider=MyCapacityProvider1,weight=1
capacityProvider=MyCapacityProvider2,weight=1
```

Output:

```
{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "PROVISIONING",
      "registeredContainerInstancesCount": 0,
      "pendingTasksCount": 0,
      "runningTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "settings": [
         {
            "name": "containerInsights",
            "value": "enabled"
         }
      ],
      "capacityProviders": [
         "MyCapacityProvider1",
         "MyCapacityProvider2"
      ],
      "defaultCapacityProviderStrategy": [
         {
            "capacityProvider": "MyCapacityProvider1",
            "weight": 1,
            "base": 0
         }
      ]
   }
}
```
{  
  "capacityProvider": "MyCapacityProvider2",
  "weight": 1,
  "base": 0
},

"attachments": [

      },
      {
        "name": "scalingPlanName",
        "value": "ECSManagedAutoScalingPlan-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
      }
    ]
  }
],

"attachmentsStatus": "UPDATE_IN_PROGRESS"
}
For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

Example 3: To create a new cluster with multiple tags

The following create-cluster example creates a cluster with multiple tags. For more information about adding tags using shorthand syntax, see Using Shorthand Syntax with the AWS Command Line Interface in the AWS CLI User Guide.

```bash
aws ecs create-cluster \
  --cluster-name MyCluster \
  --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

Output:

```json
{
  "cluster": {
    "clusterName": "MyCluster",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,
    "runningTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [
      {
        "key": "key1",
        "value": "value1"
      },
      {
        "key": "key2",
        "value": "value2"
      },
      {
        "key": "key3",
        "value": "value3"
      }
    ]
  }
}
```

For more information, see Creating a Cluster in the Amazon ECS Developer Guide.
Create a service

The following code example shows how to create an Amazon ECS service.

AWS CLI

Example 1: To create a service with a Fargate task

The following create-service example shows how to create a service using a Fargate task.

```
aws ecs create-service \
    --cluster MyCluster \
    --service-name MyService \
    --task-definition sample-fargate:1 \
    --desired-count 2 \
    --launch-type FARGATE \
    --platform-version LATEST \
    --network-configuration \
    "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321],assignPublicIp=ENABLED}" \
    --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

Output:

```
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
        "serviceName": "MyService",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",
        "desiredCount": 2,
        "runningCount": 0,
        "pendingCount": 0,
        "launchType": "FARGATE",
        "platformVersion": "LATEST",
        "deploymentConfiguration": {
```

For API details, see CreateCluster in AWS CLI Command Reference.

Example 2: To create a service using the EC2 launch type

The following `create-service` example shows how to create a service called `ecs-simple-service` with a task that uses the EC2 launch type. The service uses the `sleep360` task definition and it maintains 1 instantiation of the task.

```
aws ecs create-service \
  --cluster MyCluster \
  --service-name ecs-simple-service \
  --task-definition sleep360:2 \
  --desired-count 1
```

Output:

```
{
  "service": {
    "serviceName": "ecs-simple-service",
    "loadBalancers": []
  }
}
```
"serviceRegistries": [],
"status": "ACTIVE",
"desiredCount": 1,
"runningCount": 0,
"pendingCount": 0,
"launchType": "EC2",
"taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:2",
"deploymentConfiguration": {
  "maximumPercent": 200,
  "minimumHealthyPercent": 100
},
"deployments": [
  {
    "id": "ecs-svc/1234567890123456789",
    "status": "PRIMARY",
    "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:2",
    "desiredCount": 1,
    "pendingCount": 0,
    "runningCount": 0,
    "createdAt": 1557206498.798,
    "updatedAt": 1557206498.798,
    "launchType": "EC2"
  }

}

Example 3: To create a service that uses an external deployment controller

The following create-service example creates a service that uses an external deployment controller.

```
aws ecs create-service \
   --cluster MyCluster \
```
--service-name MyService \n--deployment-controller type=EXTERNAL \n--desired-count 1

Output:

```json
{
    "service": {
        "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
        "serviceName": "MyService",
        "loadBalancers": [],
        "serviceRegistries": [],
        "status": "ACTIVE",
        "desiredCount": 1,
        "runningCount": 0,
        "pendingCount": 0,
        "launchType": "EC2",
        "deploymentConfiguration": {
            "maximumPercent": 200,
            "minimumHealthyPercent": 100
        },
        "taskSets": [],
        "deployments": [],
        "roleArn": "arn:aws:iam::123456789012:role/aws-service-role/ecs.amazonaws.com/AWSServiceRoleForECS",
        "events": [],
        "createdAt": 1557128207.101,
        "placementConstraints": [],
        "placementStrategy": [],
        "schedulingStrategy": "REPLICA",
        "deploymentController": {
            "type": "EXTERNAL"
        },
        "enableECSManagedTags": false,
        "propagateTags": "NONE"
    }
}
```

Example 4: To create a new service behind a load balancer
The following create-service example shows how to create a service that is behind a load balancer. You must have a load balancer configured in the same Region as your container instance. This example uses the --cli-input-json option and a JSON input file called ecs-simple-service-elb.json with the following content:

```json
{
    "serviceName": "ecs-simple-service-elb",
    "taskDefinition": "ecs-demo",
    "loadBalancers": [
        {
            "loadBalancerName": "EC2Contai-EcsElast-123456789012",
            "containerName": "simple-demo",
            "containerPort": 80
        }
    ],
    "desiredCount": 10,
    "role": "ecsServiceRole"
}
```

Command:

```bash
aws ecs create-service \
    --cluster MyCluster \
    --service-name ecs-simple-service-elb \
    --cli-input-json file://ecs-simple-service-elb.json
```

Output:

```json
{
    "service": {
        "status": "ACTIVE",
        "pendingCount": 0,
        "loadBalancers": [
            {
                "containerName": "ecs-demo",
                "containerPort": 80,
                "loadBalancerName": "EC2Contai-EcsElast-123456789012"
            }
        ],
        "roleArn": "arn:aws:iam::123456789012:role/ecsServiceRole",
```
For more information, see Creating a Service in the Amazon ECS Developer Guide.

- For API details, see CreateService in AWS CLI Command Reference.

Delete a cluster

The following code example shows how to delete an Amazon ECS cluster.

**AWS CLI**

**To delete an empty cluster**

The following delete-cluster example deletes the specified empty cluster.

```
aws ecs delete-cluster --cluster MyCluster
```

Output:

```json
{
  "cluster": {
```
"status": "INACTIVE",
"clusterName": "MyCluster",
"registeredContainerInstancesCount": 0,
"pendingTasksCount": 0,
"runningTasksCount": 0,
"activeServicesCount": 0
"statistics": [],
"tags": []

For more information, see Deleting a Cluster in the Amazon ECS Developer Guide.

- For API details, see DeleteCluster in AWS CLI Command Reference.

Delete a service

The following code example shows how to delete an Amazon ECS service.

AWS CLI

To delete a service

The following ecs delete-service example deletes the specified service from a cluster. You can include the --force parameter to delete a service even if it has not been scaled to zero tasks.

```
aws ecs delete-service --cluster MyCluster --service MyService1 --force
```

For more information, see Deleting a Service in the Amazon ECS Developer Guide.

- For API details, see DeleteService in AWS CLI Command Reference.

Describe clusters

The following code example shows how to describe your Amazon ECS clusters.

AWS CLI

Example 1: To describe a cluster

The following describe-clusters example retrieves details about the specified cluster.
aws ecs describe-clusters \
 --cluster default

Output:

```
{
   "clusters": [
   {
   "status": "ACTIVE",
   "clusterName": "default",
   "registeredContainerInstancesCount": 0,
   "pendingTasksCount": 0,
   "runningTasksCount": 0,
   "activeServicesCount": 1,
   "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default"
   }
   ],
   "failures": []
}
```

For more information, see [Amazon ECS Clusters](https://docs.aws.amazon.com/ecs/latest/userguide/cluster.html) in the *Amazon ECS Developer Guide*.

**Example 2: To describe a cluster with the attachment option**

The following `describe-clusters` example specifies the ATTACHMENTS option. It retrieves details about the specified cluster and a list of resources attached to the cluster in the form of attachments. When using a capacity provider with a cluster, the resources, either AutoScaling plans or scaling policies, will be represented as asp or as_policy ATTACHMENTS.

```
aws ecs describe-clusters \
 --include ATTACHMENTS \
 --clusters sampleCluster
```

Output:

```
{
   "clusters": [
   {
   "clusterName": "sampleCluster",
   ...
   
```
For more information, see Amazon ECS Clusters in the Amazon ECS Developer Guide.

- For API details, see DescribeClusters in AWS CLI Command Reference.

**Describe tasks**

The following code example shows how to describe your Amazon ECS tasks.
AWS CLI

Example 1: To describe a single task

The following `describe-tasks` example retrieves the details of a task in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full ARN of the task.

```bash
aws ecs describe-tasks \
   --cluster MyCluster \
   --tasks arn:aws:ecs:us-east-1:123456789012:task/MyCluster/4d590253bb114126b7afa7b58EXAMPLE
```

Output:

```json
{
   "tasks": [
      {
         "attachments": [],
         "attributes": [
            {
               "name": "ecs.cpu-architecture",
               "value": "x86_64"
            }
         ],
         "availabilityZone": "us-east-1b",
         "clusterArn": "arn:aws:ecs:us-east-1:123456789012:cluster/MyCluster",
         "connectivity": "CONNECTED",
         "connectivityAt": "2021-08-11T12:26.681000-04:00",
         "containerInstanceArn": "arn:aws:ecs:us-east-1:123456789012:container-instance/test/025c7e2c5e054a6790a29fc1fEXAMPLE",
         "containers": [
            {
               "containerArn": "arn:aws:ecs:us-east-1:123456789012:container/MyCluster/4d590253bb114126b7afa7b58eea9221/a992d1cc-4a46-474a-b6e8-24688EXAMPLE",
               "taskArn": "arn:aws:ecs:us-east-1:123456789012:task/MyCluster/4d590253bb114126b7afa7b58EXAMPLE",
               "name": "simple-app",

  "version": 2
},
  "failures": []
```
Example 2: To describe multiple tasks

The following `describe-tasks` example retrieves the details of multiple tasks in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full IDs of the tasks.

```bash
aws ecs describe-tasks \
    --cluster MyCluster \ 
    --tasks "74de0355a10a4f979ac495c14EXAMPLE" "d789e94343414c25b9f6bd59eEXAMPLE"
```

Output:

```json
{
    "tasks": [
        {
            "attachments": [

- For API details, see [DescribeTasks](https://docs.aws.amazon.com/cli/latest/reference/ecs/describe-tasks.html) in *AWS CLI Command Reference*. 

Actions and scenarios
List clusters

The following code example shows how to list your Amazon ECS clusters.

AWS CLI

To list your available clusters

The following list-clusters example lists all of the available clusters.

```
aws ecs list-clusters
```

Output:

```
{
    "clusterArns": [
        "arn:aws:ecs:us-west-2:123456789012:cluster/AnotherECSCluster"
    ]
}
```

For more information, see Amazon ECS Clusters in the Amazon ECS Developer Guide.

- For API details, see ListClusters in AWS CLI Command Reference.

List services in a cluster

The following code example shows how to list your Amazon ECS services in a cluster.

AWS CLI

To list the services in a cluster

The following list-services example shows how to list the services running in a cluster.

```
aws ecs list-services --cluster MyCluster
```

Output:

```
{
    "serviceArns": [
        "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService"
    ]
}
```
List tasks in a cluster

The following code example shows how to list your Amazon ECS tasks in a cluster.

**AWS CLI**

**Example 1: To list the tasks in a cluster**

The following `list-tasks` example lists all of the tasks in a cluster.

```
aws ecs list-tasks --cluster default
```

Output:

```
{
   "taskArns": [
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
   ]
}
```

**Example 2: To list the tasks on a particular container instance**

The following `list-tasks` example lists the tasks on a container instance, using the container instance UUID as a filter.

```
aws ecs list-tasks --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{
}
```
Update a service

The following code example shows how to update an Amazon ECS service.

**AWS CLI**

**Example 1: To change the task definition used in a service**

The following update-service example updates the my-http-service service to use the amazon-ecs-sample task definition.

```
aws ecs update-service --service my-http-service --task-definition amazon-ecs-sample
```

**Example 2: To change the number of tasks in a service**

The following update-service example updates the desired task count of the service my-http-service to 3.

```
aws ecs update-service --service my-http-service --desired-count 3
```

For more information, see [Updating a Service](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/service-update.html) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateService](https://docs.aws.amazon.com/cli/latest/reference/ecs/update-service.html) in *AWS CLI Command Reference*.

**create-capacity-provider**

The following code example shows how to use create-capacity-provider.

**AWS CLI**

To create a capacity provider

```
The following create-capacity-provider example creates a capacity provider that uses an Auto Scaling group named MyASG, has managed scaling and managed termination protection enabled. This configuration is used for Amazon ECS cluster auto scaling.

```sh
aws ecs create-capacity-provider \
--name "MyCapacityProvider" \
```

Output:

```json
{
   "capacityProvider": {
      "capacityProviderArn": "arn:aws:ecs:us-east-1:123456789012:capacity-provider/MyCapacityProvider",
      "name": "MyCapacityProvider",
      "status": "ACTIVE",
      "autoScalingGroupProvider": {
         "managedScaling": {
            "status": "ENABLED",
            "targetCapacity": 100,
            "minimumScalingStepSize": 1,
            "maximumScalingStepSize": 10000,
            "instanceWarmupPeriod": 300
         },
         "managedTerminationProtection": "ENABLED"
      },
      "tags": []
   }
}
```

For more information, see [Amazon ECS cluster auto scaling](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/amazon-ecs-cluster-auto-scaling.html) in the *Amazon ECS Developer Guide*.

- For API details, see [CreateCapacityProvider](https://docs.aws.amazon.com/cli/latest/reference/ecs/create-capacity-provider.html) in *AWS CLI Command Reference*.

### create-task-set

The following code example shows how to use create-task-set.
AWS CLI

To create a task set

The following `create-task-set` example creates a task set in a service that uses an external deployment controller.

```bash
aws ecs create-task-set \
  --cluster MyCluster \
  --service MyService \
  --task-definition MyTaskDefinition:2 \
  --network-configuration
  "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321]}"
```

Output:

```json
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "status": "ACTIVE",
    "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/MyTaskDefinition:2",
    "computedDesiredCount": 0,
    "pendingCount": 0,
    "runningCount": 0,
    "createdAt": 1557128360.711,
    "updatedAt": 1557128360.711,
    "launchType": "EC2",
    "networkConfiguration": {
      "awsvpcConfiguration": {
        "subnets": ["subnet-12344321"],
        "securityGroups": ["sg-12344321"],
        "assignPublicIp": "DISABLED"
      }
    },
    "loadBalancers": [],
    "serviceRegistries": []
  }
}
```
"scale": {  
  "value": 0.0,  
  "unit": "PERCENT"  
},  
"stabilityStatus": "STABILIZING",  
"stabilityStatusAt": 1557128360.711
}

- For API details, see `CreateTaskSet` in *AWS CLI Command Reference*.

**delete-account-setting**

The following code example shows how to use `delete-account-setting`.

**AWS CLI**

**To delete the account settings for a specific IAM user or IAM role**

The following example `delete-account-setting` deletes the account settings for the specific IAM user or IAM role.

```bash
aws ecs delete-account-setting 
--name serviceLongArnFormat 
--principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```json
{
    "setting": {
        "name": "serviceLongArnFormat",
        "value": "enabled",
        "principalArn": "arn:aws:iam::123456789012:user/MyUser"
    }
}
```

For more information, see [Amazon Resource Names (ARNs) and IDs](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/arns.html) in the *Amazon ECS Developer Guide*.

- For API details, see `DeleteAccountSetting` in *AWS CLI Command Reference*.  

Actions and scenarios
delete-attributes

The following code example shows how to use delete-attributes.

AWS CLI

To delete one or more custom attributes from an Amazon ECS resource

The following delete-attributes deletes an attribute with the name stack from a container instance.

```bash
aws ecs delete-attributes \
   --attributes name=stack,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```json
{
   "attributes": [
   {
       "name": "stack",
       "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
       "value": "production"
   }
   ]
}
```

• For API details, see DeleteAttributes in AWS CLI Command Reference.

delete-capacity-provider

The following code example shows how to use delete-capacity-provider.

AWS CLI

Example 1: To delete a capacity provider using the Amazon Resource Name (ARN)

The following delete-capacity-provider example deletes a capacity provider by specifying the Amazon Resource Name (ARN) of the capacity provider. The ARN as well as the
status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```bash
aws ecs delete-capacity-provider \
```

Output:

```json
{
   "capacityProvider": {
      "name": "ExampleCapacityProvider",
      "status": "ACTIVE",
      "autoScalingGroupProvider": {
         "managedScaling": {
            "status": "ENABLED",
            "targetCapacity": 100,
            "minimumScalingStepSize": 1,
            "maximumScalingStepSize": 10000
         },
         "managedTerminationProtection": "DISABLED"
      },
      "updateStatus": "DELETE_IN_PROGRESS",
      "tags": []
   }
}
```

For more information, see Cluster capacity providers in the Amazon ECS Developer Guide.

**Example 2: To delete a capacity provider using the name**

The following `delete-capacity-provider` example deletes a capacity provider by specifying the short name of the capacity provider. The short name as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```bash
aws ecs delete-capacity-provider \
```

Example 2: To delete a capacity provider using the name

The following `delete-capacity-provider` example deletes a capacity provider by specifying the short name of the capacity provider. The short name as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```bash
aws ecs delete-capacity-provider \
```
Output:

```json
{
    "capacityProvider": {
        "name": "ExampleCapacityProvider",
        "status": "ACTIVE",
        "autoScalingGroupProvider": {
            "managedScaling": {
                "status": "ENABLED",
                "targetCapacity": 100,
                "minimumScalingStepSize": 1,
                "maximumScalingStepSize": 10000
            },
            "managedTerminationProtection": "DISABLED"
        },
        "updateStatus": "DELETE_IN_PROGRESS",
        "tags": []
    }
}
```

For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/concepts-capacity-providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteCapacityProvider](https://docs.aws.amazon.com/cli/latest/reference/ecs/delete-capacity-provider.html) in *AWS CLI Command Reference*.

### delete-task-definitions

The following code example shows how to use delete-task-definitions.

**AWS CLI**

**To delete a task definition**

The following delete-task-definitions example deletes an INACTIVE task definition.

```
aws ecs delete-task-definitions \
  --task-definition curltest:1
```
Output:

```json
{
"taskDefinitions": [
{
"taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/curltest:1",
"containerDefinitions": [

"registeredBy": "arn:aws:sts::123456789012:assumed-role/Admin/jdoe"
},
"failures": []
}

For more information, see [Amazon ECS Task Definitions](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/task_definitions.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteTaskDefinitions](https://docs.aws.amazon.com/cli/latest/reference/ecs/delete-task-definitions.html) in *AWS CLI Command Reference*.

**delete-task-set**

The following code example shows how to use delete-task-set.

**AWS CLI**

**To delete a task set**

The following delete-task-set example shows how to delete a task set. You can include the `--force` parameter to delete a task set even if it has not been scaled to zero.

```
aws ecs delete-task-set \
   --cluster MyCluster \
   --service MyService \
   --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-svc/1234567890123456789 \
   --force
```

**Output:**

```
{
   "taskSet": {
      "id": "ecs-svc/1234567890123456789",
```
For API details, see `delete-task-set` in `AWS CLI Command Reference`.

deregister-container-instance

The following code example shows how to use `deregister-container-instance`.

**AWS CLI**

To deregister a container instance from a cluster
The following deregister-container-instance example deregisters a container instance from the specified cluster. If there are still tasks running in the container instance, you must either stop those tasks before deregistering, or use the --force option.

```
aws ecs deregister-container-instance \
  --cluster arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --container-instance arn:aws:ecs:us-west-2:123456789012:container-instance/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \n  --force
```

Output:

```
{
  "containerInstance": {
    "remainingResources": [ 
      {
        "integerValue": 1024,
        "doubleValue": 0.0,
        "type": "INTEGER",

- For API details, see [DeregisterContainerInstance](AWS CLI Command Reference) in *AWS CLI Command Reference*.

### deregister-task-definition

The following code example shows how to use `deregister-task-definition`.

**AWS CLI**

**To deregister a task definition**

The following `deregister-task-definition` example deregisters the first revision of the curler task definition in your default region.

```bash
aws ecs deregister-task-definition --task-definition curler:1
```

Note that in the resulting output, the task definition status shows INACTIVE:

```json
{
    "taskDefinition": {
        "status": "INACTIVE",
        "family": "curler",
        "volumes": [],
        "containerDefinitions": [ {
            "environment": [],
            "name": "curler",
            "mountPoints": [],
            "image": "curl:latest",
            "cpu": 100,
            "portMappings": [],
            "entryPoint": [],
            "memory": 256,
            "command": [
                "curl -v http://example.com/"
            ],
            "essential": true,
            "volumesFrom": []
        }
    }
}
```
For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DeregisterTaskDefinition in AWS CLI Command Reference.

describe-capacity-providers

The following code example shows how to use describe-capacity-providers.

**AWS CLI**

**Example 1: To describe all capacity providers**

The following describe-capacity-providers example retrieves details about all capacity providers.

```bash
aws ecs describe-capacity-providers
```

Output:

```
{
   "capacityProviders": [
   {
      "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-provider/MyCapacityProvider",
      "name": "MyCapacityProvider",
      "status": "ACTIVE",
      "autoScalingGroupProvider": {
         "autoScalingGroupProvider": {
            "managedScaling": {
               "status": "ENABLED",
               "targetCapacity": 100,
               "minimumScalingStepSize": 1,
               "maximumScalingStepSize": 1000
            },
            "managedTerminationProtection": "ENABLED"
```
For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

**Example 2: To describe a specific capacity providers**

The following `describe-capacity-providers` example retrieves details about a specific capacity provider. Using the `--include TAGS` parameter will add the tags associated with the capacity provider to the output.

```bash
aws ecs describe-capacity-providers \
    --capacity-providers MyCapacityProvider \
    --include TAGS
```

**Output:**

```json
{
    "capacityProviders": [
    {
        "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-provider/MyCapacityProvider",
        "name": "MyCapacityProvider",
        "status": "ACTIVE",
        "tags": [ ]
    }
    ]
}
```
  "managedScaling": {
    "status": "ENABLED",
    "targetCapacity": 100,
    "minimumScalingStepSize": 1,
    "maximumScalingStepSize": 1000
  },
  "managedTerminationProtection": "ENABLED"
},
"tags": [
  {
    "key": "environment",
    "value": "production"
  }
]
}]

For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster_capacity_providers.html) in the *Amazon ECS Developer Guide*.

- For API details, see [DescribeCapacityProviders](https://docs.aws.amazon.com/cli/latest/reference/ecs/describe-container-instances.html) in *AWS CLI Command Reference*.

describe-container-instances

The following code example shows how to use `describe-container-instances`.

AWS CLI

**To describe container instance**

The following `describe-container-instances` example retrieves details for a container instance in the update cluster, using the container instance UUID as an identifier.

```
aws ecs describe-container-instances \
  --cluster update \
  --container-instances a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```json
{
}

For more information, see Amazon ECS Container Instances in the Amazon ECS Developer Guide.

- For API details, see DescribeContainerInstances in AWS CLI Command Reference.

**describe-services**

The following code example shows how to use describe-services.

**AWS CLI**

To describe a service
The following describe-services example retrieves details for the my-http-service service in the default cluster.

```bash
aws ecs describe-services --services my-http-service
```

Output:

```
{
   "services": [
   {
      "status": "ACTIVE",
      "pendingCount": 0,
      "loadBalancers": [],
      "desiredCount": 10,

      }
      ],
      "runningCount": 10
   }
}
```
For more information, see Services in the Amazon ECS Developer Guide.

- For API details, see DescribeServices in AWS CLI Command Reference.

describe-task-definition

The following code example shows how to use describe-task-definition.

AWS CLI

To describe a task definition

The following describe-task-definition example retrieves the details of a task definition.

```
aws ecs describe-task-definition
   --task-definition hello_world:8
```

Output:

```
{
   "tasks": [
   {
   "attachments": [
   {
   "id": "17f3dff6-a9e9-4d83-99a9-7eb5193c2634",

For more information, see Amazon ECS Task Definitions in the Amazon ECS Developer Guide.

- For API details, see DescribeTaskDefinition in AWS CLI Command Reference.

describe-task-sets

The following code example shows how to use describe-task-sets.

AWS CLI

To describe a task set

The following describe-task-sets example describes a task set in a service that uses an external deployer.

```bash
aws ecs describe-task-sets
  --cluster MyCluster
  --service MyService
```

Output:

```
{
    "taskSets": [
        {
            "id": "ecs-svc/1234567890123456789",
            "status": "ACTIVE",
            "computedDesiredCount": 0,
            "pendingCount": 0,
        }
    ]
}
```
The following code example shows how to use `execute-command`.

**AWS CLI**

To run an interactive `/bin/sh` command

The following `execute-command` example runs an interactive `/bin/sh` command against a container named `MyContainer` for a task with an id of `arn:aws:ecs:us-east-1:123456789012:task/MyCluster/d789e94343414c25b9f6bd59eEXAMPLE`.

```
aws ecs execute-command \
```
This command produces no output.

For more information, see Using Amazon ECS Exec for debugging in the Amazon ECS Developer Guide.

- For API details, see ExecuteCommand in AWS CLI Command Reference.

### list-account-settings

The following code example shows how to use list-account-settings.

#### AWS CLI

**Example 1: To view the account settings for an account**

The following list-account-settings example displays the effective account settings for an account.

```bash
aws ecs list-account-settings --effective-settings
```

**Output:**

```json
{
    "settings": [ 
        {
            "name": "containerInstanceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        },
        {
            "name": "serviceLongArnFormat",
            "value": "enabled",
            "principalArn": "arn:aws:iam::123456789012:root"
        },
        {
```
Example 2: To view the account settings for a specific IAM user or IAM role

The following list-account-settings example displays the account settings for the specified IAM user or IAM role.

```bash
aws ecs list-account-settings --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```json
{
  "settings": [
    {
      "name": "serviceLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::123456789012:user/MyUser"
    }
  ]
}
```

For more information, see [Amazon Resource Names (ARNs) and IDs](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/arns.html) in the *Amazon ECS Developer Guide*.

- For API details, see [ListAccountSettings](https://docs.aws.amazon.com/cli/latest/reference/ecs/list-account-settings.html) in *AWS CLI Command Reference*.

**list-attributes**

The following code example shows how to use list-attributes.

**AWS CLI**

**To list the container instances that contain a specific attribute**

The following example lists the attributes for container instances that have the `stack=production` attribute in the default cluster.
aws ecs list-attributes \
   --target-type container-instance \
   --attribute-name stack \
   --attribute-value production \
   --cluster default

Output:

{
   "attributes": [
   {
       "name": "stack",
       "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
       "value": "production"
   }
   ]
}

For more information, see Amazon ECS Container Agent Configuration in the Amazon ECS Developer Guide.

- For API details, see ListAttributes in AWS CLI Command Reference.

list-container-instances

The following code example shows how to use list-container-instances.

AWS CLI

To list the container instances in a cluster

The following list-container-instances example lists all of the available container instances in a cluster.

aws ecs list-container-instances --cluster MyCluster

Output:

{
   "containerInstanceArns": [
"arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
"arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
]
}

For more information, see Amazon ECS Container Instances in the Amazon ECS Developer Guide.
- For API details, see ListContainerInstances in AWS CLI Command Reference.

list-services-by-namespace

The following code example shows how to use list-services-by-namespace.

AWS CLI

To list the services in a namespace

The following list-services-by-namespace example lists all of the services configured for the specified namespace in your default Region.

```
aws ecs list-services-by-namespace \\
   --namespace service-connect
```

Output:

```
{
   "serviceArns": [
   ]
}
```

For more information, see Service Connect in the Amazon ECS Developer Guide.
- For API details, see ListServicesByNamespace in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.
AWS CLI

**To list the tags for a resource**

The following `list-tags-for-resource` example lists the tags for a specific cluster.

```
aws ecs list-tags-for-resource \
```

Output:

```json
{
   "tags": [
       {
           "key": "key1",
           "value": "value1"
       },
       {
           "key": "key2",
           "value": "value2"
       },
       {
           "key": "key3",
           "value": "value3"
       }
   ]
}
```

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/ecs/list-tags-for-resource.html) in *AWS CLI Command Reference*.

**list-task-definition-families**

The following code example shows how to use `list-task-definition-families`.

**AWS CLI**

**Example 1: To list the registered task definition families**

The following `list-task-definition-families` example lists all of the registered task definition families.

```
aws ecs list-task-definition-families
```
Output:

```
{
    "families": [
        "node-js-app",
        "web-timer",
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
}
```

**Example 2: To filter the registered task definition families**

The following `list-task-definition-families` example lists the task definition revisions that start with "hpcc".

```
aws ecs list-task-definition-families --family-prefix hpcc
```

Output:

```
{
    "families": [
        "hpcc",
        "hpcc-c4-8xlarge"
    ]
}
```

For more information, see [Task Definition Parameters](#) in the [Amazon ECS Developer Guide](#).

- For API details, see [ListTaskDefinitionFamilies](#) in [AWS CLI Command Reference](#).

### list-task-definitions

The following code example shows how to use `list-task-definitions`.

#### AWS CLI

**Example 1: To list the registered task definitions**

The following `list-task-definitions` example lists all of the registered task definitions.
aws ecs list-task-definitions

Output:

```
{
  "taskDefinitionArns": [
  ]
}
```

**Example 2: To list the registered task definitions in a family**

The following list-task-definitions example lists the task definition revisions of a specified family.

```
aws ecs list-task-definitions --family-prefix wordpress
```

Output:

```
{
  "taskDefinitionArns": [
  ]
}
```

For more information, see [Amazon ECS Task Definitions](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListTaskDefinitions](#) in *AWS CLI Command Reference*.

### put-account-setting

The following code example shows how to use put-account-setting.
AWS CLI

To modify the account setting for your IAM user account

The following put-account-setting example enables the serviceLongArnFormat account setting for your IAM user account.

```
aws ecs put-account-setting --name serviceLongArnFormat --value enabled
```

Output:

```

```json
{
   "setting": {
      "name": "serviceLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::130757420319:user/your_username"
   }
}
```

For more information, see [Modifying Account Settings](#) in the [Amazon ECS Developer Guide](#).

- For API details, see [PutAccountSetting](#) in [AWS CLI Command Reference](#).

put-account-setting-default

The following code example shows how to use put-account-setting-default.

AWS CLI

To modify the default account settings

The following put-account-setting-default example modifies the default account setting for all IAM users or roles on your account. These changes apply to the entire AWS account unless an IAM user or role explicitly overrides these settings for themselves.

```
aws ecs put-account-setting-default --name serviceLongArnFormat --value enabled
```

Output:

```

```json
{
   "setting": {
      "name": "serviceLongArnFormat",
   }
}
```
The following code example shows how to use `put-account-settings`.

**AWS CLI**

To modify the account settings for an IAM user or IAM role

The following `put-account-setting` example modifies the account settings for the specified IAM user or IAM role.

```
aws ecs put-account-setting \
  --name serviceLongArnFormat \
  --value enabled \
  --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::123456789012:user/MyUser"
  }
}
```

**put-attributes**

The following code example shows how to use `put-attributes`.

For more information, see [Amazon Resource Names (ARNs) and IDs](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/arns.html) in the *Amazon ECS Developer Guide*.

- For API details, see [PutAccountSettingDefault](https://docs.aws.amazon.com/cli/latest/reference/ecs/put-account-setting.html) in *AWS CLI Command Reference*.
AWS CLI

To create an attribute and associate it with an Amazon ECS resource

The following put-attributes applies an attribute with the name stack and the value production to a container instance.

```bash
aws ecs put-attributes \
   --attributes name=stack,value=production,targetId=arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```json
{
   "attributes": [
      {
         "name": "stack",
         "targetId": "arn:aws:ecs:us-west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
         "value": "production"
      }
   ]
}
```

- For API details, see [PutAttributes](https://docs.aws.amazon.com/cli/latest/reference/ecs/put-attributes.html) in *AWS CLI Command Reference*.

**put-cluster-capacity-providers**

The following code example shows how to use put-cluster-capacity-providers.

**AWS CLI**

**Example 1: To add an existing capacity provider to a cluster**

The following put-cluster-capacity-providers example adds an existing capacity provider to a cluster. The create-capacity-provider command is used to create a capacity provider. The describe-clusters command is used to describe the current capacity providers and the default capacity provider strategy associated with a cluster. When adding a new capacity provider to a cluster, you must specify all existing capacity providers in addition to the new capacity provider you want to associate with the cluster. You must also specify the default capacity provider strategy to associate with the cluster. In this example, the MyCluster
cluster has the MyCapacityProvider1 capacity provider associated with it and you want to add the MyCapacityProvider2 capacity provider and include it in the default capacity provider strategy so tasks are spread evenly across both capacity providers.

```bash
aws ecs put-cluster-capacity-providers \
   --cluster MyCluster \
   --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \
   --default-capacity-provider-strategy
capacityProvider=MyCapacityProvider1,weight=1
capacityProvider=MyCapacityProvider2,weight=1
```

Output:

```
{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "ACTIVE",
      "registeredContainerInstancesCount": 0,
      "runningTasksCount": 0,
      "pendingTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "tags": [],
      "settings": [
         {
            "name": "containerInsights",
            "value": "enabled"
         }
      ],
      "capacityProviders": [
         "MyCapacityProvider1",
         "MyCapacityProvider2"
      ],
      "defaultCapacityProviderStrategy": [
         {
            "capacityProvider": "MyCapacityProvider1",
            "weight": 1,
            "base": 0
         },
         {
            "capacityProvider": "MyCapacityProvider2",
            "weight": 1,
```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capacity-providers.html) in the *Amazon ECS Developer Guide*.

**Example 2: To remove a capacity provider from a cluster**
The following put-cluster-capacity-providers example removes a capacity provider from a cluster. The describe-clusters command is used to describe the current capacity providers associated with a cluster. When removing a capacity provider from a cluster, you must specify the capacity providers you want to remain associated with the cluster as well as the default capacity provider strategy to associate with the cluster. In this example, the cluster has the MyCapacityProvider1 and MyCapacityProvider2 capacity providers associated with it and you want to remove the MyCapacityProvider2 capacity provider, so you specify only MyCapacityProvider1 in the command along with the updated default capacity provider strategy.

```bash
aws ecs put-cluster-capacity-providers \
   --cluster MyCluster \
   --capacity-providers MyCapacityProvider1 \
   --default-capacity-provider-strategy
capacityProvider=MyCapacityProvider1,weight=1,base=0
```

Output:

```json
{
   "cluster": {
      "clusterName": "MyCluster",
      "status": "ACTIVE",
      "registeredContainerInstancesCount": 0,
      "runningTasksCount": 0,
      "pendingTasksCount": 0,
      "activeServicesCount": 0,
      "statistics": [],
      "tags": [],
      "settings": [
         {
            "name": "containerInsights",
            "value": "enabled"
         }
      ],
      "capacityProviders": [
         "MyCapacityProvider1"
      ],
      "defaultCapacityProviderStrategy": [
         "capacityProvider": "MyCapacityProvider1",
         "weight": 1,
         "base": 0
      ]
   }
}
```
For more information, see [Cluster capacity providers](https://docs.aws.amazon.com/AmazonECS/latest/developerguide/cluster-capability.html) in the *Amazon ECS Developer Guide*.

**Example 3: To remove all capacity providers from a cluster**
The following `put-cluster-capacity-providers` example removes all existing capacity providers from the cluster.

```
aws ecs put-cluster-capacity-providers \
    --cluster MyCluster \
    --capacity-providers [] \
    --default-capacity-provider-strategy []
```

Output:

```
{
    "cluster": {
        "clusterName": "MyCluster",
        "status": "ACTIVE",
        "registeredContainerInstancesCount": 0,
        "runningTasksCount": 0,
        "pendingTasksCount": 0,
        "activeServicesCount": 0,
        "statistics": [],
        "tags": [],
        "settings": [
            {
                "name": "containerInsights",
                "value": "enabled"
            }
        ],
        "capacityProviders": [],
        "defaultCapacityProviderStrategy": [],
        "attachments": [
            {
                "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
                "type": "as_policy",
                "status": "DELETING",
                "details": [
                    {
                        "name": "capacityProviderName",
                        "value": "MyCapacityProvider1"
                    },
                    {
                        "name": "scalingPolicyName",
                        "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111"
                    }
                ]
            }
```
register-task-definition

The following code example shows how to use register-task-definition.

AWS CLI

Example 1: To register a task definition with a JSON file

The following register-task-definition example registers a task definition to the specified family. The container definitions are saved in JSON format at the specified file location.

```shell
aws ecs register-task-definition
   --cli-input-json file://<path_to_json_file>/sleep360.json
```
Contents of `sleep360.json`:

```json
{
    "containerDefinitions": [
        {
            "name": "sleep",
            "image": "busybox",
            "cpu": 10,
            "command": ["sleep", "360"],
            "memory": 10,
            "essential": true
        }
    ],
    "family": "sleep360"
}
```

Output:

```json
{
    "taskDefinition": {
        "status": "ACTIVE",
        "family": "sleep360",
        "placementConstraints": [],
        "compatibilities": [
            "EXTERNAL",
            "EC2"
        ],
        "volumes": [],
        "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/sleep360:1",
        "containerDefinitions": [
            {
                "environment": [],
                "name": "sleep",
                "mountPoints": [],
                "image": "busybox",
                "cpu": 10,
                "portMappings": [],
                "command": ["sleep",
            
```
Example 2: To register a task definition with a JSON string parameter

The following `register-task-definition` example registers a task definition using container definitions provided as a JSON string parameter with escaped double quotes.

```bash
aws ecs register-task-definition
   --family sleep360
   --container-definitions "[{"name":"sleep","image":"busybox","cpu":10,
   "command":["sleep","360"],"memory":10,"essential":true}]"
```

The output is identical to the previous example.

For more information, see [Creating a Task Definition](https://docs.aws.amazon.com/ecs/latest/userguide/creating-task-definition.html) in the Amazon ECS Developer Guide.

For API details, see [RegisterTaskDefinition](https://docs.aws.amazon.com/cli/latest/reference/ecs/register-task-definition.html) in AWS CLI Command Reference.

---

**run-task**

The following code example shows how to use `run-task`.

**AWS CLI**

To run a task on your default cluster

The following `run-task` example runs a task on the default cluster and uses a client token.

```bash
aws ecs run-task
   --cluster default
   --task-definition sleep360:1
   --client-token 550e8400-e29b-41d4-a716-446655440000
```
Output:

```json
{
    "tasks": [ 
        {
            "attachments": [],
            "attributes": [
                {
                    "name": "ecs.cpu-architecture",
                    "value": "x86_64"
                }
            ],
            "availabilityZone": "us-east-1b",
            "capacityProviderName": "example-capacity-provider",
            "clusterArn": "arn:aws:ecs:us-east-1:123456789012:cluster/default",

            "group": "family:sleep360",
            "lastStatus": "PENDING",
            "launchType": "EC2",
            "memory": "10",
            "overrides": { 
                "containerOverrides": [
                    {
                        "name": "sleep"
                    }
                ]
            }
        }
    ]
}
```
For more information, see Running Tasks in the Amazon ECS Developer Guide.

- For API details, see RunTask in AWS CLI Command Reference.

**start-task**

The following code example shows how to use start-task.

**AWS CLI**

To start a new task

The following start-task starts a task using the latest revision of the sleep360 task definition on the specified container instance in the default cluster.

```
aws ecs start-task \
   --task-definition sleep360 \
   --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

Output:

```
{
   "tasks": [
      {
         "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/default/666fdccc2e2d4b6894dd422f4eeee8f8",
         "taskDefinitionArn": "arn:aws:ecs:us-west-2:130757420319:task-definition/sleep360:3",
      }
   ],
   "failures": []
}
```
For API details, see [StartTask](https://docs.aws.amazon.com/cli/latest/reference/ecs/start-task) in AWS CLI Command Reference.

**stop-task**

The following code example shows how to use stop-task.
To stop a task

The following stop-task stops the specified task from running in the default cluster.

```bash
aws ecs stop-task \
    --task 666fdccc2e2d4b6894dd422f4eeee8f8
```

Output:

```json
{
    "task": {
        "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/default/666fdccc2e2d4b6894dd422f4eeee8f8",
        "taskDefinitionArn": "arn:aws:ecs:us-west-2:130757420319:task-definition/sleep360:3",
        "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-instance/default/765936fadbbd46b5991a4bd70c2a43d4",
        "overrides": {
            "containerOverrides": []
        },
        "lastStatus": "STOPPED",
        "desiredStatus": "STOPPED",
        "cpu": "128",
        "memory": "128",
        "containers": [],
        "version": 2,
        "stoppedReason": "Taskfailedtostart",
        "stopCode": "TaskFailedToStart",
        "connectivity": "CONNECTED",
        "connectivityAt": 1563421494.186,
        "pullStartedAt": 1563421494.252,
        "pullStoppedAt": 1563421496.252,
        "executionStoppedAt": 1563421497,
        "createdAt": 1563421494.186,
        "stoppingAt": 1563421497.252,
        "stoppedAt": 1563421497.252,
        "group": "family:sleep360",
        "launchType": "EC2",
        "attachments": [],
        "tags": []
    }
}
```
For API details, see `StopTask` in *AWS CLI Command Reference.*

**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a resource**

The following `tag-resource` example adds a single tag to the specified resource.

```
aws ecs tag-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
    --tags key=key1,value=value1
```

This command produces no output.

**To add multiple tags to a resource**

The following `tag-resource` example adds multiple tags to the specified resource.

```
aws ecs tag-resource \
    --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
    --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

This command produces no output.

For API details, see `TagResource` in *AWS CLI Command Reference.*

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from a resource**

```
The following `untag-resource` example removes the listed tags from the specified resource.

```
aws ecs untag-resource \
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --tag-keys key1,key2
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

### update-cluster-settings

The following code example shows how to use `update-cluster-settings`.

**AWS CLI**

**To modify the settings for your cluster**

The following `update-cluster-settings` example enables CloudWatch Container Insights for the default cluster.

```
aws ecs update-cluster-settings \
  --cluster default \
  --settings name=containerInsights,value=enabled
```

**Output:**

```json
{
  "cluster": {
    "clusterName": "default",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "runningTasksCount": 0,
    "pendingTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [],
    "settings": [
      {
        "name": "containerInsights",
        "value": "enabled"
      }
    ]
  }
}
```
For more information, see [Modifying Account Settings](#) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateClusterSettings](#) in *AWS CLI Command Reference*.

### update-container-agent

The following code example shows how to use `update-container-agent`.

**AWS CLI**

To update the container agent on an Amazon ECS container instance

The following `update-container-agent` example updates the container agent on the specified container instance in the default cluster.

```
aws ecs update-container-agent --cluster default --container-instance a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
   "containerInstance": {
      "status": "ACTIVE",
      "agentUpdateStatus": "PENDING",
      "versionInfo": {
         "agentVersion": "1.0.0",
         "agentHash": "4023248",
         "dockerVersion": "DockerVersion: 1.5.0"
      }
   }
}
```

For more information, see [Updating the Amazon ECS Container Agent](#) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateContainerAgent](#) in *AWS CLI Command Reference*. 
update-container-instances-state

The following code example shows how to use update-container-instances-state.

AWS CLI

To update the state of a container instance

The following update-container-instances-state updates the state of the specified container instance to DRAINING which will remove it from the cluster it is registered to.

```
aws ecs update-container-instances-state \
  --container-instances 765936fadbdd46b5991a4bd70c2a43d4 \
  --status DRAINING
```

Output:

```
{
  "containerInstances": [
    {
      "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-instance/default/765936fadbdd46b5991a4bd70c2a43d4",

update-service-primary-task-set

The following code example shows how to use update-service-primary-task-set.

AWS CLI

To update the primary task set for a service

The following update-service-primary-task-set example updates the primary task set for the specified service.

aws ecs update-service-primary-task-set \
   --cluster MyCluster \ 
   --service MyService \ 

Output:

```json

**update-task-set**

The following code example shows how to use `update-task-set`.

**AWS CLI**

To update a task set
The following `update-task-set` example updates a task set to adjust the scale.

```
aws ecs update-task-set \
  --cluster MyCluster \
  --service MyService \
  --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-svc/1234567890123456789 \
  --scale value=50,unit=PERCENT
```

Output:

```json
{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "status": "ACTIVE",
    "computedDesiredCount": 0,

```
Amazon EFS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EFS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

create-file-system

The following code example shows how to use create-file-system.

AWS CLI

To create an encrypted file system

The following create-file-system example creates an encrypted file system using the default CMK. It also adds the tag Name=my-file-system.

```
aws efs create-file-system
  --performance-mode generalPurpose
```
--throughput-mode bursting \                       
--encrypted \                                     
--tags Key=Name,Value=my-file-system

Output:

```
{
    "OwnerId": "123456789012",
    "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
    "FileSystemId": "fs-c7a0456e",
    "CreationTime": 1595286880.0,
    "LifeCycleState": "creating",
    "Name": "my-file-system",
    "NumberOfMountTargets": 0,
    "SizeInBytes": {
        "Value": 0,
        "ValueInIA": 0,
        "ValueInStandard": 0
    },
    "PerformanceMode": "generalPurpose",
    "Encrypted": true,
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a59b3472-e62c-42e4-adcf-30d92example",
    "ThroughputMode": "bursting",
    "Tags": [
        {
            "Key": "Name",
            "Value": "my-file-system"
        }
    ]
}
```

For more information, see Creating Amazon EFS file systems in the Amazon Elastic File System User Guide.

- For API details, see CreateFileSystem in AWS CLI Command Reference.

**create-mount-target**

The following code example shows how to use create-mount-target.
AWS CLI

To create a mount target

The following create-mount-target example creates a mount target for the specified file system.

```
aws efs create-mount-target \\
    --file-system-id fs-c7a0456e \\
    --subnet-id subnet-02bf4c428bexample \\
    --security-groups sg-068f739363example
```

Output:

```
{
   "OwnerId": "123456789012",
   "MountTargetId": "fsmt-f9a14450",
   "FileSystemId": "fs-c7a0456e",
   "SubnetId": "subnet-02bf4c428bexample",
   "LifeCycleState": "creating",
   "IpAddress": "10.0.1.24",
   "NetworkInterfaceId": "eni-02d542216aexample",
   "AvailabilityZoneId": "use2-az2",
   "AvailabilityZoneName": "us-east-2b",
   "VpcId": "vpc-0123456789abcdef0"
}
```

For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see CreateMountTarget in AWS CLI Command Reference.

delete-file-system

The following code example shows how to use delete-file-system.

AWS CLI

To delete a file system

The following delete-file-system example deletes the specified file system.

```
aws efs delete-file-system \
```

--file-system-id fs-c7a0456e

This command produces no output.

For more information, see Deleting an Amazon EFS file system in the Amazon Elastic File System User Guide.

- For API details, see DeleteFileSystem in AWS CLI Command Reference.

**delete-mount-target**

The following code example shows how to use delete-mount-target.

**AWS CLI**

**To delete a mount target**

The following delete-mount-target example deletes the specified mount target.

```
aws efs delete-mount-target \
    --mount-target-id fsmt-f9a14450
```

This command produces no output.

For more information, see Creating mount targets in the Amazon Elastic File System User Guide.

- For API details, see DeleteMountTarget in AWS CLI Command Reference.

**describe-file-systems**

The following code example shows how to use describe-file-systems.

**AWS CLI**

**To describe a file system**

The following describe-file-systems example describes the specified file system.

```
aws efs describe-file-systems \
    --file-system-id fs-c7a0456e
```
Output:

```json
{
   "FileSystems": [
      {
         "OwnerId": "123456789012",
         "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",
         "FileSystemId": "fs-c7a0456e",
         "CreationTime": 1595286880.0,
         "LifeCycleState": "available",
         "Name": "my-file-system",
         "NumberOfMountTargets": 3,
         "SizeInBytes": {
            "Value": 6144,
            "Timestamp": 1600991437.0,
            "ValueInIA": 0,
            "ValueInStandard": 6144
         },
         "PerformanceMode": "generalPurpose",
         "Encrypted": true,
         "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a59b3472-e62c-42e4-adcf-30d92example",
         "ThroughputMode": "bursting",
         "Tags": [
            {
               "Key": "Name",
               "Value": "my-file-system"
            }
         ]
      }
   ]
}
```

For more information, see [Managing Amazon EFS file systems](https://docs.aws.amazon.com/efs/latest/ug/) in the *Amazon Elastic File System User Guide*.

- For API details, see [DescribeFileSystems](https://docs.aws.amazon.com/cli/latest/reference/efs/describe-mount-targets.html) in *AWS CLI Command Reference*.

**describe-mount-targets**

The following code example shows how to use `describe-mount-targets`.
AWS CLI

**To describe a mount target**

The following `describe-mount-targets` example describes the specified mount target.

```bash
aws efs describe-mount-targets \
   --mount-target-id fsmt-f9a14450
```

Output:

```
{
   "MountTargets": [
   {
      "OwnerId": "123456789012",
      "MountTargetId": "fsmt-f9a14450",
      "FileSystemId": "fs-c7a0456e",
      "SubnetId": "subnet-02bf4c428bexample",
      "LifeCycleState": "creating",
      "IpAddress": "10.0.1.24",
      "NetworkInterfaceId": "eni-02d542216aexample",
      "AvailabilityZoneId": "use2-az2",
      "AvailabilityZoneName": "us-east-2b",
      "VpcId": "vpc-0123456789abcdef0"
   }
   ]
}
```

For more information, see [Creating mount targets](https://docs.aws.amazon.com/efs/latest/fileSystemUserGuide/creating-mount-targets.html) in the *Amazon Elastic File System User Guide*.

- For API details, see [DescribeMountTargets](https://docs.aws.amazon.com/cli/latest/reference/efs/describe-mount-targets.html) in *AWS CLI Command Reference*.

**describe-tags**

The following code example shows how to use `describe-tags`.

AWS CLI

**To describe the tags for a file system**

The following `describe-tags` example describes the tags for the specified file system.
aws efs describe-tags \
--file-system-id fs-c7a0456e

Output:

```
{
   "Tags": [
    {
      "Key": "Name",
      "Value": "my-file-system"
    },
    {
      "Key": "Department",
      "Value": "Business Intelligence"
    }
   ]
}
```

For more information, see Managing file system tags in the Amazon Elastic File System User Guide.

- For API details, see DescribeTags in AWS CLI Command Reference.

### list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To retrieve the tags for a resource**

The following list-tags-for-resource example retrieves the tags associated with the specified file system.

```
aws efs list-tags-for-resource \
--resource-id fs-c7a0456e
```

Output:

```
{
```
"Tags": [
    {
      "Key": "Name",
      "Value": "my-file-system"
    },
    {
      "Key": "Department",
      "Value": "Business Intelligence"
    }
]

For more information, see [Managing file system tags](https://docs.aws.amazon.com/efs/latest/ug/) in the *Amazon Elastic File System User Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/) in *AWS CLI Command Reference*.

---

### tag-resource

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a resource**

The following `tag-resource` example adds the tag `Department=Business Intelligence` to the specified file system.

```bash
aws efs tag-resource \
  --resource-id fs-c7a0456e \
  --tags Key=Department,Value="Business Intelligence"
```

This command produces no output.

For more information, see [Managing file system tags](https://docs.aws.amazon.com/efs/latest/ug/) in the *Amazon Elastic File System User Guide*.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/) in *AWS CLI Command Reference*.

---

### untag-resource

The following code example shows how to use `untag-resource`.

---

**Actions and scenarios**
AWS CLI

**To remove a tag from a resource**

The following `untag-resource` example removes the tag with the `Department` tag key from the specified file system.

```bash
aws efs untag-resource \
  --resource-id fs-c7a0456e \
  --tag-keys Department
```

This command produces no output.

For more information, see [Managing file system tags](#) in the Amazon Elastic File System User Guide.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

**Amazon EKS examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EKS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**Create a cluster control plane**

The following code example shows how to create an Amazon EKS cluster control plane.
AWS CLI

To create a new cluster

This example command creates a cluster named prod in your default region.

Command:

```bash
aws eks create-cluster --name prod \\
--role-arn arn:aws:iam::012345678910:role/eks-service-role-\\ AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI \\
--resources-vpc-config subnetIds=subnet-6782e71e,subnet-\\ e7e761ac,securityGroupIds=sg-6979fe18
```

Output:

```json
{
   "cluster": {
      "name": "prod",
      "createdAt": 1527808069.147,
      "version": "1.10",
      "roleArn": "arn:aws:iam::012345678910:role/eks-service-role-\\ AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI",
      "resourcesVpcConfig": {
         "subnetIds": ["subnet-6782e71e","subnet-e7e761ac"],
         "securityGroupIds": ["sg-6979fe18"],
         "vpcId": "vpc-950809ec",
         "status": "CREATING",
         "certificateAuthority": {}
      }
   }
}
```

To create a new cluster with private endpoint access and logging enabled

This example command creates a cluster named example in your default region with public endpoint access disabled, private endpoint access enabled, and all logging types enabled.
Command:

```bash
aws eks create-cluster --name example --kubernetes-version 1.12 --role-arn arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q --resources-vpc-config subnetIds=subnet-0a188dcd2f9a632f,subnet-09290d93da4278664,subnet-0f21dd86e0e91134a,subnet-051f70a57ed6fcab6,subnet-01322339c5c7de9b4,securityGroupIds=sg-0c5b580845a031c10,endpointPublicAccess=false,endpointPrivateAccess=true --logging '{"clusterLogging":[{"types": ["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:

```
{
    "cluster": {
        "name": "example",
        "createdAt": 1565804921.901,
        "version": "1.12",
        "roleArn": "arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q",
        "resourcesVpcConfig": {
            "subnetIds": ["subnet-0a188dcd2f9a632f","subnet-09290d93da4278664","subnet-0f21dd86e0e91134a","subnet-0173dead68481a583","subnet-051f70a57ed6fcab6","subnet-01322339c5c7de9b4"],
            "securityGroupIds": ["sg-0c5b580845a031c10"],
            "vpcId": "vpc-0f622c01f68d4afec",
            "endpointPublicAccess": false,
            "endpointPrivateAccess": true
        },
        "logging": {
            "clusterLogging": [
                {
                    "types": ["api","audit",
```

Actions and scenarios 2704
Delete a cluster control plane

The following code example shows how to delete an Amazon EKS cluster.

AWS CLI

To delete a cluster

This example command deletes a cluster named *devel* in your default region.

Command:

```bash
aws eks delete-cluster --name devel
```

- For API details, see [DeleteCluster](https://docs.aws.amazon.com/cli/latest/reference/eks/delete-cluster.html) in *AWS CLI Command Reference*.

describe-cluster

The following code example shows how to use describe-cluster.

AWS CLI

To describe a cluster

This example command provides a description of the specified cluster in your default region.

Command:
aws eks describe-cluster --name devel

Output:

```
{
    "cluster": {
        "name": "devel",
        "createdAt": 1527807879.988,
        "version": "1.10",
        "endpoint": "https://EXAMPLE0A04F01705DD065655C30CC3D.yl4.us-west-2.eks.amazonaws.com",
        "roleArn": "arn:aws:iam::012345678910:role/eks-service-role-AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI",
        "resourcesVpcConfig": {
            "subnetIds": ["subnet-6782e71e", "subnet-e7e761ac"],
            "securityGroupIds": ["sg-6979fe18"],
            "vpcId": "vpc-950809ec"
        },
        "status": "ACTIVE",
        "certificateAuthority": {
            "data": "EXAMPLECRUdJTiBDRVJUSUZJQ0FURS0tLS0tCk1JSUN5RENDOQWJDZ0F3SUJBZ01CQRBTkJna3Foa21H0XcwQkFRc0 ...
        }
    }
}
```

- For API details, see [DescribeCluster](https://docs.aws.amazon.com/cli/latest/reference/eks/describe-cluster.html) in *AWS CLI Command Reference*.

**describe-update**

The following code example shows how to use `describe-update`.

**AWS CLI**

To describe an update for a cluster
This example command describes an update for a cluster named example in your default region.

Command:

```bash
aws eks describe-update --name example \
--update-id 10bddb13-a71b-425a-b0a6-71cd03e59161
```

Output:

```json
{
   "update": {
      "id": "10bddb13-a71b-425a-b0a6-71cd03e59161",
      "status": "Successful",
      "type": "EndpointAccessUpdate",
      "params": [
         {
            "type": "EndpointPublicAccess",
            "value": "true"
         },
         {
            "type": "EndpointPrivateAccess",
            "value": "false"
         }
      ],
      "createdAt": 1565806691.149,
      "errors": []
   }
}
```

- For API details, see [DescribeUpdate](#) in *AWS CLI Command Reference*.

**get-token**

The following code example shows how to use get-token.

**AWS CLI**

**To get a cluster authentication token**

This example command gets an authentication token for a cluster named example.
Command:

`aws eks get-token --cluster-name example`

Output:

```
{
  "kind": "ExecCredential",
  "apiVersion": "client.authentication.k8s.io/v1beta1",
  "spec": {},
  "status": {
    "expirationTimestamp": "2019-08-14T18:44:27Z",
    "token": "k8s-aws-v1EXAMPLE_TOKEN_DATA_STRING..."
  }
}
```

- For API details, see [GetToken](#) in *AWS CLI Command Reference*.

### list-clusters

The following code example shows how to use `list-clusters`.

**AWS CLI**

**To list your available clusters**

This example command lists all of your available clusters in your default region.

Command:

`aws eks list-clusters`

Output:

```
{
  "clusters": [
    "devel",
    "prod"
  ]
}
```
list-updates

The following code example shows how to use list-updates.

AWS CLI

To list the updates for a cluster

This example command lists the current updates for a cluster named example in your default region.

Command:

```bash
aws eks list-updates --name example
```

Output:

```json
{
   "updateIds": [
      "10bddb13-a71b-425a-b0a6-71cd03e59161"
   ]
}
```

For API details, see ListUpdates in AWS CLI Command Reference.

update-cluster-config

The following code example shows how to use update-cluster-config.

AWS CLI

To update cluster endpoint access

This example command updates a cluster to disable endpoint public access and enable private endpoint access.

Command:
aws eks update-cluster-config --name example \ 
--resources-vpc-config endpointPublicAccess=false,endpointPrivateAccess=true

Output:

```
{
    "update": {
        "id": "ec883c93-2e9e-407c-a22f-8f6fa6e67d4f",
        "status": "InProgress",
        "type": "EndpointAccessUpdate",
        "params": [
            {
                "type": "EndpointPublicAccess",
                "value": "false"
            },
            {
                "type": "EndpointPrivateAccess",
                "value": "true"
            }
        ],
        "createdAt": 1565806986.506,
        "errors": []
    }
}
```

To enable logging for a cluster

This example command enables all cluster control plane logging types for a cluster named example.

Command:

```
aws eks update-cluster-config --name example \ 
--logging '{"clusterLogging": [{"types": [
    "api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:

```
{
    "update": {
        "id": "7551c64b-1d27-4b1e-9f8e-c45f056eb6fd",
```
update-cluster-version

The following code example shows how to use `update-cluster-version`.

AWS CLI

To update a cluster Kubernetes version

This example command updates a cluster named example from Kubernetes 1.12 to 1.13.

Command:

```
aws eks update-cluster-version --name example --kubernetes-version 1.13
```

Output:

```
{
   "update": {
      "id": "161a74d1-7e8c-4224-825d-b32af149f23a",
      "status": "InProgress",
      "type": "VersionUpdate",
      "params": [
         {
            "type": "Version",
            "value": "1.13"
         }
      ],

   }
}
```

For API details, see `UpdateClusterConfig` in *AWS CLI Command Reference*. 
For API details, see UpdateClusterVersion in AWS CLI Command Reference.

**update-kubeconfig**

The following code example shows how to use update-kubeconfig.

**AWS CLI**

**To update a kubeconfig for your cluster**

This example command updates the default kubeconfig file to use your cluster as the current context.

**Command:**

```bash
aws eks update-kubeconfig --name example
```

**Output:**

```
```

For API details, see UpdateKubeconfig in AWS CLI Command Reference.

**Elastic Beanstalk examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Beanstalk.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

Update app

The following code example shows how to update an AWS Elastic Beanstalk app.

AWS CLI

To change an application’s description

The following command updates the description of an application named my-app:

```shell
aws elasticbeanstalk update-application --application-name my-app --description "my Elastic Beanstalk application"
```

Output:

```json
{
   "Application": {
      "ApplicationName": "my-app",
      "Description": "my Elastic Beanstalk application",
      "Versions": [
         "2fba-stage-150819_234450",
         "bf07-stage-150820_214945",
         "93f8",
         "fd7c-stage-150820_000431",
         "22a0-stage-150819_185942"
      ],
```
For API details, see UpdateApplication in AWS CLI Command Reference.

**abort-environment-update**

The following code example shows how to use abort-environment-update.

**AWS CLI**

**To abort a deployment**

The following command aborts a running application version deployment for an environment named my-env:

```bash
aws elasticbeanstalk abort-environment-update --environment-name my-env
```

For API details, see AbortEnvironmentUpdate in AWS CLI Command Reference.

**check-dns-availability**

The following code example shows how to use check-dns-availability.

**AWS CLI**

**To check the availability of a CNAME**

The following command checks the availability of the subdomain my-cname.elasticbeanstalk.com:

```bash
aws elasticbeanstalk check-dns-availability --cname-prefix my-cname
```

Output:

```json
{
  "Available": true,
  "FullyQualifiedCNAME": "my-cname.elasticbeanstalk.com"
}
```
create-application

The following code example shows how to use create-application.

AWS CLI

To create a new application

The following command creates a new application named "MyApp":

```bash
aws elasticbeanstalk create-application --application-name MyApp --description "my application"
```

The create-application command only configures the application's name and description. To upload source code for the application, create an initial version of the application using create-application-version. create-application-version also has an auto-create-application option that lets you create the application and the application version in one step.

Output:

```json
{
   "Application": {
      "ApplicationName": "MyApp",
      "ConfigurationTemplates": [],
      "DateUpdated": "2015-02-12T18:32:21.181Z",
      "Description": "my application",
      "DateCreated": "2015-02-12T18:32:21.181Z"
   }
}
```

• For API details, see CreateApplication in AWS CLI Command Reference.

create-application-version

The following code example shows how to use create-application-version.
To create a new application version

The following command creates a new version, "v1" of an application named "MyApp":

```bash
aws elasticbeanstalk create-application-version
  --application-name MyApp
  --version-label v1
  --description MyAppv1
  --source-bundle S3Bucket="my-bucket",S3Key="sample.war"
  --auto-create-application
```

The application will be created automatically if it does not already exist, due to the auto-create-application option. The source bundle is a .war file stored in an s3 bucket named "my-bucket" that contains the Apache Tomcat sample application.

Output:

```json
{
  "ApplicationVersion": {
    "ApplicationName": "MyApp",
    "VersionLabel": "v1",
    "Description": "MyAppv1",
    "DateCreated": "2015-02-03T23:01:25.412Z",
    "DateUpdated": "2015-02-03T23:01:25.412Z",
    "SourceBundle": {
      "S3Bucket": "my-bucket",
      "S3Key": "sample.war"
    }
  }
}
```

create-configuration-template

The following code example shows how to use `create-configuration-template`.

AWS CLI

To create a configuration template

The following command creates a configuration template named `my-app-v1` from the settings applied to an environment with the id `e-rpqsewtp2j`:
aws elasticbeanstalk create-configuration-template --application-name my-app --template-name my-app-v1 --environment-id e-rpqsewtp2j

Output:

{
  "ApplicationName": "my-app",
  "TemplateName": "my-app-v1",
  "DateCreated": "2015-08-12T18:40:39Z",
  "DateUpdated": "2015-08-12T18:40:39Z",
  "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}

- For API details, see CreateConfigurationTemplate in AWS CLI Command Reference.

**create-environment**

The following code example shows how to use create-environment.

**AWS CLI**

**To create a new environment for an application**

The following command creates a new environment for version "v1" of a java application named "my-app":

aws elasticbeanstalk create-environment --application-name my-app --environment-name my-env --cname-prefix my-app --version-label v1 --solution-stack-name "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"

Output:

{
  "ApplicationName": "my-app",
  "EnvironmentName": "my-env",
  "VersionLabel": "v1",
  "Status": "Launching",
  "EnvironmentId": "e-izqpassy4h",
  "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
  "CNAME": "my-app.elasticbeanstalk.com"}
v1 is the label of an application version previously uploaded with create-application-version.

To specify a JSON file to define environment configuration options

The following create-environment command specifies that a JSON file with the name myoptions.json should be used to override values obtained from the solution stack or the configuration template:

```sh
aws elasticbeanstalk create-environment --environment-name sample-env --application-name sampleapp --option-settings file://myoptions.json
```

myoptions.json is a JSON object defining several settings:

```json
[
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Interval",
    "Value": "15"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Timeout",
    "Value": "8"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "HealthyThreshold",
    "Value": "2"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "UnhealthyThreshold",
    "Value": "3"
  }
]
```
create-storage-location

The following code example shows how to use create-storage-location.

AWS CLI

To create a storage location

The following command creates a storage location in Amazon S3:

```
aws elasticbeanstalk create-storage-location
```

Output:

```
{
    "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012"
}
```

- For API details, see `CreateStorageLocation` in AWS CLI Command Reference.

delete-application

The following code example shows how to use delete-application.

AWS CLI

To delete an application

The following command deletes an application named my-app:

```
aws elasticbeanstalk delete-application --application-name my-app
```
• For API details, see **DeleteApplication** in *AWS CLI Command Reference*.

### delete-application-version

The following code example shows how to use `delete-application-version`.

**AWS CLI**

**To delete an application version**

The following command deletes an application version named `22a0-stage-150819_182129` for an application named `my-app`:

```bash
aws elasticbeanstalk delete-application-version --version-label 22a0-
stage-150819_182129 --application-name my-app
```

• For API details, see **DeleteApplicationVersion** in *AWS CLI Command Reference*.

### delete-configuration-template

The following code example shows how to use `delete-configuration-template`.

**AWS CLI**

**To delete a configuration template**

The following command deletes a configuration template named `my-template` for an application named `my-app`:

```bash
aws elasticbeanstalk delete-configuration-template --template-name my-template --application-name my-app
```

• For API details, see **DeleteConfigurationTemplate** in *AWS CLI Command Reference*.

### delete-environment-configuration

The following code example shows how to use `delete-environment-configuration`.

**AWS CLI**

**To delete a draft configuration**
The following command deletes a draft configuration for an environment named `my-env`:

```
aws elasticbeanstalk delete-environment-configuration --environment-name my-env --application-name my-app
```

- For API details, see `DeleteEnvironmentConfiguration` in *AWS CLI Command Reference*.

describe-application-versions

The following code example shows how to use `describe-application-versions`.

AWS CLI

**To view information about an application version**

The following command retrieves information about an application version labeled `v2`:

```
aws elasticbeanstalk describe-application-versions --application-name my-app --version-label "v2"
```

Output:

```json
{
   "ApplicationVersions": [
   {
      "ApplicationName": "my-app",
      "VersionLabel": "v2",
      "Description": "update cover page",
      "DateCreated": "2015-07-23T01:32:26.079Z",
      "DateUpdated": "2015-07-23T01:32:26.079Z",
      "SourceBundle": {
         "S3Bucket": "elasticbeanstalk-us-west-2-015321684451",
         "S3Key": "my-app/5026-stage-150723_224258.war"
      }
   },
   {
      "ApplicationName": "my-app",
      "VersionLabel": "v1",
      "Description": "initial version",
      "DateCreated": "2015-07-23T22:26:10.816Z",
      "DateUpdated": "2015-07-23T22:26:10.816Z",
   }
   ]
}
```
For API details, see `DescribeApplicationVersions` in *AWS CLI Command Reference*.

**describe-applications**

The following code example shows how to use `describe-applications`.

**AWS CLI**

To view a list of applications

The following command retrieves information about applications in the current region:

```bash
aws elasticbeanstalk describe-applications
```

Output:

```json
{
    "Applications": [
        {
            "ApplicationName": "ruby",
            "ConfigurationTemplates": [],
            "DateUpdated": "2015-08-13T21:05:44.376Z",
            "Versions": [
                "Sample Application"
            ],
            "DateCreated": "2015-08-13T21:05:44.376Z"
        },
        {
            "ApplicationName": "pythonsample",
            "Description": "Application created from the EB CLI using "eb init"",
            "Versions": [
                "Sample Application"
            ],
            "DateCreated": "2015-08-13T19:05:43.637Z"
        }
    ]
}
```
For API details, see DescribeApplications in AWS CLI Command Reference.

describe-configuration-options

The following code example shows how to use describe-configuration-options.

AWS CLI

**To view configuration options for an environment**

The following command retrieves descriptions of all available configuration options for an environment named my-env:

```
aws elasticbeanstalk describe-configuration-options --environment-name my-env --application-name my-app
```

Output (abbreviated):

```
{
   "Options": [
      {
         "Name": "JVMOptions",
         "UserDefined": false,
         "DefaultValue": "Xms=256m,Xmx=256m,XX:MaxPermSize=64m,JVM Options=",
         "ChangeSeverity": "RestartApplicationServer",
      }
   ]
}
```
Available configuration options vary per platform and configuration version. For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeConfigurationOptions in AWS CLI Command Reference.

**describe-configuration-settings**

The following code example shows how to use describe-configuration-settings.
AWS CLI

To view configurations settings for an environment

The following command retrieves configuration settings for an environment named `my-env`:

```
aws elasticbeanstalk describe-configuration-settings --environment-name my-env --application-name my-app
```

Output (abbreviated):

```
{
  "ConfigurationSettings": [
    {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "Description": "Environment created from the EB CLI using \"eb create \"",
      "DeploymentStatus": "deployed",
      "DateCreated": "2015-08-13T19:16:25Z",
      "OptionSettings": [
        {
          "OptionName": "Availability Zones",
          "ResourceName": "AWSEBAutoScalingGroup",
          "Namespace": "aws:autoscaling:asg",
          "Value": "Any"
        },
        {
          "OptionName": "Cooldown",
          "ResourceName": "AWSEBAutoScalingGroup",
          "Namespace": "aws:autoscaling:asg",
          "Value": "360"
        },
        ...
      ]
    }
  ]
}
```
For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeConfigurationSettings in AWS CLI Command Reference.

### describe-environment-health

The following code example shows how to use describe-environment-health.

**AWS CLI**

**To view environment health**

The following command retrieves overall health information for an environment named my-env:

```
aws elasticbeanstalk describe-environment-health --environment-name my-env --attribute-names All
```

Output:

```
{
    "Status": "Ready",
    "EnvironmentName": "my-env",
    "Color": "Green",
    "ApplicationMetrics": {
        "Duration": 10,
        "Latency": {
            "P99": 0.004,
            "P75": 0.002,
        }
    }
}
```
Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the AWS Elastic Beanstalk Developer Guide.

- For API details, see DescribeEnvironmentHealth in AWS CLI Command Reference.

describe-environment-resources

The following code example shows how to use describe-environment-resources.

AWS CLI

To view information about the AWS resources in your environment
The following command retrieves information about resources in an environment named `my-env`:

```bash
aws elasticbeanstalk describe-environment-resources --environment-name my-env
```

**Output:**

```json
{
  "EnvironmentResources": {
    "EnvironmentName": "my-env",
    "AutoScalingGroups": [
      {
        "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingGroup-QSB2Z0885XZT"
      }
    ],
    "Triggers": [],
    "LoadBalancers": [
      {
        "Name": "awseb-e-q-AWSEBLoa-1EEPZ0K98BIF0"
      }
    ],
    "Queues": [],
    "Instances": [
      {
        "Id": "i-0c91c786"
      }
    ],
    "LaunchConfigurations": [
      {
        "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingLaunchConfiguration-1UUVQ1BC96TQ2"
      }
    ]
  }
}
```

- For API details, see [DescribeEnvironmentResources](https://docs.aws.amazon.com/cli/latest/reference/elasticbeanstalk/describe-environment-resources.html) in *AWS CLI Command Reference*.

**describe-environments**

The following code example shows how to use `describe-environments`.
AWS CLI

To view information about an environment

The following command retrieves information about an environment named my-env:

```
aws elasticbeanstalk describe-environments --environment-names my-env
```

Output:

```
{
   "Environments": [
   {
      "ApplicationName": "my-app",
      "EnvironmentName": "my-env",
      "VersionLabel": "7f58-stage-150812_025409",
      "Status": "Ready",
      "EnvironmentId": "e-rpqsewtp2j",
      "EndpointURL": "awseb-e-w-AWSEBLoa-1483140XB0Q4L-109QXY8121.us-west-2.elb.amazonaws.com",
      "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
      "CNAME": "my-env.elasticbeanstalk.com",
      "Health": "Green",
      "AbortableOperationInProgress": false,
      "Tier": {
         "Version": "",
         "Type": "Standard",
         "Name": "WebServer"
      },
      "DateUpdated": "2015-08-12T18:16:55.019Z",
      "DateCreated": "2015-08-07T20:48:49.599Z"
   }
   }
}
```

• For API details, see [DescribeEnvironments](https://docs.aws.amazon.com/cli/latest/reference/elasticbeanstalk/describe-environments.html) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use describe-events.
To view events for an environment

The following command retrieves events for an environment named my-env:

```
aws elasticbeanstalk describe-events --environment-name my-env
```

Output (abbreviated):

```json
{
   "Events": [
      {
         "ApplicationName": "my-app",
         "EnvironmentName": "my-env",
         "Message": "Environment health has transitioned from Info to Ok.",
         "EventDate": "2015-08-20T07:06:53.535Z",
         "Severity": "INFO"
      },
      {
         "ApplicationName": "my-app",
         "EnvironmentName": "my-env",
         "Severity": "INFO",
         "RequestId": "b7f3960b-4709-11e5-ba1e-07e16200da41",
         "Message": "Environment update completed successfully.",
         "EventDate": "2015-08-20T07:06:02.049Z"
      },
      ...
      {
         "ApplicationName": "my-app",
         "EnvironmentName": "my-env",
         "Severity": "INFO",
         "RequestId": "ca8dfbf6-41ef-11e5-988b-651aa638f46b",
         "Message": "Using elasticbeanstalk-us-west-2-012445113685 as Amazon S3 storage bucket for environment data.",
         "EventDate": "2015-08-13T19:16:27.561Z"
      },
      {
         "ApplicationName": "my-app",
         "EnvironmentName": "my-env",
         "Severity": "INFO",
         "RequestId": "cdfba8f6-41ef-11e5-988b-65638f41aa6b",
         "Message": "createEnvironment is starting.",
         "EventDate": "2015-08-13T19:16:27.561Z"
      }
   ]
}
```
describe-instances-health

The following code example shows how to use describe-instances-health.

AWS CLI

To view environment health

The following command retrieves health information for instances in an environment named my-env:

```
aws elasticbeanstalk describe-instances-health --environment-name my-env --attribute-names All
```

Output:

```
{
  "InstanceHealthList": [ 
    {
      "InstanceId": "i-08691cc7",
      "ApplicationMetrics": {
        "Duration": 10,
        "Latency": {
          "P99": 0.006,
          "P75": 0.002,
          "P90": 0.004,
          "P95": 0.005,
          "P85": 0.003,
          "P10": 0.0,
          "P999": 0.006,
          "P50": 0.001
        },
      "RequestCount": 48,
      "StatusCodes": {
        "Status3xx": 0,
```
Health information is only available for environments with enhanced health reporting enabled. For more information, see Enhanced Health Reporting and Monitoring in the AWS Elastic Beanstalk Developer Guide.

- For API details, see `DescribeInstancesHealth` in AWS CLI Command Reference.

**list-available-solution-stacks**

The following code example shows how to use `list-available-solution-stacks`.

**AWS CLI**

To view solution stacks
The following command lists solution stacks for all currently available platform configurations and any that you have used in the past:

```
aws elasticbeanstalk list-available-solution-stacks
```

Output (abbreviated):

```
{
    "SolutionStacks": [
        "64bit Amazon Linux 2015.03 v2.0.0 running Node.js",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.6",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.5",
        "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 3.4",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python 2.7",
        "64bit Amazon Linux 2015.03 v2.0.0 running Python",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.2 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.1 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Puma)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 2.0 (Passenger Standalone)",
        "64bit Amazon Linux 2015.03 v2.0.0 running Ruby 1.9.3",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
        "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 7 Java 7",

• For API details, see ListAvailableSolutionStacks in AWS CLI Command Reference.

rebuild-environment

The following code example shows how to use rebuild-environment.

AWS CLI

To rebuild an environment

The following command terminates and recreates the resources in an environment named my-env:

aws elasticbeanstalk rebuild-environment --environment-name my-env

• For API details, see RebuildEnvironment in AWS CLI Command Reference.

request-environment-info

The following code example shows how to use request-environment-info.

AWS CLI

To request tailed logs

The following command requests logs from an environment named my-env:

aws elasticbeanstalk request-environment-info --environment-name my-env --info-type tail

After requesting logs, retrieve their location with retrieve-environment-info.

• For API details, see RequestEnvironmentInfo in AWS CLI Command Reference.
**restart-app-server**

The following code example shows how to use `restart-app-server`.

**AWS CLI**

**To restart application servers**

The following command restarts application servers on all instances in an environment named `my-env`:

```bash
aws elasticbeanstalk restart-app-server --environment-name my-env
```

- For API details, see [RestartAppServer](#) in *AWS CLI Command Reference*.

**retrieve-environment-info**

The following code example shows how to use `retrieve-environment-info`.

**AWS CLI**

**To retrieve tailed logs**

The following command retrieves a link to logs from an environment named `my-env`:

```bash
aws elasticbeanstalk retrieve-environment-info --environment-name my-env --info-type tail
```

**Output:**

```json
{
   "EnvironmentInfo": [
      {
         "SampleTimestamp": "2015-08-20T22:23:17.703Z",
         "Message": "https://elasticbeanstalk-us-west-2-0123456789012.s3.amazonaws.com/resources/environments/logs/tail/e-fyqju3yjs/i-09c1c867/TailLogs-1440109397703.out?AWSAccessKeyId=AKGPT4J56IAJ2EUBL5CQ&Expires=1440195891&Signature=n%2Bea10V6A2Hl0x4Rcfxb7LT16bB%3D",
         "InfoType": "tail",
         "Ec2InstanceId": "i-09c1c867"
      }
   ]
}
```
View the link in a browser. Prior to retrieval, logs must be requested with request-environment-info.

- For API details, see RetrieveEnvironmentInfo in AWS CLI Command Reference.

**swap-environment-cnames**

The following code example shows how to use swap-environment-cnames.

**AWS CLI**

**To swap environment CNAMES**

The following command swaps the assigned subdomains of two environments:

```
aws elasticbeanstalk swap-environment-cnames --source-environment-name my-env-blue
--destination-environment-name my-env-green
```

- For API details, see SwapEnvironmentCnames in AWS CLI Command Reference.

**terminate-environment**

The following code example shows how to use terminate-environment.

**AWS CLI**

**To terminate an environment**

The following command terminates an Elastic Beanstalk environment named my-env:

```
aws elasticbeanstalk terminate-environment --environment-name my-env
```

Output:

```
{
   "ApplicationName": "my-app",
   "EnvironmentName": "my-env",
   "Status": "Terminating",
   "EnvironmentId": "e-fh2eravpns",
}
```
• For API details, see TerminateEnvironment in AWS CLI Command Reference.

**update-application-version**

The following code example shows how to use update-application-version.

**AWS CLI**

To change an application version's description

The following command updates the description of an application version named 22a0-stage-150819_185942:

```
aws elasticbeanstalk update-application-version --version-label 22a0-stage-150819_185942 --application-name my-app --description "new description"
```

**Output:**

```
{
   "ApplicationVersion": {
      "ApplicationName": "my-app",
      "VersionLabel": "22a0-stage-150819_185942",
      "Description": "new description",
      "DateCreated": "2015-08-19T18:59:17.646Z",
      "DateUpdated": "2015-08-20T22:53:28.871Z",
      "SourceBundle": 
```
• For API details, see [UpdateApplicationVersion](#) in *AWS CLI Command Reference*.

**update-configuration-template**

The following code example shows how to use `update-configuration-template`.

**AWS CLI**

**To update a configuration template**

The following command removes the configured CloudWatch custom health metrics configuration `ConfigDocument` from a saved configuration template named `my-template`:

```sh
aws elasticbeanstalk update-configuration-template --template-name my-template --application-name my-app --options-to-remove Namespace=aws:elasticbeanstalk:healthreporting:system,OptionName=ConfigDocument
```

**Output:**

```json
{
   "TemplateName": "my-template",
   "DateCreated": "2015-08-20T22:39:31Z",
   "DateUpdated": "2015-08-20T22:43:11Z",
   "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

• For API details, see [UpdateConfigurationTemplate](#) in *AWS CLI Command Reference*.

**update-environment**

The following code example shows how to use `update-environment`.
AWS CLI

To update an environment to a new version

The following command updates an environment named "my-env" to version "v2" of the application to which it belongs:

```
aws elasticbeanstalk update-environment --environment-name my-env --version-label v2
```

This command requires that the "my-env" environment already exists and belongs to an application that has a valid application version with the label "v2".

Output:

```
{
   "ApplicationName": "my-app",
   "EnvironmentName": "my-env",
   "VersionLabel": "v2",
   "Status": "Updating",
   "EnvironmentId": "e-sqipays4h",
   "EndpointURL": "awseb-e-i-AWSEBLoa-1RDLX6TC9VUA0-0123456789.us-west-2.elb.amazonaws.com",
   "SolutionStackName": "64bit Amazon Linux running Tomcat 7",
   "CNAME": "my-env.elasticbeanstalk.com",
   "Health": "Grey",
   "Tier": {
      "Version": "",
      "Type": "Standard",
      "Name": "WebServer"
   },
   "DateUpdated": "2015-02-03T23:29:11Z",
   "DateCreated": "2015-02-03T23:04:54Z"
}
```

To set an environment variable

The following command sets the value of the "PARAM1" variable in the "my-env" environment to "ParamValue":

```
aws elasticbeanstalk update-environment --environment-name my-env --option-settings
Namespace=aws:elasticbeanstalk:application:environment,OptionName=PARAM1,Value=ParamValue
```
The option-settings parameter takes a namespace in addition to the name and value of the variable. Elastic Beanstalk supports several namespaces for options in addition to environment variables.

To configure option settings from a file

The following command configures several options in the `aws:elb:loadbalancer` namespace from a file:

```
aws elasticbeanstalk update-environment --environment-name my-env --option-settings file://options.json
```

`options.json` is a JSON object defining several settings:

```
[
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Interval",
    "Value": "15"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "Timeout",
    "Value": "8"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "HealthyThreshold",
    "Value": "2"
  },
  {
    "Namespace": "aws:elb:healthcheck",
    "OptionName": "UnhealthyThreshold",
    "Value": "3"
  }
]
```

Output:

```
{
  "ApplicationName": "my-app",
  ...
}
```
For more information about namespaces and supported options, see Option Values in the AWS Elastic Beanstalk Developer Guide.

- For API details, see UpdateEnvironment in AWS CLI Command Reference.

validate-configuration-settings

The following code example shows how to use validate-configuration-settings.

AWS CLI

To validate configuration settings

The following command validates a CloudWatch custom metrics config document:

```bash
aws elasticbeanstalk validate-configuration-settings --application-name my-app --environment-name my-env --option-settings file://options.json
```

options.json is a JSON document that includes one or more configuration settings to validate:

```json
[
]
```
If the options that you specify are valid for the specified environment, Elastic Beanstalk returns an empty Messages array:

```
{
    "Messages": []
}
```

If validation fails, the response will include information about the error:

```
{
    "Messages": [
        {
            "OptionName": "ConfigDocument",
            "Message": "Invalid option specification (Namespace: 'aws:elasticbeanstalk:healthreporting:system', OptionName: 'ConfigDocument'): Unknown configuration setting.",
            "Namespace": "aws:elasticbeanstalk:healthreporting:system",
            "Severity": "error"
        }
    ]
}
```
Elastic Load Balancing examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**Create a listener for a load balancer**

The following code example shows how to create a listener that forwards requests from an ELB load balancer to a target group.

**AWS CLI**

**Example 1: To create an HTTP listener**

The following `create-listener` example creates an HTTP listener for the specified Application Load Balancer that forwards requests to the specified target group.
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
  --protocol HTTP \
  --port 80 \
  --default-actions Type=forward,TargetGroupArn=arn:aws: elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067

For more information, see [Tutorial: Create an Application Load Balancer using the AWS CLI](https://docs.aws.amazon.com/elasticloadbalancing/latest/application/create-load-balancer-tutorial.html) in the [User Guide for Application Load Balancers](https://docs.aws.amazon.com/elasticloadbalancing/latest/application/).

**Example 2: To create an HTTPS listener**

The following `create-listener` example creates an HTTPS listener for the specified Application Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for an HTTPS listener. You can create and manage certificates using AWS Certificate Manager (ACM). Alternatively, you can create a certificate using SSL/TLS tools, get the certificate signed by a certificate authority (CA), and upload the certificate to AWS Identity and Access Management (IAM).

aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
  --protocol HTTPS \
  --port 443 \
  --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \
  --ssl-policy ELBSecurityPolicy-2016-08 \
  --default-actions Type=forward,TargetGroupArn=arn:aws: elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067

For more information, see [Add an HTTPS listener](https://docs.aws.amazon.com/elasticloadbalancing/latest/application/create-load-balancer-tutorial.html) in the [User Guide for Application Load Balancers](https://docs.aws.amazon.com/elasticloadbalancing/latest/application/).

**Example 3: To create a TCP listener**

The following `create-listener` example creates a TCP listener for the specified Network Load Balancer that forwards requests to the specified target group.

aws elbv2 create-listener \

Actions and scenarios
Example 4: To create a TLS listener

The following `create-listener` example creates a TLS listener for the specified Network Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for a TLS listener.

```bash
aws elbv2 create-listener
    --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \ 
    --protocol TLS \ 
    --port 443 \ 
    --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \ 
    --ssl-policy ELBSecurityPolicy-2016-08 \ 
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see [TLS listeners for your Network Load Balancer](https://docs.aws.amazon.com/elasticloadbalancing/latest/network/userguide/user-guide-for-network-load-balancers.html) in the *User Guide for Network Load Balancers*.

Example 5: To create a UDP listener

The following `create-listener` example creates a UDP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```bash
aws elbv2 create-listener
    --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e \ 
    --protocol UDP \ 
    --port 53 \ 
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```
For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the User Guide for Network Load Balancers.

Example 6: To create a listener for the specified gateway and forwarding

The following create-listener example creates a listener for the specified Gateway Load Balancer that forwards requests to the specified target group.

```bash
code
aws elbv2 create-listener \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-east-1:850631746142:loadbalancer/gwy/my-gateway-load-balancer/e0f9b3d5c7f7d3d6 \
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-east-1:850631746142:targetgroup/my-glb-targets/007ca469fae3bb1615
```

Output:

```json
{
  "Listeners": [
    {
      "ListenerArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:listener/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6/afc127db15f925de",
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:loadbalancer/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6",
      "DefaultActions": [
        {
          "Type": "forward",
          "ForwardConfig": {
            "TargetGroups": [
              {
                "TargetGroupArn": "arn:aws:elasticloadbalancing:us-east-1:850631746142:targetgroup/test-tg-agw-2/007ca469fae3bb1615"
              }
            ]
          }
        }
      ]
    }
  ]
}
```
For more information, see [Getting started with Gateway Load Balancers using the AWS CLI](https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/getting-started-gateway-transport.html) in the *User Guide for Gateway Load Balancers*.

- For API details, see [CreateListener](https://docs.aws.amazon.com/cli/latest/reference/elasticloadbalancing/v2/create-listener.html) in *AWS CLI Command Reference*.

**Create a target group**

The following code example shows how to create an ELB target group.

### AWS CLI

**Example 1: To create a target group for an Application Load Balancer**

The following `create-target-group` example creates a target group for an Application Load Balancer where you register targets by instance ID (the target type is `instance`). This target group uses the HTTP protocol, port 80, and the default health check settings for an HTTP target group.

```bash
aws elbv2 create-target-group
  --name my-targets
  --protocol HTTP
  --port 80
  --target-type instance
  --vpc-id vpc-3ac0fb5f
```

**Output:**

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
      "TargetGroupName": "my-targets",
      "Protocol": "HTTP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 30,
      "HealthCheckTimeoutSeconds": 5,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2
    }
  ]
}
```
"UnhealthyThresholdCount": 2,
"HealthCheckPath": "/",
"Matcher": {
   "HttpCode": "200"
},
"TargetType": "instance",
"ProtocolVersion": "HTTP1",
"IpAddressType": "ipv4"
]
]

For more information, see Create a target group in the User Guide for Application Load Balancers.

Example 2: To create a target group to route traffic from an Application Load Balancer to a Lambda function

The following create-target-group example creates a target group for an Application Load Balancer where the target is a Lambda function (the target type is lambda). Health checks are disabled for this target group by default.

```bash
aws elbv2 create-target-group \
   --name my-lambda-target \ 
   --target-type lambda
```

Output:

```json
{
   "TargetGroups": [
   {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-lambda-target/a3003e0b85d8dbb3ddc",
      "TargetGroupName": "my-lambda-target",
      "HealthCheckEnabled": false,
      "HealthCheckIntervalSeconds": 35,
      "HealthCheckTimeoutSeconds": 30,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "HealthCheckPath": "/",
      "Matcher": {
         "HttpCode": "200"
      }
   }
   ]
}
```
For more information, see [Lambda functions as targets](#) in the *User Guide for Application Load Balancers*.

**Example 3: To create a target group for a Network Load Balancer**

The following `create-target-group` example creates a target group for a Network Load Balancer where you register targets by IP address (the target type is `ip`). This target group uses the TCP protocol, port 80, and the default health check settings for a TCP target group.

```bash
aws elbv2 create-target-group \
  --name my-ip-targets \
  --protocol TCP \
  --port 80 \
  --target-type ip \
  --vpc-id vpc-3ac0fb5f
```

**Output:**

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-ip-targets/b6bba954d1361c78",
      "TargetGroupName": "my-ip-targets",
      "Protocol": "TCP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckEnabled": true,
      "HealthCheckProtocol": "TCP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckIntervalSeconds": 30,
      "HealthCheckTimeoutSeconds": 10,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "TargetType": "ip",
    }
  ]
}
```
"IpAddressType": "ipv4"
}
]
}

For more information, see Create a target group in the User Guide for Network Load Balancers.

**Example 4: To create a target group to route traffic from a Network Load Balancer to an Application Load Balancer**

The following create-target-group example creates a target group for a Network Load Balancer where you register an Application Load Balancer as a target (the target type is alb).

```bash
aws elbv2 create-target-group --name my-alb-target --protocol TCP --port 80 --target-type alb --vpc-id vpc-3ac0fb5f
```

**Output:**

```json
{
   "TargetGroups": [
   {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-alb-target/a3003e085dbb8ddc",
      "TargetGroupName": "my-alb-target",
      "Protocol": "TCP",
      "Port": 80,
      "VpcId": "vpc-838475fe",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 30,
      "HealthCheckTimeoutSeconds": 6,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "HealthCheckPath": "/",
      "Matcher": {
         "HttpCode": "200-399"
      },
      "TargetType": "alb",
      "IpAddressType": "ipv4"
   }
   ]
}
```
For more information, see Create a target group with an Application Load Balancer as the target in the User Guide for Network Load Balancers.

**Example 5: To create a target group for a Gateway Load Balancer**

The following `create-target-group` example creates a target group for a Gateway Load Balancer where the target is an instance, and the target group protocol is GENEVE.

```bash
aws elbv2 create-target-group \
  --name my-glb-targetgroup \
  --protocol GENEVE \
  --port 6081 \
  --target-type instance \
  --vpc-id vpc-838475fe
```

Output:

```json
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-glb-targetgroup/00c3d57eacd6f40b6f",
      "TargetGroupName": "my-glb-targetgroup",
      "Protocol": "GENEVE",
      "Port": 6081,
      "VpcId": "vpc-838475fe",
      "HealthCheckProtocol": "TCP",
      "HealthCheckPort": "80",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 10,
      "HealthCheckTimeoutSeconds": 5,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "TargetType": "instance"
    }
  ]
}
```

For more information, see Create a target group [https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/create-target-group.html](https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/create-target-group.html) in the Gateway Load Balancer User Guide.
For API details, see CreateTargetGroup in AWS CLI Command Reference.

Create an Application Load Balancer

The following code example shows how to create an ELB Application Load Balancer.

**AWS CLI**

**Example 1: To create an Internet-facing load balancer**

The following create-load-balancer example creates an Internet-facing Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
  --name my-load-balancer \
  --subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{
   "LoadBalancers": [
   {
      "Type": "application",
      "Scheme": "internet-facing",
      "IpAddressType": "ipv4",
      "VpcId": "vpc-3ac0fb5f",
      "AvailabilityZones": [
         {
            "ZoneName": "us-west-2a",
            "SubnetId": "subnet-8360a9e7"
         },
         {
            "ZoneName": "us-west-2b",
            "SubnetId": "subnet-b7d581c0"
         }
      ],
      "CreatedTime": "2017-08-25T21:26:12.920Z",
      "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
      "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
      "SecurityGroups": ["sg-5943793c"
   ]
   ]
}
```
"LoadBalancerName": "my-load-balancer",
"State": {
    "Code": "provisioning"
},
"LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
]
}

For more information, see Tutorial: Create an Application Load Balancer using the AWS CLI in the User Guide for Application Load Balancers.

**Example 2: To create an internal load balancer**

The following `create-load-balancer` example creates an internal Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
    --name my-internal-load-balancer \
    --scheme internal \
    --subnets subnet-b7d581c0 subnet-8360a9e7
```

**Output:**

```
{
    "LoadBalancers": [
    {
        "Type": "application",
        "Scheme": "internal",
        "IpAddressType": "ipv4",
        "VpcId": "vpc-3ac0fb5f",
        "AvailabilityZones": [
            {
                "ZoneName": "us-west-2a",
                "SubnetId": "subnet-8360a9e7"
            },
            {
                "ZoneName": "us-west-2b",
                "SubnetId": "subnet-b7d581c0"
            }
        ]
    }
}
```
"CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
"DNSName": "internal-my-internal-load-balancer-1529930873.us-west-2.elb.amazonaws.com",
"SecurityGroups": [
    "sg-5943793c"
],
"LoadBalancerName": "my-internal-load-balancer",
"State": {
    "Code": "provisioning"
},
"LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-internal-load-balancer/5b49b8d4303115c2"
]
}

For more information, see Tutorial: Create an Application Load Balancer using the AWS CLI in the User Guide for Application Load Balancers.

**Example 3: To create a Network Load Balancer**

The following create-load-balancer example creates an Internet-facing Network Load Balancer and enables the Availability Zone for the specified subnet. It uses a subnet mapping to associate the specified Elastic IP address with the network interface used by the load balancer nodes for the Availability Zone.

```bash
aws elbv2 create-load-balancer \
    --name my-network-load-balancer \
    --type network \
    --subnet-mappings SubnetId=subnet-b7d581c0,AllocationId=eipalloc-64d5890a
```

Output:

```json
{
    "LoadBalancers": [ 
    {
        "Type": "network",
        "Scheme": "internet-facing",
        "IpAddressType": "ipv4",
        "VpcId": "vpc-3ac0fb5f",
        "AvailabilityZones": [
```
For more information, see Tutorial: Create a Network Load Balancer using the AWS CLI in the User Guide for Network Load Balancers.

**Example 4: To create a Gateway Load Balancer**

The following `create-load-balancer` example creates a Gateway Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
  --name my-gateway-load-balancer \
  --type gateway \
  --subnets subnet-dc83f691 subnet-a62583f9
```

Output:

```json
{
  "LoadBalancers": [
    {
      "IpAddress": "35.161.207.171",
      "AllocationId": "eipalloc-64d5890a"
    }
  ],
  "ZoneName": "us-west-2b",
  "SubnetId": "subnet-5264e837"
}
```

Example 4: To create a Gateway Load Balancer
For more information, see Getting started with Gateway Load Balancers using the AWS CLI in the User Guide for Gateway Load Balancers.

- For API details, see CreateLoadBalancer in AWS CLI Command Reference.

Delete a load balancer

The following code example shows how to delete an ELB load balancer.

**AWS CLI**

**To delete a load balancer**

The following delete-load-balancer example deletes the specified load balancer.

```
aws elbv2 delete-load-balancer \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

- For API details, see DeleteLoadBalancer in AWS CLI Command Reference.
Delete a target group

The following code example shows how to delete an ELB target group.

AWS CLI

To delete a target group

The following delete-target-group example deletes the specified target group.

```
aws elbv2 delete-target-group \\
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

This command produces no output.

For more information, see Delete a load balancer in the Application Load Balancer Guide.

- For API details, see DeleteTargetGroup in AWS CLI Command Reference.

Describe target groups

The following code example shows how to describe specific target groups.

AWS CLI

Example 1: To describe a target group

The following describe-target-groups example displays details for the specified target group.

```
aws elbv2 describe-target-groups \\
   --target-group-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
   "TargetGroups": [
   {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
      "TargetGroupName": "my-targets",
   
```
Example 2: To describe all target groups for a load balancer

The following describe-target-groups example displays details for all target groups for the specified load balancer. The example uses the --query parameter to display only the target group names.

```
aws elbv2 describe-target-groups \\
  --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \\
  --query TargetGroups[*].TargetGroupName
```

Output:

```
[
  "my-instance-targets",
  "my-ip-targets",
  "my-lambda-target"
]
For more information, see [Target groups](#) in the *Application Load Balancers Guide*.
- For API details, see [DescribeTargetGroups](#) in *AWS CLI Command Reference*.

**Get the endpoint of a load balancer**

The following code example shows how to get the endpoint of an ELB load balancer.

**AWS CLI**

**To describe a load balancer**

This example describes the specified load balancer.

**Command:**

```bash
aws elbv2 describe-load-balancers --load-balancer-arns
  arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

**Output:**

```json
{
  "LoadBalancers": [
    {
      "Type": "application",
      "Scheme": "internet-facing",
      "IpAddressType": "ipv4",
      "VpcId": "vpc-3ac0fb5f",
      "AvailabilityZones": [
        {
          "ZoneName": "us-west-2a",
          "SubnetId": "subnet-8360a9e7"
        },
        {
          "ZoneName": "us-west-2b",
          "SubnetId": "subnet-b7d581c0"
        }
      ],
      "CreatedTime": "2016-03-25T21:26:12.920Z",
      "CanonicalHostedZoneId": "Z2P70J7EXAMPLE"
    }
  ]
}```
To describe all load balancers

This example describes all of your load balancers.

Command:

```
aws elbv2 describe-load-balancers
```

- For API details, see [DescribeLoadBalancers](https://docs.aws.amazon.com/cli/latest/reference/elbv2/describe-load-balancers.html) in *AWS CLI Command Reference*.

Get the health of a target group

The following code example shows how to get the health of instances in an ELB target group.

**AWS CLI**

**Example 1: To describe the health of the targets for a target group**

The following describe-target-health example displays health details for the targets of the specified target group. These targets are healthy.

```
aws elbv2 describe-target-health
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
}
```
Example 2: To describe the health of a target

The following `describe-target-health` example displays health details for the specified target. This target is healthy.

```bash
aws elbv2 describe-target-health \
  --targets Id=i-0f76fade,Port=80 \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```json
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-ceddcd4d",
        "Port": 80
      },
      "TargetHealth": {
        "State": "healthy"
      }
    },
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "healthy"
      }
    }
  ]
}
```
The following example output is for a target whose target group is not specified in an action for a listener. This target can't receive traffic from the load balancer.

```
{  
    "TargetHealthDescriptions": [  
    {  
      "HealthCheckPort": "80",  
      "Target": {  
        "Id": "i-0f76fade",  
        "Port": 80  
      },  
      "TargetHealth": {  
        "State": "unused",  
        "Reason": "Target.NotInUse",  
        "Description": "Target group is not configured to receive traffic from the load balancer"  
      }  
    }  
  ]}
```

The following example output is for a target whose target group was just specified in an action for a listener. The target is still being registered.

```
{  
    "TargetHealthDescriptions": [  
    {  
      "HealthCheckPort": "80",  
      "Target": {  
        "Id": "i-0f76fade",  
        "Port": 80  
      },  
      "TargetHealth": {  
        "State": "initial",  
        "Reason": "Target.NotInUse",  
        "Description": "Target group is not configured to receive traffic from the load balancer"  
      }  
    }  
  ]}
```
The following example output is for an unhealthy target.

```
{
    "TargetHealthDescriptions": [
        {
            "HealthCheckPort": "80",
            "Target": {
                "Id": "i-0f76fade",
                "Port": 80
            },
            "TargetHealth": {
                "State": "unhealthy",
                "Reason": "Target.Timeout",
                "Description": "Connection to target timed out"
            }
        }
    ]
}
```

The following example output is for a target that is a Lambda function and health checks are disabled.

```
{
    "TargetHealthDescriptions": [
        {
            "Target": {
                "AvailabilityZone": "all",
            },
            "TargetHealth": {
                "State": "unavailable",
                "Reason": "Target.HealthCheckDisabled",
                "Description": "Health checks are not enabled for this target"
            }
        }
    ]
}
```
add-listener-certificates

The following code example shows how to use add-listener-certificates.

AWS CLI

To add a certificate to a secure listener

This example adds the specified certificate to the specified secure listener.

Command:

```bash
```

Output:

```json
{
   "Certificates": [
      {
         "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
         "IsDefault": false
      }
   ]
}
```

For API details, see AddListenerCertificates in AWS CLI Command Reference.

add-tags

The following code example shows how to use add-tags.

AWS CLI

To add a tag to a load balancer
This example adds tags to the specified load balancer.

Command:

```
aws elb add-tags --load-balancer-name my-load-balancer --tags
  "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see [AddTags](#) in *AWS CLI Command Reference*.

apply-security-groups-to-load-balancer

The following code example shows how to use apply-security-groups-to-load-balancer.

**AWS CLI**

**To associate a security group with a load balancer in a VPC**

This example associates a security group with the specified load balancer in a VPC.

Command:

```
aws elb apply-security-groups-to-load-balancer --load-balancer-name my-load-balancer
  --security-groups sg-fc448899
```

Output:

```
{
  "SecurityGroups": [
    "sg-fc448899"
  ]
}
```

- For API details, see [ApplySecurityGroupsToLoadBalancer](#) in *AWS CLI Command Reference*.

attach-load-balancer-to-subnets

The following code example shows how to use attach-load-balancer-to-subnets.

**AWS CLI**

**To attach subnets to a load balancer**
This example adds the specified subnet to the set of configured subnets for the specified load balancer.

Command:

```bash
aws elb attach-load-balancer-to-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

Output:

```json
{
   "Subnets": [
      "subnet-15aaab61",
      "subnet-0ecac448"
   ]
}
```

- For API details, see [AttachLoadBalancerToSubnets](https://docs.aws.amazon.com/cli/latest/reference/elb/attach-load-balancer-to-subnets.html) in *AWS CLI Command Reference*.

---

**configure-health-check**

The following code example shows how to use `configure-health-check`.

**AWS CLI**

*To specify the health check settings for your backend EC2 instances*

This example specifies the health check settings used to evaluate the health of your backend EC2 instances.

Command:

```bash
aws elb configure-health-check --load-balancer-name my-load-balancer --health-check Target=HTTP:80/png,Interval=30,UnhealthyThreshold=2,HealthyThreshold=2,Timeout=3
```

Output:

```json
{
   "HealthCheck": {
      "HealthyThreshold": 2,
      "Interval": 30,
      ...other fields...
   }
}
```
"Target": "HTTP:80/png",
"Timeout": 3,
"UnhealthyThreshold": 2
}
}

- For API details, see ConfigureHealthCheck in AWS CLI Command Reference.

create-app-cookie-stickiness-policy

The following code example shows how to use create-app-cookie-stickiness-policy.

AWS CLI

To generate a stickiness policy for your HTTPS load balancer

This example generates a stickiness policy that follows the sticky session lifetimes of the application-generated cookie.

Command:

```
aws elb create-app-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-app-cookie-policy --cookie-name my-app-cookie
```

- For API details, see CreateAppCookieStickinessPolicy in AWS CLI Command Reference.

create-lb-cookie-stickiness-policy

The following code example shows how to use create-lb-cookie-stickiness-policy.

AWS CLI

To generate a duration-based stickiness policy for your HTTPS load balancer

This example generates a stickiness policy with sticky session lifetimes controlled by the specified expiration period.

Command:

```
aws elb create-lb-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy --cookie-expiration-period 60
```
create-load-balancer

The following code example shows how to use create-load-balancer.

AWS CLI

To create an HTTP load balancer

This example creates a load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
  "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --subnets
  subnet-15aaab61 --security-groups sg-a61988c3
```

Output:

```
{
  "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTP listener in EC2-Classic.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
  "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --availability-zones us-west-2a us-west-2b
```

Output:

```
{
  "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

To create an HTTPS load balancer

This example creates a load balancer with an HTTPS listener in a VPC.

For API details, see CreateLbCookieStickinessPolicy in AWS CLI Command Reference.
Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
  "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

Output:

```
{
  "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTPS listener in EC2-Classic.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
  "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

Output:

```
{
  "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

To create an internal load balancer

This example creates an internal load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
  "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
  --scheme internal --subnets subnet-a85db0df --security-groups sg-a61988c3
```

Output:

```
{
}
```
For API details, see CreateLoadBalancer in AWS CLI Command Reference.

create-load-balancer-listeners

The following code example shows how to use create-load-balancer-listeners.

AWS CLI

To create HTTP listeners for a load balancer

This example creates a listener for your load balancer at port 80 using the HTTP protocol.

Command:

```bash
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

To create HTTPS listeners for a load balancer

This example creates a listener for your load balancer at port 443 using the HTTPS protocol.

Command:

```bash
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --listeners "Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80"
```

For API details, see CreateLoadBalancerListeners in AWS CLI Command Reference.

create-load-balancer-policy

The following code example shows how to use create-load-balancer-policy.

AWS CLI

To create a policy that enables Proxy Protocol on a load balancer

This example creates a policy that enables Proxy Protocol on the specified load balancer.
Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-ProxyProtocol-policy --policy-type-name ProxyProtocolPolicyType --policy-attributes AttributeName=ProxyProtocol,AttributeValue=true
```

**To create an SSL negotiation policy using the recommended security policy**

This example creates an SSL negotiation policy for the specified HTTPS load balancer using the recommended security policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-attributes AttributeName=Reference-Security-Policy,AttributeValue=ELBSecurityPolicy-2015-03
```

**To create an SSL negotiation policy using a custom security policy**

This example creates an SSL negotiation policy for your HTTPS load balancer using a custom security policy by enabling the protocols and the ciphers.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-attributes AttributeName=Protocol-SSLv3,AttributeValue=true AttributeName=Protocol-TLSv1.1,AttributeValue=true AttributeName=DHE-RSA-AES256-SHA256,AttributeValue=true AttributeName=Server-Defined-Cipher-Order,AttributeValue=true
```

**To create a public key policy**

This example creates a public key policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-PublicKey-policy --policy-type-name PublicKeyPolicyType --policy-attributes AttributeName=PublicKey,AttributeValue=MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAwAYUjnfyEyXr1pxjhFWBpMlggUcqoi3kl+dS74kj/c6x7R0tusUaeQCTgIUKayttRDWchuqo1pHC1u
```
To create a backend server authentication policy

This example creates a backend server authentication policy that enables authentication on your backend instance using a public key.

Command:

```bash
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-authentication-policy --policy-type-name BackendServerAuthenticationPolicyType --policy-attributes
  AttributeName=PublicKeyPolicyName,AttributeValue=my-PublicKey-policy
```

- For API details, see CreateLoadBalancerPolicy in AWS CLI Command Reference.

create-rule

The following code example shows how to use create-rule.

AWS CLI

Example 1: To create a rule using a path condition and a forward action

The following create-rule example creates a rule that forwards requests to the specified target group if the URL contains the specified pattern.

```bash
aws elbv2 create-rule \  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \  --priority 5 \  --conditions file://conditions-pattern.json \  --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Contents of conditions-pattern.json:

```json
[
]
```
Example 2: To create a rule using a host condition and a fixed response

The following `create-rule` example creates a rule that provides a fixed response if the hostname in the host header matches the specified hostname.

```
aws elbv2 create-rule \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \n  --priority 10 \n  --conditions file://conditions-host.json \n  --actions file://actions-fixed-response.json
```

Contents of `conditions-host.json`

```
[
  {
    "Field": "host-header",
    "HostHeaderConfig": {
      "Values": ["*.example.com"]
    }
  }
]
```

Contents of `actions-fixed-response.json`

```
[
  {
    "Type": "fixed-response",
    "FixedResponseConfig": {
      "MessageBody": "Hello world",
      "StatusCode": "200",
      "ContentType": "text/plain"
    }
  }
]
```
Example 3: To create a rule using a source IP address condition, an authenticate action, and a forward action

The following create-rule example creates a rule that authenticates the user if the source IP address matches the specified IP address, and forwards the request to the specified target group if authentication is successful.

```
aws elbv2 create-rule \
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \ 
   --priority 20 \ 
   --conditions file://conditions-source-ip.json \ 
   --actions file://actions-authenticate.json
```

Contents of `conditions-source-ip.json`

```
[
  {
    "Field": "source-ip",
    "SourceIpConfig": {
      "Values": ["192.0.2.0/24", "198.51.100.10/32"]
    }
  }
]
```

Contents of `actions-authenticate.json`

```
[
  {
    "Type": "authenticate-oidc",
    "AuthenticateOidcConfig": {
      "Issuer": "https://idp-issuer.com",
      "TokenEndpoint": "https://token-endpoint.com",
      "UserInfoEndpoint": "https://user-info-endpoint.com",
      "ClientId": "abcdefghijklmnopqrstuvwxyz123456789",
      "ClientSecret": "123456789012345678901234567890",
      "SessionCookieName": "my-cookie",
      "SessionTimeout": 3600,
    }
  }
]`
For API details, see CreateRule in AWS CLI Command Reference.

delete-listener

The following code example shows how to use delete-listener.

AWS CLI

To delete a listener

The following delete-listener example deletes the specified listener.

```bash
aws elbv2 delete-listener \
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

For API details, see DeleteListener in AWS CLI Command Reference.

delete-load-balancer

The following code example shows how to use delete-load-balancer.

AWS CLI

To delete a load balancer
This example deletes the specified load balancer.

Command:

```
aws elb delete-load-balancer --load-balancer-name my-load-balancer
```

• For API details, see `DeleteLoadBalancer` in *AWS CLI Command Reference*.

delete-load-balancer-listeners

The following code example shows how to use `delete-load-balancer-listeners`.

**AWS CLI**

**To delete a listener from your load balancer**

This example deletes the listener for the specified port from the specified load balancer.

Command:

```
aws elb delete-load-balancer-listeners --load-balancer-name my-load-balancer --load-balancer-ports 80
```

• For API details, see `DeleteLoadBalancerListeners` in *AWS CLI Command Reference*.

delete-load-balancer-policy

The following code example shows how to use `delete-load-balancer-policy`.

**AWS CLI**

**To delete a policy from your load balancer**

This example deletes the specified policy from the specified load balancer. The policy must not be enabled on any listener.

Command:

```
aws elb delete-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy
```
• For API details, see [DeleteLoadBalancerPolicy](#) in *AWS CLI Command Reference*.

**delete-rule**

The following code example shows how to use delete-rule.

**AWS CLI**

**To delete a rule**

The following delete-rule example deletes the specified rule.

```
aws elbv2 delete-rule \
   app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3
```

• For API details, see [DeleteRule](#) in *AWS CLI Command Reference*.

**deregister-instances-from-load-balancer**

The following code example shows how to use deregister-instances-from-load-balancer.

**AWS CLI**

**To deregister instances from a load balancer**

This example deregisters the specified instance from the specified load balancer.

**Command:**

```
aws elb deregister-instances-from-load-balancer --load-balancer-name my-load-balancer --instances i-d6f6fae3
```

**Output:**

```json
{
   "Instances": [
      {
         "InstanceId": "i-207d9717"
      },
```
deregister-targets

The following code example shows how to use deregister-targets.

**AWS CLI**

**Example 1: To deregister a target from a target group**

The following deregister-targets example removes the specified instance from the specified target group.

```bash
aws elbv2 deregister-targets \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
  --targets Id=i-1234567890abcdef0
```

**Example 2: To deregister a target registered using port overrides**

The following deregister-targets example removes an instance from a target group that was registered using port overrides.

```bash
aws elbv2 deregister-targets \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
  --targets Id=i-1234567890abcdef0,Port=80 Id=i-1234567890abcdef0,Port=766
```

- For API details, see [DeregisterInstancesFromLoadBalancer](https://docs.aws.amazon.com/cli/latest/reference/elbv2/deregister-instances-from-load-balancer.html) in *AWS CLI Command Reference*.

**describe-account-limits**

The following code example shows how to use describe-account-limits.
AWS CLI

To describe your Classic Load Balancer limits

The following describe-account-limits example displays details about the Classic Load Balancer limits for your AWS account.

```
aws elb describe-account-limits
```

Output:

```
{
   "Limits": [
   
   { 
   "Name": "classic-load-balancers",
   "Max": "20"
   },
   
   { 
   "Name": "classic-listeners",
   "Max": "100"
   },
   
   { 
   "Name": "classic-registered-instances",
   "Max": "1000"
   }
   
   ]
}
```

- For API details, see [DescribeAccountLimits](https://docs.aws.amazon.com/cli/latest/reference/elb/describe-account-limits.html) in AWS CLI Command Reference.

describe-instance-health

The following code example shows how to use describe-instance-health.

AWS CLI

To describe the health of the instances for a load balancer

This example describes the health of the instances for the specified load balancer.

Command:
aws elb describe-instance-health --load-balancer-name my-load-balancer

Output:

```json
{
   "InstanceStates": [
      {
         "InstanceId": "i-207d9717",
         "ReasonCode": "N/A",
         "State": "InService",
         "Description": "N/A"
      },
      {
         "InstanceId": "i-afefb49b",
         "ReasonCode": "N/A",
         "State": "InService",
         "Description": "N/A"
      }
   ]
}
```

**To describe the health of an instance for a load balancer**

This example describes the health of the specified instance for the specified load balancer.

**Command:**

```bash
aws elb describe-instance-health --load-balancer-name my-load-balancer --instances i-7299c809
```

The following is an example response for an instance that is registering.

**Output:**

```json
{
   "InstanceStates": [
      {
         "InstanceId": "i-7299c809",
         "ReasonCode": "ELB",
         "State": "OutOfService",
         "Description": "Instance registration is still in progress."
      }
   ]
}
```
The following is an example response for an unhealthy instance.

Output:

```
{
  "InstanceStates": [
    {
      "InstanceId": "i-7299c809",
      "ReasonCode": "Instance",
      "State": "OutOfService",
      "Description": "Instance has failed at least the UnhealthyThreshold number of health checks consecutively."
    }
  ]
}
```

**describe-listener-certificates**

The following code example shows how to use `describe-listener-certificates`.

**AWS CLI**

*To describe the certificates for a secure listener*

This example describes the certificates for the specified secure listener.

Command:

```
aws elbv2 describe-listener-certificates --listener-arn
arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
  "Certificates": [
    {
```
"CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
  "IsDefault": false
},
{
  "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557",
  "IsDefault": false
},
{
  "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/fe59da96-6f58-4a22-8eed-6d0d50477e1d",
  "IsDefault": true
}
]

• For API details, see DescribeListenerCertificates in AWS CLI Command Reference.

describe-listeners

The following code example shows how to use describe-listeners.

AWS CLI

To describe a listener

This example describes the specified listener.

Command:

```bash
aws elbv2 describe-listeners --listener-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```json
{
  "Listeners": [
    {
      "Port": 80,
      "Protocol": "HTTP",
      "DefaultActions": [
```
To describe the listeners for a load balancer

This example describe the listeners for the specified load balancer.

Command:

aws elbv2 describe-listeners --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188

Output:

```json
{
   "Listeners": [
   {
      "Port": 443,
      "Protocol": "HTTPS",
      "DefaultActions": [
      {
         "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
         "Type": "forward"
      }
   ],
   "SslPolicy": "ELBSecurityPolicy-2015-05",
   "Certificates": [
      {
         "CertificateArn": "arn:aws:iam::123456789012:server-certificate/my-server-cert"
      }
   ]
   }
}
```
For API details, see DescribeListeners in AWS CLI Command Reference.

describe-load-balancer-attributes

The following code example shows how to use describe-load-balancer-attributes.

AWS CLI

To describe load balancer attributes

The following describe-load-balancer-attributes example displays the attributes of the specified load balancer.

```bash
aws elbv2 describe-load-balancer-attributes \
   --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balance/50dc6c495c0c9188
```

The following example output show the attributes for an Application Load Balancer.
The following example output includes the attributes for a Network Load Balancer.

```json
{
   "Attributes": [
   {
      "Value": "false",
      "Key": "access_logs.s3.enabled"
   },
   {
      "Value": "",
      "Key": "access_logs.s3.bucket"
   },
   {
      "Value": "",
      "Key": "access_logs.s3.prefix"
   },
   {
      "Value": "60",
      "Key": "idle_timeout.timeout_seconds"
   },
   {
      "Value": "false",
      "Key": "deletion_protection.enabled"
   },
   {
      "Value": "true",
      "Key": "routing.http2.enabled"
   }
]
}
```
The following code example shows how to use `describe-load-balancer-policies`.

**AWS CLI**

To describe all policies associated with a load balancer

This example describes all of the policies associated with the specified load balancer.

**Command:**

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer
```

**Output:**

```json
{
  "PolicyDescriptions": [
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "ProxyProtocol",
          "AttributeValue": "true"
        }
      ],
      "PolicyName": "my-ProxyProtocol-policy",
      "PolicyTypeName": "ProxyProtocolPolicyType"
    }
  ]
}
```
To describe a specific policy associated with a load balancer

This example describes the specified policy associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer --policy-name my-authentication-policy
```

Output:

```
{
    "PolicyDescriptions": [
    {
        "PolicyAttributeDescriptions": [
            {
                "AttributeName": "PublicKeyPolicyName",
                "AttributeValue": "my-app-cookie"
            }
        ],
        "PolicyName": "my-app-cookie-policy",
        "PolicyTypeName": "AppCookieStickinessPolicyType"
    },
    {
        "PolicyAttributeDescriptions": [
            {
                "AttributeName": "CookieExpirationPeriod",
                "AttributeValue": "60"
            }
        ],
        "PolicyName": "my-duration-cookie-policy",
        "PolicyTypeName": "LBCookieStickinessPolicyType"
    }
    ]
}
For API details, see [DescribeLoadBalancerPolicies](#) in *AWS CLI Command Reference*.

**describe-load-balancer-policy-types**

The following code example shows how to use `describe-load-balancer-policy-types`.

**AWS CLI**

**To describe the load balancer policy types defined by Elastic Load Balancing**

This example describes the load balancer policy types that you can use to create policy configurations for your load balancer.

Command:

```
aws elb describe-load-balancer-policy-types
```

Output:

```
{
   "PolicyTypeDescriptions": [
   {
      "PolicyAttributeTypeDescriptions": [
      {
         "Cardinality": "ONE",
         "AttributeName": "ProxyProtocol",
         "AttributeType": "Boolean"
      }
      ],
      "PolicyTypeName": "ProxyProtocolPolicyType",
      "Description": "Policy that controls whether to include the IP address and port of the originating request for TCP messages. This policy operates on TCP/SSL listeners only"
   }
   ]
}
```

`{  
  "PolicyAttributeTypeDescriptions": [  
    {  
      "Cardinality": "ONE",  
      "AttributeName": "PublicKey",  
      "AttributeType": "String"  
    }  
  ],  
  "PolicyTypeName": "PublicKeyPolicyType",  
  "Description": "Policy containing a list of public keys to accept when authenticating the back-end server(s). This policy cannot be applied directly to back-end servers or listeners but must be part of a BackendServerAuthenticationPolicyType."  
},  

{  
  "PolicyAttributeTypeDescriptions": [  
    {  
      "Cardinality": "ONE",  
      "AttributeName": "CookieName",  
      "AttributeType": "String"  
    }  
  ],  
  "PolicyTypeName": "AppCookieStickinessPolicyType",  
  "Description": "Stickiness policy with session lifetimes controlled by the lifetime of the application-generated cookie. This policy can be associated only with HTTP/HTTPS listeners."  
},  

{  
  "PolicyAttributeTypeDescriptions": [  
    {  
      "Cardinality": "ZERO_OR_ONE",  
      "AttributeName": "CookieExpirationPeriod",  
      "AttributeType": "Long"  
    }  
  ],  
  "PolicyTypeName": "LBCookieStickinessPolicyType",  
  "Description": "Stickiness policy with session lifetimes controlled by the browser (user-agent) or a specified expiration period. This policy can be associated only with HTTP/HTTPS listeners."  
},  

{  
  "PolicyAttributeTypeDescriptions": [  
    
  ]
}  

Actions and scenarios  2789
• For API details, see DescribeLoadBalancerPolicyTypes in AWS CLI Command Reference.

describe-load-balancers

The following code example shows how to use describe-load-balancers.

AWS CLI

To describe your load balancers

This example describes all of your load balancers.

Command:

```bash
aws elb describe-load-balancers
```

To describe one of your load balancers

This example describes the specified load balancer.
Command:

aws elb describe-load-balancers --load-balancer-name my-load-balancer

The following example response is for an HTTPS load balancer in a VPC.

Output:

```json
{
    "LoadBalancerDescriptions": [
        {
            "Subnets": [
                "subnet-15aaab61"
            ],
            "CanonicalHostedZoneNameID": "Z3DZXEN0EXAMPLE",
            "CanonicalHostedZoneName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com",
            "ListenerDescriptions": [
                {
                    "Listener": {
                        "InstancePort": 80,
                        "LoadBalancerPort": 80,
                        "Protocol": "HTTP",
                        "InstanceProtocol": "HTTP"
                    },
                    "PolicyNames": []
                },
                {
                    "Listener": {
                        "InstancePort": 443,
                        "SSLCertificateId": "arn:aws:iam::123456789012:server-certificate/my-server-cert",
                        "LoadBalancerPort": 443,
                        "Protocol": "HTTPS",

  ]
},
"LoadBalancerName": "my-load-balancer",
"CreatedTime": "2015-03-19T03:24:02.650Z",}
For API details, see **DescribeLoadBalancers** in *AWS CLI Command Reference*.

### describe-rules

The following code example shows how to use describe-rules.

#### AWS CLI

**Example 1: To describe a rule**

The following describe-rules example displays details for the specified rule.

```
aws elbv2 describe-rules \
   --rule-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

**Example 2: To describe the rules for a listener**

The following describe-rules example displays details for the rules for the specified listener. The output includes the default rule and any other rules that you've added.

```
aws elbv2 describe-rules \
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

For API details, see **DescribeRules** in *AWS CLI Command Reference*.

### describe-ssl-policies

The following code example shows how to use describe-ssl-policies.

```json
"AvailabilityZones": [
   "us-west-2a"
],
"Scheme": "internet-facing",
"SourceSecurityGroup": {
   "OwnerAlias": "123456789012",
   "GroupName": "my-elb-sg"
}
}
```
AWS CLI

**Example 1: To list the policies used for SSL negotiation by load balancer type**

The following `describe-ssl-policies` example displays the names of the policies that you can use for SSL negotiation with an Application Load Balancer. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
    --load-balancer-type application \
    --query SslPolicies[*].Name
```

**Output:**

```
[
    "ELBSecurityPolicy-2016-08",
    "ELBSecurityPolicy-TLS13-1-2-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",
    "ELBSecurityPolicy-TLS13-1-1-2021-06",
    "ELBSecurityPolicy-TLS13-1-0-2021-06",
    "ELBSecurityPolicy-TLS13-1-3-2021-06",
    "ELBSecurityPolicy-TLS-1-2-2017-01",
    "ELBSecurityPolicy-TLS-1-1-2017-01",
    "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",
    "ELBSecurityPolicy-FS-2018-06",
    "ELBSecurityPolicy-FS-2015-05",
    "ELBSecurityPolicy-TLS-1-0-2015-04",
    "ELBSecurityPolicy-FS-1-1-2019-08",
    "ELBSecurityPolicy-FS-1-2-2019-08",
    "ELBSecurityPolicy-FS-1-2-Res-2020-10"
]
```

**Example 2: To list the policies that support a specific protocol**

The following `describe-ssl-policies` example displays the names of the policies that support the TLS 1.3 protocol. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \
            --load-balancer-type application \
            --query SslPolicies[*].Name
```

```
[
    "ELBSecurityPolicy-2016-08",
    "ELBSecurityPolicy-TLS13-1-2-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",
    "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",
    "ELBSecurityPolicy-TLS13-1-1-2021-06",
    "ELBSecurityPolicy-TLS13-1-0-2021-06",
    "ELBSecurityPolicy-TLS13-1-3-2021-06",
    "ELBSecurityPolicy-TLS-1-2-2017-01",
    "ELBSecurityPolicy-TLS-1-1-2017-01",
    "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",
    "ELBSecurityPolicy-FS-2018-06",
    "ELBSecurityPolicy-FS-2015-05",
    "ELBSecurityPolicy-TLS-1-0-2015-04",
    "ELBSecurityPolicy-FS-1-1-2019-08",
    "ELBSecurityPolicy-FS-1-2-2019-08",
    "ELBSecurityPolicy-FS-1-2-Res-2020-10"
]
```
--load-balancer-type application \\n--query SslPolicies[?contains(SslProtocols,'TLSv1.3')].Name

Output:

]

Example 3: To display the ciphers for a policy

The following `describe-ssl-policies` example displays the names of the ciphers for the specified policy. The example uses the `--query` parameter to display only the cipher names. The first cipher in the list has priority 1, and the remaining ciphers are in priority order.

```bash
aws elbv2 describe-ssl-policies \\
  --names ELBSecurityPolicy-TLS13-1-2-2021-06 \\
  --query SslPolicies[*].Ciphers[*].Name
```

Output:

]

For more information, see [Security policies](#) in the *User Guide for Application Load Balancers*. 
describe-tags

The following code example shows how to use describe-tags.

AWS CLI

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:

```
aws elb describe-tags --load-balancer-name my-load-balancer
```

Output:

```
{
   "TagDescriptions": [
   {
      "Tags": [
      {
         "Value": "lima",
         "Key": "project"
      },
      {
         "Value": "digital-media",
         "Key": "department"
      }
      ],
      "LoadBalancerName": "my-load-balancer"
   }
   ]
}
```

For API details, see DescribeTags in AWS CLI Command Reference.

describe-target-group-attributes

The following code example shows how to use describe-target-group-attributes.

For API details, see DescribeSslPolicies in AWS CLI Command Reference.
AWS CLI

To describe target group attributes

The following describe-target-group-attributes example displays the attributes of the specified target group.

```bash
aws elbv2 describe-target-group-attributes \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

The output includes the attributes if the protocol is HTTP or HTTPS and the target type is instance or ip.

```json
{
  "Attributes": [
    {
      "Value": "false",
      "Key": "stickiness.enabled"
    },
    {
      "Value": "300",
      "Key": "deregistration_delay.timeout_seconds"
    },
    {
      "Value": "lb_cookie",
      "Key": "stickiness.type"
    },
    {
      "Value": "86400",
      "Key": "stickiness.lb_cookie.duration_seconds"
    },
    {
      "Value": "0",
      "Key": "slow_start.duration_seconds"
    }
  ]
}
```

The following output includes the attributes if the protocol is HTTP or HTTPS and the target type is lambda.
The following output includes the attributes if the protocol is TCP, TLS, UDP, or TCP_UDP.

```
{
    "Attributes": [
    {
      "Value": "false",
      "Key": "lambda.multi_value_headers.enabled"
    }
  ]
}
```

For API details, see `DescribeTargetGroupAttributes` in AWS CLI Command Reference.

**detach-load-balancer-from-subnets**

The following code example shows how to use `detach-load-balancer-from-subnets`.

**AWS CLI**

**To detach load balancers from subnets**

This example detaches the specified load balancer from the specified subnet.

Command:

```
aws elb detach-load-balancer-from-subnets --load-balancer-name my-load-balancer --subnets subnet-0ecac448
```

Output:
disable-availability-zones-for-load-balancer

The following code example shows how to use disable-availability-zones-for-load-balancer.

**AWS CLI**

To disable Availability Zones for a load balancer

This example removes the specified Availability Zone from the set of Availability Zones for the specified load balancer.

Command:

```
aws elb disable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2a
```

Output:

```
{
   "AvailabilityZones": [
       "us-west-2b"
   ]
}
```

**enable-availability-zones-for-load-balancer**

The following code example shows how to use enable-availability-zones-for-load-balancer.
**AWS CLI**

**To enable Availability Zones for a load balancer**

This example adds the specified Availability Zone to the specified load balancer.

Command:

```bash
aws elb enable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2b
```

Output:

```
{
    "AvailabilityZones": [
        "us-west-2a",
        "us-west-2b"
    ]
}
```

- For API details, see [EnableAvailabilityZonesForLoadBalancer](https://docs.aws.amazon.com/cli/latest/reference/elb/enable-availability-zones-for-load-balancer.html) in *AWS CLI Command Reference*.

**modify-listener**

The following code example shows how to use `modify-listener`.

**AWS CLI**

**Example 1: To change the default action to a forward action**

The following `modify-listener` example changes the default action (to a `forward` action) for the specified listener.

```bash
aws elbv2 modify-listener \
    --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
    --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:
Example 2: To change the default action to a redirect action

The following modify-listener example changes the default action to a redirect action for the specified listener.

```bash
aws elbv2 modify-listener \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
  --default-actions Type=redirect,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```json
{
  "Listeners": [
    {
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "Type": "redirect"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "Port": 80,
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
    }
  ]
}
```
Example 3: To change the server certificate

This example changes the server certificate for the specified HTTPS listener.

```bash
aws elbv2 modify-listener \
   --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65 \ 
```

Output:

```json
{
   "Listeners": [
      {
         "Protocol": "HTTPS",
         "DefaultActions": [
            {
               "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
               "Type": "forward"
            }
         ],
         "SslPolicy": "ELBSecurityPolicy-2015-05",
         "Certificates": [
            {
               "CertificateArn": "arn:aws:iam::123456789012:server-certificate/my-new-server-cert"
            }
         ],
         "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
```
```
For API details, see ModifyListener in AWS CLI Command Reference.

modify-load-balancer-attributes

The following code example shows how to use modify-load-balancer-attributes.

AWS CLI

To enable deletion protection

This example enables deletion protection for the specified load balancer.

Command:

```bash
aws elbv2 modify-load-balancer-attributes --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes Key=deletion_protection.enabled,Value=true
```

Output:

```json
{
    "Attributes": [
        {
            "Value": "true",
            "Key": "deletion_protection.enabled"
        },
        {
            "Value": "false",
            "Key": "access_logs.s3.enabled"
        },
        {
            "Value": "60",
            "Key": "idle_timeout.timeout_seconds"
        },
    ]
}
```
To change the idle timeout

This example changes the idle timeout value for the specified load balancer.

Command:

```
aws elbv2 modify-load-balancer-attributes --load-balancer-arn
arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes Key=idle_timeout.timeout_seconds,Value=30
```

Output:

```
{
   "Attributes": [
      {
         "Value": "30",
         "Key": "idle_timeout.timeout_seconds"
      },
      {
         "Value": "false",
         "Key": "access_logs.s3.enabled"
      },
      {
         "Value": "",
         "Key": "access_logs.s3.prefix"
      },
      {
         "Value": "true",
         "Key": "deletion_protection.enabled"
      },
      {
         "Value": "",
         "Key": "access_logs.s3.bucket"
      }
   ]
}
```
To enable access logs

This example enables access logs for the specified load balancer. Note that the S3 bucket must exist in the same region as the load balancer and must have a policy attached that grants access to the Elastic Load Balancing service.

Command:

```bash
aws elbv2 modify-load-balancer-attributes --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --attributes Key=access_logs.s3.enabled,Value=true Key=access_logs.s3.bucket,Value=my-loadbalancer-logs Key=access_logs.s3.prefix,Value=myapp
```

Output:

```json
{
  "Attributes": [
    {
      "Value": "true",
      "Key": "access_logs.s3.enabled"
    },
    {
      "Value": "my-load-balancer-logs",
      "Key": "access_logs.s3.bucket"
    },
    {
      "Value": "myapp",
      "Key": "access_logs.s3.prefix"
    },
    {
      "Value": "60",
      "Key": "idle_timeout.timeout_seconds"
    },
    {
      "Value": "false",
      "Key": "deletion_protection.enabled"
    }
  ]
}
```
modify-rule

The following code example shows how to use modify-rule.

AWS CLI

To modify a rule

The following modify-rule example updates the actions and conditions for the specified rule.

```
aws elbv2 modify-rule \
  --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
  --conditions Field=path-pattern,Values="/images/*" \
  --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Output:

```
{
   "Rules": [
      {
         "Priority": "10",
         "Conditions": [
            {
               "Field": "path-pattern",
               "Values": ["/images/*"]
            }
         ],
         "RuleArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee",
         "IsDefault": false,
         "Actions": [
            {
```
modify-target-group

The following code example shows how to use modify-target-group.

**AWS CLI**

To modify the health check configuration for a target group

The following modify-target-group example changes the configuration of the health checks used to evaluate the health of the targets for the specified target group. Note that due to the way the CLI parses commas, you must surround the range for the --matcher option with single quotes instead of double quotes.

```
aws elbv2 modify-target-group \
    --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f \
    --health-check-protocol HTTPS \n    --health-check-port 443 \n    --matcher HttpCode='200,299'
```

**Output:**

```
{
    "TargetGroups": [
        {
            "TargetGroupName": "my-https-targets",
            "Protocol": "HTTPS",
            "Port": 443,
........
```
"VpcId": "vpc-3ac0fb5f",
"HealthCheckProtocol": "HTTPS",
"HealthCheckPort": "443",
"HealthCheckEnabled": true,
"HealthCheckIntervalSeconds": 30,
"HealthCheckTimeoutSeconds": 5,
"HealthyThresholdCount": 5,
"UnhealthyThresholdCount": 2,
"Matcher": {
  "HttpCode": "200,299"
},
"LoadBalancerArns": [
  "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
],
"TargetType": "instance",
"ProtocolVersion": "HTTP1",
"IpAddressType": "ipv4"
]

For more information, see Target groups in the Application Load Balancers Guide.

- For API details, see ModifyTargetGroup in AWS CLI Command Reference.

**modify-target-group-attributes**

The following code example shows how to use modify-target-group-attributes.

**AWS CLI**

To modify the deregistration delay timeout

This example sets the deregistration delay timeout to the specified value for the specified target group.

Command:

```
aws elbv2 modify-target-group-attributes --target-group-arn
  arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 --attributes
  Key=deregistration_delay.timeout_seconds,Value=600
```
register-instances-with-load-balancer

The following code example shows how to use register-instances-with-load-balancer.

**AWS CLI**

To register instances with a load balancer

This example registers the specified instance with the specified load balancer.

Command:

```
aws elb register-instances-with-load-balancer --load-balancer-name my-load-balancer --instances i-d6f6fae3
```

Output:
For API details, see `RegisterInstancesWithLoadBalancer` in *AWS CLI Command Reference*.

**register-targets**

The following code example shows how to use register-targets.

**AWS CLI**

**Example 1: To register targets with a target group by instance ID**

The following `register-targets` example registers the specified instances with a target group. The target group must have a target type of `instance`.

```
aws elbv2 register-targets \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
   --targets Id=i-1234567890abcdef0 Id=i-0abcdef1234567890
```

**Example 2: To register targets with a target group using port overrides**

The following `register-targets` example registers the specified instance with a target group using multiple ports. This enables you to register containers on the same instance as targets in the target group.

```
aws elbv2 register-targets \
   --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \
```

Actions and scenarios
Example 3: To register targets with a target group by IP address

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `ip`.

```
aws elbv2 register-targets \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
  --targets Id=10.0.1.15 Id=10.0.1.23
```

Example 4: To register a Lambda function as a target

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `lambda`. You must grant Elastic Load Balancing permission to invoke the Lambda function.

```
aws elbv2 register-targets \
  --target-group-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \
  --targets Id=arn:aws:lambda:us-west-2:123456789012:function:my-function
```

- For API details, see [RegisterTargets](https://docs.aws.amazon.com/cli/latest/reference/elbv2/register-targets.html) in *AWS CLI Command Reference*.

remove-listener-certificates

The following code example shows how to use `remove-listener-certificates`.

**AWS CLI**

**To remove a certificate from a secure listener**

This example removes the specified certificate from the specified secure listener.

**Command:**

```
aws elbv2 remove-listener-certificates --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 --certificates
```
• For API details, see [RemoveListenerCertificates](#) in *AWS CLI Command Reference*.

### remove-tags

The following code example shows how to use `remove-tags`.

**AWS CLI**

**To remove tags from a load balancer**

The following example removes the `project` and `department` tags from the specified load balancer.

```bash
aws elbv2 remove-tags \\
    --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \\
    --tag-keys project department
```

• For API details, see [RemoveTags](#) in *AWS CLI Command Reference*.

### set-ip-address-type

The following code example shows how to use `set-ip-address-type`.

**AWS CLI**

**To set the address type of a load balancer**

This example sets the address type of the specified load balancer to `dualstack`. The load balancer subnets must have associated IPv6 CIDR blocks.

**Command:**

```bash
aws elbv2 set-ip-address-type \\
    --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \\
    --ip-address-type dualstack
```

**Output:**
For API details, see `SetIpAddressType` in AWS CLI Command Reference.

**set-load-balancer-listener-ssl-certificate**

The following code example shows how to use `set-load-balancer-listener-ssl-certificate`.

**AWS CLI**

**To update the SSL certificate for an HTTPS load balancer**

This example replaces the existing SSL certificate for the specified HTTPS load balancer.

Command:

```
```

For API details, see `SetLoadBalancerListenerSslCertificate` in AWS CLI Command Reference.

**set-load-balancer-policies-for-backend-server**

The following code example shows how to use `set-load-balancer-policies-for-backend-server`.

**AWS CLI**

**To replace the policies associated with a port for a backend instance**

This example replaces the policies that are currently associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names my-ProxyProtocol-policy
```
To remove all policies that are currently associated with a port on your backend instance

This example removes all policies associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names []
```

To confirm that the policies are removed, use the `describe-load-balancer-policies` command.

- For API details, see [SetLoadBalancerPoliciesForBackendServer](https://docs.aws.amazon.com/cli/latest/reference/elb/set-load-balancer-policies-for-backend-server.html) in *AWS CLI Command Reference*.

**set-load-balancer-policies-of-listener**

The following code example shows how to use `set-load-balancer-policies-of-listener`.

**AWS CLI**

**To replace the policies associated with a listener**

This example replaces the policies that are currently associated with the specified listener.

Command:

```
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer --load-balancer-port 443 --policy-names my-SSLNegotiation-policy
```

**To remove all policies associated with your listener**

This example removes all policies that are currently associated with the specified listener.

Command:

```
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer --load-balancer-port 443 --policy-names []
```

To confirm that the policies are removed from the load balancer, use the `describe-load-balancer-policies` command.
set-rule-priorities

The following code example shows how to use set-rule-priorities.

AWS CLI

To set the rule priority

This example sets the priority of the specified rule.

Command:

```bash
aws elbv2 set-rule-priorities --rule-priorities
    RuleArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3,Priority=5
```

Output:

```json
{
    "Rules": [
        {
            "Priority": "5",
            "Conditions": [
                {
                    "Field": "path-pattern",
                    "Values": [
                        "/img/**
                    ]
                }
            ],
            "RuleArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3",
            "IsDefault": false,
            "Actions": [
                {
                    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
                    "Type": "forward"
                }
            ]
        }
    ]
}
```
set-security-groups

The following code example shows how to use set-security-groups.

AWS CLI

**To associate a security group with a load balancer**

This example associates the specified security group with the specified load balancer.

Command:

```
aws elbv2 set-security-groups --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --security-groups sg-5943793c
```

Output:

```
{
   "SecurityGroupIds": [
      "sg-5943793c"
   ]
}
```

**For API details, see SetSecurityGroups in AWS CLI Command Reference.**

set-subnets

The following code example shows how to use set-subnets.

AWS CLI

**To enable Availability Zones for a load balancer**

This example enables the Availability Zone for the specified subnet for the specified load balancer.
Command:

```
aws elbv2 set-subnets --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --subnets subnet-8360a9e7 subnet-b7d581c0
```

Output:

```
{
  "AvailabilityZones": [
     {
       "SubnetId": "subnet-8360a9e7",
       "ZoneName": "us-west-2a"
     },
     {
       "SubnetId": "subnet-b7d581c0",
       "ZoneName": "us-west-2b"
     }
  ]
}
```

- For API details, see [SetSubnets](https://awscli.amazonaws.com/v2/documentation/api/current/reference/services/elbv2/2013-06-01/SetSubnets.html) in *AWS CLI Command Reference*.

**Elastic Transcoder examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Transcoder.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)
**Actions**

**cancel-job**

The following code example shows how to use `cancel-job`.

**AWS CLI**

**To cancel a job for ElasticTranscoder**

This cancels the specified job for ElasticTranscoder.

Command:

```
aws elastictranscoder cancel-job --id 3333333333333-abcde3
```

- For API details, see [CancelJob](#) in *AWS CLI Command Reference*.

**create-job**

The following code example shows how to use `create-job`.

**AWS CLI**

**To create a job for ElasticTranscoder**

The following `create-job` example creates a job for ElasticTranscoder.

```
aws elastictranscoder create-job
   --pipeline-id 1111111111111-abcde1
   --inputs file://inputs.json
   --outputs file://outputs.json
   --output-key-prefix "recipes/"
   --user-metadata file://user-metadata.json
```

Contents of `inputs.json`:

```json
[
   
   
   "Key":"ETS_example_file.mp4",
   "FrameRate":"auto",

   
]
```
Contents of outputs.json:

```json
[
{
   "Key": "webm/ETS_example_file-kindlefirehd.webm",
   "Rotate": "0",
   "PresetId": "1351620000001-100250"
}
]
```

Contents of user-metadata.json:

```json
{
   "Food type": "Italian",
   "Cook book": "recipe notebook"
}
```

Output:

```json
{
   "Job": {
      "Status": "Submitted",
      "Inputs": [
      {
         "Container": "mp4",
         "FrameRate": "auto",
         "Key": "ETS_example_file.mp4",
         "AspectRatio": "auto",
         "Resolution": "auto",
         "Interlaced": "auto"
      }
      ],
      "Playlists": [],
      "Outputs": [
      {
         "Status": "Submitted",
```
"Rotate": "0",
"PresetId": "1351620000001-100250",
"Watermarks": [],
"Key": "webm/ETS_example_file-kindlefirehd.webm",

"Arn": "arn:aws:elastictranscoder:us-west-2:123456789012:job/1533838012294-example"
}

For API details, see CreateJob in AWS CLI Command Reference.

create-pipeline

The following code example shows how to use create-pipeline.
To create a pipeline for ElasticTranscoder

The following create-pipeline example creates a pipeline for ElasticTranscoder.

```
aws elastictranscoder create-pipeline \
   --name Default \
   --input-bucket salesoffice.example.com-source \
   --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \
   --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-east-1:111222333444:ETS_Errors \
   --content-config file://content-config.json \
   --thumbnail-config file://thumbnail-config.json
```

Contents of `content-config.json`:

```json
{
   "Bucket":"salesoffice.example.com-public-promos",
   "Permissions":[
      {
         "GranteeType":"Email",
         "Grantee":"marketing-promos@example.com",
         "Access":[
            "FullControl"
         ]
      }
   ],
   "StorageClass":"Standard"
}
```

Contents of `thumbnail-config.json`:

```json
{
   "Bucket":"salesoffice.example.com-public-promos-thumbnails",
   "Permissions":[
      {
         "GranteeType":"Email",
         "Grantee":"marketing-promos@example.com",
         "Access":[
            "FullControl"
         ]
      }
   ]
}
```
Output:

```json
{
    "Pipeline": {
        "Status": "Active",
        "ContentConfig": {
            "Bucket": "salesoffice.example.com-public-promos",
            "StorageClass": "Standard",
            "Permissions": [
                {
                    "Access": ["FullControl"],
                    "Grantee": "marketing-promos@example.com",
                    "GranteeType": "Email"
                }
            ]
        },
        "Name": "Default",
        "ThumbnailConfig": {
            "Bucket": "salesoffice.example.com-public-promos-thumbnails",
            "StorageClass": "ReducedRedundancy",
            "Permissions": [
                {
                    "Access": ["FullControl"],
                    "Grantee": "marketing-promos@example.com",
                    "GranteeType": "Email"
                }
            ]
        }
    },
    "Notifications": {
        "Completed": "",
        "Warning": "",
        "Progressing": "",
        "Error": "arn:aws:sns:us-east-1:123456789012:ETS_Errors"
    }
}
```
For API details, see [CreatePipeline](https://aws.amazon.com/cli/#CreatePipeline) in *AWS CLI Command Reference*.

**create-preset**

The following code example shows how to use `create-preset`.

**AWS CLI**

To create a preset for ElasticTranscoder

The following `create-preset` example creates a preset for ElasticTranscoder.

```bash
aws elastictranscoder create-preset \
  --name DefaultPreset \
  --description "Use for published videos" \
  --container mp4 \
  --video file://video.json \
  --audio file://audio.json \
  --thumbnails file://thumbnails.json
```

Contents of `video.json`:

```json
{
  "Codec":"H.264",
}
"CodecOptions": {
    "Profile": "main",
    "Level": "2.2",
    "MaxReferenceFrames": "3",
    "MaxBitRate": "",
    "BufferSize": "",
    "InterlacedMode": "Progressive",
    "ColorSpaceConversionMode": "None"
},
"KeyframesMaxDist": "240",
"FixedGOP": "false",
"BitRate": "1600",
"FrameRate": "auto",
"MaxFrameRate": "30",
"MaxWidth": "auto",
"MaxHeight": "auto",
"SizingPolicy": "Fit",
"PaddingPolicy": "Pad",
"DisplayAspectRatio": "auto",
"Watermarks": [
    {
        "Id": "company logo",
        "MaxWidth": "20%",
        "MaxHeight": "20%",
        "SizingPolicy": "ShrinkToFit",
        "HorizontalAlign": "Right",
        "HorizontalOffset": "10px",
        "VerticalAlign": "Bottom",
        "VerticalOffset": "10px",
        "Opacity": "55.5",
        "Target": "Content"
    }
]}

Contents of audio.json:

{
    "Codec": "AAC",
    "CodecOptions": {
        "Profile": "AAC-LC"
    },
    "SampleRate": "44100",
}
Contents of thumbnails.json:

```json
{
   "Format": "png",
   "Interval": "120",
   "MaxWidth": "auto",
   "MaxHeight": "auto",
   "SizingPolicy": "Fit",
   "PaddingPolicy": "Pad"
}
```

Output:

```json
{
   "Preset": {
      "Thumbnails": {
         "SizingPolicy": "Fit",
         "MaxWidth": "auto",
         "Format": "png",
         "PaddingPolicy": "Pad",
         "Interval": "120",
         "MaxHeight": "auto"
      },
      "Container": "mp4",
      "Description": "Use for published videos",
      "Video": {
         "SizingPolicy": "Fit",
         "MaxWidth": "auto",
         "PaddingPolicy": "Pad",
         "MaxFrameRate": "30",
         "FrameRate": "auto",
         "MaxHeight": "auto",
         "KeyframesMaxDist": "240",
         "FixedGOP": "false",
         "Codec": "H.264",
         "Watermarks": [
            {
               "SizingPolicy": "ShrinkToFit",
               "VerticalOffset": "10px",
            }
         ]
      }
   }
}
```
For API details, see [CreatePreset](https://docs.aws.amazon.com/cli/latest/reference/elastictranscoder/createpreset) in *AWS CLI Command Reference*.
delete-pipeline

The following code example shows how to use delete-pipeline.

AWS CLI

To delete the specified ElasticTranscoder pipeline

This deletes the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder delete-pipeline --id 1111111111111-abcde1
```

Output:

```
{
  "Success": "true"
}
```

- For API details, see DeletePipeline in AWS CLI Command Reference.

delete-preset

The following code example shows how to use delete-preset.

AWS CLI

To delete the specified ElasticTranscoder preset

This deletes the specified ElasticTranscoder preset.

Command:

```
aws elastictranscoder delete-preset --id 5555555555555-abcde5
```

- For API details, see DeletePreset in AWS CLI Command Reference.

list-jobs-by-pipeline

The following code example shows how to use list-jobs-by-pipeline.
**AWS CLI**

**To retrieve a list of ElasticTranscoder jobs in the specified pipeline**

This example retrieves a list of ElasticTranscoder jobs in the specified pipeline.

**Command:**

```
aws elastictranscoder list-jobs-by-pipeline --pipeline-id 1111111111111-abcde1
```

**Output:**

```
{
   "Jobs": []
}
```

- For API details, see [ListJobsByPipeline](#) in *AWS CLI Command Reference*.

**list-jobs-by-status**

The following code example shows how to use `list-jobs-by-status`.

**AWS CLI**

**To retrieve a list of ElasticTranscoder jobs with a status of Complete**

This example retrieves a list of ElasticTranscoder jobs with a status of Complete.

**Command:**

```
aws elastictranscoder list-jobs-by-status --status Complete
```

**Output:**

```
{
   "Jobs": []
}
```

- For API details, see [ListJobsByStatus](#) in *AWS CLI Command Reference*. 
list-pipelines

The following code example shows how to use list-pipelines.

AWS CLI

To retrieve a list of ElasticTranscoder pipelines

This example retrieves a list of ElasticTranscoder pipelines.

Command:

```bash
aws elastictranscoder list-pipelines
```

Output:

```json
{
  "Pipelines": [
    {
      "Status": "Active",
      "ContentConfig": {
        "Bucket": "ets-example",
        "Permissions": []
      },
      "Name": "example-pipeline",
      "ThumbnailConfig": {
        "Bucket": "ets-example",
        "Permissions": []
      },
      "Notifications": {
        "Warning": "",
        "Progressing": "",
        "Error": ""
      },
      "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
      "InputBucket": "ets-example",
      "OutputBucket": "ets-example",
      "Id": "3333333333333-abcde3",
    },
    {
      "Status": "Paused",
      // More data...
    }
  ]
}
```
"ContentConfig": {
    "Bucket": "ets-example",
    "Permissions": []
},
"Name": "example-php-test",
"ThumbnailConfig": {
    "Bucket": "ets-example",
    "Permissions": []
},
"Notifications": {
    "Completed": "",
    "Warning": "",
    "Progressing": "",
    "Error": ""
},
"Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
"InputBucket": "ets-example",
"OutputBucket": "ets-example",
"Id": "3333333333333-abcde2",
},
{
    "Status": "Active",
    "ContentConfig": {
        "Bucket": "ets-west-output",
        "Permissions": []
    },
    "Name": "pipeline-west",
    "ThumbnailConfig": {
        "Bucket": "ets-west-output",
        "Permissions": []
    },
    "Notifications": {
        "Warning": "",
        "Progressing": "",
        "Error": ""
    },
    "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
    "InputBucket": "ets-west-input",
    "OutputBucket": "ets-west-output",
    "Id": "3333333333333-abcde1"}
For API details, see [ListPipelines](https://docs.aws.amazon.com/cli/latest/reference/elastictranscoder/list-pipelines.html) in *AWS CLI Command Reference*.

**list-presets**

The following code example shows how to use `list-presets`.

**AWS CLI**

**To retrieve a list of ElasticTranscoder presets**

This example retrieves a list of ElasticTranscoder presets.

**Command:**

```
aws elastictranscoder list-presets --max-items 2
```

**Output:**

```
{
   "Presets": [
      {
         "Container": "mp4",
         "Name": "KindleFireHD-preset",
         "Video": {
            "Resolution": "1280x720",
            "FrameRate": "30",
            "KeyframesMaxDist": "90",
            "FixedGOP": "false",
            "Codec": "H.264",
            "Watermarks": [],
            "CodecOptions": {
               "Profile": "main",
               "MaxReferenceFrames": "3",
               "ColorSpaceConversionMode": "None",
               "InterlacedMode": "Progressive",
               "Level": "4"
            }
      }
   }
}
```

},
"CodecOptions": {
"Profile": "main",
"MaxReferenceFrames": "3",
"ColorSpaceConversionMode": "None",
"InterlacedMode": "Progressive"
For API details, see ListPresets in AWS CLI Command Reference.

**read-job**

The following code example shows how to use read-job.

**AWS CLI**

**To retrieve an ElasticTranscoder job**

This example retrieves the specified ElasticTranscoder job.

Command:

```
aws elastictranscoder read-job --id 1533838012294-example
```

Output:

```
{
```
"Job": {
  "Status": "Progressing",
  "Inputs": [
    {
      "Container": "mp4",
      "FrameRate": "auto",
      "Key": "ETS_example_file.mp4",
      "AspectRatio": "auto",
      "Resolution": "auto",
      "Interlaced": "auto"
    }
  ],
  "Playlists": [],
  "Outputs": [
    {
      "Status": "Progressing",

      "Watermarks": [],
      "Key": "webm/ETS_example_file-kindlefirehd.webm",
      "Id": "1"
    }
  ],
  "PipelineId": "3333333333333-abcde3",
  "OutputKeyPrefix": "recipes/",
  "UserMetadata": {
    "Cook book": "recipe notebook",
    "Food type": "Italian"
  },
  "Output": {
    "Status": "Progressing",
    "Rotate": "0",
    "PresetId": "1351620000001-100250",
    "Watermarks": [],
    "Key": "webm/ETS_example_file-kindlefirehd.webm",
    "Id": "1"
  },
  "Timing": {
    "SubmitTimeMillis": 1533838012298,
    "StartTimeMillis": 1533838013786
  }
},
"Input": {
  "Container": "mp4",
  "FrameRate": "auto"
For API details, see ReadJob in AWS CLI Command Reference.

**read-pipeline**

The following code example shows how to use read-pipeline.

**AWS CLI**

**To retrieve an ElasticTranscoder pipeline**

This example retrieves the specified ElasticTranscoder pipeline.

Command:

```bash
aws elastictranscoder read-pipeline --id 3333333333333-abcde3
```

Output:

```json
{
  "Pipeline": {

**read-preset**

The following code example shows how to use read-preset.

**AWS CLI**

To retrieve an ElasticTranscoder preset

This example retrieves the specified ElasticTranscoder preset.

Command:

```bash/aws elastictranscoder read-preset --id 1351620000001-500020
```

Output:

```json
{
  "Preset": {
    "Thumbnails": {
      "SizingPolicy": "ShrinkToFit",
      "MaxWidth": "192",
      "Format": "png",
      "PaddingPolicy": "NoPad",
      "Interval": "300",
      "MaxHeight": "108"
    },
    "Container": "fmp4",
    "Description": "System preset: MPEG-Dash Video - 4.8M",
    "Video": {
      "SizingPolicy": "ShrinkToFit",
      "MaxWidth": "1280",
      "PaddingPolicy": "NoPad",
      "FrameRate": "30",
      "MaxHeight": "720",
      "KeyframesMaxDist": "60",
      "FixedGOP": "true",
      "Codec": "H.264",

          "Target": "Content",
          "MaxWidth": "10%",
```
Actions and scenarios

2838
For API details, see ReadPreset in AWS CLI Command Reference.

update-pipeline

The following code example shows how to use update-pipeline.

AWS CLI

To update an ElasticTranscoder pipeline

The following update-pipeline example updates the specified ElasticTranscoder pipeline.

```
aws elastictranscoder update-pipeline \
   --id 1111111111111-abcde1 \
   --name DefaultExample \
   --input-bucket salesoffice.example.com-source \
   --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \
   --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-east-1:111222333444:ETS_Errors \
   --content-config file://content-config.json \
   --thumbnail-config file://thumbnail-config.json
```

Contents of content-config.json:
Contents of thumbnail-config.json:

```json
{
   "Bucket":"salesoffice.example.com-public-promos-thumbnails",
   "Permissions":[
      {
         "GranteeType":"Email",
         "Grantee":"marketing-promos@example.com",
         "Access": [ "FullControl"
         ]
      }
   ],
   "StorageClass":"ReducedRedundancy"
}
```

Output:

update-pipeline-notifications

The following code example shows how to use update-pipeline-notifications.

AWS CLI

To update the notifications of an ElasticTranscoder pipeline

This example updates the notifications of the specified ElasticTranscoder pipeline.

Command:

```
```

Output:

```
{
   "Pipeline": {
      "Status": "Active",
      "ContentConfig": {
         "Bucket": "ets-example",
         "StorageClass": "Standard",
         "Permissions": [
            {
               "Access": [
                  "FullControl"
               ],
               "Grantee": "marketing-promos@example.com",
               "GranteeType": "Email"
            }
         ]
      },
      "Name": "Default",
      "ThumbnailConfig": {
         "Bucket": "ets-example",
         "StorageClass": "ReducedRedundancy",
         "Permissions": [
            {
```

Actions and scenarios
}
}

- For API details, see UpdatePipelineNotifications in AWS CLI Command Reference.

**update-pipeline-status**

The following code example shows how to use `update-pipeline-status`.

**AWS CLI**

**To update the status of an ElasticTranscoder pipeline**

This example updates the status of the specified ElasticTranscoder pipeline.

**Command:**

```
aws elastictranscoder update-pipeline-status --id 1111111111111-abcde1 --status Paused
```

**Output:**

```
{}
```
"Pipeline": {
  "Status": "Paused",
  "ContentConfig": {
    "Bucket": "ets-example",
    "StorageClass": "Standard",
    "Permissions": [
      {
        "Access": [
          "FullControl"
        ],
        "Grantee": "marketing-promos@example.com",
        "GranteeType": "Email"
      }
    ],
    "Name": "Default",
    "ThumbnailConfig": {
      "Bucket": "ets-example",
      "StorageClass": "ReducedRedundancy",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ],
          "Grantee": "marketing-promos@example.com",
          "GranteeType": "Email"
        }
      ]
    },
    "Notifications": {
      "Completed": "",
      "Warning": "",

      "Error": "arn:aws:sns:us-east-1:803981987763:ETS_Errors"
    },
    "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
    "InputBucket": "ets-example",
    "Id": "111111111111-abcd1",
    "Arn": "arn:aws:elastictranscoder:us-west-2:123456789012:pipeline/111111111111-abcd1"
  }
},
"For API details, see UpdatePipelineStatus in AWS CLI Command Reference."
ElastiCache examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with ElastiCache.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- **Actions**

Actions

**add-tags-to-resource**

The following code example shows how to use *add-tags-to-resource*.

**AWS CLI**

**To add tags to a resource**

The following *add-tags-to-resource* example adds up to 10 tags, key-value pairs, to a cluster or snapshot resource.

```bash
aws elasticache add-tags-to-resource 
  --resource-name "arn:aws:elasticache:us-east-1:1234567890:cluster:my-mem-cluster" 
  --tags '{"20150202":15, "ElastiCache":"Service"}'
```

Output:

```json
{
  "TagList": [...
```
authorize-cache-security-group-ingress

The following code example shows how to use authorize-cache-security-group-ingress.

AWS CLI

To authorize cache security group for ingress

The following authorize-cache-security-group-ingress example allows network ingress to a cache security group.

```bash
aws elasticache authorize-cache-security-group-ingress \
   --cache-security-group-name  "my-sec-grp" \
   --ec2-security-group-name "my-ec2-sec-grp" \
   --ec2-security-group-owner-id "1234567890"
```

The command produces no output.

For more information, see [Self-Service Updates in Amazon ElastiCache](https://docs.aws.amazon.com/elasticache/latest/userguide/elasticache-self-service-update.html) in the Elasticache User Guide.

batch-apply-update-action

The following code example shows how to use batch-apply-update-action.

For more information, see [Monitoring Costs with Cost Allocation Tags](https://docs.aws.amazon.com/elasticache/latest/multipurposeguide/cost-allocation-tags.html) in the Elasticache User Guide.

- For API details, see [AddTagsToResource](https://docs.aws.amazon.com/cli/latest/reference/elasticache/add-tags.html) in AWS CLI Command Reference.
AWS CLI

To apply a service update

The following `batch-apply-update-action` example applies a service update to a Redis cluster.

```bash
aws elasticache batch-apply-update-action \
   --service-update-name elc-xxxxx406-xxx \
   --replication-group-ids test-cluster
```

Output:

```json
{
   "ProcessedUpdateActions": [
      {
         "ReplicationGroupId": "pat-cluster",
         "ServiceUpdateName": "elc-xxxxx406-xxx",
         "UpdateActionStatus": "waiting-to-start"
      }
   ],
   "UnprocessedUpdateActions": []
}
```

For more information, see [Self-Service Updates in Amazon ElastiCache](https://docs.aws.amazon.com/elasticache/latest/maintenance/optional-updates.html) in the *Elasticache User Guide*.

- For API details, see [BatchApplyUpdateAction](https://docs.aws.amazon.com/cli/latest/reference/elasticache/batch-apply-update-action.html) in *AWS CLI Command Reference*.

**batch-stop-update-action**

The following code example shows how to use `batch-stop-update-action`.

AWS CLI

To stop a service update

The following `batch-stop-update-action` example applies a service update to a Redis cluster.

```bash
aws elasticache batch-stop-update-action \
   --service-update-name elc-xxxxx406-xxx \
```

Actions and scenarios
--replication-group-ids test-cluster

Output:

```json
{
  "ProcessedUpdateActions": [
    {
      "ReplicationGroupId": "pat-cluster",
      "ServiceUpdateName": "elc-xxxxx406-xxx",
      "UpdateActionStatus": "stopping"
    }
  ],
  "UnprocessedUpdateActions": []
}
```

**copy-snapshot**

The following code example shows how to use `copy-snapshot`.

**AWS CLI**

**To copy a snapshot**

The following `copy-snapshot` example makes a copy of an existing snapshot.

```bash
aws elasticache copy-snapshot \
  --source-snapshot-name "my-snapshot" \
  --target-snapshot-name "my-snapshot-copy"
```

Output:

```json
{
  "Snapshot": {
    "Engine": "redis",
    "CacheParameterGroupName": "default.redis3.2",
    "VpcId": "vpc-3820329f3",
    "CacheClusterId": "my-redis4",
```

**Actions and scenarios**
For more information, see [Exporting a Backup](#) in the *Elasticache User Guide*.

- For API details, see [CopySnapshot](#) in *AWS CLI Command Reference*.

### create-cache-cluster

The following code example shows how to use `create-cache-cluster`.

**AWS CLI**

**To create a cache cluster**

The following `create-cache-cluster` example creates a cache cluster using the Redis engine.

```bash
aws elasticache create-cache-cluster \
   --cache-cluster-id "cluster-test" \
   --engine redis \
```

```
--cache-node-type cache.m5.large \
--num-cache-nodes 1

Output:

```json
{
    "CacheCluster": {
        "CacheClusterId": "cluster-test",
        "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
        "CacheNodeType": "cache.m5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.5",
        "CacheClusterStatus": "creating",
        "NumCacheNodes": 1,
        "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
        "PendingModifiedValues": {},
        "CacheSecurityGroups": [],
        "CacheParameterGroup": {
            "CacheParameterGroupName": "default.redis5.0",
            "ParameterApplyStatus": "in-sync",
            "CacheNodeIdsToReboot": []
        },
        "CacheSubnetGroupName": "default",
        "AutoMinorVersionUpgrade": true,
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "06:30-07:30",
        "TransitEncryptionEnabled": false,
        "AtRestEncryptionEnabled": false
    }
}
```

For more information, see [Creating a Cluster](#) in the Elasticache User Guide.

- For API details, see [CreateCacheCluster](#) in AWS CLI Command Reference.

create-cache-parameter-group

The following code example shows how to use create-cache-parameter-group.

AWS CLI

To create a cache parameter group
The following `create-cache-parameter-group` example creates a new Amazon ElastiCache cache parameter group.

```bash
aws elasticache create-cache-parameter-group
    --cache-parameter-group-family "redis5.0"
    --cache-parameter-group-name "mygroup"
    --description "mygroup"
```

Output:

```json
{
    "CacheParameterGroup": {
        "CacheParameterGroupName": "mygroup",
        "CacheParameterGroupFamily": "redis5.0",
        "Description": "my group"
    }
}
```

For more information, see [Creating a Parameter Group](https://docs.aws.amazon.com/elasticache/latest/userguide/creating-parameter-group.html) in the *Elasticache User Guide*.

- For API details, see [CreateCacheParameterGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-cache-parameter-group.html) in *AWS CLI Command Reference*.

---

**create-cache-subnet-group**

The following code example shows how to use `create-cache-subnet-group`.

**AWS CLI**

**To create a cache subnet group**

The following `create-cache-subnet-group` example creates a new cache subnet group.

```bash
aws elasticache create-cache-subnet-group
    --cache-subnet-group-name "mygroup"
    --cache-subnet-group-description "my subnet group"
    --subnet-ids "subnet-xxxxec4f"
```

Output:

```json
{
    "CacheSubnetGroup": {
        "CacheSubnetGroupName": "mygroup",
    }
}
```
"CacheSubnetGroupDescription": "my subnet group",
"VpcId": "vpc-a3e97cdb",
"Subnets": [
{
   "SubnetIdentifier": "subnet-xxxxec4f",
   "SubnetAvailabilityZone": {
      "Name": "us-west-2d"
   }
}
]
}

For more information, see Creating a Cache Subnet Group in the Elasticache User Guide.

- For API details, see CreateCacheSubnetGroup in AWS CLI Command Reference.

create-global-replication-group

The following code example shows how to use create-global-replication-group.

AWS CLI

To create a global replication group

The following create-global-replication-group example creates a new global replication group.

aws elasticache create-global-replication-group \
   --global-replication-group-id-suffix my-global-replication-group \
   --primary-replication-group-id my-primary-cluster

Output:

{
   "GlobalReplicationGroupId": "sgaui-my-global-replication-group",
   "GlobalReplicationGroupDescription": "",
   "Status": "creating",
   "CacheNodeType": "cache.r5.large",
   "Engine": "redis",
   "EngineVersion": "5.0.6",
   "Members": [
For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/userguide/) in the *Elasticache User Guide*.

- For API details, see [CreateGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-global-replication-group.html) in *AWS CLI Command Reference*.

### create-replication-group

The following code example shows how to use `create-replication-group`.

**AWS CLI**

**To create a replication group**

The following `create-replication-group` example creates a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group. This operation is valid for Redis only.

```bash
aws elasticache create-replication-group \
    --replication-group-id "mygroup" \
    --replication-group-description "my group" \
    --engine "redis" \
    --cache-node-type "cache.m5.large"
```
Output:

```
{
   "ReplicationGroup": {
      "ReplicationGroupId": "mygroup",
      "Description": "my group",
      "Status": "creating",
      "PendingModifiedValues": {},
      "MemberClusters": [
         "mygroup-001"
      ],
      "AutomaticFailover": "disabled",
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "06:00-07:00",
      "ClusterEnabled": false,
      "CacheNodeType": "cache.m5.large",
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```

For more information, see [Creating a Redis Replication Group](#) in the [Elasticache User Guide](#).

- For API details, see [CreateReplicationGroup](#) in [AWS CLI Command Reference](#).

### create-snapshot

The following code example shows how to use `create-snapshot`.

**AWS CLI**

To create a snapshot

The following `create-snapshot` example creates a snapshot using the Redis engine.

```
aws elasticache create-snapshot \  
   --snapshot-name mysnapshot \  
   --cache-cluster-id cluster-test
```

Output:

```
{
```
```
```
For more information, see [Backup and Restore for ElastiCache for Redis](https://docs.aws.amazon.com/elasticache/latest/userguide/backup-restore.html) in the Elasticache User Guide.

### create-user

The following code example shows how to use `create-user`.

**AWS CLI**

**To create a user**

The following `create-user` example creates a new user.

```json
"Snapshot": {
    "SnapshotName": "mysnapshot",
    "CacheClusterId": "cluster-test",
    "SnapshotStatus": "creating",
    "SnapshotSource": "manual",
    "CacheNodeType": "cache.m5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.5",
    "NumCacheNodes": 1,
    "PreferredAvailabilityZone": "us-west-2b",
    "CacheClusterCreateTime": "2020-03-19T03:12:01.483Z",
    "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",
    "Port": 6379,
    "CacheParameterGroupName": "default.redis5.0",
    "CacheSubnetGroupName": "default",
    "VpcId": "vpc-a3e97cdb",
    "AutoMinorVersionUpgrade": true,
    "SnapshotRetentionLimit": 0,
    "SnapshotWindow": "06:30-07:30",
    "NodeSnapshots": [
        {
            "CacheNodeId": "0001",
            "CacheSize": "",
            "CacheNodeCreateTime": "2020-03-19T03:12:01.483Z"
        }
    ]
}
```
aws elasticache create-user \
  --user-id user1 \
  --user-name myUser \
  --passwords mYnuUzrpAxXw2rdzx \
  --engine redis \
  --access-string "on ~app::* -@all +@read"

Output:

```json
{
  "UserId": "user2",
  "UserName": "myUser",
  "Status": "active",
  "Engine": "redis",
  "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -georadiusbymember",
  "UserGroupIds": [],
  "Authentication": {
    "Type": "password",
    "PasswordCount": 1
  },
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/mdb/user-guide/ebs-auth-basics.html) in the Elasticache User Guide.

- For API details, see [CreateUser](https://docs.aws.amazon.com/cli/latest/reference/elasticache/create-user.html) in AWS CLI Command Reference.

create-user-group

The following code example shows how to use `create-user-group`.

AWS CLI

To create a user group

The following `create-user-group` example creates a new user group.

```bash
aws elasticache create-user-group \
  --user-group-id myusergroup \
```
**AWS Command Line Interface User Guide for Version 2**

---

**Output:**

```
{
    "UserGroupId": "myusergroup",
    "Status": "creating",
    "Engine": "redis",
    "UserIds": ["default"],
    "ReplicationGroups": [],
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](Elasticache%20User%20Guide) in the Elasticache User Guide.

- For API details, see [CreateUserGroup](AWS%20CLI%20Command%20Reference).

### decrease-node-groups-in-global-replication-group

The following code example shows how to use `decrease-node-groups-in-global-replication-group`.

**AWS CLI**

**To decrease the number of node groups in a global replication group**

The following `decrease-node-groups-in-global-replication-group` decreases the node group count using the Redis engine.

```bash
aws elasticache decrease-node-groups-in-global-replication-group \
    --global-replication-group-id sgaui-test \
    --node-group-count 1 \
    --apply-immediately \
    --global-node-groups-to-retain sgaui-test-0003
```

**Output:**

```
{
```
"GlobalReplicationGroup":
{
  "GlobalReplicationGroupId": "sgui-test",
  "GlobalReplicationGroupDescription": "test",
  "Status": "modifying",
  "CacheNodeType": "cache.r5.large",
  "Engine": "redis",

### decrease-replica-count

The following code example shows how to use `decrease-replica-count`.

**AWS CLI**

To decrease replica count

The following `decrease-replica-count` example dynamically decreases the number of replicas in a Redis (cluster mode disabled) replication group or the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```bash
aws elasticache decrease-replica-count \\
  --replication-group-id my-cluster \\
  --apply-immediately \\
  --new-replica-count 2
```

Output:

```json
{
  "ReplicationGroup": {
    "ReplicationGroupId": "my-cluster",
    "Description": "",
    "Status": "modifying",
    "PendingModifiedValues": {},
    "MemberClusters": [
      "myrepliace",
      "my-cluster-001",
      "my-cluster-002",
      "my-cluster-003"
    ]
  }
}
```
"NodeGroups": [
{
"NodeGroupId": "0001",
"Status": "modifying",
"PrimaryEndpoint": {
"Address": "my-cluster.xxxxx.ng.0001.usw2.cache.amazonaws.com",
"Port": 6379
},
"ReaderEndpoint": {
"Address": "my-cluster-ro.xxxxx.ng.0001.usw2.cache.amazonaws.com",
"Port": 6379
},
"NodeGroupMembers": [
{
"CacheClusterId": "myrepliace",
"CacheNodeId": "0001",
"ReadEndpoint": {
"Address": "myrepliace.xxxxx.0001.usw2.cache.amazonaws.com",
"Port": 6379
},
"PreferredAvailabilityZone": "us-west-2a",
"CurrentRole": "replica"
},
{
"CacheClusterId": "my-cluster-001",
"CacheNodeId": "0001",
"ReadEndpoint": {
"Address": "my-cluster-001.xxxxx.0001.usw2.cache.amazonaws.com",
"Port": 6379
},

},
{
"CacheClusterId": "my-cluster-002",
"CacheNodeId": "0001",
"ReadEndpoint": {
"Address": "my-cluster-002.xxxxx.0001.usw2.cache.amazonaws.com",
"Port": 6379
}
For more information, see Changing the Number of Replicas in the Elasticache User Guide.

- For API details, see DecreaseReplicaCount in AWS CLI Command Reference.

delete-cache-cluster

The following code example shows how to use delete-cache-cluster.

AWS CLI

To delete a cache cluster

The following delete-cache-cluster example deletes the specified previously provisioned cluster. The command deletes all associated cache nodes, node endpoints, and the cluster itself.
When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the cluster; you can't cancel or revert this operation.

This operation is not valid for the following:

Redis (cluster mode enabled) clusters
A cluster that is the last read replica of a replication group
A node group (shard) that has Multi-AZ mode enabled
A cluster from a Redis (cluster mode enabled) replication group
A cluster that is not in the available state

```
aws elasticache delete-cache-cluster
--cache-cluster-id "my-cluster-002"
```

Output:

```json
{
   "CacheCluster": {
      "CacheClusterId": "my-cluster-002",
      "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
      "CacheNodeType": "cache.r5.xlarge",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "CacheClusterStatus": "deleting",
      "NumCacheNodes": 1,
      "PreferredAvailabilityZone": "us-west-2a",
      "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
      "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
      "PendingModifiedValues": {},
      "NotificationConfiguration": {
         "TopicStatus": "active"
      },
      "CacheSecurityGroups": [],
      "CacheParameterGroup": {
         "CacheParameterGroupName": "mygroup",
         "ParameterApplyStatus": "in-sync",
         "CacheNodeIdsToReboot": []
      },
      "CacheSubnetGroupName": "kxkxk",
      "AutoMinorVersionUpgrade": true,
      "SecurityGroups": [
         {
            "SecurityGroupId": "sg-xxxxxxxxxx9836",
```
For more information, see [Deleting a Cluster](#) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheCluster](#) in *AWS CLI Command Reference*.

### delete-cache-parameter-group

The following code example shows how to use `delete-cache-parameter-group`.

**AWS CLI**

**To delete a cache parameter group**

The following `delete-cache-parameter-group` example deletes the specified cache parameter group. You can't delete a cache parameter group if it's associated with any cache clusters.

```bash
aws elasticache delete-cache-parameter-group
   --cache-parameter-group-name myparamgroup
```

This command produces no output.

For more information, see [Deleting a Parameter Group](#) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheParameterGroup](#) in *AWS CLI Command Reference*.

### delete-cache-subnet-group

The following code example shows how to use `delete-cache-subnet-group`.

```bash
aws elasticache delete-cache-subnet-group
   --cache-subnet-group-name mysubnetgroup
```

This command produces no output.

For more information, see [Deleting a Subnet Group](#) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheSubnetGroup](#) in *AWS CLI Command Reference*.
AWS CLI

To delete a cache subnet group

The following delete-cache-subnet-group example deletes the specified cache subnet group. You can't delete a cache subnet group if it's associated with any clusters.

```bash
aws elasticache delete-cache-subnet-group \
   --cache-subnet-group-name "mygroup"
```

This command produces no output.

For more information, see [Deleting a Subnet Group](https://docs.aws.amazon.com/elasticache/latest/userguide/Elasticache-Delete-Subnet-Group.html) in the Elasticache User Guide.

- For API details, see [DeleteCacheSubnetGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/delete-cache-subnet-group.html) in AWS CLI Command Reference.

delete-global-replication-group

The following code example shows how to use delete-global-replication-group.

AWS CLI

To delete a global replication group

The following delete-global-replication-group example deletes a new global replication group.

```bash
aws elasticache delete-global-replication-group \
   --global-replication-group-id my-global-replication-group \
   --retain-primary-replication-group
```

Output:

```json
{
   "GlobalReplicationGroup": {
      "GlobalReplicationGroupId": "sgau1-my-grg",
      "GlobalReplicationGroupDescription": "my-grg",
      "Status": "deleting",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.6",
      "Members": [
         {
```

"ReplicationGroupId": "my-cluster-grg",
"ReplicationGroupRegion": "us-west-2",
"Role": "PRIMARY",
"AutomaticFailover": "enabled",
"Status": "associated"
}
],
"ClusterEnabled": false,
"AuthTokenEnabled": false,
"TransitEncryptionEnabled": false,
"AtRestEncryptionEnabled": false
}
}

For more information, see [Replication Across AWS Regions Using Global Datastore](https://docs.aws.amazon.com/elasticache/latest/migration/replication-across-regions.html) in the Elasticache User Guide.

- For API details, see [DeleteGlobalReplicationGroup](https://docs.aws.amazon.com/cli/latest/reference/elasticache/delete-global-replication-group.html) in AWS CLI Command Reference.

**delete-replication-group**

The following code example shows how to use delete-replication-group.

**AWS CLI**

**To delete a replication group**

The following delete-replication-group example deletes an existing replication group. By default, this operation deletes the entire replication group, including the primary/primaries and all of the read replicas. If the replication group has only one primary, you can optionally delete only the read replicas, while retaining the primary by setting RetainPrimaryCluster=true.

When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the selected resources; you cannot cancel or revert this operation. Valid for Redis only.

```bash
aws elasticache delete-replication-group \
    --replication-group-id "mygroup"
```

Output:

```json
{
```
For API details, see [DeleteReplicationGroup](#) in *AWS CLI Command Reference*.

### delete-snapshot

The following code example shows how to use delete-snapshot.

**AWS CLI**

**To delete a snapshot**

The following delete-snapshot example deleted a snapshot using the Redis engine.

```bash
aws elasticache delete-snapshot \
--snapshot-name mysnapshot
```

**Output:**

```json
{
   "Snapshot": {
      "SnapshotName": "my-cluster-snapshot",
      "ReplicationGroupId": "mycluster",
      "ReplicationGroupDescription": "mycluster",
      "SnapshotStatus": "deleting",
      "SnapshotSource": "manual",
      "CacheNodeType": "cache.r5.xlarge",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "PreferredMaintenanceWindow": "thu:12:00-thu:13:00",
      "Port": 6379,
   }
}
```
"CacheParameterGroupName": "default.redis5.0.cluster.on",
"CacheSubnetGroupName": "default",
"VpcId": "vpc-a3e97cde",
"AutoMinorVersionUpgrade": true,
"SnapshotRetentionLimit": 1,
"SnapshotWindow": "13:00-14:00",
"NumNodeGroups": 4,
"AutomaticFailover": "enabled",
"NodeSnapshots": [
    {
        "CacheClusterId": "mycluster-0002-003",
        "NodeGroupId": "0002",
        "CacheNodeId": "0001",
        "CacheSize": "6 MB",
        "CacheNodeCreateTime": "2020-06-18T00:05:44.719000+00:00",
        "SnapshotCreateTime": "2020-06-25T20:34:30+00:00"
    },
    {
        "CacheClusterId": "mycluster-0003-003",
        "NodeGroupId": "0003",
        "CacheNodeId": "0001",
        "CacheSize": "6 MB",
        "CacheNodeCreateTime": "2019-12-05T19:13:15.912000+00:00",
        "SnapshotCreateTime": "2020-06-25T20:34:30+00:00"
    },
    {
        "CacheClusterId": "mycluster-0004-002",
        "NodeGroupId": "0004",
        "CacheNodeId": "0001",
        "CacheSize": "6 MB",
        "CacheNodeCreateTime": "2019-12-09T19:44:34.324000+00:00",
        "SnapshotCreateTime": "2020-06-25T20:34:30+00:00"
    },
    {
        "CacheClusterId": "mycluster-0005-003",
        "NodeGroupId": "0005",
        "CacheNodeId": "0001",
        "CacheSize": "6 MB",
        "CacheNodeCreateTime": "2020-06-18T00:05:44.775000+00:00",
        "SnapshotCreateTime": "2020-06-25T20:34:30+00:00"
    }
]
For more information, see [Backup and Restore for ElastiCache for Redis](#) in the *Elasticache User Guide*.

- For API details, see [DeleteSnapshot](#) in *AWS CLI Command Reference*.

### delete-user

The following code example shows how to use `delete-user`.

#### AWS CLI

**To delete a user**

The following `delete-user` example deletes a user.

```bash
aws elasticache delete-user \
  --user-id user2
```

**Output:**

```json
{
  "UserId": "user1",
  "UserName": "myUser",
  "Status": "deleting",
  "Engine": "redis",
  "AccessString": "on ~* +@all",
  "UserGroupIds": [
    "myusergroup"
  ],
  "Authentication": {
    "Type": "password",
    "PasswordCount": 1
  },
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](#) in the *Elasticache User Guide*.

- For API details, see [DeleteUser](#) in *AWS CLI Command Reference*. 
delete-user-group

The following code example shows how to use delete-user-group.

AWS CLI

To delete a user group

The following delete-user-group example deletes a user group.

```bash
aws elasticache delete-user-group \\
  --user-group-id myusergroup
```

Output:

```
{
  "UserGroupId": "myusergroup",
  "Status": "deleting",
  "Engine": "redis",
  "UserIds": [
    "default"
  ],
  "ReplicationGroups": [],
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)] in the Elasticache User Guide.

- For API details, see [DeleteUserGroup] in AWS CLI Command Reference.

describe-cache-clusters

The following code example shows how to use describe-cache-clusters.

AWS CLI

To describe a cache cluster

The following describe-cache-clusters example describes a cache cluster.

```bash
aws elasticache describe-cache-clusters
```
Output:

```json
{
   "CacheClusters": [
   {
      "CacheClusterId": "my-cluster-003",
      "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "CacheClusterStatus": "available",
      "NumCacheNodes": 1,
      "PreferredAvailabilityZone": "us-west-2a",
      "CacheClusterCreateTime": "2019-11-26T01:22:52.396Z",
      "PreferredMaintenanceWindow": "mon:17:30-mon:18:30",
      "PendingModifiedValues": {},
      "NotificationConfiguration": {
         "TopicStatus": "active"
      },
      "CacheSecurityGroups": [],
      "CacheParameterGroup": {
         "CacheParameterGroupName": "default.redis5.0",
         "ParameterApplyStatus": "in-sync",
         "CacheNodeIdsToReboot": []
      },
      "CacheSubnetGroupName": "kxkxk",
      "AutoMinorVersionUpgrade": true,
      "SecurityGroups": [
         {
            "SecurityGroupId": "sg-xxxxxd7b",
            "Status": "active"
         }
      ],
      "ReplicationGroupId": "my-cluster",
      "SnapshotRetentionLimit": 0,
      "SnapshotWindow": "06:30-07:30",
      "AuthTokenEnabled": false,
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false,
      "ReplicationGroupLogDeliveryEnabled": false,
   }
   ]
}
```
For more information, see Managing Clusters in the Elasticache User Guide.

- For API details, see DescribeCacheClusters in AWS CLI Command Reference.

**describe-cache-engine-versions**

The following code example shows how to use describe-cache-engine-versions.

**AWS CLI**

**To describe a cache engine version**

The following describe-cache-engine-versions example returns a list of the available cache engines and their versions.

```
aws elasticache describe-cache-engine-versions \
--engine "Redis"
```

**Output:**

```json
{
   "CacheEngineVersions": [
      {
         "Engine": "redis",
         "EngineVersion": "2.6.13",
         "CacheParameterGroupFamily": "redis2.6",
      }
   ]
}
```
"CacheEngineDescription": "Redis",
  "CacheEngineVersionDescription": "redis version 2.6.13"
},
{
  "Engine": "redis",
  "EngineVersion": "2.8.19",
  "CacheParameterGroupFamily": "redis2.8",
  "CacheEngineDescription": "Redis",
  "CacheEngineVersionDescription": "redis version 2.8.19"
},
{
  "Engine": "redis",
  "EngineVersion": "2.8.21",
  "CacheParameterGroupFamily": "redis2.8",
  "CacheEngineDescription": "Redis",
  "CacheEngineVersionDescription": "redis version 2.8.21"
},
{

  "CacheEngineDescription": "Redis",
  "CacheEngineVersionDescription": "redis version 5.0.0"
},
{
  "Engine": "redis",
  "EngineVersion": "5.0.3",
  "CacheParameterGroupFamily": "redis5.0",
  "CacheEngineDescription": "Redis",
  "CacheEngineVersionDescription": "redis version 5.0.3"
},
{

For API details, see DescribeCacheEngineVersions in AWS CLI Command Reference.

describe-cache-parameter-groups

The following code example shows how to use describe-cache-parameter-groups.

AWS CLI

To describe a cache parameter group

The following describe-cache-parameter-groups example returns a list of cache parameter group descriptions.

aws elasticache describe-cache-parameter-groups \   --cache-parameter-group-name "mygroup"

Output:

{
    "CacheParameterGroups": [
        {
            "CacheParameterGroupName": "mygroup",
            "CacheParameterGroupFamily": "redis5.0",
            "Description": ""
        }
    ]
}
For more information, see Configuring Engine Parameters Using Parameter Groups in the Elasticache User Guide.

- For API details, see DescribeCacheParameterGroups in AWS CLI Command Reference.

**describe-cache-parameters**

The following code example shows how to use describe-cache-parameters.

**AWS CLI**

**To describe cache parameters**

The following "describe-cache-parameters" example returns the detailed parameter list for the specified cache parameter group.

```bash
aws elasticache describe-cache-parameters \
 --cache-parameter-group-name "myparamgroup"
```

**Output:**

```json
{
   "Parameters": [

describe-cache-subnet-groups

The following code example shows how to use describe-cache-subnet-groups.

AWS CLI

To describe cache subnet groups
The following `describe-cache-subnet-groups` example returns a list of subnet groups.

```bash
aws elasticache describe-cache-subnet-groups
```

Output:

```json
{
  "CacheSubnetGroups": [
    {
      "CacheSubnetGroupName": "default",
      "CacheSubnetGroupDescription": "Default CacheSubnetGroup",
      "VpcId": "vpc-a3e97cdb",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-8d4bacf5",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2b"
          }
        },
        {
          "SubnetIdentifier": "subnet-dde21380",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2c"
          }
        },
        {
          "SubnetIdentifier": "subnet-6485ec4f",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2d"
          }
        },
        {
          "SubnetIdentifier": "subnet-b4ebebff",
          "SubnetAvailabilityZone": {
            "Name": "us-west-2a"
          }
        }
      ]
    },
    {
      "CacheSubnetGroupName": "kxkxk",
      "CacheSubnetGroupDescription": "mygroup",
      "VpcId": "vpc-a3e97cdb",
      "Subnets": [
      ]
    }
  ]
}
```
For more information, see Subnets and Subnet Groups in the Elasticache User Guide or Subnets and Subnet Groups in the ElastiCache for Memcached User Guide.

- For API details, see DescribeCacheSubnetGroups in AWS CLI Command Reference.

describe-engine-default-parameters

The following code example shows how to use describe-engine-default-parameters.

AWS CLI

To describe engine default parameters

The following describe-engine-default-parameters example returns the default engine and system parameter information for the specified cache engine.

```
aws elasticache describe-engine-default-parameters \
  --cache-parameter-group-family "redis5.0"
```
Output:

```json
{
    "EngineDefaults": {
        "Parameters": [
            {
                "ParameterName": "activedefrag",

describe-events

The following code example shows how to use describe-events.

AWS CLI

To describe events of a replication group

The following describe-events example returns a list of events for a replication group.

```
aws elasticache describe-events \
    --source-identifier test-cluster \
    --source-type replication-group
```

Output:

```
{
    "Events": [
        {
            "SourceIdentifier": "test-cluster",
            "SourceType": "replication-group",
            "Message": "Automatic failover has been turned on for replication group test-cluster",
            "Date": "2020-03-18T23:51:34.457Z"
        }
    ]
}
```
For more information, see Monitoring Events in the Elasticache User Guide.

- For API details, see DescribeEvents in AWS CLI Command Reference.

describe-global-replication-groups

The following code example shows how to use describe-global-replication-groups.

AWS CLI

To describe global replication groups

The following describe-global-replication-groups example returns details of a Global datastore.

aws elasticache describe-global-replication-groups \  --global-replication-group-id my-grg

Output:

```json
{
   "GlobalReplicationGroups": [
       {
           "GlobalReplicationGroupId": "my-grg",
           "GlobalReplicationGroupDescription": "my-grg",
           "Status": "creating",
           "CacheNodeType": "cache.r5.large",

           "AtRestEncryptionEnabled": false
       }
   ]
}
```
For more information, see Replication Across AWS Regions Using Global Datastore in the Elasticache User Guide.

- For API details, see DescribeGlobalReplicationGroups in AWS CLI Command Reference.

describe-replication-groups

The following code example shows how to use describe-replication-groups.

AWS CLI

To return a list of replication group details

The following describe-replication-groups example returns the replication groups.

aws elasticache describe-replication-groups

Output:

```json
{
   "ReplicationGroups": [
      {
         "ReplicationGroupId": "my-cluster",

For more information, see Managing Clusters in the Elasticache User Guide.

- For API details, see DescribeReplicationGroups in AWS CLI Command Reference.
describe-reserved-cache-nodes

The following code example shows how to use describe-reserved-cache-nodes.

AWS CLI

To describe reserved cache nodes

The following describe-reserved-cache-nodes example returns information about reserved cache nodes for this account, or about the specified reserved cache node.

aws elasticache describe-reserved-cache-nodes

Output:

```
{
   "ReservedCacheNodes": [
   {
      "ReservedCacheNodeId": "mynode",
      "ReservedCacheNodesOfferingId": "xxxxxxxxx-xxxxx-xxxxx-xxxx-xxxxxxxx71",

   }
   ]
}
```

For more information, see Managing Costs with Reserved Nodes in the Elasticache User Guide.

- For API details, see DescribeReservedCacheNodes in AWS CLI Command Reference.
describe-reserved-cache-nodes-offerings

The following code example shows how to use describe-reserved-cache-nodes-offerings.

AWS CLI

To describe reserved-cache-nodes-offerings

The following describe-reserved-cache-nodes-offerings example returns details of a reserved-cache-node options.

```bash
aws elasticache describe-reserved-cache-nodes-offerings
```

Output:

```json
{
  "ReservedCacheNodesOfferings": [
    {
      "ReservedCacheNodesOfferingId": "01ce0a19-a476-41cb-8aee-48eacbcdd8e5",
      "CacheNodeType": "cache.t3.small",
      "Duration": 31536000,
      "FixedPrice": 97.0,
      "UsagePrice": 0.0,
      "ProductDescription": "memcached",
      "OfferingType": "Partial Upfront",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": 0.011,
          "RecurringChargeFrequency": "Hourly"
        }
      ]
    },
    {
      "ReservedCacheNodesOfferingId": "0443a27b-4da5-4b90-b92d-929fbd7abed2",
      "CacheNodeType": "cache.m3.2xlarge",
      "Duration": 31536000,
      "FixedPrice": 1772.0,
      "UsagePrice": 0.0,
      "ProductDescription": "redis",
      "OfferingType": "Heavy Utilization",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": 0.25,
```
"RecurringChargeFrequency": "Hourly"

- For API details, see DescribeReservedCacheNodesOfferings in AWS CLI Command Reference.

describe-service-updates

The following code example shows how to use describe-service-updates.

AWS CLI

To describe service updates

The following describe-service-updates example returns details about service updates.

aws elasticache describe-service-updates

Output:

{
  "ServiceUpdates": [
    {
      "ServiceUpdateName": "elc-xxxxxxxx7-001",
      "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z",
      "ServiceUpdateEndDate": "2020-02-09T15:59:59Z",
      "ServiceUpdateSeverity": "important",
      "ServiceUpdateRecommendedApplyByDate": "2019-11-08T15:59:59Z",
      "ServiceUpdateStatus": "available",
      "ServiceUpdateDescription": "Upgrades to improve the security, reliability, and operational performance of your ElastiCache nodes",
      "ServiceUpdateType": "security-update",
      "Engine": "redis, memcached",
    }
  ]
}
• For API details, see [DescribeServiceUpdates](https://docs.aws.amazon.com/cli/latest/reference/elasticache/describe-service-updates.html) in AWS CLI Command Reference.

**describe-snapshots**

The following code example shows how to use `describe-snapshots`.

**AWS CLI**

**To describe snapshots**

The following "describe-snapshots" example returns information about your cluster or replication group snapshots.

```bash
aws elasticache describe-snapshots
```

**Output:**

```json
{
  "Snapshots": [
```
{
    "SnapshotName": "automatic.my-cluster2-002-2019-12-05-06-38",
    "CacheClusterId": "my-cluster2-002",
    "SnapshotStatus": "available",
    "SnapshotSource": "automated",

    }
  ]
}
For more information, see [Backup and Restore for ElastiCache for Redis](#) in the *Elasticache User Guide*.

- For API details, see DescribeSnapshots in *AWS CLI Command Reference*.

### describe-update-actions

The following code example shows how to use describe-update-actions.

**AWS CLI**

**To describe update actions**

The following describe-update-actions example returns details of update actions.

```bash
aws elasticache describe-update-actions
```

**Output:**

```
{
  "UpdateActions": [ [
    { "ReplicationGroupId": "mycluster", "ServiceUpdateName": "elc-20191007-001", "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z", "ServiceUpdateSeverity": "important", "ServiceUpdateStatus": "available", "ServiceUpdateRecommendedApplyByDate": "2019-11-08T15:59:59Z", "ServiceUpdateType": "security-update", "UpdateActionAvailableDate": "2019-12-05T19:15:19.995Z", "UpdateActionStatus": "complete", "NodesUpdated": "9/9", "UpdateActionStatusModifiedDate": "2019-12-05T19:15:20.461Z", "SlaMet": "n/a", "Engine": "redis"
    },
    { "CacheClusterId": "my-memcached-cluster", "ServiceUpdateName": "elc-20191007-001", "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z", "ServiceUpdateSeverity": "important",

}
For more information, see [Self-Service Updates in Amazon ElastiCache](https://docs.aws.amazon.com/elasticache/latest/m峨导/elasticache-self-service-update-actions.html) in the *Elasticache User Guide*.

- For API details, see [DescribeUpdateActions](https://docs.aws.amazon.com/cli/latest/reference/elasticache/describe-update-actions.html) in *AWS CLI Command Reference*.

### describe-user-groups

The following code example shows how to use `describe-user-groups`.

**AWS CLI**

**To describe user-groups**

The following `describe-user-groups` example returns a list of user groups.

```
aws elasticache describe-user-groups
```

Output:

```json
{
   "UserGroups": [{
      "UserGroupId": "myusergroup",
      "Status": "active",
      "Engine": "redis",
      "UserIds": [
         "default"
      ],
      "ReplicationGroups": [],
   }
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/m峨导/elasticache-authentication-role-based-access-control.html) in the *Elasticache User Guide*.

- For API details, see [DescribeUserGroups](https://docs.aws.amazon.com/cli/latest/reference/elasticache/describe-user-groups.html) in *AWS CLI Command Reference*.
describe-users

The following code example shows how to use describe-users.

AWS CLI

To describe users

The following describe-users example returns a list of users.

```bash
aws elasticache describe-users
```

Output:

```
{
  "Users": [
    {
      "UserId": "default",
      "UserName": "default",
      "Status": "active",
      "Engine": "redis",
      "AccessString": "on ~* +@all",
      "UserGroupIds": [
        "myusergroup"
      ],
      "Authentication": {
        "Type": "no-password"
      },
      "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:default"
    },
    {
      "UserId": "user1",
      "UserName": "myUser",
      "Status": "active",
      "Engine": "redis",
      "AccessString": "on ~* +@all",
      "UserGroupIds": [],
      "Authentication": {
        "Type": "password",
        "PasswordCount": 1
      },
      "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
    }
  ]
}
```
For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/m滨Guide/UsingWithOther/RoleBasedAccessControl.html) in the Elasticache User Guide.

- For API details, see [DescribeUsers](https://docs.aws.amazon.com/elasticache/latest/m滨Guide/API-DescribeUsers.html) in AWS CLI Command Reference.

### disassociate-global-replication-group

The following code example shows how to use disassociate-global-replication-group.

**AWS CLI**

**To diassociate a secondary cluster from a global replication group**

The following disassociate-global-replication-group example removes a secondary cluster from a Global datastore

```
aws elasticache disassociate-global-replication-group \
   --global-replication-group-id my-grg \
   --replication-group-id my-cluster-grg-secondary \
   --replication-group-region us-east-1
```

**Output:**

```
{
   "UserId": "user2",
   "UserName": "myUser",
   "Status": "active",
   "Engine": "redis",
   "AccessString": "on ~app::* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoad -georadius -georadiusbymember",
   "UserGroupIds": [],
   "Authentication": {
      "Type": "password",
      "PasswordCount": 1
   },
   "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```
"GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "my-grg",
    "GlobalReplicationGroupDescription": "my-grg",
    "Status": "modifying",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.6",
    "Members": [
        {
            "ReplicationGroupId": "my-cluster-grg-secondary",
            "ReplicationGroupRegion": "us-east-1",
            "Role": "SECONDARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
        },
        {
            "ReplicationGroupId": "my-cluster-grg",
            "ReplicationGroupRegion": "us-west-2",
            "Role": "PRIMARY",
            "AutomaticFailover": "enabled",
            "Status": "associated"
        }
    ],
    "ClusterEnabled": false,
    "AuthTokenEnabled": false,
    "TransitEncryptionEnabled": false,
    "AtRestEncryptionEnabled": false
}
}

For more information, see Replication Across AWS Regions Using Global Datastore in the Elasticache User Guide.

- For API details, see DisassociateGlobalReplicationGroup in AWS CLI Command Reference.

increase-node-groups-in-global-replication-group

The following code example shows how to use increase-node-groups-in-global-replication-group.

AWS CLI

To increase the number of node groups in a global replication group
The following `increase-node-groups-in-global-replication-group` increases the node group count using the Redis engine.

```
aws elasticache increase-node-groups-in-global-replication-group \
  --global-replication-group-id sgaui-pat-test-4 \
  --node-group-count 6 \
  --apply-immediately
```

Output:

```
{
    "GlobalReplicationGroup": {
        "GlobalReplicationGroupId": "sgaui-test-4",
        "GlobalReplicationGroupDescription": "test-4",
        "Status": "modifying",
        "CacheNodeType": "cache.r5.large",
        "Engine": "redis",
        "EngineVersion": "5.0.6",
        "Members": [
            {
                "ReplicationGroupId": "my-cluster-b",
                "ReplicationGroupRegion": "us-east-1",
                "Role": "SECONDARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            },
            {
                "ReplicationGroupId": "my-cluster-a",
                "ReplicationGroupRegion": "us-west-2",
                "Role": "PRIMARY",
                "AutomaticFailover": "enabled",
                "Status": "associated"
            }
        ],
        "ClusterEnabled": true,
        "GlobalNodeGroups": [
            {
                "GlobalNodeGroupId": "sgaui-test-4-0001",
                "Slots": "0-234,2420-5461"
            },
            {
                "GlobalNodeGroupId": "sgaui-test-4-0002",
                "Slots": "5462-5904,6997-9830"
            }
        ]
    }
}
```
increase-replica-count

The following code example shows how to use increase-replica-count.

AWS CLI

To increase replica count

The following increase-replica-count example does one of two things. It can dynamically increase the number of replicas in a Redis (cluster mode disabled) replication group. Or it can dynamically increase the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```bash
aws elasticache increase-replica-count \
   --replication-group-id "my-cluster" \
```
--apply-immediately \ 
--new-replica-count 3

Output:

```json
{
    "ReplicationGroup": {
        "ReplicationGroupId": "my-cluster",
        "Description": "",
        "Status": "modifying",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "my-cluster-001",
            "my-cluster-002",
            "my-cluster-003",
            "my-cluster-004"
        ],
        "NodeGroups": [
            {
                "NodeGroupId": "0001",
                "Status": "modifying",
                "PrimaryEndpoint": {
                    "Address": "my-cluster.xxxxxih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "ReaderEndpoint": {
                    "Address": "my-cluster-ro.xxxxxxih.ng.0001.usw2.cache.amazonaws.com",
                    "Port": 6379
                },
                "NodeGroupMembers": [
                    {
                        "CacheClusterId": "my-cluster-001",
                        "CacheNodeId": "0001",
                        "ReadEndpoint": {
                            "Address": "my-cluster-001.xxxxxih.0001.usw2.cache.amazonaws.com",
                            "Port": 6379
                        },
                        "PreferredAvailabilityZone": "us-west-2a",
                        "CurrentRole": "primary"
                    }
                ]
            }
        ]
    }
}
```
For more information, see [Increasing the Number of Replicas in a Shard](#) in the Elasticache User Guide.

- For API details, see [IncreaseReplicaCount](#) in AWS CLI Command Reference.

**list-allowed-node-type-modifications**

The following code example shows how to use `list-allowed-node-type-modifications`.

**AWS CLI**

**To list the allowed node modifications**

The following `list-allowed-node-type-modifications` example lists all the available node types that you can scale your Redis cluster's or replication group's current node type to.

```bash
aws elasticache list-allowed-node-type-modifications \
  --replication-group-id "my-replication-group"
```
Output:

```json
{
  "ScaleUpModifications": [
    "cache.m5.12xlarge",
    "cache.m5.24xlarge",
    "cache.m5.4xlarge",
    "cache.r5.12xlarge",
    "cache.r5.24xlarge",
    "cache.r5.2xlarge",
    "cache.r5.4xlarge"
  ],
  "ScaleDownModifications": [
    "cache.m3.large",
    "cache.m3.medium",
    "cache.m3.xlarge",
    "cache.m4.large",
    "cache.m4.xlarge",
    "cache.m5.2xlarge",
    "cache.m5.large",
    "cache.m5.xlarge",
    "cache.r3.large",
    "cache.r4.large",
    "cache.r4.xlarge",
    "cache.r5.large",
    "cache.t2.medium",
    "cache.t2.large",
    "cache.t2.micro",
    "cache.t2.small",
    "cache.t3.medium",
    "cache.t3.large",
    "cache.t3.micro",
    "cache.t3.small"
  ]
}
```

For more information, see `Scaling ElastiCache for Redis Clusters` in the Elasticache User Guide.

- For API details, see `ListAllowedNodeTypeModifications` in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.
**AWS CLI**

**To list tags for a resource**

The following `list-tags-for-resource` example lists tags for a resource.

```
aws elasticache list-tags-for-resource \
   --resource-name "arn:aws:elasticache:us-east-1:123456789012:cluster:my-cluster"
```

Output:

```
{
    "TagList": [
        {
            "Key": "Project",
            "Value": "querySpeedUp"
        },
        {
            "Key": "Environment",
            "Value": "PROD"
        }
    ]
}
```

For more information, see [Listing Tags Using the AWS CLI](#) in the *Elasticache User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

**modify-cache-cluster**

The following code example shows how to use `modify-cache-cluster`.

**AWS CLI**

**To modify cache clusters**

The following `modify-cache-cluster` example modifies the settings for the specified cluster.

```
aws elasticache modify-cache-cluster \
   --cache-cluster-id "my-cluster" \
   --num-cache-nodes 1
```

Output:
modify-cache-parameter-group

The following code example shows how to use modify-cache-parameter-group.

**AWS CLI**

To modify a cache parameter group

The following modify-cache-parameter-group example modifies the parameters of the specified cache parameter group.
aws elasticache modify-cache-parameter-group \
--cache-parameter-group-name "mygroup" \
--parameter-name-values "ParameterName=activedefrag, ParameterValue=no"

Output:

{  
   "CacheParameterGroupName": "mygroup"
}

For more information, see Modifying a Parameter Group in the Elasticache User Guide.

- For API details, see ModifyCacheParameterGroup in AWS CLI Command Reference.

modify-cache-subnet-group

The following code example shows how to use modify-cache-subnet-group.

AWS CLI

To modify a cache subnet group

The following modify-cache-subnet-group example modifies the specified cache subnet group.

aws elasticache modify-cache-subnet-group \
--cache-subnet-group-name kxxkk \
--cache-subnet-group-description "mygroup"

Output:

{
   "CacheSubnetGroup": {
      "CacheSubnetGroupName": "kxxkk",
      "CacheSubnetGroupDescription": "mygroup",
      "VpcId": "vpc-xxxxcdb",
      "Subnets": [
         {
            "SubnetIdentifier": "subnet-xxxxbbff",
            "SubnetAvailabilityZone": {
               "Name": "us-west-2a"
            }
         }
      ]
   }
}
modify-global-replication-group

The following code example shows how to use modify-global-replication-group.

AWS CLI

To modify a global replication group

The following modify-global-replication-group modifies the properties of a global replication group, in this case disabling automatic failover, using the Redis engine.

```bash
aws elasticache modify-global-replication-group
   --global-replication-group-id sgaui-pat-group
   --apply-immediately
   --no-automatic-failover-enabled
```

Output

```json
{
   "GlobalReplicationGroup": {
      "GlobalReplicationGroupId": "sgaui-test-group",
      "GlobalReplicationGroupDescription": "",
      "Status": "modifying",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.6",
      "ClusterEnabled": false,
      "AuthTokenEnabled": false,
      "TransitEncryptionEnabled": false,
      "AtRestEncryptionEnabled": false
   }
}
```
modify-replication-group

The following code example shows how to use modify-replication-group.

**AWS CLI**

**To modify a replication group**

The following modify-replication-group disables Multi-AZ using the Redis engine.

```bash
aws elasticache modify-replication-group \
    --replication-group-id test-cluster \
    --no-multi-az-enabled \ 
    --apply-immediately
```

**Output**

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test-cluster",
        "Description": "test-cluster",
        "GlobalReplicationGroupInfo": {

### modify-replication-group-shard-configuration

The following code example shows how to use `modify-replication-group-shard-configuration`.

**AWS CLI**

**To modify a replication group shard configuration**

The following `modify-replication-group-shard-configuration` decreases the node group count using the Redis engine.

```bash
aws elasticache modify-replication-group-shard-configuration \\
  --replication-group-id mycluster \\
  --node-group-count 3 \\
  --apply-immediately \\
  --node-groups-to-remove 0002
```

**Output**

```json
{
  "ReplicationGroup": {
    "ReplicationGroupId": "mycluster",
    "Description": "mycluster",
    "GlobalReplicationGroupInfo": {},
    "SnapshottingClusterId": "test-cluster-002",

    }
  ]
}
For more information, see Scaling ElastiCache for Redis Clusters in the Elasticache User Guide.
modify-user

The following code example shows how to use modify-user.

AWS CLI

To modify a user

The following modify-user example modifies a user's access string.

```
aws elasticache modify-user \
  --user-id user2 \
  --append-access-string "on ~* +@all"
```

Output:

```
{
  "UserId": "user2",
  "UserName": "myUser",
  "Status": "modifying",
  "Engine": "redis",
  "AccessString": "on ~* +@all",
  "UserGroupIds": [],
  "Authentication": {
    "Type": "password",
    "PasswordCount": 1
  },
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}
```

For more information, see Authenticating Users with Role-Based Access Control (RBAC) in the Elasticache User Guide.

- For API details, see ModifyReplicationGroupShardConfiguration in AWS CLI Command Reference.

modify-user-group

The following code example shows how to use modify-user-group.

- For API details, see ModifyUser in AWS CLI Command Reference.
AWS CLI

To modify a user group

The following `modify-user-group` example adds a user to the user group.

```bash
aws elasticache modify-user-group \
    --user-group-id myusergroup \
    --user-ids-to-add user1
```

Output:

```json
{
    "UserGroupId": "myusergroup",
    "Status": "modifying",
    "Engine": "redis",
    "UserIds": [
        "default"
    ],
    "PendingChanges": {
        "UserIdsToAdd": [
            "user1"
        ]
    },
    "ReplicationGroups": [],
}
```

For more information, see [Authenticating Users with Role-Based Access Control (RBAC)](https://docs.aws.amazon.com/elasticache/latest/userguide/ElastiCache-RBAC.html) in the Elasticache User Guide.

purchase-reserved-cache-nodes-offering

The following code example shows how to use `purchase-reserved-cache-nodes-offering`.

**AWS CLI**

To purchase a reserved-cache-node-offering

The following `purchase-reserved-cache-nodes-offering` example allows you to purchase a reserved cache node offering.
aws elasticache purchase-reserved-cache-nodes-offering \
   --reserved-cache-nodes-offering-id xxxxxxx-4da5-4b90-b92d-929fbd7abed2

Output

```json
{
   "ReservedCacheNode": {
      "ReservedCacheNodeId": "ri-2020-06-30-17-59-40-474",
      "ReservedCacheNodesOfferingId": "xxxxxxx-4da5-4b90-b92d-929fbd7abed2",
      "CacheNodeType": "cache.m3.2xlarge",
      "StartTime": "2020-06-30T17:59:40.474000+00:00",
      "Duration": 31536000,
      "FixedPrice": 1772.0,
      "UsagePrice": 0.0,
      "CacheNodeCount": 1,
      "ProductDescription": "redis",
      "OfferingType": "Heavy Utilization",
      "State": "payment-pending",
      "RecurringCharges": [
         {
            "RecurringChargeAmount": 0.25,
            "RecurringChargeFrequency": "Hourly"
         }
      ]
   }
}
```

- For API details, see [PurchaseReservedCacheNodesOffering](#) in [AWS CLI Command Reference](#).

**reboot-cache-cluster**

The following code example shows how to use `reboot-cache-cluster`.

**AWS CLI**

To reboot a cache cluster
The following `reboot-cache-cluster` example reboots some, or all, of the cache nodes within a provisioned cluster. This operation applies any modified cache parameter groups to the cluster. The reboot operation takes place as soon as possible, and results in a momentary outage to the cluster. During the reboot, the cluster status is set to `REBOOTING`.

```bash
aws elasticache reboot-cache-cluster \
   --cache-cluster-id "my-cluster-001" \ 
   --cache-node-ids-to-reboot "0001"
```

Output:

```json
{
   "CacheCluster": {
      "CacheClusterId": "my-cluster-001",
      "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
      "CacheNodeType": "cache.r5.xlarge",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
      "CacheClusterStatus": "rebooting cache cluster nodes",
      "NumCacheNodes": 1,

      "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
      "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
      "PendingModifiedValues": {},
      "NotificationConfiguration": {
         "TopicStatus": "active"
      },
      "CacheSecurityGroups": [],
      "CacheParameterGroup": {
         "CacheParameterGroupName": "mygroup",
         "ParameterApplyStatus": "in-sync",
         "CacheNodeIdsToReboot": []
      },
      "CacheSubnetGroupName": "kxxkxk",
      "AutoMinorVersionUpgrade": true,
      "SecurityGroups": [
         {
            "SecurityGroupId": "sgxxxxxxxxxxxx836",
            "Status": "active"
         }
      ]
   }
}
```
The following code example shows how to use `reset-cache-parameter-group`.

**AWS CLI**

**To reset a cache parameter group**

The following `reset-cache-parameter-group` example modifies the parameters of a cache parameter group to the engine or system default value. You can reset specific parameters by submitting a list of parameter names. To reset the entire cache parameter group, specify the `--reset-all-parameters` and `--cache-parameter-group-name` parameters.

```bash
aws elasticache reset-cache-parameter-group \
  --cache-parameter-group-name "mygroup" \n  --reset-all-parameters
```

**Output:**

```json
{
   "CacheParameterGroupName": "mygroup"
}
```

**start-migration**

The following code example shows how to use `start-migration`.

**AWS CLI**

**To start a migration**

The following `start-migration` migrates your data from self-hosted Redis on Amazon EC2 to Amazon ElastiCache, using the Redis engine.

```
aws elasticache start-migration
  --replication-group-id test
  --customer-node-endpoint-list
  "Address='test.g2xbih.ng.0001.usw2.cache.amazonaws.com',Port=6379"
```

**Output**

```
{
    "ReplicationGroup": {
        "ReplicationGroupId": "test",
        "Description": "test",
        "GlobalReplicationGroupInfo": {},

}

For more information, see Online Migration to ElastiCache in the Elasticache User Guide.

- For API details, see StartMigration in AWS CLI Command Reference.

test-failover

The following code example shows how to use test-failover.

**AWS CLI**

**To test failover of a node group**

The following test-failover example tests automatic failover on the specified node group (called a shard in the console) in a replication group (called a cluster in the console).

```bash
aws elasticache test-failover /
    --replication-group-id "mycluster" /
    --node-group-id "0001"
```

Output:

```json
{
    "ReplicationGroup": {
        "ReplicationGroupId": "mycluster",
        "Description": "My Cluster",
        "Status": "available",
        "PendingModifiedValues": {},
        "MemberClusters": [
            "mycluster-0001-001",
            "mycluster-0001-002",
            "mycluster-0001-003",
            "mycluster-0002-001",
            "mycluster-0002-002",
            "mycluster-0002-003",
            "mycluster-0003-001",
            "mycluster-0003-002",
            "mycluster-0003-003"
        ],
        "NodeGroups": [}
```

  { "CacheClusterId": "mycluster-0002-003", "CacheNodeId": "0001", "PreferredAvailabilityZone": "us-west-2c" }
 ]
},

For API details, see TestFailover in AWS CLI Command Reference.

MediaStore examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore.
**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- [Actions](#)

### Actions

**create-container**

The following code example shows how to use `create-container`.

**AWS CLI**

To create a container

The following `create-container` example creates a new, empty container.

```bash
aws mediastore create-container --container-name ExampleContainer
```

**Output:**

```json
{
   "Container": {
      "AccessLoggingEnabled": false,
      "CreationTime": 1563557265,
      "Name": "ExampleContainer",
      "Status": "CREATING",
   }
}
```

For more information, see [Creating a Container](#) in the *AWS Elemental MediaStore User Guide*. 
• For API details, see CreateContainer in AWS CLI Command Reference.

delete-container

The following code example shows how to use delete-container.

AWS CLI

To delete a container

The following delete-container example deletes the specified container. You can delete a container only if it has no objects.

```bash
aws mediastore delete-container \
  --container-name=ExampleLiveDemo
```

This command produces no output.

For more information, see Deleting a Container in the AWS Elemental MediaStore User Guide.

• For API details, see DeleteContainer in AWS CLI Command Reference.

delete-container-policy

The following code example shows how to use delete-container-policy.

AWS CLI

To delete a container policy

The following delete-container-policy example deletes the policy that is assigned to the specified container. When the policy is deleted, AWS Elemental MediaStore automatically assigns the default policy to the container.

```bash
aws mediastore delete-container-policy \
  --container-name LiveEvents
```

This command produces no output.

For more information, see DeleteContainerPolicy in the AWS Elemental MediaStore API reference.
delete-cors-policy

The following code example shows how to use delete-cors-policy.

AWS CLI

To delete a CORS policy

The following delete-cors-policy example deletes the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```bash
aws mediastore delete-cors-policy \
   --container-name ExampleContainer
```

This command produces no output.

For more information, see Deleting a CORS Policy in the AWS Elemental MediaStore User Guide.

delete-lifecycle-policy

The following code example shows how to use delete-lifecycle-policy.

AWS CLI

To delete an object lifecycle policy

The following delete-lifecycle-policy example deletes the object lifecycle policy attached to the specified container. This change can take up to 20 minutes to take effect.

```bash
aws mediastore delete-lifecycle-policy \
   --container-name LiveEvents
```

This command produces no output.

For more information, see Deleting an Object Lifecycle Policy in the AWS Elemental MediaStore User Guide.

• For API details, see DeleteCorsPolicy in AWS CLI Command Reference.
describe-container

The following code example shows how to use `describe-container`.

**AWS CLI**

To view the details of a container

The following `describe-container` example displays the details of the specified container.

```bash
aws mediastore describe-container \
   --container-name ExampleContainer
```

Output:

```
{
   "Container": {
       "CreationTime": 1563558086,
       "AccessLoggingEnabled": false,
ExampleContainer",
       "Status": "ACTIVE",
       "Name": "ExampleContainer",
       "Endpoint": "https://aaabbbccddddee.data.mediastore.us-west-2.amazonaws.com"
   }
}
```

For more information, see [Viewing the Details for a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DescribeContainer](#) in *AWS CLI Command Reference*.

describe-object

The following code example shows how to use `describe-object`.

**AWS CLI**

To view a list of objects and folders in a specific container

The following `describe-object` example displays items (objects and folders) stored in a specific container.
aws mediastore-data describe-object \
   --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \
   --path /folder_name/file1234.jpg

Output:

```json
{
   "ContentType": "image/jpeg",
   "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
   "ContentLength": "2307346",
   "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeee4dd89ff7f5555555555da6d3"
}
```

For more information, see `Viewing the Details of an Object` in the *AWS Elemental MediaStore User Guide*.

- For API details, see `DescribeObject` in *AWS CLI Command Reference*.

**get-container-policy**

The following code example shows how to use `get-container-policy`.

**AWS CLI**

**To view a container policy**

The following `get-container-policy` example displays the resource-based policy of the specified container.

aws mediastore get-container-policy \
   --container-name ExampleLiveDemo

Output:

```json
{
   "Policy": {
      "Version": "2012-10-17",
      "Statement": [
         {
            "Sid": "PublicReadOverHttps",
            "Effect": "Allow",
            "Principal": {
```
get-cors-policy

The following code example shows how to use get-cors-policy.

AWS CLI

To view a CORS policy

The following get-cors-policy example displays the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore get-cors-policy \
   --container-name ExampleContainer \
   --region us-west-2
```

Output:

```
{
   "CorsPolicy": [
}
"AllowedMethods": [
  "GET",
  "HEAD"
],
"MaxAgeSeconds": 3000,
"AllowedOrigins": [
  ""\n
],
"AllowedHeaders": [
  ""\n
]
}
}

For more information, see Viewing a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see GetCorsPolicy in AWS CLI Command Reference.

get-lifecycle-policy

The following code example shows how to use get-lifecycle-policy.

AWS CLI

To view an object lifecycle policy

The following get-lifecycle-policy example displays the object lifecycle policy attached to the specified container.

```
aws mediastore get-lifecycle-policy \
  --container-name LiveEvents
```

Output:

```json
{
  "LifecyclePolicy": {
    "rules": [
      {
        "definition": {
          "path": [
            {
              "prefix": "Football/"
```
For more information, see [Viewing an Object Lifecycle Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetLifecyclePolicy](#) in *AWS CLI Command Reference*.

**get-object**

The following code example shows how to use `get-object`.

**AWS CLI**

**To download an object**

The following `get-object` example download an object to the specified endpoint.

```
aws mediastore-data get-object \
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \
  --path=/folder_name/README.md README.md
```

Output:

```
{
  "ContentLength": "2307346",
```
To download part of an object

The following get-object example downloads a portion an object to the specified endpoint.

```
aws mediastore-data get-object \
   --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \
   --path /folder_name/README.md \
   --range="bytes=0-100" README2.md
```

Output:

```
{
   "StatusCode": 206,
   "ContentRange": "bytes 0-100/2307346",
   "ContentLength": "101",
   "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
   "ContentType": "image/jpeg",
   "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeee4dd89ff7f555555555555da6d3"
}
```

For more information, see Downloading an Object in the AWS Elemental MediaStore User Guide.

- For API details, see GetObject in AWS CLI Command Reference.

list-containers

The following code example shows how to use list-containers.

AWS CLI

To view a list of containers

The following list-containers example displays a list of all containers that are associated with your account.

```
aws mediastore list-containers
```
Output:

```json
{
    "Containers": [
        {
            "CreationTime": 1505317931,
            "Endpoint": "https://aaabbcccddee.data.mediastore.us-west-2.amazonaws.com",
            "Status": "ACTIVE",
            "AccessLoggingEnabled": false,
            "Name": "ExampleLiveDemo"
        },
        {
            "CreationTime": 1506528818,
            "Endpoint": "https://fffggghhhiiijj.data.mediastore.us-west-2.amazonaws.com",
            "Status": "ACTIVE",
            "AccessLoggingEnabled": false,
            "Name": "ExampleContainer"
        }
    ]
}
```

For more information, see [Viewing a List of Containers](https://docs.aws.amazon.com/mediastore/latest/mediastore.html) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [ListContainers](https://docs.aws.amazon.com/cli/latest/reference/mediastore/list-containers.html) in *AWS CLI Command Reference*.

**list-items**

The following code example shows how to use list-items.

**AWS CLI**

**Example 1: To view a list of objects and folders in a specific container**

The following list-items example displays items (objects and folders) stored in the specified container.
aws mediastore-data list-items \
   --endpoint https://aaabbbcccccdddeee.data.mediastore.us-west-2.amazonaws.com

Output:

```
{
   "Items": [
      {
         "ContentType": "image/jpeg",
         "LastModified": 1563571859.379,
         "Name": "filename.jpg",
         "Type": "OBJECT",
         "ETag": "543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
         "ContentLength": 3784
      },
      {
         "Type": "FOLDER",
         "Name": "ExampleLiveDemo"
      }
   ]
}
```

Example 2: To view a list of objects and folders in a specific folder

The following `list-items` example displays items (objects and folders) stored in a specific folder.

aws mediastore-data list-items \
   --endpoint https://aaabbbcccccdddeee.data.mediastore.us-west-2.amazonaws.com

Output:

```
{
   "Items": [
      {
         "ContentType": "image/jpeg",
         "LastModified": 1563571859.379,
         "Name": "filename.jpg",
         "Type": "OBJECT",
         "ETag": "543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
         "ContentLength": 3784
      }
   ]
}
```
For more information, see Viewing a List of Objects in the AWS Elemental MediaStore User Guide.

- For API details, see ListItems in AWS CLI Command Reference.

**list-tags-for-resource**

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a container**

The following list-tags-for-resource example displays the tag keys and values assigned to the specified container.

```sh
aws mediastore list-tags-for-resource \ 
```

**Output:**

```json
{
    "Tags": [
        {
            "Value": "Test",
            "Key": "Environment"
        },
        {
            "Value": "West",
            "Key": "Region"
        }
    ]
}
```
For more information, see ListTagsForResource in the AWS Elemental MediaStore API Reference.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

**put-container-policy**

The following code example shows how to use put-container-policy.

**AWS CLI**

**To edit a container policy**

The following put-container-policy example assigns a different policy to the specified container. In this example, the updated policy is defined in a file named LiveEventsContainerPolicy.json.

```bash
aws mediastore put-container-policy \
  --container-name LiveEvents \
  --policy file://LiveEventsContainerPolicy.json
```

This command produces no output.

For more information, see Editing a Container Policy in the AWS Elemental MediaStore User Guide.

- For API details, see PutContainerPolicy in AWS CLI Command Reference.

**put-cors-policy**

The following code example shows how to use put-cors-policy.

**AWS CLI**

**Example 1: To add a CORS policy**

The following put-cors-policy example adds a cross-origin resource sharing (CORS) policy to the specified container. The contents of the CORS policy are in the file named corsPolicy.json.

```bash
aws mediastore put-cors-policy \
  --container-name ExampleContainer \
```

Actions and scenarios 2962
This command produces no output.

For more information, see Adding a CORS Policy to a Container in the AWS Elemental MediaStore User Guide.

**Example 2: To edit a CORS policy**

The following put-cors-policy example updates the cross-origin resource sharing (CORS) policy that is assigned to the specified container. The contents of the updated CORS policy are in the file named corsPolicy2.json.

For more information, see Editing a CORS Policy in the AWS Elemental MediaStore User Guide.

- For API details, see PutCorsPolicy in AWS CLI Command Reference.

**put-lifecycle-policy**

The following code example shows how to use put-lifecycle-policy.

**AWS CLI**

**To create an object lifecycle policy**

The following put-lifecycle-policy example attaches an object lifecycle policy to the specified container. This enables you to specify how long the service should store objects in your container. MediaStore deletes objects in the container once they reach their expiration date, as indicated in the policy, which is in the file named LiveEventsLifecyclePolicy.json.

```
aws mediastore put-lifecycle-policy \
  --container-name ExampleContainer \
  --lifecycle-policy file://ExampleLifecyclePolicy.json
```

This command produces no output.

For more information, see Adding an Object Lifecycle Policy to a Container in the AWS Elemental MediaStore User Guide.

- For API details, see PutLifecyclePolicy in AWS CLI Command Reference.
put-object

The following code example shows how to use put-object.

AWS CLI

To upload an object

The following put-object example uploads an object to the specified container. You can specify a folder path where the object will be saved within the container. If the folder already exists, AWS Elemental MediaStore stores the object in the folder. If the folder doesn't exist, the service creates it, and then stores the object in the folder.

```
aws mediastore-data put-object \
  --endpoint https://aaabbbccccdde.data.mediastore.us-west-2.amazonaws.com \
  --body README.md \n  --path /folder_name/README.md \n  --cache-control "max-age=6, public" \n  --content-type binary/octet-stream
```

Output:

```
{
  "ContentSHA256": "74b5fdb517f423ed750ef214c44adfe2be36e37d861eafe9c842cbe1bf387a9d",
  "StorageClass": "TEMPORAL",
  "ETag": "af3e4731af032167a106015d1f2fe934e68b32ed1aa297a9e325f5c64979277b"
}
```

For more information, see Uploading an Object in the AWS Elemental MediaStore User Guide.

- For API details, see PutObject in AWS CLI Command Reference.

start-access-logging

The following code example shows how to use start-access-logging.

AWS CLI

To enable access logging on a container

The following start-access-logging example enable access logging on the specified container.
aws mediastore start-access-logging
    --container-name LiveEvents

This command produces no output.

For more information, see Enabling Access Logging for a Container in the AWS Elemental MediaStore User Guide.
• For API details, see StartAccessLogging in AWS CLI Command Reference.

stop-access-logging

The following code example shows how to use stop-access-logging.

AWS CLI

To disable access logging on a container

The following stop-access-logging example disables access logging on the specified container.

aws mediastore stop-access-logging
    --container-name LiveEvents

This command produces no output.

For more information, see Disabling Access Logging for a Container in the AWS Elemental MediaStore User Guide.
• For API details, see StopAccessLogging in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a container

The following tag-resource example adds tag keys and values to the specified container.

aws mediastore tag-resource
This command produces no output.

For more information, see `TagResource` in the *AWS Elemental MediaStore API Reference*.

- For API details, see `TagResource` in *AWS CLI Command Reference*.

**untag-resource**

The following code example shows how to use untag-resource.

**AWS CLI**

*To remove tags from a container*

The following `untag-resource` example removes the specified tag key and its associated value from a container.

```
aws mediastore untag-resource \
  --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer \
  --tag-keys Region
```

This command produces no output.

For more information, see `UntagResource` in the *AWS Elemental MediaStore API Reference*.

- For API details, see `UntagResource` in *AWS CLI Command Reference*.

**Amazon EMR examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- **Actions**

**Actions**

**Describe a cluster**

The following code example shows how to describe an Amazon EMR cluster.

**AWS CLI**

Command:

```
aws emr describe-cluster --cluster-id j-XXXXXXXX
```

Output:

For release-label based uniform instance groups cluster:

```
{
   "Cluster": {  
      "Status": {  
         "Timeline": {  
            "ReadyDateTime": 1436475075.199,

For API details, see DescribeCluster in AWS CLI Command Reference.

Describe a step

The following code example shows how to describe a step on an Amazon EMR cluster.

AWS CLI

The following command describes a step with the step ID s-3LZC0QUT43AM in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr describe-step --cluster-id j-3SD91U2E1L2QX --step-id s-3LZC0QUT43AM
```

Output:

```
{
    "Step": {
        "Status": {
            "Timeline": {
                "EndDateTime": 1433200470.481,
                "CreationDateTime": 1433199926.597,
                "StartDateTime": 1433200404.959
            },
            "State": "COMPLETED",
            "StateChangeReason": {}
        },
        "Config": {
            "Args": [
                "s3://us-west-2.elasticmapreduce/libs/hive/hive-script",
            ]
        }
    }
}
```
List steps for a cluster

The following code example shows how to list steps for an Amazon EMR cluster.

**AWS CLI**

The following command lists all of the steps in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr list-steps --cluster-id j-3SD91U2E1L2QX
```

• For API details, see **ListSteps** in *AWS CLI Command Reference*.

**add-instance-fleet**

The following code example shows how to use add-instance-fleet.

**AWS CLI**

**To add a task instance fleet to a cluster**

This example adds a new task instance fleet to the cluster specified.

Command:
aws emr add-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet
InstanceFleetType=TASK,TargetSpotCapacity=1,LaunchSpecifications={SpotSpecification='{TimeoutDurationMinutes=20,TimeoutAction=TERMINATE_CLUSTER}'},InstanceTypeConfigs=['{InstanceType=m3.xlarge,BidPrice=0.5}']

Output:

```
{
    "ClusterId": "j-12ABCDEFGHI34JK",
    "InstanceFleetId": "if-23ABCDEFGHI45JJ"
}
```

- For API details, see AddInstanceFleet in AWS CLI Command Reference.

add-steps

The following code example shows how to use add-steps.

AWS CLI

1. To add Custom JAR steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps
    Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/mytest.jar,Args=arg1,arg2,arg3
    Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3
```

Required parameters:

- Jar

Optional parameters:

- Type, Name, ActionOnFailure, Args

Output:

```
{
    "StepIds": [
        "s-XXXXXXXX",
```
2. To add Streaming steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/wordcount/input,-output,s3://mybucket/wordcount/output]
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

JSON equivalent (contents of step.json):

```
[
    {
        "Name": "JSON Streaming Step",
        "Args": ['-files','s3://elasticmapreduce/samples/wordcount/wordSplitter.py','-mapper','wordSplitter.py','-reducer','aggregate','-input','s3://elasticmapreduce/samples/wordcount/input','-output','s3://mybucket/wordcount/output'],
        "ActionOnFailure": "CONTINUE",
        "Type": "STREAMING"
    }
]
```

NOTE: JSON arguments must include options and values as their own items in the list.

Command (using step.json):

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps file:///./step.json
```

Output:
3. To add a Streaming step with multiple files to a cluster (JSON only)

JSON (multiplefiles.json):

```json
[
  {
    "Name": "JSON Streaming Step",
    "Type": "STREAMING",
    "ActionOnFailure": "CONTINUE",
    "Args": [
      "-files",
      "s3://mybucket/mapper.py,s3://mybucket/reducer.py",
      "-mapper",
      "mapper.py",
      "-reducer",
      "reducer.py",
      "-input",
      "s3://mybucket/input",
      "-output",
      "s3://mybucket/output"
    ]
  }
]
```

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps file:///multiplefiles.json
```

Required parameters:

- Type, Args

Optional parameters:

- Name, ActionOnFailure
4. To add Hive steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps
Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/myhivescript.q,-d,INPUT=s3://mybucket/myhiveinput,-d,OUTPUT=s3://mybucket/myhiveoutput,arg1,arg2]
Type=HIVE,Name='Hive steps',ActionOnFailure=TERMINATE.ClUSTER,Args=[-f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://mybucket/hive-ads/output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs]
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```
{
    "StepIds"[:
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

5. To add Pig steps to a cluster

Command:
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/mypigscript.pig,-p,INPUT=s3://mybucket/mypiginput,-p,OUTPUT=s3://mybucket/mypigoutput,arg1,arg2]
Type=PIG,Name='Pig program',Args=[-f,s3://elasticmapreduce/samples/pig-apache/doreports2.pig,-p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output,arg1,arg2]

Required parameters:

- Type, Args

Optional parameters:

- Name, ActionOnFailure

Output:

```json
{
  "StepIds": [
    "s-XXXXXXXX",
    "s-YYYYYYYY"
  ]
}
```

### 6. To add Impala steps to a cluster

**Command:**

```command
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=IMPALA,Name='Impala program',ActionOnFailure=CONTINUE,Args=--impala-script,s3://myimpala/input,--console-output-path,s3://myimpala/output
```

Required parameters:

- Type, Args

Optional parameters:

- Name, ActionOnFailure
Output:

```json
{
    "StepIds": [
        "s-XXXXXXXX",
        "s-YYYYYYYY"
    ]
}
```

- For API details, see AddSteps in AWS CLI Command Reference.

**add-tags**

The following code example shows how to use add-tags.

**AWS CLI**

1. To add tags to a cluster

   **Command:**

   ```bash
   aws emr add-tags --resource-id j-xxxxxxx --tags name="John Doe" age=29 sex=male address="123 East NW Seattle"
   ```

   **Output:**

   None

2. To list tags of a cluster

   **--Command:**

   ```bash
   aws emr describe-cluster --cluster-id j-XXXXXXYY --query Cluster.Tags
   ```

   **Output:**

   ```json
   [
   {
     "Value": "male",
     "Key": "sex"
   },
   ```
create-cluster-examples

The following code example shows how to use create-cluster-examples.

AWS CLI

Most of the following examples assume that you specified your Amazon EMR service role and Amazon EC2 instance profile. If you have not done this, you must specify each required IAM role or use the --use-default-roles parameter when creating your cluster. For more information about specifying IAM roles, see Configure IAM Roles for Amazon EMR Permissions to AWS Services in the Amazon EMR Management Guide.

Example 1: To create a cluster

The following create-cluster example creates a simple EMR cluster.

```bash
aws emr create-cluster \
   --release-label emr-5.14.0 \n   --instance-type m4.large \n   --instance-count 2
```

This command produces no output.

Example 2: To create an Amazon EMR cluster with default ServiceRole and InstanceProfile roles
The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration.

```
aws emr create-cluster \
  --release-label emr-5.14.0 \ 
  --service-role EMR_DefaultRole \ 
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \ 
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \ 
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

**Example 3: To create an Amazon EMR cluster that uses an instance fleet**

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-fleets` configuration, specifying two instance types for each fleet and two EC2 Subnets.

```
aws emr create-cluster \
  --release-label emr-5.14.0 \ 
  --service-role EMR_DefaultRole \ 
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole,SubnetIds=["subnet-ab12345c","subnet-de67890f"] \ 
  --instance-fleets 
  InstanceFleetType=MASTER,TargetOnDemandCapacity=1,InstanceTypeConfigs=["{InstanceType=m4.large}"
  InstanceFleetType=CORE,TargetSpotCapacity=11,InstanceTypeConfigs=["{InstanceType=m4.large,BidPrice=0.5,WeightedCapacity=3}
  LaunchSpecifications={SpotSpecification={TimeoutDurationMinutes=120,TimeoutAction=SWITCH_TO_ON_DEMAND}}]
```

**Example 4: To create a cluster with default roles**

The following `create-cluster` example uses the `--use-default-roles` parameter to specify the default service role and instance profile.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \ 
  --use-default-roles \ 
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \ 
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \ 
  --auto-terminate
```

**Example 5: To create a cluster and specify the applications to install**

The following `create-cluster` example uses the `--applications` parameter to specify the applications that Amazon EMR installs. This example installs Hadoop, Hive and Pig.
**Example 6: To create a cluster that includes Spark**

The following example installs Spark.

```bash
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --applications Name=Spark \
   --ec2-attributes KeyName=myKey \
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --auto-terminate
```

**Example 7: To specify a custom AMI to use for cluster instances**

The following `create-cluster` example creates a cluster instance based on the Amazon Linux AMI with ID `ami-a518e6df`.

```bash
aws emr create-cluster \
   --name "Cluster with My Custom AMI" \
   --custom-ami-id ami-a518e6df \
   --ebs-root-volume-size 20 \
   --release-label emr-5.9.0 \
   --use-default-roles \
   --instance-count 2 \
   --instance-type m4.large
```

**Example 8: To customize application configurations**

The following examples use the `--configurations` parameter to specify a JSON configuration file that contains application customizations for Hadoop. For more information, see [Configuring Applications](#) in the Amazon EMR Release Guide.

**Contents of `configurations.json`:**
The following example references configurations.json as a local file.

```bash
aws emr create-cluster
  --configurations file://configurations.json \\n  --release-label emr-5.9.0 \\n  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \\n  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \\n  --auto-terminate
```

The following example references configurations.json as a file in Amazon S3.

```bash
aws emr create-cluster
  --configurations https://s3.amazonaws.com/myBucket/configurations.json \\n  --release-label emr-5.9.0 \\n  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \\n  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \\n  --auto-terminate
```

Example 9: To create a cluster with master, core, and task instance groups
The following `create-cluster` example uses `--instance-groups` to specify the type and number of EC2 instances to use for master, core, and task instance groups.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --instance-groups    
   Name=Master,InstanceGroupType=MASTER,InstanceType=m4.large,InstanceCount=1
   Name=Core,InstanceGroupType=CORE,InstanceType=m4.large,InstanceCount=2
   Name=Task,InstanceGroupType=TASK,InstanceType=m4.large,InstanceCount=2
```

**Example 10: To specify that a cluster should terminate after completing all steps**

The following `create-cluster` example uses `--auto-terminate` to specify that the cluster should shut down automatically after completing all steps.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \
   --instance-groups    
   InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --auto-terminate
```

**Example 11: To specify cluster configuration details such as the Amazon EC2 key pair, network configuration, and security groups**

The following `create-cluster` example creates a cluster with the Amazon EC2 key pair named `myKey` and a customized instance profile named `myProfile`. Key pairs are used to authorize SSH connections to cluster nodes, most often the master node. For more information, see [Use an Amazon EC2 Key Pair for SSH Credentials](#) in the [Amazon EMR Management Guide](#).

```
aws emr create-cluster \
   --ec2-attributes KeyName=myKey,InstanceProfile=myProfile \
   --release-label emr-5.9.0 \
   --instance-groups    
   InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
   --auto-terminate
```

The following example creates a cluster in an Amazon VPC subnet.

```
aws emr create-cluster \
   --ec2-attributes SubnetId=subnet-xxxxx \
   --release-label emr-5.9.0 \
```
The following example creates a cluster in the `us-east-1b` availability zone.

```bash
aws emr create-cluster 
  --ec2-attributes AvailabilityZone=us-east-1b 
  --release-label emr-5.9.0 
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large 
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large 
  --auto-terminate
```

The following example creates a cluster and specifies only the Amazon EMR-managed security groups.

```bash
aws emr create-cluster 
  --release-label emr-5.9.0 
  --service-role myServiceRole 
  --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-master1,EmrManagedSlaveSecurityGroup=sg-slave1 
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large 
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only additional Amazon EC2 security groups.

```bash
aws emr create-cluster 
  --release-label emr-5.9.0 
  --service-role myServiceRole 
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large 
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies the EMR-Managed security groups, as well as additional security groups.

```bash
aws emr create-cluster 
  --release-label emr-5.9.0 
```
The following example creates a cluster in a VPC private subnet and use a specific Amazon EC2 security group to enable Amazon EMR service access, which is required for clusters in private subnets.

```
aws emr create-cluster
   --release-label emr-5.9.0
   --service-role myServiceRole
   --ec2-attributes file://ec2_attributes.json
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Contents of `ec2_attributes.json`:

```
[
   {
      "SubnetId": "subnet-xxxxx",
      "KeyName": "myKey",
      "InstanceProfile": "myRole",
      "EmrManagedMasterSecurityGroup": "sg-master1",
      "EmrManagedSlaveSecurityGroup": "sg-slave1",
      "AdditionalMasterSecurityGroups": ["sg-addMaster1", "sg-addMaster2", "sg-addMaster3", "sg-addMaster4"],
      "AdditionalSlaveSecurityGroups": ["sg-addSlave1", "sg-addSlave2", "sg-addSlave3", "sg-addSlave4"]
   }
]
```
Example 12: To enable debugging and specify a log URI

The following create-cluster example uses the --enable-debugging parameter, which allows you to view log files more easily using the debugging tool in the Amazon EMR console. The --log-uri parameter is required with --enable-debugging.

```bash
aws emr create-cluster \
  --enable-debugging \
  --log-uri s3://myBucket/myLog \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \n  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 13: To add tags when creating a cluster

Tags are key-value pairs that help you identify and manage clusters. The following create-cluster example uses the --tags parameter to create three tags for a cluster, one with the key name name and the value Shirley Rodriguez, a second with the key name age and the value 29, and a third tag with the key name department and the value Analytics.

```bash
aws emr create-cluster \
  --tags name="Shirley Rodriguez" age=29 department="Analytics" \
  --release-label emr-5.32.0 \
  --instance-type m5.xlarge \
  --instance-count 3 \
  --use-default-roles
```

The following example lists the tags applied to a cluster.

```bash
aws emr describe-cluster \
  --cluster-id j-XXXXXXYY \
```
Example 14: To use a security configuration that enables encryption and other security features

The following create-cluster example uses the --security-configuration parameter to specify a security configuration for an EMR cluster. You can use security configurations with Amazon EMR version 4.8.0 or later.

```
aws emr create-cluster \
   --instance-type m4.large \
   --release-label emr-5.9.0 \
   --security-configuration mySecurityConfiguration
```

Example 15: To create a cluster with additional EBS storage volumes configured for the instance groups

When specifying additional EBS volumes, the following arguments are required: VolumeType, SizeInGB if EbsBlockDeviceConfigs is specified.

The following create-cluster example creates a cluster with multiple EBS volumes attached to EC2 instances in the core instance group.

```
aws emr create-cluster \
   --release-label emr-5.9.0   \
   --use-default-roles   \
   --instance-groups  \
   InstanceGroupType=MASTER,InstanceCount=1,InstanceType=d2.xlarge
   'InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge,EbsConfiguration={EbsOptimized=true,\n   {VolumeSpecification={VolumeType=gp2,SizeInGB=100}},\n   {VolumeSpecification={VolumeType=io1,SizeInGB=100,Iops=100},VolumesPerInstance=4}}]'  \
   --auto-terminate
```

The following example creates a cluster with multiple EBS volumes attached to EC2 instances in the master instance group.

```
aws emr create-cluster \
   --release-label emr-5.9.0 \n   --use-default-roles \n   --instance-groups 'InstanceGroupType=MASTER, InstanceCount=1, \n   InstanceType=d2.xlarge, EbsConfiguration={EbsOptimized=true, \n```
Example 16: To create a cluster with an automatic scaling policy

You can attach automatic scaling policies to core and task instance groups using Amazon EMR version 4.0 and later. The automatic scaling policy dynamically adds and removes EC2 instances in response to an Amazon CloudWatch metric. For more information, see Using Automatic Scaling in Amazon EMR <https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-automatic-scaling.html>`_ in the Amazon EMR Management Guide.

When attaching an automatic scaling policy, you must also specify the default role for automatic scaling using `--auto-scaling-role` EMR_AutoScaling_DefaultRole.

The following `create-cluster` example specifies the automatic scaling policy for the CORE instance group using the AutoScalingPolicy argument with an embedded JSON structure, which specifies the scaling policy configuration. Instance groups with an embedded JSON structure must have the entire collection of arguments enclosed in single quotes. Using single quotes is optional for instance groups without an embedded JSON structure.

```
aws emr create-cluster
   --release-label emr-5.9.0 \n   --use-default-roles --auto-scaling-role EMR_AutoScaling_DefaultRole \n   --instance-groups InstanceGroupType=MASTER,InstanceType=d2.xlarge,InstanceCount=1 \n   'InstanceGroupType=CORE,InstanceType=d2.xlarge,InstanceCount=2,AutoScalingPolicy={Constraints={MinCapacity=1,MaxCapacity=5...
```

The following example uses a JSON file, `instancegroupconfig.json`, to specify the configuration of all instance groups in a cluster. The JSON file specifies the automatic scaling policy configuration for the core instance group.

```
aws emr create-cluster \n   --release-label emr-5.9.0 \n   --service-role EMR_DefaultRole \n   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \n   --instance-groups file://myfolder/instancegroupconfig.json \n   --auto-scaling-role EMR_AutoScaling_DefaultRole
```
Contents of `instancegroupconfig.json`:

```json
[
  {
    "InstanceCount": 1,
    "Name": "MyMasterIG",
    "InstanceGroupType": "MASTER",
    "InstanceType": "m4.large"
  },
  {
    "InstanceCount": 2,
    "Name": "MyCoreIG",
    "InstanceGroupType": "CORE",
    "InstanceType": "m4.large",
    "AutoScalingPolicy": {
      "Constraints": {
        "MinCapacity": 2,
        "MaxCapacity": 10
      },
      "Rules": [
        {
          "Name": "Default-scale-out",
          "Description": "Replicates the default scale-out rule in the console for YARN memory."
        },
        {
          "SimpleScalingPolicyConfiguration": {
            "AdjustmentType": "CHANGE_IN_CAPACITY",
            "ScalingAdjustment": 1,
            "CoolDown": 300
          }
        }
      ],
      "Trigger": {
        "CloudWatchAlarmDefinition": {
          "ComparisonOperator": "LESS_THAN",
          "EvaluationPeriods": 1,
          "MetricName": "YARNMemoryAvailablePercentage",
          "Namespace": "AWS/ElasticMapReduce",
          "Period": 300,
          "Threshold": 15,
          "Statistic": "AVERAGE",
          "Unit": "PERCENT",
          "Dimensions": [
            { "Key": "JobFlowId", "Value": "2991" }
          ]
        }
      }
    }
  }
]
```
Example 17: Add custom JAR steps when creating a cluster

The following `create-cluster` example adds steps by specifying a JAR file stored in Amazon S3. Steps submit work to a cluster. The main function defined in the JAR file executes after EC2 instances are provisioned, any bootstrap actions have executed, and applications are installed. The steps are specified using `Type=CUSTOM_JAR`.

Custom JAR steps require the `Jar=` parameter, which specifies the path and file name of the JAR. Optional parameters are `Type`, `Name`, `ActionOnFailure`, `Args`, and `MainClass`. If main class is not specified, the JAR file should specify `Main-Class` in its manifest file.

```bash
aws emr create-cluster
  --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://myBucket/mytest.jar,Args=arg1,arg2,arg3
  Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://myBucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3
  --release-label emr-5.3.1
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
  --auto-terminate
```

Example 18: To add streaming steps when creating a cluster

The following `create-cluster` examples add a streaming step to a cluster that terminates after all steps run. Streaming steps require parameters `Type` and `Args`. Streaming steps optional parameters are `Name` and `ActionOnFailure`.

The following example specifies the step inline.

```bash
aws emr create-cluster
  --steps Type=STREAMING,Name=StreamJAR,ActionOnFailure=CONTINUE,Args=arg1, arg2, arg3
```
The following example uses a locally stored JSON configuration file named `multiplefiles.json`. The JSON configuration specifies multiple files. To specify multiple files within a step, you must use a JSON configuration file to specify the step. JSON arguments must include options and values as their own items in the list.

```bash
aws emr create-cluster \
    --steps file://./multiplefiles.json \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \n    InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \n    --auto-terminate
```

Contents of `multiplefiles.json`:

```json
[
    {
        "Name": "JSON Streaming Step",
        "Args": [
            "-files",
            "s3://elasticmapreduce/samples/wordcount/wordSplitter.py",
            "-mapper",
            "wordSplitter.py",
            "-reducer",
            "aggregate",
            "-input",
            "s3://elasticmapreduce/samples/wordcount/input",
            "-output",
            "s3://mybucket/wordcount/output"
        ],
        "ActionOnFailure": "CONTINUE",
        "Type": "STREAMING"
    }
]
```
Example 19: To add Hive steps when creating a cluster

The following example add Hive steps when creating a cluster. Hive steps require parameters Type and Args. Hive steps optional parameters are Name and ActionOnFailure.

```
aws emr create-cluster \
    --steps Type=HIVE,Name='Hive program',ActionOnFailure=CONTINUE,ActionOnFailure=TERMINATE_CLUSTER,Args=[-f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://elasticmapreduce/samples/hive-ads/tabs,..]
    --applications Name=Hive \
    --release-label emr-5.3.1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
```

Example 20: To add Pig steps when creating a cluster

The following example adds Pig steps when creating a cluster. Pig steps required parameters are Type and Args. Pig steps optional parameters are Name and ActionOnFailure.

```
aws emr create-cluster \
    --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output]
    --applications Name=Pig \
    --release-label emr-5.3.1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
```

Example 21: To add bootstrap actions

The following create-cluster example runs two bootstrap actions defined as scripts that are stored in Amazon S3.

```
aws emr create-cluster \
    --bootstrap-actions Path=s3://mybucket/myscript1,Name=BootstrapAction1,Args=[arg1,arg2] Path=s3://mybucket/myscript2,Name=BootstrapAction2,Args=[arg1,arg2] \
    --release-label emr-5.3.1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
```

Actions and scenarios
Example 22: To enable EMRFS consistent view and customize the RetryCount and RetryPeriod settings

The following `create-cluster` example specifies the retry count and retry period for EMRFS consistent view. The `Consistent=true` argument is required.

```bash
aws emr create-cluster \
  --instance-type m4.large \
  --release-label emr-5.9.0 \
  --emrfs Consistent=true,RetryCount=6,RetryPeriod=30
```

The following example specifies the same EMRFS configuration as the previous example, using a locally stored JSON configuration file named `emrfsconfig.json`.

```bash
aws emr create-cluster \
  --instance-type m4.large \
  --release-label emr-5.9.0 \
  --emrfs file://emrfsconfig.json
```

Contents of `emrfsconfig.json`:

```json
{
  "Consistent": true,
  "RetryCount": 6,
  "RetryPeriod": 30
}
```

Example 23: To create a cluster with Kerberos configured

The following `create-cluster` examples create a cluster using a security configuration with Kerberos enabled, and establishes Kerberos parameters for the cluster using `--kerberos-attributes`.

The following command specifies Kerberos attributes for the cluster inline.

```bash
aws emr create-cluster \
  --instance-type m3.xlarge \
  --release-label emr-5.10.0 \
```
The following command specifies the same attributes, but references a locally stored JSON file named `kerberos_attributes.json`. In this example, the file is saved in the same directory where you run the command. You can also reference a configuration file saved in Amazon S3.

```bash
aws emr create-cluster \
  --instance-type m3.xlarge \
  --release-label emr-5.10.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --security-configuration mySecurityConfiguration \
  --kerberos-attributes file://kerberos_attributes.json
```

Contents of `kerberos_attributes.json`:

```json
{
  "Realm": "EC2.INTERNAL",
  "KdcAdminPassword": "123",
  "CrossRealmTrustPrincipalPassword": "123",
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration and has a managed scaling policy.

```bash
aws emr create-cluster \
  --release-label emr-5.30.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
  --managed-scaling-policy
  ComputeLimits='{MinimumCapacityUnits=2,MaximumCapacityUnits=4,UnitType=Instances}'
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--log-encryption-kms-key-id` to define KMS key ID utilized for Log encryption.
aws emr create-cluster \  
   --release-label emr-5.30.0 \  
   --log-uri s3://myBucket/myLog \  
   --log-encryption-kms-key-id arn:aws:kms:us-east-1:110302272565:key/dd559181-283e-45d7-99d1-66da348c4d33 \  
   --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
   InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large

The following create-cluster example creates an Amazon EMR cluster that uses the "--placement-group-configs" configuration to place master nodes in a high-availability (HA) cluster within an EC2 placement group using SPREAD placement strategy.

aws emr create-cluster \  
   --release-label emr-5.30.0 \  
   --service-role EMR_DefaultRole \  
   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \  
   --instance-groups  
   InstanceGroupType=MASTER,InstanceCount=3,InstanceType=m4.large  
   InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large
   \  
   --placement-group-configs InstanceRole=MASTER

The following create-cluster example creates an Amazon EMR cluster that uses the "--auto-termination-policy" configuration to place an automatic idle termination threshold for the cluster.

aws emr create-cluster \  
   --release-label emr-5.34.0 \  
   --service-role EMR_DefaultRole \  
   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \  
   --instance-groups  
   InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
   InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large \  
   --auto-termination-policy IdleTimeout=100

The following create-cluster example creates an Amazon EMR cluster that uses the "--os-release-label" to define an Amazon Linux release for cluster launch

aws emr create-cluster \  
   --release-label emr-6.6.0 \  
   --os-release-label 2.0.20220406.1 \  
   --service-role EMR_DefaultRole \  
   --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
Example 24: To specify an EBS root volume attributes: size, iops and throughput for cluster instances created with EMR releases 6.15.0 and later

The following create-cluster example creates an Amazon EMR cluster that uses root volume attributes to configure root volumes specifications for the EC2 instances.

```bash
aws emr create-cluster \
   --name "Cluster with My Custom AMI" \
   --custom-ami-id ami-a518e6df \
   --ebs-root-volume-size 20 \
   --ebs-root-volume-iops 3000 \
   --ebs-root-volume-throughput 125 \
   --release-label emr-6.15.0 \
   --use-default-roles \
   --instance-count 2 \
   --instance-type m4.large
```

- For API details, see CreateClusterExamples in AWS CLI Command Reference.

create-default-roles

The following code example shows how to use create-default-roles.

AWS CLI

1. To create the default IAM role for EC2

Command:

```bash
aws emr create-default-roles
```

Output:

If the role already exists then the command returns nothing.

If the role does not exist then the output will be:

```json
[
]
```
"RolePolicy": {
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "cloudwatch:*",
        "dynamodb:*",

      }
    ]
  }
}
• For API details, see CreateDefaultRoles in AWS CLI Command Reference.
create-security-configuration

The following code example shows how to use create-security-configuration.

AWS CLI

1. To create a security configuration with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider

Command:

```
aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
  "EncryptionConfiguration": {
    "EnableInTransitEncryption": true,
    "EnableAtRestEncryption": true,
    "InTransitEncryptionConfiguration": {
      "TLSCertificateConfiguration": {
        "CertificateProviderType": "PEM",
        "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
      }
    },
    "AtRestEncryptionConfiguration": {
      "S3EncryptionConfiguration": {
        "EncryptionMode": "SSE-S3"
      },
      "LocalDiskEncryptionConfiguration": {
        "EncryptionKeyProviderType": "AwsKms",
        "AwsKmsKey": "arn:aws:kms:us-east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
      }
    }
  }
}'
```

Output:

```
{
  "CreationDateTime": 1474070889.129,
  "Name": "MySecurityConfig"
}
```
JSON equivalent (contents of security_configuration.json):

```
{
   "EncryptionConfiguration": {
      "EnableInTransitEncryption": true,
      "EnableAtRestEncryption": true,
      "InTransitEncryptionConfiguration": {
         "TLSCertificateConfiguration": {
            "CertificateProviderType": "PEM",
            "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
         }
      },
      "AtRestEncryptionConfiguration": {
         "S3EncryptionConfiguration": {
            "EncryptionMode": "SSE-S3"
         },
         "LocalDiskEncryptionConfiguration": {
            "EncryptionKeyProviderType": "AwsKms",
            "AwsKmsKey": "arn:aws:kms:us-east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
         }
      }
   }
}
```

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file:///./security_configuration.json
```

Output:

```
{
   "CreationDateTime": 1474070889.129,
   "Name": "MySecurityConfig"
}
```

2. To create a security configuration with Kerberos enabled using cluster-dedicated KDC and cross-realm trust
Command:

```bash
aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
    "AuthenticationConfiguration": {
        "KerberosConfiguration": {
            "Provider": "ClusterDedicatedKdc",
            "ClusterDedicatedKdcConfiguration": {
                "TicketLifetimeInHours": 24,
                "CrossRealmTrustConfiguration": {
                    "Realm": "AD.DOMAIN.COM",
                    "Domain": "ad.domain.com",
                    "AdminServer": "ad.domain.com",
                    "KdcServer": "ad.domain.com"
                }
            }
        }
    }
}
'
```

Output:

```json
{
    "CreationDateTime": 1490225558.982,
    "Name": "MySecurityConfig"
}
```

JSON equivalent (contents of security_configuration.json):

```json
{
    "AuthenticationConfiguration": {
        "KerberosConfiguration": {
            "Provider": "ClusterDedicatedKdc",
            "ClusterDedicatedKdcConfiguration": {
                "TicketLifetimeInHours": 24,
                "CrossRealmTrustConfiguration": {
                    "Realm": "AD.DOMAIN.COM",
                    "Domain": "ad.domain.com",
                    "AdminServer": "ad.domain.com",
                    "KdcServer": "ad.domain.com"
                }
            }
        }
    }
}
```
Command (using security_configuration.json):

```bash
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file://./security_configuration.json
```

Output:

```json
{
   "CreationDateTime": 1490225558.982,
   "Name": "MySecurityConfig"
}
```

- For API details, see [CreateSecurityConfiguration](#) in *AWS CLI Command Reference*.

### delete-security-configuration

The following code example shows how to use `delete-security-configuration`.

**AWS CLI**

**To delete a security configuration in the current region**

Command:

```bash
aws emr delete-security-configuration --name MySecurityConfig
```

Output:

None

- For API details, see [DeleteSecurityConfiguration](#) in *AWS CLI Command Reference*.

### get

The following code example shows how to use `get`.
AWS CLI

The following downloads the hadoop-examples.jar archive from the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr get --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src /home/hadoop-examples.jar --dest ~
```

- For API details, see Get in AWS CLI Command Reference.

list-clusters

The following code example shows how to use list-clusters.

AWS CLI

The following command lists all active EMR clusters in the current region:

```
aws emr list-clusters --active
```

Output:

```
{
    "Clusters": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200405.353,
                    "CreationDateTime": 1433199926.596
                },
                "State": "WAITING",
                "StateChangeReason": {
                    "Message": "Waiting after step completed"
                }
            },
            "NormalizedInstanceHours": 6,
            "Id": "j-3SD91U2E1L2QX",
            "Name": "my-cluster"
        }
    ]
}
```
For API details, see ListClusters in AWS CLI Command Reference.

list-instance-fleets

The following code example shows how to use list-instance-fleets.

AWS CLI

To get configuration details of instance fleets in a cluster

This example lists the details of instance fleets in the cluster specified.

Command:

```
list-instance-fleets --cluster-id 'j-12ABCDEFGH12345'
```

Output:

```
{
   "InstanceFleets": [
   {
      "Status": {
         "Timeline": {
            "ReadyDateTime": 1488759094.637,
            "CreationDateTime": 1488758719.817
         },
         "State": "RUNNING",
         "StateChangeReason": {
            "Message": ""
         }
      },
      "ProvisionedSpotCapacity": 6,
      "Name": "CORE",
      "InstanceFleetType": "CORE",
      "LaunchSpecifications": {
         "SpotSpecification": {
            "TimeoutDurationMinutes": 60,
            "TimeoutAction": "TERMINATE_CLUSTER"
         }
      },
      "ProvisionedOnDemandCapacity": 2,
      "InstanceTypeSpecifications": [
      ]
   }
   ]
```

Actions and scenarios 3007
For API details, see [ListInstanceFleets](https://aws.amazon.com/documentation/lambda/) in *AWS CLI Command Reference*.

**list-instances**

The following code example shows how to use `list-instances`.

```json
{
    "BidPrice": "0.5",
    "InstanceType": "m3.xlarge",
    "WeightedCapacity": 2
}
,
    "Id": "if-1ABC2DEFGHIJ3"
},
{
    "Status": {
        "Timeline": {
            "ReadyDateTime": 1488759058.598,
            "CreationDateTime": 1488758719.811
        },
        "State": "RUNNING",
        "StateChangeReason": {
            "Message": ""
        }
    },
    "ProvisionedSpotCapacity": 0,
    "Name": "MASTER",
    "InstanceFleetType": "MASTER",
    "ProvisionedOnDemandCapacity": 1,
    "InstanceTypeSpecifications": [
        {
            "BidPriceAsPercentageOfOnDemandPrice": 100.0,
            "InstanceType": "m3.xlarge",
            "WeightedCapacity": 1
        }
    ],
    "Id": "if-2ABC4DEFGHIJ4"
}
]}
```
The following command lists all of the instances in a cluster with the cluster ID j-3C6XNQ39VR9WL:

aws emr list-instances --cluster-id j-3C6XNQ39VR9WL

Output:

```
For a uniform instance group based cluster
{
   "Instances": [
       {

    "Market": "SPOT",
    "PublicIpAddress": "xx.xx.xxx.xxx",
    "PrivateIpAddress": "172.21.11.214"
  ]
}
• For API details, see ListInstances in AWS CLI Command Reference.

**list-security-configurations**

The following code example shows how to use list-security-configurations.

**AWS CLI**

To list security configurations in the current region

Command:

```bash
aws emr list-security-configurations
```

Output:

```json
{
  "SecurityConfigurations": [
    {
      "CreationDateTime": 1473889697.417,
      "Name": "MySecurityConfig-1"
    },
    {
      "CreationDateTime": 1473889697.417,
      "Name": "MySecurityConfig-2"
    }
  ]
}
```

• For API details, see ListSecurityConfigurations in AWS CLI Command Reference.

**modify-cluster-attributes**

The following code example shows how to use modify-cluster-attributes.
AWS CLI

The following command sets the visibility of an EMR cluster with the ID j-301CDNY0J5XM4 to all users:

```
aws emr modify-cluster-attributes --cluster-id j-301CDNY0J5XM4 --visible-to-all-users
```

- For API details, see ModifyClusterAttributes in AWS CLI Command Reference.

modify-instance-fleet

The following code example shows how to use modify-instance-fleet.

AWS CLI

To change the target capacities of an instance fleet

This example changes the On-Demand and Spot target capacities to 1 for the instance fleet specified.

Command:

```
aws emr modify-instance-fleet --cluster-id 'j-12ABCDEFGHIJKLMNOPQRSTUVWXYZ' --instance-fleet InstanceFleetId='if-2ABC4DEFGHIJ4',TargetOnDemandCapacity=1,TargetSpotCapacity=1
```

- For API details, see ModifyInstanceFleet in AWS CLI Command Reference.

put

The following code example shows how to use put.

AWS CLI

The following command uploads a file named healthcheck.sh to the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr put --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src ~/scripts/healthcheck.sh --dest /home/hadoop/bin/healthcheck.sh
```

- For API details, see Put in AWS CLI Command Reference.
remove-tags

The following code example shows how to use remove-tags.

AWS CLI

The following command removes a tag with the key prod from a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr remove-tags --resource-id j-3SD91U2E1L2QX --tag-keys prod
```

- For API details, see RemoveTags in AWS CLI Command Reference.

schedule-hbase-backup

The following code example shows how to use schedule-hbase-backup.

AWS CLI

Note: This command can only be used with HBase on AMI version 2.x and 3.x

1. To schedule a full HBase backup >>>>>>> 06ab6d6e13564b5733d75abaf3b599f93cf39a23

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type full --dir s3://myBucket/backup --interval 10 --unit hours --start-time 2014-04-21T05:26:10Z --consistent
```

Output:

None

2. To schedule an incremental HBase backup

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type incremental --dir s3://myBucket/backup --interval 30 --unit minutes --start-time 2014-04-21T05:26:10Z --consistent
```
Output:

None

- For API details, see ScheduleHbaseBackup in AWS CLI Command Reference.

socks

The following code example shows how to use socks.

AWS CLI

The following command opens a socks connection with the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr socks --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.
- For API details, see Socks in AWS CLI Command Reference.

ssh

The following code example shows how to use ssh.

AWS CLI

The following command opens an ssh connection with the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr ssh --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

Output:

```
ssh -o StrictHostKeyChecking=no -o ServerAliveInterval=10 -i /home/local/user/.ssh/mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Warning: Permanently added 'ec2-52-52-41-150.us-west-2.compute.amazonaws.com,52.52.41.150' (ECDSA) to the list of known hosts.
```
Welcome to Amazon Elastic MapReduce running Hadoop and Amazon Linux.

Hadoop is installed in /home/hadoop. Log files are in /mnt/var/log/hadoop. Check /mnt/var/log/hadoop(steps for diagnosing step failures.

The Hadoop UI can be accessed via the following commands:

```bash
NameNode           lynx http://ip-172-21-11-216:9101/
```

Amazon **EMR on EKS examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR on EKS.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- For API details, see [Ssh](http://aws.amazon.com/) in *AWS CLI Command Reference*. 
Topics

- **Actions**

**Actions**

**update-role-trust-policy**

The following code example shows how to use `update-role-trust-policy`.

**AWS CLI**

**To update the trust policy of an IAM Role to be used with Amazon EMR on EKS**

This example command updates the trust policy of a role named `example_iam_role` such that it can be used with Amazon EMR on EKS with `example_namespace` namespace from an EKS cluster named `example_cluster`.

**Command:**

```
aws emr-containers update-role-trust-policy \
  --cluster example_cluster \
  --namespace example_namespace \
  --role-name example_iam_role
```

**Output:**

If the trust policy has already been updated, then the output will be:

```
Trust policy statement already exists for role example_iam_role. No changes were made!
```

If the trust policy has not been updated yet, then the output will be:

```
Successfully updated trust policy of role example_iam_role.
```

- For API details, see [UpdateRoleTrustPolicy](#) in *AWS CLI Command Reference*.

**EventBridge examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

Add a target

The following code example shows how to add a target to an Amazon EventBridge event.

AWS CLI

To add targets for CloudWatch Events rules

This example adds a Lambda function as the target of a rule:

```bash
aws events put-targets --rule DailyLambdaFunction --targets
    "Id"="1","Arn"="arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

This example sets an Amazon Kinesis stream as the target, so that events caught by this rule are relayed to the stream:

```bash
aws events put-targets --rule EC2InstanceStateChanges --targets
    "Id"="1","Arn"="arn:aws:kinesis:us-east-1:123456789012:stream/MyStream","RoleArn"="arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example sets two Amazon Kinesis streams as targets for one rule:

```bash
aws events put-targets --rule DailyLambdaFunction --targets
    "Id"="Target1","Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/MyStream1","RoleArn"="arn:aws:iam::379642911888:role/MyRoleToAccessLambda"
```
Create a rule

The following code example shows how to create an Amazon EventBridge rule.

AWS CLI

To create CloudWatch Events rules

This example creates a rule that triggers every day at 9:00am (UTC). If you use put-targets to add a Lambda function as a target of this rule, you could run the Lambda function every day at the specified time:

```bash/aws events put-rule --name "DailyLambdaFunction" --schedule-expression "cron(0 9 * * ? *)"
```

This example creates a rule that triggers when any EC2 instance in the region changes state:

```bash/aws events put-rule --name "EC2InstanceStateChanges" --event-pattern "{"source": ["aws.ec2"], "detail-type": ["EC2 Instance State-change Notification"]}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example creates a rule that triggers when any EC2 instance in the region is stopped or terminated:

```bash/aws events put-rule --name "EC2InstanceStateChangeStopOrTerminate" --event-pattern "{"source": ["aws.ec2"], "detail-type": ["EC2 Instance State-change Notification"], "detail": {"state": ["stopped", "terminated"]}}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

For API details, see PutRule in AWS CLI Command Reference.

Delete a rule

The following code example shows how to delete an Amazon EventBridge rule.
AWS CLI

**To delete a CloudWatch Events rule**

This example deletes the rule named EC2InstanceStateChanges:

```
aws events delete-rule --name "EC2InstanceStateChanges"
```

- For API details, see [DeleteRule](#) in *AWS CLI Command Reference*.

**Describe a rule**

The following code example shows how to describe an Amazon EventBridge rule.

AWS CLI

**To display information about a CloudWatch Events rule**

This example displays information about the rule named DailyLambdaFunction:

```
aws events describe-rule --name "DailyLambdaFunction"
```

- For API details, see [DescribeRule](#) in *AWS CLI Command Reference*.

**Disable a rule**

The following code example shows how to disable an Amazon EventBridge rule.

AWS CLI

**To disable a CloudWatch Events rule**

This example disables the rule named DailyLambdaFunction. The rule is not deleted:

```
aws events disable-rule --name "DailyLambdaFunction"
```

- For API details, see [DisableRule](#) in *AWS CLI Command Reference*.

**Enable a rule**

The following code example shows how to enable an Amazon EventBridge rule.
AWS CLI

To enable a CloudWatch Events rule

This example enables the rule named DailyLambdaFunction, which had been previously disabled:

```bash
aws events enable-rule --name "DailyLambdaFunction"
```

• For API details, see `EnableRule` in *AWS CLI Command Reference*.

List rule names for a target

The following code example shows how to list Amazon EventBridge rule names for a target.

AWS CLI

To display all the rules that have a specified target

This example displays all rules that have the Lambda function named "MyFunctionName" as the target:

```bash
aws events list-rule-names-by-target --target-arn "arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

• For API details, see `ListRuleNamesByTarget` in *AWS CLI Command Reference*.

List rules

The following code example shows how to list Amazon EventBridge rules.

AWS CLI

To display a list of all CloudWatch Events rules

This example displays all CloudWatch Events rules in the region:

```bash
aws events list-rules
```

To display a list of CloudWatch Events rules beginning with a certain string.
This example displays all CloudWatch Events rules in the region that have a name starting with "Daily":

```
aws events list-rules --name-prefix "Daily"
```

- For API details, see [ListRules](https://docs.aws.amazon.com/cli/latest/reference/events/list-rules.html) in *AWS CLI Command Reference*.

### List targets for a rule

The following code example shows how to list Amazon EventBridge targets for a rule.

**AWS CLI**

**To display all the targets for a CloudWatch Events rule**

This example displays all the targets of the rule named DailyLambdaFunction:

```
aws events list-targets-by-rule --rule "DailyLambdaFunction"
```

- For API details, see [ListTargetsByRule](https://docs.aws.amazon.com/cli/latest/reference/events/list-targets-by-rule.html) in *AWS CLI Command Reference*.

### Remove targets from a rule

The following code example shows how to remove Amazon EventBridge targets from a rule.

**AWS CLI**

**To remove a target for an event**

This example removes the Amazon Kinesis stream named MyStream1 from being a target of the rule DailyLambdaFunction. When DailyLambdaFunction was created, this stream was set as a target with an ID of Target1:

```
aws events remove-targets --rule "DailyLambdaFunction" --ids "Target1"
```

- For API details, see [RemoveTargets](https://docs.aws.amazon.com/cli/latest/reference/events/remove-targets.html) in *AWS CLI Command Reference*.

### Send events

The following code example shows how to send Amazon EventBridge events.
AWS CLI

To send a custom event to CloudWatch Events

This example sends a custom event to CloudWatch Events. The event is contained within the putevents.json file:

```
aws events put-events --entries file://putevents.json
```

Here are the contents of the putevents.json file:

```
[  
  {  
    "Source": "com.mycompany.myapp",  
    "Detail": "{ \"key1\": \"value1\", \"key2\": \"value2\" }",  
    "Resources": [  
      "resource1",  
      "resource2"  
    ],  
    "DetailType": "myDetailType"  
  },  
  {  
    "Source": "com.mycompany.myapp",  
    "Detail": "{ \"key1\": \"value3\", \"key2\": \"value4\" }",  
    "Resources": [  
      "resource1",  
      "resource2"  
    ],  
    "DetailType": "myDetailType"  
  }  
]
```

- For API details, see [PutEvents](#) in *AWS CLI Command Reference*.

**test-event-pattern**

The following code example shows how to use test-event-pattern.

AWS CLI

To check whether an event pattern matches a specified event
This example tests whether the pattern "source:com.mycompany.myapp" matches the specified event. In this example, the output would be "true":

```
aws events test-event-pattern --event-pattern "{"source":["com.mycompany.myapp"]}" --event "{"id":"1","source":"com.mycompany.myapp","detail-type":"myDetailType","account":"123456789012","region":"us-east-1","time":"2017-04-11T20:11:04Z"}"
```

- For API details, see [TestEventPattern](#) in [AWS CLI Command Reference](#).

**Firewall Manager examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firewall Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

**associate-admin-account**

The following code example shows how to use *associate-admin-account*.

**AWS CLI**

To set the Firewall Manager administrator account

The following *associate-admin-account* example sets the administrator account for Firewall Manager.
**aws fms associate-admin-account**

```bash
aws fms associate-admin-account
   --admin-account 123456789012
```

This command produces no output.

For more information, see [Set the AWS Firewall Manager Administrator Account](#) in the [AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide](#).

- For API details, see [AssociateAdminAccount](#) in [AWS CLI Command Reference](#).

---

**delete-notification-channel**

The following code example shows how to use `delete-notification-channel`.

**AWS CLI**

**To remove the SNS topic information for Firewall Manager logs**

The following `delete-notification-channel` example removes the SNS topic information.

```bash
aws fms delete-notification-channel
```

This command produces no output.

For more information, see [Configure Amazon SNS Notifications and Amazon CloudWatch Alarms](#) in the [AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide](#).

- For API details, see [DeleteNotificationChannel](#) in [AWS CLI Command Reference](#).

---

**delete-policy**

The following code example shows how to use `delete-policy`.

**AWS CLI**

**To delete a Firewall Manager policy**

The following `delete-policy` example removes the policy with the specified ID, along with all of its resources.

```bash
aws fms delete-policy
   --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE1111
```
--delete-all-policy-resources

This command produces no output.

For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.
• For API details, see DeletePolicy in AWS CLI Command Reference.

disassociate-admin-account

The following code example shows how to use disassociate-admin-account.

AWS CLI

To remove the Firewall Manager administrator account

The following disassociate-admin-account example removes the current administrator account association from Firewall Manager.

aws fms disassociate-admin-account

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.
• For API details, see DisassociateAdminAccount in AWS CLI Command Reference.

get-admin-account

The following code example shows how to use get-admin-account.

AWS CLI

To retrieve the Firewall Manager administrator account

The following get-admin-account example retrieves the administrator account.

aws fms get-admin-account

Output:
For more information, see AWS Firewall Manager Prerequisites in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetAdminAccount in AWS CLI Command Reference.

### get-compliance-detail

The following code example shows how to use get-compliance-detail.

**AWS CLI**

**To retrieve the compliance information for an account**

The following get-compliance-detail example retrieves compliance information for the specified policy and member account.

```
aws fms get-compliance-detail \
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --member-account 123456789012
```

Output:

```
{
  "PolicyComplianceDetail": {
    "EvaluationLimitExceeded": false,
    "IssueInfoMap": {},
    "MemberAccount": "123456789012",
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyOwner": "123456789012",
    "Violators": []
  }
}
```

For more information, see Viewing Resource Compliance with a Policy in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetComplianceDetail in AWS CLI Command Reference.
get-notification-channel

The following code example shows how to use get-notification-channel.

AWS CLI

To retrieve the SNS topic information for Firewall Manager logs

The following get-notification-channel example retrieves the SNS topic information.

```
aws fms get-notification-channel
```

Output:

```
{
   "SnsRoleName": "arn:aws:iam::123456789012:role/aws-service-role/fms.amazonaws.com/AWSServiceRoleForFMS"
}
```

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide. 
- For API details, see GetNotificationChannel in AWS CLI Command Reference.

get-policy

The following code example shows how to use get-policy.

AWS CLI

To retrieve a Firewall Manager policy

The following get-policy example retrieves the policy with the specified ID.

```
aws fms get-policy \
   --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
   "Policy": {
```
For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see GetPolicy in AWS CLI Command Reference.

**list-compliance-status**

The following code example shows how to use list-compliance-status.

**AWS CLI**

To retrieve the policy compliance information for member accounts

The following list-compliance-status example retrieves member account compliance information for the specified policy.

```
aws fms list-compliance-status \
   --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "PolicyComplianceStatusList": [
    
```
For more information, see Viewing Resource Compliance with a Policy in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListComplianceStatus in AWS CLI Command Reference.

list-member-accounts

The following code example shows how to use list-member-accounts.

AWS CLI

To retrieve the member accounts in the organization

The following list-member-accounts example lists all of the member accounts that are in the Firewall Manager administrator's organization.

```bash
aws fms list-member-accounts
```

Output:

```json
{}
```
For more information, see AWS Firewall Manager in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListMemberAccounts in AWS CLI Command Reference.

list-policies

The following code example shows how to use list-policies.

AWS CLI

To retrieve all Firewall Manager policies

The following list-policies example retrieves the list of policies for the account. In this example, the output is limited to two results per request. Each call returns a NextToken that can be used as the value for the --starting-token parameter in the next list-policies call to get the next set of results for the list.

```
aws fms list-policies \
   --max-items 2
```

Output:

```
{
   "PolicyList": [
   {
      "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "PolicyName": "test",
      "ResourceType": "AWS::EC2::Instance",
      "SecurityServiceType": "SECURITY_GROUPS_COMMON",
      "RemediationEnabled": false
   },
   {
```
For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see ListPolicies in AWS CLI Command Reference.

**put-notification-channel**

The following code example shows how to use `put-notification-channel`.

**AWS CLI**

**To set the SNS topic information for Firewall Manager logs**

The following `put-notification-channel` example sets the SNS topic information.

```bash
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see PutNotificationChannel in AWS CLI Command Reference.

**put-policy**

The following code example shows how to use `put-policy`.
AWS CLI

To create a Firewall Manager policy

The following `put-policy` example creates a Firewall Manager security group policy.

```
aws fms put-policy \\
   --cli-input-json file://policy.json
```

Contents of `policy.json`:

```
{
   "Policy": {
      "PolicyName": "test",
      "SecurityServicePolicyData": {
         "Type": "SECURITY_GROUPS_USAGE_AUDIT",
         "ManagedServiceData": "{"type":"SECURITY_GROUPS_USAGE_AUDIT","deleteUnusedSecurityGroups":false,"coalesceRedundantSecurityGroups":true}"
      },
      "ResourceType": "AWS::EC2::SecurityGroup",
      "ResourceTags": [],
      "ExcludeResourceTags": false,

```
For more information, see Working with AWS Firewall Manager Policies in the AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide.

- For API details, see PutPolicy in AWS CLI Command Reference.

AWS FIS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS FIS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

create-experiment-template

The following code example shows how to use create-experiment-template.
AWS CLI

To create an experiment template

The following create-experiment-template example creates an experiment template in your AWS FIS account.

```
aws fis create-experiment-template \
   --cli-input-json file://myfile.json
```

Contents of myfile.json:

```json
{
   "description": "experimentTemplate",
   "stopConditions": [
      {
         "source": "aws:cloudwatch:alarm",
         "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
      }
   ],
   "targets": {
      "Instances-Target-1": {
         "resourceType": "aws:ec2:instance",
         "resourceArns": [
            "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
         ],
         "selectionMode": "ALL"
      }
   },
   "actions": {
      "reboot": {
         "actionId": "aws:ec2:reboot-instances",
         "description": "reboot",
         "parameters": {},
         "targets": {
            "Instances": "Instances-Target-1"
         }
      }
   },
   "roleArn": "arn:aws:iam::123456789012:role/myRole"
}
```

Output:

```
Actions and scenarios
```

```
3034
```
For more information, see Create an experiment template in the AWS Fault Injection Simulator User Guide.

- For API details, see CreateExperimentTemplate in AWS CLI Command Reference.
**delete-experiment-template**

The following code example shows how to use delete-experiment-template.

**AWS CLI**

**To delete an experiment template**

The following delete-experiment-template example deletes the specified experiment template.

```
aws fis delete-experiment-template \
   --id ABCDE1fgHIJkLmNop
```

**Output:**

```json
{
   "experimentTemplate": {
      "id": "ABCDE1fgHIJkLmNop",
      "description": "myExperimentTemplate",
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
               "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
         }
      }
   },
   "actions": {
      "testaction": {
         "actionId": "aws:ec2:stop-instances",
         "parameters": {},
         "targets": {
            "Instances": "Instances-Target-1"
         }
      }
   },
   "stopConditions": [
      {
         "source": "none"
      }
   ]
}
```
For more information, see [Delete an experiment template](#) in the [AWS Fault Injection Simulator User Guide](#).

- For API details, see [DeleteExperimentTemplate](#) in [AWS CLI Command Reference](#).

### get-action

The following code example shows how to use `get-action`.

**AWS CLI**

#### To get action details

The following `get-action` example gets the details of the specified action.

```bash
aws fis get-action \
   --id aws:ec2:stop-instances
```

**Output:**

```json
{
   "action": {
      "id": "aws:ec2:stop-instances",
      "description": "Stop the specified EC2 instances.",
      "parameters": {
         "startInstancesAfterDuration": {
            "description": "The time to wait before restarting the instances (ISO 8601 duration).",
            "required": false
         }
      },
      "targets": {
         "Instances": {
            "resourceType": "aws:ec2:instance"
         }
      }
   }
}
```
For more information, see Actions in the AWS Fault Injection Simulator User Guide.

• For API details, see GetAction in AWS CLI Command Reference.

get-experiment

The following code example shows how to use get-experiment.

AWS CLI

To get experiment details

The following get-experiment example gets the details of the specified experiment.

```bash
aws fis get-experiment \
   --id ABC12DeFGhI3jKLMNOP
```

Output:

```json
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIjkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "completed",
            "reason": "Experiment completed."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
                ],
                "SelectionMode": "ALL"
            }
        }
    }
}
```
For more information, see Experiments for AWS FIS in the AWS Fault Injection Simulator User Guide.

- For API details, see GetExperiment in AWS CLI Command Reference.

get-experiment-template

The following code example shows how to use get-experiment-template.

AWS CLI

To get experiment template details

The following get-experiment-template example gets the details of the specified experiment template.

```bash
aws fis get-experiment-template \
```
Output:

```json
{
   "experimentTemplate": {
      "id": "ABCDE1fgHIJkLmNop",
      "description": "myExperimentTemplate",
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
               "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
         }
      },
      "actions": {
         "testaction": {
            "actionId": "aws:ec2:stop-instances",
            "parameters": {},
            "targets": {
               "Instances": "Instances-Target-1"
            }
         }
      },
      "stopConditions": [
         {
            "source": "none"
         }
      ],
      "creationTime": 1616017191.124,
      "lastUpdateTime": 1616017331.51,
      "roleArn": "arn:aws:iam::123456789012:role/FISRole",
      "tags": {
         "key": "value"
      }
   }
}
```

For more information, see Experiment templates in the AWS Fault Injection Simulator User Guide.
list-actions

The following code example shows how to use list-actions.

AWS CLI

To list actions

The following list-actions example lists the available actions.

```bash
aws fis list-actions
```

Output:

```json
{
   "actions": [
      {
         "id": "aws:ec2:reboot-instances",
         "description": "Reboot the specified EC2 instances.",
         "targets": {
            "Instances": {
               "resourceType": "aws:ec2:instance"
            }
         },
         "tags": {}
      },
      {
         "id": "aws:ec2:stop-instances",
         "description": "Stop the specified EC2 instances.",
         "targets": {
            "Instances": {
               "resourceType": "aws:ec2:instance"
            }
         },
         "tags": {}
      },
      {
         "id": "aws:ec2:terminate-instances",
         "description": "Terminate the specified EC2 instances.",
         "targets": {
            "Instances": {

```
"resourceType": "aws:ec2:instance"
],
"tags": {}},
{
"id": "aws:ecs:drain-container-instances",

},
"tags": {}}
]

For more information, see Actions in the AWS Fault Injection Simulator User Guide.

- For API details, see ListActions in AWS CLI Command Reference.

list-experiment-templates

The following code example shows how to use list-experiment-templates.

AWS CLI

To list experiment templates

The following list-experiment-templates example lists the experiment templates in your AWS account.

aws fis list-experiment-templates

Output:

```json
{
    "experimentTemplates": [
        {
            "id": "ABCDE1fgHIJkLmNop",
            "description": "myExperimentTemplate",
            "creationTime": 1616017191.124,
            "lastUpdateTime": 1616017191.124,
            "tags": {
                "key": "value"
            }
        }
    ]
}}
```
For more information, see Experiment templates in the AWS Fault Injection Simulator User Guide.

- For API details, see ListExperimentTemplates in AWS CLI Command Reference.

**list-experiments**

The following code example shows how to use list-experiments.

**AWS CLI**

**To list experiments**

The following list-experiments example lists the experiments in your AWS account.

```
aws fis list-experiments
```

Output:

```json
{
  "experiments": [ 
    { 
      "id": "ABCdeF1GHiJkLM23NO",
      "experimentTemplateId": "ABCDE1fgHIJkLmNop",
      "state": { 
        "status": "running",
        "reason": "Experiment is running."
      },
      "creationTime": 1616017341.197,
      "tags": { 
        "key": "value"
      }
    }
  ]
}
```

For more information, see Experiments in the AWS Fault Injection Simulator User Guide.

- For API details, see ListExperiments in AWS CLI Command Reference.
list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a resource

The following list-tags-for-resource example lists the tags for the specified resource.

```bash
aws fis list-tags-for-resource \
```

Output:

```json
{
   "tags": {
      "key1": "value1",
      "key2": "value2"
   }
}
```

For more information, see [Tag your AWS FIS resources](https://docs.aws.amazon.com/fis/latest/userguide/) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/fis/list-tags-for-resource.html) in *AWS CLI Command Reference*.

start-experiment

The following code example shows how to use start-experiment.

AWS CLI

To start an experiment

The following start-experiment example starts the specified experiment.

```bash
aws fis start-experiment \
   --experiment-template-id ABCDEfgHIkJlmNop
```

Output:

```json
{
}
```
"experiment": {
    "id": "ABC12DeFGhI3jKLMNOP",
    "experimentTemplateId": "ABCDE1fgHIJkLmNop",
    "roleArn": "arn:aws:iam::123456789012:role/myRole",
    "state": {
        "status": "initiating",
        "reason": "Experiment is initiating."
    },
    "targets": {
        "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
                "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
        }
    },
    "actions": {
        "reboot": {
            "actionId": "aws:ec2:reboot-instances",
            "parameters": {},
            "targets": {
                "Instances": "Instances-Target-1"
            },
            "state": {
                "status": "pending",
                "reason": "Initial state"
            }
        }
    },
    "stopConditions": [
        {
            "source": "none"
        }
    ],
    "creationTime": 1616432464.025,
    "startTime": 1616432464.374,
    "tags": {}
For more information, see Experiments for AWS FIS in the AWS Fault Injection Simulator User Guide.

- For API details, see StartExperiment in AWS CLI Command Reference.

**stop-experiment**

The following code example shows how to use stop-experiment.

**AWS CLI**

**To stop an experiment**

The following stop-experiment example stops the specified experiment from running.

```
aws fis stop-experiment \
   --id ABC12DeFGhI3jKLMNOP
```

**Output:**

```
{
   "experiment": {
      "id": "ABC12DeFGhI3jKLMNOP",
      "experimentTemplateId": "ABCDE1fgHIjKmNop",
      "roleArn": "arn:aws:iam::123456789012:role/myRole",
      "state": {
         "status": "stopping",
         "reason": "Stopping Experiment."
      },
      "targets": {
         "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
               "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
         }
      },
      "actions": {
         "reboot": {
            "actionId": "aws:ec2:reboot-instances",
            "targetIds": [
               "i-12a3b4c56d78e9012"
            ]
         }
      }
   }
}
```
For more information, see [Experiments for AWS FIS](https://docs.aws.amazon.com/fis/latest/userguide/) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [StopExperiment](https://docs.aws.amazon.com/cli/latest/reference/fis/stop-experiment.html) in *AWS CLI Command Reference*.

**tag-resource**

The following code example shows how to use `tag-resource`.
AWS CLI

To tag a resource

The following tag-resource example tags the specified resource.

```bash
aws fis tag-resource \
   --tags key1=value1,key2=value2
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To untag a resource

The following untag-resource example removes the tags from the specified resource.

```bash
aws fis untag-resource \
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the AWS Fault Injection Simulator User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-experiment-template

The following code example shows how to use update-experiment-template.
To update an experiment template

The following update-experiment-template example updates the description of the specified experiment template.

```bash
aws fis update-experiment-template \
  --id ABCDE1fgHIJkLmNop \
  ---description myExperimentTemplate
```

Output:

```json
{
  "experimentTemplate": {
    "id": "ABCDE1fgHIJkLmNop",
    "description": "myExperimentTemplate",
    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
          "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
      }
    },
    "actions": {
      "testaction": {
        "actionId": "aws:ec2:stop-instances",
        "parameters": {},
        "targets": {
          "Instances": "Instances-Target-1"
        }
      }
    },
    "stopConditions": [
      {
        "source": "none"
      }
    ],
    "creationTime": 1616017191.124,
    "lastUpdateTime": 1616017859.607
  }
}
```
For more information, see Update an experiment template in the AWS Fault Injection Simulator User Guide.

- For API details, see UpdateExperimentTemplate in AWS CLI Command Reference.

Amazon GameLift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon GameLift.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- Actions

Actions

create-build

The following code example shows how to use create-build.

AWS CLI

Example1: To create a game build from files in an S3 bucket

The following create-build example creates a custom game build resource. It uses zipped files that are stored in an S3 location in an AWS account that you control. This example assumes

```json
"roleArn": "arn:aws:iam::123456789012:role/FISRole",
"tags": {  
  "key": "value"
}
```
that you've already created an IAM role that gives Amazon GameLift permission to access the S3 location. Since the request does not specify an operating system, the new build resource defaults to WINDOWS_2012.

```bash
aws gamelift create-build
   --storage-location file://storage-loc.json
   --name MegaFrogRaceServer.NA
   --build-version 12345.678
```

Contents of `storage-loc.json`:

```json
{
   "Bucket":"MegaFrogRaceServer_NA_build_files",
   "Key":"MegaFrogRaceServer_build_123.zip",
   "RoleArn":"arn:aws:iam::123456789012:role/gamelift"
}
```

Output:

```json
{
   "Build": {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "CreationTime": 1496708916.18,
      "Name": "MegaFrogRaceServer.NA",
      "OperatingSystem": "WINDOWS_2012",
      "SizeOnDisk": 479303,
      "Status": "INITIALIZED",
      "Version": "12345.678"
   },
   "StorageLocation": {
      "Bucket": "MegaFrogRaceServer_NA_build_files",
      "Key": "MegaFrogRaceServer_build_123.zip"
   }
}
```

**Example2: To create a game build resource for manually uploading files to GameLift**

The following `create-build` example creates a new build resource. It also gets a storage location and temporary credentials that allow you to manually upload your game build to the
GameLift location in Amazon S3. Once you've successfully uploaded your build, the GameLift service validates the build and updates the new build's status.

```bash
aws gamelift create-build \
  --name MegaFrogRaceServer.NA \n  --build-version 12345.678 \n  --operating-system AMAZON_LINUX
```

Output:

```json
{
  "Build": {
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTime": 1496708916.18,
    "Name": "MegaFrogRaceServer.NA",
    "OperatingSystem": "AMAZON_LINUX",
    "SizeOnDisk": 0,
    "Status": "INITIALIZED",
    "Version": "12345.678"
  },
  "StorageLocation": {
    "Bucket": "gamelift-builds-us-west-2",
    "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  },
  "UploadCredentials": {
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfipFYc6vY思路=
    "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
  }
}
```

For more information, see [Upload a Custom Server Build to GameLift](https://docs.aws.amazon.com/gamelift/latest/developerguide/upload-custom-server-build.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [CreateBuild](https://docs.aws.amazon.com/cli/latest/reference/gamelift/create-build.html) in *AWS CLI Command Reference*.

### create-fleet

The following code example shows how to use `create-fleet`. 
**AWS CLI**

**Example 1: To create a basic Linux fleet**

The following `create-fleet` example creates a minimally configured fleet of on-demand Linux instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
    --name MegaFrogRaceServer.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --fleet-type ON_DEMAND \
    --runtime-configuration 'ServerProcesses=[{LaunchPath=/local/game/release-na/MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```
{
    "FleetAttributes": {
        "BuildId": "build-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
        "CertificateConfiguration": {"CertificateType": "GENERATED"},
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "ON_DEMAND",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "OperatingSystem": "AMAZON_LINUX",
        "ServerLaunchPath": "/local/game/release-na/MegaFrogRace_Server.exe",
        "Status": "NEW"
    }
}
```

**Example 2: To create a basic Windows fleet**
The following `create-fleet` example creates a minimally configured fleet of spot Windows instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```bash
aws gamelift create-fleet
  --name MegaFrogRace.NA.v2
  --description 'Hosts for v2 North America'
  --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff
  --certificate-configuration 'CertificateType=GENERATED'
  --ec2-instance-type c4.large
  --fleet-type SPOT
  --runtime-configuration 'ServerProcesses=[{LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```json
{
  "FleetAttributes": {
    "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
    "CertificateConfiguration": {
      "CertificateType": "GENERATED"
    },
    "CreationTime": 1496365885.44,
    "Description": "Hosts for v2 North America",
    "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetType": "SPOT",
    "InstanceType": "c4.large",
    "MetricGroups": ["default"],
    "Name": "MegaFrogRace.NA.v2",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "OperatingSystem": "WINDOWS_2012",
    "ServerLaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
    "Status": "NEW"
  }
}
```

Example 3: To create a fully configured fleet
The following `create-fleet` example creates a fleet of Spot Windows instances for a custom server build, with most commonly used configuration settings provided.

```bash
aws gamelift create-fleet \
  --name MegaFrogRace.NA.v2 \
  --description 'Hosts for v2 North America' \
  --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff \
  --certificate-configuration 'CertificateType=GENERATED' \
  --ec2-instance-type c4.large \
  --ec2-inbound-permissions
    'FromPort=33435,ToPort=33435,IpRange=10.24.34.0/23,Protocol=UDP' \
  --fleet-type SPOT \
  --new-game-session-protection-policy FullProtection \
  --runtime-configuration file://runtime-config.json \
  --metric-groups default \
  --instance-role-arn 'arn:aws:iam::444455556666:role/GameLiftS3Access'
```

Contents of `runtime-config.json`:

```json
GameSessionActivationTimeoutSeconds=300,
MaxConcurrentGameSessionActivations=2,
ServerProcesses=[
  {LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,Parameters=-debug,ConcurrentExecutions=1},
  {LaunchPath=C:\game\Bin64.Release.Dedicated \MegaFrogRace_Server.exe,ConcurrentExecutions=1}]
```

Output:

```json
{
  "FleetAttributes": {
    "InstanceRoleArn": "arn:aws:iam::444455556666:role/GameLiftS3Access",
    "Status": "NEW",
    "InstanceType": "c4.large",
    "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "Description": "Hosts for v2 North America",
    "FleetType": "SPOT",
    "OperatingSystem": "WINDOWS_2012",
    "Name": "MegaFrogRace.NA.v2",
    "CreationTime": 1569309011.11,
  }
}```
Example 4: To create a Realtime Servers fleet

The following create-fleet example creates a fleet of Spot instances with a Realtime configuration script that has been uploaded to Amazon GameLift. All Realtime servers are deployed onto Linux machines. For the purposes of this example, assume that the uploaded Realtime script includes multiple script files, with the \Init() function located in the script file called MainScript.js. As shown, this file is identified as the launch script in the runtime configuration.

```bash
aws gamelift create-fleet \
  --name MegaFrogRace.NA.realtime \
  --description 'Mega Frog Race Realtime fleet' \
  --script-id script-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
  --ec2-instance-type c4.large \
  --fleet-type SPOT \
  --certificate-configuration 'CertificateType=GENERATED' --runtime-configuration 'ServerProcesses=[[LaunchPath=/local/game/MainScript.js,Parameters=+map Winter444,ConcurrentExecutions=5]]'
```

Output:

```json
{
  "FleetAttributes": {
    "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffffff77aa",
    "Status": "NEW",
    "CreationTime": 1569310745.212,
    "InstanceType": "c4.large",
    "NewGameSessionProtectionPolicy": "NoProtection",
```
For API details, see CreateFleet in AWS CLI Command Reference.

create-game-session-queue

The following code example shows how to use create-game-session-queue.

**AWS CLI**

**Example1: To set up an ordered game session queue**

The following create-game-session-queue example creates a new game session queue with destinations in two regions. It also configures the queue so that game session requests time out after waiting 10 minutes for placement. Since no latency policies are defined, GameLift attempts to place all game sessions with the first destination listed.

```bash
aws gamelift create-game-session-queue \
    --name MegaFrogRaceServer-NA \
    --destinations file://destinations.json \
    --timeout-in-seconds 600
```

**Contents of destinations.json:**

```json
{
    "Destinations": [
        {
            "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```
Example 2: To set up a game session queue with player latency policies

The following create-game-session-queue example creates a new game session queue with two player latency policies. The first policy sets a 100ms latency cap that is enforced during the first minute of a game session placement attempt. The second policy raises the latency cap to 200ms until the placement request times out at 3 minutes.

```bash
aws gamelift create-game-session-queue \
   --name MegaFrogRaceServer-NA \
   --destinations file://destinations.json \
   --player-latency-policies file://latency-policies.json \
   --timeout-in-seconds 180
```

Contents of `destinations.json`:

```json
{
   "Destinations": [
```
Contents of latency-policies.json:

```json
{
  "PlayerLatencyPolicies": [
    {
      "MaximumIndividualPlayerLatencyMilliseconds": 200,
      "PolicyDurationSeconds": 60
    },
    {
      "MaximumIndividualPlayerLatencyMilliseconds": 100,
      "PolicyDurationSeconds": 60
    }
  ]
}
```

Output:

```json
{
  "GameSessionQueue": {
    "Name": "MegaFrogRaceServer-NA",
    "TimeoutInSeconds": 600,
    "PlayerLatencyPolicies": [
      {
        "MaximumIndividualPlayerLatencyMilliseconds": 100,
        "PolicyDurationSeconds": 60
      },
      {
        "MaximumIndividualPlayerLatencyMilliseconds": 200
      }
    ],
    "Destinations": [
      {
        "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
      },
      {
        "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
      }
    ]
  }
}
```
For more information, see Create a Queue in the Amazon GameLift Developer Guide.

- For API details, see CreateGameSessionQueue in AWS CLI Command Reference.

delete-build

The following code example shows how to use delete-build.

AWS CLI

To delete a custom game build

The following delete-build example removes a build from your Amazon GameLift account. After the build is deleted, you cannot use it to create new fleets. This operation cannot be undone.

```
aws gamelift delete-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

- For API details, see DeleteBuild in AWS CLI Command Reference.

delete-fleet

The following code example shows how to use delete-fleet.

AWS CLI

To delete a fleet that is no longer in use

The following delete-fleet example removes a fleet that has been scaled down to zero instances. If the fleet capacity is greater than zero, the request fails with an HTTP 400 error.

```
aws gamelift delete-fleet \
   --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Manage GameLift Fleets in the Amazon GameLift Developer Guide.

- For API details, see DeleteFleet in AWS CLI Command Reference.
delete-game-session-queue

The following code example shows how to use delete-game-session-queue.

AWS CLI

To delete a game session queue

The following delete-game-session-queue example deletes a specified game session queue.

```bash
aws gamelift delete-game-session-queue \
   --name MegaFrogRace-NA
```

This command produces no output.

- For API details, see [DeleteGameSessionQueue](#) in *AWS CLI Command Reference*.

describe-build

The following code example shows how to use describe-build.

AWS CLI

To get information on a custom game build

The following describe-build example retrieves properties for a game server build resource.

```bash
aws gamelift describe-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "My_Game_Server_Build_One",
        "OperatingSystem": "AMAZON_LINUX",
        "SizeOnDisk": 1304924,
    }
}
```
For more information, see Upload a Custom Server Build to GameLift in the Amazon GameLift Developer Guide.

- For API details, see DescribeBuild in AWS CLI Command Reference.

describe-ec2-instance-limits

The following code example shows how to use describe-ec2-instance-limits.

AWS CLI

To retrieve service limits for an EC2 instance type

The following describe-ec2-instance-limits example displays the maximum allowed instances and current instances in use for the specified EC2 instance type in the current Region. The result indicates that only five of the allowed twenty instances are being used.

aws gamelift describe-ec2-instance-limits \
--ec2-instance-type m5.large

Output:

```json
{
   "EC2InstanceLimits": [
      {
         "EC2InstanceType": "m5.large",
         "CurrentInstances": 5,
         "InstanceLimit": 20
      }
   ]
}
```

For more information, see Choose Computing Resources in the Amazon GameLift Developer Guide.

- For API details, see DescribeEc2InstanceLimits in AWS CLI Command Reference.
describe-fleet-attributes

The following code example shows how to use describe-fleet-attributes.

AWS CLI

Example1: To view attributes for a list of fleets

The following describe-fleet-attributes example retrieves fleet attributes for two specified fleets. As shown, the requested fleets are deployed with the same build, one for On-Demand instances and one for Spot instances, with some minor configuration differences.

```
aws gamelift describe-fleet-attributes \
   --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
   "FleetAttributes": [
      {
         "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "FleetType": "ON_DEMAND",
         "InstanceType": "c4.large",
         "Description": "On-demand hosts for v2 North America",
         "Name": "MegaFrogRaceServer.NA.v2-od",
         "CreationTime": 1568836191.995,
         "Status": "ACTIVE",
         "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
         "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
         "ServerLaunchPath": "C:\game\MegaFrogRace_Server.exe",
         "ServerLaunchParameters": "+gamelift_start_server",
         "NewGameSessionProtectionPolicy": "NoProtection",
         "OperatingSystem": "WINDOWS_2012",
         "MetricGroups": [
            "default"
         ],
         "CertificateConfiguration": {
            "CertificateType": "DISABLED"
         }
      }
   ]
}
```
Example2: To request attributes for all fleets

The following describe-fleet-attributes returns fleet attributes for all fleets with any status. This example illustrates the use of pagination parameters to return one fleet at a time.

```
aws gamelift describe-fleet-attributes \
   --limit 1
```

Output:

```
{
   "FleetAttributes": [
   {
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "FleetType": "SPOT",
      "InstanceType": "c4.large",
      "Description": "On-demand hosts for v2 North America",
      "Name": "MegaFrogRaceServer.NA.v2-spot",
      "CreationTime": 1568838275.379,
      "Status": "ACTIVATING",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
      "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
      "NewGameSessionProtectionPolicy": "NoProtection",
      "OperatingSystem": "WINDOWS_2012",
      "MetricGroups": [
          "default"
      ],
      "CertificateConfiguration": {
          "CertificateType": "GENERATED"
      }
   }
   ]
}
```
The output includes a NextToken value that you can use when you call the command a second time. Pass the value to the --next-token parameter to specify where to pick up the output. The following command returns the second result in the output.

```
aws gamelift describe-fleet-attributes \
  --limit 1 \
  --next-token
  eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiIjMjAxNjM5OCJ9LCJidWlsZElkIjI6
```

Repeat until the response doesn't include a NextToken value.

For more information, see Setting Up GameLift Fleets in the Amazon GameLift Developer Guide.
- For API details, see DescribeFleetAttributes in AWS CLI Command Reference.

**describe-fleet-capacity**

The following code example shows how to use describe-fleet-capacity.
AWS CLI

To view capacity status for a list of fleets

The following describe-fleet-capacity example retrieves current capacity for two specified fleets.

```
aws gamelift describe-fleet-capacity \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
   "FleetCapacity": [
   {
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "InstanceType": "c5.large",
      "InstanceCounts": {
         "DESIRED": 10,
         "MINIMUM": 1,
         "MAXIMUM": 20,
         "PENDING": 0,
         "ACTIVE": 10,
         "IDLE": 3,
         "TERMINATING": 0
      }
   },
   {
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "InstanceType": "c5.large",
      "InstanceCounts": {
         "DESIRED": 13,
         "MINIMUM": 1,
         "MAXIMUM": 20,
         "PENDING": 0,
         "ACTIVE": 15,
         "IDLE": 2,
         "TERMINATING": 2
      }
   }
   ]
}
```
For more information, see GameLift Metrics for Fleets in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetCapacity in AWS CLI Command Reference.

**describe-fleet-events**

The following code example shows how to use describe-fleet-events.

### AWS CLI

**To request events for a specified time span**

The following describe-fleet-events example displays details of all fleet-related events that occurred during the specified time span.

```bash
aws gamelift describe-fleet-events \
   --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
   --start-time 1579647600 \
   --end-time 1579649400 \
   --limit 5
```

**Output:**

```json
{
   "Events": [
      {
         "EventId": "a37b6892-5d07-4d3b-8b47-80244ecf66b9",
         "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "EventCode": "FLEET_STATE_ACTIVE",
         "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed state to ACTIVE",
         "EventTime": 1579649342.191
      },
      {
         "EventId": "67da4ec9-92a3-4d95-886a-5d6772c24063",
         "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
         "EventCode": "FLEET_STATE_ACTIVATING",
         "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed state to ACTIVATING",
         "EventTime": 1579649321.427
      }
   ]
}
```
For more information, see [Debug GameLift Fleet Issues](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetEvents](#) in *AWS CLI Command Reference*.

### describe-fleet-port-settings

The following code example shows how to use `describe-fleet-port-settings`.

**AWS CLI**

To view inbound connection permissions for a fleet

The following `describe-fleet-port-settings` example retrieves connection settings for a specified fleet.

```bash
aws gamelift describe-fleet-port-settings \
    --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
    "InboundPermissions": [
        {
            "FromPort": 33400,
            "ToPort": 33500,
            "IpRange": "0.0.0.0/0",
            "Protocol": "UDP"
        },
        {
            "FromPort": 1900,
            "ToPort": 2000,
            "IpRange": "0.0.0.0/0",
```
For more information, see Setting Up GameLift Fleets in the Amazon GameLift Developer Guide.

- For API details, see DescribeFleetPortSettings in AWS CLI Command Reference.

**describe-fleet-utilization**

The following code example shows how to use describe-fleet-utilization.

**AWS CLI**

**Example1: To view usage data for a list of fleets**

The following describe-fleet-utilization example retrieves current usage information for one specified fleet.

```bash
aws gamelift describe-fleet-utilization \\
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```json
{
    "FleetUtilization": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ActiveServerProcessCount": 100,
            "ActiveGameSessionCount": 62,
            "CurrentPlayerSessionCount": 329,
            "MaximumPlayerSessionCount": 1000
        }
    ]
}
```

**Example2: To request usage data for all fleets**

The following describe-fleet-utilization returns fleet usage data for all fleets with any status. This example uses pagination parameters to return data for two fleets at a time.
```
aws gamelift describe-fleet-utilization \
   --limit 2 \
   --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM1...
```

Output:

```
{
   "FleetUtilization": [ 
      {
         "FleetId": "fleet-1111aaaa-22bb-33cc-44dd-5555eeeee66ff",
         "ActiveServerProcessCount": 100,
         "ActiveGameSessionCount": 13,
         "CurrentPlayerSessionCount": 98,
         "MaximumPlayerSessionCount": 1000
      },
      {
         "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
         "ActiveServerProcessCount": 100,
         "ActiveGameSessionCount": 62,
         "CurrentPlayerSessionCount": 329,
         "MaximumPlayerSessionCount": 1000
      }
   ],
   "NextToken": "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM1...
```

Call the command a second time, passing the `NextToken` value as the argument to the `--next-token` parameter to see the next two results.

```
aws gamelift describe-fleet-utilization \
   --limit 2 \
   --next-token eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM1...
```

Repeat until the response no longer includes a `NextToken` value in the output.

For more information, see [GameLift Metrics for Fleets](https://docs.aws.amazon.com/gamelift/latest/developerguide/gamelift-metrics-fleets.html) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetUtilization](https://docs.aws.amazon.com/cli/latest/reference/gamelift/describe-fleet-utilization.html) in *AWS CLI Command Reference*.  

describe-game-session-queues

The following code example shows how to use describe-game-session-queues.

AWS CLI

To view game session queues

The following describe-game-session-queues example retrieves properties for two specified queues.

```bash
aws gamelift describe-game-session-queues \
   --names MegaFrogRace-NA MegaFrogRace-EU
```

Output:

```json
{
   "GameSessionQueues": [
      {
         "Destinations": [
            {
               "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
            },
            {
               "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
            }
         ],
         "Name": "MegaFrogRace-NA",
         "TimeoutInSeconds": 600,
         "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/MegaFrogRace-NA",
         "PlayerLatencyPolicies": [
            {
               "MaximumIndividualPlayerLatencyMilliseconds": 200
            },
            {
               "MaximumIndividualPlayerLatencyMilliseconds": 100,
               "PolicyDurationSeconds": 60
            }
         ],
         "FilterConfiguration": {
            "AllowedLocations": ["us-west-2", "ap-south-1", "us-east-1"]
         },
         "PriorityConfiguration": {
```
For more information, see [Using Multi-Region Queues](https://docs.aws.amazon.com/gamelift/latest/developerguide/multiple-regions.html) in the Amazon GameLift Developer Guide.

- For API details, see [DescribeGameSessionQueues](https://docs.aws.amazon.com/cli/latest/reference/gamelift/describe-game-session-queues.html) in AWS CLI Command Reference.

### describe-runtime-configuration

The following code example shows how to use describe-runtime-configuration.

#### AWS CLI

**To request the runtime configuration for a fleet**

The following describe-runtime-configuration example retrieves details about the current runtime configuration for a specified fleet.

```bash
aws gamelift describe-runtime-configuration \
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Output:**

```json
{
  "RuntimeConfiguration": {
    "ServerProcesses": [
      {
        "LaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
      }
    ]
  }
}
```
For more information, see [Run Multiple Processes on a Fleet](#) in the [Amazon GameLift Developer Guide](#).

* For API details, see [DescribeRuntimeConfiguration](#) in [AWS CLI Command Reference](#).

## list-builds

The following code example shows how to use `list-builds`.

### AWS CLI

**Example1: To get a list of custom game builds**

The following `list-builds` example retrieves properties for all game server builds in the current Region. The sample request illustrates how to use the pagination parameters, `Limit` and `NextToken`, to retrieve the results in sequential sets. The first command retrieves the first two builds. Because there are more than two available, the response includes a `NextToken` to indicate that more results are available.

```bash
aws gamelift list-builds \
   --limit 2
```

**Output:**

```json
{
   "Builds": [
     {
```

---

**Parameters**: "+gamelift_start_server",

"ConcurrentExecutions": 3

},

{
   "LaunchPath": "C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe",
   "Parameters": "+gamelift_start_server +debug",
   "ConcurrentExecutions": 1

}

"MaxConcurrentGameSessionActivations": 2147483647,

"GameSessionActivationTimeoutSeconds": 300

}```
You can then call the command again with the `--next-token` parameter as follows to see the next two builds.

```
aws gamelift list-builds
  --limit 2
  --next-token eyJhd3NBY2NvdW50SWQiOnsicI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmM5I
```

Repeat until the response doesn't include a `NextToken` value.

**Example2: To get a list of custom game builds in failure status**

The following `list-builds` example retrieves properties for all game server builds in the current region that currently have status `FAILED`.

```
aws gamelift list-builds
  --filter "status=FAILED"
```

---

### Actions and scenarios

The following `list-builds` example retrieves properties for all game server builds in the current region that currently have status `FAILED`.

```
aws gamelift list-builds
  --filter "status=FAILED"
```
--status FAILED

Output:

```json
{

  "Builds": [
    {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "CreationTime": 1495528748.555,
      "Name": "My_Game_Server_Build_Two",
      "OperatingSystem": "AMAZON_LINUX_2",
      "SizeOnDisk": 8567781,
      "Status": "FAILED",
      "Version": "23456.789"
    }
  ]
}
```

- For API details, see [ListBuilds](#) in *AWS CLI Command Reference*.

**list-fleets**

The following code example shows how to use `list-fleets`.

**AWS CLI**

**Example1: To get a list of all fleets in a Region**

The following `list-fleets` example displays the fleet IDs of all fleets in the current Region. This example uses pagination parameters to retrieve two fleet IDs at a time. The response includes a `next-token` attribute, which indicates that there are more results to retrieve.

```bash
aws gamelift list-fleets
  --limit 2
```

Output:

```json
{
  "FleetIds": [
```
You can pass the `NextToken` value from the previous response in the next command, as shown here to get the next two results.

```
aws gamelift list-fleets \
  --limit 2 \
  --next-token \
eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMYJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMYJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMYJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMYJ9}
```

**Example2: To get a list of all fleets in a Region with a specific build or script**

The following `list-builds` example retrieves the IDs of fleets that are deployed with the specified game build. If you're working with Realtime Servers, you can provide a script ID in place of a build ID. Because this example does not specify the limit parameter, the results can include up to 16 fleet IDs.

```
aws gamelift list-fleets \
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "FleetIds": [
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
    ]
}
```

- For API details, see [ListFleets](https://docs.aws.amazon.com/cli/latest/reference/gamelift/list-fleets.html) in *AWS CLI Command Reference*.

### request-upload-credentials

The following code example shows how to use `request-upload-credentials`.

```
AWS CLI

To refresh access credentials for uploading a build

The following create-build example obtains new, valid access credentials for uploading a GameLift build file to an Amazon S3 location. Credentials have a limited life span. You get the build ID from the response to the original CreateBuild request.

```
aws gamelift request-upload-credentials \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
   "StorageLocation": {
      "Bucket": "gamelift-builds-us-west-2",
      "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
   },
   "UploadCredentials": {
      "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
      "SecretAccessKey": "wJalrXUtNFEtM/K7MDEN9/bPXrIcyEXAMPLEKEY",
      "SessionToken": "AgoGb3Jp2ZluENZ...EXAMPLETOKEN=="
   }
}
```

For more information, see [Upload a Custom Server Build to GameLift](https://docs.aws.amazon.com/gamelift/latest/developerguide/uploadcustombuild.html) in the Amazon GameLift Developer Guide.

- For API details, see [RequestUploadCredentials](https://docs.aws.amazon.com/cli/latest/reference/gamelift/request-upload-credentials.html) in AWS CLI Command Reference.

start-fleet-actions

The following code example shows how to use start-fleet-actions.

**AWS CLI**

To restart fleet automatic scaling activity

The following start-fleet-actions example resumes the use of all scaling policies that are defined for the specified fleet but were stopped by calling ```stop-fleet-actions``` . After starting, the scaling policies immediately begin tracking their respective metrics.
aws gamelift start-fleet-actions \
   --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \ 
   --actions AUTO_SCALING

This command produces no output.

- For API details, see `StartFleetActions` in `AWS CLI Command Reference`.

**stop-fleet-actions**

The following code example shows how to use `stop-fleet-actions`.

**AWS CLI**

**To stop a fleet's automatic scaling activity**

The following `stop-fleet-actions` example stops the use of all scaling policies that are defined for the specified fleet. After the policies are suspended, fleet capacity remains at the same active instance count unless you adjust it manually.

aws gamelift start-fleet-actions \
   --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \ 
   --actions AUTO_SCALING

This command produces no output.

- For API details, see `StopFleetActions` in `AWS CLI Command Reference`.

**update-build**

The following code example shows how to use `update-build`.

**AWS CLI**

**To update a custom game build**

The following `update-build` example changes the name and version information that is associated with a specified build resource. The returned build object verifies that the changes were made successfully.

aws gamelift update-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA.east",
        "OperatingSystem": "AMAZON_LINUX_2",
        "SizeOnDisk": 1304924,
        "Status": "READY",
        "Version": "12345.east"
    }
}
```

For more information, see [Update Your Build Files](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [UpdateBuild](#) in *AWS CLI Command Reference*.

---

**update-game-session-queue**

The following code example shows how to use `update-game-session-queue`.

**AWS CLI**

**To update a game session queue configuration**

The following `update-game-session-queue` example adds a new destination and updates the player latency policies for an existing game session queue.

```
aws gamelift update-game-session-queue \
    --name MegaFrogRace-NA \
    --destinations file:///destinations.json \
    --player-latency-policies file:///latency-policies.json
```

**Contents of destinations.json:**

```
{
```
"Destinations": [
  {
    "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
      fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
  {
    "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
      fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
  {
    "DestinationArn": "arn:aws:gamelift:us-east-1::alias/
      alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"
  }
]

Contents of latency-policies.json:

```
{
    "PlayerLatencyPolicies": [
      {
        "MaximumIndividualPlayerLatencyMilliseconds": 200,
        "PolicyDurationSeconds": 120
      },
      {
        "MaximumIndividualPlayerLatencyMilliseconds": 150,
        "PolicyDurationSeconds": 120
      },
      {
        "MaximumIndividualPlayerLatencyMilliseconds": 100,
        "PolicyDurationSeconds": 120
      }
    ]
}
```

Output:

```
{
    "GameSessionQueue": {
      "Destinations": [
        {
          "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
            fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
        {
          "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
            fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
        {
          "DestinationArn": "arn:aws:gamelift:us-east-1::alias/
            alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"
        }
      ],
      "Name": "MegaFrogRace-NA",
      "TimeoutInSeconds": 600,
      "PlayerLatencyPolicies": [
        {
          "MaximumIndividualPlayerLatencyMilliseconds": 200,
          "PolicyDurationSeconds": 120
        },
        {
          "MaximumIndividualPlayerLatencyMilliseconds": 150,
          "PolicyDurationSeconds": 120
        },
        {
          "MaximumIndividualPlayerLatencyMilliseconds": 100,
          "PolicyDurationSeconds": 120
        }
      ]
    }
}
```
For more information, see Using Multi-Region Queues in the Amazon GameLift Developer Guide.

- For API details, see UpdateGameSessionQueue in AWS CLI Command Reference.

**upload-build**

The following code example shows how to use upload-build.

**AWS CLI**

**Example1: To upload a Linux game server build**

The following upload-build example uploads Linux game server build files from a file directory to the GameLift service and creates a build resource.

```bash
aws gamelift upload-build \
  --name MegaFrogRaceServer.NA \
  --build-version 2.0.1 \
  --build-root ~/MegaFrogRace_Server/release-na \
  --operating-system AMAZON_LINUX_2 \
  --server-sdk-version 4.0.2
```

Output:

```
Uploading ~/MegaFrogRace_Server/release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading ~/MegaFrogRace_Server/release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading ~/MegaFrogRace_Server/release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading ~/MegaFrogRace_Server/release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading ~/MegaFrogRace_Server/release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded ~/MegaFrogRace_Server/release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Example2: To upload a Windows game server build**

The following upload-build example uploads Windows game server build files from a directory to the GameLift service and creates a build record.
aws gamelift upload-build \
    --name MegaFrogRaceServer.NA \
    --build-version 2.0.1 \
    --build-root C:\MegaFrogRace_Server\release-na \
    --operating-system WINDOWS_2012 \
    --server-sdk-version 4.0.2

Output:

Uploading C:\MegaFrogRace_Server\release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading C:\MegaFrogRace_Server\release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading C:\MegaFrogRace_Server\release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading C:\MegaFrogRace_Server\release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading C:\MegaFrogRace_Server\release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded C:\MegaFrogRace_Server\release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

For more information, see Upload a Custom Server Build to GameLift in the Amazon GameLift Developer Guide.

- For API details, see UploadBuild in AWS CLI Command Reference.

**Global Accelerator examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Global Accelerator.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**
Actions

add-custom-routing-endpoints

The following code example shows how to use `add-custom-routing-endpoints`.

AWS CLI

To add a VPC subnet endpoint to an endpoint group for a custom routing accelerator

The following `add-custom-routing-endpoints` example adds a VPC subnet endpoint to an endpoint group for a custom routing accelerator.

```
aws globalaccelerator add-custom-routing-endpoints
   --endpoint-group-arn
   arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
   abcd-1234abcdefg/listener/0123vxyz/endpoint-group/4321abcd
   --endpoint-configurations "EndpointId=subnet-1234567890abcdef0"
```

Output:

```
{
   "EndpointDescriptions": [
      {
         "EndpointId": "subnet-1234567890abcdef0"
      }
   ],
   "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
   abcd-1234-abcd-1234abcdefg/listener/0123vxyz/endpoint-group/4321abcd"
}
```

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see AddCustomRoutingEndpoints in AWS CLI Command Reference.

advertise-byoip-cidr

The following code example shows how to use `advertise-byoip-cidr`.
AWS CLI

To advertise an address range

The following `advertise-byoip-cidr` example requests AWS to advertise an address range that you've provisioned for use with your AWS resources.

```bash
aws globalaccelerator advertise-byoip-cidr \
   --cidr 198.51.100.0/24
```

Output:

```
{
   "ByoipCidr": {
      "Cidr": "198.51.100.0/24",
      "State": "PENDING_ADVERTISING"
   }
}
```

For more information, see [Bring Your Own IP Address in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/bring-your-own-ip-address.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [AdvertiseByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/advertise-byoip-cidr.html) in *AWS CLI Command Reference*.

allow-custom-routing-traffic

The following code example shows how to use `allow-custom-routing-traffic`.

AWS CLI

To allow traffic to specific Amazon EC2 instance destinations in a VPC subnet for a custom routing accelerator

The following `allow-custom-routing-traffic` example specifies that traffic is allowed to certain Amazon EC2 instance (destination) IP addresses and ports for a VPC subnet endpoint in a custom routing accelerator can receive traffic.

```bash
aws globalaccelerator allow-custom-routing-traffic \
   --endpoint-group-arn
   arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example \
   --endpoint-id subnet-abcd123example \
```

Actions and scenarios

3087
This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see AllowCustomRoutingTraffic in AWS CLI Command Reference.

create-accelerator

The following code example shows how to use create-accelerator.

AWS CLI

To create an accelerator

The following create-accelerator example creates an accelerator with two tags with two BYOIP static IP addresses. You must specify the US-West-2 (Oregon) Region to create or update an accelerator.

```
aws globalaccelerator create-accelerator \
  --name ExampleAccelerator \ 
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \ 
  --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            { "IpAddresses": [ "192.0.2.250",
```
The following code example shows how to use `create-custom-routing-accelerator`.

**AWS CLI**

To create a custom routing accelerator

The following `create-custom-routing-accelerator` example creates a custom routing accelerator with the tags Name and Project.

```bash
aws globalaccelerator create-custom-routing-accelerator \
   --name ExampleCustomRoutingAccelerator \
   --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
   --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```json
{
   "Accelerator": {
      "AcceleratorArn":
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
      "IpAddressType": "IPV4",
      "Name": "ExampleCustomRoutingAccelerator",
      "Enabled": true,
      "IpAddresses": [
         "192.0.2.250",
         "198.51.100.52"
      ],
      "IpFamily": "IPv4"
   },
   "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
   "CreatedTime": 1542394847.0,
   "LastModifiedTime": 1542394847.0
}
```
The following code example shows how to use `create-custom-routing-endpoint-group`.

**AWS CLI**

To create an endpoint group for a custom routing accelerator

The following `create-custom-routing-endpoint-group` example creates an endpoint group for a custom routing accelerator.

```bash
aws globalaccelerator create-custom-routing-endpoint-group \
--listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
--endpoint-group-region us-east-2 \
--destination-configurations "FromPort=80,ToPort=81,Protocols=TCP,UDP"
```

Output:

```json
{
    "EndpointGroup": {
```
"EndpointGroupArn":
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd",
"EndpointGroupRegion": "us-east-2",
"DestinationDescriptions": [
{
    "FromPort": 80,
    "ToPort": 81,
    "Protocols": [
        "TCP",
        "UDP"
    ]
},
"EndpointDescriptions": []
]
}

For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/endpoint-groups.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/global-accelerator/latest/dg/).

### create-custom-routing-listener

The following code example shows how to use `create-custom-routing-listener`.

#### AWS CLI

**To create a listener for a custom routing accelerator**

The following `create-custom-routing-listener` example creates a listener with a port range from 5000 to 10000 for a custom routing accelerator.

```bash
aws globalaccelerator create-custom-routing-listener \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --port-ranges FromPort=5000,ToPort=10000
```

**Output:**

```json
{
    "Listener": {
```
For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see CreateCustomRoutingListener in AWS CLI Command Reference.

**create-endpoint-group**

The following code example shows how to use create-endpoint-group.

**AWS CLI**

To create an endpoint group

The following create-endpoint-group example creates an endpoint group with one endpoint.

```
aws globalaccelerator create-endpoint-group \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
  --endpoint-group-region us-east-1 \
  --endpoint-configurations EndpointId=i-1234567890abcdef0,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "i-1234567890abcdef0"
            }
        ]
    }
}
```
For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/endpoint-groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/create-endpoint-group.html) in *AWS CLI Command Reference*.

### create-listener

The following code example shows how to use `create-listener`.

**AWS CLI**

**To create a listener**

The following `create-listener` example creates a listener with two ports.

```bash
aws globalaccelerator create-listener
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
  --port-ranges FromPort=80,ToPort=80 FromPort=81,ToPort=81
  --protocol TCP
```

**Output:**

```
{
  "Listener": {
    "PortRanges": [
      {
        "ToPort": 80,
        "FromPort": 80
      },
      {
        "ToPort": 81,
        "FromPort": 81
      }
    ],
    "ClientAffinity": "NONE",
```
deny-custom-routing-traffic

The following code example shows how to use deny-custom-routing-traffic.

AWS CLI

To specify a destination address that cannot receive traffic in a custom routing accelerator

The following deny-custom-routing-traffic example specifies destination address or addresses in a subnet endpoint that cannot receive traffic for a custom routing accelerator. To specify more than one destination address, separate the addresses with a space. There's no response for a successful deny-custom-routing-traffic call.

```
aws globalaccelerator deny-custom-routing-traffic \
  --endpoint-group-arn
  "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example" \
  --endpoint-id "subnet-abcd123example" \
  --destination-addresses "198.51.100.52"
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

• For API details, see DenyCustomRoutingTraffic in AWS CLI Command Reference.

deprovision-byoip-cidr

The following code example shows how to use deprovision-byoip-cidr.
AWS CLI

To deprovision an address range

The following deprovision-byoip-cidr example releases the specified address range that you provisioned to use with your AWS resources.

```bash
aws globalaccelerator deprovision-byoip-cidr \
  --cidr "198.51.100.0/24"
```

Output:

```json
{
  "ByoipCidr": {
    "Cidr": "198.51.100.0/24",
    "State": "PENDING_DEPROVISIONING"
  }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DeprovisionByoipCidr in AWS CLI Command Reference.

describe-accelerator

The following code example shows how to use describe-accelerator.

AWS CLI

To describe an accelerator

The following describe-accelerator example retrieves the details about the specified accelerator.

```bash
aws globalaccelerator describe-accelerator \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{

}
```
"Accelerator": {
   "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
   "IpAddressType": "IPV4",
   "Name": "ExampleAccelerator",
   "Enabled": true,
   "Status": "IN_PROGRESS",
   "IpSets": [
      {
         "IpAddresses": [
            "192.0.2.250",
            "198.51.100.52"
         ],
         "IpFamily": "IPv4"
      }
   ],
   "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
   "CreatedTime": 1542394847,
   "LastModifiedTime": 1542395013
}

For more information, see [Accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/globalaccelerator/latest/dg).

- For API details, see [DescribeAccelerator](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-accelerator-attributes) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/).

**describe-accelerator-attributes**

The following code example shows how to use `describe-accelerator-attributes`.

**AWS CLI**

To describe an accelerator's attributes

The following `describe-accelerator-attributes` example retrieves the attribute details for an accelerator.

```bash
aws globalaccelerator describe-accelerator-attributes \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```
AcceleratorAttributes: {
"FlowLogsEnabled": true
"FlowLogsS3Bucket": flowlogs-abc
"FlowLogsS3Prefix": bucketprefix-abc
}

For more information, see [Accelerators in AWS Global Accelerator](http://aws.amazon.com/global-accelerator) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeAcceleratorAttributes](http://aws.amazon.com/cli) in *AWS CLI Command Reference*.

describe-custom-routing-accelerator

The following code example shows how to use describe-custom-routing-accelerator.

**AWS CLI**

To describe a custom routing accelerator

The following describe-custom-routing-accelerator example retrieves the details about the specified custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
   "Accelerator": {
       "AcceleratorArn":
       "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
       "IpAddressType": "IPV4",
       "Name": "ExampleCustomRoutingAccelerator",
       "Enabled": true,
       "Status": "IN_PROGRESS",
       "IpSets": [
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeCustomRoutingAccelerator in AWS CLI Command Reference.

describe-custom-routing-accelerator-attributes

The following code example shows how to use describe-custom-routing-accelerator-attributes.

AWS CLI

To describe a custom routing accelerator's attributes

The following describe-custom-routing-accelerator-attributes example describes the attributes for a custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-accelerator-attributes \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "AcceleratorAttributes": {
      "FlowLogsEnabled": false
   }
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeCustomRoutingAcceleratorAttributes in AWS CLI Command Reference.

**describe-custom-routing-endpoint-group**

The following code example shows how to use describe-custom-routing-endpoint-group.

**AWS CLI**

**To describe an endpoint group for a custom routing accelerator**

The following describe-custom-routing-endpoint-group example describes an endpoint group for a custom routing accelerator.

```bash
aws globalaccelerator describe-custom-routing-endpoint-group
  --endpoint-group-arn
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example
```

**Output:**

```json
{
  "EndpointGroup": {
    "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example",
    "EndpointGroupRegion": "us-east-2",
    "DestinationDescriptions": [
      {
        "FromPort": 5000,
        "ToPort": 10000,
        "Protocols": [
          "UDP"
        ]
      }
    ],
    "EndpointDescriptions": [
      {
        "EndpointId": "subnet-1234567890abcdef0"
      }
    ]
  }
}
```
For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/efs/latest/efs-concepts/efs-efs.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeCustomRoutingEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-custom-routing-endpoint-group.html) in *AWS CLI Command Reference*.

**describe-custom-routing-listener**

The following code example shows how to use `describe-custom-routing-listener`.

**AWS CLI**

**To describe a listener for a custom routing accelerator**

The following `describe-custom-routing-listener` example describes a listener for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-listener \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```json
{
  "Listener": {
    "PortRanges": [
      "FromPort": 5000,
      "ToPort": 10000
    ],
    "ListenerArn":
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234"
  }
}
```

For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/efs/latest/efs-concepts/efs-efs.html) in the *AWS Global Accelerator Developer Guide*. 
• For API details, see `DescribeCustomRoutingListener` in *AWS CLI Command Reference*.

**describe-endpoint-group**

The following code example shows how to use `describe-endpoint-group`.

**AWS CLI**

**To describe an endpoint group**

The following `describe-endpoint-group` example retrieves details about an endpoint group with the following endpoints: an Amazon EC2 instance, an ALB, and an NLB.

```
aws globalaccelerator describe-endpoint-group
  --endpoint-group-arn
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/ab88888example
```

**Output:**

```
{
  "EndpointGroup": {
    "TrafficDialPercentage": 100.0,
    "EndpointDescriptions": [
      {
        "Weight": 128,
        "EndpointId": "i-1234567890abcdef0"
      },
      {
        "Weight": 128,
        "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:0001234567890:loadbalancer/app/ALBTesting/alb01234567890xyz"
      },
      {
        "Weight": 128,
        "EndpointId": "arn:aws:elasticloadbalancing:us-east-1:0001234567890:loadbalancer/net/NLBTesting/alb01234567890qrs"
      }
    ],
    "EndpointGroupArn":
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-"
  }
}
For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/endpoint-groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeEndpointGroup](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/describe-endpoint-group.html) in *AWS CLI Command Reference*.

### describe-listener

The following code example shows how to use `describe-listener`.

**AWS CLI**

To describe a listener

The following `describe-listener` example describes a listener.

```bash
aws globalaccelerator describe-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```json
{
    "Listener": {
        "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
        "PortRanges": [
            {
                "FromPort": 80,
                "ToPort": 80
            }
        ],
        "Protocol": "TCP",
        "ClientAffinity": "NONE"
    }
}
```
For more information, see Listeners in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see DescribeListener in AWS CLI Command Reference.

list-accelerators

The following code example shows how to use list-accelerators.

AWS CLI

To list your accelerators

The following list-accelerators example lists the accelerators in your AWS account. This account has two accelerators.

aws globalaccelerator list-accelerators

Output:

```json
{
   "Accelerators": [
       {
           "AcceleratorArn": 
               "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-abcd-5555EXAMPLE1",
           "Name": "TestAccelerator",
           "IpAddressType": "IPV4",
           "Enabled": true,
           "IpSets": [
               {
                   "IpFamily": "IPv4",
                   "IpAddresses": [
                       "192.0.2.250",
                       "198.51.100.52"
                   ]
               }
           ],
            "DnsName": "5a5a5a5aaa5a5a5a5a5a5a5a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1552424416.0,
            "LastModifiedTime": 1569375641.0
       }
   ]
}```
For more information, see **Accelerators in AWS Global Accelerator** in the *AWS Global Accelerator Developer Guide*.

- For API details, see **ListAccelerators** in *AWS CLI Command Reference*.

### list-byoip-cidr

The following code example shows how to use list-byoip-cidr.

**AWS CLI**

**To list your address ranges**

The following `list-byoip-cidr` example list the bring your own IP address (BYOIP) address ranges that you've provisioned for use with Global Accelerator.

```bash
aws globalaccelerator list-byoip-cidrs
```
Output:

```json
{
    "ByoipCidrs": [
    {
        "Cidr": "198.51.100.0/24",
        "State": "READY"
    },
    {
        "Cidr": "203.0.113.25/24",
        "State": "READY"
    }
    ]
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/bring-your-own-ip.html) in the AWS Global Accelerator Developer Guide.

- For API details, see [ListByoipCidr](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-byoip-cidr.html) in AWS CLI Command Reference.

**list-custom-routing-accelerators**

The following code example shows how to use `list-custom-routing-accelerators`.

**AWS CLI**

**To list your custom routing accelerators**

The following `list-custom-routing-accelerators` example lists the custom routing accelerators in an AWS account.

```
aws globalaccelerator list-custom-routing-accelerators
```

Output:

```json
{
    "Accelerators": [
    {
        "AcceleratorArn":
        "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-EXAMPLE1",
        "Name": "TestCustomRoutingAccelerator",
    }
    ]
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ListCustomRoutingAccelerators in AWS CLI Command Reference.
list-custom-routing-endpoint-groups

The following code example shows how to use list-custom-routing-endpoint-groups.

AWS CLI

To list endpoint groups for a listener in a custom routing accelerator

The following list-custom-routing-endpoint-groups example lists the endpoint groups for a listener in a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-endpoint-groups \\
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```json
{
  "EndpointGroups": [
    {
      "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
      "EndpointGroupRegion": "eu-central-1",
      "DestinationDescriptions": [
        {
          "FromPort": 80,
          "ToPort": 80,
          "Protocols": [
            "TCP",
            "UDP"
          ]
        }
      ],
      "EndpointDescriptions": [
        {
          "EndpointId": "subnet-abcd123example"
        }
      ]
    }
  ]
}
```
For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/custom-routing-endpoint-groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListCustomRoutingEndpointGroups](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-custom-routing-endpoint-groups.html) in *AWS CLI Command Reference*.

### list-custom-routing-listeners

The following code example shows how to use `list-custom-routing-listeners`.

#### AWS CLI

**To list listeners for custom routing accelerators**

The following `list-custom-routing-listeners` example lists the listeners for a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-listeners \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

**Output:**

```json
{
    "Listeners": [
        {
            "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 5000,
                    "ToPort": 10000
                }
            ],
            "Protocol": "TCP"
        }
    ]
}
```

For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/listeners-custom-routing.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListCustomRoutingListeners](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-custom-routing-listeners.html) in *AWS CLI Command Reference*.
list-custom-routing-port-mappings

The following code example shows how to use list-custom-routing-port-mappings.

**AWS CLI**

**To list the port mappings in a custom routing accelerator**

The following `list-custom-routing-port-mappings` example provides a partial list of the port mappings in a custom routing accelerator.

```bash
aws globalaccelerator list-custom-routing-port-mappings \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "PortMappings": [
      {
         "AcceleratorPort": 40480,
         "EndpointGroupArn":
         "EndpointId": "subnet-1234567890abcdef0",
         "DestinationSocketAddress": {
            "IpAddress": "192.0.2.250",
            "Port": 80
         },
         "Protocols": [
            "TCP",
            "UDP"
         ],
         "DestinationTrafficState": "ALLOW"
      },
      {
         "AcceleratorPort": 40481,
         "EndpointGroupArn":
         "EndpointId": "subnet-1234567890abcdef0",
         "DestinationSocketAddress": {
            "IpAddress": "192.0.2.251",
            "Port": 80
         },
         "Protocols": [
            "TCP",
            "UDP"
         ],
         "DestinationTrafficState": "ALLOW"
      }
   ]
}
```
For more information, see [How custom routing accelerators work in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/custom-routing-accelerators.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glu/latest/userguide/).  

### list-custom-routing-port-mappings-by-destination

The following code example shows how to use `list-custom-routing-port-mappings-by-destination`.

**AWS CLI**

**To list the port mappings for a specific custom routing accelerator destination**

The following `list-custom-routing-port-mappings-by-destination` example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings-by-destination \
  --endpoint-id subnet-abcd123example \
  --destination-address 198.51.100.52
```

Output:

```
{
  "DestinationPortMappings": [
    {
      "AcceleratorArn":
      "arn:aws:globalaccelerator::402092451327:accelerator/24ea29b8-d750-4489-8919-3095f3c4b0a7",
```

For more information, see [How custom routing accelerators work in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/custom-routing-accelerators.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glu/latest/userguide/).  

### list-custom-routing-port-mappings-by-destination

The following code example shows how to use `list-custom-routing-port-mappings-by-destination`.

**AWS CLI**

**To list the port mappings for a specific custom routing accelerator destination**

The following `list-custom-routing-port-mappings-by-destination` example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings-by-destination \
  --endpoint-id subnet-abcd123example \
  --destination-address 198.51.100.52
```

Output:

```
{
  "DestinationPortMappings": [
    {
      "AcceleratorArn":
      "arn:aws:globalaccelerator::402092451327:accelerator/24ea29b8-d750-4489-8919-3095f3c4b0a7",
```

"AcceleratorSocketAddresses": [  
  {  
    "IpAddress": "192.0.2.250",  
    "Port": 65514  
  },  
  {  
    "IpAddress": "192.10.100.99",  
    "Port": 65514  
  }  
],  
"EndpointGroupArn":  
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example",  
"EndpointId": "subnet-abcd123example",  
"EndpointGroupRegion": "us-west-2",  
"DestinationSocketAddress": {  
  "IpAddress": "198.51.100.52",  
  "Port": 80  
},  
"IpAddressType": "IPv4",  
"DestinationTrafficState": "ALLOW"
]

For more information, see [How custom routing accelerators work in AWS Global Accelerator](https://aws.amazon.com/global-accelerator/) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/global-accelerator/latest/userguide/).  

**list-endpoint-groups**

The following code example shows how to use `list-endpoint-groups`.

**AWS CLI**

To list endpoint groups

The following `list-endpoint-groups` example lists the endpoint groups for a listener. This listener has two endpoint groups.

```bash
aws globalaccelerator --region us-west-2 list-endpoint-groups 
```
```
--listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234

Output:

```json
{
    "EndpointGroups": [
        {
            "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
            "EndpointGroupRegion": "eu-central-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 100.0,
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        },
        {
            "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab99999example",
            "EndpointGroupRegion": "us-east-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 50.0,
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        }
    ]
}
```

For more information, see [Endpoint Groups in AWS Global Accelerator](https://docs.aws.amazon.com/globalsignaling/latest/userguide/endpoint-groups.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListEndpointGroups](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/list-endpoint-groups.html) in *AWS CLI Command Reference*.

**list.listeners**

The following code example shows how to use `list-listeners`.

---

**Actions and scenarios**

3112
AWS CLI

To list listeners

The following list-listeners example lists the listeners for an accelerator.

```bash
aws globalaccelerator list-listeners \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```json
{
   "Listeners": [
       {
           "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
           "PortRanges": [
               {
                   "FromPort": 80,
                   "ToPort": 80
               }
           ],
           "Protocol": "TCP",
           "ClientAffinity": "NONE"
       }
   ]
}
```

For more information, see [Listeners in AWS Global Accelerator](https://docs.aws.amazon.com/glu/latest/userguide/listeners.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/glu/latest/userguide/).

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for an accelerator
The following `list-tags-for-resource` example lists the tags for a specific accelerator.

```bash
aws globalaccelerator list-tags-for-resource \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Tags": [
        {
            "Key": "Project",
            "Value": "A123456"
        }
    ]
}
```

For more information, see [Tagging in AWS Global Accelerator](http://aws.amazon.com) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListTagsForResource](http://aws.amazon.com) in *AWS CLI Command Reference*.

**provision-byoip-cidr**

The following code example shows how to use `provision-byoip-cidr`.

**AWS CLI**

**To provision an address range**

The following `provision-byoip-cidr` example provisions the specified address range to use with your AWS resources.

```bash
aws globalaccelerator provision-byoip-cidr \
    --cidr 192.0.2.250/24 \
    --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
```

Actions and scenarios
"ByoipCidr": {
    "Cidr": "192.0.2.250/24",
    "State": "PENDING_PROVISIONING"
}
}

For more information, see Bring your own IP address in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see ProvisionByoipCidr in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag an accelerator

The following tag-resource example adds tags Name and Project to an accelerator, along with corresponding values for each.

```
aws globalaccelerator tag-resource \
   --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
   --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from an accelerator
The following `untag-resource` example removes the tags Name and Project from an accelerator.

```bash
aws globalaccelerator untag-resource \\
   --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh \\
   --tag-keys Key="Name" Key="Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.
- For API details, see `UntagResource` in AWS CLI Command Reference.

**update-accelerator**

The following code example shows how to use `update-accelerator`.

AWS CLI

**To update an accelerator**

The following `update-accelerator` example modifies an accelerator to change the accelerator name to `ExampleAcceleratorNew`. You must specify the US-West-2 (Oregon) Region to create or update accelerators.

```bash
aws globalaccelerator update-accelerator \\
   --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh \\
   --name ExampleAcceleratorNew
```

Output:

```json
{
   "Accelerator": {
      "IpAddressType": "IPV4",
      "Name": "ExampleAcceleratorNew",
```
For more information, see Accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateAccelerator in AWS CLI Command Reference.

update-accelerator-attributes

The following code example shows how to use update-accelerator-attributes.

AWS CLI

To update an accelerator's attributes

The following update-accelerator-attributes example updates an accelerator to enable flow logs. You must specify the US-West-2 (Oregon) Region to create or update accelerator attributes.

```
aws globalaccelerator update-accelerator-attributes \\
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcddefgh \\
  --flow-logs-enabled \\
  --flow-logs-s3-bucket flowlogs-abc \\
  --flow-logs-s3-prefix bucketprefix-abc
```

Output:
For more information, see [Accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/what-is-accelerator.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateAcceleratorAttributes](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/update-accelerator-attributes.html) in *AWS CLI Command Reference*.

### update-custom-routing-accelerator

The following code example shows how to use `update-custom-routing-accelerator`.

**AWS CLI**

**To update a custom routing accelerator**

The following `update-custom-routing-accelerator` example modifies a custom routing accelerator to change the accelerator name.

```bash
aws globalaccelerator --region us-west-2 update-custom-routing-accelerator 
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh 
    --name ExampleCustomRoutingAcceleratorNew
```

**Output:**

```json
{
    "Accelerator": {
        "AcceleratorArn":
        "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAcceleratorNew",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [ ]
    }
}
```
For more information, see [Custom routing accelerators in AWS Global Accelerator](https://docs.aws.amazon.com/globalaccelerator/latest/dg/accelerator-overview.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/globalaccelerator/latest/dg/accelerator-overview.html).

### update-custom-routing-accelerator-attributes

The following code example shows how to use `update-custom-routing-accelerator-attributes`.

**AWS CLI**

#### To update a custom routing accelerator's attributes

The following `update-custom-routing-accelerator-attributes` example updates a custom routing accelerator to enable flow logs.

```bash
code example
aws globalaccelerator update-custom-routing-accelerator-attributes \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
  --flow-logs-enabled \
  --flow-logs-s3-bucket flowlogs-abc \
  --flow-logs-s3-prefix bucketprefix-abc
```

**Output:**

```json
{
  "AcceleratorAttributes": {
    "IpAddresses": [
      "192.0.2.250",
      "198.51.100.52"
    ],
    "IpFamily": "IPv4"
  },
  "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
  "CreatedTime": 1232394847,
  "LastModifiedTime": 1232395654
}
```
For more information, see Custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateCustomRoutingAcceleratorAttributes in AWS CLI Command Reference.

**update-custom-routing-listener**

The following code example shows how to use update-custom-routing-listener.

**AWS CLI**

To update a listener for a custom routing accelerator

The following update-custom-routing-listener example updates a listener to change the port range.

```bash
aws globalaccelerator update-custom-routing-listener \
   --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
   --port-ranges FromPort=10000,ToPort=20000
```

**Output:**

```json
{
   "Listener": {
      "ListenerArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz",
      "PortRanges": [
         {
            "FromPort": 10000,
            "ToPort": 20000
         }
      ],
      "Protocol": "TCP"
   }
}
```
For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see UpdateCustomRoutingListener in AWS CLI Command Reference.

update-endpoint-group

The following code example shows how to use update-endpoint-group.

AWS CLI

To update an endpoint group

The following update-endpoint-group example adds three endpoints to an endpoint group: an Elastic IP address, an ALB, and an NLB.

```bash
aws globalaccelerator update-endpoint-group
    --endpoint-group-arn
    arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/ab88888example
    --endpoint-configurations
        EndpointId=eipalloc-eip01234567890abc,Weight=128
        EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz,Weight=128
        EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs,Weight=128
```

Output:

```json
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "eip01234567890abc"
            }
        ]
    }
}
```
For more information, see [Endpoint groups in AWS Global Accelerator](https://docs.aws.amazon.com/globalsignature/latest/userguide/endpoint-groups.html) in the [AWS Global Accelerator Developer Guide](https://docs.aws.amazon.com/globalsignature/latest/userguide/).

"ListenerArn":
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz
"PortRanges": [
{
"FromPort": 100,
"ToPort": 100
}
],
"Protocol": "TCP",
"ClientAffinity": "NONE"
}

For more information, see [Listeners in AWS Global Accelerator](https://docs.aws.amazon.com/global-accelerator/latest/dg/listeners.html) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateListener](https://docs.aws.amazon.com/cli/latest/reference/globalaccelerator/update-listener.html) in *AWS CLI Command Reference*.

**withdraw-byoip-cidr**

The following code example shows how to use `withdraw-byoip-cidr`.

**AWS CLI**

**To withdraw an address range**

The following `withdraw-byoip-cidr` example withdraws an address range from AWS Global Accelerator that you previously advertised for use with your AWS resources.

```
aws globalaccelerator withdraw-byoip-cidr \
  --cidr 192.0.2.250/24
```

**Output:**

```
{
  "ByoipCidr": {
    "Cidr": "192.0.2.250/24",
    "State": "PENDING_WITHDRAWING"
  }
}
```
For more information, see Bring your own IP address in AWS Global Accelerator in the AWS Global Accelerator Developer Guide.

- For API details, see WithdrawByoipCidr in AWS CLI Command Reference.

AWS Glue examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Glue.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
- Actions

Actions

Create a job definition

The following code example shows how to create an AWS Glue job definition.

AWS CLI

To create a job to transform data

The following create-job example creates a streaming job that runs a script stored in S3.

```bash
aws glue create-job \
  --name my-testing-job \
  --role AWSSGlueServiceRoleDefault \
  --command '{ \
    "Name": "gluestreaming", \
    "ScriptLocation": "s3://DOC-EXAMPLE-BUCKET/folder/" \
  }
```
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import org.apache.spark.SparkContext
import scala.collection.JavaConverters._

object GlueApp {
  def main(sysArgs: Array[String]) {
    val spark: SparkContext = new SparkContext()
    val glueContext: GlueContext = new GlueContext(spark)
    // @params: [JOB_NAME]
    val args = GlueArgParser.getResolvedOptions(sysArgs,
      Seq("JOB_NAME").toArray)
    Job.init(args("JOB_NAME"), glueContext, args.asJava)
    // @type: DataSource
    // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx = "datasource0"]
    // @return: datasource0
    // @inputs: []
    val datasource0 = glueContext.getCatalogSource(database = "tempdb",
      tableName = "s3-source", redshiftTmpDir = ", transformationContext = "datasource0").getDynamicFrame()
    // @type: ApplyMapping
    // @args: [mapping = [("sensorid", "int", "sensorid", "int"),
      ("currenttemperature", "int", "currenttemperature", "int"),
      ("status", "string", "status", "string")], transformation_ctx = "applymapping1"]
// @return: applymapping1
// @inputs: [frame = datasource0]
val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid", "int", "sensorid", "int"), ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string", "status", "string")), caseSensitive = false, transformationContext = "applymapping1")
// @type: SelectFields
// @args: [paths = ["sensorid", "currenttemperature", "status"], transformation_ctx = "selectfields2"]
val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid", "currenttemperature", "status"), transformationContext = "selectfields2")
// @return: selectfields2
// @inputs: [frame = applymapping1]
val resolvechoice3 = selectfields2.resolveChoice(choiceOption = Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName = Some("my-s3-sink"), transformationContext = "resolvechoice3")
// @type: DataSink
// @args: [database = "tempdb", table_name = "my-s3-sink", transformation_ctx = "datasink4"]
val datasink4 = glueContext.getCatalogSink(database = "tempdb", tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext = "datasink4").writeDynamicFrame(resolvechoice3)
Job.commit()

Output:

{
  "Name": "my-testing-job"
}

For more information, see Authoring Jobs in AWS Glue in the AWS Glue Developer Guide.

- For API details, see CreateJob in AWS CLI Command Reference.
Delete a job definition

The following code example shows how to delete an AWS Glue job definition and all associated runs.

AWS CLI

To delete a job

The following delete-job example deletes a job that is no longer needed.

```bash
aws glue delete-job
  --job-name my-testing-job
```

Output:

```json
{
    "JobName": "my-testing-job"
}
```

For more information, see [Working with Jobs on the AWS Glue Console](https://docs.aws.amazon.com/glue/latest/dg/working-jobs-console.html) in the *AWS Glue Developer Guide*.

- For API details, see [DeleteJob](https://docs.aws.amazon.com/cli/latest/reference/glue/delete-job.html) in *AWS CLI Command Reference*.

Get a job run

The following code example shows how to get an AWS Glue job run.

AWS CLI

To get information about a job run

The following get-job-run example retrieves information about a job run.

```bash
aws glue get-job-run
  --job-name "Combine legistators data"
  --run-id jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e
```

Output:
For more information, see [Job Runs](#) in the [AWS Glue Developer Guide](#).

- For API details, see [GetJobRun](#) in [AWS CLI Command Reference](#).

### Get databases from the Data Catalog

The following code example shows how to get a list of databases from the AWS Glue Data Catalog.

**AWS CLI**

To list the definitions of some or all of the databases in the AWS Glue Data Catalog

The following `get-databases` example returns information about the databases in the Data Catalog.
aws glue get-databases

Output:

```json
{
  "DatabaseList": [
    {
      "Name": "default",
      "Description": "Default Hive database",
      "LocationUri": "file:/spark-warehouse",
      "CreateTime": 1602084052.0,
      "CreateTableDefaultPermissions": [
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    },
    {
      "Name": "flights-db",
      "CreateTime": 1587072847.0,
      "CreateTableDefaultPermissions": [
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    },
    {
      "Name": "legislators",
      "CreateTime": 1601415625.0,
      "CreateTableDefaultPermissions": [
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    }
  ]
}
```
For more information, see [Defining a Database in Your Data Catalog](#) in the [AWS Glue Developer Guide](#).

- For API details, see [GetDatabases](#) in [AWS CLI Command Reference](#).

### Get job from the Data Catalog

The following code example shows how to get a job from the AWS Glue Data Catalog.

**AWS CLI**

**To retrieve information about a job**

The following `get-job` example retrieves information about a job.
aws glue get-job \
   --job-name my-testing-job

Output:

```
{
   "Job": {
      "Name": "my-testing-job",
      "Role": "Glue_DefaultRole",
      "CreatedOn": 1602805698.167,
      "LastModifiedOn": 1602805698.167,
      "ExecutionProperty": {
         "MaxConcurrentRuns": 1
      },
      "Command": {
         "Name": "gluestreaming",
         "ScriptLocation": "s3://janetst-bucket-01/Scripts/test_script.scala",
         "PythonVersion": "2"
      },
      "DefaultArguments": {
         "--class": "GlueApp",
         "--job-language": "scala"
      },
      "MaxRetries": 0,
      "AllocatedCapacity": 10,
      "MaxCapacity": 10.0,
      "GlueVersion": "1.0"
   }
}
```

For more information, see [Jobs](https://docs.aws.amazon.com/glue/latest/dg/jobs.html) in the *AWS Glue Developer Guide*.

- For API details, see [GetJob](https://docs.aws.amazon.com/cli/latest/reference/glue/get-job.html) in *AWS CLI Command Reference*.

### Get runs of a job

The following code example shows how to get runs of an AWS Glue job.

#### AWS CLI

**To get information about all job runs for a job**

The following `get-job-runs` example retrieves information about job runs for a job.
aws glue get-job-runs \
   --job-name "my-testing-job"

Output:

{
   "JobRuns": [
   {
      "Id": "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",

**Get tables from a database**

The following code example shows how to get tables from a database in the AWS Glue Data Catalog.

**AWS CLI**

To list the definitions of some or all of the tables in the specified database

The following `get-tables` example returns information about the tables in the specified database.

```
aws glue get-tables --database-name 'tempdb'
```

Output:

```
{
   "TableList": [ 
   {
      "Name": "my-s3-sink",
      "DatabaseName": "tempdb",
      "CreateTime": 1602730539.0,

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

- For API details, see GetTables in AWS CLI Command Reference.

Start a crawler

The following code example shows how to start an AWS Glue crawler.

AWS CLI

To start a crawler

The following start-crawler example starts a crawler.

```
aws glue start-crawler --name my-crawler
```

Output:

None

For more information, see Defining Crawlers in the AWS Glue Developer Guide.

- For API details, see StartCrawler in AWS CLI Command Reference.

Start a job run

The following code example shows how to start an AWS Glue job run.
AWS CLI

To start running a job

The following `start-job-run` example starts a job.

```bash
aws glue start-job-run \
   --job-name my-job
```

Output:

```json
{
   "JobRunId": "jr_22208b1f44eb5376a60569d4b21dd20fcb8621e1a366b4e7b2494af764b82ded"
}
```

For more information, see [Authoring Jobs](https://docs.aws.amazon.com/glue/latest/dg/) in the *AWS Glue Developer Guide*.

- For API details, see [StartJobRun](https://docs.aws.amazon.com/cli/latest/reference/glue/start-job-run.html) in *AWS CLI Command Reference*.

batch-stop-job-run

The following code example shows how to use `batch-stop-job-run`.

AWS CLI

To stop job runs

The following `batch-stop-job-run` example stops a job runs.

```bash
aws glue batch-stop-job-run \
   --job-name "my-testing-job" \n   --job-run-id jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f
```

Output:

```json
{
   "SuccessfulSubmissions": [
      {
         "JobName": "my-testing-job",
```
For more information, see [Job Runs](https://docs.aws.amazon.com/glue/latest/dg/) in the *AWS Glue Developer Guide*.

- For API details, see [BatchStopJobRun](https://docs.aws.amazon.com/cli/latest/reference/glue/batchstopjobrun.html) in *AWS CLI Command Reference*.

### create-connection

The following code example shows how to use `create-connection`.

#### AWS CLI

**To create a connection for AWS Glue data stores**

The following `create-connection` example creates a connection in the AWS Glue Data Catalog that provides connection information for a Kafka data store.

```bash
aws glue create-connection \
  --connection-input '{\n    "Name":"conn-kafka-custom", \n    "Description":"kafka connection with ssl to custom kafka", \n    "ConnectionType":"KAFKA", \n    "ConnectionProperties":{ \n      "KAFKA_BOOTSTRAP_SERVERS":"<Kafka-broker-server-url>:<SSL-Port>", \n      "KAFKA_SSL_ENABLED":"true", \n      "KAFKA_CUSTOM_CERT": "s3://bucket/prefix/cert-file.pem" \n    \n```
This command produces no output.

For more information, see Defining Connections in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

- For API details, see CreateConnection in AWS CLI Command Reference.

create-database

The following code example shows how to use create-database.

AWS CLI

To create a database

The following create-database example creates a database in the AWS Glue Data Catalog.

```
aws glue create-database \
   --database-input "{"Name":"tempdb"}" \
   --profile my_profile \
   --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining a Database in Your Data Catalog in the AWS Glue Developer Guide.

- For API details, see CreateDatabase in AWS CLI Command Reference.

create-table

The following code example shows how to use create-table.
Example 1: To create a table for a Kinesis data stream

The following create-table example creates a table in the AWS Glue Data Catalog that describes a Kinesis data stream.

```bash
aws glue create-table \
   --database-name tempdb \
   --table-input  '{"Name":"test-kinesis-input", "StorageDescriptor":{ \
   "Columns":[\n   {"Name":"sensorid", "Type":"int"}, \n   {"Name":"currenttemperature", "Type":"int"}, \n   {"Name":"status", "Type":"string"}\n   ], \n   "Location":"my-testing-stream", \n   "Parameters":{ \n   "typeOfData":"kinesis","streamName":"my-testing-stream", \n   "kinesisUrl":"https://kinesis.us-east-1.amazonaws.com" \n   }, \n   "SerdeInfo":{ \n   "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"} \n   }, \n   "Parameters":{ \n   "classification":"json"\n   }', \n   --profile my-profile \n   --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see [Defining Tables in the AWS Glue Data Catalog](#) in the [AWS Glue Developer Guide](#).

Example 2: To create a table for a Kafka data store

The following create-table example creates a table in the AWS Glue Data Catalog that describes a Kafka data store.

```bash
aws glue create-table \
   --database-name tempdb \
   --table-input  '{"Name":"test-kafka-input", "StorageDescriptor":{ \
```

Actions and scenarios
This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

**Example 3: To create a table for a AWS S3 data store**

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a AWS Simple Storage Service (AWS S3) data store.

```
aws glue create-table \
    --database-name tempdb \
    --table-input "{"Name":"s3-output", "StorageDescriptor":{ \
        "Columns": [ \
            {"Name":"s1", "Type":"string"}, \
            {"Name":"s2", "Type":"int"}, \
            {"Name":"s3", "Type":"string"} \
        ], \
        "Location":"s3://bucket-path/", \
        "SerdeInfo":{ \
            "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe" \
        }, \
        "Parameters":{ \
            "separatorChar":","} \n    }', \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```
This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the AWS Glue Developer Guide.

- For API details, see CreateTable in AWS CLI Command Reference.

**get-plan**

The following code example shows how to use get-plan.

**AWS CLI**

**To get the generated code for mapping data from source tables to target tables**

The following get-plan retrieves the generated code for mapping columns from the data source to the data target.

```bash
aws glue get-plan --mapping '[]

[ 
  {
    "SourcePath":"sensorid",
    "SourceTable":"anything",
    "SourceType":"int",
    "TargetPath":"sensorid",
    "TargetTable":"anything",
    "TargetType":"int"
  },
  {
    "SourcePath":"currenttemperature",
    "SourceTable":"anything",
    "SourceType":"int",
    "TargetPath":"currenttemperature",
    "TargetTable":"anything",
    "TargetType":"int"
  },
  {
    "SourcePath":"status",
    "SourceTable":"anything",
```
Output:

```
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.GlueContext
import org.apache.spark.SparkContext
import scala.collection.JavaConverters_

object GlueApp {
  def main(sysArgs: Array[String]) {
    val spark: SparkContext = new SparkContext()
    val glueContext: GlueContext = new GlueContext(spark)
    // @params: [JOB_NAME]
    val args = GlueArgParser.getResolvedOptions(sysArgs, Seq("JOB_NAME").toArray)
    Job.init(args("JOB_NAME"), glueContext, args.asJava)
    // @type: DataSource
    // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx = "datasource0"]
    // @return: datasource0
    // @inputs: []

    transformation_ctx = "selectfields2"]
// @return: selectfields2
// @inputs: [frame = applymapping1]
val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid", 
    "currenttemperature", "status"), transformationContext = "selectfields2")

// @type: ResolveChoice
// @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-s3- 
    sink", transformation_ctx = "resolvechoice3"]
// @return: resolvechoice3
// @inputs: [frame = selectfields2]
val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
    Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName =
    Some("my-s3-sink"), transformationContext = "resolvechoice3")

// @type: DataSink
// @args: [database = "tempdb", table_name = "my-s3-sink", transformation_ctx = 
    "datasink4"]
// @return: datasink4
// @inputs: [frame = resolvechoice3]
val datasink4 = glueContext.getCatalogSink(database = "tempdb",
    tableName = "my-s3-sink", redshiftTmpDir = ",", transformationContext =
    "datasink4").writeDynamicFrame(resolvechoice3)

Job.commit()
}

For more information, see Editing Scripts in AWS Glue in the AWS Glue Developer Guide.

- For API details, see GetPlan in AWS CLI Command Reference.
GuardDuty examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with GuardDuty.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

accept-invitation

The following code example shows how to use accept-invitation.

AWS CLI

To accept an invitation to become a GuardDuty member account in the current region

The following accept-invitation example shows how to accept an invitation to become a GuardDuty member account in the current region.

```
aws guardduty accept-invitation \
  --detector-id 12abc34d567e8fa901bc2d34eexample \
  --master-id 123456789111 \
  --invitation-id d6b94fb03a66ff665f7db8764example
```

This command produces no output.

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see AcceptInvitation in AWS CLI Command Reference.
archive-findings

The following code example shows how to use `archive-findings`.

**AWS CLI**

To archive findings in the current region

This example shows how to archive findings in the current region.

```bash
aws guardduty archive-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-ids d6b94fb03a66ff665f7db8764example 3eb970e0de00c16ec14e6910fexample
```

This command produces no output.

For more information, see [Managing GuardDuty Accounts by Invitation](https://docs.aws.amazon.com/guardduty/latest/userguide/gd-manage-invitations.html) in the *GuardDuty User Guide*.

- For API details, see [ArchiveFindings](https://docs.aws.amazon.com/cli/latest/reference/guardduty/archive-findings.html) in *AWS CLI Command Reference*.

create-detector

The following code example shows how to use `create-detector`.

**AWS CLI**

To enable GuardDuty in the current region

This example shows how to create a new detector, which enables GuardDuty, in the current region:

```bash
aws guardduty create-detector \
    --enable
```

Output:

```json
{
    "DetectorId": "b6b992d6d2f48e64bc59180bfexample"
}
```

For more information, see [Enable Amazon GuardDuty](https://docs.aws.amazon.com/guardduty/latest/userguide/gd-enable-guardduty.html) in the *GuardDuty User Guide*.
create-filter

The following code example shows how to use create-filter.

AWS CLI

To create a new filter for the current region

This example creates a filter that matches all portscan findings for instance created from a specific image:

```bash
aws guardduty create-filter \
  --detector-id b6b992d6d2f48e64bc59180bfexample \
  --action ARCHIVE \
  --name myFilter \
  --finding-criteria '{"Criterion": {"type": ["Recon:EC2/Portscan"], "resource.instanceDetails.imageId": ["Eq": ["ami-0a7a207083example"]]}'}
```

Output:

```json
{
   "Name": "myFilter"
}
```

For more information, see Filtering findings in the GuardDuty User Guide.

create-ip-set

The following code example shows how to use create-ip-set.

AWS CLI

To create a trusted IP set

The following create-ip-set example creates and activates a trusted IP set in the current region.

```bash
aws guardduty create-ip-set \
```

• For API details, see CreateDetector in AWS CLI Command Reference.

• For API details, see CreateFilter in AWS CLI Command Reference.
create-members

The following code example shows how to use create-members.

AWS CLI

To associate a new member with your GuardDuty master account in the current region.

This example shows how to associate member accounts to be managed by the current account as the GuardDuty master.

```
aws guardduty create-members
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --account-details AccountId=111122223333,Email=first+member@example.com
        AccountId=111111111111 ,Email=another+member@example.com
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing multiple accounts in the GuardDuty User Guide.
- For API details, see CreateMembers in AWS CLI Command Reference.
create-publishing-destination

The following code example shows how to use create-publishing-destination.

**AWS CLI**

To create a publishing destination to export GuardDuty findings in the current region to.

This example shows how to create a publishing destination for GuardDuty findings.

```bash
aws guardduty create-publishing-destination \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --destination-type S3 \n   --destination-properties
   DestinationArn=arn:aws:s3:::yourbucket,KmsKeyArn=arn:aws:kms:us-west-1:111122223333:key/84cee9c5-dea1-401a-ab6d-e1de7example
```

Output:

```json
{
   "DestinationId": "46b99823849e1bbc242dfbe3cexample"
}
```

For more information, see Exporting findings in the GuardDuty User Guide.

- For API details, see CreatePublishingDestination in AWS CLI Command Reference.

create-sample-findings

The following code example shows how to use create-sample-findings.

**AWS CLI**

To create sample GuardDuty findings in the current region.

This example shows how to create a sample finding of the provided types.

```bash
aws guardduty create-sample-findings \
   --detector-id b6b992d6d2f48e64bc59180bfexample \
   --finding-types UnauthorizedAccess:EC2/TorClient UnauthorizedAccess:EC2/TorRelay
```

This command produces no output.
For more information, see Sample findings in the GuardDuty User Guide.

- For API details, see CreateSampleFindings in AWS CLI Command Reference.

create-threat-intel-set

The following code example shows how to use create-threat-intel-set.

AWS CLI

To create a new threat intel set in the current region.

This example shows how to upload a threat intel set to GuardDuty and activate it immediately.

```
aws guardduty create-threat-intel-set \
  --detector-id b6b992d6d2f48e64bc59180bfexample \
  --name myThreatSet \
  --format TXT \
  --location s3://EXAMPLEBUCKET/threatlist.csv \
  --activate
```

Output:

```
{
  "ThreatIntelSetId": "20b9a4691aeb33506b808878cexample"
}
```

For more information, see Trusted IP and threat lists in the GuardDuty User Guide.

- For API details, see CreateThreatIntelSet in AWS CLI Command Reference.

decline-invitations

The following code example shows how to use decline-invitations.

AWS CLI

To decline an invitation to have Guardduty managed by another account in the current region.

This example shows how to decline a membership invitation.
aws guardduty decline-invitations \
   --account-ids 11122223333

Output:

{
   "UnprocessedAccounts": []
}

For more information, see Managing GuardDuty accounts by invitation in the GuardDuty User Guide.

• For API details, see DeclineInvitations in AWS CLI Command Reference.

delete-detector

The following code example shows how to use delete-detector.

AWS CLI

To delete a detector, and disable GuardDuty, in the current region.

This example shows how to delete a detector, if successful, this will disable GuardDuty in the region associated with that detector.

aws guardduty delete-detector \
   --detector-id b6b992d6d2f48e64bc59180bfexample

This command produces no output.

For more information, see Suspending or disabling GuardDuty in the GuardDuty User Guide.

• For API details, see DeleteDetector in AWS CLI Command Reference.

delete-filter

The following code example shows how to use delete-filter.

AWS CLI

To delete an existing filter in the current region
This example shows how to create delete a filter.

```bash
aws guardduty delete-filter \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --filter-name byebyeFilter
```

This command produces no output.

For more information, see [Filtering findings](#) in the GuardDuty User Guide.

- For API details, see [DeleteFilter](#) in *AWS CLI Command Reference*.

### disable-organization-admin-account

The following code example shows how to use `disable-organization-admin-account`.

**AWS CLI**

**To remove an account as the delegated administrator for GuardDuty within your organization**

This example shows how to remove an account as the delegated administrator for GuardDuty.

```bash
aws guardduty disable-organization-admin-account \
    --admin-account-id 111122223333
```

This command produces no output.

For more information, see [Managing accounts with AWS organizations](#) in the *GuardDuty User Guide*.

- For API details, see [DisableOrganizationAdminAccount](#) in *AWS CLI Command Reference*.

### disassociate-from-master-account

The following code example shows how to use `disassociate-from-master-account`.

**AWS CLI**

**To disassociate from your current master account in the current region**
The following disassociate-from-master-account example dissociates your account from the current GuardDuty master account in the current AWS region.

```
aws guardduty disassociate-from-master-account \
    --detector-id d4b040365221be2b54a6264dceexample
```

This command produces no output.

For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](#) in the GuardDuty User Guide.

- For API details, see [DisassociateFromMasterAccount](#) in [AWS CLI Command Reference](#).

### get-detector

The following code example shows how to use get-detector.

**AWS CLI**

**To retrieve details of a specific detector**

The following get-detector example displays the configurations details of the specified detector.

```
aws guardduty get-detector \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

**Output:**

```
{
    "Status": "ENABLED",
    "ServiceRole": "arn:aws:iam::111122223333:role/aws-service-role/guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",
    "Tags": {},
    "FindingPublishingFrequency": "SIX_HOURS",
    "UpdatedAt": "2018-11-07T03:24:22.938Z",
    "CreatedAt": "2017-12-22T22:51:31.940Z"
}
```

For more information, see [Concepts and Terminology](#) in the GuardDuty User Guide.

- For API details, see [GetDetector](#) in [AWS CLI Command Reference](#).
get-findings

The following code example shows how to use `get-findings`.

**AWS CLI**

**Example 1: To retrieve the details of a specific finding**

The following `get-findings` example retrieves the full JSON finding details of the specified finding.

```bash
aws guardduty get-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-id 1ab92989eaf0e742df4a014d5example
```

**Output:**

```json
{
    "Findings": [
        {
            "Resource": {
                "ResourceType": "AccessKey",
                "AccessKeyDetails": {
                    "UserName": "testuser",
                    "UserType": "IAMUser",
                    "PrincipalId": "AIDACKCEVSQ6C2EXAMPLE",
                    "AccessKeyId": "ASIASZ4SI7REEEXAMPLE"
                }
            },
            "Description": "APIs commonly used to discover the users, groups, policies and permissions in an account, was invoked by IAM principal testuser under unusual circumstances. Such activity is not typically seen from this principal."
        }
    ],
    "Service": {

}

For more information, see Findings in the GuardDuty User Guide.

- For API details, see GetFindings in AWS CLI Command Reference.
get-ip-set

The following code example shows how to use get-ip-set.

AWS CLI

To list get details on a specified trusted IP set

The following get-ip-set example shows the status and details of the specified trusted IP set.

```
aws guardduty get-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eeexample \
    --ip-set-id d4b94fc952d6912b8f3060768example
```

Output:

```
{
    "Status": "ACTIVE",
    "Location": "s3://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/customlist.csv",
    "Tags": {},
    "Format": "TXT",
    "Name": "test-ip-set"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see GetIpSet in AWS CLI Command Reference.

get-master-account

The following code example shows how to use get-master-account.

AWS CLI

To retrieve details about your master account in the current region

The following get-master-account example displays the status and details of the master account associated with your detector in the current region.

```
aws guardduty get-master-account \
```
--detector-id 12abc34d567e8fa901bc2d34eexample

Output:

```json
{
   "Master": {
      "InvitationId": "04b94d9704854a73f94e061e8example",
      "InvitedAt": "2020-06-09T22:23:04.970Z",
      "RelationshipStatus": "Enabled",
      "AccountId": "123456789111"
   }
}
```

For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](#) in the GuardDuty User Guide.

- For API details, see [GetMasterAccount](#) in *AWS CLI Command Reference*.

list-detectors

The following code example shows how to use list-detectors.

AWS CLI

To list the available detectors in the current region

The following `list-detectors` example lists the available detectors in your current AWS region.

```bash
aws guardduty list-detectors
```

Output:

```json
{
   "DetectorIds": [
      "12abc34d567e8fa901bc2d34eexample"
   ]
}
```

For more information, see [Concepts and Terminology](#) in the GuardDuty User Guide.

- For API details, see [ListDetectors](#) in *AWS CLI Command Reference*. 
list-findings

The following code example shows how to use list-findings.

AWS CLI

Example 1: To list all findings for the current region

The following list-findings example displays a list of all findingIds for the current region sorted by severity from highest to lowest.

```bash
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --sort-criteria '{"AttributeName": "severity","OrderBy":"DESC"}'
```

Output:

```
{
    "FindingIds": [
        "04b8ab50fd29c64fc771b232dexample",
        "5ab8ab50fd21373735c826d3aexample",
        "90b93de7aba69107f05bbe60bexample",
        ...
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

Example 2: To list findings for the current region matching a specific finding criteria

The following list-findings example displays a list of all findingIds that match a specified finding type.

```bash
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-criteria '{"Criterion":{"type": {"Eq": ["UnauthorizedAccess:EC2/SSHBruteForce"]}}}'
```

Output:

```
{
    "FindingIds": [
```

Actions and scenarios
For more information, see Findings in the GuardDuty User Guide.

**Example 3: To list findings for the current region matching a specific set of finding criteria defined within a JSON file**

The following list-findings example displays a list of all findingIds that are not archived, and involve the IAM user named "testuser", as specified in a JSON file.

```bash
aws guardduty list-findings \
   --detector-id 12abc34d567e8fa901bc2d34eeexample \
   --finding-criteria file://myfile.json
```

Contents of `myfile.json`:

```json
{"Criterion": {
   "resource.accessKeyDetails.userName":{
      "Eq":["testuser"
   },
   "service.archived": { 
      "Eq": [ "false"
   ]
    }
  }
}
```

Output:

```json
{
   "FindingIds": [
      "1ab92989eaf0e742df4a014d5example"
    ]
}
```
• For API details, see `ListFindings` in *AWS CLI Command Reference*.

`list-invitations`

The following code example shows how to use `list-invitations`.

**AWS CLI**

**To list details on your invitations to become a member account in the current region**

The following `list-invitations` example lists details and statuses on your invitations to become a GuardDuty member account in the current region.

```bash
aws guardduty list-invitations
```

**Output:**

```json
{
   "Invitations": [
      {
         "InvitationId": "d6b94fb03a66ff665f7db8764example",
         "InvitedAt": "2020-06-10T17:56:38.221Z",
         "RelationshipStatus": "Invited",
         "AccountId": "123456789111"
      }
   ]
}
```

• For API details, see `ListInvitations` in *AWS CLI Command Reference*.

`list-ip-sets`

The following code example shows how to use `list-ip-sets`.
AWS CLI

To list trusted IP sets in the current region

The following `list-ip-sets` example lists the trusted IP sets in your current AWS region.

```
aws guardduty list-ip-sets \
   --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
   "IpSetIds": [
      "d4b94fc952d6912b8f3060768example"
   ]
}
```

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [ListIpSets](#) in [AWS CLI Command Reference](#).

list-members

The following code example shows how to use `list-members`.

AWS CLI

To list all members in the current region

The following `list-members` example lists all member accounts and their details for the current region.

```
aws guardduty list-members \
   --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
   "Members": [
      {
         "RelationshipStatus": "Enabled",
      }
   ]
}
```
For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](#) in the GuardDuty User Guide.

- For API details, see [ListMembers](#) in [AWS CLI Command Reference](#).

**update-ip-set**

The following code example shows how to use `update-ip-set`.

**AWS CLI**

**To update a trusted IP set**

The following `update-ip-set` example shows how to update the details of a trusted IP set.

```bash
aws guardduty update-ip-set \
  --detector-id 12abc34d567e8fa901bc2d34eeexample \
  --ip-set-id d4b94fc952d6912b8f3060768example \
  --location https://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/\ncustomtrustlist2.csv
```

This command produces no output.

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [UpdateIpSet](#) in [AWS CLI Command Reference](#).

**AWS Health examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Health.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**describe-affected-entities**

The following code example shows how to use `describe-affected-entities`.

**AWS CLI**

**To list the entities that are affected by a specified AWS Health event**

The following `describe-affected-entities` example lists the entities that are affected by the specified AWS Health event. This event is a billing notification for the AWS account.

```bash
aws health describe-affected-entities \
   --filter "eventArns=arn:aws:health:global::event/BILLING/\n   AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-\n   EXAMPLE11145" \
   --region us-east-1
```

**Output:**

```json
{
   "entities": [
      {
         "entityArn": "arn:aws:health:global:123456789012:entity/\n   EXAMPLEimSmOULmWHPb",
         "eventArn": "arn:aws:health:global::event/BILLING/\n   AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-\n   EXAMPLE11145",

```
For more information, see [Event log](#) in the AWS Health User Guide.

- For API details, see [DescribeAffectedEntities](#) in AWS CLI Command Reference.

### describe-event-details

The following code example shows how to use describe-event-details.

#### AWS CLI

**To list information about an AWS Health event**

The following describe-event-details example lists information about the specified AWS Health event.

```
aws health describe-event-details \
   --event-arns "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111" \ 
   --region us-east-1
```

**Output:**

```
{
   "successfulSet": [
   {
      "event": {
         "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
         "service": "EC2",
         "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
         "eventTypeCategory": "issue",
         "region": "us-east-1",
         "startTime": 1587462325.096,
         "endTime": 1587464204.774,
         "lastUpdatedTime": 1587464204.865,
         "statusCode": "closed"
      }
   }
   ]
}
```
The following code example shows how to use `describe-events`.

**AWS CLI**

**Example 1: To list AWS Health events**

The following `describe-events` example lists recent AWS Health events.

```
aws health describe-events \
   --region us-east-1
```

**Output:**

```
{
   "events": [
   {
      "arn": "arn:aws:health:us-west-1::event/ECS/AWS_ECS_OPERATIONAL ISSUE/AWS_ECS_OPERATIONAL_ISSUE_KWQPY_EXAMPLE111",

Example 2: To list AWS Health events by service and event status code

The following describe-events example lists AWS Health events for Amazon Elastic Compute Cloud (Amazon EC2) where the event status is closed.
aws health describe-events
   --filter "services=EC2,eventStatusCodes=closed"

Output:

```json
{
   "events": [
   {
      "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE.VKTXI.EXAMPLE111",
      "service": "EC2",

```
For more information, see [Getting started with the AWS Personal Health Dashboard](https://docs.aws.amazon.com/health/latest/PHD/getting-started.html) in the *AWS Health User Guide*.

- For API details, see [DescribeEvents](https://docs.aws.amazon.com/cli/latest/reference/medical-imaging/describe-events.html) in *AWS CLI Command Reference*.

**HealthImaging examples using AWS CLI**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthImaging.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- [Actions](#)

**Actions**

**Add a tag to a resource**

The following code example shows how to add a tag to a HealthImaging resource.

**AWS CLI**

**Example 1: To tag a data store**

The following `tag-resource` code examples tags a data store.

```
aws medical-imaging tag-resource
```
--resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:2345678901234567890123456789012" \
--tags '{"Deployment":"Development"}'

This command produces no output.

**Example 2: To tag an image set**

The following `tag-resource` code examples tags an image set.

```
aws medical-imaging tag-resource \
   --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:234567890123456789012/\n    imageset/18f88ac7870584f58d56256646b4d92b" \
   --tags '{"Deployment":"Development"}'
```

This command produces no output.

For more information, see [Tagging resources with AWS HealthImaging](https://aws.amazon.com) in the *AWS HealthImaging Developer Guide*.

- For API details, see [TagResource](https://docs.aws.amazon.com/cli/latest/reference/medical-imaging/tag-resource.html) in *AWS CLI Command Reference*.

**Copy an image set**

The following code example shows how to copy a HealthImaging image set.

**AWS CLI**

**Example 1: To copy an image set without a destination.**

The following `copy-image-set` code example makes a duplicate copy of an image set without a destination.

```
aws medical-imaging copy-image-set \
   --datastore-id 12345678901234567890123456789012 \
   --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
   --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" } }'
```

Output:

```
{  
  
}
Example 2: To copy an image set with a destination.

The following `copy-image-set` code example makes a duplicate copy of an image set with a destination.

```bash
aws medical-imaging copy-image-set \
   --datastore-id 12345678901234567890123456789012 \       
   --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \   
   --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "5" }, 
   "destinationImageSet": { "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e", 
   "latestVersionId": "1"} }'
```

Output:

```json
{
   "destinationImageSetProperties": {
      "latestVersionId": "2",
      "imageSetWorkflowStatus": "COPYING",
      "updatedAt": 1680042505.135,
      "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
      "imageSetState": "LOCKED",
      "createdAt": 1680042357.432
   },
   "sourceImageSetProperties": {
      "latestVersionId": "5",
      "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
      "updatedAt": 1680042357.432,
      "imageSetState": "LOCKED",
      "createdAt": 1680027126.436
   },
   "datastoreId": "12345678901234567890123456789012"
}
```
Create a data store

The following code example shows how to create a HealthImaging data store.

AWS CLI

To create a data store

The following `create-datastore` code example creates a data store with the name `my-datastore`.

```bash
aws medical-imaging create-datastore
  --datastore-name "my-datastore"
```

Output:

```json
{
  "datastoreId": "12345678901234567890123456789012",
  "datastoreStatus": "CREATING"
}
```

For more information, see [Creating a data store](#) in the AWS HealthImaging Developer Guide.

- For API details, see [CreateDatastore](#) in AWS CLI Command Reference.

Delete a data store

The following code example shows how to delete a HealthImaging data store.

For more information, see [Copying an image set](#) in the AWS HealthImaging Developer Guide.

- For API details, see [CopyImageSet](#) in AWS CLI Command Reference.
AWS CLI

To delete a data store

The following delete-datastore code example deletes a data store.

```bash
aws medical-imaging delete-datastore \
   --datastore-id "12345678901234567890123456789012"
```

Output:

```json
{
   "datastoreId": "12345678901234567890123456789012",
   "datastoreStatus": "DELETING"
}
```

For more information, see Deleting a data store in the AWS HealthImaging Developer Guide.

- For API details, see DeleteDatastore in AWS CLI Command Reference.

Delete an image set

The following code example shows how to delete a HealthImaging image set.

AWS CLI

To delete an image set

The following delete-image-set code example deletes an image set.

```bash
aws medical-imaging delete-image-set \
   --datastore-id 12345678901234567890123456789012 \
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```json
{
   "imageSetWorkflowStatus": "DELETING",
   "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
   "imageSetState": "LOCKED",
   "datastoreId": "12345678901234567890123456789012"
}
```
For more information, see **Deleting an image set** in the *AWS HealthImaging Developer Guide*.

- For API details, see **DeleteImageSet** in *AWS CLI Command Reference*.

### Get an image frame

The following code example shows how to get an image frame.

**AWS CLI**

**To get image set pixel data**

The following `get-image-frame` code example gets an image frame.

```bash
aws medical-imaging get-image-frame \
   --datastore-id "12345678901234567890123456789012" \
   --image-set-id "98765412345612345678907890789012" \
   --image-frame-information imageFrameId=3abf5d5d7ae72f80a0ec81b2c0de3ef4 \
   imageframe.jph
```

Note: This code example does not include output because the GetImageFrame action returns a stream of pixel data to the `imageframe.jph` file. For information about decoding and viewing image frames, see HTJ2K decoding libraries.

For more information, see **Getting image set pixel data** in the *AWS HealthImaging Developer Guide*.

- For API details, see **GetImageFrame** in *AWS CLI Command Reference*.

### Get data store properties

The following code example shows how to get HealthImaging data store properties.

**AWS CLI**

**To get a data store's properties**

The following `get-datastore` code example gets a data store's properties.

```bash
aws medical-imaging get-datastore \
   --datastore-id 12345678901234567890123456789012
```
Get image set properties

The following code example shows how to get HealthImaging image set properties.

**AWS CLI**

To get image set properties

The following `get-image-set` code example gets the properties for an image set.

```
aws medical-imaging get-image-set \
  --datastore-id 12345678901234567890123456789012 \
  --image-set-id 18f88ac7870584f58d56256646b4d92b \
  --version-id 1
```

Output:

```
{
  "versionId": "1",
  "imageSetWorkflowStatus": "COPIED",
  "updatedAt": 1680027253.471,
  "imageSetId": "18f88ac7870584f58d56256646b4d92b",
  "imageSetState": "ACTIVE",
}
```
For more information, see [Getting image set properties](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetImageSet](#) in *AWS CLI Command Reference*.

**Get import job properties**

The following code example shows how to get the import job properties.

**AWS CLI**

**To get a dicom import job's properties**

The following `get-dicom-import-job` code example gets a dicom import job's properties.

```bash
aws medical-imaging get-dicom-import-job \
   --datastore-id "12345678901234567890123456789012" \
   --job-id "09876543210987654321098765432109"
```

**Output:**

```json
{
   "jobProperties": {
      "jobId": "09876543210987654321098765432109",
      "jobName": "my-job",
      "jobStatus": "COMPLETED",
      "datastoreId": "12345678901234567890123456789012",
      "dataAccessRoleArn": "arn:aws:iam::123456789012:role/ImportJobDataAccessRole",
      "endedAt": "2022-08-12T11:29:44.285000+00:00",
      "submittedAt": "2022-08-12T11:28:11.152000+00:00",
      "inputS3Uri": "s3://medical-imaging-dicom-input/dicom_input/",
      "outputS3Uri": "s3://medical-imaging-output/job_output/12345678901234567890123456789012-DicomImport-09876543210987654321098765432109/"
   }
}
```
Get metadata for an image set

The following code example shows how to get metadata for a HealthImaging image set.

**AWS CLI**

**Example 1: To get image set metadata without version**

The following `get-image-set-metadata` code example gets metadata for an image set without specifying a version.

Note: `outfile` is a required parameter

```bash
aws medical-imaging get-image-set-metadata \
  --datastore-id 12345678901234567890123456789012 \
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
  studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the `studymetadata.json.gz` file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

**Example 2: To get image set metadata with version**

The following `get-image-set-metadata` code example gets metadata for an image set with a specified version.

Note: `outfile` is a required parameter

```bash
aws medical-imaging get-image-set-metadata \
  --datastore-id 12345678901234567890123456789012 \
```

For more information, see [Getting import job properties](https://aws.amazon.com) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetDICOMImportJob](https://aws.amazon.com) in *AWS CLI Command Reference*.
The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```json
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

For more information, see [Getting image set metadata](https://docs.aws.amazon.com/health-imaging/latest/developerguide/Getting-image-set-metadata.html) in the *AWS HealthImaging Developer Guide*.

### Import bulk data into a data store

The following code example shows how to import bulk data into a HealthImaging data store.

#### AWS CLI

**To start a dicom import job**

The following `start-dicom-import-job` code example starts a dicom import job.

```bash
aws medical-imaging start-dicom-import-job \
   --job-name "my-job" \
   --datastore-id "12345678901234567890123456789012" \
   --input-s3-uri "s3://medical-imaging-dicom-input/dicom_input/" \
   --output-s3-uri "s3://medical-imaging-output/job_output/" \
   --data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"
```

Output:

```json
{
    "datastoreId": "12345678901234567890123456789012",
    "jobId": "09876543210987654321098765432109",
    "jobStatus": "SUBMITTED",
    ...
}
```
List data stores

The following code example shows how to list HealthImaging data stores.

**AWS CLI**

**To list data stores**

The following `list-datastores` code example lists available data stores.

```bash
aws medical-imaging list-datastores
```

**Output:**

```json
{
   "datastoreSummaries": [
   {
      "datastoreId": "12345678901234567890123456789012",
      "datastoreName": "TestDatastore123",
      "datastoreStatus": "ACTIVE",
      "datastoreArn": "arn:aws:medical-imaging:us-east-1:123456789012:datastore/12345678901234567890123456789012",
      "createdAt": "2022-11-15T23:33:09.643000+00:00",
      "updatedAt": "2022-11-15T23:33:09.643000+00:00"
   }
   ]
}
```

For more information, see [Listing data stores](https://docs.aws.amazon.com/medical-imaging-developer-guide/) in the *AWS HealthImaging Developer Guide*.

- For API details, see [ListDatastores](https://docs.aws.amazon.com/cli/latest/reference/medical-imaging/list-datastores.html) in *AWS CLI Command Reference*.

List image set versions

The following code example shows how to list HealthImaging image set versions.
AWS CLI

**To list image set versions**

The following `list-image-set-versions` code example lists the version history for an image set.

```
aws medical-imaging list-image-set-versions \
--datastore-id 12345678901234567890123456789012 \
--image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

**Output:**

```
{
   "imageSetPropertiesList": [
   {
      "ImageSetWorkflowStatus": "UPDATED",
      "versionId": "4",
      "updatedAt": 1680029436.304,
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
      "imageSetState": "ACTIVE",
      "createdAt": 1680027126.436
   },
   {
      "ImageSetWorkflowStatus": "UPDATED",
      "versionId": "3",
      "updatedAt": 1680029163.325,
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
      "imageSetState": "ACTIVE",
      "createdAt": 1680027126.436
   },
   {
      "ImageSetWorkflowStatus": "COPY_FAILED",
      "versionId": "2",
      "updatedAt": 1680027455.944,
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
      "imageSetState": "ACTIVE",
      "message": "INVALID_REQUEST: Series of SourceImageSet and DestinationImageSet don't match.",
      "createdAt": 1680027126.436
   },
   {
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
```
"imageSetState": "ACTIVE",
"versionId": "1",
"ImageSetWorkflowStatus": "COPIED",
"createdAt": 1680027126.436
]
}
}

For more information, see [Listing image set versions](#) in the AWS HealthImaging Developer Guide.

- For API details, see [ListImageSetVersions](#) in *AWS CLI Command Reference*.

### List import jobs for a data store

The following code example shows how to list import jobs for a HealthImaging data store.

**AWS CLI**

#### To list dicom import jobs

The following `list-dicom-import-jobs` code example lists dicom import jobs.

```bash
aws medical-imaging list-dicom-import-jobs \
--datastore-id "12345678901234567890123456789012"
```

Output:

```
{
   "jobSummaries": [
   {
      "jobId": "09876543210987654321098765432109",
      "jobName": "my-job",
      "jobStatus": "COMPLETED",
      "datastoreId": "12345678901234567890123456789012",
      "dataAccessRoleArn": "arn:aws:iam::123456789012:role/ImportJobDataAccessRole",
      "endedAt": "2022-08-12T11:21:56.504000+00:00",
      "submittedAt": "2022-08-12T11:20:21.734000+00:00"
   }
   ]
}
```

For more information, see [Listing import jobs](#) in the AWS HealthImaging Developer Guide.
- For API details, see ListDICOMImportJobs in AWS CLI Command Reference.

List tags for a resource

The following code example shows how to list tags for a HealthImaging resource.

AWS CLI

Example 1: To list resource tags for a data store

The following list-tags-for-resource code example lists tags for a data store.

```bash
aws medical-imaging list-tags-for-resource \
  --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:dataset/12345678901234567890123456789012"
```

Output:

```json
{
  "tags":{
    "Deployment":"Development"
  }
}
```

Example 2: To list resource tags for an image set

The following list-tags-for-resource code example lists tags for an image set.

```bash
aws medical-imaging list-tags-for-resource \
  --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:dataset/12345678901234567890123456789012/\n  imageset/18f88ac7870584f58d56256646b4d92b"
```

Output:

```json
{
  "tags":{
    "Deployment":"Development"
  }
}
```
For more information, see [Tagging resources with AWS HealthImaging](https://docs.aws.amazon.com/healthimaging/latest/userguide/healthimaging-tagging.html) in the AWS HealthImaging Developer Guide.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/healthimaging/latest/userguide/healthimaging-api.html#core-api-list-tags-for-resource) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/medical-imaging/untag-resource.html).

### Remove a tag from a resource

The following code example shows how to remove a tag from a HealthImaging resource.

**AWS CLI**

**Example 1: To untag a data store**

The following `untag-resource` code example untags a data store.

```bash
aws medical-imaging untag-resource \
  --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:dataset/12345678901234567890123456789012" \
  --tag-keys "['Deployment']"
```

This command produces no output.

**Example 2: To untag an image set**

The following `untag-resource` code example untags an image set.

```bash
aws medical-imaging untag-resource \
  --resource-arn "arn:aws:medical-imaging:us-east-1:123456789012:dataset/12345678901234567890123456789012/image/18f88ac7870584f58d56256646b4d92b" \
  --tag-keys "['Deployment']"
```

This command produces no output.

For more information, see [Tagging resources with AWS HealthImaging](https://docs.aws.amazon.com/healthimaging/latest/userguide/healthimaging-tagging.html) in the AWS HealthImaging Developer Guide.

### Search image sets

The following code example shows how to search HealthImaging image sets.
Example 1: To search image sets with an EQUAL operator

The following search-image-sets code example uses the EQUAL operator to search image sets based on a specific value.

```bash
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \
   --search-criteria file://search-criteria.json
```

Contents of search-criteria.json

```json
{
   "filters": [{
      "values": [{"DICOMPatientId" : "SUBJECT08701"}],
      "operator": "EQUAL"
   }]
}
```

Output:

```json
{
   "imageSetsMetadataSummaries": [{
      "imageSetId": "09876543210987654321098765432109",
      "createdAt": "2022-12-06T21:40:59.429000+00:00",
      "version": 1,
      "DICOMTags": {
         "DICOMStudyId": "2011201407",
         "DICOMStudyDate": "19991122",
         "DICOMPatientSex": "F",
         "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
         "DICOMPatientBirthDate": "19201120",
         "DICOMStudyDescription": "UNKNOWN",
         "DICOMNumberOfStudyRelatedInstances": 1,
         "DICOMPatientId": "SUBJECT08701",
         "DICOMPatientName": "Melissa844 Huel628",
         "DICOMNumberOfStudyRelatedSeries": 1
      },
      "updatedAt": "2022-12-06T21:40:59.429000+00:00"
   }]
}
```
Example 2: To search image sets with a BETWEEN operator using DICOMStudyDate and DICOMStudyTime

The following search-image-sets code example searches for image sets with DICOM Studies generated between January 1, 1990 (12:00 AM) and January 1, 2023 (12:00 AM).

Note: DICOMStudyTime is optional. If it is not present, 12:00 AM (start of the day) is the time value for the dates provided for filtering.

```bash
aws medical-imaging search-image-sets \
   --datastore-id 12345678901234567890123456789012 \
   --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```json
{
   "filters": [
      {
         "values": [
            {
               "DICOMStudyDateAndTime": {
                  "DICOMStudyDate": "19900101",
                  "DICOMStudyTime": "000000"
               }
            },
            {
               "DICOMStudyDateAndTime": {
                  "DICOMStudyDate": "20230101",
                  "DICOMStudyTime": "000000"
               }
            }
         ],
         "operator": "BETWEEN"
      }
   ]
}
```

Output:

```json
{
   "imageSetsMetadataSummaries": [
      {
         "imageSetId": "09876543210987654321098765432109",
         "createdAt": "2022-12-06T21:40:59.429000+00:00",
         "createdBy": "user@example.com",
         "updatedAt": null,
         "updatedBy": null
      }
   ]
}
```
Example 3: To search image sets with a BETWEEN operator using createdAt (time studies were previously persisted)

The following `search-image-sets` code example searches for image sets with DICOM Studies persisted in HealthImaging between the time ranges in UTC time zone.

**Note:** Provide `createdAt` in example format ("1985-04-12T23:20:50.52Z").

```bash
aws medical-imaging search-image-sets \
  --datastore-id 12345678901234567890123456789012 \
  --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```json
{
    "filters": [[
        "values": [[
            "createdAt": "1985-04-12T23:20:50.52Z"
        ],
        {
            "createdAt": "2022-04-12T23:20:50.52Z"
        }],
        "operator": "BETWEEN"
    ]]
}```
Update image set metadata

The following code example shows how to update HealthImaging image set metadata.

**AWS CLI**

**To update image set metadata**

The following `update-image-set-metadata` code example updates image set metadata.

```bash
aws medical-imaging update-image-set-metadata
   --datastore-id 12345678901234567890123456789012
   --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```
Contents of metadata-updates.json

```
{
    "DICOMUpdates": {
        "updatableAttributes":
            "eyJTY2hlbWFVXJzaW9uIjoxLjEsIlBhdGllbnQiOnsiRElDT00iOnsiUGF0aWVudE5hdWUiOiJNWF5NWCJ9fX0="
    }
}
```

Note: updatableAttributes is a Base64 encoded JSON string. Here is the unencoded JSON string.

```json
{"SchemaVersion":1.1,"Patient":{"DICOM":{"PatientName":"MX^MX"}}}
```

Output:

```
{
    "latestVersionId": "5",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see [Updating image set metadata](#) in the AWS HealthImaging Developer Guide.

- For API details, see [UpdateImageSetMetadata](#) in AWS CLI Command Reference.

### HealthLake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthLake.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

create-fhir-datastore

The following code example shows how to use create-fhir-datastore.

AWS CLI

To create a FHIR Data Store.

The following create-fhir-datastore example demonstrates how to create a new Data Store in Amazon HealthLake.

```
aws healthlake create-fhir-datastore \
    --region us-east-1 \ 
    --datastore-type-version R4 \ 
    --datastore-type-version R4 \ 
    --datastore-name "FhirTestDatastore"
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
    "DatastoreStatus": "CREATING",
    "DatastoreId": "(Datastore ID)"
}
```

For more information, see Creating and monitoring a FHIR Data Store in the Amazon HealthLake Developer Guide.
For API details, see CreateFhirDatastore in AWS CLI Command Reference.

**delete-fhir-datastore**

The following code example shows how to use `delete-fhir-datastore`.

**AWS CLI**

**To delete a FHIR Data Store**

The following `delete-fhir-datastore` example demonstrates how to delete a Data Store and all of its contents in Amazon HealthLake.

```bash
aws healthlake delete-fhir-datastore \
   --datastore-id (Data Store ID) \
   --region us-east-1
```

Output:

```json
{
   "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
   "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
   "DatastoreStatus": "DELETING",
   "DatastoreId": "(Datastore ID)"
}
```

For more information, see Creating and monitoring a FHIR Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/working-with-FHIR-healthlake.html> in the Amazon HealthLake Developer Guide.

For API details, see DeleteFhirDatastore in AWS CLI Command Reference.

**describe-fhir-datastore**

The following code example shows how to use `describe-fhir-datastore`.

**AWS CLI**

**To describe a FHIR Data Store**
The following `describe-fhir-datastore` example demonstrates how to find the properties of a Data Store in Amazon HealthLake.

```
aws healthlake describe-fhir-datastore \
  --datastore-id "1f2f459836ac6c513ce899f9e4f66a59" \
  --region us-east-1
```

Output:

```
{
  "DatastoreProperties": {
    "PreloadDataConfig": {
      "PreloadDataType": "SYNTHEA"
    },
    "DatastoreName": "FhirTestDatastore",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
    "DatastoreStatus": "CREATING",
    "DatastoreTypeVersion": "R4",
    "DatastoreId": "(Datastore ID)"
  }
}
```

For more information, see Creating and monitoring a FHIR Data Stores in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirDatastore in AWS CLI Command Reference.

### describe-fhir-export-job

The following code example shows how to use `describe-fhir-export-job`.

#### AWS CLI

To describe a FHIR export job

The following `describe-fhir-export-job` example shows how to find the properties of a FHIR export job in Amazon HealthLake.

```
aws healthlake describe-fhir-export-job \
```
--datastore-id (Datastore ID) \ 
--job-id 9b9a51943afaedd0a8c0c26c49135a31

Output:

```
{
    "ExportJobProperties": {
        "DataAccessRoleArn": "arn:aws:i am::(AWS Account ID):role/(Role Name)",
        "JobStatus": "IN_PROGRESS",
        "JobId": "9009813e9d69ba7cf79bcb3468780f16",
        "SubmitTime": 1609175692.715,
        "OutputDataConfig": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/59593b2d0367ce252b5e66bf5fd6b574-FHIR_EXPORT-9009813e9d69ba7cf79bcb3468780f16/"
        },
        "DatastoreId": "(Datastore ID)"
    }
}
```

For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see DescribeFhirExportJob in AWS CLI Command Reference.

**describe-fhir-import-job**

The following code example shows how to use describe-fhir-import-job.

**AWS CLI**

**To describe a FHIR import job**

The following describe-fhir-import-job example shows how to learn the properties of a FHIR import job using Amazon HealthLake.

```
aws healthlake describe-fhir-import-job \
    --datastore-id (Datastore ID) \
    --job-id c145fbb27b192af392f8ce6e7838e34f \
    --region us-east-1
```

Output:
For more information, see [Importing files to a FHIR Data Store](#) in the [Amazon HealthLake Developer Guide](#).

- For API details, see [DescribeFhirImportJob](#) in [AWS CLI Command Reference](#).

**list-fhir-datastores**

The following code example shows how to use list-fhir-datastores.

**AWS CLI**

**To list FHIR Data Stores**

The following list-fhir-datastores example shows how to use the command and how users can filter results based on Data Store status in Amazon HealthLake.

```bash
aws healthlake list-fhir-datastores \
    --region us-east-1 \
    --filter DatastoreStatus=ACTIVE
```

Output:

```json
{
    "DatastorePropertiesList": [
        {
            "PreloadDataConfig": {
                "PreloadDataType": "SYNTHEA"
            }
        }
    ]
}
```
For more information, see [Creating and monitoring a FHIR Data Store](https://docs.aws.amazon.com/healthlake/latest/developer-guide/creating-fhir-data-store.html) in the *Amazon HealthLake Developer Guide*.

- For API details, see [ListFhirDatastores](https://docs.aws.amazon.com/cli/latest/reference/healthlake/list-fhir-datastores.html) in *AWS CLI Command Reference*.

**list-fhir-export-jobs**

The following code example shows how to use `list-fhir-export-jobs`.

**AWS CLI**

To list all FHIR export jobs

The following `list-fhir-export-jobs` example shows how to use the command to view a list of export jobs associated with an account.

```bash
aws healthlake list-fhir-export-jobs \
  --datastore-id (Datastore ID) \
```
Output:

```json
{
    "ExportJobProperties": {
        "OutputDataConfig": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
            "S3Configuration": {
                "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                "KmsKeyId": "(KmsKeyId)"
            }
        },
        "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
        "JobStatus": "COMPLETED",
        "JobId": "c145fbb27b192af392f8ce6e7838e34f",
        "JobName": "FHIR-EXPORT",
        "SubmitTime": 1606272542.161,
        "EndTime": 1606272609.497,
        "DatastoreId": "(Datastore ID)"
    }
}

"NextToken": String
```

For more information, see [Exporting files from a FHIR Data Store](https://docs.aws.amazon.com/healthlake/latest/developerguide/exporting-files-from-fhir-data-store.html) in the Amazon HealthLake Developer Guide.

- For API details, see [ListFhirExportJobs](https://docs.aws.amazon.com/cli/latest/reference/fhir/list-fhir-export-jobs.html) in *AWS CLI Command Reference*.

**list-fhir-import-jobs**

The following code example shows how to use `list-fhir-import-jobs`.

**AWS CLI**

**To list all FHIR import jobs**

The following `list-fhir-import-jobs` example shows how to use the command to view a list of all import jobs associated with an account.
aws healthlake list-fhir-import-jobs \
--datastore-id (Datastore ID) \
--submitted-before (DATE like 2024-10-13T19:00:00Z) \
--submitted-after (DATE like 2020-10-13T19:00:00Z ) \
--job-name "FHIR-IMPORT" \
--job-status SUBMITTED \ 
-max-results (Integer between 1 and 500)

Output:

{
    "ImportJobProperties": {
        "OutputDataConfig": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
            "S3Configuration": {
                "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                "KmsKeyId": "(KmsKey Id)"
            }
        },
        "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
        "JobStatus": "COMPLETED",
        "JobId": "c145fbb27b192af392f8ce6e7838e34f",
        "JobName": "FHIR-IMPORT",
        "SubmitTime": 1606272542.161,
        "EndTime": 1606272609.497,
        "DatastoreId": "(Datastore ID)"
    }
}

"NextToken": String

For more information, see Importing files to FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see ListFhirImportJobs in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

AWS CLI

To list tags for a Data Store
The following `list-tags-for-resource` example lists the tags associated with the specified Data Store:

```bash
aws healthlake list-tags-for-resource \
  --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
  --region us-east-1
```

Output:

```json
{
  "tags": {
    "key": "value",
    "key1": "value1"
  }
}
```

For more information, see [Tagging resources in Amazon HealthLake](http://amazons-place) in the Amazon HealthLake Developer Guide.

- For API details, see [ListTagsForResource](http://aws-cli.com) in *AWS CLI Command Reference*.

### start-fhir-export-job

The following code example shows how to use `start-fhir-export-job`.

**AWS CLI**

**To start a FHIR export job**

The following `start-fhir-export-job` example shows how to start a FHIR export job using Amazon HealthLake.

```bash
aws healthlake start-fhir-export-job \
  --output-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
  --datastore-id (Datastore ID) \
  --data-access-role-arn arn:aws:iam::(AWS Account ID):role/(Role Name)
```

Output:

```json
{
  "DatastoreId": "(Datastore ID)",

```
For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see StartFhirExportJob in AWS CLI Command Reference.

**start-fhir-import-job**

The following code example shows how to use start-fhir-import-job.

**AWS CLI**

**To start a FHIR import job**

The following start-fhir-import-job example shows how to start a FHIR import job using Amazon HealthLake.

```bash
aws healthlake start-fhir-import-job \
   --input-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
   --datastore-id (Datastore ID) \ 
   --data-access-role-arn "arn:aws:iam::(AWS Account ID):role/(Role Name)" \ 
   --region us-east-1
```

Output:

```json
{
   "DatastoreId": "(Datastore ID)",
   "JobStatus": "SUBMITTED",
   "JobId": "c145fbb27b192af392f8ce6e7838e34f"
}
```

For more information, see Importing files to a FHIR Data Store 'https://docs.aws.amazon.com/healthlake/latest/devguide/import-datastore.html in the Amazon HealthLake Developer Guide.

- For API details, see StartFhirImportJob in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.
To add a tag to Data Store

The following `tag-resource` example shows how to add a tag to a Data Store.

```bash
aws healthlake tag-resource \
  --resource-arn "arn:aws:healthlake:us-east-1:691207106566:datastore/fhir/0725c83f4307f263e16fd56b6d8ebdbe" \ 
  --tags '[["Key": "key1", "Value": "value1"]]' \ 
  --region us-east-1
```

This command produces no output.

For more information, see 'Adding a tag to a Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/add-a-tag.html>' in the Amazon HealthLake Developer Guide.

- For API details, see `TagResource` in AWS CLI Command Reference.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a Data Store.

The following `untag-resource` example shows how to remove tags from a Data Store.

```bash
aws healthlake untag-resource \
  --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/fhir/b91723d65c6fdeb1d26543a49d2ed1fa" \ 
  --tag-keys '[["key1"]]' \ 
  --region us-east-1
```

This command produces no output.

For more information, see Removing tags from a Data Store in the Amazon HealthLake Developer Guide.

- For API details, see `UntagResource` in AWS CLI Command Reference.
HealthOmics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthOmics.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics
• Actions

Actions

abort-multipart-read-set-upload

The following code example shows how to use abort-multipart-read-set-upload.

AWS CLI

To stop a multipart read set upload

The following abort-multipart-read-set-upload example stops a multipart read set upload into your HealthOmics sequence store.

```
aws omics abort-multipart-read-set-upload \
   --sequence-store-id 0123456789 \
   --upload-id 1122334455
```

This command produces no output.

For more information, see Direct upload to a sequence store in the AWS HealthOmics User Guide.

• For API details, see AbortMultipartReadSetUpload in AWS CLI Command Reference.
accept-share

The following code example shows how to use accept-share.

AWS CLI

To accept a share of analytics store data

The following accept-share example accepts a share of HealthOmics analytics store data.

```bash
aws omics accept-share \
   --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```json
{
   "status": "ACTIVATING"
}
```

For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

- For API details, see AcceptShare in AWS CLI Command Reference.

batch-delete-read-set

The following code example shows how to use batch-delete-read-set.

AWS CLI

To delete multiple read sets

The following batch-delete-read-set example deletes two read sets.

```bash
aws omics batch-delete-read-set \
   --sequence-store-id 1234567890 \
   --ids 1234567890 0123456789
```

If there is an error deleting any of the specified read sets, the service returns an error list.

```json
{
   "errors": [
```
The specified readset does not exist.

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see BatchDeleteReadSet in AWS CLI Command Reference.

**cancel-annotation-import-job**

The following code example shows how to use cancel-annotation-import-job.

**AWS CLI**

**To cancel an annotation import job**

The following cancel-annotation-import-job example cancels an annotation import job with ID 04f57618-xmpl-4fd0-9349-e5a85aefb997.

```
aws omics cancel-annotation-import-job \
   --job-id 04f57618-xmpl-4fd0-9349-e5a85aefb997
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CancelAnnotationImportJob in AWS CLI Command Reference.

**cancel-run**

The following code example shows how to use cancel-run.

**AWS CLI**

**To cancel a run**

The following cancel-run example cancels a run with ID 1234567.

```
aws omics cancel-run \
   --id 1234567
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see CancelRun in AWS CLI Command Reference.

**cancel-variant-import-job**

The following code example shows how to use cancel-variant-import-job.

**AWS CLI**

To cancel a variant import job

The following cancel-variant-import-job example cancels a variant import job with ID 69cb65d6-xmpl-4a4a-9025-4565794b684e.

```bash
aws omics cancel-variant-import-job \   --job-id 69cb65d6-xmpl-4a4a-9025-4565794b684e
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CancelVariantImportJob in AWS CLI Command Reference.

**complete-multipart-read-set-upload**

The following code example shows how to use complete-multipart-read-set-upload.

**AWS CLI**

To conclude a multipart upload once you have uploaded all of the components.

The following complete-multipart-read-set-upload example concludes a multipart upload into a sequence store once all of the components have been uploaded.

```bash
aws omics complete-multipart-read-set-upload \   --sequence-store-id 0123456789 \   --upload-id 1122334455 \   --parts '[{"checksum":"gaCBQMe+rpCFZxLpoP6gydBoXaKKDA/ Vobh5zBDdb4W4=","partNumber":1,"partSource":"SOURCE1"}]'
```

Output:

```
{
```
For more information, see [Direct upload to a sequence store](#) in the AWS HealthOmics User Guide.

- For API details, see [CompleteMultipartReadSetUpload](#) in AWS CLI Command Reference.

### create-annotation-store

The following code example shows how to use `create-annotation-store`.

**AWS CLI**

**Example 1: To create a VCF annotation store**

The following `create-annotation-store` example creates a VCF format annotation store.

```
aws omics create-annotation-store \\
  --name my_ann_store \\
  --store-format VCF \\
```

Output:

```
{
   "id": "0a91xmplc71f",
   "name": "my_ann_store",
   "reference": {
   },
   "status": "CREATING",
   "storeFormat": "VCF"
}
```

**Example 2: To create a TSV annotation store**
The following `create-annotation-store` example creates a TSV format annotation store.

```
aws omics create-annotation-store \
  --name tsv_ann_store \
  --store-format TSV \
  --store-options file://tsv-store-options.json
```

tsv-store-options.json configures format options for annotations.

```json
{
  "tsvStoreOptions": {
    "annotationType": "CHR_START_END_ZERO_BASE",
    "formatToHeader": {
      "CHR": "chromosome",
      "START": "start",
      "END": "end"
    },
    "schema": [
      {
        "chromosome": "STRING"
      },
      {
        "start": "LONG"
      },
      {
        "end": "LONG"
      },
      {
        "name": "STRING"
      }
    ]
  }
}
```

Output:

```json
{
  "creationTime": "2022-11-30T01:28:08.525586Z",
  "id": "861cxmpl96b0",
  "name": "tsv_ann_store",
}
```
"reference": {
    "status": "CREATING",
    "storeFormat": "TSV",
    "storeOptions": {
        "tsvStoreOptions": {
            "annotationType": "CHR_START_END_ZERO_BASE",
            "formatToHeader": {
                "CHR": "chromosome",
                "END": "end",
                "START": "start"
            },
            "schema": [
                {
                    "chromosome": "STRING"
                },
                {
                    "start": "LONG"
                },
                {
                    "end": "LONG"
                },
                {
                    "name": "STRING"
                }
            ]
        }
    }
},

For more information, see [Omics Analytics](https://aws.amazon.com) in the Amazon Omics Developer Guide.

- For API details, see [CreateAnnotationStore](https://docs.aws.amazon.com/cli/latest/reference/omics/create-annotation-store-version.html) in *AWS CLI Command Reference*.

**create-annotation-store-version**

The following code example shows how to use `create-annotation-store-version`.

**AWS CLI**

To create a new version of an annotation store
The following `create-annotation-store-version` example creates a new version of an annotation store.

```bash
aws omics create-annotation-store-version \
   --name my_annotation_store \
   --version-name my_version
```

**Output:**

```json
{
   "creationTime": "2023-07-21T17:15:49.251040+00:00",
   "id": "3b93cdef69d2",
   "name": "my_annotation_store",
   "reference": {
   },
   "status": "CREATING",
   "versionName": "my_version"
}
```

For more information, see [Creating new versions of annotation stores](#) in the *AWS HealthOmics User Guide*.

- For API details, see [CreateAnnotationStoreVersion](#) in *AWS CLI Command Reference*.

### create-multipart-read-set-upload

The following code example shows how to use `create-multipart-read-set-upload`.

**AWS CLI**

**To begin a multipart read set upload.**

The following `create-multipart-read-set-upload` example initiates a multipart read set upload.

```bash
aws omics create-multipart-read-set-upload \
   --sequence-store-id 0123456789 \
   --name HG00146 \
   --source-file-type FASTQ \
   --subject-id mySubject
```
create-reference-store

The following code example shows how to use create-reference-store.

AWS CLI

To create a reference store

The following create-reference-store example creates a reference store my-ref-store.

```bash
aws omics create-reference-store \
   --name my-ref-store
```

Output:

```
{
   "id": "1234567890",
```

For more information, see [Direct upload to a sequence store](https://aws.amazon.com/documentation/omics/#Direct_upload_to_a_sequence_store) in the *AWS HealthOmics User Guide*.

- For API details, see [CreateMultipartReadSetUpload](https://docs.aws.amazon.com/cli/latest/reference/omics/create-multipart-read-set-upload.html) in *AWS CLI Command Reference*.
"name": "my-ref-store"
}

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see CreateReferenceStore in AWS CLI Command Reference.

**create-run-group**

The following code example shows how to use create-run-group.

**AWS CLI**

**To create a run group**

The following create-run-group example creates a run group named cram-converter.

```bash
aws omics create-run-group \
  --name cram-converter \
  --max-cpus 20 \
  --max-duration 600
```

Output:

```json
{
   "id": "1234567",
   "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see CreateRunGroup in AWS CLI Command Reference.

**create-sequence-store**

The following code example shows how to use create-sequence-store.

**AWS CLI**

**To create a sequence store**

The following create-sequence-store example creates a sequence store.
aws omics create-sequence-store \
   --name my-seq-store

Output:

{
   "creationTime": "2022-11-23T01:24:33.629Z",
   "id": "1234567890",
   "name": "my-seq-store"
}

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see CreateSequenceStore in AWS CLI Command Reference.

create-share

The following code example shows how to use create-share.

**AWS CLI**

To create a share of a HealthOmics analytics store

The following create-share example shows how to create a share of a HealthOmics analytics store that can be accepted by a subscriber outside the account.

aws omics create-share \
   --principal-subscriber "123456789012" \
   --name "my_Share-123"

Output:

{
   "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
   "name": "my_Share-123",
   "status": "PENDING"
}

For more information, see Cross-account sharing in the AWS HealthOmics User Guide.
create-variant-store

The following code example shows how to use create-variant-store.

**AWS CLI**

**To create a variant store**

The following create-variant-store example creates a variant store named my_var_store.

```
aws omics create-variant-store \
   --name my_var_store \
```

Output:

```
{
   "creationTime": "2022-11-23T22:09:07.534499Z",
   "id": "02dexmplcfdd",
   "name": "my_var_store",
   "reference": {
   },
   "status": "CREATING"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CreateVariantStore in AWS CLI Command Reference.

create-workflow

The following code example shows how to use create-workflow.

**AWS CLI**

**To create a workflow**
The following `create-workflow` example creates a WDL workflow.

```bash
aws omics create-workflow \
  --name cram-converter \
  --engine WDL \
  --definition-zip fileb://workflow-crambam.zip \
  --parameter-template file://workflow-params.json
```

`workflow-crambam.zip` is a ZIP archive containing a workflow definition. `workflow-params.json` defines runtime parameters for the workflow.

```json
{
  "ref_fasta" : {
    "description": "Reference genome fasta file",
    "optional": false
  },
  "ref_fasta_index" : {
    "description": "Index of the reference genome fasta file",
    "optional": false
  },
  "ref_dict" : {
    "description": "dictionary file for 'ref_fasta'",
    "optional": false
  },
  "input_cram" : {
    "description": "The Cram file to convert to BAM",
    "optional": false
  },
  "sample_name" : {
    "description": "The name of the input sample, used to name the output BAM",
    "optional": false
  }
}
```

Output:

```json
{
  "id": "1234567",
  "status": "CREATING",
  "tags": {}
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see CreateWorkflow in AWS CLI Command Reference.

**delete-annotation-store**

The following code example shows how to use delete-annotation-store.

**AWS CLI**

**To delete an annotation store**

The following delete-annotation-store example deletes an annotation store named my_vcf_store.

```bash
aws omics delete-annotation-store \
    --name my_vcf_store
```

Output:

```json
{
    "status": "DELETING"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see DeleteAnnotationStore in AWS CLI Command Reference.

**delete-annotation-store-versions**

The following code example shows how to use delete-annotation-store-versions.

**AWS CLI**

**To delete an annotation store version**

The following delete-annotation-store-versions example deletes an annotation store version.

```bash
aws omics delete-annotation-store-versions \
    --name my_annotation_store \
    --versions my_version
```
Output:

```json
{
   "errors": []
}
```

For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see DeleteAnnotationStoreVersions in AWS CLI Command Reference.

**delete-reference**

The following code example shows how to use delete-reference.

**AWS CLI**

To delete a reference

The following delete-reference example deletes a reference.

```
aws omics delete-reference \
  --reference-store-id 1234567890 \
  --id 1234567890
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see DeleteReference in AWS CLI Command Reference.

**delete-reference-store**

The following code example shows how to use delete-reference-store.

**AWS CLI**

To delete a reference store

The following delete-reference-store example deletes a reference store with ID 1234567890.

```
aws omics delete-reference-store \
  --id 1234567890
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see DeleteReferenceStore in AWS CLI Command Reference.

### delete-run

The following code example shows how to use delete-run.

**AWS CLI**

**To delete a workflow run**

The following delete-run example deletes a run with ID 1234567.

```bash
aws omics delete-run \
  --id 1234567
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see DeleteRun in AWS CLI Command Reference.

### delete-run-group

The following code example shows how to use delete-run-group.

**AWS CLI**

**To delete a run group**

The following delete-run-group example deletes a run group with ID 1234567.

```bash
aws omics delete-run-group \
  --id 1234567
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see DeleteRunGroup in AWS CLI Command Reference.

### delete-sequence-store

The following code example shows how to use delete-sequence-store.
AWS CLI

To delete a sequence store

The following delete-sequence-store example deletes a sequence store with ID 1234567890.

```bash
aws omics delete-sequence-store \
  --id 1234567890
```

For more information, see [Oomics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteSequenceStore](#) in *AWS CLI Command Reference*.

delete-share

The following code example shows how to use delete-share.

AWS CLI

To delete a share of HealthOmics analytics data

The following delete-share example deletes a cross-account share of analytics data.

```bash
aws omics delete-share \
  --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```json
{
  "status": "DELETING"
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [DeleteShare](#) in *AWS CLI Command Reference*.

delete-variant-store

The following code example shows how to use delete-variant-store.
AWS CLI

To delete a variant store

The following delete-variant-store example deletes a variant store named my_var_store.

```bash
aws omics delete-variant-store \
   --name my_var_store
```

Output:

```json
{
   "status": "DELETING"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see DeleteVariantStore in AWS CLI Command Reference.

delete-workflow

The following code example shows how to use delete-workflow.

AWS CLI

To delete a workflow

The following delete-workflow example deletes a workflow with ID 1234567.

```bash
aws omics delete-workflow \
   --id 1234567
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see DeleteWorkflow in AWS CLI Command Reference.

get-annotation-import-job

The following code example shows how to use get-annotation-import-job.
AWS CLI

To view an annotation import job

The following get-annotation-import-job example gets details about an annotation import job.

```bash
aws omics get-annotation-import-job
   --job-id 984162c7-xmpl-4d23-ab47-286f7950bfbe
```

Output:

```
{
   "creationTime": "2022-11-30T01:40:11.017746Z",
   "destinationName": "tsv_ann_store",
   "id": "984162c7-xmpl-4d23-ab47-286f7950bfbe",
   "items": [
      {
         "jobStatus": "COMPLETED",
         "source": "s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz"
      }
   ],
   "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
   "runLeftNormalization": false,
   "status": "COMPLETED",
   "updateTime": "2022-11-30T01:42:39.134009Z"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetAnnotationImportJob in AWS CLI Command Reference.

get-annotation-store

The following code example shows how to use get-annotation-store.

AWS CLI

To view an annotation store

The following get-annotation-store example gets details about an annotation store named my_ann_store.
aws omics get-annotation-store \
   --name my_ann_store

Output:

{
   "id": "0a91xmplc71f",
   "name": "my_ann_store",
   "reference": {
   },
   "status": "CREATING",
   "storeFormat": "VCF",
   "storeSizeBytes": 0,
   "tags": {}
}

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see GetAnnotationStore in AWS CLI Command Reference.

get-annotation-store-version

The following code example shows how to use get-annotation-store-version.

AWS CLI

To retrieve the metadata for an annotation store version

The following get-annotation-store-version example retrieves the metadata for the requested annotation store version.

aws omics get-annotation-store-version \
   --name my_annotation_store \
   --version-name my_version

Output:
For more information, see [Creating new versions of annotation stores](#) in the *AWS HealthOmics User Guide*.

- For API details, see [GetAnnotationStoreVersion](#) in *AWS CLI Command Reference*.

### get-read-set

The following code example shows how to use `get-read-set`.

**AWS CLI**

**To download a read set**

The following `get-read-set` example downloads part 3 of a read set as `1234567890.3.bam`.

```bash
aws omics get-read-set \
   --sequence-store-id 1234567890 \
   --id 1234567890 \
   --part-number 3 1234567890.3.bam
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReadSet](#) in *AWS CLI Command Reference*.

### get-read-set-activation-job

The following code example shows how to use `get-read-set-activation-job`.

---

```json
{
   "storeId": "4934045d1c6d",
   "id": "2a3f4a44aa7b",
   "status": "ACTIVE",
   "name": "my_annotation_store",
   "versionName": "my_version",
   "creationTime": "2023-07-21T17:15:49.251040+00:00",
   "updateTime": "2023-07-21T17:15:56.434223+00:00",
   "statusMessage": ",",
   "versionSizeBytes": 0
}
```
AWS CLI

To view a read set activation job

The following `get-read-set-activation-job` example gets details about a read set activation job.

```
aws omics get-read-set-activation-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:33:42.828Z",
    "creationTime": "2022-12-06T22:32:45.213Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "sources": [
        {
            "readSetId": "1234567890",
            "status": "FINISHED",
            "statusMessage": "No activation needed as read set is already in ACTIVATING or ACTIVE state."
        }
    ],
    "status": "COMPLETED",
    "statusMessage": "The job completed successfully."
}
```

For more information, see [Omics Storage](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [GetReadSetActivationJob](#) in [AWS CLI Command Reference](#).

get-read-set-export-job

The following code example shows how to use `get-read-set-export-job`.

AWS CLI

To view a read set export job

The following `get-read-set-export-job` example gets details about a read set export job.
aws omics get-read-set-export-job \
  --sequence-store-id 1234567890 \
  --id 1234567890

Output:

```
{
  "completionTime": "2022-12-06T22:39:14.491Z",
  "creationTime": "2022-12-06T22:37:18.612Z",
  "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
  "id": "1234567890",
  "sequenceStoreId": "1234567890",
  "status": "COMPLETED",
  "statusMessage": "The job is submitted and will start soon."
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReadSetExportJob in AWS CLI Command Reference.

get-read-set-import-job

The following code example shows how to use get-read-set-import-job.

AWS CLI

To view a read set import job

The following get-read-set-import-job example gets details about a read set import job.

aws omics get-read-set-import-job \
  --sequence-store-id 1234567890 \
  --id 1234567890

Output:

```
{
  "creationTime": "2022-11-23T01:36:38.158Z",
  "id": "1234567890",
  "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMLE7QZ",
  "sequenceStoreId": "1234567890",
}
```
"sources": [
    {
      "name": "HG00100",
      "sampleId": "bam-sample",
      "sourceFileType": "BAM",
      "sourceFiles": {
        "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam",
        "source2": ""
      },
      "status": "IN_PROGRESS",
      "statusMessage": "The source job is currently in progress.",
      "subjectId": "bam-subject",

]
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReadSetImportJob in AWS CLI Command Reference.

get-read-set-metadata

The following code example shows how to use get-read-set-metadata.

AWS CLI

To view a read set

The following get-read-set-metadata example gets details about a read set's files.

```bash
aws omics get-read-set-metadata \
  --sequence-store-id 1234567890 \
  --id 1234567890
```

Output:

```
{
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReadSetMetadata in AWS CLI Command Reference.

get-reference

The following code example shows how to use get-reference.

AWS CLI

To download a genome reference

The following get-reference example downloads part 1 of a genome as hg38.1.fa.

```bash
aws omics get-reference
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReference in AWS CLI Command Reference.

**get-reference-import-job**

The following code example shows how to use get-reference-import-job.

**AWS CLI**

**To view a reference import job**

The following get-reference-import-job example gets details about a reference import job.

```bash
aws omics get-reference-import-job \
  --reference-store-id 1234567890 \
  --id 1234567890
```

Output:

```json
{
  "creationTime": "2022-11-22T22:25:41.124Z",
  "id": "1234567890",
  "referenceStoreId": "1234567890",
  "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
  "sources": [
    {
      "name": "assembly-38",
      "sourceFile": "s3://omics-artifacts-01d6xmpl4e72dd32/Homo_sapiens_assembly38.fasta",
      "status": "IN_PROGRESS",
      "statusMessage": "The source job is currently in progress."
    }
  ],
  "status": "IN_PROGRESS",
  "statusMessage": "The job is currently in progress."
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.
- For API details, see GetReferenceImportJob in AWS CLI Command Reference.

get-reference-metadata

The following code example shows how to use get-reference-metadata.

AWS CLI

To view a reference

The following get-reference-metadata example gets details about a reference.

```
aws omics get-reference-metadata \
  --reference-store-id 1234567890 \
  --id 1234567890
```

Output:

```
{
  reference/1234567890",
  "files": {
    "index": {
      "contentLength": 160928,
      "partSize": 104857600,
      "totalParts": 1
    },
    "source": {
      "contentLength": 3249912778,
      "partSize": 104857600,
      "totalParts": 31
    }
  },
  "id": "1234567890",
  "md5": "7ff134953dcca8c8997453bb80b6b5e",
  "name": "assembly-38",
  "referenceStoreId": "1234567890",
}
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReferenceMetadata in AWS CLI Command Reference.

**get-reference-store**

The following code example shows how to use `get-reference-store`.

**AWS CLI**

To view a reference store

The following `get-reference-store` example gets details about a reference store.

```bash
aws omics get-reference-store
  --id 1234567890
```

Output:

```json
{
  "creationTime": "2022-09-23T23:27:20.364Z",
  "id": "1234567890",
  "name": "my-rstore-0"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetReferenceStore in AWS CLI Command Reference.

**get-run**

The following code example shows how to use `get-run`.

**AWS CLI**

To view a workflow run
The following get-run example gets details about a workflow run.

```bash
aws omics get-run \\
--id 1234567
```

Output:

```json
{
  "creationTime": "2022-11-30T22:58:22.615865Z",

  "workflowType": "PRIVATE"
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see GetRun in AWS CLI Command Reference.

get-run-group

The following code example shows how to use get-run-group.

AWS CLI

To view a run group

The following get-run-group example gets details about a run group.

```bash
aws omics get-run-group \
--id 1234567
```

Output:

```
{
    "creationTime": "2022-12-01T00:58:42.915219Z",
    "id": "1234567",
    "maxCpus": 20,
    "maxDuration": 600,
    "name": "cram-convert",
    "tags": {}
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see GetRunGroup in AWS CLI Command Reference.

get-run-task

The following code example shows how to use get-run-task.

AWS CLI

To view a task

The following get-run-task example gets details about a workflow task.
aws omics get-run-task \
  --id 1234567 \
  --task-id 1234567

Output:

```json
{
    "cpus": 1,
    "creationTime": "2022-11-30T23:13:00.718651Z",
    "memory": 15,
    "name": "CramToBamTask",
    "startTime": "2022-11-30T23:17:47.016Z",
    "status": "COMPLETED",
    "taskId": "1234567"
}
```

For more information, see [Oomics Workflows](#) in the Amazon Omics Developer Guide.

- For API details, see [GetRunTask](#) in AWS CLI Command Reference.

### get-sequence-store

The following code example shows how to use `get-sequence-store`.

**AWS CLI**

**To view a sequence store**

The following `get-sequence-store` example gets details about a sequence store with ID 1234567890.

```bash
aws omics get-sequence-store \
  --id 1234567890
```

Output:

```json
{

```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see GetSequenceStore in AWS CLI Command Reference.

get-share

The following code example shows how to use get-share.

AWS CLI

To retrieves the metadata about a share of a HealthOmics analytics data

The following get-share example retrieves the metadata for a cross-account share of analytics data.

```
aws omics get-share \
   --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "share": {
        "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
        "name": "my_Share-123",
        "principalSubscriber": "123456789012",
        "ownerId": "555555555555",
        "status": "PENDING"
    }
}
```

For more information, see Cross-account sharing in the AWS HealthOmics User Guide.

- For API details, see GetShare in AWS CLI Command Reference.
**get-variant-import-job**

The following code example shows how to use `get-variant-import-job`.

**AWS CLI**

To view a variant import job

The following `get-variant-import-job` example gets details about a variant import job.

```bash
aws omics get-variant-import-job \\
  --job-id edd7b8ce-xmpl-47e2-bc99-258cac95a508
```

Output:

```json
{
  "creationTime": "2022-11-23T22:42:50.037812Z",
  "destinationName": "my_var_store",
  "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
  "items": [
    {
      "jobStatus": "IN_PROGRESS",
      "source": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.known_indels.vcf.gz"
    }
  ],
  "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
  "runLeftNormalization": false,
  "status": "IN_PROGRESS",
  "updateTime": "2022-11-23T22:43:05.898309Z"
}
```

For more information, see [Oomics Analytics](https://docs.aws.amazon.com/omics/latest/userguide/omics-analytics.html) in the Amazon Omics Developer Guide.

- For API details, see [GetVariantImportJob](https://docs.aws.amazon.com/cli/latest/reference/omics/get-variant-import-job.html) in **AWS CLI Command Reference**.

**get-variant-store**

The following code example shows how to use `get-variant-store`.
AWS CLI

To view a variant store

The following get-variant-store example gets details about a variant store.

```
aws omics get-variant-store \
  --name my_var_store
```

Output:

```
{
  "creationTime": "2022-11-23T22:09:07.534499Z",
  "id": "02demplcfdd",
  "name": "my_var_store",
  "reference": {
  },
  "status": "CREATING",
  "storeSizeBytes": 0,
  "tags": {},
  "updateTime": "2022-11-23T22:09:24.931711Z"
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetVariantStore](#) in *AWS CLI Command Reference*.

get-workflow

The following code example shows how to use get-workflow.

AWS CLI

To view a workflow

The following get-workflow example gets details about a workflow with ID 1234567.

```
aws omics get-workflow \
```
--id 1234567

Output:

```json
{
    "digest": "sha256:c54bxmpl742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
    "engine": "WDL",
    "id": "1234567",
    "main": "workflow-crambam.wdl",
    "name": "cram-converter",
    "parameterTemplate": {
        "ref_dict": {
            "description": "dictionary file for 'ref_fasta'"
        },
        "ref_fasta_index": {
            "description": "Index of the reference genome fasta file"
        },
        "ref_fasta": {
            "description": "Reference genome fasta file"
        },
        "input_cram": {
            "description": "The Cram file to convert to BAM"
        },
        "sample_name": {
            "description": "The name of the input sample, used to name the output BAM"
        }
    },
    "status": "ACTIVE",
    "statusMessage": "workflow-crambam.wdl
        workflow CramToBamFlow
        call CramToBamTask
        call ValidateSamFile
        task CramToBamTask
        task ValidateSamFile",
    "tags": {},
    "type": "PRIVATE"
}
```

For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see GetWorkflow in AWS CLI Command Reference.
list-annotation-import-jobs

The following code example shows how to use `list-annotation-import-jobs`.

**AWS CLI**

To get a list of annotation import jobs

The following `list-annotation-import-jobs` gets a list of annotation import jobs.

```bash
aws omics list-annotation-import-jobs
```

Output:

```json
{
   "annotationImportJobs": [
   {
      "creationTime": "2022-11-30T01:39:41.478294Z",
      "destinationName": "gff_ann_store",
      "id": "18a9e792-xmpl-4869-a105-e5b602900444",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "runLeftNormalization": false,
      "status": "COMPLETED",
      "updateTime": "2022-11-30T01:47:09.145178Z"
   },
   {
      "creationTime": "2022-11-30T00:45:58.007838Z",
      "destinationName": "my_ann_store",
      "id": "4e9eafc8-xmpl-431e-a0b2-3bda27cb600a",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "runLeftNormalization": false,
      "status": "FAILED",
      "updateTime": "2022-11-30T00:47:01.706325Z"
   }
   ]
}
```

For more information, see [Oomics Analytics](https://docs.aws.amazon.com/omics/latest/userguide/) in the [Amazon Oomics Developer Guide](https://docs.aws.amazon.com/omics/latest/userguide/).

list-annotation-store-versions

The following code example shows how to use `list-annotation-store-versions`.

AWS CLI

**To list all the versions of an annotation store.**

The following `list-annotation-store-versions` example lists all versions that exist of an annotation store.

```bash
aws omics list-annotation-store-versions \
   --name my_annotation_store
```

Output:

```json
{
   "annotationStoreVersions": [ 
   
   
   {
      "storeId": "4934045d1c6d",
      "id": "2a3f4a44aa7b",
      "status": "CREATING",
      "name": "my_annotation_store",
      "versionName": "my_version_2",
      "creationTime": "2023-07-21T17:20:59.380043+00:00",
      "versionSizeBytes": 0
   },
   
   {
      "storeId": "4934045d1c6d",
      "id": "4934045d1c6d",
      "status": "ACTIVE",
      "name": "my_annotation_store",
      "versionName": "my_version_1",
      "creationTime": "2023-07-21T17:15:49.251040+00:00",
      "updateTime": "2023-07-21T17:15:56.434223+00:00",
      "statusMessage": ",",
      "versionSizeBytes": 0
   }
   
   
}
```
For more information, see Creating new versions of annotation stores in the AWS HealthOmics User Guide.

- For API details, see ListAnnotationStoreVersions in AWS CLI Command Reference.

list-annotation-stores

The following code example shows how to use list-annotation-stores.

AWS CLI

To get a list of annotation stores

The following list-annotation-stores example gets a list of annotation stores.

```
aws omics list-annotation-stores
```

Output:

```
{
   "annotationStores": [
   {
      "id": "0a91xmplc71f",
      "name": "my_ann_store",
      "reference": {
      },
      "status": "ACTIVE",
      "statusMessage": "",
      "storeFormat": "VCF",
      "storeSizeBytes": 0,
      "updateTime": "2022-11-23T22:53:27.372840Z"
   }
  ]
}
```
list-multipart-read-set-uploads

The following code example shows how to use list-multipart-read-set-uploads.

**AWS CLI**

To list all multipart read set uploads and their statuses.

The following list-multipart-read-set-uploads example lists all multipart read set uploads and their statuses.

```
aws omics list-multipart-read-set-uploads \
    --sequence-store-id 0123456789
```

Output:

```
{
    "uploads": [
        {
            "sequenceStoreId": "0123456789",
            "uploadId": "8749584421",
            "sourceFileType": "FASTQ",
            "subjectId": "mySubject",
            "sampleId": "mySample",
            "generatedFrom": "1000 Genomes",
            "name": "HG00146",
            "description": "FASTQ for HG00146",
            "creationTime": "2023-11-29T19:22:51.349298+00:00"
        },
        {
            "sequenceStoreId": "0123456789",
            "uploadId": "5290538638",
            "sourceFileType": "BAM",
            "subjectId": "mySubject",
            "sampleId": "mySample",
            "generatedFrom": "1000 Genomes",
            "name": "HG00146",
            "description": "BAM for HG00146",
            "creationTime": "2023-11-29T19:22:51.349298+00:00"
        }
    ]
}
```
For more information, see [Direct upload to a sequence store](#) in the [AWS HealthOmics User Guide](#).

- For API details, see [ListMultipartReadSetUploads](#) in [AWS CLI Command Reference](#).

list-read-set-activation-jobs

The following code example shows how to use `list-read-set-activation-jobs`.

**AWS CLI**

**To get a list of read set activation jobs**

The following `list-read-set-activation-jobs` example gets a list of activation jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-activation-jobs \
   --sequence-store-id 1234567890
```

Output:

```
{
   "activationJobs": [
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReadSetActivationJobs in AWS CLI Command Reference.

**list-read-set-export-jobs**

The following code example shows how to use list-read-set-export-jobs.

**AWS CLI**

To get a list of read set export jobs

The following list-read-set-export-jobs example gets a list of export jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-export-jobs \
   --sequence-store-id 1234567890
```

Output:

```json
{
  "exportJobs": [
    {
      "completionTime": "2022-12-06T22:39:14.491Z",
      "creationTime": "2022-12-06T22:37:18.612Z",
      "destination": "s3://omics-artifacts-01d6xm64e72d32e72d32/read-set-export/",
      "id": "1234567890",
      "sequenceStoreId": "1234567890",
      "status": "COMPLETED"
    },
    {
      "completionTime": "2022-12-06T22:35:10.100Z",

  "status": "IN_PROGRESS"
}
}

For more information, see [Omics Storage](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [ListReadSetExportJobs](#) in [AWS CLI Command Reference](#).

list-read-set-import-jobs

The following code example shows how to use `list-read-set-import-jobs`.

**AWS CLI**

**To get a list of read set import jobs**

The following `list-read-set-import-jobs` example gets a list of import jobs for a sequence store with id 1234567890.

```bash
aws omics list-read-set-import-jobs \
  --sequence-store-id 1234567890
```

Output:

```json
{
  "importJobs": [
    {
      "completionTime": "2022-11-29T18:17:49.244Z",
      "creationTime": "2022-11-29T17:32:47.700Z",
      "id": "1234567890",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ",
      "sequenceStoreId": "1234567890",
      "status": "COMPLETED"
    }
  ]
}
```
The following code example shows how to use `list-read-set-upload-parts`.

**AWS CLI**

**To list all parts in a requested multipart upload for a sequence store.**

The following `list-read-set-upload-parts` example list all parts in a requested multipart upload for a sequence store.

```
aws omics list-read-set-upload-parts \
  --sequence-store-id 0123456789 \
  --upload-id 1122334455 \
  --part-source SOURCE1
```

**Output:**

```
{
  "parts": [
    {
      "partNumber": 1,
      "partSize": 94371840,
      "file": "SOURCE1",
      "checksum": "984979b9928ae8d862286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",

```
For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListReadSetUploadParts](#) in *AWS CLI Command Reference*.

### list-read-sets

The following code example shows how to use `list-read-sets`.

#### AWS CLI

**To get a list of read sets**

The following `list-read-sets` example gets a list of read sets for a sequence store with id 1234567890.

```bash
aws omics list-read-sets \
  --sequence-store-id 1234567890
```

**Output:**

```json
{
  "readSets": [
    {
      "creationTime": "2022-11-23T21:55:00.515Z",
      "fileType": "FASTQ",
      "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
    }
  ]
}
```
For more information, see [Oomics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReadSets](#) in *AWS CLI Command Reference*.

### list-reference-import-jobs

The following code example shows how to use `list-reference-import-jobs`.

**AWS CLI**

**To get a list of reference import jobs**

The following `list-reference-import-jobs` example gets a list of reference import jobs for a reference store with id 1234567890.

```bash
aws omics list-reference-import-jobs 
    --reference-store-id 1234567890
```

**Output:**

```json
{
    "importJobs": [
        {
            "completionTime": "2022-11-23T19:54:58.204Z",
            "creationTime": "2022-11-23T19:53:20.729Z",
            "id": "1234567890",
            "referenceStoreId": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ",
            "status": "COMPLETED"
        }
    ]
}
```
For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReferenceImportJobs in AWS CLI Command Reference.

**list-reference-stores**

The following code example shows how to use list-reference-stores.

**AWS CLI**

**To get a list of reference stores**

The following list-reference-stores example gets a list of reference stores.

```
aws omics list-reference-stores
```

Output:

```
{
   "referenceStores": [
   {
      "id": "1234567890",
      "name": "my-ref-store"
   }
   ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListReferenceStores in AWS CLI Command Reference.
list-references

The following code example shows how to use list-references.

AWS CLI

To get a list of references

The following list-references example gets a list of genome references for a reference store with id 1234567890.

```bash
aws omics list-references \
   --reference-store-id 1234567890
```

Output:

```json
{
   "references": [
      {
         "id": "1234567890",
         "md5": "7ff134953dcca8c8997453bbb80b6b5e",
         "name": "assembly-38",
         "referenceStoreId": "1234567890",
         "status": "ACTIVE",
      }
   ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.
- For API details, see ListReferences in AWS CLI Command Reference.

list-run-groups

The following code example shows how to use list-run-groups.

AWS CLI

To get a list of run groups
The following `list-run-groups` example gets a list of run groups.

```
aws omics list-run-groups
```

Output:

```
{
   "items": [
       {
           "creationTime": "2022-12-01T00:58:42.915219Z",
           "id": "1234567",
           "maxCpus": 20,
           "maxDuration": 600,
           "name": "cram-convert"
       }
   ]
}
```

For more information, see [Omics Workflows](https://aws.amazon.com/documentation/omics/) in the *Amazon Omics Developer Guide*.

- For API details, see [ListRunGroups](https://docs.aws.amazon.com/cli/latest/reference/omics/list-run-groups.html) in *AWS CLI Command Reference*.

---

### list-run-tasks

The following code example shows how to use `list-run-tasks`.

**AWS CLI**

**To get a list of tasks**

The following `list-run-tasks` example gets a list of tasks for a workflow run.

```
aws omics list-run-tasks \ 
--id 1234567
```

Output:

```
{
   "items": [
       {
           "cpus": 1,
           "name": "cram-convert"
       }
   ]
}
```
For more information, see [Omics Workflows](#) in the [Amazon Omics Developer Guide](#).

- For API details, see [ListRunTasks](#) in [AWS CLI Command Reference](#).

list-runs

The following code example shows how to use `list-runs`.

**AWS CLI**

To get a list of workflow runs

The following `list-runs` example gets a list of workflow runs.

```bash
aws omics list-runs
```

Output:

```json
{
  "items": [
    {
      ...}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see ListRuns in AWS CLI Command Reference.

list-sequence-stores

The following code example shows how to use list-sequence-stores.

AWS CLI

To get a list of sequence stores
The following list-sequence-stores example gets a list of sequence stores.

```bash
aws omics list-sequence-stores
```

Output:

```json
{
   "sequenceStores": [
      {
         "creationTime": "2022-11-23T01:24:33.629Z",
         "id": "1234567890",
         "name": "my-seq-store"
      }
   ]
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see ListSequenceStores in AWS CLI Command Reference.

### list-shares

The following code example shows how to use list-shares.

**AWS CLI**

**To list the available shares of a HealthOmics analytics data**

The following list-shares example lists all shares that have been created for a resource-owner.

```bash
aws omics list-shares \
   --resource-owner SELF
```

Output:

```json
{
   "shares": [
      {
         "shareId": "595c1cbda008-4eca-a887-954d30c91c6e",
         "name": "myShare",
```

Actions and scenarios 3253

For more information, see [Cross-account sharing](#) in the AWS HealthOmics User Guide.

- For API details, see [ListShares](#) in AWS CLI Command Reference.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To get a list of tags**

The following `list-tags-for-resource` example gets a list of tags for a workflow with id 1234567.

```
aws omics list-tags-for-resource
```
Output:

```json
{
  "tags": {
    "department": "analytics"
  }
}
```

For more information, see [Tagging resources in Amazon Omics](https://docs.aws.amazon.com/omics/latest/APIReference/API_TagResource.html) in the *Amazon Omics Developer Guide*.

- For API details, see [ListTagsForResource](https://docs.aws.amazon.com/omics/latest/APIReference/API_ListTagsForResource.html) in *AWS CLI Command Reference*.

### list-variant-import-jobs

The following code example shows how to use `list-variant-import-jobs`.

**AWS CLI**

**To get a list of variant import jobs**

The following `list-variant-import-jobs` example gets a list of variant import jobs.

```bash
aws omics list-variant-import-jobs
```

**Output:**

```json
{
  "variantImportJobs": [
    {
      "creationTime": "2022-11-23T22:47:02.514002Z",
      "destinationName": "my_var_store",
      "id": "69cb65d6-xmpl-4a4a-9025-4565794b684e",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ",
      "runLeftNormalization": false,
      "status": "COMPLETED",
      "updateTime": "2022-11-23T22:49:17.976597Z"
    },
    {
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see ListVariantImportJobs in AWS CLI Command Reference.

**list-variant-stores**

The following code example shows how to use list-variant-stores.

**AWS CLI**

To get a list of variant stores

The following list-variant-stores example gets a list of variant stores.

```bash
aws omics list-variant-stores
```

Output:

```json
{
   "variantStores": [
    {
     "creationTime": "2022-11-23T22:09:07.534999Z",
     "id": "02dexmplcfdd",
     "name": "my_var_store",
     "reference": {
     },
     "status": "CREATING",
    }
   ]
}
```
The following code example shows how to use `list-workflows`.

**AWS CLI**

**To get a list of workflows**

The following `list-workflows` example gets a list of workflows.

```
aws omics list-workflows
```

**Output:**

```
{
   "items": [
   {
      "creationTime": "2022-09-23T23:00:09.140265Z",
      "digest": "nSCNo/qMWFxmpl1a24",
      "id": "8777xmpl1a24",
      "name": "myvstore0",
      "status": "ACTIVE",
      "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/myvstore0",
      "storeSizeBytes": 0,
      "updateTime": "2022-09-23T23:03:26.013220Z"
   }
   ]
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.

- For API details, see ListWorkflows in AWS CLI Command Reference.

**start-annotation-import-job**

The following code example shows how to use start-annotation-import-job.

**AWS CLI**

**To import annotations**

The following start-annotation-import-job example imports annotations from Amazon S3.

```bash
aws omics start-annotation-import-job \
  --destination-name tsv_ann_store \ 
  --no-run-left-normalization \ 
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMP7QZ \ 
  --items source=s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz
```

Output:

```
{
  "jobId": "984162c7-xmpl-4d23-ab47-286f7950bfbf"
}
```
For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see StartAnnotationImportJob in AWS CLI Command Reference.

**start-read-set-activation-job**

The following code example shows how to use start-read-set-activation-job.

**AWS CLI**

**To activate an archived read set**

The following start-read-set-activation-job example activates two read sets.

```
aws omics start-read-set-activation-job \
    --sequence-store-id 1234567890 \
    --sources readSetId=1234567890 readSetId=1234567890
```

Output:

```
{
    "creationTime": "2022-12-06T22:35:10.100Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see StartReadSetActivationJob in AWS CLI Command Reference.

**start-read-set-export-job**

The following code example shows how to use start-read-set-export-job.

**AWS CLI**

**To export a read set**

The following start-read-set-export-job example exports two read sets to Amazon S3.
aws omics start-read-set-export-job
  --sequence-store-id 1234567890
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPLO7QZ
  --sources readSetId=1234567890 readSetId=1234567890
  --destination s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/

Output:

```json
{
  "creationTime": "2022-12-06T22:37:18.612Z",
  "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
  "id": "1234567890",
  "sequenceStoreId": "1234567890",
  "status": "SUBMITTED"
}
```

For more information, see [Omics Storage](https://docs.aws.amazon.com/omics/latest/developerguide/) in the [Amazon Omics Developer Guide](https://docs.aws.amazon.com/omics/latest/developerguide/).

**start-read-set-import-job**

The following code example shows how to use `start-read-set-import-job`.

**AWS CLI**

**To import a read set**

The following `start-read-set-import-job` example imports a read set.

```bash
aws omics start-read-set-import-job
  --sequence-store-id 1234567890
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPLO7QZ
  --sources file://readset-sources.json
```

`readset-sources.json` is a JSON document with the following content.

```json
[
]
```
Output:

```json
{
    "creationTime": "2022-11-23T01:36:38.158Z",
    "id": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801Xmpl7QZ",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see StartReadSetImportJob in AWS CLI Command Reference.

### start-reference-import-job

The following code example shows how to use start-reference-import-job.

**AWS CLI**

**To import a reference genome**

The following start-reference-import-job example imports a reference genome from Amazon S3.

```bash
aws omics start-reference-import-job
```
The following code example shows how to use `start-run`.

### AWS CLI

**To run a workflow**

The following `start-run` example runs a workflow with ID 1234567.

```bash
aws omics start-run \
  --workflow-id 1234567 \
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W801XMPL7QZ \
  --name 'cram-to-bam' \
  --output-uri s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/ \
  --run-group-id 1234567 \
  --priority 1 \
  --storage-capacity 10 \
  --log-level ALL \
  --parameters file://workflow-inputs.json
```
workflow-inputs.json is a JSON document with the following content.

```json
{
    "sample_name": "NA12878",
    "input_cram": "s3://omics-artifacts-01d6xmpl4e72dd32/NA12878.cram",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
      Homo_sapiens_assembly38.dict",
    "ref_fasta": "s3://omics-artifacts-01d6xmpl4e72dd32/
      Homo_sapiens_assembly38.fasta",
    "ref_fasta_index": "omics-artifacts-01d6xmpl4e72dd32/
      Homo_sapiens_assembly38.fasta.fai"
}
```

Output:

```json
{
    "id": "1234567",
    "status": "PENDING",
    "tags": {}
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

**To load source files from Amazon Omics**

You can also load source files from Amazon Omics storage, by using service-specific URIs. The following example workflow-inputs.json file uses Amazon Omics URIs for read set and reference genome sources.

```json
{
    "sample_name": "NA12878",
    "input_cram": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/readSet/1234567890/source1",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
      Homo_sapiens_assembly38.dict",
    "ref_fasta": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
      reference/1234567890",
    "ref_fasta_index": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/reference/1234567890/index"
}
```
For more information, see Omics Workflows in the Amazon Omics Developer Guide.
- For API details, see StartRun in AWS CLI Command Reference.

**start-variant-import-job**

The following code example shows how to use start-variant-import-job.

**AWS CLI**

To import a variant file

The following start-variant-import-job example imports a VCF format variant file.

```bash
aws omics start-variant-import-job \
   --destination-name my_var_store \
   --no-run-left-normalization \ 
   --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-W8O1XMPL7QZ \ 
   --items source=s3://omics-artifacts-01d6xmpl4e72dd32/ 
Homo_sapiens_assembly38.known_indels.vcf.gz
```

Output:

```json
{
   "jobId": "edd7b8ce-xmpl-47e2-bc99-258cac95a508"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.
- For API details, see StartVariantImportJob in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

To tag a resource

The following tag-resource example adds a department tag to a workflow with id 1234567.
aws omics tag-resource
   --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
   --tags department=analytics

For more information, see Tagging resources in Amazon Omics in the Amazon Omics Developer Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource

The following untag-resource example removes the department tag from a workflow.

aws omics untag-resource \
   --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
   --tag-keys department

For more information, see Omics Storage in the Amazon Omics Developer Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-annotation-store

The following code example shows how to use update-annotation-store.

AWS CLI

To update an annotation store

The following update-annotation-store example updates the description of an annotation store named my_vcf_store.

aws omics update-annotation-store \
   --name my_vcf_store \

--description "VCF annotation store"

Output:

```
{
    "creationTime": "2022-12-05T18:00:56.101860Z",
    "description": "VCF annotation store",
    "id": "bd6axmpl2444",
    "name": "my_vcf_store",
    "reference": {
    },
    "status": "ACTIVE",
    "storeFormat": "VCF",
    "updateTime": "2022-12-05T18:13:16.100051Z"
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see UpdateAnnotationStore in AWS CLI Command Reference.

**update-run-group**

The following code example shows how to use update-run-group.

**AWS CLI**

**To update a run group**

The following update-run-group example updates the settings of a run group with id 1234567.

```
aws omics update-run-group \ 
   --id 1234567 \ 
   --max-cpus 10
```

Output:

```
{
    "creationTime": "2022-12-01T00:58:42.915219Z",
```
"id": "1234567",
"maxCpus": 10,
"maxDuration": 600,
"name": "cram-convert",
"tags": {}  
}

For more information, see [Oomics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [UpdateRunGroup](#) in *AWS CLI Command Reference*.

**update-variant-store**

The following code example shows how to use `update-variant-store`.

**AWS CLI**

To update a variant store

The following `update-variant-store` example updates the description of a variant store named `my_var_store`.

```bash
aws omics update-variant-store \
   --name my_var_store \
   --description "variant store"
```

**Output:**

```json
{
   "creationTime": "2022-11-23T22:09:07.534499Z",
   "description": "variant store",
   "id": "02dexmplcfdd",
   "name": "my_var_store",
   "reference": {
   },
   "status": "ACTIVE",
   "updateTime": "2022-12-05T18:23:37.686402Z"
}
```

For more information, see [Oomics Analytics](#) in the *Amazon Omics Developer Guide*. 
update-workflow

The following code example shows how to use update-workflow.

AWS CLI

To update a workflow

The following update-workflow example updates the description of a workflow with ID 1234567.

```bash
aws omics update-workflow \
   --id 1234567 \
   --description "copy workflow"
```

For more information, see Omics Storage in the Amazon Omics Developer Guide.

For API details, see UpdateWorkflow in AWS CLI Command Reference.

upload-read-set-part

The following code example shows how to use upload-read-set-part.

AWS CLI

To upload a read set part.

The following upload-read-set-part example uploads a specified part of a read set.

```bash
aws omics upload-read-set-part \
   --sequence-store-id 0123456789 \
   --upload-id 1122334455 \
   --part-source SOURCE1 \
   --part-number 1 \
   --payload /path/to/file/read_1_part_1.fastq.gz
```

Output:

```json
{
```
IAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics
- **Actions**

### Actions

#### Add a user to a group

The following code example shows how to add a user to an IAM group.

**AWS CLI**

**To add a user to an IAM group**

The following `add-user-to-group` command adds an IAM user named Bob to the IAM group named Admins.

```bash
aws iam add-user-to-group
```
--user-name Bob \
--group-name Admins

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the AWS IAM User Guide.

- For API details, see AddUserToGroup in AWS CLI Command Reference.

Attach a policy to a role

The following code example shows how to attach an IAM policy to a role.

AWS CLI

To attach a managed policy to an IAM role

The following attach-role-policy command attaches the AWS managed policy named ReadOnlyAccess to the IAM role named ReadOnlyRole.

```
aws iam attach-role-policy \
  --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
  --role-name ReadOnlyRole
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.

- For API details, see AttachRolePolicy in AWS CLI Command Reference.

Attach a policy to a user

The following code example shows how to attach an IAM policy to a user.

⚠️ Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.
AWS CLI

To attach a managed policy to an IAM user

The following `attach-user-policy` command attaches the AWS managed policy named `AdministratorAccess` to the IAM user named Alice.

```
aws iam attach-user-policy \\
   --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \\
   --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.

- For API details, see AttachUserPolicy in AWS CLI Command Reference.

Attach an inline policy to a role

The following code example shows how to attach an inline policy to an IAM role.

AWS CLI

To attach a permissions policy to an IAM role

The following `put-role-policy` command adds a permissions policy to the role named Test-Role.

```
aws iam put-role-policy \\
   --role-name Test-Role \\
   --policy-name ExamplePolicy \\
   --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see PutRolePolicy in AWS CLI Command Reference.
Create a SAML provider

The following code example shows how to create an AWS Identity and Access Management (IAM) SAML provider.

**AWS CLI**

**To create a SAML provider**

This example creates a new SAML provider in IAM named `MySAMLProvider`. It is described by the SAML metadata document found in the file `SAMLMetaData.xml`.

```bash
aws iam create-saml-provider \
  --saml-metadata-document file://SAMLMetaData.xml \
  --name MySAMLProvider
```

Output:

```
{
  "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see [Creating IAM SAML identity providers](https://docs.aws.amazon.com/IAM/latest/UserGuide/create-saml-provider.html) in the *AWS IAM User Guide*.

- For API details, see [CreateSAMLProvider](https://docs.aws.amazon.com/cli/latest/reference/iam/create-saml-provider.html) in *AWS CLI Command Reference*.

Create a group

The following code example shows how to create an IAM group.

**AWS CLI**

**To create an IAM group**

The following `create-group` command creates an IAM group named `Admins`.

```bash
aws iam create-group \
  --group-name Admins
```

Output:

```
{
}
```
"Group": {
    "Path": "/",
    "CreateDate": "2015-03-09T20:30:24.940Z",
    "GroupId": "AIDGPMS9R04H3FEXAMPLE",
    "Arn": "arn:aws:iam::123456789012:group/Admins",
    "GroupName": "Admins"
}
}

For more information, see Creating IAM user groups in the AWS IAM User Guide.

- For API details, see CreateGroup in AWS CLI Command Reference.

Create a policy

The following code example shows how to create an IAM policy.

AWS CLI

Example 1: To create a customer managed policy

The following command creates a customer managed policy named my-policy.

```bash
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy
```

The file policy is a JSON document in the current folder that grants read only access to the shared folder in an Amazon S3 bucket named my-bucket.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:Get*",
                "s3:List*
            ],
            "Resource": [
                "arn:aws:s3:::my-bucket/shared/**
            ]
        }
    ]
}
```
Example 2: To create a customer managed policy with a description

The following command creates a customer managed policy named `my-policy` with an immutable description:

```
aws iam create-policy \
--policy-name my-policy \
--policy-document file://policy.json \
--description "This policy grants access to all Put, Get, and List actions for my-bucket"
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:PutObject",
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::my-bucket/*"
            ]
        }
    ]
}
```
"Action": [
  "s3:ListBucket*",
  "s3:PutBucket*",
  "s3:GetBucket*"
],
"Resource": [
  "arn:aws:s3:::my-bucket"
]
}

Output:

{
  "Policy": {
    "PolicyName": "my-policy",
    "PolicyId": "ANPAWGSUGIDPEXAMPLE",
    "Arn": "arn:aws:iam::123456789012:policy/my-policy",
    "Path": "/",
    "DefaultVersionId": "v1",
    "AttachmentCount": 0,
    "PermissionsBoundaryUsageCount": 0,
    "IsAttachable": true,
    "CreateDate": "2023-05-24T22:38:47+00:00",
    "UpdateDate": "2023-05-24T22:38:47+00:00"
  }
}

Example 3: To Create a customer managed policy with tags

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the `--tags` flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```
aws iam create-policy \
  --policy-name my-policy \
```
The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*",
            ],
            "Resource": [
                "arn:aws:s3:::my-bucket"
            ]
        }
    ]
}
```

**Output:**

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWSUGIDPAMPLE",
        "Arn": "arn:aws:iam::12345678012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T23:16:39+00:00",
        "UpdateDate": "2023-05-24T23:16:39+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
For more information on Tagging policies, see Tagging customer managed policies in the AWS IAM User Guide.

- For API details, see CreatePolicy in AWS CLI Command Reference.

Create a policy version

The following code example shows how to create an IAM policy version.

**AWS CLI**

**To create a new version of a managed policy**

This example creates a new v2 version of the IAM policy whose ARN is arn:aws:iam::123456789012:policy/MyPolicy and makes it the default version.

```bash
aws iam create-policy-version \
   --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
   --policy-document file://NewPolicyVersion.json \
   --set-as-default
```

Output:

```json
{
   "PolicyVersion": {
      "CreateDate": "2015-06-16T18:56:03.721Z",
      "VersionId": "v2",
      "IsDefaultVersion": true
   }
}
```

For more information, see Versioning IAM policies in the AWS IAM User Guide.

- For API details, see CreatePolicyVersion in AWS CLI Command Reference.
Create a role

The following code example shows how to create an IAM role.

AWS CLI

Example 1: To create an IAM role

The following create-role command creates a role named Test-Role and attaches a trust policy to it.

```bash
aws iam create-role \\
   --role-name Test-Role \\
   --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```
{
   "Role": {
      "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
      "RoleId": "AKIAIOSFODNN7EXAMPLE",
      "CreateDate": "2013-06-07T20:43:32.821Z",
      "RoleName": "Test-Role",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:role/Test-Role"
   }
}
```

The trust policy is defined as a JSON document in the `Test-Role-Trust-Policy.json` file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the put-role-policy command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

Example 2: To create an IAM role with specified maximum session duration

The following create-role command creates a role named Test-Role and sets a maximum session duration of 7200 seconds (2 hours).

```bash
aws iam create-role \\
   --role-name Test-Role \\
   --assume-role-policy-document file://Test-Role-Trust-Policy.json \\
   --max-session-duration 7200
```
--role-name Test-Role \
--assume-role-policy-document file://Test-Role-Trust-Policy.json \
--max-session-duration 7200

Output:

```
{
  "Role": {
    "Path": "/",
    "RoleName": "Test-Role",
    "RoleId": "AKIAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::12345678012:role/Test-Role",
    "CreateDate": "2023-05-24T23:50:25+00:00",
    "AssumeRolePolicyDocument": { 
      "Version": "2012-10-17",
      "Statement": [ 
        { 
          "Sid": "Statement1",
          "Effect": "Allow",
          "Principal": { 
            "AWS": "arn:aws:iam::12345678012:root"
          },
          "Action": "sts:AssumeRole"
        } 
      ]
    }
  }
}
```

For more information, see [Modifying a role maximum session duration (AWS API)](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_max_session_duration.html) in the AWS IAM User Guide.

**Example 3: To create an IAM Role with tags**

The following command creates an IAM Role Test-Role with tags. This example uses the --tags parameter flag with the following JSON-formatted tags: '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the --tags flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```bash
aws iam create-role \
```
--role-name Test-Role \
--assume-role-policy-document file://Test-Role-Trust-Policy.json \
--tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}('

Output:

```
{
   "Role": {
      "Path": "/",
      "RoleName": "Test-Role",
      "RoleId": "AKIAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:role/Test-Role",
      "CreateDate": "2023-05-25T23:29:41+00:00",
      "AssumeRolePolicyDocument": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Sid": "Statement1",
               "Effect": "Allow",
               "Principal": {
                  "AWS": "arn:aws:iam::123456789012:root"
               },
               "Action": "sts:AssumeRole"
            }
         ],
         "Tags": [
            {
               "Key": "Department",
               "Value": "Accounting"
            },
            {
               "Key": "Location",
               "Value": "Seattle"
            }
         ]
   }
}
```

For more information, see [Tagging IAM roles](https://docs.aws.amazon.com/IAM/latest/UserGuide/tutorials_tag-resources-v2.html) in the *AWS IAM User Guide*.

- For API details, see [CreateRole](https://docs.aws.amazon.com/cli/latest/reference/iam/create-role.html) in *AWS CLI Command Reference*.
Create a service-linked role

The following code example shows how to create an IAM service-linked role.

AWS CLI

To create a service-linked role

The following create-service-linked-role example creates a service-linked role for the specified AWS service and attaches the specified description.

```
aws iam create-service-linked-role \
   --aws-service-name lex.amazonaws.com \
   --description "My service-linked role to support Lex"
```

Output:

```
{
   "Role": {
      "Path": "/aws-service-role/lex.amazonaws.com/",
      "RoleName": "AWSServiceRoleForLexBots",
      "RoleId": "AROA1234567890EXAMPLE",
      "Arn": "arn:aws:iam::1234567890:role/aws-service-role/lex.amazonaws.com/AWSServiceRoleForLexBots",
      "CreateDate": "2019-04-17T20:34:14+00:00",
      "AssumeRolePolicyDocument": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Action": ["sts:AssumeRole"],
               "Effect": "Allow",
               "Principal": {
                  "Service": ["lex.amazonaws.com"
               ]
            }
         ]
      }
   }
}
```
For more information, see [Using service-linked roles](#) in the AWS IAM User Guide.

- For API details, see [CreateServiceLinkedRole](#) in AWS CLI Command Reference.

### Create a user

The following code example shows how to create an IAM user.

⚠️ **Warning**

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as [AWS IAM Identity Center](#).

---

**AWS CLI**

#### Example 1: To create an IAM user

The following `create-user` command creates an IAM user named Bob in the current account.

```bash
aws iam create-user
  --user-name Bob
```

**Output:**

```
{
  "User": {
    "UserName": "Bob",
    "Path": "/",
    "CreateDate": "2023-06-08T03:20:41.270Z",
    "UserId": "AIDAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::123456789012:user/Bob"
  }
}
```

For more information, see [Creating an IAM user in your AWS account](#) in the AWS IAM User Guide.

#### Example 2: To create an IAM user at a specified path

The following `create-user` command creates an IAM user named Bob at the specified path.
aws iam create-user \
   --user-name Bob \
   --path /division_abc/subdivision_xyz/

Output:

```
{
   "User": {
      "Path": "/division_abc/subdivision_xyz/",
      "UserName": "Bob",
      "UserId": "AIDAIOSF0DNN7EXAMPLE",
      "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
      "CreateDate": "2023-05-24T18:20:17+00:00"
   }
}
```

For more information, see IAM identifiers in the AWS IAM User Guide.

**Example 3: To Create an IAM User with tags**

The following `create-user` command creates an IAM user named Bob with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'. Alternatively, the `--tags` flag can be used with tags in the shorthand format: 'Key=Department,Value=Accounting Key=Location,Value=Seattle'.

```
aws iam create-user \
   --user-name Bob \
   --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'
```

Output:

```
{
   "User": {
      "Path": "/",
      "UserName": "Bob",
      "UserId": "AIDAIOSF0DNN7EXAMPLE",
      "Arn": "arn:aws:iam::12345678012:user/Bob",
      "CreateDate": "2023-05-25T17:14:21+00:00"
   }
}
```
For more information, see Tagging IAM users in the AWS IAM User Guide.

Example 3: To create an IAM user with a set permissions boundary

The following create-user command creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```bash
aws iam create-user \
  --user-name Bob \
  --permissions-boundary arn:aws:iam::aws:policy/AmazonS3FullAccess
```

Output:

```
{
  "User": {
    "Path": "/",
    "UserName": "Bob",
    "UserId": "AIDAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::12345678012:user/Bob",
    "CreateDate": "2023-05-24T17:50:53+00:00",
    "PermissionsBoundary": {
      "PermissionsBoundaryType": "Policy",
      "PermissionsBoundaryArn": "arn:aws:iam::aws:policy/AmazonS3FullAccess"
    }
  }
}
```

For more information, see Permissions boundaries for IAM entities in the AWS IAM User Guide.
Create an access key

The following code example shows how to create an IAM access key.

⚠️ **Warning**

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as [AWS IAM Identity Center](https://aws.amazon.com/iam/).

**AWS CLI**

**To create an access key for an IAM user**

The following `create-access-key` command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```shell
aws iam create-access-key
  --user-name Bob
```

**Output:**

```json
{
  "AccessKey": {
    "UserName": "Bob",
    "Status": "Active",
    "CreateDate": "2015-03-09T18:39:23.411Z",
    "SecretAccessKey": "wJa1rXUtnFEMI/K7MDENG/bPxRFiCyZEXmPLEKEY",
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
  }
}
```

Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see [Managing access keys for IAM users](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_access-keys.html) in the *AWS IAM User Guide*.

- For API details, see [CreateAccessKey](https://docs.aws.amazon.com/cli/latest/reference/iam/create-access-key.html) in *AWS CLI Command Reference*. 
Create an alias for an account

The following code example shows how to create an alias for an IAM account.

AWS CLI

To create an account alias

The following create-account-alias command creates the alias examplecorp for your AWS account.

```
aws iam create-account-alias \
    --account-alias examplecorp
```

This command produces no output.

• For API details, see [CreateAccountAlias](https://docs.aws.amazon.com/cli/latest/reference/iam/create-account-alias.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iam.html).

Create an inline policy for a group

The following code example shows how to create an inline IAM policy for a group.

AWS CLI

To add a policy to a group

The following put-group-policy command adds a policy to the IAM group named Admins.

```
aws iam put-group-policy \
    --group-name Admins \
    --policy-document file://AdminPolicy.json \n    --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

Create an inline policy for a user

The following code example shows how to create an inline IAM policy for a user.

⚠️ Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

AWS CLI

To attach a policy to an IAM user

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```bash
aws iam put-user-policy
  --user-name Bob 
  --policy-name ExamplePolicy 
  --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

For more information, see Adding and removing IAM identity permissions in the AWS IAM User Guide.

• For API details, see PutUserPolicy in AWS CLI Command Reference.

Create an instance profile

The following code example shows how to create an IAM instance profile.

AWS CLI

To create an instance profile

The following `create-instance-profile` command creates an instance profile named Webserver.
aws iam create-instance-profile \
   --instance-profile-name Webserver

Output:

```json
{
   "InstanceProfile": {
      "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
      "Roles": [],
      "CreateDate": "2015-03-09T20:33:19.626Z",
      "InstanceProfileName": "Webserver",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
   }
}
```

To add a role to an instance profile, use the `add-role-to-instance-profile` command.

For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](http://aws.amazon.com) in the [AWS IAM User Guide](http://aws.amazon.com).

- For API details, see [CreateInstanceProfile](http://aws.amazon.com) in [AWS CLI Command Reference](http://aws.amazon.com).

## Delete SAML provider

The following code example shows how to delete an AWS Identity and Access Management (IAM) SAML provider.

### AWS CLI

**To delete a SAML provider**

This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```bash
aws iam delete-saml-provider \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```

This command produces no output.

For more information, see [Creating IAM SAML identity providers](http://aws.amazon.com) in the [AWS IAM User Guide](http://aws.amazon.com).
Delete a group

The following code example shows how to delete an IAM group.

**AWS CLI**

**To delete an IAM group**

The following `delete-group` command deletes an IAM group named `MyTestGroup`.

```bash
aws iam delete-group \
--group-name MyTestGroup
```

This command produces no output.

For more information, see [Deleting an IAM user group](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_manage.html) in the *AWS IAM User Guide*.

- For API details, see [DeleteGroup](https://docs.aws.amazon.com/cli/latest/reference/iam/delete-group.html) in *AWS CLI Command Reference*.

Delete a group policy

The following code example shows how to delete an IAM group policy.

**AWS CLI**

**To delete a policy from an IAM group**

The following `delete-group-policy` command deletes the policy named `ExamplePolicy` from the group named `Admins`.

```bash
aws iam delete-group-policy \
--group-name Admins \
--policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the `list-group-policies` command.

For more information, see [Managing IAM policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_manage.html) in the *AWS IAM User Guide*.

- For API details, see [DeleteGroupPolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/delete-group-policy.html) in *AWS CLI Command Reference*. 
Delete a policy

The following code example shows how to delete an IAM policy.

AWS CLI

To delete an IAM policy

This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy \\
   --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see DeletePolicy in AWS CLI Command Reference.

Delete a role

The following code example shows how to delete an IAM role.

AWS CLI

To delete an IAM role

The following `delete-role` command removes the role named `Test-Role`.

```
aws iam delete-role \\
   --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (`remove-role-from-instance-profile`), detach any managed policies (`detach-role-policy`) and delete any inline policies that are attached to the role (`delete-role-policy`).

For more information, see Creating IAM roles and Using instance profiles in the AWS IAM User Guide.

- For API details, see DeleteRole in AWS CLI Command Reference.
Delete a role policy

The following code example shows how to delete an IAM role policy.

AWS CLI

To remove a policy from an IAM role

The following delete-role-policy command removes the policy named ExamplePolicy from the role named Test-Role.

```bash
aws iam delete-role-policy \
   --role-name Test-Role \
   --policy-name ExamplePolicy
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see DeleteRolePolicy in AWS CLI Command Reference.

Delete a server certificate

The following code example shows how to delete an IAM server certificate.

AWS CLI

To delete a server certificate from your AWS account

The following delete-server-certificate command removes the specified server certificate from your AWS account.

```bash
aws iam delete-server-certificate \
   --server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the list-server-certificates command.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.

- For API details, see DeleteServerCertificate in AWS CLI Command Reference.
Delete a service-linked role

The following code example shows how to delete an IAM service-linked role.

**AWS CLI**

**To delete a service-linked role**

The following `delete-service-linked-role` example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```
aws iam delete-service-linked-role \
   --role-name AWSServiceRoleForLexBots
```

**Output:**

```
{
   "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/\n   AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdEEXAMPLE"
}
```

For more information, see [Using service-linked roles](https://docs.aws.amazon.com/iam/latest/userguide/service-linked-roles.html) in the *AWS IAM User Guide*.
- For API details, see [DeleteServiceLinkedRole](https://docs.aws.amazon.com/cli/latest/reference/iam/delete-service-linked-role.html) in *AWS CLI Command Reference*.

Delete a user

The following code example shows how to delete an IAM user.

⚠️ **Warning**

To avoid security risks, don’t use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as [AWS IAM Identity Center](https://aws.amazon.com/iam/identity-center/).

**AWS CLI**

**To delete an IAM user**
The following `delete-user` command removes the IAM user named Bob from the current account.

```
aws iam delete-user
   --user-name Bob
```

This command produces no output.

For more information, see [Deleting an IAM user](#) in the AWS IAM User Guide.

- For API details, see [DeleteUser](#) in AWS CLI Command Reference.

### Delete an access key

The following code example shows how to delete an IAM access key.

⚠️ **Warning**

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as [AWS IAM Identity Center](#).

**AWS CLI**

**To delete an access key for an IAM user**

The following `delete-access-key` command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key
   --access-key-id AKIDPMS9R04H3FEXAMPLE
   --user-name Bob
```

This command produces no output.

To list the access keys defined for an IAM user, use the `list-access-keys` command.

For more information, see [Managing access keys for IAM users](#) in the AWS IAM User Guide.

- For API details, see [DeleteAccessKey](#) in AWS CLI Command Reference.
Delete an account alias

The following code example shows how to delete an IAM account alias.

AWS CLI

To delete an account alias

The following delete-account-alias command removes the alias mycompany for the current account.

```
aws iam delete-account-alias \
    --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the AWS IAM User Guide.
- For API details, see DeleteAccountAlias in AWS CLI Command Reference.

Delete an inline policy from a user

The following code example shows how to delete an inline IAM policy from a user.

⚠️ Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

AWS CLI

To remove a policy from an IAM user

The following delete-user-policy command removes the specified policy from the IAM user named Bob.

```
aws iam delete-user-policy \
    --user-name Bob \n    --policy-name ExamplePolicy
```
This command produces no output.

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Creating an IAM user in your AWS account in the AWS IAM User Guide.

- For API details, see `DeleteUserPolicy` in AWS CLI Command Reference.

**Delete an instance profile**

The following code example shows how to delete an IAM instance profile.

**AWS CLI**

**To delete an instance profile**

The following `delete-instance-profile` command deletes the instance profile named `ExampleInstanceProfile`.

```
aws iam delete-instance-profile 
  --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see `DeleteInstanceProfile` in AWS CLI Command Reference.

**Detach a policy from a role**

The following code example shows how to detach an IAM policy from a role.

**AWS CLI**

**To detach a policy from a role**

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy` from the role called `FedTesterRole`.

```
aws iam detach-role-policy 
  --role-name FedTesterRole 
  --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```
Detach a policy from a user

The following code example shows how to detach an IAM policy from a user.

⚠️ Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

AWS CLI

To detach a policy from a user

This example removes the managed policy with the ARN arn:aws:iam::123456789012:policy/TesterPolicy from the user Bob.

```
aws iam detach-user-policy \
  --user-name Bob \
  --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.

For more information, see Changing permissions for an IAM user in the AWS IAM User Guide.

- For API details, see DetachUserPolicy in AWS CLI Command Reference.

Generate a credential report

The following code example shows how to generate a credential report from IAM for the current account. After the report is generated, get it by using the GetCredentialReport action.

AWS CLI

To generate a credential report
The following example attempts to generate a credential report for the AWS account.

```bash
aws iam generate-credential-report
```

Output:

```json
{
   "State": "STARTED",
   "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see [Getting credential reports for your AWS account](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_credentials_report.html) in the *AWS IAM User Guide*.

- For API details, see [GenerateCredentialReport](https://docs.aws.amazon.com/cli/latest/reference/iam/generate-credential-report.html) in *AWS CLI Command Reference*.

---

**Get a credential report**

The following code example shows how to get the most recently generated credential report from IAM.

**AWS CLI**

**To get a credential report**

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```bash
aws iam get-credential-report
```

Output:

```json
{
   "GeneratedTime": "2015-06-17T19:11:50Z",
   "ReportFormat": "text/csv"
}
```

For more information, see [Getting credential reports for your AWS account](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_credentials_report.html) in the *AWS IAM User Guide*.

Get a detailed authorization report for your account

The following code example shows how to get a detailed IAM authorization report for your account.

AWS CLI

To list an AWS accounts IAM users, groups, roles, and policies

The following get-account-authorization-details command returns information about all IAM users, groups, roles, and policies in the AWS account.

```bash
aws iam get-account-authorization-details
```

Output:

```json
{
   "RoleDetailList": [
      {
         "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
               {
                  "Sid": "",
                  "Effect": "Allow",
                  "Principal": {
                     "Service": "ec2.amazonaws.com"
                  },
                  "Action": "sts:AssumeRole"
               }
            ]
         },

For more information, see [AWS security audit guidelines](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the AWS IAM User Guide.

### Get a policy

The following code example shows how to get an IAM policy.

**AWS CLI**

**To retrieve information about the specified managed policy**

This example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam get-policy
   --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

**Output:**

```
{
   "Policy": {
      "PolicyName": "MySamplePolicy",
      "CreateDate": "2015-06-17T19:23:32Z",
      "AttachmentCount": 0,
      "IsAttachable": true,
      "PolicyId": "Z27SI6FQMGNQ2EXAMPLE1",
      "DefaultVersionId": "v1",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:policy/MySamplePolicy",
      "UpdateDate": "2015-06-17T19:23:32Z"
   }
}
```

Get a policy version

The following code example shows how to get an IAM policy version.

**AWS CLI**

To retrieve information about the specified version of the specified managed policy

This example returns the policy document for the v2 version of the policy whose ARN is arn:aws:iam::123456789012:policy/MyManagedPolicy.

```bash
aws iam get-policy-version \
   --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
   --version-id v2
```

Output:

```json
{
   "PolicyVersion": {
      "Document": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Effect": "Allow",
               "Action": "iam:*",
               "Resource": "*"
            }
         ]
      },
      "VersionId": "v2",
      "IsDefaultVersion": true,
      "CreateDate": "2023-04-11T00:22:54+00:00"
   }
}
```

Get a role

The following code example shows how to get an IAM role.
To get information about an IAM role

The following get-role command gets information about the role named Test-Role.

```bash
aws iam get-role \
   --role-name Test-Role
```

Output:

```json
{
   "Role": {
      "Description": "Test Role",
      "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
      "MaxSessionDuration": 3600,
      "RoleId": "AROA1234567890EXAMPLE",
      "CreateDate": "2019-11-13T16:45:56Z",
      "RoleName": "Test-Role",
      "Path": "/",
      "RoleLastUsed": {
         "Region": "us-east-1",
         "LastUsedDate": "2019-11-13T17:14:00Z"
      },
      "Arn": "arn:aws:iam::123456789012:role/Test-Role"
   }
}
```

The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the list-role-policies command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see GetRole in AWS CLI Command Reference.

Get a server certificate

The following code example shows how to get an IAM server certificate.

AWS CLI

To get details about a server certificate in your AWS account
The following `get-server-certificate` command retrieves all of the details about the specified server certificate in your AWS account.

```bash
aws iam get-server-certificate
    --server-certificate-name myUpdatedServerCertificate
```

Output:

```
{
    "ServerCertificate": {
        "ServerCertificateMetadata": {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T23:23:00+00:00"
        },
        "CertificateBody": "-----BEGIN CERTIFICATE-----

"
}
```
To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.

- For API details, see `GetServerCertificate` in AWS CLI Command Reference.

### Get a service-linked role's deletion status

The following code example shows how to get an AWS Identity and Access Management (IAM) service-linked role's deletion status.

**AWS CLI**

To check the status of a request to delete a service-linked role

The following `get-service-linked-role-deletion-status` example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a DeletionTaskId value that you provide as a parameter for this command.

```
aws iam get-service-linked-role-deletion-status \
  --deletion-task-id task/aws-service-role/lex.amazonaws.com/AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```
{
  "Status": "SUCCEEDED"
}
```

For more information, see Using service-linked roles in the AWS IAM User Guide.
Get a summary of account usage

The following code example shows how to get a summary of account usage from IAM.

AWS CLI

To get information about IAM entity usage and IAM quotas in the current account

The following `get-account-summary` command returns information about the current IAM entity usage and current IAM entity quotas in the account.

```
aws iam get-account-summary
```

Output:

```
{
   "SummaryMap": {
      "UsersQuota": 5000,
      "GroupsQuota": 100,
      "InstanceProfiles": 6,
      "SigningCertificatesPerUserQuota": 2,
      "AccountAccessKeysPresent": 0,
      "RolesQuota": 250,
      "RolePolicySizeQuota": 10240,
      "AccountSigningCertificatesPresent": 0,
      "Users": 27,
      "ServerCertificatesQuota": 20,
      "ServerCertificates": 0,
      "AssumeRolePolicySizeQuota": 2048,
      "Groups": 7,
      "MFADevicesInUse": 1,
      "Roles": 3,
      "AccountMFAEnabled": 1,
      "MFADevices": 3,
      "GroupsPerUserQuota": 10,
      "GroupPolicySizeQuota": 5120,
      "InstanceProfilesQuota": 100,
      "AccessKeysPerUserQuota": 2,
      "Providers": 0,
      "UserPolicySizeQuota": 2048
   }
}
```
For more information about entity limitations, see IAM and AWS STS quotas in the AWS IAM User Guide.

- For API details, see GetAccountSummary in AWS CLI Command Reference.

Get a user

The following code example shows how to get an IAM user.

⚠️ Warning
To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

AWS CLI

To get information about an IAM user

The following get-user command gets information about the IAM user named Paulo.

```
aws iam get-user \
  --user-name Paulo
```

Output:

```
{
  "User": {
    "UserName": "Paulo",
    "Path": "/",
    "CreateDate": "2019-09-21T23:03:13Z",
    "UserId": "AIDA123456789EXAMPLE",
    "Arn": "arn:aws:iam::123456789012:user/Paulo"
  }
}
```

For more information, see Managing IAM users in the AWS IAM User Guide.
For API details, see `GetUser` in *AWS CLI Command Reference*.

**Get data about the last use of an access key**

The following code example shows how to get data about the last use of an IAM access key.

⚠ **Warning**

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as [AWS IAM Identity Center](https://aws.amazon.com/iam/).

**AWS CLI**

**To retrieve information about when the specified access key was last used**

The following example retrieves information about when the access key ABCDEEXAMPLE was last used.

```bash
aws iam get-access-key-last-used --access-key-id ABCDEEXAMPLE
```

Output:

```json
{
   "UserName": "Bob",
   "AccessKeyLastUsed": {
      "Region": "us-east-1",
      "ServiceName": "iam",
      "LastUsedDate": "2015-06-16T22:45:00Z"
   }
}
```

For more information, see [Managing access keys for IAM users](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

For API details, see `GetAccessKeyLastUsed` in *AWS CLI Command Reference*.

**Get the account password policy**

The following code example shows how to get the IAM account password policy.
To see the current account password policy

The following `get-account-password-policy` command displays details about the password policy for the current account.

```bash
aws iam get-account-password-policy
```

Output:

```json
{
   "PasswordPolicy": {
      "AllowUsersToChangePassword": false,
      "RequireLowercaseCharacters": false,
      "RequireUppercaseCharacters": false,
      "MinimumPasswordLength": 8,
      "RequireNumbers": true,
      "RequireSymbols": true
   }
}
```

If no password policy is defined for the account, the command returns a NoSuchEntity error.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see GetAccountPasswordPolicy in AWS CLI Command Reference.

List SAML providers

The following code example shows how to list SAML providers for IAM.

AWS CLI

To list the SAML providers in the AWS account

This example retrieves the list of SAML 2.0 providers created in the current AWS account.

```bash
aws iam list-saml-providers
```

Output:
For more information, see `Creating IAM SAML identity providers` in the AWS IAM User Guide.

- For API details, see `ListSAMLProviders` in AWS CLI Command Reference.

### List a user's access keys

The following code example shows how to list a user's IAM access keys.

⚠️ **Warning**

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

#### AWS CLI

**To list the access key IDs for an IAM user**

The following `list-access-keys` command lists the access keys IDs for the IAM user named Bob.

```
aws iam list-access-keys \
  --user-name Bob
```

**Output:**

```json
{
  "AccessKeyMetadata": [
    {
      "KeyId": "access-key-1",
      "UserName": "Bob",
      "CreateDate": "2023-04-01T12:00:00Z"
    },
    {
      "KeyId": "access-key-2",
      "UserName": "Bob",
      "CreateDate": "2023-04-02T12:00:00Z"
    }
  ]
}
```
You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the `create-access-keys` command.

For more information, see [Managing access keys for IAM users](https://docs.aws.amazon.com/IAM/latest/UserGuide/id.keySet.html) in the *AWS IAM User Guide*.

- For API details, see `ListAccessKeys` in *AWS CLI Command Reference*.

### List account aliases

The following code example shows how to list IAM account aliases.

**AWS CLI**

**To list account aliases**

The following `list-account-aliases` command lists the aliases for the current account.

```
aws iam list-account-aliases
```

**Output:**

```
{
   "AccountAliases": [
      "mycompany"
   ]
}
```

For more information, see [Your AWS account ID and its alias](https://docs.aws.amazon.com/IAM/latest/UserGuide/id acct-alias.html) in the *AWS IAM User Guide*.
List groups

The following code example shows how to list IAM groups.

AWS CLI

To list the IAM groups for the current account

The following `list-groups` command lists the IAM groups in the current account.

```bash
aws iam list-groups
```

Output:

```json
{
   "Groups": [
   {
      "Path": "/",
      "CreateDate": "2013-06-04T20:27:27.972Z",
      "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/Admins",
      "GroupName": "Admins"
   },
   {
      "Path": "/",
      "CreateDate": "2013-04-16T20:30:42Z",
      "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
      "GroupName": "S3-Admins"
   }
   ]
}
```

For more information, see Managing IAM user groups in the AWS IAM User Guide.

For API details, see ListAccountAliases in AWS CLI Command Reference.

List inline policies for a role

The following code example shows how to list inline policies for an IAM role.
AWS CLI

To list the policies attached to an IAM role

The following `list-role-policies` command lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \
   --role-name Test-Role
```

Output:

```
{
   "PolicyNames": [
      "ExamplePolicy"
   ]
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see ListRolePolicies in AWS CLI Command Reference.

List inline policies for a user

The following code example shows how to list inline IAM policies for a user.

⚠️ Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

AWS CLI

To list policies for an IAM user

The following `list-user-policies` command lists the policies that are attached to the IAM user named Bob.
aws iam list-user-policies \
    --user-name Bob

Output:

```json
{
    "PolicyNames": [
        "ExamplePolicy",
        "TestPolicy"
    ]
}
```

For more information, see Creating an IAM user in your AWS account in the AWS IAM User Guide.

- For API details, see ListUserPolicies in AWS CLI Command Reference.

List policies

The following code example shows how to list IAM policies.

**AWS CLI**

**To list managed policies that are available to your AWS account**

This example returns a collection of the first two managed policies available in the current AWS account.

aws iam list-policies \
    --max-items 3

Output:

```json
{
    "Policies": [
        {
            "PolicyName": "AWSCloudTrailAccessPolicy",
            "PolicyId": "ANPAXQE2B5PJ7YEXAMPLE",
            "Path": "/",
            "DefaultVersionId": "v1",
            "AttachmentCount": 0,
```
"PermissionsBoundaryUsageCount": 0,
"IsAttachable": true,
"CreateDate": "2019-09-04T17:43:42+00:00",
"UpdateDate": "2019-09-04T17:43:42+00:00"
],
{
"PolicyName": "AdministratorAccess",
"PolicyId": "ANPAIWMBCKSKIEE64ZLYK",
"Arn": "arn:aws:iam::aws:policy/AdministratorAccess",
"Path": "/",
"DefaultVersionId": "v1",
"AttachmentCount": 6,
"PermissionsBoundaryUsageCount": 0,
"IsAttachable": true,
"CreateDate": "2015-02-06T18:39:46+00:00",
"UpdateDate": "2015-02-06T18:39:46+00:00"
},
{
"PolicyName": "PowerUserAccess",
"PolicyId": "ANPAJYRXTHIB4FOVS3ZXS",
"Arn": "arn:aws:iam::aws:policy/PowerUserAccess",
"Path": "/",
"DefaultVersionId": "v5",
"AttachmentCount": 1,
"PermissionsBoundaryUsageCount": 0,
"IsAttachable": true,
"CreateDate": "2015-02-06T18:39:47+00:00",
"UpdateDate": "2023-07-06T22:04:00+00:00"
}
],
"NextToken": "EXAMPLErZXIiOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOjI4fQ=="
}

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/iam/latest/UserGuide/policies行政管理权限.html) in the *AWS IAM User Guide*.

- For API details, see [ListPolicies](https://docs.aws.amazon.com/cli/latest/reference/iam/list-policies.html) in *AWS CLI Command Reference*.

### List policies attached to a role

The following code example shows how to list policies attached to an IAM role.

**AWS CLI**

To list all managed policies that are attached to the specified role
This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account.

```bash
aws iam list-attached-role-policies \\
--role-name SecurityAuditRole
```

Output:

```json
{
  "AttachedPolicies": [
    {
      "PolicyName": "SecurityAudit",
      "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
    }
  ],
  "IsTruncated": false
}
```

For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/IAM/latest/UserGuide/id ACCESS-POLICIES-managed.html) in the **AWS IAM User Guide**.

- For API details, see [ListAttachedRolePolicies](https://docs.aws.amazon.com/cli/latest/reference/iam/list-attached-role-policies.html) in **AWS CLI Command Reference**.

### List roles

The following code example shows how to list IAM roles.

**AWS CLI**

**To list IAM roles for the current account**

The following `list-roles` command lists IAM roles for the current account.

```bash
aws iam list-roles
```

Output:

```json
{
  "Roles": [
    {
      "Path": "/",
      "RoleName": "ExampleRole",
      "RoleId": "AROAJ52OT4H7EXAMPLE",
      "Arn": "arn:aws:iam::4444444444:role/ExampleRole"
    }
  ],
  "IsTruncated": false
}
```
"Arn": "arn:aws:iam::123456789012:role/ExampleRole",
"CreateDate": "2017-09-12T19:23:36+00:00",

                "Sid": "",
                "Effect": "Allow",
                "Principal": {
                    "Service": "ec2.amazonaws.com"
                },
                "Action": "sts:AssumeRole"
            }
        ],
        "MaxSessionDuration": 3600
    }
}

For more information, see Creating IAM roles in the AWS IAM User Guide.
List server certificates

The following code example shows how to list IAM server certificates.

**AWS CLI**

**To list the server certificates in your AWS account**

The following `list-server-certificates` command lists all of the server certificates stored and available for use in your AWS account.

```bash
aws iam list-server-certificates
```

**Output:**

```json
{
  "ServerCertificateMetadataList": [
    {
      "Path": "/",
      "ServerCertificateName": "myUpdatedServerCertificate",
      "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
      "UploadDate": "2019-04-22T21:13:44+00:00",
      "Expiration": "2019-10-15T22:23:16+00:00"
    },
    {
      "Path": "/cloudfront/",
      "ServerCertificateName": "MyTestCert",
      "ServerCertificateId": "ASCAEXAMPLE456EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyTestCert",
      "UploadDate": "2015-04-21T18:14:16+00:00",
      "Expiration": "2018-01-14T17:52:36+00:00"
    }
  ]
}
```

For more information, see [Managing server certificates in IAM](https://docs.aws.amazon.com/IAM/latest/userguide/idp-server-certificate-overview.html) in the *AWS IAM User Guide*. 
List users

The following code example shows how to list IAM users.

⚠️ **Warning**

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as [AWS IAM Identity Center](https://aws.amazon.com/iam/).

### AWS CLI

#### To list IAM users

The following `list-users` command lists the IAM users in the current account.

```bash
aws iam list-users
```

**Output:**

```json
{
   "Users": [
      {
         "UserName": "Adele",
         "Path": "/",
         "CreateDate": "2013-03-07T05:14:48Z",
         "UserId": "AKIAI44QH8DH8EXAMPLE",
         "Arn": "arn:aws:iam::123456789012:user/Adele"
      },
      {
         "UserName": "Bob",
         "Path": "/",
         "CreateDate": "2012-09-21T23:03:13Z",
         "UserId": "AKIAIOSFODNN7EXAMPLE",
         "Arn": "arn:aws:iam::123456789012:user/Bob"
      }
   ]
}
```
Remove a user from a group

The following code example shows how to remove a user from an IAM group.

AWS CLI

To remove a user from an IAM group

The following `remove-user-from-group` command removes the user named Bob from the IAM group named Admins.

```
aws iam remove-user-from-group \
   --user-name Bob \
   --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the AWS IAM User Guide.

• For API details, see `RemoveUserFromGroup` in AWS CLI Command Reference.

Update a server certificate

The following code example shows how to update an IAM server certificate.

AWS CLI

To change the path or name of a server certificate in your AWS account

The following `update-server-certificate` command changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the `list-server-certificates` command.

```
aws-iam update-server-certificate \
```
Update a user

The following code example shows how to update an IAM user.

⚠️ Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

AWS CLI

To change an IAM user's name

The following update-user command changes the name of the IAM user Bob to Robert.

```bash
aws iam update-user \
  --user-name Bob \
  --new-user-name Robert
```

This command produces no output.

For more information, see Renaming an IAM user group in the AWS IAM User Guide.

- For API details, see UpdateUser in AWS CLI Command Reference.

Update an access key

The following code example shows how to update an IAM access key.

```bash
--server-certificate-name myServerCertificate \n--new-server-certificate-name myUpdatedServerCertificate \n--new-path /cloudfront/
```

This command produces no output.

For more information, see Managing server certificates in IAM in the AWS IAM User Guide.

- For API details, see UpdateServerCertificate in AWS CLI Command Reference.
AWS CLI

To activate or deactivate an access key for an IAM user

The following `update-access-key` command deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```bash
aws iam update-access-key
   --access-key-id AKIAIOSFODNN7EXAMPLE
   --status Inactive
   --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see Managing access keys for IAM users in the AWS IAM User Guide.
- For API details, see `UpdateAccessKey` in AWS CLI Command Reference.

Upload a server certificate

The following code example shows how to upload an AWS Identity and Access Management (IAM) server certificate.

AWS CLI

To upload a server certificate to your AWS account

The following `upload-server-certificate` command uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the certificate chain...
provided by the certificate authority (CA) is in the \texttt{my_certificate_chain_file.pem} file. When the file has finished uploading, it is available under the name \texttt{myServerCertificate}. Parameters that begin with \texttt{file://} tells the command to read the contents of the file and use that as the parameter value instead of the file name itself.

\begin{verbatim}
aws iam upload-server-certificate \\
    --server-certificate-name myServerCertificate \\
    --certificate-body file://public_key_cert_file.pem \\
    --private-key file://my_private_key.pem \\
    --certificate-chain file://my_certificate_chain_file.pem
\end{verbatim}

Output:

\begin{verbatim}
{
    "ServerCertificateMetadata": {
        "Path": "/",
        "ServerCertificateName": "myServerCertificate",
        "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
        "UploadDate": "2019-04-22T21:13:44+00:00",
        "Expiration": "2019-10-15T22:23:16+00:00"
    }
}
\end{verbatim}

For more information, see Creating, Uploading, and Deleting Server Certificates in the \textit{Using IAM} guide.

- For API details, see \texttt{UploadServerCertificate} in \textit{AWS CLI Command Reference}.

\texttt{add-client-id-to-open-id-connect-provider}

The following code example shows how to use \texttt{add-client-id-to-open-id-connect-provider}.

AWS CLI

\textbf{To add a client ID (audience) to an Open-ID Connect (OIDC) provider}

The following \texttt{add-client-id-to-open-id-connect-provider} command adds the client ID \texttt{my-application-ID} to the OIDC provider named \texttt{server.example.com}. 

Actions and scenarios
aws iam add-client-id-to-open-id-connect-provider \
    --client-id my-application-ID \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com

This command produces no output.

To create an OIDC provider, use the create-open-id-connect-provider command.

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see AddClientIdToOpenIdConnectProvider in AWS CLI Command Reference.

add-role-to-instance-profile

The following code example shows how to use add-role-to-instance-profile.

AWS CLI

To add a role to an instance profile

The following add-role-to-instance-profile command adds the role named S3Access to the instance profile named Webserver.

aws iam add-role-to-instance-profile \
    --role-name S3Access \
    --instance-profile-name Webserver

This command produces no output.

To create an instance profile, use the create-instance-profile command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the AWS IAM User Guide.

- For API details, see AddRoleToInstanceProfile in AWS CLI Command Reference.

attach-group-policy

The following code example shows how to use attach-group-policy.
AWS CLI

To attach a managed policy to an IAM group

The following `attach-group-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named Finance.

```bash
aws iam attach-group-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --group-name Finance
```

This command produces no output.

For more information, see Managed policies and inline policies in the AWS IAM User Guide.

- For API details, see AttachGroupPolicy in AWS CLI Command Reference.

change-password

The following code example shows how to use `change-password`.

AWS CLI

To change the password for your IAM user

To change the password for your IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the `--cli-input-json` parameter, start by using the `change-password` command with the `--generate-cli-skeleton` parameter, as in the following example.

```bash
aws iam change-password \
    --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called `change-password.json` that you can use to fill in your old and new passwords. For example, the file might look like the following.

```json
{
    "OldPassword": "3s0K_;xh4~8XXI",
    "NewPassword": "]35d/[pB9Fo9wJ"
}
```
Next, to change your password, use the `change-password` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `change-password` command uses the `--cli-input-json` parameter with a JSON file called `change-password.json`.

```bash
aws iam change-password \
  --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an `InvalidUserType` error.

For more information, see [How an IAM user changes their own password](https://docs.aws.amazon.com/iam/latest/userguide/how-change-password.html) in the *AWS IAM User Guide*.

- For API details, see [ChangePassword](https://docs.aws.amazon.com/cli/latest/reference/iam/change-password.html) in *AWS CLI Command Reference*.

### create-login-profile

The following code example shows how to use `create-login-profile`.

**AWS CLI**

**To create a password for an IAM user**

To create a password for an IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```bash
aws iam create-login-profile \
  --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called `create-login-profile.json` that you can use to fill in the information for a subsequent `create-login-profile` command. For example:
Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called `create-login-profile.json`.

```bash
aws iam create-login-profile \
  --cli-input-json file://create-login-profile.json
```

Output:

```json
{
  "LoginProfile": {
    "UserName": "Bob",
    "CreateDate": "2015-03-10T20:55:40.274Z",
    "PasswordResetRequired": true
  }
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.

- For API details, see CreateLoginProfile in AWS CLI Command Reference.

**create-open-id-connect-provider**

The following code example shows how to use `create-open-id-connect-provider`.

```bash
create-open-id-connect-provider
```
To create an OpenID Connect (OIDC) provider

To create an OpenID Connect (OIDC) provider, we recommend using the --cli-input-json parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with https://. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the --cli-input-json parameter gets around this limitation.

To use the --cli-input-json parameter, start by using the create-open-id-connect-provider command with the --generate-cli-skeleton parameter, as in the following example.

```bash
aws iam create-open-id-connect-provider \
   --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called create-open-id-connect-provider.json that you can use to fill in the information for a subsequent create-open-id-connect-provider command. For example:

```json
{
   "Url": "https://server.example.com",
   "ClientIDList": [
      "example-application-ID"
   ],
   "ThumbprintList": [
      "c376084dfb3d2b68b7897bf5f565da8eEXAMPLE"
   ]
}
```

Next, to create the OpenID Connect (OIDC) provider, use the create-open-id-connect-provider command again, this time passing the --cli-input-json parameter to specify your JSON file. The following create-open-id-connect-provider command uses the --cli-input-json parameter with a JSON file called create-open-id-connect-provider.json.

```bash
aws iam create-open-id-connect-provider \
   --cli-input-json file://create-open-id-connect-provider.json
```
Output:

```
{
   "OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/server.example.com"
}
```

For more information about OIDC providers, see [Creating OpenID Connect (OIDC) identity providers](#) in the [AWS IAM User Guide](#).

For more information about obtaining thumbprints for an OIDC provider, see [Obtaining the thumbprint for an OpenID Connect Identity Provider](#) in the [AWS IAM User Guide](#).

- For API details, see [CreateOpenIdConnectProvider](#) in [AWS CLI Command Reference](#).

**create-service-specific-credential**

The following code example shows how to use `create-service-specific-credential`.

**AWS CLI**

Create a set of service-specific credentials for a user

The following `create-service-specific-credential` example creates a username and password that can be used to access only the configured service.

```bash
aws iam create-service-specific-credential \
   --user-name sofia \
   --service-name codecommit.amazonaws.com
```

Output:

```
{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServicePassword": "k1zPZM6uVxMQ3oxqgoYlNuJPyrRTZ1vRES76zTQE3eJk=",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
      "Status": "Active"
   }
}```
For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see CreateServiceSpecificCredential in AWS CLI Command Reference.

create-virtual-mfa-device

The following code example shows how to use create-virtual-mfa-device.

AWS CLI

To create a virtual MFA device

This example creates a new virtual MFA device called BobsMFADevice. It creates a file that contains bootstrap information called QRCODE.png and places it in the C:/ directory. The bootstrap method used in this example is QRCODEPNG.

```bash
aws iam create-virtual-mfa-device \
   --virtual-mfa-device-name BobsMFADevice \
   --outfile C:/QRCODE.png \
   --bootstrap-method QRCODEPNG
```

Output:

```json
{
   "VirtualMFADevice": {
      "SerialNumber": "arn:aws:iam::210987654321:mfa/BobsMFADevice"
   }
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see CreateVirtualMfaDevice in AWS CLI Command Reference.

deactivate-mfa-device

The following code example shows how to use deactivate-mfa-device.
AWS CLI

To deactivate an MFA device

This command deactivates the virtual MFA device with the ARN `arn:aws:iam::210987654321:mfa/BobsMFADevice` that is associated with the user Bob.

```
aws iam deactivate-mfa-device \
  --user-name Bob \
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see DeactivateMfaDevice in AWS CLI Command Reference.

decode-authorization-message

The following code example shows how to use decode-authorization-message.

AWS CLI

To decode a authorization failure message

The following decode-authorization-message example decodes the message returned by the EC2 console when attempting to launch an instance without the required permissions.

```
aws sts decode-authorization-message \
  --encoded-message lxzA8VEjEvu-s0TTt3PgYXik9YakQqsrFJGRZ9R8xNcyWAXwRq14xIvd- npzbgTevuuCTbjeBAaDAR9cbTK1rJbg3awM33o-Vy3ebPerE2-mWR9hYdvX-0zKgVOWF9pWjZaJSMqxB-aLxO-I_8TTvBq88x8IFPbMArNdpu0IjxDjzf22PF3SOE3XvIQ- _PE000aUqHCCcsSrFtvxmx6yQD1nbm6VTIVrfa0Bzy81soMo75sJaJ2r5vph6SY5vCCwg6o2JKe3hIHTa8zRrDbZSFMcXxXx9AYAAIr6bhcis7C__bZ4h4d1AAWooHFGKgfoJcWGwgdzgbu9hWyVvKTpeot5hsb8qANYjJRCPXTKpi6PZfdijKwb6g
```

The output is formatted as a single-line string of JSON text that you can parse with any JSON text processor.

```json
{
}
For more information, see [How can I decode an authorization failure message after receiving an "UnauthorizedOperation" error during an EC2 instance launch?](https://aws.amazon.com/repost/) in *AWS re:Post*.

- For API details, see [DecodeAuthorizationMessage](https://docs.aws.amazon.com/cli/latest/reference/decode-authorization-message.html) in *AWS CLI Command Reference*.

### delete-account-password-policy

The following code example shows how to use `delete-account-password-policy`.

#### AWS CLI

**To delete the current account password policy**

The following `delete-account-password-policy` command removes the password policy for the current account.

```
aws iam delete-account-password-policy
```

This command produces no output.
For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see DeleteAccountPasswordPolicy in AWS CLI Command Reference.

```
delete-login-profile
```

The following code example shows how to use delete-login-profile.

**AWS CLI**

**To delete a password for an IAM user**

The following delete-login-profile command deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile \
    --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.

- For API details, see DeleteLoginProfile in AWS CLI Command Reference.

```
delete-open-id-connect-provider
```

The following code example shows how to use delete-open-id-connect-provider.

**AWS CLI**

**To delete an IAM OpenID Connect identity provider**

This example deletes the IAM OIDC provider that connects to the provider example.oidcprovider.com.

```
aws iam delete-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

This command produces no output.
For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see DeleteOpenIdConnectProvider in AWS CLI Command Reference.

**delete-policy-version**

The following code example shows how to use delete-policy-version.

**AWS CLI**

**To delete a version of a managed policy**

This example deletes the version identified as v2 from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```bash
aws iam delete-policy-version \
   --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
   --version-id v2
```

This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see DeletePolicyVersion in AWS CLI Command Reference.

**delete-role-permissions-boundary**

The following code example shows how to use delete-role-permissions-boundary.

**AWS CLI**

**To delete a permissions boundary from an IAM role**

The following delete-role-permissions-boundary example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the put-role-permissions-boundary command.

```bash
aws iam delete-role-permissions-boundary \
   --role-name lambda-application-role
```
This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see DeleteRolePermissionsBoundary in AWS CLI Command Reference.

delete-service-specific-credential

The following code example shows how to use delete-service-specific-credential.

AWS CLI

Example 1: Delete a service-specific credential for the requesting user

The following delete-service-specific-credential example deletes the specified service-specific credential for the user making the request. The service-specific-credential-id is provided when you create the credential and you can retrieve it by using the list-service-specific-credentials command.

```
aws iam delete-service-specific-credential \
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

Example 2: Delete a service-specific credential for a specified user

The following delete-service-specific-credential example deletes the specified service-specific credential for the specified user. The service-specific-credential-id is provided when you create the credential and you can retrieve it by using the list-service-specific-credentials command.

```
aws iam delete-service-specific-credential \
  --user-name sofia \
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see DeleteServiceSpecificCredential in AWS CLI Command Reference.
delete-signing-certificate

The following code example shows how to use delete-signing-certificate.

AWS CLI

To delete a signing certificate for an IAM user

The following delete-signing-certificate command deletes the specified signing certificate for the IAM user named Bob.

```bash
aws iam delete-signing-certificate \
  --user-name Bob \
  --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE
```

This command produces no output.

To get the ID for a signing certificate, use the list-signing-certificates command.

For more information, see Manage signing certificates in the Amazon EC2 User Guide.
- For API details, see DeleteSigningCertificate in AWS CLI Command Reference.

delete-ssh-public-key

The following code example shows how to use delete-ssh-public-key.

AWS CLI

To delete an SSH public keys attached to an IAM user

The following delete-ssh-public-key command deletes the specified SSH public key attached to the IAM user sofia.

```bash
aws iam delete-ssh-public-key \
  --user-name sofia \
  --ssh-public-key-id APKA123456789EXAMPLE
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide.
• For API details, see DeleteSshPublicKey in AWS CLI Command Reference.

delete-user-permissions-boundary

The following code example shows how to use delete-user-permissions-boundary.

**AWS CLI**

To delete a permissions boundary from an IAM user

The following delete-user-permissions-boundary example deletes the permissions boundary attached to the IAM user named intern. To apply a permissions boundary to a user, use the put-user-permissions-boundary command.

```
aws iam delete-user-permissions-boundary \
  --user-name intern
```

This command produces no output.

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

• For API details, see DeleteUserPermissionsBoundary in AWS CLI Command Reference.

delete-virtual-mfa-device

The following code example shows how to use delete-virtual-mfa-device.

**AWS CLI**

To remove a virtual MFA device

The following delete-virtual-mfa-device command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \
  --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the AWS IAM User Guide.
detach-group-policy

The following code example shows how to use detach-group-policy.

AWS CLI

To detach a policy from a group

This example removes the managed policy with the ARN arn:aws:iam::123456789012:policy/TesterAccessPolicy from the group called Testers.

```
aws iam detach-group-policy
   --group-name Testers
   --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.

For more information, see Managing IAM user groups in the AWS IAM User Guide.

enable-mfa-device

The following code example shows how to use enable-mfa-device.

AWS CLI

To enable an MFA device

After you use the create-virtual-mfa-device command to create a new virtual MFA device, you can assign the MFA device to a user. The following enable-mfa-device example assigns the MFA device with the serial number arn:aws:iam::210987654321:mfa/BobsMFADevice to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device
   --user-name Bob
   --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```
This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the AWS IAM User Guide.

- For API details, see EnableMfaDevice in AWS CLI Command Reference.

**generate-organizations-access-report**

The following code example shows how to use `generate-organizations-access-report`.

**AWS CLI**

**Example 1: To generate an access report for a root in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for the specified root in an organization. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
   --entity-path o-4fxmplt198/r-c3xb
```

Output:

```
{
   "JobId": "a8b6c06f-aaa4-8xmp-28bc-81da71836359"
}
```

**Example 2: To generate an access report for an account in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID 123456789012 in the organization o-4fxmplt198. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
   --entity-path o-4fxmplt198/r-c3xb/123456789012
```
Example 3: To generate an access report for an account in an organizational unit in an organization

The following generate-organizations-access-report example starts a background job to create an access report for account ID 234567890123 in organizational unit ou-c3xb-lmu7j2yg in the organization o-4fxmplt198. You can display the report after it's created by running the get-organizations-access-report command.

```bash
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb/ou-c3xb-lmu7j2yg/234567890123
```

Output:

```json
{
    "JobId": "2eb6c2e6-0xmp-ec04-1425-c937916a64af"
}
```

To get details about roots and organizational units in your organization, use the organizations list-roots and organizations list-organizational-units-for-parent commands.

For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see GenerateOrganizationsAccessReport in AWS CLI Command Reference.

generate-service-last-accessed-details

The following code example shows how to use generate-service-last-accessed-details.

AWS CLI

Example 1: To generate a service access report for a custom policy
The following generate-service-last-accessed-details example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named intern-boundary. You can display the report after it is created by running the get-service-last-accessed-details command.

```bash
aws iam generate-service-last-accessed-details \
--arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{
   "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"
}
```

**Example 2: To generate a service access report for the AWS managed AdministratorAccess policy**

The following generate-service-last-accessed-details example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed AdministratorAccess policy. You can display the report after it is created by running the get-service-last-accessed-details command.

```bash
aws iam generate-service-last-accessed-details \
--arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{
   "JobId": "78b6c2ba-d09e-6xmp-7039-ecde30b26916"
}
```

For more information, see [Refining permissions in AWS using last accessed information](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_policies_refining-permissions-last-accessed.html) in the *AWS IAM User Guide*.

- For API details, see [GenerateServiceLastAccessedDetails](https://docs.aws.amazon.com/cli/latest/reference/iam/generate-service-last-accessed-details.html) in *AWS CLI Command Reference*.

---

**get-context-keys-for-custom-policy**

The following code example shows how to use get-context-keys-for-custom-policy.
AWS CLI

Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following `get-context-keys-for-custom-policy` command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands `simulate-custom-policy` and `simulate-custom-policy`. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the `get-context-keys-for-custom-policy` command. Parameter values that begin with `file://` instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```
aws iam get-context-keys-for-custom-policy
   --policy-input-list '{"Version":"2012-10-17","Statement":
   {"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}'}
```

Output:

```
{
   "ContextKeyNames": [
      "aws:username",
      "aws:CurrentTime"
   ]
}
```

Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input

The following `get-context-keys-for-custom-policy` command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```
[  
   "Policy1",
   "Policy2"
]
So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash ".

```
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Action": "dynamodb:*",
    "Condition": {
      "DateGreaterThan": {
        "aws:CurrentTime": "2015-08-16T12:00:00Z"
      }
    }
  }
}
```

This file can then be submitted to the following command.

```
aws iam get-context-keys-for-custom-policy
   --policy-input-list file://policyfile.json
```

Output:

```
{
  "ContextKeyNames": [
    "aws:username",
    "aws:CurrentTime"
  ]
}
```

**get-context-keys-for-principal-policy**

The following code example shows how to use get-context-keys-for-principal-policy.

**AWS CLI**

To list the context keys referenced by all policies associated with an IAM principal

The following `get-context-keys-for-principal-policy` command retrieves all policies that are attached to the user saanvi and any groups she is a member of. It then parses
each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the `simulate-custom-policy` and `simulate-principal-policy` commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the `get-context-keys-for-custom-policy` command.

```
aws iam get-context-keys-for-principal-policy \
   --policy-source-arn arn:aws:iam::123456789012:user/saanvi
```

Output:

```
{
   "ContextKeyNames": [
      "aws:username",
      "aws:CurrentTime"
   ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the AWS IAM User Guide.

- For API details, see `GetContextKeysForPrincipalPolicy` in AWS CLI Command Reference.

**get-group**

The following code example shows how to use `get-group`.

**AWS CLI**

**To get an IAM group**

This example returns details about the IAM group Admins.

```
aws iam get-group \
   --group-name Admins
```

Output:

```
{
   "Group": {
```

**get-group-policy**

The following code example shows how to use `get-group-policy`.

### AWS CLI

#### To get information about a policy attached to an IAM group

The following `get-group-policy` command gets information about the specified policy attached to the group named Test-Group.

```
aws iam get-group-policy \
  --group-name Test-Group \
  --policy-name S3-ReadOnly-Policy
```

**Output:**

```json
{
  "GroupName": "Test-Group",
  "PolicyDocument": {
    "Statement": [
      {
        "Action": [
          "s3:Get*",
          "s3:List*"
        ],
        "Resource": "*",
        "Effect": "Allow"
      }
    ]
  }
}
```
For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see GetGroupPolicy in AWS CLI Command Reference.

get-instance-profile

The following code example shows how to use get-instance-profile.

AWS CLI

**To get information about an instance profile**

The following get-instance-profile command gets information about the instance profile named ExampleInstanceProfile.

```
aws iam get-instance-profile \
--instance-profile-name ExampleInstanceProfile
```

**Output:**

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
        "Roles": [
            {
                "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                "RoleId": "AIDGPMS9R04H3FEXAMPLE",
                "CreateDate": "2013-01-09T06:33:26Z",
                "RoleName": "Test-Role",
                "Path": "/",
                "Arn": "arn:aws:iam::336924118301:role/Test-Role"
            }
        ],
        "CreateDate": "2013-06-12T23:52:02Z",
        "InstanceProfileName": "ExampleInstanceProfile",
        "Path": "/",
    }
}
For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see GetInstanceProfile in AWS CLI Command Reference.

get-login-profile

The following code example shows how to use get-login-profile.

**AWS CLI**

To get password information for an IAM user

The following get-login-profile command gets information about the password for the IAM user named Bob.

```bash
aws iam get-login-profile \
   --user-name Bob
```

Output:

```json
{
   "LoginProfile": {
      "UserName": "Bob",
      "CreateDate": "2012-09-21T23:03:39Z"
   }
}
```

The get-login-profile command can be used to verify that an IAM user has a password. The command returns a NoSuchEntity error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (update-login-profile) for the user. Alternatively, you can delete the login profile (delete-login-profile) for the user and then create a new one (create-login-profile).

For more information, see Managing passwords for IAM users in the AWS IAM User Guide.

- For API details, see GetLoginProfile in AWS CLI Command Reference.
**get-mfa-device**

The following code example shows how to use `get-mfa-device`.

**AWS CLI**

To retrieve information about a FIDO security key

The following `get-mfa-device` command example retrieves information about the specified FIDO security key.

```bash
aws iam get-mfa-device \
   --serial-number arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE
```

Output:

```
{
   "UserName": "alice",
   "SerialNumber": "arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-EXAMPLEBN5FHTECLFG7EXAMPLE",
   "EnableDate": "2023-09-19T01:49:18+00:00",
   "Certifications": {
      "FIDO": "L1"
   }
}
```

For more information, see [Using multi-factor authentication (MFA) in AWS](https://docs.aws.amazon.com/iam/latest/userguide/using-mfa.html) in the AWS IAM User Guide.

**get-open-id-connect-provider**

The following code example shows how to use `get-open-id-connect-provider`.

**AWS CLI**

To return information about the specified OpenID Connect provider

This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/server.example.com`. 
aws iam get-open-id-connect-provider \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com

Output:

{
   "Url": "server.example.com"
   "CreateDate": "2015-06-16T19:41:48Z",
   "ThumbprintList": ["12345abcdefghijk67890lmnopqrst987example"],
   "ClientIDList": ["example-application-ID"
   ]
}

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see GetOpenIdConnectProvider in AWS CLI Command Reference.

**get-organizations-access-report**

The following code example shows how to use get-organizations-access-report.

**AWS CLI**

**To retrieve an access report**

The following get-organizations-access-report example displays a previously generated access report for an AWS Organizations entity. To generate a report, use the generate-organizations-access-report command.

aws iam get-organizations-access-report \
   --job-id a8b6c06f-aaa4-8xmp-28bc-81da71836359

Output:

{
   "JobStatus": "COMPLETED",
}
get-role-policy

The following code example shows how to use get-role-policy.

AWS CLI

To get information about a policy attached to an IAM role

The following get-role-policy command gets information about the specified policy attached to the role named Test-Role.

```
aws iam get-role-policy \       
    --role-name Test-Role \     
    --policy-name ExamplePolicy
```

Output:

```
{
    "RoleName": "Test-Role",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": ["s3:ListBucket",
```
For more information, see Creating IAM roles in the AWS IAM User Guide.

- For API details, see GetRolePolicy in AWS CLI Command Reference.

get-saml-provider

The following code example shows how to use get-saml-provider.

AWS CLI

To retrieve the SAML provider metadocument

This example retrieves the details about the SAML 2.0 provider whose ARM is arn:aws:iam::123456789012:saml-provider/SAMLADFS. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
aws iam get-saml-provider \
  --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
  "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
  "CreateDate": "2017-03-06T22:29:46+00:00",
  "ValidUntil": "2117-03-06T22:29:46.433000+00:00",
  "Tags": [
    {
      "Key": "DeptID",
      "Value": "Finance"
    }
  ]
}
```
For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see GetSamlProvider in AWS CLI Command Reference.

**get-service-last-accessed-details**

The following code example shows how to use get-service-last-accessed-details.

**AWS CLI**

**To retrieve a service access report**

The following get-service-last-accessed-details example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the generate-service-last-accessed-details command.

```bash
aws iam get-service-last-accessed-details \
  --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cddfca
```

**Output:**

```json
{
  "JobStatus": "COMPLETED",
  "JobCreationDate": "2019-10-01T03:50:35.929Z",
  "ServicesLastAccessed": [
    ...
    {
      "ServiceName": "AWS Lambda",
      "LastAuthenticated": "2019-09-30T23:02:00Z",
      "ServiceNamespace": "lambda",
      "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
      "TotalAuthenticatedEntities": 6
    },
  ]
}
```
For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see GetServiceLastAccessedDetails in AWS CLI Command Reference.

get-service-last-accessed-details-with-entities

The following code example shows how to use get-service-last-accessed-details-with-entities.

AWS CLI

To retrieve a service access report with details for a service

The following get-service-last-accessed-details-with-entities example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the generate-service-last-accessed-details command. To get a list of services accessed with namespaces, use get-service-last-accessed-details.

```bash
aws iam get-service-last-accessed-details-with-entities \
  --job-id 78b6c2ba-d09e-6xmp-7039-eccd30b26b16 \
  --service-namespace lambda
```

Output:

```json
{
  "JobStatus": "COMPLETED",
  "JobCreationDate": "2019-10-01T03:55:55.756Z",
  "JobCompletionDate": "2019-10-01T03:55:56.533Z",
  "EntityDetailsList": [ 
    {
      "EntityInfo": {
        "Arn": "arn:aws:iam::123456789012:user/admin",
        "Name": "admin",
        "Type": "USER",
        "Id": "AIDAIO2XMPLENQEXAMPLE",
        "Path": "/"
      },
      "LastAuthenticated": "2019-09-30T23:02:00Z"
    }
  ]
}
```
For more information, see Refining permissions in AWS using last accessed information in the AWS IAM User Guide.

- For API details, see GetServiceLastAccessedDetailsWithEntities in AWS CLI Command Reference.

**get-ssh-public-key**

The following code example shows how to use get-ssh-public-key.

**AWS CLI**

**Example 1: To retrieve an SSH public key attached to an IAM user in SSH encoded form**

The following get-ssh-public-key command retrieves the specified SSH public key from the IAM user sofia. The output is in SSH encoding.

```
aws iam get-ssh-public-key \ 
  --user-name sofia \ 
  --ssh-public-key-id APKA123456789EXAMPLE \ 
  --encoding SSH
```

**Output:**

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "SSHPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAQEAABw==",
        "Begin SSH Key": "-----BEGIN NEW SSH KEY-----
           ...some SSH key data...
        -----END NEW SSH KEY-----",
        "Encoded": false
    }
}
```
Example 2: To retrieve an SSH public key attached to an IAM user in PEM encoded form

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user sofia. The output is in PEM encoding.

/aws iam get-ssh-public-key \
   --user-name sofia \
   --ssh-public-key-id APKA123456789EXAMPLE \
   --encoding PEM

Output:

```
{
   "SSHPublicKey": {
      "UserName": "sofia",
      "SSHPublicKeyId": "APKA123456789EXAMPLE",
      "SSHPublicKeyBody": "-----BEGIN PUBLIC KEY-----
<<long encoded PEM string>>
-----END PUBLIC KEY-----
",
      "Status": "Inactive",
      "UploadDate": "2019-04-18T17:04:49+00:00"
   }
}
```

For more information, see [Use SSH keys and SSH with CodeCommit](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_sshkeys.html) in the AWS IAM User Guide.

### get-user-policy

The following code example shows how to use `get-user-policy`.

### AWS CLI

To list policy details for an IAM user
The following `get-user-policy` command lists the details of the specified policy that is attached to the IAM user named Bob.

```bash
aws iam get-user-policy
   --user-name Bob
   --policy-name ExamplePolicy
```

Output:

```json
{
   "UserName": "Bob",
   "PolicyName": "ExamplePolicy",
   "PolicyDocument": {
      "Version": "2012-10-17",
      "Statement": [
         {
            "Action": "*",
            "Resource": "*",
            "Effect": "Allow"
         }
      ]
   }
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

### list-attached-group-policies

The following code example shows how to use `list-attached-group-policies`.

**AWS CLI**

To list all managed policies that are attached to the specified group

This example returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account.

```bash
aws iam list-attached-group-policies
```
Output:

```json
{
   "AttachedPolicies": [
      {
         "PolicyName": "AdministratorAccess",
         "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
      },
      {
         "PolicyName": "SecurityAudit",
         "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
      }
   ],
   "IsTruncated": false
}
```

- For API details, see [ListAttachedGroupPolicies](https://docs.aws.amazon.com/cli/latest/reference/iam/list-attached-group-policies.html) in *AWS CLI Command Reference*.

**list-attached-user-policies**

The following code example shows how to use `list-attached-user-policies`.

**AWS CLI**

**To list all managed policies that are attached to the specified user**

This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.

```bash
aws iam list-attached-user-policies \
   --user-name Bob
```

Output:

```json
{
   "AttachedPolicies": [
      {
         "PolicyName": "AdministratorAccess",
         "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
      },
      {
         "PolicyName": "SecurityAudit",
         "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
      }
   ],
   "IsTruncated": false
}
```
"PolicyName": "AdministratorAccess",
    "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
  },
  {
    "PolicyName": "SecurityAudit",
    "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
  }
],
"IsTruncated": false
}

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListAttachedUserPolicies in AWS CLI Command Reference.

list-entities-for-policy

The following code example shows how to use list-entities-for-policy.

AWS CLI

To list all users, groups, and roles that the specified managed policy is attached to

This example returns a list of IAM groups, roles, and users who have the policy arn:aws:iam::123456789012:policy/TestPolicy attached.

```bash
aws iam list-entities-for-policy \
   --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```json
{
   "PolicyGroups": [
      {
         "GroupName": "Admins",
         "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
      }
   ],
   "PolicyUsers": [
      {
         "UserName": "Alice",
         "UserId": "AIDACKCEVSQ6C2EXAMPLE"
      }
   ]
}
```
For more information, see Policies and permissions in IAM in the AWS IAM User Guide.

- For API details, see ListEntitiesForPolicy in AWS CLI Command Reference.

**list-group-policies**

The following code example shows how to use `list-group-policies`.

**AWS CLI**

**To list all inline policies that are attached to the specified group**

The following list-group-policies command lists the names of inline policies that are attached to the IAM group named Admins in the current account.

```bash
aws iam list-group-policies \
   --group-name Admins
```

**Output:**

```json
{
   "PolicyNames": [
      "AdminRoot",
      "ExamplePolicy"
   ]
}
```

For more information, see Managing IAM policies in the AWS IAM User Guide.

- For API details, see ListGroupPolicies in AWS CLI Command Reference.
list-groups-for-user

The following code example shows how to use list-groups-for-user.

AWS CLI

To list the groups that an IAM user belongs to

The following list-groups-for-user command displays the groups that the IAM user named Bob belongs to.

```bash
aws iam list-groups-for-user \
  --user-name Bob
```

Output:

```
{
  "Groups": [
    {
      "Path": "/",
      "CreateDate": "2013-05-06T01:18:08Z",
      "GroupId": "AKIAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/Admin",
      "GroupName": "Admin"
    },
    {
      "Path": "/",
      "CreateDate": "2013-05-06T01:37:28Z",
      "GroupId": "AKIAI44QH8DHEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/s3-Users",
      "GroupName": "s3-Users"
    }
  ]
}
```

For more information, see [Managing IAM user groups](https://docs.aws.amazon.com/iam/latest/userguide/managing-user-groups.html) in the AWS IAM User Guide.

- For API details, see [ListGroupsForUser](https://docs.aws.amazon.com/cli/latest/reference/iam/list-groups-for-user.html) in AWS CLI Command Reference.

list-instance-profile-tags

The following code example shows how to use list-instance-profile-tags.
AWS CLI

To list the tags attached to an instance profile

The following `list-instance-profile-tags` command retrieves the list of tags associated with the specified instance profile.

```bash
aws iam list-instance-profile-tags 
   --instance-profile-name deployment-role
```

Output:

```json
{
   "Tags": [
      {
         "Key": "DeptID",
         "Value": "123456"
      },
      {
         "Key": "Department",
         "Value": "Accounting"
      }
   ]
}
```

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tagging.html) in the AWS IAM User Guide.

- For API details, see `ListInstanceProfileTags` in AWS CLI Command Reference.

list-instance-profiles

The following code example shows how to use `list-instance-profiles`.

AWS CLI

To lists the instance profiles for the account

The following `list-instance-profiles` command lists the instance profiles that are associated with the current account.

```bash
aws iam list-instance-profiles
```
Output:

```json
{
    "InstanceProfiles": [
    {
        "Path": "/",
        "InstanceProfileName": "example-dev-role",
        "InstanceProfileId": "AIPAIXEU4NUHUXEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
        "CreateDate": "2023-09-21T18:17:41+00:00",
        "Roles": [
            {
                "Path": "/",
                "RoleName": "example-dev-role",
                "RoleId": "AROAJ52OTH4H7LEXAMPLE",
                "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
                "CreateDate": "2023-09-21T18:17:40+00:00",
                "AssumeRolePolicyDocument": {
                    "Version": "2012-10-17",
                    "Statement": [
                        {
                            "Effect": "Allow",
                            "Principal": {
                                "Service": "ec2.amazonaws.com"
                            },
                            "Action": "sts:AssumeRole"
                        }
                    ]
                }
            }
        ]
    },
    {
        "Path": "/",
        "InstanceProfileName": "example-s3-role",
        "InstanceProfileId": "AIPAIXVJVNRIQFREXAMPLE",
        "Arn": "arn:aws:iam::123456789012:instance-profile/example-s3-role",
        "CreateDate": "2023-09-21T18:18:50+00:00",
        "Roles": [
            {
                "Path": "/",
                "RoleName": "example-s3-role",
                "RoleId": "AROAINUBC5O7XLEXAMPLE",
                "Arn": "arn:aws:iam::123456789012:role/example-s3-role",
                "CreateDate": "2023-09-21T18:18:50+00:00",
                "AssumeRolePolicyDocument": {
                    "Version": "2012-10-17",
                    "Statement": [
                        {
                            "Effect": "Allow",
                            "Principal": {
                                "Service": "s3.amazonaws.com"
                            },
                            "Action": "sts:AssumeRole"
                        }
                    ]
                }
            }
        ]
    }
}
```
For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see ListInstanceProfiles in AWS CLI Command Reference.

list-instance-profiles-for-role

The following code example shows how to use list-instance-profiles-for-role.

AWS CLI

To list the instance profiles for an IAM role

The following list-instance-profiles-for-role command lists the instance profiles that are associated with the role Test-Role.

```
aws iam list-instance-profiles-for-role \
   --role-name Test-Role
```

Output:

```
{
   "InstanceProfiles": [
   
```

Actions and scenarios 3367
"InstanceProfileId": "AIDGPMS9R04H3FEXAMPLE",
"Roles": [
  {
    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
    "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
    "CreateDate": "2013-06-07T20:42:15Z",
    "RoleName": "Test-Role",
    "Path": "/",
    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
  }
],
"CreateDate": "2013-06-07T21:05:24Z",
"InstanceProfileName": "ExampleInstanceProfile",
"Path": "/",
"Arn": "arn:aws:iam::123456789012:instance-profile/ExampleInstanceProfile"
}]
]
}

For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see ListInstanceProfilesForRole in AWS CLI Command Reference.

**list-mfa-device-tags**

The following code example shows how to use list-mfa-device-tags.

**AWS CLI**

To list the tags attached to an MFA device

The following list-mfa-device-tags command retrieves the list of tags associated with the specified MFA device.

```
aws iam list-mfa-device-tags \
  --serial-number arn:aws:iam::123456789012:mfa/alice
```

Output:

```json
{
  "Tags": [
    
  ]
}
```
For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-pythoncli-example-create-user-role.html) in the *AWS IAM User Guide*.

- For API details, see [ListMfaDeviceTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-mfa-devices.html) in *AWS CLI Command Reference*.

### list-mfa-devices

The following code example shows how to use `list-mfa-devices`.

#### AWS CLI

**To list all MFA devices for a specified user**

This example returns details about the MFA device assigned to the IAM user Bob.

```bash
aws iam list-mfa-devices \
   --user-name Bob
```

**Output:**

```json
{
   "MFADevices": [
      {
         "UserName": "Bob",
         "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
         "EnableDate": "2019-10-28T20:37:09+00:00"
      },
      {
         "UserName": "Bob",
         "SerialNumber": "GAKT12345678",
         "EnableDate": "2023-02-18T21:44:42+00:00"
      },
      {
         "UserName": "Bob",
```
For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

- For API details, see ListMfaDevices in AWS CLI Command Reference.

**list-open-id-connect-provider-tags**

The following code example shows how to use list-open-id-connect-provider-tags.

**AWS CLI**

To list the tags attached to an OpenID Connect (OIDC)-compatible identity provider

The following list-open-id-connect-provider-tags command retrieves the list of tags associated with the specified OIDC identity provider.

```
aws iam list-open-id-connect-provider-tags \     
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com
```

Output:

```
{
   "Tags": [
   {
      "Key": "DeptID",
      "Value": "123456"
   },
   
```
For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-tagging-iam-resources.html) in the *AWS IAM User Guide*.

- For API details, see [ListOpenIdConnectProviderTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-open-id-connect-providers.html) in *AWS CLI Command Reference*.

### list-open-id-connect-providers

The following code example shows how to use `list-open-id-connect-providers`.

**AWS CLI**

**To list information about the OpenID Connect providers in the AWS account**

This example returns a list of ARNs of all the OpenID Connect providers that are defined in the current AWS account.

```bash
aws iam list-open-id-connect-providers
```

**Output:**

```json
{
    "OpenIDConnectProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com"
        }
    ]
}
```

For more information, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-cognito-oidc-generic.html) in the *AWS IAM User Guide*.

- For API details, see [ListOpenIdConnectProviders](https://docs.aws.amazon.com/cli/latest/reference/iam/list-open-id-connect-providers.html) in *AWS CLI Command Reference*.

### list-policies-granting-service-access

The following code example shows how to use `list-policies-granting-service-access`.

---

**Actions and scenarios** 3371
AWS CLI

To list the policies that grant a principal access to the specified service

The following `list-policies-granting-service-access` example retrieves the list of policies that grant the IAM user sofia access to AWS CodeCommit service.

```
aws iam list-policies-granting-service-access \
  --arn arn:aws:iam::123456789012:user/sofia \
  --service-namespaces codecommit
```

Output:

```
{
  "PoliciesGrantingServiceAccess": [
    {
      "ServiceNamespace": "codecommit",
      "Policies": [
        {
          "PolicyName": "Grant-Sofia-Access-To-CodeCommit",
          "PolicyType": "INLINE",
          "EntityName": "sofia"
        }
      ]
    }
  ],
  "IsTruncated": false
}
```

For more information, see Using IAM with CodeCommit: Git credentials, SSH keys, and AWS access keys in the AWS IAM User Guide.

- For API details, see ListPoliciesGrantingServiceAccess in AWS CLI Command Reference.

list-policy-tags

The following code example shows how to use `list-policy-tags`.

AWS CLI

To list the tags attached to a managed policy
The following `list-policy-tags` command retrieves the list of tags associated with the specified managed policy.

```
aws iam list-policy-tags 
   --policy-arn arn:aws:iam::123456789012:policy/billing-access
```

Output:

```
{
   "Tags": [
       {
           "Key": "DeptID",
           "Value": "123456"
       },
       {
           "Key": "Department",
           "Value": "Accounting"
       }
   ]
}
```

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *AWS IAM User Guide*.

- For API details, see [ListPolicyTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-policy-tags.html) in *AWS CLI Command Reference*.

### list-policy-versions

The following code example shows how to use `list-policy-versions`.

**AWS CLI**

**To list information about the versions of the specified managed policy**

This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam list-policy-versions 
   --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
```

Actions and scenarios 3373
For more information, see [Policies and permissions in IAM](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_policiesLatest.html) in the *AWS IAM User Guide*.

- For API details, see [ListPolicyVersions](https://docs.aws.amazon.com/cli/latest/reference/iam/list-policy-versions.html) in *AWS CLI Command Reference*.

**list-role-tags**

The following code example shows how to use `list-role-tags`.

**AWS CLI**

**To list the tags attached to a role**

The following `list-role-tags` command retrieves the list of tags associated with the specified role.

```bash
aws iam list-role-tags \
   --role-name production-role
```

**Output:**

```json
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
        {
            "Key": "Project",
            "Value": "Production"
        }
    ]
}
```
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListRoleTags in AWS CLI Command Reference.

list-saml-provider-tags

The following code example shows how to use list-saml-provider-tags.

AWS CLI

To list the tags attached to a SAML provider

The following list-saml-provider-tags command retrieves the list of tags associated with the specified SAML provider.

```bash
aws iam list-saml-provider-tags \
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

Output:

```
{
   "Tags": [
   {
   "Key": "DeptID",
   "Value": "123456"
   },
   {
   "Key": "Department",
   "Value": "Accounting"
   }
   ]
}
```

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListSamlProviderTags in AWS CLI Command Reference.
list-server-certificate-tags

The following code example shows how to use `list-server-certificate-tags`.

AWS CLI

To list the tags attached to a server certificate

The following `list-server-certificate-tags` command retrieves the list of tags associated with the specified server certificate.

```
aws iam list-server-certificate-tags \
    --server-certificate-name ExampleCertificate
```

Output:

```
{
    "Tags": [
    {
        "Key": "DeptID",
        "Value": "123456"
    },
    {
        "Key": "Department",
        "Value": "Accounting"
    }
    ]
}
```

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see ListServerCertificateTags in AWS CLI Command Reference.

list-service-specific-credential

The following code example shows how to use `list-service-specific-credential`.

AWS CLI

Example 1: List the service-specific credentials for a user

The following `list-service-specific-credentials` example displays all service-specific credentials assigned to the specified user. Passwords are not included in the response.
aws iam list-service-specific-credentials \\
    --user-name sofia

Output:

```json
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

Example 2: List the service-specific credentials for a user filtered to a specified service

The following `list-service-specific-credentials` example displays the service-specific credentials assigned to the user making the request. The list is filtered to include only those credentials for the specified service. Passwords are not included in the response.

aws iam list-service-specific-credentials \\
    --service-name codecommit.amazonaws.com

Output:

```json
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](https://docs.aws.amazon.com/codecommit/latest/userguide/credentials.html) in the [AWS CodeCommit User Guide](https://docs.aws.amazon.com/codecommit/latest/userguide/credentials.html).

- For API details, see [ListServiceSpecificCredential](https://docs.aws.amazon.com/cli/latest/reference/iam/list-service-specific-credentials.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iam/list-service-specific-credentials.html).
list-service-specific-credentials

The following code example shows how to use list-service-specific-credentials.

AWS CLI

To retrieve a list of credentials

The following list-service-specific-credentials example lists the credentials generated for HTTPS access to AWS CodeCommit repositories for a user named developer.

```
aws iam list-service-specific-credentials \
   --user-name developer \
   --service-name codecommit.amazonaws.com
```

Output:

```
{
   "ServiceSpecificCredentials": [
      {
         "UserName": "developer",
         "Status": "Inactive",
         "ServiceUserName": "developer-at-123456789012",
         "CreateDate": "2019-10-01T04:31:41Z",
         "ServiceSpecificCredentialId": "ACCAQFODXMPL4YFHP7DZE",
         "ServiceName": "codecommit.amazonaws.com"
      },
      {
         "UserName": "developer",
         "Status": "Active",
         "ServiceUserName": "developer+1-at-123456789012",
         "CreateDate": "2019-10-01T04:31:45Z",
         "ServiceSpecificCredentialId": "ACCAQFOXMPL6VW57M7AJP",
         "ServiceName": "codecommit.amazonaws.com"
      }
   ]
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see ListServiceSpecificCredentials in AWS CLI Command Reference.
list-signing-certificates

The following code example shows how to use list-signing-certificates.

AWS CLI

To list the signing certificates for an IAM user

The following list-signing-certificates command lists the signing certificates for the IAM user named Bob.

```
aws iam list-signing-certificates \
   --user-name Bob
```

Output:

```
{
   "Certificates": [
   {
       "UserName": "Bob",
       "Status": "Inactive",
       "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END CERTIFICATE-----",
       "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
       "UploadDate": "2013-06-06T21:40:08Z"
   }
   ]
}
```

For more information, see Manage signing certificates in the Amazon EC2 User Guide.

- For API details, see ListSigningCertificates in AWS CLI Command Reference.

list-ssh-public-keys

The following code example shows how to use list-ssh-public-keys.

AWS CLI

To list the SSH public keys attached to an IAM user

The following list-ssh-public-keys example lists the SSH public keys attached to the IAM user sofia.
aws iam list-ssh-public-keys \
   --user-name sofia

Output:

```
{
   "SSHPublicKeys": [
   {
      "UserName": "sofia",
      "SSHPublicKeyId": "APKA1234567890EXAMPLE",
      "Status": "Inactive",
      "UploadDate": "2019-04-18T17:04:49+00:00"
   }
   ]
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the AWS IAM User Guide
• For API details, see ListSshPublicKeys in AWS CLI Command Reference.

list-user-tags

The following code example shows how to use list-user-tags.

AWS CLI

To list the tags attached to a user

The following list-user-tags command retrieves the list of tags associated with the specified IAM user.

aws iam list-user-tags \
   --user-name alice

Output:

```
{
   "Tags": [
   {
      "Key": "Department",
      "Value": "Accounting"
   }
   ]
}
```
For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_tagging.html) in the *AWS IAM User Guide*.

- For API details, see [ListUserTags](https://docs.aws.amazon.com/cli/latest/reference/iam/list-user-tags.html) in *AWS CLI Command Reference*.

---

### list-virtual-mfa-devices

The following code example shows how to use `list-virtual-mfa-devices`.

**AWS CLI**

#### To list virtual MFA devices

The following `list-virtual-mfa-devices` command lists the virtual MFA devices that have been configured for the current account.

```bash
aws iam list-virtual-mfa-devices
```

**Output:**

```json
{
    "VirtualMFADevices": [
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
        },
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
        }
    ]
}
```

For more information, see [Enabling a virtual multi-factor authentication (MFA) device](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_mfa.html) in the *AWS IAM User Guide*.

- For API details, see [ListVirtualMfaDevices](https://docs.aws.amazon.com/cli/latest/reference/iam/list-virtual-mfa-devices.html) in *AWS CLI Command Reference*.

---

Actions and scenarios
**put-role-permissions-boundary**

The following code example shows how to use `put-role-permissions-boundary`.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM role**

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```bash
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --role-name lambda-application-role
```

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role**

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```bash
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --role-name x-account-admin
```

This command produces no output.

For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_pas-binding-boundaries.html) in the *AWS IAM User Guide*.

- For API details, see [PutRolePermissionsBoundary](https://docs.aws.amazon.com/cli/latest/reference/iam/put-role-permissions-boundary.html) in *AWS CLI Command Reference*.

**put-user-permissions-boundary**

The following code example shows how to use `put-user-permissions-boundary`.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM user**

The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```bash
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --role-name lambda-application-role
```

This command produces no output.

For more information, see [Modifying a role](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_pas-binding-boundaries.html) in the *AWS IAM User Guide*.
aws iam put-user-permissions-boundary \
   --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
   --user-name intern

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user

The following `put-user-permissions-boundary` example applies the AWS managed policy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

aws iam put-user-permissions-boundary \
   --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
   --user-name developer

This command produces no output.

For more information, see [Adding and removing IAM identity permissions](https://docs.aws.amazon.com/IAM/latest/UserGuide/idPermissionsOverview.html) in the *AWS IAM User Guide*.

- For API details, see [PutUserPermissionsBoundary](https://docs.aws.amazon.com/cli/latest/reference/iam/put-user-permissions-boundary.html) in *AWS CLI Command Reference*.

**remove-client-id-from-open-id-connect-provider**

The following code example shows how to use `remove-client-id-from-open-id-connect-provider`.

**AWS CLI**

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

aws iam remove-client-id-from-open-id-connect-provider \
   --client-id My-TestApp-3 \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the AWS IAM User Guide.

- For API details, see RemoveClientIdFromOpenIdConnectProvider in AWS CLI Command Reference.

remove-role-from-instance-profile

The following code example shows how to use remove-role-from-instance-profile.

AWS CLI

To remove a role from an instance profile

The following remove-role-from-instance-profile command removes the role named Test-Role from the instance profile named ExampleInstanceProfile.

```
aws iam remove-role-from-instance-profile \
   --instance-profile-name ExampleInstanceProfile \
   --role-name Test-Role
```

For more information, see Using instance profiles in the AWS IAM User Guide.

- For API details, see RemoveRoleFromInstanceProfile in AWS CLI Command Reference.

reset-service-specific-credential

The following code example shows how to use reset-service-specific-credential.

AWS CLI

Example 1: Reset the password for a service-specific credential attached to the user making the request

The following reset-service-specific-credential example generates a new cryptographically strong password for the specified service-specific credential attached to the user making the request.

```
aws iam reset-service-specific-credential \
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```
Example 2: Reset the password for a service-specific credential attached to a specified user

The following `reset-service-specific-credential` example generates a new cryptographically strong password for a service-specific credential attached to the specified user.

```
aws iam reset-service-specific-credential \ 
   --user-name sofia \ 
   --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
   "ServiceSpecificCredential": {
      "CreateDate": "2019-04-18T20:45:36+00:00",
      "ServiceName": "codecommit.amazonaws.com",
      "ServiceUserName": "sofia-at-123456789012",
      "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcK0ayTmE3LnAmAmH4=",
      "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
      "UserName": "sofia",
      "Status": "Active"
   }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see `ResetServiceSpecificCredential` in AWS CLI Command Reference.
resync-mfa-device

The following code example shows how to use resync-mfa-device.

AWS CLI

To synchronize an MFA device

The following resync-mfa-device example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is arn:aws:iam::123456789012:mfa/BobsMFADevice with an authenticator program that provided the two authentication codes.

```
aws iam resync-mfa-device \
  --user-name Bob \
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
  --authentication-code1 123456 \
  --authentication-code2 987654
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the AWS IAM User Guide.

• For API details, see ResyncMfaDevice in AWS CLI Command Reference.

set-default-policy-version

The following code example shows how to use set-default-policy-version.

AWS CLI

To set the specified version of the specified policy as the policy's default version.

This example sets the v2 version of the policy whose ARN is arn:aws:iam::123456789012:policy/MyPolicy as the default active version.

```
aws iam set-default-policy-version \
  --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
  --version-id v2
```

For more information, see Policies and permissions in IAM in the AWS IAM User Guide.
• For API details, see `SetDefaultPolicyVersion` in *AWS CLI Command Reference*.

**set-security-token-service-preferences**

The following code example shows how to use `set-security-token-service-preferences`.

**AWS CLI**

**To set the global endpoint token version**

The following `set-security-token-service-preferences` example configures Amazon STS to use version 2 tokens when you authenticate against the global endpoint.

```sh/aws iam set-security-token-service-preferences \
   --global-endpoint-token-version v2Token
```

This command produces no output.

For more information, see *Managing AWS STS in an AWS Region* in the *AWS IAM User Guide*.

• For API details, see `SetSecurityTokenServicePreferences` in *AWS CLI Command Reference*.

**simulate-custom-policy**

The following code example shows how to use `simulate-custom-policy`.

**AWS CLI**

**Example 1: To simulate the effects of all IAM policies associated with an IAM user or role**

The following `simulate-custom-policy` shows how to provide both the policy and define variable values and simulate an API call to see if it is allowed or denied. The following example shows a policy that enables database access only after a specified date and time. The simulation succeeds because the simulated actions and the specified `aws:CurrentTime` variable all match the requirements of the policy.

```sh/aws iam simulate-custom-policy \
   --policy-input-list '
   \
   {"Version":"2012-10-17","Statement":
   \
   {"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
   \
   {"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}
   \
   --action-names dynamodb:CreateBackup
```
Output:

```json
{
   "EvaluationResults": [
   {
      "EvalActionName": "dynamodb:CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "allowed",
      "MatchedStatements": [
      {
         "SourcePolicyId": "PolicyInputList.1",
         "StartPosition": {
            "Line": 1,
            "Column": 38
         },
         "EndPosition": {
            "Line": 1,
            "Column": 167
         }
      }
      ],
      "MissingContextValues": []
   }
   ]
}
```

**Example 2: To simulate a command that is prohibited by the policy**

The following simulate-custom-policy example shows the results of simulating a command that is prohibited by the policy. In this example, the provided date is before that required by the policy's condition.

```bash
aws iam simulate-custom-policy \
   --policy-input-list '{"Version":"2012-10-17","Statement":"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}' \
   --action-names dynamodb:CreateBackup \
   --context-entries
   "ContextKeyName='aws:CurrentTime',ContextKeyValues='2014-04-25T11:00:00Z',ContextKeyType=date"
```
The following code example shows how to use `simulate-principal-policy`.

**AWS CLI**

**Example 1: To simulate the effects of an arbitrary IAM policy**

The following `simulate-principal-policy` shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the `codecommit:ListRepositories` action.

```
aws iam simulate-principal-policy \
   --policy-source-arn arn:aws:iam::123456789012:user/alejandro \n   --action-names codecommit:ListRepositories
```

Output:

```json
{
   "EvaluationResults": [
      {
        "EvalActionName": "codecommit:ListRepositories",
        "EvalResourceName": "*",
        "EvalDecision": "implicitDeny",
        "MatchedStatements": [],
        "MissingContextValues": []
      }
   ]
}
```
Example 2: To simulate the effects of a prohibited command

The following simulate-custom-policy example shows the results of simulating a command that is prohibited by one of the user's policies. In the following example, the user has a policy that permits access to a DynamoDB database only after a certain date and time. The simulation has the user attempting to access the database with an aws:CurrentTime value that is earlier than the policy's condition permits.

```bash
aws iam simulate-principal-policy \
  --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
  --action-names dynamodb:CreateBackup \n  --context-entries \n  "ContextKeyName='aws:CurrentTime',ContextKeyValues='2018-04-25T11:00:00Z',ContextKeyType=date"
```

Output:

```
{
  "EvaluationResults": [
  {
    "EvalActionName": "dynamodb:CreateBackup",
    "EvalResourceName": "*",
    "EvalDecision": "implicitDeny",
    "SourcePolicyId": "Grant-Access-To-CodeCommit-ListRepo",
    "StartPosition": {
      "Line": 3,
      "Column": 19
    },
    "EndPosition": {
      "Line": 9,
      "Column": 10
    }
  }
  ],
  "MissingContextValues": []
}
```
For more information, see [Testing IAM policies with the IAM policy simulator](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_policies_simulator.html) in the *AWS IAM User Guide*.

- For API details, see [SimulatePrincipalPolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/simulate-principal-policy.html) in *AWS CLI Command Reference*.

**tag-instance-profile**

The following code example shows how to use `tag-instance-profile`.

**AWS CLI**

**To add a tag to an instance profile**

The following `tag-instance-profile` command adds a tag with a Department name to the specified instance profile.

```bash
aws iam tag-instance-profile \
   --instance-profile-name deployment-role \
   --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](https://docs.aws.amazon.com/IAM/latest/UserGuide/id.Tags.html) in the *AWS IAM User Guide*.

- For API details, see [TagInstanceProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/tag-instance-profile.html) in *AWS CLI Command Reference*.

**tag-mfa-device**

The following code example shows how to use `tag-mfa-device`.

**AWS CLI**

**To add a tag to an MFA device**

The following `tag-mfa-device` command adds a tag with a Department name to the specified MFA device.
aws iam tag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tags '[["Key": "Department", "Value": "Accounting"]]'

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagMfaDevice in AWS CLI Command Reference.

tag-open-id-connect-provider

The following code example shows how to use tag-open-id-connect-provider.

AWS CLI

To add a tag to an OpenID Connect (OIDC)-compatible identity provider

The following tag-open-id-connect-provider command adds a tag with a Department name to the specified OIDC identity provider.

aws iam tag-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com \
    --tags '[["Key": "Department", "Value": "Accounting"]]'

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagOpenIdConnectProvider in AWS CLI Command Reference.

tag-policy

The following code example shows how to use tag-policy.

AWS CLI

To add a tag to a customer managed policy

The following tag-policy command adds a tag with a Department name to the specified customer managed policy.
The following code example shows how to use `tag-policy`.

**AWS CLI**

```
aws iam tag-policy
   --policy-arn arn:aws:iam::123456789012:policy/billing-access
   --tags '[]
   [{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagPolicy](#) in *AWS CLI Command Reference*.

---

The following code example shows how to use `tag-role`.

**AWS CLI**

```
aws iam tag-role
   --role-name my-role
   --tags '{"Key": "Department", "Value": "Accounting"}''
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagRole](#) in *AWS CLI Command Reference*.

---

The following code example shows how to use `tag-saml-provider`.

**AWS CLI**

```
aws iam tag-saml-provider
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

---

### Actions and scenarios

- [AWS Command Line Interface](#)
- [User Guide for Version 2](#)
This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagSamlProvider in AWS CLI Command Reference.

**tag-server-certificate**

The following code example shows how to use tag-server-certificate.

**AWS CLI**

*To add a tag to a server certificate*

The following tag-saml-provider command adds a tag with a Department name to the specified server certificate.

```bash
aws iam tag-server-certificate \
   --server-certificate-name ExampleCertificate \
   --tags '[["Key": "Department", "Value": "Accounting"]]
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see TagServerCertificate in AWS CLI Command Reference.

**tag-user**

The following code example shows how to use tag-user.

**AWS CLI**

*To add a tag to a user*

The following tag-user command adds a tag with the associated Department to the specified user.

```bash
aws iam tag-user \
   --user-name alice \
   --tags '{"Key": "Department", "Value": "Accounting"}"
```
This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.
• For API details, see TagUser in AWS CLI Command Reference.

untag-instance-profile

The following code example shows how to use untag-instance-profile.

AWS CLI

To remove a tag from an instance profile

The following untag-instance-profile command removes any tag with the key name 'Department' from the specified instance profile.

```bash
aws iam untag-instance-profile \
   --instance-profile-name deployment-role \
   --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.
• For API details, see UntagInstanceProfile in AWS CLI Command Reference.

untag-mfa-device

The following code example shows how to use untag-mfa-device.

AWS CLI

To remove a tag from an MFA device

The following untag-mfa-device command removes any tag with the key name 'Department' from the specified MFA device.

```bash
aws iam untag-mfa-device \
   --serial-number arn:aws:iam::123456789012:mfa/alice \
   --tag-keys Department
```

This command produces no output.
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagMfaDevice in AWS CLI Command Reference.

untag-open-id-connect-provider

The following code example shows how to use untag-open-id-connect-provider.

AWS CLI

To remove a tag from an OIDC identity provider

The following untag-open-id-connect-provider command removes any tag with the key name 'Department' from the specified OIDC identity provider.

```
aws iam untag-open-id-connect-provider \
   --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/server.example.com \
   --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagOpenIdConnectProvider in AWS CLI Command Reference.

untag-policy

The following code example shows how to use untag-policy.

AWS CLI

To remove a tag from a customer managed policy

The following untag-policy command removes any tag with the key name 'Department' from the specified customer managed policy.

```
aws iam untag-policy \
   --policy-arn arn:aws:iam::452925170507:policy/billing-access \
   --tag-keys Department
```

This command produces no output.
For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagPolicy in AWS CLI Command Reference.

untag-role

The following code example shows how to use untag-role.

AWS CLI

To remove a tag from a role

The following untag-role command removes any tag with the key name 'Department' from the specified role.

```
aws iam untag-role \
   --role-name my-role \
   --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

- For API details, see UntagRole in AWS CLI Command Reference.

untag-saml-provider

The following code example shows how to use untag-saml-provider.

AWS CLI

To remove a tag from a SAML provider

The following untag-saml-provider command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-saml-provider \
   --saml-provider-arm arn:aws:iam::123456789012:saml-provider/ADFS \
   --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.
For API details, see UntagSamlProvider in AWS CLI Command Reference.

untag-server-certificate

The following code example shows how to use untag-server-certificate.

AWS CLI

To remove a tag from a server certificate

The following untag-server-certificate command removes any tag with the key name 'Department' from the specified server certificate.

```
aws iam untag-server-certificate \
    --server-certificate-name ExampleCertificate \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

For API details, see UntagServerCertificate in AWS CLI Command Reference.

untag-user

The following code example shows how to use untag-user.

AWS CLI

To remove a tag from a user

The following untag-user command removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \
    --user-name alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the AWS IAM User Guide.

For API details, see UntagUser in AWS CLI Command Reference.
update-account-password-policy

The following code example shows how to use `update-account-password-policy`.

**AWS CLI**

To set or change the current account password policy

The following `update-account-password-policy` command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \
   --minimum-password-length 8 \
   --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the AWS IAM User Guide.

- For API details, see UpdateAccountPasswordPolicy in AWS CLI Command Reference.

update-assume-role-policy

The following code example shows how to use `update-assume-role-policy`.

**AWS CLI**

To update the trust policy for an IAM role

The following `update-assume-role-policy` command updates the trust policy for the role named Test-Role.

```
aws iam update-assume-role-policy \
   --role-name Test-Role \
   --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.
The trust policy is defined as a JSON document in the `Test-Role-Trust-Policy.json` file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see [Creating IAM roles](https://docs.aws.amazon.com/IAM/latest/userguide/creating-iam-roles.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateAssumeRolePolicy](https://docs.aws.amazon.com/cli/latest/reference/iam/update-assume-role-policy.html) in AWS CLI Command Reference.

### update-group

The following code example shows how to use `update-group`.

**AWS CLI**

**To rename an IAM group**

The following `update-group` command changes the name of the IAM group Test to Test-1.

```
aws iam update-group \
  --group-name Test \
  --new-group-name Test-1
```

This command produces no output.

For more information, see [Renaming an IAM user group](https://docs.aws.amazon.com/IAM/latest/userguide/iam-user-groups-renaming.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateGroup](https://docs.aws.amazon.com/cli/latest/reference/iam/update-group.html) in AWS CLI Command Reference.

### update-login-profile

The following code example shows how to use `update-login-profile`.

**AWS CLI**

**To update the password for an IAM user**

The following `update-login-profile` command creates a new password for the IAM user named Bob.

```
aws iam update-login-profile \
  --user-name Bob \
  --password <password>
```
This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see [Managing passwords for IAM users](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_passwords.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateLoginProfile](https://docs.aws.amazon.com/cli/latest/reference/iam/update-login-profile.html) in *AWS CLI Command Reference*.

### update-open-id-connect-provider-thumbprint

The following code example shows how to use `update-open-id-connect-provider-thumbprint`.

#### AWS CLI

**To replace the existing list of server certificate thumbprints with a new list**

This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```bash
aws iam update-open-id-connect-provider-thumbprint \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com \
  --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

This command produces no output.

For more information, see [Creating OpenID Connect (OIDC) identity providers](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_openidconnect_create.html) in the *AWS IAM User Guide*.

- For API details, see [UpdateOpenIdConnectProviderThumbprint](https://docs.aws.amazon.com/cli/latest/reference/iam/update-open-id-connect-provider-thumbprint.html) in *AWS CLI Command Reference*. 
update-role

The following code example shows how to use update-role.

AWS CLI

To change an IAM role's description or session duration

The following update-role command changes the description of the IAM role production-role to Main production role and sets the maximum session duration to 12 hours.

```
aws iam update-role \
  --role-name production-role \
  --description 'Main production role' \
  --max-session-duration 43200
```

This command produces no output.

For more information, see Modifying a role in the AWS IAM User Guide.
- For API details, see UpdateRole in AWS CLI Command Reference.

update-role-description

The following code example shows how to use update-role-description.

AWS CLI

To change an IAM role's description

The following update-role command changes the description of the IAM role production-role to Main production role.

```
aws iam update-role-description \
  --role-name production-role \
  --description 'Main production role'
```

Output:

```json
{
  "Role": {
    "Path": "/",
```
For more information, see Modifying a role in the AWS IAM User Guide.

- For API details, see UpdateRoleDescription in AWS CLI Command Reference.

**update-saml-provider**

The following code example shows how to use update-saml-provider.

**AWS CLI**

**To update the metadata document for an existing SAML provider**

This example updates the SAML provider in IAM whose ARN is arn:aws:iam::123456789012:saml-provider/SAMLADFS with a new SAML metadata document from the file SAMLMetaData.xml.

```
aws iam update-saml-provider \  
   --saml-metadata-document file://SAMLMetaData.xml \  
   --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:
For more information, see Creating IAM SAML identity providers in the AWS IAM User Guide.

- For API details, see UpdateSamlProvider in AWS CLI Command Reference.

update-service-specific-credential

The following code example shows how to use update-service-specific-credential.

AWS CLI

Example 1: To update the status of the requesting user's service-specific credential

The following update-service-specific-credential example changes the status for the specified credential for the user making the request to Inactive.

```
aws iam update-service-specific-credential \
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
  --status Inactive
```

This command produces no output.

Example 2: To update the status of a specified user's service-specific credential

The following update-service-specific-credential example changes the status for the credential of the specified user to Inactive.

```
aws iam update-service-specific-credential \
  --user-name sofia \
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
  --status Inactive
```

This command produces no output.

For more information, see Create Git Credentials for HTTPS Connections to CodeCommit in the AWS CodeCommit User Guide.

- For API details, see UpdateServiceSpecificCredential in AWS CLI Command Reference.
update-signing-certificate

The following code example shows how to use `update-signing-certificate`.

**AWS CLI**

To activate or deactivate a signing certificate for an IAM user

The following `update-signing-certificate` command deactivates the specified signing certificate for the IAM user named Bob.

```bash
aws iam update-signing-certificate
   --certificate-id TA7SMP42TDN5Z260BPJE7EXAMPLE
   --status Inactive
   --user-name Bob
```

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see [Manage signing certificates](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/EBSIAMSignatureCerts.html) in the *Amazon EC2 User Guide*.

update-ssh-public-key

The following code example shows how to use `update-ssh-public-key`.

**AWS CLI**

To change the status of an SSH public key

The following `update-ssh-public-key` command changes the status of the specified public key to Inactive.

```bash
aws iam update-ssh-public-key
   --user-name sofia
   --ssh-public-key-id APKA1234567890EXAMPLE
   --status Inactive
```

This command produces no output.

For more information, see [Use SSH keys and SSH with CodeCommit](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-auth-profile-sshkey.html) in the *AWS IAM User Guide*. 
For API details, see `UpdateSshPublicKey` in *AWS CLI Command Reference*.

### upload-signing-certificate

The following code example shows how to use `upload-signing-certificate`.

**AWS CLI**

**To upload a signing certificate for an IAM user**

The following `upload-signing-certificate` command uploads a signing certificate for the IAM user named Bob.

```bash
aws iam upload-signing-certificate \
    --user-name Bob \
    --certificate-body file://certificate.pem
```

**Output:**

```
{
    "Certificate": {
        "UserName": "Bob",
        "Status": "Active",
        "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END CERTIFICATE-----",
        "CertificateId": "TA7SMP42TDN5Z26OBPJEXAMPLE",
        "UploadDate": "2013-06-06T21:40:08.121Z"
    }
}
```

The certificate is in a file named `certificate.pem` in PEM format.

For more information, see Creating and Uploading a User Signing Certificate in the *Using IAM* guide.

For API details, see `UploadSigningCertificate` in *AWS CLI Command Reference*.

### upload-ssh-public-key

The following code example shows how to use `upload-ssh-public-key`.

```bash
aws iam upload-ssh-public-key \
    --user-name Bob \
    --ssh-public-key-file file://public-key.pem
```

**Output:**

```
{
    "UserName": "Bob",
    "Status": "Active",
    "PublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQD06kL6hHwL4U78Z
3406"}
```

The public key is in a file named `public-key.pem` in PEM format.

For more information, see Creating SSH Access for IAM Users in the *Using IAM* guide.

For API details, see `UploadSshPublicKey` in *AWS CLI Command Reference*. 
AWS CLI

To upload an SSH public key and associate it with a user

The following upload-ssh-public-key command uploads the public key found in the file sshkey.pub and attaches it to the user sofia.

```
aws iam upload-ssh-public-key \
   --user-name sofia \
   --ssh-public-key-body file://sshkey.pub
```

Output:

```
{
   "SSHPublicKey": {
      "UserName": "sofia",
      "SSHPublicKeyId": "APKA1234567890EXAMPLE",
      "SSHPublicKeyBody": "ssh-rsa <<long string generated by ssh-keygen command>>",
      "Status": "Active",
      "UploadDate": "2019-04-18T17:04:49+00:00"
   }
}
```

For more information about how to generate keys in a format suitable for this command, see SSH and Linux, macOS, or Unix: Set up the public and private keys for Git and CodeCommit or SSH and Windows: Set up the public and private keys for Git and CodeCommit in the AWS CodeCommit User Guide.

- For API details, see UploadSshPublicKey in AWS CLI Command Reference.

Image Builder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Image Builder.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.
Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

create-component

The following code example shows how to use create-component.

AWS CLI

To create a component

The following create-component example creates a component that uses a JSON document file and references a component document in YAML format that is uploaded to an Amazon S3 bucket.

```
aws imagebuilder create-component \
   --cli-input-json file://create-component.json
```

Contents of create-component.json:

```
{
   "name": "MyExampleComponent",
   "semanticVersion": "2019.12.02",
   "description": "An example component that builds, validates and tests an image",
   "changeDescription": "Initial version.",
   "platform": "Windows",
   "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```
{
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateComponent in AWS CLI Command Reference.

create-distribution-configuration

The following code example shows how to use create-distribution-configuration.

AWS CLI

To create a distribution configuration

The following create-distribution-configuration example creates a distribution configuration using a JSON file.

```
aws imagebuilder create-distribution-configuration \
  --cli-input-json file:/create-distribution-configuration.json
```

Contents of create-distribution-configuration.json:

```
{
  "name": "MyExampleDistribution",
  "description": "Copies AMI to eu-west-1",
  "distributions": [
    {
      "region": "us-west-2",
      "amiDistributionConfiguration": {
        "name": "Name {{imagebuilder:buildDate}}",
        "description": "An example image name with parameter references",
        "amiTags": {
          "KeyName": "{{ssm:parameter_name}}"
        },
        "launchPermission": {
          "userIds": ["123456789012"
```

Actions and scenarios
"region": "eu-west-1",
"amiDistributionConfiguration": {
    "name": "My {{imagebuilder:buildVersion}} image
{{imagebuilder:buildDate}}",
    "amiTags": {
        "KeyName": "Value"
    },
    "launchPermission": {
        "userIds": [
            "123456789012"
        ]
    }
}
]
}
]

Output:

{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-configuration/myexampledistribution"
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateDistributionConfiguration in AWS CLI Command Reference.

create-image

The following code example shows how to use create-image.

AWS CLI

To create an image
The following `create-image` example creates an image.

```bash
aws imagebuilder create-image \
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see `CreateImage` in AWS CLI Command Reference.

### create-image-pipeline

The following code example shows how to use `create-image-pipeline`.

**AWS CLI**

To create an image pipeline

The following `create-image-pipeline` example creates an image pipeline using a JSON file.

```bash
aws imagebuilder create-image-pipeline \
  --cli-input-json file://create-image-pipeline.json
```

Contents of `create-image-pipeline.json`:

```json
{
  "name": "MyWindows2016Pipeline",
  "description": "Builds Windows 2016 Images",
}
"imageTestsConfiguration": {
    "imageTestsEnabled": true,
    "timeoutMinutes": 60
},
"schedule": {
    "scheduleExpression": "cron(0 0 * * SUN)",
    "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
},
"status": "ENABLED"
}

Output:

{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImagePipeline in AWS CLI Command Reference.

create-image-recipe

The following code example shows how to use create-image-recipe.

AWS CLI

To create a recipe

The following create-image-recipe example creates an image recipe using a JSON file. Components are installed in the order in which they are specified.
aws imagebuilder create-image-recipe
   --cli-input-json file://create-image-recipe.json

Contents of create-image-recipe.json:

```json
{
   "name": "MyBasicRecipe",
   "description": "This example image recipe creates a Windows 2016 image.",
   "semanticVersion": "2019.12.03",
   "components": [
      {
         "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
      },
      {
         "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
      },
      "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-server-2016-english-full-base-x86/xxxx.x.x"
}
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateImageRecipe in AWS CLI Command Reference.

**create-infrastructure-configuration**

The following code example shows how to use `create-infrastructure-configuration`.
To create an infrastructure configuration

The following `create-infrastructure-configuration` example creates an infrastructure configuration using a JSON file.

```bash
aws imagebuilder create-infrastructure-configuration \
   --cli-input-json file://create-infrastructure-configuration.json
```

Contents of `create-infrastructure-configuration.json`:

```json
{
    "name": "MyExampleInfrastructure",
    "description": "An example that will retain instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageBuilder",
    "securityGroupIds": [
        "sg-a1b2c3d4"
    ],
    "subnetId": "subnet-a1b2c3d4",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "keyPair": "key-pair-name",
    "terminateInstanceOnFailure": false,
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see CreateInfrastructureConfiguration in AWS CLI Command Reference.

**delete-component**

The following code example shows how to use `delete-component`.

**AWS CLI**

To delete a component

The following `delete-component` example deletes a component build version by specifying its ARN.

```bash
aws imagebuilder delete-component \
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteComponent in AWS CLI Command Reference.

**delete-image**

The following code example shows how to use `delete-image`.

**AWS CLI**

To delete an image
The following `delete-image` example deletes an image build version by specifying its ARN.

```bash
aws imagebuilder delete-image \\
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/elasticcloudimagebuilder/latest/userguide/setting-up-managing-ec2-image-builder-image-pipeline-using-aws-cli.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [DeleteImage](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/delete-image.html) in *AWS CLI Command Reference*.

### delete-image-pipeline

The following code example shows how to use `delete-image-pipeline`.

**AWS CLI**

**To delete an image pipeline**

The following `delete-image-pipeline` example deletes an image pipeline by specifying its ARN.

```bash
aws imagebuilder delete-image-pipeline \\
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeletedImagePipeline in AWS CLI Command Reference.

**delete-image-recipe**

The following code example shows how to use delete-image-recipe.

**AWS CLI**

**To delete an image recipe**

The following delete-image-recipe example deletes an image recipe by specifying its ARN.

```bash
aws imagebuilder delete-image-recipe \
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteImageRecipe in AWS CLI Command Reference.

**delete-infrastructure-configuration**

The following code example shows how to use delete-infrastructure-configuration.

**AWS CLI**

**To delete an infrastructure configuration**
The following delete-infrastructure-configuration example deletes an image pipeline by specifying its ARN.

```bash
aws imagebuilder delete-infrastructure-configuration \
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see DeleteInfrastructureConfiguration in AWS CLI Command Reference.

get-component

The following code example shows how to use get-component.

AWS CLI

**To get component details**

The following get-component example lists the details of a component by specifying its ARN.

```bash
aws imagebuilder get-component \
   --component-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0/1
```

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "component": {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0/1",
      "name": "component-name",
   }
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetComponent in AWS CLI Command Reference.

**get-component-policy**

The following code example shows how to use get-component-policy.

**AWS CLI**

**To get component policy details**

The following get-component-policy example lists the details of a component policy by specifying its ARN.

```
aws imagebuilder get-component-policy \
    --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/my-example-component/2019.12.03/1
```

**Output:**

```
{
```

**get-distribution-configuration**

The following code example shows how to use get-distribution-configuration.

**AWS CLI**

To get the details of a distribution configuration

The following get-distribution-configuration example displays the details of a distribution configuration by specifying its ARN.

```bash
aws imagebuilder get-distribution-configuration \\
```

Output:

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "distributionConfiguration": {
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1 and exports to S3",
    "distributions": [
      {
        "region": "us-west-2",
        "amiDistributionConfiguration": {
          "name": "Name {{imagebuilder:buildDate}}",
          "description": "An example image name with parameter references",
          "amiTags": {
            "KeyName": "{{ssm:parameter_name}}"
          }
        }
      }
    ]
  }
}
```
},
    "launchPermission": {
        "userIds": [
            "123456789012"
        ]
    }
},
{
    "region": "eu-west-1",
    "amiDistributionConfiguration": {
        "name": "My {{imagebuilder:buildVersion}} image
{{imagebuilder:buildDate}}",
        "amiTags": {
            "KeyName": "Value"
        },
        "launchPermission": {
            "userIds": [
                "123456789012"
            ]
        }
    },
    "dateCreated": "2020-02-19T18:40:10.529Z",
    "tags": {}
}
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetDistributionConfiguration in AWS CLI Command Reference.

get-image

The following code example shows how to use get-image.

AWS CLI

To get image details

The following get-image example lists the details of an image by specifying its ARN.
aws imagebuilder get-image \

Output:

```json
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
   "image": {
      "name": "MyBasicRecipe",
      "version": "2019.12.03/1",

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImage in AWS CLI Command Reference.

**get-image-pipeline**

The following code example shows how to use get-image-pipeline.
To get image pipeline details

The following `get-image-pipeline` example lists the details of an image pipeline by specifying its ARN.

```
aws imagebuilder get-image-pipeline \
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "imagePipeline": {
      "name": "MyWindows2016Pipeline",
      "description": "Builds Windows 2016 Images",
      "platform": "Windows",
      "imageTestsConfiguration": {
         "imageTestsEnabled": true,
         "timeoutMinutes": 60
      },
      "schedule": {
         "scheduleExpression": "cron(0 0 * * SUN)",
         "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
      },
      "status": "ENABLED",
      "dateCreated": "2020-02-19T19:04:01.253Z",
      "dateUpdated": "2020-02-19T19:04:01.253Z",
      "tags": {}
   }
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImagePipeline in AWS CLI Command Reference.

get-image-policy

The following code example shows how to use get-image-policy.

**AWS CLI**

**To get image policy details**

The following get-image-policy example lists the details of an image policy by specifying its ARN.

```bash
aws imagebuilder get-image-policy
```

Output:

```
{
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImagePolicy in AWS CLI Command Reference.

get-image-recipe-policy

The following code example shows how to use get-image-recipe-policy.

**AWS CLI**

**To get image recipe policy details**

The following get-image-recipe-policy example lists the details of an image policy by specifying its ARN.

```bash
aws imagebuilder get-image-recipe-policy
```

Output:

```
{
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetImageRecipePolicy in AWS CLI Command Reference.
The following `get-image-recipe-policy` example lists the details of an image recipe policy by specifying its ARN.

```
aws imagebuilder get-image-recipe-policy \
```

Output:

```
{
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see `GetImageRecipePolicy` in AWS CLI Command Reference.

**get-infrastructure-configuration**

The following code example shows how to use `get-infrastructure-configuration`.

**AWS CLI**

To get infrastructure configuration details

The following `get-infrastructure-configuration` example lists the details of an infrastructure configuration by specifying its ARN.

```
aws imagebuilder get-infrastructure-configuration \
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "infrastructureConfiguration": {
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see GetInfrastructureConfiguration in AWS CLI Command Reference.

import-component

The following code example shows how to use import-component.

AWS CLI

To import a component

The following import-component example imports a preexisting script using a JSON file.

```
aws imagebuilder import-component \
```
--cli-input-json file://import-component.json

Contents of import-component.json:

```json
{
    "name": "MyImportedComponent",
    "semanticVersion": "1.0.0",
    "description": "An example of how to import a component",
    "changeDescription": "First commit message.",
    "format": "SHELL",
    "platform": "Windows",
    "type": "BUILD",
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ImportComponent in AWS CLI Command Reference.

list-component-build-versions

The following code example shows how to use list-component-build-versions.

AWS CLI

To list component build versions

The following list-component-build-versions example lists the component build versions with a specific semantic version.

```bash
```
Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentSummaryList": [
        {
            "name": "MyExampleComponent",
            "version": "2019.12.02",
            "platform": "Windows",
            "type": "BUILD",
            "owner": "123456789012",
            "description": "An example component that builds, validates and tests an image",
            "changeDescription": "Initial version.",
            "dateCreated": "2020-02-19T18:53:45.940Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListComponentBuildVersions in AWS CLI Command Reference.

### list-components

The following code example shows how to use list-components.

**AWS CLI**

**To list all of the component semantic versions**

The following `list-components` example lists all of the component semantic versions to which you have access. You can optionally filter on whether to list components owned by you, by Amazon, or that have been shared with you by other accounts.

```bash
aws imagebuilder list-components
```
Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "componentVersionList": [
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-name/1.0.0",
      "name": "component-name",
      "version": "1.0.0",
      "platform": "Linux",
      "type": "TEST",
      "owner": "123456789012",
      "dateCreated": "2020-01-27T20:43:30.306Z"
    }
  ]
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/elasticbeancurd/ec2-userguide/#ec2-image-builder-user-guide) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListComponents](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/list-components.html) in *AWS CLI Command Reference*.

**list-distribution-configurations**

The following code example shows how to use `list-distribution-configurations`.

**AWS CLI**

**To list distributions**

The following `list-distribution-configurations` example lists all of your distributions.

```
aws imagebuilder list-distribution-configurations
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "distributionConfigurationSummaryList": [
    {
      "name": "myexampledistribution",
      "type": "TEST",
      "owner": "123456789012",
      "dateCreated": "2020-01-27T20:43:30.306Z"
    }
  ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListDistributionConfigurations in AWS CLI Command Reference.

list-image-build-versions

The following code example shows how to use list-image-build-versions.

AWS CLI

To list image build versions

The following list-image-build-versions example lists all of the image build versions with a semantic version.

```bash
aws imagebuilder list-image-build-versions \
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageSummaryList": [
    {
        "name": "MyBasicRecipe",

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImageBuildVersions in AWS CLI Command Reference.

list-image-pipeline-images

The following code example shows how to use list-image-pipeline-images.

**AWS CLI**

To list image pipeline pipeline images

The following list-image-pipeline-images example lists all images that were created by a specific image pipeline.

```
aws imagebuilder list-image-pipeline-images
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
   "imagePipelineList": [

   ]
}
```
  "name": "MyWindows2016Pipeline",

  "tags": {
    "KeyName": "KeyValue"
  }
}
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

• For API details, see ListImagePipelineImages in AWS CLI Command Reference.

**list-image-recipes**

The following code example shows how to use list-image-recipes.

**AWS CLI**

**To list image recipes**

The following list-image-recipes example lists all of your image recipes.

```
aws imagebuilder list-image-recipes
```

**Output:**

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeSummaryList": [
        {
            "name": "MyBasicRecipe",
            "platform": "Windows",
            "owner": "123456789012",
            "dateCreated": "2020-02-19T18:54:25.975Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        },
        
    
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImageRecipes in AWS CLI Command Reference.

**list-images**

The following code example shows how to use list-images.

**AWS CLI**

**To list images**

The following list-images example lists all of the semantic versions you have access to.

```
aws imagebuilder list-images
```

**Output:**

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "imageVersionList": [
      {
         "name": "MyBasicRecipe",
         "version": "2019.12.03",
         "platform": "Windows",
         "tags": {
            "KeyName": "KeyValue"
         }
      }
   ]
}
```
For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see ListImages in AWS CLI Command Reference.

list-infrastructure-configurations

The following code example shows how to use list-infrastructure-configurations.

**AWS CLI**

**To list infrastructure configurations**

The following list-infrastructure-configurations example lists all of your infrastructure configurations.

```
aws imagebuilder list-infrastructure-configurations
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
   "infrastructureConfigurationSummaryList": [
   {
      "name": "MyExampleInfrastructure",
      "description": "An example that will retain instances of failed builds",
      "dateCreated": "2020-02-19T19:11:51.858Z",
      "tags": {}
   },
   {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-configuration/infrastructureconfiguration-name-a1b2c3d45678",
      "name": "infrastructureConfiguration-name-a1b2c3d45678",
      "dateCreated": "2019-12-16T19:01:03Z",
      "tags": {}
   }
   ]
}
```
The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for a specific resource**

The following `list-tags-for-resource` example lists all of the tags for a specific resource.

```
aws imagebuilder list-tags-for-resource \
```

Output:

```
{
  "tags": {
    "KeyName": "KeyValue"
  }
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/EC2/latest/UserGuide/ec2-imagebuilder-cli.html) in the *EC2 Image Builder Users Guide*.

* For API details, see [ListTagsForResource](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/list-tags-for-resource.html) in *AWS CLI Command Reference*.

### put-component-policy

The following code example shows how to use `put-component-policy`. 
AWS CLI

To apply a resource policy to a component

The following put-component-policy command applies a resource policy to a build component to enable cross-account sharing of build components. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-component-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-component-policy \
```

Output:

```
{
   "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutComponentPolicy in AWS CLI Command Reference.

put-image-policy

The following code example shows how to use put-image-policy.

AWS CLI

To apply a resource policy to an image
The following `put-image-policy` command applies a resource policy to an image to enable cross-account sharing of images. We recommend you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-policy 
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/example-image/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutImagePolicy in AWS CLI Command Reference.

**put-image-recipe-policy**

The following code example shows how to use `put-image-recipe-policy`.

**AWS CLI**

To apply a resource policy to an image recipe

The following `put-image-recipe-policy` command applies a resource policy to an image recipe to enable cross-account sharing of image recipes. We recommend that you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-recipe-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.
aws imagebuilder put-image-recipe-policy \
    example-image-recipe/2019.12.02/1 \
    --policy '{ "Version": "2012-10-17", "Statement": [ { "Effect": 
    "Allow", "Principal": [ "AWS": [ "123456789012" ] }, "Action": 
    [ "imagebuilder:GetImageRecipe", "imagebuilder:ListImageRecipes" ], 
    example-image-recipe/2019.12.02/1" ] } ] }'

Output:

{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    example-image-recipe/2019.12.02/1"
}

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using
the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see PutImageRecipePolicy in AWS CLI Command Reference.

start-image-pipeline-execution

The following code example shows how to use start-image-pipeline-execution.

AWS CLI

To start an image pipeline manually

The following start-image-pipeline-execution example manually starts an image pipeline.

aws imagebuilder start-image-pipeline-execution \
mywindows2016pipeline

Output:

{

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see StartImagePipelineExecution in AWS CLI Command Reference.

**tag-resource**

The following code example shows how to use tag-resource.

**AWS CLI**

**To tag a resource**

The following tag-resource example adds and tags a resource to EC2 Image Builder using a JSON file.

```
aws imagebuilder tag-resource \
   --cli-input-json file://tag-resource.json
```

**Contents of tag-resource.json:**

```
{
   "tags": {
      "KeyName": "KeyValue"
   }
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see TagResource in AWS CLI Command Reference.
untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove a tag from a resource

The following untag-resource example removes a tag from a resource using a JSON file.

```bash
aws imagebuilder untag-resource \
   --cli-input-json file://tag-resource.json
```

Contents of untag-resource.json:

```json
{
   "tagKeys": [
      "KeyName"
   ]
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-distribution-configuration

The following code example shows how to use update-distribution-configuration.

AWS CLI

To update a distribution configuration

The following update-distribution-configuration example updates a distribution configuration using a JSON file.

```bash
aws imagebuilder update-distribution-configuration \
```
Contents of `update-distribution-configuration.json`:

```json
{
    "description": "Copies AMI to eu-west-2 and exports to S3",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references"
            }
        },
        {
            "region": "eu-west-2",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}}{{imagebuilder:buildDate}}"
            }
        }
    ]
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE111111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the EC2 Image Builder Users Guide.

- For API details, see UpdateDistributionConfiguration in AWS CLI Command Reference.

**update-image-pipeline**

The following code example shows how to use `update-image-pipeline`.
AWS CLI

To update an image pipeline

The following update-image-pipeline example updates an image pipeline using a JSON file.

```bash
aws imagebuilder update-image-pipeline \
    --cli-input-json file:///update-image-pipeline.json
```

Contents of `update-image-pipeline.json`:

```json
{
    "imageTestsConfiguration": {
        "imageTestsEnabled": true,
        "timeoutMinutes": 120
    },
    "schedule": {
        "scheduleExpression": "cron(0 0 * * MON)",
        "pipelineExecutionStartCondition": "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "DISABLED"
}
```

Output:

```json
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](https://docs.aws.amazon.com/ec2/userguide/imagebuilder-update-image-pipeline.html) in the *EC2 Image Builder Users Guide*.

- For API details, see [UpdateImagePipeline](https://docs.aws.amazon.com/cli/latest/reference/imagebuilder/update-image-pipeline.html) in *AWS CLI Command Reference*. 

Actions and scenarios
**update-infrastructure-configuration**

The following code example shows how to use `update-infrastructure-configuration`.

### AWS CLI

**To update an infrastructure configuration**

The following `update-infrastructure-configuration` example updates an infrastructure configuration using a JSON file.

```bash
aws imagebuilder update-infrastructure-configuration \
  --cli-input-json file:/update-infrastructure-configuration.json
```

**Contents of update-infrastructure-configuration.json:**

```json
{
  "description": "An example that will terminate instances of failed builds",
  "instanceTypes": [
    "m5.large", "m5.2xlarge"
  ],
  "instanceProfileName": "EC2InstanceProfileForImageFactory",
  "securityGroupIds": [
    "sg-a48c95ef"
  ],
  "subnetId": "subnet-a48c95ef",
  "logging": {
    "s3Logs": {
      "s3BucketName": "bucket-name",
      "s3KeyPrefix": "bucket-path"
    }
  },
  "terminateInstanceOnFailure": true,
  "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name"
}
```

**Output:**

```json
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```
Incident Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

create-replication-set

The following code example shows how to use `create-replication-set`.

**AWS CLI**

To create the replication set

The following `create-replication-set` example creates the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account. This example uses the us-east-1 and us-east-2 Regions while creating the replication set.

```
aws ssm-incidents create-replication-set
```
Output:

```json
{
    "replicationSetArns": [
        "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
    ]
}
```

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see CreateReplicationSet in AWS CLI Command Reference.

create-response-plan

The following code example shows how to use create-response-plan.

AWS CLI

To create a response plan

The following create-response-plan example creates a response plan with the specified details.

```bash
aws ssm-incidents create-response-plan \
    --chat-channel '{"chatbotSns": ["arn:aws:sns:us-east-1:111122223333:Standard_User"]}' \
    --display-name "Example response plan" \
    --incident-template '{"impact": 5, "title": "example-incident"}' \
    --name "example-response" \
    --actions '[["ssmAutomation": {"documentName": "AWSIncidents-CriticalIncidentRunbookTemplate", "documentVersion": "$DEFAULT", "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-incidents.amazonaws.com/AWSServiceRoleForIncidentManager", "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"}]]' \
    --engagements '[["arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"]]
```
create-timeline-event

The following code example shows how to use create-timeline-event.

AWS CLI

**Example 1: To create a custom timeline event**

The following create-timeline-event example creates a custom timeline event at the specified time on the specified incident.

```bash
aws ssm-incidents create-timeline-event \
   --event-data ""example timeline event"" \
   --event-time 2022-10-01T20:30:00.000 \
   --event-type "Custom Event" \
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

Output:

```json
{
   "eventId": "c0bcc885-a41d-eb01-b4ab-9d2deEXAMPLE",
   "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

**Example 2: To create a timeline event with an incident note**

The following create-timeline-event example creates a timeline event that is listed in the 'Incident notes' panel.

```bash
aws ssm-incidents create-timeline-event \
   --event-data ""example timeline event"" \
   --event-time 2022-10-01T20:30:00.000 \
   --event-type "Custom Event" \
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

Output:

```json
{
   "eventId": "c0bcc885-a41d-eb01-b4ab-9d2deEXAMPLE",
   "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```
--event-data ""New Note"" \
--event-type "Note" \
--incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE" \
--event-time 2023-06-20T12:06:00.000 \
--event-references '[["resource":"arn:aws:ssm-incidents::111122223333:incident-record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE"]]'

Output:

```
{
    "eventId": "a41dc885-c0bc-b4ab-eb01-de9d2EXAMPLE",
    "incidentRecordArn": "arn:aws:sm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

For more information, see [Incident details](#) in the [Incident Manager User Guide](#).

- For API details, see [CreateTimelineEvent](#) in [AWS CLI Command Reference](#).

### delete-incident-record

The following code example shows how to use delete-incident-record.

**AWS CLI**

**To delete an incident record**

The following delete-incident-record example deletes the specified incident record.

```
aws ssm-incidents delete-incident-record \
   --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see [Incident tracking](#) in the [Incident Manager User Guide](#).

- For API details, see [DeleteIncidentRecord](#) in [AWS CLI Command Reference](#).

### delete-replication-set

The following code example shows how to use delete-replication-set.
AWS CLI

To delete the replication set

The following delete-replication-set example deletes the replication set from your Amazon Web Services account. Deleting the replication set also deletes all Incident Manager data. This can't be undone.

```
aws ssm-incidents delete-replication-set
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see DeleteReplicationSet in AWS CLI Command Reference.

delete-resource-policy

The following code example shows how to use delete-resource-policy.

AWS CLI

To delete a resource policy

The following delete-resource-policy example deletes a resource policy from a response plan. This will revoke access from the principal or organization that the response plan was shared with.

```
aws ssm-incidents delete-resource-policy
    --policy-id "be8b57191f0371f1c6827341aa3f0a03"
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

This command produces no output.

For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

**delete-response-plan**

The following code example shows how to use `delete-response-plan`.

**AWS CLI**

**To delete a response plan**

The following `delete-response-plan` example deletes the specified response plan.

```bash
aws ssm-incidents delete-response-plan
    --arn "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
```

This command produces no output.

For more information, see [Incident preparation](https://aws.amazon.com/about-aws/user-support/incident-mgmt/) in the *Incident Manager User Guide*.

• For API details, see [DeleteResponsePlan](https://awscli.amazonaws.com/v2/documentation/api/current/reference/services/ssm-incidents.html#DeleteResponsePlan) in [AWS CLI Command Reference](https).

**delete-timeline-event**

The following code example shows how to use `delete-timeline-event`.

**AWS CLI**

**To delete a timeline event**

The following `delete-timeline-event` example deletes a custom timeline event from the specified incident record.

```bash
aws ssm-incidents delete-timeline-event
    --event-id "c0bcc885-a41d-eb01-b4ab-9d2de193643c"
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see [Incident details](https://aws.amazon.com/about-aws/user-support/incident-mgmt/) in the *Incident Manager User Guide*. 
get-incident-record

The following code example shows how to use `get-incident-record`.

**AWS CLI**

**To get an incident record**

The following `get-incident-record` example gets details about the specified incident record.

```
aws ssm-incidents get-incident-record \
   --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
   "incidentRecord": {
      "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
      "automationExecutions": [],
      "creationTime": "2021-05-21T18:16:57.579000+00:00",
      "dedupeString": "c4bcc812-85e7-938d-2b78-17181176ee1a",
      "impact": 5,
      "incidentRecordSource": {
         "createdBy": "arn:aws:iam::111122223333:user/draliatp",
         "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
         "source": "aws.ssm-incidents.custom"
      },
      "lastModifiedBy": "arn:aws:iam::111122223333:user/draliatp",
      "lastModifiedTime": "2021-05-21T18:16:59.149000+00:00",
      "notificationTargets": [],
      "status": "OPEN",
      "title": "Example-Incident"
   }
}
```

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [GetIncidentRecord](#) in *AWS CLI Command Reference*.  
- For API details, see [DeleteTimelineEvent](#) in *AWS CLI Command Reference*. 

**get-replication-set**

The following code example shows how to use `get-replication-set`.

**AWS CLI**

**To get the replication set**

The following `get-replication-set` example gets the details of the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account.

```
aws ssm-incidents get-replication-set \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
```

**Output:**

```
{
    "replicationSet": {
        "createdBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
        "createdTime": "2021-05-14T17:57:22.010000+00:00",
        "deletionProtected": false,
        "lastModifiedBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
        "lastModifiedTime": "2021-05-14T17:57:22.010000+00:00",
        "regionMap": {
            "us-east-1": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE"
            },
            "us-east-2": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE",
                "statusMessage": "Tagging inaccessible"
            }
        }
    },
    "status": "ACTIVE"
}
```

For more information, see [Using the Incident Manager replication set](https://docs.aws.amazon.com/IncidentManager/latest/ug/replication-set.html) in the *Incident Manager User Guide*.

get-resource-policies

The following code example shows how to use get-resource-policies.

AWS CLI

To list resource policies for a response plan

The following command-name example lists the resource policies associated with the specified response plan.

```bash
aws ssm-incidents get-resource-policies \
--resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```json
{
    "resourcePolicies": [
    {
        "policyId": "be8b57191f0371f1c6827341aa3f0a03",
        "ramResourceShareRegion": "us-east-1"
    }
    ]
}
```

For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

- For API details, see GetResourcePolicies in AWS CLI Command Reference.
get-response-plan

The following code example shows how to use get-response-plan.

**AWS CLI**

**To get details of a response plan**

The following command-name example gets details about a specified response plan in your AWS account.

```bash
aws ssm-incidents get-response-plan \
  --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```json
{
  "actions": [
    {
      "ssmAutomation": {
        "documentName": "AWSIncidents-CriticalIncidentRunbookTemplate",
        "documentVersion": "$DEFAULT",
        "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-incidents.amazonaws.com/AWSServiceRoleForIncidentManager",
        "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"
      }
    }
  ],
  "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
  "chatChannel": {
    "chatbotSns": [
    ]
  },
  "displayName": "Example response plan",
  "engagements": [
    "arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"
  ],
  "incidentTemplate": {
    "impact": 5,
    "title": "Example-Incident"
  }
}
```
For more information, see [Incident preparation](#) in the *Incident Manager User Guide*.

- For API details, see [GetResponsePlan](#) in *AWS CLI Command Reference*.

---

### get-timeline-event

The following code example shows how to use `get-timeline-event`.

**AWS CLI**

**To get details of a timeline event**

The following `get-timeline-event` example returns details of the specified timeline event.

```
aws ssm-incidents get-timeline-event \
  --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \ 
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

**Output:**

```
{
  "event": {
    "eventData": "Incident Started",
    "eventId": "20bcc812-8a94-4cd7-520c-0ff742111424",
    "eventTime": "2021-05-21T18:16:57+00:00",
    "eventType": "Custom Event",
    "eventUpdatedTime": "2021-05-21T18:16:59.944000+00:00",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
  }
}
```

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [GetTimelineEvent](#) in *AWS CLI Command Reference*.

---

### list-incident-records

The following code example shows how to use `list-incident-records`.

---

**Actions and scenarios**
AWS CLI

To list incident records

The following command-name example lists the incident records in your Amazon Web Services account.

```bash
aws ssm-incidents list-incident-records
```

Output:

```json
{
  "incidentRecordSummaries": [
    {
      "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
      "creationTime": "2021-05-21T18:16:57.579000+00:00",
      "impact": 5,
      "incidentRecordSource": {
        "createdBy": "arn:aws:iam::111122223333:user/draliatp",
        "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
        "source": "aws.ssm-incidents.custom"
      },
      "status": "OPEN",
      "title": "Example-Incident"
    }
  ]
}
```

For more information, see Incident list in the Incident Manager User Guide.

- For API details, see ListIncidentRecords in AWS CLI Command Reference.

list-related-items

The following code example shows how to use list-related-items.

AWS CLI

To list related items

The following list-related-items example lists the related items of the specified incident.
aws ssm-incidents list-related-items \
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"

Output:

```json
{
  "relatedItems": [
    {
      "identifier": {
        "type": "OTHER",
        "value": {
          "url": "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?region=us-east-1"
        }
      },
      "title": "Example related item"
    },
    {
      "identifier": {
        "type": "PARENT",
        "value": {
          "arn": "arn:aws:ssm:us-east-1:111122223333:opsitem/oi-8084126392ac"
        }
      },
      "title": "parentItem"
    }
  ]
}
```

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see ListRelatedItems in AWS CLI Command Reference.

list-replication-sets

The following code example shows how to use list-replication-sets.

AWS CLI

To list the replication set
The following `list-replication-set` example lists the replication set Incident Manager uses to replicate and encrypt data in your AWS account.

```bash
aws ssm-incidents list-replication-sets
```

Output:

```json
{
  "replicationSetArns": [
    "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
  ]
}
```

For more information, see [Using the Incident Manager replication set](#) in the [Incident Manager User Guide](#).

- For API details, see [ListReplicationSets](#) in [AWS CLI Command Reference](#).

**list-response-plans**

The following code example shows how to use `list-response-plans`.

**AWS CLI**

**To list the available response plans**

The following `list-response-plans` example lists the available response plans in your Amazon Web Services account.

```bash
aws ssm-incidents list-response-plans
```

Output:

```json
{
  "responsePlanSummaries": [
    {
      "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan",
      "displayName": "Example response plan",
      "name": "Example-Response-Plan"
    }
  ]
}
```
For more information, see `Incident preparation` in the `Incident Manager User Guide`.

- For API details, see `ListResponsePlans` in `AWS CLI Command Reference`.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list tags for a response plan**

The following `list-tags-for-resource` example lists the tags associated with the specified response plan.

```bash
aws ssm-incidents list-tags-for-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

**Output:**

```json
{
    "tags": {
        "group1": "1"
    }
}
```

For more information, see `Tagging` in the `Incident Manager User Guide`.

- For API details, see `ListTagsForResource` in `AWS CLI Command Reference`.

### list-timeline-events

The following code example shows how to use `list-timeline-events`.

#### AWS CLI

**To list timeline events of an incident**
The following command-name example lists the timeline events of the specified incident.

```
aws ssm-incidents list-timeline-events \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
  "eventSummaries": [
  {
    "eventId": "8cbcc889-35e1-a42d-2429-d6f100799915",
    "eventTime": "2021-05-21T22:36:13.766000+00:00",
    "eventType": "SSM Incident Record Update",
    "eventUpdatedTime": "2021-05-21T22:36:13.766000+00:00",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
  },
  {
    "eventId": "a2bcc825-aab5-1787-c605-f9bb2640d85b",
    "eventTime": "2021-05-21T18:58:46.443000+00:00",
    "eventType": "SSM Incident Record Update",
    "eventUpdatedTime": "2021-05-21T18:58:46.443000+00:00",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
  },
  {
    "eventId": "5abcc812-89c0-b0a8-9437-1c74223d4685",
    "eventTime": "2021-05-21T18:16:59.149000+00:00",
    "eventType": "SSM Incident Record Update",
    "eventUpdatedTime": "2021-05-21T18:16:59.149000+00:00",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
  },
  {
    "eventId": "06bcc812-8820-405e-4065-8d2b14d29b92",
    "eventTime": "2021-05-21T18:16:58+00:00",
    "eventType": "SSM Automation Execution Start Failure for Incident",
    "eventUpdatedTime": "2021-05-21T18:16:58.689000+00:00",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
  }
  ]
}
```
For more information, see Incident details in the Incident Manager User Guide.

- For API details, see ListTimelineEvents in AWS CLI Command Reference.

**put-resource-policy**

The following code example shows how to use put-resource-policy.

**AWS CLI**

**To share a response plan and incidents**

The following command-name example adds a resource policy to the Example-Response-Plan that shares the response plan and associated incidents with the specified principal.

```bash
aws ssm-incidents put-resource-policy \
  --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \
```
Output:

```
{
  "policyId": "be8b57191f0371f1c6827341aa3f0a03"
}
```

For more information, see [Working with shared contacts and response plans](https://docs.aws.amazon.com/incidentmanager/latest/userguide/working-with-shared-contacts-and-response-plans.html) in the *Incident Manager User Guide*.

### start-incident

The following code example shows how to use `start-incident`.

**AWS CLI**

**To start an incident**

The following `start-incident` example starts an incident using the specified response plan.

```
aws ssm-incidents start-incident \
```

Output:

```
{
  "incidentRecordArn": "arn:aws:ssm-incidents::682428703967:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
}
```

For more information, see [Incident creation](https://docs.aws.amazon.com/incidentmanager/latest/userguide/creating-incidents.html) in the *Incident Manager User Guide*.

- For API details, see [StartIncident](https://docs.aws.amazon.com/cli/latest/reference/ssm-incidents/start-incidents.html) in *AWS CLI Command Reference*. 

---

**Actions and scenarios**

3466
**tag-resource**

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a response plan**

The following `tag-resource` example tags a specified response plan with the provided tag key-value pair.

```
aws ssm-incidents tag-resource \
   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \
   --tags '{"group1":"1"}'
```

This command produces no output.

For more information, see [Tagging](#) in the [Incident Manager User Guide](#).

- For API details, see [TagResource](#) in [AWS CLI Command Reference](#).

**untag-resource**

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a response plan**

The following `untag-resource` example removes the specified tags from the response plan.

```
aws ssm-incidents untag-resource \
   --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \
   --tag-keys '["group1"]'
```

This command produces no output.

For more information, see [Tagging](#) in the [Incident Manager User Guide](#).

- For API details, see [UntagResource](#) in [AWS CLI Command Reference](#).
**update-deletion-protection**

The following code example shows how to use `update-deletion-protection`.

**AWS CLI**

**To update replication set deletion protection**

The following `update-deletion-protection` example updates the deletion protection in your account to protect you from deleting the last Region in your replication set.

```bash
aws ssm-incidents update-deletion-protection \
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/a2bcc5c9-0f53-8047-7fef-c20749989b40" \
   --deletion-protected
```

This command produces no output.

For more information, see [Using the Incident Manager replication set](https://docs.aws.amazon.com/incident/latest/userguide/using-ssm-incidents.html) in the *Incident Manager User Guide*.

- For API details, see [UpdateDeletionProtection](https://docs.aws.amazon.com/cli/latest/reference/ssm-incidents/update-deletion-protection.html) in *AWS CLI Command Reference*.

**update-incident-record**

The following code example shows how to use `update-incident-record`.

**AWS CLI**

**To update an incident record**

The following command-name example resolves the specified incident.

```bash
aws ssm-incidents update-incident-record \
   --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
   --status "RESOLVED"
```

This command produces no output.

For more information, see [Incident details](https://docs.aws.amazon.com/incident/latest/userguide/using-ssm-incidents.html) in the *Incident Manager User Guide*. 
update-related-items

The following code example shows how to use update-related-items.

AWS CLI

To update an incidents related item

The following update-related-item example removes a related item from the specified incident record.

```bash
aws ssm-incidents update-related-items
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" 
   --related-items-update '{"itemToRemove": {"type": "OTHER", "value": {"url": "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?region=us-east-1"}}}'
```

This command produces no output.

For more information, see Incident details in the Incident Manager User Guide.

- For API details, see UpdateIncidentRecord in AWS CLI Command Reference.

update-replication-set

The following code example shows how to use update-replication-set.

AWS CLI

To update a replication set

The following command-name example deletes the us-east-2 Region from the replication set.

```bash
aws ssm-incidents update-replication-set 
   --arn "arn:aws:ssm-incidents::111122223333:replication-set/a2bcc5c9-0f53-8047-7fef-c20749989b40" 
   --actions '[["deleteRegionAction": {"regionName": "us-east-2"}]]'
```

This command produces no output.

- For API details, see UpdateRelatedItems in AWS CLI Command Reference.
For more information, see Using the Incident Manager replication set in the Incident Manager User Guide.

- For API details, see UpdateReplicationSet in AWS CLI Command Reference.

update-response-plan

The following code example shows how to use update-response-plan.

AWS CLI

To update a response plan

The following update-response-plan example removes a chat channel from the specified response plan.

```
aws ssm-incidents update-response-plan
   --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
   --chat-channel '{"empty":{}}'
```

This command produces no output.

For more information, see Incident preparation in the Incident Manager User Guide.
- For API details, see UpdateResponsePlan in AWS CLI Command Reference.

update-timeline-event

The following code example shows how to use update-timeline-event.

AWS CLI

To update a timeline event

The following update-timeline-event example updates the time that the event occurred.

```
aws ssm-incidents update-timeline-event
   --event-id 20bcc812-8a94-4cd7-520c-0ff742111424
   --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
   --event-time "2021-05-21T18:57+00:00"
```
This command produces no output.

For more information, see Incidents details in the Incident Manager User Guide.

- For API details, see UpdateTimelineEvent in AWS CLI Command Reference.

Incident Manager Contacts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager Contacts.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- **Actions**

**Actions**

**accept-page**

The following code example shows how to use `accept-page`.

**AWS CLI**

To accept a page during and engagement

The following `accept-page` example uses an accept code sent to the contact channel to accept a page.

```bash
aws ssm-contacts accept-page \  --page-id "arn:aws:ssm-contacts:us-east-2:682428703967:page/akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3"
```
This command produces no output

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see AcceptPage in AWS CLI Command Reference.

activate-contact-channel

The following code example shows how to use activate-contact-channel.

AWS CLI

Activate a contact's contact channel

The following activate-contact-channel example activates a contact channel and makes it usable as part of an incident.

```bash
aws ssm-contacts activate-contact-channel \
   --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d" \
   --activation-code "466136"
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ActivateContactChannel in AWS CLI Command Reference.

command-name

The following code example shows how to use command-name.

AWS CLI

To delete a contact

The following command-name example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.
aws ssm-contacts delete-contact \
   --contact-id "arn:aws:ssm-contacts:us-east-1:682428703967:contact/alejr"

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see CommandName in AWS CLI Command Reference.

create-contact

The following code example shows how to use create-contact.

AWS CLI

To create a contact

The following create-contact example creates a contact in your environment with a blank plan. The plan can be updated after creating contact channels. Use the create-contact-channel command with the output ARN of this command. After you have created contact channels for this contact use update-contact to update the plan.

```
aws ssm-contacts create-contact \
   --alias "akuam" \
   --display-name "Akua Mansa" \
   --type PERSONAL \
   --plan '{"Stages": []}'
```

Output:

```
{
   "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see CreateContact in AWS CLI Command Reference.

create-contact-channel

The following code example shows how to use create-contact-channel.
AWS CLI

To create a contact channel

Creates a contact channel of type SMS for the contact Akua Mansa. Contact channels can be created of type SMS, EMAIL, or VOICE.

```
aws ssm-contacts create-contact-channel \
  --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
  --name "akuas sms-test" \
  --type SMS \n  --delivery-address '{"SimpleAddress": "+15005550199"}'
```

Output:

```
{
   "ContactChannelArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/02f506b9-ea5d-4764-af89-2daa793ff024"
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see CreateContactChannel in AWS CLI Command Reference.

deactivate-contact-channel

The following code example shows how to use deactivate-contact-channel.

AWS CLI

To deactivate a contact channel

The following deactivate-contact-channel example deactivates a contact channel. Deactivating a contact channel means the contact channel will no longer be paged during an incident. You can also reactivate a contact channel at any time using the activate-contact-channel command.

```
aws ssm-contacts deactivate-contact-channel \
  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```
This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see DeactivateContactChannel in AWS CLI Command Reference.

delete-contact

The following code example shows how to use delete-contact.

AWS CLI

To delete a contact

The following delete-contact example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```bash
aws ssm-contacts delete-contact \
   --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/alejr"
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see DeleteContact in AWS CLI Command Reference.

delete-contact-channel

The following code example shows how to use delete-contact-channel.

AWS CLI

To delete a contact channel

The following delete-contact-channel example deletes a contact channel. Deleting a contact channel ensures the contact channel will not be paged during an incident.

```bash
aws ssm-contacts delete-contact-channel \
   --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/13149bad-52ee-45ea-ae1e-45857f78f9b2"
```

This command produces no output.
For more information, see Contacts in the Incident Manager User Guide.

- For API details, see DeleteContactChannel in AWS CLI Command Reference.

**describe-engagement**

The following code example shows how to use describe-engagement.

**AWS CLI**

**To describe the details of an engagement**

The following describe-engagement example lists the details of an engagement to a contact or escalation plan. The subject and content are sent to the contact channels.

```
aws ssm-contacts describe-engagement \\
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements via CLI",
    "StartTime": "2021-05-18T18:25:41.151000+00:00"
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see DescribeEngagement in AWS CLI Command Reference.

**describe-page**

The following code example shows how to use describe-page.
AWS CLI

To list the details of a page to a contact channel

The following describe-page example lists details of a page to a contact channel. The page will include the subject and content provided.

```bash
aws ssm-contacts describe-page \
```

Output:

```json
{
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements via CLI",
    "SentTime": "2021-05-18T18:43:29.301000+00:00",
    "ReadTime": "2021-05-18T18:43:55.708000+00:00",
    "DeliveryTime": "2021-05-18T18:43:55.265000+00:00"
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see DescribePage in AWS CLI Command Reference.

get-contact

The following code example shows how to use get-contact.

AWS CLI

Example 1: To describe a contact plan

The following get-contact example describes a contact.
aws ssm-contacts get-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"

Output:

```json
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "Alias": "akuam",
    "DisplayName": "Akua Mansa",
    "Type": "PERSONAL",
    "Plan": [
        {
            "DurationInMinutes": 5,
            "Targets": [
                {
                    "ChannelTargetInfo": {
                        "ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65",
                        "RetryIntervalInMinutes": 1
                    }
                }
            ],
            "DurationInMinutes": 5,
            "Targets": [
                {
                    "ChannelTargetInfo": {
                        "ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad",
                        "RetryIntervalInMinutes": 1
                    }
                }
            ],
            "DurationInMinutes": 5,
            "Targets": [
                {
                    "ChannelTargetInfo": {
                        "ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/77d4f447-f619-4954-afff-85551e369c2a",
                        "RetryIntervalInMinutes": 1
                    }
                }
            ]
        }
    ]
}
```
Example 2: To describe an escalation plan

The following get-contact example describes an escalation plan.

```
aws ssm-contacts get-contact
--contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation",
    "Alias": "example_escalation",
    "DisplayName": "Example Escalation",

}

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see GetContact in AWS CLI Command Reference.

get-contact-channel

The following code example shows how to use get-contact-channel.

AWS CLI

To list the details of a contact channel

The following get-contact-channel example lists the details of a contact channel.

```bash
aws ssm-contacts get-contact-channel \  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

Output:
GetContactChannel

The following code example shows how to use `get-contact-policy`.

AWS CLI

To list the resource policies of a contact

The following `get-contact-policy` example lists the resource policies associated with the specified contact.

```
aws ssm-contacts get-contact-policy \
   --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```
{
   "ContactArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam",
}```
For more information, see Working with shared contacts and response plans in the Incident Manager User Guide.

- For API details, see GetContactPolicy in AWS CLI Command Reference.

list-contact-channels

The following code example shows how to use list-contact-channels.

AWS CLI

To list the contact channels of a contact

The following list-contact-channels example lists the available contact channels of the specified contact.

aws ssm-contacts list-contact-channels \
 --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"

Output:

```json
{
  [
    {
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
      "Name": "akuas email",
      "Type": "EMAIL",
      "DeliveryAddress": {
        "SimpleAddress": "akuam@example.com"
      },
      "ActivationStatus": "NOT_ACTIVATED"
    },
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
      "Name": "akuas sms",
      "Type": "SMS",
      "DeliveryAddress": {
        "SimpleAddress": "+15005550100"
      }
    }
  ]
}
```
For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListContactChannels in AWS CLI Command Reference.

list-contacts

The following code example shows how to use list-contacts.

AWS CLI

To list all escalation plans and contacts

The following list-contacts example lists the contacts and escalation plans in your account.

```bash
aws ssm-contacts list-contacts
```

Output:

```json
{
   "Contacts": [
      {
         "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
         "Alias": "akuam",
         "DisplayName": "Akua Mansa",
         "Type": "PERSONAL"
      },
      {
         "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/alejr",
         "Alias": "alejr",
         "DisplayName": "Alejandro Rosalez",
         "Type": "PERSONAL"
      },
      {
         "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/anasi",
         "Alias": "anasi",
      
```
The following code example shows how to use list-engagements.

**AWS CLI**

**To list all engagements**

The following list-engagements example lists engagements to escalation plans and contacts. You can also list engagements for a single incident.

```
aws ssm-contacts list-engagements
```

Output:

```json
{
    "Engagements": [
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T20:37:50.300000+00:00"
        }
    ]
}
```
For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListEngagements in AWS CLI Command Reference.

list-page-receipts

The following code example shows how to use list-page-receipts.

**AWS CLI**

To list page receipts

The following command-name example lists whether a page was received or not by a contact.

```
aws ssm-contacts list-page-receipts \
```
Output:

```json
{
  "Receipts": [
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ReceiptType": "DELIVERED",
      "ReceiptInfo": "425440",
      "ReceiptTime": "2021-05-18T20:42:57.485000+00:00"
    },
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ReceiptType": "READ",
      "ReceiptInfo": "425440",
      "ReceiptTime": "2021-05-18T20:42:57.907000+00:00"
    },
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ReceiptType": "SENT",
      "ReceiptInfo": "SM6656c19132f1465f0c9c1123a5dde7c9",
      "ReceiptTime": "2021-05-18T20:40:52.962000+00:00"
    }
  ]
}
```

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListPageReceipts in AWS CLI Command Reference.

**list-pages-by-contact**

The following code example shows how to use list-pages-by-contact.

**AWS CLI**

To list pages by contact
The following list-pages-by-contact example lists all pages to the specified contact.

```
aws ssm-contacts list-pages-by-contact \
   --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
   "Pages": [ 
   {
      "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
      "Sender": "cli",
      "SentTime": "2021-05-18T18:43:29.301000+00:00",
      "DeliveryTime": "2021-05-18T18:43:55.265000+00:00",
      "ReadTime": "2021-05-18T18:43:55.708000+00:00"
   }
   ]
}
```

For more information, see [Contacts](Incident Manager User Guide) in the *Incident Manager User Guide*.

- For API details, see [ListPagesByContact](AWS CLI Command Reference) in *AWS CLI Command Reference*.

### list-pages-by-engagement

The following code example shows how to use list-pages-by-engagement.

**AWS CLI**

To list pages to contact channels started from an engagement.

The following list-pages-by-engagement example lists the pages that occurred while engaging the defined engagement plan.

```
aws ssm-contacts list-pages-by-engagement \
   --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0"
```
For more information, see Contacts in the Incident Manager User Guide.

- For API details, see ListPagesByEngagement in AWS CLI Command Reference.

list-tags-for-resource

The following code example shows how to use list-tags-for-resource.

**AWS CLI**

**To list tags for a contact**

The following list-tags-for-resource example lists the tags of the specified contact.

```bash
aws ssm-contacts list-tags-for-resource \
   --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```json
{
   "Tags": [
   {
      "Key": "group1",
      "Value": "1"
   }
   ]
}
```
For more information, see [Tagging](#) in the Incident Manager User Guide.

- For API details, see [ListTagsForResource](#) in AWS CLI Command Reference.

### put-contact-policy

The following code example shows how to use put-contact-policy.

**AWS CLI**

**To share a contact and engagements**

The following put-contact-policy example adds a resource policy to the contact Akua that shares the contact and related engagements with the principal.

```bash
aws ssm-contacts put-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
```

This command produces no output.

For more information, see [Working with shared contacts and response plans](#) in the Incident Manager User Guide.

- For API details, see [PutContactPolicy](#) in AWS CLI Command Reference.

### send-activation-code

The following code example shows how to use send-activation-code.

**AWS CLI**

**To send an activation code**

```bash

```
The following send-activation-code example sends an activation code and message to the specified contact channel.

```bash
aws ssm-contacts send-activation-code \
   --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/8ddae2d1-12c8-4e45-b852-c8587266c400"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [SendActivationCode](#) in *AWS CLI Command Reference*.

### start-engagement

The following code example shows how to use start-engagement.

**AWS CLI**

#### Example 1: To page a contact's contact channels

The following start-engagement pages contact's contact channels. Sender, subject, public-subject, and public-content are all free from fields. Incident Manager sends the subject and content to the provided VOICE or EMAIL contact channels. Incident Manager sends the public-subject and public-content to the provided SMS contact channels. Sender is used to track who started the engagement.

```bash
aws ssm-contacts start-engagement \
   --contact-id  "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \
   --sender "cli" \
   --subject "cli-test" \
   --content "Testing engagements via CLI" \
   --public-subject "cli-test" \
   --public-content "Testing engagements via CLI"
```

Output:

```json
{
   "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f"
```
For more information, see **Contacts** in the *Incident Manager User Guide*.

**Example 2: To page a contact in the provided escalation plan.**

The following `start-engagement` engages contact's through an escalation plan. Each contact is paged according to their engagement plan.

```
aws ssm-contacts start-engagement \
   --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/example_escalation" \
   --sender "cli" \
   --subject "cli-test" \
   --content "Testing engagements via CLI" \
   --public-subject "cli-test" \
   --public-content "Testing engagements via CLI"
```

**Output:**

```
{
   "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
}
```

For more information, see **Contacts** in the *Incident Manager User Guide*.

- For API details, see **StartEngagement** in *AWS CLI Command Reference*.

### stop-engagement

The following code example shows how to use `stop-engagement`.

**AWS CLI**

**To stop an engagement**

The following stop-engagement example stops an engagement from paging further contacts and contact channels.

```
aws ssm-contacts stop-engagement \
```
This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see StopEngagement in AWS CLI Command Reference.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a contact

The following tag-resource example tags a specified contact with the provided tag key value pair.

```
aws ssm-contacts tag-resource \
   --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
   --tags '[$_"Key"":"group1","Value"":"1"]'
```

This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see TagResource in AWS CLI Command Reference.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a contact

The following untag-resource example removes the group1 tag from the specified contact.

```
aws ssm-contacts untag-resource \
   --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
   --tag-keys "group1"
```
This command produces no output.

For more information, see Tagging in the Incident Manager User Guide.

- For API details, see UntagResource in AWS CLI Command Reference.

update-contact

The following code example shows how to use update-contact.

AWS CLI

To update the engagement plan of contact

The following update-contact example updates the engagement plan of the contact Akua to include the three types of contacts channels. This is done after creating contact channels for Akua.

```bash
aws ssm-contacts update-contact \
   --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \ 
   --plan '{"Stages": [{"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": 
   {"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact- 
   channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65","RetryIntervalInMinutes": 
   1 }]}}, {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": 
   {"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/ 
   akum/49f3c24d-5f9f-4638-ae25-3f49e04229ad", "RetryIntervalInMinutes": 1}]}], 
   {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": 
   {"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/ 
   akum/77d4f447-f619-4954-afff-85551e369c2a","RetryIntervalInMinutes": 1 }]}]}'
```

This command produces no output.

For more information, see Contacts in the Incident Manager User Guide.

- For API details, see UpdateContact in AWS CLI Command Reference.

update-contact-channel

The following code example shows how to use update-contact-channel.

AWS CLI

To update a contact channel
The following `update-contact-channel` example updates the name and delivery address of a contact channel.

```bash
aws ssm-contacts update-contact-channel \\   --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad" \\   --name "akuas voice channel" \\   --delivery-address '{"SimpleAddress": "+15005550198"}"
```

This command produces no output.

For more information, see [Contacts](Incident_Manager_User_Guide.html) in the *Incident Manager User Guide*.

- For API details, see [UpdateContactChannel](AWS_CLI_Command_Reference.html) in *AWS CLI Command Reference*.

## Amazon Inspector examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Inspector.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics
- [Actions](IAW_CLI_SSM_Contacts.html)

## Actions

### add-attributes-to-findings

The following code example shows how to use `add-attributes-to-findings`.

## AWS CLI

To add attributes to findings
The following add-attribute-to-finding command assigns an attribute with the key of Example and value of example to the finding with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU:

```bash
aws inspector add-attributes-to-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attributes key=Example,value=example
```

Output:

```json
{
  "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the Amazon Inspector guide.

- For API details, see AddAttributesToFindings in AWS CLI Command Reference.

```
create-assessment-target
```

The following code example shows how to use create-assessment-target.

AWS CLI

**To create an assessment target**

The following create-assessment-target command creates an assessment target named ExampleAssessmentTarget using the resource group with the ARN of arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv:

```bash
```

Output:

```json
{
  "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX"
}
```
create-assessment-template

The following code example shows how to use create-assessment-template.

AWS CLI

To create an assessment template

The following `create-assessment-template` command creates an assessment template called ExampleAssessmentTemplate for the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX`:

```
```

Output:

```
{
   "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T"
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see `CreateAssessmentTemplate` in AWS CLI Command Reference.

create-resource-group

The following code example shows how to use create-resource-group.

AWS CLI

To create a resource group
The following `create-resource-group` command creates a resource group using the tag key of `Name` and value of `example`:

```
aws inspector create-resource-group --resource-group-tags key=Name,value=example
```

Output:

```
{
    "resourceGroupArn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv"
}
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see [CreateResourceGroup](https://docs.aws.amazon.com/cli/latest/reference/inspector/create-resource-group.html) in AWS CLI Command Reference.

### delete-assessment-run

The following code example shows how to use `delete-assessment-run`.

**AWS CLI**

**To delete an assessment run**

The following `delete-assessment-run` command deletes the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe`:

```
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

### delete-assessment-target

The following code example shows how to use `delete-assessment-target`.
AWS CLI

To delete an assessment target

The following delete-assessment-target command deletes the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq:

```
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see DeleteAssessmentTarget in AWS CLI Command Reference.

delte-assessment-template

The following code example shows how to use delete-assessment-template.

AWS CLI

To delete an assessment template

The following delete-assessment-template command deletes the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T:

```
aws inspector delete-assessment-template --assessment-template-arn
arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DeleteAssessmentTemplate in AWS CLI Command Reference.

describe-assessment-runs

The following code example shows how to use describe-assessment-runs.

AWS CLI

To describe assessment runs
The following `describe-assessment-run` command describes an assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```
aws inspector describe-assessment-runs --assessment-run-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```json
{
    "assessmentRuns": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
            "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
            "completedAt": 1458680301.4,
            "createdAt": 1458680170.035,
            "dataCollected": true,
            "durationInSeconds": 3600,
            "name": "Run 1 for ExampleAssessmentTemplate",
            "notifications": [],
            "rulesPackageArns": [
            ],
            "startedAt": 1458680170.161,

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DescribeAssessmentRuns in AWS CLI Command Reference.

describe-assessment-targets

The following code example shows how to use describe-assessment-targets.

AWS CLI

To describe assessment targets

The following describe-assessment-targets command describes the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq:

```bash
aws inspector describe-assessment-targets --assessment-target-arns
arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```
For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see [DescribeAssessmentTargets](https://docs.aws.amazon.com/cli/latest/reference/inspector/describe-assessment-targets) in AWS CLI Command Reference.

### describe-assessment-templates

The following code example shows how to use describe-assessment-templates.

**AWS CLI**

**To describe assessment templates**

The following `describe-assessment-templates` command describes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw`:

```
aws inspector describe-assessment-templates --assessment-template-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw
```

**Output:**

```json
{
    "assessmentTemplates": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
            "createdAt": 1458074191.459,
            "name": "ExampleAssessmentTarget",
            "updatedAt": 1458074191.459
        }
    ],
    "failedItems": {}
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see DescribeAssessmentTemplates in AWS CLI Command Reference.

describe-cross-account-access-role

The following code example shows how to use describe-cross-account-access-role.

AWS CLI

To describe the cross account access role

The following describe-cross-account-access-role command describes the IAM role that enables Amazon Inspector to access your AWS account:

```
aws inspector describe-cross-account-access-role
```

Output:

```
{
    "registeredAt": 1458069182.826,
    "roleArn": "arn:aws:iam::123456789012:role/inspector",
    "valid": true
}
```

For more information, see Setting up Amazon Inspector in the Amazon Inspector guide.

- For API details, see DescribeCrossAccountAccessRole in AWS CLI Command Reference.
describe-findings

The following code example shows how to use describe-findings.

AWS CLI

To describe findings

The following describe-findings command describes the finding with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4:

```
aws inspector describe-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4
```

Output:

```
{
   "failedItems": {},
   "findings": [
   {
       "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
       "assetAttributes": {
           "ipv4Addresses": [],
           "schemaVersion": 1
       },
       "assetType": "ec2-instance",
       "attributes": [],
       "confidence": 10,
       "createdAt": 1458680301.37,
       "description": "Amazon Inspector did not find any potential security issues during this assessment.",
       "indicatorOfCompromise": false,
       "numericSeverity": 0,
       "recommendation": "No remediation needed.",
       "schemaVersion": 1,
       "service": "Inspector",
       "serviceAttributes": {
           "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
           "schemaVersion": 1
       }
   }
}
```
For more information, see Amazon Inspector Findings in the Amazon Inspector guide.

- For API details, see DescribeFindings in AWS CLI Command Reference.

**describe-resource-groups**

The following code example shows how to use describe-resource-groups.

**AWS CLI**

**To describe resource groups**

The following describe-resource-groups command describes the resource group with the ARN of arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI:

```
aws inspector describe-resource-groups --resource-group-arns arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI
```

**Output:**

```
{
   "failedItems": {},
   "resourceGroups": [
   {
      "createdAt": 1458074191.098,
      "tags": [
      {
         "key": "Name",
```
For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see DescribeResourceGroups in AWS CLI Command Reference.

**describe-rules-packages**

The following code example shows how to use describe-rules-packages.

**AWS CLI**

**To describe rules packages**

The following describe-rules-packages command describes the rules package with the ARN of `arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p`:

```bash
```

**Output:**

```json
{
    "failedItems": {},
    "rulesPackages": [
    {
        "description": "The rules in this package help verify whether the EC2 instances in your application are exposed to Common Vulnerabilities and Exposures (CVEs). Attacks can exploit unpatched vulnerabilities to compromise the confidentiality, integrity, or availability of your service or data. The CVE system provides a reference for publicly known information security vulnerabilities and exposures. For more information, see [https://cve.mitre.org/](https://cve.mitre.org/). If a particular CVE appears in one of the produced Findings at the end of a completed Inspector assessment, you can search [https://cve.mitre.org/](https://cve.mitre.org/) using the CVE's ID (for example, "CVE-2009-0021") to
```

```
find detailed information about this CVE, its severity, and how to
mitigate it.

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector*
guide.

- For API details, see [DescribeRulesPackages](#) in *AWS CLI Command Reference*.

get-telemetry-metadata

The following code example shows how to use get-telemetry-metadata.

**AWS CLI**

To get the telemetry metadata

The following get-telemetry-metadata command generates information about the
data that is collected for the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```
aws inspector get-telemetry-metadata --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
  "telemetryMetadata": [
    {
      "count": 2,
      "dataSize": 345,
      "messageType": "InspectorDuplicateProcess"
    },
    {
      "count": 3,
      "dataSize": 255,
      "messageType": "InspectorTimeEventMsg"
    }
  ]
}
```
{
    "count": 4,
    "dataSize": 1082,
    "messageType": "InspectorNetworkInterface"

},
{
list-assessment-run-agents

The following code example shows how to use `list-assessment-run-agents`.

**AWS CLI**

**To list assessment run agents**

The following `list-assessment-run-agents` command lists the agents of the assessment run with the specified ARN.

```
aws inspector list-assessment-run-agents \
  --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

**Output:**

```
{
  "assessmentRunAgents": [
    {
      "agentHealth": "HEALTHY",
      "agentHealthCode": "HEALTHY",
      "agentId": "i-49113b93",
      "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",

Actions and scenarios
For more information, see [AWS Agents](#) in the [Amazon Inspector User Guide](#).

- For API details, see [ListAssessmentRunAgents](#) in [AWS CLI Command Reference](#).

### list-assessment-runs

The following code example shows how to use `list-assessment-runs`.

**AWS CLI**

**To list assessment runs**

The following `list-assessment-runs` command lists all existing assessment runs.

```bash
aws inspector list-assessment-runs
```

**Output:**

```json
{
    "assessmentRunArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-v5D6fI3v"
    ]
}
```

For more information, see [Amazon Inspector Assessment Templates and Assessment Runs](#) in the [Amazon Inspector User Guide](#).

- For API details, see [ListAssessmentRuns](#) in [AWS CLI Command Reference](#).
**list-assessment-targets**

The following code example shows how to use `list-assessment-targets`.

**AWS CLI**

**To list assessment targets**

The following `list-assessment-targets` command lists all existing assessment targets:

```bash
aws inspector list-assessment-targets
```

Output:

```json
{
   "assessmentTargetArns": [
      "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq"
   ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [ListAssessmentTargets](https://docs.aws.amazon.com/cli/latest/reference/inspector/list-assessment-targets.html) in *AWS CLI Command Reference*.

**list-assessment-templates**

The following code example shows how to use `list-assessment-templates`.

**AWS CLI**

**To list assessment templates**

The following `list-assessment-templates` command lists all existing assessment templates:

```bash
aws inspector list-assessment-templates
```

Output:

```json
{
   "assessmentTemplateArns": [

```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [ListAssessmentTemplates](#) in *AWS CLI Command Reference*.

### list-event-subscriptions

The following code example shows how to use `list-event-subscriptions`.

**AWS CLI**

To list event subscriptions

The following `list-event-subscriptions` command lists all the event subscriptions for the assessment template with the ARN of "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0":

```bash
aws inspector list-event-subscriptions --resource-arn "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0"
```

Output:

```
{
  "subscriptions": [
  {
    "eventSubscriptions": [
    {
      "event": "ASSESSMENT_RUN_COMPLETED",
      "subscribedAt": 1459455440.867
    },
    {
      "event": "ASSESSMENT_RUN_COMPLETED",
      "subscribedAt": 1459455440.867
    }
    ],
    "resourceArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0",
    "topicArn": "arn:aws:sns:us-west-2:123456789012:exampletopic"
  }
  ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [ListEventSubscriptions](https://docs.aws.amazon.com/cli/latest/reference/inspector/list-event-subscriptions.html) in *AWS CLI Command Reference*.

### list-findings

The following code example shows how to use `list-findings`.

**AWS CLI**

**To list findings**

The following `list-findings` command lists all of the generated findings:

```bash
aws inspector list-findings
```

**Output:**

```json
{
   "findingArns": [
   "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
   "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-v5D6fI3v/finding/0-tyvmqBLy"
   ]
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [ListFindings](https://docs.aws.amazon.com/cli/latest/reference/inspector/list-findings.html) in *AWS CLI Command Reference*.

### list-rules-packages

The following code example shows how to use `list-rules-packages`.

**AWS CLI**

**To list rules packages**

Actions and scenarios
The following `list-rules-packages` command lists all available Inspector rules packages:

```bash
aws inspector list-rules-packages
```

Output:

```json
{
   "rulesPackageArns": [
   ]
}
```

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see `ListRulesPackages` in *AWS CLI Command Reference*.

### list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for resource**

The following `list-tags-for-resource` command lists all tags associated with the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFl4Yu`:

```bash
aws inspector list-tags-for-resource --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFl4Yu
```

Output:

```json
{
   "tags": [
      {
         "key": "Name",
          "Value": "example value"
      }
   ]
}
```
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see ListTagsForResource in AWS CLI Command Reference.

preview-agents

The following code example shows how to use preview-agents.

AWS CLI

**To preview agents**

The following preview-agents command previews the agents installed on the EC2 instances that are part of the assessment target with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq:

```bash
```

Output:

```
{
    "agentPreviews": [
        {
            "agentId": "i-49113b93"
        }
    ]
}
```

For more information, see Amazon Inspector Assessment Targets in the Amazon Inspector guide.

- For API details, see PreviewAgents in AWS CLI Command Reference.

register-cross-account-access-role

The following code example shows how to use register-cross-account-access-role.
AWS CLI

To register the cross account access role

The following register-cross-account-access-role command registers the IAM role with the ARN of arn:aws:iam::123456789012:role/inspector that Amazon Inspector uses to list your EC2 instances at the start of the assessment run of when you call the preview-agents command:

```
aws inspector register-cross-account-access-role --role-arn arn:aws:iam::123456789012:role/inspector
```

For more information, see Setting up Amazon Inspector in the Amazon Inspector guide.

- For API details, see RegisterCrossAccountAccessRole in AWS CLI Command Reference.

remove-attributes-from-findings

The following code example shows how to use remove-attributes-from-findings.

AWS CLI

To remove attributes from findings

The following remove-attributes-from-finding command removes the attribute with the key of Example and value of example from the finding with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU:

```
aws inspector remove-attributes-from-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attribute-keys key=Example,value=example
```

Output:

```
{
   "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the Amazon Inspector guide.
• For API details, see RemoveAttributesFromFindings in AWS CLI Command Reference.

set-tags-for-resource

The following code example shows how to use set-tags-for-resource.

AWS CLI

To set tags for a resource

The following set-tags-for-resource command sets the tag with the key of Example and value of example to the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0:

```bash
aws inspector set-tags-for-resource --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --tags key=Example,value=example
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

• For API details, see SetTagsForResource in AWS CLI Command Reference.

start-assessment-run

The following code example shows how to use start-assessment-run.

AWS CLI

To start an assessment run

The following start-assessment-run command starts the assessment run named examplerun using the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T:

```bash
```

Output:
For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see `StartAssessmentRun` in AWS CLI Command Reference.

**stop-assessment-run**

The following code example shows how to use `stop-assessment-run`.

**AWS CLI**

**To stop an assessment run**

The following `stop-assessment-run` command stops the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY`

```bash
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see `StopAssessmentRun` in AWS CLI Command Reference.

**subscribe-to-event**

The following code example shows how to use `subscribe-to-event`.

**AWS CLI**

**To subscribe to an event**

The following example enables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`
aws inspector subscribe-to-event \
  --event ASSESSMENT_RUN_COMPLETED \
  --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/\ntemplate/0-7sbz2Kz0 \

This command produces no output.

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see SubscribeToEvent in AWS CLI Command Reference.

unsubscribe-from-event

The following code example shows how to use unsubscribe-from-event.

AWS CLI

To unsubscribe from an event

The following unsubscribe-from-event command disables the process of sending Amazon SNS notifications about the ASSESSMENT_RUN_COMPLETED event to the topic with the ARN of arn:aws:sns:us-west-2:123456789012:exampletopic:

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the Amazon Inspector guide.

- For API details, see UnsubscribeFromEvent in AWS CLI Command Reference.

update-assessment-target

The following code example shows how to use update-assessment-target.

AWS CLI

To update an assessment target

```
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see `UpdateAssessmentTarget` in *AWS CLI Command Reference*.

### AWS IoT examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

#### Topics

- **Actions**

#### Actions

### Attach a certificate

The following code example shows how to attach an AWS IoT certificate.

**AWS CLI**

To attach a certificate to your thing

---

*Actions and scenarios* 3524
The following `attach-thing-principal` example attaches a certificate to the MyTemperatureSensor thing. The certificate is identified by an ARN. You can find the ARN for a certificate in the AWS IoT console.

```bash
aws iot attach-thing-principal \
  --thing-name MyTemperatureSensor \
  --principal arn:aws:iot:us-west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/thing-registry.html) in the *AWS IoT Developers Guide*.

- For API details, see [AttachThingPrincipal](https://docs.aws.amazon.com/cli/latest/reference/iot/attach-thing-principal.html) in *AWS CLI Command Reference*.

### Create a thing

The following code example shows how to create an AWS IoT thing.

**AWS CLI**

#### Example 1: To create a thing record in the registry

The following `create-thing` example creates an entry for a device in the AWS IoT thing registry.

```bash
aws iot create-thing \
  --thing-name SampleIoTThing
```

**Output:**

```json
{
  "thingName": "SampleIoTThing",
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/SampleIoTThing",
  "thingId": "EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE"
}
```

#### Example 2: To define a thing that is associated with a thing type

The following `create-thing` example creates a thing that has the specified thing type and its attributes.
aws iot create-thing \
   --thing-name "MyLightBulb" \
   --thing-type-name "LightBulb" \
   --attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"

Output:

{
   "thingName": "MyLightBulb",
   "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
   "thingId": "40da2e73-c6af-406e-b415-15acae538797"
}

For more information, see How to Manage Things with the Registry and Thing Types in the AWS IoT Developers Guide.

- For API details, see CreateThing in AWS CLI Command Reference.

Delete a certificate

The following code example shows how to delete an AWS IoT certificate.

AWS CLI

To delete a device certificate

The following delete-certificate example deletes the device certificate with the specified ID.

aws iot delete-certificate \
   --certificate-id \
   c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9

This command produces no output.

For more information, see DeleteCertificate in the AWS IoT API Reference.

- For API details, see DeleteCertificate in AWS CLI Command Reference.

Delete a thing

The following code example shows how to delete an AWS IoT thing.
AWS CLI

To display detailed information about a thing

The following delete-thing example deletes a thing from the AWS IoT registry for your AWS account.

aws iot delete-thing --thing-name "FourthBulb"

This command produces no output.

For more information, see How to Manage Things with the Registry in the AWS IoT Developers Guide.

• For API details, see DeleteThing in AWS CLI Command Reference.

Describe a thing

The following code example shows how to describe an AWS IoT thing.

AWS CLI

To display detailed information about a thing

The following describe-thing example display information about a thing (device) that is defined in the AWS IoT registry for your AWS account.

aws iot describe-thing --thing-name "MyLightBulb"

Output:

```json
{
   "defaultClientId": "MyLightBulb",
   "thingName": "MyLightBulb",
   "thingId": "40da2e73-c6af-406e-b415-15acae538797",
   "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
   "thingTypeName": "LightBulb",
   "attributes": {
      "model": "123",
      "wattage": "75"
   },
   "version": 1
}
```
For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeThing](https://docs.aws.amazon.com/iot/latest/developerguide/) in *AWS CLI Command Reference*.

### Detach a certificate

The following code example shows how to detach an AWS IoT certificate.

**AWS CLI**

*To detach a certificate/principal from a thing*

The following `detach-thing-principal` example removes a certificate that represents a principal from the specified thing.

```
aws iot detach-thing-principal \
  --thing-name "MyLightBulb" \
  --principal "arn:aws:iot:us-west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6e6943683a1acb4b1626bac36"
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/) in the *AWS IoT Developers Guide*.

- For API details, see [DetachThingPrincipal](https://docs.aws.amazon.com/iot/latest/developerguide/) in *AWS CLI Command Reference*.

### Get endpoint information

The following code example shows how to get AWS IoT endpoint information.

**AWS CLI**

**Example 1: To get your current AWS endpoint**

The following `describe-endpoint` example retrieves the default AWS endpoint to which all commands are applied.
aws iot describe-endpoint

Output:

```json
{
   "endpointAddress": "abc123defghijk.iot.us-west-2.amazonaws.com"
}
```

For more information, see [DescribeEndpoint](https://docs.aws.amazon.com/iot/latest/developerguide/aws-cli.html) in the *AWS IoT Developer Guide*.

**Example 2: To get your ATS endpoint**

The following describe-endpoint example retrieves the Amazon Trust Services (ATS) endpoint.

```
aws iot describe-endpoint \
   --endpoint-type iot:Data-ATS
```

Output:

```json
{
   "endpointAddress": "abc123defghijk-ats.iot.us-west-2.amazonaws.com"
}
```

For more information, see [X.509 Certificates and AWS IoT](https://docs.aws.amazon.com/iot/latest/developerguide/x509-certificates.html) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeEndpoint](https://docs.aws.amazon.com/iot/latest/developerguide/aws-cli.html) in *AWS CLI Command Reference*.

**List your certificates**

The following code example shows how to list your AWS IoT certificates.

**AWS CLI**

**Example 1: To list the certificates registered in your AWS account**

The following list-certificates example lists all certificates registered in your account. If you have more than the default paging limit of 25, you can use the `nextMarker` response value from this command and supply it to the next command to get the next batch of results. Repeat until `nextMarker` returns without a value.
aws iot list-certificates

Output:

```json
{
  "certificates": [
    {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
      "certificateId": "604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
      "status": "ACTIVE",
      "creationDate": 1556810537.617
    },
    {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/262a1ac8a7d8aa72f6e96e365480f7313aa9db74b8339ec65d34dc3074e1c31e",
      "certificateId": "262a1ac8a7d8aa72f6e96e365480f7313aa9db74b8339ec65d34dc3074e1c31e",
      "status": "ACTIVE",
      "creationDate": 1546447050.885
    },
    {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/b193ab7162c0fadca83246d24fa090300a1236fe58137e121b011804d8ac1d6b",
      "certificateId": "b193ab7162c0fadca83246d24fa090300a1236fe58137e121b011804d8ac1d6b",
      "status": "ACTIVE",
      "creationDate": 1546292258.322
    },
    {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/7aebeea3845d14a44ec80b06b8b78a89f3f8a706974b8b34d18f5adf0741db42",
      "certificateId": "7aebeea3845d14a44ec80b06b8b78a89f3f8a706974b8b34d18f5adf0741db42",
      "status": "ACTIVE",
      "creationDate": 1541457693.453
    },
    {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/54458aa39eb3eb39c91f7b7d4cc2a6ca1c7c094d1644b889f735a6fc2cd9a7e3",
      "certificateId": "54458aa39eb3eb39c91f7b7d4cc2a6ca1c7c094d1644b889f735a6fc2cd9a7e3"
  ]
}```
For API details, see ListCertificates in AWS CLI Command Reference.

List your things

The following code example shows how to list your AWS IoT things.

AWS CLI

Example 1: To list all things in the registry

The following list-things example lists the things (devices) that are defined in the AWS IoT registry for your AWS account.

```
aws iot list-things
```

Output:

```
{
   "things": [
      {
         "thingName": "ThirdBulb",
         "thingTypeName": "LightBulb",
         "attributes": {
            "model": "123",
            "wattage": "75"
         },
         "version": 2
      }
   ]
}
```
Example 2: To list the defined things that have a specific attribute

The following `list-things` example displays a list of things that have an attribute named `wattage`.

```
aws iot list-things 
  --attribute-name wattage
```

Output:

```
{
  "things": [
```
For more information, see [How to Manage Things with the Registry](https://docs.aws.amazon.com/iot/latest/developerguide/how-to-manage-things-with-the-registry.html) in the *AWS IoT Developers Guide*.

- For API details, see [ListThings](https://docs.aws.amazon.com/cli/latest/reference/iot/list-things.html) in *AWS CLI Command Reference*.

## Query the search index

The following code example shows how to query the AWS IoT search index.

### AWS CLI

**To query the thing index**

The following `search-index` example queries the `AWS_Things` index for things that have a type of `LightBulb`.

```
aws iot search-index \
  --index-name "AWS_Things" \
  --query-string "thingTypeName:LightBulb"
```
Output:

```json
{
    "things": [
        {
            "thingName": "MyLightBulb",
            "thingId": "40da2e73-c6af-406e-b415-15acae538797",
            "thingTypeName": "LightBulb",
            "thingGroupNames": [
                "LightBulbs",
                "DeadBulbs"
            ],
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        },
        {
            "thingName": "ThirdBulb",
            "thingId": "615c8455-33d5-40e8-95fd-3ee8b24490af",
            "thingTypeName": "LightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        },
        {
            "thingName": "MyOtherLightBulb",
            "thingId": "6dae0d3f-40c1-476a-80c4-1ed24ba6aa11",
            "thingTypeName": "LightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        }
    ]
}
```
Update a thing

The following code example shows how to update an AWS IoT thing.

**AWS CLI**

**To associate a thing with a thing type**

The following update-thing example associates a thing in the AWS IoT registry with a thing type. When you make the association, you provide values for the attributes defined by the thing type.

```bash
aws iot update-thing \
   --thing-name "MyOtherLightBulb" \
   --thing-type-name "LightBulb" \
   --attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"
```

This command does not produce output. Use the describe-thing command to see the result.

For more information, see [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-thing-type.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

• For API details, see [UpdateThing](https://docs.aws.amazon.com/cli/latest/travis/cli指挥 UPDATE THING.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/travis/cli指挥 UPDATE THING.html).

Update the search configuration

The following code example shows how to update the AWS IoT search configuration.

**AWS CLI**

**To enable thing indexing**

The following update-indexing-configuration example enables thing indexing to support searching registry data, shadow data, and thing connectivity status using the AWS_Things index.

```bash
aws iot update-indexing-configuration
```

For more information, see [Managing Thing Indexing](https://docs.aws.amazon.com/iot/latest/developerguide/thing-indexing.html) in the [AWS IoT Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

• For API details, see [SearchIndex](https://docs.aws.amazon.com/cli/latest/travis/cli指挥 SearchIndex.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/travis/cli指挥 SearchIndex.html).
--thing-indexing-configuration
  thingIndexingMode=REGISTRY_AND_SHADOW,thingConnectivityIndexingMode=STATUS

This command produces no output.

For more information, see Managing Thing Indexing in the AWS IoT Developers Guide.  
• For API details, see UpdateIndexingConfiguration in AWS CLI Command Reference.

accept-certificate-transfer

The following code example shows how to use accept-certificate-transfer.

AWS CLI

To accept a device certificate transferred from a different AWS account

The following accept-certificate-transfer example accepts a device certificate transferred from another AWS account. The certificate is identified by its ID.

```bash
aws iot accept-certificate-transfer \
  --certificate-id
  488b6a7f2acdeb00a77384e63c4e40b18bEXAMPLEe57b7272ba44c45e3448142
```

This command does not produce any output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.
• For API details, see AcceptCertificateTransfer in AWS CLI Command Reference.

add-thing-to-billing-group

The following code example shows how to use add-thing-to-billing-group.

AWS CLI

Example 1: To add a thing by name to a billing group

The following add-thing-to-billing-group example adds the thing named MyLightBulb to the billing group named GroupOne.

```bash
aws iot add-thing-to-billing-group \
```
--billing-group-name GroupOne \
--thing-name MyLightBulb

This command produces no output.

**Example 2: To add a thing by ARN to a billing group**

The following `add-thing-to-billing-group` example adds a thing with a specified ARN to a billing group with the specified ARN. Specifying an ARN is helpful if you work with multiple AWS Regions or accounts. It can help ensure that you are adding to the right Region and account.

```bash
aws iot add-thing-to-thing-group \
    --billing-group-arn "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne" \
    --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb"
```

This command produces no output.

For more information, see [Billing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/billing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [AddThingToBillingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/add-thing-to-billing-group.html) in *AWS CLI Command Reference*.

**add-thing-to-thing-group**

The following code example shows how to use `add-thing-to-thing-group`.

**AWS CLI**

**To add a thing to a group**

The following `add-thing-to-thing-group` example adds the specified thing to the specified thing group.

```bash
aws iot add-thing-to-thing-group \
    --thing-name MyLightBulb \
    --thing-group-name LightBulbs
```

This command produces no output.

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [AddThingToThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/add-thing-to-thing-group.html) in *AWS CLI Command Reference*.
associate-targets-with-job

The following code example shows how to use associate-targets-with-job.

AWS CLI

To associate a thing group with a continuous job

The following associate-targets-with-job example associates the specified thing group with the specified continuous job.

```bash
aws iot associate-targets-with-job \
   --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
   --job-id "example-job-04"
```

Output:

```json
{
   "jobId": "example-job-04",
   "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.
- For API details, see AssociateTargetsWithJob in AWS CLI Command Reference.

attach-policy

The following code example shows how to use attach-policy.

AWS CLI

Example 1: To attach a policy to a thing group

The following attach-policy example attaches the specified policy to a thing group identified by its ARN.

```bash
aws iot attach-policy \
   --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
   --policy-name "UpdateDeviceCertPolicy"
```
This command does not produce any output.

For more information, see Thing Groups in the AWS IoT Developers Guide.

Example 2: To attach a policy to a certificate

The following attach-policy example attaches the policy UpdateDeviceCertPolicy to the principal specified by a certificate.

```
aws iot attach-policy \
   --policy-name UpdateDeviceCertPolicy \
   --target "arn:aws:iot:us-west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

This command does not produce any output.

For more information, see Attach an AWS IoT Policy to a Device Certificate in the AWS IoT Developers Guide.

- For API details, see AttachPolicy in AWS CLI Command Reference.

attach-security-profile

The following code example shows how to use attach-security-profile.

AWS CLI

To associate a security profile with all unregistered devices

The following attach-security-profile example associates the AWS IoT Device Defender security profile named Testprofile with all unregistered devices in the us-west-2 region for this AWS account.

```
aws iot attach-security-profile \
   --security-profile-name Testprofile \
```

This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.
cancel-audit-mitigation-actions-task

The following code example shows how to use cancel-audit-mitigation-actions-task.

AWS CLI

To cancel an audit mitigation actions task

The following cancel-audit-mitigations-action-task example cancels the application of mitigation actions for the specified task. You cannot cancel tasks that are already completed.

```bash
aws iot cancel-audit-mitigation-actions-task
   --task-id "myActionsTaskId"
```

This command produces no output.

For more information, see CancelAuditMitigationActionsTask (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see CancelAuditMitigationActionsTask in AWS CLI Command Reference.

cancel-audit-task

The following code example shows how to use cancel-audit-task.

AWS CLI

To cancel an audit task

The following cancel-audit-task example cancels an audit task with the specified task ID. You cannot cancel a task that is complete.

```bash
aws iot cancel-audit-task \
   --task-id a3aea009955e501a31b764abe1bebd3d
```

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see CancelAuditTask in AWS CLI Command Reference.
cancel-certificate-transfer

The following code example shows how to use cancel-certificate-transfer.

AWS CLI

To cancel the transfer a certificate to a different AWS account

The following cancel-certificate-transfer example cancels the transfer of the specified certificate transfer. The certificate is identified by a certificate ID. You can find the ID for a certificate in the AWS IoT console.

```
aws iot cancel-certificate-transfer \
    --certificate-id
    f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78add5e605d630e05c7fc8
```

This command produces no output.

For more information, see Transfer a certificate to another account in the AWS IoT Core Developer Guide.

- For API details, see CancelCertificateTransfer in AWS CLI Command Reference.

cancel-job

The following code example shows how to use cancel-job.

AWS CLI

To cancel a job

The following cancel-job example cancels the specified job.

```
aws iot cancel-job \
    --job-job "example-job-03"
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-03",
    "jobId": "example-job-03",
    "description": "example job test"
}
```
The following code example shows how to use cancel-job-execution.

**AWS CLI**

**To cancel a job execution on a device**

The following cancel-job-execution example cancels the execution of the specified job on a device. If the job is not in the QUEUED state, you must add the `--force` parameter.

```
aws iot cancel-job-execution \
  --job-id "example-job-03" \
  --thing-name "MyRPi"
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see CancelJobExecution in AWS CLI Command Reference.

**clear-default-authorizer**

The following code example shows how to use clear-default-authorizer.

**AWS CLI**

**To clear the default authorizer**

The following clear-default-authorizer example clears the currently configured default custom authorizer. After you run this command, there is no default authorizer. When you use a custom authorizer, you must specify it by name in the HTTP request headers.

```
aws iot clear-default-authorizer
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see CancelJobExecution in AWS CLI Command Reference.
For more information, see ClearDefaultAuthorizer in the AWS IoT API Reference.

- For API details, see ClearDefaultAuthorizer in AWS CLI Command Reference.

**confirm-topic-rule-destination**

The following code example shows how to use confirm-topic-rule-destination.

**AWS CLI**

**To confirm a topic rule destination**

The following confirm-topic-rule-destination example confirms a topic rule destination with a confirmation token received at an HTTP endpoint.

```bash
aws iot confirm-topic-rule-destination \
--confirmation-token "AYADeIcmrtq-ZkxfpiWtQhWMSucAXwABABVhd3MtY3J5cHRvLXBlYmpyYy1zZkAREFxY1E0UmlGeDg0V21BZWZ1VjZtZWFRVUJJUktUxYJaN09OZlJOczJhRENSZmZYL3JHZ...2zwMuk_A4dPiC6eyPGuMAAAAfjB8BgkqhkiG9w0BBwagbzBtAgEAMGgGCSqGSIb3DQEHATAeBglghkgBZQMEAS4wEQQM9vtRMpf9D3CiZ8sMAgEQgDuFd0Txy-aywpqg8YEsaII4B4Qa3Js1wEHKMybiF1Ro0ZzYisl0vs12qY5UmCkqq3tv-3f7-nKosgIAAAAAADAEAAAAAABAAAIA9RMgy-V19V9m6Iw2xfbw_____wAAAAEAAAAAAAAAAAAAAEAA1hw4S0dgUcxiJ3gT06nS0NLJpvzyQR1UmPIj5sShqXEQGc0iufgrzTePll8RXOWr006Aj9DiVzJxz-1I6Pu-G6PUw1ka07Knzsz2B4AD0qfzHUF4PRTvyUgBnMGUCMQC8ZRhKqntd_c6Kgrow3bMUDbVnqo2qZr8Z8Jm2rzgseR01AnPItJ803Z4II1F8X1dPGP-PV1d0XFemyL8g"
```

This command produces no output.

For more information, see Confirming a topic rule destination in the AWS IoT Developer Guide.

- For API details, see ConfirmTopicRuleDestination in AWS CLI Command Reference.

**create-audit-suppression**

The following code example shows how to use create-audit-suppression.

**AWS CLI**

**To create an audit finding suppression**

The following create-audit-suppression example creates an audit finding suppression for a policy named "virtualMachinePolicy" that has been flagged for being overly permissive.

```bash
aws iot create-audit-suppression \
```
This command produces no output.

For more information, see Audit finding suppressions in the AWS IoT Developers Guide.

- For API details, see CreateAuditSuppression in AWS CLI Command Reference.

create-authorizer

The following code example shows how to use create-authorizer.

AWS CLI

To create a custom authorizer

The following create-authorizer example creates a custom authorizer that uses the specified Lambda function as part of a custom authentication service.

```
aws iot create-authorizer \
  --authorizer-name "CustomAuthorizer" \
  --authorizer-function-arn "arn:aws:lambda:us-west-2:123456789012:function:CustomAuthorizerFunction" \
  --token-key-name "MyAuthToken" \
  --status ACTIVE \
  --token-signing-public-keys FIRST_KEY="-----BEGIN PUBLIC KEY-----MIIBiANBgcqhkkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwoZ+7EnxAio9q6Q4FFqjGZsvjtYWjoelRKK0U8Eq9xb503kRSmyIwTzwzm/f4Gf0YZUloj+t3PUuwHzmbyTaGTrCUgREFygfWwGCPs5ZAX4Eytq5cr+AIHiiUDbx5a7pzwOBKPeic0asNjpT8PkBbRaKyljeHh5oo8INDDHhmVtbBm5A5Yi1jqYXLaVAowKzZ+GqsNvAQ9Jy1wI2VrEa10fL8flDB/BJLm7zjpfPOHDJQqID0XnZwA1Nnz0hCwIx50q2Lw2oy9R/dmqtDmJiV9P7Z4GykkPvw1YHrUXY0iW1R3AR/Ac1NhCTGZMwVDB1lQIDAQA---BEGIN PUBLIC KEY-----"
```

Output:

```
{

```
```
"authorizerName": "CustomAuthorizer",
"authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer2"
}

For more information, see CreateAuthorizer in the AWS IoT API Reference.

- For API details, see CreateAuthorizer in AWS CLI Command Reference.

create-billing-group

The following code example shows how to use create-billing-group.

AWS CLI

To create a billing group

The following create-billing-group example creates a simple billing group named GroupOne.

```
aws iot create-billing-group \
    --billing-group-name GroupOne
```

Output:

```
{
    "billingGroupName": "GroupOne",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562"
}
```

For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see CreateBillingGroup in AWS CLI Command Reference.

create-certificate-from-csr

The following code example shows how to use create-certificate-from-csr.

AWS CLI

To create a device certificate from a certificate signing request (CSR)
The following `create-certificate-from-csr` example creates a device certificate from a CSR. You can use the `openssl` command to create a CSR.

```bash
aws iot create-certificate-from-csr
   --certificate-signing-request=file://certificate.csr
```

Output:

```json
{
   "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
   "certificateId": "c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
   "certificatePem": "<certificate-text>
```

For more information, see [CreateCertificateFromCSR](https://docs.aws.amazon.com/iot/latest/developerguide/CreateCertificateFromCSR.html) in the *AWS IoT API Reference*.

- For API details, see [CreateCertificateFromCsr](https://docs.aws.amazon.com/cli/latest/reference/iot/create-certificate-from-csr.html) in *AWS CLI Command Reference*.

### create-custom-metric

The following code example shows how to use `create-custom-metric`.

AWS CLI

To create a custom metric published by your devices to Device Defender

The following `create-custom-metric` example creates a custom metric that measures battery percentage.

```bash
aws iot create-custom-metric
   --metric-name "batteryPercentage"
   --metric-type "number"
   --display-name "Remaining battery percentage."
   --region us-east-1
   --client-request-token "02ccb92b-33e8-4dfa-a0c1-35b181ed26b0"
```

Output:

```json
{
   "metricName": "batteryPercentage",
```
For more information, see Custom metrics in the AWS IoT Core Developer Guide.

- For API details, see CreateCustomMetric in AWS CLI Command Reference.

**create-dimensional**

The following code example shows how to use create-dimensional.

**AWS CLI**

To create a dimension

The following create-dimensional creates a dimension with a single topic filter called TopicFilterForAuthMessages.

```bash
aws iot create-dimension \
    --name TopicFilterForAuthMessages \
    --type TOPIC_FILTER \
    --string-values device/+/*
```

Output:

```json
{
    "name": "TopicFilterForAuthMessages",
    "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see CreateDimension in AWS CLI Command Reference.

**create-domain-configuration**

The following code example shows how to use create-domain-configuration.

**AWS CLI**

To create a domain configuration
The following create-domain-configuration example creates an AWS-managed domain configuration with a service type of DATA.

```
aws iot create-domain-configuration \  
  --domain-configuration-name "additionalDataDomain" \  
  --service-type "DATA"
```

Output:

```
{
  "domainConfigurationName": "additionalDataDomain",
  "domainConfigurationArn": "arn:aws:iot:us-west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.

- For API details, see CreateDomainConfiguration in AWS CLI Command Reference.

create-dynamic-thing-group

The following code example shows how to use create-dynamic-thing-group.

AWS CLI

**To create a dynamic thing group**

The following create-dynamic-thing-group example creates a dynamic thing group that contains any thing with a temperature attribute that is greater than 60 degrees. You must enable AWS IoT fleet indexing before you can use dynamic thing groups.

```
aws iot create-dynamic-thing-group \  
  --thing-group-name "RoomTooWarm" \  
  --query-string "attributes.temperature>60"
```

Output:

```
{
  "thingGroupName": "RoomTooWarm",
  "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/RoomTooWarm",
```
For more information, see Dynamic Thing Groups in the AWS IoT Developers Guide.

- For API details, see CreateDynamicThingGroup in AWS CLI Command Reference.

### create-job

The following code example shows how to use create-job.

**AWS CLI**

**Example 1: To create a job**

The following create-job example creates a simple AWS IoT job that sends a JSON document to the MyRaspberryPi device.

```
aws iot create-job \
  --job-id "example-job-01" \
  --targets "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi" \
  --document file://example-job.json \
  --description "example job test" \
  --target-selection SNAPSHOT
```

Output:

```
{
  "jobId": "example-job-01",
  "description": "example job test"
}
```

**Example 2: To create a continuous job**

The following create-job example creates a job that continues to run after the things specified as targets have completed the job. In this example, the target is a thing group, so when new devices are added to the group, the continuous job runs on those new things.

Output:

```json
{
    "jobId": "example-job-04",
    "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see CreateJob in AWS CLI Command Reference.

create-keys-and-certificate

The following code example shows how to use create-keys-and-certificate.

**AWS CLI**

To create an RSA key pair and issue an X.509 certificate

The following create-keys-and-certificate creates a 2048-bit RSA key pair and issues an X.509 certificate using the issued public key. Because this is the only time that AWS IoT provides the private key for this certificate, be sure to keep it in a secure location.

```bash
aws iot create-keys-and-certificate \
    --certificate-pem-outfile "myTest.cert.pem" \
    --public-key-outfile "myTest.public.key" \
    --private-key-outfile "myTest.private.key"
```

Output:

```json
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificateId": "9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
```
For more information, see Create and Register an AWS IoT Device Certificate in the AWS IoT Developer Guide.

- For API details, see CreateKeysAndCertificate in AWS CLI Command Reference.

create-mitigation-action

The following code example shows how to use create-mitigation-action.

AWS CLI

To create a mitigation action
The following `create-mitigation-action` example defines a mitigation action named `AddThingsToQuarantineGroup1Action` that, when applied, moves things into the thing group named `QuarantineGroup1`. This action overrides dynamic thing groups.

```bash
aws iot create-mitigation-action --cli-input-json file::params.json
```

Contents of `params.json`:

```json
{
    "actionName": "AddThingsToQuarantineGroup1Action",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": ["QuarantineGroup1"],
            "overrideDynamicGroups": true
        }
    },
    "roleArn": "arn:aws:iam::123456789012:role/service-role/MoveThingsToQuarantineGroupRole"
}
```

Output:

```json
{
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroup1Action",
    "actionId": "992e9a63-a899-439a-aa50-4e20c52367e1"
}
```

For more information, see `CreateMitigationAction` ([Mitigation Action Commands](aws-iot-developer-guide)) in the AWS IoT Developer Guide.

- For API details, see `CreateMitigationAction` in AWS CLI Command Reference.

### create-ota-update

The following code example shows how to use `create-ota-update`.

**AWS CLI**

To create an OTA update for use with Amazon FreeRTOS
The following `create-ota-update` example creates an AWS IoT OTAUpdate on a target group of things or groups. This is part of an Amazon FreeRTOS over-the-air update which makes it possible for you to deploy new firmware images to a single device or a group of devices.

```bash
aws iot create-ota-update \
--cli-input-json file://create-ota-update.json
```

Contents of `create-ota-update.json`:

```json
{
    "otaUpdateId": "ota12345",
    "description": "A critical update needed right away.",
    "targets": [
        "device1",
        "device2",
        "device3",
        "device4"
    ],
    "targetSelection": "SNAPSHOT",
    "awsJobExecutionsRolloutConfig": {
        "maximumPerMinute": 10
    },
    "files": [
        {
            "fileName": "firmware.bin",
            "fileLocation": {
                "stream": {
                    "streamId": "004",
                    "fileId": 123
                }
            },
            "codeSigning": {
                "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
        }
    ],
    "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
}
```

Output:

```json
{}
```
"otaUpdateId": "ota12345",
"awsIotJobId": "job54321",
"otaUpdateStatus": "CREATE_IN_PROGRESS"
}

For more information, see CreateOTAUpdate in the AWS IoT API Reference.

- For API details, see CreateOtaUpdate in AWS CLI Command Reference.

create-policy

The following code example shows how to use create-policy.

AWS CLI

To create an AWS IoT policy

The following create-policy example creates an AWS IoT policy named TemperatureSensorPolicy. The policy.json file contains statements that allow AWS IoT policy actions.

```
aws iot create-policy \
    --policy-name TemperatureSensorPolicy \
    --policy-document file://policy.json
```

Contents of policy.json:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["iot:Publish", "iot:Receive"],
        }
    ]
}
```
Output:

```json
{
    "policyName": "TemperatureSensorPolicy",
    "policyDocument": "{
        "Version": "2012-10-17",
        "Statement": [
            {
                "Effect": "Allow",
                "Action": [
                    "iot:Publish",
                    "iot:Receive"
                ],
                "Resource": [
                    "arn:aws:iot:us-west-2:123456789012:topic/topic_2"
                ]
            }
        ]
    }
}
```
```json
{
    "Effect": "Allow",
    "Action": [
        "iot:Subscribe"
    ],
    "Resource": [
        "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "iot:Connect"
    ],
    "Resource": [
    ]
}
"policyVersionId": "1"
}
```

For more information, see [AWS IoT Policies](https://docs.aws.amazon.com/iot/latest/developerguide/policy-overview.html) in the [AWS IoT Developers Guide](https://docs.aws.amazon.com/iot/latest/developerguide/policy-overview.html).

- For API details, see [CreatePolicy](https://docs.aws.amazon.com/cli/latest/reference/iot/create-policy.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iot/create-policy.html).

---

### create-policy-version

The following code example shows how to use create-policy-version.

### AWS CLI

**To update a policy with a new version**

The following `create-policy-version` example updates a policy definition, creating a new policy version. This example also makes the new version the default.

```
aws iot create-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-document file://policy.json \
    --set-as-default
```
Contents of policy.json:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "iot:UpdateCertificate",
         "Resource": "*"
      }
   ]
}
```

Output:

```json
{
   "policyVersionId": "2",
   "isDefaultVersion": true
}
```

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

- For API details, see CreatePolicyVersion in AWS CLI Command Reference.

**create-provisioning-claim**

The following code example shows how to use create-provisioning-claim.

**AWS CLI**

To create a provisioning claim

The following create-provisioning-claim example creates a provisioning claim from a provisioning template.

```bash
aws iot create-provisioning-claim \
--template-name MyTest ProvisioningTemplate
```

Output:
Actions and scenarios

For more information, see Provisioning by trusted user in the AWS IoT Core Developers Guide.

- For API details, see CreateProvisioningClaim in AWS CLI Command Reference.

create-provisioning-template

The following code example shows how to use create-provisioning-template.

AWS CLI

To create a provisioning template

The following create-provisioning-template example creates a provisioning template as defined by the file template.json.

```bash
aws iot create-provisioning-template \
  --template-name widget-template \
  --description "A provisioning template for widgets" \
  --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role \
  --template-body file://template.json
```

Contents of template.json:

```json
{
  "Parameters" : {
    "DeviceLocation": {
      "Type": "String"
    }
  },
  "Mappings": {
    "LocationTable": {
      "Seattle": {
        "LocationUrl": "https://example.aws"
      }
    }
  },
  "Resources" : {
    "thing" : {
      "Type" : "AWS::IoT::Thing",
      "Properties" : {
        "AttributePayload" : {
          "version" : "v1",
          "serialNumber" : "serialNumber"
```
"ThingName" : {"Fn::Join":"
","ThingPrefix_",
{"Ref":"SerialNumber"}}}],
"ThingTypeName" : {"Fn::Join":"
","ThingTypePrefix_",
{"Ref":"SerialNumber"}}}],
"ThingGroups" : ["widgets", "WA"],
"BillingGroup": "BillingGroup"
},
"OverrideSettings" : {
"AttributePayload" : "MERGE",
"ThingTypeName" : "REPLACE",
"ThingGroups" : "DO NOTHING"
}
},
"certificate" : {
"Type" : "AWS::IoT::Certificate",
"Properties" : {
"CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
"Status" : "Active"
}
},
"policy" : {
"Type" : "AWS::IoT::Policy",
"Properties" : {
"PolicyDocument" : {
"Version": "2012-10-17",
"Statement": [{
"Effect": "Allow",
"Action": ["iot:Publish"],
"Resource": ["arn:aws:iot:us-east-1:504350838278:topic/foo/bar"]
}]
}
}
},
"DeviceConfiguration": {
"FallbackUrl": "https://www.example.com/test-site",
"LocationUrl": {
"Fn::FindInMap": ["LocationTable",{"Ref": "DeviceLocation"},
"LocationUrl"]}
}
Output:

```json
{
    "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-template",
    "templateName": "widget-template",
    "defaultVersionId": 1
}
```

For more information, see [AWS IoT Secure Tunneling](http://aws.amazon.com) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateProvisioningTemplate](http://aws.amazon.com) in *AWS CLI Command Reference*.

**create-provisioning-template-version**

The following code example shows how to use `create-provisioning-template-version`.

**AWS CLI**

To create a provisioning template version

The following example creates a version for the specified provisioning template. The body of the new version is supplied in the file `template.json`.

```bash
aws iot create-provisioning-template-version \\
--template-name widget-template \\
--template-body file://template.json
```

Contents of `template.json`:

```json
{
    "Parameters": {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    }
}
```
Output:

```
{
    "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-template",
    "templateName": "widget-template",
    "versionId": 2,
    "isDefaultVersion": false
}
```

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/secure-tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateProvisioningTemplateVersion](https://docs.aws.amazon.com/cli/latest/reference/iot/create-provisioning-template-version.html) in *AWS CLI Command Reference*.

**create-role-alias**

The following code example shows how to use `create-role-alias`.

**AWS CLI**

**To create a role alias**

The following `create-role-alias` example creates a role alias called `LightBulbRole` for the specified role.

```
aws iot create-role-alias \\
    --role-alias LightBulbRole \\
    --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:
For more information, see CreateRoleAlias in the AWS IoT API Reference.

For API details, see CreateRoleAlias in AWS CLI Command Reference.

create-scheduled-audit

The following code example shows how to use create-scheduled-audit.

AWS CLI

To create a scheduled audit

The following create-scheduled-audit example creates a scheduled audit that runs weekly, on Wednesday, to check if CA certificates or device certificates are expiring.

```
aws iot create-scheduled-audit \
   --scheduled-audit-name WednesdayCertCheck \
   --frequency WEEKLY \
   --day-of-week WED \
   --target-check-names CA_CERTIFICATE_EXPIRING_CHECK \
   DEVICE_CERTIFICATE_EXPIRING_CHECK
```

Output:

```
{
   "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/WednesdayCertCheck"
}
```

For more information, see Audit Commands in the AWS IoT Developer Guide.

For API details, see CreateScheduledAudit in AWS CLI Command Reference.

create-security-profile

The following code example shows how to use create-security-profile.
AWS CLI

To create a security profile

The following create-security-profile example creates a security profile that checks if cellular bandwidth exceeds a threshold or if more than 10 authorization failures occur within a five-minute period.

```bash
aws iot create-security-profile \
  --security-profile-name PossibleIssue \
  --security-profile-description "Check to see if authorization fails 10 times in 5 minutes or if cellular bandwidth exceeds 128" \
  --behaviors "[{{"name":"CellularBandwidth","metric":"aws:message-byte-size","criteria":{"comparisonOperator":"greater-than","value":{"count":128},"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{"name":"Authorization","metric":"aws:num-authorization-failures","criteria":{"comparisonOperator":"less-than","value":{"count":10},"durationSeconds":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}}]"
```

Output:

```json
{
  "securityProfileName": "PossibleIssue",
  "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/ PossibleIssue"
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see CreateSecurityProfile in AWS CLI Command Reference.

create-stream

The following code example shows how to use create-stream.

AWS CLI

To create a stream for delivering one or more large files in chunks over MQTT

The following create-stream example creates a stream for delivering one or more large files in chunks over MQTT. A stream transports data bytes in chunks or blocks packaged as MQTT messages from a source like S3. You can have one or more files associated with a stream.
aws iot create-stream \
   --cli-input-json file://create-stream.json

Contents of create-stream.json:

```json
{
   "streamId": "stream12345",
   "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
   "files": [
      {
         "fileId": 123,
         "s3Location": {
            "bucket": "codesign-ota-bucket",
            "key": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
         }
      }
   ],
   "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
}
```

Output:

```json
{
   "streamId": "stream12345",
   "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
   "streamVersion": "1"
}
```

For more information, see CreateStream in the AWS IoT API Reference.

- For API details, see CreateStream in AWS CLI Command Reference.

create-thing-group

The following code example shows how to use create-thing-group.

AWS CLI

Example 1: To create a thing group
The following `create-thing-group` example creates a thing group named `LightBulbs` with a description and two attributes.

```
aws iot create-thing-group \
   --thing-group-name LightBulbs \
   --thing-group-properties "thingGroupDescription="Generic bulb group",
    attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```
{
   "thingGroupName": "LightBulbs",
   "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs",
   "thingGroupId": "9198bf9f-1e76-4a88-8e8c-e7140142c331"
}
```

**Example 2: To create a thing group that's part of a parent group**

The following `create-thing-group` creates a thing group named `HalogenBulbs` that has a parent thing group named `LightBulbs`.

```
aws iot create-thing-group \
   --thing-group-name HalogenBulbs \
   --parent-group-name LightBulbs
```

Output:

```
{
   "thingGroupName": "HalogenBulbs",
   "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e"
}
```

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/create-thing-group.html) in *AWS CLI Command Reference*.

**create-thing-type**

The following code example shows how to use `create-thing-type`.
To define a thing type

The following `create-thing-type` example defines a thing type and associated attributes.

```
aws iot create-thing-type \
    --thing-type-name "LightBulb" \
    --thing-type-properties "thingTypeDescription=light bulb type, searchableAttributes=wattage,model"
```

Output:

```
{
    "thingTypeName": "LightBulb",
    "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
    "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190"
}
```

For more information, see [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/thing-type-concepts.html) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThingType](https://docs.aws.amazon.com/cli/latest/reference/iot/create-thing-type.html) in *AWS CLI Command Reference*.

create-topic-rule

The following code example shows how to use `create-topic-rule`.

AWS CLI

To create a rule that sends an Amazon SNS alert

The following `create-topic-rule` example creates a rule that sends an Amazon SNS message when soil moisture level readings, as found in a device shadow, are low.

```
aws iot create-topic-rule \
    --rule-name "LowMoistureRule" \
    --topic-rule-payload file://plant-rule.json
```

The example requires the following JSON code to be saved to a file named `plant-rule.json`:

```
{
```

Actions and scenarios
"sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE state.reported.moisture = 'low'\n",
"description": "Sends an alert whenever soil moisture level readings are too low.",
"ruleDisabled": false,
"awsIotSqlVersion": "2016-03-23",
"actions": [{
   "sns": {
      "roleArn": "arn:aws:iam::123456789012:role/service-role/MyRPiLowMoistureTopicRole",
      "messageFormat": "RAW"
   }
}]

This command produces no output.

For more information, see Creating an AWS IoT Rule in the AWS IoT Developers Guide.

- For API details, see CreateTopicRule in AWS CLI Command Reference.

**create-topic-rule-destination**

The following code example shows how to use create-topic-rule-destination.

**AWS CLI**

**To create a topic rule destination**

The following create-topic-rule-destination example creates a topic rule destination for an HTTP endpoint.

```
aws iot create-topic-rule-destination \
   --destination-configuration httpUrlConfiguration={confirmationUrl=https://example.com}
```

Output:

```
{
```
"topicRuleDestination": {
    "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "status": "IN_PROGRESS",
    "statusReason": "Awaiting confirmation. Confirmation message sent on 2020-07-09T22:47:54.154Z; no response received from the endpoint.",
    "httpUrlProperties": {
        "confirmationUrl": "https://example.com"
    }
}

For more information, see Creating a topic rule destination in the AWS IoT Developer Guide.

- For API details, see CreateTopicRuleDestination in AWS CLI Command Reference.

delete-account-audit-configuration

The following code example shows how to use delete-account-audit-configuration.

AWS CLI

To disable all audit checks for your AWS account

The following delete-account-audit-configuration example restores the default settings for AWS IoT Device Defender for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account. Use this command with caution.

```
aws iot delete-account-audit-configuration \
    --delete-scheduled-audits
```

This command produces no output.

For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DeleteAccountAuditConfiguration in AWS CLI Command Reference.

delete-audit-suppression

The following code example shows how to use delete-audit-suppression.
AWS CLI

**To delete an audit finding suppression**

The following delete-audit-suppression example deletes an audit finding suppression for DEVICE_CERTIFICATE_EXPIRING_CHECK.

```bash
aws iot delete-audit-suppression \
   --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
   --resource-identifier deviceCertificateId="c7691e<shortened>"
```

This command produces no output.

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/latest/developerguide/audit-suppressions.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteAuditSuppression](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-audit-suppression.html) in *AWS CLI Command Reference*.

**delete-authorizer**

The following code example shows how to use delete-authorizer.

AWS CLI

**To delete a custom authorizer**

The following delete-authorizer example deletes the authorizer named CustomAuthorizer. A custom authorizer must be in the INACTIVE state before you can delete it.

```bash
aws iot delete-authorizer \
   --authorizer-name CustomAuthorizer
```

This command produces no output.

For more information, see [DeleteAuthorizer](https://docs.aws.amazon.com/iot/latest/developerguide/delete-authorizer.html) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteAuthorizer](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-authorizer.html) in *AWS CLI Command Reference*.

**delete-billing-group**

The following code example shows how to use delete-billing-group.
AWS CLI

To delete a billing group

The following delete-billing-group example deletes the specified billing group. You can delete a billing group even if it contains one or more things.

```
aws iot delete-billing-group \
  --billing-group-name BillingGroupTwo
```

This command does not produce any output.

For more information, see Billing Groups in the AWS IoT Developers Guide.
- For API details, see DeleteBillingGroup in AWS CLI Command Reference.

delete-ca-certificate

The following code example shows how to use delete-ca-certificate.

AWS CLI

To delete a CA certificate

The following delete-ca-certificate example deletes the CA certificate with the specified certificate ID.

```
aws iot delete-ca-certificate \
  --certificate-id \
  f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

This command produces no output.

For more information, see DeleteCACertificate in the AWS IoT API Reference.
- For API details, see DeleteCaCertificate in AWS CLI Command Reference.

delete-custom-metric

The following code example shows how to use delete-custom-metric.
AWS CLI

To delete a custom metric

The following delete-custom-metric example deletes a custom metric.

```
aws iot delete-custom-metric \
   --metric-name batteryPercentage \
   --region us-east-1
```

Output:

HTTP 200

For more information, see Custom metrics in the AWS IoT Core Developer Guide.
• For API details, see DeleteCustomMetric in AWS CLI Command Reference.

delete-dimension

The following code example shows how to use delete-dimension.

AWS CLI

To delete a dimension

The following delete-dimension example deletes a dimension called TopicFilterForAuthMessages.

```
aws iot delete-dimension \
   --name TopicFilterForAuthMessages
```

This command produces no output.

For more information, see Detect Commands in the AWS IoT Developer Guide.
• For API details, see DeleteDimension in AWS CLI Command Reference.

delete-domain-configuration

The following code example shows how to use delete-domain-configuration.
AWS CLI

To delete a domain configuration

The following delete-domain-configuration example deletes a domain configuration named additionalDataDomain from your AWS account.

```bash
aws iot delete-domain-configuration \
   --domain-configuration-name "additionalDataDomain" \
   --domain-configuration-status "OK"
```

This command produces no output.

For more information, see Configurable Endpoints in the AWS IoT Developer Guide.
- For API details, see DeleteDomainConfiguration in AWS CLI Command Reference.

delete-dynamic-thing-group

The following code example shows how to use delete-dynamic-thing-group.

AWS CLI

To delete a dynamic thing group

The following delete-dynamic-thing-group example deletes the specified dynamic thing group.

```bash
aws iot delete-dynamic-thing-group \
   --thing-group-name "RoomTooWarm"
```

This command produces no output.

For more information, see Dynamic Thing Groups in the AWS IoT Developers Guide.
- For API details, see DeleteDynamicThingGroup in AWS CLI Command Reference.

delete-job

The following code example shows how to use delete-job.
AWS CLI

To delete a job

The following delete-job example deletes the specified job. By specifying the --force option, the job is deleted even if the status is IN_PROGRESS.

```
aws iot delete-job \
   --job-id "example-job-04" \
   --force
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.
• For API details, see DeleteJob in AWS CLI Command Reference.

delete-job-execution

The following code example shows how to use delete-job-execution.

AWS CLI

To delete a job execution

The following delete-job-execution example deletes the job execution of the specified job on a device. Use describe-job-execution to get the execution number.

```
aws iot delete-job-execution \
   --job-id "example-job-02" \
   --thing-name "MyRaspberryPi" \
   --execution-number 1
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.
• For API details, see DeleteJobExecution in AWS CLI Command Reference.

delete-mitigation-action

The following code example shows how to use delete-mitigation-action.
AWS CLI

To delete a mitigation action

The following `delete-mitigation-action` example deletes the specified mitigation action.

```
aws iot delete-mitigation-action
    --action-name AddThingsToQuarantineGroup1Action
```

This command produces no output.

For more information, see `DeleteMitigationAction` in the *AWS IoT Developer Guide*.

- For API details, see `DeleteMitigationAction` in *AWS CLI Command Reference*.

Delete-ota-update

The following code example shows how to use `delete-ota-update`.

AWS CLI

To delete an OTA update

The following `delete-ota-update` example deletes the specified OTA update.

```
aws iot delete-ota-update
    --ota-update-id ota12345
    --delete-stream
    --force-delete-aws-job
```

This command produces no output.

For more information, see `DeleteOTAUpdate` in the *AWS IoT API Reference*.

- For API details, see `DeleteOtaUpdate` in *AWS CLI Command Reference*.

Delete-policy

The following code example shows how to use `delete-policy`.
AWS CLI

To delete a policy

The following delete-policy example deletes the specified policy from your AWS account.

```bash
aws iot delete-policy --policy-name UpdateDeviceCertPolicy
```

This command produces no output.

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

- For API details, see `DeletePolicy` in AWS CLI Command Reference.

delete-policy-version

The following code example shows how to use delete-policy-version.

AWS CLI

To delete a version of policy

The following delete-policy-version example deletes version 2 of the specified policy from your AWS account.

```bash
aws iot delete-policy-version \
   --policy-name UpdateDeviceCertPolicy \
   --policy-version-id 2
```

This command produces no output.

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

- For API details, see `DeletePolicyVersion` in AWS CLI Command Reference.

delete-provisioning-template

The following code example shows how to use delete-provisioning-template.

AWS CLI

To delete a provisioning template
The following `delete-provisioning-template` example deletes the specified provisioning template.

```
aws iot delete-provisioning-template \
   --template-name widget-template
```

This command produces no output.

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-secure-tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [DeleteProvisioningTemplate](https://docs.aws.amazon.com/iotsitecore/latest/developerguide/rest-api-reference-iot-core.html#iot-core-delete-provisioning-template) in *AWS CLI Command Reference*.

### delete-provisioning-template-version

The following code example shows how to use `delete-provisioning-template-version`.

**AWS CLI**

**To delete a provisioning template version**

The following `delete-provisioning-template-version` example deletes version 2 of the specified provisioning template.

```
aws iot delete-provisioning-template-version \
   --version-id 2 \
   --template-name "widget-template"
```

This command produces no output.

For more information, see [AWS IoT Secure Tunneling](https://docs.aws.amazon.com/iot/latest/developerguide/aws-iot-secure-tunneling.html) in the *AWS IoT Core Developer Guide*.

- For API details, see [DeleteProvisioningTemplateVersion](https://docs.aws.amazon.com/iotsitecore/latest/developerguide/rest-api-reference-iot-core.html#iot-core-delete-provisioning-template-version) in *AWS CLI Command Reference*.

### delete-registration-code

The following code example shows how to use `delete-registration-code`.

**AWS CLI**

**To delete your registration code**

The following `delete-registration-code` example deletes an AWS IoT account-specific registration code.
aws iot delete-registration-code

This command produces no output.

For more information, see Use Your Own Certificate in the AWS IoT Developer Guide. For API details, see DeleteRegistrationCode in AWS CLI Command Reference.

deleterole-alias

The following code example shows how to use delete-role-alias.

AWS CLI

To delete an AWS IoT role alias

The following delete-role-alias example deletes an AWS IoT role alias named LightBulbRole.

```
aws iot delete-role-alias \n    --role-alias LightBulbRole
```

This command produces no output.

For more information, see Authorizing Direct Calls to AWS Services in the AWS IoT Developer Guide. For API details, see DeleteRoleAlias in AWS CLI Command Reference.

delete-scheduled-audit

The following code example shows how to use delete-scheduled-audit.

AWS CLI

To delete a scheduled audit

The following delete-scheduled-audit example deletes the AWS IoT Device Defender scheduled audit named AWSIoTDeviceDefenderDailyAudit.

```
aws iot delete-scheduled-audit \n    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```
This command produces no output.

For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/audit-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteScheduledAudit](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-scheduled-audit.html) in *AWS CLI Command Reference*.

### delete-security-profile

The following code example shows how to use `delete-security-profile`.

**AWS CLI**

**To delete a security profile**

The following `delete-security-profile` example deletes a security profile named `PossibleIssue`.

```
aws iot delete-security-profile \
    --security-profile-name PossibleIssue
```

This command produces no output.

For more information, see [Detect Commands](https://docs.aws.amazon.com/iot/latest/developerguide/detect-commands.html) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteSecurityProfile](https://docs.aws.amazon.com/iot/latest/developerguide/delete-security-profile.html) in *AWS CLI Command Reference*.

### delete-stream

The following code example shows how to use `delete-stream`.

**AWS CLI**

**To delete a stream**

The following `delete-stream` example deletes the specified stream.

```
aws iot delete-stream \
    --stream-id stream12345
```

This command produces no output.

For more information, see [DeleteStream](https://docs.aws.amazon.com/iot/latest/developerguide/delete-stream.html) in the *AWS IoT API Reference*.

- For API details, see [DeleteStream](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-stream.html) in *AWS CLI Command Reference*. 
**delete-thing-group**

The following code example shows how to use delete-thing-group.

**AWS CLI**

**To delete a thing group**

The following delete-thing-group example deletes the specified thing group. You cannot delete a thing group if it contains child thing groups.

```
aws iot delete-thing-group \
    --thing-group-name DefectiveBulbs
```

This command produces no output.

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThingGroup](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-thing-group.html) in *AWS CLI Command Reference*.

**delete-thing-type**

The following code example shows how to use delete-thing-type.

**AWS CLI**

**Example 1: To delete a thing type**

The following delete-thing-type example deletes a deprecated thing type.

```
aws iot delete-thing-type \
    --thing-type-name "obsoleteThingType"
```

This command produces no output.

For more information, see [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/thing-types.html) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThingType](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-thing-type.html) in *AWS CLI Command Reference*.

**delete-topic-rule**

The following code example shows how to use delete-topic-rule.
AWS CLI

To delete a rule

The following delete-topic-rule example deletes the specified rule.

```bash
aws iot delete-topic-rule \
    --rule-name "LowMoistureRule"
```

This command produces no output.

For more information, see [Deleting a Rule](https://docs.aws.amazon.com/iot/latest/developerguide/) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteTopicRule](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-topic-rule.html) in *AWS CLI Command Reference*.

**delete-topic-rule-destination**

The following code example shows how to use `delete-topic-rule-destination`.

AWS CLI

To delete a topic rule destination

The following delete-topic-rule-destination example deletes the specified topic rule destination.

```bash
aws iot delete-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

This command produces no output.

For more information, see [Deleting a topic rule destination](https://docs.aws.amazon.com/iot/latest/developerguide/) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteTopicRuleDestination](https://docs.aws.amazon.com/cli/latest/reference/iot/delete-topic-rule-destination.html) in *AWS CLI Command Reference*.

**delete-v2-logging-level**

The following code example shows how to use `delete-v2-logging-level`.

AWS CLI

To delete the logging level for a thing group
The following delete-v2-logging-level example deletes the logging level for the specified thing group.

```
aws iot delete-v2-logging-level \
   --target-type THING_GROUP \
   --target-name LightBulbs
```

This command produces no output.

- For API details, see [DeleteV2LoggingLevel](#) in [AWS CLI Command Reference](#).

### deprecate-thing-type

The following code example shows how to use deprecate-thing-type.

**AWS CLI**

**Example 1: To deprecate a thing type**

The following deprecate-thing-type example deprecates a thing type so that users can't associate any new things with it.

```
aws iot deprecate-thing-type \
   --thing-type-name "obsoleteThingType"
```

This command produces no output.

**Example 2: To reverse the deprecation of a thing type**

The following deprecate-thing-type example reverses the deprecation of a thing type, which makes it possible for users to associate new things with it again.

```
aws iot deprecate-thing-type \
   --thing-type-name "obsoleteThingType" \
   --undo-deprecate
```

This command produces no output.

For more information, see [Thing Types](#) in the [AWS IoT Developers Guide](#).

- For API details, see [DeprecateThingType](#) in [AWS CLI Command Reference](#).
describe-account-audit-configuration

The following code example shows how to use `describe-account-audit-configuration`.

**AWS CLI**

**To view current audit configuration settings**

The following `describe-account-audit-configuration` example lists the current settings for your AWS IoT Device Defender audit configuration.

```bash
aws iot describe-account-audit-configuration
```

**Output:**

```json
{
   "roleArn": "arn:aws:iam::123456789012:role/service-role/AWSIoTDeviceDefenderAudit_1551201085996",
   "auditNotificationTargetConfigurations": {
      "SNS": {
         "roleArn": "arn:aws:iam::123456789012:role/service-role/AWSIoTDeviceDefenderAudit",
         "enabled": true
      }
   },
   "auditCheckConfigurations": {
      "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
         "enabled": true
      },
      "CA_CERTIFICATE_EXPIRING_CHECK": {
         "enabled": true
      },
      "CONFLICTING_CLIENT_IDS_CHECK": {
         "enabled": true
      },
      "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
         "enabled": true
      },
      "DEVICE_CERTIFICATE_SHARED_CHECK": {
         "enabled": true
      },
      "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
```

Actions and scenarios
For more information, see Audit Commands in the AWS IoT Developer Guide.

- For API details, see DescribeAccountAuditConfiguration in AWS CLI Command Reference.

describe-audit-finding

The following code example shows how to use describe-audit-finding.

AWS CLI

To list details for an audit finding

The following describe-audit-finding example lists the details for the specified AWS IoT Device Defender audit finding. An audit can produce multiple findings. Use the list-audit-findings command to get a list of the findings from an audit to get the findingId.

```bash
aws iot describe-audit-finding \
  --finding-id "ef4826b8-e55a-44b9-b460-5c485355371b"
```

Output:

```json
{
    "finding": {
        "findingId": "ef4826b8-e55a-44b9-b460-5c485355371b",
    }
}
```
For more information, see Check Audit Results (Audit Commands) in the AWS IoT Developer Guide.

- For API details, see DescribeAuditFinding in AWS CLI Command Reference.

describe-audit-mitigation-actions-task

The following code example shows how to use describe-audit-mitigation-actions-task.

AWS CLI

To show the details of an audit mitigation actions task

The following describe-audit-mitigation-actions-task example shows the details for the specified task, where the ResetPolicyVersionAction was applied to a finding. The results include when the task started and ended, how many findings were targeted (and the outcome), and the definition of the action that is applied as part of this task.

```bash
aws iot describe-audit-mitigation-actions-task \   --task-id ResetPolicyTask01
```
For more information, see [DescribeAuditMitigationActionsTask (Mitigation Action Commands)](https://docs.aws.amazon.com/iot/latest/developerguide/mCaption> in the [AWS IoT Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/mCaption>.

describe-audit-suppression

The following code example shows how to use describe-audit-suppression.

AWS CLI

To get details about an audit finding suppression

The following describe-audit-suppression example lists details about an audit finding suppression.

```bash
aws iot describe-audit-task \
--task-id "787ed873b69cb4d6cdbae6ddd06996c5"
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK",
    "taskStartTime": 1596168096.157,
    "taskStatistics": {
        "totalChecks": 1,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 0,
        "nonCompliantChecks": 1,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "auditDetails": {
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_NON_COMPLIANT",
            "checkCompliant": false,
            "totalResourcesCount": 195,
            "nonCompliantResourcesCount": 2
        }
    }
}
```

For more information, see [Audit finding suppressions](https://docs.aws.amazon.com/iot/latest/developerguide/audit-suppressions.html) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeAuditSuppression](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-audit-suppression.html) in *AWS CLI Command Reference*. 

**describe-audit-task**

The following code example shows how to use describe-audit-task.

**AWS CLI**

**To get information about an audit instance**

The following `describe-audit-task` example gets information about an instance of an AWS IoT Device Defender audit. If the audit is complete, summary statistics for the run are included in the results.

```bash
aws iot describe-audit-task \
   --task-id a3aea009955e501a31b764abe1bebd3d
```

**Output:**

```json
{
   "taskStatus": "COMPLETED",
   "taskType": "ON_DEMAND_AUDIT_TASK",
   "taskStartTime": 1560356923.434,
   "taskStatistics": {
      "totalChecks": 3,
      "inProgressChecks": 0,
      "waitingForDataCollectionChecks": 0,
      "compliantChecks": 3,
      "nonCompliantChecks": 0,
      "failedChecks": 0,
      "canceledChecks": 0
   },
   "auditDetails": {
      "CA_CERTIFICATE_EXPIRING_CHECK": {
         "checkRunStatus": "COMPLETED_COMPLIANT",
         "checkCompliant": true,
         "totalResourcesCount": 0,
         "nonCompliantResourcesCount": 0
      },
      "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
         "checkRunStatus": "COMPLETED_COMPLIANT",
         "checkCompliant": true,
         "totalResourcesCount": 6,
         "nonCompliantResourcesCount": 0
      }
   }
}
```
For more information, see Audit Commands in the AWS IoT Developer Guide.

• For API details, see DescribeAuditTask in AWS CLI Command Reference.

describe-authorizer

The following code example shows how to use describe-authorizer.

AWS CLI

To get information about a custom authorizer

The following describe-authorizer example displays details for the specified custom authorizer.

```bash
aws iot describe-authorizer \
   --authorizer-name CustomAuthorizer
```

Output:

```json
{
   "authorizerDescription": {
      "authorizerName": "CustomAuthorizer",
      "tokenKeyName": "MyAuthToken",
      "tokenSigningPublicKeys": {
         "FIRST_KEY": "-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwoZ+7ENxAio9q6QD4FFqjGZsvjtYwjoe1RKK0U8Eq9xbSmyIwTzwzm/f4Gf0Y..."
```
For more information, see [DescribeAuthorizer](https://docs.aws.amazon.com/iot/latest/api/index.html#2020-11-01/API_DescribeAuthorizer) in the *AWS IoT API Reference*.

- For API details, see [DescribeAuthorizer](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-authorizer.html) in *AWS CLI Command Reference*.

### describe-billing-group

The following code example shows how to use `describe-billing-group`.

**AWS CLI**

**To get information about a billing group**

The following `describe-billing-group` example gets information for the specified billing group.

```bash
code
aws iot describe-billing-group --billing-group-name GroupOne
```

**Output:**

```json
dict
    "billingGroupName": "GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "version": 1,
    "billingGroupProperties": {},
    "billingGroupMetadata": {
        "creationDate": 1560199355.378
    }
```
For more information, see Billing Groups in the AWS IoT Developers Guide.

- For API details, see DescribeBillingGroup in AWS CLI Command Reference.

descrIBE-ca-certificate

The following code example shows how to use describe-ca-certificate.

AWS CLI

To get details about a CA certificate

The following describe-ca-certificate example displays the details for the specified CA certificate.

```bash
aws iot describe-ca-certificate 
   --certificate-id 
   f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```
{
   "certificateDescription": {
      "certificateId": "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
      "status": "INACTIVE",
      "certificatePem": "-----BEGIN CERTIFICATE-----
MIICzzCCAbegEXAMPLEJANVEPWX18taPMA0GCSqGSiib3DQEBBQUAMB4xCzAJBgNV
BAYTAlVTMQ8wDQYDVQQKDAZBbWF6b24wHhcNMjEzMTkwOTI0MjEzMTE1WhcNMjEz
MTE1WjAeMQswCQYDVQQGEw9JYVYXcmFyeWNOb3JlLmNvbTCCASIwDQYJKoZIhvc
NlBNQJ4KDQeMDgNCQQDBAQEEAQQAMIBGkq

```
For more information, see `DescribeCACertificate` in the *AWS IoT API Reference*.

- For API details, see `DescribeCaCertificate` in *AWS CLI Command Reference*.

```bash
describe-certificate

The following code example shows how to use `describe-certificate`.

**AWS CLI**

To get information about a certificate

The following `describe-certificate` example displays the details for the specified certificate.

```bash
aws iot describe-certificate
   --certificate-id
   "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

Output:

```json
{
   "certificateDescription": {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",
      "certificateId": "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",
      "status": "ACTIVE",
```
For more information, see DescribeCertificate in the AWS IoT API Reference.

• For API details, see DescribeCertificate in AWS CLI Command Reference.

describe-custom-metric

The following code example shows how to use describe-custom-metric.

AWS CLI

To get information about a Device Defender custom metric

The following describe-custom-metric example gets information about a custom metric named myCustomMetric.
aws iot describe-custom-metric \
   --metric-name myCustomMetric

Output:

```
{
   "metricName": "myCustomMetric",
   "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/myCustomMetric",
   "metricType": "number",
   "displayName": "My custom metric",
   "creationDate": 2020-11-17T23:02:12.879000-09:00,
   "lastModifiedDate": 2020-11-17T23:02:12.879000-09:00
}
```

For more information, see Custom metrics in the AWS IoT Core Developer Guide.

• For API details, see DescribeCustomMetric in AWS CLI Command Reference.

describe-default-authorizer

The following code example shows how to use describe-default-authorizer.

AWS CLI

To get information about the default custom authorizer

The following describe-default-authorizer example displays details for the default custom authorizer.

```
aws iot describe-default-authorizer
```

Output:

```
{
   "authorizerName": "CustomAuthorizer",
   "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/CustomAuthorizer"
}
```

For more information, see DescribeDefaultAuthorizer in the AWS IoT API Reference.

• For API details, see DescribeDefaultAuthorizer in AWS CLI Command Reference.
describe-dimension

The following code example shows how to use describe-dimension.

AWS CLI

To get information about a dimension

The following describe-dimension example gets information about a dimension named TopicFilterForAuthMessages.

```
aws iot describe-dimension \
   --name TopicFilterForAuthMessages
```

Output:

```
{
   "name": "TopicFilterForAuthMessages",
   "type": "TOPIC_FILTER",
   "stringValues": [
      "device/+/auth"
   ],
   "creationDate": 1578620223.255,
   "lastModifiedDate": 1578620223.255
}
```

For more information, see Detect Commands in the AWS IoT Developer Guide.

- For API details, see DescribeDimension in AWS CLI Command Reference.

describe-domain-configuration

The following code example shows how to use describe-domain-configuration.

AWS CLI

To describe a domain configuration

The following describe-domain-configuration example displays details about the specified domain configuration.
aws iot describe-domain-configuration \
   --domain-configuration-name "additionalDataDomain"

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-east-1:758EXAMPLE143:domainconfiguration/additionalDataDomain/norpw",
    "domainName": "d055exampleed74y71zfd-ats.beta.us-east-1.iot.amazonaws.com",
    "serverCertificates": [],
    "domainConfigurationStatus": "ENABLED",
    "serviceType": "DATA",
    "domainType": "AWS_MANAGED",
    "lastStatusChangeDate": 1601923783.774
}
```

For more information, see [Configurable Endpoints](https://docs.aws.amazon.com/iot/latest/developerguide/configurable-endpoints.html) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeDomainConfiguration](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-domain-configuration.html) in *AWS CLI Command Reference*.

---

**describe-event-configurations**

The following code example shows how to use `describe-event-configurations`.

**AWS CLI**

**To show which event types are published**

The following describe-event-configurations example lists the configuration that controls which events are generated when something is added, updated, or deleted.

```bash
aws iot describe-event-configurations
```

Output:

```
{
    "eventConfigurations": {
        "CA_CERTIFICATE": {
            "Enabled": false
        },
        "CERTIFICATE": {
```

---

**Actions and scenarios**

3598
"Enabled": false
},
"JOB": {
    "Enabled": false
},
"JOB_EXECUTION": {
    "Enabled": false
},
"POLICY": {
    "Enabled": false
},
"THING": {
    "Enabled": false
},
"THING_GROUP": {
    "Enabled": false
},
"THING_GROUP_HIERARCHY": {
    "Enabled": false
},
"THING_GROUP_MEMBERSHIP": {
    "Enabled": false
},
"THING_TYPE": {
    "Enabled": false
},
"THING_TYPE_ASSOCIATION": {
    "Enabled": false
}
}

For more information, see [Event Messages](#) in the [AWS IoT Developer Guide](#).

- For API details, see [DescribeEventConfigurations](#) in [AWS CLI Command Reference](#).

**describe-index**

The following code example shows how to use `describe-index`.

**AWS CLI**

To retrieve the current status of the thing index
The following describe-index example retrieves the current status of the thing index.

```
aws iot describe-index \
    --index-name "AWS_Things"
```

Output:

```
{
    "indexName": "AWS_Things",
    "indexStatus": "ACTIVE",
    "schema": "REGISTRY_AND_SHADOW_AND_CONNECTIVITY_STATUS"
}
```

For more information, see Managing Thing Indexing in the AWS IoT Developer Guide.

- For API details, see DescribeIndex in AWS CLI Command Reference.

**describe-job**

The following code example shows how to use describe-job.

**AWS CLI**

**To get detailed status for a job**

The following describe-job example gets detailed status for the job whose ID is example-job-01.

```
aws iot describe-job \
    --job-id "example-job-01"
```

Output:

```
{
    "job": {
        "jobId": "example-job-01",
        "targetSelection": "SNAPSHOT",
        "status": "IN_PROGRESS",
        "targets": [
        ]
    }
}
```
For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DescribeJob in AWS CLI Command Reference.

describe-job-execution

The following code example shows how to use describe-job-execution.

AWS CLI

To get execution details for a job on a device

The following describe-job-execution example gets execution details for the specified job.

```
aws iot describe-job-execution \
  --job-id "example-job-01" \
  --thing-name "MyRaspberryPi"
```

Output:

```
{
    "execution": {
        "jobId": "example-job-01",
        "status": "QUEUED",
```
For more information, see Creating and Managing Jobs (CLI) in the AWS IoT Developer Guide.

- For API details, see DescribeJobExecution in AWS CLI Command Reference.

describe-mitigation-action

The following code example shows how to use describe-mitigation-action.

AWS CLI

To view the details for a defined mitigation action

The following describe-mitigation-action example displays details for the specified mitigation action.

```
aws iot describe-mitigation-action \
   --action-name AddThingsToQuarantineGroupAction
```

Output:

```
{
   "actionName": "AddThingsToQuarantineGroupAction",
   "actionType": "ADD_THINGS_TO_THING_GROUP",
   "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
   "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa",
   "roleArn": "arn:aws:iam::123456789012:role/service-role/MoveThingsToQuarantineGroupRole",
   "actionParams": {
      "addThingsToThingGroupParams": {
         "thingGroupNames": [
            "QuarantineGroup1"
         ],
         "overrideDynamicGroups": true
      }
   }
}
```
For more information, see DescribeMitigationAction (Mitigation Action Commands) in the AWS IoT Developer Guide.

- For API details, see DescribeMitigationAction in AWS CLI Command Reference.

describe-provisioning-template

The following code example shows how to use describe-provisioning-template.

**AWS CLI**

To describe a provisioning template

The following describe-provisioning-template example describes a provisioning template.

```bash
aws iot describe-provisioning-template \
    --template-name MyTestProvisioningTemplate
```

Output:

```json
{
    "templateName": "MyTestProvisioningTemplate",
    "creationDate": 1589308310.574,
    "lastModifiedDate": 1589308345.539,
    "defaultVersionId": 1,
    "templateBody": "{
        "Parameters":{
            "SerialNumber":{
                "Type":"String"},
            "AWS::IoT::Certificate::Id":{
                "Type":"String"}
        },
    }
}
```
"Resources":{
  "certificate":{
    "Properties":{
      "CertificateId":{
        "Ref": "AWS::IoT::Certificate::Id"
      },
      "Status": "Active"
    },
    "Type": "AWS::IoT::Certificate"
  },
  "policy":{
    "Properties":{
      "PolicyName": "MyIotPolicy"
    },
    "Type": "AWS::IoT::Policy"
  },
  "thing":{
    "OverrideSettings":{
      "AttributePayload": "MERGE",
      "ThingGroups": "DO NOTHING",
      "ThingTypeName": "REPLACE"
    },
    "Properties":{
      "AttributePayload": {},
      "ThingGroups": [],
      "ThingName": {
        "Fn::Join": [
          "",
          [
            "DemoGroup_",
            {"Ref": "SerialNumber"}
          ]
        ]
      },
      "ThingTypeName": "VirtualThings"
    },
    "Type": "AWS::IoT::Thing"
  }
},
"enabled": true,
"provisioningRoleArn": "arn:aws:iam::571032923833:role/service-role/IoT_access"}
For more information, see Provisioning devices that don’t have device certificates using fleet provisioning in the AWS IoT Core Developers Guide.

- For API details, see DescribeProvisioningTemplate in AWS CLI Command Reference.

**describe-provisioning-template-version**

The following code example shows how to use describe-provisioning-template-version.

**AWS CLI**

To describe a provisioning template version

The following describe-provisioning-template-version example describes a provisioning template version.

```
aws iot describe-provisioning-template-version \
   --template-name MyTestProvisioningTemplate \
   --version-id 1
```

**Output:**

```
{
   "versionId": 1,
   "creationDate": 1589308310.574,
   "templateBody": "{

}
"isDefaultVersion": true
}

For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the AWS IoT Core Developers Guide.

- For API details, see DescribeProvisioningTemplateVersion in AWS CLI Command Reference.

describe-role-alias

The following code example shows how to use describe-role-alias.
AWS CLI

To get information about an AWS IoT role alias

The following describe-role-alias example displays details for the specified role alias.

```
aws iot describe-role-alias \
   --role-alias LightBulbRole
```

Output:

```
{
   "roleAliasDescription": {
      "roleAlias": "LightBulbRole",
      "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole",
      "roleArn": "arn:aws:iam::123456789012:role/light_bulb_role_001",
      "owner": "123456789012",
      "credentialDurationSeconds": 3600,
      "creationDate": 1570558643.221,
      "lastModifiedDate": 1570558643.221
   }
}
```

For more information, see DescribeRoleAlias in the AWS IoT API Reference.

- For API details, see DescribeRoleAlias in AWS CLI Command Reference.

describe-scheduled-audit

The following code example shows how to use describe-scheduled-audit.

AWS CLI

To get information about a scheduled audit

The following describe-scheduled-audit example gets detailed information about an AWS IOT Device Defender scheduled audit named AWSIoTDeviceDefenderDailyAudit.

```
aws iot describe-scheduled-audit \
   --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```
Output:

```json
{
    "frequency": "DAILY",
    "targetCheckNames": [
        "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK",
        "CONFLICTING_CLIENT_IDS_CHECK",
        "DEVICE_CERTIFICATE_SHARED_CHECK",
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK",
        "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK"
    ],
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/AWSIoTDeviceDefenderDailyAudit"
}
```

For more information, see [Audit Commands](https://docs.aws.amazon.com/iot/latest/developerguide/iot-device-defender-audit-commands.html) in the [AWS IoT Developer Guide](https://docs.aws.amazon.com/iot/latest/developerguide/).

- For API details, see [DescribeScheduledAudit](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-scheduled-audit.html) in [AWS CLI Command Reference](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-scheduled-audit.html).

describe-security-profile

The following code example shows how to use describe-security-profile.

**AWS CLI**

**To get information about a security profile**

The following describe-security-profile example gets information about the AWS IoT Device Defender security profile named PossibleIssue.

```
aws iot describe-security-profile \
    --security-profile-name PossibleIssue
```

Output:

```json
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 10 times in 5 minutes or if cellular bandwidth exceeds 128",
}
```
"behaviors": [
    {
        "name": "CellularBandwidth",
        "metric": "aws:message-byte-size",
        "criteria": {
            "comparisonOperator": "greater-than",
            "value": {
                "count": 128
            },
            "consecutiveDatapointsToAlarm": 1,
            "consecutiveDatapointsToClear": 1
        }
    },
    {
        "name": "Authorization",
        "metric": "aws:num-authorization-failures",
        "criteria": {
            "comparisonOperator": "greater-than",
            "value": {
                "count": 10
            },
            "durationSeconds": 300,
            "consecutiveDatapointsToAlarm": 1,
            "consecutiveDatapointsToClear": 1
        }
    }
],
"version": 1,
"creationDate": 1560278102.528,
"lastModifiedDate": 1560278102.528
}

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeSecurityProfile](#) in *AWS CLI Command Reference*.

### describe-stream

The following code example shows how to use `describe-stream`.

**AWS CLI**

To get information about a stream
The following describe-stream example displays the details about the specified stream.

```bash
aws iot describe-stream \
   --stream-id stream12345
```

Output:

```
{
   "streamInfo": {
      "streamId": "stream12345",
      "streamVersion": 1,
      "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
      "files": [
         {
            "fileId": "123",
            "s3Location": {
               "bucket": "codesign-ota-bucket",
               "key": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
         }
      ],
      "createdAt": 1557863215.995,
      "lastUpdatedAt": 1557863215.995,
      "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
   }
}
```

For more information, see `DescribeStream` in the `AWS IoT API Reference`.

- For API details, see `DescribeStream` in `AWS CLI Command Reference`.

**describe-thing-group**

The following code example shows how to use `describe-thing-group`.

**AWS CLI**

To get information about a thing group

The following `describe-thing-group` example gets information about the thing group named HalogenBulbs.
aws iot describe-thing-group \
   --thing-group-name HalogenBulbs

Output:

```
{
   "thingGroupName": "HalogenBulbs",
   "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e",
   "version": 1,
   "thingGroupProperties": {},
   "thingGroupMetadata": {
      "parentGroupName": "LightBulbs",
      "rootToParentThingGroups": [
         {
            "groupName": "LightBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
         }
      ],
      "creationDate": 1559927609.897
   }
}
```

For more information, see Thing Groups in the AWS IoT Developers Guide.

- For API details, see DescribeThingGroup in AWS CLI Command Reference.

describe-thing-type

The following code example shows how to use describe-thing-type.

AWS CLI

To get information about a thing type

The following describe-thing-type example display information about the specified thing type defined in your AWS account.

```
aws iot describe-thing-type \
   --thing-type-name "LightBulb"
```
Output:

```json
{
   "thingTypeName": "LightBulb",
   "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190",
   "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
   "thingTypeProperties": {
      "thingTypeDescription": "light bulb type",
      "searchableAttributes": ["model",
                              "wattage"
                           ]
   },
   "thingTypeMetadata": {
      "deprecated": false,
      "creationDate": 1559772562.498
   }
}
```

For more information, see [Thing Types](https://docs.aws.amazon.com/iot/latest/developerguide/thing-types.html) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeThingType](https://docs.aws.amazon.com/cli/latest/reference/iot/describe-things-type.html) in *AWS CLI Command Reference*.

**detach-policy**

The following code example shows how to use `detach-policy`.

**AWS CLI**

**Example 1: To detach an AWS IoT policy from a thing group**

The following `detach-policy` example detaches the specified policy from a thing group and, by extension, from all things in that group and any of the group's child groups.

```
aws iot detach-policy \
   --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
   --policy-name "MyFirstGroup_Core-policy"
```

This command produces no output.

For more information, see [Thing Groups](https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html) in the *AWS IoT Developers Guide*.

**Example 2: To detach an AWS IoT policy from a device certificate**
The following `detach-policy` example detaches the `TemperatureSensorPolicy` policy from a device certificate identified by ARN.

```
aws iot detach-policy \
   --policy-name TemperatureSensorPolicy \
   --target arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

This command produces no output.

- For API details, see [DetachPolicy](https://docs.aws.amazon.com/cli/latest/reference/iot/detach-policy.html) in the *AWS CLI Command Reference*.

---

### `detach-security-profile`

The following code example shows how to use `detach-security-profile`.

**AWS CLI**

**To disassociate a security profile from a target**

The following `detach-security-profile` example removes the association between the AWS IoT Device Defender security profile named `Testprofile` and the all registered things target.

```
aws iot detach-security-profile \
   --security-profile-name Testprofile \
```

This command produces no output.

- For more information, see [Detect Commands](https://docs.aws.amazon.com/iot/latest/developerguide/detect-command-list.html) in the *AWS IoT Developer Guide*.
- For API details, see [DetachSecurityProfile](https://docs.aws.amazon.com/cli/latest/reference/iot/detach-security-profile.html) in the *AWS CLI Command Reference*.

---

### `disable-topic-rule`

The following code example shows how to use `disable-topic-rule`.

**AWS CLI**

**To disable a topic rule**
The following `disable-topic-rule` example disables the specified topic rule.

```bash
aws iot disable-topic-rule \
  --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see [Viewing Your Rules](https://aws.amazon.com/documentation/iot/how-to-view-your-rules/) in the *AWS IoT Developer Guide*.

- For API details, see [DisableTopicRule](https://docs.aws.amazon.com/cli/latest/reference/iot/disable-topic-rule.html) in *AWS CLI Command Reference*.

`enable-topic-rule`

The following code example shows how to use `enable-topic-rule`.

**AWS CLI**

**To enable a topic rule**

The following `enable-topic-rule` example enables (or re-enables) the specified topic rule.

```bash
aws iot enable-topic-rule \
  --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see [Viewing Your Rules](https://aws.amazon.com/documentation/iot/how-to-view-your-rules/) in the *AWS IoT Developer Guide*.

- For API details, see [EnableTopicRule](https://docs.aws.amazon.com/cli/latest/reference/iot/enable-topic-rule.html) in *AWS CLI Command Reference*.

`get-behavior-model-training-summaries`

The following code example shows how to use `get-behavior-model-training-summaries`.

**AWS CLI**

**To list a Device Defender's ML Detect Security Profile training model's status**

The following `get-behavior-model-training-summaries` example lists model training status for the configured behaviors in the chosen Security Profile. For each behavior, the name, model status, and percentage of datapoints collected are listed.
aws iot get-behavior-model-training-summaries \
   --security-profile-name MySecuriyProfileName

Output:

```json
{
   "summaries": [
      {
         "securityProfileName": "MySecuriyProfileName",
         "behaviorName": "Messages_sent_ML_behavior",
         "modelStatus": "PENDING_BUILD",
         "datapointsCollectionPercentage": 0.0
      },
      {
         "securityProfileName": "MySecuriyProfileName",
         "behaviorName": "Messages_received_ML_behavior",
         "modelStatus": "PENDING_BUILD",
         "datapointsCollectionPercentage": 0.0
      },
      {
         "securityProfileName": "MySecuriyProfileName",
         "behaviorName": "Authorization_failures_ML_behavior",
         "modelStatus": "PENDING_BUILD",
         "datapointsCollectionPercentage": 0.0
      },
      {
         "securityProfileName": "MySecuriyProfileName",
         "behaviorName": "Message_size_ML_behavior",
         "modelStatus": "PENDING_BUILD",
         "datapointsCollectionPercentage": 0.0
      },
      {
         "securityProfileName": "MySecuriyProfileName",
         "behaviorName": "Connection_attempts_ML_behavior",
         "modelStatus": "PENDING_BUILD",
         "datapointsCollectionPercentage": 0.0
      },
      {
         "securityProfileName": "MySPNoALerts",
         "behaviorName": "Disconnects_ML_behavior",
         "modelStatus": "PENDING_BUILD",
         "datapointsCollectionPercentage": 0.0
      }
   ]
}```
For more information, see GetBehaviorModelTrainingSummaries (Detect Commands) in the AWS IoT Developer Guide.

- For API details, see GetBehaviorModelTrainingSummaries in AWS CLI Command Reference.

get-cardinality

The following code example shows how to use get-cardinality.

AWS CLI

To return the approximate count of unique values that match the query

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 3 attributes.

```bash
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
Racks=(Rack1 Rack1 Rack2 Rack2 Rack3 Rack4 Rack5 Rack6 Rack6 Rack6)
IsNormal=(true true true true true true false false false false)
for ((i=0; i<10 ; i++))
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
               attributes="\n                 {temperature=${Temperatures[i]},rackId=${Racks[i]},stateNormal=${IsNormal[i]}}\n               "
               )
  aws iot describe-thing --thing-name "TempSensor$i"
done

Example output of the setup script:

{
  "version": 1,
  "thingName": "TempSensor0",
  "defaultClientId": "TempSensor0",
  "attributes": {
    "rackId": "Rack1",
    "stateNormal": "true",
    "temperature": "70"
  }
}
The following get-cardinality example queries the 10 sensors created by the setup script and returns the number of racks that have temperature sensors reporting abnormal temperature values. If the temperature value is below 60 or above 80, the temperature sensor is in an abnormal state.

```bash
aws iot get-cardinality
   --aggregation-field "attributes.rackId"
   --query-string "thingName:TempSensor* AND attributes.stateNormal:false"
```

Output:

```json
{
   "cardinality": 2
}
```

For more information, see Querying for Aggregate Data in the AWS IoT Developer Guide.

- For API details, see GetCardinality in AWS CLI Command Reference.

get-effective-policies

The following code example shows how to use get-effective-policies.

AWS CLI

**To list the policies that effect a thing**

The following get-effective-policies example lists the policies that effect the specified thing, including policies attached to any groups to which it belongs.

```bash
aws iot get-effective-policies
   --thing-name TemperatureSensor-001
   --principal arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba444c45e3448142
```
Output:

{
    "effectivePolicies": [
        {
            "policyName": "TemperatureSensorPolicy",
            "policyDocument": "{ "Version": "2012-10-17", "Statement": [ {
                "Effect": "Allow",
                "Action": [ "iot:Publish", "iot:Receive" ],
            }, {
                "Effect": "Allow",
                "Action": [ "iot:Subscribe" ],
            }, {
                "Effect": "Allow",
                "Action": [ "iot:Connect" ],
            } ] }"}
    ]
}
get-indexing-configuration

The following code example shows how to use get-indexing-configuration.

**AWS CLI**

**To get the thing indexing configuration**

The following `get-indexing-configuration` example gets the current configuration data for AWS IoT fleet indexing.

```
aws iot get-indexing-configuration
```

**Output:**

```
{
    "thingIndexingConfiguration": {
        "thingIndexingMode": "OFF",
        "thingConnectivityIndexingMode": "OFF"
    },
    "thingGroupIndexingConfiguration": {
        "thingGroupIndexingMode": "OFF"
    }
}
```

For more information, see [Managing Thing Indexing](https://docs.aws.amazon.com/iot/latest/developerguide/topic-indexing.html) in the *AWS IoT Developers Guide*.

- For API details, see [GetIndexingConfiguration](https://docs.aws.amazon.com/cli/latest/reference/iot/get-indexing-configuration.html) in *AWS CLI Command Reference*.

get-job-document

The following code example shows how to use get-job-document.
AWS CLI

To retrieve the document for a job

The following get-job-document example displays details about the document for the job whose ID is example-job-01.

```bash
aws iot get-job-document \
  --job-id "example-job-01"
```

Output:

```json
{
  "document": "\n{
    "operation": "customJob",
    "otherInfo": "someValue"
}\n"
}
```

For more information, see [Creating and Managing Jobs (CLI)] in the [AWS IoT Developer Guide].

- For API details, see [GetJobDocument] in [AWS CLI Command Reference].

get-logging-options

The following code example shows how to use get-logging-options.

AWS CLI

To get the logging options

The following get-logging-options example gets the current logging options for your AWS account.

```bash
aws iot get-logging-options
```

Output:

```json
{
  "roleArn": "arn:aws:iam::123456789012:role/service-role/iotLoggingRole",
  "logLevel": "ERROR"
}
```
For more information, see title in the AWS IoT Developer Guide.

- For API details, see GetLoggingOptions in AWS CLI Command Reference.

**get-ota-update**

The following code example shows how to use get-ota-update.

**AWS CLI**

To retrieve information about an OTA Update

The following get-ota-update example displays details about the specified OTA Update.

```bash
aws iot get-ota-update \
    --ota-update-id ota12345
```

**Output:**

```json
{
    "otaUpdateInfo": {
        "otaUpdateId": "ota12345",
        "creationDate": 1557863215.995,
        "lastModifiedDate": 1557863215.995,
        "description": "A critical update needed right away.",
        "targets": [
            "device1",
            "device2",
            "device3",
            "device4"
        ],
        "targetSelection": "SNAPSHOT",
        "protocols": ["HTTP"],
        "awsJobExecutionsRolloutConfig": {
            "maximumPerMinute": 10
        },
        "otaUpdateFiles": [
            {
                "fileName": "firmware.bin",
```
"fileLocation": {
    "stream": {
        "streamId": "004",
        "fileId": 123
    }
},
"codeSigning": {
    "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
}
],
"roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
"otaUpdateStatus": "CREATE_COMPLETE",
"awsIotJobId": "job54321",
"errorInfo": {
}
}
}

For more information, see [GetOTAUpdate](https://docs.aws.amazon.com/iot/latest/developerguide/otaupdate-get.html) in the AWS IoT API Reference.

get-percentiles

The following code example shows how to use get-percentiles.

**AWS CLI**

To group the aggregated values that match the query into percentile groupings

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 1 attribute.

```bash
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
for ((i=0; i<10 ; i++))
  do
    thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
    attributes="{temperature=${Temperatures[i]}}")
    aws iot describe-thing --thing-name "TempSensor$i"
  done
```

Actions and scenarios 3622
Example output of the setup script:

```json
{
    "version": 1,
    "thingName": "TempSensor0",
    "defaultClientId": "TempSensor0",
    "attributes": {
        "temperature": "70"
    },
    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
    "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-percentiles` example queries the 10 sensors created by the setup script and returns a value for each percentile group specified. The percentile group "10" contains the aggregated field value that occurs in approximately 10 percent of the values that match the query. In the following output, {"percent": 10.0, "value": 67.7} means approximately 10.0% of the temperature values are below 67.7.

```
aws iot get-percentiles \
    --aggregation-field "attributes.temperature" \
    --query-string "thingName:TempSensor*" \
    --percents 10 25 50 75 90
```

Output:

```json
{
    "percentiles": [
        {
            "percent": 10.0,
            "value": 67.7
        },
        {
            "percent": 25.0,
            "value": 71.25
        },
        {
            "percent": 50.0,
            "value": 73.5
        }
    ]
}
```
The following code example shows how to use `get-policy`.

**AWS CLI**

**To get information about the default version of a policy**

The following `get-policy` example retrieves information about the default version of the specified policy.

```bash
aws iot get-policy \
    --policy-name UpdateDeviceCertPolicy
```

Output:

```json
{
    "policyName": "UpdateDeviceCertPolicy",
    "defaultVersionId": "2",
    "creationDate": 1559925941.924,
    "lastModifiedDate": 1559925941.924,
    "generationId": "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```
For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

- For API details, see GetPolicy in AWS CLI Command Reference.

get-policy-version

The following code example shows how to use get-policy-version.

AWS CLI

To get information about a specific version of a policy

The following get-policy-version example gets information about the first version of the specified policy.

```bash
aws iot get-policy \
   --policy-name UpdateDeviceCertPolicy \
   --policy-version-id "1"
```

Output:

```
{
   "policyName": "UpdateDeviceCertPolicy",
   "policyVersionId": "1",
   "isDefaultVersion": false,
   "creationDate": 1559925941.924,
   "lastModifiedDate": 1559926175.458,
   "generationId": "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see AWS IoT Policies in the AWS IoT Developers Guide.

- For API details, see GetPolicyVersion in AWS CLI Command Reference.

get-registration-code

The following code example shows how to use get-registration-code.
AWS CLI

To get your AWS account-specific registration code

The following get-registration-code example retrieves your AWS account-specific registration code.

```bash
aws iot get-registration-code
```

Output:

```json
{
   "registrationCode": "15c51ae5e36ba59ba77042df1115862076bea4bd15841c838fcb68d5010a614c"
}
```

For more information, see Use Your Own Certificate in the AWS IoT Developer Guide.

- For API details, see GetRegistrationCode in AWS CLI Command Reference.

get-statistics

The following code example shows how to use get-statistics.

AWS CLI

To search the device index for aggregate data

The following get-statistics example returns the number of things that have a property called connectivity.connected set to false (that is, the number of devices that are not connected) in their device shadow.

```bash
aws iot get-statistics \
   --index-name AWS_Things \
   --query-string "connectivity.connected:false"
```

Output:

```json
{
}
```
For more information, see [Getting Statistics About Your Device Fleet](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetStatistics](#) in *AWS CLI Command Reference*.

### get-topic-rule

The following code example shows how to use `get-topic-rule`.

**AWS CLI**

**To get information about a rule**

The following `get-topic-rule` example gets information about the specified rule.

```
aws iot get-topic-rule \
   --rule-name MyRPiLowMoistureAlertRule
```

**Output:**

```
{
   "rule": {
      "ruleName": "MyRPiLowMoistureAlertRule",
      "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE state.reported.moisture = 'low'\n                   ",
      "description": "Sends an alert whenever soil moisture level readings are too low."
   },
