Introduction: AWS Control Tower Controls Reference Guide

The *AWS Control Tower Controls Reference Guide* accompanies the [AWS Control Tower User Guide](#). It gives information about the controls that are specific to the AWS Control Tower environment.

The *Controls Reference Guide* contains

- A detailed page about each control that can be enabled through AWS Control Tower.
- Extensive reference tables showing the regional availability and the metadata for the controls.
- It explains how to view and enable controls from the AWS Control Tower console and with AWS Control Tower APIs.
- It includes examples of using the AWS CLI and AWS CloudFormation to work with controls.
- The *Controls and compliance* section explains how AWS Control Tower defines compliance and how an administrator can review compliance within the AWS Control Tower environment.

For more information about the AWS Control Tower application programming interface (API), see [The AWS Control Tower API Reference](#).

For information about availability of specific controls across AWS Regions, see [Control limitations](#), and [AWS Region availability for AWS Control Tower controls](#).

About controls in AWS Control Tower

A control is a high-level rule that provides ongoing governance for your overall AWS environment. It's expressed in plain language. AWS Control Tower implements *preventive*, *detective*, and *proactive* controls that help you govern your resources and monitor compliance across groups of AWS accounts.

A control applies to an entire organizational unit (OU), and every AWS account within the OU is affected by the control. Therefore, when users perform work in any AWS account in your landing zone, they're always subject to the controls that are governing their account's OU.

Note

We are transitioning our terminology to align better with industry usage and with other AWS services. During this time, you may see the previous term, *guardrail*, as well as the new term, *control*, in our documentation, console, blogs, and videos. These terms are synonymous for our purposes.

The purpose of controls

Controls assist you to express your policy intentions. For example, if you enable the detective control **Detect Whether Public Read Access to Amazon S3 Buckets is Allowed** on an OU, you can determine whether an entity (such as a user) would be permitted to have read access over the internet to any Amazon S3 buckets, for any accounts under that OU.

Control behavior and guidance

Controls are categorized according to their *behavior* and their *guidance*.

The *behavior* of each control is one of preventive, detective, or proactive. Control *guidance* refers to the recommended practice for how to apply each control to your OUs. The guidance of a control is independent of whether its behavior is preventive, detective, or proactive.

Control behavior

- **Preventive** – A preventive control ensures that your accounts maintain compliance, because it disallows actions that lead to policy violations. The status of a preventive control is either **enforced** or **not enabled**. Preventive controls are supported in all AWS Regions.
- **Detective** – A detective control detects noncompliance of resources within your accounts, such as policy violations, and provides alerts through the dashboard. The status of a detective control is either **clear**, **in violation**, or **not enabled**. Detective controls apply only in those AWS Regions supported by AWS Control Tower.
- **Proactive** – A proactive control scans your resources before they are provisioned, and makes sure that the resources are compliant with that control. Resources that are not compliant will not be provisioned. Proactive controls are implemented by means of AWS CloudFormation hooks, and they apply to resources that would be provisioned by AWS CloudFormation. The status of a proactive control is PASS, FAIL, or SKIP. For more information about AWS CloudFormation hooks, see [Characteristics of hooks](#) in the AWS CloudFormation documentation.

Implementation of control behavior

- The preventive controls are implemented using Service Control Policies (SCPs), which are part of AWS Organizations.
- The detective controls are implemented using AWS Config rules.
- The proactive controls are implemented using AWS CloudFormation hooks.
- Certain mandatory controls are implemented by means of a single SCP that performs multiple actions, rather than as unique SCPs. Therefore, the same SCP is shown in the control reference, under each mandatory control to which that SCP applies.
- The integrated, detective Security Hub controls are implemented using AWS Config rules, similarly to all Security Hub controls. These controls are owned by the **Service-Managed Standard: AWS Control Tower**, which is part of Security Hub.

Control guidance

AWS Control Tower provides three categories of guidance: *mandatory*, *strongly recommended*, and *elective* controls.

- Mandatory controls are always enforced in your landing zone. You cannot turn them off for any OU.

- Strongly recommended controls are designed to enforce some common best practices for well-architected, multi-account environments. These controls apply at the OU level, for all accounts in that OU.
- Elective controls enable you to track or lock down actions that are commonly restricted in an AWS enterprise environment. These controls apply at the OU level, for all accounts in that OU.

Defaults: When you create a new landing zone, AWS Control Tower enables all mandatory controls by default and applies them to your top-level OUs. When you extend governance to an OU, AWS Control Tower applies mandatory controls to the OU by default. Strongly recommended and elective controls are not enabled by default.

Considerations for controls and OUs

When working with controls and OUs, consider the following properties:

Controls, landing zones, and OUs

- After you create your landing zone, all resources in your landing zone are subject to controls. For example, certain controls apply to Amazon S3 buckets.
- OUs created through AWS Control Tower have mandatory controls applied to them automatically. Optional controls are applied at the discretion of administrators.
- OUs created outside of an AWS Control Tower landing zone (such as, *unregistered OUs created in AWS Organizations*) are displayed in the AWS Control Tower console, but AWS Control Tower controls do not apply to those OUs, unless they become registered OUs.
- Regarding nested OUs, preventive controls enabled on any OUs higher in the tree will apply to unregistered OUs in that tree.
- When you enable controls on an organizational unit (OU) that is registered with AWS Control Tower, preventive controls apply to all member accounts under the OU, enrolled and unenrolled. Detective controls apply to enrolled accounts only.

For more information about how controls are applied to nested OUs, in AWS Control Tower, see [Nested Ous and controls](#).

Exception to controls for the management account

The root user and any administrators in the management account can perform work that controls would otherwise deny. This exception is intentional. It prevents the management account from entering into an unusable state. All actions taken within the management account continue to be tracked in the logs contained within the log archive account, for purposes of accountability and auditing.

Considerations for controls and accounts

When working with controls and accounts, consider the following properties:

Controls and accounts

- Accounts created through the Account Factory in AWS Control Tower inherit the controls of the parent OU, and the associated resources are created.
- Accounts created outside of an AWS Control Tower landing zone do not inherit AWS Control Tower controls. These are called *unenrolled* accounts.
- Accounts created outside of AWS Control Tower won't inherit controls in AWS Control Tower until you enroll them. However, these unenrolled accounts *are* displayed in AWS Control Tower.

Accounts inherit controls from an OU upon enrollment in that OU.

- An OU can contain enrolled or unenrolled *member accounts*.
- Controls do not apply to an unenrolled account unless it becomes a member account of a registered AWS Control Tower OU. In that case, preventive controls for the OU will apply to the unenrolled account. Detective controls will not apply.
- When you enable optional controls, AWS Control Tower creates and manages certain additional AWS resources in your accounts. Do not modify or delete resources created by AWS Control Tower. Doing so could result in the controls entering an unknown state. For more information, see [The AWS Control Tower controls library](#).
- When you move an account from one OU to another, the controls from the previous OU are not removed. If you enable any new hook-based control on the destination OU, the old hook-based control is removed from the account, and the new control replaces it. Controls implemented with SCPs and AWS Config rules always must be removed manually when an account changes OUs.

View control details

To view details about an individual control in the console, select the name of the control from the table on the **Controls** page.

To view more details about an individual control in the *AWS Control Tower User Guide*, see [Tables of control metadata](#). For each control, the **API controlIdentifier** for each Region is available, along with the framework and objective. Certain additional information is available only in the console, as described in the next sections.

In each **Control details** page of the console, you can find the following details for each control:

- **Name** – The name of the control.
- **Control objective** – The pre-defined objective that this control helps you enforce. See the [List of control objectives](#).
- **Service** – The AWS service to which this control applies.
- **Control owner** – The AWS service that owns and maintains this control.
- **Behavior** – A control's behavior is set to preventive, detective, or proactive.
- **Implementation** – The underlying implementation method for this control, such as SCP, AWS Config managed rule, or AWS CloudFormation hook.
- **Resource** – The AWS resource that is monitored or affected by this control.
- **Framework** – The industry-standard compliance framework that this control helps to enforce, for example, **NIST 800-53 Rev 5**.
- **Control ID** – A unique identifier assigned to each control. This identifier is part of a classification system for the controls.
- **API controlIdentifier** – This identifier is needed when calling the AWS Control Tower APIs.
- **Guidance** – The guidance is either mandatory, strongly recommended, or elective.
- **Severity** – The relative risk associated with any violation of this control.
- **Release date** – The date the control became available.

The status of the Region deny control is shown as a separate entry.

Other information may appear on the **Control details** page, including these:

- **Description** – A brief description of the control and its function.

- **Remediation message** – Suggestions for what to change if your AWS CloudFormation hook control returns a FAIL status.
- **Remediation samples** – Examples showing configurations that can return a PASS or FAIL result for your AWS CloudFormation hook control.
- **Usage considerations** – Additional information about how to apply this control or about the resources it can affect.
- The **Gherkin** artifact – The Gherkin is a readable specification for the AWS CloudFormation hook controls, showing requirements for tests that cause PASS, FAIL, or SKIP results to be returned.

To view a control artifact

Each control is implemented by one or more artifacts. These artifacts can include a baseline AWS CloudFormation template, a service control policy (SCP) to prevent account-level configuration changes or activity that may create configuration drift, and AWS Config Rules to detect account-level policy violations.

To view a control's artifact, select the **Artifact** tab to view the **Service control policy (SCP)**, **AWS Config rule**, or **AWS CloudFormation policy template** on the **Control details** page.

Resource identifiers for APIs and controls

Each control in AWS Control Tower has a unique identifier for use with the control APIs. A different identifier is given for each Region in which AWS Control Tower operates. The identifier for each control is shown in the **API controlIdentifier** field, on the **Control details** page in the AWS Control Tower console, and in the [Tables of control metadata](#).

Note

This identifier is distinct from the **ControlID** field, which is a classification system for controls.

View the control identifiers for all controls

To view the tables of control metadata, including the `controlIdentifier` ARN for each control and Region, see [Tables of control metadata](#). The tables also include the identifiers for Security Hub controls that are part of the [AWS Security Hub Service-Managed Standard:AWS Control Tower](#).

View control identifiers in the console

To view the control identifiers and other details about AWS Control Tower controls in the console, navigate to the **Control details** page in the AWS Control Tower console. You can find the identifier in the **API controlIdentifier** field.

Example forms of Identifiers

When you look in the AWS Control Tower console, here are examples of identifiers you may see.

- Security Hub example **API controlIdentifier**: `arn:aws:controltower:us-east-1::control/00TDCUSIKIZZ`
- Legacy control example **API controlIdentifier**: `arn:aws:controltower:us-east-1::control/AWS-GR_LOG_GROUP_POLICY`
- Proactive control example **API controlIdentifier**: `arn:aws:controltower:us-east-1::control/EHSOKSSMVFWF`

Older controls (legacy controls) include the name of the control in the ARN, but newer controls have a different identifier, and that is expected.

Old example: `arn:aws:controltower:us-east-1::control/AWS-GR_CLOUDTRAIL_CHANGE_PROHIBITED`

New example: `arn:aws:controltower:us-east-1::control/WTDSMKDKDNLE`

The following list contains the API `controlIdentifier` designations of the (legacy) **Strongly recommended** and **Elective**, *preventive* and *detective*, controls that are owned by AWS Control Tower, including the elective **Data residency** controls. Mandatory controls cannot be deactivated by the control APIs.

Each item in the list that follows serves as a link, which provides more information about these individual (legacy) controls that are owned by AWS Control Tower, as given in [The AWS Control Tower controls library](#).

Designations for legacy Elective controls

Controls that cannot be changed with the AWS Control Tower APIs

The following controls cannot be activated or deactivated by means of the AWS Control Tower APIs. Except for the Region deny control, all of these are mandatory controls. In general, mandatory controls cannot be deactivated. The Region deny control must be changed in the console.

- AWS-GR_REGION_DENY
- AWS-GR_AUDIT_BUCKET_DELETION_PROHIBITED
- AWS-GR_AUDIT_BUCKET_PUBLIC_READ_PROHIBITED
- AWS-GR_AUDIT_BUCKET_PUBLIC_WRITE_PROHIBITED
- AWS-GR_CLOUDTRAIL_CHANGE_PROHIBITED

- AWS-GR_CLOUDTRAIL_CLOUDWATCH_LOGS_ENABLED
- AWS-GR_CLOUDTRAIL_ENABLED
- AWS-GR_CLOUDTRAIL_VALIDATION_ENABLED
- AWS-GR_CLOUDWATCH_EVENTS_CHANGE_PROHIBITED
- AWS-GR_CONFIG_AGGREGATION_AUTHORIZATION_POLICY
- AWS-GR_CONFIG_AGGREGATION_CHANGE_PROHIBITED
- AWS-GR_CONFIG_CHANGE_PROHIBITED
- AWS-GR_CONFIG_ENABLED
- AWS-GR_CONFIG_RULE_CHANGE_PROHIBITED
- AWS-GR_CT_AUDIT_BUCKET_ENCRYPTION_CHANGES_PROHIBITED
- AWS-GR_CT_AUDIT_BUCKET_LIFECYCLE_CONFIGURATION_CHANGES_PROHIBITED
- AWS-GR_CT_AUDIT_BUCKET_LOGGING_CONFIGURATION_CHANGES_PROHIBITED
- AWS-GR_CT_AUDIT_BUCKET_POLICY_CHANGES_PROHIBITED
- AWS-GR_IAM_ROLE_CHANGE_PROHIBITED
- AWS-GR_LAMBDA_CHANGE_PROHIBITED
- AWS-GR_LOG_GROUP_POLICY
- AWS-GR_SNS_CHANGE_PROHIBITED
- AWS-GR_SNS_SUBSCRIPTION_CHANGE_PROHIBITED
- AWS-GR_ENSURE_CLOUDTRAIL_ENABLED_ON_SHARED_ACCOUNTS

Find identifiers for OUs

For more information about how to find the resource identifier for an OU and its resources, see [Resource types defined by AWS Organizations](#).

To learn more about how to get information from an OU, see [the AWS Organizations API Reference](#).

Note

The control **State** and status information is available in the console only. It is not available from the public API. To view the status of a control, navigate to the **Control details** page in the AWS Control Tower console.

Control API examples

Each control in AWS Control Tower has a unique identifier for use with the control APIs. The identifier for each control is shown in the **API controlIdentifier** field, on the **Control details** page in the AWS Control Tower console. This identifier is distinct from the **ControlID** field, which is a classification system for controls.

Note

When you invoke `EnableControl` on an account or OU, the `operationIdentifier` value is returned by means of `ListEnabledControls` or `GetEnabledControl` even if the enable operation fails. In the AWS Control Tower console, you can determine whether the `EnableControl` operation was successful, by verifying that the control is enabled on the account or OU. Programmatically, you can track the status of the `EnableControl` operation with the `GetControlOperation` API command, by passing it the value of `operationIdentifier` as shown in an example that follows.

EnableControl

For more information about this API operation, see [EnableControl](#).

Example input for EnableControl:

This example shows how to specify the control you wish to enable, and activate that control for the target OU that you identify.

```
{
  controlIdentifier: "arn:aws:controltower:us-west-2::control/AWS-
GR_AUTOSCALING_LAUNCH_CONFIG_PUBLIC_IP_DISABLED",
  targetIdentifier: "arn:aws:organizations::123456789123:ou/o-kg8aXXXXXX/ou-prlj-
a5kXXXXX"
}
```

Example output for EnableControl:

As an example of how to use this output parameter, you can pass the **operationIdentifier** parameter as an input to the **GetControlOperation** API, to track the status of your **EnableControl** task.

```
{
  "operationIdentifier": "e2bXXXXX-6cab-XXXX-bde7-XX0c6fXXXXXX"
}
```

Example CLI command:

```
aws controltower enable-control \
--control-identifier arn:aws:controltower:us-west-2::control/AWS-
GR_AUDIT_BUCKET_POLICY_CHANGES_PROHIBITED \
--target-identifier arn:aws:organizations::123456789123:ou/o-qnilXXXXXX/ou-vwxu-
qq1XXXXX \
--region us-west-2
```

DisableControl

For more information about this API operation, see [DisableControl](#).

Example input for DisableControl:

```
{
  controlIdentifier: "arn:aws:controltower:us-west-2::control/AWS-
GR_AUTOSCALING_LAUNCH_CONFIG_PUBLIC_IP_DISABLED",
  targetIdentifier: "arn:aws:organizations::123456789123:ou/o-kg8aXXXXXX/ou-prlj-
a5kXXXXX"
}
```

Example output for DisableControl:

```
{
  "operationIdentifier": "e2bXXXXX-8xai-XXXX-bde7-XX0c6fXXXXXX"
}
```

GetControlOperation

For more information about this API operation, see [GetControlOperation](#).

Example input for GetControlOperation:

When you give an **operationIdentifier** as input, you receive a status message as output.

```
{
  operationIdentifier: "e2bXXXXX-6cab-XXXX-bde7-XX0c6fXXXXXX"
}
```

Example output for GetControlOperation:

```
{
  "ControlOperationStatus": {
    "OperationType": "ENABLE_CONTROL",
    "StartTime": "2022-02-02T20:52:08.034Z",
    "Status": "IN_PROGRESS"
  }
}
```

Example output for GetControlOperation:

```
{
  "ControlOperationStatus": {
    "EndTime": "2022-04-28T19:36:31Z",
    "OperationType": "DISABLE_CONTROL",
    "StartTime": "2022-04-28T19:35:00Z",
    "Status": "SUCCEEDED"
  }
}
```

```
{
  "ControlOperationStatus": {
    "EndTime": "2022-04-28T19:36:31Z",
    "OperationType": "DISABLE_CONTROL",
    "StartTime": "2022-04-28T19:35:00Z",
    "Status": "FAILED",
    "StatusMessage": "AWS Control Tower cannot add the SCP because the IAM user or role does not have permission to perform the requested operation in AWS Organizations. To continue, update your access permissions for AWS Organizations. For more information, see Access Management in the IAM User Guide."
  }
}
```

GetEnabledControl

For more information about this API operation, see [GetEnabledControl](#).

Example for GetEnabledControl

```
aws controltower get-enabled-control --enabled-control-identifier
arn:aws:controltower:us-east-1:123456789012:enabledcontrol/49DVF3KP34ANNC57{
  "enabledControlDetails": {
    "arn": "arn:aws:controltower:us-
east-1:123456789012:enabledcontrol/49DVF3KP34ANNC57",
    "controlIdentifier": "arn:aws:controltower:us-east-1::control/AWS-
GR_EBS_OPTIMIZED_INSTANCE",
    "targetIdentifier": "arn:aws:organizations::123456789012:ou/o-ct7amcilen/ou-

    "targetRegions": [
      {
        "name": "eu-north-1"
      },
      {
        "name": "eu-west-2"
      }
    ],
    "statusSummary": {
      "status": "SUCCEEDED",
      "lastOperationIdentifier": "12e51344-a73a-439a-8477-fb3cd7f8b410"
    },
    "driftStatusSummary": {
      "driftStatus": "NOT_CHECKING"
    }
  }
}
```

ListEnabledControls

For more information about this API operation, see [ListEnabledControls](#).

Example input for ListEnabledControls:

This example shows how to specify the target OU as input, so you can receive a list of controls as output.

```
{
  targetIdentifier: "arn:aws:organizations::123456789123:ou/o-kg8aXXXXXX/ou-prlj-
a5kXXXXX",
  nextToken: "bde7-XX0c6fXXXXXX",
}
```

```
maxResults: 2
}
```

Example output for ListEnabledControls:

```
{
  "enabledControls": [
    {
      "controlIdentifier": "arn:aws:controltower:us-west-2::control/AWS-
GR_AUTOSCALING_LAUNCH_CONFIG_PUBLIC_IP_DISABLED"
    },
    {
      "controlIdentifier": "arn:aws:controltower:us-west-2::control/AWS-
GR_RESTRICT_ROOT_USER"
    }
  ],
  "nextToken": "e2bXXXXX-6cab-XXXX"
}
```

This example shows a larger set of returned values for ListEnabledControls.

```

Example for UntagResource

```
aws controltower untag-resource --resource-arn "arn:aws:controltower:us-east-1:123456789012:enabledcontrol/49DVF3KP34ANNC57" --tag-keys "TestTagKey"
{
}
```

UpdateEnabledControl

For more information about this API operation, see [UpdateEnabledControl](#).

Change the parameters of a control:

```
aws controltower update-enabled-control \
  --enabled-control-identifier arn:aws:controltower:us-east-1:01234567890:enabledcontrol/EXAMPLE_NAME \
  --parameters '[{"key":"AllowedRegions","value":["us-east-1","us-west-1","us-west-2","us-east-2"]}, {"key":"ExemptedPrincipalArns","value":["arn:aws:iam:*:role/ReadOnly","arn:aws:sts:*:assumed-role/ReadOnly/*"]}, {"key":"ExemptedActions","value":["logs:DescribeLogGroups","logs:StartQuery","logs:GetQueryResults","cloudwatch:Get*","cloudwatc
```

Here's a more readable version of parameters input:

```
[
  {
```

```
    "key": "AllowedRegions",
    "value":
      [
        "us-east-1",
        "us-west-1",
        "us-west-2",
        "us-east-2"
      ]
  },
  {
    "key": "ExemptedPrincipalArns",
    "value":
      [
        "arn:aws:iam::*:role/ReadOnly",
        "arn:aws:sts::*:assumed-role/ReadOnly/*"
      ]
  },
  {
    "key": "ExemptedActions",
    "value":
      [
        "logs:DescribeLogGroups",
        "logs:StartQuery",
        "logs:GetQueryResults",
        "cloudwatch:Get*",
        "cloudwatch:Describe*"
      ]
  }
]
```

View parameters

You can view the existing parameters for a control with the `GetEnabledControl` API call.

Example input:

```
aws controltower get-enabled-control --enabled-control-identifier
arn:aws:controltower:us-east-1:01234567890:enabledcontrol/EXAMPLE_NAME \
```

Example output:

```
{
```

```
"enabledControlDetails": {
  "arn": "arn:aws:controltower:us-east-1:01234567890:enabledcontrol/
EXAMPLE_NAME",
  "controlIdentifier": "arn:aws:controltower:us-east-1::control/EXAMPLE_NAME",
  "targetIdentifier": "arn:aws:organizations::01234567890:ou/o-EXAMPLE/ou-zzxx-

        "logs:GetQueryResults"
      ]
    }
  ]
}
}
```

Enable controls with AWS CloudFormation

You can enable controls with AWS CloudFormation, either through the AWS CloudFormation console, or through the AWS CLI. This section gives an example of each type.

Each control in AWS Control Tower has a unique identifier for use with the control APIs. The identifier for each control is shown in the **API controlIdentifier** field, on the **Control details** page

in the AWS Control Tower console. This identifier is distinct from the **ControlID** field, which is a classification system for controls.

Create the stack through AWS CloudFormation

You can use AWS CloudFormation to help you enable AWS Control Tower controls. Here's an example template.

```
Resources:
  TestControl:
    Type: AWS::ControlTower::EnabledControl
    Properties:
      ControlIdentifier: arn:aws:controltower:us-west-2::control/AWS-
GR_RESTRICT_ROOT_USER
      TargetIdentifier: arn:aws:organizations::123456789012:ou/o-ybfpt9XXX1/ou-
XXXc-nlqXXXXX
```

To create your stack through the AWS CloudFormation console, edit the template to contain the control and target of your choice, then save the template with the file name `template.yaml`. Follow the AWS CloudFormation wizard. When the wizard asks for a template file, enter the file you saved as `template.yaml`. For more information, see [Creating a stack on the Amazon CloudFormation console](#).

Note

The limit for `EnableControl` and `DisableControl` updates in AWS Control Tower is 10 concurrent operations.

Create the stack through AWS CloudFormation and the AWS CLI

Here's an example of creating the stack with the CLI.

```
aws cloudformation create-stack --region us-west-2 --stack-name testControlTower --
template-body "$(cat << TEMPLATE
Resources:
  TestControl:
    Type: AWS::ControlTower::EnabledControl
    Properties:
```

```
ControlIdentifier: arn:aws:controltower:us-west-2::control/AWS-GR_RESTRICT_ROOT_USER
  TargetIdentifier: arn:aws:organizations::123456789012:ou/o-ybfpt9XXX1/ou-XXXc-nlqXXXXX
  TEMPLATE)"
```

You can also save the example template as a `template.yaml` file, then upload your file to an Amazon S3 bucket. Later, you can provide the URL for the bucket with the `--template-url` flag.

When you enter your template into the wizard or through the CLI, if the stack is created, it means that the control was enabled.

View the progress of your stack through the AWS CLI:

```
aws cloudformation describe-stack-events --region us-west-2 --stack-name
testControlTower
```

or

```
aws cloudformation describe-stacks --region us-west-2 --stack-name testControlTower
```

Delete the stack through the AWS CLI:

```
aws cloudformation delete-stack --region us-west-2 --stack-name testControlTower
```

Configure controls with AWS CloudFormation

The following examples show how to configure controls through AWS CloudFormation templates. These examples happen to show **Value** as a list, but it can be any of several types.

Enable configurable controls with AWS CloudFormation templates

Enable a control with parameters through AWS CloudFormation:

```
aws cloudformation create-stack \
  --stack-name ExampleStack \
  --template-body file://ExampleStack.yml \
  --region us-east-1
```

Example templates in YAML and JSON:

```

Enable controls on an OU from the console

Mandatory and inherited controls are enabled automatically according to an OU's configuration. Optional controls can be enabled manually on your OUs, from the console, or by means of the [control APIs](#). The following procedure describes the steps for enabling controls on an OU, from the console.

Important

When you enable optional controls, AWS Control Tower creates and manages AWS resources in your accounts. Do not modify or delete resources created by AWS Control Tower. Doing so could result in the controls entering an unknown state.

To enable controls in an OU, from the console

1. Using a web browser, navigate to the AWS Control Tower console at <https://console.aws.amazon.com/controltower>.
2. From the left navigation, choose **All Controls**.
3. Choose a control that you want to enable; for example, **Control: Detect Whether Encryption is Enabled for Amazon EBS Volumes Attached to Amazon EC2 Instances**. This choice opens the control's details page.

4. From **Organizational units enabled**, choose **Enable control on OU**.
5. A new page is displayed that lists the names of your OUs. Identify the OU on which you want to enable this control.
6. Choose **Enable control on OU**.
7. Your control is now enabled. It may take several minutes for the change to complete. When it does, you'll see that this control is applied to the OU you selected.

 **Note**

You can enable preventive and detective controls concurrently.

To deactivate controls for an OU, from the console

1. Using a web browser, navigate to the AWS Control Tower console at <https://console.aws.amazon.com/controltower>.
2. From the left navigation, choose **Controls**.
3. Choose a control that you want to deactivate; for example, **Control: Detect Whether Encryption is Enabled for Amazon EBS Volumes Attached to Amazon EC2 Instances**. This choice opens the control's details page.
4. From the **Organizational units enabled** tab, select the radio button next to the OU from which you want to remove the control.
5. Choose **Disable control** at the upper right.
6. Your control is now deactivated. It may take several minutes for the change to complete. When it does, you'll see that this control is no longer applied to the OU you selected.

 **Note**

The **OU Region deny** control is a specialized control with parameters. For steps on how to enable that control, see [Region deny control applied to the OU](#).

Concurrent deployment for optional controls

When applying optional controls, you can deploy more than one control at a time. For example, you can enable **Detect Whether MFA for the Root User is Enabled** and **Detect Whether Public Write Access to Amazon S3 Buckets is Allowed**, at the same time.

You can apply and remove multiple optional controls without waiting for individual control operations to complete, and up to 25 control operations are queued. The only restricted times are when AWS Control Tower is in the process of landing zone setup, or while extending governance to a new organization.

Functionality available in the console and with APIs

- Apply and remove different detective controls on the same OU, concurrently.
- Apply and remove different detective controls on different OUs, concurrently.
- Apply and remove the same detective control on multiple OUs, concurrently.
- Apply and remove different preventive controls on the same OU, concurrently.
- Apply and remove different preventive controls on different OUs, concurrently.
- Apply and remove the same preventive control on multiple OUs, concurrently.
- Apply and remove different proactive controls on the same OU, concurrently.
- Apply and remove different proactive controls on different OUs, concurrently.
- Apply and remove the same proactive control on multiple OUs, concurrently.
- You can apply and remove preventive, detective, and proactive controls, concurrently.

When you apply preventive controls to nested OUs, the preventive controls affect all accounts and OUs nested under the target OU, even if those accounts and OUs are not registered with AWS Control Tower. Preventive controls are implemented using Service Control Policies (SCPs), which are part of AWS Organizations. Detective controls are implemented using AWS Config rules. Proactive controls are implemented using CloudFormation hooks.

Controls remain in effect for the entire OU, as you create new accounts or make changes to your existing accounts, and AWS Control Tower provides a summary report of how each account conforms to your enabled controls. For a full list of available controls, see [The AWS Control Tower controls library](#).

Note

Certain controls cannot be enabled on the **Security OU** because they may restrict the ability of AWS Control Tower to function properly. You may see an error message in the console if you try to enable any of these controls.

The AWS Control Tower controls library

The following sections include an individual reference entry for each of the controls available in AWS Control Tower. The controls are grouped into sections according to common characteristics. In the AWS Control Tower console you may see similar items as **Categories**: Objectives, Frameworks, Services, and Groups. Each control reference entry includes the details, artifacts, additional information, and considerations to keep in mind when enabling a specific control on a OU in your landing zone.

For summary tables of control information, including **Frameworks**, see [Tables of control metadata](#). Additional detail is available in the AWS Control Tower console.

Note

The four mandatory controls with "Sid": "GRCLOUDTRAIENABLED" are identical by design. The sample code is correct.

List of control objectives

Each control enforces one of these objectives. Sometimes controls must be applied in a group so that the control objective is enforced. Information about related controls is viewable in the AWS Control Tower console, on the **Control details** page.

Control objectives

For more information about controls and their associated control objectives, see [Tables of control metadata](#).

- **CO.1** Establish logging and monitoring
- **CO.2** Encrypt data at rest
- **CO.3** Encrypt data in transit
- **CO.4** Protect data integrity
- **CO.5** Enforce least privilege
- **CO.6** Limit network access
- **CO.7** Optimize costs
- **CO.8** Improve resiliency
- **CO.9** Improve availability
- **CO.10** Protect configurations
- **CO.11** Prepare for incident response
- **CO.12** Manage vulnerabilities
- **CO.13** Manage secrets
- **CO.14** Prepare for disaster recovery
- **CO.15** Use strong authentication

Mandatory controls

Mandatory controls are owned by AWS Control Tower, and they apply to every OU on your landing zone. These controls are applied by default when you set up your landing zone, and they can't be deactivated. Following, you'll find a reference for each of the mandatory controls available in AWS Control Tower.

Disallow Changes to Encryption Configuration for AWS Control Tower Created Amazon S3 Buckets in Log Archive

This control prevents changes to encryption for the Amazon S3 buckets that AWS Control Tower creates in the log archive account. This is a preventive control with mandatory guidance. By default, this control is enabled on the Security OU. It cannot be enabled on additional OUs.

The artifact for this control is the following service control policy (SCP).

```
{
  "Version": "2012-10-17",
  "Statement": [

    }
  ]
}

```

Disallow Changes to Amazon CloudWatch Logs Log Groups set up by AWS Control Tower

This control prevents changes to the retention policy for Amazon CloudWatch Logs log groups that AWS Control Tower created in the log archive account when you set up your landing zone. It also prevents modifying the log retention policy in customer accounts. This is a preventive control with mandatory guidance. By default, this control is enabled on all OUs.

The artifact for this control is the following SCP.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRLOGGROUPOPOLICY",

          ]
        }
      }
    }
  ]
}
```

Disallow Deletion of AWS Config Aggregation Authorizations Created by AWS Control Tower

This control prevents deletion of AWS Config aggregation authorizations that AWS Control Tower created in the audit account when you set up your landing zone. This is a preventive control with mandatory guidance. By default, this control is enabled on all OUs.

The artifact for this control is the following SCP.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {

```

Disallow Deletion of Log Archive

This control prevents deletion of Amazon S3 buckets created by AWS Control Tower in the log archive account. This is a preventive control with mandatory guidance. By default, this control is enabled on the **Security** OU.

The artifact for this control is the following SCP.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {

    }
  }
}
]
}

```

Detect Public Read Access Setting for Log Archive

This control detects whether public read access is enabled to the Amazon S3 buckets in the log archive shared account. This control does not change the status of the account. This is a detective control with mandatory guidance. By default, this control is enabled on the **Security** OU.

The artifact for this control is the following AWS Config rule.

```

AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check that your S3 buckets do not allow
public access
Parameters:
  ConfigRuleName:

```

Detect Public Write Access Setting for Log Archive

This control detects whether public write access is enabled to the Amazon S3 buckets in the log archive shared account. This control does not change the status of the account. This is a detective control with mandatory guidance. By default, this control is enabled on the **Security OU**.

The artifact for this control is the following AWS Config rule.

```

AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check that your S3 buckets do not allow
public access
Parameters:

```

Disallow Configuration Changes to CloudTrail

This control prevents configuration changes to CloudTrail in your landing zone. This is a preventive control with mandatory guidance. By default, this control is enabled on all OUs.

The artifact for this control is the following SCP.

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRCLOUDTRAIENABLED",
      "Effect": "Deny",

      }
    }
  }
]
}

```

Integrate CloudTrail Events with Amazon CloudWatch Logs

This control performs real-time analysis of activity data by sending CloudTrail events to CloudWatch Logs log files. This is a preventive control with mandatory guidance. By default, this control is enabled on all OUs.

The artifact for this control is the following SCP.

```

{
  "Version": "2012-10-17",

Enable CloudTrail in All Available Regions

This control enables CloudTrail in all available AWS Regions. This is a preventive control with mandatory guidance. By default, this control is enabled in all OUs.

The artifact for this control is the following SCP.

Enable Integrity Validation for CloudTrail Log File

This control enables integrity validation for the CloudTrail log file in all accounts and OUs. It protects the integrity of account activity logs using CloudTrail log file validation, which creates a digitally signed digest file that contains a hash of each log that CloudTrail writes to Amazon S3. This is a preventive control with mandatory guidance. By default, this control is enabled in all OUs.

The artifact for this control is the following SCP.

```

Disallow Changes to Amazon CloudWatch Set Up by AWS Control Tower

This control disallows changes to Amazon CloudWatch; as it was configured by AWS Control Tower when you set up your landing zone. This is a preventive control with mandatory guidance. By default, this control is enabled in all OUs.

The artifact for this control is the following SCP.

```

Disallow Changes to Tags Created by AWS Control Tower for AWS Config Resources

This control prevents changes to the tags that AWS Control Tower created when you set up your landing zone, for AWS Config resources that collect configuration and compliance data. It denies any `TagResource` and `UntagResource` operation for aggregation authorizations tagged by AWS Control Tower. This is a preventive control with mandatory guidance. By default, this control is enabled in all OUs.

The artifact for this control is the following SCP.

```

{

```

Disallow Configuration Changes to AWS Config

This control prevents configuration changes to AWS Config. It ensures that AWS Config records resource configurations in a consistent manner by disallowing AWS Config settings changes. This is a preventive control with mandatory guidance. By default, this control is enabled in all OUs.

The artifact for this control is the following SCP.

```
{

Disallow Changes to AWS Config Rules Set Up by AWS Control Tower

This control disallows changes to AWS Config Rules that were implemented by AWS Control Tower when the landing zone was set up. This is a preventive control with mandatory guidance. By default, this control is enabled in all OUs.

The artifact for this control is the following SCP.

```

Disallow Changes to AWS IAM Roles Set Up by AWS Control Tower and AWS CloudFormation

This control disallows changes to the AWS IAM roles that AWS Control Tower created when the landing zone was set up. This is a preventive control with mandatory guidance. By default, this control is enabled in all OUs.

Control update

An updated version has been released for the mandatory control `AWS-GR_IAM_ROLE_CHANGE_PROHIBITED`.

This change to the control is required because accounts in OUs that are being enrolled into AWS Control Tower must have the `AWSControlTowerExecution` role enabled. The previous version of the control prevents this role from being created.

AWS Control Tower updated the existing control to add an exception so that AWS CloudFormation StackSets can create the `AWSControlTowerExecution` role. As a second measure, this new control protects the StackSets role to prevent principals in the child account from gaining access.

The new control version performs the following actions, in addition to all actions provided in the previous version:

- Allows the `stacksets-exec-*` role (owned by AWS CloudFormation) to perform actions on IAM roles that were created by AWS Control Tower.

- Prevents changes to any IAM role in child accounts, where the IAM role name matches the pattern `stacksets-exec-*`.

The update to the control version affects your OUs and accounts as follows:

- If you extend governance to an OU, that incoming OU receives the updated version of the control as part of the registration process. You do not need to update your landing zone to get the latest version for this OU. AWS Control Tower applies the latest version automatically to OUs that register.
- If you update or repair your landing zone at any time after this release, your control will be updated to this version for future provisioning.
- OUs created in or registered with AWS Control Tower before this release date, and which are part of a landing zone that has not been repaired or updated after the release date, will continue to operate with the old version of the control, which blocks the creation of the `AWSControlTowerExecution` role.
- One consequence of this control update is that your OUs can be functioning with different versions of the control. Update your landing zone to apply the updated version of the control to your OUs uniformly.

The artifact of the updated control is the following SCP.

Disallow Changes to Amazon SNS Subscriptions Set Up by AWS Control Tower

This control disallows changes to Amazon SNS subscriptions set up by AWS Control Tower. It protects the integrity of Amazon SNS subscriptions settings for your landing zone, to trigger

notifications for AWS Config Rules compliance changes. This is a preventive control with mandatory guidance. By default, this control is enabled in all OUs.

Detect whether shared accounts under the Security organizational unit have AWS CloudTrail or CloudTrail Lake enabled

This control detects whether shared accounts under the Security organizational unit have AWS CloudTrail or CloudTrail Lake enabled. The rule is NON_COMPLIANT if either CloudTrail or CloudTrail Lake is not enabled in a shared account. This is a detective control with mandatory guidance. By default, this control is enabled on the Security OU.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to detect whether an account has AWS CloudTrail or CloudTrail Lake enabled.

Proactive controls

Proactive controls are *optional controls* implemented with [AWS CloudFormation hooks](#). Proactive controls fall into four main **Categories**.

These controls are referred to as *proactive* because they check your resources – before the resources are deployed – to determine whether the new resources will comply with the controls that are activated in your environment.

In the AWS Control Tower console, you can view the controls in groups according to their assigned categories, which are:

- **Control objectives:** Specific purposes for implementing controls in your environment.
- **Frameworks:** Industry-standard compliance frameworks.
- **Services:** The AWS services that the control may govern.
- **Groups:** Groups of controls designed to help you meet a specific policy standard.

In this reference guide, the proactive controls are categorized according to their associated AWS services.

Note

You must apply an elective, SCP-based control with the identifier **CT.CLOUDFORMATION.PR.1** before you can activate proactive controls on an OU. See [CT.CLOUDFORMATION.PR.1](#). If this SCP is not activated, you'll see an error message directing you to enable this control as a prerequisite, or showing it as a dependency for other proactive controls.

Behavior of proactive controls

Proactive controls check resources whenever those resources are created or updated by means of AWS CloudFormation stack operations. Specifically, these proactive controls are implemented as `preCreate` and `preUpdate` AWS CloudFormation hook handlers. As a consequence, these controls may not affect requests that are made directly to services through the AWS console, through AWS APIs, or through other means such as AWS SDKs, or other Infrastructure-as-Code (IaC) tools. For more information about when `preCreate` and `preUpdate` hooks operate, see [AWS CloudFormation hooks](#).

Note

Proactive controls evaluate strings passed into the AWS CloudFormation hook within the `targetNames` property. Secure strings and secrets are not resolved before they are sent to the hook, which prevents the proactive control from evaluating the string. For more information about how the `targetNames` are passed to hooks, see [AWS CloudFormation Hooks structure overview](#).

When you follow an example template to set up a test for a proactive control in your environment, be aware that the template is created to test one specific control only. Other controls may not receive a PASS rating for that template. This behavior is expected. We recommend that you test proactive controls individually before you enable them in your environment.

Note

It is important to know that some proactive controls in AWS Control Tower do not operate in certain AWS Regions where AWS Control Tower is available, because those Regions do not support the required underlying functionality for AWS CloudFormation hooks. As a

result, when you deploy a proactive control through AWS Control Tower, the control may not be operating in all Regions that you govern with AWS Control Tower. You can view the Regions for each proactive control in the AWS Control Tower console.

[CT.APIGATEWAY.PR.1] Require an Amazon API Gateway REST and WebSocket API to have logging activated

This control checks whether all methods in Amazon API Gateway stage have execution logging configured.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ApiGateway::Stage
- **AWS CloudFormation guard rule:** [CT.APIGATEWAY.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.APIGATEWAY.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.APIGATEWAY.PR.1 example templates](#)

Explanation

Amazon API Gateway REST or WebSocket API stages should have relevant logs enabled. API Gateway REST and WebSocket API execution logging provides detailed records of requests made to API Gateway REST and WebSocket API stages. The stages include API integration backend responses, Lambda authorizer responses, and the `requestId` for AWS integration endpoints.

Usage considerations

- This control requires Amazon API Gateway stages to configure execution logging for all methods and resources (`HttpMethod` of `*` and `ResourcePath` of `/*`).

Remediation for rule failure

Configure execution logging on Amazon API Gateway stages with a `MethodSetting` that sets `LogLevel` to `ERROR` or `INFO` for all methods (`HttpMethod` of `*` and `ResourcePath` of `/*`). Ensure that you do not set `LogLevel` to `OFF` for any method setting.

The examples that follow show how to implement this remediation.

Amazon API Gateway Stage - Example

[CT.APIGATEWAY.PR.2] Require an Amazon API Gateway REST API stage to have AWS X-Ray tracing activated

This control ensures that AWS X-Ray tracing is enabled on Amazon API Gateway REST APIs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ApiGateway::Stage
- **AWS CloudFormation guard rule:** [CT.APIGATEWAY.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.APIGATEWAY.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.APIGATEWAY.PR.2 example templates](#)

Explanation

AWS X-Ray active tracing enables a more rapid response to performance changes in the underlying infrastructure. Changes in performance could result in a lack of availability of the API. X-Ray active tracing provides real-time metrics of user requests that flow through your API Gateway REST API operations and connected services.

Remediation for rule failure

Set TracingEnabled to true.

The examples that follow show how to implement this remediation.

Amazon API Gateway Stage - Example

        "DeploymentId": {
            "Ref": "Deployment"
        }
    }
}

```

[CT.APIGATEWAY.PR.3] Require that an Amazon API Gateway REST API stage has encryption at rest configured for cache data

This control checks whether an Amazon API Gateway REST API stage that has caching enabled also encrypts the caches.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ApiGateway::Stage
- **AWS CloudFormation guard rule:** [CT.APIGATEWAY.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.APIGATEWAY.PR.3 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.APIGATEWAY.PR.3 example templates](#)

Explanation

Encrypting data at rest reduces the risk that data stored on disk may be accessible by a user not authenticated to AWS. It adds another set of access controls to limit unauthorized users' ability to obtain the data. For example, API permissions are required to decrypt the data before it can be read.

For an added layer of security, API Gateway REST API caches should be encrypted at rest.

Usage considerations

- This control applies only to API Gateway stage resources with cache clustering enabled.
- Where cache clustering is enabled, this control requires cache encryption to be enabled for all resources and methods by specifying a `MethodSetting` entry with an `HttpMethod` of `*` and `ResourcePath` of `/*`.

Remediation for rule failure

Configure encryption on API Gateway caches with a `MethodSetting` that sets `CacheDataEncrypted` to `true` for all methods (`HttpMethod` of `*` and `ResourcePath` of `/*`). Ensure that you do not set `CacheDataEncrypted` to `false` for any method setting.

The examples that follow show how to implement this remediation.

API Gateway stage examples

This example shows the API Gateway stage configured to encrypt cache data for all methods (`HttpMethod` of `*` and `ResourcePath` of `/*`). The example is shown in JSON and in YAML.

[CT.APIGATEWAY.PR.4] Require an Amazon API Gateway V2 stage to have access logging activated

This control checks whether Amazon API Gateway V2 stages have access logging enabled. Access logging is supported for HTTP and WebSocket APIs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ApiGatewayV2::Stage
- **AWS CloudFormation guard rule:** [CT.APIGATEWAY.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.APIGATEWAY.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.APIGATEWAY.PR.4 example templates](#)

Explanation

Access logging allows you to log who has called your API and how the caller gained access to the API. You can create your own log group or choose an existing log group that could be managed by API Gateway.

Remediation for rule failure

Provide an `AccessLogSettings` configuration, setting `DestinationArn` to the ARN of an Amazon CloudWatch log group and `Format` to a single line log format configuration.

The examples that follow show how to implement this remediation.

Amazon API Gateway HTTP API Stage - Example

Amazon API Gateway HTTP API stage configured to send API access logs to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

JSON example

```
{
  "HttpApiStage": {
    "Type": "AWS::ApiGatewayV2::Stage",
    "Properties": {
      "StageName": "SampleStage",
      "Description": "Sample Stage",
      "ApiId": {
        "Ref": "HttpApi"
      },
      "AccessLogSettings": {
        "DestinationArn": {
          "Fn::GetAtt": [
            "LogGroup",
            "Arn"
          ]
        }
      }
    }
  },
}
```

```

        "Format": "{\\"requestId\\":\\"$context.requestId\\", \\"ip\\":
  \\"$context.identity.sourceIp\\", \\"user\\":\\"$context.identity.user\\",\\"requestTime\\":
  \\"$context.requestTime\\"}"
      }
    }
  }
}

```

YAML example

```

HttpApiStage:
  Type: AWS::ApiGatewayV2::Stage
  Properties:
    StageName: SampleStage
    Description: Sample Stage
    ApiId: !Ref 'HttpApi'
    AccessLogSettings:

[CT.APIGATEWAY.PR.5] Require Amazon API Gateway V2 Websocket and HTTP routes to specify an authorization type

This control checks whether Amazon API Gateway V2 API routes have an authorization type set.

- **Control objective:** Use strong authentication
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ApiGatewayV2::Route, AWS::ApiGatewayV2::ApiGatewayManagedOverrides
- **AWS CloudFormation guard rule:** [CT.APIGATEWAY.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.APIGATEWAY.PR.5 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.APIGATEWAY.PR.5 example templates](#)

Explanation

API Gateway supports multiple mechanisms for controlling and managing access to your Websocket or HTTP API. By specifying an authorization type, you can restrict access to your API, to allow only required users or processes.

Usage considerations

- This control applies only to routes created by means of the `AWS::ApiGatewayV2::Route` resource, and to managed overrides that apply to HTTP API routes that are created through quick create.
- This control does not evaluate HTTP API routes imported using the `Body` or `BodyS3Location` properties of `AWS::ApiGatewayV2::API` resources.

Remediation for rule failure

For Amazon API Gateway V2 routes, set `AuthorizationType` to `AWS_IAM`, `JWT` or `CUSTOM`. For Amazon API Gateway V2 managed route overrides with `AuthorizationType`, set `AuthorizationType` to `AWS_IAM`, `JWT` or `CUSTOM`.

The examples that follow show how to implement this remediation.

Amazon API Gateway V2 Route - Example

Amazon API Gateway V2 route configured with AWS IAM authorization. The example is shown in JSON and in YAML.

JSON example

```
{  
  "ApiGatewayV2Route": {
```

```

    "Type": "AWS::ApiGatewayV2::Route",
    "Properties": {
      "ApiId": {
        "Ref": "WebsocketApi"
      },
      "RouteKey": "$connect",
      "AuthorizationType": "AWS_IAM"
    }
  }
}

```

YAML example

```

ApiGatewayV2Route:
  Type: AWS::ApiGatewayV2::Route
  Properties:
    ApiId: !Ref 'WebsocketApi'
    RouteKey: $connect
    AuthorizationType: AWS_IAM

```

The examples that follow show how to implement this remediation.

Amazon API Gateway V2 Managed Overrides - Example

Amazon API Gateway V2 managed overrides configured with AWS IAM authorization. The example is shown in JSON and in YAML.

JSON example

```

{
  "ApiGatewayManagedOverride": {
    "Type": "AWS::ApiGatewayV2::ApiGatewayManagedOverrides",
    "Properties": {
      "ApiId": {
        "Ref": "HttpApi"

      "Route": {
        "AuthorizationType": "AWS_IAM"
      }
    }
  }
}

```

```

    }
  }
}

```

YAML example

Explanation

The TLS protocol addresses network security problems, such as tampering and eavesdropping between a client and server. When your clients establish a TLS handshake to your API through the custom domain, you can choose a minimum Transport Layer Security (TLS) protocol version. This version is enforced for your Amazon API Gateway custom domain by setting a security policy, which is a predefined combination of minimum TLS version and cipher suite offered by Amazon API Gateway.

Usage considerations

- TLS protocol versions and ciphers used by Amazon API Gateway security policies depend on the type of API Gateway endpoint in use. For more about supported TLS protocol versions and ciphers for each endpoint type, review the Amazon API Gateway documentation.

Remediation for rule failure

Set the value of SecurityPolicy to TLS_1_2, or to adopt the default value, do not provide a value for SecurityPolicy.

The examples that follow show how to implement this remediation.

Amazon API Gateway Domain Name - Example

An Amazon API Gateway regional domain name configured with a security policy that requires a minimum of TLSv1.2 for API client connections. The example is shown in JSON and in YAML.

JSON example

```
{
  "DomainName": {
    "Type": "AWS::ApiGateway::DomainName",
    "Properties": {
      "DomainName": "example.com",
      "RegionalCertificateArn": {

      },
      "EndpointConfiguration": {
        "Types": [
          "REGIONAL"
        ]
      },
      "SecurityPolicy": "TLS_1_2"
    }
  }
}
```

YAML example

```
DomainName:
  Type: AWS::ApiGateway::DomainName
  Properties:
    DomainName: example.com
    RegionalCertificateArn: !Ref 'AcmCertificate'
    EndpointConfiguration:
      Types:

[CT.ACM.PR.1] Require an AWS Private CA certificate to have a single domain name

This control checks whether any AWS Certificate Manager (ACM) Private CA certificates have wildcard domain names instead of single domain names.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CertificateManager::Certificate`
- **AWS CloudFormation guard rule:** [CT.ACM.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ACM.PR.1 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ACM.PR.1 example templates](#)

Explanation

AWS Private CA allows you to use wildcards (*) in the domain name, so you can protect several sites in the same domain. This type of certificate presents some risk, because if the private key of a certificate is compromised, all domain and subdomains with the compromised certificate are compromised. We recommend that you use single domain name certificates instead of wildcard certificates to reduce these associated risks.

Remediation for rule failure

Set `DomainName` and each entry within `SubjectAlternativeNames` to a fully qualified domain name (FQDN) that does not contain a wildcard (*).

The examples that follow show how to implement this remediation.

AWS Certificate Manager Private CA Certificate - Example One

AWS Certificate Manager Private CA certificate configured with a single domain and no subject alternative names. The example is shown in JSON and in YAML.

JSON example

```
{
  "Resources": {
    "ACMCertificate": {
      "Type": "AWS::CertificateManager::Certificate",
      "Properties": {
        "CertificateAuthorityArn": "arn:aws:acm-pca:us-east-1:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012",
        "DomainName": "example.com"
      }
    }
  }
}
```

YAML example

[CT.APPSYNC.PR.1] Require an AWS AppSync GraphQL API to have logging enabled

This control checks whether an AWS AppSync GraphQL API has been configured to send request-level and field-level logs to Amazon CloudWatch Logs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::AppSync::GraphQLApi`
- **AWS CloudFormation guard rule:** [CT.APPSYNC.PR.1 rule specification](#)

Details and examples

- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.APPSYNC.PR.1 example templates](#)

Explanation

AppSync logs are useful for debugging issues related to requests.

Remediation for rule failure

Within `LogConfig`, set `FieldLogLevel` to `ALL` or `ERROR` and set `CloudWatchLogsRoleArn` to the ARN of an AWS IAM role configured to allow AWS AppSync to send logs to Amazon CloudWatch Logs.

The examples that follow show how to implement this remediation.

AWS AppSync GraphQL API - Example

An AWS AppSync GraphQL API configured to send GraphQL operations and tracing to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

JSON example

            "Arn"
          ]
        }
      }
    }
  }

[CT.APPSYNC.PR.2] Require an AWS AppSync GraphQL API to be configured with private visibility

This control checks whether an AWS AppSync GraphQL API has been configured with private visibility.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::AppSync::GraphQLApi`
- **AWS CloudFormation guard rule:** [CT.APPSYNC.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.APPSYNC.PR.2 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.APPSYNC.PR.2 example templates](#)

Explanation

If you use Amazon Virtual Private Cloud (Amazon VPC), you can create AWS AppSync Private APIs, which are APIs that are accessible only from a Amazon VPC. With a Private API, you can restrict API access to your internal applications and connect to your GraphQL and Realtime endpoints without exposing data publicly.

Usage considerations

- This control requires AWS AppSync GraphQL APIs to be configured with private API features, so that they are accessible only from a Amazon VPC. If you require your AWS AppSync GraphQL APIs to be accessible from an AWS AppSync public endpoint, do not enable this control.

Remediation for rule failure

Set the Visibility property to PRIVATE.

The examples that follow show how to implement this remediation.

AWS AppSync Private API - Example

      "AuthenticationType": "AWS_IAM",
      "Visibility": "PRIVATE"
    }
  }
}
```

YAML example

```

  Type: AWS::AppSync::GraphQLApi
  Properties:
    Name: SampleApi
    AuthenticationType: AWS_IAM

[CT.APPSYNC.PR.3] Require that an AWS AppSync GraphQL API is not authenticated with API keys

This control checks that an AWS AppSync GraphQL API has been configured with an authentication type other than API_KEY authentication.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::AppSync::GraphQLApi
- **AWS CloudFormation guard rule:** [CT.APPSYNC.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.APPSYNC.PR.3 rule specification](#)

- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.APPSYNC.PR.3 example templates](#)

Explanation

One way to control throttling for unauthenticated GraphQL endpoints is through the use of API keys. API keys are recommended only for development purposes, or in scenarios where it is safe to expose a public API. If static API keys are stolen, an API can become vulnerable to replay attacks.

Remediation for rule failure

Set the `AuthenticationType` property to a value other than `API_KEY`, and ensure no entry in the `AdditionalAuthenticationProviders` property has an `AuthenticationType` value of `API_KEY`.

The examples that follow show how to implement this remediation.

[CT.APPSYNC.PR.4] Require an AWS AppSync GraphQL API cache to have encryption in transit enabled.

This control checks whether an AWS AppSync API cache has encryption in transit enabled.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule

- **Control behavior:** Proactive
- **Resource types:** `AWS::AppSync::ApiCache`
- **AWS CloudFormation guard rule:** [CT.APPSYNC.PR.4 rule specification](#)

- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.APPSYNC.PR.4 example templates](#)

Explanation

Enabling this feature ensures that requests between AWS AppSync, the cache, and the data sources (except insecure HTTP data sources) are encrypted at the network level. Because some processing is needed to encrypt and decrypt the data at the endpoints, in-transit encryption can affect performance.

Remediation for rule failure

Set the value of the `TransitEncryptionEnabled` property to `true`.

The examples that follow show how to implement this remediation.

[CT.APPSYNC.PR.5] Require an AWS AppSync GraphQL API cache to have encryption at rest enabled.

This control checks whether an AWS AppSync API cache has encryption at rest enabled.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::AppSync::ApiCache`

- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.APPSYNC.PR.5 example templates](#)

Explanation

Data saved to disk from memory during swap operations is encrypted at the cache instance. Protecting data at rest is an important security best practice. It can mitigate the risk associated with unintended data exposure.

Remediation for rule failure

Set the value of the `AtRestEncryptionEnabled` property to true.

[CT.ATHENA.PR.2] Require an Amazon Athena workgroup to encrypt Athena query results at rest with an AWS Key Management Service (KMS) key

This control checks whether an Amazon Athena workgroup is configured to encrypt query results at rest with an AWS KMS key.

- **Control objective:** Encrypt data at rest

- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Athena::WorkGroup`
- **AWS CloudFormation guard rule:** [CT.ATHENA.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ATHENA.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ATHENA.PR.2 example templates](#)

Explanation

For an added layer of security, you can encrypt the results of Athena queries in the workgroup with AWS Key Management Service (KMS).

Usage considerations

- This control requires an Athena workgroup to override client settings by requiring the `EnforceWorkGroupConfiguration` property to be provided and set to true, or omitted to adopt the default value of true.

Remediation for rule failure

In the `WorkGroupConfiguration.ResultConfiguration` parameter, provide an `EncryptionConfiguration` configuration with an `EncryptionOption` set to a KMS-based encryption option, and with `KmsKey` set to the identifier or ARN of an AWS KMS key, or the name of an AWS KMS key alias.

The examples that follow show how to implement this remediation.

Amazon Athena workgroup - Example

[CT.CLOUDFRONT.PR.1] Require an Amazon CloudFront distribution to have a default root object configured

This control checks whether an Amazon CloudFront distribution is configured to return a specific object that is the default root object.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::CloudFront::Distribution
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.1 rule specification](#)

Details and examples

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.1 example templates](#)

Explanation

A user could possibly request a distribution's root URL instead of an object in the distribution. In this situation, specifying a default root object can help you to avoid exposing the contents of your web distribution.

Remediation for rule failure

Specify a default root object in the `DefaultRootObject` property.

The examples that follow show how to implement this remediation.

[CT.CLOUDFRONT.PR.2] Require any Amazon CloudFront distributions with Amazon S3 backed origins to have an origin access identity configured

This control checks whether Amazon CloudFront distributions backed by Amazon S3 are configured with an origin access identity.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudFront::Distribution`
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see: [CT.CLOUDFRONT.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.2 example templates](#)

Explanation

CloudFront OAI prevents users from gaining direct access to Amazon S3 bucket content. With direct access to an Amazon S3 bucket, a user bypasses the CloudFront distribution and any permissions that are applied to the underlying S3 bucket content.

Usage considerations

- This control applies only to Amazon CloudFront distributions that are configured with one or more origins that are backed by Amazon S3.

Remediation for rule failure

Configure Amazon S3 backed origins by means of the `Origins` property. For each origin backed by Amazon S3, configure an origin access identity by means of the `OriginAccessIdentity` property within an `S3OriginConfig` configuration.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example

Amazon CloudFront distribution with an Amazon S3 bucket origin and origin access identity. The example is shown in JSON and in YAML.

[CT.CLOUDFRONT.PR.3] Require an Amazon CloudFront distribution to have encryption in transit configured

This control checks whether your Amazon CloudFront distributions use HTTPS, either directly or through a redirection.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::CloudFront::Distribution
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.3 example templates](#)

Explanation

HTTPS (TLS) can help prevent potential attackers from attempting person-in-the-middle or similar attacks, which can eavesdrop on or manipulate network traffic. Only encrypted connections over HTTPS (TLS) should be allowed. Encrypting data in transit can affect performance. We recommend that you test your application with this feature to understand the performance profile and the impact of TLS.

Remediation for rule failure

Set `ViewerProtocolPolicy` in `DefaultCacheBehavior` and `CacheBehavior` to `https-only` or `redirect-to-https`.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example One

Amazon CloudFront distribution configured with a default cache behavior that requires viewer connections to use HTTPS. The example is shown in JSON and in YAML.

JSON example

```
{
  "CloudFrontDistribution": {
    "Type": "AWS::CloudFront::Distribution",
    "Properties": {
      "DistributionConfig": {
        "Enabled": false,
        "Origins": [
          {
            "Id": "sampleOrigin",
            "DomainName": "example.com",
            "CustomOriginConfig": {
              "OriginProtocolPolicy": "https-only"
            }
          }
        ],
        "DefaultCacheBehavior": {
          "ViewerProtocolPolicy": "https-only",
          "TargetOriginId": "sampleOrigin",
          "CachePolicyId": {
            "Ref": "CachePolicy"
          }
        }
      }
    }
  }
}
```

```

    }
  }
}

```

YAML example

```

CloudFrontDistribution:
  Type: AWS::CloudFront::Distribution
  Properties:
    DistributionConfig:
      Enabled: false
      Origins:
        - Id: sampleOrigin

    DefaultCacheBehavior:
      ViewerProtocolPolicy: https-only
      TargetOriginId: sampleOrigin
      CachePolicyId: !Ref 'CachePolicy'

```

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example Two

Amazon CloudFront distribution configured with a cache behavior that redirects viewer HTTP connections to HTTPS. The example is shown in JSON and in YAML.

JSON example

```

[CT.CLOUDFRONT.PR.4] Require an Amazon CloudFront distribution to have origin failover configured

This control checks whether your Amazon CloudFront distribution is configured with an origin group that contains two origin group members.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudFront::Distribution`
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.4 example templates](#)

Explanation

CloudFront origin failover can increase availability. Origin failover automatically redirects traffic to a secondary origin if the primary origin is unavailable or if it returns specific HTTP response status codes.

Remediation for rule failure

Configure an origin group on the Amazon CloudFront Distribution with two origin group members.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example One

Amazon CloudFront distribution configured with an origin group that contains two origin group members. The example is shown in JSON and in YAML.

[CT.CLOUDFRONT.PR.5] Require any Amazon CloudFront distribution to have logging enabled

This control checks whether Amazon CloudFront distributions are configured with access logging.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudFront::Distribution`
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.5 example templates](#)

Explanation

CloudFront access logs provide detailed information about every user request that CloudFront receives. Each log contains information such as the date and time the request was received, the IP address of the viewer that made the request, the source of the request, and the port number of the request from the viewer.

These access logs are useful for applications such as security and access audits, and in forensic investigation.

Remediation for rule failure

Set `Bucket` in `DistributionConfig.Logging` to an Amazon S3 bucket that has been configured to receive Amazon CloudFront distribution access logs.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example

Amazon CloudFront distribution configured with access logging enabled. The example is shown in JSON and in YAML.

[CT.CLOUDFRONT.PR.6] Require an Amazon CloudFront distribution to use custom SSL/TLS certificates

This control checks whether the certificate associated with an Amazon CloudFront distribution is a custom SSL/TLS certificate.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::CloudFront::Distribution
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.6 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.6 example templates](#)

Explanation

Custom SSL/TLS certificates give your users access to content by using alternate domain names. You can store custom certificates in AWS Certificate Manager (recommended), or in IAM.

Usage considerations

- This control requires a viewer certificate configuration compatible only with Amazon CloudFront distributions that use `Aliases`, also known as alternate domain names or CNAMEs.

Remediation for rule failure

Provide a `ViewerCertificate` configuration with values for `AcmCertificateArn`, `MinimumProtocolVersion`, and `SslSupportMethod`.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example

Amazon CloudFront distribution configured with an AWS Certificate Manager SSL certificate. The example is shown in JSON and in YAML.

[CT.CLOUDFRONT.PR.7] Require an Amazon CloudFront distribution to use SNI to serve HTTPS requests

This control checks whether your Amazon CloudFront distributions are configured to use SNI to serve HTTPS requests.

- **Control objective:** Encrypt data in transit, Improve availability
- **Implementation:** AWS CloudFormation Guard Rule

- **Control behavior:** Proactive
- **Resource types:** AWS::CloudFront::Distribution
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.7 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.7 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.7 example templates](#)

Explanation

Server Name Indication (SNI) is an extension to the TLS protocol. It is supported by browsers and clients released after 2010. If you configure CloudFront to serve HTTPS requests using SNI, CloudFront associates your alternate domain name with an IP address for each edge location. When a viewer submits an HTTPS request for your content, DNS routes the request to the IP address for the correct edge location. The IP address for your domain name is determined during the SSL/TLS handshake negotiation; the IP address isn't dedicated to your distribution.

Usage considerations

- This control requires a viewer certificate configuration which is only compatible with Amazon CloudFront distributions that use Aliases (also known as alternate domain names or CNAMEs)

Remediation for rule failure

Within `ViewerCertificate`, set `SslSupportMethod` to `sni-only`, `MinimumProtocolVersion` to a protocol that supports SNI (TLSv1 or greater), and `AcmCertificateArn` to the ARN of an AWS ACM certificate.

The examples that follow show how to implement this remediation.

[CT.CLOUDFRONT.PR.8] Require an Amazon CloudFront distribution to encrypt traffic to custom origins

This control checks whether your Amazon CloudFront distributions are encrypting traffic to custom origins.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation Guard Rule

- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudFront::Distribution`
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.8 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.8 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.8 example templates](#)

Explanation

HTTPS (TLS) can help prevent eavesdropping or manipulation of network traffic. Only encrypted connections over HTTPS (TLS) should be allowed.

Usage considerations

- This control applies only to Amazon CloudFront distributions that have one or more origins configured.

Remediation for rule failure

For Amazon CloudFront custom origins, set `OriginProtocolPolicy` to `https-only` or `match-viewer`. When setting `OriginProtocolPolicy` to `match-viewer`, do not set `ViewerProtocolPolicy` to `allow-all` for any cache behaviors.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example One

Amazon CloudFront distribution configured to require HTTPS connections to custom origins, by means of an origin protocol policy of `https-only`. The example is shown in JSON and in YAML.

JSON example

```

{
  "CloudFrontDistribution": {
    "Type": "AWS::CloudFront::Distribution",
    "Properties": {
      "DistributionConfig": {
        "Enabled": false,
        "DefaultCacheBehavior": {
          "ViewerProtocolPolicy": "https-only",
          "TargetOriginId": "sampleOrigin",
          "CachePolicyId": {
            "Ref": "CachePolicy"
          }
        }
      },
      "CacheBehaviors": [
        {
          "ViewerProtocolPolicy": "https-only",
          "TargetOriginId": "sampleOrigin",
          "PathPattern": "*",
          "CachePolicyId": {
            "Ref": "CachePolicy"

            "OriginProtocolPolicy": "https-only"
          }
        }
      ]
    }
  }
}

```

YAML example

```

CloudFrontDistribution:
  Type: AWS::CloudFront::Distribution

```

```

Properties:
  DistributionConfig:
    Enabled: false
    DefaultCacheBehavior:
      ViewerProtocolPolicy: https-only
      TargetOriginId: sampleOrigin
      CachePolicyId: !Ref 'CachePolicy'
    CacheBehaviors:
      - ViewerProtocolPolicy: https-only
        TargetOriginId: sampleOrigin
        PathPattern: '*'

  Origins:
    - Id: sampleOrigin
      DomainName: example.com
      CustomOriginConfig:
        OriginProtocolPolicy: https-only

```

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example Two

Amazon CloudFront distribution configured to require HTTPS connections to custom origins, by means of an origin protocol policy of match-viewer. The example is shown in JSON and in YAML.

[CT.CLOUDFRONT.PR.9] Require an Amazon CloudFront distribution to have a security policy of TLSv1.2 as a minimum

This control checks whether your Amazon CloudFront distributions are using a minimum security policy and cipher suite of TLSv1.2 or greater for viewer connections.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudFront::Distribution`
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.9 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.9 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.9 example templates](#)

Explanation

AWS Control Tower recommends that you use SSL/TLS to communicate with AWS resources. We recommend TLS version 1.2 or later.

You can specify the security policy CloudFront will use for HTTPS connections with viewers. The security policy determines two settings: 1) the minimum SSL/TLS protocol that CloudFront can use to communicate with viewers, and 2) the ciphers that CloudFront can use to encrypt the content that it returns to viewers.

Usage considerations

- This control requires a viewer certificate configuration compatible only with Amazon CloudFront distributions that use Aliases, also known as alternate domain names or CNAMEs.

Remediation for rule failure

Provide a `ViewerCertificate` configuration with `MinimumProtocolVersion` set to `TLSv1.2` or higher.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example

Amazon CloudFront distribution configured to use TLS version 1.2 for viewer HTTPS connections. The example is shown in JSON and in YAML.

[CT.CLOUDFRONT.PR.10] Require any Amazon CloudFront distributions with Amazon S3 backed origins to have origin access control configured

This control checks whether your Amazon CloudFront distributions backed by Amazon S3 are configured to use an origin access control.

- **Control objective:** Enforce least privilege, Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::CloudFront::Distribution
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.10 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.10 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.10 example templates](#)

Explanation

CloudFront OAC prevents users from gaining direct access to an Amazon S3 bucket's content. Direct access an S3 bucket bypasses the CloudFront distribution and any permissions that are applied to the underlying S3 bucket content.

Usage considerations

- This control applies only to Amazon CloudFront distributions that have one or more origins backed by Amazon S3 configured.

Remediation for rule failure

The `Origins` property configures origins backed by Amazon S3. For each origin backed by Amazon S3, configure an origin access control identifier using the `OriginAccessControlId` property.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example

Amazon CloudFront distribution with an Amazon S3 bucket origin, configured with an origin access control. The example is shown in JSON and in YAML.

[CT.CLOUDFRONT.PR.11] Require an Amazon CloudFront distribution to use updated SSL protocols between edge locations and custom origins

This control checks whether your Amazon CloudFront distributions are using deprecated SSL protocols for HTTPS communication between CloudFront edge locations and custom origins.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudFront::Distribution`
- **AWS CloudFormation guard rule:** [CT.CLOUDFRONT.PR.11 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDFRONT.PR.11 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDFRONT.PR.11 example templates](#)

Explanation

In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated, because the protocol is insufficiently secure. We recommend that you use TLSv1.2 or later for HTTPS communication to your custom origins.

Usage considerations

- This control applies only to Amazon CloudFront distributions that have one or more custom origins configured.

Remediation for rule failure

Remove deprecated SSL protocols from `OriginSSLProtocols` in `Origins` that have `CustomOriginConfig` configurations.

The examples that follow show how to implement this remediation.

Amazon CloudFront Distribution - Example

Amazon CloudFront distribution configured to use TLS v1.2 as an origin SSL protocol. The example is shown in JSON and in YAML.

[CT.CLOUDTRAIL.PR.1] Require an AWS CloudTrail trail to have encryption at rest activated

This control checks whether your AWS CloudTrail is configured to use the server-side encryption (SSE) AWS KMS key encryption.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::CloudTrail::Trail`
- **AWS CloudFormation guard rule:** [CT.CLOUDTRAIL.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDTRAIL.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDTRAIL.PR.1 example templates](#)

Explanation

For an added layer of security for your sensitive CloudTrail log files, you should use server-side encryption with AWS KMS keys (SSE-KMS) for your CloudTrail log files for encryption at rest. Note that by default, the log files delivered by CloudTrail to your buckets are encrypted by Amazon server-side encryption with Amazon S3-managed encryption keys (SSE-S3).

Remediation for rule failure

Set the `KMSKeyId` property to a valid KMS key.

The examples that follow show how to implement this remediation.

AWS CloudTrail trail - Example

AWS CloudTrail Trail configured to use server-side encryption with AWS KMS keys (SSE-KMS). The example is shown in JSON and in YAML.

      },
      "S3BucketName": {
        "Ref": "LoggingBucket"
      }
    }
  }
}
```

```

    }
  }
}

[CT.CLOUDTRAIL.PR.2] Require an AWS CloudTrail trail to have log file validation activated

This control checks whether log file integrity validation is enabled on an AWS CloudTrail trail.

- **Control objective:** Manage secrets
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::CloudTrail::Trail`
- **AWS CloudFormation guard rule:** [CT.CLOUDTRAIL.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDTRAIL.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDTRAIL.PR.2 example templates](#)

Explanation

CloudTrail log file validation creates a digitally-signed digest file that contains a hash of each log that CloudTrail writes to Amazon S3. You can use these digest files to determine whether a log file was changed, deleted, or unchanged after CloudTrail delivered the log.

AWS Control Tower recommends that you enable file validation on all trails. Log file validation provides additional integrity checks of CloudTrail logs.

Remediation for rule failure

Set the CloudTrail resource `EnableLogFileValidation` property to true.

The examples that follow show how to implement this remediation.

AWS CloudTrail trail - Example

AWS CloudTrail trail configured with log file validation. The example is shown in JSON and in YAML.

JSON example

```

[CT.CLOUDTRAIL.PR.3] Require an AWS CloudTrail trail to have an Amazon CloudWatch Logs log group configuration

This control checks whether your AWS CloudTrail trail is configured to send logs to Amazon CloudWatch Logs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudTrail::Trail`
- **AWS CloudFormation guard rule:** [CT.CLOUDTRAIL.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDTRAIL.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDTRAIL.PR.3 example templates](#)

Explanation

CloudTrail records AWS API calls that are made in a given account. The recorded information includes: the identity of the API caller, the time of the API call, the source IP address of the API caller, the request parameters and the response elements returned by the AWS service.

CloudTrail uses Amazon S3 for log file storage and delivery. You can capture CloudTrail logs in a specified S3 bucket for long-term analysis. To perform real-time analysis, you can configure CloudTrail to send logs to CloudWatch Logs.

For a trail that is enabled in all AWS Regions in an account, CloudTrail sends log files from all of those Regions to a CloudWatch Logs log group.

AWS CloudTrail recommends that you send CloudTrail logs to CloudWatch Logs. Note that this recommendation is intended to ensure that account activity is captured, monitored, and appropriately alarmed on. You can use CloudWatch Logs to set this up with your AWS services. This recommendation does not preclude the use of a different solution.

Sending CloudTrail logs to CloudWatch Logs facilitates real-time and historic activity logging based on user, API, resource, and IP address. You can use this approach to establish alarms and notifications for anomalous or sensitivity account activity.

Remediation for rule failure

Set the `CloudWatchLogsLogGroupArn` and `CloudWatchLogsRoleArn` properties.

The examples that follow show how to implement this remediation.

[CT.CLOUDTRAIL.PR.4] Require an AWS CloudTrail Lake event data store to enable encryption at rest with an AWS KMS key

This control checks whether a CloudTrail Lake event data store is encrypted at rest with a KMS key.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::CloudTrail::EventDataStore`
- **AWS CloudFormation guard rule:** [CT.CLOUDTRAIL.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDTRAIL.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CLOUDTRAIL.PR.4 example templates](#)

Explanation

Encrypting data at rest reduces the risk that a user not authenticated to AWS may obtain access to data stored on disk. For added control over encryption keys, you can use customer-managed keys from AWS KMS. You have full control over these KMS keys. You can establish and maintain their key policies, IAM policies, and grants, enable and disable the keys, rotate their cryptographic material, add tags, create aliases that refer to the KMS keys, and schedule the KMS keys for deletion.

Usage considerations

- All events in an AWS CloudTrail Lake event data store are encrypted by CloudTrail using a KMS key that AWS owns and manages for you. For added control over encryption keys, you can use customer-managed keys from AWS KMS. For more information, see [AWS KMS Concepts](#) in the *AWS KMS Developer Guide*.

Remediation for rule failure

Set the `KmsKeyId` parameter to the ARN of an AWS KMS customer-managed key, configured with permissions that allow the CloudTrail service principal to use the key.

The examples that follow show how to implement this remediation.

CloudTrail Lake event data store - Example

CloudTrail Lake event data store configured to encrypt data at rest with an AWS KMS key. The example is shown in JSON and in YAML.

JSON example

```
{
  "CloudTrailEventDataStore": {
    "Type": "AWS::CloudTrail::EventDataStore",
    "Properties": {
      "Name": {
        "Fn::Sub": "${AWS::StackName}-example"
      },
      "TerminationProtectionEnabled": false,
      "KmsKeyId": {
        "Fn::GetAtt": [
          "KMSKey",
          "Arn"
        ]
      }
    }
  }
}
```

YAML example

```
CloudTrailEventDataStore:
  Type: AWS::CloudTrail::EventDataStore
  Properties:
    Name: !Sub '${AWS::StackName}-example'
    TerminationProtectionEnabled: false
    KmsKeyId: !GetAtt 'KMSKey.Arn'

[CT.CLOUDWATCH.PR.1] Require an Amazon CloudWatch alarm to have an action configured for the alarm state

This control checks whether an Amazon CloudWatch alarm has at least one action configured for the alarm state.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudWatch::Alarm`
- **AWS CloudFormation guard rule:** [CT.CLOUDWATCH.PR.1 rule specification](#)

- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.CLOUDWATCH.PR.1 example templates](#)

Explanation

AWS Control Tower recommends configuring actions for alarms to alert you automatically when an alarm is in the alarm state and the monitored metric is outside the defined threshold. This configuration ensures that alarms are monitored, and that necessary actions are taken when the alarm is triggered. Monitoring alarms help you identify unusual activities and respond quickly to security and operational issues. You can specify the actions an alarm should take when it goes into OK, ALARM, and INSUFFICIENT_DATA states. The most common CloudWatch alarm action in the alarm state is to notify one or more users by sending a message to an Amazon Simple Notification Service (Amazon SNS) topic.

Remediation for rule failure

Set `AlarmActions` to a list with one or more alarm action values.

The examples that follow show how to implement this remediation.

Explanation

Amazon CloudWatch Logs centralizes the logs from all of your systems, applications, and AWS services in a single, highly scalable service. You can use Amazon CloudWatch Logs to monitor, store, and retrieve your log files from Amazon EC2 instances, CloudTrail, Route 53, and other sources. Retaining your logs for at least one year can help you comply with log retention standards.

Remediation for rule failure

Omit the field value of `RetentionInDays` to adopt the default retention setting of `Never` expire, or set `RetentionInDays` to an integer value greater than or equal to 365.

The examples that follow show how to implement this remediation.

[CT.CLOUDWATCH.PR.3] Require an Amazon CloudWatch log group to be encrypted at rest with an AWS KMS key

This control checks whether an Amazon CloudWatch Logs log group is encrypted at rest with an AWS KMS key

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Logs::LogGroup
- **AWS CloudFormation guard rule:** [CT.CLOUDWATCH.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDWATCH.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.CLOUDWATCH.PR.3 example templates](#)

Explanation

Amazon CloudWatch Logs log groups are encrypted by default using server-side encryption. For added control over encryption keys, you can use customer-managed keys from AWS KMS. You have full control over these KMS keys, including establishing and maintaining their key policies, IAM policies, and grants, enabling and disabling the keys, rotating their cryptographic material, adding tags, creating aliases that refer to the KMS keys, and scheduling the KMS keys for deletion.

Remediation for rule failure

Set `KmsKeyId` to the ARN of an AWS KMS customer-managed key configured with permissions that allow the CloudWatch service principal to use the key.

The examples that follow show how to implement this remediation.

Amazon CloudWatch Logs Group - Example

An Amazon CloudWatch log group configured to encrypt logs with an AWS KMS customer-managed key. The example is shown in JSON and in YAML.

[CT.CLOUDWATCH.PR.4] Require an Amazon CloudWatch alarm to have actions activated

This control checks whether an Amazon CloudWatch alarm has actions enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CloudWatch::Alarm`
- **AWS CloudFormation guard rule:** [CT.CLOUDWATCH.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CLOUDWATCH.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.CLOUDWATCH.PR.4 example templates](#)

Explanation

Alarm actions automatically alert you when a monitored metric is outside the defined threshold. If the alarm action is deactivated, no actions are executed when the alarm changes state, so you won't be alerted to changes in monitored metrics. AWS Control Tower recommends activating CloudWatch alarm actions to help you respond quickly to security and operational issues.

Remediation for rule failure

Set `ActionsEnabled` to `true` or do not provide the `ActionsEnabled` property.

The examples that follow show how to implement this remediation.

[CT.CODEBUILD.PR.1] Require OAuth on GitHub or Bitbucket source repository URLs for AWS CodeBuild projects

This control checks whether the GitHub or Bitbucket source repository URL contains either personal access tokens or a user name and password.

- **Control objective:** Use strong authentication
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::CodeBuild::Project
- **AWS CloudFormation guard rule:** [CT.CODEBUILD.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CODEBUILD.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CODEBUILD.PR.1 example templates](#)

Explanation

Authentication credentials should never be stored or transmitted in clear text or appear in the repository URL. Instead of personal access tokens or username and password, you should use OAuth to grant authorization for accessing GitHub or Bitbucket repositories. Using personal access tokens or a username and password could expose your credentials to unintended data exposure and unauthorized access.

Usage considerations

- This control applies only to AWS CodeBuild projects with a primary or secondary source type of GitHub or Bitbucket.

Remediation for rule failure

Remove any embedded credentials from repository URLs in AWS CodeBuild project source configurations. Instead, connect your CodeBuild projects to GitHub or Bitbucket repositories by configuring GitHub Access Token or Bitbucket App Password credentials in the AWS Management Console or AWS CLI.

The examples that follow show how to implement this remediation.

[CT.CODEBUILD.PR.2] Require any AWS CodeBuild project environment variable to encrypt credentials in environment variables

This control checks whether AWS CodeBuild projects contain environment variables `AWS_ACCESS_KEY_ID` and `AWS_SECRET_ACCESS_KEY` stored as `PLAINTEXT`.

- **Control objective:** Use strong authentication
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CodeBuild::Project`
- **AWS CloudFormation guard rule:** [CT.CODEBUILD.PR.2 rule specification](#)

Details and examples

- For details about the `PASS`, `FAIL`, and `SKIP` behaviors associated with this control, see the: [CT.CODEBUILD.PR.2 rule specification](#)
- For examples of `PASS` and `FAIL` CloudFormation Templates related to this control, see: [CT.CODEBUILD.PR.2 example templates](#)

Explanation

Authentication credentials `AWS_ACCESS_KEY_ID` and `AWS_SECRET_ACCESS_KEY` should never be stored in clear text, as this could lead to unintended data exposure and unauthorized access.

Usage considerations

- This control only applies to AWS CodeBuild projects configured with `AWS_ACCESS_KEY_ID` and `AWS_SECRET_ACCESS_KEY` environment variables

Remediation for rule failure

Use `PARAMETER_STORE` or `SECRETS_MANAGER` to store values for environment variables named `AWS_ACCESS_KEY_ID` or `AWS_SECRET_ACCESS_KEY`.

The examples that follow show how to implement this remediation.

AWS CodeBuild Project - Example

AWS CodeBuild project configured to use credentials stored in AWS Secrets Manager. The example is shown in JSON and in YAML.

[CT.CODEBUILD.PR.3] Require any AWS CodeBuild project environment to have logging configured

This control checks whether AWS CodeBuild projects environment has at least one logging option enabled.

- **Control objective:** Establish logging and monitoring

- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CodeBuild::Project`
- **AWS CloudFormation guard rule:** [CT.CODEBUILD.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CODEBUILD.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CODEBUILD.PR.3 example templates](#)

Explanation

From a security perspective, logging is an important feature to enable, to assist future forensics efforts in case of a security incident. Correlating anomalies in CodeBuild projects with threat detections can increase confidence in the accuracy of those threat detections.

Remediation for rule failure

Set LogsConfig with a CloudWatchLogs or S3Logs configuration.

The examples that follow show how to implement this remediation.

AWS CodeBuild Project - Example One

AWS CodeBuild project configured to enable logging, by means of Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

JSON example

```

    "Type": "AWS::CodeBuild::Project",
    "Properties": {
      "Artifacts": {
        "Type": "NO_ARTIFACTS"

    }
  },
}
```

```

    \ build:\n    commands:\n    - npm test\n"
LogsConfig:
  CloudWatchLogs:
    Status: ENABLED

```

The examples that follow show how to implement this remediation.

AWS CodeBuild Project - Example Two

AWS CodeBuild project configured to enable logging, by means of Amazon S3. The example is shown in JSON and in YAML.

[CT.CODEBUILD.PR.5] Require encryption on all AWS CodeBuild project artifacts

This control checks whether AWS CodeBuild projects are configured to encrypt artifacts.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::CodeBuild::Project`
- **AWS CloudFormation guard rule:** [CT.CODEBUILD.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CODEBUILD.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CODEBUILD.PR.5 example templates](#)

Explanation

Encryption of data at rest is a recommended best practice. It adds a layer of access management around your data. In case of a compromise to your CodeBuild artifacts, encryption at rest ensures that your data is protected from unintended access.

Usage considerations

- This control applies only to AWS CodeBuild projects configured to return primary or secondary artifacts as output.

Remediation for rule failure

Set the `EncryptionDisabled` property in `Artifacts` and any `SecondaryArtifacts` to `false`, or omit the `EncryptionDisabled` property.

The examples that follow show how to implement this remediation.

AWS CodeBuild Project - Example One

AWS CodeBuild project configured to return primary artifacts as output with artifact encryption enabled, by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

[CT.CODEBUILD.PR.6] Require encryption on all Amazon S3 logs for AWS CodeBuild projects

This control checks whether AWS CodeBuild projects configured with Amazon S3 logs have encryption enabled.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::CodeBuild::Project
- **AWS CloudFormation guard rule:** [CT.CODEBUILD.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.CODEBUILD.PR.6 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.CODEBUILD.PR.6 example templates](#)

Explanation

Encryption of data at rest is a recommended best practice. It adds a layer of access management around your data. In case of a compromise to your CodeBuild artifacts, encryption at rest ensures that your data is protected from unintended access.

Usage considerations

- This control applies only to AWS CodeBuild projects with log delivery to Amazon S3 enabled.

Remediation for rule failure

Set EncryptionDisabled in S3Logs to false, or do not specify the EncryptionDisabled property.

The examples that follow show how to implement this remediation.

AWS CodeBuild Project - Example One

AWS CodeBuild project configured to encrypt logs delivered to an Amazon S3 logging destination, by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

AWS Database Migration Service (AWS DMS) controls

- [\[CT.DMS.PR.2\] Require an AWS Database Migration Service \(DMS\) Endpoint to encrypt connections for source and target endpoints](#)

[CT.DMS.PR.1] Require that a public AWS DMS replication instance is not public

This control checks whether your AWS DMS replication instance is public.

- **Control objective:** Limit network access, Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::DMS::ReplicationInstance
- **AWS CloudFormation guard rule:** [CT.DMS.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.DMS.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.DMS.PR.1 example templates](#)

Explanation

A private replication instance has a private IP address that you cannot access outside of the replication network. You use a private instance when both source and target databases are in the same network that is connected to the replication instance's VPC. The network can be connected to the VPC by using a VPN, AWS Direct Connect, or VPC peering.

Remediation for rule failure

Set `PubliclyAccessible` to `false`.

The examples that follow show how to implement this remediation.

AWS DMS Replication Instance - Example

AWS DMS replication instance configured with public access disabled. The example is shown in JSON and in YAML.

JSON example

```
{
  "DMSReplicationInstance": {
    "Type": "AWS::DMS::ReplicationInstance",
    "Properties": {
      "ReplicationInstanceClass": "dms.t3.micro",
      "PubliclyAccessible": false
    }
  }
}
```

YAML example

```
DMSReplicationInstance:
  Type: AWS::DMS::ReplicationInstance
  Properties:
    ReplicationInstanceClass: dms.t3.micro
    PubliclyAccessible: false
```

[CT.DMS.PR.2] Require an AWS Database Migration Service (DMS) Endpoint to encrypt connections for source and target endpoints

This control checks whether an AWS Database Migration Service (AWS DMS) Endpoint is configured to encrypt connections for source and target endpoints by using Secure Sockets Layer (SSL).

- **Control objective:** Encrypt data in transit

- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::DMS::Endpoint
- **AWS CloudFormation guard rule:** [CT.DMS.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.DMS.PR.2 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.DMS.PR.2 example templates](#)

Explanation

You can encrypt connections for source and target endpoints by using Secure Sockets Layer (SSL). By enabling encryption in-transit with SSL, you can protect the confidentiality of data during AWS DMS data migrations.

Usage considerations

- This control applies only to AWS DMS endpoints with an EngineName property of `mysql`, `oracle`, `postgres`, `mariadb`, `aurora`, `aurora-postgresql`, `db2`, `sybase`, `mongodb`, `docdb`, or `sqlserver`.
- Not all SSL modes work with all database endpoints. See [Using SSL with AWS Database Migration Service](#) in the *AWS Database Migration Service User Guide* for information on which SSL modes are supported for each database engine, and limitations of using SSL with AWS DMS.

Remediation for rule failure

Set the value of the SslMode property to a supported encryption mode for the endpoint engine (one of `require`, `verify-ca`, or `verify-full`).

The examples that follow show how to implement this remediation.

AWS DMS Endpoint - Example

An AWS DMS endpoint configured with a postgres database target and connection encryption using SSL (TLS). The example is shown in JSON and in YAML.

[CT.DOCUMENTDB.PR.1] Require an Amazon DocumentDB cluster to be encrypted at rest

This control checks whether storage encryption is enabled for an Amazon DocumentDB (with MongoDB compatibility) cluster.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::DocDB::DBCluster`
- **AWS CloudFormation guard rule:** [CT.DOCUMENTDB.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.DOCUMENTDB.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.DOCUMENTDB.PR.1 example templates](#)

Explanation

You encrypt data at rest in your Amazon DocumentDB cluster by specifying the storage encryption option when you create your cluster. Storage encryption is enabled cluster-wide, and it is applied to all instances, including the primary instance and any replicas. It also is applied to your cluster's storage volume, data, indexes, logs, automated backups, and snapshots.

Clusters that you create using AWS CloudFormation have encryption at rest turned off by default. Therefore, you must explicitly enable encryption at rest using the `StorageEncrypted` property.

Remediation for rule failure

Set the value of the `StorageEncrypted` parameter to true.

The examples that follow show how to implement this remediation.

[CT.DOCUMENTDB.PR.2] Require an Amazon DocumentDB cluster to have a backup retention period greater than or equal to seven days

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::DocDB::DBCluster`

- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.DOCUMENTDB.PR.2 example templates](#)

Explanation

Amazon DocumentDB creates daily automatic snapshots of your cluster during your cluster's backup window. Amazon DocumentDB saves the automatic snapshots of your cluster according to the backup retention period that you specify, allowing you to restore to any point within the backup retention period. This daily snapshot strengthens the resilience of your systems, and it can help you recover quickly from a security incident.

Remediation for rule failure

Set the value of the `BackupRetentionPeriod` parameter to an integer value between 7 and 35 days (inclusive).

The examples that follow show how to implement this remediation.

Amazon DocumentDB Cluster - Example

An Amazon DocumentDB cluster configured with a backup retention period of seven (7) days. The example is shown in JSON and in YAML.

Explanation

Backups help you to recover more quickly from a security incident. They also strengthen the resilience of your systems. Amazon DynamoDB point-in-time recovery (PITR) automates backups for DynamoDB tables, which can reduce the time required to recover from accidental delete or write operations. DynamoDB tables that have PITR enabled can be restored to any point in time within the last 35 days.

Remediation for rule failure

Provide a `PointInTimeRecoverySpecification` configuration and set `PointInTimeRecoveryEnabled` to `true`.

The examples that follow show how to implement this remediation.

[CT.DYNAMODB.PR.2] Require an Amazon DynamoDB table to be encrypted at rest using an AWS KMS key

This control checks whether your Amazon DynamoDB table is encrypted with an AWS Key Management Service (KMS) key.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive

- **Resource types:** AWS::DynamoDB::Table
- **AWS CloudFormation guard rule:** [CT.DYNAMODB.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.DYNAMODB.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.DYNAMODB.PR.2 example templates](#)

Explanation

Amazon DynamoDB encryption at rest provides an additional layer of data protection, because it always secures your data in an encrypted table - including its primary key, local and global secondary indexes, streams, global tables, backups, and DynamoDB Accelerator (DAX) clusters, whenever the data is stored in durable media.

Encryption at rest integrates with AWS KMS for managing the encryption keys that are used to encrypt your tables.

Usage considerations

- This control requires only that KMS keys are used for server-side encryption. It does not check the properties of the KMS key used, such as whether the KMS key is customer-managed or service-managed.

Remediation for rule failure

Provide a `SSESpecification` configuration and set `SSEEnabled` to `true`.

The examples that follow show how to implement this remediation.

      ],
      "SSESpecification": {
        "SSEEnabled": true
      }

[CT.DAX.PR.1] Require encryption at rest for all Amazon DynamoDB Accelerator (DAX) clusters

This control checks whether Amazon DynamoDB Accelerator (DAX) clusters are encrypted at rest.

Note

The control CT.DAX.PR.1 cannot be activated from home Regions Canada (Central) Region, Europe (Stockholm) Region, and Asia Pacific (Seoul) Region, because the `AWS::DAX::Cluster` resource type is not available in those Regions. If your home Region is not one of these three, you can activate the control for these three Regions from another home Region, if these three Regions are governed by AWS Control Tower in your landing zone. For example, if your home Region is US West (Oregon) Region, you can deploy the control to Canada (Central) Region, if Canada (Central) Region is governed by AWS Control Tower.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::DAX::Cluster`
- **AWS CloudFormation guard rule:** [CT.DAX.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.DAX.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.DAX.PR.1 example templates](#)

Explanation

Encrypting data at rest reduces the risk that data stored on disk may be accessible to a user who is not authenticated to AWS. Encryption adds another set of access controls, which limits the ability of unauthorized users to gain access to the data. For example, API permissions must decrypt the data before it can be read.

Remediation for rule failure

Provide an `SSESpecification` configuration with `SSEEnabled` set to `true`.

The examples that follow show how to implement this remediation.

[CT.DAX.PR.2] Require an Amazon DAX cluster to deploy nodes to at least three Availability Zones

This control checks whether an Amazon DAX cluster is configured to deploy cluster nodes to at least three Availability Zones.

- **Control objective:** Improve resiliency, Improve availability
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::DAX::Cluster
- **AWS CloudFormation guard rule:** [CT.DAX.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.DAX.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.DAX.PR.2 example templates](#)

Explanation

AWS Control Tower recommends that you deploy your Amazon DAX clusters in multiple Availability Zones. This deployment technique allows you to design and operate applications and databases that fail over between Availability Zones automatically, without interruption. For production usage,

we strongly recommend that you deploy DAX across at least three nodes, with each node placed into a different Availability Zone.

Remediation for rule failure

Set the `ReplicationFactor` parameter to an integer value greater than or equal to three (≥ 3), and set the `AvailabilityZones` parameter to a list containing three unique Availability Zone entries.

The examples that follow show how to implement this remediation.

Amazon DAX cluster - Example

Amazon DAX cluster configured with three nodes and three distinct Availability Zones. The example is shown in JSON and in YAML.

[CT.DAX.PR.3] Require an Amazon DAX cluster to encrypt data in transit with Transport Layer Security (TLS)

This control checks whether an Amazon DynamoDB Accelerator (DAX) cluster endpoint is configured to encrypt data in transit with Transport Layer Security (TLS).

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::DAX::Cluster`
- **AWS CloudFormation guard rule:** [CT.DAX.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.DAX.PR.3 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.DAX.PR.3 example templates](#)

Explanation

Amazon DynamoDB Accelerator (DAX) supports encryption in transit of data between your application and your DAX cluster, so that you can use DAX in applications with stringent encryption requirements. DAX encryption in transit ensures that all requests and responses between the application and the cluster are encrypted by transport level security (TLS), and that connections to the cluster can be authenticated by verification of a cluster x509 certificate.

Usage considerations

- To enable encryption in transit between your application and DAX cluster, be sure to use a recent version of any of the DAX clients that support TLS in your application.

Encryption in transit cannot be enabled on an existing DAX cluster. To use encryption in transit in an existing DAX application, create a new cluster with encryption in transit enabled, shift your application's traffic to it, then delete the old cluster.

Remediation for rule failure

Set the value of the `ClusterEndpointEncryptionType` property to `TLS`.

The examples that follow show how to implement this remediation.

[CT.ELASTICBEANSTALK.PR.1] Require AWS Elastic Beanstalk environments to have enhanced health reporting enabled

This control checks whether AWS Elastic Beanstalk environments and configuration templates are configured for enhanced health reporting.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ElasticBeanstalk::Environment, AWS::ElasticBeanstalk::ConfigurationTemplate
- **AWS CloudFormation guard rule:** [CT.ELASTICBEANSTALK.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICBEANSTALK.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICBEANSTALK.PR.1 example templates](#)

Explanation

Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application.

Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. The Elastic Beanstalk health agent, included in supported Amazon Machine Images (AMIs), evaluates logs and metrics of environment EC2 instances.

Remediation for rule failure

For AWS Elastic Beanstalk environments, configure an `OptionSetting` with `Namespace` set to `aws:elasticbeanstalk:healthreporting:system`, `OptionName` set to `SystemType`, and `Value` set to `enhanced`. For AWS Elastic Beanstalk configuration templates, configure an `OptionSetting` with `Namespace` set to `aws:elasticbeanstalk:healthreporting:system`, `OptionName` set to `SystemType`, and `Value` set to `enhanced`. Omit this setting to adopt the default value of `enhanced`.

The examples that follow show how to implement this remediation.

AWS Elastic Beanstalk Configuration Template - Example Two

AWS Elastic Beanstalk configuration template configured with enhanced health reporting, enabled by means of an entry in the `OptionSettings` property. The example is shown in JSON and in YAML.

JSON example

```
{
  "ElasticBeanstalkConfigurationTemplate": {
    "Type": "AWS::ElasticBeanstalk::ConfigurationTemplate",
    "Properties": {
      "ApplicationName": {
        "Ref": "App"
      },
      "SolutionStackName": "64bit Amazon Linux 2 v3.4.0 running Python 3.8",
      "OptionSettings": [
        {
          "Namespace": "aws:elasticbeanstalk:healthreporting:system",
          "OptionName": "SystemType",
          "Value": "enhanced"
        }
      ]
    }
  }
}
```

YAML example

```
ElasticBeanstalkConfigurationTemplate:
  Type: AWS::ElasticBeanstalk::ConfigurationTemplate
  Properties:
    ApplicationName: !Ref 'App'
    SolutionStackName: 64bit Amazon Linux 2 v3.4.0 running Python 3.8

[CT.ELASTICBEANSTALK.PR.2] Require an AWS Elastic Beanstalk environment to have managed platform updates configured

This control checks whether managed platform updates in AWS Elastic Beanstalk environments and configuration templates are activated.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ElasticBeanstalk::Environment, AWS::ElasticBeanstalk::ConfigurationTemplate
- **AWS CloudFormation guard rule:** [CT.ELASTICBEANSTALK.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICBEANSTALK.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICBEANSTALK.PR.2 example templates](#)

Explanation

Managed platform updates ensure that the most recent platform fixes, updates, and features for the environment are installed. Keeping patch installations up to date is an important step in securing systems.

Usage considerations

- When you set up managed actions on AWS Elastic Beanstalk environments and configuration templates, you must provide `PreferredStartTime` and `UpdateLevel` option settings also.
- This control allows you to set up managed actions on AWS Elastic Beanstalk environments only, because environment-level settings take precedence over settings that are defined in configuration templates.
- This control does not allow you to deactivate managed actions on AWS Elastic Beanstalk configuration templates.

Remediation for rule failure

For AWS Elastic Beanstalk environments, create an `OptionSetting` with a `Namespace` value set to `aws:elasticbeanstalk:managedactions`, `OptionName` set to `ManagedActionsEnabled`, and `Value` set to `true`. For Elastic Beanstalk configuration templates, create an `OptionSetting` with a `Namespace` value set to `aws:elasticbeanstalk:managedactions`, `OptionName` set to `ManagedActionsEnabled`, and `Value` set to `true`, or omit this setting to adopt the default value of `true`.

[CT.ELASTICBEANSTALK.PR.3] Require an AWS Elastic Beanstalk environment to have a logging configuration

This control checks whether an AWS Elastic Beanstalk environment is configured to send logs to Amazon CloudWatch Logs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ElasticBeanstalk::Environment, AWS::ElasticBeanstalk::ConfigurationTemplate
- **AWS CloudFormation guard rule:** [CT.ELASTICBEANSTALK.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICBEANSTALK.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.ELASTICBEANSTALK.PR.3 example templates](#)

Explanation

Monitoring is an important part of maintaining the reliability, availability, and performance of your AWS solutions. We recommend that you collect monitoring data from all of the parts of your AWS solution, so that you can debug a multi-point failure, if one occurs. From a security perspective, logging is an important feature to enable for future forensics efforts in the case of a security incident.

Usage considerations

- This control requires only enabling logging to Amazon CloudWatch Logs on AWS Elastic Beanstalk environments, because environment level settings take precedence over settings defined in configuration templates.
- This control does not allow explicitly disabling logging to Amazon CloudWatch Logs on AWS Elastic Beanstalk configuration templates.

Remediation for rule failure

For AWS Elastic Beanstalk environments, establish an `OptionSetting` with a `Namespace` set to `aws:elasticbeanstalk:cloudwatch:logs`, `OptionName` set to `StreamLogs`, and `Value` set to `true`. For Elastic Beanstalk configuration templates, establish an `OptionSetting` with a `Namespace` set to `aws:elasticbeanstalk:cloudwatch:logs`, `OptionName` set to `StreamLogs`, and `Value` set to `true`, or omit this `OptionSetting`.

The examples that follow show how to implement this remediation.

AWS Elastic Beanstalk Environment - Example

An AWS Elastic Beanstalk environment configured to stream logs to Amazon CloudWatch Logs by means of an entry in the `OptionSettings` property. The example is shown in JSON and in YAML.

[CT.EC2.PR.1] Require an Amazon EC2 launch template to have IMDSv2 configured

This control checks whether your Amazon EC2 launch templates are configured with Instance Metadata Service Version 2 (IMDSv2).

- **Control objective:** Enforce least privilege, Protect configurations
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::LaunchTemplate
- **AWS CloudFormation guard rule:** [CT.EC2.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.1 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.1 example templates](#)

Explanation

Instance metadata configures and manages your running instances. The IMDS provides access to temporary, frequently rotated credentials, so you don't need to distribute sensitive credentials to instances, either manually or programmatically. The IMDS is attached locally to every EC2 instance. It runs on a special IP address of 169.254.169.254. This IP address is accessible only to software that runs on the instance.

Version 2 of the IMDS adds protections for vulnerabilities that can be used to gain access to the IMDS: Open website application firewalls, Open reverse proxies, Server-side request forgery (SSRF) vulnerabilities and Open Layer 3 firewalls and network address translation (NAT).

AWS Control Tower recommends that you configure your EC2 instances with IMDSv2.

Usage considerations

- This control applies only to Amazon EC2 launch templates that allow access to instance metadata.

Remediation for rule failure

Within the `LaunchTemplateData` property, provide a `MetadataOptions` configuration and set the value of `HttpTokens` to `required`.

The examples that follow show how to implement this remediation.

[CT.EC2.PR.2] Require that Amazon EC2 launch templates restrict the token hop limit to a maximum of one

This control checks whether an Amazon EC2 launch template has a metadata token hop limit set to 1.

- **Control objective:** Enforce least privilege, Protect configurations
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::LaunchTemplate
- **AWS CloudFormation guard rule:** [CT.EC2.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.2 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.2 example templates](#)

Explanation

The Amazon Instance Metadata Service (IMDS) provides metadata information about an Amazon EC2 instance, which is useful for application configuration. Restricting the HTTP PUT response for the metadata service to the EC2 instance protects the IMDS from unauthorized use.

The Time To Live (TTL) field in the IP packet is reduced by one on every hop. This reduction can be used to ensure that the packet does not travel outside EC2. IMDSv2 protects EC2 instances that may have been misconfigured as open routers, layer 3 firewalls, VPNs, tunnels, or NAT devices, which prevents unauthorized users from retrieving metadata. With IMDSv2, the PUT response that contains the secret token cannot travel outside the instance, because the default metadata response hop limit is set to 1. However, if this value is greater than 1, the token can leave the EC2 instance.

Usage considerations

- This control applies only to Amazon EC2 launch templates that allow access to instance metadata.
- This control is incompatible with Amazon EC2 launch templates that require a token hop limit of 2.

Remediation for rule failure

Within the `LaunchTemplateData` property, provide a `MetadataOptions` configuration with the value of `HttpPutResponseLimit` set to 1, or omit the `HttpPutResponseLimit` property to adopt the AWS CloudFormation default value of 1.

The examples that follow show how to implement this remediation.

Amazon EC2 Launch Template - Example One

Amazon EC2 launch template configured with access to instance metadata enabled and a token hop limit of 1, set by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

JSON example

```
{
  "EC2LaunchTemplate": {
    "Type": "AWS::EC2::LaunchTemplate",
    "Properties": {
      "LaunchTemplateData": {
        "MetadataOptions": {
          "HttpEndpoint": "enabled"
        }
      }
    }
  }
}
```

YAML example

```
EC2LaunchTemplate:
  Type: AWS::EC2::LaunchTemplate
  Properties:
    LaunchTemplateData:
      MetadataOptions:
        HttpEndpoint: enabled
```

The examples that follow show how to implement this remediation.

Amazon EC2 Launch Template - Example Two

Amazon EC2 launch template configured with access to instance metadata enabled and a token hop limit of 1, set by means of the MetadataOptions property. The example is shown in JSON and in YAML.

JSON example

```
{
  "EC2LaunchTemplate": {
    "Type": "AWS::EC2::LaunchTemplate",
```

```

    "Properties": {
      "LaunchTemplateData": {
        "MetadataOptions": {
          "HttpEndpoint": "enabled",
          "HttpPutResponseHopLimit": 1
        }
      }
    }
  }
}

```

YAML example

```

[CT.EC2.PR.3] Require that any Amazon EC2 security group rule does not use the source IP range 0.0.0.0/0 or ::/0 for ports other than 80 and 443

This control checks whether an Amazon EC2 security group rule contains the string 0.0.0.0/0 or ::/0 as a source IP range. This control is not triggered if a rule allows connection to port 80 or 443 with TCP, UDP, ICMP, or ICMPv6. The use of managed prefix lists is not supported.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::SecurityGroup, AWS::EC2::SecurityGroupIngress
- **AWS CloudFormation guard rule:** [CT.EC2.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.3 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.EC2.PR.3 example templates](#)

Explanation

Security groups provide stateful filtering of ingress and egress network traffic to AWS resources. Disallowing usage of the strings `0.0.0.0/0` or `::/0` helps protect against this common misconfiguration and encourages users to choose a range aligned with least-privilege principles.

AWS recommends a layered approach, to ensure that network access is provided only as necessary for your business requirements. Security group rules should follow the principle of least privileged access. Unrestricted access increases the opportunity for malicious activity. Unless a port is specifically allowed, the port should deny unrestricted access (any IP address with a `/0` suffix).

Usage considerations

- This control applies only to Amazon EC2 security group and EC2 security group ingress resources with ingress rules that allow inbound traffic from `0.0.0.0/0` or `::/0`
- This control does not allow use of the `SourcePrefixListId` property on Amazon EC2 Security Group and Amazon EC2 Security Group Ingress resources.

Remediation for rule failure

Ensure that security groups with ingress rules that allow TCP or UDP traffic from `0.0.0.0/0` or `::/0` allow traffic from ports 80 or 443 only.

The use of managed prefix lists is not supported.

The examples that follow show how to implement this remediation.

Amazon EC2 Security Group - Example One

Amazon EC2 Security Group allowing inbound TCP traffic from `0.0.0.0/0` on port 80. The example is shown in JSON and in YAML.

JSON example

```

The examples that follow show how to implement this remediation.

Amazon EC2 Security Group - Example Two

Amazon EC2 Security Group allowing inbound TCP traffic from `0.0.0.0/0` on port 443. The example is shown in JSON and in YAML.

[CT.EC2.PR.4] Require that any Amazon EC2 security group rule does not use the source IP range 0.0.0.0/0 or ::/0 for specific high-risk ports

This control checks whether an Amazon EC2 security group rule that contains the strings 0.0.0.0/0 or ::/0 as a source IP range does not allow incoming TCP, UDP, ICMP, or ICMPv6 traffic to the following ports: 3389, 20, 23, 110, 143, 3306, 8080, 1433, 9200, 9300, 25, 445, 135, 21, 1434, 4333, 5432, 5500, 5601, 22, 3000, 5000, 8088, 8888. The use of managed prefix lists is not supported.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::SecurityGroup, AWS::EC2::SecurityGroupIngress
- **AWS CloudFormation guard rule:** [CT.EC2.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.4 example templates](#)

Explanation

Security groups provide stateful filtering of ingress and egress network traffic to AWS resources. Disallowing usage of the strings `0.0.0.0/0` or `::/0` helps protect against this common misconfiguration and encourages users to choose a range aligned with least-privilege principles.

AWS recommends a layered approach, to ensure that network access is provided only as necessary for your business requirements. No security group should allow unrestricted ingress access to the following ports:

3389, 20, 23, 110, 143, 3306, 8080, 1433, 9200, 9300, 25, 445, 135, 21, 1434, 4333, 5432, 5500, 5601, 22, 3000, 5000, 8088, 8888.

Unrestricted access (`0.0.0.0/0`) increases opportunities for malicious activity, such as hacking, denial-of-service attacks, and loss of data.

Usage considerations

- This control applies only to Amazon EC2 security group and security group ingress resources with ingress rules that allow inbound traffic from `0.0.0.0/0` or `::/0`.
- This control does not allow use of the `SourcePrefixListId` property on Amazon EC2 Security Group and Amazon EC2 Security Group Ingress resources.

Remediation for rule failure

Remove Amazon EC2 security group ingress rules that allow traffic from `0.0.0.0/0` or `::/0` to high-risk ports: 3389, 20, 23, 110, 143, 3306, 8080, 1433, 9200, 9300, 25, 445, 135, 21, 1434, 4333, 5432, 5500, 5601, 22, 3000, 5000, 8088, 8888.

The use of managed prefix lists is not supported.

The examples that follow show how to implement this remediation.

Amazon EC2 Security Group - Example

Amazon EC2 security group configured to allow traffic from the source IP range `0.0.0.0/0` or `::/0` on a port range that does not include a high-risk port. The example is shown in JSON and in YAML.

JSON example

```
{
  "SecurityGroup": {
    "Type": "AWS::EC2::SecurityGroup",
    "Properties": {
      "GroupDescription": "sample-security-group",
      "SecurityGroupIngress": [

          "FromPort": 80,
          "ToPort": 80
        }
      ]
    }
  }
}
```

YAML example

```
SecurityGroup:
  Type: AWS::EC2::SecurityGroup
  Properties:
    GroupDescription: sample-security-group
    SecurityGroupIngress:
      - IpProtocol: tcp
        CidrIp: '0.0.0.0/0'
        FromPort: 80
        ToPort: 80
```

The examples that follow show how to implement this remediation.

Amazon EC2 Security Group Ingress Rule - Example

Amazon EC2 security group ingress rule configured to allow traffic from the source IP range `0.0.0.0/0` or `::/0` on a port range that does not include a high-risk port. The example is shown in JSON and in YAML.

JSON example

```
{
  "SecurityGroupIngress": {
    "Type": "AWS::EC2::SecurityGroupIngress",
    "Properties": {
      "GroupId": {
        "Fn::GetAtt": [

      "CidrIp": "0.0.0.0/0",
      "FromPort": 80,
      "ToPort": 90
    }
  }
}
```

YAML example

```
SecurityGroupIngress:
  Type: AWS::EC2::SecurityGroupIngress
  Properties:
    GroupId: !GetAtt 'SecurityGroup.GroupId'
    IpProtocol: tcp
    CidrIp: '0.0.0.0/0'

[CT.EC2.PR.5] Require any Amazon EC2 network ACL to prevent ingress from 0.0.0.0/0 to port 22 or port 3389

This control checks whether the Amazon EC2 network ACL inbound entry allows unrestricted incoming traffic (0.0.0.0/0 or ::/0) for SSH or RDP.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::NetworkACLEntry
- **AWS CloudFormation guard rule:** [CT.EC2.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.5 example templates](#)

Explanation

Access to remote server administration ports, such as port 22 (SSH) and port 3389 (RDP), should not be publicly accessible, because these ports may allow unintended access to resources within your VPC.

Usage considerations

- This control only applies to Amazon EC2 network ACL entry resources that allow unrestricted inbound traffic.

Remediation for rule failure

For Amazon EC2 network ACL entries that allow inbound connectivity on port 22 or port 3389, provide a CIDR range in `CidrBlock` or `Ipv6CidrBlock` that does not allow traffic from all sources.

The examples that follow show how to implement this remediation.

Amazon EC2 Network ACL Entry - Example One

Amazon EC2 network ACL entry configured to allow unrestricted inbound IPv4 TCP traffic in a port range excluding port 22 (SSH) and port 3389 (RDP). The example is shown in JSON and in YAML.

JSON example

```
{
  "NetworkAclEntry": {
    "Type": "AWS::EC2::NetworkAclEntry",
    "Properties": {
      "CidrBlock": "0.0.0.0/0",
      "Egress": false,
      "NetworkAclId": {
```

```

        "Ref": "NACL"
      },
      "Protocol": 6,
      "PortRange": {
        "From": 2000,
        "To": 2005
      },
      "RuleAction": "allow",
      "RuleNumber": 100
    }
  }
}

```

YAML example

```

NetworkAclEntry:
  Type: AWS::EC2::NetworkAclEntry
  Properties:
    CidrBlock: '0.0.0.0/0'
    Egress: false
    NetworkAclId: !Ref 'NACL'

    PortRange:
      From: 2000
      To: 2005
    RuleAction: allow
    RuleNumber: 100

```

The examples that follow show how to implement this remediation.

Amazon EC2 Network ACL Entry - Example Two

Amazon EC2 network ACL entry configured to allow unrestricted inbound IPv6 UDP traffic in a port range excluding port 3389 (RDP). The example is shown in JSON and in YAML.

JSON example

```
{
```

```

"NetworkAclEntry": {
  "Type": "AWS::EC2::NetworkAclEntry",
  "Properties": {
    "Ipv6CidrBlock": ":::/0",
    "Egress": false,
    "NetworkAclId": {
      "Ref": "NACL"
    },
    "Protocol": 17,
    "PortRange": {

      "To": 200
    },
    "RuleAction": "allow",
    "RuleNumber": 100
  }
}
}

```

YAML example

```

NetworkAclEntry:
  Type: AWS::EC2::NetworkAclEntry
  Properties:
    Ipv6CidrBlock: :::/0
    Egress: false
    NetworkAclId: !Ref 'NACL'

[CT.EC2.PR.6] Require that Amazon EC2 transit gateways refuse automatic Amazon VPC attachment requests

This control checks whether Amazon EC2 transit gateways are configured to accept Amazon VPC attachment requests automatically.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::EC2::TransitGateway`
- **AWS CloudFormation guard rule:** [CT.EC2.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.6 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.6 example templates](#)

Explanation

Turning on the `AutoAcceptSharedAttachments` property configures a transit gateway to accept cross-account VPC attachment requests automatically, without verifying the request or the account from which the attachment is originating. In alignment with the best practices of authorization and authentication, we recommended turning off this feature, to ensure that only authorized VPC attachment requests are accepted.

Remediation for rule failure

Omit the `AutoAcceptSharedAttachments` property or set the property to `disable`.

The examples that follow show how to implement this remediation.

AWS Transit Gateway - Example

AWS Transit Gateway configured to deactivate auto-acceptance of cross-account Amazon VPC attachments. The example is shown in JSON and in YAML.

[CT.EC2.PR.7] Require an Amazon EBS volume resource to be encrypted at rest when defined by means of the `AWS::EC2::Instance BlockDeviceMappings` property or `AWS::EC2::Volume` resource type

This control checks whether your standalone Amazon EC2 EBS volume and Amazon Elastic Block Store (EBS) volume created through EC2 instance Block Device Mappings are encrypted at rest. Specifically, it checks that the **Encrypted** property is set to **true** in either the EBS volume resource definition or an EC2 instance resource definition's **BlockDeviceMappings** property.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::EC2::Instance`, `AWS::EC2::Volume`
- **AWS CloudFormation guard rule:** [CT.EC2.PR.7 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.7 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.7 example templates](#)

Explanation

For an added layer of security of your sensitive data in Amazon EC2 EBS volumes, you should enable EBS encryption at rest. Amazon EBS encryption offers a straightforward encryption solution for your EBS resources that doesn't require you to build, maintain, and secure your own key management infrastructure. It uses KMS keys when creating encrypted volumes and snapshots.

Amazon Elastic Block Store (EBS) volumes can be inherited from:

- The Amazon Machine Image (AMI) specified with the `ImageId` property
- The Launch Template specified with the `LaunchTemplateId` property

Usage considerations

- For Amazon EC2 instance block device mappings, this control does not check any block device mappings created by means of an EC2 launch template or inherited through the AMI from which the instance is launched.

Remediation for rule failure

Set Encryption to true on Amazon EC2 EBS Volumes.

The examples that follow show how to implement this remediation.

Amazon EC2 Instance - Example

[CT.EC2.PR.8] Require an Amazon EC2 instance to set `AssociatePublicIpAddress` to `false` on a new network interface created by means of the `NetworkInterfaces` property in the `AWS::EC2::Instance` resource

This control checks whether your Amazon EC2 instance is configured **not** to associate a public IP address by default. In particular, this control requires configuring the `AssociatePublicIpAddress` parameter to `false` on a new network interface created by means of the `NetworkInterfaces` property.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::EC2::Instance`
- **AWS CloudFormation guard rule:** [CT.EC2.PR.8 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.8 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.8 example templates](#)

This control is incompatible with AWS Cloud9

A compatibility issue exists with AWS Cloud9 and this AWS Control Tower proactive control, [\[CT.EC2.PR.8\] Require an Amazon EC2 instance to set **AssociatePublicIpAddress** to **false** on a new network interface created by means of the **NetworkInterfaces** property in the **AWS::EC2::Instance** resource](#). If this control is enabled, you cannot create an Amazon EC2 environment in AWS Cloud9. For more information, see [Troubleshooting AWS Cloud9](#).

Explanation

A public IPv4 address is an IP address that is reachable from the internet. If you launch your instance with a public IP address, then your EC2 instance is reachable from the internet. A private IPv4 address is an IP address that is not reachable from the internet. You can use private IPv4 addresses for communication between EC2 instances in the same VPC or in your connected private network.

IPv6 addresses are globally unique, and therefore are reachable from the internet. However, by default all subnets have the IPv6 addressing attribute set to false.

The network interface settings can be inherited from the Launch Template specified with the **LaunchTemplateId** property.

Usage considerations

- This control applies only to a new network interface created by means of the **NetworkInterfaces** property, where a **NetworkInterfaceId** has not been specified.
- This control requires subnet information to be specified within a **NetworkInterfaces** configuration instead of the root level **SubnetId** property.
- This control does not check a network interface that may be created in an Amazon EC2 launch template that may be referenced by the **LaunchTemplateId** property.
- A compatibility issue exists with AWS Cloud9 and this AWS Control Tower proactive control. If this control is enabled, you cannot create an Amazon EC2 environment in AWS Cloud9.

Remediation for rule failure

Specify network interfaces using the `NetworkInterfaces` property instead of the root level `SubnetId` property. Set `AssociatePublicIpAddress` to `false` within each `NetworkInterfaces` configuration.

The examples that follow show how to implement this remediation.

Amazon EC2 Instance - Example

Amazon EC2 instance configured with a new interface that disables public IP address association on creation. The example is shown in JSON and in YAML.

[CT.EC2.PR.9] Require any Amazon EC2 launch template not to auto-assign public IP addresses to network interfaces

This control checks whether your Amazon EC2 launch templates are configured to assign public IP addresses to network interfaces.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::LaunchTemplate
- **AWS CloudFormation guard rule:** [CT.EC2.PR.9 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.9 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.9 example templates](#)

Explanation

A public IP address is an IP address that is reachable from the internet. If you configure your network interfaces with a public IP address, then the resources associated to those network interfaces are reachable from the internet. EC2 resources should not be publicly accessible, because this may allow unintended access to your application servers.

Usage considerations

- This control applies only to new network interfaces created by means of the `NetworkInterfaceId` property in `LaunchTemplateData` (`NetworkInterfaces` configurations where a `NetworkInterfaceId` has not been specified).
- This control requires setting `AssociatePublicIpAddress` to `false` on new network interfaces created by means of the `NetworkInterfaces` property in `LaunchTemplateData`.

Remediation for rule failure

Set `AssociatePublicIpAddress` to `false` within each `NetworkInterfaces` configuration in `LaunchTemplateData`.

The examples that follow show how to implement this remediation.

            "AssociatePublicIpAddress": false
          }
        ]
      }
    }
  }
}
```

[CT.EC2.PR.10] Require Amazon EC2 launch templates to have Amazon CloudWatch detailed monitoring activated

This control checks whether the Amazon EC2 launch template has detailed monitoring enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::LaunchTemplate
- **AWS CloudFormation guard rule:** [CT.EC2.PR.10 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.10 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.10 example templates](#)

Explanation

Monitoring is an important part of maintaining the reliability, availability, and performance of your AWS solutions. You should collect monitoring data from all of the parts of your AWS solution so that you can more easily debug a multi-point failure if one occurs. From a security perspective, logging is also an important feature to enable for future forensics efforts in the case of any security incidents.

Remediation for rule failure

In `LaunchTemplateData`, provide a `Monitoring` configuration with `Enabled` set to `true`.

The examples that follow show how to implement this remediation.

Amazon EC2 Launch Template - Example

Amazon EC2 launch template configured with detailed monitoring enabled. The example is shown in JSON and in YAML.

        "Monitoring": {
          "Enabled": true
        }
      }
    }
  }
}
```

YAML example

[CT.EC2.PR.11] Require that an Amazon EC2 subnet does not automatically assign public IP addresses

This control checks whether your Amazon VPC subnets assign public IP addresses automatically.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::Subnet
- **AWS CloudFormation guard rule:** [CT.EC2.PR.11 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.11 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.11 example templates](#)

Explanation

All subnets have an attribute that determines whether a network interface created in the subnet automatically receives a public IPv4 address. When launched into subnets that have this attribute enabled, instances receive a public IP address assigned to their primary network interface.

Usage considerations

- This control deactivates automatic assignment of public IP addresses for new network interfaces in Amazon VPC subnets.
- When this control is in operation, public IP addresses can be assigned to network interfaces by means of resource-level settings. (For example, assignment of a public IP address can be made at EC2 instance launch time.)

Remediation for rule failure

Omit the `MapPublicIpOnLaunch` property to use the default configuration, or set the `MapPublicIpOnLaunch` property to `false`.

The examples that follow show how to implement this remediation.

Amazon VPC Subnet - Example One

Amazon VPC subnet configured to deactivate automatic assignment of public IP addresses by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

[CT.EC2.PR.12] Require an Amazon EC2 instance to specify at most one network interface by means of the `NetworkInterfaces` property in the `AWS::EC2::Instance` resource

This control checks whether your Amazon Elastic Compute Cloud (Amazon EC2) instance uses multiple ENIs (Elastic Network Interfaces). Specifically, it checks whether an `AWS::EC2::Instance` resource specifies multiple ENIs in the `NetworkInterfaces` property.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::EC2::Instance`
- **AWS CloudFormation guard rule:** [CT.EC2.PR.12 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.12 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.EC2.PR.12 example templates](#)

Explanation

Multiple ENIs can cause dual-homed instances, meaning instances that have multiple subnets. This duplication can add network security complexity and introduce unintended network paths and access.

The network interface settings can be inherited from the Launch Template specified with the `LaunchTemplateId` property.

Usage considerations

- This control does not check a network interface that may be specified in an Amazon EC2 launch template and referenced by the `LaunchTemplateId` property.
- This rule is incompatible with scenarios in which the `NetworkInterfaces` property must be used to specify multiple ENIs. For example, this control may fail if an Amazon EC2

instance that belongs to an Amazon EKS cluster specifies more than one ENI by means of the **NetworkInterfaces** property.

Remediation for rule failure

Configure Amazon EC2 instances with only one ENI.

The examples that follow show how to implement this remediation.

Amazon EC2 Instance - Example

EC2 Instance with a single network interface. The example is shown in JSON and in YAML.

JSON example

```
{
  "EC2Instance": {
    "Type": "AWS::EC2::Instance",
    "Properties": {
      "ImageId": {
        "Ref": "LatestAmiId"

[CT.EC2.PR.13] Require an Amazon EC2 instance to have detailed monitoring enabled

This control checks whether an Amazon EC2 instance has detailed monitoring enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::Instance
- **AWS CloudFormation guard rule:** [CT.EC2.PR.13 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.13 rule specification](#)

- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.EC2.PR.13 example templates](#)

Explanation

By default, all Amazon EC2 instances are created with basic monitoring that sends host-level logs to Amazon CloudWatch every five (5) minutes. With detailed monitoring, host-level logs are collected every one (1) minute instead, leading to faster detection of possible malicious or anomalous activity.

Usage considerations

- When you enable detailed monitoring, you are charged per metric that is sent to CloudWatch. You are not charged for data storage. For more information, see the Amazon CloudWatch pricing page.

Remediation for rule failure

Set `Monitoring` to `true`.

The examples that follow show how to implement this remediation.

An EC2 Instance with detailed monitoring enabled. The example is shown in JSON and in YAML.

[CT.EC2.PR.14] Require an Amazon EBS volume configured through an Amazon EC2 launch template to encrypt data at rest

This control checks whether an Amazon EC2 launch template with EBS volume block device mappings is configured to enable EBS volume encryption.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::LaunchTemplate
- **AWS CloudFormation guard rule:** [CT.EC2.PR.14 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.14 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EC2.PR.14 example templates](#)

Explanation

For an added layer of security of your sensitive data in an EBS volume, you should enable EBS encryption at rest. Amazon EBS encryption offers a straightforward encryption solution for your EBS resources. It doesn't require you to build, maintain, and secure your own key management infrastructure, and it uses KMS keys when creating encrypted volumes and snapshots.

Usage considerations

- This control applies only to an EC2 launch template that specifies EBS block device mappings.
- When you launch an instance using a launch template, you can override parameters that are specified in the launch template. To ensure that encryption is enabled for EBS block device mappings when you launch an instance with a launch template by means of the AWS::EC2::Instance resource, use this control in conjunction with CT.EC2.PR.7.

Remediation for rule failure

For every entry in the `BlockDeviceMappings` parameter with an `Ebs` configuration, set `Encryption` to `true`.

The examples that follow show how to implement this remediation.

Amazon EC2 launch template - Example

An Amazon EC2 launch template configured with an EBS block device mapping that has volume encryption enabled. The example is shown in JSON and in YAML.

JSON example

```
{
  "LaunchTemplate": {
    "Type": "AWS::EC2::LaunchTemplate",
    "Properties": {
      "LaunchTemplateData": {
        "BlockDeviceMappings": [
          {
            "DeviceName": "/dev/sdc",
            "Ebs": {
              "Encrypted": true
            }
          }
        ]
      }
    }
  }
}
```

YAML example

```
LaunchTemplate:
  Type: AWS::EC2::LaunchTemplate
  Properties:
    LaunchTemplateData:
      BlockDeviceMappings:
```

```
- DeviceName: /dev/sdc
  Ebs:
    Encrypted: true

[CT.EC2.PR.15] Require an Amazon EC2 instance to use an AWS Nitro instance type when creating from the 'AWS::EC2::LaunchTemplate' resource type

This control checks whether Amazon EC2 launch templates that specify an Amazon EC2 instance type or use attribute based instance selection, specify only AWS Nitro instance types.

- **Control objective:** Protect data integrity, Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::LaunchTemplate
- **AWS CloudFormation guard rule:** [CT.EC2.PR.15 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.15 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.EC2.PR.15 example templates](#)

Explanation

The AWS Nitro System is a collection of hardware and software components built by AWS to enable high performance, high availability, and high security. The Nitro System provides enhanced security that continuously monitors, protects, and verifies the instance hardware and firmware. AWS Nitro offloads virtualization resources to dedicated hardware and software, which minimizes the attack surface. Finally, the Nitro System has a locked down security model to prohibit administrative access, eliminating the possibility of human error and tampering.

For information about Nitro instance types, see [Instances built on the Nitro System](#) in the *Amazon EC2 User Guide for Linux Instances*.

Usage considerations

- This control applies only to launch templates that specify an Amazon EC2 instance type by means of the InstanceType property or use attribute based instance selection by means of the InstanceRequirements property.
- When you launch an instance using a launch template, you can override parameters that are specified in the launch template. To launch instances with a Nitro instance type when using a launch template, use this control in conjunction with related proactive controls.

Remediation for rule failure

When InstanceType in LaunchTemplateData has been provided, set InstanceType to an Amazon EC2 instance type that is based on the AWS Nitro system. When InstanceRequirements in LaunchTemplateData has been provided, set AllowedInstanceTypes to a list of Amazon EC2 instance types based on the AWS Nitro system.

The examples that follow show how to implement this remediation.

[CT.EC2.PR.16] Require an Amazon EC2 instance to use an AWS Nitro instance type when created using the 'AWS::EC2::Instance' resource type

This control checks whether an Amazon EC2 instance is configured to run using an AWS Nitro instance type.

- **Control objective:** Protect data integrity, Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::Instance
- **AWS CloudFormation guard rule:** [CT.EC2.PR.16 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.16 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.EC2.PR.16 example templates](#)

Explanation

The Nitro System is a collection of hardware and software components built by AWS to enable high performance, high availability, and high security. The Nitro System provides enhanced security because it continuously monitors, protects, and verifies the instance's hardware and firmware. Virtualization resources are offloaded to dedicated hardware and software, minimizing the attack surface. The Nitro System security model is locked down to prohibit administrative access, reducing the possibility of human error and tampering.

Usage considerations

- This control requires that the InstanceType property is provided and set to a Nitro instance type. This setting prevents you from inheriting an instance type, by way of an Amazon EC2 launch template.

Remediation for rule failure

Set the value of the InstanceType property to an Amazon EC2 instance type based on the AWS Nitro system.

The examples that follow show how to implement this remediation.

Amazon EC2 Instance - Example

An Amazon EC2 instance configured with an instance type based on the AWS Nitro system. The example is shown in JSON and in YAML.

[CT.EC2.PR.17] Require an Amazon EC2 dedicated host to use an AWS Nitro instance type

This control checks whether an Amazon EC2 dedicated host is configured to run using an AWS Nitro instance type or family.

- **Control objective:** Protect data integrity, Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::Host
- **AWS CloudFormation guard rule:** [CT.EC2.PR.17 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.17 rule specification](#)

- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.EC2.PR.17 example templates](#)

Explanation

The Nitro System is a collection of hardware and software components built by AWS to enable high performance, high availability, and high security. The Nitro System provides enhanced security because it continuously monitors, protects, and verifies the instance's hardware and firmware. Virtualization resources are offloaded to dedicated hardware and software, minimizing the attack surface. The Nitro System security model is locked down to prohibit administrative access, reducing the possibility of human error and tampering.

Usage considerations

- When you allocate a dedicated host in your account, you can choose a configuration that supports either a single instance type, or multiple instance types within the same instance family. The number of instances that you can run on a host depends on the configuration you choose. See [Instance capacity configurations](#) in the *Amazon EC2 User Guide for Linux Instances* for information about support for single instance types and multiple instance types.

Remediation for rule failure

Set the value of the InstanceType property to an Amazon EC2 instance type that is based on the AWS Nitro system, and that supports dedicated hosts, or set the value of the InstanceFamily property to an Amazon EC2 instance family that is based on the AWS Nitro system, and that supports dedicated hosts and multiple instance types.

The examples that follow show how to implement this remediation.

[CT.EC2.PR.18] Require an Amazon EC2 fleet to override only those launch templates with AWS Nitro instance types

This control checks that Amazon EC2 fleets only override launch templates with AWS Nitro instance types.

- **Control objective:** Protect data integrity, Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::EC2Fleet
- **AWS CloudFormation guard rule:** [CT.EC2.PR.18 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.18 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.EC2.PR.18 example templates](#)

Explanation

The Nitro System is a collection of hardware and software components built by AWS to enable high performance, high availability, and high security. The Nitro System provides enhanced security because it continuously monitors, protects, and verifies the instance's hardware and firmware. Virtualization resources are offloaded to dedicated hardware and software, minimizing the attack surface. The Nitro System security model is locked down to prohibit administrative access, reducing the possibility of human error and tampering.

Usage considerations

- This control applies only when launch template overrides have been provided, specifically, entries in `LaunchTemplateConfigs` specifying one or more `Overrides` that also include values for `InstanceType` or `InstanceRequirements` properties.
- This control does not check the instance type configured on a launch template. To ensure that launch templates use Nitro instances types, use this control in conjunction with related controls that check launch templates for Nitro instance types.

Remediation for rule failure

For any entry in the `LaunchTemplateConfigs` parameter, if it has one or more `Overrides` properties that also include `InstanceType` or `InstanceRequirements` fields, set the value of the `InstanceType` field to an EC2 instance type based on the AWS Nitro system, or set the value of the `AllowedInstanceTypes` field in the `InstanceRequirements` property to one or more EC2 instance types that are based on the AWS Nitro system.

The examples that follow show how to implement this remediation.

[CT.EC2.PR.19] Require an Amazon EC2 Amazon EC2 instance to use an AWS Nitro instance type that supports encryption in-transit between instances when created using the AWS::EC2::Instance resource type

This control checks whether an Amazon EC2 instance has been configured to run using a Nitro instance type that supports encryption in-transit between instances.

- **Control objective:** Encrypt data in transit, Protect data integrity, Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::Instance
- **AWS CloudFormation guard rule:** [CT.EC2.PR.19 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.19 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.EC2.PR.19 example templates](#)

Explanation

The Nitro System is a collection of hardware and software components built by AWS to enable high performance, high availability, and high security. The Nitro System provides enhanced security because it continuously monitors, protects, and verifies the instance's hardware and firmware. Virtualization resources are offloaded to dedicated hardware and software, minimizing the attack surface. The Nitro System security model is locked down to prohibit administrative access, reducing the possibility of human error and tampering.

AWS provides secure and private connectivity between Amazon EC2 instances of all types. In addition, some instance types utilize the offload capabilities of the underlying Nitro System hardware to encrypt in-transit traffic between instances, automatically. This encryption process uses Authenticated Encryption with Associated Data (AEAD) algorithms, with 256-bit encryption. It has no impact on network performance.

Usage considerations

- This control requires that the InstanceType property is provided and set to a Nitro instance type that supports encryption in transit between instances. This setting prevents you from inheriting an instance type by way of an Amazon EC2 launch template.
- To support in-transit traffic encryption between instances, in addition to using one of the Amazon EC2 instance types required by this control, the instances must be in the same Region, and they must be in the same VPC or group of peered VPCs, in which traffic does not pass through a virtual network device or service, such as a load balancer or a transit gateway.

Remediation for rule failure

Set InstanceType to an Amazon EC2 instance type based on the AWS Nitro system that supports encryption in-transit between instances.

The examples that follow show how to implement this remediation.

Amazon EC2 Instance - Example

An Amazon EC2 instance configured with an instance type based on the AWS Nitro system, and that supports encryption in transit between instances. The example is shown in JSON and in YAML.

JSON example

```

  "EC2Instance": {
    "Type": "AWS::EC2::Instance",
    "Properties": {
      "ImageId": {
        "Ref": "LatestAmiId"
      },
      "InstanceType": "t3.micro"
    }
  }
}
```

YAML example

```
EC2Instance:
  Type: AWS::EC2::Instance
  Properties:
    ImageId: !Ref 'LatestAmiId'
    InstanceType: t3.micro

CT.EC2.PR.19 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Parameters:

LatestAmiId:

Description: Region specific latest AMI ID from the Parameter Store

Type: AWS::SSM::Parameter::Value 'AWS::EC2::Image::Id'

Default: /aws/service/ami-amazon-linux-latest/amzn2-ami-hvm-x86_64-gp2

Resources:

EC2Instance:

Type: AWS::EC2::Instance

Properties:

[CT.EC2.PR.20] Require an Amazon EC2 fleet to override only those launch templates with AWS Nitro instance types that support encryption in transit between instances

This control checks whether an Amazon EC2 fleet overrides only the launch templates based upon AWS Nitro instance types that support encryption in transit between instances.

- **Control objective:** Encrypt data in transit, Protect data integrity, Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EC2::EC2Fleet
- **AWS CloudFormation guard rule:** [CT.EC2.PR.20 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EC2.PR.20 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.EC2.PR.20 example templates](#)

Explanation

The Nitro System is a collection of hardware and software components built by AWS to enable high performance, high availability, and high security. The Nitro System provides enhanced security because it continuously monitors, protects, and verifies the instance's hardware and firmware. Virtualization resources are offloaded to dedicated hardware and software, minimizing the attack surface. The Nitro System security model is locked down to prohibit administrative access, reducing the possibility of human error and tampering.

AWS provides secure and private connectivity between Amazon EC2 instances of all types. In addition, some instance types utilize the offload capabilities of the underlying Nitro System hardware to encrypt in-transit traffic between instances, automatically. This encryption process uses Authenticated Encryption with Associated Data (AEAD) algorithms, with 256-bit encryption. It has no impact on network performance.

Usage considerations

- This control applies only when launch template overrides have been provided, specifically, entries in `LaunchTemplateConfigs` specifying one or more `Overrides` that also include values for `InstanceType` or `InstanceRequirements` properties.
- This control does not check the instance type configured on a launch template. To ensure that launch templates use Nitro instances types that support encryption in-transit between instances, use this control in conjunction with related controls that check launch templates for Nitro instance types, and that the Nitro instance types support encryption in transit between instances.
- To support in-transit traffic encryption between instances, in addition to using one of the EC2 instance types required by this control, the instances must be in the same AWS Region, and they must be in the same VPC or group of peered VPCs, in which traffic does not pass through a virtual network device or service, such as a load balancer or a transit gateway.

Remediation for rule failure

For any entry in the `LaunchTemplateConfigs` parameter, if it has one or more `Overrides` properties that also include `InstanceType` or `InstanceRequirements` fields, set the value of the `InstanceType` field to an Amazon EC2 instance type that's based on the AWS Nitro system, and that supports encryption in transit between instances, or set the value of the `AllowedInstanceTypes` field in the `InstanceRequirements` property to one or more Amazon EC2 instance types that are based on the AWS Nitro system, and that support encryption in transit between instances.

The examples that follow show how to implement this remediation.

Amazon EC2 Fleet - Example One

An Amazon EC2 fleet configured with a launch template override and instance type that is based on the AWS Nitro system, and that supports encryption in transit between instances. The example is shown in JSON and in YAML.

Explanation

Amazon EC2 Auto Scaling groups can be configured to use multiple Availability Zones. An Auto Scaling group with a single Availability Zone is preferred in some use cases, such as batch-jobs or when inter-AZ transfer costs need to be kept to a minimum. However, an Auto Scaling group that does not span multiple Availability Zones will not launch instances in another Availability Zone to compensate if the configured single Availability Zone becomes unavailable.

Remediation for rule failure

Configure Auto Scaling groups with multiple Availability Zones.

The examples that follow show how to implement this remediation.

Auto Scaling group - Example

[CT.AUTOSCALING.PR.2] Require an Amazon EC2 Auto Scaling group launch configuration to configure Amazon EC2 instances for IMDSv2

This control checks whether an Amazon EC2 Auto Scaling launch configuration is configured to require the use of Instance Metadata Service Version 2 (IMDSv2).

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::AutoScaling::LaunchConfiguration
- **AWS CloudFormation guard rule:** [CT.AUTOSCALING.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.AUTOSCALING.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFront Templates related to this control, see: [CT.AUTOSCALING.PR.2 example templates](#)

Explanation

IMDS provides data about your instance, which you can use to configure or manage the running instance.

Version 2 of the IMDS adds protections that weren't available in IMDSv1, to safeguard your EC2 instances further.

Usage considerations

- This control applies only to Amazon EC2 Auto Scaling launch configurations that allow access to instance metadata.

Remediation for rule failure

Provide a `MetadataOptions` configuration and set the value of `HttpTokens` to `required`.

The examples that follow show how to implement this remediation.

Amazon EC2 Auto Scaling Launch Configuration - Example

Amazon EC2 Auto Scaling launch configuration with IMDSv2 enabled. The example is shown in JSON and in YAML.

      "InstanceType": "t3.micro",
      "MetadataOptions": {
        "HttpTokens": "required"
      }
    }
  }
}
```

YAML example

[CT.AUTOSCALING.PR.4] Require an Amazon EC2 Auto Scaling group associated with an AWS Elastic Load Balancing (ELB) to have ELB health checks activated

This control checks whether your Amazon EC2 Auto Scaling groups that are associated with a load balancer are using Elastic Load Balancing health checks.

- **Control objective:** Improve availability

- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::AutoScaling::AutoScalingGroup
- **AWS CloudFormation guard rule:** [CT.AUTOSCALING.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.AUTOSCALING.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [GitHub](#)

Explanation

This configuration requirement ensures that the group can determine an instance's health based on additional tests provided by the load balancer. Using Elastic Load Balancing health checks can help support the availability of applications that use EC2 Auto Scaling groups.

Usage considerations

- This control only applies to Auto Scaling groups associated with a Classic Load Balancer or Target Group

Remediation for rule failure

Configure Amazon EC2 Auto Scaling groups associated with an Elastic Load Balancing to use Elastic Load Balancing health checks.

The examples that follow show how to implement this remediation.

Auto Scaling group - Example One

Auto Scaling group with a Classic Load Balancer association and Elastic Load Balancing health checks. The example is shown in JSON and in YAML.

[CT.AUTOSCALING.PR.5] Require than an Amazon EC2 Auto Scaling group launch configuration does not have Amazon EC2 instances with public IP addresses

This control checks whether Amazon EC2 Auto Scaling groups have public IP addresses configured through Launch Configurations.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::AutoScaling::LaunchConfiguration
- **AWS CloudFormation guard rule:** [CT.AUTOSCALING.PR.5 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.AUTOSCALING.PR.5 example templates](#)

Explanation

Amazon EC2 instances in an Auto Scaling group launch configuration should not have an associated public IP address, except for in limited edge cases. Amazon EC2 instances should only be accessible from behind a load balancer instead of being directly exposed to the internet.

Remediation for rule failure

Set `AssociatePublicIpAddress` to `false` on Auto Scaling Launch Configurations.

The examples that follow show how to implement this remediation.

CT.AUTOSCALING.PR.5 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Parameters:

LatestAmiId:

Description: Region specific latest AMI ID from the Parameter Store

Type: AWS::SSM::Parameter::Value<AWS::EC2::Image::Id>

Default: /aws/service/ami-amazon-linux-latest/amzn2-ami-hvm-x86_64-gp2

Resources:

AutoScalingLaunchConfiguration:

Type: AWS::AutoScaling::LaunchConfiguration

Properties:

[CT.AUTOSCALING.PR.6] Require any Amazon EC2 Auto Scaling groups to use multiple instance types

This control checks whether an Amazon EC2 Auto Scaling group uses multiple instance types through a mixed instance policy and explicit instance type overrides.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::AutoScaling::AutoScalingGroup
- **AWS CloudFormation guard rule:** [CT.AUTOSCALING.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.AUTOSCALING.PR.6 rule specification](#)

- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.AUTOSCALING.PR.6 example templates](#)

Explanation

You can enhance availability by deploying your application across multiple instance types running in multiple Availability Zones. AWS Control Tower recommends using multiple instance types so that the Auto Scaling group can launch another instance type if there is insufficient instance capacity in your chosen Availability Zones.

Usage considerations

- This control applies only to Amazon EC2 Auto Scaling groups that do not use attribute-based instance type selection within a mixed instances policy (configured by means of the InstanceRequirements property within mixed instances policy Overrides).

Remediation for rule failure

Within a MixedInstancePolicy configuration, provide a LaunchTemplate configuration with two entries in the Overrides property. Within each override, set the InstanceType property to a different Amazon EC2 instance type.

The examples that follow show how to implement this remediation.

Explanation

An Auto Scaling group can be created from an EC2 launch template or from a launch configuration. If you use a launch template to create an Auto Scaling group, you have access to the latest features and improvements.

Remediation for rule failure

Provide a LaunchTemplate or MixedInstancesPolicy.LaunchTemplate.LaunchTemplateSpecification configuration with a valid Version and a LaunchTemplateId or LaunchTemplateName.

The examples that follow show how to implement this remediation.

[CT.AUTOSCALING.PR.9] Require an Amazon EBS volume configured through an Amazon EC2 Auto Scaling launch configuration to encrypt data at rest

This control checks whether Auto Scaling launch configurations with Amazon EBS volume block device mappings enable Amazon EBS volume encryption.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::AutoScaling::LaunchConfiguration`
- **AWS CloudFormation guard rule:** [CT.AUTOSCALING.PR.9 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.AUTOSCALING.PR.9 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.AUTOSCALING.PR.9 example templates](#)

Explanation

Enable Amazon EBS encryption at rest, to provide an added layer of security for your sensitive data in Amazon EBS volumes. Amazon EBS encryption offers a straightforward encryption solution for your Amazon EBS resources. It doesn't require you to build, maintain, and secure your own key management infrastructure. It uses KMS keys when creating encrypted volumes and snapshots.

Usage considerations

- This control applies only to Amazon EC2 Auto Scaling launch configurations that specify Amazon EBS block device mappings.

Remediation for rule failure

For every entry in the `BlockDeviceMappings` parameter with an `Ebs` configuration, set the value of `Encryption` to `true`.

The examples that follow show how to implement this remediation.

Amazon EC2 Auto Scaling Launch Configuration - Example

An Amazon EC2 Auto Scaling launch configuration configured with an Amazon EBS block device mapping that has volume encryption enabled. The example is shown in JSON and in YAML.

[CT.AUTOSCALING.PR.10] Require an Amazon EC2 Auto Scaling group to use only AWS Nitro instance types when overriding a launch template

This control checks whether, when using a `MixedInstancesPolicy` resource parameter override, an Amazon EC2 Auto Scaling group overrides launch templates by specifying AWS Nitro instance types only.

- **Control objective:** Protect data integrity, Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::AutoScaling::AutoScalingGroup`
- **AWS CloudFormation guard rule:** [CT.AUTOSCALING.PR.10 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.AUTOSCALING.PR.10 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.AUTOSCALING.PR.10 example templates](#)

Explanation

The Nitro System is a collection of hardware and software components built by AWS to enable high performance, high availability, and high security. The Nitro System provides enhanced security because it continuously monitors, protects, and verifies the instance's hardware and firmware. Virtualization resources are offloaded to dedicated hardware and software, thereby minimizing the attack surface. The Nitro System security model is locked down to prohibit administrative access, greatly reducing the possibility of human error and tampering.

Usage considerations

- This control applies only to Amazon EC2 Auto Scaling groups that are configured with launch template overrides that specify an instance type or instance attributes. A `LaunchTemplate.LaunchTemplateSpecification` configuration specifies one or more `Overrides` that also include `InstanceType` or `InstanceRequirements`.

- This control does not check the instance type configured on a launch template. To ensure that launch templates use Nitro instances types, use this control in conjunction with related controls that check launch templates for Nitro instance types.

Remediation for rule failure

In the `MixedInstancesPolicy.LaunchTemplate` property, if it has one or more `Overrides` fields that include `InstanceType` or `InstanceRequirements`, set the value of `InstanceType` to an Amazon EC2 instance type that is based on the AWS Nitro system, or set the value of `AllowedInstanceTypes` in `InstanceRequirements` to one or more Amazon EC2 instance types that are based on the AWS Nitro system.

The examples that follow show how to implement this remediation.

Amazon EC2 Auto Scaling Group - Example One

[CT.AUTOSCALING.PR.11] Require only AWS Nitro instance types that support network traffic encryption between instances to be added to an Amazon EC2 Auto Scaling group, when overriding a launch template

This control checks whether an Amazon EC2 Auto Scaling group uses AWS Nitro instance types that support network traffic encryption between instances, when overriding a launch template. The Auto Scaling group creates this override in the `AWS::AutoScaling::AutoScalingGroup.MixedInstancesPolicy.LaunchTemplate` parameter.

- **Control objective:** Encrypt data in transit, Protect data integrity, Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::AutoScaling::AutoScalingGroup`
- **AWS CloudFormation guard rule:** [CT.AUTOSCALING.PR.11 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.AUTOSCALING.PR.11 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.AUTOSCALING.PR.11 example templates](#)

Explanation

The Nitro System is a collection of hardware and software components built by AWS to enable high performance, high availability, and high security. The Nitro System provides enhanced security because it continuously monitors, protects, and verifies the instance's hardware and firmware. Virtualization resources are offloaded to dedicated hardware and software, thereby minimizing the

attack surface. The Nitro System security model is locked down to prohibit administrative access, greatly reducing the possibility of human error and tampering.

AWS provides secure and private connectivity between Amazon EC2 instances of all types. In addition, some instance types use the offload capabilities of the underlying Nitro System hardware to encrypt in-transit traffic between instances, automatically. This encryption uses Authenticated Encryption with Associated Data (AEAD) algorithms, and 256-bit encryption. It has no impact on network performance.

Usage considerations

- This control applies only to Amazon EC2 Auto Scaling groups that are configured with launch template overrides that specify an instance type or instance attributes. A `LaunchTemplate.LaunchTemplateSpecification` configuration specifies one or more `Overrides` that also include `InstanceType` or `InstanceRequirements`.
- This control does not check the instance type configured on a launch template. To ensure that launch templates use Nitro instance types that support encryption in-transit between instances, use this control in conjunction with related controls that check launch templates for Nitro instance types that support encryption in-transit between instances.
- To support in-transit traffic encryption between instances, the Amazon EC2 instances must be one of the types required by this control, the instances must be in the same AWS Region, and they must be in the same VPC or group of peered VPCs, in which traffic does not pass through a virtual network device or service, such as a load balancer or a transit gateway.

Remediation for rule failure

In `MixedInstancesPolicy.LaunchTemplate` with one or more `Overrides` that include `InstanceType` or `InstanceRequirements`, set either `InstanceType` to an EC2 instance type based on the AWS Nitro system that supports encryption in-transit between instances, or set `AllowedInstanceTypes` in `InstanceRequirements` to one or more EC2 instance types based on the AWS Nitro system that supports encryption in-transit between instances.

The examples that follow show how to implement this remediation.

Amazon EC2 Auto Scaling Group - Example One

An Amazon EC2 Auto Scaling group configured with a launch template override and an instance type that is based on the AWS Nitro system. It supports encryption in transit between instances. The example is shown in JSON and in YAML.

[CT.ELASTICACHE.PR.1] Require an Amazon ElastiCache for Redis cluster to have automatic backups activated

This control checks whether an Amazon ElastiCache Redis cluster has automatic backups enabled.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElastiCache::CacheCluster`
- **AWS CloudFormation guard rule:** [CT.ELASTICACHE.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICACHE.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.ELASTICACHE.PR.1 example templates](#)

Explanation

When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. There is no impact on the cluster, and the change is immediate. Automatic backups can help guard against data loss. In the event of a failure, you can create a new cluster, and restore your data from the most recent backup.

Usage considerations

- This control applies only to Amazon ElastiCache cache clusters with an engine type of `redis`

Remediation for rule failure

Set the value of the `SnapshotRetentionLimit` parameter to an integer value greater than 0.

The examples that follow show how to implement this remediation.

[CT.ELASTICACHE.PR.2] Require an Amazon ElastiCache for Redis cluster to have automatic minor version upgrades activated

This control checks whether an Amazon ElastiCache for Redis cluster has automatic minor version upgrades enabled.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticCache::CacheCluster`
- **AWS CloudFormation guard rule:** [CT.ELASTICACHE.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICACHE.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.ELASTICACHE.PR.2 example templates](#)

Explanation

By enabling automatic minor version upgrades, you ensure that the latest minor version updates to Amazon ElastiCache cache clusters are installed. These upgrades may include security patches and bug fixes. Keeping up to date with patch installation is an important step in securing systems.

Usage considerations

- This control applies only to Amazon ElastiCache cache clusters with an engine type of `redis` and an engine version of 6.0 or later.

Remediation for rule failure

Set the value of the `AutoMinorVersionUpgrade` parameter to `true`.

The examples that follow show how to implement this remediation.

[CT.ELASTICACHE.PR.3] Require an Amazon ElastiCache for Redis replication group to have automatic failover activated

This control checks whether an Amazon ElastiCache Redis replication group has automatic failover enabled.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::ElastiCache::ReplicationGroup`
- **AWS CloudFormation guard rule:** [CT.ELASTICACHE.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICACHE.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.ELASTICACHE.PR.3 example templates](#)

Explanation

When automatic failover is enabled for a replication group, the role of primary node will fail over to one of the read replicas, automatically. This failover and replica promotion ensure that you can resume writing to the new primary as soon as promotion is complete, thereby reducing overall downtime in case of failure.

Remediation for rule failure

Set the value of the `AutomaticFailoverEnabled` parameter to true.

The examples that follow show how to implement this remediation.

[CT.ELASTICACHE.PR.4] Require an Amazon ElastiCache replication group to have encryption at rest activated

This control checks whether an Amazon ElastiCache replication group has the encryption-at-rest setting enabled.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElastiCache::ReplicationGroup`
- **AWS CloudFormation guard rule:** [CT.ELASTICACHE.PR.4 rule specification](#)

Details and examples

- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.ELASTICACHE.PR.4 example templates](#)

Explanation

Encryption of data at rest is a recommended best practice that adds a layer of access management around your data. In case of any compromise to your Amazon ElastiCache replica nodes, this encryption-at-rest setting ensures that your data is protected from unintended access.

Usage considerations

- This control requires the use of encryption at rest, which is supported only for replication groups with Redis engine versions of 3.2.6 or above.

Remediation for rule failure

Set the value of the `AtRestEncryptionEnabled` parameter to `true`.

The examples that follow show how to implement this remediation.

[CT.ELASTICACHE.PR.5] Require an Amazon ElastiCache for Redis replication group to have encryption in transit activated

This control checks whether an Amazon ElastiCache replication group has encryption-in-transit enabled.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElastiCache::ReplicationGroup`
- **AWS CloudFormation guard rule:** [CT.ELASTICACHE.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICACHE.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.ELASTICACHE.PR.5 example templates](#)

Explanation

TLS can be used to help prevent potential attackers from eavesdropping on or manipulating network traffic using person-in-the-middle or similar attacks. Amazon ElastiCache in-transit encryption is an optional feature that you can use to help protect your data when it is moving from one location to another.

Usage considerations

- Encryption-in-transit is supported on Amazon ElastiCache replication groups running Redis versions 3.2.6, 4.0.10 and later.

- Because of the processing required to encrypt and decrypt the data at the endpoints, implementing in-transit encryption can reduce performance. We recommend that you benchmark in-transit encryption, compared to no encryption, on your own data, to determine the impact of encryption-in-transit on performance for your implementation.

Remediation for rule failure

Set the value of the `TransitEncryptionEnabled` parameter to `true`.

The examples that follow show how to implement this remediation.

[CT.ELASTICACHE.PR.6] Require an Amazon ElastiCache cache cluster to use a custom subnet group

This control checks whether an Amazon ElastiCache cache cluster is configured with a custom subnet group.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticCache::CacheCluster`
- **AWS CloudFormation guard rule:** [CT.ELASTICACHE.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICACHE.PR.6 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.ELASTICACHE.PR.6 example templates](#)

Explanation

When you launch an ElastiCache cluster, AWS creates a default subnet group if none exists already. The default group utilizes subnets from the default VPC. Using custom subnet groups allows you to be more restrictive about network access to ElastiCache clusters.

Usage considerations

- This rule evaluates whether an Amazon ElastiCache cache cluster has been configured with a custom subnet group.
- Custom subnet groups may contain subnets that reside in the default Amazon VPC.

Remediation for rule failure

Set the `CacheSubnetGroupName` parameter to the name of a custom Amazon ElastiCache cache subnet group.

The examples that follow show how to implement this remediation.

[CT.ELASTICACHE.PR.7] Require an Amazon ElastiCache replication group of earlier Redis versions to have Redis AUTH activated

This control checks whether an Amazon ElastiCache replication group with an engine version earlier than 6.0 has Redis AUTH enabled.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ElastiCache::ReplicationGroup
- **AWS CloudFormation guard rule:** [CT.ELASTICACHE.PR.7 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICACHE.PR.7 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.ELASTICACHE.PR.7 example templates](#)

Explanation

Redis authentication tokens, or passwords, enable Redis to require a password before allowing clients to run commands, thereby improving data security.

Usage considerations

- This control applies only to Amazon ElastiCache replication groups of Redis engine versions earlier than six (6).
- This control requires encryption-in-transit to be enabled on replication groups by means of the `TransitEncryptionEnabled` property.

Remediation for rule failure

Set the value of the AuthToken parameter to a string between 16 characters and 128 characters in length, which contains only printable ASCII characters and does not contain non-alphanumeric characters outside of the set (!, &,

The examples that follow show how to implement this remediation.

[CT.ELASTICACHE.PR.8] Require an Amazon ElastiCache replication group of later Redis versions to have RBAC authentication activated

This control checks whether Amazon ElastiCache replication groups with an engine version greater than or equal to 6.0 have RBAC authentication enabled.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule

- **Control behavior:** Proactive
- **Resource types:** `AWS::ElastiCache::ReplicationGroup`
- **AWS CloudFormation guard rule:** [CT.ELASTICACHE.PR.8 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICACHE.PR.8 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.ELASTICACHE.PR.8 example templates](#)

Explanation

Role-Based Access Control (RBAC) helps you create users and assign specific permissions to them, by using an access string. You assign the users to user groups aligned with a specific role, such as administrators, or human resources. The roles are deployed to Amazon ElastiCache for Redis replication groups. This technique establishes security boundaries between clients using the same Redis replication groups, and it prevents clients from having access to other clients' data. If you use RBAC authentication over Redis AUTH, it reduces the number of credentials required for authenticated access to an Amazon ElastiCache replication group.

Usage considerations

- This control applies only to Amazon ElastiCache replication groups of Redis engine versions greater than or equal to 6.0
- This control requires encryption in transit to be enabled on replication groups by means of the `TransitEncryptionEnabled` property

Remediation for rule failure

Set the value of the `UserGroupIds` property to a list that contains at least one Amazon ElastiCache user group identifier.

The examples that follow show how to implement this remediation.

[CT.ECR.PR.1] Require Amazon ECR repositories to have a lifecycle policy configured

This control checks whether a private Amazon Elastic Container Registry (Amazon ECR) repository has at least one lifecycle policy configured.

- **Control objective:** Manage vulnerabilities, Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECR::Repository`
- **AWS CloudFormation guard rule:** [CT.ECR.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECR.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECR.PR.1 example templates](#)

Explanation

Amazon ECR lifecycle policies specify the lifecycle management of images in a repository. By configuring lifecycle policies, you can automate the cleanup of unused images and the expiration

of images, based on age or count. Automating these tasks can help you to avoid unintentionally using outdated images in your repository.

Remediation for rule failure

Provide a `LifecyclePolicy` configuration and set `LifecyclePolicyText` to an Amazon ECR repository lifecycle policy.

The examples that follow show how to implement this remediation.

Amazon ECR Repository - Example

Amazon ECR repository configured with a lifecycle policy. The example is shown in JSON and in YAML.

JSON example

```
{
  "ECRRepository": {
    "Type": "AWS::ECR::Repository",
    "Properties": {
      "LifecyclePolicy": {
        "LifecyclePolicyText": "{\n  \"rules\": [\n    {\n      \"rulePriority\n\": 1,\n      \"description\": \"Expire images older than 14 days\",\n      \"selection\n\": {\n        \"tagStatus\": \"untagged\",\n        \"countType\": \"sinceImagePushed\n\",,\n        \"countUnit\": \"days\",\n        \"countNumber\": 14\n      },\n      \"action\": {\n        \"type\": \"expire\"\n      }\n    }\n  ]\n}"
      }
    }
  }
}
```

YAML example

```
ECRRepository:
  Type: AWS::ECR::Repository
  Properties:
    LifecyclePolicy:
      LifecyclePolicyText: |
        {
```

```

    "rules": [

[CT.ECR.PR.2] Require Amazon ECR private repositories to have image scanning enabled

This control checks whether a private Amazon Elastic Container Registry (Amazon ECR) repository has image scanning enabled.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECR::Repository`
- **AWS CloudFormation guard rule:** [CT.ECR.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECR.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECR.PR.2 example templates](#)

Explanation

Amazon ECR image scanning helps with identifying software vulnerabilities in your container images. Amazon ECR uses the Common Vulnerabilities and Exposures (CVEs) database from the open-source Clair project, and it provides a list of scan findings. Enabling image scanning on Amazon ECR repositories adds a layer of verification regarding the integrity and safety of the images being stored.

Remediation for rule failure

Set `ScanOnPush` in `ImageScanningConfiguration` to `true`.

The examples that follow show how to implement this remediation.

Amazon ECR Repository - Example

      "ImageScanningConfiguration": {
        "ScanOnPush": true
      }
    }
  }
}
```

YAML example

[CT.ECR.PR.3] Require Amazon ECR private repositories to have tag immutability enabled

This control checks whether a private Amazon Elastic Container Registry (Amazon ECR) repository has tag immutability enabled.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECR::Repository`
- **AWS CloudFormation guard rule:** [CT.ECR.PR.3 rule specification](#)

Details and examples

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECR.PR.3 example templates](#)

Explanation

Amazon ECR tag immutability enables customers to rely on the descriptive tags of an image as a reliable mechanism that tracks and uniquely identifies images. An immutable tag is static, which

means that each tag refers to a unique image. This tagging improves reliability and scalability, because the use of a static tag always results in the same image being deployed. When configured, tag immutability prevents the tags from being overridden, which reduces the attack surface.

Remediation for rule failure

Set `ImageTagMutability` to `IMMUTABLE`.

The examples that follow show how to implement this remediation.

Amazon ECR Repository - Example

[CT.ECS.PR.1] Require Amazon ECS Fargate Services to run on the latest Fargate platform version

This control checks whether Amazon Elastic Container Service (Amazon ECS) Fargate services are configured to deploy using the LATEST platform version rather than a specified version number.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ECS::Service
- **AWS CloudFormation guard rule:** [CT.ECS.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.1 example templates](#)

Explanation

AWS Fargate platform versions refer to a specific runtime environment for Fargate task infrastructure, which is a combination of kernel and container runtime versions. New platform versions are released as the runtime environment evolves. For example, a new version may be released for kernel or operating system updates, new features, bug fixes, or security updates. Security updates and patches are deployed automatically for your Fargate tasks. If a security issue is found that affects a platform version, AWS patches the platform version.

Usage considerations

- This control only applies to Amazon ECS services with a LaunchType of FARGATE

Remediation for rule failure

When LaunchType is set to FARGATE, set the PlatformVersion property to LATEST or omit the PlatformVersion property (default: LATEST).

The examples that follow show how to implement this remediation.

Amazon ECS Service - Example One

Amazon ECS service configured to deploy using the LATEST platform version by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

[CT.ECS.PR.2] Require any Amazon ECS cluster to have container insights activated

This control checks whether your Amazon Elastic Container Service (Amazon ECS) clusters have container insights enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECS::Cluster`
- **AWS CloudFormation guard rule:** [CT.ECS.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.2 example templates](#)

Explanation

Monitoring is an important part of maintaining the reliability, availability, and performance of Amazon ECS clusters. Use CloudWatch container insights to collect, aggregate, and summarize metrics and logs from your containerized applications and microservices. CloudWatch automatically collects metrics for many resources, such as CPU, memory, disk, and network. The container insights capability also provides diagnostic information, such as container restart failures, which helps you isolate issues and resolve them quickly. You can set CloudWatch alarms on the metrics that container insights collects.

Remediation for rule failure

Enable container insights on Amazon ECS clusters with an entry in `ClusterSettings` that has `Name` set to `containerInsights` and `Value` set to `enabled`.

The examples that follow show how to implement this remediation.

Amazon ECS Cluster - Example

Amazon ECS cluster configured with container insights enabled. The example is shown in JSON and in YAML.

JSON example

```

    "Type": "AWS::ECS::Cluster",
    "Properties": {
      "ClusterSettings": [
        {
          "Name": "containerInsights",
          "Value": "enabled"
        }
      ]
    }
  }
}
```

YAML example

  Type: AWS::ECS::Cluster
  Properties:
    ClusterSettings:
      - Name: containerInsights
        Value: enabled

[CT.ECS.PR.3] Require any Amazon ECS task definition to specify a user that is not the root

This control checks whether Amazon Elastic Container Service (ECS) task definitions run as a non-root user within Amazon ECS containers.

- **Control objective:** Enforce least privilege, Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ECS::TaskDefinition
- **AWS CloudFormation guard rule:** [CT.ECS.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.3 example templates](#)

Explanation

It is a best practice to run containers as a non-root user user. By default, containers run as the root user user, unless the `User` directive is included in your Dockerfile. The default Linux capabilities that are assigned by Docker restrict the actions that can be run as the root user user, but only marginally. For example, a container running as the root user user does not have access to devices.

Usage considerations

- This control applies only to Amazon ECS task definitions that are configured with container definitions.

Remediation for rule failure

Set the `User` property to a non-root user user.

The examples that follow show how to implement this remediation.

        "User": "sampleuser",
        "Memory": 256
      }
    ]
  }
}

```

[CT.ECS.PR.4] Require Amazon ECS tasks to use 'awsvpc' networking mode

This control checks whether the networking mode for Amazon Elastic Container Service (ECS) task definitions is set to awsvpc.

- **Control objective:** Limit network access

- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ECS::TaskDefinition
- **AWS CloudFormation guard rule:** [CT.ECS.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.4 example templates](#)

Explanation

Amazon ECS recommends using the `awsvpc` network mode, unless you have a specific reason to use a different network mode. The `awsvpc` network mode simplifies container networking, and it gives you control over the ways that containerized applications communicate with each other, or with other services, within your VPCs. The `awsvpc` network mode provides improved security for your containers, because it empowers you to use security groups and network monitoring tools at a detailed level within your tasks. Each task has its own elastic network interface (ENI); therefore, you can include other Amazon EC2 networking features, such as VPC Flow Logs, which help you monitor traffic among your tasks.

Usage considerations

- This control applies only to Amazon ECS task definitions for launch types of EC2 and Fargate.

Remediation for rule failure

Set `NetworkMode` to `awsvpc` for Amazon ECS tasks that deploy to Amazon EC2 or AWS Fargate.

The examples that follow show how to implement this remediation.

Amazon ECS Task Definition - Example

Amazon ECS task definition configured with awsvpc networking mode. The example is shown in JSON and in YAML.

[CT.ECS.PR.5] Require an active Amazon ECS task definition to have a logging configuration

This control checks whether Amazon Elastic Container Service (ECS) task definitions have a logging configuration specified.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECS::TaskDefinition`
- **AWS CloudFormation guard rule:** [CT.ECS.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.5 example templates](#)

Explanation

Monitoring is an important part of maintaining the reliability, availability, and performance of Amazon Elastic Container Service (ECS) and your AWS environments. We recommend that you collect monitoring data from all parts of your AWS environment, because this data can help you debug a multi-point failure, if such a failure occurs.

Usage considerations

- This control applies only to Amazon ECS task definitions that are configured with container definitions.

Remediation for rule failure

For each container definition, within `LogConfiguration` set the `LogDriver` property to a supported log driver.

The examples that follow show how to implement this remediation.

Amazon ECS Task Definition - Example

Amazon ECS task definition configured to send log information to Amazon CloudWatch Logs for each container definition. The example is shown in JSON and in YAML.

[CT.ECS.PR.6] Require Amazon ECS containers to allow read-only access to the root filesystem

This control checks whether Amazon Elastic Container Service (Amazon ECS) task definitions have been configured to require read-only access to container root filesystems.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECS::TaskDefinition`
- **AWS CloudFormation guard rule:** [CT.ECS.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.6 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.6 example templates](#)

Explanation

Enabling this option reduces security attack vectors. When it is enabled, the container instance's filesystem cannot be tampered with or written to unless it has explicitly granted read-write

permissions on its filesystem folder and directories. This control adheres to the principle of least privilege.

Usage considerations

- This control is incompatible with Amazon ECS task definitions that use Windows containers.

Remediation for rule failure

Set the `ReadOnlyRootFilesystem` property to `true` for all `ContainerDefinitions`.

The examples that follow show how to implement this remediation.

[CT.ECS.PR.7] Require an Amazon ECS task definition to have a specific memory usage limit

This control checks whether Amazon Elastic Container Service (ECS) task definitions have specified a memory limit for container definitions.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECS::TaskDefinition`
- **AWS CloudFormation guard rule:** [CT.ECS.PR.7 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.7 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.7 example templates](#)

Explanation

We recommend that you specify the maximum memory available to your containers, because this limit protects your resources in the event of malicious access to your containers.

Usage considerations

- This control applies only to Amazon ECS task definitions that are configured with container definitions.

Remediation for rule failure

Set the Memory property in ContainerDefinitions for Amazon ECS task definitions.

The examples that follow show how to implement this remediation.

Amazon ECS Task Definition - Example

Amazon ECS task definition configured with a specified memory limit for container definitions. The example is shown in JSON and in YAML.

JSON example

```

          "Name": "SampleContainer",
          "Memory": 256
        }
      ]
    }
  }
}
```

```

    ]
  }
}

```

YAML example

[CT.ECS.PR.8] Require Amazon ECS task definitions to have secure networking modes and user definitions

This control checks whether Amazon Elastic Container Service (ECS) task definitions that use host networking mode have a privileged container definition, and whether they specify a non-root user definition.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ECS::TaskDefinition
- **AWS CloudFormation guard rule:** [CT.ECS.PR.8 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.8 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.8 example templates](#)

Explanation

If a task definition has elevated privileges, it implies that a customer has specifically chosen that configuration. This control checks for unexpected privilege escalation, which occurs when a task definition enables host networking, but a customer has not opted into elevated privileges.

Usage considerations

- This control applies only to Amazon ECS task definitions that include host networking mode and one or more container definitions.
- This control is incompatible with Amazon ECS task definitions that use Windows containers.

Remediation for rule failure

For Amazon ECS task definitions that use host networking mode, your container definitions must set the `User` property to a non-root user. Also, to opt into elevated privileges, configure containers to run in privileged mode by setting the `Privileged` property to `true`.

The examples that follow show how to implement this remediation.

Amazon ECS Task Definition - Example One

Amazon ECS task definition with host networking mode configured for privileged container definitions. The example is shown in JSON and in YAML.

JSON example

```
{
  "ECSTaskDefinition": {
    "Type": "AWS::ECS::TaskDefinition",
```

```
"Properties": {
  "Memory": "512",
  "NetworkMode": "host",
  "ContainerDefinitions": [
    {
      "Name": "SampleContainerA",
      "User": "root",
      "Privileged": true,
      "Image": "nginx:latest",
      "Essential": true
    },
    {
      "Name": "SampleContainerB",
      "User": "root",
      "Privileged": true,
      "Image": "alpine:latest"
    }
  ]
}
```

YAML example

```
ECSTaskDefinition:
  Type: AWS::ECS::TaskDefinition
  Properties:
    Memory: '512'
    NetworkMode: host
    ContainerDefinitions:
      - Name: SampleContainerA
        User: root
        Privileged: true
        Image: nginx:latest
        Essential: true
      - Name: SampleContainerB
        User: root
        Privileged: true
        Image: alpine:latest
```

The examples that follow show how to implement this remediation.

Amazon ECS Task Definition - Example Two

Amazon ECS task definition with host networking mode configured for non-root user container definitions and privileged mode deactivated, by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

JSON example

```

    "Type": "AWS::ECS::TaskDefinition",
    "Properties": {
      "Memory": "512",
      "NetworkMode": "host",
      "ContainerDefinitions": [
        {
          "Name": "SampleContainerA",
          "User": "root",
          "Privileged": true,
          "Image": "nginx:latest",
          "Essential": true
        },
        {
          "Name": "SampleContainerB",
          "User": "root",
          "Privileged": true,
          "Image": "alpine:latest"
        }
      ]
    }
  }
}

[CT.ECS.PR.9] Require Amazon ECS services not to assign public IP addresses automatically

This control checks whether your Amazon Elastic Container Service (Amazon ECS) service resources are configured to assign public IP addresses automatically.

- **Control objective:** Limit network access, Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECS::Service`
- **AWS CloudFormation guard rule:** [CT.ECS.PR.9 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.9 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.9 example templates](#)

Explanation

A public IP address is an IP address that is reachable from the internet. If you launch your Amazon ECS instances with a public IP address, then your Amazon ECS instances are reachable from the

internet. Amazon ECS services should not be publicly accessible, because it may allow unintended access to your container application servers.

Remediation for rule failure

Set `AssignPublicIp` in `NetworkConfiguration.AwsVpcConfiguration` to `DISABLED`.

The examples that follow show how to implement this remediation.

Amazon ECS Service - Example One

[CT.ECS.PR.10] Require that Amazon ECS task definitions do not share the host's process namespace

This control checks whether Amazon Elastic Container Service (ECS) task definitions are configured to share a host's process namespace with its containers.

- **Control objective:** Protect configurations, Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECS::TaskDefinition`
- **AWS CloudFormation guard rule:** [CT.ECS.PR.10 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ECS.PR.10 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.10 example templates](#)

Explanation

A process ID (PID) namespace provides separation between processes. It prevents system processes from being visible to other processes, and it allows PIDs to be reused, including PID 1. If the hosts PID namespace is shared with containers, those containers can see all of the processes on the host system. Process visibility reduces the benefit of process-level isolation between the host and the containers. Reduced isolation can allow unauthorized access to processes on the host itself, including the ability to manipulate and terminate the hosts processes. As a best practice, do not share the host's process namespace with containers running on the host.

Usage considerations

- This control applies only to Amazon ECS task definitions that are configured with container definitions.
- This control is not compatible with Amazon ECS task definitions that are configured to run on AWS Fargate, or definitions that use Windows containers.

Remediation for rule failure

Omit the `PidMode` property, or set `PidMode` to `task`.

The examples that follow show how to implement this remediation.

Amazon ECS Task Definition - Example One

Amazon ECS task definition configured with a task-level process namespace, by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

JSON example

```
{
  "TaskDefinition": {
    "Type": "AWS::ECS::TaskDefinition",
    "Properties": {
      "Memory": "512",
      "ContainerDefinitions": [
        {
          "Essential": true,
```

```

        "Image": "nginx:latest",
        "Name": "SampleContainer"
      }
    ]
  }
}

```

YAML example

```

TaskDefinition:
  Type: AWS::ECS::TaskDefinition
  Properties:
    Memory: '512'
    ContainerDefinitions:
      - Essential: true
        Image: nginx:latest
        Name: SampleContainer

```

The examples that follow show how to implement this remediation.

Amazon ECS Task Definition - Example Two

Amazon ECS task definition configured with a task-level process namespace, by means of the `PidMode` property. The example is shown in JSON and in YAML.

JSON example

```

{
  "TaskDefinition": {
    "Type": "AWS::ECS::TaskDefinition",
    "Properties": {
      "Memory": "512",
      "ContainerDefinitions": [
        {
          "Essential": true,
          "Image": "nginx:latest",
          "Name": "SampleContainer"

```

```

        }
      ],
      "PidMode": "task"
    }
  }
}

```

YAML example

```

[CT.ECS.PR.11] Require an Amazon ECS container to run as non-privileged

This control checks whether container definitions in Amazon Elastic Container Service (ECS) task definitions are configured with elevated privileges.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ECS::TaskDefinition`
- **AWS CloudFormation guard rule:** [CT.ECS.PR.11 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the [CT.ECS.PR.11 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ECS.PR.11 example templates](#)

Explanation

We recommend that you remove elevated privileges from your Amazon ECS task definitions. When the `privileged` parameter is `true`, the container can operate with elevated privileges on the host container instance. These privileges are similar to the root user privileges.

Usage considerations

- This control applies only to Amazon ECS task definitions that are configured with container definitions.
- This control is incompatible with Amazon ECS task definitions that use Windows containers.

Remediation for rule failure

Be sure that all containers defined in `ContainerDefinitions` either omit the `Privileged` property, or that they set `Privileged` to `false`.

The examples that follow show how to implement this remediation.

[CT.ECS.PR.12] Require that Amazon ECS task definitions do not pass secrets as container environment variables

- **Control objective:** Use strong authentication
- **Implementation:** AWS CloudFormation Guard Rule

Explanation

AWS Systems Manager Parameter Store can help you improve the security posture of your organization. We recommend the Parameter Store as a way to store secrets and credentials, instead of passing them into your container instances or entering them into your source code.

Usage considerations

- This control applies only to Amazon ECS task definitions that are configured with container definitions.
- This control evaluates plaintext environment variables configured directly on container definitions.

Remediation for rule failure

Omit environment variables with Name set to `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY` or `ECS_ENGINE_AUTH_DATA` from container definitions.

The examples that follow show how to implement this remediation.

[CT.ELASTICFILESYSTEM.PR.1] Require an Amazon EFS file system to encrypt file data at rest using AWS KMS

This control checks whether an Amazon Elastic File System (Amazon EFS) file system is configured to encrypt file data using AWS KMS.

- **Control objective:** Encrypt data at rest

- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::EFS::FileSystem`
- **AWS CloudFormation guard rule:** [CT.ELASTICFILESYSTEM.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICFILESYSTEM.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICFILESYSTEM.PR.1 example templates](#)

Explanation

For an added layer of security for your sensitive data in Amazon EFS, you should create encrypted file systems. Amazon EFS supports encryption for file systems at rest. You can enable encryption of data at rest when you create an Amazon EFS file system.

Usage considerations

- This control requires only the `Encrypted` property to be set to `true`, and it does not require the `KmsKeyId` property to be provided.
- If the `KmsKeyId` property is not provided, the default AWS KMS key for Amazon EFS, `aws/elasticfilesystem`, is used to protect the encrypted file system.

Remediation for rule failure

Set `Encrypted` to `true` and optionally set `KmsKeyId` to a valid AWS KMS key identifier.

The examples that follow show how to implement this remediation.

Amazon EFS File System - Example One

Amazon EFS file system configured with encryption enabled, by means of the default AWS KMS key for Amazon EFS. The example is shown in JSON and in YAML.

JSON example

```
{
  "EFSFileSystem": {
    "Type": "AWS::EFS::FileSystem",
    "Properties": {
      "Encrypted": true
    }
  }
}
```

YAML example

```
EFSFileSystem:
  Type: AWS::EFS::FileSystem
  Properties:
    Encrypted: true
```

The examples that follow show how to implement this remediation.

Amazon EFS File System - Example Two

Amazon EFS file system configured with encryption enabled, by means of a customer-managed AWS KMS key. The example is shown in JSON and in YAML.

JSON example

```
{
  "EFSFileSystem": {
    "Type": "AWS::EFS::FileSystem",
    "Properties": {
      "Encrypted": true,
      "KmsKeyId": {
        "Ref": "KMSKey"
      }
    }
  }
}
```

YAML example

```
EFSFileSystem:
  Type: AWS::EFS::FileSystem
  Properties:
    Encrypted: true
    KmsKeyId: !Ref 'KMSKey'
```

[CT.ELASTICFILESYSTEM.PR.2] Require an Amazon EFS volume to have an automated backup plan

This control checks whether your Amazon Elastic File System (Amazon EFS) file system has been configured with automatic backups through AWS Backup.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::EFS::FileSystem`
- **AWS CloudFormation guard rule:** [CT.ELASTICFILESYSTEM.PR.2 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICFILESYSTEM.PR.2 example templates](#)

Explanation

Including Amazon EFS file systems in the backup plans helps you to protect your data from deletion and data loss.

Remediation for rule failure

Enable automatic backups by setting `BackupPolicy.Status` to `ENABLED`.

The examples that follow show how to implement this remediation.

Amazon EFS File System - Example

Amazon EFS file system configured with automatic backups enabled. The example is shown in JSON and in YAML.

[CT.ELASTICFILESYSTEM.PR.3] Require Amazon EFS access points to have a root directory

This control checks whether your Amazon Elastic File System (Amazon EFS) access points are configured to enforce a root directory.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::EFS::AccessPoint`
- **AWS CloudFormation guard rule:** [CT.ELASTICFILESYSTEM.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICFILESYSTEM.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICFILESYSTEM.PR.3 example templates](#)

Explanation

When you enforce a root directory, the NFS client at the access point uses the root directory configured on the access point, instead of the file system's root directory. Enforcing a root directory for an access point helps restrict data access by ensuring that users of the access point can reach only the files of the specified subdirectory.

Remediation for rule failure

Provide a `RootDirectory.Path` configuration with a value for `Path` that does not equal `/`.

The examples that follow show how to implement this remediation.

Amazon EFS Access Point - Example

Amazon EFS access point configured with a root directory set to a specific subdirectory. The example is shown in JSON and in YAML.

JSON example

```
{
  "EFSAccessPoint": {
    "Type": "AWS::EFS::AccessPoint",
    "Properties": {
      "FileSystemId": {
        "Ref": "EFSFileSystem"
      },
      "RootDirectory": {
        "Path": "/dir1/child1"
      }
    }
  }
}
```

YAML example

```
EFSAccessPoint:
  Type: AWS::EFS::AccessPoint
  Properties:
    FileSystemId: !Ref 'EFSFileSystem'
    RootDirectory:
      Path: /dir1/child1

[CT.ELASTICFILESYSTEM.PR.4] Require Amazon EFS access points to enforce a user identity

This control checks whether your Amazon Elastic File System (Amazon EFS) access points are configured to enforce a user identity.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::EFS::AccessPoint`
- **AWS CloudFormation guard rule:** [CT.ELASTICFILESYSTEM.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICFILESYSTEM.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICFILESYSTEM.PR.4 example templates](#)

Explanation

Amazon EFS access points are application-specific entry points into an Amazon EFS file system that make it easier to manage application access to shared datasets. Access points can enforce a user identity, including the user's POSIX groups, for all file system requests that are made through the access point. Access points also can enforce a different root directory for the file system, so that clients gain access only to data in the specified directory or its subdirectories.

Remediation for rule failure

Provide a `PosixUser` configuration with a POSIX user ID (`Uid`) and POSIX group ID (`Gid`).

The examples that follow show how to implement this remediation.

Amazon EFS Access Point - Example

[CT.EKS.PR.1] Require an Amazon EKS cluster to be configured with public access disabled to the cluster Kubernetes API server endpoint

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule

- **Control behavior:** Proactive
- **Resource types:** `AWS::EKS::Cluster`
- **AWS CloudFormation guard rule:** [CT.EKS.PR.1 rule specification](#)

Details and examples

- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.EKS.PR.1 example templates](#)

Explanation

When you create a new cluster, Amazon Elastic Kubernetes Service (EKS) creates an endpoint for the managed Kubernetes API server, which you can use to communicate with your cluster using Kubernetes management tools, such as `kubectl`. By default, this API server endpoint is public to the internet, and access to the API server is secured using a combination of AWS Identity and Access Management (IAM) along with native Kubernetes Role-Based Access Control (RBAC). Enabling private access to the Kubernetes API server ensures that all communication between your nodes and the API server stays within your VPC. You can limit the IP addresses that have access to your API server from the internet, or you can completely disallow internet access to the API server.

Remediation for rule failure

Set the value of the `EndpointPublicAccess` parameter to `false` and the value of the `EndpointPrivateAccess` parameter to `true`.

The examples that follow show how to implement this remediation.

[CT.EKS.PR.2] Require an Amazon EKS cluster to be configured with secret encryption using AWS Key Management Service (KMS) keys

This control checks whether Amazon Elastic Kubernetes Service (Amazon EKS) clusters are configured to use Kubernetes secrets encrypted with AWS Key Management Service (KMS) keys.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::EKS::Cluster`
- **AWS CloudFormation guard rule:** [CT.EKS.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EKS.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EKS.PR.2 example templates](#)

Explanation

Kubernetes secrets store sensitive information, such as user certificates, passwords, or API keys. Encrypting Kubernetes secrets at rest bolsters the security of your EKS clusters.

Usage considerations

- For a cluster that uses KMS Envelope Encryption, `kms:CreateGrant` permissions are required. The condition `kms:GrantIsForAWSResource` is not supported for the `CreateCluster` action, and this condition should not be given in KMS policies to control `kms:CreateGrant` permissions for users performing `CreateCluster` operations.

Remediation for rule failure

Provide an `EncryptionConfig` configuration with a list of `Resources` that contains secrets and a `Provider` configuration containing a `KeyArn`.

The examples that follow show how to implement this remediation.

Amazon EKS cluster - Example

[CT.ELASTICLOADBALANCING.PR.1] Require any application load balancer listener default actions to redirect all HTTP requests to HTTPS

This control checks whether HTTP to HTTPS redirection is configured as a default action on HTTP listeners of Application Load Balancers.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::ElasticLoadBalancingV2::Listener`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.1 example templates](#)

Explanation

Before you start to use your Application Load Balancer, you must add one or more listeners. A listener is a process that uses the configured protocol and port to check for connection requests. Listeners support HTTP and HTTPS protocols. You can use an HTTPS listener to offload the work of encryption and decryption to your Application Load Balancer. You should utilize redirect actions with Application Load Balancer to redirect any client HTTP request to an HTTPS request on port 443, to enforce encryption in transit.

Usage considerations

- This control evaluates only the default actions on Application Load Balancer listeners.

Remediation for rule failure

Configure a default HTTPS redirect action on Application Load Balancer HTTP listeners.

The examples that follow show how to implement this remediation.

Application Load Balancer Listener - Example

Application load balancer listener configured with a default action that redirects HTTP requests on port 80 to HTTPS requests on port 443, retaining the original host name, path, and query string. The example is shown in JSON and in YAML.

[CT.ELASTICLOADBALANCING.PR.2] Require any Amazon ELB application or network load balancer to have an AWS Certificate Manager certificate

This control checks whether your Elastic Load Balancing (ELB) application and network load balancers use certificates provided by AWS Certificate Manager (ACM).

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ElasticLoadBalancingV2::Listener, AWS::ElasticLoadBalancingV2::ListenerCertificate
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.2 example templates](#)

Explanation

To create a certificate, use AWS Certificate Manager (ACM) or another tool that supports the SSL and TLS protocols, such as OpenSSL. AWS Control Tower recommends that you use AWS Certificate Manager to create or import certificates for your load balancer.

AWS Certificate Manager integrates with Amazon ELB application load balancers and network load balancers, so that you can deploy the certificate on your load balancer. We also recommend that you automatically renew these certificates.

Usage considerations

- This control applies only to HTTPS and TLS Amazon ELB listeners and ELB listener certificate resources that have one or more certificates configured.

Remediation for rule failure

Configure the Certificates property to use certificates provided by AWS Certificate Manager.

The examples that follow show how to implement this remediation.

Amazon ELB Listener - Example

Amazon ELB HTTPS listener configured with an AWS Certificate Manager SSL certificate. The example is shown in JSON and in YAML.

JSON example

```
{
  "ELBListener": {
    "Type": "AWS::ElasticLoadBalancingV2::Listener",
    "Properties": {
      "DefaultActions": [
        {

          }
        }
      ],
      "LoadBalancerArn": {
        "Ref": "ApplicationLoadBalancer"
      }
    }
  }
}
```

```

    },
    "Protocol": "HTTPS",

```

The examples that follow show how to implement this remediation.

Amazon ELB Listener Certificate - Example

Amazon ELB listener certificate configured with an AWS Certificate Manager SSL certificate. The example is shown in JSON and in YAML.

JSON example

```
{
```

```

"ELBListenerCertificate": {
  "Type": "AWS::ElasticLoadBalancingV2::ListenerCertificate",
  "Properties": {
    "ListenerArn": {
      "Ref": "Listener"

        "CertificateArn": {
          "Ref": "ACMCertificate"
        }
      }
    ]
  }
}
}

```

YAML example

```

ELBListenerCertificate:
  Type: AWS::ElasticLoadBalancingV2::ListenerCertificate
  Properties:
    ListenerArn: !Ref 'Listener'
    Certificates:

[CT.ELASTICLOADBALANCING.PR.3] Require any application load balancer to have defensive or strictest desync mitigation mode activated

This control checks to ensure that an Application Load Balancer is configured with defensive or strictest desync mitigation mode.

- **Control objective:** Protect data integrity
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancingV2::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.3 example templates](#)

Explanation

HTTP desynchronization (desync) issues can lead to request smuggling and make applications vulnerable to request queue or cache poisoning. In turn, these vulnerabilities can lead to credential stuffing or execution of unauthorized commands. When configured with defensive or strictest desync mitigation mode, Application Load Balancers can protect your application from security issues that may be caused by HTTP desync.

Remediation for rule failure

Omit the load balancer attribute `routing.http.desync_mitigation_mode` or set the attribute to one of `defensive` or `strictest`.

The examples that follow show how to implement this remediation.

Application Load Balancer - Example

Application Load Balancer configured with defensive desync mitigation mode, by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

JSON example

```
{
  "ApplicationLoadBalancer": {
    "Type": "AWS::ElasticLoadBalancingV2::LoadBalancer",
    "Properties": {
      "Scheme": "internal",
      "Subnets": [
        {
          "Ref": "SubnetOne"
        },
        {
          "Ref": "SubnetTwo"
        }
      ],
      "IpAddressType": "ipv4",
      "Type": "application"
    }
  }
}
```

YAML example

```
ApplicationLoadBalancer:
  Type: AWS::ElasticLoadBalancingV2::LoadBalancer
  Properties:
    Scheme: internal
    Subnets:
      - !Ref 'SubnetOne'
      - !Ref 'SubnetTwo'
    IpAddressType: ipv4
    Type: application
```

The examples that follow show how to implement this remediation.

Application Load Balancer - Example

Application Load Balancer configured with `strictest` desync mitigation mode, by meand of the `routing.http.desync_mitigation_mode` load balancer attribute. The example is shown in JSON and in YAML.

JSON example

```
{
  "ApplicationLoadBalancer": {
    "Type": "AWS::ElasticLoadBalancingV2::LoadBalancer",
    "Properties": {
      "Scheme": "internal",
      "Subnets": [

        },
        {
          "Ref": "SubnetTwo"
        }
      ],
      "IpAddressType": "ipv4",
      "Type": "application",
      "LoadBalancerAttributes": [
        {
          "Key": "routing.http.desync_mitigation_mode",
          "Value": "strictest"
        }
      ]
    }
  }
}
```

YAML example

```

  Properties:
    Scheme: internal
    Subnets:
```

```

- !Ref 'SubnetOne'
- !Ref 'SubnetTwo'
IpAddressType: ipv4

[CT.ELASTICLOADBALANCING.PR.4] Require that any application load balancer must be configured to drop HTTP headers

This control checks whether Application Load Balancers are configured to drop non-valid HTTP headers.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancingV2::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.4 example templates](#)

Explanation

By default, Application Load Balancers are not configured to drop non-valid HTTP header values. Removing these header values prevents HTTP desync attacks.

Remediation for rule failure

Set the load balancer attribute `routing.http.drop_invalid_header_fields.enabled` to `true`.

The examples that follow show how to implement this remediation.

Application Load Balancer - Example

Application Load Balancer configured to drop non-valid HTTP headers. The example is shown in JSON and in YAML.

[CT.ELASTICLOADBALANCING.PR.5] Require that application load balancer deletion protection is activated

Checks whether Elastic Load Balancing (ELB) has deletion protection activated.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancingV2::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.5 rule specification](#)

[CT.ELASTICLOADBALANCING.PR.6] Require that application and network load balancer access logging is activated

This control checks whether your Elastic Load Balancing (ELB) application and network load balancers have logging activated.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancingV2::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.6 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.6 example templates](#)

Explanation

Elastic Load Balancing provides access logs that capture detailed information about requests sent to your load balancer. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. You can use these access logs to analyze traffic patterns and to troubleshoot issues.

Usage considerations

- This control applies only to ELB load balancer types of application and network.

Remediation for rule failure

Set the load balancer attribute `access_logs.s3.enabled` to `true`, and set `access_logs.s3.bucket` to reach an S3 bucket that's configured to receive application load balancer or network load balancer access logs.

The examples that follow show how to implement this remediation.

Application Load Balancer - Example

Application Load Balancer configured with access logging activated. The example is shown in JSON and in YAML.

[CT.ELASTICLOADBALANCING.PR.7] Require any classic load balancer to have multiple Availability Zones configured

This control checks whether an Elastic Load Balancing (ELB) classic load balancer has been configured with multiple Availability Zones.

- **Control objective:** Improve availability

- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancing::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.7 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.7 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.7 example templates](#)

Explanation

A Classic Load Balancer can be set up to distribute incoming requests across Amazon EC2 instances in a single Availability Zone or multiple Availability Zones. A Classic Load Balancer that does not span multiple Availability Zones is unable to redirect traffic to targets in another Availability Zone, in case the sole configured Availability Zone becomes unavailable.

Remediation for rule failure

Configure Classic Load Balancers with two or more subnets or Availability Zones.

The examples that follow show how to implement this remediation.

Classic Load Balancer - Example One

Classic Load Balancer configured with two Availability Zones. The example is shown in JSON and in YAML.

# #####
##      Rule Specification      ##
#####
#
# Rule Identifier:
#   elb_multiple_az_check
#
# Description:
#   This control checks whether an Elastic Load Balancing (ELB) Classic Load Balancer
#   has been configured with multiple Availability Zones.
#
# Reports on:
#   AWS::ElasticLoadBalancing::LoadBalancer
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
#     document
#     And: The input document does not contain any Elastic Load Balancing load
#     balancer resources
#     Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
#     document
#     And: The input document contains an Elastic Load Balancing load balancer
#     resource
#     And: Neither 'AvailabilityZones' or 'Subnets' have been specified
#     Then: FAIL
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
#     document
#     And: The input document contains an Elastic Load Balancing load balancer
#     resource
#     And: 'AvailabilityZones' been specified on the Elastic Load Balancing load
#     balancer resource
```

```
#      And: The number of entries in 'AvailabilityZones' is < 2 or the number of
#          unique 'AvailabilityZones' provided is less than 2 (< 2)
#      Then: FAIL
#      Scenario: 4
#      Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
#              document
#      And: The input document contains an Elastic Load Balancing load balancer
#              resource
#      And: 'Subnets' been specified on the Elastic Load Balancing load balancer
#              resource
#      And: The number of entries in 'Subnets' is < 2
#      Then: FAIL
#      Scenario: 5
#      Given: The input document is an AWS CloudFormation or AWS CloudFormation hook

[CT.ELASTICLOADBALANCING.PR.8] Require any classic load balancer SSL/HTTPS listener to have a certificate provided by AWS Certificate Manager

This control checks whether classic load balancers use HTTPS/SSL certificates provided by AWS Certificate Manager.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancing::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.8 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.8 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.8 example templates](#)

Explanation

To create a certificate, you can use either ACM or a tool that supports the SSL and TLS protocols, such as OpenSSL. Security Hub recommends that you use ACM to create or import certificates for your load balancer.

ACM integrates with Classic Load Balancers, so that you can deploy the certificate on your load balancer. You also should renew these certificates automatically.

Usage considerations

- This control applies only to Classic Load Balancers configured with HTTPS or SSL listeners.

Remediation for rule failure

Configure Classic Load Balancers to use certificates provided by AWS Certificate Manager (ACM).

The examples that follow show how to implement this remediation.

Classic Load Balancer - Example

Classic Load Balancer configured with an HTTPS listener and AWS Certificate Manager SSL certificate. The example is shown in JSON and in YAML.

[CT.ELASTICLOADBALANCING.PR.9] Require that an AWS ELB Application or Classic Load Balancer listener is configured with HTTPS or TLS termination

This control checks whether your Elastic Load Balancing (ELB) Classic Load Balancer front-end listeners are configured with HTTPS or SSL protocols.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ElasticLoadBalancing::LoadBalancer
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.9 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.9 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.9 example templates](#)

Explanation

Before you start to use a load balancer, you must add one or more listeners. A listener is a process that uses the configured protocol and port to check for connection requests. Listeners can support HTTP and HTTPS/TLS protocols. You should always use an HTTPS or TLS listener, so that the load balancer does the work of encryption and decryption in transit.

Remediation for rule failure

Configure Classic Load Balancer front-end listeners with HTTPS or SSL protocols.

The examples that follow show how to implement this remediation.

Classic Load Balancer - Example One

Classic Load Balancer configured with an HTTPS Listener. The example is shown in JSON and in YAML.

JSON example

```
{
  "LoadBalancer": {
    "Type": "AWS::ElasticLoadBalancing::LoadBalancer",
    "Properties": {
      "Scheme": "internal",
      "Subnets": [
        {
          "Ref": "Subnet"
        }
      ],
      "Listeners": [
        {
          "Protocol": "HTTPS",
          "SSLCertificateId": {
            "Ref": "ACMCertificate"
          },
          "InstancePort": 80,
          "LoadBalancerPort": 443
        }
      ]
    }
  }
}
```

YAML example

```
LoadBalancer:
  Type: AWS::ElasticLoadBalancing::LoadBalancer
  Properties:
    Scheme: internal
    Subnets:
      - !Ref 'Subnet'
    Listeners:
```

```
- Protocol: HTTPS
  SSLCertificateId: !Ref 'ACMCertificate'
  InstancePort: 80
  LoadBalancerPort: 443
```

The examples that follow show how to implement this remediation.

Classic Load Balancer - Example Two

Classic Load Balancer configured with an SSL Listener. The example is shown in JSON and in YAML.

JSON example

```
{
  "LoadBalancer": {
    "Type": "AWS::ElasticLoadBalancing::LoadBalancer",

[CT.ELASTICLOADBALANCING.PR.10] Require an ELB application or classic load balancer to have logging activated

This control checks whether Classic Load Balancers have logging enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancing::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.10 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.10 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.10 example templates](#)

Explanation

Elastic Load Balancing provides access logs that capture detailed information about requests sent to your load balancer. Each log contains information such as the time the request was received, the

client's IP address, latencies, request paths, and server responses. You can use these access logs to analyze traffic patterns and to troubleshoot issues.

Remediation for rule failure

Set an `AccessLoggingPolicy` and provide an `S3BucketName` with an Amazon S3 bucket configured to receive classic load balancer access logs.

The examples that follow show how to implement this remediation.

Classic Load Balancer - Example

Classic Load Balancer configured with an HTTPS listener and access logging. The example is shown in JSON and in YAML.

[CT.ELASTICLOADBALANCING.PR.11] Require any ELB classic load balancer to have connection draining activated

This control checks whether Elastic Load Balancing (ELB) Classic Load Balancers have connection draining configured.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::ElasticLoadBalancing::LoadBalancer
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.11 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.11 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.11 example templates](#)

Explanation

Activating connection draining on Classic Load Balancers ensures that the load balancer stops sending requests to instances that are de-registering or unhealthy. It keeps the existing connections open. This configuration is particularly useful for instances in Auto Scaling groups, to ensure that connections aren't severed abruptly.

Remediation for rule failure

Configure a ConnectionDrainingPolicy on Elastic Load Balancing Classic Load Balancers.

The examples that follow show how to implement this remediation.

Classic Load Balancer - Example

Classic Load Balancer configured with connection draining active. The example is shown in JSON and in YAML.

[CT.ELASTICLOADBALANCING.PR.12] Require any ELB classic load balancer SSL/HTTPS listener to have a predefined security policy with a strong configuration

This control checks whether Elastic Load Balancing (ELB) Classic Load Balancer HTTPS/SSL listeners use the predefined security policy `ELBSecurityPolicy-TLS-1-2-2017-01`.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancing::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.12 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.12 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.12 example templates](#)

Explanation

A security policy is a combination of SSL protocols, ciphers, and the server order preference option. Predefined policies control the ciphers, protocols, and preference orders that provide support during SSL negotiations between a client and load balancer.

Using `ELBSecurityPolicy-TLS-1-2-2017-01` can help you to meet compliance and security standards that require you to turn off specific versions of SSL and TLS.

Usage considerations

- This control applies only to Elastic Load Balancing Classic Load Balancers configured with HTTPS or SSL listeners.

Remediation for rule failure

Configure Classic Load Balancer HTTPS/SSL listeners to use the predefined security policy called `ELBSecurityPolicy-TLS-1-2-2017-01`.

The examples that follow show how to implement this remediation.

Classic Load Balancer - Example

Classic Load Balancer configured with an HTTPS listener and SSL negotiation policy that references the `ELBSecurityPolicy-TLS-1-2-2017-01` predefined security policy for classic load balancers. The example is shown in JSON and in YAML.

[CT.ELASTICLOADBALANCING.PR.13] Require any ELB classic load balancer to have cross-zone load balancing activated

This control checks whether cross-zone load balancing is configured for your Classic Load Balancer.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancing::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.13 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.13 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.13 example templates](#)

Explanation

A load balancer node distributes traffic across the registered targets in its Availability Zone. When cross-zone load balancing is turned off, each load balancer node distributes traffic only across the registered targets in its own Availability Zone. If the number of registered targets is not same across the Availability Zones, traffic is not distributed evenly, so the instances in one zone may become over-utilized, when compared to the instances in another zone. With cross-zone load balancing activated, each load balancer node for your classic load balancer distributes requests evenly across the registered instances in all enabled Availability Zones.

Remediation for rule failure

Set CrossZone to true on Classic Load Balancers.

The examples that follow show how to implement this remediation.

Classic Load Balancer - Example

Classic Load Balancer configured with cross-zone load balancing active. The example is shown in JSON and in YAML.

[CT.ELASTICLOADBALANCING.PR.14] Require a Network Load Balancer to have cross-zone load balancing activated

This control checks whether a Network Load Balancer (NLB) is configured with cross-zone load balancing.

- **Control objective:** Improve resiliency, Improve availability
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancingV2::LoadBalancer`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.14 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.14 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.14 example templates](#)

Explanation

The nodes for your load balancer distribute requests from clients to registered targets. When cross-zone load balancing is enabled, each load balancer node distributes traffic across the registered targets in all enabled Availability Zones. When cross-zone load balancing is not enabled, each load balancer node distributes traffic only across the registered targets in its own Availability Zone.

Usage considerations

- This control applies only to a Network Load Balancer (Type of network).
- With a Network Load Balancer, cross-zone load balancing is off by default at the load-balancer level. You can turn it on at any time. For target groups, the default is to use the load balancer setting, but you can override the default by turning cross-zone load balancing on or off explicitly, at the target group level. To ensure that cross-zone load balancing is configured on target groups, use this control in conjunction with `CT.ELASTICLOADBALANCING.PR.15`.

Remediation for rule failure

Set the load balancer attribute `load_balancing.cross_zone.enabled` to `true`.

The examples that follow show how to implement this remediation.

[CT.ELASTICLOADBALANCING.PR.15] Require that an Elastic Load Balancing v2 target group does not explicitly disable cross-zone load balancing

This control checks whether an Elastic Load Balancing v2 target group is configured so that it does not explicitly turn off cross-zone load balancing.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::ElasticLoadBalancingV2::TargetGroup`
- **AWS CloudFormation guard rule:** [CT.ELASTICLOADBALANCING.PR.15 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.ELASTICLOADBALANCING.PR.15 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.ELASTICLOADBALANCING.PR.15 example templates](#)

Explanation

The nodes for your load balancer distribute requests from clients to registered targets. When cross-zone load balancing is enabled, each load balancer node distributes traffic across the registered targets in all enabled Availability Zones. When cross-zone load balancing is not enabled, each load balancer node distributes traffic only across the registered targets in its Availability Zone.

The target group's cross-zone load balancing setting determines the load balancing behavior for the entire target group. For example, if cross-zone load balancing is enabled at the load balancer

level, but not enabled at the target group level, traffic sent to the target group is not routed across Availability Zones.

Usage considerations

- This control checks only to ensure that cross-zone load balancing has not been explicitly turned off on an ELB target group. To ensure that cross-zone load balancing is enabled, be sure to enable this control in conjunction with related proactive controls that check load balancers directly.
- If you turn on cross-zone load balancing, you can't start a zonal shift. For more information, see [Resources supported for zonal shifts] (<https://docs.aws.amazon.com/r53recovery/latest/dg/arc-zonal-shift.resource-types.html>) in the Amazon Route 53 Application Recovery Controller Developer Guide.

Remediation for rule failure

Do not set the load balancer attribute `load_balancing.cross_zone.enabled` to adopt the default value of `use_load_balancer_configuration`. Do not explicitly set the attribute to true, nor to the value `use_load_balancer_configuration`.

The examples that follow show how to implement this remediation.

[CT.EMR.PR.1] Require that an Amazon Elastic MapReduce (EMR) security configuration is configured to encrypt data at rest in Amazon S3

This control checks whether an Amazon EMR security configuration is configured to encrypt EMR File System (EMRFS) objects at rest in Amazon S3.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EMR::SecurityConfiguration
- **AWS CloudFormation guard rule:** [CT.EMR.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EMR.PR.1 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EMR.PR.1 example templates](#)

Explanation

Amazon S3 encryption works with EMR File System (EMRFS) objects that are read from and written to Amazon S3. When you enable encryption at rest, you specify Amazon S3 server-side encryption (SSE) or client-side encryption (CSE) as the default encryption mode. Optionally, you can specify different encryption methods for individual buckets by using per bucket encryption overrides.

Remediation for rule failure

In the EncryptionConfiguration parameter, set the value of EnableAtRestEncryption to true, and provide an AtRestEncryptionConfiguration configuration.

The examples that follow show how to implement this remediation.

Amazon EMR security configuration - Example

An Amazon EMR security configuration configured to encrypt EMR File System (EMRFS) objects at rest in Amazon S3. The example is shown in JSON and in YAML.

          }
        }
      }
    }

[CT.EMR.PR.3] Require that an Amazon Elastic MapReduce (EMR) security configuration is configured with EBS volume local disk encryption using an AWS KMS key

This control checks whether Amazon EMR security configurations are configured with local disk encryption enabled, using EBS volume encryption and AWS KMS.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EMR::SecurityConfiguration
- **AWS CloudFormation guard rule:** [CT.EMR.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EMR.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EMR.PR.3 example templates](#)

Explanation

For data at rest, EMR provides the option to encrypt local disk storage. The local storage consists of EC2 instance store volumes and the attached Amazon Elastic Block Store (EBS) storage, which are provisioned with your cluster. The EBS encryption option encrypts the EBS root device volume and its attached storage volumes. The EBS encryption option is available only when you specify AWS Key Management Service as your key provider. AWS Control Tower recommends using EBS encryption.

Usage considerations

- If you create a cluster in a Region where Amazon EC2 encryption of EBS volumes is enabled by default for your account, an EBS volume is encrypted even when local disk encryption is not enabled.
- With local disk encryption enabled in a security configuration, the Amazon EMR settings take precedence over the Amazon EC2 encryption-by-default settings for cluster EC2 instances.

Remediation for rule failure

In the `EncryptionConfiguration` parameter, set the value of `EnableAtRestEncryption` to `true`, and provide an `AtRestEncryptionConfiguration` configuration, containing an `LocalDiskEncryptionConfiguration` configuration that sets `EnableEbsEncryption` to `true`.

The examples that follow show how to implement this remediation.

[CT.EMR.PR.4] Require that an Amazon Elastic MapReduce (EMR) security configuration is configured to encrypt data in transit

This control checks whether an Amazon EMR security configuration is configured to require encryption in transit.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::EMR::SecurityConfiguration
- **AWS CloudFormation guard rule:** [CT.EMR.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.EMR.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.EMR.PR.4 example templates](#)

Explanation

For data in transit, EMR security configurations provide you two options. You can create PEM certificates, zip them in a file, and reference them from Amazon S3, or you can implement a certificate custom provider in Java and specify the S3 path to the JAR. In either case, EMR downloads artifacts to each node in the cluster automatically, and later uses them to implement open-source, in-transit encryption features. For more information on how these certificates are used with different big data technologies, see Amazon EMR documentation.

Usage considerations

- Several encryption mechanisms are associated with in-transit encryption. These mechanisms are open-source features, they are application-specific, and they may vary

by Amazon EMR release. For more information, see [Encryption in transit](#) in the *Amazon EMR Management Guide*.

Remediation for rule failure

In the `EncryptionConfiguration` parameter, set the `EnableInTransitEncryption` parameter to `true`, and provide an `InTransitEncryptionConfiguration` configuration.

The examples that follow show how to implement this remediation.

[CT.GLUE.PR.1] Require an AWS Glue job to have an associated security configuration

This control checks whether an AWS Glue job has an associated security configuration.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Glue::Job
- **AWS CloudFormation guard rule:** [CT.GLUE.PR.1 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.GLUE.PR.1 example templates](#)

Explanation

In AWS Glue, a security configuration contains the properties that are needed when you write encrypted data. Security configurations for an AWS Glue job must be configured to specify how the data is encrypted at the Amazon S3 target. Encryption helps protect the data from unauthorized access and exposure.

Remediation for rule failure

Set the `SecurityConfiguration` parameter to the name of an AWS Glue security configuration.

The examples that follow show how to implement this remediation.

[CT.GUARDDUTY.PR.1] Require an Amazon GuardDuty detector to have Amazon S3 protection activated

This control checks whether Amazon S3 protection is enabled on an Amazon GuardDuty detector.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::GuardDuty::Detector`
- **AWS CloudFormation guard rule:** [CT.GUARDDUTY.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.GUARDDUTY.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.GUARDDUTY.PR.1 example templates](#)

Explanation

Amazon GuardDuty monitors threats against your Amazon S3 resources by analyzing AWS CloudTrail management events and CloudTrail S3 data events. These data sources monitor different kinds of activity. For example, CloudTrail management events for S3 include operations that list or configure S3 buckets, such as `ListBuckets`, `DeleteBuckets`, and `PutBucketReplication`. Examples of data events for S3 include object-level API operations, such as `GetObject`, `ListObjects`, `DeleteObject`, and `PutObject`.

Amazon GuardDuty monitoring of AWS CloudTrail management events is on by default for all accounts that have enabled GuardDuty, and it is not configurable. Amazon S3 data event logs are a configurable data source in GuardDuty.

AWS Control Tower recommends that you enable Amazon S3 protection in GuardDuty. If the feature is not enabled, GuardDuty cannot fully monitor or generate findings for suspicious access to data stored in your Amazon S3 buckets.

Remediation for rule failure

Set `DataSources.S3Logs` to `true`.

The examples that follow show how to implement this remediation.

GuardDuty Detector - Example

Amazon GuardDuty detector with Amazon S3 protection enabled. The example is shown in JSON and in YAML.

          "Enable": true
        }
      }
    }
  }
}
```

[CT.IAM.PR.1] Require that an AWS Identity and Access Management (IAM) inline policy does not have a statement that includes "*" in the Action and Resource elements

This control checks that AWS Identity and Access Management (IAM) inline policies do not include Effect: Allow with Action: * over Resource: *.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::IAM::Policy, AWS::IAM::Role, AWS::IAM::User, AWS::IAM::Group
- **AWS CloudFormation guard rule:** [CT.IAM.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.IAM.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.IAM.PR.1 example templates](#)

Explanation

IAM policies define a set of privileges that are granted to users, groups, or roles. In alignment with industry-standard security advice, AWS recommends that your policies grant least privilege, which means to grant only the permissions that are required to perform a task. When you provide full

administrative privileges instead of the minimum set of permissions that the user requires, you may expose the resources to unwanted actions.

Instead of allowing full administrative privileges, determine the specific actions that your users must carry out, and then craft policies that let the users perform only those tasks. It is more secure to start with a minimum set of permissions and grant additional permissions when necessary. Do not start with lenient permissions and try to tighten them later.

Remove IAM policies that have a statement with `Effect: Allow` that permit `Action: *` over `Resource: *`.

Usage considerations

- This control applies only to IAM inline policies with statements that contain an `Effect` of `Allow` and that contain both the `Action` and the `Resource` element.

Remediation for rule failure

Remove IAM inline policy statements with `Effect: Allow` that permit `Action: *` over `Resource: *`.

The examples that follow show how to implement this remediation.

IAM Policy - Example One

IAM inline policy configured to allow retrieval of objects from an Amazon S3 bucket. The example is shown in JSON and in YAML.

```

The examples that follow show how to implement this remediation.

IAM Role - Example Two

IAM role configured with an inline policy allowing retrieval of objects from an Amazon S3 bucket. The example is shown in JSON and in YAML.

[CT.IAM.PR.2] Require that AWS Identity and Access Management (IAM) customer-managed policies do not contain a statement that includes "*" in the Action and Resource elements

This control checks whether AWS Identity and Access Management (IAM) customer managed policies do not include Effect: Allow with Action: * over Resource: *.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::IAM::ManagedPolicy
- **AWS CloudFormation guard rule:** [CT.IAM.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.IAM.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.IAM.PR.2 example templates](#)

Explanation

IAM policies define a set of privileges that are granted to users, groups, or roles. In alignment with industry-standard security advice, AWS recommends that your policies grant least privilege, which means to grant only the permissions that are required to perform a task. When you provide full privileges instead of the minimum set of permissions that the user requires, you may expose the resources to unwanted actions.

Instead of allowing full privileges, determine the specific actions that your users must carry out, and then craft policies that let the users perform only those tasks. It is more secure to start with a minimum set of permissions and grant additional permissions when necessary. Do not start with lenient permissions and try to tighten them later.

Remove IAM policies that have a statement with Effect: Allow that permit Action: * over Resource: *.

Usage considerations

- This control checks IAM customer-managed policies only. It does not check inline and AWS-managed policies.
- This control applies only to IAM inline policies with statements that contain an Effect of Allow and that contain both the Action and the Resource element.

Remediation for rule failure

Remove IAM inline policy statements with Effect: Allow that permit Action: * over Resource: *.

The examples that follow show how to implement this remediation.

[CT.IAM.PR.3] Require that AWS Identity and Access Management (IAM) customer-managed policies do not have wildcard service actions

This control checks that AWS Identity and Access Management (IAM) customer-managed policies do not contain statements of Effect: Allow with Action: Service:* (for example, s3:*) for individual AWS services, and that the policies do not use the combination of NotAction with an Effect of Allow.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::IAM::ManagedPolicy
- **AWS CloudFormation guard rule:** [CT.IAM.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the [CT.IAM.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.IAM.PR.3 example templates](#)

Explanation

When you assign permissions to AWS services, it is important to scope the allowed IAM actions in your IAM policies. We recommend that you provision least-privilege permissions by restricting IAM policies to required actions only. Overly permissive policies can lead to privilege escalation, if the policies are attached to an IAM principal that may not require the permission.

Usage considerations

- This control checks IAM customer-managed policies only. It does not check inline and AWS-managed policies.
- This control applies only to IAM customer-managed policies with statements that contain an Effect of Allow with an Action or NotAction element present.

Remediation for rule failure

Remove statements from IAM customer-managed policies with Effect: Allow and Action: service:* or Effect: Allow and NotAction.

The examples that follow show how to implement this remediation.

[CT.IAM.PR.4] Require that an AWS Identity and Access Management(IAM) user does not have an inline or managed policy attached

This control checks whether your AWS Identity and Access Management (IAM) user has inline or managed (AWS and customer) policies directly attached. Instead, IAM users should inherit permissions from IAM groups or roles.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::IAM::User, AWS::IAM::Policy, AWS::IAM::ManagedPolicy
- **AWS CloudFormation guard rule:** [CT.IAM.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.IAM.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.IAM.PR.4 example templates](#)

Explanation

By default, IAM users, groups, and roles have no access to AWS resources. IAM policies grant privileges to users, groups, or roles. We recommend that you apply IAM policies directly to groups and roles, but not to users. As the number of users grows, assigning privileges at the group or role level reduces the complexity of access management. Reducing access management complexity may in turn reduce the opportunity for a principal to receive or retain excessive privileges inadvertently.

Remediation for rule failure

Configure IAM users to inherit permissions from IAM groups.

The examples that follow show how to implement this remediation.

IAM User - Example

IAM user configured with no IAM policy or managed policy attachments. The example is shown in JSON and in YAML.

JSON example

```
{
  "IAMUser": {
    "Type": "AWS::IAM::User"
  }
}
```

YAML example

```
IAMUser:
  Type: AWS::IAM::User
```

The examples that follow show how to implement this remediation.

IAM Policy - Example

IAM policy configured with no IAM user associations. The example is shown in JSON and in YAML.

JSON example

```
{
  "IAMPolicy": {
    "Type": "AWS::IAM::Policy",
    "Properties": {
      "PolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
          {
            "Effect": "Allow",
            "Action": [
              "cloudformation:DescribeStacks"
            ],
            "Resource": "*"
          }
        ]
      },
      "PolicyName": "sample-policy",
      "Roles": [
        {
          "Ref": "IAMRole"
        }
      ]
    }
  }
}
```

YAML example

```
IAMPolicy:
  Type: AWS::IAM::Policy
  Properties:
    PolicyDocument:
      Version: '2012-10-17'
```

```
Statement:
  - Effect: Allow
    Action:
      - cloudformation:DescribeStacks
    Resource: '*'
PolicyName: sample-policy
Roles:
  - !Ref 'IAMRole'
```

The examples that follow show how to implement this remediation.

IAM Managed Policy - Example

IAM managed policy configured with no IAM user associations. The example is shown in JSON and in YAML.

JSON example

```
{
  "IAMManagedPolicy": {
    "Type": "AWS::IAM::ManagedPolicy",
    "Properties": {
      "PolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
          {
            "Effect": "Allow",
            "Action": [
              "cloudformation:DescribeStacks"
            ],
            "Resource": "*"
          }
        ]
      }
    }
  }
}
```

YAML example

[CT.IAM.PR.5] Require that AWS Identity and Access Management (IAM) inline policies do not have wildcard service actions

This control checks whether AWS Identity and Access Management (IAM) inline policies do not include Effect: Allow with Action: Service:* (e.g. s3:*) for individual AWS services or use the combination of NotAction with an Effect of Allow.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::IAM::Policy, AWS::IAM::Role, AWS::IAM::User, AWS::IAM::Group
- **AWS CloudFormation guard rule:** [CT.IAM.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.IAM.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.IAM.PR.5 example templates](#)

Explanation

When you assign permissions to AWS services, it is important to scope the allowed IAM actions in your IAM policies. You should restrict IAM actions to only those actions that are needed. This helps you to provision least privilege permissions. Overly permissive policies might lead to privilege escalation if the policies are attached to an IAM principal that might not require the permission.

Usage considerations

- This control only applies to IAM inline policies with statements that contain an Effect of Allow with an Action or NotAction element present

- This control only applies to IAM role, user or group resources with one or more inline policies and IAM policy resources with one or more statements configured

Remediation for rule failure

Remove statements from IAM inline policies with Effect: Allow and Action: service:* or Effect: Allow and NotAction.

The examples that follow show how to implement this remediation.

IAM Inline Policy - Example One

IAM role configured with an inline policy allowing the S3 ListBucket action. The example is shown in JSON and in YAML.

JSON example

                ]
              }
            ]
          }
        }
      ]
    }
  }
}
```

```

    "Resource": [
      "*"
    ]
  },
  "PolicyName": "sample-policy"
}
]
}
}
}
}

```

YAML example

```

IAMGroup:
  Type: AWS::IAM::Group
  Properties:
    Policies:
      - PolicyDocument:
          Version: '2012-10-17'
          Statement:
            - Effect: Allow
              Action:

              Resource:
                - '*'
          PolicyName: sample-policy

```

The examples that follow show how to implement this remediation.

IAM Inline Policy - Example Four

IAM policy associated with an IAM role as an inline policy and configured to allow the S3 ListBucket action. The example is shown in JSON and in YAML.

JSON example

```

{
  "IAMPolicy": {
    "Type": "AWS::IAM::Policy",
    "Properties": {
      "PolicyName": "sample-policy",
      "Roles": [
        {
          "Ref": "IAMRole"
        }
      ],
      "PolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
          {
            "Effect": "Allow",
            "Action": [
              "s3:ListBucket"
            ],
            "Resource": [
              "*"
            ]
          }
        ]
      }
    }
  }
}

```

YAML example

```

IAMPolicy:
  Type: AWS::IAM::Policy
  Properties:
    PolicyName: sample-policy
    Roles:
      - !Ref 'IAMRole'
    PolicyDocument:
      Version: '2012-10-17'

[CT.KMS.PR.1] Require any AWS KMS key to have rotation configured

This control checks whether key rotation is enabled for AWS KMS customer managed keys.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::KMS::Key
- **AWS CloudFormation guard rule:** [CT.KMS.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.KMS.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.KMS.PR.1 example templates](#)

Explanation

Key rotation minimizes the possibility of key exposure to malicious users. Cryptographic best practices discourage extensive reuse of encryption keys. Rotation of keys on regular basis helps you meet organizational security and compliance requirements.

Usage considerations

- This control applies only to AWS KMS symmetric-encryption, customer managed keys.

Remediation for rule failure

Set `EnableKeyRotation` to `true` for AWS KMS symmetric-encryption keys.

The examples that follow show how to implement this remediation.

AWS KMS key - Example

[CT.KMS.PR.2] Require that an AWS Key Management Service asymmetric key with RSA key material used for encryption has a key length greater than 2048 bits

This control checks whether an AWS KMS asymmetric key with RSA key material, which is used for encryption and decryption, to use a key spec with a key length greater than 2048 bits (that is, a key spec other than `RSA_2048`).

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::KMS::Key`
- **AWS CloudFormation guard rule:** [CT.KMS.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.KMS.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.KMS.PR.2 example templates](#)

Explanation

AWS Control Tower recommends using an RSA key spec with a key length greater than 2048 bits, when you are using such keys for encryption and decryption. The key spec determines whether the KMS key is symmetric or asymmetric. It also determines the type of key material, and the

algorithms it supports. AWS KMS supports asymmetric KMS keys that represent a mathematically-related RSA or elliptic curve (ECC) public and private key pair. A KMS key with an RSA key pair can be used for encryption and decryption, or for signing and verification (but not both). AWS KMS supports several key lengths for different security requirements.

Usage considerations

- This control applies only to a KMS key with an RSA key spec, which is configured for encryption and decryption.

Remediation for rule failure

For KMS keys with an RSA keyspec, which are configured for encryption and decryption (KeyUsage of ENCRYPT_DECRYPT), set the KeySpec parameter to a key spec other than RSA_2048.

The examples that follow show how to implement this remediation.

AWS KMS key - Example

An AWS KMS asymmetric key configured for encryption and decryption, with an RSA_4096 key spec. The example is shown in JSON and in YAML.

[CT.KMS.PR.3] Require an AWS Key Management Service key policy to have a statement that limits creation of AWS KMS grants to AWS services

This control checks whether an AWS KMS key has an associated key policy statement that limits creation of AWS KMS grants to AWS services only.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::KMS::Key`
- **AWS CloudFormation guard rule:** [CT.KMS.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.KMS.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.KMS.PR.3 example templates](#)

Explanation

Users with permission to create grants for a KMS key (`kms:CreateGrant`) can use a grant to allow other users and roles, including AWS services, to use the KMS key (grantee principals). Grantee

principals can be identities in your own AWS account, or identities from a different account or organization.

By denying creation of AWS KMS grants unless the request originates from an AWS service, you prevent grants from being assigned directly to principals other than AWS service principals, and you reduce the opportunities for grant misuse. The `kms:GrantIsForAWSResource` condition helps check whether the `CreateGrant` operation is being called by an AWS service integrated with AWS KMS, on behalf of another principal. The `aws:PrincipalIsAWSService` condition helps check whether the `CreateGrant` operation is being called directly by an AWS service principal.

Usage considerations

- If you must use additional conditions on your grants, or if you must issue AWS KMS grants directly to your IAM principals for a customer-managed key, **do not** enable this control. This control requires a policy statement that denies the creation of AWS KMS grants for your customer-managed KMS keys, if the request does not originate from an AWS service that's integrated with AWS KMS, or from an AWS service principal.

Remediation for rule failure

Configure an AWS KMS policy statement that denies access to the `kms:CreateGrant` operation for all principals when the `kms:GrantIsForAWSResource` and `aws:PrincipalIsAWSService` conditions are both false, using the `BoolIfExists` condition operator.

The examples that follow show how to implement this remediation.

[CT.KINESIS.PR.1] Require any Amazon Kinesis data stream to have encryption at rest configured

This control checks whether Amazon Kinesis data streams are encrypted at rest with server-side encryption.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Kinesis::Stream
- **AWS CloudFormation guard rule:** [CT.KINESIS.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.KINESIS.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.KINESIS.PR.1 example templates](#)

Explanation

Server-side encryption is a feature in Amazon Kinesis data streams that encrypts data automatically, before the data is at rest, by using an AWS KMS key. Data is encrypted before it is written to the Kinesis stream storage layer, and decrypted after it is retrieved from storage. As a result, your data is encrypted at rest within the Amazon Kinesis data stream service.

Remediation for rule failure

Specify a `StreamEncryption` configuration, with `EncryptionType` set to `KMS` and `KeyId` set to an AWS KMS key identifier.

The examples that follow show how to implement this remediation.

Amazon Kinesis Data Stream - Example

Amazon Kinesis data stream configured to encrypt data at rest with server-side encryption, using an AWS KMS key. The example is shown in JSON and in YAML.

JSON example

        "EncryptionType": "KMS",
        "KeyId": {
          "Ref": "KMSKey"
        }
      }
    }
  }
}
```

YAML example

```
KinesisStream:

  Properties:
    RetentionPeriodHours: 168
    ShardCount: 3
    StreamEncryption:
      EncryptionType: KMS

[CT.LAMBDA.PR.2] Require AWS Lambda function policies to prohibit public access

This control checks whether an AWS Lambda function resource-based policy prohibits public access.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Lambda::Permission`
- **AWS CloudFormation guard rule:** [CT.LAMBDA.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.LAMBDA.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.LAMBDA.PR.2 example templates](#)

Explanation

The Lambda function should not be publicly accessible, because it may permit unintended access to your code stored in the function.

Remediation for rule failure

When setting `Principal` to `*`, provide one of `SourceAccount`, `SourceArn`, or `PrincipalOrgID`. When setting `Principal` to a service principal (for example, `s3.amazonaws.com`), provide one of `SourceAccount` or `SourceArn`.

The examples that follow show how to implement this remediation.

AWS Lambda Function Policy - Example One

AWS Lambda function policy configured with an AWS account ID principal. The example is shown in JSON and in YAML.

JSON example

```
{
```

```
"LambdaPermission": {
  "Type": "AWS::Lambda::Permission",
  "Properties": {
    "Action": "lambda:InvokeFunction",
    "FunctionName": {
      "Ref": "LambdaFunction"
    },
    "Principal": {
      "Ref": "AWS::AccountId"
    }
  }
}
```

YAML example

```
LambdaPermission:
  Type: AWS::Lambda::Permission
  Properties:
    Action: lambda:InvokeFunction
    FunctionName: !Ref 'LambdaFunction'
    Principal: !Ref 'AWS::AccountId'
```

The examples that follow show how to implement this remediation.

AWS Lambda Function Policy - Example Two

AWS Lambda function policy configured with a wildcard principal and source account condition. The example is shown in JSON and in YAML.

JSON example

```
{
  "LambdaPermission": {
    "Type": "AWS::Lambda::Permission",
    "Properties": {
      "Action": "lambda:InvokeFunction",
      "FunctionName": {
```

```

        "Ref": "LambdaFunction"
    },
    "Principal": "*",
    "SourceAccount": {
        "Ref": "AWS::AccountId"
    }
}
}
}
}

```

YAML example

```

LambdaPermission:
  Type: AWS::Lambda::Permission
  Properties:
    Action: lambda:InvokeFunction
    FunctionName: !Ref 'LambdaFunction'
    Principal: '*'
    SourceAccount: !Ref 'AWS::AccountId'

```

The examples that follow show how to implement this remediation.

AWS Lambda Function Policy - Example Three

AWS Lambda function policy configured with a service principal and source ARN condition. The example is shown in JSON and in YAML.

JSON example

```

{
  "LambdaPermission": {
    "Type": "AWS::Lambda::Permission",
    "Properties": {
      "Action": "lambda:InvokeFunction",
      "FunctionName": {
        "Ref": "LambdaFunction"
      },
    },
    "Principal": "s3.amazonaws.com",

```

```

        "SourceArn": {
            "Fn::GetAtt": [
                "S3Bucket",
                "Arn"
            ]
        }
    }
}

```

YAML example

```

LambdaPermission:
  Type: AWS::Lambda::Permission
  Properties:
    Action: lambda:InvokeFunction
    FunctionName: !Ref 'LambdaFunction'
    Principal: s3.amazonaws.com
    SourceArn: !GetAtt 'S3Bucket.Arn'

[CT.LAMBDA.PR.3] Require an AWS Lambda function to be in a customer-managed Amazon Virtual Private Cloud (VPC)

This control checks whether an AWS Lambda function has been configured with access to resources in a customer-managed Amazon Virtual Private Cloud (VPC).

- **Control objective:** Limit network access

- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Lambda::Function`
- **AWS CloudFormation guard rule:** [CT.LAMBDA.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.LAMBDA.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.LAMBDA.PR.3 example templates](#)

Explanation

AWS Lambda functions can be linked to private subnets within a virtual private cloud (VPC) in your AWS account to connect to resources such as databases, cache instances, or internal services. Ensure that the subnets and security groups used allow access to the necessary resources.

Usage considerations

- This control does not evaluate the VPC subnet routing configuration to determine public reachability.
- This control does not support AWS Lambda@Edge Functions. Lambda@Edge does not support functions that are configured with access to resources inside your VPC.
- Lambda functions can't connect directly to a VPC with dedicated instance tenancy. To connect to resources in a dedicated VPC, peer it to a second VPC with default tenancy.

Remediation for rule failure

In `VpcConfig`, provide the `SubnetIds` property with one or more Subnet IDs, and provide the `SecurityGroupIds` property with one or more Security Group IDs.

The examples that follow show how to implement this remediation.

[CT.LAMBDA.PR.4] Require an AWS Lambda layer permission to grant access to an AWS organization or specific AWS account

This control checks whether an AWS Lambda layer permission has been configured to grant access to an AWS organization or to a specific AWS account only, by ensuring that public access from all AWS accounts has not been granted to a layer.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Lambda::LayerVersionPermission`
- **AWS CloudFormation guard rule:** [CT.LAMBDA.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.LAMBDA.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.LAMBDA.PR.4 example templates](#)

Explanation

By default, a layer that you create is **private** to your AWS account. However, you can share the layer with other accounts or make it public, optionally.

A **public** layer may allow unintended access to your source code and applications. A public Lambda layer can expose valuable information about your account, resources, and internal processes.

Remediation for rule failure

Set the `OrganizationId` parameter to the ID of an AWS organization, or set the `Principal` parameter to an AWS account ID.

The examples that follow show how to implement this remediation.

AWS Lambda layer permission - Example one

An AWS Lambda version permission URL configured to grant layer usage permission to all accounts in an organization. The example is shown in JSON and in YAML.

JSON example

```
{
  "LayerVersionPermission": {
    "Type": "AWS::Lambda::LayerVersionPermission",
    "Properties": {
      "Action": "lambda:GetLayerVersion",
      "LayerVersionArn": {
        "Ref": "LayerVersion"
      },
      "OrganizationId": "o-abc123defg"
    }
  }
}
```

YAML example

```
LayerVersionPermission:
  Type: AWS::Lambda::LayerVersionPermission
  Properties:
    Action: lambda:GetLayerVersion
    LayerVersionArn: !Ref 'LayerVersion'
    OrganizationId: o-abc123defg
```

The examples that follow show how to implement this remediation.

AWS Lambda layer permission - Example two

An AWS Lambda version permission URL configured to grant layer usage permission for an AWS account. The example is shown in JSON and in YAML.

JSON example

```
{
  "LayerVersionPermission": {
    "Type": "AWS::Lambda::LayerVersionPermission",
    "Properties": {
```

```

        "Action": "lambda:GetLayerVersion",
        "LayerVersionArn": {
            "Ref": "LayerVersion"
        },
        "Principal": "123456789012"
    }
}
}

```

YAML example

```

LayerVersionPermission:
  Type: AWS::Lambda::LayerVersionPermission
  Properties:
    Action: lambda:GetLayerVersion
    LayerVersionArn: !Ref 'LayerVersion'
    Principal: '123456789012'

[CT.LAMBDA.PR.5] Require an AWS Lambda function URL to use AWS IAM-based authentication

This control checks whether an AWS Lambda function URL is configured to use authentication that's based on IAM.

- **Control objective:** Enforce least privilege

- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Lambda::Url`
- **AWS CloudFormation guard rule:** [CT.LAMBDA.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.LAMBDA.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.LAMBDA.PR.5 example templates](#)

Explanation

You can control access to a Lambda function URL using the `AuthType` parameter, combined with resource-based policies that are attached to your specific function. The configuration of these two components determines who can invoke or perform other administrative actions on your function URL.

The `AuthType` parameter determines how Lambda authenticates or authorizes requests to your Lambda function URL (endpoint). Setting `AuthType` to `NONE` means that Lambda does not perform any authentication before it invokes your function. However, your function's resource-based policy is always in effect, and the policy must grant public access before your Lambda function URL (endpoint) can receive requests.

Remediation for rule failure

Set the `AuthType` parameter to `AWS_IAM`

The examples that follow show how to implement this remediation.

AWS Lambda function URL - Example

An AWS Lambda function URL (endpoint) configured with AWS IAM-based authentication. The example is shown in JSON and in YAML.

JSON example

```

    "Properties": {
      "TargetFunctionArn": {

          "Arn"
        ]
      },
      "AuthType": "AWS_IAM"
    }
  }
}
```

YAML example

```
FunctionUrl:
  Type: AWS::Lambda::Url
  Properties:
    TargetFunctionArn: !GetAtt 'LambdaFunction.Arn'
    AuthType: AWS_IAM
```

[CT.LAMBDA.PR.6] Require an AWS Lambda function URL CORS policy to restrict access to specific origins

This control checks whether an AWS Lambda function URL is configured with a cross-origin resource sharing (CORS) policy that does not grant access to all origins.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Lambda::Url
- **AWS CloudFormation guard rule:** [CT.LAMBDA.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.LAMBDA.PR.6 rule specification](#)

- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.LAMBDA.PR.6 example templates](#)

Explanation

Cross-Origin Resource Sharing (CORS) is a mechanism based on an HTTP-header, which allows a server to indicate any origins (domain, scheme, or port) other than its own, from which a browser should permit loading resources.

If you set a wildcard origin (*) in a CORS policy, you allow code running in browsers from any origin to gain access to your function URL.

Remediation for rule failure

In the Cors parameter, ensure that the value of AllowOrigins does not contain wildcard origins (*, http://* and https://*)

The examples that follow show how to implement this remediation.

AWS Lambda Function URL - Example

AWS Lambda function URL configured with a cross-origin resource sharing (CORS) policy that restricts access to a specific origin. The example is shown in JSON and in YAML.

JSON example

```

[CT.MQ.PR.1] Require an Amazon MQ ActiveMQ broker to use use active/standby deployment mode for high availability

This control checks whether an Amazon MQ ActiveMQ broker is configured in an active/standby deployment mode.

- **Control objective:** Improve resiliency, Improve availability
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::AmazonMQ::Broker`
- **AWS CloudFormation guard rule:** [CT.MQ.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.MQ.PR.1 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.MQ.PR.1 example templates](#)

Explanation

Amazon MQ ActiveMQ active/standby deployment mode helps you achieve high availability for your Amazon MQ brokers across a single region. The Amazon MQ active/standby deployment mode includes two broker instances, which are configured in a redundant pair across different availability zones.

Usage considerations

- This control applies only to Amazon MQ brokers with an engine type of ACTIVEMQ.

Remediation for rule failure

For Amazon MQ brokers with an engine type of ACTIVEMQ, set the DeploymentMode property to ACTIVE_STANDBY_MULTI_AZ.

The examples that follow show how to implement this remediation.

- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.MQ.PR.2 example templates](#)

Explanation

Amazon MQ cluster deployments for RabbitMQ help you achieve high availability for your Amazon MQ brokers across a single region. RabbitMQ clusters include three broker instances, which are configured in a cluster across different availability zones.

Usage considerations

- This control applies only to Amazon MQ brokers with an engine type of RABBITMQ.

Remediation for rule failure

For Amazon MQ brokers with an engine type of RABBITMQ, set the DeploymentMode property to CLUSTER_MULTI_AZ.

The examples that follow show how to implement this remediation.

[CT.MSK.PR.1] Require an Amazon Managed Streaming for Apache Kafka (Amazon MSK) cluster to enforce encryption in transit between cluster broker nodes

This control checks whether an Amazon MSK cluster is configured to encrypt data in transit between broker nodes of the cluster.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::MSK::Cluster`
- **AWS CloudFormation guard rule:** [CT.MSK.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.MSK.PR.1 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.MSK.PR.1 example templates](#)

Explanation

Amazon MSK uses TLSv1.2. By default, it encrypts data in transit between the brokers of your Amazon MSK cluster. However, you can override this default at the time you create the cluster.

Usage considerations

- Although we highly recommend enabling in-transit encryption, it can add additional CPU overhead and a few milliseconds of latency. Most use cases aren't sensitive to these

differences, and the magnitude of impact depends on the configuration of your cluster, clients, and usage profile.

Remediation for rule failure

In the `EncryptionInfo` property, provide an `EncryptionInTransit` configuration and set the value of `InCluster` to `true`. Otherwise, omit the `InCluster` property to adopt the default value of `true`.

The examples that follow show how to implement this remediation.

[CT.MSK.PR.2] Require an Amazon Managed Streaming for Apache Kafka (Amazon MSK) cluster to be configured with PublicAccess disabled

This control checks whether an Amazon MSK cluster is configured to disallow public access to cluster brokers by means of the PublicAccess property.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::MSK::Cluster`
- **AWS CloudFormation guard rule:** [CT.MSK.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.MSK.PR.2 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.MSK.PR.2 example templates](#)

Explanation

Amazon MSK gives you the option to turn on public access to the brokers of Amazon MSK clusters that run Apache Kafka version 2.6.0 or later. For security reasons, you can't turn on public access while creating an Amazon MSK cluster. However, you can update an existing cluster to make it publicly accessible.

Usage considerations

- In addition to configuring the `PublicAccess` property, other prerequisite conditions are required when you enable public access to Amazon MSK clusters. For more information on configuring Amazon MSK clusters for public access, see [Public Access](#) in the *Amazon MSK Developer Guide*.

Remediation for rule failure

In the parameter `BrokerNodeGroupInfo.ConnectivityInfo.PublicAccess`, set the value of `Type` to `DISABLED`, or to adopt the default value of `DISABLED`, do not provide a `PublicAccess` configuration.

The examples that follow show how to implement this remediation.

[CT.NEPTUNE.PR.1] Require an Amazon Neptune DB cluster to have AWS Identity and Access Management (IAM) database authentication enabled

This control checks whether an Amazon Neptune cluster has AWS Identity and Access Management (IAM) database authentication enabled.

- **Control objective:** Enforce least privilege, Use strong authentication
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Neptune::DBCluster`
- **AWS CloudFormation guard rule:** [CT.NEPTUNE.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.NEPTUNE.PR.1 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.NEPTUNE.PR.1 example templates](#)

Explanation

You can use AWS Identity and Access Management (IAM) to authenticate to your Neptune DB instance or DB cluster. IAM allows you to manage access to your database resources centrally, instead of managing access individually on each DB instance or cluster.

Remediation for rule failure

Set the value of the `IamAuthEnabled` parameter to true.

The examples that follow show how to implement this remediation.

Amazon Neptune Cluster - Example

Neptune Cluster configured with AWS IAM database authentication enabled. The example is shown in JSON and in YAML.

JSON example

```

  "NeptuneDBCluster": {
    "Type": "AWS::Neptune::DBCluster",
    "Properties": {
      "IamAuthEnabled": true
    }
  }
}
```

  Type: AWS::Neptune::DBCluster
  Properties:
    IamAuthEnabled: true

[CT.NEPTUNE.PR.2] Require an Amazon Neptune DB cluster to have deletion protection enabled

This control checks whether an Amazon Neptune cluster has deletion protection enabled.

- **Control objective:** Improve availability, Protect configurations
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::Neptune::DBCluster`
- **AWS CloudFormation guard rule:** [CT.NEPTUNE.PR.2 rule specification](#)

- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.NEPTUNE.PR.2 example templates](#)

Explanation

Cluster deletion protection adds an additional layer of protection against accidental database deletion, or deletion by an unauthorized entity. A Neptune cluster cannot be deleted while deletion protection is enabled. Deletion protection must be disabled first, before a delete request can succeed.

Remediation for rule failure

Set the value of the `DeletionProtection` parameter to true.

The examples that follow show how to implement this remediation.

[CT.NEPTUNE.PR.3] Require an Amazon Neptune DB cluster to have storage encryption enabled

This control checks whether an Amazon Neptune cluster has storage encryption enabled.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Neptune::DBCluster`
- **AWS CloudFormation guard rule:** [CT.NEPTUNE.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.NEPTUNE.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.NEPTUNE.PR.3 example templates](#)

Explanation

Neptune encrypted instances provide an additional layer of data protection, because they help to secure your data from unauthorized access to the underlying storage. Neptune encryption helps increase data protection of your applications that are deployed in the cloud. You also can use it to fulfill compliance requirements for data-at-rest encryption.

Usage considerations

- This control checks only whether the `StorageEncrypted` property is provided and set to `true`. When you create an encrypted Neptune DB instance, you also can supply the AWS KMS key identifier for your encryption key by means of the `KmsKeyId` property. If you don't specify an AWS KMS key identifier, Neptune uses your default Amazon RDS encryption key (`aws/rds`) for your new Neptune DB instance.

Remediation for rule failure

Set `StorageEncrypted` to `true`.

The examples that follow show how to implement this remediation.

[CT.NEPTUNE.PR.4] Require an Amazon Neptune DB cluster to enable Amazon CloudWatch Logs export for audit logs

This control checks whether an Amazon Neptune cluster is configured to send audit logs to Amazon CloudWatch Logs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Neptune::DBCluster
- **AWS CloudFormation guard rule:** [CT.NEPTUNE.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.NEPTUNE.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.NEPTUNE.PR.4 example templates](#)

Explanation

You can configure an Amazon Neptune DB cluster to publish audit log data to a log group in Amazon CloudWatch Logs. Storing your Neptune DB cluster audit log data in Amazon CloudWatch Logs allows you to perform real-time analysis of the log data, and also to use Amazon CloudWatch to create alarms and view metrics.

Remediation for rule failure

In the `EnableCloudwatchLogsExports` parameter, set an entry to the value `audit`.

The examples that follow show how to implement this remediation.

Amazon Neptune cluster - Example

An Amazon Neptune Cluster configured to export audit logs to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

[CT.NEPTUNE.PR.5] Require an Amazon Neptune DB cluster to set a backup retention period greater than or equal to seven days

This control checks whether Amazon Neptune DB clusters have configured automatic backups with a retention period set to 7 or more days (≥ 7). The default retention period is one day.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::Neptune::DBCluster`
- **AWS CloudFormation guard rule:** [CT.NEPTUNE.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.NEPTUNE.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.NEPTUNE.PR.5 example templates](#)

Explanation

Amazon Neptune backs up your cluster volume automatically, and it retains restore data for the length of the backup retention period. Backups are continuous and incremental. You can restore to any point within the backup retention period, quickly. No performance impact or interruption of database service occurs as backup data is being written.

Remediation for rule failure

Set the `BackupRetentionPeriod` parameter to an integer value between 7 and 35 days (inclusive).

The examples that follow show how to implement this remediation.

Amazon Neptune cluster - Example

An Amazon Neptune Cluster configured with a backup retention period of seven (7) days. The example is shown in JSON and in YAML.

[CT.NETWORK-FIREWALL.PR.1] Require any AWS Network Firewall firewall policy to have an associated rule group

This control checks whether there is at least one stateful or stateless rule group associated with an AWS Network Firewall firewall policy.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::NetworkFirewall::FirewallPolicy`
- **AWS CloudFormation guard rule:** [CT.NETWORK-FIREWALL.PR.1 rule specification](#)

Details and examples

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.NETWORK-FIREWALL.PR.1 example templates](#)

Explanation

A firewall policy defines how your firewall monitors and handles traffic in Amazon Virtual Private Cloud (Amazon VPC). Configuration of stateless and stateful rule groups helps to filter packets and traffic flows, and to define the default traffic handling settings.

Remediation for rule failure

Within the FirewallPolicy definition, refer to one or more rule groups in StatefulRuleGroupReferences or StatelessRuleGroupReferences.

The examples that follow show how to implement this remediation.

AWS Network Firewall Firewall Policy - Example

AWS Network Firewall firewall policy configured with stateful and stateless rule group associations. The example is shown in JSON and in YAML.

[CT.NETWORK-FIREWALL.PR.2] Require any AWS Network Firewall firewall policy to drop or forward stateless full packets by default when they do not match a rule

This control checks whether an AWS Network Firewall firewall policy is configured with a user-defined stateless default action for full packets.

- **Control objective:** Limit network access

- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::NetworkFirewall::FirewallPolicy`
- **AWS CloudFormation guard rule:** [CT.NETWORK-FIREWALL.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.NETWORK-FIREWALL.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.NETWORK-FIREWALL.PR.2 example templates](#)

Explanation

A firewall policy defines how your firewall monitors and handles traffic in Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows. Defaulting to Pass can allow unintended traffic.

Remediation for rule failure

Within `FirewallPolicy`, include one of `aws:drop` or `aws:forward_to_sfe` in `StatelessDefaultActions`.

The examples that follow show how to implement this remediation.

AWS Network Firewall Firewall Policy - Example One

AWS Network Firewall firewall policy configured with a stateless default action to drop full packets. The example is shown in JSON and in YAML.

JSON example

```
{
  "FirewallPolicy": {
    "Type": "AWS::NetworkFirewall::FirewallPolicy",
    "Properties": {
      "FirewallPolicyName": {
        "Fn::Sub": "${AWS::StackName}-sample"
      }
    }
  },
```

```

    "FirewallPolicy": {
      "StatelessFragmentDefaultActions": [
        "aws:forward_to_sfe"
      ],
      "StatelessDefaultActions": [
        "aws:drop"
      ]
    }
  }
}
}

```

YAML example

```

FirewallPolicy:
  Type: AWS::NetworkFirewall::FirewallPolicy
  Properties:
    FirewallPolicyName: !Sub '${AWS::StackName}-sample'
    FirewallPolicy:
      StatelessFragmentDefaultActions:
        - aws:forward_to_sfe
      StatelessDefaultActions:
        - aws:drop

```

The examples that follow show how to implement this remediation.

AWS Network Firewall Firewall Policy - Example Two

AWS Network Firewall firewall policy configured with a stateless default action to forward full packets to the stateful rule engine for further inspection. The example is shown in JSON and in YAML.

JSON example

```

{
  "FirewallPolicy": {
    "Type": "AWS::NetworkFirewall::FirewallPolicy",
    "Properties": {

```

```

    "FirewallPolicyName": {
      "Fn::Sub": "${AWS::StackName}-sample"

    "FirewallPolicy": {
      "StatelessFragmentDefaultActions": [
        "aws:forward_to_sfe"
      ],
      "StatelessDefaultActions": [
        "aws:forward_to_sfe"
      ]
    }
  }
}

```

YAML example

```

[CT.NETWORK-FIREWALL.PR.3] Require any AWS Network Firewall firewall policy to drop or forward fragmented packets by default when they do not match a stateless rule

This control checks whether an AWS Network Firewall firewall policy is configured with a default action to drop or forward fragmented packets, when the packets do not match a stateless rule.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::NetworkFirewall::FirewallPolicy`
- **AWS CloudFormation guard rule:** [CT.NETWORK-FIREWALL.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.NETWORK-FIREWALL.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.NETWORK-FIREWALL.PR.3 example templates](#)

Explanation

A firewall policy defines how your firewall monitors and handles traffic in Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows. Defaulting to Pass can allow unintended traffic.

Remediation for rule failure

Within `FirewallPolicy`, include one of `aws:drop` or `aws:forward_to_sfe` in `StatelessFragmentDefaultActions`.

The examples that follow show how to implement this remediation.

AWS Network Firewall Firewall Policy - Example One

AWS Network Firewall firewall policy configured with a stateless default action to drop fragmented packets. The example is shown in JSON and in YAML.

JSON example

```
{
  "FirewallPolicy": {
    "Type": "AWS::NetworkFirewall::FirewallPolicy",
    "Properties": {
      "FirewallPolicyName": {
        "Fn::Sub": "${AWS::StackName}-sample"
      },
      "FirewallPolicy": {
        "StatelessDefaultActions": [
          "aws:forward_to_sfe"
        ],
        "StatelessFragmentDefaultActions": [
          "aws:drop"
        ]
      }
    }
  }
}
```

YAML example

```
FirewallPolicy:
  Type: AWS::NetworkFirewall::FirewallPolicy
  Properties:
    FirewallPolicyName: !Sub '${AWS::StackName}-sample'
    FirewallPolicy:
      StatelessDefaultActions:
        - aws:forward_to_sfe
      StatelessFragmentDefaultActions:
        - aws:drop
```

The examples that follow show how to implement this remediation.

AWS Network Firewall Firewall Policy - Example Two

AWS Network Firewall firewall policy configured with a stateless default action to forward fragmented packets to the stateful rule engine for further inspection. The example is shown in JSON and in YAML.

JSON example

```
{
  "FirewallPolicy": {
    "Type": "AWS::NetworkFirewall::FirewallPolicy",
    "Properties": {
      "FirewallPolicyName": {
        "Fn::Sub": "${AWS::StackName}-sample"
      },
      "FirewallPolicy": {
        "StatelessDefaultActions": [
          "aws:forward_to_sfe"
        ],
        "StatelessFragmentDefaultActions": [
          "aws:forward_to_sfe"
        ]
      }
    }
  }
}
```

YAML example

```
FirewallPolicy:
  Type: AWS::NetworkFirewall::FirewallPolicy
  Properties:
    FirewallPolicyName: !Sub '${AWS::StackName}-sample'
    FirewallPolicy:
      StatelessDefaultActions:
        - aws:forward_to_sfe
      StatelessFragmentDefaultActions:
        - aws:forward_to_sfe
```

[CT.NETWORK-FIREWALL.PR.4] Require any AWS Network Firewall rule group to contain at least one rule

This control checks whether an AWS Network Firewall stateless rule group contains rules.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::NetworkFirewall::RuleGroup`
- **AWS CloudFormation guard rule:** [CT.NETWORK-FIREWALL.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.NETWORK-FIREWALL.PR.4 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.NETWORK-FIREWALL.PR.4 example templates](#)

Explanation

A rule group contains rules that define how your firewall processes traffic in your VPC. An empty, stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic.

Usage considerations

- This control applies only to AWS Network Firewall stateless rule groups.

Remediation for rule failure

Provide one or more AWS Network Firewall stateless rules within the `RuleGroup.RulesSource.StatelessRulesAndCustomActions.StatelessRules` property.

The examples that follow show how to implement this remediation.

[CT.NETWORK-FIREWALL.PR.5] Require an AWS Network Firewall firewall to be deployed across multiple Availability Zones

This control checks whether an AWS Network Firewall firewall is deployed across multiple Availability Zones (AZs), to permit automatic failover between AZs.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::NetworkFirewall::Firewall`
- **AWS CloudFormation guard rule:** [CT.NETWORK-FIREWALL.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.NETWORK-FIREWALL.PR.5 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.NETWORK-FIREWALL.PR.5 example templates](#)

Explanation

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple Availability Zones (AZs), physically separated and isolated. These AZs are connected by low-latency, high-throughput, and highly redundant networking. You can design and operate applications and databases that fail over between Availability Zones without interruption, automatically. Availability Zones are more highly available, fault tolerant, and scalable than traditional single- or multiple-datacenter infrastructures.

Remediation for rule failure

In the SubnetMappings parameter, provide at least two entries that refer to subnets in different Availability Zones.

The examples that follow show how to implement this remediation.

AWS Network Firewall Firewall - Example

An AWS Network Firewall firewall configured to deploy across two subnets in different Availability Zones. The example is shown in JSON and in YAML.

[CT.OPENSEARCH.PR.1] Require an Elasticsearch domain to encrypt data at rest

This control checks whether Elasticsearch domains have encryption-at-rest enabled.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Elasticsearch::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.1 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.1 example templates](#)

Explanation

For an added layer of security for your sensitive data in OpenSearch, you should configure your OpenSearch to be encrypted at rest. Elasticsearch domains offer encryption of data at rest. The feature uses AWS KMS to store and manage your encryption keys. To perform the encryption, it uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Remediation for rule failure

Within `EncryptionAtRestOptions`, set `Enabled` to `true`.

The examples that follow show how to implement this remediation.

Elasticsearch Domain - Example

An Elasticsearch domain configured with encryption-at-rest enabled. The example is shown in JSON and in YAML.

[CT.OPENSEARCH.PR.2] Require an Elasticsearch domain to be created in a user-specified Amazon VPC

This control checks whether Elasticsearch domains are configured with VPC option settings that specify a target Amazon VPC.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Elasticsearch::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.2 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.2 example templates](#)

Explanation

Elasticsearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network

controls that help create secure access to Elasticsearch domains, including network ACLs and security groups. Security Hub recommends that you migrate public Elasticsearch domains to VPCs to take advantage of these controls.

Remediation for rule failure

Within `VPCOptions`, set `SubnetIds` to a list with one or more Amazon EC2 subnet IDs.

The examples that follow show how to implement this remediation.

[CT.OPENSEARCH.PR.3] Require an Elasticsearch domain to encrypt data sent between nodes

This control checks whether Elasticsearch domains have node-to-node encryption enabled.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Elasticsearch::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.3 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.3 example templates](#)

Explanation

HTTPS (TLS) can help prevent potential attackers from eavesdropping on or manipulating network traffic using person-in-the-middle, or similar, attacks. Only encrypted connections over HTTPS (TLS) should be allowed. Enabling node-to-node encryption for Elasticsearch domains ensures that intra-cluster communications are encrypted in transit.

Usage considerations

- A performance penalty may be associated with this configuration. You should be aware of and test the performance trade-offs before enabling this option.

Remediation for rule failure

Within `NodeToNodeEncryptionOptions`, set `Enabled` to `true`.

The examples that follow show how to implement this remediation.

[CT.OPENSEARCH.PR.4] Require an Elasticsearch domain to send error logs to Amazon CloudWatch Logs

This control checks whether Elasticsearch domains are configured to send error logs to an Amazon CloudWatch Logs log group.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Elasticsearch::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.4 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.4 example templates](#)

Explanation

Enable error logs (ES_APPLICATION_LOGS) for Elasticsearch domains and send those logs to CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Remediation for rule failure

Within `LogPublishingOptions`, provide an `ES_APPLICATION_LOGS` configuration, set `Enabled` to `true`, and set `CloudWatchLogsLogGroupArn` to the ARN of a valid Amazon CloudWatch Logs log group.

The examples that follow show how to implement this remediation.

[CT.OPENSEARCH.PR.5] Require an Elasticsearch domain to send audit logs to Amazon CloudWatch Logs

This control checks whether Elasticsearch domains are configured to send audit logs to an Amazon CloudWatch Logs log group.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Elasticsearch::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.5 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.5 example templates](#)

Explanation

Audit logs are highly customizable. They allow you to track user activity on your Elasticsearch clusters, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.

Usage considerations

- This control requires that Elasticsearch domains must have advanced security options configured.
- To enable advanced security options on an Elasticsearch domain through the `AdvancedSecurityOptions` property, you must enable encryption of data at rest (by means of `EncryptionAtRestOptions`), node-to-node encryption (by means of `NodeToNodeEncryptionOptions`), and enforce HTTPS connections (by means of `DomainEndpointOptions`).

Remediation for rule failure

Within `LogPublishingOptions`, provide an `AUDIT_LOGS` configuration, set `Enabled` to `true`, and set `CloudWatchLogsLogGroupArn` to the ARN of a valid Amazon CloudWatch Logs log group.

The examples that follow show how to implement this remediation.

Elasticsearch Domain - Example

An Elasticsearch domain configured to send audit logs to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

[CT.OPENSEARCH.PR.6] Require an Elasticsearch domain to have zone awareness and at least three data nodes

This control checks whether ElasticSearch domains are configured with at least three data nodes and zone awareness enabled.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Elasticsearch::Domain

- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.6 example templates](#)

Explanation

An Elasticsearch domain requires at least three data nodes for high availability and fault-tolerance. Deploying an Elasticsearch domain with at least three data nodes ensures that cluster operations can continue if a node fails.

Remediation for rule failure

Within `ElasticsearchClusterConfig`, set `ZoneAwarenessEnabled` to `true`, and set `InstanceCount` to an integer value greater than or equal to three.

The examples that follow show how to implement this remediation.

Elasticsearch Domain - Example

An Elasticsearch domain configured with three data nodes and zone awareness enabled. The example is shown in JSON and in YAML.

[CT.OPENSEARCH.PR.7] Require an Elasticsearch domain to have at least three dedicated master nodes

This control checks whether Elasticsearch domains are configured with at least three dedicated master nodes.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::Elasticsearch::Domain`
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.7 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.7 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.7 example templates](#)

Explanation

An Elasticsearch domain requires at least three dedicated master nodes for high availability and fault-tolerance. Dedicated master node resources can be strained during data node blue/green deployments, because additional nodes must be managed. Deploying an Elasticsearch domain with at least three dedicated master nodes ensures that sufficient master node resource capacity exists, and that cluster operations can continue if a node fails.

Remediation for rule failure

Within `ElasticsearchClusterConfig`, set `DedicatedMasterEnabled` to `true`, and set `DedicatedMasterCount` to an integer value greater than or equal to three, or omit the `DedicatedMasterCount` property to adopt the default value of three.

The examples that follow show how to implement this remediation.

Elasticsearch Domain - Example One

An Elasticsearch domain configured with three dedicated master nodes by means of the `DedicatedMasterCount` property. The example is shown in JSON and in YAML.

[CT.OPENSEARCH.PR.8] Require an Elasticsearch Service domain to use TLSv1.2

This control checks whether Elasticsearch Service domains are configured to require HTTPS with a minimum TLS version of TLSv1.2.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive

- **Resource types:** `AWS::Elasticsearch::Domain`
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.8 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.8 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.8 example templates](#)

Explanation

HTTPS (TLS) can help prevent potential attackers from using person-in-the-middle, or similar attacks, to eavesdrop on or manipulate network traffic. Only encrypted connections over HTTPS (TLS) should be allowed. Encrypting data in transit can affect performance. You should test your application with this feature to understand the performance profile and the effects of TLS. TLS 1.2 provides several security enhancements over previous versions of TLS.

Remediation for rule failure

Within `DomainEndpointOptions`, set `EnforceHTTPS` to `true` and set `TLSSecurityPolicy` to `Policy-Min-TLS-1-2-2019-07`.

The examples that follow show how to implement this remediation.

[CT.OPENSEARCH.PR.9] Require an Amazon OpenSearch Service domain to encrypt data at rest

This control checks whether Amazon OpenSearch Service domains have encryption-at-rest enabled.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::OpenSearchService::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.9 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.9 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.9 example templates](#)

Explanation

For an added layer of security for sensitive data, you should configure your OpenSearch Service domain to be encrypted at rest. When you configure encryption of data at rest, AWS KMS stores and manages your encryption keys. To perform the encryption, AWS KMS uses the Advanced Encryption Standard algorithm with 256-bit keys (AES-256).

Remediation for rule failure

Within `EncryptionAtRestOptions`, set `Enabled` to `true`.

The examples that follow show how to implement this remediation.

[CT.OPENSEARCH.PR.10] Require an Amazon OpenSearch Service domain to be created in a user-specified Amazon VPC

This control checks whether Amazon OpenSearch Service domains are configured with VPC option settings that specify a target Amazon VPC.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::OpenSearchService::Domain`
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.10 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.10 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.10 example templates](#)

Explanation

Ensure that OpenSearch domains are not attached to public subnets. See Resource-based policies in the Amazon OpenSearch Service Developer Guide. Also ensure that your VPC is configured according to the recommended best practices. See Security best practices for your VPC in the Amazon VPC User Guide.

OpenSearch domains deployed within a VPC can communicate with VPC resources over the private AWS network, without the need to traverse the public internet. This configuration increases the security posture by limiting access to the data in transit. VPCs provide a number of network controls to secure access to OpenSearch domains, including network ACL and security groups. AWS Control Tower recommends that you migrate public OpenSearch domains to VPCs to take advantage of these controls.

Remediation for rule failure

Within `VPCOptions`, set `SubnetIds` to a list with one or more `AAmazon EC2` subnet IDs.

The examples that follow show how to implement this remediation.

Explanation

HTTPS (TLS) can help prevent potential attackers from eavesdropping on or manipulating network traffic using person-in-the-middle, or similar, attacks. Only encrypted connections over HTTPS

(TLS) should be allowed. Enabling node-to-node encryption for OpenSearch domains ensures that intra-cluster communications are encrypted in transit.

Usage considerations

- A performance penalty may be associated with this configuration. You should be aware of the performance trade-offs and test them before enabling this option.

Remediation for rule failure

Within `NodeToNodeEncryptionOptions`, set `Enabled` to `true`.

The examples that follow show how to implement this remediation.

Explanation

Enable error logs (ES_APPLICATION_LOGS) for OpenSearch Service domains and send those logs to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues.

Remediation for rule failure

Within `LogPublishingOptions`, provide an `ES_APPLICATION_LOGS` configuration, set `Enabled` to `true`, and set `CloudWatchLogsLogGroupArn` to the ARN of a valid Amazon CloudWatch Logs log group.

The examples that follow show how to implement this remediation.

[CT.OPENSEARCH.PR.13] Require an Amazon OpenSearch Service domain to send audit logs to Amazon CloudWatch Logs

This control checks whether Amazon OpenSearch Service domains are configured to send audit logs to an Amazon CloudWatch Logs log group.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::OpenSearchService::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.13 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.13 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.13 example templates](#)

Explanation

Audit logs are highly customizable. They allow you to track user activity on your OpenSearch clusters, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries.

Usage considerations

- Audit log publishing requires advanced security options to be enabled on Amazon OpenSearch Service domains.
- To enable advanced security options on an Amazon OpenSearch Service domain, you must enable encryption of data at rest by means of the `EncryptionAtRestOptions` property, node-to-node encryption by means of the `NodeToNodeEncryptionOptions` property, and enforce HTTPS connections by means of the `EnforceHTTPS` property within `DomainEndpointOptions`.

Remediation for rule failure

Within `LogPublishingOptions`, provide an `AUDIT_LOGS` configuration, set `Enabled` to `true` and `CloudWatchLogsLogGroupArn` to the ARN of a valid Amazon CloudWatch Logs log group.

The examples that follow show how to implement this remediation.

Amazon OpenSearch Service Domain - Example

[CT.OPENSEARCH.PR.14] Require an Amazon OpenSearch Service domain to have zone awareness and at least three data nodes

This control checks whether Amazon OpenSearch Service domains are configured with at least three data nodes and zone awareness enabled.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::OpenSearchService::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.14 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.14 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.14 example templates](#)

Explanation

An OpenSearch domain requires at least three data nodes for high availability and fault-tolerance. Deploying an OpenSearch domain with at least three data nodes ensures that the cluster can remain operative if a node fails.

Remediation for rule failure

Within `ClusterConfig`, set `ZoneAwarenessEnabled` to `true` and `InstanceCount` to an integer value greater than or equal to three.

The examples that follow show how to implement this remediation.

Amazon OpenSearch Service Domain - Example

An Amazon OpenSearch Service domain configured with three data nodes and zone awareness enabled. The example is shown in JSON and in YAML.

[CT.OPENSEARCH.PR.15] Require an Amazon OpenSearch Service domain to use fine-grained access control

This control checks whether Amazon OpenSearch Service domains have fine-grained access control enabled.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::OpenSearchService::Domain`
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.15 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.15 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.15 example templates](#)

Explanation

Fine-grained access control offers additional ways of controlling access to your data on Amazon OpenSearch Service.

Usage considerations

- Fine-grained access control requires that advanced security options must be enabled on Amazon OpenSearch Service domains.
- To enable advanced security options on an Amazon OpenSearch Service domain, you must enable encryption of data at rest by means of the `EncryptionAtRestOptions` property, node-to-node encryption by means of the `NodeToNodeEncryptionOptions` property, and enforce HTTPS connections by means of the `EnforceHTTPS` property within `DomainEndpointOptions`.

Remediation for rule failure

Within `AdvancedSecurityOptions`, set `Enabled` to `true`, set `InternalUserDatabaseEnabled` to `true` or `false`, and set `MasterUserOptions` with an options configuration for your master user.

The examples that follow show how to implement this remediation.

[CT.OPENSEARCH.PR.16] Require an Amazon OpenSearch Service domain to use TLSv1.2

This control checks whether Amazon OpenSearch Service domains are configured to require HTTPS with a minimum TLS version of TLSv1.2.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::OpenSearchService::Domain
- **AWS CloudFormation guard rule:** [CT.OPENSEARCH.PR.16 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.OPENSEARCH.PR.16 rule specification](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.OPENSEARCH.PR.16 example templates](#)

Explanation

HTTPS (TLS) can help prevent potential attackers from using person-in-the-middle, or similar attacks, to eavesdrop on or manipulate network traffic. Only encrypted connections over HTTPS (TLS) should be allowed. Encrypting data in transit can affect performance. You should test your application with this feature to understand the performance profile and the effects of TLS. TLS 1.2 provides several security enhancements over previous versions of TLS.

Remediation for rule failure

Within `DomainEndpointOptions`, set `EnforceHTTPS` to `true` and set `TLSSecurityPolicy` to `Policy-Min-TLS-1-2-2019-07`.

The examples that follow show how to implement this remediation.

Amazon OpenSearch Service Domain - Example

[CT.RDS.PR.1] Require that an Amazon RDS database instance is configured with multiple Availability Zones

This control checks whether high availability is configured for your Amazon Relational Database Service (RDS) database instances.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.1 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.1 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.1 example templates](#)

Explanation

Amazon RDS database (DB) instances should be configured for multiple Availability Zones (AZs). This configuration increases the availability of the stored data. Deployment into multiple Availability Zones allows for automated failover, in case an Availability Zone has an outage, and during regular RDS maintenance.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.
- This control applies only when the Engine property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an Engine has not been set explicitly.

Remediation for rule failure

Set `MultiAZ` to `true`.

The examples that follow show how to implement this remediation.

[CT.RDS.PR.2] Require an Amazon RDS database instance or cluster to have enhanced monitoring configured

This control checks whether enhanced monitoring is activated for Amazon Relational Database Service (RDS) instances.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance

- **AWS CloudFormation guard rule:** [CT.RDS.PR.2 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.2 example templates](#)

Explanation

In Amazon RDS, enhanced monitoring facilitates a more rapid response to performance changes in underlying infrastructure. These performance changes could result in a lack of availability of the data. Enhanced monitoring provides real-time metrics of the operating system on which your RDS DB instance runs. An agent, installed on the instance, can obtain metrics more accurately than is possible from the hypervisor layer.

Enhanced monitoring metrics are useful when you want to see how different processes or threads on a database (DB) instance use the CPU.

Usage considerations

- This control applies only to Amazon RDS DB engine types `aurora`, `aurora-mysql`, `aurora-postgresql`, `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set `MonitoringInterval` to a supported value (1, 5, 10, 15, 30, 60), and set `MonitoringRoleArn` to the ARN of an AWS IAM role.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

[CT.RDS.PR.3] Require an Amazon RDS cluster to have deletion protection configured

This control checks whether your Amazon Relational Database Service (Amazon RDS) cluster has deletion protection activated.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.3 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.3 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.3 example templates](#)

Explanation

Enabling cluster deletion protection is an additional layer of protection against accidental database deletion or deletion by an unauthorized entity.

When deletion protection is enabled, an Amazon RDS cluster cannot be deleted. Before a deletion request can succeed, deletion protection must be deactivated.

Remediation for rule failure

Set the value of the `DeletionProtection` parameter to true.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

[CT.RDS.PR.4] Require an Amazon RDS database cluster to have AWS IAM database authentication configured

This control checks whether an Amazon Relational Database Service (RDS) database (DB) cluster has AWS IAM database authentication activated.

- **Control objective:** Use strong authentication
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.4 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.4 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.4 example templates](#)

Explanation

IAM database authentication allows for password-free authentication to database instances. The authentication uses an authentication token. Network traffic to and from the database is encrypted using SSL.

Usage considerations

- This control applies only to Amazon RDS DB cluster engine types `aurora`, `aurora-mysql` and `aurora-postgresql`.

Remediation for rule failure

Set `EnableIAMDatabaseAuthentication` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

Amazon RDS DB cluster configured with AWS IAM database authentication. The example is shown in JSON and in YAML.

JSON example

```

```

```

        "Ref": "DBSubnetGroup"
      },
      "EnableIAMDatabaseAuthentication": true
    }
  }
}

[CT.RDS.PR.5] Require an Amazon RDS database instance to have minor version upgrades configured

This control checks whether automatic minor version upgrades are enabled for an Amazon Relational Database Service (RDS) database instance.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.5 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.5 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.5 example templates](#)

Explanation

By activating automatic minor version upgrades, you can ensure that the latest minor version updates to the relational database management system (RDBMS) are installed. These upgrades might include security patches and bug fixes. Keeping up to date with patch installation is an important step in securing systems.

Usage considerations

- This control applies only to Amazon RDS DB engine types `aurora`, `aurora-mysql`, `aurora-postgresql`, `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Omit the `AutoMinorVersionUpgrade` property or set it to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example One

Amazon RDS DB instance configured with automatic minor version upgrades, enabled by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

JSON example

```
{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": "14.2",
      "DBInstanceClass": "db.m5.large",
      "StorageType": "gp2",
      "AllocatedStorage": 5,
      "MasterUsername": {
        "Fn::Sub": "${resolve:secretsmanager:${DBInstanceSecret}}:username"
      }
    }
  }
}
```

```

    },
    "MasterUserPassword": {
      "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
    }
  },
  "DeletionPolicy": "Delete"
}
}

```

YAML example

```

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    DeletionPolicy: Delete

```

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example Two

Amazon RDS DB instance configured with automatic minor version upgrades, enabled by means of the `AutoMinorVersionUpgrade` property. The example is shown in JSON and in YAML.

JSON example

```

{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": 14.2,

```

```

    "DBInstanceClass": "db.m5.large",
    "StorageType": "gp2",
    "AllocatedStorage": 5,
    "MasterUsername": {
      "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
    },
    "MasterUserPassword": {
      "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
    },
    "AutoMinorVersionUpgrade": true
  },
  "DeletionPolicy": "Delete"
}
}

```

YAML example

```

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    AutoMinorVersionUpgrade: true

[CT.RDS.PR.6] Require an Amazon RDS database cluster to have backtracking configured

This control checks whether an Amazon Relational Database Service (RDS) database (DB) cluster has backtracking enabled.

- **Control objective:** Improve resiliency

- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.6 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.6 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.6 example templates](#)

Explanation

Backups help you to recover more quickly from a security incident. Backups also strengthen the resilience of your systems. Aurora backtracking reduces the time required to recover a database for a specific point in time, and the recovery does not require a database restore.

Usage considerations

- This control applies only to Amazon RDS DB cluster engine types `aurora` and `aurora-mysql`, and to DB cluster engine modes `provisioned` and `parallelquery`
- This control does not apply to Amazon RDS DB clusters that support Aurora Serverless V2 database instances (For example, RDS DB clusters configured with a `ServerlessV2ScalingConfiguration` and Aurora Serverless V2 compatible `EngineVersion`.)

Remediation for rule failure

Set `BacktrackWindow` to a number between 1 and 259200.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

Amazon RDS DB cluster configured with a backtrack window of 720 seconds (12 minutes). The example is shown in JSON and in YAML.

Explanation

IAM database authentication allows authentication to database instances with an authentication token instead of a password. Network traffic to and from the database is encrypted with SSL.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql` and `postgres`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set `EnableIAMDatabaseAuthentication` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with IAM database authentication. The example is shown in JSON and in YAML.

[CT.RDS.PR.8] Require an Amazon RDS database instance to have automatic backups configured

This control checks whether Amazon RDS database (DB) instances have automated backups enabled, and verifies that the backup retention period is greater than or equal to seven (7) days.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.8 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.8 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.8 example templates](#)

Explanation

Backups help you recover more quickly from a security incident, and they strengthen the resilience of your systems. Amazon RDS provides an easy way to configure daily, full-instance volume snapshots.

Usage considerations

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web.

- This control applies only when the Engine property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an Engine has not been set explicitly.

Remediation for rule failure

Set BackupRetentionPeriod to an integer value between 7 and 35 days (inclusive).

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with automated backups configured and a backup retention period of 14 days. The example is shown in JSON and in YAML.

JSON example

```

    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": "14.2",
      "DBInstanceClass": "db.m5.large",

[CT.RDS.PR.9] Require an Amazon RDS database cluster to copy tags to snapshots

This control checks whether an Amazon RDS database (DB) cluster is configured to copy all tags to snapshots created.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.9 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.9 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.9 example templates](#)

Explanation

Identification and inventory of your infrastructure assets is a crucial aspect of governance and security. With visibility into all your Amazon RDS DB clusters, you can assess their security posture and take action on potential areas of weakness. We recommend that you tag snapshots in the same way as their parent RDS database clusters. Activating this setting ensures that snapshots inherit the tags of their parent database clusters.

Usage considerations

- This control applies only to Amazon RDS DB cluster engine types `aurora`, `aurora-mysql`, and `aurora-postgresql`.

Remediation for rule failure

Set `CopyTagsToSnapshot` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

Amazon RDS DB cluster configured to copy tags to snapshots. The example is shown in JSON and in YAML.

    "DBSubnetGroupName": {
      "Ref": "DBSubnetGroup"

    "CopyTagsToSnapshot": true
  }
}
}

[CT.RDS.PR.10] Require an Amazon RDS database instance to copy tags to snapshots

This control checks whether Amazon RDS database (DB) instances are configured to copy all tags to snapshots created.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.10 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.10 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.10 example templates](#)

Explanation

Identification and inventory of your IT assets is a crucial aspect of governance and security. With visibility of all your RDS DB instances, you can assess their security posture and take action on potential areas of weakness. Snapshots should be tagged to match their parent RDS database instances. Enabling this setting ensures that snapshots inherit the tags from their parent database instances.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set `CopyTagsToSnapshot` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured to copy all tags to snapshots created. The example is shown in JSON and in YAML.

JSON example

```
{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": "14.2",
      "DBInstanceClass": "db.m5.large",
      "StorageType": "gp2",
      "AllocatedStorage": 5,
```

```

    "MasterUsername": {
      "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
    },
    "MasterUserPassword": {
      "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
    },
    "CopyTagsToSnapshot": true
  },
  "DeletionPolicy": "Delete"
}
}

```

YAML example

```

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large

[CT.RDS.PR.11] Require an Amazon RDS database instance to have a VPC configuration

This control checks whether an Amazon RDS database (DB) instance is deployed in a VPC (that is, with an EC2-VPC instance).

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.11 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.11 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.11 example templates](#)

Explanation

Amazon Virtual Private Cloud (Amazon VPC) provides a number of network controls to create secure access to RDS resources. These controls include VPC endpoints, network ACLs, and security groups. To take advantage of these controls, create your Amazon RDS instances as EC2 VPC instances.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set a `DBSubnetGroupName`.

The examples that follow show how to implement this remediation.

[CT.RDS.PR.12] Require an Amazon RDS event subscription to have critical cluster events configured

This control checks whether your Amazon RDS event subscriptions for RDS clusters are configured to notify on event categories of maintenance and failure.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::EventSubscription
- **AWS CloudFormation guard rule:** [CT.RDS.PR.12 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.12 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.12 example templates](#)

Explanation

Amazon RDS event notifications uses Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response.

Usage considerations

- This control applies only to Amazon RDS event subscriptions for RDS clusters (SourceType of db-cluster).

Remediation for rule failure

When SourceType is set to db-cluster, set Enabled to true and ensure that EventCategories contains both maintenance and failure values.

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example One

Amazon RDS event subscription for RDS clusters configured to notify on all event categories. The example is shown in JSON and in YAML.

JSON example

```
{
  "RDSEventSubscription": {
    "Type": "AWS::RDS::EventSubscription",
    "Properties": {
      "SnsTopicArn": {
        "Ref": "SnsTopic"
      },
      "SourceType": "db-cluster",
      "Enabled": true
    }
  }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
```

```
SnsTopicArn: !Ref 'SnsTopic'  
SourceType: db-cluster  
Enabled: true
```

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example Two

Amazon RDS event subscription for RDS clusters configured to notify on maintenance and failure event categories. The example is shown in JSON and in YAML.

JSON example

```
{  
  "RDSEventSubscription": {  
    "Type": "AWS::RDS::EventSubscription",  
    "Properties": {  
      "SnsTopicArn": {  
        "Ref": "SnsTopic"  
      },  
      "EventCategories": [  
        "maintenance",  
        "failure"  
      ],  
      "SourceType": "db-cluster",  
      "Enabled": true  
    }  
  }  
}
```

YAML example

```
RDSEventSubscription:  
  Type: AWS::RDS::EventSubscription  
  Properties:  
    SnsTopicArn: !Ref 'SnsTopic'  
    EventCategories:  
      - maintenance
```

```

- failure
SourceType: db-cluster

[CT.RDS.PR.13] Require any Amazon RDS instance to have deletion protection configured

This control checks whether an Amazon Relational Database Service (Amazon RDS) instance has deletion protection activated.

- **Control objective:** Improve availability
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.13 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.13 rule specification](#)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.13 example templates](#)

Explanation

When active, instance deletion protection provides an additional layer of protection against accidental database deletion, or deletion by an unauthorized entity.

While deletion protection is active, an RDS DB instance cannot be deleted. Before a deletion request can succeed, deletion protection must be turned off.

Usage considerations

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web.
- This control applies only when the Engine property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an Engine has not been set explicitly.

Remediation for rule failure

Set DeletionProtection to true.

The examples that follow show how to implement this remediation.

[CT.RDS.PR.14] Require an Amazon RDS database instance to export logs to Amazon CloudWatch Logs by means of the EnableCloudwatchLogsExports property

This rule checks whether Amazon Relational Database Service (RDS) instances have all available log types configured for export to Amazon CloudWatch Logs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive

- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.14 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.14 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.14 example templates](#)

Explanation

AWS Control Tower recommends that you enable the export of relevant logs for all Amazon RDS databases to Amazon CloudWatch Logs. Database logging provides detailed records of requests made to RDS. Database logs can assist with security and access audits, and they can help you diagnose availability issues.

Usage considerations

- This control applies only to Amazon RDS DB engine types mariadb, mysql, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, oracle-ee, oracle-se2, oracle-se1, and oracle-se.
- This control applies only when the Engine property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an Engine has not been set explicitly.
- Additional prerequisites may exist for enabling logging based on your selected database engine type. Refer to [Monitoring Amazon RDS log files](#) in the *Amazon RDS User Guide* for more information.

Remediation for rule failure

Specify `EnableCloudwatchLogsExports` with a list of all supported log types for the Amazon RDS database instance engine.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example One

Amazon RDS DB instance configured with an engine type of `mysql` and all supported log types, for the `mysql` engine type. The example is shown in JSON and in YAML.

[CT.RDS.PR.15] Require that an Amazon RDS instance does not create DB security groups

This control checks whether any Amazon Relational Database Service (RDS) database (DB) security groups are created by, or associated to, an RDS DB instance, because DB security groups are intended for the EC2-Classic platform only.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive

- **Resource types:** AWS::RDS::DBInstance, AWS::RDS::DBSecurityGroup
- **AWS CloudFormation guard rule:** [CT.RDS.PR.15 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.15 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.15 example templates](#)

Explanation

We recommend that all Amazon Relational Database Service (RDS) databases use Amazon VPC security groups to secure their access. Amazon DB security groups are for the EC2-Classical platform only, and they are not recommended for use.

Remediation for rule failure

Omit the DBSecurityGroups property. Instead, configure Amazon VPC security groups by means of the VPCSecurityGroups property.

The examples that follow show how to implement this remediation.

[CT.RDS.PR.16] Require an Amazon RDS database cluster to have encryption at rest configured

This control checks whether the storage encryption is configured on Amazon Relational Database Service (RDS) database (DB) clusters that are not being restored from an existing cluster.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.16 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.16 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.16 example templates](#)

Explanation

We recommend that you configure your Amazon RDS DB clusters to be encrypted at rest, to give an added layer of security for your sensitive data. To encrypt your RDS DB clusters and snapshots at rest, enable the encryption option for your RDS DB clusters. Data that is encrypted at rest includes the underlying storage for DB clusters, its automated backups, read replicas, and snapshots.

Encrypted RDS DB clusters use the open standard AES-256 encryption algorithm to encrypt your data on the server that hosts the clusters. After your data is encrypted, Amazon RDS handles authentication of access and decryption of your data with a minimal impact on performance. You do not need to modify your database client applications to use encryption.

Usage considerations

- This control applies only to Amazon RDS DB clusters that are not being restored from an existing cluster or created as a read replica. (For example, when `SourceDBClusterIdentifier` or `ReplicationSourceIdentifier` properties have been provided.)

Remediation for rule failure

Set `StorageEncrypted` to `true`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

Amazon RDS DB cluster configured with storage encryption enabled. The example is shown in JSON and in YAML.

JSON example

        "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
      },
      "StorageEncrypted": true
    }
  }
}
```

YAML example

```

[CT.RDS.PR.17] Require an Amazon RDS event notification subscription to have critical database instance events configured

This control checks whether your Amazon RDS event subscriptions for RDS instances are configured to notify on event categories of maintenance, failure, and configuration change.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::EventSubscription
- **AWS CloudFormation guard rule:** [CT.RDS.PR.17 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.17 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.17 example templates](#)

Explanation

Amazon RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response.

Usage considerations

- This control applies only to Amazon RDS Event Subscriptions for RDS instances (SourceType of db-instance).

Remediation for rule failure

When `SourceType` is set to `db-instance`, set `Enabled` to `true` and ensure that the parameter `EventCategories` contains `maintenance`, `failure`, and `configuration change` values.

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example One

Amazon RDS Event Subscription for RDS instances configured to notify on all event categories. The example is shown in JSON and in YAML.

JSON example

```
{
  "RDSEventSubscription": {
    "Type": "AWS::RDS::EventSubscription",
    "Properties": {
      "SnsTopicArn": {
        "Ref": "SnsTopic"
      },
      "SourceType": "db-instance",
      "Enabled": true
    }
  }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-instance
    Enabled: true
```

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example Two

Amazon RDS Event Subscription for RDS instances configured to notify on maintenance, failure, and configuration change event categories. The example is shown in JSON and in YAML.

JSON example

```
{
  "RDSEventSubscription": {
    "Type": "AWS::RDS::EventSubscription",
    "Properties": {
      "SnsTopicArn": {
        "Ref": "SnsTopic"
      },
      "EventCategories": [
        "maintenance",
        "failure",
        "configuration change"
      ],
      "SourceType": "db-instance",
      "Enabled": true
    }
  }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - maintenance
      - failure
      - configuration change
    SourceType: db-instance
    Enabled: true
```

[CT.RDS.PR.19] Require an Amazon RDS event notifications subscription to have critical database security group events configured

This control checks whether your Amazon RDS event subscriptions for RDS security groups are configured to notify on event categories of failure and configuration change

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::EventSubscription
- **AWS CloudFormation guard rule:** [CT.RDS.PR.19 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.19 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.19 example templates](#)

Explanation

Amazon RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for a rapid response.

Usage considerations

- This control applies only to Amazon RDS Event Subscriptions for RDS security groups (SourceType of db-security-group)

Remediation for rule failure

When SourceType is set to db-security-group, set Enabled to true and ensure that the parameter EventCategories contains both failure and configuration change values.

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example One

Amazon RDS Event Subscription for RDS security groups configured to notify on all event categories. The example is shown in JSON and in YAML.

JSON example

```
{
  "RDSEventSubscription": {
    "Type": "AWS::RDS::EventSubscription",
    "Properties": {
      "SnsTopicArn": {
        "Ref": "SnsTopic"
      },
      "SourceType": "db-security-group",
      "Enabled": true
    }
  }
}
```

```

    }
  }
}

```

YAML example

```

RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-security-group
    Enabled: true

```

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example Two

Amazon RDS Event Subscription for RDS security groups configured to notify on failure and configuration change event categories. The example is shown in JSON and in YAML.

JSON example

```

{
  "RDSEventSubscription": {
    "Type": "AWS::RDS::EventSubscription",
    "Properties": {
      "SnsTopicArn": {
        "Ref": "SnsTopic"
      },
      "EventCategories": [
        "failure",
        "configuration change"
      ],
      "SourceType": "db-security-group",
      "Enabled": true
    }
  }
}

```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - failure
      - configuration change
    SourceType: db-security-group
    Enabled: true
```

[CT.RDS.PR.20] Require an Amazon RDS database instance not to use a database engine default port

This control checks whether Amazon Relational Database Service (RDS) database instances are configured for default database port for their specific engine types.

- **Control objective:** Limit network access

- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.20 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.20 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.20 example templates](#)

Explanation

If you use a known port to deploy an Amazon RDS cluster or instance, an attacker can guess information about the cluster or instance. The attacker can use this information in conjunction with other information to connect to an Amazon RDS cluster or instance, or to gain additional information about your application.

When you change the port, you must also update the existing connection strings that were used to connect to the old port. You also should check the security group of the DB instance to ensure that it includes an ingress rule that allows connectivity on the new port.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-se2`, `oracle-ee-cdb`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex` and `sqlserver-web`.
- This control applies only when the `Engine` property is provided. It does not apply when restoring from a DB snapshot or cluster snapshot where an `Engine` has not been set explicitly.

Remediation for rule failure

Set a value for `Port` that is different than the default value for the Amazon RDS DB instance engine type.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example One

Amazon RDS DB instance configured with a port that's different than the mysql engine default port. The example is shown in JSON and in YAML.

JSON example

```
{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "mysql",
      "EngineVersion": "5.7",

[CT.RDS.PR.21] Require an Amazon RDS DB cluster to have a unique administrator username

This control checks whether an Amazon Relational Database Service (RDS) database (DB) cluster has changed the administrator username from its default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBCluster`
- **AWS CloudFormation guard rule:** [CT.RDS.PR.21 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.21 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.21 example templates](#)

Explanation

When you create an Amazon RDS database, we recommend that you change the default administrator username to a unique value. Default user names are public knowledge, and they should be changed, because changing these user names reduces the risk of unintended access.

Usage considerations

- This control applies only to Amazon RDS DB clusters that set the `MasterUsername` property.

Remediation for rule failure

Set `MasterUsername` to a value other than `admin` or `postgres`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Cluster - Example

Amazon RDS DB cluster configured with a unique administrator username. The example is shown in JSON and in YAML.

JSON example

```
{
  "DBCluster": {
    "Type": "AWS::RDS::DBCluster",
    "Properties": {
      "Engine": "aurora-mysql",
      "MasterUsername": "samplemasteruser",

        "Fn::Sub": "${resolve:secretsmanager:${RDSClusterSecret}::password}"
      },
      "DBSubnetGroupName": {
        "Ref": "DBSubnetGroup"
      }
    }
  }
}
```

YAML example

```

Properties:
  Engine: aurora-mysql
  MasterUsername: samplemasteruser
  MasterUserPassword: !Sub '{{resolve:secretsmanager:${RDSClusterSecret}::password}}'

[CT.RDS.PR.22] Require an Amazon RDS database instance to have a unique administrator username

This control checks whether an Amazon Relational Database Service (RDS) database has changed the administrator username from its default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.22 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.22 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.22 example templates](#)

Explanation

Default administrative usernames on Amazon RDS databases are public knowledge. When creating an Amazon RDS database, you should change the default administrative username to a unique value, thereby reducing the risk of unintended access.

Usage considerations

- This control applies only to Amazon RDS DB engine types `mariadb`, `mysql`, `oracle-ee`, `oracle-ee-cdb`, `oracle-se2`, `oracle-se2-cdb`, `postgres`, `sqlserver-ee`, `sqlserver-se`, `sqlserver-ex`, and `sqlserver-web`.

Remediation for rule failure

Set `MasterUsername` to a value other than `postgres` or `admin`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with a custom administrator username. The example is shown in JSON and in YAML.

JSON example

```

    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": "14.2",
      "DBInstanceClass": "db.m5.large",
```

```

        "StorageType": "gp2",
        "AllocatedStorage": 5,
        "MasterUsername": "testUser",
        "MasterUserPassword": {
            "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
        }
    },
    "DeletionPolicy": "Delete"
}
}

```

YAML example

```

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large

[CT.RDS.PR.23] Require an Amazon RDS database instance to not be publicly accessible

This rule checks whether Amazon Relational Database Service (RDS) database (DB) instances are publicly accessible, as determined by checking the `PubliclyAccessible` configuration property.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** `AWS::RDS::DBInstance`
- **AWS CloudFormation guard rule:** [CT.RDS.PR.23 rule specification](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.23 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.23 example templates](#)

Explanation

The `PubliclyAccessible` property in the RDS instance CloudFormation resource indicates whether the DB instance is publicly accessible. When the DB instance is configured with `PubliclyAccessible` set to `true`, it is an internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. When the DB instance isn't publicly accessible, it is an internal instance with a DNS name that resolves to a private IP address.

Unless you intend for your RDS instance to be publicly accessible, do not configure the RDS instance with the `PubliclyAccessible` value set to `true`, because this configuration may allow unwanted traffic to your database instance.

Remediation for rule failure

Set the value of `PubliclyAccessible` to `false`.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured as an internal instance, by means of a publicly accessible configuration. The example is shown in JSON and in YAML.

JSON example

```
