**Additional Note:**

- **Control identifier** refers to unique identifiers assigned to each control within the AWS Control Tower framework.
- **Framework** categorizes the controls based on specific regions.
- **Control objective** outlines the purpose or goal of each control.
- **Control API identifiers, by Region** lists the specific ARNs (Amazon Resource Names) associated with each control instance within the respective regions.

The table lists control identifiers and framework APIs for various regions. Each region is associated with a unique control identifier and framework API, providing a structured way to manage and identify control objectives across different geographical locations.

**Control objective**

- **Enforce a minimum password length** ensures that passwords in your accounts are strong enough to protect your resources from accidental or malicious unauthorized access. This is critical for maintaining the confidentiality and integrity of your data and ensuring business continuity. A strong password policy contributes to a holistic, multi-layered security approach, where multiple strategies are integrated to safeguard against cyber threats.

**Control API identifiers, by Region**

- **Europe (Stockholm)** arn:aws:controltower::eu-north-1::control::KUWH VRCLYOJB
- **Asia Pacific (Mumbai)** arn:aws:controltower::ap-south-1::control::LHHY JCUXFCSE
- **Asia Pacific (Seoul)** arn:aws:controltower::ap-northeast-2::control::HDFINDBKXQR
- **Asia Pacific (Tokyo)** arn:aws:controltower::ap-northeast-1::control::

**Control identifier**: Unique identifier for each control.

**Framework**: The AWS Control Tower framework performs all the controls for the listed regions.

**Control objective**: The objective of the control is to ensure compliance with specific AWS best practices.

**Control API identifiers, by Region**: The ARN (Amazon Resource Name) for each region that implements the control.
