#
CT.RDS.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```yaml
Resources:
  MonitoringIAMRole:
    Type: AWS::IAM::Role
    Properties:
      AssumeRolePolicyDocument:
        Version: "2012-10-17"
        Statement:
          - Effect: "Allow"
            Principal:
              Service:
                - "monitoring.rds.amazonaws.com"
            Action:
              - "sts:AssumeRole"
            Path: "/"
      ManagedPolicyArns:
        - arn:aws:iam::aws:policy/service-role/AmazonRDSEnhancedMonitoringRole
```
FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

**[CT.RDS.PR.3]** Require an Amazon RDS cluster to have deletion protection configured

This control checks whether your Amazon Relational Database Service (Amazon RDS) cluster has deletion protection activated.
• **Control objective:** Improve availability
• **Implementation:** AWS CloudFormation Guard Rule
• **Control behavior:** Proactive
• **Resource types:** AWS::RDS::DBCluster
• **AWS CloudFormation guard rule:** CT.RDS.PR.3 rule specification (p. 1083)

Details and examples

• For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.3 rule specification (p. 1083)
• For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.3 example templates (p. 1084)

Explanation

Enabling cluster deletion protection is an additional layer of protection against accidental database deletion or deletion by an unauthorized entity.

When deletion protection is enabled, an Amazon RDS cluster cannot be deleted. Before a deletion request can succeed, deletion protection must be deactivated.

**Remediation for rule failure**

Set the value of the DeletionProtection parameter to true.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Cluster - Example**

Amazon RDS DB cluster with deletion protection enabled. The example is shown in JSON and in YAML.

**JSON example**

```
{
   "RDSDBCluster": {
      "Type": "AWS::RDS::DBCluster",
      "Properties": {
         "Engine": "aurora",
         "MasterUsername": {
            "Fn::Sub": "{{resolve:secretsmanager:${RDSClusterSecret}::username}}"
         },
         "MasterUserPassword": {
            "Fn::Sub": "{{resolve:secretsmanager:${RDSClusterSecret}::password}}"
         },
         "DBSubnetGroupName": {
            "Ref": "TestDBSubnetGroup"
         },
         "DeletionProtection": true
      }
   }
}
```

**YAML example**

```
RDSDBCluster:
```
Type: AWS::RDS::DBCluster

Properties:
  Engine: aurora
  MasterUsername: !Sub '{{resolve:secretsmanager:${RDSClusterSecret}::username}}'
  MasterUserPassword: !Sub '{{resolve:secretsmanager:${RDSClusterSecret}::password}}'
  DBSubnetGroupName: !Ref 'TestDBSubnetGroup'
  DeletionProtection: true

      Ref: DBSubnetGroup
    DeletionProtection: false

**[CT.RDS.PR.4] Require an Amazon RDS database cluster to have AWS IAM database authentication configured**

This control checks whether an Amazon Relational Database Service (RDS) database (DB) cluster has AWS IAM database authentication activated.

- **Control objective:** Use strong authentication
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.4 rule specification](p. 1088)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.4 rule specification](p. 1088)
For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.4 example templates (p. 1090)

**Explanation**

IAM database authentication allows for password-free authentication to database instances. The authentication uses an authentication token. Network traffic to and from the database is encrypted using SSL.

**Usage considerations**

- This control applies only to Amazon RDS DB cluster engine types aurora, aurora-mysql and aurora-postgresql.

**Remediation for rule failure**

Set `EnableIAMDatabaseAuthentication` to `true`.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Cluster - Example**

Amazon RDS DB cluster configured with AWS IAM database authentication. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}" 
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "EnableIAMDatabaseAuthentication": true
        }
    }
}
```

**YAML example**

```yaml
DBCluster:
    Type: AWS::RDS::DBCluster
    Properties:
        Engine: aurora-mysql
        MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
        MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
        DBSubnetGroupName: !Ref 'DBSubnetGroup'
        EnableIAMDatabaseAuthentication: true
```

[CT.RDS.PR.5] Require an Amazon RDS database instance to have minor version upgrades configured

This control checks whether automatic minor version upgrades are enabled for an Amazon Relational Database Service (RDS) database instance.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.5 rule specification](p. 1094)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.5 rule specification](p. 1094)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.5 example templates](p. 1096)

**Explanation**

By activating automatic minor version upgrades, you can ensure that the latest minor version updates to the relational database management system (RDBMS) are installed. These upgrades might include security patches and bug fixes. Keeping up to date with patch installation is an important step in securing systems.

**Usage considerations**

- This control applies only to Amazon RDS DB engine types aurora, aurora-mysql, aurora-postgresql, mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web.

**Remediation for rule failure**

Omit the `AutoMinorVersionUpgrade` property or set it to `true`.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Instance - Example One**

Amazon RDS DB instance configured with automatic minor version upgrades, enabled by means of AWS CloudFormation defaults. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
        }
    }
}
```
"MasterUsername": {
  "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
},
"MasterUserPassword": {
  "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
},
"DeletionPolicy": "Delete"
}

YAML example

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    AutoMinorVersionUpgrade: true
  DeletionPolicy: "Delete"

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example Two

Amazon RDS DB instance configured with automatic minor version upgrades, enabled by means of the AutoMinorVersionUpgrade property. The example is shown in JSON and in YAML.

JSON example

{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": "14.2",
      "DBInstanceClass": "db.m5.large",
      "StorageType": "gp2",
      "AllocatedStorage": 5,
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
      },
      "AutoMinorVersionUpgrade": true
    },
    "DeletionPolicy": "Delete"
  }
}

YAML example
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    - Engine: postgres
    - EngineVersion: 14.2
    - DBInstanceClass: db.m5.large
    - StorageType: gp2
    - AllocatedStorage: 5
    - MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    - MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'

CT.RDS.PR.5 rule specification

```# ###########################
##       Rule Specification        
# ###########################
#
# Rule Identifier:
#   rds_instance_automatic_minor_version_upgrade_enabled_check
#
# Description:
#   This control checks whether automatic minor version upgrades are enabled for an Amazon
#   Relational Database Service (RDS) database instance.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
#     And: The input document does not contain any RDS DB instance resources
#     Then: SKIP
#   Scenario: 2
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
#     And: The input document contains an RDS DB instance resource
#     And: 'Engine' is not one of 'aurora', 'aurora-mysql', 'aurora-postgresql',
#         'mariadb', 'mysql',
#         'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb',
#         'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web',
#         'postgres'
#     Then: SKIP
#   Scenario: 3
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
#     And: The input document contains an RDS DB instance resource
#     And: 'Engine' is one of 'aurora', 'aurora-mysql', 'aurora-postgresql', 'mariadb',
#         'mysql',
#         'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb',
#         'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web',
#         'postgres'
```
### And: 'AutoMinorVersionUpgrade' has been specified
### And: 'AutoMinorVersionUpgrade' has been set to bool(false)
### Then: FAIL

### Scenario: 4
### Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
### And: The input document contains an RDS DB instance resource
### And: 'Engine' is one of 'aurora', 'aurora-mysql', 'aurora-postgresql', 'mariadb',
### 'mysql',
### 'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb',
### 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web',
### 'postgres'
### And: 'AutoMinorVersionUpgrade' has not been specified
### Then: PASS

### Scenario: 5
### Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
### And: The input document contains an RDS DB instance resource
### And: 'Engine' is one of 'aurora', 'aurora-mysql', 'aurora-postgresql', 'mariadb',
### 'mysql',
### 'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb',
### 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web',
### 'postgres'
### And: 'AutoMinorVersionUpgrade' has been specified
### And: 'AutoMinorVersionUpgrade' has been set to bool(true)
### Then: PASS

### Constants

```scala
let RDS_DB_INSTANCE_TYPE = "AWS::RDS::DBInstance"
let INPUT_DOCUMENT = this
let SUPPORTED_RDS_INSTANCE_ENGINES = [
  "aurora", "aurora-mysql", "aurora-postgresql", "mariadb", "mysql",
  "oracle-ee", "oracle-ee-cdb", "oracle-se2", "oracle-se2-cdb",
  "sqlserver-ee", "sqlserver-se", "sqlserver-ex", "sqlserver-web",
  "postgres"
]
```

### Assignments

```scala
let rds_db_instances = Resources.*[ Type == %RDS_DB_INSTANCE_TYPE ]
```

### Primary Rules

```scala
rule rds_instance_automatic_minor_version_upgrade_enabled_check when
  is_cfn_template(%INPUTDOCUMENT)
  %rds_db_instances not empty
{
  check(%rds_db_instances.Properties)
  <<
  [CT.RDS.PR.5]: Require an Amazon RDS database instance to have minor version
  upgrades configured
  [FIX]: Omit the 'AutoMinorVersionUpgrade' property or set it to 'true'.
  >>
}
```

```scala
rule rds_instance_automatic_minor_version_upgrade_enabled_check when
  is_cfn_hook(%INPUT_DOCUMENT, %RDS_DB_INSTANCE_TYPE) {
  check(%INPUT_DOCUMENT.%RDS_DB_INSTANCE_TYPE.resourceProperties)
  <<
  [CT.RDS.PR.5]: Require an Amazon RDS database instance to have minor version
  upgrades configured
  [FIX]: Omit the 'AutoMinorVersionUpgrade' property or set it to 'true'.
  >>
}```
## Proactive controls

### Parameterized Rules

```python
# Parameterized Rules
#
rule check(rds_db_instance) {
  %rds_db_instance [ filter_engine(this) ] {
    # Scenario: 4
    AutoMinorVersionUpgrade not exists or
    # Scenario: 3 and 5
    AutoMinorVersionUpgrade == true
  }
}

rule filter_engine(db_properties) {
  %db_properties {
    # Scenario: 2
    Engine exists
    Engine is_string
    Engine in %SUPPORTED_RDS_INSTANCE_ENGINES
  }
}

# Utility Rules
#
rule is_cfn_template(doc) {
  %doc {
    AWSTemplateFormatVersion exists  or
    Resources exists
  }
}

rule is_cfn_hook(doc, RESOURCE_TYPE) {
  %doc.%RESOURCE_TYPE.resourceProperties exists
}
```

### CT.RDS.PR.5 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

**PASS Example** - Use this template to verify a compliant resource creation.

```
Resources:
DBInstanceSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: Test RDS DB Instance secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "testUser"}'
    GenerateStringKey: password
    PasswordLength: 22
    ExcludeCharacters: '"@/\'
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
```
FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:

DBInstanceSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: Test RDS DB Instance secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "testUser"}'
      GenerateStringKey: password
      PasswordLength: 22
      ExcludeCharacters: '"/@/'

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername:
      Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword:
      Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    AutoMinorVersionUpgrade: false
    DeletionPolicy: Delete

[CT.RDS.PR.6] Require an Amazon RDS database cluster to have backtracking configured

This control checks whether an Amazon Relational Database Service (RDS) database (DB) cluster has backtracking enabled.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.6 rule specification](p. 1099)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.6 rule specification](p. 1099)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.6 example templates](p. 1101)

Explanation
Backups help you to recover more quickly from a security incident. Backups also strengthen the resilience of your systems. Aurora backtracking reduces the time required to recover a database for a specific point in time, and the recovery does not require a database restore.

**Usage considerations**

- This control applies only to Amazon RDS DB cluster engine types *aurora* and *aurora-mysql*, and to DB cluster engine modes *provisioned* and *parallelquery*.
- This control does not apply to Amazon RDS DB clusters that support Aurora Serverless V2 database instances (for example, RDS DB clusters configured with a `ServerlessV2ScalingConfiguration` and Aurora Serverless V2 compatible `EngineVersion`).

**Remediation for rule failure**

Set `BacktrackWindow` to a number between 1 and 259200.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Cluster - Example**

Amazon RDS DB cluster configured with a backtrack window of 720 seconds (12 minutes). The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "DBCluster": {
    "Type": "AWS::RDS::DBCluster",
    "Properties": {
      "Engine": "aurora-mysql",
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
      },
      "DBSubnetGroupName": {
        "Ref": "DBSubnetGroup"
      },
      "BacktrackWindow": 720
    }
  }
}
```

**YAML example**

```yaml
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
    MasterUserPassword: !Sub "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    BacktrackWindow: 720
```

    Ref: DBSubnetGroup

[CT.RDS.PR.7] Require Amazon RDS database instances to have IAM authentication configured

This control checks whether an Amazon RDS database (DB) instance has AWS Identity and Access Management (IAM) database authentication activated.

- **Control objective:** Use strong authentication
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** CT.RDS.PR.7 rule specification (p. 1104)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.7 rule specification (p. 1104)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.7 example templates (p. 1106)

Explanation

IAM database authentication allows authentication to database instances with an authentication token instead of a password. Network traffic to and from the database is encrypted with SSL.

**Usage considerations**

- This control applies only to Amazon RDS DB engine types mariadb, mysql and postgres.

Remediation for rule failure

Set EnableIAMDatabaseAuthentication to true.
The examples that follow show how to implement this remediation.

**Amazon RDS DB Instance - Example**

Amazon RDS DB instance configured with IAM database authentication. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": "14.2",
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
            },
            "EnableIAMDatabaseAuthentication": true
        },
        "DeletionPolicy": "Delete"
    }
}
```

**YAML example**

```yaml
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    EnableIAMDatabaseAuthentication: true
  DeletionPolicy: Delete
```

**CT.RDS.PR.7 rule specification**

```bash

      EnableIAMDatabaseAuthentication: false
      DeletionPolicy: Delete

[CT.RDS.PR.8] Require an Amazon RDS database instance to have automatic backups configured

This control checks whether Amazon RDS database (DB) instances have automated backups enabled, and verifies that the backup retention period is greater than or equal to seven (7) days.

- **Control objective**: Improve resiliency
- **Implementation**: AWS CloudFormation Guard Rule
- **Control behavior**: Proactive
• **Resource types:** AWS::RDS::DBInstance
• **AWS CloudFormation guard rule:** [CT.RDS.PR.8 rule specification (p. 1109)](#)

### Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.8 rule specification (p. 1109)](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.8 example templates (p. 1111)](#)

### Explanation

Backups help you recover more quickly from a security incident, and they strengthen the resilience of your systems. Amazon RDS provides an easy way to configure daily, full-instance volume snapshots.

#### Usage considerations

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web.

### Remediation for rule failure

Set BackupRetentionPeriod to an integer value between 7 and 35 days (inclusive).

The examples that follow show how to implement this remediation.

#### Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with automated backups configured and a backup retention period of 14 days. The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "DBInstance": {

CT.RDS.PR.8 rule specification

# ###################################
##       Rule Specification        ##
#####################################
#
# Rule Identifier:
#   rds_instance_backup_enabled_check
#
# Description:
#   This control checks whether Amazon RDS database (DB) instances have automated backups enabled, and verifies that the backup retention period is greater than or equal to seven (7) days.
#
# Reports on:
#   AWS::RDS::DBInstance
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
#     And: The input document does not contain any RDS DB instance resources
#     Then: SKIP
#   Scenario: 2
#     Given: The input document contains an RDS DB instance resource
#     And: 'Engine' is not one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web'
#     Then: SKIP
#   Scenario: 3
#     Given: The input document contains an RDS DB instance resource
#     And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb', 'oracle-se2', 'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web'
#     And: 'BackupRetentionPeriod' has been specified
#     And: 'BackupRetentionPeriod' has been set to 0 (backup disabled)
# Given: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb', 'oracle-se2',
#       'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex',
#       'sqlserver-web'
# And: 'BackupRetentionPeriod' has not been specified
# Then: FAIL

# Given: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb', 'oracle-se2',
#       'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex',
#       'sqlserver-web'
# And: 'BackupRetentionPeriod' has been specified
# And: 'BackupRetentionPeriod' has been set to < 7
# Then: FAIL

# Given: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'mariadb', 'mysql', 'oracle-ee', 'oracle-ee-cdb', 'oracle-se2',
#       'oracle-se2-cdb', 'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex',
#       'sqlserver-web'
# And: 'BackupRetentionPeriod' has been specified
# And: 'BackupRetentionPeriod' has been set to an integer >= 7
# Then: PASS

CT.RDS.PR.8 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
Properties:
    Description: Test RDS DB Instance secret
    GenerateSecretString:
        SecretStringTemplate: '{"username": "testUser"}"
        GenerateStringKey: password
        PasswordLength: 22
        ExcludeCharacters: '@/'
Type: AWS::RDS::DBInstance
Properties:
  Engine: postgres
  EngineVersion: 14.2
  DBInstanceClass: db.m5.large
  StorageType: gp2
  AllocatedStorage: 5
  MasterUsername:
    Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
  MasterUserPassword:
    Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
  BackupRetentionPeriod: 14
  DeletionPolicy: Delete

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
  DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Test RDS DB Instance secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "testUser"}'
        GenerateStringKey: password
        PasswordLength: 22
        ExcludeCharacters: '"@/
  DBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      Engine: postgres
      EngineVersion: 14.2
      DBInstanceClass: db.m5.large
      StorageType: gp2
      AllocatedStorage: 5
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
      BackupRetentionPeriod: 4
      DeletionPolicy: Delete

[CT.RDS.PR.9] Require an Amazon RDS database cluster to copy tags to snapshots

This control checks whether an Amazon RDS database (DB) cluster is configured to copy all tags to snapshots created.

- **Control objective**: Protect configurations
- **Implementation**: AWS CloudFormation Guard Rule
- **Control behavior**: Proactive
- **Resource types**: AWS::RDS::DBCluster
- **AWS CloudFormation guard rule**: CT.RDS.PR.9 rule specification (p. 1114)

Details and examples
For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.9 rule specification](p. 1114)

For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.9 example templates](p. 1116)

**Explanation**

Identification and inventory of your infrastructure assets is a crucial aspect of governance and security. With visibility into all your Amazon RDS DB clusters, you can assess their security posture and take action on potential areas of weakness. We recommend that you tag snapshots in the same way as their parent RDS database clusters. Activating this setting ensures that snapshots inherit the tags of their parent database clusters.

**Usage considerations**

- This control applies only to Amazon RDS DB cluster engine types `aurora`, `aurora-mysql`, and `aurora-postgresql`.

**Remediation for rule failure**

Set `CopyTagsToSnapshot` to `true`.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Cluster - Example**

Amazon RDS DB cluster configured to copy tags to snapshots. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "DBSubnetGroupName": {
                "Ref": "DBSubnetGroup"
            },
            "CopyTagsToSnapshot": true
        }
    }
}
```

**YAML example**

```yaml
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    DBSubnetGroupName: !Ref "DBSubnetGroup"
    CopyTagsToSnapshot: true
```

[CT.RDS.PR.10] Require an Amazon RDS database instance to copy tags to snapshots

This control checks whether Amazon RDS database (DB) instances are configured to copy all tags to snapshots created.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.10 rule specification (p. 1119)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.10 rule specification (p. 1119)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.10 example templates (p. 1121)]

**Explanation**

Identification and inventory of your IT assets is a crucial aspect of governance and security. With visibility of all your RDS DB instances, you can assess their security posture and take action on potential areas of weakness. Snapshots should be tagged to match their parent RDS database instances. Enabling this setting ensures that snapshots inherit the tags from their parent database instances.

**Usage considerations**

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web.

**Remediation for rule failure**

Set CopyTagsToSnapshot to true.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Instance - Example**

Amazon RDS DB instance configured to copy all tags to snapshots created. The example is shown in JSON and in YAML.

**JSON example**

```json
{
"DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
        "Engine": "postgres",
        "EngineVersion": 14.2,
        "DBInstanceClass": "db.m5.large",
        "StorageType": "gp2",
        "AllocatedStorage": 5,
        "MasterUsername": {
            ...
```
"Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}",
"MasterUserPassword": {
  "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}",
  "CopyTagsToSnapshot": true
},
"DeletionPolicy": "Delete"
}

YAML example

```yaml
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    CopyTagsToSnapshot: true
    DeletionPolicy: Delete
```

**CT.RDS.PR.10 example templates**

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

**PASS Example** - Use this template to verify a compliant resource creation.

**Resources:**
- **DBInstanceSecret:**
  - Type: AWS::SecretsManager::Secret
  - Properties:
    - Description: Test RDS DB Instance secret
    - GenerateSecretString:
      - SecretStringTemplate: '{"username": "testUser"}'
      - GenerateStringKey: password
      - PasswordLength: 22
      - ExcludeCharacters: '@\'
[CT.RDS.PR.11] Require an Amazon RDS database instance to have a VPC configuration

This control checks whether an Amazon RDS database (DB) instance is deployed in a VPC (that is, with an EC2-VPC instance).

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** CT.RDS.PR.11 rule specification (p. 1124)

Details and examples
- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.11 rule specification (p. 1124)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.11 example templates (p. 1127)]

**Explanation**

Amazon Virtual Private Cloud (Amazon VPC) provides a number of network controls to create secure access to RDS resources. These controls include VPC endpoints, network ACLs, and security groups. To take advantage of these controls, create your Amazon RDS instances as EC2 VPC instances.

**Usage considerations**

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web.

**Remediation for rule failure**

Set a DBSubnetGroupName.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Instance - Example**

Amazon RDS DB instance configured to deploy in an Amazon VPC with an RDS DB subnet group. The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": 14.2,
      "DBInstanceClass": "db.m5.large",
      "StorageType": "gp2",
      "AllocatedStorage": 5,
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
      },
      "DBSubnetGroupName": {
        "Ref": "DBSubnetGroup"
      }
    },
    "DeletionPolicy": "Delete"
  }
}
```

**YAML example**

```yaml
DBInstance:
  Type: AWS::RDS::DBInstance
```
AWS Control Tower User Guide
Proactive controls

Properties:
  Engine: postgres
  EngineVersion: 14.2
  DBInstanceClass: db.m5.large
  StorageType: gp2

[CT.RDS.PR.12] Require an Amazon RDS event subscription to have critical cluster events configured

This control checks whether your Amazon RDS event subscriptions for RDS clusters are configured to notify on event categories of maintenance and failure.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::EventSubscription
- **AWS CloudFormation guard rule:** [CT.RDS.PR.12 rule specification (p. 1130)]

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.12 rule specification (p. 1130)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.12 example templates (p. 1132)]

Explanation

Amazon RDS event notifications uses Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response.
Usage considerations

- This control applies only to Amazon RDS event subscriptions for RDS clusters (SourceType of db-cluster).

Remediation for rule failure

When SourceType is set to db-cluster, set Enabled to true and ensure that EventCategories contains both maintenance and failure values.

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example One

Amazon RDS event subscription for RDS clusters configured to notify on all event categories. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "RDSEventSubscription": {
      "Type": "AWS::RDS::EventSubscription",
      "Properties": {
         "SnsTopicArn": {
            "Ref": "SnsTopic"
         },
         "SourceType": "db-cluster",
         "Enabled": true
      }
   }
}
```

**YAML example**

```yaml
RDSEventSubscription:
   Type: AWS::RDS::EventSubscription
   Properties:
      SnsTopicArn: !Ref 'SnsTopic'
      SourceType: db-cluster
      Enabled: true
```

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example Two

Amazon RDS event subscription for RDS clusters configured to notify on maintenance and failure event categories. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "RDSEventSubscription": {
      "Type": "AWS::RDS::EventSubscription",
      "Properties": {
         "SnsTopicArn": {
            "Ref": "SnsTopic"
         },
         "EventCategories": ["maintenance", "failure"],
         "Enabled": true
      }
   }
}
```
"Properties": {
  "SnsTopicArn": {
    "Ref": "SnsTopic"
  },
  "EventCategories": [
    "maintenance",
    "failure"
  ],
  "SourceType": "db-cluster",
  "Enabled": true
}
}

YAML example

RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - maintenance
      - failure
    SourceType: db-cluster
    Enabled: true

CT.RDS.PR.12 rule specification

# ###############################################################################

  >>
}
CT.RDS.PR.12 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  SNSTopic:
    Type: AWS::SNS::Topic
    Properties: {}
  RDSEventSubscription:
    Type: AWS::RDS::EventSubscription
    Properties:
      SnsTopicArn:
        Ref: SNSTopic
      SourceType: db-cluster
      Enabled: true
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.
Resources:
SNSTopic:
  Type: AWS::SNS::Topic
  Properties: {}
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn:
      Ref: SNSTopic
    EventCategories:
      - maintenance
      - deletion
    SourceType: db-cluster
    Enabled: true

[CT.RDS.PR.13] Require any Amazon RDS instance to have deletion protection configured

This control checks whether an Amazon Relational Database Service (Amazon RDS) instance has deletion protection activated.

- **Control objective**: Improve availability
- **Implementation**: AWS CloudFormation Guard Rule
- **Control behavior**: Proactive
- **Resource types**: AWS::RDS::DBInstance
- **AWS CloudFormation guard rule**: [CT.RDS.PR.13 rule specification](p. 1134)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.13 rule specification](p. 1134)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.13 example templates](p. 1137)

**Explanation**

When active, instance deletion protection provides an additional layer of protection against accidental database deletion, or deletion by an unauthorized entity.

While deletion protection is active, an RDS DB instance cannot be deleted. Before a deletion request can succeed, deletion protection must be turned off.

**Usage considerations**

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web.

**Remediation for rule failure**

Set DeletionProtection to true.

The examples that follow show how to implement this remediation.
Amazon RDS DB instance - Example

Amazon RDS DB instance configured with deletion protection active. The example is shown in JSON and in YAML.

JSON example

```
{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": 5.7,
      "DBInstanceClass": "db.m5.large",
      "StorageType": "gp2",
      "AllocatedStorage": 5,
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
      },
      "StorageEncrypted": true,
      "DeletionProtection": true
    },
    "DeletionPolicy": "Delete"
  }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    DeletionProtection: true
  DeletionPolicy: Delete
```

CT.RDS.PR.13 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
DBInstanceSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: RDS DB Instance secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "testUser"}'
      GenerateStringKey: password
      PasswordLength: 22
      ExcludeCharacters: '@/

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername:
      Fn::Sub: '{resolve:secretsmanager:${DBInstanceSecret}::username}'
    MasterUserPassword:
      Fn::Sub: '{resolve:secretsmanager:${DBInstanceSecret}::password}'
    DeletionProtection: true
    DeletionPolicy: Delete
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
DBInstanceSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: RDS DB Instance secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "testUser"}'
      GenerateStringKey: password
      PasswordLength: 22
      ExcludeCharacters: '@/

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername:
      Fn::Sub: '{resolve:secretsmanager:${DBInstanceSecret}::username}'
    MasterUserPassword:
      Fn::Sub: '{resolve:secretsmanager:${DBInstanceSecret}::password}'
    DeletionProtection: false
```

1137
[CT.RDS.PR.14] Require an Amazon RDS database instance to have logging configured

This rules checks whether Amazon Relational Database Service (RDS) instances have all available log types configured for export to Amazon CloudWatch Logs.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.14 rule specification (p. 1140)](CT.RDS.PR.14 rule specification (p. 1140))

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.14 rule specification (p. 1140)](CT.RDS.PR.14 rule specification (p. 1140))
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.14 example templates (p. 1144)](CT.RDS.PR.14 example templates (p. 1144))

**Explanation**

We recommend that you enable relevant logs for all Amazon RDS databases. Database logging provides detailed records of requests made to RDS. Database logs can assist with security and access audits, and they can help you diagnose availability issues.

**Usage considerations**

- This control applies only to Amazon RDS DB engine types mariadb, mysql, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, oracle-ee, oracle-se2, oracle-se1, and oracle-se.

**Remediation for rule failure**

Specify `EnableCloudwatchLogsExports` with a list of all supported log types for the Amazon RDS database instance engine.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Instance - Example One**

Amazon RDS DB instance configured with an engine type of `mysql` and all supported log types, for the `mysql` engine type. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "mysql",
```
"EngineVersion": 5.7,
"DBInstanceClass": "db.m5.large",
"StorageType": "gp2",
"AllocatedStorage": 5,
"MasterUsername": {
    "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}",
},
"MasterUserPassword": {
    "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}",
},
"StorageEncrypted": true,
"EnableCloudwatchLogsExports": [
    "error",
    "general",
    "slowquery",
    "audit"
],
"DeletionPolicy": "Delete"
}

YAML example

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    EnableCloudwatchLogsExports:
      - error
      - general
      - slowquery
      - audit
    DeletionPolicy: Delete

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example Two

Amazon RDS DB instance configured with an engine type of postgres and all supported log types, for the postgres engine type. The example is shown in JSON and in YAML.

JSON example

```json
[
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": "14.2",
```
"DBInstanceClass": "db.m5.large",
"StorageType": "gp2",
"AllocatedStorage": 5,
"MasterUsername": {
    "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
},
"MasterUserPassword": {
    "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
},
"EnableCloudwatchLogsExports": [
    "postgresql",
    "upgrade"
],
"DeletionPolicy": "Delete"
}

YAML example

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    EnableCloudwatchLogsExports:
      - postgresql
      - upgrade
    DeletionPolicy: Delete

CT.RDS.PR.14 rule specification

# ####################################################################
##       Rule Specification       ##
# ####################################################################
#
# Rule Identifier:
#  rds_instance_logging_enabled_check
#
# Description:
#  This rules checks whether Amazon Relational Database Service (RDS) instances have all
#  available log types configured for export to Amazon CloudWatch Logs.
#
# Reports on:
#  AWS::RDS::DBInstance
#
# Evaluates:
#  AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#  None
#
# Scenarios:

1140
# Scenario: 1
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document does not contain any RDS DB instance resources
# Then: SKIP
# Scenario: 2
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB instance resource
# And: 'Engine' is not one of 'mariadb', 'mysql',
#   'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#   'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web'
# Then: SKIP
# Scenario: 3
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'mariadb', 'mysql',
#   'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#   'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web'
# And: 'EnableCloudwatchLogsExports' has not been specified or has been specified
#      and is an empty list
# Then: FAIL
# Scenario: 4
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'mariadb', 'mysql',
#   'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#   'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web'
# And: 'EnableCloudwatchLogsExports' has been specified and is a non-empty list
# And: One or more log types in 'EnableCloudwatchLogsExports' are not supported by
#      the specified 'Engine'
# Then: FAIL
# Scenario: 5
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'mariadb', 'mysql',
#   'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#   'postgres', 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex', 'sqlserver-web'
# And: 'EnableCloudwatchLogsExports' has been specified and is a non-empty list
# And: 'EnableCloudwatchLogsExports' does not contain all log types supported by the
#      specified 'Engine'
# Then: FAIL
# Scenario: 6
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'mariadb', 'mysql'
# And: 'EnableCloudwatchLogsExports' has been specified
# And: 'EnableCloudwatchLogsExports' value is a non-empty and all supported log types
#      are enabled - 'audit', 'error', 'general', 'slowquery'
# Then: PASS
# Scenario: 7
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB instance resource
# And: 'Engine' is 'postgres'
# And: 'EnableCloudwatchLogsExports' has been specified
# And: 'EnableCloudwatchLogsExports' value is a non-empty and all supported log types
#      are enabled - 'postgresql', 'upgrade'
# Then: PASS
# Scenario: 8
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# If: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'sqlserver-ee', 'sqlserver-se', 'sqlserver-ex',
#      'sqlserver-web'
# And: 'EnableCloudwatchLogsExports' has been specified
# And: 'EnableCloudwatchLogsExports' value is a non-empty and all supported log types
#      are enabled - 'agent', 'error'
# Then: PASS

# Scenario: 9
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB instance resource
# And: 'Engine' is one of 'oracle-ee', 'oracle-se2', 'oracle-ee-cdb', 'oracle-se2-cdb',
#      'oracle-se1-cdb', 'oracle-se1', 'oracle-se', 'oracle-ee-cdb',
# And: 'EnableCloudwatchLogsExports' has been specified
# And: 'EnableCloudwatchLogsExports' value is a non-empty and all supported log types
#      are enabled - 'alert', 'audit', 'listener', 'oemagent', 'trace'
# Then: PASS

CT.RDS.PR.14 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:

DBInstanceSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: RDS DB instance secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "examplemasteruser"}'
      GenerateStringKey: password
      PasswordLength: 22
      ExcludeCharacters: '@/\'

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername:
      Fn::Sub: '{resolve:secretsmanager:${DBInstanceSecret}::username}''
    MasterUserPassword:
      Fn::Sub: '{resolve:secretsmanager:${DBInstanceSecret}::password}''
    StorageEncrypted: true
    EnableCloudwatchLogsExports: ["error", "general", "slowquery", "audit"
    DeletionPolicy: Delete

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:

DBInstanceSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: RDS DB instance secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "examplemasteruser"}'
      GenerateStringKey: password
      PasswordLength: 22
      ExcludeCharacters: '@/\'

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername:
      Fn::Sub: '{resolve:secretsmanager:${DBInstanceSecret}::username}''
[CT.RDS.PR.15] Require that an Amazon RDS instance does not create DB security groups

This control checks whether any Amazon Relational Database Service (RDS) database (DB) security groups are created by, or associated to, an RDS DB instance, because DB security groups are intended for the EC2-Classic platform only.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance, AWS::RDS::DBSecurityGroup
- **AWS CloudFormation guard rule:** [CT.RDS.PR.15 rule specification (p. 1146)](#)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.15 rule specification (p. 1146)](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.15 example templates (p. 1149)](#)

**Explanation**

We recommend that all Amazon Relational Database Service (RDS) databases use Amazon VPC security groups to secure their access. Amazon DB security groups are for the EC2-Classic platform only, and they are not recommended for use.

**Remediation for rule failure**

Omit the **DBSecurityGroups** property. Instead, configure Amazon VPC security groups by means of the **VPCSecurityGroups** property.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Instance - Example**

Amazon RDS DB instance configured with an Amazon VPC security group. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "DBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "mysql",
            "EngineVersion": "5.7",
```
"DBInstanceClass": "db.t3.small",
"StorageType": "gp2",
"AllocatedStorage": 5,
"MasterUsername": {
    "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
},
"MasterUserPassword": {
    "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
},
"StorageEncrypted": true,
"Port": 6733,
"DBSubnetGroupName": {
    "Ref": "DBSubnetGroup"
},
"VPCSecurityGroups": [
    "Ref": "SecurityGroup"
]
}
}}

YAML example

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.t3.small
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    Port: 6733
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    VPCSecurityGroups:
      - !Ref 'SecurityGroup'

    Properties:
      DBSecurityGroupIngress:
        - CIDRIP: "0.0.0.0/0"
      GroupDescription: "Ingress for Amazon EC2 security group"
```

### [CT.RDS.PR.16] Require an Amazon RDS database cluster to have encryption at rest configured

This control checks whether the storage encryption is configured on Amazon Relational Database Service (RDS) database (DB) clusters that are not being restored from an existing cluster.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.16 rule specification (p. 1151)](#)

#### Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.16 rule specification (p. 1151)](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.16 example templates (p. 1155)](#)

#### Explanation

We recommend that you configure your Amazon RDS DB clusters to be encrypted at rest, to give an added layer of security for your sensitive data. To encrypt your RDS DB clusters and snapshots at rest, enable the encryption option for your RDS DB clusters. Data that is encrypted at rest includes the underlying storage for DB clusters, its automated backups, read replicas, and snapshots.
Encrypted RDS DB clusters use the open standard AES-256 encryption algorithm to encrypt your data on the server that hosts the clusters. After your data is encrypted, Amazon RDS handles authentication of access and decryption of your data with a minimal impact on performance. You do not need to modify your database client applications to use encryption.

**Usage considerations**

- This control applies only to Amazon RDS DB clusters that are not being restored from an existing cluster or created as a read replica. (For example, when `SourceDBClusterIdentifier` or `ReplicationSourceIdentifier` properties have been provided.)

**Remediation for rule failure**

Set `StorageEncrypted` to `true`.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Cluster - Example**

Amazon RDS DB cluster configured with storage encryption enabled. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "DBCluster": {
        "Type": "AWS::RDS::DBCluster",
        "Properties": {
            "Engine": "aurora-mysql",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
            },
            "StorageEncrypted": true
        }
    }
}
```

**YAML example**

```yaml
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    StorageEncrypted: true
```

**CT.RDS.PR.16 rule specification**

```
# ################################################################
```

1151
## Rule Specification

- **Rule Identifier:** rds_cluster_storage_encrypted_check
- **Description:** This control checks whether the storage encryption is configured on Amazon Relational Database Service (RDS) database (DB) clusters that are not being restored from an existing cluster.
- **Reports on:** AWS::RDS::DBCluster
- **Evaluates:** AWS CloudFormation, AWS CloudFormation hook
- **Rule Parameters:** None
- **Scenarios:**
  - **Scenario: 1**
    - Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
    - And: The input document does not contain any RDS DB cluster resources
    - Then: SKIP
  - **Scenario: 2**
    - Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
    - And: The input document contains an RDS DB cluster resource
    - And: 'SourceDBClusterIdentifier' or 'ReplicationSourceIdentifier' has been provided
    - Then: SKIP
  - **Scenario: 3**
    - Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
    - And: The input document contains an RDS DB cluster resource
    - And: 'SourceDBClusterIdentifier' or 'ReplicationSourceIdentifier' has not been provided
    - And: 'StorageEncrypted' has not been provided
    - Then: FAIL
  - **Scenario: 4**
    - Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
    - And: The input document contains an RDS DB cluster resource
    - And: 'SourceDBClusterIdentifier' or 'ReplicationSourceIdentifier' has not been provided
    - And: 'StorageEncrypted' has been provided and set to bool(false)
    - Then: FAIL
  - **Scenario: 5**
    - Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
    - And: The input document contains an RDS DB cluster resource
    - And: 'SourceDBClusterIdentifier' or 'ReplicationSourceIdentifier' has not been provided
    - And: 'StorageEncrypted' has been provided and set to bool(true)
    - Then: PASS

### Constants

CT.RDS.PR.16 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
  DBClusterSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: RDS Cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasteruser"}''
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: '"@/\'
  DBCluster:
    Type: AWS::RDS::DBCluster
    Properties:
      Engine: aurora-mysql
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${DBClusterSecret}::username}}''
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBClusterSecret}::password}}''
      StorageEncrypted: true

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
  DBClusterSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: RDS Cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasteruser"}''
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: '"@/"
[CT.RDS.PR.17] Require an Amazon RDS event notification subscription to have critical database instance events configured

This control checks whether your Amazon RDS event subscriptions for RDS instances are configured to notify on event categories of maintenance, failure, and configuration change.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::EventSubscription
- **AWS CloudFormation guard rule:** [CT.RDS.PR.17 rule specification (p. 1158)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.17 rule specification (p. 1158)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.17 example templates (p. 1160)]

**Explanation**

Amazon RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response.

**Usage considerations**

- This control applies only to Amazon RDS Event Subscriptions for RDS instances (SourceType of db-instance).

**Remediation for rule failure**

When SourceType is set to db-instance, set Enabled to true and ensure that the parameter EventCategories contains maintenance, failure, and configuration change values.

The examples that follow show how to implement this remediation.

**Amazon RDS Event Subscription - Example One**

Amazon RDS Event Subscription for RDS instances configured to notify on all event categories. The example is shown in JSON and in YAML.

**JSON example**
The examples that follow show how to implement this remediation.

**Amazon RDS Event Subscription - Example Two**

Amazon RDS Event Subscription for RDS instances configured to notify on maintenance, failure, and configuration change event categories. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "RDSEventSubscription": {
      "Type": "AWS::RDS::EventSubscription",
      "Properties": {
         "SnsTopicArn": {
            "Ref": "SnsTopic"
         },
         "SourceType": "db-instance",
         "Enabled": true
      }
   }
}
```

**YAML example**

```yaml
RDSEventSubscription:
   Type: AWS::RDS::EventSubscription
   Properties:
      SnsTopicArn: !Ref 'SnsTopic'
      SourceType: db-instance
      Enabled: true
```

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.18 rule specification (p. 1162)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.18 example templates (p. 1165)]

**Explanation**

Amazon RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for rapid response.

**Usage considerations**

- This control applies only to Amazon RDS event subscriptions for RDS parameter groups (SourceType of db-parameter-group).

**Remediation for rule failure**

When SourceType is set to db-parameter-group, set Enabled to true and ensure that the parameter EventCategories contains configuration change as a value.

The examples that follow show how to implement this remediation.

**Amazon RDS Event Subscription - Example One**

Amazon RDS event subscription for RDS parameter groups configured to notify on all event categories. The example is shown in JSON and in YAML.

**JSON example**

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "SourceType": "db-parameter-group",
            "Enabled": true
        }
    }
}
```
The examples that follow show how to implement this remediation.

**Amazon RDS Event Subscription - Example Two**

Amazon RDS event subscription for RDS parameter groups configured to notify on the configuration change event category. The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "RDSEventSubscription": {
    "Type": "AWS::RDS::EventSubscription",
    "Properties": {
      "SnsTopicArn": "!Ref 'SnsTopic'",
      "EventCategories": [
        "configuration change"
      ],
      "SourceType": "db-parameter-group",
      "Enabled": true
    }
  }
}
```

**YAML example**

```yaml
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - configuration change
    SourceType: db-parameter-group
    Enabled: true
```

CT.RDS.PR.18 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
SNSTopic:
  Type: AWS::SNS::Topic
  Properties: {}
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn:
      Ref: SNSTopic
    SourceType: db-parameter-group
    Enabled: true

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
SNSTopic:
  Type: AWS::SNS::Topic
  Properties: {}
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn:
      Ref: SNSTopic
    Enabled: false
    SourceType: db-parameter-group

[CT.RDS.PR.19] Require an Amazon RDS event notifications subscription to have critical database security group events configured

This control checks whether your Amazon RDS event subscriptions for RDS security groups are configured to notify on event categories of failure and configuration change

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::EventSubscription
- **AWS CloudFormation guard rule:** CT.RDS.PR.19 rule specification (p. 1167)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.RDS.PR.19 rule specification (p. 1167)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.RDS.PR.19 example templates (p. 1169)
Explanation

Amazon RDS event notifications use Amazon SNS to make you aware of changes in the availability or configuration of your RDS resources. These notifications allow for a rapid response.

Usage considerations

- This control applies only to Amazon RDS Event Subscriptions for RDS security groups (SourceType of db-security-group)

Remediation for rule failure

When SourceType is set to db-security-group, set Enabled to true and ensure that the parameter EventCategories contains both failure and configuration change values.

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example One

Amazon RDS Event Subscription for RDS security groups configured to notify on all event categories. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "SourceType": "db-security-group",
            "Enabled": true
        }
    }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-security-group
    Enabled: true
```

The examples that follow show how to implement this remediation.

Amazon RDS Event Subscription - Example Two

Amazon RDS Event Subscription for RDS security groups configured to notify on failure and configuration change event categories. The example is shown in JSON and in YAML.

JSON example

```
{
    "RDSEventSubscription": {
        "Type": "AWS::RDS::EventSubscription",
        "Properties": {
            "SnsTopicArn": {
                "Ref": "SnsTopic"
            },
            "SourceType": "db-security-group",
            "Enabled": true
        }
    }
}
```

YAML example

```
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    SourceType: db-security-group
    Enabled: true
```
YAML example

RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn: !Ref 'SnsTopic'
    EventCategories:
      - failure
      - configuration change
    SourceType: db-security-group
    Enabled: true

CT.RDS.PR.19 rule specification

# ****************************
#   Rule Specification      
# ****************************
#
# Rule Identifier:
#   rds_sg_event_notifications_configured_check
# Description:
#   Checks whether an Amazon RDS event subscription for RDS security groups are configured
to notify on event categories of 'failure' and 'configuration change'.
# Reports on:
#   AWS::RDS::EventSubscription
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
# Rule Parameters:
#   None
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or CloudFormation hook document
#        And: The input document does not contain any Amazon RDS event subscription
#        resources
#     Then: SKIP

CT.RDS.PR.19 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
- **SNSTopic**: Type: AWS::SNS::Topic
  Properties: {}
- **RDSEventSubscription**: Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn:
      Ref: SNSTopic
    SourceType: db-security-group
    Enabled: true
FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
SNSTopic:
  Type: AWS::SNS::Topic
  Properties: {}
RDSEventSubscription:
  Type: AWS::RDS::EventSubscription
  Properties:
    SnsTopicArn:
      Ref: SNSTopic
    EventCategories:
      - failure
    SourceType: db-security-group
    Enabled: true

[CT.RDS.PR.20] Require an Amazon RDS database instance not to use a database engine default port

This control checks whether Amazon Relational Database Service (RDS) database instances are configured for default database port for their specific engine types.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.20 rule specification](p. 1172)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.20 rule specification](p. 1172)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.20 example templates](p. 1175)

Explanation

If you use a known port to deploy an Amazon RDS cluster or instance, an attacker can guess information about the cluster or instance. The attacker can use this information in conjunction with other information to connect to an Amazon RDS cluster or instance, or to gain additional information about your application.

When you change the port, you must also update the existing connection strings that were used to connect to the old port. You also should check the security group of the DB instance to ensure that it includes an ingress rule that allows connectivity on the new port.

Usage considerations

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-se2, oracle-ee-cdb, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web.
Remediation for rule failure

Set a value for Port that is different than the default value for the Amazon RDS DB instance engine type.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example One

Amazon RDS DB instance configured with a port that's different than the mysql engine default port. The example is shown in JSON and in YAML.

JSON example

```
{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "mysql",
      "EngineVersion": 5.7,
      "DBInstanceClass": "db.m5.large",
      "StorageType": "gp2",
      "AllocatedStorage": 5,
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
      },
      "StorageEncrypted": true,
      "Port": 6733
    },
    "DeletionPolicy": "Delete"
  }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    StorageEncrypted: true
    Port: 6733
    DeletionPolicy: Delete
```

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example Two

Amazon RDS DB instance configured with a port that's different than the postgres engine default port. The example is shown in JSON and in YAML.
JSON example

```json
{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": "14.2",
      "DBInstanceClass": "db.m5.large",
      "StorageType": "gp2",
      "AllocatedStorage": 5,
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
      },
      "Port": 5723
    },
    "DeletionPolicy": "Delete"
  }
}
```

YAML example

```yaml
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    Port: 5723
  DeletionPolicy: Delete
```

CT.RDS.PR.20 rule specification

```bash
# #######################################################################
##       Rule Specification       ##
# ############################################################################
#
# Rule Identifier:
#   rds_instance_no_default_ports_check
#
# Description:

CT.RDS.PR.20 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
Properties:
    Description: RDS DB instance secret
    GenerateSecretString:
        SecretStringTemplate: '{"username": "testUser"}'
        GenerateStringKey: password
        PasswordLength: 22
        ExcludeCharacters: '"/@\'
DBInstance:
    Type: AWS::RDS::DBInstance
Properties:
    Engine: mysql
    EngineVersion: 5.7
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername:
        Fn::Sub: '${resolve:secretsmanager:${DBInstanceSecret}::username}'}
[CT.RDS.PR.21] Require an Amazon RDS DB cluster to have a unique administrator username

This control checks whether an Amazon Relational Database Service (RDS) database (DB) cluster has changed the administrator username from its default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBCluster
- **AWS CloudFormation guard rule:** [CT.RDS.PR.21 rule specification (p. 1177)]

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.21 rule specification (p. 1177)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.21 example templates (p. 1179)]

Explanation
When you create an Amazon RDS database, we recommend that you change the default administrator username to a unique value. Default user names are public knowledge, and they should be changed, because changing these user names reduces the risk of unintended access.

**Usage considerations**

- This control applies only to Amazon RDS DB clusters that set the `MasterUsername` property.

**Remediation for rule failure**

Set `MasterUsername` to a value other than `admin` or `postgres`.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Cluster - Example**

Amazon RDS DB cluster configured with a unique administrator username. The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "DBCluster": {
    "Type": "AWS::RDS::DBCluster",
    "Properties": {
      "Engine": "aurora-mysql",
      "MasterUsername": "samplemasteruser",
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${RDSClusterSecret}::password}}"
      },
      "DBSubnetGroupName": {
        "Ref": "DBSubnetGroup"
      }
    }
  }
}
```

**YAML example**

```yaml
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora-mysql
    MasterUsername: samplemasteruser
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RDSClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
```

**CT.RDS.PR.21 rule specification**

```yaml
# ###################################
##       Rule Specification        ##
#####################################
```
# Rule Identifier:
#   rds_cluster_default_admin_check
#
# Description:
#   This control checks whether an Amazon Relational Database Service (RDS) database (DB)
#   cluster has changed the administrator username from its default value.
#
# Reports on:
#   AWS::RDS::DBCluster
#
# Evaluates:
#   AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#   None
#
# Scenarios:
#   Scenario: 1
#     Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
#            document
#     And: The input document does not contain any RDS DB cluster resources
#     Then: SKIP
#   Scenario: 2
#     Given: The input document contains an RDS DB cluster resource
#           And: 'MasterUsername' has not been provided
#     Then: SKIP
#   Scenario: 3
#     Given: The input document contains an RDS DB cluster resource
#           And: 'MasterUsername' has been provided and it is set to 'admin' or 'postgres'
#     Then: FAIL
#   Scenario: 4

CT.RDS.PR.21 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
VPC:
    Type: AWS::EC2::VPC
    Properties:
        CidrBlock: 10.0.0.0/16
        EnableDnsHostnames: true
        EnableDnsSupport: true
SubnetOne:
    Type: AWS::EC2::Subnet
    Properties:
        VpcId:
            Ref: VPC
        CidrBlock: 10.0.0.0/25
        AvailabilityZone:
FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.
[CT.RDS.PR.22] Require an Amazon RDS database instance to have a unique administrator username

This control checks whether an Amazon Relational Database Service (RDS) database has changed the administrator username from its default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.22 rule specification (p. 1182)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.22 rule specification (p. 1182)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.22 example templates (p. 1185)]

**Explanation**

Default administrative usernames on Amazon RDS databases are public knowledge. When creating an Amazon RDS database, you should change the default administrative username to a unique value, thereby reducing the risk of unintended access.
Usage considerations

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex, and sqlserver-web.

Remediation for rule failure

Set MasterUsername to a value other than postgres or admin.

The examples that follow show how to implement this remediation.

Amazon RDS DB Instance - Example

Amazon RDS DB instance configured with a custom administrator username. The example is shown in JSON and in YAML.

JSON example

```
{
  "DBInstance": {
    "Type": "AWS::RDS::DBInstance",
    "Properties": {
      "Engine": "postgres",
      "EngineVersion": 14.2,
      "DBInstanceClass": "db.m5.large",
      "StorageType": "gp2",
      "AllocatedStorage": 5,
      "MasterUsername": "testUser",
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
      }
    },
    "DeletionPolicy": "Delete"
  }
}
```

YAML example

```
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: testUser
    MasterUserPassword: !Sub "{{resolve:secretsmanager:${DBInstanceSecret}::password}}"
  DeletionPolicy: Delete
```

CT.RDS.PR.22 rule specification

CT.RDS.PR.22 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Test RDS DB Instance secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "testUser"}'
        GenerateStringValue: password
        PasswordLength: 22
        ExcludeCharacters: '@\'
  DBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      Engine: postgres
      EngineVersion: 14.2
      DBInstanceClass: db.m5.large
      StorageType: gp2
      AllocatedStorage: 5
      MasterUsername: testUser
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    DeletionPolicy: Delete
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  DBInstanceSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Test RDS DB Instance secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "testUser"}'
        GenerateStringValue: password
        PasswordLength: 22
        ExcludeCharacters: '@\'
  DBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      Engine: postgres
      EngineVersion: 14.2
      DBInstanceClass: db.m5.large
      StorageType: gp2
      AllocatedStorage: 5
      MasterUsername: postgres
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${DBInstanceSecret}::password}}'
    DeletionPolicy: Delete
```
**[CT.RDS.PR.23] Require an Amazon RDS database instance to not be publicly accessible**

This rule checks whether Amazon Relational Database Service (RDS) database (DB) instances are publicly accessible, as determined by checking the PubliclyAccessible configuration property.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.23 rule specification (p. 1187)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.23 rule specification (p. 1187)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.23 example templates (p. 1189)]

**Explanation**

The PubliclyAccessible property in the RDS instance CloudFormation resource indicates whether the DB instance is publicly accessible. When the DB instance is configured with PubliclyAccessible set to true, it is an internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. When the DB instance isn't publicly accessible, it is an internal instance with a DNS name that resolves to a private IP address.

Unless you intend for your RDS instance to be publicly accessible, do not configure the RDS instance with the PubliclyAccessible value set to true, because this configuration may allow unwanted traffic to your database instance.

**Remediation for rule failure**

Set the value of PubliclyAccessible to false.

The examples that follow show how to implement this remediation.

**Amazon RDS DB Instance - Example**

Amazon RDS DB instance configured as an internal instance, by means of a publicly accessible configuration. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "DBInstance": {
      "Type": "AWS::RDS::DBInstance",
      "Properties": {
         "Engine": "postgres",
         "EngineVersion": "14.2",
         "DBInstanceClass": "db.m5.large",
         "StorageType": "gp2",
         "AllocatedStorage": 5,
         "MasterUsername": {
            "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::username}}"
         }
      }
   }
}
```
"MasterUserPassword": {
    "Fn::Sub": "{{resolve:secretsmanager:${DBInstanceSecret}::password}}",
    "PubliclyAccessible": false
},
"DeletionPolicy": "Delete"
}

YAML example

DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{${resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{${resolve:secretsmanager:${DBInstanceSecret}::password}}'
    PubliclyAccessible: false
    DeletionPolicy: Delete

ct.rds.pr.23 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
DBInstanceSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: RDS DB instance secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "examplemasteruser"}'
      GenerateStringKey: password
      PasswordLength: 22
      ExcludeCharacters: '"@/\'
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername:
      Fn::Sub: '{{$resolve:secretsmanager:${DBInstanceSecret}::username}}'
    MasterUserPassword:
      Fn::Sub: '{{$resolve:secretsmanager:${DBInstanceSecret}::password}}'
    PubliclyAccessible: false
    DeletionPolicy: Delete

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
DBInstanceSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: RDS DB instance secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "examplemasteruser"}'
      GenerateStringKey: password
      PasswordLength: 22
      ExcludeCharacters: '"@/\'
DBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
[CT.RDS.PR.24] Require an Amazon RDS database instance to have encryption at rest configured

This control checks whether storage encryption is enabled for your Amazon RDS database (DB) instance.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::RDS::DBInstance
- **AWS CloudFormation guard rule:** [CT.RDS.PR.24 rule specification](p. 1191)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.24 rule specification](p. 1191)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.24 example templates](p. 1193)

Explanation

For an added layer of security for your sensitive data in Amazon RDS DB instances, you should configure your RDS DB instances to be encrypted at rest. To encrypt your RDS DB instances and snapshots at rest, enable the encryption option for your RDS DB instances. Data that is encrypted at rest includes the underlying storage for DB instances, its automated backups, read replicas, and snapshots.

Encrypted Amazon RDS DB instances use the open standard AES-256 encryption algorithm to encrypt your data on the server that hosts your RDS DB instances. After your data is encrypted, Amazon RDS handles authentication of access and decryption of your data transparently with a minimal impact on performance. You do not need to modify your database client applications to use encryption.

Amazon RDS encryption currently is available for all database engines and storage types. Amazon RDS encryption is available for most DB instance classes.

**Usage considerations**

- This control applies only to Amazon RDS DB engine types mariadb, mysql, oracle-ee, oracle-ee-cdb, oracle-se2, oracle-se2-cdb, postgres, sqlserver-ee, sqlserver-se, sqlserver-ex and sqlserver-web

**Remediation for rule failure**

The parameter StorageEncrypted must be set to true for RDS DB Instances.

The examples that follow show how to implement this remediation.
Amazon RDS DB instance - Example

Amazon RDS DB instance with storage encryption enabled. The example is shown in JSON and in YAML.

**JSON example**

```
{
    "RDSDBInstance": {
        "Type": "AWS::RDS::DBInstance",
        "Properties": {
            "Engine": "postgres",
            "EngineVersion": 14.2,
            "DBInstanceClass": "db.m5.large",
            "StorageType": "gp2",
            "AllocatedStorage": 5,
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RDSDBInstanceSecret}::username}}" 
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RDSDBInstanceSecret}::password}}" 
            },
            "StorageEncrypted": true
        }
    }
}
```

**YAML example**

```
RDSDBInstance:
  Type: AWS::RDS::DBInstance
  Properties:
    Engine: postgres
    EngineVersion: 14.2
    DBInstanceClass: db.m5.large
    StorageType: gp2
    AllocatedStorage: 5
    MasterUsername: !Sub '{{resolve:secretsmanager:${RDSDBInstanceSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RDSDBInstanceSecret}::password}}'
    StorageEncrypted: true
```

CT.RDS.PR.24 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:

1193
FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

[CT.RDS.PR.25] Require an Amazon RDS database cluster to have logging configured

This control checks whether Amazon RDS database clusters have all available log types enabled for export to Amazon CloudWatch Logs.

- Control objective: Establish logging and monitoring
• **Implementation**: AWS CloudFormation guard rule
• **Control behavior**: Proactive
• **Resource types**: AWS::RDS::DBCluster
• **AWS CloudFormation guard rule**: [CT.RDS.PR.25 rule specification](p. 1197)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.RDS.PR.25 rule specification](p. 1197)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.RDS.PR.25 example templates](p. 1200)

**Explanation**

Amazon RDS databases should have relevant logs enabled. Database logging provides detailed records of requests made to RDS. Database logs can assist with security and access audits, and they can help to diagnose availability issues.

**Usage considerations**

- This control applies only to Amazon RDS DB cluster engine types aurora, aurora-mysql, aurora-postgresql, mysql and postgres.

**Remediation for rule failure**

Specify EnableCloudwatchLogsExports with a list of all supported log types for the Amazon RDS database cluster engine.

The examples that follow show how to implement this remediation.

**Amazon RDS database (DB) Cluster - Example One**

Amazon RDS Aurora DB cluster configured with all available log types enabled for export to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "DBCluster": {
    "Type": "AWS::RDS::DBCluster",
    "Properties": {
      "Engine": "aurora",
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}:username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}:password}}"
      },
      "DBSubnetGroupName": {
        "Ref": "DBSubnetGroup"
      },
      "EnableCloudwatchLogsExports": [
        "audit",
        "error",
        "general",
        "slowquery"
      ]
  }
}
```

1195
YAML example

```yaml
DBCluster:
  Type: AWS::RDS::DBCluster
  Properties:
    Engine: aurora
    MasterUsername: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${DBClusterSecret}::password}}'
    DBSubnetGroupName: !Ref 'DBSubnetGroup'
    EnableCloudwatchLogsExports:
      - audit
      - error
      - general
      - slowquery
```

The examples that follow show how to implement this remediation.

**Amazon RDS DB Cluster - Example Two**

Amazon RDS Multi-AZ Postgres DB cluster configured with all available log types enabled for export to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "DBCluster": {
    "Type": "AWS::RDS::DBCluster",
    "Properties": {
      "Engine": "aurora",
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${DBClusterSecret}::password}}"
      },
      "DBSubnetGroupName": {
        "Ref": "DBSubnetGroup"
      },
      "EnableCloudwatchLogsExports": [
        "audit",
        "error",
        "general",
        "slowquery"
      ]
    }
  }
}
```

**YAML example**
CT.RDS.PR.25 rule specification

# Rule Specification

Rule Identifier:
rds_cluster_logging_enabled_check

Description:
This control checks whether Amazon RDS database clusters have all available log types enabled for export to Amazon CloudWatch Logs.

Reports on:
AWS::RDS::DBCluster

Evaluates:
AWS CloudFormation, AWS CloudFormation hook

Rule Parameters:
None

Scenarios:
1. Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
   And: The input document does not contain any RDS DB cluster resources
   Then: SKIP

2. Given: The input document contains an RDS DB cluster Resource
   And: 'Engine' is not one of 'aurora', 'aurora-mysql', 'aurora-postgresql', 'mysql' or 'postgres'
   Then: SKIP

3. Given: The input document contains an RDS DB cluster resource
   And: 'EnableCloudwatchLogsExports' has not been specified or has been specified as an empty list
   Then: FAIL

4. Given: The input document contains an RDS DB cluster resource
   And: The input document contains an RDS DB cluster resource
# And: 'Engine' is one of 'aurora', 'aurora-mysql', 'aurora-postgresql', 'mysql' or
# 'postgres':
# And: 'EnableCloudwatchLogsExports' has been specified and is a non-empty list
# And: One or more log types in 'EnableCloudwatchLogsExports' are not supported by
# the specified 'Engine'
# Then: FAIL
# Scenario: 5
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB cluster resource
# And: 'Engine' is one of 'aurora', 'aurora-mysql', 'aurora-postgresql', 'mysql' or
# 'postgres':
# And: 'EnableCloudwatchLogsExports' has been specified and is a non-empty list
# And: 'EnableCloudwatchLogsExports' does not contain all log types supported by the
# specified 'Engine'
# Then: FAIL
# Scenario: 6
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB cluster resource
# And: 'Engine' is one of 'aurora', 'aurora-mysql' or 'mysql'
# And: 'EnableCloudwatchLogsExports' has been specified as a list with all supported
# log types
# for the 'Engine' ('audit', 'error', 'general' and 'slowquery')
# Then: PASS
# Scenario: 7
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB cluster resource
# And: 'Engine' is 'aurora-postgresql'
# And: 'EnableCloudwatchLogsExports' has been specified as a list with all supported
# log types
# for the 'Engine' ('postgresql')
# Then: PASS
# Scenario: 8
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
# And: The input document contains an RDS DB cluster resource
# And: 'Engine' is 'postgres'
# And: 'EnableCloudwatchLogsExports' has been specified as a list with all supported
# log types
# for the 'Engine' ('postgresql', 'upgrade')
# Then: PASS

# Constants
#

Amazon Redshift controls

Topics
- [CT.REDSHIFT.PR.1] Require an Amazon Redshift cluster to prohibit public access (p. 1201)
- [CT.REDSHIFT.PR.2] Require an Amazon Redshift cluster to have automatic snapshots configured (p. 1205)
- [CT.REDSHIFT.PR.3] Require an Amazon Redshift cluster to have audit logging configured (p. 1209)
- [CT.REDSHIFT.PR.4] Require an Amazon Redshift cluster to have automatic upgrades to major versions configured (p. 1214)
- [CT.REDSHIFT.PR.5] Require an Amazon Redshift cluster to have enhanced VPC routing (p. 1219)
- [CT.REDSHIFT.PR.6] Require an Amazon Redshift cluster to have a unique administrator username (p. 1223)
- [CT.REDSHIFT.PR.7] Require an Amazon Redshift cluster to have a unique database name (p. 1227)
- [CT.REDSHIFT.PR.8] Require an Amazon Redshift cluster to be encrypted (p. 1231)
- [CT.REDSHIFT.PR.9] Require that an Amazon Redshift cluster parameter group is configured to use Secure Sockets Layer (SSL) for encryption of data in transit (p. 1235)

[CT.REDSHIFT.PR.1] Require an Amazon Redshift cluster to prohibit public access

This control checks whether Amazon Redshift clusters are configured to prohibit public access.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::Cluster
- **AWS CloudFormation guard rule:** [CT.REDSHIFT.PR.1 rule specification (p. 1202)]

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.REDSHIFT.PR.1 rule specification (p. 1202)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.REDSHIFT.PR.1 example templates (p. 1204)]

Explanation

The PubliclyAccessible attribute of the Amazon Redshift cluster configuration indicates whether the cluster is publicly accessible. When the cluster is configured with the PubliclyAccessible parameter...
set to true, it is an internet-facing instance that has a publicly resolvable DNS name, which resolves to a public IP address.

When the cluster is not publicly accessible, it is an internal instance with a DNS name that resolves to a private IP address. Unless you intend for your cluster to be publicly accessible, the cluster should not be configured with PubliclyAccessible set to true.

**Remediation for rule failure**

Set PubliclyAccessible to false.

The examples that follow show how to implement this remediation.

**Amazon Redshift Cluster - Example**

Amazon Redshift cluster configured to prohibit public access. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftClusterSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftClusterSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "PubliclyAccessible": false
        }
    }
}
```

**YAML example**

```yaml
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftClusterSecret}::password}}'
    NodeType: ds2.xlarge
    PubliclyAccessible: false
```

CT.REDSHIFT.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
RedshiftSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: Redshift cluster secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "examplemasterusername"}'
      GenerateStringKey: password
      PasswordLength: 16
      ExcludeCharacters: ""@/\\"
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername:
      Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword:
      Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:

RedshiftSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: Redshift cluster secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "examplemasterusername"}'
      GenerateStringKey: password
      PasswordLength: 16
      ExcludeCharacters: "'"@/\"

RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: true

[CT.REDSHIFT.PR.2] Require an Amazon Redshift cluster to have automatic snapshots configured

This control checks whether Amazon Redshift clusters have automated snapshots enabled, and that the clusters are set with an automated snapshot retention period greater than or equal to seven (7) days.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::Cluster
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.2 rule specification (p. 1206)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.2 rule specification (p. 1206)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.REDSHIFT.PR.2 example templates (p. 1208)

Explanation

Backups help you to recover more quickly from a security incident. They strengthen the resilience of your systems. Amazon Redshift takes periodic snapshots by default. This control checks whether automatic snapshots are created and retained for at least seven days.

**Remediation for rule failure**

Set AutomatedSnapshotRetentionPeriod to an integer value greater than or equal to 7 days.
The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

Amazon Redshift cluster configured with automatic snapshots active. The example is shown in JSON and in YAML.

JSON example

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            },
            "NodeType": "ds2.xlarge",
            "AutomatedSnapshotRetentionPeriod": 7
        }
    }
}
```

YAML example

```
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
    MasterUserPassword: !Sub "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
    NodeType: ds2.xlarge
    AutomatedSnapshotRetentionPeriod: 7
```

[CT.REDSHIFT.PR.3] Require an Amazon Redshift cluster to have audit logging configured

This control checks whether an Amazon Redshift cluster has audit logging activated.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::Cluster
- **AWS CloudFormation guard rule:** [CT.REDSHIFT.PR.3 rule specification](p. 1210)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.REDSHIFT.PR.3 rule specification](p. 1210)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.REDSHIFT.PR.3 example templates](p. 1213)

Explanation

Amazon Redshift audit logging provides additional information about connections and user activities in your cluster. This data can be stored and secured in Amazon S3, and it can be helpful for security audits and investigations.
Remediation for rule failure

Provide a `LoggingProperties` configuration and set `BucketName` to the name of an Amazon S3 bucket configured to receive Amazon Redshift audit logs.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

Amazon Redshift cluster configured with audit logging enabled. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "RedshiftCluster": {
      "Type": "AWS::Redshift::Cluster",
      "Properties": {
         "ClusterType": "single-node",
         "DBName": "sampledb",
         "MasterUsername": {
            "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
         },
         "MasterUserPassword": {
            "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
         },
         "NodeType": "dc2.large",
         "PubliclyAccessible": false,
         "LoggingProperties": {
            "BucketName": {
               "Ref": "S3Bucket"
            },
            "S3KeyPrefix": "sample-cluster-logs"
         }
      }
   }
}
```

**YAML example**

```yaml
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
    LoggingProperties:
      BucketName: !Ref 'S3Bucket'
      S3KeyPrefix: sample-cluster-logs
```

**CT.REDSHIFT.PR.3 rule specification**

[CT.REDSHIFT.PR.4] Require an Amazon Redshift cluster to have automatic upgrades to major versions configured

This control checks whether automatic major version upgrades are enabled for your Amazon Redshift cluster.

- **Control objective:** Manage vulnerabilities
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::Cluster
- **AWS CloudFormation guard rule:** [CT.REDSHIFT.PR.4 rule specification (p. 1216)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.REDSHIFT.PR.4 rule specification (p. 1216)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.REDSHIFT.PR.4 example templates (p. 1218)]
Explanation

Enabling automatic major version upgrades ensures that the latest major version updates to Amazon Redshift clusters are installed during the maintenance window. These updates might include security patches and bug fixes. Keeping up to date with patch installation is an important step in securing systems.

Remediation for rule failure

Set the AllowVersionUpgrade property to true or do not specify it (default).

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example One

Amazon Redshift cluster with automatic major version upgrades enabled through AWS CloudFormation defaults. The example is shown in JSON and in YAML.

JSON example

```json
{
  "RedshiftCluster": {
    "Type": "AWS::Redshift::Cluster",
    "Properties": {
      "ClusterType": "single-node",
      "DBName": "exampledb",
      "MasterUsername": {
        "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
      },
      "MasterUserPassword": {
        "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
      },
      "NodeType": "ds2.xlarge"
    }
  }
}
```

YAML example

```yaml
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
```

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example Two

Amazon Redshift cluster configured with automatic major version upgrades enabled through the AllowVersionUpgrade property. The example is shown in JSON and in YAML.

JSON example
YAML example

RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: ds2.xlarge
    AllowVersionUpgrade: true

## Proactive controls

### CT.REDSHIFT.PR.4 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

**PASS Example** - Use this template to verify a compliant resource creation.

```
Resources:
  RedshiftSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Redshift cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasterusername"}'
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: "'"@/\"

  RedshiftCluster:
    Type: AWS::Redshift::Cluster
    Properties:
      ClusterType: single-node
      DBName: exampledb
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
      NodeType: dc2.large
      PubliclyAccessible: false
```

**FAIL Example** - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  RedshiftSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Redshift cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasterusername"}'
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: "'"@/\"

  RedshiftCluster:
    Type: AWS::Redshift::Cluster
    Properties:
```

1218
ClusterType: single-node
DBName: exampledb
MasterUsername:
  Fn::Sub: '{\{resolve:secretsmanager:${RedshiftSecret}::username\}}'
MasterUserPassword:
  Fn::Sub: '{\{resolve:secretsmanager:${RedshiftSecret}::password\}}'
NodeType: dc2.large
PubliclyAccessible: false
AllowVersionUpgrade: false

[CT.REDSHIFT.PR.5] Require an Amazon Redshift cluster to have enhanced VPC routing

This control checks whether an Amazon Redshift cluster has enhanced VPC routing configured.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::Cluster
- **AWS CloudFormation guard rule:** [CT.REDSHIFT.PR.5 rule specification (p. 1220)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.REDSHIFT.PR.5 rule specification (p. 1220)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.REDSHIFT.PR.5 example templates (p. 1222)]

**Explanation**

Enhanced VPC routing forces all copy and unload traffic between the cluster and the data repositories to go through your VPC. With enhanced routing active, you can use VPC features, such as security groups and network access control lists, to secure network traffic. You can also use VPC Flow Logs to monitor network traffic.

**Remediation for rule failure**

Set EnhancedVpcRouting to true.

The examples that follow show how to implement this remediation.

**Amazon Redshift Cluster - Example**

Amazon Redshift cluster configured with enhanced VPC routing. The example is shown in JSON and in YAML.

**JSON example**

```
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            
```
"MasterUsername": {
    "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
},
"MasterUserPassword": {
    "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
},
"NodeType": "ds2.xlarge",
"EnhancedVpcRouting": true
}
}

YAML example

RedshiftCluster:
    Type: AWS::Redshift::Cluster
    Properties:
        ClusterType: single-node
        DBName: sampledb
        MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
        MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
        NodeType: ds2.xlarge
        EnhancedVpcRouting: true

#### CT.REDSHIFT.PR.5 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

**PASS Example** - Use this template to verify a compliant resource creation.

```yaml
Resources:
  RedshiftSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Redshift cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasterusername"}
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: "@/\"
  RedshiftCluster:
    Type: AWS::Redshift::Cluster
    Properties:
      ClusterType: single-node
      DBName: exampledb
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
      NodeType: dc2.large
      PubliclyAccessible: false
      EnhancedVpcRouting: true
```

**FAIL Example** - Use this template to verify that the control prevents non-compliant resource creation.

```yaml
Resources:
  RedshiftSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Description: Redshift cluster secret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "examplemasterusername"}
        GenerateStringKey: password
        PasswordLength: 16
        ExcludeCharacters: "@/\"
  RedshiftCluster:
    Type: AWS::Redshift::Cluster
    Properties:
      ClusterType: single-node
      DBName: exampledb
      MasterUsername:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
      MasterUserPassword:
        Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
```

1222
[CT.REDSHIFT.PR.6] Require an Amazon Redshift cluster to have a unique administrator username

This control checks whether an Amazon Redshift cluster has changed the administrator username from its default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::Cluster
- **AWS CloudFormation guard rule:** [CT.REDSHIFT.PR.6 rule specification](p. 1224)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.REDSHIFT.PR.6 rule specification](p. 1224)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.REDSHIFT.PR.6 example templates](p. 1226)

**Explanation**

When creating an Amazon Redshift cluster, you should change the default administrator username to a unique value. Default usernames are public knowledge, so they should be changed upon configuration. Changing the default username reduces the risk of unintended access.

**Remediation for rule failure**

Set **MasterUsername** to a value other than **awsuser**.

The examples that follow show how to implement this remediation.

**Amazon Redshift Cluster - Example**

Amazon Redshift cluster configured with an administrator username different from the default value of **awsuser**. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": "samplemasterusername",
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftClusterSecret}::password}}",
            },
            "NodeType": "ds2.xlarge"
        }
    }
}
```
YAML example

RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: samplemasterusername
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftClusterSecret}::password}}'
    NodeType: ds2.xlarge

CT.REDSHIFT.PR.6 rule specification

```
# ####################################################################
##       Rule Specification        ##
# ####################################################################
#
# Rule Identifier:
#   redshift_default_admin_check
#
# Description:
#   This control checks whether an Amazon Redshift cluster has changed the administrator
#   username from its default value.
#
# Reports on:

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
RedshiftSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: Redshift cluster secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "examplemasterusername"}'
      GenerateStringKey: password
      PasswordLength: 16
      ExcludeCharacters: '"@/\'
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: examplemasterusername
    MasterUserPassword:
      Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
RedshiftSecret:
  Type: AWS::SecretsManager::Secret
  Properties:
    Description: Redshift cluster secret
    GenerateSecretString:
      SecretStringTemplate: '{"username": "awsuser"}'
      GenerateStringKey: password
      PasswordLength: 16
      ExcludeCharacters: '"@/\'
RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: exampledb
    MasterUsername: awsuser
    MasterUserPassword:
      Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
[CT.REDSHIFT.PR.7] Require an Amazon Redshift cluster to have a unique database name

This control checks whether an Amazon Redshift cluster has changed its database name from the default value.

- **Control objective:** Protect configurations
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::Cluster
- **AWS CloudFormation guard rule:** [CT.REDSHIFT.PR.7 rule specification (p. 1228)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.REDSHIFT.PR.7 rule specification (p. 1228)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.REDSHIFT.PR.7 example templates (p. 1230)]

**Explanation**

When creating a Redshift cluster, you should change the default database name to a unique value. Default names are public knowledge, so they should be changed upon configuration. For example, a well-known name can lead to inadvertent access, if included in IAM policy conditions.

**Remediation for rule failure**

Set `DBName` to a database name that is different from the default value of `dev`.

The examples that follow show how to implement this remediation.

**Amazon Redshift Cluster - Example**

Amazon Redshift cluster configured with a database name different from the default value of `dev`. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftClusterSecret}\::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftClusterSecret}\::password}}"
            },
            "NodeType": "dc2.large",
            "PubliclyAccessible": false
        }
    }
}
```
YAML example

RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftClusterSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftClusterSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false

CT.REDSHIFT.PR.7 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
- **RedshiftSecret**:
  - Type: AWS::SecretsManager::Secret
  - Properties:
    - Description: Redshift cluster secret
    - GenerateSecretString:
      - SecretStringTemplate: '{"username": "examplemasterusername"}'
      - GenerateStringKey: password
      - PasswordLength: 16
      - ExcludeCharacters: "'"@/\"

- **RedshiftCluster**:
  - Type: AWS::Redshift::Cluster
  - Properties:
    - ClusterType: "single-node"
    - MasterUsername:
      - Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    - MasterUserPassword:
      - Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    - NodeType: dc2.large
    - PubliclyAccessible: false
    - DBName: exampledb

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
- **RedshiftSecret**:
  - Type: AWS::SecretsManager::Secret
  - Properties:
    - Description: Redshift cluster secret
    - GenerateSecretString:
      - SecretStringTemplate: '{"username": "examplemasterusername"}'
      - GenerateStringKey: password
      - PasswordLength: 16
      - ExcludeCharacters: "'"@/\"

- **RedshiftCluster**:
  - Type: AWS::Redshift::Cluster
  - Properties:
    - ClusterType: "single-node"
    - MasterUsername:
      - Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    - MasterUserPassword:
      - Fn::Sub: '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    - NodeType: dc2.large
    - PubliclyAccessible: false
    - DBName: exampledb
[CT.REDSHIFT.PR.8] Require an Amazon Redshift cluster to be encrypted

This control checks whether an Amazon Redshift cluster is encrypted.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::Cluster
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.8 rule specification (p. 1232)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.8 rule specification (p. 1232)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.REDSHIFT.PR.8 example templates (p. 1234)

Explanation

In Amazon Redshift, you can enable database encryption for your clusters, which helps protect data at rest. When you enable encryption for a cluster, the data blocks and system metadata are encrypted for the cluster and its snapshots.

**Remediation for rule failure**

Set the value of the Encrypted property to true.

The examples that follow show how to implement this remediation.

Amazon Redshift Cluster - Example

An Amazon Redshift cluster configured with encryption enabled. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "RedshiftCluster": {
        "Type": "AWS::Redshift::Cluster",
        "Properties": {
            "ClusterType": "single-node",
            "DBName": "sampledb",
            "MasterUsername": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::username}}"
            },
            "MasterUserPassword": {
                "Fn::Sub": "{{resolve:secretsmanager:${RedshiftSecret}::password}}"
            }
        }
    }
}
```
YAML example

RedshiftCluster:
  Type: AWS::Redshift::Cluster
  Properties:
    ClusterType: single-node
    DBName: sampledb
    MasterUsername: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::username}}'
    MasterUserPassword: !Sub '{{resolve:secretsmanager:${RedshiftSecret}::password}}'
    NodeType: dc2.large
    PubliclyAccessible: false
    Encrypted: true

Proactive controls

[CT.REDSHIFT.PR.9] Require that an Amazon Redshift cluster parameter group is configured to use Secure Sockets Layer (SSL) for encryption of data in transit

This control checks whether an Amazon Redshift cluster parameter group is configured to require encryption by means of Secure Sockets Layer (SSL), for data in transit.

- **Control objective:** Encrypt data in transit
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::Redshift::ClusterParameterGroup
- **AWS CloudFormation guard rule:** CT.REDSHIFT.PR.9 rule specification (p. 1236)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.REDSHIFT.PR.9 rule specification (p. 1236)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.REDSHIFT.PR.9 example templates (p. 1238)

**Explanation**

In Amazon Redshift, you can enable encryption of data in transit between an Amazon Redshift cluster and SQL clients over JDBC/ODBC. To support SSL connections, Amazon Redshift creates and installs certificates on each cluster, which are issued by AWS Certificate Manager (ACM).

**Remediation for rule failure**

Set an entry in Parameters with a ParameterName of require_ssl and a ParameterValue of true.

The examples that follow show how to implement this remediation.

**Amazon Redshift cluster parameter group - Example**

An Amazon Redshift cluster parameter group, configured to require encryption of data in transit. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "ClusterParameterGroup": {
      "Type": "AWS::Redshift::ClusterParameterGroup",
      "Properties": {
         "Description": "Example parameter group",
         "ParameterGroupFamily": "redshift-1.0",
         "Parameters": [
            {
               "ParameterName": "require_ssl",
               "ParameterValue": true
            }
         ]
      }
   }
}
```

**YAML example**

```yaml
---

"ClusterParameterGroup": {
  "Type": "AWS::Redshift::ClusterParameterGroup",
  "Properties": {
    "Description": "Example parameter group",
    "ParameterGroupFamily": "redshift-1.0",
    "Parameters": [
      {
        "ParameterName": "require_ssl",
        "ParameterValue": true
      }
    ]
  }
}
```
ClusterParameterGroup:
  Type: AWS::Redshift::ClusterParameterGroup
Properties:
  Description: Example parameter group
  ParameterGroupFamily: redshift-1.0
  Parameters:
    - ParameterName: require_ssl
      ParameterValue: true

CT.REDSHIFT.PR.9 rule specification

# ###################################################################
##       Rule Specification

# Description:
#  This control checks whether an Amazon Redshift cluster parameter group is configured to
#  require encryption by means of Secure Sockets Layer (SSL), for data in transit.
#
# Reports on:
#  AWS::Redshift::ClusterParameterGroup
#
# Evaluates:
#  AWS CloudFormation, AWS CloudFormation hook
# #
# Rule Parameters:
#  # None
#
# Scenarios:
#  # Scenario: 1
#    Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
#    And: The input document does not contain any Amazon Redshift cluster parameter
group resources
#    Then: SKIP
#  # Scenario: 2
#    Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
#    And: The input document contains an Amazon Redshift cluster parameter group
resource
#    And: 'Parameters' has not been provided or has been provided as an empty list
#    Then: FAIL
#  # Scenario: 3
#    Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
#    And: The input document contains an Amazon Redshift cluster parameter group
resource
#    And: 'Parameters' has been provided as a non-empty list that does not contain an
#      entry with 'ParameterName' set to 'require_ssl' and 'ParameterValue' set to bool(true) or
#      a supported boolean string value ('true', 'True', 'TRUE', 'on', 'On' or 'ON')
#    Then: FAIL
#  # Scenario: 4
#    Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document

1236
And: The input document contains an Amazon Redshift cluster parameter group resource
And: Any entry in 'Parameters' with a 'ParameterName' is set to 'require_ssl' has a corresponding 'ParameterValue' set to a value other than bool(true) or a supported boolean string value ('true', 'True', 'TRUE', 'on', 'On' or 'ON')
Then: FAIL

Scenario: 5
Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
And: The input document contains an Amazon Redshift cluster parameter group resource
And: 'Parameters' has been provided as a non-empty list
And: 'Parameters' contains an entry with 'ParameterName' set to 'require_ssl' and 'ParameterValue' set to bool(true) or a supported boolean string value ('true', 'True', 'TRUE', 'on', 'On' or 'ON')
And: All entries in 'Parameters' with a 'ParameterName' set to 'require_ssl' have a corresponding 'ParameterValue' set to bool(true) or a supported boolean string value ('true', 'True', 'TRUE', 'on', 'On' or 'ON')
Then: PASS

Amazon Simple Storage Service (Amazon S3) controls

Topics

- [CT.S3.PR.1] Require an Amazon S3 bucket to have block public access settings configured (p. 1239)
- [CT.S3.PR.2] Require an Amazon S3 bucket to have server access logging configured (p. 1243)
- [CT.S3.PR.3] Require an Amazon S3 buckets to have versioning configured and a lifecycle policy (p. 1247)
- [CT.S3.PR.4] Require an Amazon S3 bucket to have event notifications configured (p. 1251)
- [CT.S3.PR.5] Require that an Amazon S3 bucket does not manage user access with an access control list (ACL) (p. 1255)
- [CT.S3.PR.6] Require an Amazon S3 bucket to have lifecycle policies configured (p. 1258)
- [CT.S3.PR.8] Require that Amazon S3 bucket requests use Secure Socket Layer (p. 1262)
- [CT.S3.PR.9] Require that an Amazon S3 bucket has S3 Object Lock activated (p. 1269)
- [CT.S3.PR.10] Require an Amazon S3 bucket to have server-side encryption configured using an AWS KMS key (p. 1272)
- [CT.S3.PR.11] Require an Amazon S3 bucket to have versioning enabled (p. 1276)

[CT.S3.PR.1] Require an Amazon S3 bucket to have block public access settings configured

This control checks whether your Amazon Simple Storage Service (Amazon S3) bucket has a bucket-level Block Public Access (BPA) configuration.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::S3::Bucket
- **AWS CloudFormation guard rule:** [CT.S3.PR.1 rule specification](p. 1240)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.S3.PR.1 rule specification](p. 1240)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.S3.PR.1 example templates](p. 1242)

Explanation

Block Public Access at the Amazon S3 bucket level provides controls to ensure that objects never have public access. Public access is granted to buckets and objects through access control lists (ACLs), bucket policies, or both.

Unless you intend to have your S3 buckets publicly accessible, you should configure the bucket level Amazon S3 Block Public Access feature.
Usage considerations

- This control is incompatible with Amazon S3 buckets that require a public access configuration.

Remediation for rule failure

The parameters `BlockPublicAcls`, `BlockPublicPolicy`, `IgnorePublicAcls`, `RestrictPublicBuckets` must be set to true under the bucket-level `PublicAccessBlockConfiguration`.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example

Amazon S3 bucket with a bucket level Block Public Access configuration that ensures objects never have public access. The example is shown in JSON and in YAML.

**JSON example**

```json
{
"S3Bucket": {
  "Type": "AWS::S3::Bucket",
  "Properties": {
    "PublicAccessBlockConfiguration": {
      "BlockPublicAcls": true,
      "BlockPublicPolicy": true,
      "IgnorePublicAcls": true,
      "RestrictPublicBuckets": true
    }
  }
}
```

**YAML example**

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    PublicAccessBlockConfiguration:
      BlockPublicAcls: true
      BlockPublicPolicy: true
      IgnorePublicAcls: true
      RestrictPublicBuckets: true
```

CT.S3.PR.1 rule specification

</tbody>
</table>

**[CT.S3.PR.2] Require an Amazon S3 bucket to have server access logging configured**

This control checks whether server access logging is enabled for your Amazon S3 bucket.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::S3::Bucket
- **AWS CloudFormation guard rule:** [CT.S3.PR.2 rule specification (p. 1244)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.S3.PR.2 rule specification (p. 1244)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.S3.PR.2 example templates (p. 1246)]

**Explanation**

Server access logging provides detailed records of requests made to a bucket. Server access logs can assist in security and access audits.

**Remediation for rule failure**

Set a LoggingConfiguration on the S3 bucket and optionally set DestinationBucketName to an S3 bucket configured to receive S3 Access Logs.
The examples that follow show how to implement this remediation.

**Amazon S3 Bucket - Example**

Amazon S3 bucket with a server access logging configuration. The example is shown in JSON and in YAML.

**JSON example**

```
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "LoggingConfiguration": {
                "DestinationBucketName": {
                    "Ref": "LoggingBucket"
                }
            }
        }
    }
}
```

**YAML example**

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    LoggingConfiguration:
      DestinationBucketName: !Ref 'LoggingBucket'
```

**CT.S3.PR.2 rule specification**

CT.S3.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
[CT.S3.PR.3] Require an Amazon S3 buckets to have versioning configured and a lifecycle policy

This control checks whether your Amazon Simple Storage Service (Amazon S3) version-enabled bucket has a lifecycle policy configured.

- **Control objective:** Optimize costs
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::S3::Bucket
- **AWS CloudFormation guard rule:** [CT.S3.PR.3 rule specification (p. 1248)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.S3.PR.3 rule specification (p. 1248)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.S3.PR.3 example templates (p. 1250)]

**Explanation**

We recommend that you configure lifecycle rules on your Amazon S3 bucket, because these rules help you define actions that you want Amazon S3 to take during an object's lifetime.

- **Usage considerations**
  - This control applies only to Amazon S3 buckets with versioning enabled.

**Remediation for rule failure**

Configure versioning-enabled buckets with at least one active lifecycle rule.

The examples that follow show how to implement this remediation.

**Amazon S3 Bucket - Example One**

Amazon S3 bucket with versioning enabled and an active lifecycle rule. The example is shown in JSON and in YAML.

**JSON example**
```json
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "VersioningConfiguration": {
                "Status": "Enabled"
            },
            "LifecycleConfiguration": {
                "Rules": [
                    {
                        "Status": "Enabled",
                        "ExpirationInDays": 1,
                        "Id": "FirstRule"
                    }
                ]
            }
        }
    }
}
```

### YAML example

% doc.%RESOURCE_TYPE.resourceProperties exists  
}  

CT.S3.PR.3 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:  
Bucket:  
    Type: AWS::S3::Bucket  
Properties:  
    VersioningConfiguration:  
        Status: Enabled
**LifecycleConfiguration:**
- **Status:** Enabled
  - **ExpirationInDays:** 1
- **Id:** FirstRule

**FAIL Example** - Use this template to verify that the control prevents non-compliant resource creation.

```yaml
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      VersioningConfiguration:
        Status: Enabled
      LifecycleConfiguration:
        Rules:
        - Status: Disabled
          ExpirationInDays: 1
          Id: FirstRule
```

[**CT.S3.PR.4**] **Require an Amazon S3 bucket to have event notifications configured**

This control checks whether Amazon S3 events notifications are enabled on your Amazon S3 bucket.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::S3::Bucket
- **AWS CloudFormation guard rule:** [CT.S3.PR.4 rule specification (p. 1253)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see: [CT.S3.PR.4 rule specification (p. 1253)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.S3.PR.4 example templates (p. 1255)]

**Explanation**

By enabling event notifications, you receive alerts on your Amazon S3 buckets when specific events occur. For example, you can be notified of object creation, object removal, and object restoration. These notifications can alert relevant teams to accidental or intentional modifications that may lead to unauthorized data access.

**Remediation for rule failure**

Set a `NotificationConfiguration` parameter on your bucket with one of `EventBridgeConfiguration`, `LambdaConfigurations`, `QueueConfigurations` or `TopicConfigurations`.

The examples that follow show how to implement this remediation.
Amazon S3 Bucket - Example One

Amazon S3 bucket with Amazon EventBridge notifications configured. The example is shown in JSON and in YAML.

**JSON example**

```
{
  "S3Bucket": {
    "Type": "AWS::S3::Bucket",
    "Properties": {
      "NotificationConfiguration": {
        "EventBridgeConfiguration": {
          "EventBridgeEnabled": true
        }
      }
    }
  }
}
```

**YAML example**

```
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    NotificationConfiguration:
      EventBridgeConfiguration:
        EventBridgeEnabled: true
```

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example Two

Amazon S3 bucket with SNS topic notifications configured. The example is shown in JSON and in YAML.

**JSON example**

```
{
  "S3Bucket": {
    "Type": "AWS::S3::Bucket",
    "Properties": {
      "NotificationConfiguration": {
        "TopicConfigurations": [
          {
            "Topic": {
              "Ref": "SnsTopic"
            },
            "Event": "s3:ReducedRedundancyLostObject"
          }
        ]
      }
    }
  }
}
```

**CT.S3.PR.4 rule specification**

```yaml
# This control checks whether Amazon S3 event notifications are enabled on an S3 bucket.
# Reports on: AWS::S3::Bucket
# Evaluates: AWS CloudFormation, AWS CloudFormation hook

# Rule Parameters:
# None

# Scenarios:
# Scenario: 1
# Given: The input document is an AWS CloudFormation or CloudFormation hook document
# And: The input document does not contain any Amazon S3 bucket resources
# Then: SKIP
# Scenario: 2
# Given: The input document is an AWS CloudFormation or CloudFormation hook document
# And: The input document contains an Amazon S3 bucket resource
# And: 'NotificationConfiguration' has not been provided
# Then: FAIL
# Scenario: 3
# Given: The input document is an AWS CloudFormation or CloudFormation hook document
# And: The input document contains an Amazon S3 bucket resource
# And: 'NotificationConfiguration' has been provided
# And: At least one of 'EventBridgeConfiguration.EventBridgeEnabled', 'LambdaConfigurations',
# 'QueueConfigurations', or 'TopicConfigurations' have not been provided or provided as empty lists.
# Then: FAIL
# Scenario: 4
# Given: The input document is an AWS CloudFormation or CloudFormation hook document
# And: The input document contains an Amazon S3 bucket resource
# And: 'NotificationConfiguration' has been provided
# And: 'EventBridgeConfiguration.EventBridgeEnabled' is set to bool(true) or 'LambdaConfigurations',
# 'QueueConfigurations', or 'TopicConfigurations' have been provided with at least one configuration
# Then: PASS
```
### Constants

```
let S3_BUCKET_TYPE = "AWS::S3::Bucket"
let INPUT_DOCUMENT = this
```

### Assignments

```
let s3_buckets = Resources.*[ Type == %S3_BUCKET_TYPE ]
```

### Primary Rules

```
# Primary Rules
#
rule s3_event_notifications_enabled_check when is_cfn_template(%INPUT_DOCUMENT)
    %s3_buckets not empty {
        check(%s3_buckets.Properties)
        <<
        [CT.S3.PR.4]: Require an Amazon S3 bucket to have event notifications configured
        [FIX]: Set a 'NotificationConfiguration' parameter on your bucket with one
        of 'EventBridgeConfiguration', 'LambdaConfigurations', 'QueueConfigurations' or
        'TopicConfigurations.'
        >>
    }
rule s3_event_notifications_enabled_check when is_cfn_hook(%INPUT_DOCUMENT, %S3_BUCKET_TYPE) {
    check(%INPUT_DOCUMENT.%S3_BUCKET_TYPE.resourceProperties)
    <<
    [CT.S3.PR.4]: Require an Amazon S3 bucket to have event notifications configured
    [FIX]: Set a 'NotificationConfiguration' parameter on your bucket with one
    of 'EventBridgeConfiguration', 'LambdaConfigurations', 'QueueConfigurations' or
    'TopicConfigurations.'
    >>
}
```

### Parameterized Rules

```
# Parameterized Rules
#
rule check(s3_bucket) {
    %s3_bucket {
        # Scenario 2
        NotificationConfiguration exists
        NotificationConfiguration is_struct
        NotificationConfiguration {
            # Scenario 3 and 4
            EventBridgeConfiguration exists or
            LambdaConfigurations exists or
            QueueConfigurations exists or
            TopicConfigurations exists
            check_event_bridge_notifications(EventBridgeConfiguration) or
            check_other_notifications(LambdaConfigurations) or

1254
CT.S3.PR.4 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
Bucket:
  Type: AWS::S3::Bucket
  Properties:
    NotificationConfiguration:
      EventBridgeConfiguration:
        EventBridgeEnabled: true

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
Bucket:
  Type: AWS::S3::Bucket
  Properties:
    NotificationConfiguration: {}

[CT.S3.PR.5] Require that an Amazon S3 bucket does not manage user access with an access control list (ACL)

This control checks whether your Amazon Simple Storage Service (Amazon S3) bucket allows user permissions through access control lists.

- **Control objective:** Enforce least privilege
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
**Resource types**: AWS::S3::Bucket

**AWS CloudFormation guard rule**: [CT.S3.PR.5 rule specification](p. 1256)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see: [CT.S3.PR.5 rule specification](p. 1256)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.S3.PR.5 example templates](p. 1258)

**Explanation**

ACLs are legacy access control mechanisms that predate IAM. Instead of ACLs, we recommend using IAM policies or Amazon S3 bucket policies to more easily manage access to your S3 buckets.

**Remediation for rule failure**

Manage access to Amazon S3 buckets with bucket resource policies and IAM identity policies instead.

The examples that follow show how to implement this remediation.

**Amazon S3 Bucket - Example**

Amazon S3 bucket that does not allow user permissions through access control lists by omitting the `AccessControl` property. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "S3Bucket": {
      "Type": "AWS::S3::Bucket",
      "Properties": {}
   }
}
```

**YAML example**

```yaml
S3Bucket:
  Type: AWS::S3::Bucket
  Properties: {}
```

**CT.S3.PR.5 rule specification**

```bash

[CT.S3.PR.6] Require an Amazon S3 bucket to have lifecycle policies configured

This control checks whether a lifecycle rule is configured for Amazon S3 buckets.

- **Control objective**: Optimize costs, Improve availability
- **Implementation**: AWS CloudFormation Guard Rule
- **Control behavior**: Proactive
- **Resource types**: AWS::S3::Bucket
- **AWS CloudFormation guard rule**: [CT.S3.PR.6 rule specification](p. 1259)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.S3.PR.6 rule specification](p. 1259)
Proactive controls

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.6 example templates (p. 1261)

Explanation

Configuring lifecycle rules on your Amazon S3 bucket defines actions that you want S3 to take during an object's lifetime. For example, you can transition objects to another storage class, archive them, or delete them after a specified period of time.

Remediation for rule failure

Configure at least one active lifecycle rule in LifecycleConfiguration.Rules by setting Status on a rule to Enabled.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket - Example

Amazon S3 bucket configured with an active lifecycle rule. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "LifecycleConfiguration": {
                "Rules": [
                    {
                        "Status": "Enabled",
                        "ExpirationInDays": 1,
                        "Id": "FirstRule"
                    }
                ]
            }
        }
    }
}
```

**YAML example**

```yaml
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    LifecycleConfiguration:
      Rules:
      - Status: Enabled
        ExpirationInDays: 1
        Id: FirstRule
```

**CT.S3.PR.6 rule specification**

```bash
# ###################################################################
##       Rule Specification       ##
# ###################################################################
```

CT.S3.PR.6 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
S3Bucket:
FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
S3Bucket:
  Type: AWS::S3::Bucket
  Properties:
    LifecycleConfiguration:
      Rules:
        - Status: Enabled
          ExpirationInDays: 1
          Id: FirstRule

[CT.S3.PR.8] Require that Amazon S3 bucket requests use Secure Socket Layer

This control checks whether Amazon S3 bucket policies require requests to use Secure Socket Layer (SSL).

- Control objective: Encrypt data in transit
- Implementation: AWS CloudFormation Guard Rule
- Control behavior: Proactive
- Resource types: AWS::S3::BucketPolicy
- AWS CloudFormation guard rule: CT.S3.PR.8 rule specification (p. 1264)

Details and examples
- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.8 rule specification (p. 1264)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: CT.S3.PR.8 example templates (p. 1267)

Explanation
Amazon S3 buckets should have policies that require all requests (Action: S3:*) to accept transmission of data over HTTPS in the S3 resource policy only, as indicated by the condition key aws:SecureTransport.

Remediation for rule failure
Configure an Amazon S3 bucket policy statement that denies access to all principals and actions for the S3 bucket and bucket objects when a secure transport protocol is not in use.

The examples that follow show how to implement this remediation.

Amazon S3 Bucket Policy - Example
Amazon S3 bucket policy configured to deny all access to the bucket and bucket objects when transmission of data is not over HTTPS. The example is shown in JSON and in YAML.
**JSON example**

```json
{
  "S3BucketPolicy": {
    "Type": "AWS::S3::BucketPolicy",
    "Properties": {
      "Bucket": {
        "Ref": "S3Bucket"
      },
      "PolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
          {
            "Effect": "Deny",
            "Action": "s3:*",
            "Resource": [
              { "Fn::GetAtt": [ "S3Bucket", "Arn" ] },
              "Principal": "*",
              "Condition": {
                "Bool": {
                  "aws:SecureTransport": "false"
                }
              }
            ]
          }
        ]
      }
    }
  }
}
```

**YAML example**

```yaml
S3BucketPolicy:
  Type: AWS::S3::BucketPolicy
  Properties:
    Bucket: !Ref 'S3Bucket'
  PolicyDocument:
    Version: 2012-10-17
    Statement:
      - Effect: Deny
        Action: s3:*`
```
Resource:
- !GetAtt 'S3Bucket.Arn'
- !Join
  - ''
  - - !GetAtt 'S3Bucket.Arn'
- /*
Principal: ''
Condition:
  Bool:
    aws:SecureTransport: 'false'

[CT.S3.PR.9] Require that an Amazon S3 bucket has S3 Object Lock activated

This control checks whether an Amazon Simple Storage Service (Amazon S3) bucket has been configured to use S3 Object Lock.

- **Control objective:** Protect data integrity
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::S3::Bucket
- **AWS CloudFormation guard rule:** CT.S3.PR.9 rule specification (p. 1270)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.S3.PR.9 rule specification (p. 1270)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.S3.PR.9 example templates (p. 1271)

Explanation

S3 Object Lock allows you to store objects using a write-once-read-many (WORM) model. Object Lock can help prevent objects from being deleted or overwritten for a fixed amount of time, or indefinitely. You can use S3 Object Lock to meet regulatory requirements that require WORM storage, or to add an extra layer of protection against object changes and deletion.

Usage considerations

- When you create an Amazon S3 bucket with object lock activated, S3 automatically enables versioning for the bucket.

Remediation for rule failure

Set ObjectLockEnabled to true.

The examples that follow show how to implement this remediation.

S3 bucket - Example

An Amazon S3 bucket configured with S3 object lock enabled. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "Bucket": {
        "Type": "AWS::S3::Bucket",
        ...
    }
}
```
"Properties": {
  "ObjectLockEnabled": true
}
}

YAML example

Bucket:
  Type: AWS::S3::Bucket
  Properties:
    ObjectLockEnabled: true

    ObjectLockEnabled: false

[CT.S3.PR.10] Require an Amazon S3 bucket to have server-side encryption configured using an AWS KMS key

This control checks whether default server-side encryption is enabled on an Amazon S3 bucket using AWS KMS.

- **Control objective:** Encrypt data at rest
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::S3::Bucket
- **AWS CloudFormation guard rule:** [CT.S3.PR.10 rule specification](p. 1273)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.S3.PR.10 rule specification](p. 1273)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.S3.PR.10 example templates](p. 1276)

Explanation

Server-side encryption (SSE) is the encryption of data at its destination by the application or service that receives the data. Unless you specify otherwise, Amazon S3 buckets use SSE-S3 by default to encrypt objects. However, for added control, you can choose to configure buckets to use server-side encryption with AWS KMS keys (SSE-KMS) instead. Amazon S3 encrypts your data at the object level as it writes data to disks in AWS data centers, and then decrypts the data for you, when you require access to it.

Remediation for rule failure

The examples that follow show how to implement this remediation.
S3 Bucket - Example

An Amazon S3 bucket configured with AWS Key Management Service (AWS KMS) (SSE-KMS) default server-side encryption. The example is shown in JSON and in YAML.

JSON example

```json
{
    "S3Bucket": {
        "Type": "AWS::S3::Bucket",
        "Properties": {
            "BucketEncryption": {
                "ServerSideEncryptionConfiguration": [
                    {
                        "ServerSideEncryptionByDefault": {
                            "SSEAlgorithm": "aws:kms"
                        }
                    }
                ]
            }
        }
    }
}
```

YAML example

```yaml
S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
        BucketEncryption:
            ServerSideEncryptionConfiguration:
                - ServerSideEncryptionByDefault:
                    SSEAlgorithm: aws:kms
```

CT.S3.PR.10 rule specification

```yaml
# ###################################################################
# Rule Specification                                              #
# ###################################################################
# # Rule Identifier:  # s3_bucket_default_encryption_kms_check  #
# # Description:     # This control checks whether default server-side encryption is enabled on an Amazon S3 bucket using AWS KMS. #
# # Reports on:      # AWS::S3::Bucket #
# # Evaluates:       # AWS CloudFormation, AWS CloudFormation hook #
# # Rule Parameters: # None #
```
# Scenarios:

## Scenario: 1

- **Given:** The input document is an AWS CloudFormation or AWS CloudFormation hook document
- **And:** The input document does not contain any S3 bucket resources
- **Then:** SKIP

## Scenario: 2

- **Given:** The input document is an AWS CloudFormation or AWS CloudFormation hook document
- **And:** The input document contains an S3 bucket resource
- **And:** 'ServerSideEncryptionConfiguration' in 'BucketEncryption' has not been provided or provided as an empty list
- **Then:** FAIL

## Scenario: 3

- **Given:** The input document is an AWS CloudFormation or AWS CloudFormation hook document
- **And:** The input document contains an S3 bucket resource
- **And:** 'ServerSideEncryptionConfiguration' in 'BucketEncryption' has been provided as a non empty list
- **And:** 'ServerSideEncryptionConfiguration' in 'BucketEncryption' does not contain an encryption rule with a 'ServerSideEncryptionByDefault' configuration
- **Then:** FAIL

## Scenario: 4

- **Given:** The input document is an AWS CloudFormation or AWS CloudFormation hook document
- **And:** The input document contains an S3 bucket resource
- **And:** 'ServerSideEncryptionConfiguration' in 'BucketEncryption' has been provided as a non empty list
- **And:** 'ServerSideEncryptionConfiguration' in 'BucketEncryption' contains an encryption rule with a 'ServerSideEncryptionByDefault' configuration
- **And:** For an encryption rule, 'SSEAlgorithm' in 'ServerSideEncryptionByDefault' is not provided or has been provided and set to an SSE Algorithm other than 'aws:kms' or 'aws:kms:dsse'
- **Then:** FAIL

## Scenario: 5

- **Given:** The input document is an AWS CloudFormation or AWS CloudFormation hook document
- **And:** The input document contains an S3 bucket resource
- **And:** 'ServerSideEncryptionConfiguration' in 'BucketEncryption' has been provided as a non empty list
- **And:** 'ServerSideEncryptionConfiguration' in 'BucketEncryption' contains an encryption rule with a 'ServerSideEncryptionByDefault' configuration
- **And:** For all encryption rules, 'SSEAlgorithm' in 'ServerSideEncryptionByDefault' is provided and set to 'aws:kms' or 'aws:kms:dsse'
- **Then:** PASS

## Constants

- `let S3_BUCKET_TYPE = "AWS::S3::Bucket"

    }
}

rule is_cfn_hook(doc, RESOURCE_TYPE) {
    %doc.%RESOURCE_TYPE.resourceProperties exists
}
```
CT.S3.PR.10 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties:
      BucketEncryption:
        ServerSideEncryptionConfiguration:
          - ServerSideEncryptionByDefault:
            SSEAlgorithm: aws:kms
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  Bucket:
    Type: AWS::S3::Bucket
    Properties: {}
```

[CT.S3.PR.11] Require an Amazon S3 bucket to have versioning enabled

This control checks whether an Amazon Simple Storage Service (Amazon S3) bucket has versioning enabled.

- **Control objective**: Improve availability
- **Implementation**: AWS CloudFormation guard rule
- **Control behavior**: Proactive
- **Resource types**: AWS::S3::Bucket
- **AWS CloudFormation guard rule**: [CT.S3.PR.11 rule specification](p. 1277)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see: [CT.S3.PR.11 rule specification](p. 1277)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.S3.PR.11 example templates](p. 1279)

Explanation

Versioning keeps multiple variants of an object in the same Amazon S3 bucket. You can use versioning to preserve, retrieve, and restore every version of every object stored in your S3 bucket. With versioning, you can recover more easily from unintended user actions and application failures.
Usage considerations

- If you have an unversioned bucket with an object expiration lifecycle configuration, and if you want to maintain the same permanent delete behavior when you enable versioning, you must set an expiration configuration for noncurrent objects. The noncurrent expiration configuration lifecycle manages deletion of noncurrent object versions in the version-enabled bucket. (A version-enabled bucket maintains one current, and zero or more noncurrent, object versions.)

Remediation for rule failure

Set the Status in VersioningConfiguration to Enabled.

The examples that follow show how to implement this remediation.

S3 Bucket - Example One

An Amazon S3 bucket with versioning enabled. The example is shown in JSON and in YAML.

JSON example

```
{
   "Bucket": {
      "Type": "AWS::S3::Bucket",
      "Properties": {
         "VersioningConfiguration": {
            "Status": "Enabled"
         }
      }
   }
}
```

YAML example

```
Bucket:
   Type: AWS::S3::Bucket
   Properties:
      VersioningConfiguration:
         Status: Enabled
```

[CT.SAGEMAKER.PR.1] Require an Amazon SageMaker notebook instance to prevent direct internet access

This control checks that direct internet access is not allowed for an Amazon SageMaker notebook instance.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::SageMaker::NotebookInstance
- **AWS CloudFormation guard rule:** [CT.SAGEMAKER.PR.1 rule specification (p. 1281)]

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.SAGEMAKER.PR.1 rule specification (p. 1281)]
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.SAGEMAKER.PR.1 example templates (p. 1284)]

Explanation

When you configure your SageMaker notebook instance without a VPC, direct internet access is allowed for your instance, by default. Instead, you should configure your instance with a VPC and change the default setting to **Disable - Access the internet through a VPC.**

To train or host models from a notebook, you require internet access. To set up internet access, make sure that your VPC has a NAT gateway, and that your security group allows outbound connections.

Ensure that access to your SageMaker configuration is limited to authorized users. Restrict users' IAM permissions for modifying SageMaker settings and resources.

**Usage considerations**

- To set up outbound internet access for Amazon SageMaker notebook instances when this control is activated - First, associate the notebook instance with a private subnet that has access to the internet, through a default route to a NAT gateway instance. Also, be sure that the security groups assigned to the notebook instance, and the network access control list (NACL) of the private subnet, allow outbound traffic to the internet.

**Remediation for rule failure**

Set **DirectInternetAccess** to **Disabled** and provide a **SubnetId** and one or more **SecurityGroupIds**.
The examples that follow show how to implement this remediation.

**Amazon SageMaker Notebook Instance - Example**

Amazon SageMaker notebook instance configured with direct internet access deactivated. The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "SageMakerNoteBookInstance": {
    "Type": "AWS::SageMaker::NotebookInstance",
    "Properties": {
      "InstanceType": "ml.t2.medium",
      "RoleArn": {
        "Fn::GetAtt": [
          "ExecutionRole",
          "Arn"
        ]
      },
      "DirectInternetAccess": "Disabled",
      "SubnetId": {
        "Ref": "Subnet"
      },
      "SecurityGroupIds": [
        {
          "Fn::GetAtt": [
            "SecurityGroup",
            "GroupId"
          ]
        ]
      }
    }
  }
}
```

**YAML example**

```yaml
SageMakerNoteBookInstance:
  Type: AWS::SageMaker::NotebookInstance
  Properties:
    InstanceType: ml.t2.medium
    RoleArn: !GetAtt 'ExecutionRole.Arn'
    DirectInternetAccess: Disabled
    SubnetId: !Ref 'Subnet'
    SecurityGroupIds:
      - !GetAtt 'SecurityGroup.GroupId'
```

**CT.SAGEMAKER.PR.1 rule specification**

```plaintext
# ###################################################################
##       Rule Specification       ##
# ###################################################################
# Rule Identifier:
# sagemaker_notebook_no_direct_internet_access_check
# 1281
```
# Description:
This control checks that direct internet access is not allowed for an Amazon SageMaker notebook instance.

# Reports on:
AWS::SageMaker::NotebookInstance

# Evaluates:
AWS CloudFormation, AWS CloudFormation hook

# Rule Parameters:
None

# Scenarios:
# Scenario: 1
Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
And: The input document does not contain any SageMaker notebook instance resources
Then: SKIP

# Scenario: 2
Given: The input document contains an SageMaker notebook instance resource
And: 'DirectInternetAccess' has not been provided on the SageMaker notebook instance resource
Then: FAIL

# Scenario: 3
Given: The input document contains an SageMaker notebook instance resource
And: 'DirectInternetAccess' has been provided on the SageMaker notebook instance resource
And: 'DirectInternetAccess' is set to 'Enabled'
Then: FAIL

# Scenario: 4
Given: The input document contains an SageMaker notebook instance resource
And: 'DirectInternetAccess' has been provided on the SageMaker notebook instance resource
And: 'DirectInternetAccess' is set to 'Disabled'
And: 'SecurityGroupIds' have been provided as a non-empty list with non-empty strings or valid local references
And: 'SubnetId' has been provided as an empty string or non-valid local reference
Then: FAIL

# Scenario: 5
Given: The input document contains an SageMaker notebook instance resource
And: 'DirectInternetAccess' has been provided on the SageMaker notebook instance resource
And: 'DirectInternetAccess' is set to 'Disabled'
And: 'SubnetId' has been provided as a non-empty string or valid local reference
And: 'SecurityGroupIds' have been provided as an empty list or a list that contains empty string values or non-valid local references
Then: FAIL

# Scenario: 6
Given: The input document contains an SageMaker notebook instance resource
And: 'DirectInternetAccess' has been provided on the SageMaker notebook instance resource
And: 'DirectInternetAccess' is set to 'Disabled'
And: 'SecurityGroupIds' have been provided as a non-empty list with non-empty strings or valid local references
And: 'SubnetId' has been provided as a non-empty string or valid local reference
Then: PASS

### CT.SAGEMAKER.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

**PASS Example** - Use this template to verify a compliant resource creation.

**Resources:**

**VPC:**
  Type: AWS::EC2::VPC
  Properties:
  CidrBlock: 10.0.0.0/16
  EnableDnsSupport: 'true'
  EnableDnsHostnames: 'true'

**Subnet:**
  Type: AWS::EC2::Subnet
  Properties:
  VpcId:
    Ref: VPC
  CidrBlock: 10.0.0.0/24
AvailabilityZone:
  - Fn::Select:
    - 0
    - Fn::GetAZs: ''

SecurityGroup:
  Type: AWS::EC2::SecurityGroup
  Properties:
    GroupDescription: Notebook SG1
    VpcId:
      Ref: VPC

ExecutionRole:
  Type: AWS::IAM::Role
  Properties:
    AssumeRolePolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
          Principal:
            Service:
              - sagemaker.amazonaws.com
          Action:
            - sts:AssumeRole
          Path: /
        ManagedPolicyArns:
          - Fn::Sub: arn:${AWS::Partition}:iam::aws:policy/AmazonSageMakerFullAccess

SageMakerNoteBookInstance:
  Type: AWS::SageMaker::NotebookInstance
  Properties:
    InstanceType: ml.t2.medium
    RoleArn:
      Fn::GetAtt:
        - ExecutionRole
        - Arn
    DirectInternetAccess: Disabled
    SubnetId:
      Fn::GetAtt:
        - Subnet
        - SubnetId
    SecurityGroupIds:
      - Fn::GetAtt:
        - SecurityGroup
        - GroupId

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
ExecutionRole:
  Type: AWS::IAM::Role
  Properties:
    AssumeRolePolicyDocument:
      Version: '2012-10-17'
      Statement:
        - Effect: Allow
          Principal:
            Service:
              - sagemaker.amazonaws.com
          Action:
            - sts:AssumeRole
          Path: /
        ManagedPolicyArns:
          - Fn::Sub: arn:${AWS::Partition}:iam::aws:policy/AmazonSageMakerFullAccess

SageMakerNoteBookInstance:
[CT.SAGEMAKER.PR.2] Require Amazon SageMaker notebook instances to be deployed within a custom Amazon VPC

This control checks whether an Amazon SageMaker notebook instance is configured to launch within a custom Amazon VPC.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::SageMaker::NotebookInstance
- **AWS CloudFormation guard rule:** [CT.SAGEMAKER.PR.2 rule specification](p. 1287)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.SAGEMAKER.PR.2 rule specification](p. 1287)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.SAGEMAKER.PR.2 example templates](p. 1290)

**Explanation**

As a best practice, we recommend that you keep your resources contained inside a VPC whenever possible, to ensure the secure network protection of your infrastructure.

**Remediation for rule failure**

Set SubnetId to the identifier of an Amazon EC2 subnet and set SecurityGroupIds to a list containing one or more EC2 security group identifiers.

The examples that follow show how to implement this remediation.

**Amazon SageMaker Notebook Instance - Example**

Amazon SageMaker notebook instance configured with Amazon VPC connectivity. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "NotebookInstance": {
        "Type": "AWS::SageMaker::NotebookInstance",
        "Properties": {
            "InstanceType": "ml.t2.large",
            "RoleArn": {
                "Fn::GetAtt": [
                    "ExecutionRole",
                    "Arn"
                ]
            },
            "DirectInternetAccess": "Enabled"
        }
    }
}
```
YAML example

NotebookInstance:
  Type: AWS::SageMaker::NotebookInstance
  Properties:
    InstanceType: ml.t2.large
    RoleArn: !GetAtt 'ExecutionRole.Arn'
    SubnetId: !GetAtt 'Subnet.SubnetId'
    SecurityGroupIds:
      - !GetAtt 'SecurityGroup.GroupId'

CT.SAGEMAKER.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```yaml
Resources:
  NotebookInstance:
    Type: AWS::SageMaker::NotebookInstance
    Properties:
      InstanceType: ml.t2.large
      RoleArn: example-role-arn
      SubnetId: example-subnet-id
      SecurityGroupIds:
        - example-sg-id
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```yaml
Resources:
  NotebookInstance:
    Type: AWS::SageMaker::NotebookInstance
    Properties:
      InstanceType: ml.t2.large
      RoleArn: example-role-arn
```

[CT.SAGEMAKER.PR.3] Require Amazon SageMaker notebook instances to have root access disallowed

This control checks whether Amazon SageMaker notebook instances allow root access.

- **Control objective**: Enforce least privilege
- **Implementation**: AWS CloudFormation guard rule
- **Control behavior**: Proactive
- **Resource types**: AWS::SageMaker::NotebookInstance
- **AWS CloudFormation guard rule**: [CT.SAGEMAKER.PR.3 rule specification (p. 1291)](#)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.SAGEMAKER.PR.3 rule specification (p. 1291)](#)
- For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.SAGEMAKER.PR.3 example templates (p. 1293)](#)

Explanation
By default, when you create a notebook instance, users that log into that notebook instance have root access. Because users with root access have administrator privileges, users have access to edit all files on a notebook instance with root access enabled. In adherence to the principle of least privilege, for security reasons, we recommend that you restrict root access to instance resources whenever possible, to avoid unintentional over-provisioning of permissions.

**Usage considerations**

- Lifecycle configurations associated with an Amazon SageMaker notebook instance always run with root access, even if you turn off root access for users.

**Remediation for rule failure**

Set RootAccess to Disabled.

The examples that follow show how to implement this remediation.

**Amazon SageMaker Notebook Instance - Example**

Amazon SageMaker notebook instance configured with root access turned off. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "NotebookInstance": {
      "Type": "AWS::SageMaker::NotebookInstance",
      "Properties": {
         "InstanceType": "ml.t2.large",
         "RoleArn": {
            "Fn::GetAtt": [
               "ExecutionRole",
               "Arn"
            ],
            "RootAccess": "Disabled"
         }
      }
   }
}
```

**YAML example**

```yaml
NotebookInstance:
   Type: AWS::SageMaker::NotebookInstance
   Properties:
      InstanceType: ml.t2.large
      RoleArn: !GetAtt 'ExecutionRole.Arn'
      RootAccess: Disabled
```

CT.SAGEMAKER.PR.3 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
NotebookInstance:
    Type: AWS::SageMaker::NotebookInstance
    Properties:
        InstanceType: ml.t2.large
        RoleArn: example-role-arn
        RootAccess: Disabled

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
NotebookInstance:
    Type: AWS::SageMaker::NotebookInstance
    Properties:
        InstanceType: ml.t2.large
        RoleArn: example-role-arn
        RootAccess: Enabled
Amazon Simple Queue Service (Amazon SQS) controls

Topics
- [CT.SQS.PR.1] Require any Amazon SQS queue to have a dead-letter queue configured (p. 1294)
- [CT.SQS.PR.2] Require any Amazon SQS queue to have encryption at rest configured (p. 1298)

[CT.SQS.PR.1] Require any Amazon SQS queue to have a dead-letter queue configured

This control checks whether an Amazon SQS queue is configured with a dead-letter queue.

- **Control objective:** Improve resiliency
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::SQS::Queue
- **AWS CloudFormation guard rule:** [CT.SQS.PR.1 rule specification (p. 1295)]

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.SQS.PR.1 rule specification (p. 1295)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.SQS.PR.1 example templates (p. 1298)]

Explanation

The main task of a dead-letter queue is to handle the lifecycle of unconsumed messages. A dead-letter queue lets you set aside and isolate messages that can't be processed correctly, so you can determine why their processing didn't succeed.

**Usage considerations**

- This control applies only to Amazon SQS queues that are not configured as a dead-letter queue with a RedriveAllowPolicy property.

Remediation for rule failure

Create a RedrivePolicy with a deadLetterTargetArn value that's set to the ARN of an Amazon SQS dead-letter queue. For Amazon SQS dead-letter queues, instead provide a redrive configuration in the RedriveAllowPolicy property.

The examples that follow show how to implement this remediation.

Amazon SQS Queue - Example

Amazon SQS queue configured to send messages to a dead-letter queue, if the messages can't be processed (consumed) successfully. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "SQSQueue": {
        "Type": "AWS::SQS::Queue",
```
"Properties": {
  "RedrivePolicy": {
    "deadLetterTargetArn": {
      "Fn::GetAtt": [
        "DLQQueue",
        "Arn"
      ],
      "maxReceiveCount": 3
    }
  }
}

YAML example

```yaml
SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    RedrivePolicy:
      deadLetterTargetArn: !GetAtt 'DLQQueue.Arn'
      maxReceiveCount: 3
```

CT.SQS.PR.1 rule specification

```plaintext
# #############################################################################

# #############################################################################
#
# Rule Identifier:
#    sqs_dlq_check
#
# Description:
#    This control checks whether an Amazon SQS queue is configured with a dead-letter queue.
#
# Reports on:
#    AWS::SQS::Queue
#
# Evaluates:
#    AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
#    None
#
# Scenarios:
#    Scenario: 1
#      Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
#      And: The input document does not contain any SQS queue resources
#      Then: SKIP
#    Scenario: 2
#      Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
#      And: The input document contains an SQS queue resource
#      And: 'RedriveAllowPolicy' has been provided on the SQS queue
#      And: 'RedriveAllowPolicy.redrivePermission' is set to 'allowAll' or 'byQueue'
#      Then: SKIP
#    Scenario: 3
```
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
# And: The input document contains an SQS queue resource
# And: 'RedriveAllowPolicy' has not been provided on the SQS queue or 'RedriveAllowPolicy.redrivePermission' has been provided and is set to a value other than 'allowAll' or 'byQueue'
# And: 'RedrivePolicy' has not been provided
# Then: FAIL
# Scenario: 4
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
# And: The input document contains an SQS queue resource
# And: 'RedriveAllowPolicy' has not been provided on the SQS queue or 'RedriveAllowPolicy.redrivePermission' has been provided and is set to a value other than 'allowAll' or 'byQueue'
# And: 'RedrivePolicy' has been provided
# And: 'RedrivePolicy.deadLetterTargetArn' has not been provided or has been provided as an empty string or invalid local reference to an SQS queue
# Then: FAIL
# Scenario: 5
# Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
# And: The input document contains an SQS queue resource
# And: 'RedriveAllowPolicy' has not been provided on the SQS queue or 'RedriveAllowPolicy.redrivePermission' has been provided and is set to a value other than 'allowAll' or 'byQueue'
# And: 'RedrivePolicy' has been provided
# And: 'RedrivePolicy.deadLetterTargetArn' has been provided as a non-empty string or valid local reference to an SQS queue
# Then: PASS

CT.SQS.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

```
Resources:
  SQSQueue:
    Type: AWS::SQS::Queue
    Properties:
      RedrivePolicy:
        deadLetterTargetArn:
          Fn::GetAtt: [DLQQueue, Arn]
        maxReceiveCount: 3
  DLQQueue:
    Type: AWS::SQS::Queue
    Properties:
      RedriveAllowPolicy:
        redrivePermission: allowAll
```

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

```
Resources:
  SQSQueue:
    Type: AWS::SQS::Queue
    Properties: {}
```

[CT.SQS.PR.2] Require any Amazon SQS queue to have encryption at rest configured

This control checks whether an Amazon SQS queue is encrypted at rest.

- **Control objective**: Encrypt data at rest
- **Implementation**: AWS CloudFormation Guard Rule
- **Control behavior**: Proactive
- **Resource types**: AWS::SQS::Queue
- **AWS CloudFormation guard rule**: CT.SQS.PR.2 rule specification (p. 1300)

Details and examples
• For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.SQS.PR.2 rule specification](p. 1300)

• For examples of PASS and FAIL AWS CloudFormation Templates related to this control, see: [CT.SQS.PR.2 example templates](p. 1302)

**Explanation**

Server-side encryption (SSE) allows you to transmit sensitive data in encrypted queues. To protect the content of messages in queues, SSE uses KMS keys.

**Remediation for rule failure**

Set `SqsManagedSseEnabled` to `true` or set an AWS KMS key identifier in the `KmsMasterKeyId` property.

The examples that follow show how to implement this remediation.

**Amazon SQS Queue - Example One**

Amazon SQS queue configured to encrypt data at rest with server-side encryption enabled, by means of SQS managed encryption keys (SSE-SQS). The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "SQSQueue": {
    "Type": "AWS::SQS::Queue",
    "Properties": {
      "SqsManagedSseEnabled": true
    }
  }
}
```

**YAML example**

```yaml
SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    SqsManagedSseEnabled: true
```

The examples that follow show how to implement this remediation.

**Amazon SQS Queue - Example Two**

Amazon SQS queue configured to encrypt data at rest with server-side encryption enabled, by means of AWS KMS (SSE-KMS). The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "SQSQueue": {
    "Type": "AWS::SQS::Queue",
    "Properties": {
      "SqsManagedSseEnabled": true
    }
  }
}
```
"KmsMasterKeyId": {  
  "Ref": "KMSKey"
}
}
}

YAML example

SQSQueue:
  Type: AWS::SQS::Queue
  Properties:
    KmsMasterKeyId: !Ref 'KMSKey'

AWS Step Functions controls

Topics
- [CT.STEPFUNCTIONS.PR.1] Require an AWS Step Functions state machine to have logging activated (p. 1303)
- [CT.STEPFUNCTIONS.PR.2] Require an AWS Step Functions state machine to have AWS X-Ray tracing activated (p. 1311)

[CT.STEPFUNCTIONS.PR.1] Require an AWS Step Functions state machine to have logging activated

This control checks whether an AWS Step Functions state machine has logging enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::StepFunctions::StateMachine
- **AWS CloudFormation guard rule:** CT.STEPFUNCTIONS.PR.1 rule specification (p. 1305)

Details and examples
For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.STEPFUNCTIONS.PR.1 rule specification (p. 1305)]

For examples of PASS and FAIL CloudFormation templates related to this control, see: [CT.STEPFUNCTIONS.PR.1 example templates (p. 1308)]

Explanation

Defining a logging configuration for your state machines allows you to track their execution history and results. This configuration allows you to track failed events that occur on a state machine, and this insight into errors can assist you when you’re troubleshooting issues.

Remediation for rule failure

In `LoggingConfiguration`, set `Level` to `ERROR` or `ALL`, and set `Destinations` to a list with one or more valid Amazon CloudWatch Logs log group ARNs.

The examples that follow show how to implement this remediation.

**AWS Step Functions State Machine - Example**

AWS Step Functions state machine configured to send logs to Amazon CloudWatch Logs. The example is shown in JSON and in YAML.

**JSON example**

```json
{
  "StateMachine": {
    "Type": "AWS::StepFunctions::StateMachine",
    "Properties": {
      "StateMachineType": "STANDARD",
      "DefinitionString": "{"StartAt": "Sample","States": {"Sample": {"Type": "Task", "Resource":"arn:aws:lambda:us-east-1:111122223333:function:SampleFunction", "End": true}}}}",
      "RoleArn": {
        "Fn::GetAtt": [
          "StepFunctionExecutionRole",
          "Arn"
        ],
      },
      "LoggingConfiguration": {
        "Level": "ALL",
        "Destinations": [
          {
            "CloudWatchLogsLogGroup": {
              "LogGroupArn": {
                "Fn::GetAtt": [
                  "LogGroup",
                  "Arn"
                ]
              }
            }
          }
        ]
      }
    }
  }
}
```

**YAML example**

```yaml
...
```
StateMachine:
  Type: AWS::StepFunctions::StateMachine
  Properties:
    StateMachineType: STANDARD
    DefinitionString: '{"StartAt": "Sample","States": [{"Sample": {"Type": "Task",
       "End": true}}],
    RoleArn: !GetAtt 'StepFunctionExecutionRole.Arn'
    LoggingConfiguration:
      Level: ALL
      Destinations:
        - CloudWatchLogsLogGroup:
            LogGroupArn: !GetAtt 'LogGroup.Arn'

```
Proactive controls

LoggingConfiguration:
Level: 'OFF'

[CT.STEPFUNCTIONS.PR.2] Require an AWS Step Functions state machine to have AWS X-Ray tracing activated

This control checks whether an AWS Step Functions state machine has AWS X-Ray tracing enabled.

- **Control objective:** Establish logging and monitoring
- **Implementation:** AWS CloudFormation guard rule
- **Control behavior:** Proactive
- **Resource types:** AWS::StepFunctions::StateMachine
- **AWS CloudFormation guard rule:** CT.STEPFUNCTIONS.PR.2 rule specification (p. 1312)

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: CT.STEPFUNCTIONS.PR.2 rule specification (p. 1312)
- For examples of PASS and FAIL CloudFormation templates related to this control, see: CT.STEPFUNCTIONS.PR.2 example templates (p. 1314)

Explanation

A tracing configuration allows your state machine to send tracing data to AWS X-Ray, so you can visualize the components of your state machine, identify performance bottlenecks, and troubleshoot requests that resulted in errors.

Remediation for rule failure

In the TracingConfiguration property, set the value of Enabled to true.

The examples that follow show how to implement this remediation.

**AWS Step Functions State Machine - Example**

An AWS Step Functions state machine configured to send trace data to AWS X-Ray. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "StateMachine": {
        "Type": "AWS::StepFunctions::StateMachine",
        "Properties": {
            "StateMachineType": "STANDARD",
            "DefinitionString": "\"StartAt\": \"Sample\", \"States\": [{\"Sample\": {\"Type \": \"Task\", \"Resource\": \"arn:aws:lambda:us-east-1:111122223333:function:SampleFunction \", \"End\": true}}],
            "RoleArn": {
                "Fn::GetAtt": [
                    "StepFunctionExecutionRole",
                    "Arn"
                ]
            }
        }
    }
}
```

1311
"LoggingConfiguration": {
    "Level": "ALL",
    "Destinations": [
        "CloudWatchLogsLogGroup": {
            "LogGroupArn": {
                "Fn::GetAtt": [
                    "LogGroup",
                    "Arn"
                ]
            }
        }
    ]
},
"TracingConfiguration": {
    "Enabled": true
}
}

YAML example

StateMachine:
  Type: AWS::StepFunctions::StateMachine
Properties:
  StateMachineType: STANDARD
  DefinitionString: '{"StartAt": "Sample","States": {"Sample": {"Type": "Task",
    "End": true}},
RoleArn: !GetAtt 'StepFunctionExecutionRole.Arn'

AWS WAF regional controls

Topics
- [CT.WAF-REGIONAL.PR.1] Require any AWS WAF regional rule to have a condition (p. 1317)
- [CT.WAF-REGIONAL.PR.2] Require any AWS WAF regional web access control list (ACL) to have a rule or rule group (p. 1320)

[CT.WAF-REGIONAL.PR.1] Require any AWS WAF regional rule to have a condition

This control checks whether an AWS WAF Classic Regional rule contains any conditions.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::WAFRegional::Rule
- **AWS CloudFormation guard rule:** [CT.WAF-REGIONAL.PR.1 rule specification (p. 1318)]

Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see: [CT.WAF-REGIONAL.PR.1 rule specification (p. 1318)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.WAF-REGIONAL.PR.1 example templates (p. 1320)]

Explanation

An AWS WAF (web application firewall) Regional rule can contain multiple conditions. The rule count's conditions allow for traffic inspection, based on a defined action, such as allow, block, or count. Without any conditions, the traffic passes without inspection. An AWS WAF Regional rule with no conditions, but with a name or tag suggesting allow, block, or count, could lead to the inaccurate assumption that one of those actions is occurring.

Remediation for rule failure

Provide one or more AWS WAF rule conditions within the Predicates property.

The examples that follow show how to implement this remediation.

**AWS WAF Classic Regional Rule - Example**

AWS WAF Classic Regional rule configured with an IP match predicate. The example is shown in JSON and in YAML.

**JSON example**

```json
{
   "WafRegionalRule": {
```
YAML example

WafRegionalRule:
  Type: AWS::WAFRegional::Rule
  Properties:
    Name: SampleRule
    MetricName: SampleRuleMetric
    Predicates:
      - DataId: !Ref 'IPSet'
        Negated: false
        Type: IPMatch

CT.WAF-REGIONAL.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
- IPSetDenylist:
  - Type: AWS::WAFRegional::IPSet
  - Properties:
    - Name: IPSet for deny listed IP addresses
    - IPSetDescriptors:
      - Type: IPV4
      - Value: 192.0.2.44/32
- WafRegionalRule:
  - Type: AWS::WAFRegional::Rule
  - Properties:
    - Name: ExampleRule
    - MetricName: ExampleRuleMetric
    - Predicates:
      - Type: "IPMatch"
      - DataId:
        - Ref: IPSetDenylist
        - Negated: false

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
- WafRegionalRule:
  - Type: AWS::WAFRegional::Rule
  - Properties:
    - Name: ExampleRule
    - MetricName: ExampleRuleMetric

[CT.WAF-REGIONAL.PR.2] Require any AWS WAF regional web access control list (ACL) to have a rule or rule group

This control checks whether an AWS WAF Classic Regional web ACL contains any WAF rules or rule groups.

- Control objective: Limit network access
AWS Control Tower User Guide
Proactive controls

- **Implementation**: AWS CloudFormation Guard Rule
- **Control behavior**: Proactive
- **Resource types**: AWS::WAFRegional::WebACL
- **AWS CloudFormation guard rule**: [CT.WAF-REGIONAL.PR.2 rule specification](#)

### Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.WAF-REGIONAL.PR.2 rule specification](#)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.WAF-REGIONAL.PR.2 example templates](#)

### Explanation

An AWS WAF Regional web access control list (ACL) can contain a collection of rules and rule groups that inspect and control web requests. If a web ACL is empty, the web traffic can pass without being detected or acted upon by WAF, depending on the default action.

#### Remediation for rule failure

Provide one or more AWS WAF rules within the `Rules` property.

The examples that follow show how to implement this remediation.

**AWS WAF Classic Regional web ACL - Example**

AWS WAF Classic Regional web ACL configured with a rule to block requests based on an IP set match. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "WafRegionalWebAcl": {
        "Type": "AWS::WAFRegional::WebACL",
        "Properties": {
            "Name": "SampleWebACL",
            "DefaultAction": {
                "Type": "ALLOW"
            },
            "MetricName": "SampleWebACLMetric",
            "Rules": [
                {
                    "Action": {
                        "Type": "BLOCK"
                    },
                    "Priority": 1,
                    "RuleId": {
                        "Ref": "IPSetRule"
                    }
                }
            ]
        }
    }
}
```

**YAML example**

```yaml
{
    "WafRegionalWebAcl": {
        "Type": "AWS::WAFRegional::WebACL",
        "Properties": {
            "Name": "SampleWebACL",
            "DefaultAction": {
                "Type": "ALLOW"
            },
            "MetricName": "SampleWebACLMetric",
            "Rules": [
                {
                    "Action": {
                        "Type": "BLOCK"
                    },
                    "Priority": 1,
                    "RuleId": {
                        "Ref": "IPSetRule"
                    }
                }
            ]
        }
    }
}
```
WafRegionalWebAcl:
  Type: AWS::WAFRegional::WebACL
Properties:
  Name: SampleWebACL
  DefaultAction:
    Type: ALLOW
  MetricName: SampleWebACLMetric
Rules:

AWS WAF controls

Topics
- [CT.WAF.PR.1] Require any AWS WAF global rule to have a condition (p. 1324)
- [CT.WAF.PR.2] Require any AWS WAF global web ACL to have a rule or rule group (p. 1328)

[CT.WAF.PR.1] Require any AWS WAF global rule to have a condition

This control checks whether an AWS WAF Classic global rule contains any conditions.
• **Control objective**: Limit network access
• **Implementation**: AWS CloudFormation Guard Rule
• **Control behavior**: Proactive
• **Resource types**: AWS::WAF::Rule
• **AWS CloudFormation guard rule**: [CT.WAF.PR.1 rule specification (p. 1326)](https://aws.amazon.com)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see: [CT.WAF.PR.1 rule specification (p. 1326)](https://aws.amazon.com)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.WAF.PR.1 example templates (p. 1327)](https://aws.amazon.com)

**Explanation**

A WAF global rule can contain multiple conditions. A rule's conditions allow for traffic inspection and take a defined action (allow, block, or count). Without any conditions, the traffic passes without inspection. A WAF global rule with no conditions, but with a name or tag suggesting allow, block, or count, could lead to the wrong assumption that one of those actions is occurring.

**Remediation for rule failure**

Provide one or more AWS WAF rule conditions within the Predicates property.

The examples that follow show how to implement this remediation.

**AWS WAF Classic Global Rule - Example**

AWS WAF Classic global rule configured with an IP match predicate. The example is shown in JSON and YAML.

**JSON example**

```json
{
    "WAFRule": {
        "Type": "AWS::WAF::Rule",
        "Properties": {
            "Name": "SampleWAFRule",
            "MetricName": "SampleWAFRuleMetric",
            "Predicates": [
                {
                    "DataId": {
                        "Ref": "IPSet"
                    },
                    "Negated": false,
                    "Type": "IPMatch"
                }
            ]
        }
    }
}
```

**YAML example**

```yaml
WAFRule:
```
Type: AWS::WAF::Rule
Properties:
  Name: SampleWAFRule
  MetricName: SampleWAFRuleMetric
  Predicates:
    - DataId: !Ref 'IPSet'
      Negated: false
      Type: IPMatch

**[CT.WAF.PR.2]** Require any AWS WAF global web ACL to have a rule or rule group

This control checks whether an AWS WAF Classic global web ACL contains any WAF rules or rule groups.

- **Control objective**: Limit network access
- **Implementation**: AWS CloudFormation Guard Rule
- **Control behavior**: Proactive
- **Resource types**: AWS::WAF::WebACL
- **AWS CloudFormation guard rule**: [CT.WAF.PR.2 rule specification](p. 1329)

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.WAF.PR.2 rule specification](p. 1329)
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.WAF.PR.2 example templates](p. 1331)

**Explanation**

A WAF global web ACL can contain a collection of rules and rule groups that inspect and control web requests. If a web ACL is empty, the web traffic can pass without being detected or acted upon by WAF depending on the default action.

**Remediation for rule failure**

Provide one or more AWS WAF rules within the Rules property.
The examples that follow show how to implement this remediation.

**AWS WAF Classic Global Web ACL - Example**

AWS WAF Classic global web ACL configured with a rule to block requests based on an IP set match. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "WafGlobalWebAcl": {
        "Type": "AWS::WAF::WebACL",
        "Properties": {
            "Name": "SampleWebACL",
            "DefaultAction": {
                "Type": "ALLOW"
            },
            "MetricName": "SampleWebACLMetric",
            "Rules": [
                {
                    "Action": {
                        "Type": "BLOCK"
                    },
                    "Priority": 1,
                    "RuleId": {
                        "Ref": "IPSetRule"
                    }
                }
            ]
        }
    }
}
```

**YAML example**

```yaml
WafGlobalWebAcl:
  Type: AWS::WAF::WebACL
  Properties:
    Name: SampleWebACL
    DefaultAction:
      Type: ALLOW
    MetricName: SampleWebACLMetric
    Rules:
    - Action:
        Type: BLOCK
        Priority: 1
        RuleId: !Ref 'IPSetRule'
```

**AWS WAFV2 controls**

**Topics**
- [CT.WAFV2.PR.1] Require an AWS WAFV2 web ACL to be non-empty (p. 1332)
- [CT.WAFV2.PR.2] Require an AWS WAFV2 rule group to be non-empty (p. 1336)

**[CT.WAFV2.PR.1] Require an AWS WAFV2 web ACL to be non-empty**

This control checks whether an AWS WAFV2 web ACL contains any WAF rules or WAF rule groups.

- **Control objective:** Limit network access
- **Implementation:** AWS CloudFormation Guard Rule
- **Control behavior:** Proactive
- **Resource types:** AWS::WAFv2::WebACL
- **AWS CloudFormation guard rule:** [CT.WAFV2.PR.1 rule specification (p. 1334)]

**Details and examples**

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.WAFV2.PR.1 rule specification (p. 1334)]
- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.WAFV2.PR.1 example templates (p. 1336)]

**Explanation**

A web access control list (ACL) attached to WAFv2 can contain a collection of rules and rule groups. The rules are designed to inspect and control web requests. If a web ACL is empty, the web traffic passes without being detected or acted upon by the web application firewall (WAF).

**Remediation for rule failure**

Provide one or more AWS WAFV2 rules within the Rules property.
The examples that follow show how to implement this remediation.

**AWS WAFV2 web ACL - Example**

AWS WAFV2 web ACL configured with a rule to block requests based on a cross-site scripting (XSS) match. statement. The example is shown in JSON and in YAML.

**JSON example**

```json
{
    "WAFv2WebACL": {
        "Type": "AWS::WAFv2::WebACL",
        "Properties": {
            "Scope": "REGIONAL",
            "Description": "Sample WebACL",
            "DefaultAction": {
                  "Allow": {}
            },
            "VisibilityConfig": {
                "SampledRequestsEnabled": true,
                "CloudWatchMetricsEnabled": true,
                "MetricName": "SampleWebACLMetric"
            },
            "Rules": [
                {
                    "Name": "SampleXssRule",
                    "Priority": 0,
                    "Action": {
                         "Block": {}
                    },
                    "VisibilityConfig": {
                        "SampledRequestsEnabled": true,
                        "CloudWatchMetricsEnabled": true,
                        "MetricName": "SampleXssMatchMetric"
                    },
                    "Statement": {
                        "XssMatchStatement": {
                            "FieldToMatch": {
                                "AllQueryArguments": {}
                            },
                            "TextTransformations": [
                                {
                                    "Priority": 1,
                                    "Type": "NONE"
                                }
                            ]
                        }
                    }
                }
            ]
        }
    }
}

CT.WAFV2.PR.1 rule specification

# #####################################################################
## Rule Specification
# #####################################################################
# # Rule Identifier:
# # wafv2_webacl_not_empty_check
# # Description:
# # This control checks whether an AWS WAFV2 web ACL contains any WAF rules or WAF rule groups.
# # Reports on:
# # AWS::WAFv2::WebACL
# # Evaluates:
# # AWS CloudFormation, AWS CloudFormation hook
# # Rule Parameters:
# # None
# # Scenarios:
# # Scenario: 1
# # Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
# # And: The input document does not contain any WAFv2 web ACL resources
# # Then: SKIP
# # Scenario: 2
# # Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
# # And: The input document contains an WAFv2 web ACL resource
# # And: 'Rules' has not been provided
# # Then: FAIL
# # Scenario: 3
# # Given: The input document is an AWS CloudFormation or AWS CloudFormation hook document
# Constants

```plaintext
let WAFV2_WEB_ACL_TYPE = "AWS::WAFv2::WebACL"
let INPUT_DOCUMENT = this
```

# Assignments

```plaintext
let wafv2_web_acls = Resources.*[ Type == %WAFV2_WEB_ACL_TYPE ]
```

# Primary Rules

```plaintext
rule wafv2_web_acl_not_empty_check when is_cfn_template(%INPUT_DOCUMENT) {
  %wafv2_web_acls not empty {
    check(%wafv2_web_acls.Properties)
    [CT.WAFV2.PR.1]: Require an AWS WAFV2 web ACL to be non-empty
    [FIX]: Provide one or more AWS WAFv2 rules within the 'Rules' property.
  }
}
rule wafv2_web_acl_not_empty_check when is_cfn_hook(%INPUT_DOCUMENT, %WAFV2_WEB_ACL_TYPE) {
  check(%INPUT_DOCUMENT.%WAFV2_WEB_ACL_TYPE.resourceProperties)
  [CT.WAFV2.PR.1]: Require an AWS WAFV2 web ACL to be non-empty
  [FIX]: Provide one or more AWS WAFv2 rules within the 'Rules' property.
}
```

# Parameterized Rules

```plaintext
rule check(wafv2_web_acl) {
  %wafv2_web_acl {
    # Scenario 2, 3 and 4
    Rules exists
    Rules is_list
    Rules not empty
  }
}
```

# Utility Rules

```plaintext
rule is_cfn_template(doc) {
  %doc {
    AWSTemplateFormatVersion exists or
    Resources exists
  }
}
rule is_cfn_hook(doc, RESOURCE_TYPE) {
  %doc.%RESOURCE_TYPE.resourceProperties exists
}
```
CT.WAFV2.PR.1 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

PASS Example - Use this template to verify a compliant resource creation.

Resources:
WAFv2WebACL:
  Type: AWS::WAFv2::WebACL
  Properties:
    Scope: REGIONAL
    Description: Example WebACL
    DefaultAction:
      Allow: {}

          CloudWatchMetricsEnabled: true
          MetricName: ExampleXssMatchMetric
        Statement:
          XssMatchStatement:
            FieldToMatch:
              AllQueryArguments: {}
            TextTransformations:
              - Priority: 1
                Type: NONE

FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
WAFv2WebACL:
  Type: AWS::WAFv2::WebACL
  Properties:
    Scope: REGIONAL
    Description: Example WebACL
    DefaultAction:
      Allow: {}
    VisibilityConfig:
      SampledRequestsEnabled: true
      CloudWatchMetricsEnabled: true
      MetricName: ExampleWebACLMetric

[CT.WAFV2.PR.2] Require an AWS WAFV2 rule group to be non-empty

This control checks whether AWS WAFV2 rule groups contain rules.
• **Control objective:** Limit network access
  
  **Implementation:** AWS CloudFormation Guard Rule
  
  **Control behavior:** Proactive
  
  **Resource types:** AWS::WAFv2::RuleGroup
  
  **AWS CloudFormation guard rule:** [CT.WAFV2.PR.2 rule specification (p. 1338)](https://docs.aws.amazon.com/wafv2/latest/developerguide/ctwafv2pr2-rule-specification.html)

## Details and examples

- For details about the PASS, FAIL, and SKIP behaviors associated with this control, see the: [CT.WAFV2.PR.2 rule specification (p. 1338)](https://docs.aws.amazon.com/wafv2/latest/developerguide/ctwafv2pr2-rule-specification.html)

- For examples of PASS and FAIL CloudFormation Templates related to this control, see: [CT.WAFV2.PR.2 example templates (p. 1340)](https://docs.aws.amazon.com/wafv2/latest/developerguide/ctwafv2pr2-example-templates.html)

## Explanation

An AWS WAFV2 rule group can contain multiple rules. The rules are designed to inspect and control web requests. When an empty AWS WAFV2 rule group is associated with a web ACL, and the web ACL is not associated with any other rules or rule groups, the web traffic passes without being detected or acted upon by the web application firewall (WAF).

### Remediation for rule failure

Provide one or more AWS WAFV2 rules within the `Rules` property.

The examples that follow show how to implement this remediation.

#### AWS WAFV2 Rule Group - Example

AWS WAFV2 rule group configured with a rule to block requests based on a cross-site scripting (XSS) match statement. The example is shown in JSON and in YAML.

#### JSON example

```json
{
  "WAFv2RuleGroup": {
    "Type": "AWS::WAFv2::RuleGroup",
    "Properties": {
      "Scope": "REGIONAL",
      "Description": "Sample Rule Group",
      "VisibilityConfig": {
        "SampledRequestsEnabled": true,
        "CloudWatchMetricsEnabled": true,
        "MetricName": "SampleRuleGroupMetric"
      },
      "Capacity": 1000,
      "Rules": [
        {
          "Name": "XssRule",
          "Priority": 0,
          "Action": {
            "Block": {}
          },
          "VisibilityConfig": {
            "SampledRequestsEnabled": true,
            "CloudWatchMetricsEnabled": true,
            "MetricName": "SampleXssMatchMetric"
          },
          "Statement": {
            "XssMatchStatement": {
```
YAML example

```yaml
WAFv2RuleGroup:
  Type: AWS::WAFv2::RuleGroup
  Properties:
    Scope: REGIONAL
    Description: Sample Rule Group
    VisibilityConfig:
      SampledRequestsEnabled: true
      CloudWatchMetricsEnabled: true
      MetricName: SampleRuleGroupMetric
    Capacity: 1000
  Rules:
    - Name: XssRule
      Priority: 0
      Action:
        Block: {}
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: SampleXssMatchMetric
    Statement:
      XssMatchStatement:
        FieldToMatch:
          AllQueryArguments: {}
        TextTransformations:
          - Priority: 1
            Type: NONE
```

CT.WAFV2.PR.2 rule specification

```plaintext
# ###################################################################
# Rule Specification  ##
# ###################################################################
#
# Rule Identifier:
# wafv2_rulegroup_not_empty_check
#
# Description:
# This control checks whether AWS WAFV2 rule groups contain rules.
#```
# Reports on:
# AWS::WAFv2::RuleGroup
#
# Evaluates:
# AWS CloudFormation, AWS CloudFormation hook
#
# Rule Parameters:
# None
#
# Scenarios:
# Scenario: 1
#   Given: The input document is an AWS CloudFormation or AWS CloudFormation hook
document
#         And: The input document does not contain any AWS WAFV2 rule group resources

    Rules not empty
}
```

## CT.WAFV2.PR.2 example templates

You can view examples of the PASS and FAIL test artifacts for the AWS Control Tower proactive controls.

**PASS Example** - Use this template to verify a compliant resource creation.

```json
Resources:
WAFv2RuleGroup:
  Type: AWS::WAFv2::RuleGroup
  Properties:
    Scope: REGIONAL
    Description: Example Rule Group
    VisibilityConfig:
      SampledRequestsEnabled: true
      CloudWatchMetricsEnabled: true
      MetricName: SampleRuleGroupMetrics
    Capacity: 1000
    Rules:
    - Name: TestXssRule
      Priority: 0
      Action:
        Block: {}
      VisibilityConfig:
        SampledRequestsEnabled: true
        CloudWatchMetricsEnabled: true
        MetricName: ExampleXssMatchMetric
    Statement:
      XssMatchStatement:
        FieldToMatch:
          AllQueryArguments: {}
        TextTransformations:
          - Priority: 1
            Type: NONE
```

```
FAIL Example - Use this template to verify that the control prevents non-compliant resource creation.

Resources:
WAFv2RuleGroup:
  Type: AWS::WAFv2::RuleGroup
  Properties:
  Description: Example Rule Group
  VisibilityConfig:
    SampledRequestsEnabled: true
    CloudWatchMetricsEnabled: true
    MetricName: ExampleRuleGroupMetric
  Capacity: 1000
  Rules: []

Security Hub standard

AWS Control Tower is integrated with AWS Security Hub to provide detective controls that help you monitor your AWS environment. The integration is accomplished with a Security Hub standard, called the Service-Managed Standard: AWS Control Tower.

This standard is available only for AWS Control Tower customers who have created the standard in the AWS Control Tower console. AWS Control Tower creates the standard for you when you enable the first Security Hub control in the AWS Control Tower console. When you enable the first control, if you haven’t already enabled Security Hub, AWS Control Tower also enables Security Hub for you.

After you create this standard, you can view the Security Hub detective controls alongside other AWS Control Tower controls, in the AWS Control Tower console and in Security Hub.

Control behavior

- No controls are enabled automatically when you create this standard in AWS Control Tower.
- The Security Hub controls are active at the OU level only, not for all AWS Control Tower OUs (if not enabled for all), and not for individual accounts.
- When Security Hub adds new controls, the new controls are not added to the Service-Managed Standard: AWS Control Tower automatically.

Enable or remove controls for the Service-Managed Standard

To avoid drift, always enable and remove controls for the Service-Managed Standard by means of the AWS Control Tower service, either in the console or by calling the AWS Control Tower APIs, EnableControl and DisableControl. When you change the enablement status of a control in AWS Control Tower, the change also is reflected in Security Hub.

Note
If you deactivate a Service-Managed Standard control by means of the Security Hub console, the AWS Control Tower member account enters a state of control drift. In this situation, AWS
Control Tower is not receiving the Security Hub findings for the control that you deactivated. You must resolve this drift before AWS Control Tower can apply the control successfully to your registered organizational units and member accounts.

You can delete this standard in the AWS Control Tower console by deactivating all controls in the standard. This deletes the standard for all managed accounts and governed Regions in AWS Control Tower. Deleting the standard does not deactivate Security Hub for your account.

**Deprecated control**
The control named [SH.S3.4] S3 buckets should have server-side encryption enabled is deprecated, effective July 18, 2023. It was removed from the controls library on August 18, 2023. For more information, see [AWS Control Tower deprecates two controls](p. 1462).

**Security Hub score and findings**
Based on control status, Security Hub calculates a security score for the **Service-Managed Standard: AWS Control Tower**. This security score and the control findings are available only in Security Hub. These items aren't available in AWS Control Tower.

**Note**
When you create **Service-Managed Standard: AWS Control Tower** and enable controls for it, Security Hub may take up to 18 hours to generate findings for controls that use the same underlying AWS Config service-linked rule as controls from other enabled Security Hub standards. For more information, see [Schedule for running security checks](p. 1342) in the AWS Security Hub User Guide.

**Security Hub control drift reporting**
When reporting drift for controls that are part of the AWS Security Hub Service-Managed Standard, AWS Control Tower receives a daily status update from Security Hub. If no update is received, AWS Control Tower verifies whether drift has occurred. If so, AWS Control Tower reports drift. If a control shows drift, AWS Control Tower sends an Amazon SNS notification to the AWS Control Tower security-aggregate-notification channel. You must subscribe to this SNS notification to receive information about which specific account is affected by Security Hub control drift. For more information about Security Hub control drift in AWS Control Tower, see [Security Hub control drift](p. 178).

Although controls are active in every governed Region, AWS Control Tower sends the AWS Security Hub **Finding** events to the AWS Control Tower home Region only.

**Remediate drift**
When drift is reported, you can remediate the situation by choosing **Re-register OU** on the **Organizations** page in the AWS Control Tower console, or by deactivating and re-activating the control that's in a drifted state, either by means of the console, or through the AWS Control Tower API.

**Note**
You can enable and manage some Security Hub controls from AWS Control Tower, with the **Security Hub Service-managed Standard: AWS Control Tower**. It is important to know that some Security Hub controls do not operate in certain AWS Regions where AWS Control Tower is available, because those Regions do not support the required underlying functionality. As a result, when you deploy an Security Hub control through AWS Control Tower, the control may not be operating in all Regions that you govern with AWS Control Tower. For more information about the Security Hub controls that cannot be deployed in certain Regions, see the [Security Hub controls reference documentation](p. 1342).

**The following AWS Regions do not support controls that are part of the Security Hub Service-managed Standard: AWS Control Tower**

- Asia Pacific (Hong Kong) Region, ap-east-1
Data residency controls

- Asia Pacific (Jakarta) Region, ap-southeast-3
- Asia Pacific (Osaka) Region, ap-northeast-3
- Europe (Milan) Region, eu-south-1
- Africa (Cape Town) Region, af-south-1
- Middle East (Bahrain) Region, me-south-1
- Israel (Tel Aviv), il-central-1
- Middle East (UAE) Region, me-central-1
- Europe (Spain) Region, eu-south-2
- Asia Pacific (Hyderabad) Region, ap-south-2
- Europe (Zurich) Region, eu-central-2
- Asia Pacific (Melbourne) Region ap-southeast-4

You can view the Regions for each control in the AWS Control Tower console.

Controls that enhance data residency protection

These elective controls complement your enterprise’s data residency posture. By applying these controls together, you can set up your multi-account environment to help detect and inhibit the purposeful or accidental creation, sharing, or copying of data, outside of your selected AWS Region or Regions.

These controls take effect at the OU level, and they apply to all member accounts within the OU.

Important
Certain global AWS services, such as AWS Identity and Access Management (IAM) and AWS Organizations, are exempt from these controls. You can identify the services that are exempt by reviewing the Region deny SCP, shown in the example code. Services with "*" after their identifier are exempt, because all actions are permitted when the "*" notation is given. This SCP essentially contains a list of explicitly permitted actions, and all other actions are denied. You cannot deny access to your home Region.

Video: Enable data residency controls

This video (5:58) describes how to enable data residency controls with AWS Control Tower controls. For better viewing, select the icon at the lower right corner of the video to enlarge it to full screen. Captioning is available.

Video Walkthrough of Enabling Data Residency Controls in AWS Control Tower.

Note
We are transitioning our terminology to align better with industry usage and with other AWS services. During this time, you may see the previous term, guardrail, as well as the new term, control, in our documentation, console, blogs, and videos. These terms are synonymous for our purposes.

Topics
- Deny access to AWS based on the requested AWS Region (p. 1344)
- Disallow internet access for an Amazon VPC instance managed by a customer (p. 1346)
- Disallow Amazon Virtual Private Network (VPN) connections (p. 1347)
- Disallow cross-region networking for Amazon EC2, Amazon CloudFront, and AWS Global Accelerator (p. 1347)
- Detect whether public IP addresses for Amazon EC2 autoscaling are enabled through launch configurations (p. 1348)
• Detect whether replication instances for AWS Database Migration Service are public (p. 1349)
• Detect whether Amazon EBS snapshots are restorable by all AWS accounts (p. 1350)
• Detect whether any Amazon EC2 instance has an associated public IPv4 address (p. 1351)
• Detect whether Amazon S3 settings to block public access are set as true for the account (p. 1351)
• Detects whether an Amazon EKS endpoint is blocked from public access (p. 1352)
• Detect whether an Amazon OpenSearch Service domain is in Amazon VPC (p. 1353)
• Detect whether any Amazon EMR cluster master nodes have public IP addresses (p. 1354)
• Detect whether the AWS Lambda function policy attached to the Lambda resource blocks public access (p. 1355)
• Detect whether public routes exist in the route table for an Internet Gateway (IGW) (p. 1356)
• Detect whether Amazon Redshift clusters are blocked from public access (p. 1357)
• Detect whether an Amazon SageMaker notebook instance allows direct internet access (p. 1357)
• Detect whether any Amazon VPC subnets are assigned a public IP address (p. 1358)
• Detect whether AWS Systems Manager documents owned by the account are public (p. 1359)

Deny access to AWS based on the requested AWS Region

This control is commonly referred to as the Region deny control.

This control disallows access to unlisted operations in global and regional services outside of the specified Regions. That includes all Regions where AWS Control Tower is not available, as well as all Regions not selected for governance in the Landing zone settings page. Actions are allowed as usual in Regions with Governed status.

Note
Certain global AWS services, such as AWS Identity and Access Management (IAM) and AWS Organizations, are exempt from data residency controls. Those services are specified in the SCP example code that follows.

This is an elective control with preventive guidance. It is the primary control associated with the Region deny action. For more information, see Configure the Region deny control (p. 102).

The format for this control is based on the following SCP.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {

Based on this example SCP format, AWS Control Tower adds your governed Regions into the `aws:RequestedRegion` statement. You cannot exclude your home Region. Actions not listed in the SCP are not permitted.

**Disallow internet access for an Amazon VPC instance managed by a customer**

This control disallows internet access for an Amazon Virtual Private Cloud (VPC) instance managed by a customer, rather than by an AWS service.

*Important*

If you provision Account Factory accounts with VPC internet access settings enabled, that Account Factory setting overrides this control. To avoid enabling internet access for newly provisioned accounts, you must change the setting in Account Factory. For more information, see [Walkthrough: Configure AWS Control Tower Without a VPC](p. 1432).

- This control does not apply to VPCs managed by AWS services.
- Existing VPCs that have internet access retain their internet access. It applies to new instances only. After this control is applied, access cannot be changed.

This is a preventive control with elective guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following service control policy (SCP).

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRDISALLOWVPCINTERNETACCESS",
      "Effect": "Deny",
      "Action": [
        "ec2:CreateInternetGateway",
        "ec2:AttachInternetGateway",
        "ec2:CreateEgressOnlyInternetGateway",
        "ec2:AttachEgressOnlyInternetGateway",
        "ec2:CreateDefaultVpc",
        "ec2:CreateDefaultSubnet",
        "ec2:CreateCarrierGateway"
      ],
    }
  ]
}
```
Disallow Amazon Virtual Private Network (VPN) connections

This control prevents Virtual Private Network (VPN) connections (Site-to-Site VPN and Client VPN) to an Amazon Virtual Private Cloud (VPC).

Note
Existing VPCs that have internet access retain their internet access.

This is a preventive control with elective guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following service control policy (SCP).

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRDISALLOWVPNCONNECTIONS",
            "Effect": "Deny",
            "Action": [
                "ec2:CreateVPNGateway",
                "ec2:AttachVPNGateway",
                "ec2:CreateCustomerGateway",
                "ec2:CreateVpnConnection",
                "ec2:ModifyVpnConnection",
                "ec2:CreateClientVpnEndpoint",
                "ec2:ModifyClientVpnEndpoint",
                "ec2:AssociateClientVpnTargetNetwork",
                "ec2:AuthorizeClientVpnIngress"
            ],
            "Resource": [
                "*
            ]
        }
    ]
}
```

Disallow cross-region networking for Amazon EC2, Amazon CloudFront, and AWS Global Accelerator

This control prevents configuring cross-region networking connections from Amazon EC2, Amazon CloudFront, and AWS Global Accelerator services. It prevents VPC peering and transit gateway peering.

Note
This control prevents Amazon EC2 VPC peering and Amazon EC2 transit gateway peering within a single Region, as well as across Regions. For this reason, this control may affect certain workloads in addition to your data residency posture.
This is a preventive control with elective guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following service control policy (SCP).

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "GRDISALLOWCROSSREGIONNETWORKING",
         "Effect": "Deny",
         "Action": ["ec2:CreateVpcPeeringConnection",
                    "ec2:AcceptVpcPeeringConnection",
                    "ec2:CreateTransitGatewayPeeringAttachment",
                    "ec2:AcceptTransitGatewayPeeringAttachment",
                    "cloudfront:CreateDistribution",
                    "cloudfront:UpdateDistribution",
                    "globalaccelerator:Create*",
                    "globalaccelerator:Update*"
                  ],
         "Resource": ["*"],
      }
   ]
}
```

### Detect whether public IP addresses for Amazon EC2 autoscaling are enabled through launch configurations

This control detects whether Amazon EC2 Auto Scaling groups have public IP addresses enabled through launch configurations.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

**In the console:**

- The rule shows **Non-compliant** status if the launch configuration for an autoscaling group sets the value of the field `AssociatePublicIpAddress` set as **True**.

The artifact for this control is the following AWS Config rule.

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether public IP addresses for Amazon EC2 Auto Scaling are enabled through launch configurations

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

Resources:
  AutoscalingLaunchConfigPublicIpDisabled:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether Amazon EC2 Auto Scaling groups have public IP addresses enabled through launch configurations. This rule is NON_COMPLIANT if the launch configuration for an Auto Scaling group has the value of the field `AssociatePublicIpAddress` set as True.
```
Scope:

ComplianceResourceTypes:
- AWS::AutoScaling::LaunchConfiguration

Source:

Owner: AWS
SourceIdentifier: AUTOSCALING_LAUNCH_CONFIG_PUBLIC_IP_DISABLED

Detect whether replication instances for AWS Database Migration Service are public

This control detects whether AWS Database Migration Service replication instances are public.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

In the console:

- The rule shows **Non-compliant** status if the value of the `PubliclyAccessible` field is set as **True**.

The artifact for this control is the following AWS Config rule.

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether replication instances for AWS Database Migration Service are public

Parameters:
ConfigRuleName:
  Type: 'String'
  Description: 'Name for the Config rule'

MaximumExecutionFrequency:
  Type: String
  Default: 24hours
  Description: The frequency at which AWS Config will run evaluations for the rule.
  AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours

Mappings:
  Settings:
    FrequencyMap:
      1hour : One_Hour
      3hours : Three_Hours
      6hours : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours

Resources:
DmsReplicationNotPublic:
  Type: AWS::Config::ConfigRule
  Properties:
    ConfigRuleName: !Sub ${ConfigRuleName}
    Description: Detects whether AWS Database Migration Service replication instances are public. The rule is NON_COMPLIANT if the value of the `PubliclyAccessible` field is set as True.
    Source:
      Owner: AWS
      SourceIdentifier: DMS_REPLICATION_NOT_PUBLIC
      MaximumExecutionFrequency:
```
Detect whether Amazon EBS snapshots are restorable by all AWS accounts

This control detects whether all AWS accounts have access to restore Amazon EBS snapshots.

This is a detective control with elective guidance. By default, this control isn’t enabled on any OUs.

In the console:

- The rule shows **Non-compliant** status if any snapshots have the RestorableByUserIds field set to the value **All**. In that case, the Amazon EBS snapshots are public.

The artifact for this control is the following AWS Config rule.

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether Amazon EBS snapshots are restorable by all AWS accounts

Parameters:
ConfigRuleName:
  Type: 'String'
  Description: 'Name for the Config rule'

MaximumExecutionFrequency:
  Type: String
  Default: 24hours
  Description: The frequency at which AWS Config will run evaluations for the rule.
  AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours

Mappings:
Settings:
  FrequencyMap:
    1hour   : One_Hour
    3hours  : Three_Hours
    6hours  : Six_Hours
    12hours : Twelve_Hours
    24hours : TwentyFour_Hours

Resources:
EbsSnapshotPublicRestorableCheck:
  Type: AWS::Config::ConfigRule
  Properties:
    ConfigRuleName: !Sub ${ConfigRuleName}
    Description: Detects whether all AWS accounts have access to restore Amazon EBS snapshots. The rule is NON_COMPLIANT if any snapshots have the RestorableByUserIds field set to the value All. In that case, the Amazon EBS snapshots are public.
    Source:

    MaximumExecutionFrequency:
```
Detect whether any Amazon EC2 instance has an associated public IPv4 address

This control detects whether an Amazon Elastic Compute Cloud (Amazon EC2) instance has an associated public IPv4 address. This control applies only to IPv4 addresses.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

In the console:

- The rule shows **Non-compliant** status if the public IP field is present in the Amazon EC2 instance configuration item.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether any Amazon EC2 instance has an associated public IPv4 address
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  Ec2InstanceNoPublicIp:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether an Amazon Elastic Compute Cloud (Amazon EC2) instance has an associated public IPv4 address. The rule is NON_COMPLIANT if the public IP field is present in the Amazon EC2 instance configuration item.
      Scope:
        ComplianceResourceTypes:
        - AWS::EC2::Instance
      Source:
        Owner: AWS
        SourceIdentifier: EC2_INSTANCE_NO_PUBLIC_IP
```

Detect whether Amazon S3 settings to block public access are set as true for the account

This control periodically detects whether the required Amazon S3 settings to block public access are configured as true for the account, rather than for a bucket or an access point.

In the console:

- The rule shows **Non-compliant** status if at least one of the settings is false.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following AWS Config rule.
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to check whether Amazon S3 settings to block public access are set as true for the account.

Parameters:
ConfigRuleName:
  Type: 'String'
  Description: 'Name for the Config rule'
PublicAccessBlockSetting:
  Type: 'String'
  Default: 'True'
MaximumExecutionFrequency:
  Type: String
  Default: 24hours
  Description: The frequency at which AWS Config will run evaluations for the rule.
  AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours

Mappings:
Settings:
  FrequencyMap:
    1hour   : One_Hour
    3hours  : Three_Hours
    6hours  : Six_Hours
    12hours : Twelve_Hours
    24hours : TwentyFour_Hours

Resources:
CheckForS3PublicAccessBlock:
  Type: AWS::Config::ConfigRule
  Properties:

Detects whether an Amazon EKS endpoint is blocked from public access

This control detects whether an Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is blocked from public access.

This is a detective control with elective guidance. By default, this control isn’t enabled on any OUs.
In the console:

- The rule shows **Non-compliant** status if the endpoint is publicly accessible.

The artifact for this control is the following AWS Config rule.

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rule to detect whether an Amazon EKS endpoint is blocked from public access

Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'

  MaximumExecutionFrequency:
    Type: String
    Default: 24hours
    Description: The frequency at which AWS Config will run evaluations for the rule.
  AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours

            - **SourceIdentifier:** SUBNET_AUTO_ASSIGN_PUBLIC_IP_DISABLED

**Detect whether AWS Systems Manager documents owned by the account are public**

This control detects whether AWS Systems Manager documents owned by the account are public.

This is a detective control with elective guidance. By default, this control isn't enabled on any OUs.

In the console: The rule shows **Non-compliant** status if any documents with owner 'Self' are public.

The artifact for this control is the following AWS Config rule.

**AWS Template Format Version: 2010-09-09**

**Description:** Configure AWS Config rule to detect whether AWS Systems Manager documents owned by the account are public

**Parameters:**
- **ConfigRuleName:**
  - Type: `String`
  - Description: 'Name for the Config rule'

**MaximumExecutionFrequency:**
- **Type:** String
- **Default:** 24hours
  - Description: The frequency at which AWS Config will run evaluations for the rule.
  - **AllowedValues:**
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours

**Mappings:**
- **Settings:**
  - **FrequencyMap:**
    - 1hour : One_Hour
    - 3hours : Three_Hours
    - 6hours : Six_Hours
Optional controls

Optional controls in AWS Control Tower are applied at the OU level. You can activate and deactivate these optional controls through the AWS Control Tower console, or by means of the control APIs.

AWS Control Tower offers several types of optional controls:

- **Proactive controls (p. 230)**, which are based on AWS CloudFormation hooks.
- Security Hub controls, which are based on AWS Config rules – these controls are owned by Security Hub and integrated with AWS Control Tower, by means of the **Service-Managed Standard: AWS Control Tower**.
- Data residency controls, which are elective controls based on SCPs and AWS Config rules, implemented within AWS Control Tower.
- Strongly recommended controls, which are based on SCPs and AWS Config rules, implemented within AWS Control Tower.
- Elective controls, which are based on SCPs and AWS Config rules, implemented within AWS Control Tower.

The strongly recommended and elective controls owned by AWS Control Tower are optional, which means that you can customize the level of enforcement for OUs in your landing zone by choosing which ones to enable. Optional controls are not enabled by default. For more information about optional controls, see the following control reference pages in the next sections.

**Note**

It is important to know that some detective controls in AWS Control Tower do not operate in certain AWS Regions where AWS Control Tower is available, because those Regions do not support the required underlying functionality. As a result, when you deploy a detective control, the control may not be operating in all Regions that you govern with AWS Control Tower. For details, see Control limitations (p. 28).

You can view the Regions for each control in the AWS Control Tower console. For more information about the detective controls that cannot be deployed in certain Regions, see the Regional services list documentation to learn more about the Regions where AWS Config is available. If the detective control is implemented as a managed AWS Config rule, see the Security Hub controls reference documentation.

**Strongly recommended controls**

Strongly recommended controls are owned by AWS Control Tower. They are based on best practices for well-architected multi-account environments. These controls are not enabled by default, and they can be
deactivated through the AWS Control Tower console or the control APIs. Following, you'll find a reference for each of the strongly recommended controls available in AWS Control Tower.

Topics

- Disallow Creation of Access Keys for the Root User (p. 1361)
- Disallow Actions as a Root User (p. 1361)
- Detect Whether Encryption is Enabled for Amazon EBS Volumes Attached to Amazon EC2 Instances (p. 1362)
- Detect Whether Unrestricted Incoming TCP Traffic is Allowed (p. 1362)
- Detect Whether Unrestricted Internet Connection Through SSH is Allowed (p. 1364)
- Detect Whether MFA for the Root User is Enabled (p. 1365)
- Detect Whether Public Read Access to Amazon S3 Buckets is Allowed (p. 1365)
- Detect Whether Public Write Access to Amazon S3 Buckets is Allowed (p. 1366)
- Detect Whether Amazon EBS Volumes are Attached to Amazon EC2 Instances (p. 1366)
- Detect Whether Amazon EBS Optimization is Enabled for Amazon EC2 Instances (p. 1367)
- Detect Whether Public Access to Amazon RDS Database Instances is Enabled (p. 1368)
- Detect Whether Public Access to Amazon RDS Database Snapshots is Enabled (p. 1368)
- Detect Whether Storage Encryption is Enabled for Amazon RDS Database Instances (p. 1369)
- Detect whether an account has AWS CloudTrail or CloudTrail Lake enabled (p. 1369)

Disallow Creation of Access Keys for the Root User

Secures your AWS accounts by disallowing creation of access keys for the root user. We recommend that you instead create access keys for the IAM users or IAM Identity Center users, which grant limited permissions to interact with your AWS account. This is a preventive control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following SCP.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRRESTRICTROOTUSERACCESSKEYS",
      "Effect": "Deny",
      "Action": "iam:CreateAccessKey",
      "Resource": ["*"]
    },
    "Condition": {
      "StringLike": {
        "aws:PrincipalArn": [
          "arn:aws:iam::*:root"
        ]
      }
    }
  ]
}
```

Disallow Actions as a Root User

Secures your AWS accounts by disallowing account access with root user credentials, which are credentials of the account owner that allow unrestricted access to all resources in the account. Instead,
we recommend that you create IAM Identity Center users for everyday interaction with your AWS account. This is a preventive control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following SCP.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GRRESTRICTROOTUSER",
            "Effect": "Deny",
            "Action": "*",
            "Resource": "*",
            "Condition": {
                "StringLike": {
                    "aws:PrincipalArn": ["arn:aws:iam::*:root"]
                }
            }
        }
    ]
}
```

Detect Whether Encryption is Enabled for Amazon EBS Volumes Attached to Amazon EC2 Instances

This control detects whether the Amazon EBS volumes attached to an Amazon EC2 instance are encrypted. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control isn't enabled on any OUs.

The artifact for this control is the following AWS Config rule.

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check for encryption of all storage volumes attached to compute
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForEncryptedVolumes:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether EBS volumes that are in an attached state are encrypted.
      Source:
        Owner: AWS
        SourceIdentifier: ENCRYPTED_VOLUMES
      Scope:
        ComplianceResourceTypes:
        - AWS::EC2::Volume
```

Detect Whether Unrestricted Incoming TCP Traffic is Allowed

This control helps reduce a server's exposure to risk by detecting whether unrestricted incoming TCP traffic is allowed. It detects whether internet connections are enabled to Amazon EC2 instances through
services such as Remote Desktop Protocol (RDP). This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

**Note**
This control fails if any of the rules in a security group allow ingress traffic from `0.0.0.0/0` or `::/0` for those ports.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether security groups that are in use disallow unrestricted incoming TCP traffic to the specified ports.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  blockedPort1:
    Type: String
    Default: '20'
    Description: Blocked TCP port number.
  blockedPort2:
    Type: String
    Default: '21'
    Description: Blocked TCP port number.
  blockedPort3:
    Type: String
    Default: '3389'
    Description: Blocked TCP port number.
  blockedPort4:
    Type: String
    Default: '3306'
    Description: Blocked TCP port number.
  blockedPort5:
    Type: String
    Default: '4333'
    Description: Blocked TCP port number.
Conditions:
  blockedPort1:
    Fn::Not:
    - Fn::Equals:
      - ''
      - Ref: blockedPort1
  blockedPort2:
    Fn::Not:
    - Fn::Equals:
      - ''
      - Ref: blockedPort2
  blockedPort3:
    Fn::Not:
    - Fn::Equals:
      - ''
      - Ref: blockedPort3
  blockedPort4:
    Fn::Not:
    - Fn::Equals:
      - ''
      - Ref: blockedPort4
  blockedPort5:
    Fn::Not:
    - Fn::Equals:
      - ''
      - Ref: blockedPort5
Resources:
  CheckForRestrictedCommonPortsPolicy:
    Type: AWS::Config::ConfigRule
```
Properties:
    ConfigRuleName: !Sub ${ConfigRuleName}
    Description: Checks whether security groups that are in use disallow unrestricted incoming TCP traffic to the specified ports.
InputParameters:
    blockedPort1:
        Fn::If:
            - blockedPort1
            - Ref: blockedPort1
            - Ref: AWS::NoValue
    blockedPort2:
        Fn::If:
            - blockedPort2
            - Ref: blockedPort2
            - Ref: AWS::NoValue
    blockedPort3:
        Fn::If:
            - blockedPort3
            - Ref: blockedPort3
            - Ref: AWS::NoValue
    blockedPort4:

Scope:
    ComplianceResourceTypes:
        - AWS::EC2::SecurityGroup
Source:
    Owner: AWS
    SourceIdentifier: RESTRICTED_INCOMING_TRAFFIC

Detect Whether Unrestricted Internet Connection Through SSH is Allowed

This control detects whether internet connections are allowed through remote services such as the Secure Shell (SSH) protocol. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

**Note**
This control fails if any of the rules in a security group allow ingress traffic from 0.0.0.0/0 or ::/0 for SSH traffic.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether security groups that are in use disallow SSH
Parameters:
    ConfigRuleName:
        Type: 'String'
        Description: 'Name for the Config rule'
Resources:
    CheckForRestrictedSshPolicy:
        Type: AWS::Config::ConfigRule
        Properties:
            ConfigRuleName: !Sub ${ConfigRuleName}
            Description: Checks whether security groups that are in use disallow unrestricted incoming SSH traffic.
```
Optional controls

ComplianceResourceTypes:
- AWS::EC2::SecurityGroup
Source:
Owner: AWS
SourceIdentifier: INCOMING_SSH_DISABLED

Detect Whether MFA for the Root User is Enabled

This control detects whether multi-factor authentication (MFA) is enabled for the root user of the management account. MFA reduces vulnerability risks from weak authentication by requiring an additional authentication code after the user name and password are successful. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to require MFA for root access to accounts
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
MaximumExecutionFrequency:
  Type: String
  Default: 24hours
  Description: The frequency that you want AWS Config to run evaluations for the rule.
  AllowedValues:
    - 1hour
    - 3hours
    - 6hours
    - 12hours
    - 24hours
Mappings:
  Settings:
    FrequencyMap:
      1hour : One_Hour
      3hours : Three_Hours
      6hours : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours
Resources:
  CheckForRootMfa:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether the root user of your AWS account requires multi-factor authentication for console sign-in.
      Source:
        Owner: AWS
        SourceIdentifier: ROOT_ACCOUNT_MFA_ENABLED
      MaximumExecutionFrequency:

        - Settings
        - FrequencyMap
        - !Ref MaximumExecutionFrequency
```

Detect Whether Public Read Access to Amazon S3 Buckets is Allowed

This control detects whether public read access is allowed to Amazon S3 buckets. It helps you maintain secure access to data stored in the buckets. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.
The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check that your S3 buckets do not allow public access.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3PublicRead:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks that your S3 buckets do not allow public read access. If an S3 bucket policy or bucket ACL allows public read access, the bucket is noncompliant.
      Source:
        Owner: AWS
        SourceIdentifier: S3_BUCKET_PUBLIC_READ_PROHIBITED
      Scope:
        ComplianceResourceTypes:
          - AWS::S3::Bucket
```

Detect Whether Public Write Access to Amazon S3 Buckets is Allowed

This control detects whether public write access is allowed to Amazon S3 buckets. It helps you maintain secure access to data stored in the buckets. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check that your S3 buckets do not allow public access.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3PublicWrite:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks that your S3 buckets do not allow public write access. If an S3 bucket policy or bucket ACL allows public write access, the bucket is noncompliant.
      Source:
        Owner: AWS
        SourceIdentifier: S3_BUCKET_PUBLIC_WRITE_PROHIBITED
      Scope:
        ComplianceResourceTypes:
          - AWS::S3::Bucket
```

Detect Whether Amazon EBS Volumes are Attached to Amazon EC2 Instances

This control detects whether an Amazon EBS volume device persists independently from an Amazon EC2 instance. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
```
Description: Configure AWS Config rules to check whether EBS volumes are attached to EC2 instances

Parameters:
- ConfigRuleName:
  Type: 'String'
  Description: 'Name for the Config rule'
- deleteOnTermination:
  Type: 'String'
  Default: 'None'
  Description: 'Check for Delete on termination'

Conditions:
- deleteOnTermination:
  Fn::Not:
  - Fn::Equals:
    - 'None'
    - Ref: deleteOnTermination

Resources:
- CheckForEc2VolumesInUse:
  Type: AWS::Config::ConfigRule
  Properties:
    ConfigRuleName: !Sub ${ConfigRuleName}
    Description: Checks whether EBS volumes are attached to EC2 instances
    InputParameters:
      deleteOnTermination:
        Fn::If:
          - deleteOnTermination
          - Ref: deleteOnTermination
          - Ref: AWS::NoValue
    Source:
      Owner: AWS
      SourceIdentifier: EC2_VOLUME_INUSE_CHECK
    Scope:
      ComplianceResourceTypes:
      - AWS::EC2::Volume

Detect Whether Amazon EBS Optimization isEnabled for Amazon EC2 Instances

Detects whether Amazon EC2 instances are launched without an Amazon EBS volume that is optimized for performance. Amazon EBS-optimized volumes minimize contention between Amazon EBS I/O and other traffic from your instance. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether EBS optimization is enabled for your EC2 instances that can be EBS-optimized
Parameters:
- ConfigRuleName:
  Type: 'String'
  Description: 'Name for the Config rule'

Resources:
- CheckForEbsOptimizedInstance:
  Type: AWS::Config::ConfigRule
  Properties:
    ConfigRuleName: !Sub ${ConfigRuleName}
    Description: Checks whether EBS optimization is enabled for your EC2 instances that can be EBS-optimized
    Source:
      Owner: AWS
      SourceIdentifier: EBS_OPTIMIZED_INSTANCE
    Scope:
      ComplianceResourceTypes:
- AWS::EC2::Instance

**Detect Whether Public Access to Amazon RDS Database Instances is Enabled**

Detects whether your Amazon RDS database instances allow public access. You can secure your Amazon RDS database instances by disallowing public access. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether Amazon RDS instances are not publicly accessible.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsPublicAccess:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub '${ConfigRuleName}'}
      Description: Checks whether the Amazon Relational Database Service (RDS) instances are not publicly accessible. The rule is non-compliant if the publiclyAccessible field is true in the instance configuration item.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_INSTANCE_PUBLIC_ACCESS_CHECK
      Scope:
        ComplianceResourceTypes:
          - AWS::RDS::DBInstance
```

**Detect Whether Public Access to Amazon RDS Database Snapshots is Enabled**

Detects whether your Amazon RDS database snapshots have public access enabled. You can protect your information by disabling public access. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Checks if Amazon Relational Database Service (Amazon RDS) snapshots are public.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsStorageEncryption:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub '${ConfigRuleName}'}
      Description: Checks if Amazon Relational Database Service (Amazon RDS) snapshots are public. The rule is non-compliant if any existing and new Amazon RDS snapshots are public.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_SNAPSHOTS_PUBLIC_PROHIBITED
      Scope:
        ComplianceResourceTypes:
          - AWS::RDS::DBSnapshot
```
Detect Whether Storage Encryption is Enabled for Amazon RDS Database Instances

Detects Amazon RDS database instances that are not encrypted at rest. You can secure your Amazon RDS database instances at rest by encrypting the underlying storage for database instances and their automated backups, Read Replicas, and snapshots. This control does not change the status of the account. This is a detective control with strongly recommended guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether storage encryption is enabled for your RDS DB instances
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForRdsStorageEncryption:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether storage encryption is enabled for your RDS DB instances.
      Source:
        Owner: AWS
        SourceIdentifier: RDS_STORAGE_ENCRYPTED
      Scope:
        ComplianceResourceTypes:
        - AWS::RDS::DBInstance
```

Detect whether an account has AWS CloudTrail or CloudTrail Lake enabled

This control detects whether an account has AWS CloudTrail or CloudTrail Lake enabled. The rule is NON_COMPLIANT if either CloudTrail or CloudTrail Lake is not enabled in an account. This is a detective control with strongly recommended guidance. By default, this control is not enabled on any OUs.

The artifact for this control is the following AWS Config rule.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to detect whether an account has AWS CloudTrail or CloudTrail Lake enabled.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForCloudtrailEnabled:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Detects whether an account has AWS CloudTrail or CloudTrail Lake enabled. The rule is NON_COMPLIANT if either CloudTrail or CloudTrail Lake is not enabled in an account.
      Source:
        Owner: AWS
        SourceIdentifier: CLOUD_TRAIL_ENABLED
```

Elective controls

Elective controls enable you to lock down or track attempts at performing commonly restricted actions in an AWS enterprise environment. These controls are not enabled by default, and can be disabled. Following, you'll find a reference for the elective controls available in AWS Control Tower. The elective controls specifically for data residency are collected into a separate section, Controls that enhance data residency protection (p. 1343).

Topics

- Disallow Changes to Encryption Configuration for Amazon S3 Buckets [Previously: Enable Encryption at Rest for Log Archive] (p. 1370)
- Disallow Changes to Logging Configuration for Amazon S3 Buckets [Previously: Enable Access Logging for Log Archive] (p. 1371)
- Disallow Changes to Bucket Policy for Amazon S3 Buckets [Previously: Disallow Policy Changes to Log Archive] (p. 1371)
- Disallow Changes to Lifecycle Configuration for Amazon S3 Buckets [Previously: Set a Retention Policy for Log Archive] (p. 1371)
- Disallow Changes to Replication Configuration for Amazon S3 Buckets (p. 1372)
- Disallow Delete Actions on Amazon S3 Buckets Without MFA (p. 1372)
- Detect Whether MFA is Enabled for AWS IAM Users (p. 1372)
- Detect Whether MFA is Enabled for AWS IAM Users of the AWS Console (p. 1374)
- Detect Whether Versioning for Amazon S3 Buckets is Enabled (p. 1374)
- Disallow management of resource types, modules, and hooks within the AWS CloudFormation registry (p. 1375)

Disallow Changes to Encryption Configuration for Amazon S3 Buckets [Previously: Enable Encryption at Rest for Log Archive]

This control disallows changes to encryption for all Amazon S3 buckets. This is a preventive control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following service control policy (SCP).

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "GRAUDITBUCKETENCRYPTIONENABLED",
         "Effect": "Deny",
         "Action": [
            "s3:PutEncryptionConfiguration"
         ],
         "Resource": ["*"],
         "Condition": {
            "ArnNotLike": {
               "aws:PrincipalARN":"arn:aws:iam::*:role/AWSControlTowerExecution"
            }
         }
      }
   ]
}
```
Disallow Changes to Logging Configuration for Amazon S3 Buckets [Previously: Enable Access Logging for Log Archive]

This control disallows changes to logging configuration for all Amazon S3 buckets. This is a preventive control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following SCP.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRAUDITBUCKETLOGGINGENABLED",
      "Effect": "Deny",
      "Action": ["s3:PutBucketLogging"],
      "Resource": ["*"],
      "Condition": {
        "ArnNotLike": {
          "aws:PrincipalARN": "arn:aws:iam::*:role/AWSControlTowerExecution"
        }
      }
    }
  ]
}
```

Disallow Changes to Bucket Policy for Amazon S3 Buckets [Previously: Disallow Policy Changes to Log Archive]

This control disallows changes to bucket policy for all Amazon S3 buckets. This is a preventive control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following SCP.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRAUDITBUCKETPOLICYCHANGESPROHIBITED",
      "Effect": "Deny",
      "Action": ["s3:PutBucketPolicy"],
      "Resource": ["*"],
      "Condition": {
        "ArnNotLike": {
          "aws:PrincipalARN": "arn:aws:iam::*:role/AWSControlTowerExecution"
        }
      }
    }
  ]
}
```

Disallow Changes to Lifecycle Configuration for Amazon S3 Buckets [Previously: Set a Retention Policy for Log Archive]

This control disallows lifecycle configuration changes for all Amazon S3 buckets. This is a preventive control with elective guidance. By default, this control is not enabled.
The artifact for this control is the following SCP.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "GRAUDITBUCKETRETENTIONPOLICY",
         "Effect": "Deny",
         "Action": [
            "s3:PutLifecycleConfiguration"
         ],
         "Resource": ["*"]
      }
   ]
}
```

Disallow Changes to Replication Configuration for Amazon S3 Buckets

Prevents changes to the way your Amazon S3 buckets have been set up to handle replication within Regions or across Regions. For example, if you set up your buckets with single-region replication, to restrict the location of your Amazon S3 data to a single AWS Region (thereby disabling any automatic, asynchronous copying of objects across buckets to other AWS Regions), then this control prevents that replication setting from being changed. This is a preventive control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following SCP.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "GRRESTRICTS3CROSSREGIONREPLICATION",
         "Effect": "Deny",
         "Action": [
            "s3:PutReplicationConfiguration"
         ],
         "Resource": ["*"]
      }
   ]
}
```

Disallow Delete Actions on Amazon S3 Buckets Without MFA

Protects your Amazon S3 buckets by requiring MFA for delete actions. MFA requires an extra authentication code after the user name and password are successful. This is a preventive control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following SCP.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "GRREQUIREMAFADELETE",
         "Effect": "Deny",
         "Action": [
            "s3:DeleteObject"
         ],
         "Resource": ["*"]
      }
   ]
}
```
Detect Whether MFA is Enabled for AWS IAM Users

This control detects whether MFA is enabled for AWS IAM users. You can protect your account by requiring MFA for all AWS users in the account. MFA requires an additional authentication code after the user name and password are successful. This control does not change the status of the account. This is a detective control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether the IAM users have MFA enabled
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  MaximumExecutionFrequency:
    Type: String
    Default: 1hour
    Description: The frequency that you want AWS Config to run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours
Mappings:
  Settings:
    FrequencyMap:
      1hour : One_Hour
      3hours : Three_Hours
      6hours : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours
Resources:
  CheckForIAMUserMFA:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether the AWS Identity and Access Management users have multi-factor authentication (MFA) enabled. The rule is COMPLIANT if MFA is enabled.
      Source:
        Owner: AWS
        SourceIdentifier: IAM_USER_MFA_ENABLED
      MaximumExecutionFrequency:
```
Detect Whether MFA is Enabled for AWS IAM Users of the AWS Console

Protects your account by requiring MFA for all AWS IAM users in the console. MFA reduces vulnerability risks from weak authentication by requiring an additional authentication code after the user name and password are successful. This control detects whether MFA is enabled. This control does not change the status of the account. This is a detective control with elective guidance. By default, this control is not enabled.

The artifact for this control is the following AWS Config rule.

```yaml
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether MFA is enabled for all AWS IAM users that use a console password.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
  MaximumExecutionFrequency:
    Type: String
    Default: 1hour
    Description: The frequency that you want AWS Config to run evaluations for the rule.
    AllowedValues:
      - 1hour
      - 3hours
      - 6hours
      - 12hours
      - 24hours
Mappings:
  Settings:
    FrequencyMap:
      1hour   : One_Hour
      3hours  : Three_Hours
      6hours  : Six_Hours
      12hours : Twelve_Hours
      24hours : TwentyFour_Hours
Resources:
  CheckForIAMUserConsoleMFA:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether AWS Multi-Factor Authentication (MFA) is enabled for all AWS Identity and Access Management (IAM) users that use a console password. The rule is COMPLIANT if MFA is enabled.
      Source:
        Owner: AWS
        SourceIdentifier: MFA_ENABLED_FOR_IAM_CONSOLE_ACCESS
      MaximumExecutionFrequency:
        !FindInMap
        - Settings
        - FrequencyMap
        - !Ref MaximumExecutionFrequency
```

Detect Whether Versioning for Amazon S3 Buckets is Enabled

Detects whether your Amazon S3 buckets are enabled for versioning. Versioning allows you to recover objects from accidental deletion or overwrite. This control does not change the status of the account. This is a detective control with elective guidance. By default, this control is not enabled.
The artifact for this control is the following AWS Config rule.

```json
AWSTemplateFormatVersion: 2010-09-09
Description: Configure AWS Config rules to check whether versioning is enabled for your S3 buckets.
Parameters:
  ConfigRuleName:
    Type: 'String'
    Description: 'Name for the Config rule'
Resources:
  CheckForS3VersioningEnabled:
    Type: AWS::Config::ConfigRule
    Properties:
      ConfigRuleName: !Sub ${ConfigRuleName}
      Description: Checks whether versioning is enabled for your S3 buckets.
      Source:
        Owner: AWS
        SourceIdentifier: S3_BUCKET_VERSIONING_ENABLED
      Scope:
        ComplianceResourceTypes:
          - AWS::S3::Bucket

Disallow management of resource types, modules, and hooks within the AWS CloudFormation registry

This elective control disallows management of the following extension types in the AWS CloudFormation registry: resource types, modules, and hooks. For more information about AWS CloudFormation extensions, see Using the AWS CloudFormation registry.

Note
You must enable this control when you activate proactive controls in your environment.

- **Control objective**: Protect configurations
- **Implementation** Service control policy (SCP)
- **Control behavior**: Preventive
- **Control guidance**: Elective
- **Control owner**: AWS Control Tower
- **Control ID**: CT.CLOUDFORMATION.PR.1
- **Severity**: Critical
- **AWS Service**: AWS CloudFormation
- **Resource types**: AWS::CloudFormation::HookDefaultVersion, AWS::CloudFormation::HookTypeConfig, AWS::CloudFormation::HookVersion, AWS::CloudFormation::ModuleDefaultVersion, AWS::CloudFormation::ModuleVersion, AWS::CloudFormation::ResourceDefaultVersion, AWS::CloudFormation::ResourceVersion

The following example shows the SCP artifact for this control.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GRDISALLOWMODIFICATIONCFNREGISTRY",
      "Effect": "Deny",
      "Action": [
        "cloudformation:RegisterType",
```
Optional controls

- `cloudformation:DeregisterType`
- `cloudformation:SetTypeConfiguration`
- `cloudformation:SetTypeDefaultVersion`
- `cloudformation:PublishType`

```
"Resource": [ "*
"Condition": {
  "ArnNotLike": {
    "aws:PrincipalARN": "arn:aws:iam::*:role/AWSControlTowerExecution"
  }
}
```

AWS Control Tower is a service that's built on top of other AWS services, to assist you in setting up a well-architected environment. This chapter provides a brief overview of these services, including configuration information about the underlying services and how they work in AWS Control Tower.

For more information about how to measure a well-architected environment, learn about the AWS Well-Architected Tool. Also see the Management and Governance Cloud Environment Guide.

**Topics**

- Deploy Environments with AWS CloudFormation (p. 1377)
- Monitor Events with CloudTrail (p. 1377)
- Monitor Resources and Services with CloudWatch (p. 1378)
- Govern Resource Configurations with AWS Config (p. 1378)
- AWS Key Management Service (p. 1379)
- Run Serverless Compute Functions with Lambda (p. 1379)
- Manage Accounts Through AWS Organizations (p. 1379)
- Store Objects with Amazon S3 (p. 1380)
- Monitor your environment with Security Hub (p. 1380)
- Provision Accounts Through Service Catalog (p. 1380)
- Manage Users and Access Through AWS IAM Identity Center (p. 1380)
- Track Alerts Through Amazon Simple Notification Service (p. 1384)
- Build Distributed Applications with AWS Step Functions (p. 1385)

### Deploy Environments with AWS CloudFormation

AWS CloudFormation enables you to create and provision AWS infrastructure deployments predictably and repeatedly. It helps you leverage AWS products to build highly reliable, highly scalable, cost-effective applications in the cloud without worrying about creating and configuring the underlying AWS infrastructure. AWS CloudFormation enables you to use a template file to create and delete a collection of resources together as a single unit (a stack). For more information, see AWS CloudFormation User Guide.

AWS Control Tower uses AWS CloudFormation stacksets to apply controls on accounts. For more information about how AWS CloudFormation and AWS Control Tower work together, see Creating AWS Control Tower resources with AWS CloudFormation (p. 54).

### Monitor Events with CloudTrail

AWS Control Tower configures AWS CloudTrail to enable centralized logging and auditing. With CloudTrail, the management account can review administrative actions and lifecycle events for member accounts.
CloudTrail helps you monitor your AWS environment in the cloud by keeping a history of AWS API calls for your accounts. For example, you can identify the users and accounts that called AWS APIs for services that support CloudTrail, the source IP address from which the calls were made, and the time when the calls occurred. You can integrate CloudTrail into applications using the API, automate trail creation for your organization, check the status of your trails, and control how administrators turn CloudTrail logging on and off. For more information, see AWS CloudTrail User Guide.

Organization-level trails

AWS Control Tower sets up a new CloudTrail trail when you set up a landing zone. It is an organization-level trail, which means that it logs all events for the management account and all member accounts in the organization. This feature relies on trusted access to give the management account permissions to create a trail on every member account.

For more information about AWS Control Tower and CloudTrail organization trails, see Creating a trail for an organization.

Note
In AWS Control Tower releases before landing zone version 3.0, AWS Control Tower created a member account trail in each account. When you update to release 3.0, your CloudTrail trail becomes an organization trail. For best practices when moving between trails, see Best practices for changing trails in the CloudTrail User Guide.

When you enroll an account into AWS Control Tower, your account is governed by the AWS CloudTrail trail for the AWS Control Tower organization. If you have an existing deployment of a CloudTrail trail in that account, you may see duplicate charges unless you delete the existing trail for the account before you enroll it in AWS Control Tower.

Note
When you update to landing zone version 3.0, AWS Control Tower deletes the account-level trails of your enrolled accounts on your behalf. Your existing, account-level log files are preserved in their Amazon S3 bucket.

Monitor Resources and Services with CloudWatch

Amazon CloudWatch provides a reliable, scalable, and flexible monitoring solution that you can start using within minutes. You no longer need to set up, manage, and scale your own monitoring systems and infrastructure. For more information, see Amazon CloudWatch User Guide.

For more information about how Amazon CloudWatch works with AWS Control Tower, see Monitoring.

Govern Resource Configurations with AWS Config

AWS Config provides a detailed view of the resources associated with your AWS account, including how they are configured, how they are related to one another, and how the configurations and their relationships have changed over time. For more information, see AWS Config Developer Guide.

AWS Config resources provisioned by AWS Control Tower are tagged automatically with aws-control-tower and a value of managed-by-control-tower.

For more information about how AWS Config monitors and records resources in AWS Control Tower, and how it bills you for them, see Monitoring resource changes with AWS Config (p. 1413).

AWS Control Tower uses AWS Config Rules to implement detective controls. For more information, see About controls in AWS Control Tower (p. 196).
AWS Key Management Service

AWS Key Management Service allows you to create and control keys that protect your data. AWS Control Tower optionally allows you to encrypt your data with AWS KMS encryption keys. For information about AWS KMS, see the AWS KMS Developer Guide.

For information about how to set up AWS KMS keys with AWS Control Tower, see Step 2. Configure and launch your landing zone (p. 20).

Run Serverless Compute Functions with Lambda

With AWS Lambda, you can run code without provisioning or managing servers. You can run code for many types of application or backend service—with no need for additional administration overhead. When you upload your code, Lambda can run and scale the code with high availability. You can set up your code to trigger from other AWS services automatically, or you can call it directly from any web or mobile app.

For example, certain roles in the AWS Control Tower audit account can be assumed programmatically, so that you can review other accounts using Lambda. Also, you can use AWS Control Tower lifecycle events to trigger Lambda functions.

Manage Accounts Through AWS Organizations

AWS Organizations is an account management service that lets you consolidate multiple AWS accounts into an organization that you create and centrally manage. With Organizations, you can create member accounts and invite existing accounts to join your organization. You can organize those accounts into groups and attach policy-based controls. For more information, see AWS Organizations User Guide.

In AWS Control Tower, Organizations helps centrally manage billing; control access, compliance, and security; and share resources across your member AWS accounts. Accounts are grouped into logical groups, called organizational units (OUs). For more information on Organizations, see AWS Organizations User Guide.

AWS Control Tower uses the following OUs:

- **Root** – The parent container for all accounts and all other OUs in your landing zone.
- **Security** – This OU contains the log archive account, the audit account, and the resources they own.
- **Sandbox** – This OU is created when you set up your landing zone. It and other child OUs in your landing zone contain your member accounts. These are the accounts that your end users access to perform work on AWS resources.

**Note**

You can add additional OUs in your landing zone through the AWS Control Tower console on the Organizational units page.

Considerations

OUs created through AWS Control Tower can have controls applied to them. OUs created outside of AWS Control Tower cannot, by default. You can, however, register such OUs. Once you have registered an
OU, you can apply controls to it and its accounts. For information on registering an OU, see Register an existing organizational unit with AWS Control Tower (p. 190).

Store Objects with Amazon S3

Amazon Simple Storage Service (Amazon S3) is storage for the internet. You can use Amazon S3 to store and retrieve any amount of data at any time, from anywhere on the web. You can accomplish these tasks using the simple and intuitive web interface of the AWS Management Console. For more information, see Amazon Simple Storage Service User Guide.

When you set up your landing zone, an Amazon S3 bucket is created in your log archive account to contain all logs across all accounts in your landing zone.

Monitor your environment with Security Hub

Provision Accounts Through Service Catalog

Service Catalog enables IT administrators to create, manage, and distribute portfolios of approved products to end users, who then have access to the products they need in a personalized portal. Typical products include servers, databases, websites, or applications that are deployed using AWS resources.

You can control the users that have access to specific products, which allows you to enforce compliance with organizational business standards, manage product lifecycles, and help users find and launch products with confidence. For more information, see Service Catalog Administrator Guide.

In AWS Control Tower, your central cloud administrators and your end users can provision accounts in your landing zone using Account Factory, a product in Service Catalog. For more information, see Provision and manage accounts with Account Factory (p. 121).

AWS Control Tower also can make use of the Service Catalog APIs to further automate account provisioning and updating. For details, see the AWS Service Catalog Developer Guide.

Manage Users and Access Through AWS IAM Identity Center

AWS IAM Identity Center is a web-based service for securely controlling access to other AWS services. With IAM, you can centrally manage users, along with their security credentials—such as access keys and permissions—that designate the AWS resources to which specific users and applications are granted access.

AWS Identity and Access Management (IAM) simplifies how you manage access to AWS accounts and business applications. You can control IAM Identity Center access and user permissions across all your AWS accounts in AWS Control Tower.

With IAM Identity Center, you also can administer access to popular business applications and custom applications that support Security Assertion Markup Language (SAML) 2.0. Also, IAM Identity Center
offers a user portal where your users can find all their assigned AWS accounts, business applications, and custom applications in one place. For more information, see AWS IAM Identity Center User Guide.

Working With AWS IAM Identity Center and AWS Control Tower

In AWS Control Tower, IAM Identity Center allows central cloud administrators and end-users to manage access to multiple AWS accounts and business applications. By default, AWS Control Tower uses this service to set up and manage access to the accounts created through Account Factory, unless you have selected the option to self-manage your identity and access control.

For a brief tutorial about how to set up your IAM Identity Center users and permissions in AWS Control Tower, you can view this video (6:23). For better viewing, select the icon at the lower right corner of the video to enlarge it to full screen. Captioning is available.

Video Walkthrough of Setting Up AWS IAM Identity Center in AWS Control Tower.

About setting up AWS Control Tower with IAM Identity Center

When you initially set up AWS Control Tower, only the root user user and any IAM users with the correct permissions can add IAM Identity Center users. However, after end users have been added in the AWSAccountFactory group, they can create new IAM Identity Center users from the Account Factory wizard. For more information, see Provision and manage accounts with Account Factory (p. 121).

If you choose the recommended default, AWS Control Tower sets up your landing zone with a preconfigured directory that helps you manage user identities and single sign-on, so that your users have federated access across accounts. When you set up your landing zone, this default directory is created to contain user groups and permission sets.

Note
You can delegate administration of AWS IAM Identity Center in your organization to an account other than the management account, by using the delegated administrator feature of IAM Identity Center. If you choose to use this feature, be aware that Administrators with access to manage group membership also can manage groups assigned to the management account. For more information, see this blog post, entitled, Getting started with AWS SSO delegated administration

User Groups, Roles, and Permission Sets

User groups manage specialized roles that are defined within your shared accounts. Roles establish sets of permissions that belong together. All members of a group inherit the permission sets, or roles, associated with the group. You can create new groups for the end users of your member accounts, so that you can custom-assign only the roles that are needed for the specific tasks a group performs.

The permission sets available cover a broad range of distinct user permission requirements, such as read-only access, AWS Control Tower administrative access, and Service Catalog access. These permission sets enable your end users to provision their own AWS accounts in your landing zone quickly, and in compliance with your enterprise's guidelines.

For tips on planning your allocations of users, groups, and permissions, refer to Recommendations for setting up groups, roles, and policies (p. 40).

For more information on how to use this service in the context of AWS Control Tower, see the following topics in the AWS IAM Identity Center User Guide.

- To add users, see Add Users.
- To add users to groups, see Add Users to Groups.
- To edit user properties, see Edit User Properties.
- To add a group, see Add Groups.
**Warning**

AWS Control Tower sets up your IAM Identity Center directory in your home region. If you set up your landing zone in another Region and then navigate to the IAM Identity Center console, you must change the Region to your home region. Do not delete your IAM Identity Center configuration in your home region.

**Things to Know About IAM Identity Center Accounts and AWS Control Tower**

Here are some good things to know when working with IAM Identity Center user accounts in AWS Control Tower.

- If your AWS IAM Identity Center user account is disabled, you'll get an error message when trying to provision new accounts in Account Factory. You can re-enable your IAM Identity Center user in the IAM Identity Center console.

- If you specify a new IAM Identity Center user email address when you update the provisioned product associated with an account that was vended by Account Factory, AWS Control Tower creates a new IAM Identity Center user account. The previously created user account is not removed. If you prefer to remove the previous IAM Identity Center user email address from AWS IAM Identity Center, see **Disabling a User**.

- AWS IAM Identity Center has been integrated with Azure Active Directory, and you can connect your existing Azure Active Directory to AWS Control Tower.

- For more information about how the behavior of AWS Control Tower interacts with AWS IAM Identity Center and different identity sources, refer to the Considerations for Changing Your Identity Source in the AWS IAM Identity Center documentation.

**IAM Identity Center Groups for AWS Control Tower**

AWS Control Tower offers preconfigured groups to organize users that perform specific tasks in your accounts. You can add users and assign them to these groups directly in IAM Identity Center. Doing so matches permission sets to users in groups within your accounts. The following groups are created when you set up your landing zone.

**AWSAccountFactory**

<table>
<thead>
<tr>
<th>Account</th>
<th>Permission sets</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management account</td>
<td>AWSServiceCatalogEndUserAccess</td>
<td>This group is only used in this account to provision new accounts using Account Factory.</td>
</tr>
</tbody>
</table>

**AWSServiceCatalogAdmins**

<table>
<thead>
<tr>
<th>Account</th>
<th>Permission sets</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management account</td>
<td>AWSServiceCatalogAdminFullAccess</td>
<td>This group is only used in this account to make administrative changes to Account Factory. Users in this group can't provision new accounts unless they're also in the AWSAccountFactory group.</td>
</tr>
</tbody>
</table>
## AWSControlTowerAdmins

<table>
<thead>
<tr>
<th>Account</th>
<th>Permission sets</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management account</td>
<td>AWSAdministratorAccess</td>
<td>Users of this group in this account are the only ones that have access to the AWS Control Tower console.</td>
</tr>
<tr>
<td>Log archive account</td>
<td>AWSAdministratorAccess</td>
<td>Users have administrator access in this account.</td>
</tr>
<tr>
<td>Audit account</td>
<td>AWSAdministratorAccess</td>
<td>Users have administrator access in this account.</td>
</tr>
<tr>
<td>Member accounts</td>
<td>AWSOrganizationsFullAccess</td>
<td>Users have full access to Organizations in this account.</td>
</tr>
</tbody>
</table>

## AWSSecurityAuditPowerUsers

<table>
<thead>
<tr>
<th>Account</th>
<th>Permission sets</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management account</td>
<td>AWSPowerUserAccess</td>
<td>Users can perform application development tasks and can create and configure resources and services that support AWS aware application development.</td>
</tr>
<tr>
<td>Log archive account</td>
<td>AWSPowerUserAccess</td>
<td>Users can perform application development tasks and can create and configure resources and services that support AWS aware application development.</td>
</tr>
<tr>
<td>Audit account</td>
<td>AWSPowerUserAccess</td>
<td>Users can perform application development tasks and can create and configure resources and services that support AWS aware application development.</td>
</tr>
<tr>
<td>Member accounts</td>
<td>AWSPowerUserAccess</td>
<td>Users can perform application development tasks and can create and configure resources and services that support AWS aware application development.</td>
</tr>
</tbody>
</table>

## AWSSecurityAuditors

<table>
<thead>
<tr>
<th>Account</th>
<th>Permission sets</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management account</td>
<td>AWSReadOnlyAccess</td>
<td>Users have read-only access to all AWS services and resources in this account.</td>
</tr>
<tr>
<td>Log archive account</td>
<td>AWSReadOnlyAccess</td>
<td>Users have read-only access to all AWS services and resources in this account.</td>
</tr>
<tr>
<td>Account</td>
<td>Permission sets</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Audit account</td>
<td>AWSReadOnlyAccess</td>
<td>Users have read-only access to all AWS services and resources in this account.</td>
</tr>
<tr>
<td>Member accounts</td>
<td>AWSReadOnlyAccess</td>
<td>Users have read-only access to all AWS services and resources in this account.</td>
</tr>
</tbody>
</table>

**AWSLogArchiveAdmins**

<table>
<thead>
<tr>
<th>Account</th>
<th>Permission sets</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log archive account</td>
<td>AWSAdministratorAccess</td>
<td>Users have administrator access in this account.</td>
</tr>
</tbody>
</table>

**AWSLogArchiveViewers**

<table>
<thead>
<tr>
<th>Account</th>
<th>Permission sets</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log archive account</td>
<td>AWSReadOnlyAccess</td>
<td>Users have read-only access to all AWS services and resources in this account.</td>
</tr>
</tbody>
</table>

**AWSAuditAccountAdmins**

<table>
<thead>
<tr>
<th>Account</th>
<th>Permission sets</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit account</td>
<td>AWSAdministratorAccess</td>
<td>Users have administrator access in this account.</td>
</tr>
</tbody>
</table>

---

**Track Alerts Through Amazon Simple Notification Service**

Amazon Simple Notification Service (Amazon SNS) is a web service that enables applications, end-users, and devices to send and receive notifications instantly from the cloud. For more information, see the [Amazon Simple Notification Service Developer Guide](#).

AWS Control Tower uses Amazon SNS to send programmatic alerts to the email addresses of your management account and your audit account. These alerts help you prevent drift within your landing zone. For more information, see [Detect and resolve drift in AWS Control Tower](#) (p. 169).

We also use Amazon Simple Notification Service to send compliance notifications from AWS Config.

**Tip**

One of the best ways to receive AWS Control Tower control compliance notifications (in your audit account) is to subscribe to `AggregateConfigurationNotifications`. It is a service that helps you inspect compliance. It gives you real data about AWS Config rules going out of compliance. AWS Config automatically maintains the list of accounts in your OU.

You must subscribe manually, using email or any type of subscription that SNS allows. The statement `arn:aws:sns:homeregion:account:aws-controltower-AggregateSecurityNotifications` leads to your audit account.
Build Distributed Applications with AWS Step Functions

AWS Step Functions makes it easy to coordinate the components of distributed applications as a series of steps in a visual workflow. You can quickly build and run state machines to execute the steps of your application in a reliable and scalable fashion. For more information, see the AWS Step Functions Developer Guide.
Security in AWS Control Tower

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. The effectiveness of our security is regularly tested and verified by third-party auditors as part of the AWS compliance programs. To learn about the compliance programs that apply to AWS Control Tower, see AWS Services in Scope by Compliance Program.

- **Security in the cloud** – Your responsibility is determined by the AWS services that you use. You are also responsible for other factors including the sensitivity of your data, your organization's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using AWS Control Tower. The following topics show you how to configure AWS Control Tower to meet your security and compliance objectives. You also learn how to use other AWS services that help you monitor and secure your AWS Control Tower resources.

Data Protection in AWS Control Tower

The AWS shared responsibility model applies to data protection in AWS Control Tower. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers’ email addresses, into tags or free-form text fields such as a Name field. This includes when you work with AWS Control Tower or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.
**Note**
User activity logging with AWS CloudTrail is handled automatically in AWS Control Tower when you set up your landing zone.

For more information about data protection, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog. AWS Control Tower provides the following options that you can use to help secure the content that exists in your landing zone:

**Topics**
- Encryption at Rest (p. 1387)
- Encryption in Transit (p. 1387)
- Restrict Access to Content (p. 1387)

**Encryption at Rest**
AWS Control Tower uses Amazon S3 buckets and Amazon DynamoDB databases that are encrypted at rest by using Amazon S3-Managed Keys (SSE-S3) in support of your landing zone. This encryption is configured by default when you set up your landing zone. Optionally, you can configure your landing zone to encrypt resources with KMS encryption keys. You can also establish encryption at rest for the services you use in your landing zone for the services that support it. For more information, see the security chapter of that service's online documentation.

**Encryption in Transit**
AWS Control Tower uses Transport Layer Security (TLS) and client-side encryption for encryption in transit in support of your landing zone. In addition, accessing AWS Control Tower requires using the console, which can only be accessed through an HTTPS endpoint. This encryption is configured by default when you set up your landing zone.

**Restrict Access to Content**
As a best practice, you should restrict access to the appropriate subset of users. With AWS Control Tower, you can do this by ensuring that your central cloud administrators and end users have the right IAM permissions or, in the case of IAM Identity Center users, that they are in the correct groups.

- For more information about roles and policies for IAM entities, see IAM User Guide.
- For more information about the IAM Identity Center groups that are created when you set up your landing zone, see IAM Identity Center Groups for AWS Control Tower (p. 1382).

**Identity and access management in AWS Control Tower**
To perform any operation in your landing zone, such as provisioning accounts in Account Factory or creating new organizational units (OUs) in the AWS Control Tower console, either AWS Identity and Access Management (IAM) or AWS IAM Identity Center require you to authenticate that you're an approved AWS user. For example, if you're using the AWS Control Tower console, you authenticate your identity by providing your AWS credentials, as provided by your administrator.

After you authenticate your identity, IAM controls your access to AWS with a defined set of permissions on a specific set of operations and resources. If you are an account administrator, you can use IAM to control the access of other IAM users to the resources that are associated with your account.
Topics

- Authentication (p. 1388)
- Access control (p. 1389)
- Overview of managing access permissions to your AWS Control Tower resources (p. 1389)
- Prevent cross-service impersonation (p. 1396)
- Using identity-based policies (IAM policies) for AWS Control Tower (p. 1397)

Authentication

You have access to AWS as any of the following types of identities:

- **AWS account root user** – When you first create an AWS account, you begin with an identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user. You have access to this identity when you sign in with the email address and password that you used to create the account. We strongly recommend that you do not use the root user for your everyday tasks, even the administrative ones. Instead, adhere to the best practice of using the root user only to create your first IAM Identity Center user (recommended) or IAM user (not a best practice in most use cases). Then securely lock away the root user credentials and use them to perform only a few account and service management tasks. For more information, see When to sign in as a root user (p. 41).

- **IAM user** – An IAM user is an identity within your AWS account that has specific, customized permissions. You can use the IAM user credentials to sign in to secure AWS webpages such as the AWS Management Console, AWS Discussion Forums, or the AWS Support Center. AWS best practices recommend that you create an IAM Identity Center user instead of an IAM user, because there is more security risk when you create an IAM user that has long-term credentials. If you must create an IAM user for a certain purpose, in addition to sign-in credentials, you can generate access keys for each IAM user. You can use these keys when you call AWS services programmatically, either through one of the several SDKs or by using the AWS Command Line Interface (CLI). The SDK and CLI tools use the access keys to cryptographically sign your request. If you don't use AWS tools, you must sign the request yourself. AWS Control Tower supports Signature Version 4, a protocol for authenticating inbound API requests. For more information about authenticating requests, see Signature Version 4 Signing Process in the AWS General Reference.

- **IAM role** – An IAM role is an IAM identity that you can create in your account that has specific permissions. An IAM role is similar to an IAM user in that it is an AWS identity, and it has permissions policies that determine what the identity can and cannot do in AWS. However, instead of being uniquely associated with one person, a role is intended to be assumable by anyone who needs it. Also, a role does not have standard long-term credentials such as a password or access keys associated with it. Instead, when you assume a role, it provides you with temporary security credentials for your role session. IAM roles with temporary credentials are useful in the following situations:
  - **Federated user access** – Instead of creating an IAM user, you can use existing identities from AWS Directory Service, your enterprise user directory, or a web identity provider. These are known as federated users. AWS assigns a role to a federated user when access is requested through an identity provider. For more information about federated users, see Federated Users and Roles in the IAM User Guide.
  - **AWS service access** – A service role is an IAM role that a service assumes to perform actions in your account on your behalf. When you set up some AWS service environments, you must define a role for the service to assume. This service role must include all the permissions that are required for the service to access the AWS resources that it needs. Service roles vary from service to service, but many allow you to choose your permissions as long as you meet the documented requirements for that service. Service roles provide access only within your account and cannot be used to grant access to services in other accounts. You can create, modify, and delete a service role from within IAM. For example, you can create a role that allows Amazon Redshift to access an Amazon S3 bucket.

If you must create an IAM user for a certain purpose, in addition to sign-in credentials, you can generate access keys for each IAM user. You can use these keys when you call AWS services programmatically, either through one of the several SDKs or by using the AWS Command Line Interface (CLI). The SDK and CLI tools use the access keys to cryptographically sign your request. If you don't use AWS tools, you must sign the request yourself. AWS Control Tower supports Signature Version 4, a protocol for authenticating inbound API requests. For more information about authenticating requests, see Signature Version 4 Signing Process in the AWS General Reference.
on your behalf and then load data from that bucket into an Amazon Redshift cluster. For more information, see Creating a Role to Delegate Permissions to an AWS Service in the IAM User Guide.

- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an Amazon EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the Amazon EC2 instance. To assign an AWS role to an Amazon EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the Amazon EC2 instance to get temporary credentials. For more information, see Using an IAM Role to Grant Permissions to Applications Running on Amazon EC2 Instances in the IAM User Guide.

- **IAM Identity Center user** Authentication to the IAM Identity Center user portal is controlled by the directory that you have connected to IAM Identity Center. However, authorization to the AWS accounts that are available to end users from within the user portal is determined by two factors:
  - Who has been assigned access to those AWS accounts in the AWS IAM Identity Center console. For more information, see Single Sign-On Access in the AWS IAM Identity Center User Guide.
  - What level of permissions have been granted to the end-users in the AWS IAM Identity Center console to allow them the appropriate access to those AWS accounts. For more information, see Permission Sets in the AWS IAM Identity Center User Guide.

### Access control

To create, update, delete, or list AWS Control Tower resources, or other AWS resources in your landing zone you need permissions to perform the operation, and you need permissions to access the corresponding resources. In addition, to perform the operation programmatically, you need valid access keys.

The following sections describe how to manage permissions for AWS Control Tower:

**Topics**

- Overview of managing access permissions to your AWS Control Tower resources (p. 1389)
- Using identity-based policies (IAM policies) for AWS Control Tower (p. 1397)

#### Overview of managing access permissions to your AWS Control Tower resources

Every AWS resource is owned by an AWS account, and permissions to create or gain access to a resource are governed by permissions policies. An account administrator can attach permissions policies to IAM identities (that is, users, groups, and roles). Some services (such as AWS Lambda) also support attaching permissions policies to resources.

**Note**

An account administrator (or administrator) is a user with administrator privileges. For more information, see IAM Best Practices in the IAM User Guide.

When you are responsible for granting permissions to a user or role, you must know and track the users and roles that require permissions, the resources for which each user and role requires permissions, and the specific actions that must be allowed for operating those resources.

**Topics**

- About resource ownership (p. 1390)
- Manage access to resources (p. 1390)
Overview of managing access with IAM

- Specifying policy elements: Actions, Effects, and Principals (p. 1396)
- Specifying conditions in a policy (p. 1396)

AWS Control Tower resources and operations

In AWS Control Tower, the primary resource is a landing zone. AWS Control Tower also supports an additional resource type, controls, sometimes referred to as guardrails. However, for AWS Control Tower, you can manage controls only in the context of an existing landing zone. Controls can be referred to as a subresource.

Resources and subresources in AWS have unique Amazon Resource Names (ARNs) associated with them, as shown in the following example.

About resource ownership

The AWS account owns the resources that are created in the account, regardless of who created the resources. Specifically, the resource owner is the AWS account of the principal entity (that is, the AWS account root user, an IAM Identity Center user, an IAM user, or an IAM role) that authenticates the resource creation request. The following examples illustrate how this works:

- If you use the AWS account root user credentials of your AWS account to set up a landing zone, your AWS account is the owner of the resource.
- If you create an IAM user in your AWS account and grant permissions to set up a landing zone to that user, the user can set up a landing zone as long as their account meets the prerequisites. However, your AWS account, to which the user belongs, owns the landing zone resource.
- If you create an IAM role in your AWS account with permissions to set up a landing zone, anyone who can assume the role can set up a landing zone. Your AWS account, to which the role belongs, owns the landing zone resource.

Manage access to resources

A permissions policy describes who has access to what. The following section explains the available options for creating permissions policies.

Note

This section discusses using IAM in the context of AWS Control Tower. It doesn't provide detailed information about the IAM service. For complete IAM documentation, see What Is IAM? in the IAM User Guide. For information about IAM policy syntax and descriptions, see AWS IAM Policy Reference in the IAM User Guide.

Policies attached to an IAM identity are referred to as identity-based policies (IAM polices). Policies attached to a resource are referred to as resource-based policies.

Note

AWS Control Tower supports only identity-based policies (IAM policies).

Topics

- About identity-based policies (IAM policies) (p. 1390)
- Create roles and assign permissions (p. 1391)
- Resource-based policies (p. 1396)

About identity-based policies (IAM policies)

You can attach policies to IAM identities. For example, you can do the following:
• **Attach a permissions policy to a user or a group in your account** – To grant a user permissions to create an AWS Control Tower resource, such as setting up a landing zone, you can attach a permissions policy to a user or group that the user belongs to.

• **Attach a permissions policy to a role (grant cross-account permissions)** – You can attach an identity-based permissions policy to an IAM role to grant cross-account permissions. For example, an administrator for one AWS account (Account A) can create a role that grants cross-account permissions to another AWS account (Account B), or the administrator can create a role that grants permissions to another AWS service.

  1. The Account A administrator creates an IAM role and attaches a permissions policy to the role that grants permissions to manage resources in Account A.
  2. The Account A administrator attaches a trust policy to the role. The policy identifies Account B as the principal who can assume the role.
  3. As principal, the Account B administrator can give any user in Account B permission to assume the role. By assuming the role, users in Account B can create or gain access to resources in Account A.
  4. To grant an AWS service the ability (permissions) to assume the role, the principal that you specify in the trust policy can be an AWS service.

**Create roles and assign permissions**

Roles and permissions give you access to resources, in AWS Control Tower and in other AWS services, including programmatic access to resources.

To provide access, add permissions to your users, groups, or roles:

• Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in [Create a permission set](#) in the [AWS IAM Identity Center User Guide](#).

• Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider (federation)](#) in the [IAM User Guide](#).

• IAM users:

  - Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the [IAM User Guide](#).
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user (console)](#) in the [IAM User Guide](#).

For more information about using IAM to delegate permissions, see [Access Management](#) in the [IAM User Guide](#).

**Note**

When setting up an AWS Control Tower landing zone, you'll need a user or role with the **AdministratorAccess** managed policy. (arn:aws:iam::aws:policy/AdministratorAccess)

**To create a role for an AWS service (IAM console)**

1. Sign in to the AWS Management Console and open the IAM console at [https://console.aws.amazon.com/iam/](https://console.aws.amazon.com/iam/).
2. In the navigation pane of the IAM console, choose **Roles**, and then choose **Create role**.
3. Choose the **AWS service** role type.
4. Choose the use case for your service. Use cases are defined by the service to include the trust policy that the service requires.
5. Choose **Next**.
6. If possible, select the policy to use for the permissions policy. Otherwise, choose Create policy to open a new browser tab and create a new policy from scratch. For more information, see Creating IAM policies in the IAM User Guide.

7. After you create the policy, close that tab and return to your original tab. Select the check box next to the permissions policies that you want the service to have.

Depending on the use case that you selected, the service might let you do any of the following:

- Nothing, because the service defines the permissions for the role.
- Choose from a limited set of permissions.
- Choose from any permissions.
- Select no policies at this time. However, you can create the policies later, and then attach them to the role.

8. (Optional) Set a permissions boundary. This is an advanced feature that is available for service roles, but not for service-linked roles.

Expand the Permissions boundary section and choose Use a permissions boundary to control the maximum role permissions. IAM includes a list of the AWS managed and customer managed policies in your account. Select the policy to use for the permissions boundary or choose Create policy to open a new browser tab and create a new policy from scratch. For more information, see Creating IAM policies in the IAM User Guide. After you create the policy, close that tab and return to your original tab to select the policy to use for the permissions boundary.

9. Choose Next.

10. For Role name, the degree of role name customization is defined by the service. If the service defines the role's name, you can't edit this option. In other cases, the service might define a prefix for the role and you can enter an optional suffix. For some services, you can specify the entire name of your role.

If possible, enter a role name or role name suffix to help you identify the purpose of this role. Role names must be unique within your AWS account, so don't create roles named both PRODROLE and prodrole. When a role name is used in a policy or as part of an ARN, the role name is case sensitive. When a role name appears to customers in the console, such as during the sign-in process, the role name is case insensitive. Because various entities might reference the role, you can't edit the name of the role after it is created.

11. (Optional) For Description, enter a description for the new role.

12. Choose Edit in the Step 1: Select trusted entities or Step 2: Select permissions sections to edit the use cases and permissions for the role.

13. (Optional) Add metadata to the role by attaching tags as key-value pairs. For more information about using tags in IAM, see Tagging IAM resources in the IAM User Guide.

14. Review the role, and then choose Create role.

To use the JSON policy editor to create a policy

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.

2. In the navigation pane on the left, choose Policies.

   If this is your first time choosing Policies, the Welcome to Managed Policies page appears. Choose Get Started.

3. At the top of the page, choose Create policy.

4. In the Policy editor section, choose the JSON option.

5. Enter or paste a JSON policy document. For details about the IAM policy language, see IAM JSON policy reference.
6. Resolve any security warnings, errors, or general warnings generated during policy validation, and then choose Next.

   **Note**
   You can switch between the Visual and JSON editor options anytime. However, if you make changes or choose Next in the Visual editor, IAM might restructure your policy to optimize it for the visual editor. For more information, see Policy restructuring in the IAM User Guide.

7. (Optional) When you create or edit a policy in the AWS Management Console, you can generate a JSON or YAML policy template that you can use in AWS CloudFormation templates.

   To do this, in the Policy editor choose Actions, and then choose Generate CloudFormation template. To learn more about AWS CloudFormation, see AWS Identity and Access Management resource type reference in the AWS CloudFormation User Guide.

8. When you are finished adding permissions to the policy, choose Next.

9. On the Review and create page, enter a Policy name and a Description (optional) for the policy that you are creating. Review Permissions defined in this policy to see the permissions that are granted by your policy.

10. (Optional) Add metadata to the policy by attaching tags as key-value pairs. For more information about using tags in IAM, see Tagging IAM resources in the IAM User Guide.

11. Choose Create policy to save your new policy.

### To use the visual editor to create a policy

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane on the left, choose Policies.

   If this is your first time choosing Policies, the Welcome to Managed Policies page appears. Choose Get Started.

3. Choose Create policy.

4. In the Policy editor section, find the Select a service section, and then choose an AWS service. You can use the search box at the top to limit the results in the list of services. You can choose only one service within a visual editor permission block. To grant access to more than one service, add multiple permission blocks by choosing Add more permissions.

5. In Actions allowed, choose the actions to add to the policy. You can choose actions in the following ways:

   - Select the check box for all actions.
   - Choose Add actions to enter the name of a specific action. You can use a wildcard character (*) to specify multiple actions.
   - Select one of the Access level groups to choose all actions for the access level (for example, Read, Write, or List).
   - Expand each of the Access level groups to choose individual actions.

   By default, the policy that you are creating allows the actions that you choose. To deny the chosen actions instead, choose Switch to deny permissions. Because IAM denies by default, we recommend as a security best practice that you allow permissions to only those actions and resources that a user needs. Create a JSON statement to deny permissions only if you want to override a permission separately allowed by another statement or policy. We recommend that you limit the number of deny permissions to a minimum because they can increase the difficulty of troubleshooting permissions.

6. For Resources, if the service and actions that you selected in the previous steps do not support choosing specific resources, all resources are allowed and you cannot edit this section.
If you chose one or more actions that support resource-level permissions, then the visual editor lists those resources. You can then expand Resources to specify resources for your policy.

You can specify resources in the following ways:

- Choose Add ARNs to specify resources by their Amazon Resource Names (ARN). You can use the visual ARN editor or list ARNs manually. For more information about ARN syntax, see Amazon Resource Names (ARNs) in the IAM User Guide. For information about using ARNs in the Resource element of a policy, see IAM JSON policy elements: Resource in the IAM User Guide.
- Choose Any in this account next to a resource to grant permissions to any resources of that type.
- Choose All to choose all resources for the service.

7. (Optional) Choose Request conditions - optional to add conditions to the policy that you are creating. Conditions limit a JSON policy statement's effect. For example, you can specify that a user is allowed to perform the actions on the resources only when that user's request happens within a certain time range. You can also use commonly used conditions to limit whether a user must be authenticated by using a multi-factor authentication (MFA) device. Or you can require that the request originate from within a certain range of IP addresses. For lists of all of the context keys that you can use in a policy condition, see Actions, resources, and condition keys for AWS services in the Service Authorization Reference.

You can choose conditions in the following ways:

- Use check boxes to select commonly used conditions.
- Choose Add another condition to specify other conditions. Choose the condition's Condition Key, Qualifier, and Operator, and then enter a Value. To add more than one value, choose Add. You can consider the values as being connected by a logical OR operator. When you are finished, choose Add condition.

To add more than one condition, choose Add another condition again. Repeat as needed. Each condition applies only to this one visual editor permission block. All the conditions must be true for the permission block to be considered a match. In other words, consider the conditions to be connected by a logical AND operator.

For more information about the Condition element, see IAM JSON policy elements: Condition in the IAM User Guide.

8. To add more permission blocks, choose Add more permissions. For each block, repeat steps 2 through 5.

Note
You can switch between the Visual and JSON editor options anytime. However, if you make changes or choose Next in the Visual editor, IAM might restructure your policy to optimize it for the visual editor. For more information, see Policy restructuring in the IAM User Guide.

9. (Optional) When you create or edit a policy in the AWS Management Console, you can generate a JSON or YAML policy template that you can use in AWS CloudFormation templates.

To do this, in the Policy editor choose Actions, and then choose Generate CloudFormation template. To learn more about AWS CloudFormation, see AWS Identity and Access Management resource type reference in the AWS CloudFormation User Guide.

10. When you are finished adding permissions to the policy, choose Next.

11. On the Review and create page, enter a Policy name and a Description (optional) for the policy that you are creating. Review the Permissions defined in this policy to make sure that you have granted the intended permissions.

12. (Optional) Add metadata to the policy by attaching tags as key-value pairs. For more information about using tags in IAM, see Tagging IAM resources in the IAM User Guide.
13. Choose **Create policy** to save your new policy.

**To grant programmatic access**

Users need programmatic access if they want to interact with AWS outside of the AWS Management Console. The way to grant programmatic access depends on the type of user that's accessing AWS.

To grant users programmatic access, choose one of the following options.

<table>
<thead>
<tr>
<th>Which user needs programmatic access?</th>
<th>To</th>
<th>By</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workforce identity (Users managed in IAM Identity Center)</td>
<td>Use temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.</td>
<td>Following the instructions for the interface that you want to use.</td>
</tr>
<tr>
<td><strong>• For the AWS CLI,</strong> see <a href="https://docs.aws.amazon.com/cli/latest/userguide/cli-iam.html">Configuring the AWS CLI to use AWS IAM Identity Center</a> in the AWS Command Line Interface User Guide.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>• For AWS SDKs, tools, and AWS APIs,</strong> see <a href="https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/ssl-identity-center.html">IAM Identity Center authentication</a> in the AWS SDKs and Tools Reference Guide.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IAM</td>
<td>Use temporary credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.</td>
<td>Following the instructions in <a href="https://docs.aws.amazon.com/IAM/latest/UserGuide/idConditions.html">Using temporary credentials with AWS resources</a> in the IAM User Guide.</td>
</tr>
<tr>
<td>IAM (Not recommended)</td>
<td>Use long-term credentials to sign programmatic requests to the AWS CLI, AWS SDKs, or AWS APIs.</td>
<td>Following the instructions for the interface that you want to use.</td>
</tr>
<tr>
<td><strong>• For the AWS CLI,</strong> see <a href="https://docs.aws.amazon.com/cli/latest/userguide/cli-iam-user-credentials.html">Authenticating using IAM user credentials</a> in the AWS Command Line Interface User Guide.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>• For AWS APIs,</strong> see <a href="https://docs.aws.amazon.com/IAM/latest/UserGuide/id_credentials_access-keys.html">Managing access keys for IAM users</a> in the IAM User Guide.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Protect against attackers**

For more information about how to help protect against attackers when you grant permissions to other AWS service principals, see [Optional conditions for your role trust relationships](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_permissions-policy-elements.html#optional-conditions) (p. 88). By adding certain conditions to your policies, you can help prevent a specific type of attack, known as a confused deputy attack, which occurs if an entity coerces a more-privileged entity to perform an action, such as
with cross-service impersonation. For general information about policy conditions, also see *Specifying conditions in a policy* (p. 1396).

For more information about using identity-based policies with AWS Control Tower, see *Using identity-based policies (IAM policies) for AWS Control Tower* (p. 1397). For more information about users, groups, roles, and permissions, see *Identities (Users, Groups, and Roles)* in the IAM User Guide.

**Resource-based policies**

Other services, such as Amazon S3, also support resource-based permissions policies. For example, you can attach a policy to an S3 bucket to manage access permissions to that bucket. AWS Control Tower does not support resource-based policies.

**Specifying policy elements: Actions, Effects, and Principals**

Currently, AWS Control Tower doesn't have an API for setting up a landing zone, only for managing controls. You can set up and manage your landing zone through the AWS Control Tower console. To set up your landing zone, you must be an IAM user with administrative permissions as defined in an IAM policy.

The following elements are the most basic ones you can identify in a policy:

- **Resource** – In a policy, you use an Amazon Resource Name (ARN) to identify the resource to which the policy applies. For more information, see *AWS Control Tower resources and operations* (p. 1390).
- **Action** – You use action keywords to identify resource operations that you want to allow or deny. For information about types of actions available to be performed, see *Actions defined by AWS Control Tower*.
- **Effect** – You specify the effect when the user requests the specific action—this can be either allow or deny. If you don't explicitly grant access to (allow) a resource, access is implicitly denied. You can also explicitly deny access to a resource, which you might do to make sure that a user cannot access it, even if a different policy grants access.
- **Principal** – In identity-based policies (IAM policies), that user to which the policy is attached is the implicit principal. For resource-based policies, you specify the user, account, service, or other entity that you want to receive permissions (applies to resource-based policies only). AWS Control Tower doesn't support resource-based policies.

To learn more about IAM policy syntax and descriptions, see *AWS IAM Policy Reference* in the IAM User Guide.

**Specifying conditions in a policy**

When you grant permissions, you can use the IAM policy language to specify the conditions when a policy should take effect. For example, you might want a policy to be applied only after a specific date. For more information about specifying conditions in a policy language, see *Condition* in the IAM User Guide.

To express conditions, you can use predefined condition keys. There are no condition keys specific to AWS Control Tower. However, there are AWS-wide condition keys that you can use as appropriate. For a complete list of AWS-wide keys, see *Available Keys for Conditions* in the IAM User Guide.

**Prevent cross-service impersonation**

In AWS, cross-service impersonation can result in the confused deputy problem. When one service calls another service, cross-service impersonation occurs if one service manipulates another service to use its permissions to act on a customer's resources in a way that's not otherwise permitted. To prevent this
attack, AWS provides tools to help you protect your data, so that only those services with legitimate permission can gain access to resources in your account.

We recommend using the `aws:SourceArn` and `aws:SourceAccount` conditions in your policies, to limit the permissions that AWS Control Tower gives to another service for access to your resources.

- Use `aws:SourceArn` if you want only one resource to be associated with cross-service access.
- Use `aws:SourceAccount` if you want to allow any resource in that account to be associated with cross-service use.
- If the `aws:SourceArn` value does not contain the account ID, such as the ARN for an Amazon S3 bucket, you must use both conditions to limit permissions.
- If you use both conditions, and if the `aws:SourceArn` value contains the account ID, the `aws:SourceAccount` value and the account in the `aws:SourceArn` value must show the same account ID when used in the same policy statement.

For more information and examples, see Optional conditions for your role trust relationships (p. 88).

**Using identity-based policies (IAM policies) for AWS Control Tower**

This topic provides examples of identity-based policies that demonstrate how an account administrator can attach permissions policies to IAM identities (that is, users, groups, and roles) and thereby grant permissions to perform operations on AWS Control Tower resources.

**Important**

We recommend that you first review the introductory topics that explain the basic concepts and options available for you to manage access to your AWS Control Tower resources. For more information, see Overview of managing access permissions to your AWS Control Tower resources (p. 1389).

**Permissions Required to Use the AWS Control Tower Console**

AWS Control Tower creates three roles automatically when you set up a landing zone. All three roles are required to allow console access. AWS Control Tower splits permissions into three roles as a best practice to restrict access to the minimal sets of actions and resources.

**Three required roles**

- [AWSControlTowerAdmin role](p. 1397)
- [AWSControlTowerStackSetRole](p. 1401)
- [AWSControlTowerCloudTrailRole](p. 1402)

We recommend that you restrict access to your role trust policies for these roles. For more information, see Optional conditions for your role trust relationships (p. 88).

**AWSControlTowerAdmin role**

This role provides AWS Control Tower with access to infrastructure critical to maintaining the landing zone. The AWSControlTowerAdmin role requires an attached managed policy and a role trust policy for the IAM role. A role trust policy is a resource-based policy, specifying which principals can assume the role.

**Managed Policy for this role: AWSControlTowerServiceRolePolicy**
AWSControlTowerServiceRolePolicy

The AWSControlTowerServiceRolePolicy AWS-managed policy defines permissions to create and manage AWS Control Tower resources such as AWS CloudFormation stacksets and stack instances, AWS CloudTrail log files, a configuration aggregator for AWS Control Tower, as well as AWS Organizations accounts and organizational units (OUs) that are governed by AWS Control Tower.

Updates to this managed policy are summarized in the table, Managed policies for AWS Control Tower (p. 1405).

For more information, see AWSControlTowerServiceRolePolicy in the AWS Managed Policy Reference Guide.

Managed Policy Name: AWSControlTowerServiceRolePolicy

The JSON artifact for AWSControlTowerServiceRolePolicy is the following:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cloudformation:CreateStack",
        "cloudformation:CreateStackInstances",

      "cloudtrail.amazonaws.com"
    ]
  }
}
}]
```
Using identity-based policies (IAM policies)

Role trust policy:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": ["controltower.amazonaws.com"]
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

The inline policy is `AWSControlTowerAdminPolicy`:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": ["sts:AssumeRole"],
      "Resource": ["arn:aws:iam::*:role/AWSControlTowerExecution"],
      "Effect": "Allow"
    }
  ]
}
```

**AWSControlTowerStackSetRole**

AWS CloudFormation assumes this role to deploy stack sets in accounts created by AWS Control Tower.

**Inline Policy:**

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": ["sts:AssumeRole"],
      "Resource": ["arn:aws:iam::*:role/AWSControlTowerExecution"],
      "Effect": "Allow"
    }
  ]
}
```
AWS Control Tower User Guide
Using identity-based policies (IAM policies)

AWSControlTowerCloudTrailRole

AWS Control Tower enables CloudTrail as a best practice and provides this role to CloudTrail. CloudTrail assumes this role to create and publish CloudTrail logs. Inline Policy:

```
{
   "Version": "2012-10-17",
   "Statement": [
   {
      "Action": "logs:CreateLogStream",
      "Effect": "Allow"
   },
   {
      "Action": "logs:PutLogEvents",
      "Effect": "Allow"
   }
   ]
}
```

AWSControlTowerBlueprintAccess role requirements

AWS Control Tower requires you to create the AWSControlTowerBlueprintAccess role in the designated blueprint hub account, within the same organization.

Role name

The role name must be AWSControlTowerBlueprintAccess.

Role trust policy

The role must be set up to trust the following principals:

- The principal that uses AWS Control Tower in the management account.
- The AWSControlTowerAdmin role in the management account.

The following example shows a least-privilege trust policy:

```
{
   "Version": "2012-10-17",
   "Statement": [
   {
      "Effect": "Allow",
      "Principal": {
         "AWS": [
           "arn:aws:iam::ManagementAccountId:role/AWSControlTowerAdmin",
           "arn:aws:iam::ManagementAccountId:role/YourControlTowerUserRole"
         ]
      },
      "Action": "sts:AssumeRole",
      "Condition": {}
   }
   ]
}
```
Role permissions

You are required to attach the managed policy `AWSServiceCatalogAdminFullAccess` to the role.

**AWSServiceRoleForAWSControlTower**

This role provides AWS Control Tower with access to the Log Archive account, Audit account, and member accounts, for operations critical to maintaining the landing zone, such as notifying you of drifted resources.

The `AWSServiceRoleForAWSControlTower` role requires an attached managed policy and a role trust policy for the IAM role.

**Managed policy for this role:** `AWSControlTowerAccountServiceRolePolicy`

**Role trust policy:**

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "controltower.amazonaws.com"
         },
         "Action": "sts:AssumeRole"
      }
   ]
}
```

**AWSControlTowerAccountServiceRolePolicy**

This AWS-managed policy allows AWS Control Tower to call AWS services that provide automated account configuration and centralized governance on your behalf.

The policy contains the minimum permissions for AWS Control Tower to implement AWS Security Hub findings forwarding for resources managed by Security Hub controls that are part of the **Security Hub Service-managed Standard: AWS Control Tower**, and it prevents changes that restrict the ability to manage customer accounts. It is part of background AWS Security Hub drift detection process that is not directly initiated by a customer.

The policy gives permissions to create Amazon EventBridge rules, specifically for Security Hub controls, in each member account, and these rules must specify an exact EventPattern. Also, a rule can operate only on rules managed by our service principal.

**Service principal:** `controltower.amazonaws.com`

The JSON artifact for `AWSControlTowerAccountServiceRolePolicy` is the following:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "AllowPutRuleOnSpecificSourcesAndDetailTypes",
         "Effect": "Allow",
         "Action": "events:PutRule",
         "Resource": "arn:aws:events:*::*:rule/*ControlTower*",
         "Condition": {
            "ForAnyValue:StringEquals": {
               "events:source": "aws.securityhub"
            }
         }
      }
   ]
}
```
Updates to this managed policy are summarized in the table, Managed policies for AWS Control Tower (p. 1405).
Managed policies for AWS Control Tower

AWS addresses many common use cases by providing standalone IAM policies that are created and administered by AWS. Managed policies grant necessary permissions for common use cases so you can avoid having to investigate what permissions are needed. For more information, see AWS Managed Policies in the IAM User Guide.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWSControlTowerAccountServiceRolePolicy</td>
<td>AWS Control Tower added a new service-linked role that allows AWS Control Tower to create and manage event rules, and based on those rules, to manage drift detection for controls that are related to Security Hub. This change is needed so that customers can view drifted resources in the console, when those resources are related to Security Hub controls that are part of the Security Hub Service-managed Standard: AWS Control Tower.</td>
<td>May 22, 2023</td>
</tr>
<tr>
<td>AWSControlTowerServiceRolePolicy</td>
<td>AWS Control Tower added new permissions that allow AWS Control Tower to make calls to the EnableRegion, ListRegions, and GetRegionOptStatus APIs implemented by the AWS Account Management service, to make the opt-in AWS Regions available for customer accounts in the landing zone (Management account, Log archive account, Audit account, OU member accounts). This change is needed so that customers can have the option to expand Region governance by AWS Control Tower into the opt-in Regions.</td>
<td>April 6, 2023</td>
</tr>
<tr>
<td>AWSControlTowerServiceRolePolicy</td>
<td>AWS Control Tower added new permissions that allow AWS Control Tower to assume the AWSControlTowerBlueprintAccess role in the blueprint (hub) account, which is a dedicated account in an organization, containing pre-defined blueprints stored in one or more Service Catalog Products. AWS</td>

Compliance Validation for AWS Control Tower

AWS Control Tower is a well-architected service that can help your organization meet your compliance needs with controls and best practices. Additionally, third-party auditors assess the security and compliance of a number of the services you can use in your landing zone as a part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of AWS services in scope of specific compliance programs, see AWS Services in Scope by Compliance Program. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact in the AWS Artifact User Guide.

Your compliance responsibility when using AWS Control Tower is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- **Architecting for HIPAA Security and Compliance on Amazon Web Services** – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.
- **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.
- **AWS Config** – This AWS service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- **AWS Security Hub** – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.

Resilience in AWS Control Tower

The AWS global infrastructure is built around AWS Regions and Availability Zones.

AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected by means of low-latency, high-throughput, and highly redundant networking. Availability Zones allow you to design and operate applications and databases that automatically fail over between Availability Zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For a list of AWS Regions where AWS Control Tower is available, see How AWS Regions Work With AWS Control Tower (p. 97).

Your *home region* is defined as the AWS Region in which your landing zone was set up.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

Infrastructure Security in AWS Control Tower

AWS Control Tower is protected by the AWS global network security procedures that are described in the Amazon Web Services: Overview of Security Processes whitepaper.

You use AWS published API calls for access to AWS services and resources within your landing zone through the network. We require Transport Layer Security (TLS) 1.2 and recommend Transport Layer
Security (TLS) 1.3 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

You can set up security groups to provide additional network infrastructure security for your AWS Control Tower landing zone workloads. For more information, see Walkthrough: Set Up Security Groups in AWS Control Tower With AWS Firewall Manager (p. 1434).
Logging and monitoring in AWS Control Tower

Monitoring allows you to plan for and respond to potential incidents. Therefore, monitoring is an important part of the well-architected nature of AWS Control Tower. The results of monitoring activities are stored in log files; therefore, logging and monitoring are closely related concepts.

When you set up your landing zone, one of the shared accounts created is the log archive account, dedicated to collecting all logs centrally, including logs for all of your other accounts. These log files allow administrators and auditors to review actions and events that have occurred.

As a best practice, you should collect monitoring data from all of the parts of your AWS setup into your logs, so that you can more easily debug a multi-point failure if one occurs. AWS provides several tools for monitoring your resources and activity in your landing zone.

For example, the status of your controls is monitored constantly. You can see their status at a glance in the AWS Control Tower console. The health and status of the accounts you provisioned in Account Factory also is monitored constantly.

Logging

AWS Control Tower accomplishes logging of actions and events automatically, through its integration with AWS CloudTrail and AWS Config, and it records them in CloudWatch. All actions are logged, including actions from the AWS Control Tower management account and from your organization's member accounts. Management account actions and events are viewable on the Activities page in the console. You can view member account actions and events in the log archive files.

The Activities Page

The Activities page provides an overview of AWS Control Tower management account actions. To navigate to the AWS Control Tower Activities page, select Activities from the left navigation.

The Activities page shows all AWS Control Tower actions initiated from the management account. It includes actions that are logged automatically when you navigate through the AWS Control Tower console. Here are the fields that the Activities page shows you:

- Date and time: The timestamp for the activity.
- User: The person or account that initiated the activity.
- Action: The activity that occurred.
- Resources: The resources affected by the activity.
- Status: Success, failure, or other state of the activity.
- Description: More details about the activity.

The activities shown in the Activities page are the same ones reported in the AWS CloudTrail events log for AWS Control Tower, but they're shown in a table format. To learn more about a specific activity, select the activity from the table and then choose View details.

The following sections describe monitoring and logging in AWS Control Tower with more detail:

Topics

- Monitoring (p. 1410)
Monitoring

Monitoring is an important part of maintaining the reliability, availability, and performance of AWS Control Tower and your other AWS solutions. AWS provides the following monitoring tools to watch AWS Control Tower, report when something is wrong, and take automatic actions when appropriate:

- **Amazon CloudWatch** monitors your AWS resources and the applications you run on AWS in real time. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. For example, you can have CloudWatch track CPU usage or other metrics of your Amazon EC2 instances and automatically launch new instances when needed. For more information, see the [Amazon CloudWatch User Guide](https://docs.aws.amazon.com/AmazonCloudWatch/latest/userguide/).

- **Amazon CloudWatch Events** delivers a near real-time stream of system events that describe changes in AWS resources. CloudWatch Events enables automated event-driven computing, as you can write rules that watch for certain events and trigger automated actions in other AWS services when these events happen. For more information, see the [Amazon CloudWatch Events User Guide](https://docs.aws.amazon.com/AmazonCloudWatchEvents/latest/userguide/).

- **Amazon CloudWatch Logs** enables you to monitor, store, and access your log files from Amazon EC2 instances, CloudTrail, and other sources. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see the [Amazon CloudWatch Logs User Guide](https://docs.aws.amazon.com/AmazonCloudWatchLogs/latest/userguide/).

- **AWS CloudTrail** captures API calls and related events made by or on behalf of your AWS account and delivers the log files to an Amazon S3 bucket that you specify. You can identify which users and accounts called AWS, the source IP address from which the calls were made, and when the calls occurred.

Tip: You can view and query CloudTrail activity on an account through CloudWatch Logs and CloudWatch Logs Insights. This activity includes AWS Control Tower lifecycle events. CloudWatch Logs' capabilities allow you to perform more granular and precise queries than you would normally be able to make using CloudTrail.

Logging AWS Control Tower Actions with AWS CloudTrail

AWS Control Tower is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in AWS Control Tower. CloudTrail captures actions for AWS Control Tower as events. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for AWS Control Tower.

If you don't configure a trail, you can still view the most recent events in the CloudTrail console in Event history. Using the information collected by CloudTrail, you can determine the request that was made to AWS Control Tower, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, including how to configure and enable it, see the [AWS CloudTrail User Guide](https://docs.aws.amazon.com/CloudTrail/latest/userguide/).
AWS Control Tower Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When supported event activity occurs in AWS Control Tower, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

**Note**

In AWS Control Tower releases before landing zone version 3.0, AWS Control Tower created a member account trail. When you update to release 3.0, your CloudTrail trail is updated to become an organization trail. For best practices when moving between trails, see Creating an organizational trail in the CloudTrail User Guide.

**Recommended: Create a trail**

For an ongoing record of events in your AWS account, including events for AWS Control Tower, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for Creating a Trail
- Prepare for creating a trail
- Managing CloudTrail costs
- CloudTrail Supported Services and Integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

AWS Control Tower logs the following actions as events in CloudTrail log files:

**Public APIs**

- DisableControl
- EnableControl
- GetControlOperation
- ListEnabledControls

**Other APIs**

- SetupLandingZone
- UpdateAccountFactoryConfig
- ManageOrganizationalUnit
- CreateManagedAccount
- EnableGuardrail
- GetLandingZoneStatus
- GetHomeRegion
- ListManagedAccounts
- DescribeManagedAccount
- DescribeAccountFactoryConfig
Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.
- Whether the request was rejected as access denied or processed successfully.

For more information, see the CloudTrail `userIdentity` Element.

**Example: AWS Control Tower Log File Entries**

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail events don't appear in any specific order in the log files.

The following example shows a CloudTrail log entry that shows the structure of a typical log file entry for a `SetupLandingZone` AWS Control Tower event, including a record of the identity of the user who initiated the action.

```json
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "AssumedRole",
    "principalId": "AIDACKCEVSQ6C2EXAMPLE:backend-test-assume-role-session",
    "arn": "arn:aws:sts::76543EXAMPLE::assumed-role/AWSControlTowerTestAdmin/backend-test-assume-role-session",
    "accountId": "76543EXAMPLE",
    "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "sessionContext": {
      "attributes": {
        "mfaAuthenticated": "false",
```

1412
Monitoring resource changes with AWS Config

AWS Control Tower enables AWS Config on all enrolled accounts, so that it can monitor compliance through detective controls, record resource changes, and deliver resource change logs to the log archive account.

If your landing zone version is earlier than 3.0: For your enrolled accounts, AWS Config logs all changes to resources, for all Regions in which the account operates. Each change is modeled as a configuration item (CI), which contains information such as the resource identifier, the Region, the date that each change was recorded, and whether the change relates to a known resource or a newly discovered one.

If your landing zone version is 3.0 or later: AWS Control Tower limits recording for global resources, such as IAM users, groups, roles, and customer managed policies, to your home Region only. Copies of global resource changes are not stored in every Region. This limitation of resource recording conforms with AWS Config best practices. A full list of global resources is available in AWS Config documentation.

- To learn more about AWS Config, see How AWS Config works.
- For a list of resources that AWS Config can support, see Supported resource types.
- To learn about how to customize resource tracking in the AWS Control Tower environment, see the blog post entitled Customize AWS Config resource tracking in AWS Control Tower.

AWS Control Tower sets up an AWS Config delivery channel in all enrolled accounts. Through this delivery channel, it logs all changes recorded by AWS Config in the log archive account, where they are stored to a folder in an Amazon Simple Storage Service bucket.
Managing AWS Config costs in AWS Control Tower

This section describes how AWS Config records and bills you for changes to resources in your AWS Control Tower accounts. This information may help you understand how to manage the costs associated with AWS Config, when you're utilizing AWS Control Tower. AWS Control Tower adds no additional cost.

**Note**

If your landing zone version is 3.0 or later: AWS Control Tower limits AWS Config recording for global resources, such as IAM users, groups, roles, and customer-managed polices, to your home Region only. Therefore, some of the information in this section may not apply to your landing zone.

AWS Config is designed to record each change to each resource, in each Region where an account operates, as a configuration item (CI). AWS Config bills you for each configuration item that it generates.

**How AWS Config operates**

AWS Config records resources in each Region, separately. Some global resources, such as IAM roles, are recorded once per Region. For example, if you create a new IAM role in an enrolled account that is operating in five Regions, AWS Config generates five CIs, one for each Region. Other global resources, such as Route 53 hosted zones, are recorded only once across all Regions. For example, if you create a new Route 53 hosted zone in an enrolled account, AWS Config generates one CI, regardless of how many Regions are selected for that account. For a list that helps you distinguish these types of resources, see the AWS Config documentation.

**Note**

When AWS Control Tower works with AWS Config, a Region may be governed by AWS Control Tower, or ungoverned, and AWS Config still records the changes if the account operates in that Region.

**AWS Config detects two types of relationships in resources**

AWS Config makes a distinction between *direct* and *indirect* relationships among resources. If a resource is returned in another resource's Describe API call, those resources are recorded as a direct relationship. When you change a resource in a direct relationship with another resource, AWS Config does not make a CI for both resources.

For example, if you create an Amazon EC2 instance, and the API requires you to create a network interface, AWS Config considers the Amazon EC2 instance to have a direct relationship with the network interface. As a result, AWS Config generates only one CI.

AWS Config records separate changes for resource relationships that are *indirect* relationships. For example, AWS Config generates two CIs if you create a security group and add an associated Amazon EC2 instance that's part of the security group.

For more information about direct and indirect relationships, see [What is a direct and an indirect relationship with respect to a resource?](https://docs.aws.amazon.com/config/latest/developerguide/aws-config-relationships.html)

You can find a list of resource relationships in the AWS Config documentation.

**View the AWS Config recorder data on enrolled accounts**

AWS Config is integrated with CloudWatch so that you can view AWS Config CIs in a dashboard. For more information, see the blog post entitled [AWS Config supports Amazon CloudWatch metrics](https://aws.amazon.com/blogs/aws/aws-config-supports-amazon-cloudwatch-metrics/).

Programmatically, to view AWS Config data, you can work with the AWS CLI, or you can utilize other AWS tools.
Query the AWS Config recorder data on a specific resource

You can use the AWS CLI to retrieve a list of the most recent changes for a resource.

Resource history command:

- `aws configservice get-resource-config-history --resource-type RESOURCE-TYPE --resource-id RESOURCE-ID --region REGION`

To learn more, see the API documentation for `get-config-history`.

Visualize AWS Config data with Amazon QuickSight

You can visualize and query resources recorded by AWS Config across your entire organization. For more information, see Visualizing AWS Config data using Amazon Athena and Amazon QuickSight.

Troubleshooting AWS Config in AWS Control Tower

This section gives information about some problems you may encounter when using AWS Config with AWS Control Tower.

High AWS Config costs

If your workflow includes processes that create, update, or delete resources frequently, or if it handles resources in large numbers, that workflow may generate large numbers of CIs. If you run these processes in a non-production account, consider unenrolling the account. You may need to de-activate the AWS Config recorder for that account manually.

Note
After you unenroll the account, AWS Control Tower cannot enforce detective controls or log account events, such as AWS Config activities, for resources in that account.

For more information, see Unmanage an enrolled account. To learn how to deactivate the AWS Config recorder, see Managing the configuration recorder.

The same resource is recorded multiple times

Check whether the resource is a global resource. For AWS Control Tower landing zones prior to version 3.0, AWS Config may record certain global resources once for each Region in which AWS Config is operating. For example, if AWS Config is enabled on eight Regions, each role is recorded eight times.

The following resources are recorded once for each Region in which AWS Config is operating:

- AWS::IAM::Group
- AWS::IAM::Policy
- AWS::IAM::Role
- AWS::IAM::User

Other global resources are recorded only once. Here are some examples of resources that are recorded once:

- AWS::Route53::HostedZone
- AWS::Route53::HealthCheck
- AWS::ECR::PublicRepository
• AWS::GlobalAccelerator::Listener
• AWS::GlobalAccelerator::EndpointGroup
• AWS::GlobalAccelerator::Accelerator

AWS Config did not record a resource

Certain resources have dependency relationships with other resources. These relationships may be direct or indirect. You can find a list of deprecated indirect relationships in the AWS Config FAQ.

Lifecycle Events in AWS Control Tower

Some events logged by AWS Control Tower are lifecycle events. A lifecycle event's purpose is to mark the completion of certain AWS Control Tower actions that change the state of resources. Lifecycle events apply to resources that AWS Control Tower creates or manages, such as organizational units (OUs), accounts, and controls.

Characteristics of AWS Control Tower lifecycle events

• For each lifecycle event, the event log shows whether the originating Control Tower action completed successfully, or failed.
• AWS CloudTrail automatically records each lifecycle event as a non-API AWS service event. For more information, see the AWS CloudTrail User Guide.
• Each lifecycle event also is delivered to the Amazon EventBridge and Amazon CloudWatch Events services.

Lifecycle events in AWS Control Tower offer two primary benefits:

• Because a lifecycle event registers the completion of an AWS Control Tower action, you can create an Amazon EventBridge rule or Amazon CloudWatch Events rule that can trigger the next steps in your automation workflow, based on the state of the lifecycle event.
• The logs provide additional detail to assist administrators and auditors in reviewing certain types of activity in your organizations.

How lifecycle events work

AWS Control Tower relies upon multiple services to implement its actions. Therefore, each lifecycle event is recorded only after a series of actions is complete. For example, when you enable a control on an OU, AWS Control Tower launches a series of sub-steps that implement the request. The final result of the entire series of sub-steps is recorded in the log as the state of the lifecycle event.

• If every underlying sub-step has completed successfully, the lifecycle event state is recorded as Succeeded.
• If any of the underlying sub-steps did not complete successfully, the lifecycle event state is recorded as Failed.

Each lifecycle event includes a logged timestamp that shows when the AWS Control Tower action was initiated, and another timestamp showing when the lifecycle event is completed, marking success or failure.

Viewing lifecycle events in Control Tower

You can view lifecycle events from the Activities page in your AWS Control Tower dashboard.
To navigate to the **Activities** page, choose **Activities** from the left navigation pane.

To get more details about a specific event, select the event and then choose the **View details** button at the upper right.

For more information about how to integrate AWS Control Tower lifecycle events into your workflows, see this blog post, [*Using lifecycle events to track AWS Control Tower actions and trigger automated workflows*](#).

**Expected behavior of CreateManagedAccount and UpdateManagedAccount lifecycle events**

When you create an account or enroll an account in AWS Control Tower, those two actions call the same internal API. If there's an error during the process, it usually occurs after the account has been created but is not fully provisioned. When you retry to create the account after the error, or when you try to update the provisioned product, AWS Control Tower sees that the account already exists.

Because the account exists, AWS Control Tower records the **UpdateManagedAccount** lifecycle event instead of the **CreateManagedAccount** lifecycle event at the end of the retry request. You may have expected to see another **CreateManagedAccount** event because of the error. However, the **UpdateManagedAccount** lifecycle event is the expected and desired behavior.

If you plan to create or enroll accounts into AWS Control Tower using automated methods, program the Lambda function to look for **UpdateManagedAccount** lifecycle events as well as **CreateManagedAccount** lifecycle events.

**Lifecycle event names**

Each lifecycle event is named so that it corresponds to the originating AWS Control Tower action, which also is recorded by AWS CloudTrail. Thus, for example, a lifecycle event originated by the AWS Control Tower **CreateManagedAccount** CloudTrail event is named **CreateManagedAccount**.

Each name in the list that follows is a link to an example of the logged detail in JSON format. The additional detail shown in these examples is taken from the Amazon CloudWatch event logs.

Although JSON does not support comments, some comments have been added in the examples for explanatory purposes. Comments are preceded by “//” and they appear in the right side of the examples.

In these examples, some account names and organization names are obscured. An **accountId** is always a 12-number sequence, which has been replaced with “xxxxxxxxxxxx” in the examples. An **organizationalUnitID** is a unique string of letters and numbers. Its form is preserved in the examples.

- **CreateManagedAccount** *(p. 1418)*: The log records whether AWS Control Tower successfully completed every action to create and provision a new account using account factory.
- **UpdateManagedAccount** *(p. 1419)*: The log records whether AWS Control Tower successfully completed every action to update a provisioned product that's associated with an account you had previously created by using account factory.
- **EnableGuardrail** *(p. 1419)*: The log records whether AWS Control Tower successfully completed every action to enable a control on an OU that was created by AWS Control Tower.
- **DisableGuardrail** *(p. 1420)*: The log records whether AWS Control Tower successfully completed every action to disable a control on an OU that was created by AWS Control Tower.
- **SetupLandingZone** *(p. 1421)*: The log records whether AWS Control Tower successfully completed every action to set up a landing zone.
- **UpdateLandingZone** *(p. 1422)*: The log records whether AWS Control Tower successfully completed every action to update your existing landing zone.
- **RegisterOrganizationalUnit** *(p. 1424)*: The log records whether AWS Control Tower successfully completed every action to enable its governance features on an OU.
The log records whether AWS Control Tower successfully completed every action to disable its governance features on an OU.

- **DeregisterOrganizationalUnit** (p. 1424): The log records whether AWS Control Tower detected any resource that would prevent the **Extend governance** operation from completing successfully.

The following sections provide a list of AWS Control Tower lifecycle events, with examples of the details logged for each type of lifecycle event.

**CreateManagedAccount**

This lifecycle event records whether AWS Control Tower successfully created and provisioned a new account using account factory. This event corresponds to the AWS Control Tower CreateManagedAccount CloudTrail event. The lifecycle event log includes the accountName and accountId of the newly-created account, and the organizationalUnitName and organizationalUnitId of the OU in which the account has been placed.

```
UpdateManagedAccount

This lifecycle event records whether AWS Control Tower successfully updated the provisioned product associated with an account that was created previously by using account factory. This event corresponds to the AWS Control Tower UpdateManagedAccount CloudTrail event. The lifecycle event log includes the accountName and accountId of the associated account, and the organizationalUnitName and organizationalUnitId of the OU in which the updated account is placed.

```

EnableGuardrail

This lifecycle event records whether AWS Control Tower successfully enabled a control on an OU that is being managed by AWS Control Tower. This event corresponds to the AWS Control Tower EnableGuardrail CloudTrail event. The lifecycle event log includes the
DisableGuardrail

guardrailId and guardrailBehavior of the control, and the organizationalUnitName and organizationalUnitId of the OU on which the control is enabled.

SetupLandingZone

This lifecycle event records whether AWS Control Tower successfully set up a landing zone. This event corresponds to the AWS Control Tower SetupLandingZone CloudTrail event. The lifecycle event log includes the rootOrganizationalId, which is ID of the organization that AWS Control Tower creates from the management account. The log entry also includes the organizationalUnitName and organizationalUnitId for each of of the OUs, and the accountName and accountId for each account, that are created when AWS Control Tower sets up the landing zone.

RegisterOrganizationalUnit

This lifecycle event records whether AWS Control Tower successfully enabled its governance features on an OU. This event corresponds to the AWS Control Tower RegisterOrganizationalUnit CloudTrail event. The lifecycle event log includes the organizationalUnitName and organizationalUnitId of the OU that AWS Control Tower has brought under its governance.

DeregisterOrganizationalUnit

This lifecycle event records whether AWS Control Tower successfully disabled its governance features on an OU. This event corresponds to the AWS Control Tower DeregisterOrganizationalUnit event.
CloudTrail event. The lifecycle event log includes the organizationalUnitName and organizationalUnitId of the OU on which AWS Control Tower has disabled its governance features.

        "sourceIPAddress": "AWS Internal",
        "userAgent": "AWS Internal",
        "eventID": "0000000-0000-0000-1111-123456789012",
        "readOnly": false,
        "eventType": "AwsServiceEvent",
        "serviceEventDetails": {
            "deregisterOrganizationalUnitStatus": {
                "state": "SUCCEEDED",
                "message": "AWS Control Tower successfully deregistered an organizational unit, and enabled mandatory guardrails on the new organizational unit.",
                "organizationalUnit": {
                    "organizationalUnitName": "Test", // Foundational OU
                    "organizationalUnitId": "ou-adpf-302pk332" // Foundational OU
                },
                "requestedTimestamp": "2018-08-30T21:42:18Z",
                "completedTimestamp": "2018-08-30T21:42:18Z"
            }
        }
    }
}
```

**PrecheckOrganizationalUnit**

This lifecycle event records whether AWS Control Tower successfully performed prechecks on an OU. This event corresponds to the AWS Control Tower PrecheckOrganizationalUnit CloudTrail event. The lifecycle event log contains a field for the Id, Name, and failedPrechecks values, for each resource on which AWS Control Tower has performed prechecks during the OU registration process.

The event log also contains information about the nested accounts on which the prechecks were performed, including the accountName, accountId, and failedPrechecks fields.

If the failedPrechecks value is empty, it means that all prechecks for that resource passed successfully.

- This event is emitted only if there is a precheck failure.
- This event is not emitted if you are registering an empty OU.
Example of event:

```json
{
    "eventVersion": "1.08",
    "userIdentity": {
        "accountId": "XXXXXXXXXXXX",
        "invokedBy": "AWS Internal"
    },
    "eventTime": "2021-09-20T22:45:43Z",
    "eventSource": "controltower.amazonaws.com",
    "eventName": "PrecheckOrganizationalUnit",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "AWS Internal",
    "userAgent": "AWS Internal",
    "eventID": "b41a9d67-0da4-4dc5-a87a-25fa19dc5305",
    "readOnly": false,
    "eventType": "AwsServiceEvent",
    "managementEvent": true,
    "recipientAccountId": "XXXXXXXXXXXX",
    "serviceEventDetails": {
        "precheckOrganizationalUnitStatus": {
            "organizationalUnit": {
                "organizationalUnitName": "Ou-123",
                "organizationalUnitId": "ou-abcd-123456",
                "failedPrechecks": [
                    "SCP_CONFLICT"
                ]
            },
            "accounts": [
                { "accountName": "Child Account 1",
                  "accountId": "XXXXXXXXXXXX",
                  "failedPrechecks": [
                    "FAILED_TO_ASSUME_ROLE"
                ],
                { "accountName": "Child Account 2",
                  "accountId": "XXXXXXXXXXXX",
                  "failedPrechecks": [
                    "FAILED_TO_ASSUME_ROLE"
                ],
                { "accountName": "Management Account",
                  "accountId": "XXXXXXXXXXXX",
                  "failedPrechecks": [
                    "MISSING_PERMISSIONS_AF_PRODUCT"
                  ],
                { "accountName": "Child Account 3",
                  "accountId": "XXXXXXXXXXXX",
                  "failedPrechecks": []
                },
                ...
            ],
            "state": "FAILED",
            "message": "AWS Control Tower failed to register an organizational unit due to precheck failures. Go to the OU details page to download a list of failed pre-checks for the OU and accounts within."
        },
        "requestedTimestamp": "2021-09-20T22:44:02+0000",
        "completedTimestamp": "2021-09-20T22:45:43+0000"
    }
}
```
Using AWS User Notifications with AWS Control Tower

You can use AWS User Notifications to set up delivery channels to be notified about AWS Control Tower events. You receive a notification when an event matches a rule that you specify. You can receive notifications for events through multiple channels, including email, AWS Chatbot chat notifications, or AWS Console Mobile App push notifications. You can also see notifications in the Console Notifications Center.

AWS User Notifications supports aggregation, which can reduce the number of notifications you receive during specific events. Notifications also are visible in the Console Notifications Center.

The advantages of subscribing to notifications through AWS User Notifications instead of EventBridge include:

- A friendlier user interface (UI).
- Integration with the AWS console, in the bell/notifications area on the global navigation bar.
- Native support for email notifications, there's no need to set up Amazon SNS.
- Most notably, support for mobile push notifications, exclusive to AWS User Notifications.

For example, one type of notification you may wish to receive is in case of Security Hub critical and high severity findings. A code snippet in JSON to set up that notification subscription may look something like this:

```json
{
  "detail": {
    "findings": {
      "Compliance": {
        "Status": ["FAILED", "WARNING", "NOT_AVAILABLE"]
      },
      "RecordState": ["ACTIVE"],
      "Severity": {
        "Label": ["CRITICAL", "HIGH"]
      },
      "Workflow": {
        "Status": ["NEW", "NOTIFIED"]
      }
    }
  }
}
```

**Event filtering**

- You can filter events by service and name using the filters available on the AWS User Notifications console.
- You can filter events by specific properties if you create your own EventBridge filter from JSON code.

**Example AWS Control Tower event**

Here is a generalized example event for AWS Control Tower.
• It an EventBridge event.
• You can subscribe to EventBridge events (such as this one) using AWS User Notifications.

```json
{
  "version": "0",
  "id": "<id>", // alphanumeric string
  "detail-type": "AWS Service Event via CloudTrail",
  "source": "aws.controltower",
  "account": "<account ID>", // Management account ID.
  "time": "<date>", // Format: yyyy-MM-dd'T'hh:mm:ssZ
  "region": "<region>", // AWS Control Tower home region.
  "resources": [],
  "detail": {
    "eventVersion": "1.05",
    "userIdentity": {
      "accountId": "121212121212",
      "invokedBy": "AWS Internal"
    },
    "eventSource": "controltower.amazonaws.com",
    "eventName": "<event name>", // one of the 9 event names in https://docs.aws.amazon.com/controltower/latest/userguide/lifecycle-events.html
    "awsRegion": "<region>",
    "sourceIPAddress": "AWS Internal",
    "userAgent": "AWS Internal",
    "eventID": "<id>",
    "readOnly": false,
    "eventType": "AwsServiceEvent",
    "serviceEventDetails": {
      // the contents of this object vary depending on the event subtype and event state
    }
  }
}
```
Walkthroughs

This chapter contains walkthrough procedures that can help you in your use of AWS Control Tower.

Topics

- Walkthrough: Move from ALZ to AWS Control Tower (p. 1429)
- Walkthrough: Automate Account Provisioning in AWS Control Tower by Service Catalog APIs (p. 1429)
- Walkthrough: Configure AWS Control Tower Without a VPC (p. 1432)
- Manage AWS Control Tower Resources (p. 1437)
- Walkthrough: Set Up Security Groups in AWS Control Tower With AWS Firewall Manager (p. 1434)
- Walkthrough: Decommission an AWS Control Tower Landing Zone (p. 1434)

Walkthrough: Move from ALZ to AWS Control Tower

Many AWS customers have adopted the AWS Landing Zone solution (ALZ) to set up a secure, compliant, multi-account AWS environment. To reduce the burden of managing a landing zone, AWS created the managed service called AWS Control Tower.

No additional features are scheduled for ALZ; it is in long-term support only. Therefore, we recommend that you move to the AWS Control Tower service from ALZ. The blog that is linked in this chapter walks you through different considerations for that move, and it explains how you can plan a successful migration from ALZ to AWS Control Tower.

Blog: Migrate AWS Landing Zone solution to AWS Control Tower

AWS Prescriptive Guidance offers more extensive documentation, including steps for transitioning from ALZ to AWS Control Tower. Essentially, you will enable AWS Control Tower governance in your existing organization that is running ALZ, based upon a number of prerequisites. For information, see Transitioning from AWS Landing Zone to AWS Control Tower.

Walkthrough: Automate Account Provisioning in AWS Control Tower by Service Catalog APIs

AWS Control Tower is integrated with several other AWS services, such as AWS Service Catalog. You can use the APIs to create and provision your member accounts in AWS Control Tower.

The video shows you how to provision accounts in an automated, batch fashion, by calling the AWS Service Catalog APIs. For provisioning, you'll call the `ProvisionProduct` API from the AWS command line interface (CLI), and you'll specify a JSON file that contains the parameters for each account you'd like to set up. The video illustrates installing and using the AWS Cloud9 development environment to perform this work. The CLI commands would be the same if you use AWS Cloudshell instead of AWS Cloud9.

Note

You also can adapt this approach for automating account updates, by calling the `UpdateProvisionedProduct` API of AWS Service Catalog for each account. You can write a script to update the accounts, one by one.
As a completely different automation method, if you are familiar with Terraform, you can provision accounts with AWS Control Tower Account Factory for Terraform (AFT) (p. 139).

**Sample automation administration role**

Here is a sample template you can use to help configure your automation administration role in the management account. You would configure this role in your management account so it can perform the automation with Administrator access in the target accounts.

```
AWSTemplateFormatVersion: 2010-09-09
Description: Configure the SampleAutoAdminRole

Resources:
  AdministrationRole:
    Type: AWS::IAM::Role
    Properties:
      RoleName: SampleAutoAdminRole
      AssumeRolePolicyDocument:
        Version: 2012-10-17
        Statement:
          - Effect: Allow
            Principal:
              Service: cloudformation.amazonaws.com
            Action:
              - sts:AssumeRole
            Path: /
        Policies:
          - PolicyName: AssumeSampleAutoAdminRole
            PolicyDocument:
              Version: 2012-10-17
              Statement:
                - Effect: Allow
                  Action:
                    - sts:AssumeRole
                  Resource:
                    - "arn:aws:iam::*:role/SampleAutomationExecutionRole"
```

**Sample automation execution role**

Here is a sample template you can use to help you set up your automation execution role. You would configure this role in the target accounts.

```
AWSTemplateFormatVersion: "2010-09-09"
Description: "Create automation execution role for creating Sample Additional Role."

Parameters:
  AdminAccountId:
    Type: "String"
    Description: "Account ID for the administrator account (typically management, security or shared services)."
  AdminRoleName:
    Type: "String"
    Description: "Role name for automation administrator access."
    Default: "SampleAutomationAdministrationRole"
  ExecutionRoleName:
    Type: "String"
    Description: "Role name for automation execution."
    Default: "SampleAutomationExecutionRole"
  SessionDurationInSecs:
    Type: "Number"
    Description: "Maximum session duration in seconds."
    Default: 14400
```
After configuring these roles, you call the AWS Service Catalog APIs to perform the automated tasks. The CLI commands are given in the video.

### Sample provisioning input for Service Catalog API

Here is a sample of the input you can give to the Service Catalog ProvisionProduct API if you're using the API to provision AWS Control Tower accounts:

```json
{
  pathId: "lpv2-7n2o3nud1j46e",
  productId: "prod-y422ydgjge2rs",
  provisioningProductName: "Example product 1",
  provisioningArtifactId: "pa-2mmz36cfpj2p4",
  provisioningParameters: [
    {
      key: "AccountEmail",
      value: "abc@amazon.com"
    },
    {
      key: "AccountName",
      value: "ABC"
    },
    {
      key: "ManagedOrganizationalUnit",
      value: "Custom (ou-xfe5-a8hb8ml8)"
    },
    {
      key: "SSOUserEmail",
      value: "abc@amazon.com"
    },
    {
      key: "SSOUserFirstName",
      value: "John"
    },
    {
      key: "SSOUserLastName",
      value: "Smith"
    }
  ],
  provisionToken: "c3c795a1-9824-4fb2-a4c2-4b1841be4068"
}
```
For more information, see the API reference for Service Catalog.

**Note**
Notice that the format of the input string for the value of ManagedOrganizationalUnit has changed from OU_NAME to OU_NAME (OU_ID). The video that follows does not mention this change.

**Video Walkthrough**

This video (6:58) describes how to automate account deployments in AWS Control Tower. For better viewing, select the icon at the lower right corner of the video to enlarge it to full screen. Captioning is available.

[Video Walkthrough of Automated Account Provisioning in AWS Control Tower](#)

### Walkthrough: Configure AWS Control Tower Without a VPC

This topic walks through how to configure your AWS Control Tower accounts without a VPC.

If your workload does not require a VPC, you can do the following:

- You can delete the AWS Control Tower virtual private cloud (VPC). This VPC was created when you set up your landing zone.
- You can change your Account Factory settings so that new AWS Control Tower accounts are created without an associated VPC.

**Important**
If you provision Account Factory accounts with VPC internet access settings enabled, that Account Factory setting overrides the control Disallow internet access for an Amazon VPC instance managed by a customer (p. 1346). To avoid enabling internet access for newly provisioned accounts, you must change the setting in Account Factory.

### Delete the AWS Control Tower VPC

Outside of AWS Control Tower, every AWS customer has a default VPC, which you can view on the Amazon Virtual Private Cloud (Amazon VPC) console at [https://console.aws.amazon.com/vpc/](https://console.aws.amazon.com/vpc/). You'll recognize the default VPC, because its name always includes the word *(default)* at the end of the name.

When you set up a AWS Control Tower landing zone, AWS Control Tower deletes your AWS default VPC and creates a new AWS Control Tower default VPC. The new VPC is associated with your AWS Control Tower management account. This topic refers to that new VPC as the *Control Tower VPC*.

When you view your AWS Control Tower VPC in the Amazon VPC console, you will not see the word *(default)* at the end of the name. If you have more than one VPC, you must use the assigned CIDR range to identify the correct AWS Control Tower VPC.

You can delete the AWS Control Tower VPC, but if you later need a VPC in AWS Control Tower, you must create it yourself.

**To delete the AWS Control Tower VPC**

1. Open the Amazon VPC console at [https://console.aws.amazon.com/vpc/](https://console.aws.amazon.com/vpc/).
2. Search for VPC or select VPC from the Service Catalog options. You then see the VPC Dashboard.
3. From the menu on the left, choose Your VPCs. You then see a list of all your VPCs.
4. Identify the AWS Control Tower VPC by its CIDR range.
5. To delete the VPC, choose Actions and then choose Delete VPC.

An AWS (default) VPC already exists in every Region for the AWS Control Tower management account. To follow security best practices, if you choose to delete the AWS Control Tower VPC, it's best also to delete the AWS default VPC associated with the management account from all AWS Regions. Therefore, to secure the management account, remove the default VPC from each Region, as well as removing the VPC created by Control Tower in your AWS Control Tower home region.

Create an Account in AWS Control Tower Without a VPC

If your end-user workloads do not require VPCs, you can use this method to set up end-user accounts that don't have VPCs created for them automatically.

From the AWS Control Tower dashboard, you can view and edit your network configurations settings. After you change the settings so that AWS Control Tower accounts are created without an associated VPC, all new accounts are created without a VPC until you change the settings again.

To configure Account Factory for creating accounts without VPCs

2. Choose Account Factory from the menu on the left.
3. You then see the Account Factory page with the Network Configuration section.
4. Note the current settings if you intend to restore them later.
5. Choose the Edit button in the Network Configuration section.
6. In the Edit account factory network configuration page, go to the VPC Configuration options for new accounts section.

You can follow Option 1 or Option 2, or both, to ensure that AWS Control Tower does not create a VPC when provisioning an account.

a. Option 1 – Removing subnets
   • Turn off the Internet-accessible subnet toggle switch.
   • Set the Maximum number of private subnets value to 0.

b. Option 2 – Removing AWS Regions
   • Clear every checkbox in the Regions for VPC creation column.

7. Choose Save.

Possible Errors

Be aware of these possible errors that could occur when you delete your AWS Control Tower VPC or reconfigure Account Factory to create accounts without VPCs.

• Your existing management account may have dependencies or resources in the AWS Control Tower VPC, which can cause a deletion failure error.
• If you leave the default CIDR in place when setting up to launch new accounts without a VPC, your request fails with an error that the CIDR is not valid.
Walkthrough: Set Up Security Groups in AWS Control Tower With AWS Firewall Manager

The video shows you how to use the AWS Firewall Manager service to provide improvements to your network security for AWS Control Tower. You can designate a security administrator account that's enabled to set up security groups. You will see how you can configure security policies and enforce security rules for your AWS Control Tower organizations, and how you can remediate non-compliant resources by applying policies automatically. You can view the security groups that are in effect for each account and resource (such as an Amazon EC2 instance) in your organization.

You can create your own firewall policies, or you can subscribe to rules from trusted vendors.

Set Up Security Groups With AWS Firewall Manager

This video (8:02) describes how to set up better network infrastructure security for your resources and workloads in AWS Control Tower. For better viewing, select the icon at the lower right corner of the video to enlarge it to full screen. Captioning is available.

Video Walkthrough of Firewall Setup in AWS Control Tower.

For more information, see the documentation on how to set up AWS WAF.

Walkthrough: Decommission an AWS Control Tower Landing Zone

AWS Control Tower allows you to set up and govern secure multi-account AWS environments, known as landing zones. The process of cleaning up all of the resources allocated by AWS Control Tower is referred to as decommissioning a landing zone.

If you no longer want to use AWS Control Tower, the automated decommissioning tool cleans up the resources allocated by AWS Control Tower. To begin the automated decommissioning process, navigate to the Landing Zone Settings page, select the decommission tab, and choose Decommission landing zone.

For a list of actions performed during decommissioning, see Overview of the decommissioning process (p. 1435).

Warning
Manually deleting all of your AWS Control Tower resources is not the same as decommissioning. It will not allow you to set up a new landing zone.

Your data and your existing AWS Organizations are not changed by the decommissioning process, in the following ways.

- AWS Control Tower does not remove your data, it only removes parts of the landing zone that it created.
- After the decommissioning process is complete, a few resource artifacts remain, such as Amazon S3 buckets and Amazon CloudWatch Logs log groups. These resources must be deleted manually before you set up another landing zone, and to avoid possible costs associated with maintaining certain resources.
- You can't use automated decommissioning to remove a landing zone that's partially set up. If your landing zone setup process fails, you must resolve the failure state and set it up all the way to make automated decommissioning possible, or you must manually delete the resources individually.
Decommissioning a landing zone is a process with significant consequences, and it cannot be undone. The decommissioning actions taken by AWS Control Tower and the artifacts that remain after decommissioning are described in the following sections.

**Important**
We strongly recommend that you perform this decommissioning process only if you intend to stop using your landing zone. It is not possible to re-create your existing landing zone after you've decommissioned it.

### Overview of the decommissioning process

When you request decommissioning of your landing zone, AWS Control Tower does the following actions.

- Disables each detective control enabled in the landing zone. AWS Control Tower deletes the AWS CloudFormation resources supporting the control.
- Disables each preventive control by removing service control policies (SCPs) from AWS Organizations. If a policy is empty (which it should be after removing all SCPs managed by AWS Control Tower), AWS Control Tower detaches and deletes the policy entirely.
- Deletes all blueprints deployed as AWS CloudFormation StackSets.
- Deletes all blueprints deployed as CloudFormation Stacks across all Regions.
- For each provisioned account, AWS Control Tower does the following actions during the decommissioning process.
  - Deletes records of each account factory account.
  - Revokes the AWS Control Tower permissions to the account by removing the IAM role that AWS Control Tower created (unless additional policies have been added to it) and recreates the standard OrganizationsFullAccessRole IAM role.
  - Removes records of the account from AWS Service Catalog.
  - Removes the account factory product and portfolio from AWS Service Catalog.
  - Deletes the blueprints for the shared (Audit and Log Archive) accounts.
  - Revokes the AWS Control Tower permissions from the shared accounts by removing the IAM role that AWS Control Tower created (unless additional policies have been added to it) and recreates the OrganizationsFullAccessRole IAM role.
  - Deletes records related to the shared accounts.
  - Deletes records related to customer-created OUs.
  - Deletes internal records that identify the home Region.

**Note**
After decommissioning, you may wish to remove the Account Factory VPC blueprint (BP_ACCOUNT_FACTORY_VPC) to clean up the routes and NAT gateways, if your VPC was not empty.

### Resources not removed during decommissioning

Decommissioning a landing zone does not fully reverse the AWS Control Tower setup process. Certain resources remain, which may be removed manually.

**AWS Organizations**

For customers without existing AWS Organizations organizations, AWS Control Tower sets up an organization with two organizational units (OUs), named Security and Sandbox. When you decommission your landing zone, the hierarchy of the organization is preserved, as follows:
• Organizational Units (OUs) you created from the AWS Control Tower console are not removed.
• The Security and Sandbox OUs are not removed.
• The organization is not deleted from AWS Organizations.
• No accounts in AWS Organizations (shared, provisioned, or management) are moved or removed.

AWS IAM Identity Center (SSO)

For customers without an existing IAM Identity Center directory, AWS Control Tower sets up IAM Identity Center and configures an initial directory. When you decommission your landing zone, AWS Control Tower makes no changes to IAM Identity Center. If needed, you can delete the IAM Identity Center information stored in your management account manually. In particular, these areas are unchanged by decommissioning:

• Users created with Account Factory are not removed.
• Groups created by AWS Control Tower setup are not removed.
• Permission sets created by AWS Control Tower are not removed.
• Associations between AWS accounts and IAM Identity Center permission sets are not removed.
• IAM Identity Center directories are not changed.

Amazon S3 Buckets

During setup, AWS Control Tower creates buckets in the logging account for logging and for logging access. When you decommission your landing zone, the following resources are not removed:

• Logging and logging access S3 buckets in the logging account are not removed.
• Contents of the logging and logging access buckets are not removed.

Shared Accounts

Two shared accounts (Audit and Log Archive) are created in the Security OU during AWS Control Tower setup. When you decommission your landing zone:

• Shared accounts that were created during AWS Control Tower setup are not closed.
• The OrganizationAccountAccessRole IAM role is recreated to align with standard AWS Organizations configuration.
• The AWSControlTowerExecution role is removed.

Provisioned Accounts

AWS Control Tower customers can use account factory to create new AWS accounts. When you decommission your landing zone:

• Provisioned accounts you created with Account Factory are not closed.
• Provisioned products in AWS Service Catalog are not removed. If you clean those up by terminating them, their accounts are moved into the Root OU.
• The VPC that AWS Control Tower created is not removed, and the associated AWS CloudFormation stack set (BP_ACCOUNT_FACTORY_VPC) is not removed.
• The OrganizationAccountAccessRole IAM role is recreated to align with standard AWS Organizations configuration.
• The AWSControlTowerExecution role is removed.
Resources not removed during decommissioning

CloudWatch Logs Log Group

A CloudWatch Logs log group, aws-controltowertower/CloudTrailLogs, is created as part of the blueprint named AWSControlTowerBP-BASELINE-CLOUDTRAIL-MANAGEMENT. This log group is not removed. Instead, the blueprint is deleted and the resources are retained.

- This log group must be deleted manually before you set up another landing zone.

Note

Customers on landing zone 3.0 and later do not need to delete their individual enrolled account's CloudTrail logs and CloudTrail logs roles, because these are created in the management account only, for the organization-level trail. Beginning with landing zone version 3.2, AWS Control Tower creates an EventBridge rule, called AWSControlTowerManagedRule. This rule is created in each member account, for all governed Regions. The rule is not deleted automatically during decommissioning, so you must delete it manually from the shared and member accounts for all governed Regions before you can set up a landing zone in a new Region.

Procedures for how to delete AWS Control Tower resources are given in Manage AWS Control Tower Resources (p. 1437).

Manage AWS Control Tower Resources

This document provides instructions for how to remove AWS Control Tower resources individually, as part of regular maintenance and administrative tasks. The procedures given in this chapter are intended only for removing individual resources, or a few resources, when needed. It not the same as decommissioning your landing zone.

Two types of tasks may require you to remove resources:

- To delete resources as you manage your landing zone in ordinary situations.
- To clean up resources that remain after automated decommissioning.

Warning

Manually removing resources will not allow you to set up a new landing zone. It is not the same as decommissioning. If you intend to decommission your AWS Control Tower landing zone, follow the instructions on Walkthrough: Decommission an AWS Control Tower Landing Zone (p. 1434) before you take any actions described in this chapter. The instructions in this chapter can help you clean up resources that remain after automated decommissioning is complete. Even if you delete all of your landing zone resources manually, it is not the same as decommissioning the landing zone, and you may incur unexpected charges.

If you need to remove an account from AWS Control Tower, see the following sections to close an account:

- Unmanage an account
- Close an account created in Account Factory

Do I need decommissioning instead of deleting?

If you no longer intend to use AWS Control Tower for your enterprise, or if you require a major redeployment of your organizational resources, you may want to decommission the resources created when you initially set up your landing zone.

- After the decommissioning process is complete, a few resource artifacts remain, such as Amazon S3 buckets and Amazon CloudWatch Logs log groups.
• You must clean up the remaining resources in your accounts manually before you set up another landing zone, and to avoid the possibility of unexpected charges. For more information, see Resources not removed during decommissioning (p. 1435).

**Warning**
We strongly recommend that you perform a decommissioning process only if you intend to stop using your landing zone. This process cannot be undone.

**About removing AWS Control Tower resources**

The individual procedures in this chapter guide you through manual methods of removing AWS Control Tower resources. These procedures can be followed when you need to delete a specific resource from your landing zone.

Before performing these procedures, unless it's otherwise indicated, you must be signed in to the AWS Management Console in the home Region for your landing zone, and you must be signed in as an IAM user or user in IAM Identity Center with administrative permissions for the management account that contains your landing zone.

**Warning**
These are destructive actions that can introduce governance drift into your AWS Control Tower setup. They cannot be undone.

**Topics**

- **Delete SCPs** (p. 1438)
- **Delete StackSets and Stacks** (p. 1438)
- **Delete Amazon S3 Buckets in the Log Archive Account** (p. 1439)
- **Remove an Account Factory Portfolio and Product** (p. 1440)
- **Remove AWS Control Tower Roles and Policies** (p. 1441)
- **AWS Control Tower resource help** (p. 1442)

**Delete SCPs**

AWS Control Tower uses service control policies (SCPs) for its controls. This procedure walks through how to delete the SCPs specifically related to AWS Control Tower.

**To delete AWS Organizations SCPs**

2. Open the **Policies** tab, and find the Service Control Policies (SCPs) that have the prefix **aws-guardrails-** and do the following for each SCP:
   a. Detach the SCP from the associated OU.
   b. Delete the SCP.

**Delete StackSets and Stacks**

AWS Control Tower uses StackSets and stacks to deploy AWS Config Rules related to controls in your landing zone. The following procedures walk through how to delete these specific resources.

**To delete AWS CloudFormation StackSets**

2. From the left navigation menu, choose StackSets.
3. For each StackSet with the prefix AWSControlTower, do the following. If you have many accounts in a StackSet, this can take some time.
   a. Choose the specific StackSet from the table in the dashboard. This opens the properties page for that StackSet.
   b. At the bottom of the page, in the Stacks table, make a record of the AWS account IDs for all the accounts in the table. Copy the list of all accounts.
   c. From Actions, choose Delete stacks from StackSet.
   d. On Set deployment options, from Deployment locations, choose Deploy stacks in accounts.
   e. In the text field, enter the AWS account IDs you made a record of in step 3.b, separated by commas. For example: 123456789012, 098765431098, and so on.
   f. From Specify regions, choose Add all, leave the rest of the parameters on the page set to their defaults, and choose Next.
   g. On the Review page, review your choices, and then choose Delete stacks.
   h. On the StackSet properties page, you can begin this procedure again for your other StackSets.
4. The process is complete when the records in the Stacks table of the different StackSets properties pages are empty.
5. When the records in the Stacks table are empty, choose Delete StackSet.

To delete AWS CloudFormation stacks

2. From the Stacks dashboard, search for all of the stacks with the prefix AWSControlTower.
3. For each stack in the table, do the following:
   a. Choose the check box next to the name of the stack.
   b. From the Actions menu, choose Delete Stack.
   c. In the dialog box that opens, review the information to make sure it's accurate, and choose Yes, Delete.

Delete Amazon S3 Buckets in the Log Archive Account

The following procedures guide you through how to sign in to the log archive account as an IAM Identity Center user in the AWSControlTowerExecution group and then delete the Amazon S3 buckets in your log archive account.

To sign in to your log archive account with the right permissions

1. Open the Organizations console at https://console.aws.amazon.com/organizations/.
2. From the Accounts tab, find the Log archive account.
3. From the right pane that opens, make a record of the log archive account number.
4. From the navigation bar, choose your account name to open your account menu.
5. Choose Switch Role.
6. On the page that opens, provide the account number for the log archive account in Account.
7. For Role, enter AWSControlTowerExecution.
8. The Display Name populates with text.
9. Choose your favorite Color.
10. Choose Switch Role.
To delete Amazon S3 buckets
1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. Search for bucket names that contain `aws-controltower`.
3. For each bucket in the table, do the following:
   a. Choose the check box for the bucket in the table.
   b. Choose Delete.
   c. In the dialog box that opens, review the information to make sure it's accurate, enter the name of the bucket to confirm, and then choose Confirm.

Remove an Account Factory Portfolio and Product

The following procedure guides you through how to sign in as an IAM Identity Center user in the AWSServiceCatalogAdmins group and then clean up your Account Factory portfolio and products.

To sign in to your management account with the right permissions
1. Go to your user portal URL at directory-id.awsapps.com/start
2. From AWS Account, find the Management account.
3. From AWSServiceCatalogAdminFullAccess, choose Management console to sign in to the AWS Management Console as this role.

To clean up Account Factory
1. Open the Service Catalog console at https://console.aws.amazon.com/servicecatalog/.
2. From the left navigation menu, choose Portfolios list.
3. In the Local Portfolios table, search for a portfolio named AWS Control Tower Account Factory Portfolio.
4. Choose the name of that portfolio to go to its details page.
5. Expand the Constraints section of the page, and choose the radio button for the constraint with the product name AWS Control Tower Account Factory.
6. Choose REMOVE CONSTRAINTS.
7. In the dialog box that opens, review the information to make sure it's accurate, and then choose CONTINUE.
8. From the Products section of the page, choose the radio button for the product named AWS Control Tower Account Factory.
9. Choose REMOVE PRODUCT.
10. In the dialog box that opens, review the information to make sure it's accurate, and then choose CONTINUE.
11. Expand the Users, Groups, and Roles section of the page, and choose the check boxes for all the records in this table.
12. Choose REMOVE USERS, GROUP OR ROLE.
13. In the dialog box that opens, review the information to make sure it's accurate, and then choose CONTINUE.
14. From the left navigation menu, choose Portfolios list.
15. In the Local Portfolios table, search for a portfolio named AWS Control Tower Account Factory Portfolio.
16. Choose the radio button for that portfolio, and then choose DELETE PORTFOLIO.
17. In the dialog box that opens, review the information to make sure it's accurate, and then choose **CONTINUE**.
18. From the left navigation menu, choose **Product list**.
19. On the **Admin products** page, search for the product named **AWS Control Tower Account Factory**.
20. Choose the product to open the **Admin product details** page.
21. From **Actions**, choose **Delete product**.
22. In the dialog box that opens, review the information to make sure it's accurate, and then choose **CONTINUE**.

### Remove AWS Control Tower Roles and Policies

These procedures walk you through how to clean up the roles and policies that AWS Control Tower created when your landing zone was set up, or later.

#### To delete the IAM Identity Center AWSServiceCatalogEndUserAccess role

1. Open the AWS IAM Identity Center console at [https://console.aws.amazon.com/singlesignon/](https://console.aws.amazon.com/singlesignon/).
2. Change your AWS Region to your home Region, which is the Region where you initially set up AWS Control Tower.
3. From the left navigation menu, choose **AWS accounts**.
4. Choose your management account link.
5. Choose the dropdown for **Permission sets**, select **AWSServiceCatalogEndUserAccess**, and then choose **Remove**.
6. Choose **AWS accounts** from the left panel.
7. Open the **Permission sets** tab.
8. Select **AWSServiceCatalogEndUserAccess** and delete it.

#### To delete IAM roles

2. From the left navigation menu, choose **Roles**.
3. From the table, search for roles with the name **AWSControlTower**.
4. For each role in the table, do the following:
   a. Choose the check box for the role.
   b. Choose **Delete role**.
   c. In the dialog box that opens, review the information to make sure it's accurate, and then choose **Yes, delete**.

#### To delete IAM policies

2. From the left navigation menu, choose **Policies**.
3. From the table, search for policies with the name **AWSControlTower**.
4. For each policy in the table, do the following:
   a. Choose the check box for the policy.
   b. Choose **Policy actions**, and **Delete** from the dropdown menu.
   c. In the dialog box that opens, review the information to make sure it's accurate, and then choose **Delete**.
AWS Control Tower resource help

If you encounter any issues that you can't resolve when you remove AWS Control Tower resources, contact AWS Support.

How to decommission a landing zone

To decommission your AWS Control Tower landing zone, follow the procedure given here.

Note
We recommend that you unmanage your enrolled accounts prior to decommissioning.

1. Navigate to the Landing Zone Settings page in the AWS Control Tower console.
2. Choose Decommission your landing zone within the Decommission your landing zone section.
3. A dialog appears, explaining the action you are about to perform, with a required confirmation process. To confirm your intent to decommission, you must select every box and type the confirmation as requested.

   Important
   The decommissioning process cannot be undone.

4. If you confirm your intent to decommission your landing zone, you are redirected to the AWS Control Tower home page while decommissioning is in progress. The process may require up to two hours.
5. When decommissioning has succeeded, you must delete remaining resources manually before setting up a new landing zone from the AWS Control Tower console. These remaining resources include some specific Amazon S3 buckets, organizations, and CloudWatch Logs log groups.

   Note
   These actions may have significant consequences for your billing and compliance activities. For example, failure to delete these resources can result in unexpected charges.

   For more information about how to delete resources manually, see About removing AWS Control Tower resources (p. 1438).

6. If you intend to set up a new landing zone in a new AWS Region, follow this additional step. Enter the following command through the CLI:

   ```bash
   aws organizations disable-aws-service-access --service-principal controltower.amazonaws.com
   ```

Manual cleanup tasks required after decommissioning

- You must specify different email addresses for the Log archive and Audit accounts if you create a new landing zone after decommissioning one, or follow the procedure for bringing your own existing Log archive or Audit accounts.
- The CloudWatch Logs log group, aws-controltower/CloudTrailLogs, must be deleted manually before you set up another landing zone.
- The two Amazon S3 buckets with reserved names for logs must be removed, or renamed, manually.
- You must delete, or rename, the existing Security and Sandbox organizational units manually.

   Note
   Before you can delete the AWS Control Tower Security OU organization, you must first delete the logging and audit accounts, but not the management account. To delete these accounts, you must When to sign in as a root user (p. 41) to the audit account and to the logging account and delete them individually.
Setup after decommissioning a landing zone

After you decommission your landing zone, you cannot successfully execute setup again until manual cleanup is complete. Also, without manual cleanup of these remaining resources, you may incur unexpected billing charges. You must attend to these issues:

- The AWS Control Tower management account is part of the AWS Control Tower Root OU. Be sure that these IAM roles and IAM policies are removed from the management account:
  - Roles:
    - AWSControlTowerAdmin
    - AWSControlTowerCloudTrailRole
    - AWSControlTowerStackSetRole
  - Policies:
    - AWSControlTowerAdminPolicy
    - AWSControlTowerCloudTrailRolePolicy
    - AWSControlTowerStackSetRolePolicy
- You may wish to delete or update the existing IAM Identity Center configuration for AWS Control Tower before you set up a landing zone again, but it is not required that you delete it.
- You may wish to remove the VPC created by AWS Control Tower.
- Setup fails if the email addresses specified for the logging or audit accounts are associated with an existing AWS account. You may close the AWS accounts, or use different email addresses to set up a landing zone again. Alternatively, you may re-use these existing shared accounts, with the feature that allows you to bring your own logging and audit accounts. For more information, see Considerations for bringing existing security or logging accounts (p. 106).
- Setup fails if Amazon S3 buckets with the following reserved names already exist in the logging account:
  - `aws-controltower-logs-{accountId}-{region}` (used for the logging bucket).
  - `aws-controltower-s3-access-logs-{accountId}-{region}` (used for the logging access bucket).

You must either rename or remove these buckets, or use a different account for the logging account.
- Setup fails if the management account has the existing log group, `aws-controltower/CloudTrailLogs`, in CloudWatch Logs. You must either rename or remove the log group.
Before you set up in a new AWS Region

If you intend to set up a new landing zone in a new AWS Region, follow these additional steps.

- Enter the following command through the CLI:

  ```bash
  aws organizations disable-aws-service-access --service-principal controltower.amazonaws.com
  ```

- Delete the remaining managed rule, called AWSControlTowerManagedRule, from shared and member accounts for all governed Regions.

  **Note**
  You cannot set up a new landing zone in an organization with top-level OUs named either **Security** or **Sandbox**. You must rename or remove these OUs to set up a landing zone again.
Troubleshooting

If you encounter issues while using AWS Control Tower, you can use the following information to resolve them according to our best practices. If the issues you encounter are outside the scope of the following information, or if they persist after you've tried to resolve them, contact AWS Support.

Landing Zone Launch Failed

Common causes of landing zone launch failure:

- Lack of response to a confirmation email message.
- AWS CloudFormation StackSet failure.

**Confirmation email messages:** If your management account is less than an hour old, you may encounter issues when the additional accounts are created.

**Action to take**

If you encounter this issue, check your email. You might have been sent confirmation email that is awaiting response. Alternatively, we recommend that you wait an hour, and then try again. If the issue persists, contact AWS Support.

**Failed StackSets:** Another possible cause of landing zone launch failure is AWS CloudFormation StackSet failure. AWS Security Token Service (STS) regions must be enabled in the management account for all AWS Regions that AWS Control Tower is governing, so that the provisioning can be successful; otherwise, stack sets will fail to launch.

**Action to take**

Be sure to enable all of your required AWS Security Token Service (STS) endpoint regions before you launch AWS Control Tower.

To view a list of AWS Regions that AWS Control Tower supports, see How AWS Regions Work With AWS Control Tower (p. 97).

Landing zone not up to date error

If you have not updated your landing zone recently, you may receive an error when you try to regain access to AWS Control Tower. You may see an error message similar to this one:

**Unable to access Control Tower**

*Your account has been inactive for too long. Due to inactivity, you must update your landing zone for access to AWS Control Tower.*

However, your landing zone update may fail.

**Steps to take**

Sign in to the management account of your organization, and sign in as root user. Your IAM user or user in IAM Identity Center must have AWS Control Tower administrator permissions and be part of the **AWSControlTowerAdmins** group. Then try the update again.
New Account Provisioning Failed

If you encounter this issue, check for these common causes.

When you filled out the account provisioning form, you may have:

- specified tagOptions,
- enabled SNS notifications,
- enabled provisioned product notifications.

Try again to provision your account, without specifying any of those options. For more information, see Provision accounts with AWS Service Catalog Account Factory (p. 122).

Other common causes for failure:

- If you created a provisioned product plan (to view resource changes), your account provisioning may remain in an In progress state indefinitely.
- Creation of a new account in Account Factory will fail while other AWS Control Tower configuration changes are in progress. For example, while a process is running to add a control to an OU, Account Factory will display an error message if you try to provision an account.

To check the status of a previous action in AWS Control Tower

- Navigate to AWS CloudFormation > StackSets
- Check each stack set related to AWS Control Tower (prefix: "AWSControlTower")
- Look for AWS CloudFormation StackSets operations that are still running.

If your account provisioning takes longer than one hour, it's best to terminate the provisioning process and try again.

Failed to Enroll an Existing Account

If you try once to enroll an existing AWS account and that enrollment fails, when you try a second time, the error message may tell you that the stack set exists. To continue, you must remove the provisioned product in Account Factory.

If the reason for the first enrollment failure was that you forgot to create the AWSControlTowerExecution role in the account in advance, the error message you'll receive correctly tells you to create the role. However, when you try to create the role, you are likely to receive another error message stating that AWS Control Tower could not create the role. This error occurs because the process has been partially completed.

In this case, you must take two recovery steps before you can proceed with enrolling your existing account. First, you must terminate the Account Factory provisioned product through the AWS Service Catalog console. Next, you must use the AWS Organizations console to manually move the account out of the OU and back to the root. After that is done, create the AWSControlTowerExecution role in the account, and then fill in the Enroll account form again.

Another possible cause of enrollment failure is that the account has existing AWS Config resources. In that case, see Enroll accounts that have existing AWS Config resources for instructions on how you can modify your existing resources.
Unable to Update an Account Factory Account

When an account is in an inconsistent state, it cannot be updated successfully from Account Factory or AWS Service Catalog.

Case 1: You may encounter an error message similar to this one:

AWS Control Tower could not baseline VPC in the managed account because of existing resource dependencies.

Common cause: AWS Control Tower always removes the AWS default VPC during initial provisioning. To have an AWS default VPC in an account, you must add it after account creation. AWS Control Tower has its own default VPC that replaces the AWS default VPC, unless you set up Account Factory the way the walkthrough shows you—so that AWS Control Tower doesn't provision a VPC at all. Then the account has no VPC. You'd have to re-add the AWS default VPC if you want to use that one.

However, AWS Control Tower doesn't support the AWS default VPC. Deploying one causes the account to enter a Tainted state. When it is in that state, you cannot update the account through AWS Service Catalog.

Action to take: You must delete the default VPC that you added, and then you will be able to update the account.

Note
The Tainted state causes a follow-on issue: An account that is not updated may prevent enabling controls on the OU of which it is a part.

Case 2: You may see an error message similar to this one:

AWS Control Tower detects that your enrolled account has been moved to a new organizational unit.

Common cause: You attempted to move an account from one registered OU to another, but old AWS Config rules remain. The account is in an inconsistent state.

Action to take:

If the account move was intended:

- Terminate the account in Service Catalog.
- Enroll it again.
- Context/impact: Deployed AWS Config rules don't match the configuration dictated by the destination OU.
- AWS Config rules may remain from the previous OU, causing unintended spending.
- Attempts to re-enroll or update the account will fail due to resource naming conflicts.

If the account move was unintended:

- Return the account to its original OU.
- Update the account from Service Catalog.
- In the launch parameters, enter the OU that the account was originally in.
- Context/impact: If the account is not returned to its original OU, its state will be inconsistent with the controls dictated by the new OU it's in.
- Updating an account is not a valid remediation, because it does not delete the AWS Config rules associated with its previous OU.
Unable to Update Landing Zone

When an account is in a Closed or Suspended state, you may encounter an issue when you try to update your landing zone. You must delete the provisioned product on every closed account before you perform an update to the landing zone.

On the AWS Service Catalog provisioned product page, you may see an error message similar to this one:

AWSControlTowerExecution role can’t be assumed on the account.

Common cause: You have suspended an account without deleting the provisioned product.

Action to take: If you see this error, you have two options:

1. Contact AWS Support and reopen the account, delete the provisioned product, then close the account again.
2. Remove the resources from the StackSets that have been orphaned because of the account closure. (This option is available only if the StackSets have instances in Current state that you are not removing.)

To remove the resources from the StackSets, do this for each closed account:

- Go into each of the AWS Control Tower StackSets and remove the StackInstances from every region, for the account that has been closed.
- IMPORTANT: Choose the Retain Stack option so the StackSet removes only the stack instances. StackSet can't assume a role from the closed account, so it will fail if it tries to assume the AWSControlTowerExecution role, which leads to the error message you received.

Failure Error that Mentions AWS Config

If AWS Config is enabled in any AWS Region supported by AWS Control Tower, you may receive an error message because a pre-check has failed. The message might not seem to explain the problem adequately, due to some underlying behavior of AWS Config.

You may receive an error message, similar to one of these:

- AWS Control Tower cannot create an AWS Config delivery channel because one already exists. To continue, delete the existing delivery channel and try again.
- AWS Control Tower cannot create an AWS Config configuration recorder because one already exists. To continue, delete the existing delivery channel and try again.

Common cause: When the AWS Config service is enabled on an AWS account, it creates a configuration recorder and delivery channel with a default naming. If you disable the AWS Config service through the console, it does not delete the configuration recorder or the delivery channel. You must delete them through the CLI, or modify them for AWS Control Tower use. If the AWS Config service is enabled in any one of the Regions supported by AWS Control Tower, it can result in this failure.

If the account has existing AWS Config resources, see Enroll accounts that have existing AWS Config resources for instructions on how you can modify your existing resources.
Action to take: Delete the configuration recorder and delivery channel in all supported regions. Disabling AWS Config is not enough, the configuration recorder and delivery channel must be deleted by means of the CLI. After you’ve deleted the configuration recorder and delivery channel from the CLI, you can try again to launch AWS Control Tower and enroll the account.

If you are in the process of deploying a provisioned product, you must delete the provisioned product before you retry. Otherwise, you may see an error message similar to this one:

- An error occurred (InvalidParametersException) when calling the ProvisionProduct operation: A stack named Stackname already exists.

In the message, Stackname specifies the name of the stack.

Here are some example AWS Config CLI commands you can use to determine the status of your configuration recorder and delivery channel.

View commands:

- aws configservice describe-delivery-channels
- aws configservice describe-delivery-channel-status
- aws configservice describe-configuration-recorders
- The normal response is something like "name": "default"

Delete commands:

- aws configservice stop-configuration-recorder --configuration-recorder-name NAME-FROM-DESCRIBE-OUTPUT
- aws configservice delete-delivery-channel --delivery-channel-name NAME-FROM-DESCRIBE-OUTPUT
- aws configservice delete-configuration-recorder --configuration-recorder-name NAME-FROM-DESCRIBE-OUTPUT

For more information, see the AWS Config documentation

- Managing the Configuration Recorder (AWS CLI)
- Managing the Delivery Channel

No Launch Paths Found Error

When you're trying to create a new account, you may see an error message similar to this one:

No launch paths found for resource: prod-dpqfywxxxx

This error message is generated by AWS Service Catalog, which is the integrated service that helps provision accounts in AWS Control Tower.

Common Causes:

- You may be logged in as root. AWS Control Tower does not support creating accounts when you're logged in as root user.
- Your IAM Identity Center user has not been added to the appropriate permission group. You may need to add your IAM Identity Center user to one of these permission groups: AWSAccountFactory (for end-user access) or AWSServiceCatalogAdmins (for admin access).
• If you are authenticated as an IAM user, you must add it to the AWS Service Catalog portfolio so that it has the correct permissions.
• This issue also occurs if you have the correct permissions, but AWS Control Tower drift is detected and a repair is necessary.

Received an Insufficient Permissions Error

It's possible that your account may not have the necessary permissions to perform certain work in certain AWS Organizations. If you encounter the following type of error, check all the permissions areas, such as IAM or IAM Identity Center permissions, to make sure your permission is not being denied from those places:

You have insufficient permissions to perform AWS Organizations API actions.

If you believe your work requires the action you're attempting, and you can't locate any relevant restriction, contact your system administrator or AWS Support.

Detective controls are not taking effect on accounts

If you've recently expanded your AWS Control Tower deployment into a new AWS Region, newly-applied detective controls do not take effect on new accounts you create in any Region until the individual accounts within OUs governed by AWS Control Tower are updated. Existing detective controls on existing accounts are still in effect.

If you try to enable a detective control before updating your accounts, you may see an error message similar to this one:

AWS Control Tower can't enable the selected control on this OU. AWS Control Tower cannot apply the control on the OU ou-xxx-xxxxxxxx, because child accounts have dependencies that are missing. Update all child accounts under the OU, then try again.

Action to take: Update accounts.

To update your accounts from the AWS Control Tower console, see When to update AWS Control Tower OUs and accounts (p. 194).

To update multiple individual accounts programmatically, you can use the APIs from AWS Service Catalog and the AWS CLI to automate the updates. For more information about how to approach the update process, see this Video Walkthrough (p. 1432). You can substitute the UpdateProvisionedProduct API for the ProvisionProduct API shown in the video.

If you have further difficulties with enabling detective controls on your accounts, contact AWS Support.

Rate exceeded error returned by the AWS Organizations API

Possible cause
Your workload was running while AWS Control Tower was running a daily scan to check whether your SCPs have drifted.

Steps to follow

If you encounter an API throttling or rate exceeded error, try these steps:

- Run your workloads at a different time. (Refer to the AWS Control Tower SCP invariance scan schedule by Region to find out when AWS Control Tower runs its audit scans.)
- If you are calling the APIs directly through HTTP: Use the AWS SDK, which automatically retries failed actions
- Request a limit increase through Service Quotas and AWS Support

An example of troubleshooting instructions for API throttling in Elastic Beanstalk can be found here: https://aws.amazon.com/premiumsupport/knowledge-center/elastic-beanstalk-api-throttling-errors/

Failure to move an Account Factory account directly from one AWS Control Tower landing zone to another AWS Control Tower landing zone

Warning
This practice does not meet the prerequisite for eligible account enrollment, because eligible accounts must be part of the same overall AWS Organization, and each organization may have only one landing zone. If you have tried to do this action and you find yourself receiving multiple error messages, here is some information that might be helpful.

To move an account that you've provisioned through Account Factory into another landing zone that's managed by AWS Control Tower, under another management account, you must remove all of the IAM roles and the stacks associated with that account from the original OU. Remove these resources from every Region in which the account is deployed.

Note
The best way to remove the resources is to deprovision the account in its original OU before you try to move it.

If you don't remove the resources, enrollment into the new OU will fail, somewhat spectacularly. You may encounter one or more error messages, and you will keep receiving similar error messages until the remaining roles and stacks are removed from every Region in which the account was deployed.

Each time you receive an error message, you must remove the account from the new OU, delete the old resource that is the subject of the error message, and then attempt to move the account back into the new OU. This process of removing-and-deleting must be repeated for every remaining resource, for every Region in which the account was deployed, possibly 10 or 20 times. These repeated errors occur because the account was provisioned into an OU with an SCP that prevents IAM role deletion. You can make the recovery process shorter by deleting all the account's resources before you retry.

The examples below represent the types of failure messages you may receive if undeleted roles and stacks remain. You would most likely see one of these messages at a time, for each time you attempt to enroll the account, as long as old resources remain.

The values of the resource ID strings have been modified for the examples. Their values will not be the same in an error message you may receive. You may see a message similar to the following examples:
• AWS Control Tower cannot create the IAM role `aws-controltower-AdministratorExecutionRole` because the role already exists. To continue, delete the existing IAM role and try again.

• AWS Control Tower cannot create the IAM role `aws-controltower-ConfigRecorderRole` because the role already exists. To continue, delete the existing IAM role and try again.

• AWS Control Tower cannot create the IAM role `aws-controltower-ForwardSnsNotificationRole` because the role already exists. To continue, delete the existing IAM role and try again.

Or you may see an error message about a stack set failure, similar to this one:

```
"Error":"StackSetFailState",
"Cause":"StackSetOperation on AWSControlTowerBP-BASELINE-CLOUDWATCH with id 8aXXXXf5-e0XX-4XXa-bc4XX-dXXXXXee31 has reached SUCCEEDED state but has 1 NON-CURRENT stack instances; here is the summary :{
  Stack Set Id: AWSControlTowerBP-BASELINE-CLOUDWATCH:40XXXbf2-Xead-46a1-XXXa-eXXXXecb2ee2,
  Stack instance Id: arn:aws:cloudformation:eu-west-1:1X23456789XX:stack/StackSet-AWSControlTowerBP-BASELINE-CLOUDWATCH-4feXXXXXX-ecXX-XXc6-bXXX-4ae678/4feXXXXXX-ecX-4ae123458,
  Status: OUTDATED,
  Status Reason: ResourceLogicalId:ForwardSnsNotification,
  ResourceType:AWS::Lambda::Function,
  ResourceStatusReason:aws-controltower-NotificationForwarder already exists in stack
```

After all of the remaining resources are removed from the first OU, you’ll be able to invite, provision, or enroll the account into the new OU successfully.

**AWS Support**

If you want to move your existing member accounts into a different support plan, you can sign in to each account with root account credentials, compare plans, and set the support level that you prefer.

We recommend that you update the MFA and account security contacts when you make changes to your support plan.

This blog is intended for AWS Control Tower administrators, or those responsible for managing networks within their AWS environment.

Security, identity, and logging

Extend your security posture, integrate with external or existing identity providers, and centralize logging systems.

**Security**

- **Automating AWS Security Hub Alerts with AWS Control Tower lifecycle events** – This blog post describes how to automate Security Hub enablement and configuration in an AWS Control Tower multi-account environment on existing and new accounts.
- **Enabling AWS Identity and Access Management** – This blog post describes how to enhance your organizational security visibility by enabling and centralizing IAM Access Analyzer findings.
- **AWS Systems Manager Parameter Store** provides secure, hierarchical storage for configuration data management and secrets management. You can use it to share configuration information in a secure location, for use by AWS Systems Manager and by AWS CloudFormation. For example, you can store a list of Regions in which you want to deploy conformance packs.
Identity

- Link Azure AD user identity into AWS accounts and applications for single sign-on – This blog post describes how to use Azure AD with IAM Identity Center and AWS Control Tower.
- Manage access to AWS centrally for Okta users with AWS IAM Identity Center – This blog post describes how to use Okta with IAM Identity Center and AWS Control Tower.

Logging

- AWS Centralized Logging Solution – This solutions post describes the Centralized Logging solution which enables organizations to collect, analyze, and display logs on AWS across multiple accounts and AWS Regions.

Deploying resources and managing workloads

Deploy and manage resources and workloads.

- Getting Started Library integration – This blog post describes Getting Started portfolios you can use.
- Continuous deployment of Cloud Custodian to AWS Control Tower

Working with existing organizations and accounts

Work with existing AWS organizations and accounts.

- Enroll an account – This user guide topic describes how to enroll an existing AWS account in AWS Control Tower.
- Bring an account under AWS Control Tower – This blog post describes how to deploy AWS Control Tower into your existing AWS organizations.
- Extend AWS Control Tower governance using AWS Config conformance packs – This blog post describes how to deploy AWS Config conformance packs to assist with bringing existing accounts and organizations into governance by AWS Control Tower.
- How to Detect and Mitigate Guardrail Violation with AWS Control Tower – This blog post describes how to add controls and how to subscribe to SNS notifications so that you can be notified by email of control compliance violations.

Automation and integration

Automate account creation and integrate lifecycle events with AWS Control Tower.

- Lifecycle events – This blog post describes how to use lifecycle events with AWS Control Tower.
- Automate account creation – This blog post describes how to set up automated account creation in AWS Control Tower.
- Amazon VPC flow log automation – This blog post describes how to automate and centralize Amazon VPC Flow Logs in a multi-account environment.
- Automate VPC tagging with AWS Control Tower lifecycle events – This blog post describes how to automate resource tagging for VPCs, by means of lifecycle events in AWS Control Tower.
- Automated account management – This blog post describes how to automate account management tasks after your AWS Control Tower environment is set up.
Migrating workloads

Use other AWS services with AWS Control Tower to assist in workload migration.

- **CloudEndure migration** – This blog post describes how to combine CloudEndure and other AWS services with AWS Control Tower to assist in workload migration.

Related AWS services

AWS Control Tower acts as an orchestration layer for AWS Organizations. Therefore, by means of the AWS Organizations console and APIs, you have access to over 20 other AWS services that work with AWS Control Tower. These additional services are not accessible directly through the AWS Control Tower console.

- For a full list of services available to AWS Control Tower by means of AWS Organizations, see [AWS services that you can use with AWS Organizations](#).
- To enable multi-account capabilities for these related AWS services, you must enable trusted access. For more information, see [Using AWS Organizations with other AWS services](#).

  **Note**
  
  Remember that AWS IAM Identity Center, AWS Config, and AWS CloudTrail are set up for you in AWS Control Tower and fully integrated. You do not need to modify your trusted access or delegated administration settings for these services.

- Some AWS services available through AWS Organizations can use delegated administration, including AWS Systems Manager and AWS Firewall Manager. For more information, see [Configuring a Delegated Administrator](#) and [Enabling a delegated administrator account for Firewall Manager](#). Also see this video, [Set up security groups with AWS Firewall Manager](#).

AWS Marketplace solutions

Discover solutions from AWS Marketplace.

- **AWS Control Tower Marketplace** – AWS Marketplace offers a broad range of solutions for AWS Control Tower to help you integrate third-party software. These solutions help solve key infrastructure and operational use cases including identity management, security for a multi-account environment, centralized networking, operational intelligence, and security information and event management (SIEM).
AWS Control Tower release notes

Following are details about AWS Control Tower releases that require an update for an AWS Control Tower landing zone, as well as releases that are incorporated into the service automatically.

Features and releases are listed in reverse chronological order (most recent first) based on the date on which they were officially announced to the public. Because there can be a lag between when the feature or release is documented and when it is officially announced, the date listed for a feature or release here may differ slightly from the date in the Document history (p. 1492).

Features released in 2023 (p. 1456)
Features released in 2022 (p. 1469)
Features released in 2021 (p. 1478)
Features released in 2020 (p. 1485)
Features released in 2019 (p. 1489)

January 2023 - Present

Since January 2023, AWS Control Tower has released the following updates:

- AWS Control Tower available in Asia Pacific (Melbourne) Region (p. 1457)
- Transition to new AWS Service Catalog External product type (p. 1457)
- New control API available (p. 1457)
- AWS Control Tower adds additional controls (p. 1458)
- New drift type reported: trusted access disabled (p. 1459)
- Four additional AWS Regions (p. 1460)
- AWS Control Tower available in Tel Aviv Region (p. 1460)
- AWS Control Tower launches 28 new proactive controls (p. 1460)
- AWS Control Tower deprecates two controls (p. 1462)
- AWS Control Tower landing zone version 3.2 (p. 1462)
- AWS Control Tower handles accounts based on ID (p. 1463)
- Additional Security Hub detective controls available in the AWS Control Tower controls library (p. 1463)
- AWS Control Tower publishes control metadata tables (p. 1464)
- Terraform support for Account Factory Customization (p. 1464)
- AWS IAM Identity Center self-management available for landing zone (p. 1465)
- AWS Control Tower addresses mixed governance for OUs (p. 1465)
- Additional proactive controls available (p. 1465)
- Updated Amazon EC2 proactive controls (p. 1467)
- Seven additional AWS Regions available (p. 1467)
- Account Factory for Terraform (AFT) account customization request tracing (p. 1468)
AWS Control Tower available in Asia Pacific (Melbourne) Region

November 3, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower is available in Asia Pacific (Melbourne) Region.

If you are already using AWS Control Tower and you want to extend its governance features to this Region in your accounts, go to the Settings page in your AWS Control Tower dashboard, select the Region, and then update your landing zone. After a landing zone update, you must update all accounts that are governed by AWS Control Tower, to bring your accounts and OUs under governance in the new Region. For more information, see About Updates.

For a full list of Regions in which AWS Control Tower is available, see the AWS Region Table.

Transition to new AWS Service Catalog External product type

October 31, 2023

(No update required for AWS Control Tower landing zone.)

HashiCorp updated their Terraform licensing. As a result, AWS Service Catalog updated support for Terraform Open Source products and provisioned products to a new product type, called External.

AWS Control Tower does not support Account Factory customizations that rely on the AWS Service Catalog External product type. To avoid disruption to existing workloads and AWS resources in your accounts, follow the AWS Control Tower transition steps in this suggested order, by December 14, 2023:

1. Upgrade your existing Terraform Reference Engine for AWS Service Catalog to include support for both External and Terraform Open Source product types. For instructions about updating your Terraform Reference Engine, review the AWS Service Catalog GitHub Repository.
2. Go to AWS Service Catalog and duplicate any existing Terraform Open Source blueprints to use the new External product type. Do not terminate the existing Terraform Open Source blueprints.
3. Continue to use your existing Terraform Open Source blueprints to create or update accounts in AWS Control Tower.

New control API available

October 14, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower now supports an additional API that you can use to deploy and manage your AWS Control Tower controls, at scale. For more information about the AWS Control Tower control APIs, see the API Reference.

AWS Control Tower added a new control API.
• GetEnabledControl—The API call provides details about an enabled control.

We also updated this API:

ListEnabledControls—This API call lists the controls enabled by AWS Control Tower on the specified organizational unit and the accounts it contains. It now returns additional information in an EnabledControlSummary object.

With these APIs, you can perform several common operations programmatically. For example:

• Get a list of all the controls you’ve enabled from the AWS Control Tower controls library.
• For any enabled control, you can get information about the Regions in which the control is supported, the control's identifier (ARN), the drift status of the control, and the control's status summary.

AWS Control Tower adds additional controls

October 5, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower announces new proactive and detective controls.

Proactive controls in AWS Control Tower are implemented by means of AWS CloudFormation Hooks, which identify and block non-compliant resources before AWS CloudFormation provisions them. Proactive controls complement existing preventive and detective control capabilities in AWS Control Tower.

New proactive controls

• [CT.ATHENA.PR.1] Require an Amazon Athena workgroup to encrypt Athena query results at rest
• [CT.ATHENA.PR.2] Require an Amazon Athena workgroup to encrypt Athena query results at rest with an AWS Key Management Service (KMS) key
• [CT.CLOUDTRAIL.PR.4] Require an AWS CloudTrail Lake event data store to enable encryption at rest with an AWS KMS key
• [CT.DAX.PR.2] Require an Amazon DAX cluster to deploy nodes to at least three Availability Zones
• [CT.EC2.PR.14] Require an Amazon EBS volume configured through an Amazon EC2 launch template to encrypt data at rest
• [CT.EKS.PR.2] Require an Amazon EKS cluster to be configured with secret encryption using AWS Key Management Service (KMS) keys
• [CT.ELASTICLOADBALANCING.PR.14] Require a Network Load Balancer to have cross-zone load balancing activated
• [CT.ELASTICLOADBALANCING.PR.15] Require that an Elastic Load Balancing v2 target group does not explicitly disable cross-zone load balancing
• [CT.EMR.PR.1] Require that an Amazon EMR (EMR) security configuration is configured to encrypt data at rest in Amazon S3
• [CT.EMR.PR.2] Require that an Amazon EMR (EMR) security configuration is configured to encrypt data at rest in Amazon S3 with an AWS KMS key
• [CT.EMR.PR.3] Require that an Amazon EMR (EMR) security configuration is configured with EBS volume local disk encryption using an AWS KMS key
• [CT.EMR.PR.4] Require that an Amazon EMR (EMR) security configuration is configured to encrypt data in transit
• [CT.GLUE.PR.1] Require an AWS Glue job to have an associated security configuration
New drift type reported: trusted access disabled

- **[CT.GLUE.PR.2]** Require an AWS Glue security configuration to encrypt data in Amazon S3 targets using AWS KMS keys
- **[CT.KMS.PR.2]** Require that an AWS KMS asymmetric key with RSA key material used for encryption has a key length greater than 2048 bits
- **[CT.KMS.PR.3]** Require an AWS KMS key policy to have a statement that limits creation of AWS KMS grants to AWS services
- **[CT.LAMBDA.PR.4]** Require an AWS Lambda layer permission to grant access to an AWS organization or specific AWS account
- **[CT.LAMBDA.PR.5]** Require an AWS Lambda function URL to use AWS IAM-based authentication
- **[CT.LAMBDA.PR.6]** Require an AWS Lambda function URL CORS policy to restrict access to specific origins
- **[CT.NEPTUNE.PR.4]** Require an Amazon Neptune DB cluster to enable Amazon CloudWatch log export for audit logs
- **[CT.NEPTUNE.PR.5]** Require an Amazon Neptune DB cluster to set a backup retention period greater than or equal to seven days
- **[CT.REDSHIFT.PR.9]** Require that an Amazon Redshift cluster parameter group is configured to use Secure Sockets Layer (SSL) for encryption of data in transit

These new proactive controls are available in commercial AWS Regions where AWS Control Tower is available. For more details about these controls, see Proactive controls (p. 230). For more details about where the controls are available, see Control limitations (p. 28).

New detective controls

New controls were added to the Security Hub Service-Managed Standard: AWS Control Tower. These controls help you enhance your governance posture. They act as part of the Security Hub Service-Managed Standard: AWS Control Tower, after you enable them on any specific OU.

- **[SH.Athena.1]** Athena workgroups should be encrypted at rest
- **[SH.Neptune.1]** Neptune DB clusters should be encrypted at rest
- **[SH.Neptune.2]** Neptune DB clusters should publish audit logs to CloudWatch Logs
- **[SH.Neptune.3]** Neptune DB cluster snapshots should not be public
- **[SH.Neptune.4]** Neptune DB clusters should have deletion protection enabled
- **[SH.Neptune.5]** Neptune DB clusters should have automated backups enabled
- **[SH.Neptune.6]** Neptune DB cluster snapshots should be encrypted at rest
- **[SH.Neptune.7]** Neptune DB clusters should have IAM database authentication enabled
- **[SH.Neptune.8]** Neptune DB clusters should be configured to copy tags to snapshots
- **[SH.RDS.27]** RDS DB clusters should be encrypted at rest

The new AWS Security Hub detective controls are available in most AWS Regions where AWS Control Tower is available. For more details about these controls, see Controls that apply to Service-Managed Standard: AWS Control Tower. For more details about where the controls are available, see Control limitations (p. 28).

New drift type reported: trusted access disabled

September 21, 2023

(No update required for AWS Control Tower landing zone.)

After you set up your AWS Control Tower landing zone, you can disable trusted access to AWS Control Tower in AWS Organizations. However, doing so causes drift.
With the trusted access disabled drift type, AWS Control Tower notifies you when this type of drift occurs, so you can repair your AWS Control Tower landing zone. For more information, see Types of governance drift.

Four additional AWS Regions

September 13, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower is now available in Asia Pacific (Hyderabad), Europe (Spain and Zurich), and Middle East (UAE).

If you are already using AWS Control Tower and you want to extend its governance features to this Region in your accounts, go to the Settings page in your AWS Control Tower dashboard, select the Region, and then update your landing zone. After a landing zone update, you must update all accounts that are governed by AWS Control Tower to bring your accounts and OUs under governance in the new Region. For more information, see About Updates.

For a full list of Regions in which AWS Control Tower is available, see the AWS Region Table.

AWS Control Tower available in Tel Aviv Region

August 28, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower announces availability in the Israel (Tel Aviv) Region.

If you are already using AWS Control Tower and you want to extend its governance features to this Region in your accounts, go to the Settings page in your AWS Control Tower dashboard, select the Region, and then update your landing zone. After a landing zone update, you must update all accounts that are governed by AWS Control Tower to bring your accounts and OUs under governance in the new Region. For more information, see About Updates.

For a full list of Regions in which AWS Control Tower is available, see the AWS Region Table.

AWS Control Tower launches 28 new proactive controls

July 24, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower is adding 28 new proactive controls, to assist you in managing your AWS environment.

Proactive controls enhance the governance capabilities of AWS Control Tower across your multi-account AWS environments, by blocking non-compliant resources before they are provisioned. These controls help manage AWS services such as Amazon CloudWatch, Amazon Neptune, Amazon ElastiCache, AWS Step Functions, and Amazon DocumentDB. The new controls help you meet control objectives such as establishing logging and monitoring, encrypting data at rest, or improving resiliency.

Here is a full list of the new controls:

- [CT.APPSYNC.PR.1] Require an AWS AppSync GraphQL API to have logging enabled
- [CT.CLOUDWATCH.PR.1] Require an Amazon CloudWatch alarm to have an action configured for the alarm state
AWS Control Tower User Guide

AWS Control Tower launches 28 new proactive controls

- [CT.CLOUDWATCH.PR.2] Require an Amazon CloudWatch log group to be retained for at least one year
- [CT.CLOUDWATCH.PR.3] Require an Amazon CloudWatch log group to be encrypted at rest with an AWS KMS key
- [CT.CLOUDWATCH.PR.4] Require an Amazon CloudWatch alarm action to be activated
- [CT.DOCUMENTDB.PR.1] Require an Amazon DocumentDB cluster to be encrypted at rest
- [CT.DOCUMENTDB.PR.2] Require an Amazon DocumentDB cluster to have automatic backups enabled
- [CT.DYNAMODB.PR.2] Require an Amazon DynamoDB table to be encrypted at rest using AWS KMS keys
- [CT.EC2.PR.13] Require an Amazon EC2 instance to have detailed monitoring enabled
- [CT.EKS.PR.1] Require an Amazon EKS cluster to be configured with public access disabled to the cluster Kubernetes API server endpoint
- [CT.ELASTICACHE.PR.1] Require an Amazon ElastiCache for Redis cluster to have automatic backups activated
- [CT.ELASTICACHE.PR.2] Require an Amazon ElastiCache for Redis cluster to have automatic minor version upgrades activated
- [CT.ELASTICACHE.PR.3] Require an Amazon ElastiCache for Redis replication group to have automatic failover activated
- [CT.ELASTICACHE.PR.4] Require an Amazon ElastiCache replication group to have encryption at rest activated
- [CT.ELASTICACHE.PR.5] Require an Amazon ElastiCache for Redis replication group to have encryption in transit activated
- [CT.ELASTICACHE.PR.6] Require an Amazon ElastiCache cache cluster to use a custom subnet group
- [CT.ELASTICACHE.PR.7] Require an Amazon ElastiCache replication group of earlier Redis versions to have Redis AUTH authentication
- [CT.ELASTICBEANSTALK.PR.3] Require an AWS Elastic Beanstalk environment to have a logging configuration
- [CT.LAMBDA.PR.3] Require an AWS Lambda function to be in a customer-managed Amazon Virtual Private Cloud (VPC)
- [CT.NEPTUNE.PR.1] Require an Amazon Neptune DB cluster to have AWS Identity and Access Management (IAM) database authentication
- [CT.NEPTUNE.PR.2] Require an Amazon Neptune DB cluster to have deletion protection enabled
- [CT.NEPTUNE.PR.3] Require an Amazon Neptune DB cluster to have storage encryption enabled
- [CT.REDSHIFT.PR.8] Require an Amazon Redshift cluster to be encrypted
- [CT.S3.PR.9] Require that an Amazon S3 bucket has S3 Object Lock activated
- [CT.S3.PR.10] Require an Amazon S3 bucket to have server-side encryption configured using AWS KMS keys
- [CT.S3.PR.11] Require an Amazon S3 bucket to have versioning enabled
- [CT.STEPFUNCTIONS.PR.1] Require an AWS Step Functions state machine to have logging activated
- [CT.STEPFUNCTIONS.PR.2] Require an AWS Step Functions state machine to have AWS X-Ray tracing activated

Proactive controls in AWS Control Tower are implemented by means of AWS CloudFormation Hooks, which identify and block non-compliant resources before AWS CloudFormation provisions them. Proactive controls complement existing preventive and detective control capabilities in AWS Control Tower.

These new proactive controls are available in all AWS Regions where AWS Control Tower is available. For more details about these controls, see Proactive controls (p. 230).
AWS Control Tower deprecates two controls

July 18, 2023

AWS Control Tower deprecates two controls

AWS Control Tower conducts regular reviews of its security controls to ensure that they are up to date and are still considered best practices. The following two controls have been deprecated, effective July 18, 2023, and they will be removed from the controls library, effective August 18, 2023. You can no longer enable these controls on any organizational units. You can choose to deactivate these controls before the removal date.

- [SH.S3.4] S3 buckets should have server-side encryption enabled
- [CT.S3.PR.7] Require an Amazon S3 bucket to have server-side encryption configured

Reason for deprecation

As of January 2023, Amazon S3 configured default encryption on all new and existing unencrypted buckets to apply server-side encryption with S3 managed keys (SSE-S3) as the base level of encryption for new objects uploaded to these buckets. No changes have been made to the default encryption configuration for an existing bucket that already had SSE-S3 or server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS) configured.

AWS Control Tower landing zone version 3.2

June 16, 2023

AWS Control Tower landing zone version 3.2 brings the controls that are part of the AWS Security Hub Service-Managed Standard: AWS Control Tower to general availability. It introduces the ability to view the drift status of controls that are part of this standard in the AWS Control Tower console.

This update includes a new service-linked role (SLR), called the AWSServiceRoleForAWSControlTower. This role assists AWS Control Tower by creating an EventBridge Managed Rule, called the AWSControlTowerManagedRule in each member account. This managed rule collects AWS Security Hub Finding events, from with AWS Control Tower can determine control drift.

This rule is the first managed rule to be created by AWS Control Tower. The rule is not deployed by a stack; it is deployed directly from the EventBridge APIs. You can view the rule in the EventBridge console, or by means of the EventBridge APIs. If the managed-by field is populated, it will show the AWS Control Tower service principal.

Previously, AWS Control Tower assumed the AWSControlTowerExecution role to perform operations in member accounts. This new role and rule are better aligned with the best practices principle of allowing least privilege when performing operations in a multi-account AWS environment. The new role provides scoped-down permissions that specifically allow: creating the managed rule in member accounts, maintaining the managed rule, publishing security notifications through SNS, and verifying drift. For more information, see AWSServiceRoleForAWSControlTower (p. 1403).

The landing zone 3.2 update also includes a new StackSet resource in the management account, BP_BASELINE_SERVICE_LINKED_ROLE, which initially deploys the service-linked role.

When reporting Security Hub control drift (in landing zone 3.2 and later), AWS Control Tower receives a daily status update from Security Hub. Although controls are active in every governed Region, AWS
AWS Control Tower User Guide
AWS Control Tower handles accounts based on ID

Control Tower sends the AWS Security Hub Finding events to the AWS Control Tower home Region only. For more information, see Security Hub control drift reporting (p. 1342).

Update to the Region Deny control
This landing zone version also includes an update to the Region Deny control.

Global services and APIs added
- AWS Billing and Cost Management (billing:*)
- AWS CloudTrail (cloudtrail:LookupEvents) to allow visibility of global events in member accounts.
- AWS Consolidated Billing (consolidatedbilling:*)
- AWS Management Console Mobile Application (consoleapp:*)
- AWS Free Tier (freetier:*)
- AWS Invoicing (invoicing:*)
- AWS IQ (iq:*)
- AWS User Notifications (notifications:*)
- AWS User Notifications Contacts (notifications-contacts:*)
- Amazon Payments (payments:*)
- AWS Tax Settings (tax:*)

Global services and APIs removed
- Removed s3:GetAccountPublic because it is not a valid action.
- Removed s3:PutAccountPublic because it is not a valid action.

AWS Control Tower handles accounts based on ID

June 14, 2023
(No update required for AWS Control Tower landing zone.)

AWS Control Tower now creates and manages accounts that you create in Account Factory by tracking the AWS account ID, rather than the account's email address.

When provisioning an account, the account requester always must have the CreateAccount and the DescribeCreateAccountStatus permissions. This permission set is part of the Admin role, and it is given automatically when a requester assumes the Admin role. If you delegate permission to provision accounts, you may need to add these permissions directly for the account requestors.

Additional Security Hub detective controls available in the AWS Control Tower controls library

June 12, 2023
(No update required for AWS Control Tower landing zone.)

AWS Control Tower has added ten new AWS Security Hub detective controls to the AWS Control Tower controls library. These new controls target services such as API Gateway, AWS CodeBuild, Amazon Elastic Compute Cloud (EC2), Amazon Elastic Load Balancer, Amazon Redshift, Amazon SageMaker, and AWS WAF. These new controls help you enhance your governance posture by meeting control objectives, such as Establish logging and monitoring, Limit network access, and Encrypt data at rest.
These controls act as part of the Security Hub Service-Managed Standard: AWS Control Tower, after you enable them on any specific OU.

- [SH.Account.1] Security contact information should be provided for an AWS account
- [SH.APIGateway.8] API Gateway routes should specify an authorization type
- [SH.APIGateway.9] Access logging should be configured for API Gateway V2 Stages
- [SH.CodeBuild.3] CodeBuild S3 logs should be encrypted
- [SH.EC2.25] EC2 launch templates should not assign public IPs to network interfaces
- [SH.ELB.1] Application Load Balancer should be configured to redirect all HTTP requests to HTTPS
- [SH.Redshift.10] Redshift clusters should be encrypted at rest
- [SH.SageMaker.2] SageMaker notebook instances should be launched in a custom VPC
- [SH.SageMaker.3] Users should not have root access to SageMaker notebook instances
- [SH.WAF.10] A WAFV2 web ACL should have at least one rule or rule group

The new AWS Security Hub detective controls are available in all AWS Regions where AWS Control Tower is available. For more details about these controls, see Controls that apply to Service-Managed Standard: AWS Control Tower.

AWS Control Tower publishes control metadata tables

June 7, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower now provides full tables of control metadata as part of the published documentation. When working with the control APIs, you can look up each control's API controlIdentifier, which is a unique ARN associated with each AWS Region. The tables include the frameworks and control objectives that each control covers. Previously, this information was available in the console only.

The tables also include the metadata for Security Hub controls that are part of the AWS Security Hub Service-Managed Standard:AWS Control Tower. For full details, see Tables of control metadata (p. 1501).

For an abbreviated list of control identifiers, and some usage examples, see Resource identifiers for APIs and controls (p. 200).

Terraform support for Account Factory Customization

June 6, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower offers single-Region support for Terraform through Account Factory Customization (AFC). Starting with this release, you can use AWS Control Tower and Service Catalog together, to define AFC account blueprints, in Terraform open source. You can customize your new and existing AWS accounts, before you provision resources in AWS Control Tower. By default, this feature enables you to deploy and update accounts, with Terraform, in your AWS Control Tower home Region.

An account blueprint describes the specific resources and configurations that are required when an AWS account is provisioned. You can use the blueprint as a template to create multiple AWS accounts at scale.
To get started, use the Terraform Reference Engine on GitHub. The Reference Engine configures the code and infrastructure required for the Terraform open source engine to work with Service Catalog. This one-time setup process takes a few minutes. After that, you can define your custom account requirements in Terraform, and then deploy your accounts with the well-defined AWS Control Tower account factory workflow. Customers who prefer to work with Terraform can utilize AWS Control Tower account customization at scale with AFC, and gain immediate access to each account after it is provisioned.

To learn how to create these customizations, see Creating Products and Getting started with Terraform open source in the Service Catalog documentation. This feature is available in all AWS Regions where AWS Control Tower is available.

AWS IAM Identity Center self-management available for landing zone

June 6, 2023

(No update required for AWS Control Tower landing zone.)

AWS Control Tower now supports an optional choice of identity provider for an AWS Control Tower landing zone, which you can configure during setup or update. By default, the landing zone is opted-in to using AWS IAM Identity Center, in alignment with best-practices guidance defined in Organizing Your AWS Environment Using Multiple Accounts. You now have three alternatives:

- You can accept the default and allow AWS Control Tower to set up and manage AWS IAM Identity Center for you.
- You can choose to self-manage AWS IAM Identity Center, to reflect your specific business requirements.
- You can optionally bring and self-manage a third-party identity provider, by connecting it through IAM Identity Center, if needed. You should use identity provider optionality if your regulatory environment requires you to use a specific provider, or if you operate in AWS Regions where AWS IAM Identity Center is not available.

For more information, see IAM Identity Center guidance (p. 43).

Selection of identity providers at the account level is not supported. This feature applies only for the landing zone as a whole. AWS Control Tower identity provider optionality is available in all AWS Regions where AWS Control Tower is available.

AWS Control Tower addresses mixed governance for OUs

June 1, 2023

(No update required for AWS Control Tower landing zone.)

With this release, AWS Control Tower prevents controls from deploying to an organizational unit (OU), if that OU is in a state of mixed governance. Mixed governance occurs in an OU if accounts are not updated after AWS Control Tower extends governance to a new AWS Region, or removes governance. This release helps you keep the member accounts of that OU in uniform compliance. For more information, see Avoid mixed governance when configuring Regions (p. 99).

Additional proactive controls available

May 19, 2023
AWS Control Tower User Guide
Additional proactive controls available

(No update required for AWS Control Tower landing zone.)

AWS Control Tower is adding 28 new proactive controls to assist you in governing your multi-account environment and meeting specific control objectives, such as data encryption at rest, or limiting network access. Proactive controls are implemented with AWS CloudFormation hooks that check your resources before they are provisioned. The new controls can help govern AWS services such as Amazon OpenSearch Service, Amazon EC2 Auto Scaling, Amazon SageMaker, Amazon API Gateway, and Amazon Relational Database Service (RDS).

Proactive controls are supported in all commercial AWS Regions where AWS Control Tower is available.

**Amazon OpenSearch Service**

- [CT.OPENSEARCH.PR.1] Require an Elasticsearch domain to encrypt data at rest
- [CT.OPENSEARCH.PR.2] Require an Elasticsearch domain to be created in a user-specified Amazon VPC
- [CT.OPENSEARCH.PR.3] Require an Elasticsearch domain to encrypt data sent between nodes
- [CT.OPENSEARCH.PR.4] Require an Elasticsearch domain to send error logs to Amazon CloudWatch Logs
- [CT.OPENSEARCH.PR.5] Require an Elasticsearch domain to send audit logs to Amazon CloudWatch Logs
- [CT.OPENSEARCH.PR.6] Require an Elasticsearch domain to have zone awareness and at least three data nodes
- [CT.OPENSEARCH.PR.7] Require an Elasticsearch domain to have at least three dedicated master nodes
- [CT.OPENSEARCH.PR.8] Require an Elasticsearch Service domain to use TLSv1.2
- [CT.OPENSEARCH.PR.9] Require an Amazon OpenSearch Service domain to encrypt data at rest
- [CT.OPENSEARCH.PR.10] Require an Amazon OpenSearch Service domain to be created in a user-specified Amazon VPC
- [CT.OPENSEARCH.PR.11] Require an Amazon OpenSearch Service domain to encrypt data sent between nodes
- [CT.OPENSEARCH.PR.12] Require an Amazon OpenSearch Service domain to send error logs to Amazon CloudWatch Logs
- [CT.OPENSEARCH.PR.13] Require an Amazon OpenSearch Service domain to send audit logs to Amazon CloudWatch Logs
- [CT.OPENSEARCH.PR.14] Require an Amazon OpenSearch Service domain to have zone awareness and at least three data nodes
- [CT.OPENSEARCH.PR.15] Require an Amazon OpenSearch Service domain to use fine-grained access control
- [CT.OPENSEARCH.PR.16] Require an Amazon OpenSearch Service domain to use TLSv1.2

**Amazon EC2 Auto Scaling**

- [CT.AUTOISCALING.PR.1] Require an Amazon EC2 Auto Scaling group to have multiple Availability Zones
- [CT.AUTOISCALING.PR.2] Require an Amazon EC2 Auto Scaling group launch configuration to configure Amazon EC2 instances for IMDSv2
- [CT.AUTOISCALING.PR.3] Require an Amazon EC2 Auto Scaling launch configuration to have a single-hop metadata response limit
- [CT.AUTOISCALING.PR.4] Require an Amazon EC2 Auto Scaling group associated with an Amazon Elastic Load Balancing (ELB) to have ELB health checks activated
- [CT.AUTOISCALING.PR.5] Require that an Amazon EC2 Auto Scaling group launch configuration does not have Amazon EC2 instances with public IP addresses
- [CT.AUTOISCALING.PR.6] Require any Amazon EC2 Auto Scaling groups to use multiple instance types
• [CT.AUTOSCALING.PR.8] Require an Amazon EC2 Auto Scaling group to have EC2 launch templates configured

**Amazon SageMaker**

• [CT.SAGEMAKER.PR.1] Require an Amazon SageMaker notebook instance to prevent direct internet access
• [CT.SAGEMAKER.PR.2] Require Amazon SageMaker notebook instances to be deployed within a custom Amazon VPC
• [CT.SAGEMAKER.PR.3] Require Amazon SageMaker notebook instances to have root access disallowed

**Amazon API Gateway**

• [CT.APIGATEWAY.PR.5] Require Amazon API Gateway V2 Websocket and HTTP routes to specify an authorization type

**Amazon Relational Database Service (RDS)**

• [CT.RDS.PR.25] Require an Amazon RDS database cluster to have logging configured

For more information, see Proactive controls (p. 230).

### Updated Amazon EC2 proactive controls

**May 2, 2023**

(No update required for AWS Control Tower landing zone.)

AWS Control Tower has updated two proactive controls: CT.EC2.PR.3 and CT.EC2.PR.4.

For the updated CT.EC2.PR.3 control, any AWS CloudFormation deployment that references a prefix list for a security group resource is blocked from deployment, unless it is for port 80 or 443.

For the updated CT.EC2.PR.4 control, any AWS CloudFormation deployment that references a prefix list for a security group resource is blocked if the port is 3389, 20, 23, 110, 143, 3306, 8080, 1433, 9200, 9300, 25, 445, 135, 21, 1434, 4333, 5432, 5500, 5601, 22, 3000, 5000, 8088, 8888.

### Seven additional AWS Regions available

**April 19, 2023**

(No update required for AWS Control Tower landing zone.)

AWS Control Tower is now available in seven additional AWS Regions: Northern California (San Francisco), Asia Pacific (Hong Kong, Jakarta, and Osaka), Europe (Milan), Middle East (Bahrain), and Africa (Cape Town). These additional Regions for AWS Control Tower, called opt-in Regions, are not active by default, except the US West (N. California) Region, which is active by default.

Some controls in AWS Control Tower do not operate in some of these additional AWS Regions where AWS Control Tower is available, because those Regions do not support the required underlying functionality. For details, see Control limitations (p. 28).

Among these new Regions, CfCT is not available in Asia Pacific (Jakarta and Osaka). Availability in other AWS Regions is unchanged.
For more information about how AWS Control Tower manages the limitations of Regions and controls, see [Considerations for activating AWS opt-in Regions (p. 100)](#).

The VPCe endpoints required by AFT are not available in the Middle East (Bahrain) Region. Customers deploying AFT in this Region are required to deploy with parameter `aft_vpc_endpoints=false`. For more information, see the parameter in [the README file](#).

AWS Control Tower VPCs have two Availability Zones in the US West (N. California) Region, `us-west-1`, due to a limitation in Amazon EC2. In the US West (N. California), six subnets are divided across two Availability Zones. For more information, see [Overview of AWS Control Tower and VPCs (p. 84)](#).

AWS Control Tower added new permissions to `AWSControlTowerServiceRolePolicy` that allow AWS Control Tower to make calls to the `EnableRegion`, `ListRegions`, and `GetRegionOptStatus` APIs implemented by the AWS Account Management service, to make these additional AWS Regions available for your shared accounts in the landing zone (Management account, Log archive account, Audit account) and your OU member accounts. For more information, see [Managed policies for AWS Control Tower](#).

## Account Factory for Terraform (AFT) account customization request tracing

February 16, 2023

AFT supports account customization request tracing. Every time you submit an account customization request, AFT generates a unique tracing token that passes through an AFT customization AWS Step Functions state machine, which logs the token as part of its execution. You can use Amazon CloudWatch Logs insights queries to search timestamp ranges and retrieve the request token. As a result, you can see payloads that accompany the token, so you can trace your account customization request throughout the entire AFT workflow. For more information about AFT, see [Overview of AWS Control Tower Account Factory for Terraform](#). For information about CloudWatch Logs and Step Functions, see the following:

- [What is Amazon CloudWatch Logs?](#) in the [Amazon CloudWatch Logs User Guide](#)
- [What is AWS Step Functions?](#) in the [AWS Step Functions Developer Guide](#)

## AWS Control Tower landing zone version 3.1

February 9, 2023

(Update required for AWS Control Tower landing zone to version 3.1. For information, see [Update Your Landing Zone (p. 47)](#))

AWS Control Tower landing zone version 3.1 includes the following updates:

- With this release, AWS Control Tower deactivates unnecessary access logging for your `access logging bucket`, which is the Amazon S3 bucket where access logs are stored in the Log Archive account, while continuing to enable server access logging for S3 buckets. This release also includes updates to the Region Deny control that allow additional actions for global services, such as AWS Support Plans and AWS Artifact.
- Deactivation of server access logging for the AWS Control Tower access logging bucket causes Security Hub to create a finding for the Log Archive account's `access logging bucket`, due to an AWS Security Hub rule, [S3.9] S3 bucket server access logging should be enabled. In alignment with Security Hub, we recommend that you suppress this particular finding, as stated in the Security Hub description of this rule. For additional information, see [information about suppressed findings](#).
- Access logging for the (regular) logging bucket in the Log Archive account is unchanged in version 3.1. In alignment with best practices, access events for that bucket are recorded as log entries in the `access`
Proactive controls generally available

January 24, 2023

(No update required for AWS Control Tower landing zone.)

Optional proactive controls, previously announced in preview status, are now generally available. These controls are referred to as proactive because they check your resources – before the resources are deployed – to determine whether the new resources comply with the controls that are activated in your environment. For more information, see Comprehensive controls assist in AWS resource provisioning and management (p. 1471).

January - December 2022

In 2022, AWS Control Tower released the following updates:

- Concurrent account operations (p. 1470)
- Account Factory Customization (AFC) (p. 1470)
- Comprehensive controls assist in AWS resource provisioning and management (p. 1471)
Concurrent account operations

December 16, 2022

AWS Control Tower now supports concurrent actions in account factory. You can create, update, or enroll up to five (5) accounts at a time. Submit up to five actions in succession and view the completion status of each request, while your accounts finish building in the background. For example, you no longer must wait for each process to complete before you update another account, or before you re-register an entire organizational unit (OU).

Account Factory Customization (AFC)

November 28, 2022

Account factory customization allows you to customize new and existing accounts from within the AWS Control Tower console. These new customization capabilities give you the flexibility to define account blueprints, which are AWS CloudFormation templates contained in a specialized Service Catalog product. Blueprints provision fully customized resources and configurations. You also may choose use pre-defined blueprints, built and managed by AWS partners, that help you customize accounts for specific use cases.

Previously, AWS Control Tower account factory did not support account customization in the console. With this update of account factory, you can pre-define account requirements and implement them as part of a well-defined workflow. You can apply blueprints to create new accounts, to enroll other AWS accounts into AWS Control Tower, and to update existing AWS Control Tower accounts.

When you provision, enroll, or update an account in account factory, you will select the blueprint to deploy. Those resources specified in the blueprint are provisioned in your account. When your account has finished building, all of the custom configurations are available for use immediately.

To get started with customizing accounts, you can define the resources for your intended use case in a Service Catalog product. You also can select partner-managed solutions from the AWS Getting Started Library. For more information, see Customize accounts with Account Factory Customization (AFC) (p. 129).
Comprehensive controls assist in AWS resource provisioning and management

November 28, 2022

(No update required for AWS Control Tower landing zone.)

AWS Control Tower now supports comprehensive controls management, including new, optional proactive controls, implemented through AWS CloudFormation hooks. These controls are referred to as proactive because they check your resources – before the resources are deployed – to determine whether the new resources will comply with the controls that are activated in your environment.

Over 130 new proactive controls assist you with meeting specific policy objectives for your AWS Control Tower environment; with meeting requirements of industry-standard compliance frameworks; and with governing AWS Control Tower interactions across more than twenty other AWS services.

The AWS Control Tower controls library classifies these controls according to the associated AWS services and resources. For more details, see Proactive controls (p. 230).

With this release, AWS Control Tower also is integrated with AWS Security Hub, by means of the new Security Hub Service-Managed Standard: AWS Control Tower, which supports the AWS Foundational Security Best Practices (FSBP) standard. You can view over 160 Security Hub controls alongside AWS Control Tower controls in the console, and you can obtain a Security Hub security score for your AWS Control Tower environment. For more information, see Security Hub standard (p. 1341).

Compliance status viewable for all AWS Config rules

November 18, 2022

(No update required for AWS Control Tower landing zone.)

AWS Control Tower now displays the compliance status of all AWS Config rules deployed into organizational units registered with AWS Control Tower. You can view the compliance status of all AWS Config rules that affect your accounts in AWS Control Tower, enrolled or unenrolled, without navigating outside of the AWS Control Tower console. Customers can choose to set up Config rules, called detective controls, in AWS Control Tower, or to set them up directly through the AWS Config service. The rules deployed by AWS Config are shown, along with the rules deployed by AWS Control Tower.

Previously, AWS Config rules deployed through the AWS Config service were not visible in the AWS Control Tower console. Customers had to navigate to the AWS Config service to identify non-compliant AWS Config rules. Now you can identify any non-compliant AWS Config rule within the AWS Control Tower console. To view the compliance status of all your Config rules, navigate to the Account details page in the AWS Control Tower console. You will see a list showing the compliance status of controls managed by AWS Control Tower and Config rules deployed outside of AWS Control Tower.

API for controls and a new AWS CloudFormation resource

September 1, 2022

(No update required for AWS Control Tower landing zone.)

AWS Control Tower now supports programmatic management of controls, also known as guardrails, through a set of API calls. A new AWS CloudFormation resource supports the API functionality for controls. For more details, see Automate tasks in AWS Control Tower (p. 50) and Creating AWS Control Tower resources with AWS CloudFormation (p. 54).
These APIs allow you to enable, disable, and view the application status of controls in the AWS Control Tower library. The APIs include support for AWS CloudFormation, so you can manage AWS resources as infrastructure-as-code (IaC). AWS Control Tower provides optional preventive and detective controls that express your policy intentions regarding an entire organizational unit (OU), and every AWS account within the OU. These rules remain in effect as you create new accounts or make changes to existing accounts.

APIs included in this release

- **EnableControl**– This API call activates a control. It starts an asynchronous operation that creates AWS resources on the specified organizational unit and the accounts it contains.
- **DisableControl**– This API call turns off a control. It starts an asynchronous operation that deletes AWS resources on the specified organizational unit and the accounts it contains.
- **GetControlOperation**– Returns the status of a particular EnableControl or DisableControl operation.
- **ListEnabledControls**– Lists the controls enabled by AWS Control Tower on the specified organizational unit and the accounts it contains.

To view a list of control names for optional controls, see Resource identifiers for APIs and controls (p. 200), in the AWS Control Tower User Guide.

CfCT supports stack set deletion

August 26, 2022

(No update required for AWS Control Tower landing zone.)

Customizations for AWS Control Tower (CfCT) now supports stack set deletion, by setting a parameter in the manifests.yaml file. For more information, see Delete a stack set (p. 67).

**Important**

When you initially set the value of enable_stack_set_deletion to true, the next time you invoke CfCT, **ALL** resources that begin with the prefix CustomControlTower-, which have the associated key tag Key:AWS_Solutions, Value: CustomControlTowerStackSet, and which are not declared in the manifest file, are staged for deletion.

Customized log retention

August 15, 2022

(Update required for AWS Control Tower landing zone. For information, see Update Your Landing Zone (p. 47))

AWS Control Tower now provides the ability to customize the retention policy for Amazon S3 buckets that store your AWS Control Tower CloudTrail logs. You can customize your Amazon S3 log retention policy, in increments of days or years, up to a maximum of 15 years.

If you choose not customize your log retention, the default settings are 1 year for standard account logging, and 10 years for access logging.

This feature is available for existing customers through AWS Control Tower when you update or repair your landing zone, and for new customers through the AWS Control Tower setup process.

Role drift repair available

August 11, 2022
AWS Control Tower now supports repair for role drift. You can restore a required role without a full repair of your landing zone. If this type of drift repair is needed, the console error page provides steps for restoring the role, so that your landing zone is once again available.

AWS Control Tower landing zone version 3.0

July 29, 2022

AWS Control Tower landing zone version 3.0 includes the following updates:

- The option to choose organization-level AWS CloudTrail trails, or to opt out of CloudTrail trails managed by AWS Control Tower.
- Two new detective controls to determine whether AWS CloudTrail is logging activity in your accounts.
- The option to aggregate AWS Config information about global resources in your home Region only.
- An update to the Region deny control.
- An update to the managed policy, `AWSControlTowerServiceRolePolicy`.
- We no longer create the IAM role `aws-controltower-CloudWatchLogsRole` and the CloudWatch log group `aws-controltower/CloudTrailLogs` in each enrolled account. Previously, we created these in each account for its account trail. With organization trails, we only create one in the management account.

The following sections provide more details about each new capability.

Organization-level CloudTrail trails in AWS Control Tower

With landing zone version 3.0, AWS Control Tower now supports organization-level AWS CloudTrail trails.

When you update your AWS Control Tower landing zone to version 3.0, you have the option to select organization-level AWS CloudTrail trails as your logging preference, or to opt out of CloudTrail trails that are managed by AWS Control Tower. When you update to version 3.0, AWS Control Tower deletes the existing account-level trails for enrolled accounts after a 24-hour waiting period. AWS Control Tower does not delete account-level trails for unenrolled accounts. Going forward from landing zone 3.0, AWS Control Tower no longer will support account-level trails that AWS manages. Instead, AWS Control Tower creates an organization-level trail, which is active or inactive, according to your selection.

Note

After you update to version 3.0 or later, you do not have the option to continue with account-level CloudTrail trails managed by AWS Control Tower.

No logging data is lost from your aggregated account logs, because the logs remain in the existing Amazon S3 bucket where they are stored. Only the trails are deleted, not the existing logs. If you select the option to add organization-level trails, AWS Control Tower opens a new path to a new folder within your Amazon S3 bucket and continues sending logging information to that location. If you choose to opt out of trails managed by AWS Control Tower, your existing logs remain in the bucket, unchanged.

Path naming conventions for log storage

- Account trail logs are stored with a path of this form: `/*org id*/AWSLogs/…`
- Organization trail logs are stored with a path of this form: `/*org id*/AWSLogs/*org id*/…`
The path that AWS Control Tower creates for your organization-level CloudTrail trails is different than the default path for a manually-created organization-level trail, which would have the following form:

- /AWSLogs/org_id/...

For more information about CloudTrail path naming, see Finding your CloudTrail log files.

Tip
If you plan to create and manage your own account-level trails, we recommend that you create the new trails before you complete the update to AWS Control Tower landing zone version 3.0, to start logging right away.

At any time, you may choose to create new account-level or organization-level CloudTrail trails and manage them on your own. The option to choose organization-level CloudTrail trails managed by AWS Control Tower is available during any landing zone update to version 3.0 or later. You can opt into and opt out of organization-level trails, whenever you update your landing zone.

If your logs are managed by a third-party service, be sure to give the new path name to your service.

Note
For landing zones at version 3.0 or later, account-level AWS CloudTrail trails are not supported by AWS Control Tower. You can create and maintain your own account-level trails at any time, or you can opt into organization-level trails managed by AWS Control Tower.

Record AWS Config resources in the home Region only

In landing zone version 3.0, AWS Control Tower has updated the baseline configuration for AWS Config so that it records global resources in the home Region only. After you update to version 3.0, resource recording for global resources is enabled only in your home Region.

This configuration is considered a best practice. It is recommended by AWS Security Hub and AWS Config, and it creates cost savings by reducing the number of configuration items created when global resources are created, modified, or deleted. Previously, each time a global resource was created, updated, or deleted, whether by a customer or by an AWS service, a configuration item was created for each item in each governed Region.

Two new detective controls for AWS CloudTrail logging

As part of the change to organization-level AWS CloudTrail trails, AWS Control Tower is introducing two new detective controls that check whether CloudTrail is enabled. The first control has Mandatory guidance, and it is enabled on the Security OU during setup or landing zone updates of 3.0 and later. The second control has Strongly recommended guidance, and it is optionally applied to any OUs other than the Security OU, which already has the mandatory control protection enforced.

Mandatory control: Detect whether shared accounts under the Security organizational unit have AWS CloudTrail or CloudTrail Lake enabled (p. 229)

Strongly recommended control: Detect whether an account has AWS CloudTrail or CloudTrail Lake enabled (p. 1369)

For more information about the new controls, see the The AWS Control Tower controls library (p. 215).

An update to the Region deny control

We updated the NotAction list in the Region deny control to include actions by some additional services, listed below:

```
"chatbot:**",
"s3:GetAccountPublic",
```
| "s3:DeleteMultiRegionAccessPoint", |
| "s3:DescribeMultiRegionAccessPointOperation", |
| "s3:GetMultiRegionAccessPoint", |
| "s3:GetMultiRegionAccessPointPolicy", |
| "s3:GetMultiRegionAccessPointPolicyStatus", |
| "s3:ListMultiRegionAccessPoints", |
| "s3:GetStorageLensConfiguration", |
| "s3:GetStorageLensDashboard", |
| "s3:ListStorageLensConfigurations" |
| "s3:GetAccountPublicAccessBlock", |
| "s3:PutAccountPublic", |
| "s3:PutAccountPublicAccessBlock" |

### Video Walkthrough

This video (3:07) describes how to update your existing AWS Control Tower landing zone to version 3. For better viewing, select the icon at the lower right corner of the video to enlarge it to full screen. Captioning is available.

**Video Walkthrough of Update an Existing AWS Control Tower Landing Zone to Landing Zone 3.**

### The Organization page combines views of OUs and accounts

**July 18, 2022**

(No update required for AWS Control Tower landing zone)

The new **Organization** page in AWS Control Tower shows a hierarchical view of all organizational units (OUs) and accounts. It combines the information from the **OUs** and **Accounts** pages, which existed previously.

On the new page, you can see relationships between parent OUs and their nested OUs and accounts. You can take action on groupings of resources. You can configure the page view. For example, you can expand or collapse the hierarchical view, filter the view to see accounts or OUs only, choose to view only your enrolled accounts and registered OUs, or you can view groups of related resources. It is easier to ensure that your entire organization is updated properly.

### Easier enroll and update for individual member accounts

**May 31, 2022**

(No update required for AWS Control Tower landing zone)

AWS Control Tower now gives you an improved capability to update and enroll member accounts individually. Each account shows when it is available for an update, so you can more easily ensure that your member accounts include the latest configuration. You can update your landing zone, remediate account drift, or enroll an account into a registered OU, in a few streamlined steps.

When you update an account, there’s no need to include an account’s entire organizational unit (OU) in each update action. As a result, the time required to update an individual account is greatly reduced.

You can enroll accounts into AWS Control Tower OUs with more help from the AWS Control Tower console. Existing accounts that you enroll in AWS Control Tower must still meet the account
prerequisites, and you must add the AWSControlTowerExecution role. Then, you can choose any registered OU and enroll the account into it by selecting the Enroll button.

We’ve separated the Enroll account functionality from the Create account workflow in account factory, to create more distinction between these similar processes, and help avoid setup errors when you’re entering account information.

AFT supports automated customization for shared AWS Control Tower accounts

May 27, 2022

(No update required for AWS Control Tower landing zone)

Account Factory for Terraform (AFT) now can programmatically customize and update any of your accounts that are managed by AWS Control Tower, including the management account, audit account, and log archive account, along with your enrolled accounts. You can centralize your account customization and update management, while protecting the security of your account configurations, because you scope the role that carries out the work.

The existing AWSAFTExecution role now deploys customizations in all accounts. You can set up IAM permissions with boundaries that limit the access of the AWSAFTExecution role according to your business and security requirements. You also can programmatically delegate the approved customization permissions in that role, for trusted users. As a best practice, we recommend that you restrict permissions to those that are necessary to deploy the required customizations.

AFT now creates the new AWSAFTService role to deploy AFT resources in all managed accounts, including the shared accounts and management account. Resources formerly were deployed by the AWSAFTExecution role.

The AWS Control Tower shared and management accounts are not provisioned through account factory, so they do not have corresponding provisioned products in AWS Service Catalog. Therefore, you are not able to update the shared and management accounts in Service Catalog.

Concurrent operations for all optional controls

May 18, 2022

(No update required for AWS Control Tower landing zone)

AWS Control Tower now supports concurrent operations for preventive controls, as well as for detective controls.

With this new feature, any optional control now can be applied or removed concurrently, thereby improving the ease of use and performance for all optional controls. You can enable multiple optional controls without waiting for individual control operations to complete. The only restricted times are when AWS Control Tower is in the process of landing zone setup, or while extending governance to a new organization.

Supported functionality for preventive controls:

• Apply and remove different preventive controls on the same OU.
• Apply and remove different preventive controls on different OUs, concurrently.
• Apply and remove the same preventive control on multiple OUs, concurrently.
• You can apply and remove any preventive and detective controls, concurrently.
You can experience these control concurrency improvements in all released versions of AWS Control Tower.

When you apply preventive controls to nested OUs, the preventive controls affect all accounts and OUs nested under the target OU, even if those accounts and OUs are not registered with AWS Control Tower. Preventive controls are implemented using Service Control Policies (SCPs), which are part of AWS Organizations. Detective controls are implemented using AWS Config rules. Guardrails remain in effect as you create new accounts or make changes to your existing accounts, and AWS Control Tower provides a summary report of how each account conforms to your enabled policies. For a full list of available controls, see the The AWS Control Tower controls library (p. 215).

Existing security and logging accounts

May 16, 2022

(Available during initial setup.)

AWS Control Tower now provides the option for you to specify an existing AWS account as an AWS Control Tower security or logging account, during the initial landing zone setup process. This option eliminates the need for AWS Control Tower to create new, shared accounts. The security account, which is called the Audit account by default, is a restricted account that gives your security and compliance teams access to all accounts in your landing zone. The logging account, which is called the Log Archive account by default, works as a repository. It stores logs of API activities and resource configurations from all accounts in your landing zone.

By bringing your existing security and logging accounts, it is easier to extend AWS Control Tower governance into your existing organizations, or to move to AWS Control Tower from an alternate landing zone. The option for you to use existing accounts is displayed during the initial landing zone setup. It includes checks during the setup process, which ensure successful deployment. AWS Control Tower implements the necessary roles and controls on your existing accounts. It does not remove or merge any existing resources or data that exists in these accounts.

Limitation: If you plan to bring existing AWS accounts into AWS Control Tower as audit and log archive accounts, and if those accounts have existing AWS Config resources, you must delete the existing AWS Config resources before you can enroll the accounts into AWS Control Tower.

AWS Control Tower landing zone version 2.9

April 22, 2022

(Update required for AWS Control Tower landing zone to version 2.9. For information, see Update Your Landing Zone (p. 47))

AWS Control Tower landing zone version 2.9 updates the notification forwarder Lambda to use the Python version 3.9 runtime. This update addresses the deprecation of Python version 3.6, which is planned for July of 2022. For the latest information, see the Python deprecation page.

AWS Control Tower landing zone version 2.8

February 10, 2022

(Update required for AWS Control Tower landing zone to version 2.8. For information, see Update Your Landing Zone (p. 47))

AWS Control Tower landing zone version 2.8 adds functionality that aligns with recent updates to the AWS Foundational Security Best Practices.
In this release:

- Access logging is configured for the access log bucket in the Log Archive account, to keep track of access to the existing S3 access log bucket.
- Support for lifecycle policy is added. The access log for the existing S3 access log bucket is set to a default retention time of 10 years.
- Additionally, this release updates AWS Control Tower to use the AWS Service Linked Role (SLR) provided by AWS Config, in all managed accounts (not including the management account), so that you can set up and manage Config rules to match AWS Config best practices. Customers who do not upgrade will continue to use their existing role.
- This release streamlines the AWS Control Tower KMS configuration process for encrypting Config data, and it improves the related status messaging in CloudTrail.
- The release includes an update to the Region deny control, to allow for the route53-application-recovery feature in us-west-2.
- Update: On February 15, 2022, we removed the dead letter queue for AWS Lambda functions.

Additional details:

- If you decommission your landing zone, AWS Control Tower does not remove the AWS Config service-linked role.
- If you deprovision an Account Factory account, AWS Control Tower does not remove the AWS Config service-linked role.

To update your landing zone to 2.8, navigate to the Landing zone settings page, select the 2.8 version, and then choose Update. After you update your landing zone, you must update all accounts that are governed by AWS Control Tower, as given in Configuration update management in AWS Control Tower (p. 46).

January - December 2021

In 2021, AWS Control Tower released the following updates:

- Region deny capabilities (p. 1479)
- Data residency features (p. 1479)
- AWS Control Tower introduces Terraform account provisioning and customization (p. 1479)
- New lifecycle event available (p. 1480)
- AWS Control Tower enables nested OUs (p. 1480)
- Detective control concurrency (p. 1480)
- Two new Regions available (p. 1481)
- Region deselection (p. 1481)
- AWS Control Tower works with AWS Key Management Systems (p. 1482)
- Controls renamed, functionality unchanged (p. 1482)
- AWS Control Tower scans SCPs daily to check for drift (p. 1482)
- Customized names for OUs and accounts (p. 1483)
- AWS Control Tower landing zone version 2.7 (p. 1483)
- Three new AWS Regions available (p. 1484)
- Govern selected Regions only (p. 1484)
AWS Control Tower User Guide
Region deny capabilities

- AWS Control Tower now extends governance to existing OUs in your AWS organizations (p. 1485)
- AWS Control Tower provides bulk account updates (p. 1485)

Region deny capabilities

November 30, 2021

(No update required for AWS Control Tower landing zone.)

AWS Control Tower now provides Region deny capabilities, which assist you in limiting access to AWS services and operations for enrolled accounts in your AWS Control Tower environment. The Region deny feature complements existing Region selection and Region deselection features in AWS Control Tower. Together, these features help you to address compliance and regulatory concerns, while balancing the costs associated with expanding into additional Regions.

For example, AWS customers in Germany can deny access to AWS services in Regions outside of the Frankfurt Region. You can select restricted Regions during the AWS Control Tower set up process, or in the Landing zone settings page. The Region deny feature is available when you update your AWS Control Tower landing zone version. Select AWS services are exempt from Region deny capabilities. To learn more, see Configure the Region deny control (p. 102).

Data residency features

November 30, 2021

(No update required for AWS Control Tower landing zone)

AWS Control Tower now offers purpose-built controls to help ensure that any customer data you upload to AWS services is located only in the AWS Regions that you specify. You can select the AWS Region or Regions in which your customer data is stored and processed. For a full list of AWS Regions where AWS Control Tower is available, see the AWS Region Table.

For granular control, you can apply additional controls, such as Disallow Amazon Virtual Private Network (VPN) connections, or Disallow internet access for an Amazon VPC instance. You can view the compliance status of the controls in the AWS Control Tower console. For a full list of available controls, see The AWS Control Tower controls library (p. 215).

AWS Control Tower introduces Terraform account provisioning and customization

November 29, 2021

(Optional update for AWS Control Tower landing zone)

You can now employ Terraform to provision and update customized accounts through AWS Control Tower, with AWS Control Tower Account Factory for Terraform (AFT).

AFT provides a single Terraform infrastructure as code (IaC) pipeline, which provisions accounts managed by AWS Control Tower. Customizations during provisioning help to meet your business and security policies, before you give the accounts to end-users.

The AFT automated account creation pipeline monitors until account provisioning is complete, and then it continues, triggering additional Terraform modules that enhance the account with any necessary customizations. As an additional part of the customization process, you can configure the pipeline to
install your own custom Terraform modules, and you can choose to add any of the AFT Feature Options, which are provided by AWS for common customizations.

Get started with AWS Control Tower Account Factory for Terraform by following the steps provided in the AWS Control Tower User Guide, Deploy AWS Control Tower Account Factory for Terraform (AFT) (p. 142), and by downloading AFT for your Terraform instance. AFT supports Terraform Cloud, Terraform Enterprise, and Terraform Open Source distributions.

New lifecycle event available

November 18, 2021

(No update required for AWS Control Tower landing zone)

The PrecheckOrganizationalUnit event logs whether any resources block the Extend governance task from success, including resources in nested OUs. For more information, see PrecheckOrganizationalUnit (p. 1425).

AWS Control Tower enables nested OUs

November 16, 2021

(No update required for AWS Control Tower landing zone)

AWS Control Tower now enables you to include nested OUs as part of your landing zone.

AWS Control Tower provides support for nested organizational units (OUs), allowing you to organize accounts into multiple hierarchy levels, and to enforce preventive controls hierarchically. You can register OUs containing nested OUs, create and register OUs under parent OUs, and enable controls on any registered OU, regardless of depth. To support this functionality, the console shows the number of governed accounts and OUs.

With nested OUs, you can align your AWS Control Tower OUs to the AWS multi-account strategy, and you can reduce the time required to enable controls on multiple OUs, by enforcing controls at the parent OU level.

Key considerations

1. You can register existing, multi-level OUs with AWS Control Tower one OU at a time, starting with the top-level OU and then proceeding down the tree. For more information, see Expand from flat OU structure to nested OU structure (p. 186).
2. Accounts directly under a registered OU are enrolled automatically. Accounts further down the tree can be enrolled by registering their immediate parent OU.
3. Preventive controls (SCPs) are inherited down the hierarchy automatically; SCPs applied to the parent are inherited by all nested OUs.
4. Detective controls (AWS Config rules) are NOT inherited automatically.
5. Compliance with detective controls is reported by each OU.
6. SCP drift on an OU affects all accounts and OUs under it.
7. You cannot create new nested OUs under the Security OU (Core OU).

Detective control concurrency

November 5, 2021

(Optional update for AWS Control Tower landing zone)
AWS Control Tower detective controls now support concurrent operations for detective controls, improving the ease of use and performance. You can enable multiple detective controls without waiting for individual control operations to complete.

**Supported functionality:**

- Enable different detective controls on the same OU (for example, Detect Whether MFA for the Root User is Enabled and Detect Whether Public Write Access to Amazon S3 Buckets is Allowed).
- Enable different detective controls on different OUs, concurrently.
- Guardrail error messaging has been improved to give additional guidance for supported control concurrency operations.

**Not supported in this release:**

- Enabling the same detective control on multiple OUs concurrently is not supported.
- Preventive control concurrency is not supported.

You can experience the detective control concurrency improvements in all versions of AWS Control Tower. It is recommended that customers not currently on version 2.7 perform a landing zone update to take advantage of other features, such as Region selection and deselection, which are available in the latest version.

**Two new Regions available**

**July 29, 2021**

(Update required for AWS Control Tower landing zone)

AWS Control Tower is now available in two additional AWS Regions: South America (Sao Paulo), and Europe (Paris). This update expands AWS Control Tower availability to 15 AWS Regions.

If you are new to AWS Control Tower, you can launch it right away in any of the supported Regions. During the launch, you can select the Regions in which you want AWS Control Tower to build and govern your multi-account environment.

If you already have an AWS Control Tower environment and you want to extend or remove AWS Control Tower governance features in one or more supported Regions, go to the **Landing Zone Settings** page in your AWS Control Tower dashboard, then select the Regions. After updating your landing zone, you must then update all accounts that are governed by AWS Control Tower.

**Region deselection**

**July 29, 2021**

(Optional update for AWS Control Tower landing zone)

AWS Control Tower Region deselection enhances your ability to manage the geographical footprint of your AWS Control Tower resources. You can deselect Regions you would no longer like AWS Control Tower to govern. This feature provides you with the capability to address compliance and regulatory concerns while balancing the costs associated with expanding into additional Regions.

Region deselection is available when you update your AWS Control Tower landing zone version.

When you use Account Factory to create a new account or enroll a pre-existing member account, or when you select **Extend Governance** to enroll accounts in a pre-existing organizational unit, AWS Control
AWS Control Tower works with AWS Key Management Systems

July 28, 2021

(Optional update for AWS Control Tower landing zone)

AWS Control Tower provides you the option to use an AWS Key Management Service (AWS KMS) key. A key is provided and managed by you, to secure the services that AWS Control Tower deploys, including AWS CloudTrail, AWS Config, and the associated Amazon S3 data. AWS KMS encryption is an enhanced level of encryption over the SSE-S3 encryption that AWS Control Tower uses by default.

The integration of AWS KMS support into AWS Control Tower aligns with the AWS Foundational Security Best Practices, which recommend an added layer of security for your sensitive log files. You should use AWS KMS–managed keys (SSE-KMS) for encryption at rest. AWS KMS encryption support is available when you set up a new landing zone or when you update your existing AWS Control Tower landing zone.

To configure this functionality, you can select KMS Key Configuration during your initial landing zone setup. You can choose an existing KMS key, or you can select a button that directs you to the AWS KMS console to create a new one. You also have the flexibility to change from default encryption to SSE-KMS, or to a different SSE-KMS key.

For an existing AWS Control Tower landing zone, you can perform an update to start using AWS KMS keys.

Controls renamed, functionality unchanged

July 26, 2021

(No update required for AWS Control Tower landing zone)

AWS Control Tower is revising certain control names and descriptions to better reflect the policy intentions of the control. The revised names and descriptions help you understand more intuitively the ways in which controls embody the policies of your accounts. For example, we changed part of the names of detective controls from “Disallow” to “Detect” because the detective control itself does not stop a specific action, it only detects policy violations and provides alerts through the dashboard.

Control functionality, guidance, and implementation remain unchanged. Only the control names and descriptions have been revised.

AWS Control Tower scans SCPs daily to check for drift

May 11, 2021

(No update required for AWS Control Tower landing zone)

AWS Control Tower now performs daily automated scans of your managed SCPs to verify that the corresponding controls are applied correctly and that they have not drifted. If a scan discovers drift, you will receive a notification. AWS Control Tower sends only one notification per drift issue, so if your
AWS Control Tower User Guide

Customized names for OUs and accounts

April 16, 2021

(No update required for AWS Control Tower landing zone)

AWS Control Tower now allows you to customize your landing zone naming. You can retain the names that AWS Control Tower recommends for the organizational units (OUs) and core accounts, or you can modify these names during the initial landing zone setup process.

The default names that AWS Control Tower provides for the OUs and core accounts match the AWS multi-account best practices guidance. However, if your company has specific naming policies, or if you already have an existing OU or account with the same recommended name, the new OU and account naming functionality gives you the flexibility to address those constraints.

Separately from that workflow change during setup, the OU formerly known as the Core OU is now called the Security OU, and the OU formerly known as the Custom OU is now called the Sandbox OU. We made this change to improve our alignment with overall AWS best practices guidance for naming.

New customers will see these new OU names. Existing customers will continue to see the original names of these OUs. You may encounter some inconsistencies in OU naming while we are updating our documentation to the new names.

To get started with AWS Control Tower from the AWS Management Console, go to the AWS Control Tower console, and select Set up landing zone in the top right. For additional information, you can read about planning your AWS Control Tower landing zone.

AWS Control Tower landing zone version 2.7

April 8, 2021

(Update required for AWS Control Tower landing zone to version 2.7. For information, see Update Your Landing Zone (p. 47))

With AWS Control Tower version 2.7, AWS Control Tower introduces four new mandatory preventative Log Archive controls that implement policy solely on AWS Control Tower resources. We have adjusted the guidance on four existing Log Archive controls from mandatory to elective, because they set policy for resources outside of AWS Control Tower. This control change and expansion provides the ability to separate Log Archive governance for resources within AWS Control Tower from governance of resources outside of AWS Control Tower.

The four changed controls can be used in conjunction with the new mandatory controls to provide governance to a broader set of AWS Log Archives. Existing AWS Control Tower environments will keep these four changed controls enabled automatically, for environment consistency; however, these elective controls now can be disabled. New AWS Control Tower environments must enable all elective controls. Existing environments must disable the formerly mandatory controls before adding encryption to Amazon S3 buckets that are not deployed by AWS Control Tower.

New mandatory controls:

- Disallow Changes to Encryption Configuration for AWS Control Tower Created S3 Buckets in Log Archive
- Disallow Changes to Logging Configuration for AWS Control Tower Created S3 Buckets in Log Archive
- Disallow Changes to Bucket Policy for AWS Control Tower Created S3 Buckets in Log Archive
- Disallow Changes to Lifecycle Configuration for AWS Control Tower Created S3 Buckets in Log Archive
Guidance changed from Mandatory to Elective:

- Disallow Changes to Encryption Configuration for all Amazon S3 Buckets [Previously: Enable Encryption at Rest for Log Archive]
- Disallow Changes to Logging Configuration for all Amazon S3 Buckets [Previously: Enable Access Logging for Log Archive]
- Disallow Changes to Bucket Policy for all Amazon S3 Buckets [Previously: Disallow Policy Changes to Log Archive]
- Disallow Changes to Lifecycle Configuration for all Amazon S3 Buckets [Previously: Set a Retention Policy for Log Archive]

AWS Control Tower version 2.7 includes changes to the AWS Control Tower landing zone blueprint that can cause incompatibility with previous versions after you upgrade to 2.7.

- In particular, AWS Control Tower version 2.7 enables `BlockPublicAccess` automatically on S3 buckets deployed by AWS Control Tower. You can turn this default off if your workload requires access across accounts. For more information about what happens with `BlockPublicAccess` enabled, see `Blocking public access to your Amazon S3 storage`.
- AWS Control Tower version 2.7 includes a requirement for HTTPS. All requests sent to S3 buckets deployed by AWS Control Tower must use secure socket layer (SSL). Only HTTPS requests are allowed to pass. If you use HTTP (without SSL) as an endpoint to send the requests, this change gives you an access denied error, which can potentially break your workflow. **This change cannot be reverted after the 2.7 update to your landing zone.**

  We recommend that you change your requests to use TLS instead of HTTP.

Three new AWS Regions available

April 8, 2021

(Update required for AWS Control Tower landing zone)

AWS Control Tower is available in three additional AWS Regions: Asia Pacific (Tokyo) Region, Asia Pacific (Seoul) Region, and Asia Pacific (Mumbai) Region. A landing zone update to version 2.7 is required for expanding governance into these Regions.

Your landing zone is not expanded automatically into these Regions when you perform the update to version 2.7, you must view and select them in the Regions table for inclusion.

Govern selected Regions only

February 19, 2021

(No update required for AWS Control Tower landing zone)

AWS Control Tower Region selection provides better ability to manage the geographical footprint of your AWS Control Tower resources. To expand the number of Regions in which you host AWS resources or workloads – for compliance, regulatory, cost, or other reasons – you can now select the additional Regions to govern.

Region selection is available when you set up a new landing zone or update your AWS Control Tower landing zone version. When you use Account Factory to create a new account or enroll a pre-existing member account, or when you use `Extend Governance` to enroll accounts in a pre-existing organizational unit, AWS Control Tower deploys its governance capabilities of centralized logging, monitoring, and controls in your chosen Regions in the accounts. For more information about selecting Regions, see `Configure your AWS Control Tower Regions (p. 98)`.
AWS Control Tower now extends governance to existing OUs in your AWS organizations

January 28, 2021

(No update required for AWS Control Tower landing zone)

Extend governance to existing organizational units (OUs) (those not in AWS Control Tower) from within the AWS Control Tower console. With this feature, you can bring top-level OUs and included accounts under AWS Control Tower governance. For information about extending governance to an entire OU, see Register an existing organizational unit with AWS Control Tower (p. 190).

When you register an OU, AWS Control Tower performs a series of checks to ensure successful extension of governance and enrollment of accounts within the OU. For more information about common issues associated with the initial registration of an OU, see Common causes of failure during registration or re-registration (p. 192).

You can also visit the AWS Control Tower product webpage or visit YouTube to watch this video about getting started with AWS Control Tower for AWS Organizations.

AWS Control Tower provides bulk account updates

January 28, 2021

(No update required for AWS Control Tower landing zone)

With the bulk update feature, you can now update all accounts in a registered AWS Organizations organizational unit (OU) containing up to 300 accounts, with a single click, from the AWS Control Tower dashboard. This is particularly useful in cases where you update your AWS Control Tower landing zone and must also update your enrolled accounts to align them to the current landing zone version.

This feature also helps you keep your accounts up to date when you update your AWS Control Tower landing zone to expand to new regions, or when you want to re-register an OU to ensure that all accounts in that OU have the latest controls applied. Bulk account update eliminates the need to update one account at a time or use an external script to perform the update on multiple accounts.

For information about updating a landing zone, see Update Your Landing Zone (p. 47).

For information about registering or re-registering an OU, see Register an existing organizational unit with AWS Control Tower (p. 190).

January - December 2020

In 2020, AWS Control Tower released the following updates:

- AWS Control Tower console now links to external AWS Config rules (p. 1486)
- AWS Control Tower now available in additional Regions (p. 1486)
- Guardrail update (p. 1486)
- AWS Control Tower console shows more detail about OUs and accounts (p. 1487)
- Use AWS Control Tower to set up new multi-account AWS environments in AWS Organizations (p. 1487)
- Customizations for AWS Control Tower solution (p. 1488)
- General availability of AWS Control Tower version 2.3 (p. 1488)
AWS Control Tower console now links to external AWS Config rules

December 29, 2020

(Update required for AWS Control Tower landing zone to version 2.6. For information, see Update Your Landing Zone (p. 47))

AWS Control Tower now includes an organization-level aggregator, which assists in detecting external AWS Config rules. This provides you with visibility in the AWS Control Tower console to see the existence of externally created AWS Config rules in addition to those AWS Config rules created by AWS Control Tower. The aggregator allows AWS Control Tower to detect external rules and provide a link to the AWS Config console without the need for AWS Control Tower to gain access to unmanaged accounts.

With this feature, you now have a consolidated view of detective controls applied to your accounts so you can track compliance and determine if you need additional controls for your account. For information, see How AWS Control Tower aggregates AWS Config rules in unmanaged OUs and accounts (p. 91).

AWS Control Tower now available in additional Regions

November 18, 2020

(Update required for AWS Control Tower landing zone to version 2.5. For information, see Update Your Landing Zone (p. 47))

AWS Control Tower is now available in 5 additional AWS Regions:

- Asia Pacific (Singapore) Region
- Europe (Frankfurt) Region
- Europe (London) Region
- Europe (Stockholm) Region
- Canada (Central) Region

The addition of these 5 AWS Regions is the only change introduced for version 2.5 of AWS Control Tower.

AWS Control Tower is also available in US East (N. Virginia) Region, US East (Ohio) Region, US West (Oregon) Region, Europe (Ireland) Region, and Asia Pacific (Sydney) Region. With this launch AWS Control Tower is now available in 10 AWS Regions.

This landing zone update includes all Regions listed and cannot be undone. After updating your landing zone to version 2.5, you must manually update all enrolled accounts for AWS Control Tower to govern in the 10 supported AWS Regions. For information, see Configure your AWS Control Tower Regions (p. 98).

Guardrail update

October 8, 2020
AWS Control Tower User Guide
AWS Control Tower console shows more detail about OUs and accounts

(No update required for AWS Control Tower landing zone)

An updated version has been released for the mandatory control AWS-GR_IAM_ROLE_CHANGE_PROHIBITED.

This change to the control is required because accounts that are being enrolled automatically into AWS Control Tower must have the AWSControlTowerExecution role enabled. The previous version of the control prevents this role from being created.

For more information, see Control update (p. 226) in the AWS Control Tower User Guide Control reference.

**AWS Control Tower console shows more detail about OUs and accounts**

July 22, 2020

(No update required for AWS Control Tower landing zone)

You can view your organizations and accounts that are not enrolled in AWS Control Tower, alongside organizations and accounts that are enrolled.

Within the AWS Control Tower console, you can view more detail about your AWS accounts and organizational units (OUs). The Accounts page now lists all accounts in your organization, regardless of OU or enrollment status in AWS Control Tower. You can now search, sort, and filter across all tables.

**Use AWS Control Tower to set up new multi-account AWS environments in AWS Organizations**

April 22, 2020

(No update required for AWS Control Tower landing zone)

AWS Organizations customers can now use AWS Control Tower to manage newly created organizational units (OUs) and accounts by taking advantage of these new capabilities:

- Existing AWS Organizations customers can now set up a new landing zone for new organizational units (OUs) in their existing management account. You can create new OUs in AWS Control Tower and create new accounts in those OUs with AWS Control Tower governance.
- AWS Organizations customers can enroll existing accounts using the account enrollment process or through scripting.

AWS Control Tower provides an orchestration service that uses other AWS services. It's designed for organizations with multiple accounts and teams who are looking for the easiest way to set up their new or existing multi-account AWS environment and govern at scale. With an organization governed by AWS Control Tower, cloud administrators know that accounts in the organization are compliant with established policies. Builders benefit because they can provision new AWS accounts quickly, without undue concerns about compliance.

For information about setting up a landing zone, see Plan your AWS Control Tower landing zone (p. 33). You can also visit the AWS Control Tower product webpage or visit YouTube to watch this video about getting started with AWS Control Tower for AWS Organizations.

In addition to this change, the Quick account provisioning capability in AWS Control Tower was renamed to Enroll account. It now permits enrollment of existing AWS accounts as well as creation of new accounts. For more information, see Enroll an existing account (p. 110).
Customizations for AWS Control Tower solution

March 17, 2020

(No update required for AWS Control Tower landing zone)

AWS Control Tower now includes a new reference implementation that makes it easy for you to apply custom templates and policies to your AWS Control Tower landing zone.

With customizations for AWS Control Tower, you can use AWS CloudFormation templates to deploy new resources to existing and new accounts within your organization. You can also apply custom service control policies (SCPs) to those accounts in addition to the SCPs already provided by AWS Control Tower. Customizations for AWS Control Tower pipeline integrate with AWS Control Tower lifecycle events and notifications (Lifecycle Events in AWS Control Tower (p. 1416)) to ensure that resource deployments stay in sync with your landing zone.

The deployment documentation for this AWS Control Tower solution architecture is available through the AWS Solutions web page.

General availability of AWS Control Tower version 2.3

March 5, 2020

(Update required for AWS Control Tower landing zone. For information, see Update Your Landing Zone (p. 47).)

AWS Control Tower is now available in the Asia Pacific (Sydney) AWS Region, in addition to the US East (Ohio), US East (N. Virginia), US West (Oregon), and Europe (Ireland) Regions. The addition of the Asia Pacific (Sydney) Region is the only change introduced for version 2.3 of AWS Control Tower.

If you have not used AWS Control Tower previously, you can launch it today in any of the supported Regions. If you are already using AWS Control Tower and want to extend its governance features to the Asia Pacific (Sydney) Region in your accounts, go to the Settings page in your AWS Control Tower dashboard. From there, update your landing zone to the latest release. Then, update your accounts individually.

**Note**

Updating your landing zone does not automatically update your accounts. If you have more than a few accounts, the required updates can be time-consuming. For that reason, we recommend that you avoid expanding your AWS Control Tower landing zone into Regions in which you do not require your workloads to run.

For information about the expected behavior of detective controls as a result of a deployment to a new Region, see Configure your AWS Control Tower Regions (p. 98).

Single-step account provisioning in AWS Control Tower

March 2, 2020

(No update required for AWS Control Tower landing zone)

AWS Control Tower now supports single-step account provisioning through the AWS Control Tower console. This feature allows you to provision new accounts from within the AWS Control Tower console.

To use the simplified form, navigate to Account Factory in the AWS Control Tower console and then choose Quick account provisioning. AWS Control Tower assigns the same email address to the
AWS Control Tower decommissioning tool

February 28, 2020
(No update required for AWS Control Tower landing zone)

AWS Control Tower now supports an automated decommissioning tool to assist you in cleaning up resources allocated by AWS Control Tower. If you no longer intend to use AWS Control Tower for your enterprise, or if you require a major redeployment of your organizational resources, you may want to clean up the resources created when you initially set up your landing zone.

To decommission your landing zone by using a process that is mostly automated, contact AWS Support to get assistance with the additional steps that are required. For more information about decommissioning, see Walkthrough: Decommission an AWS Control Tower Landing Zone (p. 1434).

AWS Control Tower lifecycle event notifications

January 22, 2020
(No update required for AWS Control Tower landing zone)

AWS Control Tower announces the availability of lifecycle event notifications. A lifecycle event (p. 1416) marks the completion of an AWS Control Tower action that can change the state of resources such as organizational units (OUs), accounts, and controls that are created and managed by AWS Control Tower. Lifecycle events are recorded as AWS CloudTrail events and delivered to Amazon EventBridge as events.

AWS Control Tower records lifecycle events at the completion of the following actions that can be performed using the service: creating or updating a landing zone; creating or deleting an OU; enabling or disabling a control on an OU; and using account factory to create a new account or to move an account to another OU.

AWS Control Tower uses multiple AWS services to build and govern a best practices multi-account AWS environment. It can take several minutes for an AWS Control Tower action to complete. You can track lifecycle events in the CloudTrail logs to verify if the originating AWS Control Tower action completed successfully. You can create an EventBridge rule to notify you when CloudTrail records a lifecycle event or to automatically trigger the next step in your automation workflow.

January - December 2019

From January 1 through December 31, 2019, AWS Control Tower released the following updates:

- General availability of AWS Control Tower version 2.2 (p. 1490)
- New elective controls in AWS Control Tower (p. 1490)
General availability of AWS Control Tower version 2.2

November 13, 2019

Update required for AWS Control Tower landing zone. For information, see Update Your Landing Zone (p. 47).

AWS Control Tower version 2.2 provides three new preventive controls that prevent drift in accounts:

- **Disallow Changes to Amazon CloudWatch Logs Log Groups set up by AWS Control Tower** (p. 218)
- **Disallow Deletion of AWS Config Aggregation Authorizations Created by AWS Control Tower** (p. 219)
- **Disallow Deletion of Log Archive** (p. 219)

A control is a high-level rule that provides ongoing governance for your overall AWS environment. When you create your AWS Control Tower landing zone, the landing zone and all the organizational units (OUs), accounts, and resources are compliant with the governance rules enforced by your chosen controls. As you and your organization members use the landing zone, changes (accidental or intentional) in this compliance status may occur. Drift detection helps you identify resources that need changes or configuration updates to resolve the drift. For more information, see Detect and resolve drift in AWS Control Tower (p. 169).

New elective controls in AWS Control Tower

September 05, 2019

(No update required for AWS Control Tower landing zone)

AWS Control Tower now includes the following four new elective controls:

- **Disallow Delete Actions on Amazon S3 Buckets Without MFA** (p. 1372)
- **Disallow Changes to Replication Configuration for Amazon S3 Buckets** (p. 1372)
- **Disallow Actions as a Root User** (p. 1361)
- **Disallow Creation of Access Keys for the Root User** (p. 1361)

A control is a high-level rule that provides ongoing governance for your overall AWS environment. Guardrails enable you to express your policy intentions. For more information, see About controls in AWS Control Tower (p. 196).

New detective controls in AWS Control Tower

August 25, 2019

(No update required for AWS Control Tower landing zone)

AWS Control Tower now includes the following eight new detective controls:

- **Detect Whether Versioning for Amazon S3 Buckets is Enabled** (p. 1374)
- **Detect Whether MFA is Enabled for AWS IAM Users of the AWS Console** (p. 1374)
A control is a high-level rule that provides ongoing governance for your overall AWS environment. A detective control detects noncompliance of resources within your accounts, such as policy violations, and provides alerts through the dashboard. For more information, see About controls in AWS Control Tower (p. 196).

AWS Control Tower accepts email addresses for shared accounts with different domains than the management account

August 01, 2019

(No update required for AWS Control Tower landing zone)

In AWS Control Tower, you can now submit email addresses for shared accounts (log archive and audit member) and child accounts (vended using account factory) whose domains are different from the management account's email address. This feature is available only when you create a new landing zone and when you provision new child accounts.

General availability of AWS Control Tower version 2.1

June 24, 2019

(Update required for AWS Control Tower landing zone. For information, see Update Your Landing Zone (p. 47).)

AWS Control Tower is now generally available and supported for production use. AWS Control Tower is intended for organizations with multiple accounts and teams who are looking for the easiest way to set up their new multi-account AWS environment and govern at scale. With AWS Control Tower, you can help make sure that accounts in your organization are compliant with established policies. End users on distributed teams can provision new AWS accounts quickly.

Using AWS Control Tower, you can set up a landing zone (p. 16) that employs best practices such as configuring a multi-account structure using AWS Organizations, managing user identities and federated access with AWS IAM Identity Center, enabling account provisioning through Service Catalog, and creating a centralized log archive using AWS CloudTrail and AWS Config.

For ongoing governance, you can enable pre-configured controls, which are clearly defined rules for security, operations, and compliance. Guardrails help prevent deployment of resources that don’t conform to policies and continuously monitor deployed resources for nonconformance. The AWS Control Tower dashboard provides centralized visibility into an AWS environment including accounts provisioned, controls enabled, and the compliance status of accounts.

You can set up a new multi-account environment with a single click in the AWS Control Tower console. There are no additional charges or upfront commitments to use AWS Control Tower. You pay only for those AWS services that you enabled to set up a landing zone and implement selected controls.
The following table describes important changes to the *AWS Control Tower User Guide*. For notifications about documentation updates, you can subscribe to the RSS feed.

<tr>
<td><strong>New Log Archive controls, landing zone version 2.7 available (p. 1492)</strong></td>
<td>Four new Log Archive controls provide Log Archive governance over AWS Control Tower resources, separately from governance of resources outside of AWS Control Tower. Guidance on four existing controls has changed from mandatory to elective. Version 2.7 of the AWS Control Tower landing zone includes a requirement for HTTPS, which cannot be undone after you update.</td>
<td>April 8, 2021</td>
</tr>
<tr>
<td><strong>Region selection (p. 1492)</strong></td>
<td>AWS Control Tower Region selection provides better ability to manage the geographical footprint of your AWS Control Tower resources. To expand the number of Regions in which you host AWS resources or workloads – for compliance, regulatory, cost, or other reasons – you can now select the additional Regions to govern.</td>
<td>February 19, 2021</td>
</tr>
<tr>
<td><strong>Register an OU and govern all of its accounts with AWS Control Tower at one time (p. 1492)</strong></td>
<td>AWS Control Tower adds the capability to register an OU, which is a way to bring multiple accounts into governance at the same time.</td>
<td>January 28, 2021</td>
</tr>
<tr>
<td><strong>Multiple account updates in registered OUs (p. 1492)</strong></td>
<td>You can now update all accounts in any registered AWS Organizations organizational unit (OU) containing up to 300 accounts, with a single click, from the AWS Control Tower dashboard. The multiple account update feature, also referred to as bulk update, eliminates the need to update one account at a time, or to use an external script to perform the update on multiple accounts together.</td>
<td>January 28, 2021</td>
</tr>
<tr>
<td><strong>New role for aggregating unmanaged OUs and accounts (p. 1492)</strong></td>
<td>A new role assists in detecting external AWS Config rules, so AWS Control Tower does not need to gain access to unmanaged accounts.</td>
<td>December 29, 2020</td>
</tr>
<tr>
<td>AWS Control Tower is available in more AWS Regions. (p. 1492)</td>
<td>AWS Control Tower is now available to be deployed in the Asia Pacific (Singapore) Region, Europe (Frankfurt) Region, Europe (London) Region, Europe (Stockholm) Region, and Canada (Central) Region. With this launch AWS Control Tower is now available in 10 AWS Regions. This landing zone update includes all Regions listed, and it cannot be undone. After updating your landing zone to version 2.5, you must manually update all enrolled accounts for AWS Control Tower to govern in the 10 supported AWS Regions.</td>
<td>November 18, 2020</td>

</tbody>
</table>
Tables of control metadata

This section contains tables that show the metadata for controls. Remember that each control has a unique API identifier for each Region in which AWS Control Tower is available. When you are working with the control APIs, provide the identifier for the Region in which you are making the API call.

The identifiers for mandatory controls are not shown in this table, because those controls cannot be turned on or turned off.
