What is AWS Cost Management?

Welcome to the AWS Cost Management User Guide.

The AWS Cost Management console has features that you can use for budgeting and forecasting costs and methods for you to optimize your pricing to reduce your overall AWS bill.

The AWS Cost Management console is integrated closely with the Billing console. Using both together, you can manage your costs in a holistic manner. You can use Billing console resources to manage your ongoing payments, and AWS Cost Management console resources to optimize your future costs. For information about AWS resources to understand, pay, or organize your AWS bills, see the AWS Billing User Guide.

With the AWS Cost Management console and the Billing console, you can do the following tasks.

<table>

Features of AWS Cost Management

**AWS Cost Explorer**

**Use case:** Report, Forecast, Inspect

AWS Cost Explorer is a feature that you can use to visualize your cost data for further analysis. Using it, you can filter graphs by several different values. This includes Availability Zone, AWS service, and AWS Region. It also includes other specifics such as custom cost allocation tag, Amazon EC2 instance type, and purchase option. If you use consolidated billing, you can also filter by member account. In addition, you can see a forecast of future costs based on your historical cost data.

**Documentation:** Analyzing your costs with AWS Cost Explorer (p. 8)

**AWS Budgets**

**Use case:** Forecast, Inspect

AWS Budgets tracks your AWS usage and costs. AWS Budgets uses the cost visualization that's provided by AWS Cost Explorer to show the status of your budgets. This provides forecasts of your estimated costs and tracks your AWS usage, including your AWS Free Tier usage. You can also use AWS Budgets to create Amazon Simple Notification Service (Amazon SNS) notifications for when you exceed your budgeted amounts, or when your estimated costs exceed your budgets.

**Documentation:** Managing your costs with AWS Budgets (p. 38)

**AWS Cost Anomaly Detection**

**Use case:** Control

AWS Cost Anomaly Detection is a feature that uses machine learning to continuously monitor your cost and usage to detect unusual spends. You can receive alerts individually in aggregated reports, and receive alerts in an email or an Amazon SNS topic. AWS Cost Anomaly Detection is beneficial to analyze and determine the root cause of the anomaly, and identify the factor that is driving the cost increase.

**Documentation:** Detecting unusual spend with AWS Cost Anomaly Detection (p. 65)

**Rightsize Recommendations**

**Use case:** Control
Rightsizing recommendations is a feature that reviews your historical Amazon EC2 usage for the past 14 days to identify opportunities for greater cost and usage efficiency. The feature identifies cost saving opportunities by downsizing or terminating instances in Amazon EC2.

**Documentation:** [Accessing Reserved Instance Recommendations (p. 87)]

**Savings Plans**

**Use case:** Purchase

Savings Plans offers a flexible pricing model that provides savings on AWS usage. Savings Plans provide savings beyond On-Demand rates in exchange for a commitment of using a specified amount of compute power (measured every hour) for a one or three year period. You can manage your plans by using recommendations, performance reporting, and budget alerts in AWS Cost Explorer.

**Documentation:** [What is Savings Plans]

**Savings Plans**

**Use case:** Cost estimation

If you want to see the costs associated with Savings Plans before making a purchase decision, you can use the AWS Price List Bulk API.

**Documentation:** [Using the AWS Price List Bulk API]
Getting started

This section provides information that you need to get started with using the AWS Cost Management console.

Topics

• Sign up for an AWS account (p. 4)
• Create an administrative user (p. 4)
• Attach the required IAM policy to an IAM identity (p. 5)
• Review your bills and usage (p. 5)
• Set up your AWS Cost Management features (p. 5)
• What do I do next? (p. 6)

Sign up for an AWS account

If you do not have an AWS account, complete the following steps to create one.

To sign up for an AWS account

2. Follow the online instructions.

Part of the sign-up procedure involves receiving a phone call and entering a verification code on the phone keypad.

When you sign up for an AWS account, an AWS account root user is created. The root user has access to all AWS services and resources in the account. As a security best practice, assign administrative access to an administrative user, and use only the root user to perform tasks that require root user access.

AWS sends you a confirmation email after the sign-up process is complete. At any time, you can view your current account activity and manage your account by going to https://aws.amazon.com/ and choosing My Account.

Create an administrative user

After you sign up for an AWS account, create an administrative user so that you don't use the root user for everyday tasks.

Secure your AWS account root user

1. Sign in to the AWS Management Console as the account owner by choosing Root user and entering your AWS account email address. On the next page, enter your password.

For help signing in by using root user, see Signing in as the root user in the AWS Sign-In User Guide.

2. Turn on multi-factor authentication (MFA) for your root user.

For instructions, see Enable a virtual MFA device for your AWS account root user (console) in the IAM User Guide.
Create an administrative user

- For your daily administrative tasks, grant administrative access to an administrative user in AWS IAM Identity Center.

  For instructions, see Getting started in the AWS IAM Identity Center User Guide.

Sign in as the administrative user

- To sign in with your IAM Identity Center user, use the sign-in URL that was sent to your email address when you created the IAM Identity Center user.

  For help signing in using an IAM Identity Center user, see Signing in to the AWS access portal in the AWS Sign-In User Guide.

Attach the required IAM policy to an IAM identity

AWS account owners can provide permissions to specific users who need to view or manage the Billing and Cost Management data for an AWS account. To start activating access to the Billing and Cost Management console, see IAM tutorial: Delegate access to the billing console in the IAM User Guide.

For more information about IAM policies specific to Billing and Cost Management, see Using identity-based policies (IAM policies) for Billing and Cost Management.

For a list of Billing and Cost Management policy examples, see Billing and Cost Management policy examples.

Review your bills and usage

Use features in the Billing console to view your current AWS charges and AWS usage.

To open the Billing console and view your usage and charges

2. Choose Bills to see the details for your current charges.
3. Choose Payments to see your historical payment transactions.
4. Choose AWS Cost and Usage Reports to see reports that break down your costs.

For information about Billing console features, see the Billing User Guide.

For more information about setting up and using AWS Cost and Usage Reports, see the AWS Cost and Usage Reports User Guide.

Set up your AWS Cost Management features

Review the process that's needed to activate your AWS Cost Management features.

- AWS Cost Explorer: Enabling Cost Explorer (p. 8)
What do I do next?

Now that you have AWS Cost Management set up, you're ready to use the features available to you. The rest of this guide helps you navigate your journey using the console.

Using the Billing and Cost Management API

Use the AWS Billing and Cost Management API Reference to programmatically use some AWS Cost Management features.

Learn more

You can find more information about AWS Cost Management features including presentations, virtual workshops, and blog posts on the Cloud Financial Management with AWS page.

You can find virtual workshops by choosing the Services drop-down and selecting your feature.

Getting help

There are several resources that you can use if you want to learn more about or need help with any of the AWS Cost Management features.

AWS Knowledge Center

All AWS account owners have access to account and billing support free of charge. You can find answers to your questions quickly by visiting the AWS Knowledge Center.

To find your question or request

1. Open AWS Knowledge Center.
2. Choose Billing Management.
3. Scan the list of topics to locate a question that is similar to yours.

Contacting AWS Support

Contacting AWS Support is the fastest and most direct method for communicating with an AWS associate about your questions. AWS Support doesn't publish a direct phone number for reaching a support representative. You can use the following process to have an associate reach out to you by email or phone instead.

Only personalized technical support requires a support plan. For more information, visit AWS Support.

To open an AWS Support case where you specify Regarding: Account and Billing Support, you must either be signed into AWS as the root account owner, or have IAM permissions to open a support case. For more information, see Accessing AWS Support in the AWS Support User Guide.

If you closed your AWS account, you can still sign in to AWS Support and view past bills.
To contact AWS Support

1. Sign in and navigate to the AWS Support Center.
2. Choose Create case.
3. On the Create case page, choose Account and billing and fill in the required fields on the form.
4. After you complete the form, under Contact options, choose either Web for an email response or Phone to request a telephone call from an AWS Support representative. Instant messaging support isn't available for billing inquiries.

To contact AWS Support when you can't sign in to AWS

1. Recover your password or submit a form at AWS account support.
2. Choose an inquiry type in the Request information section.
3. Fill out the How can we help you? section.
4. Choose Submit.
Analyzing your costs with AWS Cost Explorer

AWS Cost Explorer is a tool that enables you to view and analyze your costs and usage. You can explore your usage and costs using the main graph, the Cost Explorer cost and usage reports, or the Cost Explorer RI reports. You can view data for up to the last 12 months, forecast how much you're likely to spend for the next 12 months, and get recommendations for what Reserved Instances to purchase. You can use Cost Explorer to identify areas that need further inquiry and see trends that you can use to understand your costs.

You can view your costs and usage using the Cost Explorer user interface free of charge. You can also access your data programmatically using the Cost Explorer API. Each paginated API request incurs a charge of $0.01. You can't disable Cost Explorer after you enable it.

In addition, Cost Explorer provides preconfigured views that display at-a-glance information about your cost trends and give you a head start on customizing views that suit your needs.

When you first sign up for Cost Explorer, AWS prepares the data about your costs for the current month and the last 12 months, and then calculates the forecast for the next 12 months. The current month's data is available for viewing in about 24 hours. The rest of your data takes a few days longer. Cost Explorer refreshes your cost data at least once every 24 hours. However, this depends on your upstream data from your billing applications, and some data might be updated later than 24 hours. After you sign up, Cost Explorer can display up to 12 months of historical data (if you have that much), the current month, and the forecasted costs for the next 12 months. The first time that you use Cost Explorer, Cost Explorer walks you through the main parts of the console with an explanation for each section.

Cost Explorer uses the same dataset that is used to generate the AWS Cost and Usage Reports and the detailed billing reports. For a comprehensive review of the data, you can download it into a comma-separated value (CSV) file.

Topics

- Enabling Cost Explorer (p. 8)
- Getting started with Cost Explorer (p. 11)
- Exploring your data using Cost Explorer (p. 12)
- Using the AWS Cost Explorer API (p. 28)

Enabling Cost Explorer

You can enable Cost Explorer for your account by opening Cost Explorer for the first time in the AWS Cost Management console. You can't enable Cost Explorer using the API. After you enable Cost Explorer, AWS prepares the data about your costs for the current month and the previous 12 months, and then calculates the forecast for the next 12 months. The current month's data is available for viewing in about 24 hours. The rest of your data takes a few days longer. Cost Explorer updates your cost data at least once every 24 hours.

As part of the process of enabling Cost Explorer, AWS automatically configures Cost Anomaly Detection for your account. Cost Anomaly Detection is an AWS Cost Management feature. This feature uses machine learning models to detect and alert on anomalous spend patterns in your deployed AWS services. To get you started with Cost Anomaly Detection, AWS sets up an AWS services monitor and a daily summary alert subscription. You're alerted about any anomalous spend that exceeds $100 and 40% of your expected spend across the majority of your AWS services in your accounts. For more information, see limitations and Detecting unusual spend with AWS Cost Anomaly Detection.
Note
You can opt out of Cost Anomaly Detection at any time. For more information, see Opting out of Cost Anomaly Detection.

You can launch Cost Explorer if your account is a member account in an organization where the management account enabled Cost Explorer. Know that your organization’s management account can also deny your account access. For more information, see Consolidated billing for AWS Organizations.

Note
An account’s status within an organization determines what cost and usage data are visible:

• A standalone account joins an organization. After this, the account can no longer access cost and usage data from when the account was a standalone account.
• A member account leaves an organization to become a standalone account. After this, the account can no longer access cost and usage data from when the account was a member of the organization. The account can access only the data that’s generated as a standalone account.
• A member account leaves organization A to join organization B. After this, the account can no longer access cost and usage data from when the account was a member of organization A. The account can access only the data that’s generated as a member of organization B.
• An account rejoins an organization that the account previously belonged to. After this, the account regains access to its historical cost and usage data.

Signing up to receive the AWS Cost and Usage Reports or the Detailed Billing Report doesn’t automatically enable Cost Explorer. To do so, follow this procedure.

To sign up for Cost Explorer

2. In the navigation pane, choose Cost Explorer.

For more information about controlling access to Cost Explorer, see Controlling access to Cost Explorer (p. 9).

Controlling access to Cost Explorer

You can manage access to your Cost Explorer in the following ways:

• Using the management account, you can enable Cost Explorer as a root user, automatically enabling all member accounts.
• After member accounts are enabled, you can change Cost Explorer settings from within the management account. You can control the information that can be accessed in Cost Explorer. This includes costs, refunds or credits, discounts, and Reserved Instance (RI) recommendations.
• After you enable Cost Explorer at the management account level, you can manage user IAM policies. For example, you can grant users full access or deny users access to Cost Explorer.

This topic provides information about how to control access in Cost Explorer.

For information about managing access to Billing and Cost Management pages, see Overview of managing access permissions (p. 98).

To reference Cost Explorer IAM policies, see Using identity-based policies (IAM policies) for AWS Cost Management (p. 111).
For more information about consolidated billing, see Consolidated billing for AWS Organizations.

**Topics**

- Granting Cost Explorer access (p. 10)
- Controlling access using Cost Explorer preferences (p. 10)
- Managing Cost Explorer access for users (p. 11)

**Granting Cost Explorer access**

If you're signed into the management account with your root account credentials, you can enable Cost Explorer access. Your root account credentials are through the Billing and Cost Management console. Enabling Cost Explorer at the management account level enables Cost Explorer for all of your organization accounts. All accounts in the organization are granted access, and you can't grant or deny access individually.

**Controlling access using Cost Explorer preferences**

A management account can grant access to Cost Explorer for all or none of the member accounts. Access isn't customizable for each individual member account.

The management account in AWS Organizations has full access to all Billing and Cost Management information for costs incurred by both the management account and member accounts. Member accounts only have access to their own cost and usage data in Cost Explorer.

By default, the management account in AWS Organizations sees all costs at the chargeable rate. If an organization is onboarded to Billing Conductor, the management account also sees costs at the proforma rate. The Cost Explorer view for member accounts depends on the configuration in Billing Conductor.

The owner of a management account can do the following:

- View all costs in Cost Explorer.
- Grant all member accounts the permission to see the costs for their own member account, refunds, credits, and RI recommendations.

Member account owners can't see costs, refunds, and RI recommendations for other accounts in the Organizations. For more information about consolidated billing, see Consolidated billing for AWS Organizations.

If you're an AWS account owner and not using consolidated billing, you have full access to all Billing and Cost Management information including Cost Explorer.

If you're onboarded to Billing Conductor, the Cost Explorer view for member accounts depends on whether a member account is part of a billing group.

If a member account is part of a billing group:

- The member account sees all costs at the proforma rate.
- Cost Explorer preferences, such as Linked Account Access, Linked Account Refunds and Credits, Linked Account Discounts, Hourly and Resource Level Data, and Split cost allocation data are not applicable to the member account.

If a member account is not part of a billing group:

- The member account see costs at the chargeable rate.
• Cost Explorer preferences apply to the member account.

For more information about Billing Conductor, see the Billing Conductor User Guide.

Organizations account status use cases

An account’s status within an organization determines what cost and usage data are visible in the following ways:

• A standalone account joins an organization. After this, the account can no longer access cost and usage data from when the account was a standalone account.
• A member account leaves an organization to become a standalone account. After this, the account can no longer access cost and usage data from when the account was a member of their previous organization. The account can only access the data that's generated as a standalone account.
• A member account leaves organization A to join organization B. After this, the account can no longer access cost and usage data from organization A. The account can access only the data that's generated as a member of organization B.
• An account rejoins an organization that it previously belonged to. After this, the account regains access to its historical cost and usage data.

Controlling member accounts’ access using Cost Explorer preferences

You can grant or restrict the access to all member accounts in your Organizations. When you enable your account at the management account level, all member accounts are granted access to their cost and usage data by default.

To control member account access to Cost Explorer data

2. In the navigation pane, choose Preferences.
3. On the Preferences page, select or clear Linked Account Access.
4. Choose Save.

Managing Cost Explorer access for users

After you enable Cost Explorer at the management account level, you can use IAM to manage access to your billing data for individual users. This way, you can grant or revoke access on an individual level for each account, rather than granting access to all member accounts.

A user must be granted explicit permissions to view pages in the Billing and Cost Management console. With the appropriate permissions, the user can view costs for the AWS account that the user belongs to. For the policy that grants the necessary permissions to a user, see Overview of managing access permissions (p. 98).

Getting started with Cost Explorer

After you enable Cost Explorer, you can launch it from the AWS Cost Management console.

Starting Cost Explorer

Start Cost Explorer by opening the AWS Cost Management console.
To open Cost Explorer

- Sign in to the AWS Management Console and open the AWS Cost Management console at https://console.aws.amazon.com/cost-management/home.

This opens the Cost dashboard that shows you the following:

- Your estimated costs for the month to date
- Your forecasted costs for the month
- A graph of your daily costs
- Your five top cost trends
- A list of reports that you recently viewed

Exploring your data using Cost Explorer

On the Cost Explorer dashboard, Cost Explorer shows your estimated costs for the month to date, your forecasted costs for the month, a graph of your daily costs, your five top cost trends, and a list of reports that you recently viewed.

All costs reflect your usage up to the previous day. For example, if today is December 2, the data includes your usage through December 1.

**Note**

In the current billing period, the data depends on your upstream data from your billing applications, and some data might be updated later than 24 hours.

- Your Cost Explorer costs (p. 12)
- Your Cost Explorer trends (p. 13)
- Your daily unblended costs (p. 13)
- Your monthly unblended costs (p. 13)
- Your net unblended costs (p. 14)
- Your recent Cost Explorer reports (p. 14)
- Your amortized costs (p. 14)
- Your net amortized costs (p. 14)

Navigating Cost Explorer

You can use the icons in the left pane to do the following:

- Go to the main Cost Explorer dashboard
- See a list of the default Cost Explorer reports
- See a list of your saved reports
- See information about your reservations
- See your reservation recommendations

Your Cost Explorer costs

At the top of the Cost Explorer page are the Month-to-date costs and Forecasted month end costs. The Month-to-date costs shows how much you’re estimated to have incurred in charges so far this...
Your Cost Explorer trends

In the *this month* trends section, Cost Explorer shows your top cost trends. For example, your costs related to a specific service have gone up, or your costs from a specific type of RI have gone up. To see all of your costs trends, choose View all trends in the upper-right corner of the trend section.

To understand a trend in more depth, choose it. You're taken to a Cost Explorer chart that shows the costs that went into calculating that trend.

Your daily unblended costs

In the center of the Cost Explorer dashboard, Cost Explorer shows a graph of your current unblended daily costs. You can access the filters and parameters used to create the graph by choosing Explore costs in the upper-right corner. That takes you to the Cost Explorer report page, enabling you to access the default Cost Explorer reports and modify the parameters used to create the chart. The Cost Explorer reports offer additional functionality such as downloading your data as a CSV file and saving your specific parameters as a report. For more information, see Using Cost Explorer reports (p. 30). Your daily unblended costs don't include refunds.

Your monthly unblended costs

Monthly granularity

You can view your unblended costs at the monthly granularity and see the discounts applied to your monthly bill. When forecasting costs, discounts are included by default. To view your unblended costs, open the Cost Explorer page and choose Cost Explorer from the navigation pane. Discounts appear as the RI Volume Discount in the chart. The discount amount aligns with the discount amount shown in your Billing and Cost Management console.

To see the details in your Billing and Cost Management console

2. In the navigation pane, choose Bills.
3. To display the discount, select the arrow next to Total Discounts, under Credits, Total Discounts and Tax Invoices.

Monthly gross charges

You can view your gross monthly charges by excluding the RI Volume Discount.

To exclude RI volume discounts in your monthly view

2. In the left pane, choose Cost Explorer.
3. Choose **Cost & Usage**.
4. On the **Filters** pane, choose **Charge Type**.
5. Select **RI Volume Discount**.
6. To open a dropdown, select **Include only** and choose **Exclude only**.
7. Select **Apply filters**.

**Your net unblended costs**

This enables you to see your net costs after all applicable discounts are calculated. You should still exclude any manual adjustment such as refunds and credits as a best practice. **RI Volume Discounts** are no longer visible because these are post-discount amounts.

**Your recent Cost Explorer reports**

At the bottom of the Cost Explorer dashboard is a list of reports that you have accessed recently, when you accessed them, and a link back to the report. This enables you to switch between reports or remember the reports that you find most useful.

For more information about Cost Explorer reports, see [Using Cost Explorer reports (p. 30)](#).

**Your amortized costs**

This enables you to see the cost of your AWS commitments, such as Amazon EC2 Reserved Instances or Savings Plans, spread across the usage of the selection period. AWS estimates your amortized costs by combining the unblended upfront and recurring reservation fees, and calculates the effective rate over the period of time that the upfront or recurring fee applies. In the daily view, Cost Explorer shows the unused portion of your commitment fees at the first of the month or the date of purchase.

**Your net amortized costs**

This enables you to see the cost of your AWS commitments, such as Amazon EC2 Reserved Instances or Savings Plans, after discounts with the additional logic that shows how the actual cost applies over time. Since Savings Plans and Reserved Instances usually have upfront or recurring monthly fees associated with them, the net amortized cost dataset reveals the true cost by showing how post-discount fees amortize over the period of time that the upfront or recurring fee applies.

**Using the Cost Explorer chart**

By default, you can view your costs at the chargeable rate as either a cash-based view with unblended costs or as an accrual-based view. In a cash-based view, your costs are recorded when cash is received or paid. In an accrual-based view, your costs are recorded when income is earned or costs are incurred. You can view data for up to the last 12 months and forecast how much you're likely to spend for the next 12 months. You can also specify time ranges for the data and view time data by day or by month.

By default, Cost Explorer uses the **Group by** filter for the **Daily unblended costs** graph. When using the **Group by** filter, the Cost Explorer chart displays data for up to ten values in the **Group by** filter. If your data contains additional values, the chart displays nine bars or lines and then aggregates all remaining items in a tenth. The data table that's below the chart breaks out the data for individual services that are aggregated in the chart.

If your organization is onboarded to Billing Conductor, member accounts placed in billing groups automatically see your costs in Cost Explorer at the proforma rate configured in Billing Conductor.
Member accounts can view costs and usage starting from when they joined their current billing group, and will lose access to the chargeable data for the period prior to joining their current billing group. If a backfill of proforma billing data is needed, submit a support ticket requesting a proforma backfill from the Billing Conductor team.

For more information about proforma rate configurations, see the Billing Conductor User Guide.

Topics
- Modifying your chart (p. 15)
- Reading the Cost Explorer data table (p. 27)
- Forecasting with Cost Explorer (p. 27)

Modifying your chart

You can modify the parameters that Cost Explorer uses to create your chart to explore different sets of data.

- Selecting a style for your chart (p. 15)
- Choosing time ranges for the data that you want to view (p. 15)
- Grouping data by filter type (p. 17)
- Filtering the data that you want to view (p. 17)
- Choosing advanced options (p. 25)

Selecting a style for your chart

Cost Explorer provides three styles for charting your cost data:

- Bar charts (Bar)
- Stacked bar charts (Stack)
- Line graphs (Line)

You can set the style by choosing one of the views on the top right corner of the chart.

Choosing time ranges for the data that you want to view

You can choose to view your cost data in monthly or daily levels of granularity. You can use preconfigured time ranges or set custom start and end dates.

To set the granularity and time range for your data

1. Start Cost Explorer.
2. Choose a time granularity of Daily, Monthly, or Hourly.
   
   **Note**
   
   To enable hourly granularity, opt in through the Cost Explorer console Preferences page as the management account. When hourly granularity is enabled, information is available for the previous 14 days.
3. For your monthly or daily data, open the calendar and define a custom time range for your report. Or, alternatively, choose a preconfigured time range (Auto-select) using the dropdowns shown below the calendar. You can choose from a number of historical or forecast time ranges. The name of the time range that you choose appears in the calendar.
4. Choose Apply.
Historical time range options

In Cost Explorer, months are defined as calendar months. Days are defined as 12:00:00 AM to 11:59:59 PM. Based on these definitions, when you choose Last 3 Months for a date range, you see cost data for the 3 previous months. This doesn’t include the present month. For example, if you view your chart on June 6, 2017, and select Last 3 Months, your chart includes data for March, April, and May 2017. All times are in Universal Coordinated Time (UTC).

You can choose time ranges for both your past costs and your forecasted future costs.

The following list defines each time range option for your past costs in Cost Explorer.

- Custom
  Displays data for the From and To time range that you specify with calendar controls.
- 1D (Last 1 Day)
  Displays cost data from the previous day.
- 7D (Last 7 Days)
  Displays cost data from the day before and the previous 6 days.
- Current Month
  Displays cost data and forecast data for the current month.
- 3M (Last 3 Months)
  Includes cost data from the previous 3 months but doesn't include the current month.
- 6M (Last 6 Months)
  Includes cost data from the previous 6 months but doesn't include the current month.
- 1Y (Last 12 Months)
  Includes cost data from the previous 12 months but doesn't include the current month.
- MTD (Month to Date)
  Displays cost data from the current calendar month.
- YTD (Year to Date)
  Displays cost data from the current calendar year.

Forecast time range options

With the Daily or Monthly time granularity, you have the option to view forecast costs in Cost Explorer. The following list defines each time range option for your forecast data. You can select a Historical time range and a Forecasted time range to display together. For example, you can select a Historical time range of 3 months (3M) and select a Forecasted time range of 3 months (+3M). Your report includes historical data for the previous 3 months plus forecasted data for the next 3 months. To clear a Historical time range and see only the forecast, choose the Historical time range option again.

**Note**

If you choose any forecasted dates, your current date’s cost and usage data shows as Forecast. The current date’s cost and usage won’t include historical data.

- Custom
  Displays forecast data for the From and To time range that you specify with calendar controls.
- +1M
Displays forecast data for the next month. This option is available if you choose the Daily time granularity.

• +3M

Displays forecast data for the next 3 months. This option is available if you choose the Daily or Monthly time granularity.

• +12M

Displays forecast data for the next 12 months. This option is available if you choose the Monthly time granularity.

### Grouping data by filter type

Use the **Group by** button to have Cost Explorer display the cost data groups by filter type. By default, Cost Explorer doesn't use grouping. Forecasting isn't available for charts that have grouping. If you don't select a **Group by** option, Cost Explorer displays total costs for the specified date range.

#### To group your data by filter type

1. Launch Cost Explorer.
2. (Optional) Use the **Filters** controls to configure a view of your cost data.
3. Choose a **Group by** option to group by the category that you want. The data table below the chart also groups your cost figures by the category that you select.

### Filtering the data that you want to view

With Cost Explorer, you can filter how you view your AWS costs by one or more of the following values:

- API operation
- Availability Zone (AZ)
- Billing entity
- Charge type
- Include all
- Instance type
- Legal entity
- Linked account
- Platform
- Purchase option
- Region
- Resources
- Service
- Tag
- Tenancy
- Usage type
- Usage type group

You can use Cost Explorer to see which service you use the most, which Availability Zone (AZ) most of your traffic is in, and which member account uses AWS the most. You can also apply multiple filters to look at intersecting datasets. For example, you can use the **Linked Account** and **Services** filters to identify the member account that spent the most money on Amazon EC2.
To filter your data

1. Open Cost Explorer.
2. For Filters, choose a value. After you make a selection, a new control appears with additional options.
3. In the new control, select the items from each list that you want to display in the chart. Or, start typing in the search box to have Cost Explorer autocomplete your selection. After you choose your filters, choose Apply filters.

   **Note**

   Each time that you apply filters to your costs, Cost Explorer creates a new chart. However, you can use your browser’s bookmark feature to save configuration settings (p. 35) for repeated use. Forecasts aren’t saved, and Cost Explorer displays the most recent forecast when you revisit your saved chart.

You can continue refining your cost analysis by using multiple filters, grouping your data by filter type, and choosing Advanced Options tab options.

Combining filters to show data in common

Cost Explorer displays a chart that represents the data in common to all the filters that you have selected. You can use this view to analyze subsets of cost data. For example, assume that you set the Service filter to show costs that are related to Amazon EC2 and Amazon RDS services and then select Reserved using the filter. The cost chart will show how much money Reserved instances on Amazon EC2 and Amazon RDS cost for each of the three months.

   **Note**

   - AWS Cost and Usage Reports in Cost Explorer can use a maximum of 1024 filters.
   - You can filter RI Utilization reports by only one service at a time. You can do this only for the following services:
     - Amazon EC2
     - Amazon Redshift
     - Amazon RDS
     - ElastiCache
     - OpenSearch Service

Filters and logical operations (AND/OR)

When you select multiple filters and multiple values for each filter, Cost Explorer applies rules that emulate the logical AND and OR operators to your selections. Within each filter, Cost Explorer emulates the logical OR filter to your selection of filter types. This means that the resulting chart adds the aggregate costs for each item together. Using the previous example, you see bars for both of the selected services, Amazon EC2 and Amazon RDS.

When you select multiple filters, Cost Explorer applies the logical AND operator to your selections. For a more concrete example, assume that you use the Services filter and specify Amazon EC2 and Amazon RDS costs for inclusion and then also apply the Purchase Options filter to select a single type of purchase option. You will see only the Non-Reserved charges incurred by Amazon EC2 and Amazon RDS.

Filter and group options

In Cost Explorer, you can filter by the following groups:

- API operation
Requests made to and tasks performed by a service, such as write and get requests to Amazon S3.

- **Availability Zone**

Distinct locations within a Region that are insulated from failures in other Availability Zones. They provide inexpensive, low-latency network connectivity to other Availability Zones in the same Region.

- **Billing entity**

Helps you identify whether your invoices or transactions are for AWS Marketplace or for purchases of other AWS services. Possible values include:

- AWS: Identifies a transaction for AWS services other than in AWS Marketplace.

- **Charge type**

Different types of charges or fees.

- **Credit**

Any AWS credits that are applied to your account.

- **Other out-of-cycle charges**

Any subscription charges that aren’t upfront reservation charges or support charges.

- **Recurring reservation fee**

Any recurring charges to your account. When you purchase a Partial Upfront or No Upfront Reserved Instance from AWS, you pay a recurring charge in exchange for a lower rate for using the instance. The recurring fees can result in spikes on the first day of every month, when AWS charges your account.

- **Refund**

Any refunds that you received. Refunds are listed as a separate line item in the data table. They don’t appear as an item in the chart because they represent a negative value in the calculation of your costs. The chart displays only positive values.

- **Reservation applied usage**

Usage that AWS applied reservation discounts to.

- **Savings Plan upfront fee**

Any one-time upfront fee from your purchase of an All Upfront or Partial Upfront Savings Plan.

- **Savings Plan recurring fee**

Any recurring hourly charges that correspond with your No Upfront or Partial Upfront Savings Plan. The Savings Plan recurring fee is initially added to your bill on the day that you purchase a No Upfront or Partial Upfront Savings Plan. After the initial purchase, AWS adds the recurring fee hourly.

For an All Upfront Savings Plan, the line item indicates the portion of the Savings Plan unused during the billing period. For example, if a Savings Plan was 100% utilized for a billing period, this shows as “0” in your amortized costs view. Any number greater than “0” indicates an unused Savings Plan.

- **Savings Plan covered usage**

Any on-demand cost that’s covered by your Savings Plan. In an **Unblended costs** view, this represents the covered usage at on-demand rates. In an **Amortized costs** view, this represents the covered usage at your Savings Plan rates. Savings Plan covered usage line items are offset by the corresponding Savings Plan negation items.
Savings Plan negation

Any offset cost through your Savings Plan benefit that’s associated with the corresponding Savings Plan covered usage item.

Support fee

Any charges that AWS charges you for a support plan. When you purchase a support plan from AWS, you pay a monthly charge in exchange for service support. The monthly fees can result in spikes on the first day of every month, when AWS charges your account.

Tax

Any taxes that are associated with the charges or fees in your cost chart. Cost Explorer adds all taxes together as a single component of your costs. If you select five or fewer filters, Cost Explorer displays your tax expenses as a single bar. If you select six or more filters, Cost Explorer displays five bars, stacks, or lines, and then aggregates all remaining items, including taxes, into a sixth bar, stack slice, or plot line that’s labeled Other.

If you choose to omit RI upfront fees, RI recurring charges, or Support charges from your chart, Cost Explorer continues to include any taxes that are associated with the charges.

Cost Explorer displays your tax costs in the chart only when you choose Monthly drop down. When you filter your cost chart, the following rules govern the inclusion of taxes:

1. Taxes are excluded if you select non-Linked Account filters, either singly or in combination with other filters.
2. Taxes are included if you select the Linked Accounts filters.

Upfront reservation fee

Any upfront fees that are charged to your account. When you purchase an All Upfront or Partial Upfront Reserved Instance from AWS, you pay an upfront fee in exchange for a lower rate for using the instance. The upfront fees can result in spikes in the chart for the days or months when you make your purchases.

Usage

Usage that AWS didn’t apply reservation discounts to.

• Instance type

The type of RI that you specified when you launched an Amazon EC2 host, Amazon RDS instance class, Amazon Redshift node, or Amazon ElastiCache node. The instance type determines the hardware of the computer used to host your instance.

• Legal entity

The Seller of Record of a specific product or service. In most cases, the invoicing entity and legal entity are the same. The values might differ for third-party AWS Marketplace transactions. Possible values include:

• Amazon Web Services, Inc. – The entity that sells AWS services.
• Amazon Web Services India Private Limited – The local Indian entity that acts as a reseller for AWS services in India.

• Linked account

The member accounts in an organization. For more information, see Consolidated billing for AWS Organizations.

• Platform

The operating system that your RI runs on. Platform is either Linux or Windows.
• **Purchase option**

The method you choose to pay for your Amazon EC2 instances. This includes Reserved Instances, Spot Instances, Scheduled Reserved Instances, and On-Demand Instances.

• **Region**

The geographic areas where AWS hosts your resources.

• **Resources**

The unique identifier for your resources.

  **Note**

  To enable resource granularity, opt-in through on the Cost Explorer settings page as the management account. This is available for Amazon EC2 instances.

• **Service**

AWS products. To learn what's available, see [AWS Products and Services](#). You can use this dimension to filter costs by specific AWS Marketplace software, including your costs for AMIs, web services, and desktop apps. See the [What is AWS Marketplace?](#) guide for more information.

  **Note**

  You can only filter RI Utilization reports by one service at a time and only for these services: Amazon EC2, Amazon Redshift, Amazon RDS, and ElastiCache.

• **Tag**

A label that you can use to track the costs associated with specific areas or entities within your business. For more information about working with tags, see [Applying User-Defined Cost Allocation Tags](#).

• **Tenancy**

Specifies if the Amazon EC2 instance is hosted on shared or single-tenant hardware. Some tenancy values include Shared (Default), Dedicated, and Host.

• **Usage type**

Usage types are the units that each service uses to measure the usage of a specific type of resource. For example, the BoxUsage:t2.micro(Hrs) usage type filters by the running hours of Amazon EC2 t2.micro instances.

• **Usage type group**

Usage type groups are filters that collect a specific category of usage type filters into one filter. For example, BoxUsage:c1.medium(Hrs), BoxUsage:m3.xlarge(Hrs), and BoxUsage:t1.micro(Hrs) are all filters for Amazon EC2 instance running hours, so they are collected into the EC2: Running Hours filter.

Usage type groups are available for DynamoDB, Amazon EC2, ElastiCache, Amazon RDS, Amazon Redshift, and Amazon S3. The specific groups available to your account depend on what services you've used. The list of groups that might be available includes but isn't limited to the following:

  • **DDB: Data Transfer - Internet (In)**

    Filters by the costs associated with how many GB are transferred to your DynamoDB databases.

  • **DDB: Data Transfer - Internet (Out)**

    Filters by the costs associated with how many GB are transferred from your DynamoDB databases.

  • **DDB: Indexed Data Storage**

    Filters by the costs associated with how many GB that you have stored in DynamoDB.

  • **DDB: Provisioned Throughput Capacity - Read**
Filters by the costs associated with how many units of read capacity that your DynamoDB databases used.

- **DDB: Provisioned Throughput Capacity - Write**
  Filters by the costs associated with how many units of write capacity that your DynamoDB databases used.

- **EC2: CloudWatch - Alarms**
  Filters by the costs associated with how many CloudWatch alarms that you have.

- **EC2: CloudWatch - Metrics**
  Filters by the costs associated with how many CloudWatch metrics that you have.

- **EC2: CloudWatch - Requests**
  Filters by the costs associated with how many CloudWatch requests that you make.

- **EC2: Data Transfer - CloudFront (Out)**
  Filters by the costs associated with how many GB are transferred from your Amazon EC2 instances to a CloudFront distribution.

- **EC2: Data Transfer - CloudFront (In)**
  Filters by the costs associated with how many GB are transferred to your Amazon EC2 instances from a CloudFront distribution.

- **EC2: Data Transfer - Inter AZ**
  Filters by the costs associated with how many GB are transferred into, out of, or between your Amazon EC2 instances in different AZs.

- **EC2: Data Transfer - Internet (In)**
  Filters by the costs associated with how many GB are transferred to your Amazon EC2 instances from outside the AWS network.

- **EC2: Data Transfer - Internet (Out)**
  Filters by the costs associated with how many GB are transferred from an Amazon EC2 instance to a host outside the AWS network.

- **EC2: Data Transfer - Region to Region (In)**
  Filters by the costs associated with how many GB are transferred to your Amazon EC2 instances from a different AWS Region.

- **EC2: Data Transfer - Region to Region (Out)**
  Filters by the costs associated with how many GB are transferred from your Amazon EC2 instances to a different AWS Region.

- **EC2: EBS - I/O Requests**
  Filters by the costs associated with how many I/O requests that you make to your Amazon EBS volumes.

- **EC2: EBS - Magnetic**
  Filters by the costs associated with how many GB that you have stored on Amazon EBS Magnetic volumes.

- **EC2: EBS - Provisioned IOPS**
  Filters by the costs associated with how many IOPS-months that you have provisioned for Amazon EBS.
• EC2: EBS - SSD(gp2)

Filters by the costs associated with how many GB per month of General Purpose storage that your Amazon EBS volumes use.

• EC2: EBS - SSD(io1)

Filters by the costs associated with how many GB per month of Provisioned IOPS SSD storage that your Amazon EBS volumes use.

• EC2: EBS - Snapshots

Filters by the costs associated with how many GB per month that your Amazon EBS snapshots store.

• EC2: EBS - Optimized

Filters by the costs associated with how many MB per instance hour that your Amazon EBS-optimized instances use.

• EC2: ELB - Running Hours

Filters by the costs associated with how many hours that your Elastic Load Balancing load balancers ran.

• EC2: Elastic IP - Additional Address

Filters by the costs associated with how many Elastic IP addresses that you attached to running Amazon EC2 instances.

• EC2: Elastic IP - Idle Address

Filters by the costs associated with Elastic IP addresses that you have that aren't attached to running Amazon EC2 instances.

• EC2: NAT Gateway - Data Processed

Filters by the costs associated with how many GB that your network address translation gateways (NAT gateways) processed.

• EC2: NAT Gateway - Running Hours

Filters by the costs associated with how many hours that your NAT gateways ran.

• EC2: Running Hours

Filters by the costs associated with how many hours that your Amazon EC2 instances ran.

This Usage Type Group contains only the following Usage Types:

• BoxUsage
• DedicatedUsage
• HostBoxUsage
• HostUsage
• ReservedHostUsage
• SchedUsage
• SpotUsage
• UnusedBox

• ElastiCache: Running Hours

Filters by the costs associated with how many hours that your Amazon ElastiCache nodes ran.

• ElastiCache: Storage

Filters by the costs associated with how many GB that you stored in Amazon ElastiCache.

• RDS: Running Hours
Filters by the costs associated with how many hours that your Amazon RDS databases ran.

This **Usage Type Group** contains only the following **Usage Types**:
- AlwaysOnUsage
- BoxUsage
- DedicatedUsage
- HighUsage
- InstanceUsage
- MirrorUsage
- Multi-AZUsage
- SpotUsage
- **RDS: Data Transfer – CloudFront – In**
  Filters by the costs associated with how many GB are transferred into Amazon RDS from a CloudFront distribution.
- **RDS: Data Transfer – CloudFront – Out**
  Filters by the costs associated with how many GB are transferred from a CloudFront distribution to Amazon RDS data transfers.
- **RDS: Data Transfer – Direct Connect Locations – In**
  Filters by the costs associated with how many GB are transferred into Amazon RDS through a Direct Connect network connection.
- **RDS: Data Transfer – Direct Connect Locations – Out**
  Filters by the costs associated with how many GB are transferred from Amazon RDS through a Direct Connect network connection.
- **RDS: Data Transfer – InterAZ**
  Filters by the costs associated with how many GB are transferred into, out of, or between Amazon RDS buckets in different Availability Zones.
- **RDS: Data Transfer – Internet – In**
  Filters by the costs associated with how many GB are transferred to your Amazon RDS databases.
- **RDS: Data Transfer – Internet – Out**
  Filters by the costs associated with how many GB are transferred from your Amazon RDS databases.
- **RDS: Data Transfer – Region to Region – In**
  Filters by the costs associated with how many GB are transferred to your Amazon RDS instances from a different AWS Region.
- **RDS: Data Transfer – Region to Region – Out**
  Filters by the costs associated with how many GB are transferred from your Amazon RDS instances to a different AWS Region.
- **RDS: I/O Requests**
  Filters by the costs associated with how many I/O requests that you make to your Amazon RDS instance.
- **RDS: Provisioned IOPS**
  Filters by the costs associated with how many IOPS-months that you have provisioned for Amazon RDS.
• **RDS: Storage**
  Filters by the costs associated with how many GB that you have stored in Amazon RDS.

• **Redshift: DataScanned**
  Filters by the costs associated with how many GB that your Amazon Redshift nodes scanned.

• **Redshift: Running Hours**
  Filters by the costs associated with how many hours that your Amazon Redshift nodes ran.

• **S3: API Requests - Standard**
  Filters by the costs associated with GET and all other standard storage Amazon S3 requests.

• **S3: Data Transfer - CloudFront (In)**
  Filters by the costs associated with how many GB are transferred into Amazon S3 from a CloudFront distribution.

• **S3: Data Transfer - CloudFront (Out)**
  Filters by costs associated with how many GB are transferred from a CloudFront distribution to Amazon S3 data transfers, such as how much data was uploaded from your Amazon S3 bucket to your CloudFront distribution.

• **S3: Data Transfer - Inter AZ**
  Filters by the costs associated with how many GB are transferred into, out of, or between Amazon S3 buckets in different Availability Zones.

• **S3: Data Transfer - Internet (In)**
  Filters by the costs associated with how many GB are transferred to an Amazon S3 bucket from outside the AWS network.

• **S3: Data Transfer - Internet (Out)**
  Filters by the costs associated with how many GB are transferred from an Amazon S3 bucket to a host outside the AWS network.

• **S3: Data Transfer - Region to Region (In)**
  Filters by the costs associated with how many GB are transferred to Amazon S3 from a different AWS Region.

• **S3: Data Transfer - Region to Region (Out)**
  Filters by the costs associated with how many GB are transferred from Amazon S3 to a different AWS Region.

• **S3: Storage - Standard**
  Filters by the costs associated with how many GB that you have stored in Amazon S3.

### Choosing advanced options

You can customize how you view your data in Cost Explorer using **Advanced Options** to include or exclude specific types of data.

### To exclude data from your chart

- In the right pane, under **Advanced Options**, under **Include costs related to**, deselect the data type that you want to exclude.
In addition to the costs that Cost Explorer includes, you can show specific costs such as untagged resources or blended costs. By doing this, you also see the following alternate views of your costs.

**Show only untagged resources**

By default, Cost Explorer includes costs both for resources that have cost allocation tags and for resources that don't have cost allocation tags. To find untagged resources that add to your costs, select **Show only untagged resources**. For more information about cost allocation tags, see [Using Cost Allocation Tags](#).

**Show only uncategorized resources**

By default, Cost Explorer includes costs both for resources that are mapped to a cost category and for resources that aren't mapped to a cost category. To find uncategorized resources that add to your costs, select **Show only uncategorized resources**. For more information about cost categories, see [Managing your costs with AWS Cost Categories](#).

**Show blended costs**

This cost metric reflects the average cost of usage across the consolidated billing family. If you use the consolidated billing feature in AWS Organizations, you can view costs using **blended rates**. For more information, see [Blended Rates and Costs](#).

**Show unblended costs**

This cost metric reflects the cost of the usage. When grouped by charge type, **unblended costs** separate discounts into their own line items. This enables you to view the amount of each discount received.

**Show net unblended costs**

This cost metric reflects the cost after discounts.

**Show amortized costs**

This cost metric reflects the effective cost of the upfront and monthly reservation fees spread across the billing period. By default, Cost Explorer shows the fees for Reserved Instances as a spike on the day that you're charged. However, if you choose to show costs as amortized costs, the costs are amortized over the billing period. This means that the costs are broken out into the effective daily rate. AWS estimates your amortized costs by combining your unblended costs with the amortized portion of your upfront and recurring reservation fees. For the daily view, Cost Explorer shows the unused portion of your upfront reservation fees and recurring RI charges on the first of the month.

For example, suppose that Alejandro purchases a Partial Upfront t2.micro RI for a one-year term at $30 dollars upfront. The monthly fee is $2.48. Cost Explorer shows the costs for this RI as a spike on the first of the month. If Alejandro chooses **Amortized costs** for a 30-day month, the Cost Explorer chart shows a daily effective rate of $0.165. This is the EC2 effective rate multiplied by the number of hours in a day.

Amortized costs aren't available for billing periods before 2018. If you want to see how much of your reservation was unused, group by purchase option.

**Show net amortized costs**

This cost metric amortizes the upfront and monthly reservation fees while including discounts such as RI volume discounts.

You can show these specific costs by using the following procedure.

**To show specific cost types in your chart**

• In the right pane, under **Advanced Options**, under **Other**, select the cost type that you want to show.

### Reading the Cost Explorer data table

A data table follows each Cost Explorer chart. The data table displays the cost figures that the chart represents. If your chart is using a grouping, the data table displays the aggregate amounts for the filter types that you choose for your chart. If your chart isn't using a grouping, the table displays the aggregate amounts for your past and forecasted cost data. You can download the .csv file that contains the complete data set for your chart.

**Note**
For the RI Utilization and Savings report, the maximum table size is 20 rows. If the data exceeds this, it appears in a truncated form.

In the grouped data table, each row is a value for one of the filter type options: API operations, Availability Zones, AWS services, custom cost allocation tags, instance types, member accounts, purchase options, Region, usage type, or usage type group. The columns represent time intervals. For example, the data table shows the costs for selected services for the last three months in separate columns. Then, the last column of the data table shows the aggregated total for the 3 months.

**Note**
Data transfer costs are included in the services that they're associated with, such as Amazon EC2 or Amazon S3. They aren't represented as either a separate line item in the data table or a bar in the chart.

In the ungrouped data table, the row is your costs. The columns represent time intervals.

### Forecasting with Cost Explorer

You create a forecast by selecting a future time range for your report. For more information, see [Choosing time ranges for the data that you want to view](p. 15). The following section discusses the accuracy of the forecasts created by Cost Explorer and how to read them.

A forecast is a prediction of how much you will use AWS services over the forecast time period that you selected. This forecast is based on your past usage. You can use a forecast to estimate your AWS bill and set alarms and budgets for based on predictions. Because forecasts are predictions, the forecasted billing amounts are estimated and might differ from your actual charges for each statement period.

Like weather forecasts, billing forecasts can vary in accuracy. Different ranges of accuracy have different prediction intervals. The higher the prediction interval, the more likely the forecast has a wider range. For example, suppose that you have a budget set to 100 dollars for a given month. An 80% prediction interval might forecast your spend between 90 and 100, with a mean of 95. The range in the prediction band is dependent on your historical spend volatility, or fluctuations. The more consistent and predictable the historical spend, the narrower the prediction range in forecast spend.

Cost Explorer forecasts have a prediction interval of 80%. If AWS doesn't have enough data to forecast an 80% prediction interval, Cost Explorer doesn't provide a forecast. This is common for accounts that have less than one full billing cycle.

### Reading forecasts

How you read the Cost Explorer forecasts depends on the type of chart that you're using. Forecasts are available for both line charts and bar charts.

The 80% prediction interval appears differently on each type of chart:

• Line charts represent the prediction interval as a set of lines that are on either side of your costs line.
• Bar charts represent the prediction interval as two lines that are on either side of the top of your bar.

When forecasting costs, discounts are included by default.

Note
If you want your forecasts to include non-recurring discounts such as refunds, we encourage you to use Show net unblended costs. For more information about different costs, see Cost Explorer Advanced Options.

Using forecasts with consolidated billing
If you use the consolidated billing feature in AWS Organizations, the forecasts are calculated with the data from all the accounts. If you add a new member account to an organization, forecasts don’t include that new member account until the new spending patterns of the organization are analyzed. For more information about consolidated billing, see Consolidated billing for AWS Organizations.

Using the AWS Cost Explorer API

The Cost Explorer API allows you to programmatically query your cost and usage data. You can query for aggregated data such as total monthly costs or total daily usage. You can also query for granular data, such as the number of daily write operations for DynamoDB database tables in your production environment.

If you use a programming language that AWS provides an SDK for, we recommend that you use the SDK. All the AWS SDKs greatly simplify the process of signing requests and save you a significant amount of time when compared with using the AWS Cost Explorer API. In addition, the SDKs integrate easily with your development environment and provide easy access to related commands.

For more information about available SDKs, see Tools for Amazon Web Services. For more information about the AWS Cost Explorer API, see the AWS Billing and Cost Management API Reference.

Service endpoint
The Cost Explorer API provides the following endpoint:

https://ce.us-east-1.amazonaws.com

Granting IAM permissions to use the AWS Cost Explorer API
A user must be granted explicit permission to query the AWS Cost Explorer API. For the policy that grants the necessary permissions to a user, see View costs and usage (p. 123).

Best practices for the AWS Cost Explorer API
The following are best practices when working with the Cost Explorer API.

Topics
• Best practices for configuring access to the Cost Explorer API (p. 29)
• Best practices for querying the Cost Explorer API (p. 29)
• Best practices for optimizing your Cost Explorer API costs (p. 29)
Best practices for configuring access to the Cost Explorer API

A user must be granted explicit permissions to query the Cost Explorer API. Granting a user access to the Cost Explorer API gives that user query access to any cost and usage data available to that account. For the policy that grants the necessary permissions to a user, see View costs and usage (p. 123).

When configuring access to the Cost Explorer API, we recommend creating a unique role for the user. If you want to give multiple users query access to the Cost Explorer API, we recommend creating a role for each of them.

Best practices for querying the Cost Explorer API

When querying the Cost Explorer API, we recommend using filtering conditions to refine your queries so that you receive only the data that you need. You can do this by restricting the time range to a smaller interval or by using filters to limit the result set that your request returns. This enables your queries to return data more quickly than if you're accessing a larger set of data.

Adding one or more grouping dimensions to your query can increase the size of your result and can impact query performance. Depending on your use case, it can make sense to filter your data instead.

The Cost Explorer API can access up to 12 months of historical data and data for the current month. It can also provide 3 months of cost forecast data at the daily level of granularity and 12 months of cost forecast data at the monthly level of granularity.

Best practices for optimizing your Cost Explorer API costs

Because you're charged for the Cost Explorer API per paginated request, we recommend identifying the exact dataset to access before submitting queries.

AWS billing information is updated up to three times daily. Typical workloads and use cases for the Cost Explorer API anticipate a call pattern cadence ranging from daily to several times per day. To receive the most up-to-date data available, query for the time period that you're interested in.

If you're creating an application using the Cost Explorer API, we recommend architecting the application so that it has a caching layer. This enables you to regularly update the underlying data for your end users, but doesn't trigger queries every time that an individual in your organization accesses it.
Using Cost Explorer reports

Cost Explorer provides default reports, but also enables you to change the filters and constraints used to create the reports. Cost Explorer also provides you ways to save the reports that you made. You can save them as a bookmark, download the CSV file, or save them as a report.

Topics
- Using the default Cost Explorer reports (p. 30)
- Saving reports and results (p. 35)

Using the default Cost Explorer reports

Cost Explorer provides you with a couple of default reports. You can't modify these reports, but you can use them to create your own custom reports.

- Cost and usage reports (p. 30)
- Reserved Instance reports (p. 31)

Cost and usage reports

Cost Explorer provides you with the following reports for understanding your costs.

- AWS Marketplace (p. 30)
- Daily costs (p. 30)
- Monthly costs by linked account (p. 30)
- Monthly costs by service (p. 30)
- Monthly EC2 running hours costs and usage (p. 31)

AWS Marketplace

The AWS Marketplace report shows how much you have spent through AWS Marketplace.

Daily costs

The Daily costs report shows how much you've spent in the last six months, along with how much you're forecasted to spend over the next month.

Monthly costs by linked account

The Monthly costs by linked account report shows your costs for the last six months, grouped by linked, or member account. The top five member accounts are shown by themselves, and the rest are grouped into one bar.

Monthly costs by service

The Monthly costs by service report shows your costs for the last six months, grouped by service. The top five services are shown by themselves, and the rest are grouped into one bar.
Monthly EC2 running hours costs and usage

The Monthly EC2 running hours costs and usage report shows how much you have spent on active Reserved Instances (RIs).

Reserved Instance reports

Cost Explorer provides you with the following reports for understanding your reservations.

The reservation reports show your Amazon EC2 coverage and utilization in either hours or normalized units. Normalized units enable you to see your Amazon EC2 usage for multiple sizes of instances in a uniform way. For example, suppose you run an xlarge instance and a 2xlarge instance. If you run both instances for the same amount of time, the 2xlarge instance uses twice as much of your reservation as the xlarge instance, even though both instances show only one instance-hour. Using normalized units instead of instance-hours, the xlarge instance used 8 normalized units, and the 2xlarge instance used 16 normalized units. For more information, see Instance Size Flexibility for EC2 Reserved Instances.

- RI utilization reports (p. 31)
- RI coverage reports (p. 34)

RI utilization reports

The RI Utilization reports show how much of your Amazon EC2, Amazon Redshift, Amazon RDS, Amazon OpenSearch Service, and Amazon ElastiCache Reserved Instance (RIs) that you use, how much you saved by using RIs, how much you overspent on RIs, and your net savings from purchasing RIs during the selected time range. This helps you to see if you have purchased too many RIs.

The RI Utilization charts display the number of RI hours that your account uses, helping you to understand and monitor your combined usage (utilization) across all of your RIs and services. It also shows how much you saved over On-Demand Instance costs by purchasing a reservation, the amortized costs of your unused reservations, and your total net savings from purchasing reservations. AWS calculates your total net savings by subtracting the costs of your unused reservations from your reservations savings.

The following table shows an example of potential savings (all costs are in USD).

<table>
<thead>
<tr>
<th>Account</th>
<th>RI utilization</th>
<th>RI hours purchased</th>
<th>RI hours used</th>
<th>RI hours unused</th>
<th>On-Demand cost of RI hours used</th>
<th>Effective RI cost</th>
<th>Net savings</th>
<th>Total potential savings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Martha</td>
<td>0.50</td>
<td>100</td>
<td>50</td>
<td>50</td>
<td>$200</td>
<td>$150</td>
<td>$50</td>
<td>$250</td>
</tr>
<tr>
<td>Liu Jie</td>
<td>0.75</td>
<td>100</td>
<td>75</td>
<td>25</td>
<td>$300</td>
<td>$150</td>
<td>$150</td>
<td>$250</td>
</tr>
<tr>
<td>Saanvi</td>
<td>1.00</td>
<td>50</td>
<td>50</td>
<td>0</td>
<td>$200</td>
<td>$75</td>
<td>$125</td>
<td>$125</td>
</tr>
</tbody>
</table>

As shown in the preceding table, Martha, Liu Jie, and Saanvi purchase RIs at $1.50 an hour and On-Demand hours at $4.00 an hour. Breaking down this example further, you can see how much each of them saves by purchasing RIs:

- Martha purchases 100 RI hours for $150. She uses 50 hours, which would cost $200 if she used On-Demand Instances. She saves $50, which is the cost of 50 On-Demand hours minus the cost of the
RI. She could optimize her savings by using more of her purchased RI hours, by converting her RI to cover other instances, or by selling her RIs on the RI Marketplace. For more information about selling an RI on the RI Marketplace, see Selling on the Reserved Instance Marketplace in the Amazon EC2 User Guide for Linux Instances.

- Liu Jie purchases 100 RI hours for $150. He uses 75 of them, which would cost $300 if he used On-Demand Instances. So he saves $150, which is the cost of 300 On-Demand hours minus the cost of the RI.
- Saanvi purchases 50 RI hours for $75. She uses all 50 of them, which would cost $200 if she used On-Demand Instances. So she saves $125, which is the cost of 200 On-Demand hours minus the cost of the RI.

The reports allow you to define a utilization threshold, known as a utilization target, and identify RIs that meet your utilization target and RIs that are underutilized. The chart shows RI utilization as the percentage of purchased RI hours that are used by matching instances, rounded to the nearest percentage.

Target utilization is shown on the chart as a dotted line in the chart and in the table below the chart as a colored RI utilization status bar. RIs with a red status bar are RIs with no hours used. RIs with a yellow status bar are under your utilization target. RIs with a green status bar have met your utilization target. Instances with a gray bar aren't using reservations. You can change the utilization target in the Display Options section. To remove the utilization target line from the chart, clear the Show target line on chart check box. You can also create budgets that enable AWS to notify you if you fall below your utilization targets. For more information, see Managing your costs with AWS Budgets (p. 38).

You can filter the chart to analyze the purchasing accounts, instance types, and more. RI reports use a combination of RI-specific filters and regular Cost Explorer filters. The RI-specific filters are available only for the Cost Explorer RI Utilization and RI Coverage reports. They aren't available anywhere else that AWS uses Cost Explorer filters. The following filters are available:

- **Availability Zone** – Filter your RI usage by specific Availability Zones.
- **Instance Type** – Filter your RI usage by specific instance types, such as t2.micro or m3.medium. This also applies to Amazon RDS instance classes, such as db.m4, and Amazon Redshift and ElastiCache node types, such as dc2.large.
- **Linked Account** – Filter your reservations by specific member accounts.
- **Platform** – Filter your RI usage by platform, such as Linux or Windows. This also applies to Amazon RDS database engines.
- **Region** – Filter your RI usage by specific regions, such as US East (N. Virginia) or Asia Pacific (Singapore).
- **Scope** (Amazon EC2) – Filter your Amazon EC2 usage to show RIs that are purchased for use in specific Availability Zones or regions.
- **Tenancy** (Amazon EC2) – Filter your Amazon EC2 usage by tenancy, such as Dedicated or Default. An RI with a Dedicated tenancy is reserved for a single tenant, and an RI with a Default tenancy might share hardware with another RI.

In addition to changing your utilization target and filtering your RIs, you can choose a single RI or a group of RIs to show in the chart. To choose a single RI or a selection of RIs to see in the chart, select the check box next to the RI in the table below the chart. You can select up to 10 leases at one time.

Cost Explorer shows the combined utilization across all of your RIs in the chart and shows utilization for individual RI reservations in the table below the chart. The table also includes a subset of the information for each RI reservation. You can find the following information for each reservation in the downloadable .csv file:

- **Account Name** – The name of the account that owns the RI reservation.
• **Subscription ID** – The unique subscription ID for the RI reservation.
• **Reservation ID** – The unique ID for the RI reservation.
• **Instance Type** – The RI instance class, instance type, or node type, such as `t2.micro`, `db.m4`, or `dc2.large`.
• **RI Utilization** – The percentage of purchased RI hours that were used by matching instances.
• **RI Hours Purchased** – The number of purchased hours for the RI reservation.
• **RI Hours Used** – The number of purchased hours that were used by matching instances.
• **RI Hours Unused** – The number of purchased hours that weren't used by matching instances.
• **Account ID** – The unique ID of the account that owns the RI reservation.
• **Start Date** – The date that the RI starts.
• **End Date** – The date that the RI expires.
• **Numbers of RIs** – The numbers of RIs that are associated with the reservation.
• **Scope** – Whether this RI is for a specific Availability Zone or region.
• **Region** – The region that the RI is available in.
• **Availability Zone** – The Availability Zone that the RI is available in.
• **Platform** (Amazon EC2) – The platform that this RI is for.
• **Tenancy** (Amazon EC2) – Whether this RI is for a shared or dedicated instance.
• **Payment Option** – Whether this RI is a Full Upfront, Partial Upfront, or No Upfront RI.
• **Offering Type** – Whether this RI is Convertible or Standard.
• **On-Demand Cost Equivalent** – The cost of the RI hours that you used, based on the public On-Demand prices.
• **Amortized Upfront Fee** – The upfront cost of this reservation, amortized over the RI period.
• **Amortized Recurring Charges** – The monthly cost of this reservation, amortized over the RI period.
• **Effective RI Cost** – The combined amortized upfront and amortized recurring costs of the RI hours that you purchased.
• **Net Savings** – The amount that Cost Explorer estimates that you saved by purchasing reservations.
• **Potential Savings** – The total potential savings that you might see if you use your entire RI.
• **Average On-Demand Rate** – The On-Demand rate of the RI hours that you used. When you view the On-Demand rates for an extended period of time, the On-Demand rate reflects any price changes made during that time period.

If there isn't any usage for the given time period, the average On-Demand rate shows **N/A**.

• **Total Asset Value** – The effective cost of your reservation term. The total asset value takes both your start date and either your end date or your cancellation date into consideration.
• **Effective Hourly Rate** – The effective hourly rate of your total RI costs. The hourly rate takes both your upfront fees and your recurring fees into consideration.
• **Upfront Fee** – The one-time upfront cost of the RI hours that you purchased.
• **Hourly Recurring Fee** – The effective hourly rate of your monthly RI costs. The hourly recurring fee takes only your recurring fees into consideration.
• **RI Cost For Unused Hours** – The amount that you spent on RI hours that you didn't use.

You can use this information to track how many RI usage hours you used and how many RI hours you reserved but didn't use during the selected time range.

The Daily RI Utilization chart displays your RI utilization for the previous three months on a daily basis. The Monthly RI Utilization chart displays your RI utilization for the previous 12 months on a monthly basis.
RI coverage reports

The RI Coverage reports show how many of your Amazon EC2, Amazon Redshift, Amazon RDS, Amazon OpenSearch Service, and Amazon ElastiCache instance hours are covered by RIs, how much you spent on On-Demand Instances, and how much you might have saved had you purchased more reservations. This enables you to see if you have under-purchased RIs.

The RI coverage charts display the percentage of instance hours that your account used that were covered by reservations, helping you to understand and monitor the combined coverage across all of your RIs. It also shows how much you spent on On-Demand Instances and how much you might have saved had you purchased more reservations.

You can define a threshold for how much coverage you want from RIs, known as a coverage target, which enables you to see where you can reserve more RIs.

Target coverage is shown on the chart as a dotted line, and the average coverage is shown in the table below the chart as a colored status bar. Instances with a red status bar are instances with no RI coverage. Instances with a yellow status bar are under your coverage target. Instances with a green status bar have met your coverage target. Instances with a gray bar aren't using reservations. You can change the coverage target in the Display Options section. To remove the coverage target line from the chart, clear the Show target line on chart check box. You can also create coverage budgets that enable AWS to notify you if you fall below your coverage target. For more information, see Managing your costs with AWS Budgets (p. 38).

The RI coverage reports use the Cost Explorer filters instead of the RI Utilization filters. You can filter the chart to analyze the purchasing accounts, instance types, and more. RI reports use a combination of RI-specific filters and regular Cost Explorer filters. The RI-specific filters are available only for the Cost Explorer RI Utilization and RI Coverage reports, and aren't available anywhere else that AWS uses Cost Explorer filters. The following filters are available:

- **Availability Zone** – Filter your RI usage by specific Availability Zones.
- **Instance Type** – Filter your RI usage by specific instance types, such as t2.micro or m3.medium. This also applies to Amazon RDS instance classes such as db.m4.
- **Linked Account** – Filter your RI usage by specific member accounts.
- **Platform** – Filter your RI usage by platform, such as Linux or Windows. This also applies to Amazon RDS database engines.
- **Region** – Filter your RI usage by specific regions, such as US East (N. Virginia) or Asia Pacific (Singapore).
- **Scope** (Amazon EC2) – Filter your Amazon EC2 usage to show RIs that are purchased for use in specific Availability Zones or regions.
- **Tenancy** (Amazon EC2) – Filter your Amazon EC2 usage by tenancy, such as Dedicated or Default. A Dedicated RI is reserved for a single tenant, and a Default RI might share hardware with another RI.

In addition to changing your coverage target and filtering your instance types with the available filters, you can choose a single instance type or a group of instance types to show in the chart. To choose a single instance type or a selection of instance types to see in the chart, select the check box next to the instance type in the table below the chart. You can select up to 10 instances at one time.

Cost Explorer shows the combined coverage across all of your instance types in the chart and shows coverage for individual instance types in the table below the chart. The table also includes a subset of the information for each instance type. You can find the following information for each instance type in the downloadable .csv file:

- **Instance Type** (Amazon EC2), **Instance Class** (Amazon RDS), or **Node Type** (Amazon Redshift or Amazon ElastiCache) – The RI instance class, instance type, or node type, such as t2.micro, db.m4, or dc2.large.
• **Database Engine** (Amazon RDS) – Filter your Amazon RDS coverage to show RIs that cover a specific database engine, such as Amazon Aurora, MySQL, or Oracle.

• **Deployment Option** (Amazon RDS) – Filter your Amazon RDS coverage to show RIs that cover a specific deployment option, such as Multi-AZ deployments.

• **Region** – The region that the instance ran in, such as **us-east-1**.

• **Platform** (Amazon EC2) – The platform that this RI is for.

• **Tenancy** (Amazon EC2) – Whether this RI is for a shared, dedicated, or host instance.

• **Average Coverage** – The average number of usage hours that a reservation covers.

• **RI Covered Hours** – The number of usage hours that a reservation covers.

• **On-Demand Hours** – The number of usage hours that aren't covered by reservations.

• **On-Demand Cost** – The amount that you spent on On-Demand Instances.

• **Total Running Hours** – The total number of usage hours, both covered and uncovered.

You can use this information to track how many hours you use and how many of those hours are covered by RIs.

The daily chart displays the number of RI hours that your account used on a daily basis for the last three months. The monthly chart displays your RI coverage for the previous 12 months, listed by month.

### Saving reports and results

You can save your Cost Explorer filters and data multiple ways. You can save the exact configuration as a bookmark, you can download the CSV file of the data that Cost Explorer used to create your graphs, or you can save the Cost Explorer configuration as a saved report. Cost Explorer keeps your saved reports and lists them on your report page along with the default Cost Explorer reports.

### Topics

- Saving your Cost Explorer configuration with bookmarks or favorites (p. 35)
- Downloading the cost data CSV file (p. 35)
- Managing your saved Cost Explorer reports (p. 36)

### Saving your Cost Explorer configuration with bookmarks or favorites

You can save your date, filter, chart style, group by, and advanced settings by saving the Cost Explorer URLs as favorites or bookmarks in your browser. When you return to the link that you saved, Cost Explorer refreshes the page using current cost data for time range you selected and displays the most recent forecast. This feature enables you to save a configuration that you're likely to refresh and return to often. You can also save a configuration for a specific, unchanging range of time by using the **Custom** time range and setting fixed start and end dates for your chart.

**Warning**

If you want to save a number of configurations, make sure to give each bookmark or favorite a unique name so that you don't overwrite older configurations when you save a new URL.

### Downloading the cost data CSV file

When you want to review comprehensive detail, you can download a comma-separated values (CSV) file of the cost data that Cost Explorer uses to generate the chart. This is the same data that appears in the
To download a CSV file

2. Configure Cost Explorer to use the options that you want to see in the CSV file.
3. Choose Download CSV.

Note the following about the format of the CSV download:

- If you view the CSV file in a table format, the file's columns represent costs and the rows represent time. When compared to the Cost Explorer data table in the console, the columns and rows are transposed.
- The file shows data with up to 15 decimal places of precision.
- The file shows dates in the YYYY-MM-DD format.

Managing your saved Cost Explorer reports

You can save the results of a Cost Explorer query as a Cost Explorer report. This enables you to track your Cost Explorer results and forecasts over time.

Topics

- Creating a Cost Explorer report (p. 36)
- Viewing a Cost Explorer report (p. 36)
- Editing a Cost Explorer report (p. 37)
- Deleting a Cost Explorer report (p. 37)

Creating a Cost Explorer report

You can use the console to save the results of a Cost Explorer query as a report.

Note

Cost Explorer reports can be modified. We strongly recommend that you don't use them for auditing purposes.

To save a Cost Explorer report

Sign in to the AWS Management Console and open the AWS Cost Management console at https://console.aws.amazon.com/cost-management/home.

1. Choose New report. This resets all of your Cost Explorer settings to your default settings.
2. For the report name text field, enter a name for your report.
3. Customize your Cost Explorer settings.
4. Choose Save report.
5. In the Save report dialog box, choose Continue.

Viewing a Cost Explorer report

You can use the console to view saved Cost Explorer reports.
To view your saved reports

1. On the report dropdown menu, choose View/Manage all reports.
2. To return to the Cost Explorer page, choose Back.

Editing a Cost Explorer report

You can use the console to edit Cost Explorer reports.

To edit your report

1. On the report dropdown menu, choose the report that you want to edit.
   
   Note
   You can't edit the preconfigured reports. If you choose one of the preconfigured reports as a starting point for a report, enter a new report name in the report name field and continue with this procedure.
   
2. Customize your Cost Explorer settings.
3. Choose Save report.
4. In the Save report dialog box, choose Continue.

Deleting a Cost Explorer report

You can use the console to delete saved Cost Explorer reports.

To delete a saved report

1. On the report dropdown menu, choose View/Manage all reports.
2. Next to the report that you want to delete, select the check box.
3. On the navigation bar, choose Delete.
4. In the Delete Report dialog box, choose Delete.
Managing your costs with AWS Budgets

You can use AWS Budgets to track and take action on your AWS costs and usage. You can use AWS Budgets to monitor your aggregate utilization and coverage metrics for your Reserved Instances (RIs) or Savings Plans. If you’re new to AWS Budgets, see Best practices for AWS Budgets (p. 39).

You can use AWS Budgets to enable simple-to-complex cost and usage tracking. Some examples include:

- Setting a monthly cost budget with a fixed target amount to track all costs associated with your account. You can choose to be alerted for both actual (after accruing) and forecasted (before accruing) spends.
- Setting a monthly cost budget with a variable target amount, with each subsequent month growing the budget target by 5 percent. Then, you can configure your notifications for 80 percent of your budgeted amount and apply an action. For example, you could automatically apply a custom IAM policy that denies you the ability to provision additional resources within an account.
- Setting a monthly usage budget with a fixed usage amount and forecasted notifications to help ensure that you are staying within the service limits for a specific service. You can also be sure you are staying under a specific AWS Free Tier offering.
- Setting a daily utilization or coverage budget to track your RI or Savings Plans. You can choose to be notified through email and Amazon SNS topics when your utilization drops below 80 percent for a given day.

AWS Budgets information is updated up to three times a day. Updates typically occur 8–12 hours after the previous update. Budgets can track your unblended, amortized, and blended costs. Budgets can include or exclude charges such as discounts, refunds, support fees, and taxes.

You can create the following types of budgets:

- **Cost budgets** – Plan how much you want to spend on a service.
- **Usage budgets** – Plan how much you want to use one or more services.
- **RI utilization budgets** – Define a utilization threshold and receive alerts when your RI usage falls below that threshold. This lets you see if your RIs are unused or under-utilized.
- **RI coverage budgets** – Define a coverage threshold and receive alerts when the number of your instance hours that are covered by RIs fall below that threshold. This lets you see how much of your instance usage is covered by a reservation.
- **Savings Plans utilization budgets** – Define a utilization threshold and receive alerts when the usage of your Savings Plans falls below that threshold. This lets you see if your Savings Plans are unused or under-utilized.
- **Savings Plans coverage budgets** – Define a coverage threshold and receive alerts when your Savings Plans eligible usage that is covered by Savings Plans fall below that threshold. This lets you see how much of your instance usage is covered by Savings Plans.

You can set up optional notifications that warn you if you exceed, or are forecasted to exceed, your budgeted amount for cost or usage budgets. Or if you fall below your target utilization and coverage for RI or Savings Plans budgets. You can have notifications sent to an Amazon SNS topic, to an email address, or to both. For more information, see Creating an Amazon SNS topic for budget notifications (p. 58).
If you use consolidated billing in an organization and you own the management account, you can use IAM policies to control access to budgets by member accounts. By default, owners of member accounts can create their own budgets but can't create or edit budgets for other users. You can create roles with permissions that allow users to create, edit, delete, or read budgets in a specific account. However, we don't support cross-account usage.

A budget is only visible to users with access to the account that created the budget, and with access to the budget itself. For example, a management account can create a budget that tracks a specific member account's cost, but the member account can only view the same budget if they receive access to the management account. For more information, see Overview of managing access permissions (p. 98). For more information about AWS Organizations, see the AWS Organizations User Guide.

**Note**
There can be a delay between when you incur a charge and when you receive a notification from AWS Budgets for the charge. This is due to a delay between when an AWS resource is used and when that resource usage is billed. You might incur additional costs or usage that exceed your budget notification threshold before AWS Budgets can notify you.

---

**Best practices for controlling access to AWS Budgets**

To allow users to create budgets in the AWS Billing and Cost Management console, you must also allow users to do the following:

- View your billing information
• Create Amazon CloudWatch alarms
• Create Amazon Simple Notification Service (Amazon SNS) notifications

To learn more about giving users the ability to create budgets on the AWS Budgets console, see Allow users to create budgets (p. 121).

You can also create budgets programmatically using the Budgets API. When configuring access to the Budgets API, we recommend creating a unique user role for making programmatic requests. This helps you define more precise access controls between who in your organization has access to the AWS Budgets console and the API. To give multiple users query access to the Budgets API, we recommend creating a role for each of them.

Best practices for budget actions

Using managed policies

There are two AWS managed policies to help get you started with budget actions. One for the user, and the other for budgets. These policies are related. The first policy ensures a user can pass a role to the budgets service, and the second allows budgets to execute the action.

If you don’t have proper permissions configured and assigned for the user and for AWS Budgets, AWS Budgets can’t execute your configured actions. To ensure proper configuration and execution, we’ve configured these managed policies so your AWS Budgets actions work as intended. We recommend you use these IAM policies to be sure you don’t have to update your existing IAM policy for AWS Budgets when a new functionality is included. We will add new capabilities to the managed policy by default.

For details about managed policies, see Managed policies (p. 116).

To learn more about AWS Budgets actions, see the Configuring AWS Budgets actions (p. 54) section.

Using Amazon EC2 Auto Scaling

If a budget action is used to stop an Amazon EC2 instance in an Auto Scaling Group (ASG), Amazon EC2 Auto Scaling restarts the instance, or launches new instances to replace the stopped instance. Therefore, “shutdown budget actions is not effective to Amazon EC2/Amazon RDS budget actions” aren’t effective unless you combine a second budget action that removes permissions on the role used by the Launch Configuration managing the ASG.

Best practices for setting budgets

Use AWS Budgets to set custom budgets based on your costs, usage, reservation utilization, and reservation coverage.

With AWS Budgets, you can set budgets on a recurring basis or for a specific time frame. However, we recommend setting your budget on a recurring basis so that you don’t unexpectedly stop receiving budget alerts.

Best practices for using the advanced options when setting cost budgets

Cost budgets can be aggregated by unblended costs, amortized costs, or blended costs. Cost budgets can also either include or exclude refunds, credits, upfront reservation fees, recurring reservation charges, non-reservation subscription costs, taxes, and support charges.
Understanding the AWS Budgets update frequency

AWS billing data, which Budgets uses to monitor resources, is updated at least once per day. Keep in mind that budget information and associated alerts are updated and sent according to this data refresh cadence.

Best practices for setting budget alerts

Budget alerts can be sent to up to 10 email addresses and one Amazon SNS topic per alert. You can set budgets to alert against either actual values or forecasted values.

Actual alerts are only sent out once per budget, per budget period, when a budget first reached the actual alert threshold.

Forecast-based budget alerts are sent out on a per-budget, per-budget period basis. They might alert more than once in a budgeted period if the forecasted values exceed, dip below, and then exceed the alert threshold again during the budgeted period.

AWS requires approximately 5 weeks of usage data to generate budget forecasts. If you set a budget to alert based on a forecasted amount, this budget alert isn't triggered until you have enough historical usage information.

The following video highlights the importance of setting up budget alerts, which give you control over your spending. It also touches on the use of multi-factor authentication (MFA) to increase the security of your account.

How to set up AWS multi-factor authentication (MFA) and AWS Budgets alerts

Best practices for setting budget alerts using Amazon SNS topics

When you create a budget that sends notifications to an Amazon SNS topic, you must either have a preexisting Amazon SNS topic or create an Amazon SNS topic. Amazon SNS topics enable you to send notifications over SMS in addition to email.

For budget notifications to be sent successfully, your budget must have permissions to send a notification to your topic, and you must accept the subscription to the Amazon SNS notification topic. For more information, see Creating an Amazon SNS topic for budget notifications (p. 58).

Creating a budget

You can create budgets to track and take action on your costs and usage. You can also create budgets to track your aggregate Reserved Instance (RI) and Savings Plans utilization and coverage. By default, single accounts, the management account, and member accounts in an organization can create budgets.

When you create a budget, AWS Budgets provides a Cost Explorer graph to help you see your incurred costs and usage. If you didn't enable Cost Explorer yet, this graph is blank and AWS Budgets will enable Cost Explorer when you create your first budget. You can create your budget without enabling Cost Explorer. It can take up to 24 hours for this graph to appear after you or AWS Budgets enable Cost Explorer.

You can create and set up a budget in two ways:

- Using a budget template (simplified) (p. 42)
- Customizing a budget (advanced) (p. 42)
You can also use our walk-through tutorials to learn how to achieve your objectives with AWS Budgets.

To access tutorials

2. In the navigation pane, choose Budgets.
3. Next to Overview, choose Info.
4. In the help panel, choose Tutorials.

Using a budget template (simplified)

You can create a budget using a template with recommended configurations. Budget templates are a simplified way to start using AWS Budgets, with a single page workflow, unlike the 5-step workflow that is required for Customizing a budget (advanced) (p. 42).

You can choose from the following budget templates:

Zero spend budget

A budget that notifies you after your spending exceeds AWS Free Tier limits.

Monthly cost budget

A monthly budget that notifies you if you exceed, or are forecasted to exceed, the budget amount.

Daily Savings Plans coverage budget

A coverage budget for your Savings Plans that notifies you when you fall below the defined target. This helps you to identify your on-demand spend sooner so that you can consider purchasing a new commitment.

Daily reservation utilization budget

A utilization budget for your Reserved Instances that notifies you when you fall below the defined target. This helps you to identify when you’re not using some of your hourly commitment that you already purchased.

While each template has default configurations, they can be changed later. This way, you can use it to create most of the budget, and then edit certain settings in the advanced workflow, such as adding a linked account or a cost category filter. To change any of the settings, under Template settings, choose Custom.

You can also download a template for offline use in AWS CLI or CloudFormation, for example. To download a template, under Template settings, choose JSON.

Customizing a budget (advanced)

You can customize a budget to set parameters specific to your use case. You can customize the time period, the start month, and specific accounts. Creating a customized budget involves a 5-step workflow.

You can choose between four main budget types that track against the following:

- Cost (see Creating a cost budget (p. 43))
- Usage (see Creating a usage budget (p. 45))
- Savings Plans (see Creating a Savings Plans budget (p. 47))
  - Savings Plans utilization
  - Savings Plans coverage
Creating a cost budget

Use this procedure to create a budget that's based on your costs.

To create a cost budget

2. In the navigation pane, choose Budgets.
3. At the top of the page, choose Create budget.
4. Under Budget setup, choose Customize (advanced).
5. Under Budget types, choose Cost budget. Then, choose Next.
6. Under Details, for Budget name, enter the name of your budget. Your budget name must be unique within your account. It can contain A-Z, a-z, spaces, and the following characters: _ . : / = + % @

7. Under Set budget amount, for Period, choose how often you want the budget to reset the actual and forecasted spend. Select Daily for every day, Monthly for every month, Quarterly for every three months, or Annually for every year.
   
   Note
   With a Monthly or Quarterly budget period, you can set future budgeted amounts using the budget planning feature.

8. For Budget renewal type, choose Recurring budget for a budget that resets after the budget period. Or, choose Expiring budget for a one-time budget that doesn't reset after the budget period.
9. Choose the start date or period to begin tracking against your budgeted amount. For an Expiring budget, choose the end date or period for the budget to end on.
   
   All budget times are in the UTC format.
10. For Budgeting method, select the way that you want your budget amount to be determined each budget period:
   
   • Fixed: Set one amount to monitor every budget period.
   • Planned: Set different amounts to monitor each budget period.
   • Auto-adjusting: Set your budget amount to be adjusted automatically based on your spending pattern over a time range that you specify.

   For more information about each method, see the section called “Budget methods” (p. 49)
11. (Optional) Under Budget scope, for Filters, choose Add filter to apply one or more of the available filters (p. 50). Your choice of budget type determines the set of filters that's displayed on the console.

   Note
   You can't use the Linked account filter within a linked account.
12. (Optional) Under Budget scope, for Advanced options, choose one or more of the following filters.

   If you're signed in from a member account in an organization, you might not see all of the advanced options. To see all of the advanced options, sign in from a management account.
Refunds

Any refunds that you received.

Credits

Any AWS credits that are applied to your account.

Upfront reservation fees

Any upfront fees that are charged to your account. When you purchase an All Upfront or Partial
Upfront Reserved Instance from AWS, you pay an upfront fee in exchange for a lower rate for
using the instance.

Recurring reservation charges

Any recurring charges to your account. When you purchase a Partial Upfront or No Upfront
Reserved Instance from AWS, you pay a recurring charge in exchange for a lower rate for using
the instance.

Taxes

Any taxes that are associated with the charges or fees in your budget.

Support charges

Any charges that AWS charges you for a support plan. When you purchase a support plan from
AWS, you pay a monthly charge in exchange for service support.

Other subscription costs

Other applicable subscription costs that aren't covered by the other data categories. These costs
can include data such as AWS training fees, AWS competency fees, out-of-cycle charges such as
registering a domain with Route 53.

Use blended costs

The cost of the instance hours that you used. A blended rate doesn't include either the RI
upfront costs or the RI discounted hourly rate.

Use amortized costs

The amortized cost of any reservation hours that you used. For more information about
amortized costs, see Show amortized costs.

Discounts

Any enterprise discount such as RI volume discounts. Discount line items don't contain tags.

13. Choose Next.

15. Under Set alert threshold, for Threshold, enter the amount that must be reached for you to be
notified. This can be either an absolute value or a percentage. For example, say you have a budget of
200 dollars. To be notified at 160 dollars (80% of your budget), enter 160 for an absolute budget or
80 for a percentage budget.

Next to the amount, choose Absolute value to be notified when your costs exceed the threshold
amount. Or, choose % of budgeted amount to be notified when your costs exceed the threshold
percentage.

Next to the threshold, choose Actual to create an alert for actual spend. Or, choose Forecasted to
create an alert for forecasted spend.

16. (Optional) Under Notification preferences, for Email recipients, enter the email addresses that you
want the alert to notify. Separate multiple email addresses with commas. A notification can be sent
to a maximum of 10 email addresses.
17. (Optional) Under Notification preferences, for Amazon SNS Alerts, enter the Amazon Resource Name (ARN) for your Amazon SNS topic. For instructions on how to create a topic, see Creating an Amazon SNS topic for budget notifications (p. 58).

   Important
   After you create a budget with Amazon SNS notifications, Amazon SNS sends a confirmation email to the email addresses that you specified. The subject line is AWS Notification - Subscription Confirmation. The recipient must choose Confirm subscription in the confirmation email to receive future notifications.

18. (Optional) Under Notification preferences, for AWS Chatbot Alerts, you can choose to configure AWS Chatbot to send budget alerts to an Amazon Chime or Slack chat room. You configure these alerts on the AWS Chatbot console.

19. Choose Next.

20. (Optional) For Attach actions, you can configure an action that AWS Budgets performs on your behalf when the alert threshold is exceeded. For more information and instructions, see To configure a budget action (p. 56).

21. Choose Next.

   Note
   To proceed, you must configure at least one of the following parameters for each alert:
   - An email recipient for notifications
   - An Amazon SNS topic for notifications
   - A budget action

22. Review your budget settings, and then choose Create budget.

Creating a usage budget

Use this procedure to create a budget that's based on your usage.

To create a usage budget

2. In the navigation pane, choose Budgets.
3. At the top of the page, choose Create budget.
4. Under Budget setup, choose Customize (advanced).
5. Under Budget types, choose Usage budget. Then, choose Next.
6. Under Details, for Budget name, enter the name of your budget. Your budget name must be unique within your account. It can contain A-Z, a-z, spaces, and the following characters:

   _. :/+-%@

7. Under Choose what you're budgeting against, for Budget against, choose Usage type groups or Usage types. A usage type group is a collection of usage types that have the same unit of measure. For example, resources that measure usage by the hour is one usage type group.
   - For Usage type groups, choose the unit of measurement and the applicable service usage that you want the budget to monitor.
   - For Usage types, choose the specific service usage measurements that you want the budget to monitor.
8. Under Set budget amount, for Period, choose how often you want the budget to reset the actual and forecasted usage. Select Daily for every day, Monthly for every month, Quarterly for every three months, or Annually for every year.
Note
With a Monthly or Quarterly budget period, you can set future budgeted amounts using the budget planning feature.

9. For Budget renewal type, choose Recurring budget for a budget that resets at the end of each budget period. Or, choose Expiring budget for a one-time budget that doesn't reset after the given budget period.

10. Choose the start date or period to begin tracking against your budgeted amount. For an Expiring budget, choose the end date or period for the budget to end on.

All budget times are in the UTC format.

11. For Budgeting method, select the way that you want your budget amount to be determined each budget period:

- **Fixed**: Set one amount to monitor every budget period.
- **Planned**: Set different amounts to monitor each budget period.
- **Auto-adjusting**: Set your budget amount to be adjusted automatically based on your usage pattern over a time range that you specify.

For more information about each method, see the section called “Budget methods” (p. 49)

12. (Optional) Under Budget scope, for Filters, choose Add filter to apply one or more of the available filters (p. 50). Your choice of budget type determines the set of filters that's displayed on the console.

   Note
   You can't use the Linked account filter within a linked account.

13. Choose **Next**.

14. Choose **Add an alert threshold**.

15. Under Set alert threshold, for Threshold, enter the amount that must be reached for you to be notified. This can be either an absolute value or a percentage. For example, say you have a budget of 200 hours. To be notified at 160 hours (80% of your budget), enter **160** for an absolute budget or **80** for a percentage budget.

   Next to the amount, choose **Absolute value** to be notified when your usage exceeds the threshold amount. Or, choose **% of budgeted amount** to be notified when your usage exceeds the threshold percentage.

   Next to the threshold, choose **Actual** to create an alert for actual usage. Or, choose **Forecasted** to create an alert for forecasted usage.

16. (Optional) Under Notification preferences, for Email recipients, enter the email addresses that you want the alert to notify. Separate multiple email addresses with commas. A notification can be sent to a maximum of 10 email addresses.

17. (Optional) Under Notification preferences, for Amazon SNS Alerts, enter the Amazon Resource Name (ARN) for your Amazon SNS topic. For instructions on how to create a topic, see Creating an Amazon SNS topic for budget notifications (p. 58).

   Important
   After you create a budget with Amazon SNS notifications, Amazon SNS sends a confirmation email to the email addresses that you specified. The subject line is AWS Notification - Subscription Confirmation. The recipient must choose Confirm subscription in the confirmation email to receive future notifications.

18. (Optional) Under Notification preferences, for AWS Chatbot Alerts, you can choose to configure AWS Chatbot to send budget alerts to an Amazon Chime or Slack chat room. You configure these alerts on the AWS Chatbot console.

19. Choose **Next**.
20. (Optional) For **Attach actions**, you can configure an action that AWS Budgets performs on your behalf when the alert threshold is exceeded. For more information and instructions, see [To configure a budget action](p. 56).

21. Choose **Next**.

   **Note**
   To proceed, you must configure at least one of the following parameters for each alert:
   
   - An email recipient for notifications
   - An Amazon SNS topic for notifications
   - A budget action

22. Review your budget settings, and then choose **Create budget**.

## Creating a Savings Plans budget

Use this procedure to create a budget that's specifically for Savings Plans utilization or coverage.

**To create a Savings Plans budget**

2. In the navigation pane, choose **Budgets**.
3. At the top of the page, choose **Create budget**.
4. Under **Budget setup**, choose **Customize (advanced)**.
5. Under **Budget types**, choose **Savings Plans budget**. Then, choose **Next**.
6. Under **Details**, for **Budget name**, enter the name of your budget. Your budget name must be unique within your account. It can contain A-Z, a-z, spaces, and the following characters:

   `_ :/+-%@

7. Under **Utilization threshold**, for **Period**, choose how often you want the budget to reset the tracked utilization or coverage. Select **Daily** for every day, **Monthly** for every month, **Quarterly** for every three months, or **Annually** for every year.

   All budget times are in the UTC format.

8. For **Monitor my spend against**, choose **Utilization of Savings Plans** to track how much of your Savings Plans you used. Or, choose **Coverage of Savings Plans** to track how much of your instance usage is covered by Savings Plans.

   For **Utilization threshold**, enter the utilization percentage that you want AWS to notify you at. For example, for a utilization budget where you want to stay above 90% Savings Plans utilization, enter **90**. The budget notifies you when your overall Savings Plans utilization is below 90%.

   For **Coverage threshold**, enter the coverage percentage that you want AWS to notify you at. For example, for a coverage budget where you want to stay above 80%, enter **80**. The budget notifies you when your overall coverage is below 80%.

9. (Optional) Under **Budget scope**, for **Filters**, choose **Add filter** to apply one or more of the available filters (p. 50). Your choice of budget type determines the set of filters that's displayed on the console.

   **Note**
   You can't use the **Linked account** filter within a linked account.

10. Choose **Next**.
11. Under **Notification preferences**, for **Email recipients**, enter the email addresses that you want the alert to notify. Separate multiple email addresses with commas. A notification can be sent to a maximum of 10 email addresses.

12. (Optional) For **Amazon SNS Alerts**, enter the Amazon Resource Name (ARN) for your Amazon SNS topic. For instructions on how to create a topic, see **Creating an Amazon SNS topic for budget notifications** (p. 58).

   **Important**
   After you create a budget with Amazon SNS notifications, Amazon SNS sends a confirmation email to the email addresses that you specified. The subject line is **AWS Notification - Subscription Confirmation**. The recipient must choose **Confirm subscription** in the confirmation email to receive future notifications.

13. (Optional) For **AWS Chatbot Alerts**, you can choose to configure AWS Chatbot to send budget alerts to an Amazon Chime or Slack chat room. You configure these alerts through the AWS Chatbot console.

14. Choose **Next**.

   **Note**
   To proceed, you must configure at least one email recipient or an Amazon SNS topic for notifications.

15. Review your budget settings, and then choose **Create budget**.

## Creating a reservation budget

Use this procedure to create a budget for RI utilization or coverage.

### To create a reservation budget

2. In the navigation pane, choose **Budgets**.
3. At the top of the page, choose **Create budget**.
4. Under **Budget setup**, choose **Customize (advanced)**.
5. Under **Budget types**, choose **Reservation budget**. Then, choose **Next**.
6. Under **Details**, for **Budget name**, enter the name of your budget. Your budget name must be unique within your account. It can contain A-Z, a-z, spaces, and the following characters:

   ```
   _\.:/+-@%`
   ```

7. Under **Utilization threshold**, for **Period**, choose how often you want the budget to reset the tracked utilization or coverage. Select **Daily** for every day, **Monthly** for every month, **Quarterly** for every three months, or **Annually** for every year.

   All budget times are in the UTC format.

8. For **Monitor my spend against**, choose **Utilization of reservations** to track how much of your reservation you used. Or, choose **Coverage of reservations** to track how much of your instance usage is covered by reservations.

9. For **Service**, choose the service that you want the budget to track.

10. For **Utilization threshold**, enter the utilization percentage that you want AWS to notify you at. For example, for a utilization budget where you want to stay above 90% RI utilization, enter **90**. The budget notifies you when your overall RI utilization is below 90%.

    For **Coverage threshold**, enter the coverage percentage that you want AWS to notify you at. For example, for a coverage budget where you want to stay above 80%, enter **80**. The budget notifies you when your overall coverage is below 80%.

---

48
11. (Optional) Under **Budget scope**, for **Filters**, choose **Add filter** to apply one or more of the available filters (p. 50). Your choice of budget type determines the set of filters that's displayed on the console.

   **Note**
   You can't use the **Linked account** filter within a linked account.

12. Choose **Next**.

13. Under **Notification preferences**, for **Email recipients**, enter the email addresses that you want the alert to notify. Separate multiple email addresses with commas. A notification can be sent to a maximum of 10 email addresses.

14. (Optional) For **Amazon SNS Alerts**, enter the Amazon Resource Name (ARN) for your Amazon SNS topic. For instructions on how to create a topic, see [Creating an Amazon SNS topic for budget notifications](p. 58).

   **Important**
   After you create a budget with Amazon SNS notifications, Amazon SNS sends a confirmation email to the email addresses that you specified. The subject line is **AWS Notification - Subscription Confirmation**. The recipient must choose **Confirm subscription** in the confirmation email to receive future notifications.

15. (Optional) For **AWS Chatbot Alerts**, you can choose to configure AWS Chatbot to send budget alerts to an Amazon Chime or Slack chat room. You configure these alerts through the AWS Chatbot console.

16. Choose **Next**.

   **Note**
   To proceed, you must configure at least one email recipient or an Amazon SNS topic for notifications.

17. Review your budget settings, and then choose **Create budget**.

---

**Budget methods**

You can set the budgeted amount of your cost or usage budget in one of the following ways. You can set one of these budgets no matter whether you're budgeting in a traditional sense—tracking to plan, for example—or if you want to monitor spend and receive alerts when costs increase beyond your threshold.

**Fixed**

With a fixed budget, you can monitor the same amount every budget period. For example, you can use a cost budget with the fixed method to monitor your costs against $100 every budget period.

**Planned**

The planned budgeting method is available for only monthly or quarterly budgets. With a planned budget, you can set a different amount to monitor each budget period. For example, you can use a monthly cost budget with the planned method to monitor your costs against $100 in the first month, $110 in the second month, and other amounts in the remaining months.

With a planned budget, you can set the budget amount for up to 12 months or 4 quarters. After 12 months or 4 quarters, your budget amount is fixed at the last budget amount.

**Auto-adjusting**

An auto-adjusting budget dynamically sets your budget amount based on your spending or usage over a time range that you specify. The historical or forecast time range that you select is the auto-adjustment baseline for your budget.

At the beginning of each new period, AWS Budgets calculates your budget amount from your cost or usage data within the baseline time range. Make sure to select a time range that best matches
your expectations for your account's AWS costs or usage. If you select a time range with lower usage than you typically expect, then you might get more budget alerts than you need. If you select a time range with higher usage than you typically expect, then you might not get as many budget alerts as you need.

For example, you can create an auto-adjusting cost budget with a baseline time range of the last six months. In this scenario, if your average spending each budget period in the last six months was $100, your auto-adjusted budget amount in the new period is $100.

If AWS Budgets updates your budget amount based on changes in your spending or usage, all budget alert notification subscribers get a notification that the budget amount changed.

Note
- When calculating your auto-adjusted budget amount, AWS Budgets doesn't include periods at the beginning of your baseline time range that don't have cost or usage data. For example, assume that you set your baseline time range as the last four quarters. However, your account had no cost data in the first quarter. Then, in this case, AWS Budgets calculates your auto-adjusted budget amount from only the last three quarters.
- You see a temporary forecast while you're creating or editing a budget. After you save your budget, your auto-adjusted budget is set for the first time.

**Budget filters**

Based on your choice of budget type, you can choose one or more of the available budget filters.

**API Operation**

Choose an action, such as `CreateBucket`.

**Availability Zone**

Choose the Availability Zone in which the resource that you want to create a budget for is running.

**Billing Entity**

Helps you identify whether your invoices or transactions are for AWS Marketplace or for purchases of other AWS services. Possible values include:

- AWS: Identifies a transaction for AWS services other than in AWS Marketplace.

**Cost category**

Choose the cost category group and value to track with this budget.

**Invoicing Entity**

The AWS entity that issues the invoice. Possible values include:

- Amazon Web Services, Inc. – The entity that issues invoices to customer globally, where applicable.
- Amazon Web Services India Private Limited – The entity that issues invoices to customers based in India.
- Amazon Web Services South Africa Proprietary Limited – The entity that issues invoices to customers in South Africa.

**Instance Family**

Choose the family of instances to track using this budget.

**Instance Type**

Choose the type of instance that you want to track with this budget.
Legal Entity

The Seller of Record of a specific product or service. In most cases, the invoicing entity and legal entity are the same. The values might differ for third-party AWS Marketplace transactions. Possible values include:

- Amazon Web Services, Inc.– The entity that sells AWS services.
- Amazon Web Services India Private Limited – The local Indian entity that acts as a reseller for AWS services in India.

Note
Amazon Web Services EMEA SARL is the marketplace operator for your purchases if your account is located in EMEA (excluding Turkey and South Africa), and the seller is eligible in EMEA. Purchases include subscriptions. Amazon Web Services, Inc. is the marketplace operator for purchases if the seller isn't eligible for EMEA. For more information, see AWS Europe.

Linked Account

Choose an AWS account that is a member of the consolidating billing family that you’re creating the budget for. For more information, see Consolidated billing for AWS Organizations in the AWS Billing User Guide.

Note
Do not use this filter within a member account. If the current account is a member account, filtering by linked account is not supported.

Platform

Choose the operating system that your RI runs on. Platform is either Linux or Windows.

Purchase Option

Choose On Demand Instances, Standard Reserved Instances, or Savings Plans.

Savings Plans Type

Choose what you want to budget for, between Compute Savings Plans and EC2 Instance Savings Plans. The Savings Plans type filter is only available for Savings Plans utilization budgets.

Service

Choose an AWS service. Combined with Billing Entity, Invoicing Entity, and Legal Entity, you can also use the Service dimension to filter costs by specific AWS Marketplace purchases. This includes your costs for specific AMIs, web services, and desktop apps. For more information, see What Is AWS Marketplace?

Note
You can use this filter only for cost, Savings Plans and Reserved Instance (RI) utilization, or Savings Plans and RI coverage budgets. Cost Explorer doesn't show revenue or usage for the AWS Marketplace software seller.

The Savings Plans utilization, RI utilization, Savings Plans coverage reports, and RI coverage reports lets you filter by only one service at a time and only for the following services:

- Amazon Elastic Compute Cloud
- Amazon Redshift
- Amazon Relational Database Service
- Amazon ElastiCache
- Amazon OpenSearch Service

Tag

If you activated any tags, choose a resource tag. A tag is a label that you can use to organize your resource costs and track them on a detailed level. There are AWS generated tags and user-defined tags. You must activate tags to use them. For more information, see Activating the AWS-Generated Cost Allocation Tags and Activating User-Defined Cost Allocation Tags.
Tenancy

Choose whether you share an RI with another user. **Tenancy** is either **Dedicated** or **Default**.

Usage Type

Usage types are the units each service uses to measure the usage for specific types of resources. If you choose a filter such as S3 and then choose a usage type value, such as DataTransfer-Out-Bytes (GB), your costs are limited to S3 DataTransfer-Out-Bytes (GB). You can create a usage budget only for a specific unit of measure. If you choose **Usage Type** but not **Usage Type Group**, the budget monitors all of the available units of measure for the usage type.

Usage Type Group

A usage type group is a collection of usage types that have the same unit of measure. If you choose both the **Usage Type Group** and the **Usage Type** filters, Cost Explorer shows you usage types that are automatically constrained to the group unit of measure. For example, assume you choose the group **EC2: Running Hours (Hrs)** and then choose the EC2-Instances filter for **Usage Type**. Cost Explorer shows you only the usage types that are measured in hours.

Viewing your budgets

You can view the state of your budgets at a glance on the **Budgets Overview** page. Your budgets are listed in a filterable table along with the following data:

- Your current costs and usage incurred for a budget during the budget period
- Your budgeted costs or usage for the budget period
- Your forecasted usage or costs for the budget period
- A percentage that shows your costs or usage compared to your budgeted amount
- A percentage that shows your forecasted costs or usage compared to your budgeted amount

To view your budgets

2. On the navigation pane, choose **Budgets**.
3. To see the filters and cost variances for your budgets, choose the budget's name in your list of budgets.

**Note**
You can view information about multiple budgets at once by selecting the check boxes in the Overview table. This opens a split-view panel on the right-hand side, where you can sort or filter the alerts to customize a budget report.

Reading your budgets

You can view detailed information about your budgets in two ways.

- Select your budget in the table to open a split-view panel with budget history and alert status on the right-hand side. In the split-view panel, navigation buttons allow you to move between budgets without leaving the page. To use the navigation buttons, select one budget at a time. When multiple budgets are selected, the navigation buttons are hidden.
- Choose your budget's name to see the budget details page. This page includes the following information:
Editing a budget

• **Current vs. budgeted** – Your current incurred costs compared to your budgeted costs.
• **Forecasted vs. budgeted** – Your forecasted costs compared to your budgeted costs.
• **Alerts** – Any alerts or notifications about the state of your budgets.
• **Details** – The amount, type, time period, and any other additional parameters for your budget.
• **Budget history** tab – A chart and table that show the history of your budget. QUARTERLY budgets show the last four quarters of history, and MONTHLY budgets show the last 12 months. Budget history isn’t available for ANNUAL budgets.

If you change the budgeted amount for a budget period, then the budgeted amount in the table is the last budgeted amount. For example, if you have a monthly budget set for 100 in January and you change the budget to 200 in February, then the February line in the table shows only the 200 budget.

• **Alerts** tab – More details for any alerts about the state of your budget, including a **Definition** that describes the conditions for exceeding the alert threshold.

You can use this information to see how well your budget has matched your costs and usage in the past. You can also download all of the data that Budgets used to create the table through the following procedure.

**To download a budget in a CSV file**

2. On the navigation pane, choose **Budgets**.
3. To see the filters and cost variances for your budgets, choose the budget name in your list of budgets.
4. On the **Budget history** tab, choose **Download as CSV**.
5. Follow the instructions onscreen.

**Editing a budget**

**Note**
You can't edit the budget name.

**To edit a budget**

2. On the navigation pane, choose **Budgets**.
3. On the **Budgets** page, from your list of budgets, choose the budget that you want to edit.
4. Choose **Edit**.
5. Change the parameters that you want to edit. You can't change the budget name.
6. After you make your changes on each page, choose **Next**.
7. Choose **Save**.

**Downloading a budget**

You can download your budgets as a CSV file. The file includes all of the data for all of your budgets, such as Budget Name, Current Value and Forecasted Value, Budgeted Value, and more.
To download a budget
2. On the navigation pane, choose Budgets.
3. Choose Download CSV.
4. Open or save your file.

Copying a budget
You can copy an existing budget to a new one. By doing this, you can retain the filters and notification settings from your original budget, or change them. Billing and Cost Management automatically populates the fields on the page that you create the new budget on. You can update the budget parameters on this page.

To copy a budget
2. On the navigation pane, choose Budgets.
3. From the list of budgets, select the budget that you want to copy.
4. At the top of the page, choose Actions, and then choose Copy.
5. Change the parameters that you want to update. You must change the budget name.
6. After you make any necessary changes on each page, choose Next.
7. Choose Copy budget.

Deleting a budget
You can delete your budgets and the associated email and Amazon SNS notifications at any time. However, you can't recover a budget after you delete it. If you delete a budget, all email notifications and notification subscribers that are associated with the budget are also deleted.

To delete a budget
2. On the navigation pane, choose Budgets.
3. From your list of budgets, select one or more budgets that you want to delete.
4. At the top of the page, choose Actions, and then choose Delete.
5. Choose Confirm.

Configuring AWS Budgets actions
You can use AWS Budgets to run an action on your behalf when a budget exceeds a certain cost or usage threshold. To do this, after you set a threshold, configure a budget action to run either automatically or after your manual approval.
Your available actions include applying an IAM policy or a service control policy (SCP). They also include targeting specific Amazon EC2 or Amazon RDS instances in your account. You can use SCPs so that you don't need to provision any new resources during the budget period.

**Note**
From the management account, you can apply an SCP to another account. However, you can't target Amazon EC2 or Amazon RDS instances in another account.

You can also configure multiple actions to initiate at the same notification threshold. For example, you can configure actions to initiate automatically when you reach 90 percent of your forecasted costs for the month. To do so, perform the following actions:

- Apply a custom Deny IAM policy that restricts the ability for a user, group, or role to provision additional Amazon EC2 resources.
- Target specific Amazon EC2 instances in US East (N. Virginia) us-east-1.

**Setting up a role for AWS Budgets to run budget actions**

To use budget actions, you must create a service role for AWS Budgets. A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the IAM User Guide.

To allow AWS Budgets to perform actions on your behalf, you must grant the necessary permissions to the service role. The following table lists the permissions that you can grant the service role.

<table>
<thead>
<tr>
<th>Permissions policy for budget actions</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allows AWS Budgets broad permission to control AWS resources (p. 117)</td>
<td>This is an AWS managed policy. For instructions on how to attach a managed policy, see <a href="#">To use a managed policy as a permissions policy for an identity (console)</a> in the IAM User Guide.</td>
</tr>
<tr>
<td>Allow AWS Budgets to apply IAM policies and SCPs (p. 128)</td>
<td>You can use this example policy as an inline policy or a customer managed policy. For instructions on how to embed an inline policy, see <a href="#">To embed an inline policy for a user or role (console)</a> in the IAM User Guide. For instructions on how to create a customer managed policy, see <a href="#">Creating IAM policies (console)</a> in the IAM User Guide.</td>
</tr>
<tr>
<td>Allow AWS Budgets to apply IAM policies and SCPs and target EC2 and RDS instances (p. 128)</td>
<td>You can use this example policy as an inline policy or a customer managed policy. For instructions on how to embed an inline policy, see <a href="#">To embed an inline policy for a user or role (console)</a> in the IAM User Guide. For instructions on how to create a customer managed policy, see <a href="#">Creating IAM policies (console)</a> in the IAM User Guide.</td>
</tr>
</tbody>
</table>
Configuring a budget action

You can attach budget actions to an alert for either a cost budget or a usage budget. To configure a budget action on a new budget, first follow the steps for Creating a cost budget (p. 43) or Creating a usage budget (p. 45). To configure a budget action on an existing cost or usage budget, first follow the steps for Editing a budget (p. 53). Then, after you reach the Configure alerts step of creating or editing the budget, use the following procedure.

To configure a budget action

1. To configure a budget action on a new alert, choose Add an alert threshold. To configure a budget action on an existing alert, skip to step 7.
2. Under Set alert threshold, for Threshold, enter the amount that needs to be reached for you to be notified. This can be either an absolute value or a percentage. For example, say you have a budget of 200 dollars. To be notified at 160 dollars (80% of your budget), enter 160 for an absolute budget or 80 for a percentage budget.

   Next to the amount, choose Absolute value to be notified when your costs exceed the threshold amount. Or, choose % of budgeted amount to be notified when your costs exceed the threshold percentage.

   Next to the threshold, choose Actual to create an alert for actual spend. Or, choose Forecasted to create an alert for forecasted spend.
3. (Optional) Under Notification preferences - Optional, for Email recipients, enter the email addresses that you want the alert to notify. Separate multiple email addresses with commas. A notification can have up to 10 email addresses.
4. (Optional) Under Notification preferences - Optional, for Amazon SNS Alerts, enter the Amazon Resource Name (ARN) for your Amazon SNS topic. For instructions on how to create a topic, see Creating an Amazon SNS topic for budget notifications (p. 58).

   Important
   After you create a budget with Amazon SNS notifications, Amazon SNS sends a confirmation email to the email addresses that you specified. The subject line is AWS Notification - Subscription Confirmation. The recipient must choose Confirm subscription in the confirmation email to receive future notifications.
5. (Optional) Under Notification preferences - Optional, for AWS Chatbot Alerts, you can configure AWS Chatbot to send budget alerts to an Amazon Chime or Slack chat room. You configure these alerts through the AWS Chatbot console.
6. Choose Next.
7. For Attach actions - Optional, choose Add Action.
   a. For Select IAM role, choose an IAM role to allow AWS Budgets to perform an action on your behalf.

   Note
   If you didn't configure and assign the appropriate permissions for the IAM role and for AWS Budgets, then AWS Budgets can't run your configured actions. For simplified permissions management, we recommend that you use the managed policy. This ensures that your AWS Budgets actions work as intended and eliminates the need to update your existing IAM policy for AWS Budgets whenever any new functionality is added. This is because new functions and capabilities are added to the managed policy by default. For more information about managed policies, see Managed policies (p. 116).

   For more information and examples of IAM role permissions, see Allow AWS Budgets to apply IAM policies and SCPs and target EC2 and RDS instances (p. 128).
b. For **Which action type should be applied when the budget threshold has been exceeded**, select the action that you want AWS Budgets to take on your behalf.

You can choose from applying an IAM policy, attaching a service control policy (SCP), or targeting specific Amazon EC2 or Amazon RDS instances. You can apply multiple budget actions to a single alert. Only a management account can apply SCPs.

c. Depending on the action that you chose, complete the fields related to the resources that you want to apply the action to.

d. For **Do you want to automatically run this action when this threshold is exceeded**, choose **Yes** or **No**. If you choose **No**, then you run the action manually on the **Alert details** page. For instructions, see **Reviewing and approving your budget action** (p. 57).

e. For **How do you want to be alerted when this action is run**, choose **Use the same alert settings when you defined this threshold** or **Use different alert settings**. To use different alert settings, complete the **Notification preferences** specific to this action.

8. Choose **Next**.

   **Note**
   To proceed, you must configure at least one of the following for each alert:

   - An email recipient for notifications
   - An Amazon SNS topic for notifications
   - A budget action

9. Review your budget settings, and then choose **Create budget** or **Save**.

After you create an action, you can view its status from the AWS Budgets page on the **Actions** column. This column shows your configured actions count, actions waiting for your approval (**Requires approval**), and your successfully completed actions.

**Reviewing and approving your budget action**

You receive a notification to inform you that an action is pending or has already run on your behalf, regardless of your action preferences. The notification includes a link to the **Budget details** page of the action. You can also navigate to the **Budget details** page by choosing the budget name on the AWS Budgets page.

On the **Budget details** page, you can review and approve your budget action.

**To review and approve your budget action**

1. On the **Budget details** page, in the **Alerts** section, choose **Requires approval**.
2. In the **Actions** pop-up, choose the name of the alert that requires an action.
3. On the **Alert details** page, in the **Action** section, review the action that requires approval.
4. Select the action that you want to run, and then choose **Run action**.
5. Choose **Yes, I am sure**.

Your pending actions move from the pending status in **Action history**, listing the newest actions at the top. AWS Budgets shows actions configured and run in the last 60 days. You can view the full history of actions by using AWS CloudTrail or by calling the **DescribeBudgetActionHistories** API.

**Reversing a previous action**

You can review and undo previously completed actions from the **Action history** table. Each status is defined as follows:
• **Standby** - AWS Budgets is actively evaluating the action.
• **Requires approval** - The action was initiated, and is waiting for your approval.
• **Completed** - The action successfully completed.
• **Reversed** - The action was undone, and AWS Budgets will no longer evaluate the action for the remaining budgeted period.

If you want AWS Budgets to re-evaluate the reversed action during the same period, you can choose **Reset**. You can do this, for example, if you initiated a read-only policy but then received approval from your manager to increase your budget and adjust your budgeted amount during the current period.

---

**Creating an Amazon SNS topic for budget notifications**

When you create a budget that sends notifications to an Amazon Simple Notification Service (Amazon SNS) topic, you need to either have a preexisting Amazon SNS topic or create one. Amazon SNS topics allow you to send notifications over SNS in addition to email. Your budget must have permissions to send a notification to your topic.

To create an Amazon SNS topic and grant permissions to your budget, use the Amazon SNS console.

**Note**

Amazon SNS topics must be in the same account as the Budgets you're configuring. Cross-account Amazon SNS isn't supported.

**To create an Amazon SNS notification topic and grant permissions**

2. On the navigation pane, choose **Topics**.
3. Choose **Create topic**.
4. For **Name**, enter the name for your notification topic.
5. (Optional) For **Display name**, enter the name that you want displayed when you receive a notification.
6. In **Access policy**, choose **Advanced**.
7. In the policy text field, after "Statement": [], add the following text:

```json
{
  "Sid": "E.g., AWSBudgetsSNSPublishingPermissions",
  "Effect": "Allow",
  "Principal": {
    "Service": "budgets.amazonaws.com"
  },
  "Action": "SNS:Publish",
  "Resource": "your topic ARN",
  "Condition": {
    "StringEquals": {
      "aws:SourceAccount": "<account-id>"
    },
    "ArnLike": {
      "aws:SourceArn": "arn:aws:budgets::<account-id>:**"
    }
  }
}
```
8. Replace E.g., AWSBudgetsSNSPublishingPermissions with a string. The Sid must be unique within the policy.
9. Choose Create topic.
10. Under Details, save your ARN.
11. Choose Edit.
12. Under Access policy, replace your topic ARN with the Amazon SNS topic ARN from step 10.
13. Choose Save changes.

Your topic now appears in the list of topics on the Topics page.

Troubleshooting

You might encounter the following error messages when you're creating your Amazon SNS topic for budget notifications.

Please comply with SNS ARN format

There’s a syntax error in the ARN you replaced (step 9). Confirm the ARN for proper syntax and formatting.

Invalid SNS topic

AWS Budgets doesn’t have access to the SNS topic. Confirm that you’ve allowed budgets.amazonaws.com the ability to publish messages to this SNS topic, in the SNS topic’s resource based policy.

The SNS topic is encrypted

You have encryption enabled on the SNS topic. The SNS topic won’t work without additional permissions. Disable encryption on the topic, and refresh the Budget edit page.

Checking or resending notification confirmation emails

When you create a budget with notifications, you also create Amazon SNS notifications. For notifications to be sent, you must accept the subscription to the Amazon SNS notification topic.

To confirm that your notification subscriptions have been accepted or to resend a subscription confirmation email, use the Amazon SNS console.

To check your notification status or to resend a notification confirmation email

2. On the navigation pane, choose Subscriptions.
3. On the Subscriptions page, for Filter, enter budget. A list of your budget notifications appears.
4. Check the status of your notification. Under Status, Pending Confirmation appears if a subscription hasn’t been accepted and confirmed.
5. (Optional) To resend a confirmation request, select the subscription with a pending confirmation and choose Request confirmation. Amazon SNS sends a confirmation request to the endpoints that are subscribed to the notification.

When each owner of an endpoint receives the email, they must choose the Confirm subscription link to activate the notification.
Protecting your Amazon SNS budget alerts data with SSE and AWS KMS

You can use server-side encryption (SSE) to transfer sensitive data in encrypted topics. SSE protects Amazon SNS messages by using keys managed in AWS Key Management Service (AWS KMS).

To manage SSE using AWS Management Console or the AWS Service Development Kit (SDK), see Enabling Server-Side Encryption (SSE) for an Amazon SNS Topic in the Amazon Simple Notification Service Getting Started Guide.

To create encrypted topics using AWS CloudFormation, see the AWS CloudFormation User Guide.

SSE encrypts messages as soon as Amazon SNS receives them. The messages are stored encrypted and are decrypted using Amazon SNS only when they're sent.

Configuring AWS KMS permissions

You must configure your AWS KMS key policies before you can use SSE. The configuration enables you to encrypt topics, as well as encrypt and decrypt messages. For details about AWS KMS permissions, see AWS KMS API Permissions: Actions and Resources Reference in the AWS Key Management Service Developer Guide.

You can also use IAM policies to manage AWS KMS key permissions. For more information, see Using IAM Policies with AWS KMS.

Note
Although you can configure global permissions to send and receive message from Amazon SNS, AWS KMS requires you to name the full ARN of AWS KMS keys (KMS key) in the specific Regions. You can find this in the Resource section of an IAM policy. You must ensure that the key policies of the KMS keys allow the necessary permissions. To do this, name the principals that produce and consume encrypted messages in Amazon SNS as users in the KMS key policy.

To enable compatibility between AWS Budgets and encrypted Amazon SNS topics

1. Create a KMS key.
2. Add the following text to the KMS key policy.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "budgets.amazonaws.com"
         },
         "Action": [
            "kms:GenerateDataKey*",
            "kms:Decrypt"
         ],
         "Resource": "*",
         "Condition": {
            "StringEquals": {
               "aws:SourceAccount": "<account-id>"
            },
            "ArnLike": {
               "aws:SourceArn": "arn:aws:budgets::<account-id>::*"
            }
         }
      }
   ]
}
```
3. **Enable SSE for your SNS topic.**

   **Note**
   Be sure that you’re using the same KMS key that grants AWS Budgets the permissions to publish to encrypted Amazon SNS topics.

4. Choose **Save Changes.**

### Receiving budget alerts in Amazon Chime and Slack

You can receive your AWS Budgets alerts in Amazon Chime and Slack by using AWS Chatbot.

AWS Chatbot enables you to receive AWS Budgets alerts directly into your designated Slack channel or Amazon Chime chat room.

**To begin receiving your budget alerts in Slack and Amazon Chime**

1. Follow [Creating a budget](#) or [ Editing a budget](#) and select **Configure alerts.**
2. Add an Amazon SNS topic as an alert recipient to a specific alert or alerts. To ensure that AWS Budgets has permissions to publish to your Amazon SNS topics, see [Creating an Amazon SNS Topic for Budget Notifications](#).
3. Select **Confirm Budget.**
4. Select **Done.**
5. Open the [AWS Chatbot console](#).
7. Choose **Configure.**

   There are specific authorization processes for each endpoint: for example, Slack channel, Amazon Chime rooms, AWS Chatbot IAM permissions, and SNS topics receiving the budget alerts.

8. Choose **Slack workspace.**
9. Choose a **channel type.**
   - **Public:** Everyone in your workspace can see or join the channel
   - **Private:** The channel is viewable only by invitation
10. Either select an existing IAM role for AWS Chatbot to assign or create a new IAM role.
11. Choose a **role name.**
12. Select the Amazon SNS Region.
13. Select the **SNS topic.**

   **Note**
   You can send AWS Budgets alerts to multiple Amazon SNS topics and Regions. At least one of the Amazon SNS topics must match the Amazon SNS topic or topics of your budget or budgets.

14. Select **Configure.**
Reporting your budget metrics with budget reports

With AWS Budgets, you can configure a report to monitor the performance of your existing budgets on a daily, weekly, or monthly cadence and deliver that report to up to 50 email addresses.

You can create up to 50 reports for each standalone account or AWS Organizations management account. Each budget report costs $.01 USD for each report delivered. This is regardless of the number of recipients receiving the report. For example, a daily budget report costs $.01 a day, a weekly budget report costs $.01 a week, and a monthly budget report costs $.01 a month.

If you use consolidated billing in an organization and you own the management account, you can use IAM policies to control access to budgets by member accounts. By default, owners of member accounts can create their own budgets but can’t create or edit budgets for other users. You can use IAM to allow users in a member account to create, edit, delete, or read the budget for your management account. Do this, for example, to allow another account to administer your budget. For more information, see Overview of managing access permissions (p. 98). For more information about AWS Organizations, see the AWS Organizations User Guide.

Topics
• Creating an AWS Budgets report (p. 62)
• Editing an AWS Budgets report (p. 63)
• Copying an AWS Budgets report (p. 63)
• Deleting an AWS Budgets report (p. 63)

Creating an AWS Budgets report

Use the following procedure to create an AWS Budgets report.

To create an AWS Budgets report

2. In the navigation pane, choose Budgets Reports.
3. On the top right of the page, choose Create budget report.
4. Select the budgets that you want to include in your report. You can select up to 50 budgets.
   Note
   If you select more, you can’t proceed to the next step until you change your selection to 50 or fewer budgets.
5. For Report frequency, choose Daily, Weekly, or Monthly.
   • If you choose a Weekly report: For Day of week, choose the day of the week that you want the report delivered.
   • If you choose a Monthly report: For Day of month, choose the calendar day of the month that you want the report delivered. If you choose any day after the 28th day, and the next month doesn’t have that calendar day, then your report is delivered on the last day of that month.
Reports are delivered at approximately 0:00 UTC+0 on the specified day.

6. For **Email recipients**, enter the email addresses to deliver the report to. Separate multiple email addresses with commas. You can include up to 50 email recipients for each budget report.

7. For **Budget report name**, enter the name of your budget report. This name appears on the subject line of the budget report email. You can change the report name at any time.

8. Choose **Create budget report**.

Your report appears on the AWS Budgets Reports dashboard. On the dashboard, you can filter your reports by **Report name**. For each report, the dashboard also shows **Frequency**, **Budgets included**, and **Recipient(s)**.

---

**Editing an AWS Budgets report**

You can use this procedure to edit an AWS Budgets report.

**To edit an AWS Budgets report**

2. In the navigation pane, choose **Budgets Reports**.
3. Choose the name of the report that you want to edit.
4. On the **Edit budget report** page, change the parameters that you want to edit.
5. Choose **Save**.

---

**Copying an AWS Budgets report**

Use the following procedure to copy an AWS Budgets report.

**To copy an AWS Budgets report**

2. In the navigation pane, choose **Budgets Reports**.
3. From the list of reports, select the report that you want to copy.
4. At the top of the page, choose **Actions**, and then choose **Copy**.
5. Change the parameters that you want to update.
6. Choose **Create budget report**.

---

**Deleting an AWS Budgets report**

Use the following procedure to delete an AWS Budgets report.

**To delete an AWS Budgets report**

2. In the navigation pane, choose **Budgets Reports**.
3. From the list of reports, select the report that you want to delete.
4. At the top of the page, choose **Actions**, and then choose **Delete**.
5. Choose **Confirm**.
Detecting unusual spend with AWS Cost Anomaly Detection

AWS Cost Anomaly Detection is an AWS Cost Management feature. This feature uses machine learning models to detect and alert on anomalous spend patterns in your deployed AWS services.

Using AWS Cost Anomaly Detection includes the following benefits:

- You receive alerts individually in aggregated reports either in an email message or an Amazon SNS topic.
  For Amazon SNS topics, create an AWS Chatbot configuration that maps the SNS topic to a Slack channel or an Amazon Chime chat room. For more information, see Receiving AWS Cost Anomaly Detection alerts in Amazon Chime and Slack (p. 79).
- You can evaluate your spend patterns using machine learning methods to minimize false positive alerts. For example, you can evaluate weekly or monthly seasonality and natural growth.
- You can investigate the root cause of the anomaly, such as the AWS account, service, Region, or usage type that’s driving the cost increase.
- You can configure how to evaluate your costs. Choose whether you want to analyze all of your AWS services independently or analyze specific member accounts, cost allocation tags, or cost categories.

After your billing data is processed, AWS Cost Anomaly Detection runs approximately three times a day in order to monitor for anomalies in your net unblended cost data (that is, net costs after all applicable discounts are calculated). You might experience a slight delay in receiving alerts. Cost Anomaly Detection uses data from Cost Explorer, which has a delay of up to 24 hours. As a result, it can take up to 24 hours to detect an anomaly after a usage occurs. If you create a new monitor, it can take 24 hours to begin detecting new anomalies. For a new service subscription, 10 days of historical service usage data is needed before anomalies can be detected for that service.

**Note**
You can opt out of Cost Anomaly Detection at any time. For more information, see Opting out of Cost Anomaly Detection.

**Topics**
- Setting up your anomaly detection (p. 65)
- Access control and examples for Cost Anomaly Detection (p. 66)
- Getting started with AWS Cost Anomaly Detection (p. 68)
- Editing your alerting preferences (p. 75)
- Creating an Amazon SNS topic for anomaly notifications (p. 75)
- Receiving AWS Cost Anomaly Detection alerts in Amazon Chime and Slack (p. 79)
- Opting out of Cost Anomaly Detection (p. 80)

**Setting up your anomaly detection**

The overviews in this section describe how to get started with AWS Cost Anomaly Detection in AWS Billing and Cost Management.

**Topics**
Enabling Cost Explorer

AWS Cost Anomaly Detection is a feature within Cost Explorer. To access AWS Cost Anomaly Detection, enable Cost Explorer. For instructions on how to enable Cost Explorer using the console, see Enabling Cost Explorer (p. 8).

Controlling access using IAM

After you enable Cost Explorer at the management account level, you can use AWS Identity and Access Management (IAM) to manage access to your billing data for individual users. You can then grant or revoke access on an individual level for each user role, rather than granting access to all users.

A user must be granted explicit permission to view pages in the Billing and Cost Management console. With the appropriate permissions, the user can view costs for the AWS account that the user belongs to. For the policy that grants the necessary permissions to a user, see Billing and Cost Management actions policies (p. 112).

For more information about using resource-level access and attribute-based access control (ABAC) for Cost Anomaly Detection, see Access control and examples for Cost Anomaly Detection (p. 66).

Accessing the console

When your setup is complete, access AWS Cost Anomaly Detection.

To access AWS Cost Anomaly Detection

2. In the navigation pane, choose Cost Anomaly Detection.

Quotas

For the default quotas, see AWS Cost Anomaly Detection (p. 143).

Access control and examples for Cost Anomaly Detection

You can use resource-level access controls and attribute-based access control (ABAC) tags for cost anomaly monitors and anomaly subscriptions. Each anomaly monitor and anomaly subscription resource has a unique Amazon Resource Name (ARN). You can also attach tags (key-value pairs) to each feature. Both resource ARNs and ABAC tags can be used to give granular access control to user roles or groups within your AWS accounts.

For more information about resource-level access controls and ABAC tags, see How AWS Cost Management works with IAM (p. 104).
Note
Cost Anomaly Detection doesn't support resource-based policies. Resource-based policies are directly attached to AWS resources. For more information about the difference between policies and permissions, see Identity-based policies and resource-based policies in the IAM User Guide.

Controlling access using resource-level policies

You can use resource-level permissions to allow or deny access to one or more Cost Anomaly Detection resources in an IAM policy. Alternatively, use resource-level permissions to allow or deny access to all Cost Anomaly Detection resources.

When you create an IAM, use the following Amazon Resource Name (ARN) formats:

- AnomalyMonitor resource ARN
  arn:${partition}:ce::${account-id}:anomalymonitor/${monitor-id}

- AnomalySubscription resource ARN
  arn:${partition}:ce::${account-id}:anomalysubscription/${subscription-id}

To allow the IAM entity to get and create an anomaly monitor or anomaly subscription, use a policy similar to this example policy.

Note
- For ce:GetAnomalyMonitor and ce:GetAnomalySubscription, users have all or none of the resource-level access control. This requires the policy to use a generic ARN in the form of arn:${partition}:ce::${account-id}:anomalymonitor/*, arn:${partition}:ce::${account-id}:anomalysubscription/*, or *.
- For ce:CreateAnomalyMonitor and ce:CreateAnomalySubscription, we don't have a resource ARN for this resource. So, the policy always uses the generic ARN that was mentioned in the previous bullet.
- For ce:GetAnomalies, use the optional monitorArn parameter. When used with this parameter, we confirm if the user has access to the monitorArn passed.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [
                "ce:GetAnomalyMonitors",
                "ce:CreateAnomalyMonitor"
            ],
            "Effect": "Allow",
            "Resource": "arn:aws:ce::999999999999:anomalymonitor/**"
        },
        {
            "Action": [
                "ce:GetAnomalySubscriptions",
                "ce:CreateAnomalySubscription"
            ],
            "Effect": "Allow",
            "Resource": "arn:aws:ce::999999999999:anomalysubscription/**"
        }
    ]
}
```

To allow the IAM entity to update or delete anomaly monitors, use a policy similar to this example policy.
Controlling access using tags (ABAC)

You can use tags (ABAC) to control access to Cost Anomaly Detection resources that support tagging. To control access using tags, provide the tag information in the Condition element of a policy. You can then create an IAM policy that allows or denies access to a resource based on the resource's tags. You can use tag condition keys to control access to resources, requests, or any part of the authorization process. For more information about IAM roles using tags, see Controlling access to and for users and roles using tags in the IAM User Guide.

Create an identity-based policy that allows updating anomaly monitors. If the monitor tag Owner has the value of the user name, use a policy that's similar to this example policy.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ce:UpdateAnomalyMonitor",
        "ce:DeleteAnomalyMonitor"
      ],
      "Resource": [
        "arn:aws:ce::999999999999:anomalymonitor/f558fa8a-bd3c-462b-974a-000abc12a000",
        "arn:aws:ce::999999999999:anomalymonitor/f111fa8a-bd3c-462b-974a-000abc12a001"
      ]
    },
    {
      "Effect": "Allow",
      "Action": ["ce:GetAnomalyMonitors"],
      "Resource": "*"
    }
  ]
}
```

Getting started with AWS Cost Anomaly Detection

With AWS Cost Anomaly Detection in AWS Billing and Cost Management, you can configure your cost monitors and alert subscriptions in several different ways.
Creating your cost monitors and alert subscriptions

Configure AWS Cost Anomaly Detection so that it detects anomalies at a lower granularity and spend patterns, in context to your monitor type.

For example, your spend patterns for Amazon EC2 usage might be different from your AWS Lambda or Amazon S3 spend patterns. By segmenting spends by AWS services, AWS Cost Anomaly Detection can detect separate spend patterns that help decrease false positive alerts. You can also create cost monitors. They can evaluate specific cost allocation tags, member accounts within an organization (AWS Organizations), and cost categories based on your AWS account structure.

As you create your cost monitors, configure your alert subscriptions specific to each monitor.

To create a cost monitor

2. In the navigation pane, choose Cost Anomaly Detection.
3. Choose the Cost monitors tab.
4. Choose Create monitor.
5. In Step 1, choose a monitor type and name your monitor.
   For more information about each monitor type and best practices, see Monitor types (p. 74).
   For Monitor name, enter a name for your anomaly monitor. We recommend that the name is a short description. That way, you know what the monitor represents when you view your monitors on the Cost monitors tab.
6. (Optional) Add a tag to your monitor. For more information about tags, see Tagging AWS resources in the AWS General Reference guide.
   a. Enter the key value for the tag.
   b. Choose Add new tag to add additional tags. The maximum number of tags that you can add is 50.
7. Choose Next.
8. In Step 2, configure your alert subscriptions.
   For Alert subscription, if you don't have an existing subscription, choose Create a new subscription. If you have existing subscriptions, select Choose an existing subscription.
   
   Note
   An alert subscription notifies you when a cost monitor detects an anomaly. Depending on the alert frequency, you can notify designated individuals by email or Amazon SNS. For Amazon SNS topics, configure to create an AWS Chatbot configuration. This configuration maps the SNS topic to a Slack channel or an Amazon Chime chat room. For example, create a subscription for the Finance team in your organization. For more information, see Receiving AWS Cost Anomaly Detection alerts in Amazon Chime and Slack (p. 79).
For **Subscription name**, enter a name that describes your use case. For example, if the subscription is meant for leadership, the subscription name might be “Leadership report.”

Under **Alerting frequency**, choose your preferred notification frequency.

- **Individual alerts** - The alert notifies you as soon as an anomaly is detected. You might receive multiple alerts throughout a day. These notifications require an Amazon SNS topic.

  You can configure the Amazon SNS topic to create an AWS Chatbot configuration that maps the SNS topic to a Slack channel or an Amazon Chime chat room. For more information, see Receiving AWS Cost Anomaly Detection alerts in Amazon Chime and Slack (p. 79).

- **Daily summaries** - The alert notifies you with a daily summary when anomalies are detected. You receive one email that contains information for multiple anomalies that occurred that day. These notifications require at least one email recipient.

- **Weekly summaries** - The alert notifies you with a weekly summary when anomalies are detected. You receive one email that contains information for multiple anomalies that occurred that week. These notifications require at least one email recipient.

Under **Alert recipients**, enter email addresses for this subscription.

For **Threshold**, enter a number to configure the anomalies that you want to generate alerts for.

There are two types of thresholds: absolute and percentage. Absolute thresholds trigger alerts when an anomaly’s total cost impact exceeds your chosen threshold. Percentage thresholds trigger alerts when an anomaly’s total impact percentage exceeds your chosen threshold. Total impact percentage is the percentage difference between the total expected spend and total actual spend.

(Optional) Choose **Add threshold** to configure a second threshold on the same subscription. Thresholds can be combined by choosing **AND** or **OR** from the dropdown list.

**Note**
AWS Cost Anomaly Detection sends you a notification when an anomaly reaches or exceeds the **Threshold**. If an anomaly continues over multiple days, then alert recipients will continue to get notifications while the threshold is met. Even if an anomaly is below the alert threshold, the machine learning model continues to detect spend anomalies on your account. All the anomalies that the machine learning model detected (with cost impacts that are greater or less than the threshold) are available in the **Detection history** tab.

9. (Optional) Add a tag to your alert subscription. For more information about tags, see **Tagging AWS resources** in the **AWS General Reference guide**.
   a. Enter the key value for the tag.
   b. Choose **Add new tag** to add additional tags. The maximum number of tags that you can add is 50.

10. (Optional) Choose **Add alert subscriptions** to create another alert subscription. With this option, you can create a new subscription using the same monitor.

11. Choose **Create monitor**.

**To create an alert subscription**

You must create at least one alert subscription for each monitor. The “create cost monitor steps” that are described earlier already include the alert subscription creation process. If you want to create additional subscriptions, follow these steps.

1. Choose the **Alert subscriptions** tab.
2. Choose **Create a subscription**.

3. For **Subscription name**, enter a name that describes your use case. For example, if the subscription is meant for leadership, then the subscription name might be “Leadership report.”

4. Under **Alerting frequency**, choose your preferred notification frequency.
   - **Individual alerts** - The alert notifies you as soon as an anomaly is detected. You might receive multiple alerts throughout a day. These notifications require an Amazon SNS topic.

   You can configure the Amazon SNS topic to create an AWS Chatbot configuration. This configuration maps the SNS topic to a Slack channel or an Amazon Chime chat room. For more information, see Receiving AWS Cost Anomaly Detection alerts in Amazon Chime and Slack (p. 79).

   - **Daily summaries** - The alert notifies you with a daily summary when anomalies are detected. You receive one email that contains information for multiple anomalies that occurred that day. These notifications require at least one email recipient.

   - **Weekly summaries** - The alert notifies you with a weekly summary when anomalies are detected. You receive one email that contains information for multiple anomalies that occurred that week. These notifications require at least one email recipient.

5. Under **Alert recipients**, enter email addresses for this subscription.

6. For **Threshold**, enter a number to configure the anomalies that you want to generate alerts for.

   There are two types of thresholds: absolute and percentage. Absolute thresholds trigger alerts when an anomaly's total cost impact exceeds your chosen threshold. Percentage thresholds trigger alerts when an anomaly's total impact percentage exceeds your chosen threshold. Total impact percentage is the percentage difference between the total expected spend and total actual spend.

   (Optional) Choose **Add threshold** to configure a second threshold on the same subscription. Thresholds can be combined by choosing **AND** or **OR** from the dropdown list.

   **Note**

   AWS Cost Anomaly Detection sends you a notification when an anomaly reaches or exceeds the **Threshold**. If an anomaly continues over multiple days, then alert recipients will continue to get notifications while the threshold is met.

   Even if an anomaly is below the alert threshold, the machine learning model continues to detect spend anomalies on your account. All the anomalies that the machine learning model detected (with cost impacts that are greater or less than the threshold) are available in the **Detection history** tab.

7. In the **Cost monitors** section, select the monitors that you want to be associated with the alert subscription.

8. (Optional) Add a tag to your alert subscription. For more information about tags, see Tagging AWS resources in the AWS General Reference guide.

   a. Enter the key value for the tag.

   b. Choose **Add new tag** to add additional tags. The maximum number of tags that you can add is 50.

9. Choose **Create subscription**.

   **Note**

   You can only access cost monitors and alert subscriptions under the account that created them. For example, suppose that the cost monitor was created under a member account. Then, the management account can't view or edit the cost monitors, alert subscriptions, or detected anomalies.
Detection history values

On the Detection history tab, you can view a list of all the anomalies detected over the time frame that you selected. By default, you can see the anomalies that are detected in the last 90 days. You can search by Severity, Assessment, Service, Account, Usage type, Region, or Monitor type. You can sort by Start date, Last detected date, Actual spend, Expected spend, Total cost impact, and Impact percentage.

The following information is included on the Detection history tab:

**Time frame**

The options are Last 30 days, Last 60 days, and Last 90 days.

**Start date**

The day that the anomaly started.

**Last detected date**

The last time that the anomaly was detected.

**Severity**

Represents how abnormal a certain anomaly is accounting for historical spending patterns. A low severity generally suggests a small spike compared to historical spend and a high severity suggests a big spike. However, a small spike with historically consistent spend is categorized as high severity. And, similarly, a big spike with irregular historical spend is categorized as low severity.

**Duration**

The duration that the anomaly lasted. An anomaly can be on-going.

**Monitor name**

The name of the anomaly monitor.

**Service**

The service that caused the anomaly. If the service field is empty, AWS has detected an anomaly, but the root cause is unclear.

**Account**

The account ID and account name that caused the anomaly. If the account is empty, AWS has detected an anomaly, but the root cause is undetermined.

**Actual spend**

The total amount you actually spent during the anomaly's duration.

**Expected spend**

The amount our machine learning models expected you to spend during the anomaly's duration, based on your historical spending pattern.

**Total cost impact**

The spend increase detected compared to the expected spend amount. It is calculated as actual spend - expected spend. For example, a total cost impact of $20 on a service monitor means that there was a $20 increase detected in a particular service with a total duration of the specified days.

**Impact percentage**

The percentage difference between the actual spend and expected spend. It is calculated as (total cost impact / expected spend) * 100. For example, if the total cost impact was $20 and the expected spend was $60, then the impact percentage would be 33.33%. This value cannot be calculated when expected spend is zero, so in those situations the value will show as "N/A".
Assessment

For each detected anomaly, you can submit an assessment to help improve our anomaly detection systems. The possible values are Not submitted, Not an issue, or Accurate anomaly.

Viewing your detected anomalies and root causes

After you create your monitors, AWS Cost Anomaly Detection evaluates your future spend. Based on your defined alert subscriptions, you might start receiving alerts within 24 hours.

To view your anomalies from an email alert

1. Choose the provided View in Anomaly Detection link.
2. On the Anomaly details page, you can view the root cause analysis and cost impact of the anomaly.
3. (Optional) Choose View in Cost Explorer to view a time series graph of the cost impact.
4. (Optional) Choose View root cause in the Top ranked potential root causes table to see a time series graph that’s filtered by the root cause.
5. (Optional) Choose Submit assessment in the Did you find this detected anomaly to be helpful? information alert to provide feedback and help improve our detection accuracy.

To view your anomalies from the AWS Cost Management console

2. In the navigation pane, choose Cost Anomaly Detection.
3. (Optional) On the Detection history tab, use the search area to narrow the list of detected anomalies for a particular category. The categories that you can choose are Severity, Assessment, Service, Account, Usage type, Region, and Monitor type.
4. (Optional) Choose the Start date for a particular anomaly to view the details.
5. On the Anomaly details page, you can view the root cause analysis and cost impact of the anomaly.
6. (Optional) Choose View in Cost Explorer to view a time series graph of the cost impact and, if necessary, dive deeper into the data.
7. (Optional) Choose View root cause in the Top ranked potential root causes table to see a time series graph that’s filtered by the root cause.
8. (Optional) Choose Submit assessment in the Did you find this detected anomaly to be helpful? information alert to provide feedback and help improve our detection accuracy.

To view your anomalies from an Amazon SNS topic

1. Subscribe an endpoint to the Amazon SNS topic that you created for a cost monitor with individual alerts. For instructions, see Subscribing to an Amazon SNS topic in the Amazon Simple Notification Service Developer Guide.
2. After your endpoint receives messages from the Amazon SNS topic, open a message and then find the anomalyDetailsLink URL. The following example is a message from AWS Cost Anomaly Detection through Amazon SNS.

```json
{
    "accountId": "123456789012",
    "anomalyDetailsLink": "https://console.aws.amazon.com/cost-management/home#/anomaly-detection/monitors/abcdef12-1234-4ea0-84cc-918a97d736ef/anomalies/12345678-abcd-ef12-3456-987654321a12",
    "anomalyEndDate": "2021-05-25T00:00:00Z",
    "anomalyId": "12345678-abcd-ef12-3456-987654321a12"
}
```
Monitor types

You can choose the monitor type that fits your account structure. Currently, we offer the following monitor types:

- **AWS services** - We recommend this monitor if you don't need to segment your spend by internal organizations or environments. This single monitor evaluates all the AWS services that are used by your individual AWS account for anomalies. When you add new AWS services, the monitor automatically begins to evaluate the new service for anomalies. That way, you don't have to manually configure your settings.
  
  **Note**
  
  Management accounts can have one AWS services monitor and up to 500 custom monitors (linked account, cost allocation tag, and cost category) for a total of 501 anomaly monitors. Member accounts only have access to the AWS services monitor.

- **Linked account** - This monitor evaluates the total spend of an individual, or group of, member accounts. If your Organizations need to segment spend by team, product, services, or environment, this monitor is useful. The maximum number of member accounts that you can select for each monitor is 10.

- **Cost category** - This monitor is recommended if you use cost categories to organize and manage your spend. This monitor type is restricted to one key: value pair.

- **Cost allocation tag** - This monitor is similar to Linked account. If you need to segment your spend by team, product, services, or environment, this monitor is useful. This monitor type is restricted to one key, but accepts multiple values. The maximum number of values that you can select for each monitor is 10.

We recommend that you do not create monitors that span multiple monitor types. This might lead to evaluating overlapping spends that generate duplicate alerts.
Editing your alerting preferences

You can adjust your cost monitors and alert subscriptions in AWS Billing and Cost Management to match your needs.

**To edit your cost monitors**

2. In the navigation pane, choose **Cost Anomaly Detection**.
3. Choose the **Cost monitors** tab.
4. Select the monitor that you want to edit.
5. Choose **Edit**.
   - (Alternative) Choose the individual monitor name.
   - Choose **Edit monitor**.
6. On the **Edit monitor** page, change any settings for **monitor name** and **attached alert subscriptions**.
7. Choose **Manage tags** to add, edit, or remove tags for the monitor.
8. Choose **Save**.

**To edit your alert subscriptions**

2. In the navigation pane, choose **Cost Anomaly Detection**.
3. Choose the **Alert subscriptions** tab.
4. Select the subscription that you want to edit.
5. Choose **Edit**.
   - (Alternative) Choose the individual monitor name.
   - Choose **Edit**.
6. On the **Edit alert subscription** page, change any settings for **subscription name**, **threshold**, **frequency**, **recipients**, or **cost monitors**.
7. Choose **Manage tags** to add, edit, or remove tags for the monitor.
8. Choose **Save**.

Creating an Amazon SNS topic for anomaly notifications

To create an anomaly detection monitor that sends notifications to an Amazon Simple Notification Service (Amazon SNS) topic, you must already have Amazon SNS topic or create a new one. You can use Amazon SNS topics to send notifications over SNS in addition to email. AWS Cost Anomaly Detection must have permissions to send a notification to your topic.
To create an Amazon SNS notification topic and grant permissions

2. In the navigation pane, choose Topics.
3. Choose Create topic.
4. For Name, enter the name for your notification topic.
5. (Optional) For Display name, enter the name that you want displayed when you receive a notification.
7. In the policy text field, after "Statement": [ enter one of the following statements:

   To allow the AWS Cost Anomaly Detection service to publish to the Amazon SNS topic, use the following statement:

   ```
   {
       "Sid": "E.g., AWSAnomalyDetectionSNSPublishingPermissions",
       "Effect": "Allow",
       "Principal": {
           "Service": "costalerts.amazonaws.com"
       },
       "Action": "SNS:Publish",
       "Resource": "your topic ARN"
   }
   ```

   To allow the AWS Cost Anomaly Detection service to publish to the Amazon SNS topic only on behalf of a certain account, use the following statement:

   ```
   {
       "Sid": "E.g., AWSAnomalyDetectionSNSPublishingPermissions",
       "Effect": "Allow",
       "Principal": {
           "Service": "costalerts.amazonaws.com"
       },
       "Action": "SNS:Publish",
       "Resource": "your topic ARN",
       "Condition": {
           "StringEquals": {
               "aws:SourceAccount": [ "account-ID"
           }
       }
   }
   ```

   Note
   In this topic policy, you enter the subscription's account ID as the value for the aws:SourceAccount condition. This condition has AWS Cost Anomaly Detection interact with the Amazon SNS topic only when performing operations for the account that owns the subscription.
   You can restrict AWS Cost Anomaly Detection to interact with the topic only when performing operations on behalf of a specific subscription. To do this, use the aws:SourceArn condition in the topic policy.
   For more information about these conditions, see aws:SourceAccount and aws:SourceArn in the IAM User Guide.
8. In the topic policy statement that you select, replace the following values:
Checking or resending notification confirmation email messages

When you create an anomaly detection monitor with notifications, you also create Amazon SNS notifications. For notifications to be sent, you must accept the subscription to the Amazon SNS notification topic.

To confirm that your notification subscriptions are accepted or to resend a subscription confirmation email, use the Amazon SNS console.

To check your notification status or to resend a notification confirmation email message

2. In the navigation pane, choose Subscriptions.
3. Check the status of your notification. Under Status, PendingConfirmation appears if a subscription isn't accepted and confirmed.
4. (Optional) To resend a confirmation request, select the subscription with a pending confirmation and choose Request confirmation. Amazon SNS sends a confirmation request to the endpoints that are subscribed to the notification.

When each owner of an endpoint receives the email, they must choose the Confirm subscription link to activate the notification.

Protecting your Amazon SNS anomaly detection alerts data with SSE and AWS KMS

You can use server-side encryption (SSE) to transfer sensitive data in encrypted topics. SSE protects Amazon SNS messages by using keys managed in AWS Key Management Service (AWS KMS).

To manage SSE using AWS Management Console or the AWS SDK, see Enabling Server-Side Encryption (SSE) for an Amazon SNS Topic in the Amazon Simple Notification Service Getting Started Guide.

To create encrypted topics using AWS CloudFormation, see the AWS CloudFormation User Guide.

SSE encrypts messages as soon as Amazon SNS receives them. The messages are stored encrypted and are decrypted using Amazon SNS only when they're sent.

Configuring AWS KMS permissions

You must configure your AWS KMS key policies before you can use server-side encryption (SSE). You can use this configuration to encrypt topics, in addition to encrypting and decrypting messages.
Protecting your Amazon SNS anomaly detection alerts data with SSE and AWS KMS

For information about AWS KMS permissions, see AWS KMS API Permissions: Actions and Resources Reference in the AWS Key Management Service Developer Guide.

You can also use IAM policies to manage AWS KMS key permissions. For more information, see Using IAM Policies with AWS KMS.

**Note**
You can configure global permissions to send and receive message from Amazon SNS. However, AWS KMS requires that you name the full Amazon Resource Name (ARN) of the AWS KMS keys (KMS keys) in the specific AWS Regions. You can find this in the Resource section of an IAM policy.

Ensure that the key policies of the KMS key allow the necessary permissions. To do this, name the principals that produce and consume encrypted messages in Amazon SNS as users in the KMS key policy.

**To enable compatibility between AWS Cost Anomaly Detection and encrypted Amazon SNS topics**

1. Create a KMS key.
2. Add one of the following policies as the KMS key policy:

   To grant the AWS Cost Anomaly Detection service access to the KMS key, use the following statement.

   ```json
   {       "Version": "2012-10-17",
          "Statement": [{
              "Effect": "Allow",
              "Principal": {
                  "Service": "costalerts.amazonaws.com"
              },
              "Action": [
                  "kms:GenerateDataKey*",
                  "kms:Decrypt"
              ],
              "Resource": "*"
          }]
   }
   ```

   To grant the AWS Cost Anomaly Detection service access to the KMS key only when performing operations on behalf of a certain account, use the following statement.

   ```json
   {       "Version": "2012-10-17",
          "Statement": [{
              "Effect": "Allow",
              "Principal": {
                  "Service": "costalerts.amazonaws.com"
              },
              "Action": [
                  "kms:GenerateDataKey*",
                  "kms:Decrypt"
              ],
              "Resource": "*",
              "Condition": {
                  "StringEquals": {
                      "aws:SourceAccount": [
                          "account-ID"
                      ]
              }
          }]
   }
   ```
Note
In this KMS key policy, you enter the subscription’s account ID as the value for the aws:SourceAccount condition. This condition has AWS Cost Anomaly Detection interact with the KMS key only when performing operations for the account that owns the subscription.
To have AWS Cost Anomaly Detection interact with the KMS key only when performing operations on behalf of a specific subscription, use the aws:SourceArn condition in the KMS key policy.
For more information about these conditions, see aws:SourceAccount and aws:SourceArn in the IAM User Guide.

3. If you're using the KMS key policy with the aws:SourceAccount condition, replace account-ID with the account ID that owns the subscription. If the Amazon SNS topic has multiple subscriptions from different accounts, add multiple account IDs to the aws:SourceAccount condition.

4. Enable SSE for your SNS topic.

Note
Make sure that you're using the same KMS key that grants AWS Cost Anomaly Detection the permissions to publish to encrypted Amazon SNS topics.

5. Choose Save Changes.

Receiving AWS Cost Anomaly Detection alerts in Amazon Chime and Slack

You can receive your AWS Cost Anomaly Detection alerts in Amazon Chime and Slack by using AWS Chatbot.

You can use AWS Chatbot to receive AWS Cost Anomaly Detection alerts directly into your designated Slack channel or Amazon Chime chat room.

To begin receiving your anomaly alerts in Slack and Amazon Chime

1. Follow Getting started with AWS Cost Anomaly Detection (p. 68) to create a monitor.
2. Create an alert subscription using the Individual alerts type. Amazon SNS topics can be configured for individual alerts only.
3. Add an Amazon SNS topic as an alert recipient to a specific alert or alerts. To ensure that Cost Anomaly Detection has permissions to publish to your Amazon SNS topics, see Creating an Amazon SNS topic for anomaly notifications (p. 75).
4. Attach the alert subscription to the monitor that you want to receive Slack or Amazon Chime alerts for.
5. Open the AWS Chatbot console.
6. Choose either Slack or Amazon Chime as your chat client.

To configure a Slack channel

1. Choose Configure new channel.
2. Enter a Configuration name.
3. Choose your Slack Channel ID.
4. In the Permissions section, choose a Role setting. Role settings determine what permissions channel members have.
   - Channel IAM role: This role is appropriate if channel members need the same permissions.
   - User role: This role is appropriate if channel members require different permissions.
5. (For Channel IAM role setting) Choose an existing IAM role for AWS Chatbot to assign or create a new IAM role.
6. Choose a Policy template. By default, the Notification permissions template is selected.
7. Choose a Channel Guardrail. Channel guardrails provide detailed control over what actions your channel members can take.
8. Select an SNS topic.
   
   Note
   Amazon SNS topics are scoped to specific AWS Regions. Choose the appropriate Region to see a list of Amazon SNS topics that are available in that Region.
   Your Amazon SNS topic must match the Amazon SNS topic in the Begin receiving your anomaly alerts in Slack and Amazon Chime process (Step 3).
9. Choose Configure.

To configure an Amazon Chime webhook

1. Choose Configure a new webhook.
2. Enter a Configuration name.
3. Enter a Chime Webhook URL. You can identify a webhook URL by following the onscreen instructions.
4. (Optional) Enter a description for your configuration.
5. In the Permissions section, configure an IAM role. Choose an existing IAM role, or create a new IAM role.
6. Enter a Role name.
7. Choose a Policy template. By default, the Notification permissions template is selected.
8. Select an SNS topic.
   
   Note
   Amazon SNS topics are scoped to specific AWS Regions. Choose the appropriate Region to see a list of Amazon SNS topics that are available in that Region.
   Your Amazon SNS topic must match the Amazon SNS topic in the Begin receiving your anomaly alerts in Slack and Amazon Chime process (Step 3).
9. Choose Configure.

Opting out of Cost Anomaly Detection

You can opt out of Cost Anomaly Detection at any time. To opt out, you need to delete all cost monitors and alert subscriptions in your account. After you opt out, Cost Anomaly Detection no longer monitors your spend patterns for anomalies. You also won't receive any further notifications.

To opt out of Cost Anomaly Detection

2. In the navigation pane, choose Cost Anomaly Detection.
3. To delete any existing cost monitors:
a. Choose the **Cost monitors** tab.
b. Select the cost monitor that you want to delete.
c. Choose **Delete**.
d. In the **Delete cost monitor** dialog box, choose **Delete**.
e. Repeat the steps for any additional cost monitors.

4. To delete any existing alert subscriptions:
   a. Choose the **Alert subscriptions** tab.
   b. Select the alert subscription that you want to delete.
   c. Choose **Delete**.
   d. In the **Delete alert subscription** dialog box, choose **Delete**.
   e. Repeat the steps for any additional alert subscriptions.

**Note**
You can also opt out of Cost Anomaly Detection by deleting your cost monitors and alert subscriptions in the Cost Explorer API. To do so, you need to use **DeleteAnomalyMonitor** and **DeleteAnomalySubscription**.
Optimizing your cost with Rightsizing Recommendations

The rightsizing recommendations feature in Cost Explorer helps you identify cost-saving opportunities by downsizing or terminating instances in Amazon Elastic Compute Cloud (Amazon EC2). Rightsizing recommendations analyze your Amazon EC2 resources and usage to show opportunities for how you can lower your spending. You can see all of your underutilized Amazon EC2 instances across member accounts in a single view to immediately identify how much you can save. After you identify your recommendations, you can take action on the Amazon EC2 console.

Topics
- Getting started with rightsizing recommendations (p. 82)
- Using your rightsizing recommendations (p. 83)
- CSV details (p. 84)
- Understanding your rightsizing recommendations calculations (p. 85)
- Understanding your reservations with Cost Explorer (p. 86)
- Accessing Reserved Instance Recommendations (p. 87)

Getting started with rightsizing recommendations

You can access your reservation recommendations and resource-based recommendations on the Cost Explorer console. After you enable the feature, it can take up to 24 hours to generate your recommendations.

To access rightsizing recommendations
2. In the navigation pane, choose Rightsizing recommendations.

To enable rightsizing recommendations
2. In the navigation pane, choose Preferences.
3. In the Recommendations section, choose Receive Amazon EC2 resource recommendations.
4. Choose Save preferences.

Note
Only regular or a management account can enable rightsizing recommendations. After you enable the feature, both member and management account can access rightsizing recommendations unless the management account specifically prohibits member account access on the settings page.
To improve the recommendation quality, AWS might use your published utilization metrics, such as disk or memory utilization, to improve our recommendation models and algorithms. All metrics are anonymized and aggregated before AWS uses them for model training. If you want to opt out of this experience and request that your metrics not be stored and used for model improvement, contact AWS Support. For more information, see AWS Service Terms.

Using your rightsizing recommendations

You can see the following top-level key performance indicators (KPIs) in your rightsizing recommendations:

- **Optimization opportunities** – The number of recommendations available based on your resources and usage
- **Estimated monthly savings** – The sum of the projected monthly savings associated with each of the recommendations provided
- **Estimated savings (%)** – The available savings relative to the direct instance costs (On-Demand) associated with the instances in the recommendation list

To filter your rightsizing recommendations

2. In the left navigation pane, choose Rightsizing recommendations.
3. At the top of the Rightsizing Recommendations page, filter your recommendations by selecting any or all of the following check boxes:
   - Idle instances (termination recommendations)
   - Underutilized instances
   - Include Savings Plans and Reserved Instances (option to consider existing Savings Plans or RI coverage in recommendation savings calculations)
   - Generate recommendations (option to generate recommendations within the instance family, or across multiple instance families)
4. Above the Findings table, use the search bar to filter by the following parameters:
   - Account ID (option available from the management account)
   - Region
   - Cost allocation tag

To view your rightsizing recommendations details

2. In the left navigation pane, choose Rightsizing recommendations.
3. Choose View.

   The View button on the right of each recommendation opens a window that provides details on the instances and recommended actions.

To download your recommendations in CSV format

1. Choose Launch Cost Explorer.
2. In the left navigation pane, choose Recommendations.
3. Select Download CSV.

For definitions for the CSV file fields, see CSV details (p. 84).

Enhancing your recommendations using CloudWatch metrics

We can examine your memory utilization if you enable your Amazon CloudWatch agent.

To enable memory utilization, see Installing the CloudWatch Agent.

**Important**

When you create a CloudWatch configuration file, use the default namespace and default names for the collected metrics.

For `InstanceID`, choose `append_Dimension`. Do not add additional dimensions for individual memory or disk metrics. Disk utilization is currently not examined.

For Linux instances, choose `mem_used_percent` as your metric for your CloudWatch agent to collect. For Windows instances, choose "% Committed Bytes In Use".

For more information about the CloudWatch agent, see Collecting Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent in the Amazon CloudWatch User Guide.

CSV details

The following is a list of fields in the downloadable CSV form from the Rightsizing Recommendations page. The fields are repeated if there are multiple rightsizing options available. The file also contains all of your relevant cost allocation tags.

- **Account ID** – The AWS account ID that owns the instance that the recommendation is based off of.
- **Account Name** – The name of the account that owns the instance that the recommendation is based off of.
- **Instance ID** – The unique instance identifier.
- **Instance Name** – The name you've given to the instance.
- **Instance Type** – The instance family and size of the original instance.
- **Instance Name** – The name you've given an instance. This field will show as blank if you haven't given the instance a name.
- **OS** – The operating system or platform of the current instance.
- **Region** – The AWS Region that the instance is running in.
- **Running Hours** – The total number of running hours of the instance over the last 14 days.
- **RI Hours** – The subset of the total running hours that are covered by an AWS reservation over the look-back period.
- **OD Hours** – The subset of the total running hours that are On-Demand over the look-back period.
- **SP Hours** – The subset of the total running hours that are covered by Savings Plans over the look-back period.
- **CPU Utilization** – The maximum CPU utilization of the instance over the look-back period.
- **Memory Utilization** – The maximum memory utilization of the instance over the look-back period (if available from the Amazon CloudWatch agent).
- **Disk Utilization** – The maximum disk utilization of the instance over the look-back period (if available from the CloudWatch agent - currently not supported).
Understanding your rightsizing recommendations calculations

This section provides an overview of the savings calculations that are used in your rightsizing recommendations algorithms.

Consolidated billing family

To identify all instances for all accounts in the consolidated billing family, rightsizing recommendations look at the usage for the last 14 days for each account. If the instance was stopped or terminated, we remove it from consideration. For all remaining instances, we call CloudWatch to get maximum CPU utilization data, memory utilization (if enabled), network in/out, local disk input/output (I/O), and performance of attached EBS volumes for the last 14 days. This is to produce conservative recommendations, not to recommend instance modifications that could be detrimental to application performance or that could unexpectedly impact your performance.

Determining if an instance is idle, underutilized, or neither

We look at the maximum CPU utilization of the instance for the last 14 days to make one of the following assessments:

- **Idle** – If the maximum CPU utilization is at or below 1%. A termination recommendation is generated, and savings are calculated. For more information, see Savings calculation (p. 86).
Generating modification recommendations

Recommendations use a machine learning engine to identify the optimal Amazon EC2 instance types for a particular workload. Instance types include those that are a part of AWS Auto Scaling groups.

The recommendations engine analyzes the configuration and resource usage of a workload to identify dozens of defining characteristics. For example, it can determine whether a workload is CPU-intensive or whether it exhibits a daily pattern. The recommendations engine analyzes these characteristics and identifies the hardware resources that the workload requires.

Finally, it concludes how the workload would perform on various Amazon EC2 instances to make recommendations for the optimal AWS compute resources that the specific workload.

Savings calculation

We first examine the instance running in the last 14 days to identify whether it was partially or fully covered by an RI or Savings Plans, or running On-Demand. Another factor is whether the RI is size-flexible. The cost to run the instance is calculated based on the On-Demand hours and the rate of the instance type.

For each recommendation, we calculate the cost to operate a new instance. We assume that a size-flexible RI covers the new instance in the same way as the previous instance if the new instance is within the same instance family. Estimated savings are calculated based on the number of On-Demand running hours and the difference in On-Demand rates. If the RI isn't size-flexible, or if the new instance is in a different instance family, the estimated savings calculation is based on whether the new instance had been running during the last 14 days as On-Demand.

Cost Explorer only provides recommendations with an estimated savings greater than or equal to $0. These recommendations are a subset of Compute Optimizer results. For more performance-based recommendations that might result in a cost increase, see Compute Optimizer.

You can choose to view saving with or without consideration for RI or Savings Plans discounts. Recommendations consider both discounts by default. Considering RI or Savings Plans discounts might result in some recommendations showing a savings value of $0. To change this option, see Using your rightsizing recommendations (p. 83).

Note
Rightsizing recommendations doesn't capture second-order effects of rightsizing, such as the resulting RI hour's availability and how they will apply to other instances. Potential savings based on reallocation of the RI hours aren't included in the calculation.

Understanding your reservations with Cost Explorer

Balancing your Reserved Instance (RI) usage and your On-Demand Instance usage can help you achieve better efficiency. To help, Cost Explorer provides tools that help you understand where your greatest RI costs are and how you can potentially lower your costs. Cost Explorer provides you with an overview of
your current reservations, shows your RI utilization and coverage, and calculates recommended Reserved Instances (RIs) that could save you money if you purchase them.

**Using your RI reports**

You can use the **RI reports** page in the Cost Explorer console to see how many reservations you have, how much your reservations are saving you compared to similar usage of On-Demand Instances, and how many of your reservations are expiring this month.

Cost Explorer breaks down your reservations and savings by service and lists your potential savings: that is, the costs of On-Demand usage compared to what that usage could cost you with an RI.

To use your potential savings, see [Accessing Reserved Instance Recommendations](#)

**Managing your reservation expiration alerts**

You can track your reservations and when your reservations expire in Cost Explorer. With reservation expiration alerts, you can receive email alerts 7, 30, or 60 days in advance before your reservation expires. These alerts can be sent to up to 10 email recipients. You can also choose to be notified on the day that your reservation expires. Reservation expiration alerts are supported for Amazon EC2, Amazon RDS, Amazon Redshift, Amazon ElastiCache, and Amazon OpenSearch Service reservations.

To turn on reservation expiration alerts

2. Navigate to the **Overview** page under the **Reservations** section.
3. Choose **Manage alert subscriptions** in the upper right corner.
4. Select the check boxes for when you want to receive your alerts.
5. Enter email addresses for who you want to notify. You can have up to 10 email recipients.
6. Choose **Save**.

AWS starts monitoring your reservation portfolio and sends alerts based on the preferences that you specify.

**Accessing Reserved Instance Recommendations**

If you enable Cost Explorer, you automatically get Amazon EC2, Amazon RDS, ElastiCache, OpenSearch Service, Amazon Redshift, and Amazon MemoryDB Reserved Instance (RI) purchase recommendations that could help you reduce your costs. RIs provide a discounted hourly rate (up to 75%) compared to On-Demand pricing. Cost Explorer generates your RI recommendations using the following process:

- Identifies your On-Demand Instance usage for a service during a specific time period
- Collects your usage into categories that are eligible for an RI
- Simulates every combination of RIs in each category of usage
- Identifies the best number of each type of RI to purchase to maximize your estimated savings

For example, Cost Explorer automatically aggregates your Amazon EC2 Linux, shared tenancy, and c4 family usage in the US West (Oregon) Region and recommends that you buy size-flexible regional RIs to apply to the c4 family usage. Cost Explorer recommends the smallest size instance in an instance
family. This makes it easier to purchase a size-flexible RI. Cost Explorer also shows the equal number of normalized units so that you can purchase any instance size that you want. For this example, your RI recommendation would be for c4.large because that is the smallest size instance in the c4 instance family.

Cost Explorer recommendations are based on a single account or organization usage of the past seven, 30, or 60 days. Cost Explorer uses On-Demand instance usage during the selected look-back period to generate recommendations. All other usage in the look-back period that are covered by features such as RI, SPOT, and Savings Plans aren’t included. Amazon EC2, ElastiCache, OpenSearch Service, Amazon Redshift, and Amazon MemoryDB recommendations are for RIs scoped to Region, not Availability Zones, and your estimated savings reflects the application of those RIs to your usage. Amazon RDS recommendations are scoped to either Single-AZ or Multi-AZ RIs. Cost Explorer updates your recommendations at least once every 24 hours.

**Note**

Cost Explorer doesn’t forecast your usage or take forecasts into account when recommending RIs. Instead, Cost Explorer assumes that your historical usage reflects your future usage when determining which RIs to recommend.

Linked accounts can see recommendations only if they have the relevant permissions. Linked accounts need permissions to view Cost Explorer and permissions to view recommendations. For more information, see Viewing the Cost Explorer Reservation Recommendations (p. 89).

**Topics**

- RI Recommendations for Size-Flexible RIs (p. 88)
- Viewing the Cost Explorer Reservation Recommendations (p. 89)
- Reading the Cost Explorer RI Recommendations (p. 89)
- Modifying Your RI Recommendations (p. 90)
- Saving Your RI Recommendations (p. 90)
- Using Your RI Recommendations (p. 93)

**RI Recommendations for Size-Flexible RIs**

Cost Explorer also considers the benefits of size-flexible regional RIs when generating your RI purchase recommendations. Size-flexible regional RIs help maximize your estimated savings across eligible instance families in your recommendations. AWS uses the concept of normalized units to compare the various sizes within an instance family. Cost Explorer uses the smallest normalization factor to represent the instance type that it recommends. For more information, see Instance Size Flexibility for EC2 Reserved Instances.

For example, let’s say you own an EC2 RI for a c4.8xlarge. This RI applies to any usage of a Linux/Unix c4 instance with shared tenancy in the same region as the RI, such as the following instances:

- One c4.8xlarge instance
- Two c4.4xlarge instances
- Four c4.2xlarge instances
- Sixteen c4.large instances

It also includes combinations of EC2 usage, such as one c4.4xlarge and eight c4.large instances.

If you own an RI that is smaller than the instance that you’re running, you are charged the prorated, On-Demand price for the excess. This means that you could buy an RI for a c4.4xlarge, use a c4.4xlarge instance most of the time, but occasionally scale up to a c4.8xlarge instance. Some of your c4.8xlarge usage is covered by the purchased RI, and the rest is charged at On-Demand prices.
Viewing the Cost Explorer Reservation Recommendations

Linked accounts need the following permissions to view recommendations:

- ViewBilling
- ViewAccount

For more information, see Using identity-based policies (IAM policies) for AWS Cost Management (p. 111).

To view your RI recommendations

2. In the navigation pane, under Reservations, choose Recommendations.
3. For Select recommendation type, choose the service that you want recommendations for.

Reading the Cost Explorer RI Recommendations

The RI recommendation page shows you your estimated potential savings, your RI purchase recommendations, and the parameters that Cost Explorer used to create your recommendations. You can change the parameters to get recommendations that might match your use case more closely.

The top of the RI recommendations page show you three numbers:

- **Estimated Annual Savings** – Your Estimated Annual Savings is how much Cost Explorer calculates that you could save by purchasing all the recommended RIs.
- **Savings vs. On-Demand** – Your Savings vs. On-Demand is your estimated savings as a percentage of your current costs.
- **Purchase Recommendations** – Your Purchase Recommendations is how many different RI purchase options that Cost Explorer found for you.

These numbers enable you to see a rough estimate of how much you could potentially save by buying more RIs. You can recalculate these numbers for a different use case by using the parameters in the pane on the right. The pane allows you to change the following parameters:

- **RI term** – The length of the RI reservation that you want recommendations for.
- **Offering class** – Whether you want recommendations for a standard RI or a convertible RI.
- **Payment option** – Whether you want to pay for recommended RIs upfront.
- **Based on the past** – How many days of your previous instance usage that you want your recommendations to take into account.

At the bottom of the page are tabs with some of your savings estimates. The **All accounts** tab enables you to see the recommendations based on the combined usage across your entire organization, and the **Individual accounts** tab enables you to see recommendations that Cost Explorer generated on a per-linked-account basis. The table on each tab shows the different purchase recommendations and details about the recommendations. If you want to see the usage that Cost Explorer based a recommendation
on, choose the **View associated usage** link in the recommendation details. This takes you to a report that shows the exact parameters that Cost Explorer used to generate your recommendation. The report also shows your costs and associated usage grouped by **Purchase option**, so that you can view the On-Demand Instance usage that your recommendation is based on.

**Note**

Recommendations that Cost Explorer bases on an individual linked account consider all usage by that linked account, including any RIs used by that linked account. This includes RIs shared by another linked account. The recommendations don’t assume that an RI will be shared with the linked account in the future.

You can sort your recommendations by **Monthly estimated savings**, **Upfront RI cost**, **Purchase recommendation**, or **Instance type**.

## Modifying Your RI Recommendations

You can change the information that Cost Explorer uses when it creates your recommendations, and you can also change the types of recommendations that you want. This allows you to see recommendations for the RIs that work best for you, such as All UpFront RIs with a one-year term, based on your last 30 days of usage.

**Note**

Instead of forecasting your future usage, Cost Explorer assumes that your future usage is the same as your previous usage. Cost Explorer also assumes that you are renewing any expiring RIs.

### To modify your RI recommendations

2. On the navigation bar, choose the menu, choose **RI Recommendations** and then under Select a service choose the service that you want to modify the recommendations for.
3. In the **RI Recommendation Parameters** pane, change the parameters that you want to change. Your estimated savings update automatically.
   a. For **RI term**, select the RI term that you want.
   b. For **Offering class**, select the RI class that you want.
   c. For **Payment option**, select the purchase option that you want.
   d. For **Recommendation type**, select the logic that you want your recommendations based on.
   e. For **Based on the past**, select how many days of usage that you want your RI recommendations to be based on.
4. Choose either **All accounts** or **Individual accounts** to see recommendations based either on your organization-wide usage or on all of your linked accounts based on their individual account usage.

## Saving Your RI Recommendations

You can save your RI recommendations as a CSV file.

### To save your RI recommendations

1. On the **Reserved Instance Recommendations** page, in the RI parameter pane, change any parameters that you want to change. Your estimated savings update automatically.
2. Above the recommendation table, choose **Download CSV**.

The CSV file contains the following columns.
## RI Recommendation CSV Columns

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Service</th>
<th>Column Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account ID</td>
<td>Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB</td>
<td>The account associated with your recommendation.</td>
</tr>
<tr>
<td>Availability zone</td>
<td>Amazon RDS</td>
<td>The availability zone of the instances used to generate a recommendation.</td>
</tr>
<tr>
<td>Average hourly normalized unit usage</td>
<td>Amazon EC2, RDS, MemoryDB</td>
<td>The average number of normalized units used per hour over the period chosen for generating recommendations.</td>
</tr>
<tr>
<td>in historical period</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Average hourly usage in historical period</td>
<td>Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB</td>
<td>The average number of instance hours used per hour over the period chosen for generating recommendations.</td>
</tr>
<tr>
<td>Break even months</td>
<td>Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB</td>
<td>The estimated length of time before you recoup your upfront costs for this set of recommended reservations.</td>
</tr>
<tr>
<td>Cache engine</td>
<td>Amazon ElastiCache</td>
<td>The kind of engine that the recommended ElastiCache reserved node runs, such as Redis or Memcheched.</td>
</tr>
<tr>
<td>Database edition</td>
<td>Amazon RDS</td>
<td>The edition of the database engine that the recommended RDS reserved instance runs.</td>
</tr>
<tr>
<td>Database engine</td>
<td>Amazon RDS</td>
<td>The kind of engine that the recommended RDS RI runs, such as Aurora MySQL or MariaDB.</td>
</tr>
<tr>
<td>Deployment option</td>
<td>Amazon RDS</td>
<td>Whether your RI is for an RDS instance in a single Availability Zone or an RDS instance with a backup in another Availability Zone.</td>
</tr>
<tr>
<td>Estimated savings</td>
<td>Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB</td>
<td>The estimated savings of the recommended reservations.</td>
</tr>
<tr>
<td>Expected utilization</td>
<td>Amazon EC2, RDS, Redshift,</td>
<td>How much of the recommended RI Cost Explorer estimates you will use.</td>
</tr>
<tr>
<td>Column Name</td>
<td>Service</td>
<td>Column Explanation</td>

<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Instance type</td>
<td>Amazon EC2, RDS, OpenSearch Service, MemoryDB</td>
<td>The type of instance that the recommendation is generated for (for example, m4.large or t2.nano). For size-flexible recommendations, Cost Explorer aggregates all usage in a organization (for example, the m4 family) and shows a recommendation for the smallest instance type RI that is available for purchase (for example, m4.large).</td>
</tr>
<tr>
<td>Max hourly normalized unit usage in historical period</td>
<td>Amazon EC2, RDS, MemoryDB</td>
<td>The maximum number of normalized units used in an hour over the period chosen for generating recommendations.</td>
</tr>
<tr>
<td>Max hourly usage in historical period</td>
<td>Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB</td>
<td>The maximum number of instance hours used in an hour over the period chosen for generating recommendations.</td>
</tr>
<tr>
<td>Min hourly normalized unit usage in historical period</td>
<td>Amazon EC2, RDS, MemoryDB</td>
<td>The minimum number of normalized units used in an hour over the period chosen for generating recommendations.</td>
</tr>
<tr>
<td>Min hourly usage in historical period</td>
<td>Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB</td>
<td>The minimum number of instance hours used in an hour over the period chosen for generating recommendations.</td>
</tr>
<tr>
<td>Node type</td>
<td>Amazon ElastiCache, Redshift, MemoryDB</td>
<td>The type of node that the recommendation is generated for, such as ds2.xlarge.</td>
</tr>
<tr>
<td>Normalized hours to purchase</td>
<td>Amazon EC2, RDS, MemoryDB</td>
<td>How many normalized units that Cost Explorer recommends that you buy.</td>
</tr>
<tr>
<td>Number of instances to purchase</td>
<td>Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB</td>
<td>How many reservations Cost Explorer recommends that you buy.</td>
</tr>
<tr>
<td>Offering class</td>
<td>Amazon EC2</td>
<td>The offering class associated with your recommendation.</td>
</tr>
</tbody>
</table>
**Column Name** | **Service** | **Column Explanation**
--- | --- | ---
Payment option | Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB | The recommended payment option for the recommendation.
Platform | Amazon EC2 | The operating system and license model for the recommended RI instance type.
Recommendation date | Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB | The date that Cost Explorer generated your recommendation.
Recurring monthly cost | Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB | The recurring monthly cost of the recommended reservations.
Region | Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB | The region of the instances used to generate a recommendation. You must purchase the recommended RIs in the recommended region to see potential savings.
Size flexible | Amazon EC2, RDS, MemoryDB | Whether a recommended RI is size-flexible.
Tenancy | Amazon EC2 | The tenancy for the recommended RI purchase. Valid values are shared or dedicated.
Term | Amazon EC2, RDS, Redshift, ElastiCache, OpenSearch Service, MemoryDB | The recommended term length for the recommendation.

**Using Your RI Recommendations**

To purchase the recommended reservations, go to the purchase page on a service console. You can also save a CSV file of your recommendations and purchase the reservations at a later date.

**To use Amazon Elastic Compute Cloud recommendations**

1. On the Reserved Instance Recommendations page, choose Amazon EC2 RI Purchase Console to go to the Amazon EC2 Purchase Console.
2. Purchase your RIs by following the instructions at Buying Reserved Instances in the Amazon EC2 User Guide for Linux Instances.

To use Amazon Relational Database Service recommendations

1. On the Reserved instances page in the Amazon RDS console, choose Purchase Reserved DB Instance.
2. Purchase your reservations by following the instructions at Working with reserved DB instances in the Amazon RDS User Guide.

To use Amazon Redshift recommendations

1. On the Reserved nodes page in the Amazon Redshift console, choose Purchase reserved nodes.
2. Purchase your reservations by following the instructions at Purchasing a reserved node offering with the Amazon Redshift console in the Amazon Redshift Management Guide.

To use Amazon OpenSearch Service recommendations

2. Purchase your reservations by following the instructions at Reserved Instances in Amazon OpenSearch Service in the Amazon OpenSearch Service Developer Guide.

To use Amazon ElastiCache recommendations

1. On the Reserved Nodes page in the ElastiCache console, choose Purchase reserved nodes.
2. Purchase your reservations by following the instructions at Purchasing a Reserved Node in the Amazon ElastiCache User Guide.

To use Amazon MemoryDB recommendations

1. On the Reserved nodes page in the MemoryDB console, choose Purchase reserved nodes.
2. Purchase your reservations by following the instructions at Working with reserved nodes in the Amazon MemoryDB Developer Guide.
Manage your costs with Savings Plans

Savings Plans offers a flexible pricing model that provides savings on AWS usage. Savings Plans provide savings beyond On-Demand rates in exchange for a commitment of using a specified amount of compute power (measured every hour) for a one or three year period. You can manage your plans by using recommendations, performance reporting, and budget alerts in AWS Cost Explorer.

For more information, see What is Savings Plans in the Savings Plans User Guide.
Security in AWS Cost Management

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to AWS Cost Management, see AWS Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company’s requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using Billing and Cost Management. The following topics show you how to configure Billing and Cost Management to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Billing and Cost Management resources.

**Topics**
- Data protection in AWS Cost Management (p. 96)
- Identity and Access Management for AWS Cost Management (p. 97)
- Logging and monitoring in AWS Cost Management (p. 138)
- Compliance validation for AWS Cost Management (p. 140)
- Resilience in AWS Cost Management (p. 141)
- Infrastructure security in AWS Cost Management (p. 141)

Data protection in AWS Cost Management

The AWS shared responsibility model applies to data protection in AWS Cost Management. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
• If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers’ email addresses, into tags or free-form text fields such as a Name field. This includes when you work with AWS Cost Management or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Identity and Access Management for AWS Cost Management

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be authenticated (signed in) and authorized (have permissions) to use AWS Cost Management resources. IAM is an AWS service that you can use with no additional charge.

Topics
• User types and billing permissions (p. 97)
• Overview of managing access permissions (p. 98)
• Audience (p. 97)
• Authenticating with identities (p. 100)
• Managing access using policies (p. 103)
• How AWS Cost Management works with IAM (p. 104)
• Identity-based policy examples for AWS Cost Management (p. 109)
• Using identity-based policies (IAM policies) for AWS Cost Management (p. 111)
• AWS Cost Management policy examples (p. 118)
• Migrating access control for AWS Cost Management (p. 129)
• Cross-service confused deputy prevention (p. 135)
• Troubleshooting AWS Cost Management identity and access (p. 136)

User types and billing permissions

This table summarizes the default actions that are permitted in AWS Cost Management for each type of billing user.

User types and billing permissions

<table>
<thead>
<tr>
<th>User type</th>
<th>Description</th>
<th>Billing permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account owner</td>
<td>The person or entity in whose name your account is set up as.</td>
<td>• Has full control of all Billing and Cost Management resources.</td>
</tr>

**Overview of managing access permissions**

**Granting access to your billing information and tools**

The AWS account owner can access billing information and tools by signing in to the AWS Management Console using the account credentials. We recommend that you don’t use the account credentials for everyday access to the account, and especially that you don’t share account credentials with others to give them access to your account.

For your daily administrative tasks, create an administrative user to securely control access to AWS resources. By default, users don’t have access to the AWS Cost Management console. As an administrator, you can create roles under your AWS account that your users can assume. After you create roles, you
can attach your IAM policy to them, based on the access needed. For example, you can grant some users limited access to some of your billing information and tools, and grant others complete access to all of the information and tools.

**Note**
IAM is a feature of your AWS account. If you are already signed up for a product that is integrated with IAM, you don't need to do anything else to sign up for IAM, nor will you be charged for using it. Permissions for Cost Explorer apply to all accounts and member accounts, regardless of IAM policies. For more information about Cost Explorer access, see [Controlling access to Cost Explorer](p. 9).

**Activating access to the Billing and Cost Management console**
IAM roles within an AWS account can't access the Billing and Cost Management console pages by default. This is true even if the role has IAM policies that grant access to certain Billing and Cost Management features. The AWS account administrator can allow roles access to Billing and Cost Management console pages by using the **Activate IAM Access** setting.

On the AWS Cost Management console, the **Activate IAM Access** setting controls access to the following pages:

- Home
- Cost Explorer
- Reports
- Rightsizing recommendations
- Savings Plans recommendations
- Savings Plans utilization report
- Savings Plans coverage report
- Reservations overview
- Reservations recommendations
- Reservations utilization report
- Reservations coverage report
- Preferences

For a list of pages the **Activate IAM Access** setting controls for the Billing console, see [Activating access to the Billing console](p. 9) in the *Billing User Guide*.

**Important**
Activating IAM access alone doesn't grant roles the necessary permissions for these Billing and Cost Management console pages. In addition to activating IAM access, you must also attach the required IAM policies to those roles. For more information, see [Using identity-based policies (IAM policies) for AWS Cost Management](p. 111).

The **Activate IAM Access** setting doesn't control access to the following pages and resources:

- The console pages for AWS Cost Anomaly Detection, Savings Plans overview, Savings Plans inventory, Purchase Savings Plans, and Savings Plans cart
- The Cost Management view in the AWS Console Mobile Application
- The Billing and Cost Management SDK APIs (AWS Cost Explorer, AWS Budgets, and AWS Cost and Usage Reports APIs)
- AWS Systems Manager Application Manager
By default, the Activate IAM Access setting is deactivated. To activate this setting, you must log in to your AWS account using the root user credentials, and then select the setting in the Account page. Activate this setting in each account where you want to allow IAM role access to the Billing and Cost Management console pages. If you use AWS Organizations, then activate this setting in each management or member account where you want to allow IAM role access to the console pages.

**Note**
The Activate IAM Access setting isn't available to users with administrator access. This setting is available only to the root user of the account.

If the Activate IAM Access setting is deactivated, then IAM roles in the account can't access the Billing and Cost Management console pages. This is true even if they have administrator access or the required IAM policies.

**To activate IAM user and role access to the Billing and Cost Management console**

1. Sign in to the AWS Management Console with your root account credentials (specifically, the email address and password that you used to create your AWS account).
2. On the navigation bar, choose your account name, and then choose My Account.
4. Select the Activate IAM Access check box to activate access to the Billing and Cost Management console pages.
5. Choose Update.

After you activate IAM access, you must also attach the required IAM policies to the IAM roles. The IAM policies can grant or deny access to specific Billing and Cost Management features. For more information, see Using identity-based policies (IAM policies) for AWS Cost Management (p. 111).

**Audience**

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in AWS Cost Management.

**Service user** – If you use the AWS Cost Management service to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more AWS Cost Management features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in AWS Cost Management, see Troubleshooting AWS Cost Management identity and access (p. 136).

**Service administrator** – If you're in charge of AWS Cost Management resources at your company, you probably have full access to AWS Cost Management. It's your job to determine which AWS Cost Management features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with AWS Cost Management, see How AWS Cost Management works with IAM (p. 104).

**IAM administrator** – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to AWS Cost Management. To view example AWS Cost Management identity-based policies that you can use in IAM, see Identity-based policy examples for AWS Cost Management (p. 109).

**Authenticating with identities**

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.
You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see How to sign in to your AWS account in the AWS Sign-In User Guide.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see Signing AWS API requests in the IAM User Guide.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Multi-factor authentication in the AWS IAM Identity Center User Guide and Using multi-factor authentication (MFA) in AWS in the IAM User Guide.

AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don’t use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the IAM User Guide.

Federated identity

As a best practice, require human users, including users that require administrator access, to use federation with an identity provider to access AWS services by using temporary credentials.

A federated identity is a user from your enterprise user directory, a web identity provider, the AWS Directory Service, the Identity Center directory, or any user that accesses AWS services by using credentials provided through an identity source. When federated identities access AWS accounts, they assume roles, and the roles provide temporary credentials.

For centralized access management, we recommend that you use AWS IAM Identity Center. You can create users and groups in IAM Identity Center, or you can connect and synchronize to a set of users and groups in your own identity source for use across all your AWS accounts and applications. For information about IAM Identity Center, see What is IAM Identity Center? in the AWS IAM Identity Center User Guide.

IAM users and groups

An IAM user is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the IAM User Guide.

An IAM group is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to
manage for large sets of users. For example, you could have a group named IAMAdmins and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see When to create an IAM user (instead of a role) in the IAM User Guide.

**IAM roles**

An IAM role is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see Creating a role for a third-party Identity Provider in the IAM User Guide. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see Permission sets in the AWS IAM Identity Center User Guide.

- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.

- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.

- **Principal permissions** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. Policies grant permissions to a principal. When you use some services, you might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see Actions, resources, and condition keys for AWS Cost Management in the Service Authorization Reference.

- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests.

  This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the IAM User Guide.
Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the IAM User Guide.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the iam:GetRole action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Creating IAM policies in the IAM User Guide.

Identity-based policies can be further categorized as inline policies or managed policies. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choosing between managed policies and inline policies in the IAM User Guide.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the Amazon Simple Storage Service Developer Guide.
Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the Principal field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the IAM User Guide.

- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the AWS Organizations User Guide.

- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the IAM User Guide.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the IAM User Guide.

How AWS Cost Management works with IAM

AWS Cost Management integrates with the AWS Identity and Access Management (IAM) service so that you can control who in your organization has access to specific pages on the AWS Cost Management console. You can control access to invoices and detailed information about charges and account activity, budgets, payment methods, and credits.

For more information about how to activate access to the Billing and Cost Management Console, see Tutorial: Delegate Access to the Billing Console in the IAM User Guide.

Before you use IAM to manage access to AWS Cost Management, learn what IAM features are available to use with AWS Cost Management.

IAM features you can use with AWS Cost Management

<table>
<thead>
<tr>
<th>IAM feature</th>
<th>AWS Cost Management support</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity-based policies (p. 105)</td>
<td>Yes</td>
</tr>
<tr>
<td>Resource-based policies (p. 105)</td>
<td>No</td>
</tr>
<tr>
<td>Policy actions (p. 106)</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Identity-based policies for AWS Cost Management

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Creating IAM policies in the IAM User Guide.

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. You can't specify the principal in an identity-based policy because it applies to the user or role to which it is attached. To learn about all of the elements that you can use in a JSON policy, see IAM JSON policy elements reference in the IAM User Guide.

Identity-based policy examples for AWS Cost Management

To view examples of AWS Cost Management identity-based policies, see Identity-based policy examples for AWS Cost Management (p. 109).

Resource-based policies within AWS Cost Management

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

To enable cross-account access, you can specify an entire account or IAM entities in another account as the principal in a resource-based policy. Adding a cross-account principal to a resource-based policy is
only half of establishing the trust relationship. When the principal and the resource are in different AWS accounts, an IAM administrator in the trusted account must also grant the principal entity (user or role) permission to access the resource. They grant permission by attaching an identity-based policy to the entity. However, if a resource-based policy grants access to a principal in the same account, no additional identity-based policy is required. For more information, see How IAM roles differ from resource-based policies in the IAM User Guide.

Policy actions for AWS Cost Management

| Supports policy actions | Yes |

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Action element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Policy actions usually have the same name as the associated AWS API operation. There are some exceptions, such as permission-only actions that don’t have a matching API operation. There are also some operations that require multiple actions in a policy. These additional actions are called dependent actions.

Include actions in a policy to grant permissions to perform the associated operation.

To see a list of AWS Cost Management actions, see Actions defined by AWS Cost Management in the Service Authorization Reference.

Policy actions in AWS Cost Management use the following prefix before the action:

\[
\text{ce}
\]

To specify multiple actions in a single statement, separate them with commas.

"Action": [
  "ce:action1",
  "ce:action2"
]

To view examples of AWS Cost Management identity-based policies, see Identity-based policy examples for AWS Cost Management (p. 109).

Policy resources for AWS Cost Management

| Supports policy resources | Partial |

Policy resources are only supported for monitors, subscriptions, and cost categories.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Resource JSON policy element specifies the object or objects to which the action applies. Statements must include either a Resource or a NotResource element. As a best practice, specify
a resource using its Amazon Resource Name (ARN). You can do this for actions that support a specific resource type, known as resource-level permissions.

For actions that don't support resource-level permissions, such as listing operations, use a wildcard (*) to indicate that the statement applies to all resources.

"Resource": "*

To see a list of AWS Cost Explorer resource types, see Actions, resources, and condition keys for AWS Cost Explorer in the Service Authorization Reference.

To view examples of AWS Cost Management identity-based policies, see Identity-based policy examples for AWS Cost Management (p. 109).

Policy condition keys for AWS Cost Management

| Supports service-specific policy condition keys | Yes |

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Condition element (or Condition block) lets you specify conditions in which a statement is in effect. The Condition element is optional. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request.

If you specify multiple Condition elements in a statement, or multiple keys in a single Condition element, AWS evaluates them using a logical AND operation. If you specify multiple values for a single condition key, AWS evaluates the condition using a logical OR operation. All of the conditions must be met before the statement's permissions are granted.

You can also use placeholder variables when you specify conditions. For example, you can grant an IAM user permission to access a resource only if it is tagged with their IAM user name. For more information, see IAM policy elements: variables and tags in the IAM User Guide.

AWS supports global condition keys and service-specific condition keys. To see all AWS global condition keys, see AWS global condition context keys in the IAM User Guide.

To see a list of AWS Cost Management condition keys, actions, and resources, see Condition keys for AWS Cost Management in the Service Authorization Reference.

To view examples of AWS Cost Management identity-based policies, see Identity-based policy examples for AWS Cost Management (p. 109).

Access control lists (ACLs) in AWS Cost Management

| Supports ACLs | No |

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.
Attribute-based access control (ABAC) with AWS Cost Management

<table>
<thead>
<tr>
<th>Supports ABAC (tags in policies)</th>
<th>Partial</th>
</tr>
</thead>
</table>

ABAC (tags in policies) are only supported for monitors, subscriptions, and cost categories.

Attribute-based access control (ABAC) is an authorization strategy that defines permissions based on attributes. In AWS, these attributes are called tags. You can attach tags to IAM entities (users or roles) and to many AWS resources. Tagging entities and resources is the first step of ABAC. Then you design ABAC policies to allow operations when the principal's tag matches the tag on the resource that they are trying to access.

ABAC is helpful in environments that are growing rapidly and helps with situations where policy management becomes cumbersome.

To control access based on tags, you provide tag information in the condition element of a policy using the aws:ResourceTag/key-name, aws:RequestTag/key-name, or aws:TagKeys condition keys.

If a service supports all three condition keys for every resource type, then the value is Yes for the service. If a service supports all three condition keys for only some resource types, then the value is Partial.

For more information about ABAC, see What is ABAC? in the IAM User Guide. To view a tutorial with steps for setting up ABAC, see Use attribute-based access control (ABAC) in the IAM User Guide.

Using Temporary credentials with AWS Cost Management

<table>
<thead>
<tr>
<th>Supports temporary credentials</th>
<th>Yes</th>
</tr>
</thead>
</table>

Some AWS services don't work when you sign in using temporary credentials. For additional information, including which AWS services work with temporary credentials, see AWS services that work with IAM in the IAM User Guide.

You are using temporary credentials if you sign in to the AWS Management Console using any method except a user name and password. For example, when you access AWS using your company's single sign-on (SSO) link, that process automatically creates temporary credentials. You also automatically create temporary credentials when you sign in to the console as a user and then switch roles. For more information about switching roles, see Switching to a role (console) in the IAM User Guide.

You can manually create temporary credentials using the AWS CLI or AWS API. You can then use those temporary credentials to access AWS. AWS recommends that you dynamically generate temporary credentials instead of using long-term access keys. For more information, see Temporary security credentials in IAM.

Cross-service principal permissions for AWS Cost Management

<table>
<thead>
<tr>
<th>Supports principal permissions</th>
<th>Yes</th>
</tr>
</thead>
</table>

When you use an IAM user or role to perform actions in AWS, you are considered a principal. Policies grant permissions to a principal. When you use some services, you might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see Actions, resources, and condition keys for AWS Cost Management in the Service Authorization Reference.
Service roles for AWS Cost Management

| Supports service roles | Yes |

A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

Warning
Changing the permissions for a service role might break AWS Cost Management functionality. Edit service roles only when AWS Cost Management provides guidance to do so.

Service-linked roles for AWS Cost Management

| Supports service-linked roles | No |

A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

For details about creating or managing service-linked roles, see AWS services that work with IAM. Find a service in the table that includes a Yes in the Service-linked role column. Choose the Yes link to view the service-linked role documentation for that service.

Identity-based policy examples for AWS Cost Management

By default, users and roles don’t have permission to create or modify AWS Cost Management resources. They also can’t perform tasks by using the AWS Management Console, AWS Command Line Interface (AWS CLI), or AWS API. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

To learn how to create an IAM identity-based policy by using these example JSON policy documents, see Creating IAM policies in the IAM User Guide.

For details about actions and resource types defined by AWS Cost Management, including the format of the ARNs for each of the resource types, see Actions, resources, and condition keys for AWS Cost Management in the Service Authorization Reference.

Topics
- Policy best practices (p. 109)
- Using the AWS Cost Management console (p. 110)
- Allow users to view their own permissions (p. 110)

Policy best practices

Identity-based policies determine whether someone can create, access, or delete AWS Cost Management resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:
• Get started with AWS managed policies and move toward least-privilege permissions – To get started granting permissions to your users and workloads, use the AWS managed policies that grant permissions for many common use cases. They are available in your AWS account. We recommend that you reduce permissions further by defining AWS customer managed policies that are specific to your use cases. For more information, see AWS managed policies or AWS managed policies for job functions in the IAM User Guide.

• Apply least-privilege permissions – When you set permissions with IAM policies, grant only the permissions required to perform a task. You do this by defining the actions that can be taken on specific resources under specific conditions, also known as least-privilege permissions. For more information about using IAM to apply permissions, see Policies and permissions in IAM in the IAM User Guide.

• Use conditions in IAM policies to further restrict access – You can add a condition to your policies to limit access to actions and resources. For example, you can write a policy condition to specify that all requests must be sent using SSL. You can also use conditions to grant access to service actions if they are used through a specific AWS service, such as AWS CloudFormation. For more information, see IAM JSON policy elements: Condition in the IAM User Guide.

• Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy checks and actionable recommendations to help you author secure and functional policies. For more information, see IAM Access Analyzer policy validation in the IAM User Guide.

• Require multi-factor authentication (MFA) – If you have a scenario that requires IAM users or a root user in your AWS account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see Configuring MFA-protected API access in the IAM User Guide.

For more information about best practices in IAM, see Security best practices in IAM in the IAM User Guide.

Using the AWS Cost Management console

To access the AWS Cost Management console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the AWS Cost Management resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won’t function as intended for entities (users or roles) with that policy.

You don’t need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that they’re trying to perform.

To ensure that users and roles can still use the AWS Cost Management console, also attach the AWS Cost Management ConsoleAccess or ReadOnly AWS managed policy to the entities. For more information, see Adding permissions to a user in the IAM User Guide.

Allow users to view their own permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "ViewOwnUserInfo",
            "Effect": "Allow",

```
Using IAM policies for AWS Cost Management

Using identity-based policies (IAM policies) for AWS Cost Management

**Note**
The following AWS Identity and Access Management (IAM) actions have reached the end of standard support on July 2023:

- `aws-portal` namespace
- `purchase-orders:ViewPurchaseOrders`
- `purchase-orders:ModifyPurchaseOrders`

If you haven't migrated the old IAM actions to the new fine-grained actions, you have until December 2023 to do so.

If you're using AWS Organizations, you can use the [bulk policy migrator scripts](https://aws.amazon.com/bulk-policy-migrator/) to update polices from your payer account. You can also use the [old to granular action mapping reference](https://aws.amazon.com/bulk-policy-migrator/) to verify the IAM actions that need to be added.

For more information, see the [Changes to AWS Billing, AWS Cost Management, and Account Consoles Permission](https://aws.amazon.com/bulk-policy-migrator/) blog.

If you have an AWS account, or are a part of an AWS Organizations created on or after March 6, 2023, 11:00 AM (PDT), the fine-grained actions are already in effect in your organization.

This topic provides examples of identity-based policies that demonstrate how an account administrator can attach permissions policies to IAM identities (roles and groups) and thereby grant permissions to perform operations on Billing and Cost Management resources.

Billing and Cost Management actions policies

This table summarizes the permissions that allow or deny users access to your billing information and tools. For examples of policies that use these permissions, see AWS Cost Management policy examples (p. 118).

For a list of actions policies for the Billing console, see Billing actions policies in the Billing user guide.

<table>
<thead>
<tr>
<th>Permission name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aws-portal:ViewBilling</td>
<td>Allow or deny users permission to view the Billing and Cost Management console pages. For an example policy, see Allow IAM users to view your billing information in the Billing User Guide.</td>
</tr>
<tr>
<td>aws-portal:ViewUsage</td>
<td>Allow or deny users permission to view AWS usage Reports. To allow users to view usage reports, you must allow both ViewUsage and ViewBilling. For an example policy, see Allow IAM users to access the reports console page in the Billing User Guide.</td>
</tr>
<tr>
<td>aws-portal:ModifyBilling</td>
<td>Allow or deny users permission to modify the following Billing and Cost Management console pages:</td>
</tr>
<tr>
<td></td>
<td>- Budgets</td>

<tr>
<td>ce:DescribeCostCategoryDefinition</td>
<td>Allow or deny users permissions to view cost categories.</td>
</tr>
<tr>
<td></td>
<td>For an example policy, see <a href="#">View and manage cost categories</a> in the <a href="#">Billing User Guide</a>.</td>
</tr>
<tr>
<td>Permission name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ce:ListCostCategoryDefinitions</td>
<td>Allow or deny users permissions to list cost categories.</td>
</tr>
<tr>
<td></td>
<td>For an example policy, see <a href="https://docs.aws.amazon.com/billing/latest/utilities/billing-users-guide.html">View and manage cost categories</a> in the <em>Billing User Guide</em>.</td>
</tr>
<tr>
<td>ce:ListTagsForResource</td>
<td>Allow or deny users permissions to list all resource tags for a given resource. For a list of supported resources, see ResourceTag in the AWS Billing and Cost Management API Reference.</td>
</tr>
<tr>
<td>ce:UpdateCostCategoryDefinition</td>
<td>Allow or deny users permissions to update cost categories.</td>
</tr>
<tr>
<td></td>
<td>For an example policy, see <a href="https://docs.aws.amazon.com/billing/latest/utilities/billing-users-guide.html">View and manage cost categories</a> in the <em>Billing User Guide</em>.</td>
</tr>
<tr>
<td>ce:CreateAnomalyMonitor</td>
<td>Allow or deny users permissions to create a single AWS Cost Anomaly Detection (p. 65) monitor. You can add resource tags to monitors during Create. In order to create monitors with resource tags, you need the ce:TagResource permission.</td>
</tr>
<tr>
<td>ce:GetAnomalyMonitors</td>
<td>Allow or deny users permissions to view all AWS Cost Anomaly Detection (p. 65) monitors.</td>
</tr>
<tr>
<td>ce:UpdateAnomalyMonitor</td>
<td>Allow or deny users permissions to update AWS Cost Anomaly Detection (p. 65) monitors.</td>
</tr>
<tr>
<td>ce:DeleteAnomalyMonitor</td>
<td>Allow or deny users permissions to delete AWS Cost Anomaly Detection (p. 65) monitors.</td>
</tr>
<tr>
<td>ce:CreateAnomalySubscription</td>
<td>Allow or deny users permissions to create a single subscription for AWS Cost Anomaly Detection (p. 65). You can add resource tags to subscriptions during Create. In order to create subscriptions with resource tags, you need the ce:TagResource permission.</td>
</tr>
<tr>
<td>ce:GetAnomalySubscriptions</td>
<td>Allow or deny users permissions to view all subscriptions for AWS Cost Anomaly Detection (p. 65).</td>
</tr>
<tr>
<td>ce:UpdateAnomalySubscription</td>
<td>Allow or deny users permissions to update AWS Cost Anomaly Detection (p. 65) subscriptions.</td>
</tr>
<tr>
<td>ce:DeleteAnomalySubscription</td>
<td>Allow or deny users permissions to delete AWS Cost Anomaly Detection (p. 65) subscriptions.</td>
</tr>
<tr>
<td>ce:GetAnomalies</td>
<td>Allow or deny users permissions to view all anomalies in AWS Cost Anomaly Detection (p. 65).</td>
</tr>
<tr>
<td>ce:ProvideAnomalyFeedback</td>
<td>Allow or deny users permissions to provide feedback on a detected AWS Cost Anomaly Detection (p. 65).</td>
</tr>
<tr>
<td>Permission name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ce:TagResource</td>
<td>Allow or deny users permissions to add resource tag key-value pairs to a resource. For a list of supported resources, see ResourceTag in the AWS Billing and Cost Management API Reference.</td>
</tr>
<tr>
<td>ce:UntagResource</td>
<td>Allow or deny users permissions to delete resource tags from a resource. For a list of supported resources, see ResourceTag in the AWS Billing and Cost Management API Reference.</td>
</tr>
</tbody>
</table>

**Managed policies**

**Note**
The following AWS Identity and Access Management (IAM) actions have reached the end of standard support on July 2023:

- `aws-portal` namespace
- `purchase-orders:ViewPurchaseOrders`
- `purchase-orders:ModifyPurchaseOrders`

If you haven't migrated the old IAM actions to the new fine-grained actions, you have until December 2023 to do so.

If you're using AWS Organizations, you can use the bulk policy migrator scripts to update policies from your payer account. You can also use the old to granular action mapping reference to verify the IAM actions that need to be added.

For more information, see the Changes to AWS Billing, AWS Cost Management, and Account Consoles Permission blog.

If you have an AWS account, or are a part of an AWS Organizations created on or after March 6, 2023, 11:00 AM (PDT), the fine-grained actions are already in effect in your organization.

Managed policies are standalone identity-based policies that you can attach to multiple users, groups, and roles in your AWS account. You can use AWS managed policies to control access in Billing and Cost Management.

An AWS managed policy is a standalone policy that is created and administered by AWS. AWS managed policies are designed to provide permissions for many common use cases. AWS managed policies make it easier for you to assign appropriate permissions to users, groups, and roles than if you had to write the policies yourself.

You can't change the permissions defined in AWS managed policies. AWS occasionally updates the permissions defined in an AWS managed policy. When this occurs, the update affects all principal entities (users, groups, and roles) that the policy is attached to.

Billing and Cost Management provides several AWS managed policies for common use cases.

**Topics**

- Allows full access to AWS Budgets including budgets actions (p. 116)
- Allows AWS Budgets broad permission to control AWS resources (p. 117)

**Allows full access to AWS Budgets including budgets actions**

Managed policy name: AWSBudgetsActionsWithAWSResourceControlAccess
This managed policy is focused on the user, ensuring that you have the proper permissions to grant permission to AWS Budgets to run the defined actions. This policy provides full access to AWS Budgets, including budgets actions, to retrieve the status of your policies and run AWS resources using the AWS Management Console.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "budgets:*"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "aws-portal:ViewBilling"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:PassRole"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": "budgets.amazonaws.com"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "aws-portal:ModifyBilling",
                "ec2:DescribeInstances",
                "iam:ListGroups",
                "iam:ListPolicies",
                "iam:ListRoles",
                "iam:ListUsers",
                "organizations:ListAccounts",
                "organizations:ListOrganizationalUnitsForParent",
                "organizations:ListPolicies",
                "organizations:ListRoots",
                "rds:DescribeDBInstances",
                "sns:ListTopics"
            ],
            "Resource": "*"
        }
    ]
}
```

Allows AWS Budgets broad permission to control AWS resources

Managed policy name: AWSBudgetsActionsRolePolicyForResourceAdministrationWithSSM

This managed policy is focused on specific actions that AWS Budgets takes on your behalf when completing a specific action. This policy gives AWS Budgets broad permission to control AWS resources. For example, starts and stops Amazon EC2 or Amazon RDS instances by running AWS Systems Manager (SSM) scripts.
AWS Cost Management policy examples

**Note**
The following AWS Identity and Access Management (IAM) actions have reached the end of standard support on July 2023:

- `aws-portal` namespace
- `purchase-orders:ViewPurchaseOrders`
- `purchase-orders:ModifyPurchaseOrders`

If you haven't migrated the old IAM actions to the new fine-grained actions, you have until December 2023 to do so. If you're using AWS Organizations, you can use the bulk policy migrator scripts to update polices from your payer account. You can also use the old to granular action mapping reference to verify the IAM actions that need to be added. For more information, see the Changes to AWS Billing, AWS Cost Management, and Account Consoles Permission blog.

If you have an AWS account, or are a part of an AWS Organizations created on or after March 6, 2023, 11:00 AM (PDT), the fine-grained actions are already in effect in your organization.

This topic contains example policies that you can attach to your IAM role or group to control access to your account's billing information and tools. The following basic rules apply to IAM policies for Billing and Cost Management:

- **Version** is always `2012-10-17`.
- **Effect** is always Allow or Deny.
• **Action** is the name of the action or a wildcard (*).

The action prefix is budgets for AWS Budgets, cur for AWS Cost and Usage Reports, aws-portal for AWS Billing, or ce for Cost Explorer.

• **Resource** is always * for AWS Billing.

For actions performed on a budget resource, specify the budget Amazon Resource Name (ARN).

• It's possible to have multiple statements in one policy.

For a list of policy examples for the Billing console, see **Billing policy examples** in the **Billing user guide**.

**Note**

These policies require that you activate user access to the Billing and Cost Management console on the **Account Settings** console page. For more information, see **Activating access to the Billing and Cost Management console** (p. 99).

**Topics**

• Deny users access to the Billing and Cost Management console (p. 119)
• Deny AWS Console cost and usage widget access for member accounts (p. 120)
• Deny AWS Console cost and usage widget access for specific users and roles (p. 120)
• Allow full access to AWS services but deny users access to the Billing and Cost Management console (p. 120)
• Allow users to view the Billing and Cost Management console except for account settings (p. 121)
• Allow users to modify billing information (p. 121)
• Allow users to create budgets (p. 121)
• Deny access to account settings, but allow full access to all other billing and usage information (p. 122)
• Deposit reports into an Amazon S3 bucket (p. 123)
• View costs and usage (p. 123)
• Enable and disable AWS Regions (p. 123)
• View and update the Cost Explorer preferences page (p. 124)
• View, create, update, and delete using the Cost Explorer reports page (p. 125)
• View, create, update, and delete reservation and Savings Plans alerts (p. 126)
• Allow read-only access to AWS Cost Anomaly Detection (p. 127)
• Allow AWS Budgets to apply IAM policies and SCPs (p. 128)
• Allow AWS Budgets to apply IAM policies and SCPs and target EC2 and RDS instances (p. 128)

**Deny users access to the Billing and Cost Management console**

To explicitly deny a user access to the all Billing and Cost Management console pages, use a policy similar to this example policy.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "aws-portal:*",
            "Resource": "*"
        }
    ]
}
```
Deny AWS Console cost and usage widget access for member accounts

To restrict member (linked) account access to cost and usage data, use your management (payer) account to access the Cost Explorer preferences tab and uncheck **Linked Account Access**. This will deny access to cost and usage data from the Cost Explorer (AWS Cost Management) console, Cost Explorer API, and AWS Console Home page's cost and usage widget regardless of the IAM actions a member account's user or role has.

Deny AWS Console cost and usage widget access for specific users and roles

To deny AWS Console cost and usage widget access for specific users and roles, use the permissions policy below.

**Note**

Adding this policy to a user or role will deny users access to Cost Explorer (AWS Cost Management) console and Cost Explorer APIs as well.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": "ce:*",
      "Resource": "*
    }
  ]
}
```

Allow full access to AWS services but deny users access to the Billing and Cost Management console

To deny users access to everything on the Billing and Cost Management console, use the following policy. In this case, you should also deny user access to AWS Identity and Access Management (IAM) so that the users can't access the policies that control access to billing information and tools.

**Important**

This policy doesn't allow any actions. Use this policy in combination with other policies that allow specific actions.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": [
        "aws-portal:*",
        "iam:*"
      ],
      "Resource": "*
    }
  ]
}
```
Allow users to view the Billing and Cost Management console except for account settings

This policy allows read-only access to all of the Billing and Cost Management console, including the Payments Method and Reports console pages, but denies access to the Account Settings page, thus protecting the account password, contact information, and security questions.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "aws-portal:View*",
         "Resource": "*"
      },
      {
         "Effect": "Deny",
         "Action": "aws-portal:*Account",
         "Resource": "*"
      }
   ]
}
```

Allow users to modify billing information

To allow users to modify account billing information in the Billing and Cost Management console, you must also allow users to view your billing information. The following policy example allows a user to modify the Consolidated Billing, Preferences, and Credits console pages. It also allows a user to view the following Billing and Cost Management console pages:

- Dashboard
- Cost Explorer
- Bills
- Orders and invoices
- Advance Payment

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "aws-portal:*Billing",
         "Resource": "*"
      }
   ]
}
```

Allow users to create budgets

To allow users to create budgets in the Billing and Cost Management console, you must also allow users to view your billing information, create CloudWatch alarms, and create Amazon SNS notifications. The following policy example allows a user to modify the Budget console page.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "aws-portal:*Billing",
         "Resource": "*"
      }
   ]
}
```
Deny access to account settings, but allow full access to all other billing and usage information

To protect your account password, contact information, and security questions, you can deny user access to **Account Settings** while still enabling full access to the rest of the functionality in the Billing and Cost Management console, as shown in the following example.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "aws-portal:*Billing",
        "aws-portal:*Usage",
        "aws-portal:*PaymentMethods"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Deny",
      "Action": "aws-portal:*Account",
      "Resource": "*"
    }
  ]
}
```
Deposit reports into an Amazon S3 bucket

The following policy allows Billing and Cost Management to save your detailed AWS bills to an Amazon S3 bucket, as long as you own both the AWS account and the Amazon S3 bucket. Note that this policy must be applied to the Amazon S3 bucket, instead of to a user. That is, it's a resource-based policy, not a user-based policy. You should deny user access to the bucket for users who don't need access to your bills.

Replace `bucketname` with the name of your bucket.

For more information, see Using Bucket Policies and User Policies in the Amazon Simple Storage Service User Guide.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "billingreports.amazonaws.com"
         },
         "Action": [
            "s3:GetBucketAcl",
            "s3:GetBucketPolicy"
         ],
         "Resource": "arn:aws:s3:::bucketname"
      },
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "billingreports.amazonaws.com"
         },
         "Action": "s3:PutObject",
         "Resource": "arn:aws:s3:::bucketname/*"
      }
   ]
}
```

View costs and usage

To allow users to use the AWS Cost Explorer API, use the following policy to grant them access.

```json
{
   "Version": "2012-10-17",
   "Statement": [  
      {
         "Effect": "Allow",
         "Action": "ce:*",
         "Resource": ["*"]
      }
   ]
}
```

Enable and disable AWS Regions

For an example IAM policy that allows users to enable and disable Regions, see AWS: Allows Enabling and Disabling AWS Regions in the IAM User Guide.
View and update the Cost Explorer preferences page

This policy allows a user to view and update using the Cost Explorer preferences page.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [ "aws-portal:ViewBilling",
                   "ce:UpdatePreferences"
                 ],
      "Resource": "*"
    }
  ]
}
```

The following policy allows users to view Cost Explorer, but deny permission to view or edit the Preferences page.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [ "aws-portal:ViewBilling"
                 ],
      "Resource": "*"
    },
    {
      "Sid": "VisualEditor1",
      "Effect": "Deny",
      "Action": [ "ce:GetPreferences",
                   "ce:UpdatePreferences"
                 ],
      "Resource": "*"
    }
  ]
}
```

The following policy allows users to view Cost Explorer, but deny permission to edit the Preferences page.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [ "aws-portal:ViewBilling"
                 ],
      "Resource": "*"
    },
    {
      "Sid": "VisualEditor1",
      "Effect": "Deny",
      "Action": [ "ce:GetPreferences",
                   "ce:UpdatePreferences"
                 ],
      "Resource": "*"
    }
  ]
}
```
"Effect": "Deny",
"Action": [
    "ce:UpdatePreferences"
],
"Resource": "*"
}
}]

View, create, update, and delete using the Cost Explorer reports page

This policy allows a user to view, create, update, and delete using the Cost Explorer reports page.

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "aws-portal:ViewBilling",
                "ce:CreateReport",
                "ce:UpdateReport",
                "ce:DeleteReport"
            ],
            "Resource": "*"
        }
    ]
}

The following policy allows users to view Cost Explorer, but deny permission to view or edit the Reports page.

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "aws-portal:ViewBilling"
            ],
            "Resource": "*"
        },
        {
            "Sid": "VisualEditor1",
            "Effect": "Deny",
            "Action": [
                "ce:DescribeReport",
                "ce:CreateReport",
                "ce:UpdateReport",
                "ce:DeleteReport"
            ],
            "Resource": "*"
        }
    ]
}

The following policy allows users to view Cost Explorer, but deny permission to edit the Reports page.
View, create, update, and delete reservation and Savings Plans alerts

This policy allows a user to view, create, update, and delete reservation expiration alerts and Savings Plans alerts. To edit reservation expiration alerts or Savings Plans alerts, a user needs all three granular actions: ce:CreateNotificationSubscription, ce:UpdateNotificationSubscription, and ce:DeleteNotificationSubscription.

The following policy allows users to view Cost Explorer, but denies permission to view or edit the Reservation Expiration Alerts and Savings Plans alert pages.
The following policy allows users to view Cost Explorer, but denies permission to edit the Reservation Expiration Alerts and Savings Plans alert pages.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [ "aws-portal:ViewBilling" ],
            "Resource": "*"
        },
        {
            "Sid": "VisualEditor1",
            "Effect": "Deny",
            "Action": [ "ce:CreateNotificationSubscription", "ce:UpdateNotificationSubscription", "ce:DeleteNotificationSubscription" ],
            "Resource": "*"
        }
    ]
}
```

Allow read-only access to AWS Cost Anomaly Detection

To allow users read-only access to AWS Cost Anomaly Detection, use the following policy to grant them access. ce:ProvideAnomalyFeedback is optional as a part of the read-only access.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [ "ce:Get**" ],
            "Effect": "Allow",
            "Resource": "*"
        }
    ]
}
```
Allow AWS Budgets to apply IAM policies and SCPs

This policy allows AWS Budgets to apply IAM policies and service control policies (SCPs) on behalf of the user.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "iam:AttachGroupPolicy",
        "iam:AttachRolePolicy",
        "iam:AttachUserPolicy",
        "iam:DetachGroupPolicy",
        "iam:DetachRolePolicy",
        "iam:DetachUserPolicy",
        "organizations:AttachPolicy",
        "organizations:DetachPolicy"
      ],
      "Resource": "*"
    }
  ]
}
```

Allow AWS Budgets to apply IAM policies and SCPs and target EC2 and RDS instances

This policy allows AWS Budgets to apply IAM policies and service control policies (SCPs), and to target Amazon EC2 and Amazon RDS instances on behalf of the user.

Trust policy

**Note**
This trust policy allows AWS Budgets to assume a role that can call other services on your behalf. For more information on the best practices for cross-service permissions like this, see Cross-service confused deputy prevention (p. 135).

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "budgets.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
          "aws:SourceArn": "arn:aws:budgets::123456789012:budget/*"
        },
        "StringEquals": {
          "aws:SourceAccount": "123456789012"
        }
      }
    }
  ]
}
```

Permissions policy
Migrating access control for AWS Cost Management

**Note**
The following AWS Identity and Access Management (IAM) actions have reached the end of standard support on July 2023:

- `aws-portal` namespace
- `purchase-orders:ViewPurchaseOrders`
- `purchase-orders:ModifyPurchaseOrders`

If you haven't migrated the old IAM actions to the new fine-grained actions, you have until December 2023 to do so.

If you're using AWS Organizations, you can use the bulk policy migrator scripts to update polices from your payer account. You can also use the old to granular action mapping reference to verify the IAM actions that need to be added.

For more information, see the Changes to AWS Billing, AWS Cost Management, and Account Consoles Permission blog.

If you have an AWS account, or are a part of an AWS Organizations created on or after March 6, 2023, 11:00 AM (PDT), the fine-grained actions are already in effect in your organization.

You can use fine-grained access controls to provide individuals in your organization access to AWS Billing and Cost Management services. For example, you can provide access to Cost Explorer without providing access to the AWS Billing console.

To use the fine-grained access controls, you'll need to migrate your policies from under `aws-portal` to the new IAM actions.

The following IAM actions in your permission policies or service control policies (SCP) require updating with this migration:

- `aws-portal:ViewAccount`
- `aws-portal:ViewBilling`
- aws-portal:ViewPaymentMethods
- aws-portal:ViewUsage
- aws-portal:ModifyAccount
- aws-portal:ModifyBilling
- aws-portal:ModifyPaymentMethods
- purchase-orders:ViewPurchaseOrders
- purchase-orders:ModifyPurchaseOrders

To learn how to use the **Affected policies** tool to identify your impacted IAM policies, see [How to use the affected policies tool](p. 134).

**Note**
Programmatic requests to AWS Cost Explorer, AWS Cost and Usage Reports, and AWS Budgets remains unaffected.
[Activating access to the Billing and Cost Management console](p. 99) remain unchanged.

**Topics**
- Managing access permissions (p. 130)
- How to use the affected policies tool (p. 134)

**Managing access permissions**

AWS Cost Management integrates with the AWS Identity and Access Management (IAM) service so that you can control who in your organization has access to specific pages on the AWS Cost Management console. You can control access to AWS Cost Management features. For example, AWS Cost Explorer, Savings Plans, and reservation recommendations, Savings Plans and reservations utilization and coverage reports.

Use the following IAM permissions for granular control for the AWS Cost Management console.

**Using fine-grained AWS Cost Management actions**

This table summarizes the permissions that allow or deny IAM users and roles access to your cost and usage information. For examples of policies that use these permissions, see [AWS Cost Management policy examples](p. 118).

For a list of actions for the AWS Billing console, see [AWS Billing actions policies](p. 130) in the AWS Billing user guide.

**How to use the affected policies tool**

**Note**
The following AWS Identity and Access Management (IAM) actions have reached the end of standard support on July 2023:

- `aws-portal` namespace
- `purchase-orders:ViewPurchaseOrders`
- `purchase-orders:ModifyPurchaseOrders`

If you haven't migrated the old IAM actions to the new fine-grained actions, you have until December 2023 to do so.

If you're using AWS Organizations, you can use the bulk policy migrator scripts to update polices from your payer account. You can also use the old to granular action mapping reference to verify the IAM actions that need to be added.

For more information, see the Changes to AWS Billing, AWS Cost Management, and Account Consoles Permission blog.

If you have an AWS account, or are a part of an AWS Organizations created on or after March 6, 2023, 11:00 AM (PDT), the fine-grained actions are already in effect in your organization.

You can use the Affected policies tool in the AWS Cost Management console to identify IAM policies (excluding SCPs), and reference the IAM actions impacted by this migration. This tool operates within the boundaries of the AWS account you're logged into, and information regarding other AWS Organizations accounts are not disclosed.
To use the Affected policies tool

2. Paste the following URL into your browser to access the Affected policies tool: https://us-east-1.console.aws.amazon.com/poliden/home?region=us-east-1#/.
   
   Note that you require iam:GetAccountAuthorizationDetails permission to view this page.
3. Review the table that lists the IAM policies impacted. Use the Deprecated IAM actions column to review specific IAM actions referenced in a policy.
4. Choose an IAM policy name you wish to edit.
5. Once you’re redirected to the IAM console, remove the impacted IAM action and add the new action.
   
   For a list of new actions, see Using fine-grained AWS Cost Management actions (p. 130).
6. Repeat steps 3 to 5 for all listed policies.
7. Once all of the policies are resolved, access the Affected policies tool to confirm there are no policies listed.

Cross-service confused deputy prevention

The confused deputy problem is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. In AWS, cross-service impersonation can result in the confused deputy problem. Cross-service impersonation can occur when one service (the calling service) calls another service (the called service). The calling service can be manipulated to use its permissions to act on another customer's resources in a way it should not otherwise have permission to access. To prevent this, AWS provides tools that help you protect your data for all services with service principals that have been given access to resources in your account.

We recommend using the aws:SourceArn and aws:SourceAccount global condition context keys in resource policies to limit the permissions to the resource that AWS Cost Management features can give another service. If you use both global condition context keys, the aws:SourceAccount value and the account in the aws:SourceArn value must use the same account ID when used in the same policy statement.

The most effective way to protect against the confused deputy problem is to use the aws:SourceArn global condition context key with the full ARN of the resource. If you don't know the full ARN of the resource or if you are specifying multiple resources, use the aws:SourceArn global context condition key with wildcards (*) for the unknown portions of the ARN. For example, arn:aws: servicename::123456789012: *. For AWS Budgets, the value of aws:SourceArn must be arn:aws:budgets::123456789012: budget/*.

The following example shows how you can use the aws:SourceArn and aws:SourceAccount global condition context keys in AWS Budgets to prevent the confused deputy problem.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "budgets.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
          "aws:SourceArn": "arn:aws:budgets::123456789012: budget/*"
        }
      }
    }
  ]
}
```
Troubleshooting AWS Cost Management identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS Cost Management and IAM.

Topics

- I am not authorized to perform an action in AWS Cost Management (p. 136)
- I am not authorized to perform iam:PassRole (p. 136)
- I want to view my access keys (p. 137)
- I'm an administrator and want to allow others to access AWS Cost Management (p. 137)
- I want to allow people outside of my AWS account to access my AWS Cost Management resources (p. 137)

I am not authorized to perform an action in AWS Cost Management

If the AWS Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person who provided you with your sign-in credentials.

The following example error occurs when the mateojackson user tries to use the console to view details about a fictional my-example-widget resource but does not have the fictional ce:GetWidget permissions.

User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform: ce:GetWidget on resource: my-example-widget

In this case, Mateo asks his administrator to update his policies to allow him to access the my-example-widget resource using the ce:GetWidget action.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the iam:PassRole action, your policies must be updated to allow you to pass a role to AWS Cost Management.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named marymajor tries to use the console to perform an action in AWS Cost Management. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.
In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

### I want to view my access keys

After you create your IAM user access keys, you can view your access key ID at any time. However, you can't view your secret access key again. If you lose your secret key, you must create a new access key pair.

Access keys consist of two parts: an access key ID (for example, AKIAIOSFODNN7EXAMPLE) and a secret access key (for example, wJalrXUtnFEMI/K7MDENG/bPxRFiCYEXAMPLEKEY). Like a user name and password, you must use both the access key ID and secret access key together to authenticate your requests. Manage your access keys as securely as you do your user name and password.

**Important**

Do not provide your access keys to a third party, even to help find your canonical user ID. By doing this, you might give someone permanent access to your AWS account.

When you create an access key pair, you are prompted to save the access key ID and secret access key in a secure location. The secret access key is available only at the time you create it. If you lose your secret access key, you must add new access keys to your IAM user. You can have a maximum of two access keys. If you already have two, you must delete one key pair before creating a new one. To view instructions, see Managing access keys in the IAM User Guide.

### I'm an administrator and want to allow others to access AWS Cost Management

To allow others to access AWS Cost Management, you must create an IAM entity (user or role) for the person or application that needs access. They will use the credentials for that entity to access AWS. You must then attach a policy to the entity that grants them the correct permissions in AWS Cost Management.

To get started right away, see Creating your first IAM delegated user and group in the IAM User Guide.

### I want to allow people outside of my AWS account to access my AWS Cost Management resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether AWS Cost Management supports these features, see How AWS Cost Management works with IAM (p. 104).
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the IAM User Guide.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the IAM User Guide.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the IAM User Guide.
• To learn the difference between using roles and resource-based policies for cross-account access, see "How IAM roles differ from resource-based policies" in the IAM User Guide.

Logging and monitoring in AWS Cost Management

Monitoring is an important part of maintaining the reliability, availability, and performance of your AWS account. There are several tools available to monitor your Billing and Cost Management usage.

AWS Cost and Usage Reports

AWS Cost and Usage Reports tracks your AWS usage and provides estimated charges associated with your account. Each report contains line items for each unique combination of AWS products, usage type, and operation that you use in your AWS account. You can customize the AWS Cost and Usage Reports to aggregate the information either by the hour or by the day.

For more information about AWS Cost and Usage Reports, see the Cost and Usage Report Guide.

AWS Cost Explorer

Cost Explorer enables you to view and analyze your costs and usage. You can monitor data for up to the last 12 months, forecast how much you’re likely to spend for the next three months, and get recommendations for what Reserved Instances to purchase. You can use Cost Explorer to identify areas that need further inquiry and see trends that you can use to understand your costs.

For more information about Cost Explorer, see the Analyzing your costs with AWS Cost Explorer (p. 8).

AWS Budgets

Budgets enables you to track your AWS cost and usage by using the cost visualization provided by Cost Explorer. Budgets shows the status of your budgets, provides forecasts of your estimated costs, and tracks your AWS usage, including Free Tier. You can also receive notifications when your estimated costs exceed your budgets.

For more information about Budgets, see the Managing your costs with AWS Budgets (p. 38).

AWS CloudTrail

Billing and Cost Management is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Billing and Cost Management. CloudTrail captures all write and modify API calls for Billing and Cost Management as events, including calls from the Billing and Cost Management console and from code calls to the Billing and Cost Management APIs.

For more information about AWS CloudTrail, see the Logging AWS Cost Management API calls with AWS CloudTrail.

Logging AWS Cost Management API calls with AWS CloudTrail

AWS Cost Management is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in AWS Cost Management. CloudTrail captures API calls for AWS Cost Management as events. The calls captured include API calls from the AWS Cost Management console and from your applications.
If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for AWS Cost Management. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in Event history. Using the information collected by CloudTrail, you can determine the request that was made to AWS Cost Management, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the AWS CloudTrail User Guide.

**AWS Cost Management information in CloudTrail**

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in AWS Cost Management, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for AWS Cost Management, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the CloudTrail console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partitions and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to analyze and act on the event data collected in CloudTrail logs.

For more information, see the following in the CloudTrail User Guide:

- Creating a trail for your AWS account (overview)
- CloudTrail supported services and integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail log files from multiple regions
- Receiving CloudTrail log files from multiple accounts

AWS Cost Management actions are logged by CloudTrail and documented in the AWS Billing and Cost Management API Reference. For example, calls to the GetDimensionValues, GetCostCategories, and GetCostandUsage endpoints generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine whether the request was made:

- With root or user role credentials.
- With temporary security credentials for a role or federated user.
- By another AWS service.

For more information, see the CloudTrail userIdentity Element.

**Understanding AWS Cost Management log file entries**

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on.

CloudTrail log files contain one or more log entries. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following example shows a CloudTrail log entry for the GetCostandUsage endpoint.

```json
{
    "eventVersion":"1.08",
```
Compliance validation for AWS Cost Management

Third-party auditors assess the security and compliance of AWS services as part of multiple AWS compliance programs. AWS Cost Management is not in scope of any AWS compliance programs.

For a list of AWS services in scope of specific compliance programs, see AWS Services in Scope by Compliance Program. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS Cost Management is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.
Resilience in AWS Cost Management

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

Infrastructure security in AWS Cost Management

As a managed service, AWS Cost Management is protected by the AWS global network security procedures that are described in the Amazon Web Services: Overview of Security Processes whitepaper.

You use AWS published API calls to access Billing and Cost Management through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.
Quotas and restrictions

The following table describes the current quotas, restrictions, and naming constraints within AWS Cost Management features.

For a list of quotas and restrictions for features in the AWS Billing console, see Quotas and restrictions in the AWS Billing User Guide.

Topics
- Budgets (p. 142)
- Budget reports (p. 142)
- Cost Explorer (p. 142)
- AWS Cost Anomaly Detection (p. 143)
- Savings Plans (p. 143)

Budgets

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of free budgets per account</td>
<td>2</td>
</tr>
<tr>
<td>Total number of budgets per management account</td>
<td>20,000</td>
</tr>
<tr>
<td>Characters allowed in a budget name</td>
<td>• 0-9</td>
</tr>
<tr>
<td></td>
<td>• A-Z and a-z</td>
</tr>
<tr>
<td></td>
<td>• Space</td>
</tr>
<tr>
<td></td>
<td>• The following symbols: _. : /=+-%@</td>
</tr>
</tbody>
</table>

Budget reports

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of budget reports</td>
<td>50</td>
</tr>
<tr>
<td>Maximum number of budgets per budget report</td>
<td>50</td>
</tr>
<tr>
<td>Maximum email recipients in a budget report</td>
<td>50</td>
</tr>
</tbody>
</table>

Cost Explorer

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of reports that you can save per account</td>
<td>300</td>
</tr>
<tr>
<td>Maximum number of filters in the GetCostAndUsage operation (API)</td>
<td>100</td>
</tr>
</tbody>
</table>
AWS Cost Anomaly Detection

| Maximum number of anomaly monitors you can create for an AWS services monitor type | 1 monitor per account |
| Maximum number of anomaly monitors you can create for other monitor types (linked account, cost category, cost allocation tag) | 500 total monitors per management account |
| Maximum number of anomaly alert subscriptions you can create | 100 subscriptions per account |

Unsupported services

- AWS Marketplace
- AWS Support
- WorkSpaces
- Cost Explorer
- Budgets
- AWS Shield
- Amazon Route 53
- AWS Certificate Manager
- Upfront and recurring reserved fee and Savings Plan fees

Savings Plans

| Maximum number of daily refresh requests for Savings Plans recommendations per consolidated billing family | 3 |
## Document history

The following table describes the documentation for this release of the AWS Cost Management console.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>New AWS Cost Anomaly Detection anomaly monitors limit</td>
<td>Increased the number of anomaly monitors you can create for other monitor types (linked account, cost category, cost allocation tag).</td>
<td>September 12, 2023</td>
</tr>
<tr>
<td>New AWS Cost Anomaly Detection configuration by default</td>
<td>Added automatic configuration of AWS Cost Anomaly Detection for all new AWS Cost Explorer users.</td>
<td>March 27, 2023</td>
</tr>
<tr>
<td>New AWS Cost Anomaly Detection details in alert notifications</td>
<td>Added important details such as account name, monitor name, and monitor type in alert emails, the console, and notifications sent through SNS to Slack or Chime.</td>
<td>December 8, 2022</td>
</tr>
<tr>
<td>New templates and tutorials in AWS Budgets</td>
<td>Added a new feature to create a budget using a template with recommended configurations as well as walk-through tutorials to learn about creating different kinds of budgets.</td>
<td>September 27, 2022</td>
</tr>
<tr>
<td>New AWS Cost Anomaly Detection history values</td>
<td>Added information about new values in the AWS Cost Anomaly Detection history tab into the AWS Cost Management guide to align with the console.</td>
<td>August 16, 2022</td>
</tr>
<tr>
<td>New split-view panel in AWS Budgets</td>
<td>Added a new feature to enhance the console experience by adding a split-view panel that allows you to view budget details without leaving the Budgets Overview page.</td>
<td>June 15, 2022</td>
</tr>
<tr>
<td>New AWS Cost Management guide</td>
<td>Split the Billing and Cost Management user guide and aligned the feature details into the Billing guide and AWS Cost Management guide to align with the console.</td>
<td>October 20, 2021</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
<td>Date</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>New AWS Cost Anomaly Detection</td>
<td>Added a new AWS Cost Anomaly Detection feature that uses machine learning to continuously monitor your cost and usage to detect unusual spends.</td>
<td>December 16, 2020</td>
</tr>
<tr>
<td>New Purchase Order Management</td>
<td>Added a new purchase order feature to configure how your purchases are reflected on your invoices.</td>
<td>October 15, 2020</td>
</tr>
<tr>
<td>New Budget Actions</td>
<td>Added a new AWS Budgets actions feature to run an action on your behalf when a budget exceeds a certain cost or usage threshold.</td>
<td>October 15, 2020</td>
</tr>
<tr>
<td>New China bank redirect payment method</td>
<td>Added a new payment method that allows China CNY customers using AWS to pay their overdue payments using China Bank Redirect.</td>
<td>February 20, 2020</td>
</tr>
<tr>
<td>New security chapter</td>
<td>Added a new security chapter that provides information about various security controls. Former &quot;Controlling Access&quot; chapter contents have been migrated here.</td>
<td>February 6, 2020</td>
</tr>
<tr>
<td>New reporting method using AWS Budgets</td>
<td>Added a new reporting functionality using AWS Budgets reports.</td>
<td>June 27, 2019</td>
</tr>
<tr>
<td>Added normalized units to AWS Cost Explorer</td>
<td>AWS Cost Explorer reports now include normalized units.</td>
<td>February 5, 2019</td>
</tr>
<tr>
<td>New payment behavior</td>
<td>AWS India customers can now enable the auto-charge ability for their payments.</td>
<td>December 20, 2018</td>
</tr>
<tr>
<td>Updated the AWS Cost Explorer UI</td>
<td>Updated the AWS Cost Explorer UI.</td>
<td>November 15, 2018</td>
</tr>
<tr>
<td>Added budget history</td>
<td>Added the ability to see the history of a budget.</td>
<td>November 13, 2018</td>
</tr>
<tr>
<td>Expanded budget services</td>
<td>Expanded RI budgets to Amazon OpenSearch Service.</td>
<td>November 8, 2018</td>
</tr>
<tr>
<td>Added a new payment method</td>
<td>Added the SEPA Direct Debit payment method.</td>
<td>October 25, 2018</td>
</tr>
<tr>
<td>Redesigned budget experience</td>
<td>Updated the budget UI and workflow.</td>
<td>October 23, 2018</td>
</tr>
<tr>
<td>New Reserved Instance recommendation columns</td>
<td>Added new columns to the AWS Cost Explorer RI recommendations.</td>
<td>October 18, 2018</td>
</tr>
<tr>
<td>Change</td>
<td>Description</td>
<td>Date</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
<td>------</td>
</tr>
<tr>
<td>Added a new Reserved Instance report</td>
<td>Expanded RI reports to Amazon OpenSearch Service.</td>
<td>October 10, 2018</td>
</tr>
<tr>
<td>AWS Cost Explorer walkthrough</td>
<td>AWS Cost Explorer now provides a walkthrough for the most common functionality.</td>
<td>September 24, 2018</td>
</tr>
<tr>
<td>Added a new payment method</td>
<td>Added the ACH Direct Debit payment method.</td>
<td>July 24, 2018</td>
</tr>
<tr>
<td>Added RI purchase recommendations for additional services</td>
<td>Added RI purchase recommendations for additional services in AWS Cost Explorer.</td>
<td>July 11, 2018</td>
</tr>
<tr>
<td>Added RI purchase recommendations for linked accounts</td>
<td>Added RI purchase recommendations for linked accounts in AWS Cost Explorer.</td>
<td>June 27, 2018</td>
</tr>
<tr>
<td>Added AWS CloudFormation for budgets</td>
<td>Added Budgets templates for AWS CloudFormation.</td>
<td>May 22, 2018</td>
</tr>
<tr>
<td>Updated RI allocation behavior for linked accounts</td>
<td>Updated the RI allocation behavior size-flexible RI for linked accounts.</td>
<td>May 9, 2018</td>
</tr>
<tr>
<td>RI coverage alerts</td>
<td>Added RI coverage alerts.</td>
<td>May 8, 2018</td>
</tr>
<tr>
<td>Unblend linked account bills (p. 144)</td>
<td>Linked account bills no longer show the blended rate for the organization.</td>
<td>May 7, 2018</td>
</tr>
<tr>
<td>Added Amazon RDS recommendations to AWS Cost Explorer</td>
<td>Added Amazon RDS Recommendations to AWS Cost Explorer.</td>
<td>April 19, 2018</td>
</tr>
<tr>
<td>Added a new AWS Cost Explorer dimension and AWS Cost and Usage Reports line item (p. 144)</td>
<td>Added a new AWS Cost Explorer dimension and AWS Cost and Usage Reports line item.</td>
<td>March 27, 2018</td>
</tr>
<tr>
<td>Added purchase recommendations to the AWS Cost Explorer API</td>
<td>Added access to the Amazon EC2 Reserved Instance (RI) purchase recommendations via the AWS Cost Explorer API.</td>
<td>March 20, 2018</td>
</tr>
<tr>
<td>Added RI coverage for Amazon RDS, Amazon Redshift, and ElastiCache</td>
<td>Reserved Instance (RI) coverage for Amazon RDS, Amazon Redshift, and ElastiCache.</td>
<td>March 13, 2018</td>
</tr>
<tr>
<td>Added RI coverage to the AWS Cost Explorer API</td>
<td>Added GetReservationCoverage to the AWS Cost Explorer API.</td>
<td>February 22, 2018</td>
</tr>
<tr>
<td>RI recommendations</td>
<td>Added RI recommendations based on previous usage.</td>
<td>November 20, 2017</td>
</tr>
<tr>
<td>AWS Cost Explorer API</td>
<td>Enabled programmatic access to AWS Cost Explorer via API.</td>
<td>November 20, 2017</td>
</tr>
<tr>
<td>RI utilization alerts for additional services</td>
<td>Added notifications for additional services.</td>
<td>November 10, 2017</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
<td>Date</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>Added RI reports</td>
<td>Expanded RI reports to Amazon RDS, Redshift, and ElastiCache.</td>
<td>November 10, 2017</td>
</tr>
<tr>
<td>Discount sharing preferences</td>
<td>Updated preferences so that AWS credits and RI discount sharing can be turned off.</td>
<td>November 6, 2017</td>
</tr>
<tr>
<td>RI utilization alerts</td>
<td>Added notifications for when RI utilization drops below a preset percentage-based threshold.</td>
<td>August 21, 2017</td>
</tr>
<tr>
<td>Updated AWS Cost Explorer UI</td>
<td>Released a new AWS Cost Explorer UI.</td>
<td>August 16, 2017</td>
</tr>
<tr>
<td>AWS Marketplace data integration (p. 144)</td>
<td>Added AWS Marketplace so that customers can see their data reflected in all billing artifacts, including the Bills page, AWS Cost Explorer, and more.</td>
<td>August 10, 2017</td>
</tr>
<tr>
<td>Linked account access and usage type groups in budgets</td>
<td>Added support for creating cost and usage budgets based on specific usage types and usage type groups, and extended budget creation capabilities to all account types.</td>
<td>June 19, 2017</td>
</tr>
<tr>
<td>Added AWS Cost Explorer advanced options</td>
<td>You can now filter AWS Cost Explorer reports by additional advanced options, such as refunds, credits, RI upfront fees, RI recurring charges, and support charges.</td>
<td>March 22, 2017</td>
</tr>
<tr>
<td>Added a AWS Cost Explorer report</td>
<td>You can now track your Reserved Instance (RI) coverage in AWS Cost Explorer.</td>
<td>March 20, 2017</td>
</tr>
<tr>
<td>Added AWS Cost Explorer filters</td>
<td>You can now filter AWS Cost Explorer reports by tenancy, platform, and the Amazon EC2 Spot and Scheduled Reserved Instance purchase options.</td>
<td>March 20, 2017</td>
</tr>
<tr>
<td>AWS Cost Explorer and budgets for AWS India</td>
<td>AWS India users can now use AWS Cost Explorer and budgets.</td>
<td>March 6, 2017</td>
</tr>
<tr>
<td>Added grouping for AWS Cost Explorer usage types</td>
<td>AWS Cost Explorer supports grouping for both cost and usage data, enabling customers to identify their cost drivers by cross-referencing their cost and usage charts.</td>
<td>February 24, 2017</td>
</tr>
<tr>
<td>Added a AWS Cost Explorer report</td>
<td>You can now track your monthly Amazon EC2 Reserved Instance (RI) utilization in AWS Cost Explorer.</td>
<td>December 16, 2016</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
<td>Date</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>Added a AWS Cost Explorer report</td>
<td>You can now track your daily Amazon EC2 Reserved Instance (RI) utilization in AWS Cost Explorer.</td>
<td>December 15, 2016</td>
</tr>
<tr>
<td>Added AWS Cost Explorer advanced options</td>
<td>You can now exclude tagged resources from your AWS Cost Explorer reports.</td>
<td>November 18, 2016</td>
</tr>
<tr>
<td>Expanded budget functionality</td>
<td>You can now use budgets to track usage data.</td>
<td>October 20, 2016</td>
</tr>
<tr>
<td>Expanded AWS Cost Explorer functionality</td>
<td>You can now use AWS Cost Explorer to visualize your costs by usage type groups.</td>
<td>September 15, 2016</td>
</tr>
<tr>
<td>AWS Cost Explorer report manager</td>
<td>You can now save AWS Cost Explorer queries.</td>
<td>November 12, 2015</td>
</tr>
<tr>
<td>Budgets and forecasting</td>
<td>You can now manage your AWS usage and costs using budgets and cost forecasts.</td>
<td>June 29, 2015</td>
</tr>
<tr>
<td>Amazon Web Services India Private Limited</td>
<td>You can now manage your account settings and payment methods for an Amazon Web Services India Private Limited (AWS India) account.</td>
<td>June 1, 2015</td>
</tr>
<tr>
<td>Expanded AWS Cost Explorer functionality</td>
<td>You can now use AWS Cost Explorer to visualize your costs by Availability Zone, API operation, purchase option, or multiple cost allocation tags.</td>
<td>February 19, 2015</td>
</tr>
<tr>
<td>Preferred payment currencies</td>
<td>You can now change the currency associated with your credit card.</td>
<td>February 16, 2015</td>
</tr>
<tr>
<td>Expanded AWS Cost Explorer functionality</td>
<td>You can now use AWS Cost Explorer to visualize your costs by Amazon EC2 instance type or region.</td>
<td>January 5, 2015</td>
</tr>
<tr>
<td>User permissions</td>
<td>You can now enable federated users or roles to access and manage your account settings, view your bills, and perform cost management. For example, you can grant people in your finance department full access to the financial setup and control of your AWS account, without having to give them access to your production AWS environment.</td>
<td>July 7, 2014</td>
</tr>
<tr>
<td>Event Description</td>
