Welcome

Welcome to the AWS Data Exchange API Reference. AWS Data Exchange is a service that helps AWS customers to exchange data in the AWS Cloud. You can use the AWS Data Exchange API operations in the AWS Cloud.

As a subscriber, you can view and access the data sets that you have an entitlement to through a subscription. You can use the API operations to download (export) or copy your entitled data sets to Amazon Simple Storage Service (Amazon S3) for use across a variety of AWS analytics and machine learning services.

As a provider, you can create and manage your data sets that you want to publish to a product. You can download (export) or copy your assets or revisions to Amazon S3 or a signed URL. In addition, providers can import assets from an Amazon API Gateway API or import assets from an Amazon Redshift datashare.

A data set in AWS Data Exchange is a collection of data that can be changed or updated over time. Data sets can be updated using revisions, which represent a new version or incremental change to a data set. A revision contains one or more assets.

An asset in AWS Data Exchange is a piece of data. The asset can be one of the following:

- A structured data file, an image file, or some other data file that is stored as an Amazon S3 object.
- An Amazon Redshift datashare. Datashares are created in Amazon Redshift based on an existing database within a cluster that contain schemas, tables, views, or user-defined functions.
- A REST API that you created in Amazon API Gateway.
- An Amazon S3 access point that allows read-only access to an Amazon S3 bucket or subset of a bucket.
- An AWS Lake Formation data permission (Preview).

As a subscriber, you can view and access the data sets that you have an entitlement to through a subscription. You can use the API operations to export or copy your entitled data sets for use across a variety of AWS analytics and machine learning services, or download them locally.

As a provider, you can create and manage your data sets that you want to publish to a product. Providers can import assets locally, from an Amazon Simple Storage Service (S3) bucket, an Amazon API Gateway API, from an Amazon Redshift datashare, or from an AWS Lake Formation data permission (Preview).

Jobs are asynchronous import or export operations used to create or copy assets.

To learn more about these and other AWS Data Exchange concepts, procedures, best practices, and AWS Marketplace integration, see the AWS Marketplace Catalog API Reference and the AWS Data Exchange User Guide.

Note
Currently, the SendApiAsset operation is not supported for AWS SDKs for Java or Swift.

Data sets and products

You can manage and interact with data sets by using the AWS Data Exchange API operations. You can perform product publishing and product subscription tasks through the AWS Marketplace Catalog API or the AWS Data Exchange console. For more information, see the AWS Data Exchange User Guide.
API access control

You use AWS Identity and Access Management (IAM) to create IAM roles and assign policies that grant limited permissions to end users. The policies define the actions that the role can take on your data sets, revisions, assets, and associated jobs in the AWS Data Exchange API. For example, you can define roles such as engineering, marketing, and pricing. A user in your organization who has been added to the engineering role might be granted permissions to import an asset from Amazon S3 but can't finalize a revision for your data set.

For more information about AWS Data Exchange permissions, including managed policies, and a permissions reference for AWS Data Exchange actions and resources, see Identity and Access Management in AWS Data Exchange in the AWS Data Exchange User Guide.

Endpoints and AWS Regions

For information about AWS Regions and endpoints that are supported for AWS Data Exchange, see AWS Data Exchange endpoints and quotas in the AWS General Reference.

Service quotas

For information about the quotas for using AWS Data Exchange, see AWS Data Exchange endpoints and quotas in the AWS General Reference.
Actions

The following actions are supported:

- `CancelJob` (p. 4)
- `CreateDataSet` (p. 6)
- `CreateEventAction` (p. 10)
- `CreateJob` (p. 13)
- `CreateRevision` (p. 20)
- `DeleteAsset` (p. 24)
- `DeleteDataSet` (p. 26)
- `DeleteEventAction` (p. 28)
- `DeleteRevision` (p. 30)
- `GetAsset` (p. 32)
- `GetDataSet` (p. 36)
- `GetEventAction` (p. 39)
- `GetJob` (p. 42)
- `GetRevision` (p. 47)
- `ListDataSetRevisions` (p. 50)
- `ListDataSets` (p. 53)
- `ListEventActions` (p. 56)
- `ListJobs` (p. 59)
- `ListRevisionAssets` (p. 64)
- `ListTagsForResource` (p. 67)
- `RevokeRevision` (p. 69)
- `SendApiAsset` (p. 73)
- `SendDataSetNotification` (p. 76)
- `StartJob` (p. 79)
- `TagResource` (p. 81)
- `UntagResource` (p. 83)
- `UpdateAsset` (p. 85)
- `UpdateDataSet` (p. 90)
- `UpdateEventAction` (p. 94)
- `UpdateRevision` (p. 97)
CancelJob

This operation cancels a job. Jobs can be cancelled only when they are in the WAITING state.

Request Syntax

DELETE /v1/jobs/JobId HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

JobId (p. 4)

The unique identifier for a job.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

ConflictException

The request couldn't be completed because it conflicted with the current state of the resource.

HTTP Status Code: 409

InternalServerException

An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException

The resource couldn't be found.

HTTP Status Code: 404

ThrottlingException

The limit on the number of requests per second was exceeded.
HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS Command Line Interface](#)
- [AWS SDK for .NET](#)
- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for JavaScript](#)
- [AWS SDK for PHP V3](#)

- [AWS SDK for Ruby V3](#)
CreateDataSet

This operation creates a data set.

**Request Syntax**

```plaintext
POST /v1/data-sets HTTP/1.1
Content-type: application/json
{
   "AssetType": "string",
   "Description": "string",
   "Name": "string",
   "Tags": {
      "string" : "string"
   }
}
```

**URI Request Parameters**

The request does not use any URI parameters.

**Request Body**

The request accepts the following data in JSON format.

**AssetType (p. 6)**

The type of asset that is added to a data set.

Type: String

Valid Values: S3_SNAPSHOT | REDSHIFT_DATA_SHARE | API_GATEWAY_API | S3_DATA_ACCESS | LAKE_FORMATION_DATA_PERMISSION

Required: Yes

**Description (p. 6)**

A description for the data set. This value can be up to 16,348 characters long.

Type: String

Required: Yes

**Name (p. 6)**

The name of the data set.

Type: String

Required: Yes

**Tags (p. 6)**

A data set tag is an optional label that you can assign to a data set when you create it. Each tag consists of a key and an optional value, both of which you define. When you use tagging, you can also use tag-based access control in IAM policies to control access to these data sets and revisions.

Type: String to string map
Required: No

Response Syntax

HTTP/1.1 201
Content-type: application/json

{
    "Arn": "string",
    "AssetType": "string",
    "CreatedAt": "string",
    "Description": "string",
    "Id": "string",
    "Name": "string",
    "Origin": "string",
    "OriginDetails": {
        "ProductId": "string"
    },
    "SourceId": "string",
    "Tags": {
        "string": "string"
    },
    "UpdatedAt": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 201 response.

The following data is returned in JSON format by the service.

Arn (p. 7)

The ARN for the data set.

Type: String

AssetType (p. 7)

The type of asset that is added to a data set.

Type: String

Valid Values: S3_SNAPSHOT | REDSHIFT_DATA_SHARE | API_GATEWAY_API | S3_DATA_ACCESS | LAKEFORMATION_DATA_PERMISSION

CreatedAt (p. 7)

The date and time that the data set was created, in ISO 8601 format.

Type: Timestamp

Description (p. 7)

The description for the data set.

Type: String

Id (p. 7)

The unique identifier for the data set.
**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 185).

**AccessDeniedException**

Access to the resource is denied.

HTTP Status Code: 403

**InternalServerErrorException**

An exception occurred with the service.

HTTP Status Code: 500

**ServiceLimitExceededException**

The request has exceeded the quotas imposed by the service.

HTTP Status Code: 402

**ThrottlingException**

The limit on the number of requests per second was exceeded.
HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

CreateEventAction

This operation creates an event action.

Request Syntax

```json
POST /v1/event-actions HTTP/1.1
Content-type: application/json
{
  "Action": {
    "ExportRevisionToS3": {
      "Encryption": {
        "KmsKeyArn": "string",
        "Type": "string"
      },
      "RevisionDestination": {
        "Bucket": "string",
        "KeyPattern": "string"
      }
    }
  },
  "Event": {
    "RevisionPublished": {
      "DataSetId": "String"
    }
  }
}
```

URI Request Parameters

The request does not use any URI parameters.

Request Body

The request accepts the following data in JSON format.

**Action (p. 10)**

What occurs after a certain event.

Type: Action (p. 103) object

Required: Yes

**Event (p. 10)**

What occurs to start an action.

Type: Event (p. 122) object

Required: Yes

Response Syntax

```
HTTP/1.1 201
```
Response Elements

If the action is successful, the service sends back an HTTP 201 response.

The following data is returned in JSON format by the service.

**Action (p. 10)**

What occurs after a certain event.

Type: Action (p. 103) object

**Arn (p. 10)**

The ARN for the event action.

Type: String

**CreatedAt (p. 10)**

The date and time that the event action was created, in ISO 8601 format.

Type: Timestamp

**Event (p. 10)**

What occurs to start an action.

Type: Event (p. 122) object

**Id (p. 10)**

The unique identifier for the event action.

Type: String

**UpdatedAt (p. 10)**

The date and time that the event action was last updated, in ISO 8601 format.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

AccessDeniedException

Access to the resource is denied.

HTTP Status Code: 403

InternalServerException

An exception occurred with the service.

HTTP Status Code: 500

ServiceLimitExceededException

The request has exceeded the quotas imposed by the service.

HTTP Status Code: 402

ThrottlingException

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

ValidationException

The request was invalid.

HTTP Status Code: 400

CreateJob

This operation creates a job.

Request Syntax

POST /v1/jobs HTTP/1.1
Content-type: application/json

{
    "Details": {
        "CreateS3DataAccessFromS3Bucket": {
            "AssetSource": {
                "Bucket": "string",
                "KeyPrefixes": [ "string" ],
                "Keys": [ "string" ],
                "KmsKeysToGrant": [

                },
                "RevisionDestinations": [
                    {
                        "Bucket": "string",
                        "KeyPattern": "string",
                        "RevisionId": "string"
                    }
                ]
            },
            "ImportAssetFromApiGatewayApi": {
                "ApiDescription": "string",
                "ApiId": "string"
            }
        }
    }
}
The request does not use any URI parameters.
Request Body

The request accepts the following data in JSON format.

**Details** (p. 13)

The details for the CreateJob request.

Type: [RequestDetails](p. 165) object

Required: Yes

**Type** (p. 13)

The type of job to be created.

Type: String

Valid Values: IMPORT_ASSETS_FROM_S3 | IMPORT_ASSET_FROM_SIGNED_URL | EXPORT_ASSETS_TO_S3 | EXPORT_ASSET_TO_SIGNED_URL | EXPORT_REVISIONS_TO_S3 | IMPORT_ASSETS_FROM_REDSHIFT_DATA_SHARES | IMPORT_ASSET_FROM_API_GATEWAY_API | CREATE_S3_DATA_ACCESS_FROM_S3_BUCKET | IMPORT_ASSETS_FROM_LAKEFORMATION_TAG_POLICY

Required: Yes

Response Syntax

```
HTTP/1.1 201
Content-type: application/json

{

Response Elements

If the action is successful, the service sends back an HTTP 201 response.

The following data is returned in JSON format by the service.

Arn (p. 15)

The ARN for the job.

Type: String
**CreatedAt (p. 15)**

The date and time that the job was created, in ISO 8601 format.

Type: Timestamp

**Details (p. 15)**

Details about the job.

Type: `ResponseDetails (p. 167)` object

**Errors (p. 15)**

The errors associated with jobs.

Type: Array of `JobError (p. 150)` objects

**Id (p. 15)**

The unique identifier for the job.

Type: String

**State (p. 15)**

The state of the job.

Type: String

Valid Values: WAITING | IN_PROGRESS | ERROR | COMPLETED | CANCELLED | TIMED_OUT

**Type (p. 15)**

The job type.

Type: String

Valid Values: IMPORT_ASSETS_FROM_S3 | IMPORT_ASSET_FROM_SIGNED_URL | EXPORT_ASSETS_TO_S3 | EXPORT_ASSET_TO_SIGNED_URL | EXPORT_REVISIONS_TO_S3 | IMPORT_ASSETS_FROM_REDSHIFT_DATA_SHARES | IMPORT_ASSET_FROM_API_GATEWAY_API | CREATE_S3_DATA_ACCESS_FROM_S3_BUCKET | IMPORT_ASSETS_FROM_LAKEFORMATION_TAG_POLICY

**UpdatedAt (p. 15)**

The date and time that the job was last updated, in ISO 8601 format.

Type: Timestamp

**Errors**

For information about the errors that are common to all actions, see *Common Errors (p. 185)*.

**AccessDeniedException**

Access to the resource is denied.

HTTP Status Code: 403

**ConflictException**

The request couldn’t be completed because it conflicted with the current state of the resource.

HTTP Status Code: 409
**InternalServerException**

An exception occurred with the service.

HTTP Status Code: 500

**ResourceNotFoundException**

The resource couldn't be found.

HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

## See Also

CreateRevision

This operation creates a revision for a data set.

**Request Syntax**

```
POST /v1/data-sets/DataSetId/revisions HTTP/1.1
Content-type: application/json
{
    "Comment": "string",
    "Tags": {
        "string": "string"
    }
}
```

**URI Request Parameters**

The request uses the following URI parameters.

**DataSetId (p. 20)**

The unique identifier for a data set.

Required: Yes

**Request Body**

The request accepts the following data in JSON format.

**Comment (p. 20)**

An optional comment about the revision.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 16384.

Required: No

**Tags (p. 20)**

A revision tag is an optional label that you can assign to a revision when you create it. Each tag consists of a key and an optional value, both of which you define. When you use tagging, you can also use tag-based access control in IAM policies to control access to these data sets and revisions.

Type: String to string map

Required: No

**Response Syntax**

```
HTTP/1.1 201
Content-type: application/json
```
Response Elements

If the action is successful, the service sends back an HTTP 201 response.

The following data is returned in JSON format by the service.

Arn (p. 20)

The ARN for the revision.

Type: String

Comment (p. 20)

An optional comment about the revision.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 16384.

CreatedAt (p. 20)

The date and time that the revision was created, in ISO 8601 format.

Type: Timestamp

DataSetId (p. 20)

The unique identifier for the data set associated with the data set revision.

Type: String

Finalized (p. 20)

To publish a revision to a data set in a product, the revision must first be finalized. Finalizing a revision tells AWS Data Exchange that your changes to the assets in the revision are complete. After it's in this read-only state, you can publish the revision to your products. Finalized revisions can be published through the AWS Data Exchange console or the AWS Marketplace Catalog API, using the StartChangeSet AWS Marketplace Catalog API action. When using the API, revisions are uniquely identified by their ARN.

Type: Boolean

Id (p. 20)

The unique identifier for the revision.

Type: String
RevocationComment (p. 20)
A required comment to inform subscribers of the reason their access to the revision was revoked.
Type: String

Revoked (p. 20)
A status indicating that subscribers’ access to the revision was revoked.
Type: Boolean

RevokedAt (p. 20)
The date and time that the revision was revoked, in ISO 8601 format.
Type: Timestamp

SourceId (p. 20)
The revision ID of the owned revision corresponding to the entitled revision being viewed. This parameter is returned when a revision owner is viewing the entitled copy of its owned revision.
Type: String

Tags (p. 20)
The tags for the revision.
Type: String to string map

UpdatedAt (p. 20)
The date and time that the revision was last updated, in ISO 8601 format.
Type: Timestamp

Errors
For information about the errors that are common to all actions, see Common Errors (p. 185).

AccessDeniedException
Access to the resource is denied.
HTTP Status Code: 403

InternalServerException
An exception occurred with the service.
HTTP Status Code: 500

ResourceNotFoundException
The resource couldn't be found.
HTTP Status Code: 404

ThrottlingException
The limit on the number of requests per second was exceeded.
HTTP Status Code: 429
ValidationException
The request was invalid.
HTTP Status Code: 400

DeleteAsset

This operation deletes an asset.

**Request Syntax**

```
DELETE /v1/data-sets/DataSetId/revisions/RevisionId/assets/AssetId HTTP/1.1
```

**URI Request Parameters**

The request uses the following URI parameters.

- **AssetId (p. 24)**
  
  The unique identifier for an asset.
  
  Required: Yes

- **DataSetId (p. 24)**
  
  The unique identifier for a data set.
  
  Required: Yes

- **RevisionId (p. 24)**
  
  The unique identifier for a revision.
  
  Required: Yes

**Request Body**

The request does not have a request body.

**Response Syntax**

```
HTTP/1.1 204
```

**Response Elements**

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 185)](#).

- **AccessDeniedException**
  
  Access to the resource is denied.
  
  HTTP Status Code: 403

- **ConflictException**
  
  The request couldn't be completed because it conflicted with the current state of the resource.
HTTP Status Code: 409
**InternalServerException**
An exception occurred with the service.

HTTP Status Code: 500
**ResourceNotFoundException**
The resource couldn't be found.

HTTP Status Code: 404
**ThrottlingException**
The limit on the number of requests per second was exceeded.

HTTP Status Code: 429
**ValidationException**
The request was invalid.

HTTP Status Code: 400

DeleteDataSet

This operation deletes a data set.

Request Syntax

```
DELETE /v1/data-sets/{DataSetId} HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

**DataSetId (p. 26)**

The unique identifier for a data set.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 204
```

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

**AccessDeniedException**

Access to the resource is denied.

HTTP Status Code: 403

**ConflictException**

The request couldn't be completed because it conflicted with the current state of the resource.

HTTP Status Code: 409

**InternalServerException**

An exception occurred with the service.

HTTP Status Code: 500

**ResourceNotFoundException**

The resource couldn't be found.
HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

DeleteEventAction

This operation deletes the event action.

Request Syntax

```
DELETE /v1/event-actions/EventActionId HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

**EventActionId** *(p. 28)*

The unique identifier for the event action.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 204
```

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors *(p. 185).*

**InternalServerException**

An exception occurred with the service.

HTTP Status Code: 500

**ResourceNotFoundException**

The resource couldn't be found.

HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.
HTTP Status Code: 400

DeleteRevision

This operation deletes a revision.

Request Syntax

```
DELETE /v1/data-sets/{DataSetId}/revisions/{RevisionId} HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

- **DataSetId** *(p. 30)*
  - The unique identifier for a data set.
  - Required: Yes

- **RevisionId** *(p. 30)*
  - The unique identifier for a revision.
  - Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 204
```

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 185)](#).

- **AccessDeniedException**
  - Access to the resource is denied.
  - HTTP Status Code: 403

- **ConflictException**
  - The request couldn't be completed because it conflicted with the current state of the resource.
  - HTTP Status Code: 409

- **InternalServerException**
  - An exception occurred with the service.
HTTP Status Code: 500
ResourceNotFoundException

The resource couldn't be found.

HTTP Status Code: 404
ThrottlingException

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429
ValidationException

The request was invalid.

HTTP Status Code: 400

GetAsset

This operation returns information about an asset.

Request Syntax

```
GET /v1/data-sets/DataSetId/revisions/RevisionId/assets/AssetId HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

**AssetId (p. 32)**

The unique identifier for an asset.

Required: Yes

**DataSetId (p. 32)**

The unique identifier for a data set.

Required: Yes

**RevisionId (p. 32)**

The unique identifier for a revision.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
Content-type: application/json

"UpdatedAt": "string"  
}  

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Arn (p. 32)**

The ARN for the asset.

Type: String
AssetDetails (p. 32)
Details about the asset.
Type: AssetDetails (p. 107) object

AssetType (p. 32)
The type of asset that is added to a data set.
Type: String
Valid Values: S3_SNAPSHOT | REDSHIFT_DATA_SHARE | API_GATEWAY_API | S3_DATA_ACCESS | LAKE_FORMATION_DATA_PERMISSION

CreatedAt (p. 32)
The date and time that the asset was created, in ISO 8601 format.
Type: Timestamp

DataSetId (p. 32)
The unique identifier for the data set associated with this asset.
Type: String

Id (p. 32)
The unique identifier for the asset.
Type: String

Name (p. 32)
The name of the asset. When importing from Amazon S3, the Amazon S3 object key is used as the asset name. When exporting to Amazon S3, the asset name is used as default target Amazon S3 object key. When importing from Amazon API Gateway API, the API name is used as the asset name. When importing from Amazon Redshift, the datashare name is used as the asset name. When importing from AWS Lake Formation, the static values of "Database(s) included in the LF-tag policy" or "Table(s) included in the LF-tag policy" are used as the asset name.
Type: String

RevisionId (p. 32)
The unique identifier for the revision associated with this asset.
Type: String

SourceId (p. 32)
The asset ID of the owned asset corresponding to the entitled asset being viewed. This parameter is returned when an asset owner is viewing the entitled copy of its owned asset.
Type: String

UpdatedAt (p. 32)
The date and time that the asset was last updated, in ISO 8601 format.
Type: Timestamp

Errors
For information about the errors that are common to all actions, see Common Errors (p. 185).
**InternalServerException**

An exception occurred with the service.

HTTP Status Code: 500

**ResourceNotFoundException**

The resource couldn't be found.

HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

GetDataSet

This operation returns information about a data set.

Request Syntax

```
GET /v1/data-sets/DataSetId HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

**DataSetId** *(p. 36)*

The unique identifier for a data set.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
Content-type: application/json
{
    "Arn": "string",
    "AssetType": "string",
    "CreatedAt": "string",
    "Description": "string",
    "Id": "string",
    "Name": "string",
    "Origin": "string",
    "OriginDetails": {
        "ProductId": "string"
    },
    "SourceId": "string",
    "Tags": {
        "string": "string"
    },
    "UpdatedAt": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Arn** *(p. 36)*

The ARN for the data set.
**AssetType (p. 36)**

The type of asset that is added to a data set.

Type: String

Valid Values: S3_SNAPSHOT | REDSHIFT_DATA_SHARE | API_GATEWAY_API | S3_DATA_ACCESS | LAKEFORMATION_DATA_PERMISSION

**CreatedAt (p. 36)**

The date and time that the data set was created, in ISO 8601 format.

Type: Timestamp

**Description (p. 36)**

The description for the data set.

Type: String

**Id (p. 36)**

The unique identifier for the data set.

Type: String

**Name (p. 36)**

The name of the data set.

Type: String

**Origin (p. 36)**

A property that defines the data set as OWNED by the account (for providers) or ENTITLED to the account (for subscribers).

Type: String

Valid Values: OWNED | ENTITLED

**OriginDetails (p. 36)**

If the origin of this data set is ENTITLED, includes the details for the product on AWS Marketplace.

Type: OriginDetails (p. 160) object

**SourceId (p. 36)**

The data set ID of the owned data set corresponding to the entitled data set being viewed. This parameter is returned when a data set owner is viewing the entitled copy of its owned data set.

Type: String

**Tags (p. 36)**

The tags for the data set.

Type: String to string map

**UpdatedAt (p. 36)**

The date and time that the data set was last updated, in ISO 8601 format.

Type: Timestamp
Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

**InternalServerException**

An exception occurred with the service.

HTTP Status Code: 500

**ResourceNotFoundException**

The resource couldn't be found.

HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

GetEventAction

This operation retrieves information about an event action.

Request Syntax

```
GET /v1/event-actions/{EventActionId} HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

**EventActionId (p. 39)**

The unique identifier for the event action.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
Content-type: application/json

{
  "Action": {
    "ExportRevisionToS3": {
      "Encryption": {
        "KmsKeyArn": "string",
        "Type": "string"
      },
      "RevisionDestination": {
        "Bucket": "string",
        "KeyPattern": "string"
      }
    }
  },
  " Arn": "string",
  "CreatedAt": "string",
  "Event": {
    "RevisionPublished": {
      "DataSetId": "string"
    }
  },
  "Id": "string",
  "UpdatedAt": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**Action** *(p. 39)*
- What occurs after a certain event.
  - Type: Action *(p. 103)* object

**Arn** *(p. 39)*
- The ARN for the event action.
  - Type: String

**CreatedAt** *(p. 39)*
- The date and time that the event action was created, in ISO 8601 format.
  - Type: Timestamp

**Event** *(p. 39)*
- What occurs to start an action.
  - Type: Event *(p. 122)* object

**Id** *(p. 39)*
- The unique identifier for the event action.
  - Type: String

**UpdatedAt** *(p. 39)*
- The date and time that the event action was last updated, in ISO 8601 format.
  - Type: Timestamp

### Errors

For information about the errors that are common to all actions, see [Common Errors *(p. 185)*].

**InternalServerException**
- An exception occurred with the service.
  - HTTP Status Code: 500

**ResourceNotFoundException**
- The resource couldn't be found.
  - HTTP Status Code: 404

**ThrottlingException**
- The limit on the number of requests per second was exceeded.
  - HTTP Status Code: 429

**ValidationException**
- The request was invalid.
  - HTTP Status Code: 400

GetJob

This operation returns information about a job.

Request Syntax

GET /v1/jobs/JobId HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

JobId (p. 42)

The unique identifier for a job.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Content-type: application/json

## Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Arn (p. 42)**

The ARN for the job.

Type: String
CreatedAt (p. 42)

The date and time that the job was created, in ISO 8601 format.

Type: Timestamp

Details (p. 42)

Details about the job.

Type: ResponseDetails (p. 167) object

Errors (p. 42)

The errors associated with jobs.

Type: Array of JobError (p. 150) objects

Id (p. 42)

The unique identifier for the job.

Type: String

State (p. 42)

The state of the job.

Type: String

Valid Values: WAITING | IN_PROGRESS | ERROR | COMPLETED | CANCELLED | TIMED_OUT

Type (p. 42)

The job type.

Type: String

Valid Values: IMPORT_ASSETS_FROM_S3 | IMPORT_ASSET_FROM_SIGNED_URL | EXPORT_ASSETS_TO_S3 | EXPORT_ASSET_TO_SIGNED_URL | EXPORT_REVISIONS_TO_S3 | IMPORT_ASSETS_FROM_REDSHIFT_DATA_SHARES | IMPORT_ASSET_FROM_API_GATEWAY_API | CREATE_S3_DATA_ACCESS_FROM_S3_BUCKET | IMPORT_ASSETS_FROM LAKE_FORMATION_TAG_POLICY

UpdatedAt (p. 42)

The date and time that the job was last updated, in ISO 8601 format.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

InternalServerErrorException

An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException

The resource couldn't be found.

HTTP Status Code: 404
ThrottlingException

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

ValidationException

The request was invalid.

HTTP Status Code: 400

GetRevision

This operation returns information about a revision.

Request Syntax

GET /v1/data-sets/DataSetId/revisions/RevisionId HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

**DataSetId (p. 47)**

The unique identifier for a data set.

Required: Yes

**RevisionId (p. 47)**

The unique identifier for a revision.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Content-type: application/json

```
{
    "Arn": "string",
    "Comment": "string",
    "CreatedAt": "string",
    "DataSetId": "string",
    "Finalized": boolean,
    "Id": "string",
    "RevocationComment": "string",
    "Revoked": boolean,
    "RevokedAt": "string",
    "SourceId": "string",
    "Tags": {
        "string": "string"
    },
    "UpdatedAt": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
Arn (p. 47)
The ARN for the revision.
Type: String

Comment (p. 47)
An optional comment about the revision.
Type: String
Length Constraints: Minimum length of 0. Maximum length of 16384.

CreatedAt (p. 47)
The date and time that the revision was created, in ISO 8601 format.
Type: Timestamp

DataSetId (p. 47)
The unique identifier for the data set associated with the data set revision.
Type: String

Finalized (p. 47)
To publish a revision to a data set in a product, the revision must first be finalized. Finalizing a revision tells AWS Data Exchange that your changes to the assets in the revision are complete. After it's in this read-only state, you can publish the revision to your products. Finalized revisions can be published through the AWS Data Exchange console or the AWS Marketplace Catalog API, using the StartChangeSet AWS Marketplace Catalog API action. When using the API, revisions are uniquely identified by their ARN.
Type: Boolean

Id (p. 47)
The unique identifier for the revision.
Type: String

RevocationComment (p. 47)
A required comment to inform subscribers of the reason their access to the revision was revoked.
Type: String

Revoked (p. 47)
A status indicating that subscribers' access to the revision was revoked.
Type: Boolean

RevokedAt (p. 47)
The date and time that the revision was revoked, in ISO 8601 format.
Type: Timestamp

SourceId (p. 47)
The revision ID of the owned revision corresponding to the entitled revision being viewed. This parameter is returned when a revision owner is viewing the entitled copy of its owned revision.
Type: String

**Tags** *(p. 47)*

The tags for the revision.

Type: String to string map

**UpdatedAt** *(p. 47)*

The date and time that the revision was last updated, in ISO 8601 format.

Type: Timestamp

---

**Errors**

For information about the errors that are common to all actions, see [Common Errors](p. 185).

**InternalServerException**

An exception occurred with the service.

HTTP Status Code: 500

**ResourceNotFoundException**

The resource couldn't be found.

HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

ListDataSetRevisions

This operation lists a data set's revisions sorted by CreatedAt in descending order.

Request Syntax

```
GET /v1/data-sets/{DataSetId}/revisions?maxResults={MaxResults}&nextToken={NextToken} HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

- **DataSetId (p. 50)**
  - The unique identifier for a data set.
  - Required: Yes

- **MaxResults (p. 50)**
  - The maximum number of results returned by a single call.

- **NextToken (p. 50)**
  - The token value retrieved from a previous call to access the next page of results.

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
Content-type: application/json

{
  "NextToken": "string",
  "Revisions": [
    {
      "Arn": "string",
      "Comment": "string",
      "CreatedAt": "string",
      "DataSetId": "string",
      "Finalized": boolean,
      "Id": "string",
      "RevocationComment": "string",
      "Revoked": boolean,
      "RevokedAt": "string",
      "SourceId": "string",
      "UpdatedAt": "string"
    }
  ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

NextToken (p. 50)

The token value retrieved from a previous call to access the next page of results.

Type: String

Revisions (p. 50)

The asset objects listed by the request.

Type: Array of RevisionEntry (p. 170) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

InternalServerException

An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException

The resource couldn't be found.

HTTP Status Code: 404

ThrottlingException

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

ValidationException

The request was invalid.

HTTP Status Code: 400

ListDataSets

This operation lists your data sets. When listing by origin OWNED, results are sorted by CreatedAt in descending order. When listing by origin ENTITLED, there is no order and the maxResults parameter is ignored.

Request Syntax

```
GET /v1/data-sets?maxResults=MaxResults&nextToken=NextToken&origin=Origin HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

**MaxResults (p. 53)**

The maximum number of results returned by a single call.

**NextToken (p. 53)**

The token value retrieved from a previous call to access the next page of results.

**Origin (p. 53)**

A property that defines the data set as OWNED by the account (for providers) or ENTITLED to the account (for subscribers).

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1 200
Content-type: application/json

{
   "DataSets": [
      {
         "Arn": "string",
         "AssetType": "string",
         "CreatedAt": "string",
         "Description": "string",
         "Id": "string",
         "Name": "string",
         "Origin": "string",
         "OriginDetails": {
            "ProductId": "string"
         },
         "SourceId": "string",
         "UpdatedAt": "string"
      }
   ],
   "NextToken": "string"
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**DataSets (p. 53)**

The data set objects listed by the request.

Type: Array of [DataSetEntry (p. 117)] objects

**NextToken (p. 53)**

The token value retrieved from a previous call to access the next page of results.

Type: String

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 185)].

**InternalServerException**

An exception occurred with the service.

HTTP Status Code: 500

**ResourceNotFoundException**

The resource couldn't be found.

HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

ListEventActions

This operation lists your event actions.

Request Syntax

```
GET /v1/event-actions?eventSourceId=EventSourceId&maxResults=MaxResults&nextToken=NextToken
HTTP/1.1
```

URI Request Parameters

The request uses the following URI parameters.

**EventSourceId (p. 56)**

The unique identifier for the event source.

**MaxResults (p. 56)**

The maximum number of results returned by a single call.

**NextToken (p. 56)**

The token value retrieved from a previous call to access the next page of results.

Request Body

The request does not have a request body.

Response Syntax

```
HTTP/1.1  200
Content-type: application/json

{
  "EventActions": [
    {
      "Action": {
        "ExportRevisionToS3": {
          "Encryption": {
            "KmsKeyArn": "string",
            "Type": "string"
          },
          "RevisionDestination": {
            "Bucket": "string",
            "KeyPattern": "string"
          }
        }
      },
      "Arn": "string",
      "CreatedAt": "string",
      "Event": {
        "RevisionPublished": {
          "DataSetId": "string"
        }
      }
    }
  ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

**EventActions (p. 56)**

- The event action objects listed by the request.
  - Type: Array of [EventActionEntry (p. 123)]

**NextToken (p. 56)**

- The token value retrieved from a previous call to access the next page of results.
  - Type: String

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 185)].

**InternalServerException**

- An exception occurred with the service.
  - HTTP Status Code: 500

**ResourceNotFoundException**

- The resource couldn't be found.
  - HTTP Status Code: 404

**ThrottlingException**

- The limit on the number of requests per second was exceeded.
  - HTTP Status Code: 429

**ValidationException**

ListJobs

This operation lists your jobs sorted by CreatedAt in descending order.

Request Syntax

GET /v1/jobs?
dataSetId=DataSetId&maxResults=MaxResults&nextToken=NextToken&revisionId=RevisionId

HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

**DataSetId (p. 59)**

The unique identifier for a data set.

**MaxResults (p. 59)**

The maximum number of results returned by a single call.

**NextToken (p. 59)**

The token value retrieved from a previous call to access the next page of results.

**RevisionId (p. 59)**

The unique identifier for a revision.

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Content-type: application/json

```json
{

}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Jobs (p. 59)
The jobs listed by the request.

Type: Array of JobEntry (p. 148) objects

NextToken (p. 59)
The token value retrieved from a previous call to access the next page of results.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

InternalServerException
An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException
The resource couldn't be found.

HTTP Status Code: 404

ThrottlingException
The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

ValidationException
The request was invalid.

HTTP Status Code: 400

ListRevisionAssets

This operation lists a revision's assets sorted alphabetically in descending order.

Request Syntax

GET /v1/data-sets/DataSetId/revisions/RevisionId/assets?
maxResults=MaxResults&nextToken=NextToken HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

DataSetId (p. 64)
The unique identifier for a data set.
Required: Yes

MaxResults (p. 64)
The maximum number of results returned by a single call.

NextToken (p. 64)
The token value retrieved from a previous call to access the next page of results.

RevisionId (p. 64)
The unique identifier for a revision.
Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Content-type: application/json

```json
{
    "Assets": [
        {
            "Arn": "string",

            }
          ],
          "Table": {
            "Expression": [
              {
                "TagKey": "string",
                "TagValues": [ "string" ]
              }
            ],
            "ResourceType": "string"
          }
        },
        "LakeFormationDataPermissionType": "string",
        "Permissions": [ "string" ],
        "RoleArn": "string"
      }
    },
    "RedshiftDataShareAsset": {
      "Arn": "string"
    },
    "S3DataAccessAsset": {
      "Bucket": "string",
      "KeyPrefixes": [ "string" ],
      "Keys": [ "string" ],
      "KmsKeysToGrant": [ {
        "KmsKeyArn": "string"
      } ],
      "S3AccessPointAlias": "string",
      "S3AccessPointArn": "string"
    },
    "S3SnapshotAsset": {
      "Size": number
    }
  },
  "AssetType": "string",
  "CreatedAt": "string",
  "DataSetId": "string",
  "Id": "string",
  "Name": "string",
  "RevisionId": "string",
  "SourceId": "string",
  "UpdatedAt": "string"
},
"NextToken": "string"}
The following data is returned in JSON format by the service.

**Assets (p. 64)**

The asset objects listed by the request.

Type: Array of AssetEntry (p. 108) objects

**NextToken (p. 64)**

The token value retrieved from a previous call to access the next page of results.

Type: String

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 185).

**InternalServerException**

An exception occurred with the service.

HTTP Status Code: 500

**ResourceNotFoundException**

The resource couldn't be found.

HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

ListTagsForResource

This operation lists the tags on the resource.

Request Syntax

GET /tags/ResourceArn HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

ResourceArn (p. 67)

An Amazon Resource Name (ARN) that uniquely identifies an AWS resource.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 200
Content-type: application/json

{  
   "tags": {  
      "string" : "string"  
   }  
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

tags (p. 67)

A label that consists of a customer-defined key and an optional value.

Type: String to string map

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

See Also

RevokeRevision

This operation revokes subscribers’ access to a revision.

Request Syntax

POST /v1/data-sets/{DataSetId}/revisions/{RevisionId}/revoke HTTP/1.1
Content-type: application/json

{
  "RevocationComment": "string"
}

URI Request Parameters

The request uses the following URI parameters.

- **DataSetId (p. 69)**
  - The unique identifier for a data set.
  - Required: Yes

- **RevisionId (p. 69)**
  - The unique identifier for a revision.
  - Required: Yes

Request Body

The request accepts the following data in JSON format.

- **RevocationComment (p. 69)**
  - A required comment to inform subscribers of the reason their access to the revision was revoked.
  - Type: String
  - Required: Yes

Response Syntax

HTTP/1.1 200
Content-type: application/json

{
  "Arn": "string",
  "Comment": "string",
  "CreatedAt": "string",
  "DataSetId": "string",
  "Finalized": boolean,
  "Id": "string",
  "RevocationComment": "string"
}
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Arn (p. 69)

The ARN for the revision.
Type: String

Comment (p. 69)

An optional comment about the revision.
Type: String
Length Constraints: Minimum length of 0. Maximum length of 16384.

CreatedAt (p. 69)

The date and time that the revision was created, in ISO 8601 format.
Type: Timestamp

DataSetId (p. 69)

The unique identifier for the data set associated with the data set revision.
Type: String

Finalized (p. 69)

To publish a revision to a data set in a product, the revision must first be finalized. Finalizing a revision tells AWS Data Exchange that changes to the assets in the revision are complete. After it's in this read-only state, you can publish the revision to your products. Finalized revisions can be published through the AWS Data Exchange console or the AWS Marketplace Catalog API, using the StartChangeSet AWS Marketplace Catalog API action. When using the API, revisions are uniquely identified by their ARN.
Type: Boolean

Id (p. 69)

The unique identifier for the revision.
Type: String

RevocationComment (p. 69)

A required comment to inform subscribers of the reason their access to the revision was revoked.
Type: String

Revoked (p. 69)

A status indicating that subscribers' access to the revision was revoked.
Type: Boolean

**RevokedAt (p. 69)**

The date and time that the revision was revoked, in ISO 8601 format.

Type: Timestamp

**SourceId (p. 69)**

The revision ID of the owned revision corresponding to the entitled revision being viewed. This parameter is returned when a revision owner is viewing the entitled copy of its owned revision.

Type: String

**UpdatedAt (p. 69)**

The date and time that the revision was last updated, in ISO 8601 format.

Type: Timestamp

## Errors

For information about the errors that are common to all actions, see [Common Errors (p. 185)](#).

**AccessDeniedException**

- Access to the resource is denied.
- HTTP Status Code: 403

**ConflictException**

- The request couldn't be completed because it conflicted with the current state of the resource.
- HTTP Status Code: 409

**InternalServerException**

- An exception occurred with the service.
- HTTP Status Code: 500

**ResourceNotFoundException**

- The resource couldn't be found.
- HTTP Status Code: 404

**ThrottlingException**

- The limit on the number of requests per second was exceeded.
- HTTP Status Code: 429

**ValidationException**

- The request was invalid.
- HTTP Status Code: 400

SendApiAsset

This operation invokes an API Gateway API asset. The request is proxied to the provider’s API Gateway API.

Request Syntax

<table>
<thead>
<tr>
<th>POST /v1?QueryStringParameters HTTP/1.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-amzn-dataexchange-asset-id: AssetId</td>
</tr>
<tr>
<td>x-amzn-dataexchange-data-set-id: DataSetId</td>
</tr>
<tr>
<td>x-amzn-dataexchange-http-method: Method</td>
</tr>
<tr>
<td>x-amzn-dataexchange-path: Path</td>
</tr>
<tr>
<td>x-amzn-dataexchange-revision-id: RevisionId</td>
</tr>
</tbody>
</table>

**Body**

URI Request Parameters

The request uses the following URI parameters.

**AssetId (p. 73)**

Asset ID value for the API request.

Required: Yes

**DataSetId (p. 73)**

Data set ID value for the API request.

Required: Yes

**Method (p. 73)**

HTTP method value for the API request. Alternatively, you can use the appropriate verb in your request.

**Path (p. 73)**

URI path value for the API request. Alternatively, you can set the URI path directly by invoking /v1/{pathValue}.

**QueryStringParameters (p. 73)**

Attach query string parameters to the end of the URI (for example, /v1/examplePath?exampleParam=exampleValue).

**RevisionId (p. 73)**

Revision ID value for the API request.

Required: Yes

Request Body

The request accepts the following string data.

**Body (p. 73)**

The request body.
Response Syntax

HTTP/1.1 200

Body

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The response returns the following as the HTTP body.

Body (p. 74)

The response body from the underlying API tracked by the API asset.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

AccessDeniedException

Access to the resource is denied.

HTTP Status Code: 403

InternalServerException

An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException

The resource couldn't be found.

HTTP Status Code: 404

ThrottlingException

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

ValidationException

The request was invalid.

HTTP Status Code: 400

SendDataSetNotification

The type of event associated with the data set.

Request Syntax

POST /v1/data-sets/{DataSetId}/notification HTTP/1.1
Content-type: application/json

```
{
   "clientToken": "string",
   "comment": "string",
   "details": {
      "dataUpdate": {
         "dataUpdatedAt": "string"
      },
      "deprecation": {
         "deprecationAt": "string"
      },
      "schemaChange": {
         "changes": [
            {
               "description": "string",
               "name": "string",
               "type": "string"
            }
         ],
         "schemaChangeAt": "string"
      }
   },
   "scope": {
      "lakeFormationTagPolicies": [
         {
            "database": "string",
            "table": "string"
         }
      ],
      "redshiftDataShares": [
         {
            "arn": "string",
            "database": "string",
            "function": "string",
            "schema": "string",
            "table": "string",
            "view": "string"
         }
      ],
      "s3DataAccesses": [
         {
            "keyPrefixes": [ "string" ],
            "keys": [ "string" ]
         }
      ],
      "type": "string"
   }
}
```

URI Request Parameters

The request uses the following URI parameters.
**Request Body**

The request accepts the following data in JSON format.

**ClientToken (p. 76)**

Idempotency key for the notification, this key allows us to deduplicate notifications that are sent in quick succession erroneously.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: `[^\x21-\x7E]{1,64}`

Required: No

**Comment (p. 76)**

Free-form text field for providers to add information about their notifications.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 16384.

Required: No

**Details (p. 76)**

Extra details specific to this notification type.

Type: `NotificationDetails (p. 159)` object

Required: No

**Scope (p. 76)**

Affected scope of this notification such as the underlying resources affected by the notification event.

Type: `ScopeDetails (p. 180)` object

Required: No

**Type (p. 76)**

The type of the notification. Describing the kind of event the notification is alerting you to.

Type: String

Valid Values: `DATA_DELAY` | `DATA_UPDATE` | `DEPRECIATION` | `SCHEMA_CHANGE`

Required: Yes

**Response Syntax**

```
HTTP/1.1 202
```
Response Elements

If the action is successful, the service sends back an HTTP 202 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

AccessDeniedException

Access to the resource is denied.

HTTP Status Code: 403

ConflictException

The request couldn't be completed because it conflicted with the current state of the resource.

HTTP Status Code: 409

InternalServerException

An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException

The resource couldn't be found.

HTTP Status Code: 404

ThrottlingException

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

ValidationException

The request was invalid.

HTTP Status Code: 400

StartJob

This operation starts a job.

Request Syntax

PATCH /v1/jobs/{JobId} HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

JobId (p. 79)

The unique identifier for a job.

Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 202

Response Elements

If the action is successful, the service sends back an HTTP 202 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

AccessDeniedException

Access to the resource is denied.

HTTP Status Code: 403

ConflictException

The request couldn't be completed because it conflicted with the current state of the resource.

HTTP Status Code: 409

InternalServerException

An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException

The resource couldn't be found.
HTTP Status Code: 404

**ThrottlingException**

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

**ValidationException**

The request was invalid.

HTTP Status Code: 400

TagResource

This operation tags a resource.

Request Syntax

```
POST /tags/ResourceArn HTTP/1.1
Content-type: application/json

{
    "tags": {
        "string": "string"
    }
}
```

URI Request Parameters

The request uses the following URI parameters.

ResourceArn (p. 81)

An Amazon Resource Name (ARN) that uniquely identifies an AWS resource.

Required: Yes

Request Body

The request accepts the following data in JSON format.

tags (p. 81)

A label that consists of a customer-defined key and an optional value.

Type: String to string map

Required: Yes

Response Syntax

```
HTTP/1.1 204
```

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

UntagResource

This operation removes one or more tags from a resource.

Request Syntax

DELETE /tags/ResourceArn?tagKeys=TagKeys  HTTP/1.1

URI Request Parameters

The request uses the following URI parameters.

ResourceArn (p. 83)

An Amazon Resource Name (ARN) that uniquely identifies an AWS resource.

    Required: Yes

TagKeys (p. 83)

The key tags.

    Required: Yes

Request Body

The request does not have a request body.

Response Syntax

HTTP/1.1 204

Response Elements

If the action is successful, the service sends back an HTTP 204 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

UpdateAsset

This operation updates an asset.

**Request Syntax**

```plaintext
PATCH /v1/data-sets/DataSetId/revisions/RevisionId/assets/AssetId HTTP/1.1
Content-type: application/json
{
  "Name": "string"
}
```

**URI Request Parameters**

The request uses the following URI parameters.

- **AssetId (p. 85)**
  
  The unique identifier for an asset.
  
  Required: Yes

- **DataSetId (p. 85)**
  
  The unique identifier for a data set.
  
  Required: Yes

- **RevisionId (p. 85)**
  
  The unique identifier for a revision.
  
  Required: Yes

**Request Body**

The request accepts the following data in JSON format.

- **Name (p. 85)**
  
  The name of the asset. When importing from Amazon S3, the Amazon S3 object key is used as the asset name. When exporting to Amazon S3, the asset name is used as default target Amazon S3 object key. When importing from Amazon API Gateway API, the API name is used as the asset name. When importing from Amazon Redshift, the datashare name is used as the asset name. When importing from AWS Lake Formation, the static values of "Database(s) included in the LF-tag policy" or "Table(s) included in LF-tag policy" are used as the name.
  
  Type: String
  
  Required: Yes

**Response Syntax**

```
HTTP/1.1 200
```
Content-type: application/json

{
   "Arn": "string",
   "AssetDetails": {
      "ApiGatewayApiAsset": {
         "ApiDescription": "string",

   },
   "S3SnapshotAsset": {
      "Size": number
   }
   "AssetType": "string",
   "CreatedAt": "string",
   "LastUpdatedAt": "string"
}
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Arn** *(p. 85)*

The ARN for the asset.

Type: String

**AssetDetails** *(p. 85)*

Details about the asset.

Type: `AssetDetails` *(p. 107)* object

**AssetType** *(p. 85)*

The type of asset that is added to a data set.

Type: String

Valid Values: `S3_SNAPSHOT` | `REDSHIFT_DATA_SHARE` | `API_GATEWAY_API` | `S3_DATA_ACCESS` | `LAKEFORMATION_DATA_PERMISSION`  

**CreatedAt** *(p. 85)*

The date and time that the asset was created, in ISO 8601 format.

Type: Timestamp

**DataSetId** *(p. 85)*

The unique identifier for the data set associated with this asset.

Type: String

**Id** *(p. 85)*

The unique identifier for the asset.

Type: String

**Name** *(p. 85)*

The name of the asset. When importing from Amazon S3, the Amazon S3 object key is used as the asset name. When exporting to Amazon S3, the asset name is used as default target Amazon S3 object key. When importing from Amazon API Gateway API, the API name is used as the asset name. When importing from Amazon Redshift, the datashare name is used as the asset name. When importing from AWS Lake Formation, the static values of "Database(s) included in the LF-tag policy"-or "Table(s) included in LF-tag policy" are used as the asset name.

Type: String
RevisionId (p. 85)

The unique identifier for the revision associated with this asset.

Type: String

SourceId (p. 85)

The asset ID of the owned asset corresponding to the entitled asset being viewed. This parameter is returned when an asset owner is viewing the entitled copy of its owned asset.

Type: String

UpdatedAt (p. 85)

The date and time that the asset was last updated, in ISO 8601 format.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

AccessDeniedException

Access to the resource is denied.

HTTP Status Code: 403

ConflictException

The request couldn't be completed because it conflicted with the current state of the resource.

HTTP Status Code: 409

InternalServerException

An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException

The resource couldn't be found.

HTTP Status Code: 404

ThrottlingException

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

ValidationException

The request was invalid.

HTTP Status Code: 400

UpdateDataSet

This operation updates a data set.

Request Syntax

PATCH /v1/data-sets/{DataSetId} HTTP/1.1
Content-type: application/json
{
    "Description": "string",
    "Name": "string"
}

URI Request Parameters

The request uses the following URI parameters.

**DataSetId (p. 90)**

The unique identifier for a data set.

Required: Yes

Request Body

The request accepts the following data in JSON format.

**Description (p. 90)**

The description for the data set.

Type: String

Required: No

**Name (p. 90)**

The name of the data set.

Type: String

Required: No

Response Syntax

HTTP/1.1 200
Content-type: application/json
{
    "Arn": "string",
    "AssetType": "string",
    "CreatedAt": "string",
    "Description": "string",
    "Id": "string",
    "Name": "string",
    "UpdatedAt": "string"
}
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Arn (p. 90)**

The ARN for the data set.

Type: String

**AssetType (p. 90)**

The type of asset that is added to a data set.

Type: String

Valid Values: S3_SNAPSHOT | REDSHIFT_DATA_SHARE | API_GATEWAY_API | S3_DATA_ACCESS | LAKEFORMATION_DATA_PERMISSION

**CreatedAt (p. 90)**

The date and time that the data set was created, in ISO 8601 format.

Type: Timestamp

**Description (p. 90)**

The description for the data set.

Type: String

**Id (p. 90)**

The unique identifier for the data set.

Type: String

**Name (p. 90)**

The name of the data set.

Type: String

**Origin (p. 90)**

A property that defines the data set as OWNED by the account (for providers) or ENTITLED to the account (for subscribers).

Type: String

Valid Values: OWNED | ENTITLED

**OriginDetails (p. 90)**

If the origin of this data set is ENTITLED, includes the details for the product on AWS Marketplace.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 185).

AccessDeniedException

Access to the resource is denied.

HTTP Status Code: 403

InternalServerException

An exception occurred with the service.

HTTP Status Code: 500

ResourceNotFoundException

The resource couldn't be found.

HTTP Status Code: 404

ThrottlingException

The limit on the number of requests per second was exceeded.

HTTP Status Code: 429

ValidationException

The request was invalid.

HTTP Status Code: 400

UpdateEventAction

This operation updates the event action.

Request Syntax

PATCH /v1/event-actions/{EventActionId} HTTP/1.1
Content-type: application/json

{
   "Action": {
      "ExportRevisionToS3": {
         "Encryption": {
            "KmsKeyArn": "string",
            "Type": "string"
         },
         "RevisionDestination": {
            "Bucket": "string",
            "KeyPattern": "string"
         }
      }
   }
}

URI Request Parameters

The request uses the following URI parameters.

EventActionId (p. 94)

The unique identifier for the event action.

Required: Yes

Request Body

The request accepts the following data in JSON format.

Action (p. 94)

What occurs after a certain event.

Type: Action (p. 103) object

Required: No

Response Syntax

HTTP/1.1 200
Content-type: application/json

{
   "Action": {
      "ExportRevisionToS3": {
         "Encryption": {
            "KmsKeyArn": "string",
            "Type": "string"
         },
         "RevisionDestination": {
            "Bucket": "string",
            "KeyPattern": "string"
         }
      }
   }
}
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**Action (p. 94)**

What occurs after a certain event.

Type: Action (p. 103) object

**Arn (p. 94)**

The ARN for the event action.

Type: String

**CreatedAt (p. 94)**

The date and time that the event action was created, in ISO 8601 format.

Type: Timestamp

**Event (p. 94)**

What occurs to start an action.

Type: Event (p. 122) object

**Id (p. 94)**

The unique identifier for the event action.

Type: String

**UpdatedAt (p. 94)**

The date and time that the event action was last updated, in ISO 8601 format.

Type: Timestamp

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 185).
AccessDeniedException
Access to the resource is denied.
HTTP Status Code: 403

InternalServerException
An exception occurred with the service.
HTTP Status Code: 500

ResourceNotFoundException
The resource couldn't be found.
HTTP Status Code: 404

ThrottlingException
The limit on the number of requests per second was exceeded.
HTTP Status Code: 429

ValidationException
The request was invalid.
HTTP Status Code: 400

See Also

- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
UpdateRevision

This operation updates a revision.

Request Syntax

PATCH /v1/data-sets/{DataSetId}/revisions/{RevisionId} HTTP/1.1
Content-type: application/json
{
   "Comment": "string",
   "Finalized": boolean
}

URI Request Parameters

The request uses the following URI parameters.

**DataSetId (p. 97)**

The unique identifier for a data set.

Required: Yes

**RevisionId (p. 97)**

The unique identifier for a revision.

Required: Yes

Request Body

The request accepts the following data in JSON format.

**Comment (p. 97)**

An optional comment about the revision.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 16384.

Required: No

**Finalized (p. 97)**

Finalizing a revision tells AWS Data Exchange that your changes to the assets in the revision are complete. After it's in this read-only state, you can publish the revision to your products.

Type: Boolean

Required: No

Response Syntax

HTTP/1.1 200
Content-type: application/json

{
    "Arn": "string",
    "Comment": "string",
    "CreatedAt": "string",
    "DataSetId": "string",
    "Finalized": boolean,
    "Id": "string",
    "RevocationComment": "string",
    "Revoked": boolean,
    "RevokedAt": "string",
    "SourceId": "string",
    "UpdatedAt": "string"
}
RevocationComment (p. 97)
A required comment to inform subscribers of the reason their access to the revision was revoked.
Type: String

Revoked (p. 97)
A status indicating that subscribers' access to the revision was revoked.
Type: Boolean

RevokedAt (p. 97)
The date and time that the revision was revoked, in ISO 8601 format.
Type: Timestamp

SourceId (p. 97)
The revision ID of the owned revision corresponding to the entitled revision being viewed. This parameter is returned when a revision owner is viewing the entitled copy of its owned revision.
Type: String

UpdatedAt (p. 97)
The date and time that the revision was last updated, in ISO 8601 format.
Type: Timestamp

Errors
For information about the errors that are common to all actions, see Common Errors (p. 185).

AccessDeniedException
Access to the resource is denied.
HTTP Status Code: 403

ConflictException
The request couldn't be completed because it conflicted with the current state of the resource.
HTTP Status Code: 409

InternalServerException
An exception occurred with the service.
HTTP Status Code: 500

ResourceNotFoundException
The resource couldn't be found.
HTTP Status Code: 404

ThrottlingException
The limit on the number of requests per second was exceeded.
HTTP Status Code: 429
ValidationException

The request was invalid.

HTTP Status Code: 400

Data Types

The AWS Data Exchange API contains several data types that various actions use. This section describes each data type in detail.

**Note**
The order of each element in a data type structure is not guaranteed. Applications should not assume a particular order.

The following data types are supported:

- Action (p. 103)
- ApiGatewayApiAsset (p. 104)
- AssetDestinationEntry (p. 106)
- AssetDetails (p. 107)
- AssetEntry (p. 108)
- AssetSourceEntry (p. 110)
- AutoExportRevisionDestinationEntry (p. 111)
- AutoExportRevisionToS3RequestDetails (p. 112)
- CreateS3DataAccessFromS3BucketRequestDetails (p. 113)
- CreateS3DataAccessFromS3BucketResponseDetails (p. 114)
- DatabaseLFTagPolicy (p. 115)
- DatabaseLFTagPolicyAndPermissions (p. 116)
- DataSetEntry (p. 117)
- DataUpdateRequestDetails (p. 119)
- DeprecationRequestDetails (p. 120)
- Details (p. 121)
- Event (p. 122)
- EventActionEntry (p. 123)
- ExportAssetsToS3RequestDetails (p. 125)
- ExportAssetsToS3ResponseDetails (p. 126)
- ExportAssetToSignedUrlRequestDetails (p. 127)
- ExportAssetToSignedUrlResponseDetails (p. 128)
- ExportRevisionsToS3RequestDetails (p. 129)
- ExportRevisionsToS3ResponseDetails (p. 130)
- ExportServerSideEncryption (p. 131)
- ImportAssetFromApiGatewayApiRequestDetails (p. 132)
- ImportAssetFromApiGatewayApiResponseDetails (p. 134)
- ImportAssetFromSignedUrlJobErrorDetails (p. 136)
- ImportAssetFromSignedUrlRequestDetails (p. 137)
- ImportAssetFromSignedUrlResponseDetails (p. 138)
- ImportAssetsFromLakeFormationTagPolicyRequestDetails (p. 140)
- ImportAssetsFromLakeFormationTagPolicyResponseDetails (p. 142)

• SchemaChangeRequestDetails (p. 179)
• ScopeDetails (p. 180)
• TableLFTagPolicy (p. 181)
• TableLFTagPolicyAndPermissions (p. 182)
Action

What occurs after a certain event.

Contents

ExportRevisionToS3

Details for the export revision to Amazon S3 action.

Type: AutoExportRevisionToS3RequestDetails (p. 112) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ApiGatewayApiAsset

The API Gateway API that is the asset.

Contents

ApiDescription

The API description of the API asset.
  Type: String
  Required: No

ApiEndpoint

The API endpoint of the API asset.
  Type: String
  Required: No

ApiId

The unique identifier of the API asset.
  Type: String
  Required: No

ApiKey

The API key of the API asset.
  Type: String
  Required: No

ApiName

The API name of the API asset.
  Type: String
  Required: No

ApiSpecificationDownloadUrl

The download URL of the API specification of the API asset.
  Type: String
  Required: No

ApiSpecificationDownloadUrlExpiresAt

The date and time that the upload URL expires, in ISO 8601 format.
  Type: Timestamp
  Required: No

ProtocolType

The protocol type of the API asset.
Type: String
Valid Values: REST
Required: No

Stage
The stage of the API asset.
Type: String
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AssetDestinationEntry

The destination for the asset.

Contents

AssetId

The unique identifier for the asset.
Type: String
Required: Yes

Bucket

The Amazon S3 bucket that is the destination for the asset.
Type: String
Required: Yes

Key

The name of the object in Amazon S3 for the asset.
Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AssetDetails

Details about the asset.

Contents

ApiGatewayApiAsset

Information about the API Gateway API asset.
Type: ApiGatewayApiAsset (p. 104) object
Required: No

LakeFormationDataPermissionAsset

The AWS Lake Formation data permission that is the asset.
Type: LakeFormationDataPermissionAsset (p. 153) object
Required: No

RedshiftDataShareAsset

The Amazon Redshift datashare that is the asset.
Type: RedshiftDataShareAsset (p. 161) object
Required: No

S3DataAccessAsset

The Amazon S3 data access that is the asset.
Type: S3DataAccessAsset (p. 173) object
Required: No

S3SnapshotAsset

The Amazon S3 object that is the asset.
Type: S3SnapshotAsset (p. 177) object
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AssetEntry

An asset in AWS Data Exchange is a piece of data (Amazon S3 object) or a means of fulfilling data (Amazon Redshift datashare or Amazon API Gateway API, AWS Lake Formation data permission, or Amazon S3 data access). The asset can be a structured data file, an image file, or some other data file that can be stored as an Amazon S3 object, an Amazon API Gateway API, or an Amazon Redshift datashare, an AWS Lake Formation data permission, or an Amazon S3 data access. When you create an import job for your files, API Gateway APIs, Amazon Redshift datashares, AWS Lake Formation data permission, or Amazon S3 data access, you create an asset in AWS Data Exchange.

Contents

Arn
The ARN for the asset.
Type: String
Required: Yes

AssetDetails
Details about the asset.
Type: AssetDetails (p. 107) object
Required: Yes

AssetType
The type of asset that is added to a data set.
Type: String
Valid Values: S3_SNAPSHOT | REDSHIFT_DATA_SHARE | API_GATEWAY_API | S3_DATA_ACCESS | LAKE_FORMATION_DATA_PERMISSION
Required: Yes

CreatedAt
The date and time that the asset was created, in ISO 8601 format.
Type: Timestamp
Required: Yes

DataSetId
The unique identifier for the data set associated with this asset.
Type: String
Required: Yes

Id
The unique identifier for the asset.
Type: String
Required: Yes
Name

The name of the asset. When importing from Amazon S3, the Amazon S3 object key is used as the asset name. When exporting to Amazon S3, the asset name is used as default target Amazon S3 object key. When importing from Amazon API Gateway API, the API name is used as the asset name. When importing from Amazon Redshift, the datashare name is used as the asset name. When importing from AWS Lake Formation, the static values of "Database(s) included in LF-tag policy" or "Table(s) included in LF-tag policy" are used as the asset name.

Type: String
Required: Yes

RevisionId

The unique identifier for the revision associated with this asset.

Type: String
Required: Yes

UpdatedAt

The date and time that the asset was last updated, in ISO 8601 format.

Type: Timestamp
Required: Yes

SourceId

The asset ID of the owned asset corresponding to the entitled asset being viewed. This parameter is returned when an asset owner is viewing the entitled copy of its owned asset.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AssetSourceEntry

The source of the assets.

Contents

Bucket

The Amazon S3 bucket that's part of the source of the asset.

Type: String

Required: Yes

Key

The name of the object in Amazon S3 for the asset.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AutoExportRevisionDestinationEntry

A revision destination is the Amazon S3 bucket folder destination to where the export will be sent.

Contents

Bucket

The Amazon S3 bucket that is the destination for the event action.

Type: String
Required: Yes

KeyPattern

A string representing the pattern for generated names of the individual assets in the revision. For more information about key patterns, see Key patterns when exporting revisions.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AutoExportRevisionToS3RequestDetails

Details of the operation to be performed by the job.

Contents

RevisionDestination
A revision destination is the Amazon S3 bucket folder destination to where the export will be sent.
Type: AutoExportRevisionDestinationEntry (p. 111) object
Required: Yes

Encryption
Encryption configuration for the auto export job.
Type: ExportServerSideEncryption (p. 131) object
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CreateS3DataAccessFromS3BucketRequestDetails

Details of the operation to create an Amazon S3 data access from an S3 bucket.

Contents

AssetSource

Details about the S3 data access source asset.

Type: S3DataAccessAssetSourceEntry (p. 175) object

Required: Yes

DataSetId

The unique identifier for the data set associated with the creation of this Amazon S3 data access.

Type: String

Required: Yes

RevisionId

The unique identifier for a revision.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CreateS3DataAccessFromS3BucketResponseDetails

Details about the response of the operation to create an S3 data access from an S3 bucket.

Contents

AssetSource

Details about the asset source from an Amazon S3 bucket.

Type: S3DataAccessAssetSourceEntry (p. 175) object

Required: Yes

DataSetId

The unique identifier for this data set.

Type: String

Required: Yes

RevisionId

The unique identifier for the revision.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DatabaseLFTagPolicy

The LF-tag policy for database resources.

Contents

Expression

A list of LF-tag conditions that apply to database resources.

Type: Array of LFTag (p. 157) objects

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DatabaseLFTagPolicyAndPermissions

The LF-tag policy and permissions for database resources.

Contents

Expression

A list of LF-tag conditions that apply to database resources.

Type: Array of LFTag (p. 157) objects

Required: Yes

Permissions

The permissions granted to subscribers on database resources.

Type: Array of strings

Valid Values: DESCRIBE

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DataSetEntry

A data set is an AWS resource with one or more revisions.

Contents

Arn

The ARN for the data set.

Type: String

Required: Yes

AssetType

The type of asset that is added to a data set.

Type: String

Valid Values: S3_SNAPSHOT | REDSHIFT_DATA_SHARE | API_GATEWAY_API | S3_DATA_ACCESS | LAKEFORMATION_DATA_PERMISSION

Required: Yes

CreatedAt

The date and time that the data set was created, in ISO 8601 format.

Type: Timestamp

Required: Yes

Description

The description for the data set.

Type: String

Required: Yes

Id

The unique identifier for the data set.

Type: String

Required: Yes

Name

The name of the data set.

Type: String

Required: Yes

Origin

A property that defines the data set as OWNED by the account (for providers) or ENTITLED to the account (for subscribers).

Type: String
Valid Values: OWNED | ENTITLED

Required: Yes

**UpdatedAt**

The date and time that the data set was last updated, in ISO 8601 format.

Type: Timestamp

Required: Yes

**OriginDetails**

If the origin of this data set is ENTITLED, includes the details for the product on AWS Marketplace.

Type: [OriginDetails](p. 160) object

Required: No

**SourceId**

The data set ID of the owned data set corresponding to the entitled data set being viewed. This parameter is returned when a data set owner is viewing the entitled copy of its owned data set.

Type: String

Required: No

---

**See Also**

DataUpdateRequestDetails

Extra details specific to a data update type notification.

Contents

DataUpdatedAt

A datetime in the past when the data was updated. This typically means that the underlying resource supporting the data set was updated.

Type: Timestamp

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeprecationRequestDetails

Extra details specific to a deprecation type notification.

Contents

DeprecationAt

A datetime in the future when the data set will be deprecated.

Type: Timestamp

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Details

Information about the job error.

Contents

**ImportAssetFromSignedUrlJobErrorDetails**

Information about the job error.

Type: [ImportAssetFromSignedUrlJobErrorDetails](p. 136) object

Required: No

**ImportAssetsFromS3JobErrorDetails**

Details about the job error.

Type: Array of [AssetSourceEntry](p. 110) objects

Required: No

See Also

- [AWS SDK for Ruby V3](AWS SDK for Ruby V3)
Event

What occurs to start an action.

Contents

RevisionPublished

What occurs to start the revision publish action.

Type: RevisionPublished (p. 172) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
EventActionEntry

An event action is an object that defines the relationship between a specific event and an automated action that will be taken on behalf of the customer.

Contents

Action

What occurs after a certain event.
Type: Action (p. 103) object
Required: Yes

Arn

The Amazon Resource Name (ARN) for the event action.
Type: String
Required: Yes

CreatedAt

The date and time that the event action was created, in ISO 8601 format.
Type: Timestamp
Required: Yes

Event

What occurs to start an action.
Type: Event (p. 122) object
Required: Yes

Id

The unique identifier for the event action.
Type: String
Required: Yes

UpdatedAt

The date and time that the event action was last updated, in ISO 8601 format.
Type: Timestamp
Required: Yes

See Also

ExportAssetsToS3RequestDetails

Details of the operation to be performed by the job.

Contents

AssetDestinations

The destination for the asset.

Type: Array of AssetDestinationEntry (p. 106) objects

Required: Yes

DataSetId

The unique identifier for the data set associated with this export job.

Type: String

Required: Yes

RevisionId

The unique identifier for the revision associated with this export request.

Type: String

Required: Yes

Encryption

Encryption configuration for the export job.

Type: ExportServerSideEncryption (p. 131) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ExportAssetsToS3ResponseDetails

Details about the export to Amazon S3 response.

Contents

AssetDestinations

The destination in Amazon S3 where the asset is exported.

Type: Array of AssetDestinationEntry (p. 106) objects

Required: Yes

DataSetId

The unique identifier for the data set associated with this export job.

Type: String

Required: Yes

RevisionId

The unique identifier for the revision associated with this export response.

Type: String

Required: Yes

Encryption

Encryption configuration of the export job.

Type: ExportServerSideEncryption (p. 131) object

Required: No

See Also

ExportAssetToSignedUrlRequestDetails

Details of the operation to be performed by the job.

Contents

AssetId

The unique identifier for the asset that is exported to a signed URL.

Type: String
Required: Yes

DataSetId

The unique identifier for the data set associated with this export job.

Type: String
Required: Yes

RevisionId

The unique identifier for the revision associated with this export request.

Type: String
Required: Yes

See Also

ExportAssetToSignedUrlResponseDetails

The details of the export to signed URL response.

Contents

**AssetId**

The unique identifier for the asset associated with this export job.

Type: String

Required: Yes

**DataSetId**

The unique identifier for the data set associated with this export job.

Type: String

Required: Yes

**RevisionId**

The unique identifier for the revision associated with this export response.

Type: String

Required: Yes

**SignedUrl**

The signed URL for the export request.

Type: String

Required: No

**SignedUrlExpiresAt**

The date and time that the signed URL expires, in ISO 8601 format.

Type: Timestamp

Required: No

See Also

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
ExportRevisionsToS3RequestDetails

Details of the operation to be performed by the job.

Contents

DataSetId

The unique identifier for the data set associated with this export job.

Type: String

Required: Yes

RevisionDestinations

The destination for the revision.

Type: Array of RevisionDestinationEntry (p. 169) objects

Required: Yes

Encryption

Encryption configuration for the export job.

Type: ExportServerSideEncryption (p. 131) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ExportRevisionsToS3ResponseDetails

Details about the export revisions to Amazon S3 response.

Contents

DataSetId

The unique identifier for the data set associated with this export job.

Type: String

Required: Yes

RevisionDestinations

The destination in Amazon S3 where the revision is exported.

Type: Array of RevisionDestinationEntry (p. 169) objects

Required: Yes

Encryption

Encryption configuration of the export job.

Type: ExportServerSideEncryption (p. 131) object

Required: No

EventActionArn

The Amazon Resource Name (ARN) of the event action.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ExportServerSideEncryption

Encryption configuration of the export job. Includes the encryption type in addition to the AWS KMS key. The KMS key is only necessary if you chose the KMS encryption type.

Contents

Type

The type of server side encryption used for encrypting the objects in Amazon S3.

Type: String

Valid Values: aws:kms | AES256

Required: Yes

KmsKeyArn

The Amazon Resource Name (ARN) of the AWS KMS key you want to use to encrypt the Amazon S3 objects. This parameter is required if you choose aws:kms as an encryption type.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportAssetFromApiGatewayApiRequestDetails

The request details.

Contents

ApiId

The API Gateway API ID.

Type: String

Required: Yes

ApiName

The API name.

Type: String

Required: Yes

ApiSpecificationMd5Hash

The Base64-encoded MD5 hash of the OpenAPI 3.0 JSON API specification file. It is used to ensure the integrity of the file.

Type: String

Pattern: (? : [A-Za-z0-9+/]{4} ){4} *(?: [A-Za-z0-9+/]{2} == | [A-Za-z0-9+/]{3} = )?

Required: Yes

DataSetId

The data set ID.

Type: String

Required: Yes

ProtocolType

The protocol type.

Type: String

Valid Values: REST

Required: Yes

RevisionId

The revision ID.

Type: String

Required: Yes

Stage

The API stage.
**Type**: String

**Required**: Yes

**ApiDescription**

The API description. Markdown supported.

**Type**: String

**Required**: No

**ApiKey**

The API Gateway API key.

**Type**: String

**Required**: No

---

**See Also**

ImportAssetFromApiGatewayApiResponseDetails

The response details.

Contents

ApiId
The API ID.
Type: String
Required: Yes

ApiName
The API name.
Type: String
Required: Yes

ApiSpecificationMd5Hash
The Base64-encoded Md5 hash for the API asset, used to ensure the integrity of the API at that location.
Type: String
Pattern: (?:[A-Za-z0-9+/-]{4})*(?:[A-Za-z0-9+/-]{2}==|[A-Za-z0-9+/-]{3}=)?
Required: Yes

ApiSpecificationUploadUrl
The upload URL of the API specification.
Type: String
Required: Yes

ApiSpecificationUploadUrlExpiresAt
The date and time that the upload URL expires, in ISO 8601 format.
Type: Timestamp
Required: Yes

DataSetId
The data set ID.
Type: String
Required: Yes

ProtocolType
The protocol type.
Type: String
Valid Values: REST
Required: Yes

**RevisionId**
The revision ID.
Type: String
Required: Yes

**Stage**
The API stage.
Type: String
Required: Yes

**ApiDescription**
The API description.
Type: String
Required: No

**ApiKey**
The API key.
Type: String
Required: No

ImportAssetFromSignedUrlJobErrorDetails

Details about the job error.

Contents

AssetName

Details about the job error.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportAssetFromSignedUrlRequestDetails

Details of the operation to be performed by the job.

Contents

AssetName

The name of the asset. When importing from Amazon S3, the Amazon S3 object key is used as the asset name.

Type: String

Required: Yes

DataSetId

The unique identifier for the data set associated with this import job.

Type: String

Required: Yes

Md5Hash

The Base64-encoded Md5 hash for the asset, used to ensure the integrity of the file at that location.

Type: String

Pattern: (?:[A-Za-z0-9+/-]{4})*(?:[A-Za-z0-9+/-]{2}==|[A-Za-z0-9+/-]{3}=)?

Required: Yes

RevisionId

The unique identifier for the revision associated with this import request.

Type: String

Required: Yes

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportAssetFromSignedUrlResponseDetails

The details in the response for an import request, including the signed URL and other information.

Contents

**AssetName**

The name for the asset associated with this import job.

Type: String

Required: Yes

**DataSetId**

The unique identifier for the data set associated with this import job.

Type: String

Required: Yes

**RevisionId**

The unique identifier for the revision associated with this import response.

Type: String

Required: Yes

**Md5Hash**

The Base64-encoded Md5 hash for the asset, used to ensure the integrity of the file at that location.

Type: String

Pattern: (?: [A-Za-z0-9+/]{4})* (?: [A-Za-z0-9+/]{2}==| [A-Za-z0-9+/]{3}=)?

Required: No

**SignedUrl**

The signed URL.

Type: String

Required: No

**SignedUrlExpiresAt**

The time and date at which the signed URL expires, in ISO 8601 format.

Type: Timestamp

Required: No

See Also

ImportAssetsFromLakeFormationTagPolicyRequestDetails

Details about the assets imported from an AWS Lake Formation tag policy request.

Contents

**CatalogId**

The identifier for the AWS Glue Data Catalog.

Type: String

Length Constraints: Fixed length of 12.

Pattern: .*/^[\d]{12}$/.

Required: Yes

**DataSetId**

The unique identifier for the data set associated with this import job.

Type: String

Required: Yes

**RevisionId**

The unique identifier for the revision associated with this import job.

Type: String

Required: Yes

**RoleArn**

The IAM role's ARN that allows AWS Data Exchange to assume the role and grant and revoke permissions of subscribers to AWS Lake Formation data permissions.

Type: String

Pattern: arn:aws:iam::(\d{12}):role\./.

Required: Yes

**Database**

A structure for the database object.

Type: `DatabaseLFTagPolicyAndPermissions (p. 116)` object

Required: No

**Table**

A structure for the table object.

Type: `TableLFTagPolicyAndPermissions (p. 182)` object

Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Details from an import AWS Lake Formation tag policy job response.

## Contents

### CatalogId

The identifier for the AWS Glue Data Catalog.

Type: String

Length Constraints: Fixed length of 12.

Pattern: .*/^[\d]{12}$/.*

Required: Yes

### DataSetId

The unique identifier for the data set associated with this import job.

Type: String

Required: Yes

### RevisionId

The unique identifier for the revision associated with this import job.

Type: String

Required: Yes

### RoleArn

The IAM role's ARN that allows AWS Data Exchange to assume the role and grant and revoke permissions to AWS Lake Formation data permissions.

Type: String

Pattern: arn:aws:iam::(\d{12}):role\./.*

Required: Yes

### Database

A structure for the database object.

Type: [DatabaseLFTagPolicyAndPermissions (p. 116)](p. 116) object

Required: No

### Table

A structure for the table object.

Type: [TableLFTagPolicyAndPermissions (p. 182)](p. 182) object

Required: No

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportAssetsFromRedshiftDataSharesRequestDetails

Details from an import from Amazon Redshift datashare request.

Contents

AssetSources

A list of Amazon Redshift datashare assets.

Type: Array of RedshiftDataShareAssetSourceEntry (p. 162) objects

Required: Yes

DataSetId

The unique identifier for the data set associated with this import job.

Type: String

Required: Yes

RevisionId

The unique identifier for the revision associated with this import job.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportAssetsFromRedshiftDataSharesResponseDetails

Details from an import from Amazon Redshift datashare response.

Contents

AssetSources

A list of Amazon Redshift datashare asset sources.

Type: Array of RedshiftDataShareAssetSourceEntry (p. 162) objects

Required: Yes

DataSetId

The unique identifier for the data set associated with this import job.

Type: String

Required: Yes

RevisionId

The unique identifier for the revision associated with this import job.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportAssetsFromS3RequestDetails

Details of the operation to be performed by the job.

Contents

AssetSources

Is a list of Amazon S3 bucket and object key pairs.

Type: Array of AssetSourceEntry (p. 110) objects

Required: Yes

DataSetId

The unique identifier for the data set associated with this import job.

Type: String

Required: Yes

RevisionId

The unique identifier for the revision associated with this import request.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ImportAssetsFromS3ResponseDetails

Details from an import from Amazon S3 response.

Contents

AssetSources

Is a list of Amazon S3 bucket and object key pairs.

Type: Array of AssetSourceEntry (p. 110) objects

Required: Yes

DataSetId

The unique identifier for the data set associated with this import job.

Type: String

Required: Yes

RevisionId

The unique identifier for the revision associated with this import response.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
JobEntry

AWS Data Exchange Jobs are asynchronous import or export operations used to create or copy assets. A data set owner can both import and export as they see fit. Someone with an entitlement to a data set can only export. Jobs are deleted 90 days after they are created.

Contents

Arn

The ARN for the job.

Type: String

Required: Yes

CreatedAt

The date and time that the job was created, in ISO 8601 format.

Type: Timestamp

Required: Yes

Details

Details of the operation to be performed by the job, such as export destination details or import source details.

Type: ResponseDetails (p. 167) object

Required: Yes

Id

The unique identifier for the job.

Type: String

Required: Yes

State

The state of the job.

Type: String

Valid Values: WAITING | IN_PROGRESS | ERROR | COMPLETED | CANCELLED | TIMED_OUT

Required: Yes

Type

The job type.

Type: String

Valid Values: IMPORT_ASSETS_FROM_S3 | IMPORT_ASSET_FROM_SIGNED_URL
| EXPORT_ASSETS_TO_S3 | EXPORT_ASSET_TO_SIGNED_URL | EXPORT_REVISIONS_TO_S3 | IMPORT_ASSETS_FROM_REDSHIFT_DATA_SHARES | IMPORT_ASSET_FROM_API_GATEWAY_API | CREATE_S3_DATA_ACCESS_FROM_S3_BUCKET | IMPORT_ASSETS_FROM_LAKE_FORMATION_TAG_POLICY
**UpdatedAt**

The date and time that the job was last updated, in ISO 8601 format.

Type: Timestamp

Required: Yes

**Errors**

Errors for jobs.

Type: Array of [JobError (p. 150)](p. 150) objects

Required: No

---

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](aws-c-sdk)
- [AWS SDK for Go](aws-go-sdk)
- [AWS SDK for Java V2](aws-java-sdk)
- [AWS SDK for Ruby V3](aws-ruby-sdk)
JobError

An error that occurred with the job request.

Contents

Code

The code for the job error.

Type: String

Valid Values: ACCESS_DENIED_EXCEPTION | INTERNAL_SERVER_EXCEPTION | MALWARE_DETECTED | RESOURCE_NOT_FOUND_EXCEPTION | SERVICE_QUOTA_EXCEEDED_EXCEPTION | VALIDATION_EXCEPTION | MALWARE_SCAN_ENCRYPTED_FILE

Required: Yes

Message

The message related to the job error.

Type: String

Required: Yes

Details

The details about the job error.

Type: `Details (p. 121)` object

Required: No

LimitName

The name of the limit that was reached.

Type: String

Valid Values: Assets per revision | Asset size in GB | Amazon Redshift datashare assets per revision | AWS Lake Formation data permission assets per revision | Amazon S3 data access assets per revision

Required: No

LimitValue

The value of the exceeded limit.

Type: Double

Required: No

ResourceId

The unique identifier for the resource related to the error.

Type: String

Required: No
**ResourceType**

The type of resource related to the error.

Type: String

Valid Values: REVISION | ASSET | DATA_SET

Required: No

**See Also**

KmsKeyToGrant

The Amazon Resource Name (ARN) of the AWS KMS key used to encrypt the shared S3 objects.

Contents

KmsKeyArn

The AWS KMS CMK (Key Management System Customer Managed Key) used to encrypt S3 objects in the shared S3 Bucket. AWS Data exchange will create a KMS grant for each subscriber to allow them to access and decrypt their entitled data that is encrypted using this KMS key specified.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 2048.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LakeFormationDataPermissionAsset

The AWS Lake Formation data permission asset.

Contents

LakeFormationDataPermissionDetails

Details about the AWS Lake Formation data permission.

Type: LakeFormationDataPermissionDetails (p. 154) object

Required: Yes

LakeFormationDataPermissionType

The data permission type.

Type: String

Valid Values: LFTagPolicy

Required: Yes

Permissions

The permissions granted to the subscribers on the resource.

Type: Array of strings

Valid Values: DESCRIBE | SELECT

Required: Yes

RoleArn

The IAM role's ARN that allows AWS Data Exchange to assume the role and grant and revoke permissions to AWS Lake Formation data permissions.

Type: String

Pattern: arn:aws:iam::(\d{12}):role\/.+

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LakeFormationDataPermissionDetails

Details about the AWS Lake Formation data permission.

Contents

LFTagPolicy

Details about the LF-tag policy.

Type: LFTagPolicyDetails (p. 158) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LakeFormationTagPolicyDetails

Extra details specific to the affected scope in this LF data set.

Contents

Database

The underlying Glue database that the notification is referring to.

Type: String
Required: No

Table

The underlying Glue table that the notification is referring to.

Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LFResourceDetails

Details about the AWS Lake Formation resource (Table or Database) included in the AWS Lake Formation data permission.

Contents

Database

Details about the database resource included in the AWS Lake Formation data permission.

Type: DatabaseLFTagPolicy (p. 115) object

Required: No

Table

Details about the table resource included in the AWS Lake Formation data permission.

Type: TableLFTagPolicy (p. 181) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
LFTag

A structure that allows an LF-admin to grant permissions on certain conditions.

Contents

TagKey

The key name for the LF-tag.

Type: String

Required: Yes

TagValues

A list of LF-tag values.

Type: Array of strings

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
LFTagPolicyDetails

Details about the LF-tag policy.

Contents

CatalogId

The identifier for the AWS Glue Data Catalog.

Type: String

Length Constraints: Fixed length of 12.

Pattern: */^[\d]{12}$/

Required: Yes

ResourceDetails

Details for the Lake Formation Resources included in the LF-tag policy.

Type: LFRsourceDetails (p. 156) object

Required: Yes

ResourceType

The resource type for which the LF-tag policy applies.

Type: String

Valid Values: TABLE | DATABASE

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NotificationDetails

Extra details specific to this notification.

Contents

DataUpdate

Extra details specific to a data update type notification.

Type: DataUpdateRequestDetails (p. 119) object

Required: No

Deprecation

Extra details specific to a deprecation type notification.

Type: DeprecationRequestDetails (p. 120) object

Required: No

SchemaChange

Extra details specific to a schema change type notification.

Type: SchemaChangeRequestDetails (p. 179) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
OriginDetails

Details about the origin of the data set.

Contents

ProductId

The product ID of the origin of the data set.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RedshiftDataShareAsset

The Amazon Redshift datashare asset.

Contents

Arn

The Amazon Resource Name (ARN) of the datashare asset.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RedshiftDataShareAssetSourceEntry

The source of the Amazon Redshift datashare asset.

Contents

DataShareArn

The Amazon Resource Name (ARN) of the datashare asset.

Type: String

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RedshiftDataShareDetails

Extra details specific to the affected scope in this Redshift data set.

Contents

Arn
The ARN of the underlying Redshift data share that is being affected by this notification.
Type: String
Required: Yes

Database
The database name in the Redshift data share that is being affected by this notification.
Type: String
Required: Yes

Function
A function name in the Redshift database that is being affected by this notification.
Type: String
Required: No

Schema
A schema name in the Redshift database that is being affected by this notification.
Type: String
Required: No

Table
A table name in the Redshift database that is being affected by this notification.
Type: String
Required: No

View
A view name in the Redshift database that is being affected by this notification.
Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

RequestDetails

The details for the request.

Contents

CreateS3DataAccessFromS3Bucket

Details of the request to create S3 data access from the Amazon S3 bucket.

Type: CreateS3DataAccessFromS3BucketRequestDetails (p. 113) object

Required: No

ExportAssetsToS3

Details about the export to Amazon S3 request.

Type: ExportAssetsToS3RequestDetails (p. 125) object

Required: No

ExportAssetToSignedUrl

Details about the export to signed URL request.

Type: ExportAssetToSignedUrlRequestDetails (p. 127) object

Required: No

ExportRevisionsToS3

Details about the export to Amazon S3 request.

Type: ExportRevisionsToS3RequestDetails (p. 129) object

Required: No

ImportAssetFromApiGatewayApi

Details about the import from signed URL request.

Type: ImportAssetFromApiGatewayApiRequestDetails (p. 132) object

Required: No

ImportAssetFromSignedUrl

Details about the import from Amazon S3 request.

Type: ImportAssetFromSignedUrlRequestDetails (p. 137) object

Required: No

ImportAssetsFromLakeFormationTagPolicy

Request details for the ImportAssetsFromLakeFormationTagPolicy job.

Type: ImportAssetsFromLakeFormationTagPolicyRequestDetails (p. 140) object

Required: No

ImportAssetsFromRedshiftDataShares

Details from an import from Amazon Redshift datashare request.
Type: ImportAssetsFromRedshiftDataSharesRequestDetails (p. 144) object

Required: No

ImportAssetsFromS3

Details about the import asset from API Gateway API request.

Type: ImportAssetsFromS3RequestDetails (p. 146) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ResponseDetails

Details for the response.

Contents

CreateS3DataAccessFromS3Bucket
Response details from the CreateS3DataAccessFromS3Bucket job.
Type: CreateS3DataAccessFromS3BucketResponseDetails (p. 114) object
Required: No

ExportAssetsToS3
Details for the export to Amazon S3 response.
Type: ExportAssetsToS3ResponseDetails (p. 126) object
Required: No

ExportAssetToSignedUrl
Details for the export to signed URL response.
Type: ExportAssetToSignedUrlResponseDetails (p. 128) object
Required: No

ExportRevisionsToS3
Details for the export revisions to Amazon S3 response.
Type: ExportRevisionsToS3ResponseDetails (p. 130) object
Required: No

ImportAssetFromApiGatewayApi
The response details.
Type: ImportAssetFromApiGatewayApiResponseDetails (p. 134) object
Required: No

ImportAssetFromSignedUrl
Details for the import from signed URL response.
Type: ImportAssetFromSignedUrlResponseDetails (p. 138) object
Required: No

ImportAssetsFromLakeFormationTagPolicy
Response details from the ImportAssetsFromLakeFormationTagPolicy job.
Type: ImportAssetsFromLakeFormationTagPolicyResponseDetails (p. 142) object
Required: No

ImportAssetsFromRedshiftDataShares
Details from an import from Amazon Redshift datashare response.
Type: `ImportAssetsFromRedshiftDataSharesResponseDetails (p. 145)` object

Required: No

**ImportAssetsFromS3**

Details for the import from Amazon S3 response.

Type: `ImportAssetsFromS3ResponseDetails (p. 147)` object

Required: No

**See Also**

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
RevisionDestinationEntry

The destination where the assets in the revision will be exported.

Contents

Bucket

The Amazon S3 bucket that is the destination for the assets in the revision.

Type: String

Required: Yes

RevisionId

The unique identifier for the revision.

Type: String

Required: Yes

KeyPattern

A string representing the pattern for generated names of the individual assets in the revision. For more information about key patterns, see Key patterns when exporting revisions.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RevisionEntry

A revision is a container for one or more assets.

Contents

Arn
The ARN for the revision.
Type: String
Required: Yes

CreatedAt
The date and time that the revision was created, in ISO 8601 format.
Type: Timestamp
Required: Yes

DataSetId
The unique identifier for the data set associated with the data set revision.
Type: String
Required: Yes

Id
The unique identifier for the revision.
Type: String
Required: Yes

UpdatedAt
The date and time that the revision was last updated, in ISO 8601 format.
Type: Timestamp
Required: Yes

Comment
An optional comment about the revision.
Type: String
Length Constraints: Minimum length of 0. Maximum length of 16384.
Required: No

Finalized
To publish a revision to a data set in a product, the revision must first be finalized. Finalizing a revision tells AWS Data Exchange that your changes to the assets in the revision are complete. After it's in this read-only state, you can publish the revision to your products. Finalized revisions can be published through the AWS Data Exchange console or the AWS Marketplace Catalog API, using the StartChangeSet AWS Marketplace Catalog API action. When using the API, revisions are uniquely identified by their ARN.
Type: Boolean
Required: No

**RevocationComment**
A required comment to inform subscribers of the reason their access to the revision was revoked.

Type: String
Required: No

**Revoked**
A status indicating that subscribers' access to the revision was revoked.

Type: Boolean
Required: No

**RevokedAt**
The date and time that the revision was revoked, in ISO 8601 format.

Type: Timestamp
Required: No

**SourceId**
The revision ID of the owned revision corresponding to the entitled revision being viewed. This parameter is returned when a revision owner is viewing the entitled copy of its owned revision.

Type: String
Required: No

RevisionPublished

Information about the published revision.

Contents

**DataSetId**

The data set ID of the published revision.

Type: String

Required: Yes

S3DataAccessAsset

The Amazon S3 data access that is the asset.

Contents

Bucket

- The Amazon S3 bucket hosting data to be shared in the S3 data access.
  - Type: String
  - Required: Yes

KeyPrefixes

- The Amazon S3 bucket used for hosting shared data in the Amazon S3 data access.
  - Type: Array of strings
  - Required: No

Keys

- S3 keys made available using this asset.
  - Type: Array of strings
  - Required: No

KmsKeysToGrant

- List of AWS KMS CMKs (Key Management System Customer Managed Keys) and ARNs used to encrypt S3 objects being shared in this S3 Data Access asset. Providers must include all AWS KMS keys used to encrypt these shared S3 objects.
  - Type: Array of KmsKeyToGrant (p. 152) objects
  - Array Members: Minimum number of 1 item. Maximum number of 10 items.
  - Required: No

S3AccessPointAlias

- The automatically-generated bucket-style alias for your Amazon S3 Access Point. Customers can access their entitled data using the S3 Access Point alias.
  - Type: String
  - Required: No

S3AccessPointArn

- The ARN for your Amazon S3 Access Point. Customers can also access their entitled data using the S3 Access Point ARN.
  - Type: String
  - Required: No

See Also

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
S3DataAccessAssetSourceEntry

Source details for an Amazon S3 data access asset.

Contents

Bucket

The Amazon S3 bucket used for hosting shared data in the Amazon S3 data access.

Type: String

Required: Yes

KeyPrefixes

Organizes Amazon S3 asset key prefixes stored in an Amazon S3 bucket.

Type: Array of strings

Required: No

Keys

The keys used to create the Amazon S3 data access.

Type: Array of strings

Required: No

KmsKeysToGrant

List of AWS KMS CMKs (Key Management System Customer Managed Keys) and ARNs used to encrypt S3 objects being shared in this S3 Data Access asset.

Type: Array of KmsKeyToGrant (p. 152) objects

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
S3DataAccessDetails

Extra details specific to the affected scope in this S3 Data Access data set.

Contents

**KeyPrefixes**

A list of the key prefixes affected by this notification. This can have up to 50 entries.

Type: Array of strings

Required: No

**Keys**

A list of the keys affected by this notification. This can have up to 50 entries.

Type: Array of strings

Required: No

See Also

S3SnapshotAsset

The Amazon S3 object that is the asset.

Contents

Size

The size of the Amazon S3 object that is the object.

Type: Double

Required: Yes

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SchemaChangeDetails

Object encompassing information about a schema change to a single, particular field, a notification can have up to 100 of these.

Contents

Name

Name of the changing field. This value can be up to 255 characters long.
Type: String
Required: Yes

Type

Is the field being added, removed, or modified?
Type: String
Valid Values: ADD | REMOVE | MODIFY
Required: Yes

Description

Description of what's changing about this field. This value can be up to 512 characters long.
Type: String
Required: No

See Also

SchemaChangeRequestDetails

Extra details specific to this schema change type notification.

Contents

SchemaChangeAt

A date in the future when the schema change is taking effect.

Type: Timestamp
Required: Yes

Changes

List of schema changes happening in the scope of this notification. This can have up to 100 entries.

Type: Array of SchemaChangeDetails objects
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ScopeDetails

Details about the scope of the notifications such as the affected resources.

Contents

LakeFormationTagPolicies

Underlying LF resources that will be affected by this notification.

Type: Array of LakeFormationTagPolicyDetails (p. 155) objects

Required: No

RedshiftDataShares

Underlying Redshift resources that will be affected by this notification.

Type: Array of RedshiftDataShareDetails (p. 163) objects

Required: No

S3DataAccesses

Underlying S3 resources that will be affected by this notification.

Type: Array of S3DataAccessDetails (p. 176) objects

Required: No

See Also

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
TableLFTagPolicy

The LF-tag policy for a table resource.

Contents

Expression

A list of LF-tag conditions that apply to table resources.

Type: Array of LTag (p. 157) objects

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
TableLFTagPolicyAndPermissions

The LF-tag policy and permissions that apply to table resources.

Contents

Expression

A list of LF-tag conditions that apply to table resources.
Type: Array of LTag (p. 157) objects
Required: Yes

Permissions

The permissions granted to subscribers on table resources.
Type: Array of strings
Valid Values: DESCRIBE | SELECT
Required: Yes

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see Signing AWS API requests in the IAM User Guide.

Action
The action to be performed.
Type: string
Required: Yes

Version
The API version that the request is written for, expressed in the format YYYY-MM-DD.
Type: string
Required: Yes

X-Amz-Algorithm
The hash algorithm that you used to create the request signature.
Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.
Type: string
Valid Values: AWS4-HMAC-SHA256
Required: Conditional

X-Amz-Credential
The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string ("aws4_request"). The value is expressed in the following format: access_key/YYYYMMDD/region/service/aws4_request.
For more information, see Create a signed AWS API request in the IAM User Guide.
Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.
Type: string
Required: Conditional

X-Amz-Date
The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: 20120325T120000Z.
Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see Elements of an AWS API request signature in the IAM User Guide.
Type: string
Required: Conditional

**X-Amz-Security-Token**

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS STS, see [AWS services that work with IAM](https://docs.aws.amazon.com/iam/latest_USER_Guide/) in the [IAM User Guide](https://docs.aws.amazon.com/iam/latest_USER_Guide/).

Condition: If you're using temporary security credentials from AWS STS, you must include the security token.

Type: string
Required: Conditional

**X-Amz-Signature**

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string
Required: Conditional

**X-Amz-SignedHeaders**

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see [Create a signed AWS API request](https://docs.aws.amazon.com/iam/latest_USER_Guide/) in the [IAM User Guide](https://docs.aws.amazon.com/iam/latest_USER_Guide/).

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string
Required: Conditional
Common Errors

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

**AccessDeniedException**

You do not have sufficient access to perform this action.

HTTP Status Code: 400

**IncompleteSignature**

The request signature does not conform to AWS standards.

HTTP Status Code: 400

**InternalFailure**

The request processing has failed because of an unknown error, exception or failure.

HTTP Status Code: 500

**InvalidAction**

The action or operation requested is invalid. Verify that the action is typed correctly.

HTTP Status Code: 400

**InvalidClientTokenId**

The X.509 certificate or AWS access key ID provided does not exist in our records.

HTTP Status Code: 403

**NotAuthorized**

You do not have permission to perform this action.

HTTP Status Code: 400

**OptInRequired**

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

**RequestExpired**

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

**ServiceUnavailable**

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

**ThrottlingException**

The request was denied due to request throttling.
HTTP Status Code: 400

**ValidationError**

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
# Document history

The following table describes the documentation for this release of the *AWS Data Exchange API Reference*.

For notification about updates to this documentation, you can subscribe to the RSS feed. To subscribe to the RSS feed, you must have an RSS plug-in enabled for the browser you are using.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Documentation organization enhancements (p. 187)</strong></td>
<td>Documentation-only update to enhance the organization of the AWS Data Exchange API Reference Guide.</td>
<td>September 7, 2022</td>
</tr>
<tr>
<td><strong>Revoke Revision API operation (p. 187)</strong></td>
<td>Providers can now use the RevokeRevision API operation to revoke subscriber access to a revision.</td>
<td>March 15, 2022</td>
</tr>
<tr>
<td><strong>Send API Asset API operation and updates to Asset, Data Set, and Job API operations (p. 187)</strong></td>
<td>Providers can now use the CreateDataSet API operation to include a new AssetType: IMPORT_ASSET_FROM_API_GATEWAY_API, which adds API assets from Amazon API Gateway. This new job type, which affects the Job shape, comes with its own Details block that looks very similar to other Job types. Subscribers can now use the SendApiAsset API operation to invoke a provider's Amazon API Gateway API that they are entitled to.</td>
<td>November 29, 2021</td>
</tr>
<tr>
<td><strong>(Preview) Updates to Asset, Data Set, and Job API operations (p. 187)</strong></td>
<td>(Preview) Providers can now use the CreateDataSet API operation to include a new AssetType: REDSHIFT_DATA_SHARE, which affects the Data Set shape. Assets can now be Type REDSHIFT_DATA_SHARE, which only affects the Asset shape. There is a new AssetDetails object for this type, which points at the Amazon Redshift datashare ARN. Providers can now use the CreateJob API operation to run a new job type: IMPORT_ASSETS_FROM_REDSHIFT_DATA_SHARES, which adds assets from Amazon Redshift datashares. This new</td>
