What Is the AWS Deep Learning AMI?

Welcome to the User Guide for the AWS Deep Learning AMI.

The AWS Deep Learning AMI (DLAMI) is your one-stop shop for deep learning in the cloud. This customized machine image is available in most Amazon EC2 regions for a variety of instance types, from a small CPU-only instance to the latest high-powered multi-GPU instances. It comes preconfigured with NVIDIA CUDA and NVIDIA cuDNN, as well as the latest releases of the most popular deep learning frameworks.

About This Guide

This guide will help you launch and use the DLAMI. It covers several use cases that are common for deep learning, for both training and inference. Choosing the right AMI for your purpose and the kind of instances you may prefer is also covered. The DLAMI comes with several tutorials for each of the frameworks. It also has tutorials on distributed training, debugging, using AWS Inferentia and AWS Trainium, and other key concepts. You will find instructions on how to configure Jupyter to run the tutorials in your browser.

Prerequisites

You should be familiar with command line tools and basic Python to successfully run the DLAMI. Tutorials on how to use each framework are provided by the frameworks themselves, however, this guide can show you how to activate each one and find the appropriate tutorials to get started.

Example DLAMI Uses

Learning about deep learning: The DLAMI is a great choice for learning or teaching machine learning and deep learning frameworks. It takes the headache away from troubleshooting the installations of each framework and getting them to play along on the same computer. The DLAMI comes with a Jupyter notebook and makes it easy to run the tutorials provided by the frameworks for people new to machine learning and deep learning.

App development: If you're an app developer and are interested in using deep learning to make your apps utilize the latest advances in AI, the DLAMI is the perfect test bed for you. Each framework comes with tutorials on how to get started with deep learning, and many of them
have model zoos that make it easy to try out deep learning without having to create the neural networks yourself or to do any of the model training. Some examples show you how to build an image detection application in just a few minutes, or how to build a speech recognition app for your own chatbot.

**Machine learning and data analytics:** If you're a data scientist or interested in processing your data with deep learning, you'll find that many of the frameworks have support for R and Spark. You will find tutorials on how to do simple regressions, all the way up to building scalable data processing systems for personalization and predictions systems.

**Research:** If you're a researcher and want to try out a new framework, test out a new model, or train new models, the DLAMI and AWS capabilities for scale can alleviate the pain of tedious installations and management of multiple training nodes.

---

**Note**

While your initial choice might be to upgrade your instance type up to a larger instance with more GPUs (up to 8), you can also scale horizontally by creating a cluster of DLAMI instances. Check out [Related Information](#) for more information on cluster builds.

---

**Features of the DLAMI**

**Preinstalled Frameworks**

There are currently two primary flavors of the DLAMI with other variations related to the operating system (OS) and software versions:

- **Deep Learning AMI with Conda** - frameworks installed separately using conda packages and separate Python environments
- **Deep Learning Base AMI** - no frameworks installed; only **NVIDIA CUDA** and other dependencies

The Deep Learning AMI with Conda uses conda environments to isolate each framework, so you can switch between them at will and not worry about their dependencies conflicting.

This is the full list of supported frameworks by Deep Learning AMI with Conda:

- PyTorch
• TensorFlow 2

Note

We no longer support the MXnet, CNTK, Caffe, Caffe2, Theano, Chainer, or Keras in the AWS Deep Learning AMI.

Preinstalled GPU Software

Even if you use a CPU-only instance, the DLAMI will have NVIDIA CUDA and NVIDIA cuDNN. The installed software is the same regardless of the instance type. Keep in mind that GPU-specific tools only work on an instance that has at least one GPU. More information on this is covered in the Selecting the Instance Type for DLAMI.

For more information on CUDA Installation, see the CUDA Installations and Framework Bindings.

Model Serving and Visualization

Deep Learning AMI with Conda comes preinstalled with model servers for TensorFlow, as well as TensorBoard, for model visualizations.

• TensorFlow Serving
Getting Started

How to Get Started with the DLAMI

This guide includes tips about picking the DLAMI that's right for you, selecting an instance type that fits your use case and budget, and Related Information that describes custom setups that may be of interest.

If you're new to using AWS or using Amazon EC2, start with the Deep Learning AMI with Conda. If you're familiar with Amazon EC2 and other AWS services like Amazon EMR, Amazon EFS, or Amazon S3, and are interested in integrating those services for projects that need distributed training or inference, then check out Related Information to see if one fits your use case.

We recommend that you check out Choosing Your DLAMI to get an idea of which instance type might be best for your application.

Another option is this quick tutorial: Launch a AWS Deep Learning AMI (in 10 minutes).

Next Step

Choosing Your DLAMI

Choosing Your DLAMI

We offer a range of DLAMI options. To help you select the correct DLAMI for your use case, we group images by the hardware type or functionality for which they were developed. Our top level groupings are:

- **DLAMI Type**: CUDA versus Base versus Single-Framework versus Multi-Framework (Conda DLAMI)
- **Compute Architecture**: x86-based versus Arm64-based AWS Graviton
- **Processor Type**: GPU versus CPU versus Inferentia
- **SDK**: CUDA versus AWS Neuron
- **OS**: Amazon Linux versus Ubuntu

The rest of the topics in this guide help further inform you and go into more details.

Deep Learning AMI with Conda

CUDA Installations and Framework Bindings

While deep learning is all pretty cutting edge, each framework offers "stable" versions. These stable versions may not work with the latest CUDA or cuDNN implementation and features. Your use case and the features you require can help you choose a framework. If you are not sure, then use the latest Deep Learning AMI with Conda. It has official pip binaries for all frameworks with CUDA, using whichever most recent version is supported by each framework. If you want the latest versions, and to customize your deep learning environment, use the Deep Learning Base AMI.

Look at our guide on Stable Versus Release Candidates for further guidance.

Choose a DLAMI with CUDA

The Deep Learning Base AMI has all available CUDA version series

The Deep Learning AMI with Conda has all available CUDA version series

Note

We no longer include the MXNet, CNTK, Caffe, Caffe2, Theano, Chainer, or Keras Conda environments in the AWS Deep Learning AMI.

For specific framework version numbers, see the Release Notes for DLAMI

Choose this DLAMI type or learn more about the different DLAMIs with the Next Up option.

Choose one of the CUDA versions and review the full list of DLAMIs that have that version in the Appendix, or learn more about the different DLAMIs with the Next Up option.
Next Up

Deep Learning Base AMI

Related Topics

• For instructions on switching between CUDA versions, refer to the Using the Deep Learning Base AMI tutorial.

Deep Learning Base AMI

The Deep Learning Base AMI is like an empty canvas for deep learning. It comes with everything you need up until the point of the installation of a particular framework, and has your choice of CUDA versions.

Why to Choose the Base DLAMI

This AMI group is useful for project contributors who want to fork a deep learning project and build the latest. It's for someone who wants to roll their own environment with the confidence that the latest NVIDIA software is installed and working so they can focus on picking which frameworks and versions they want to install.

Choose this DLAMI type or learn more about the different DLAMIs with the Next Up option.

Next Up

DLAMI with Conda

Related Topics

• Using the Deep Learning Base AMI

Deep Learning AMI with Conda

The Conda DLAMI uses conda virtual environments, they are present either multi-framework or single framework DLAMIs. These environments are configured to keep the different framework installations separate and streamline switching between frameworks. This is great for learning and experimenting with all of the frameworks the DLAMI has to offer. Most users find that the new Deep Learning AMI with Conda is perfect for them.
They are updated often with the latest versions from the frameworks, and have the latest GPU drivers and software. They are generally referred to as the AWS Deep Learning AMI in most documents. These DLAMIs support Ubuntu20.04, Amazon Linux 2 Operating systems. Operating systems support depends on support from upstream OS.

**Stable Versus Release Candidates**

The Conda AMIs use optimized binaries of the most recent formal releases from each framework. Release candidates and experimental features are not to be expected. The optimizations depend on the framework's support for acceleration technologies like Intel's MKL DNN, which speeds up training and inference on C5 and C4 CPU instance types. The binaries are also compiled to support advanced Intel instruction sets including but not limited to AVX, AVX-2, SSE4.1, and SSE4.2. These accelerate vector and floating point operations on Intel CPU architectures. Additionally, for GPU instance types, the CUDA and cuDNN are updated with whichever version the latest official release supports.

The Deep Learning AMI with Conda automatically installs the most optimized version of the framework for your Amazon EC2 instance upon the framework's first activation. For more information, refer to [Using the Deep Learning AMI with Conda](#).

If you want to install from source, using custom or optimized build options, the Deep Learning Base AMIs might be a better option for you.

**Python 2 Deprecation**

The Python open source community has officially ended support for Python 2 on January 1, 2020. The TensorFlow and PyTorch community have announced that the TensorFlow 2.1 and PyTorch 1.4 releases are the last ones supporting Python 2. Previous releases of the DLAMI (v26, v25, etc) that contain Python 2 Conda environments continue to be available. However, we provide updates to the Python 2 Conda environments on previously published DLAMI versions only if there are security fixes published by the open-source community for those versions. DLAMI releases with the latest versions of the TensorFlow and PyTorch frameworks do not contain the Python 2 Conda environments.

**CUDA Support**

Specific CUDA version numbers can be found in the [GPU DLAMI release notes](#).

**Next Up**
Related Topics

- For a tutorial on using a Deep Learning AMI with Conda, see the Using the Deep Learning AMI with Conda tutorial.

DLAMI Architecture Options

AWS Deep Learning AMIs are offered with either x86-based or Arm64-based AWS Graviton2 architectures.

For information about getting started with the ARM64 GPU DLAMI, see The ARM64 DLAMI. For more details on available instance types, see Selecting the Instance Type for DLAMI.

Next Up

DLAMI Operating System Options

DLAMIs are offered in the following operating systems.

- Amazon Linux 2
- Ubuntu 20.04
- Ubuntu 22.04

Older versions of operating systems are available on deprecated DLAMIs. For more information on DLAMI deprecation, see Deprecations for DLAMI

Before choosing a DLAMI, assess what instance type you need and identify your AWS Region.

Next Up

Selecting the Instance Type for DLAMI

More generally, consider the following when selecting an instance type for a DLAMI.
• If you're new to deep learning, then an instance with a single GPU might suit your needs.

• If you're budget conscious, then you can use CPU-only instances.

• If you're looking to optimize high performance and cost efficiency for deep learning model inference, then you can use instances with AWS Inferentia chips.

• If you're looking for a high performance GPU instance with an Arm64-based CPU architecture, then you can use the G5g instance type.

• If you're interested in running a pretrained model for inference and predictions, then you can attach an Amazon Elastic Inference to your Amazon EC2 instance. Amazon Elastic Inference gives you access to an accelerator with a fraction of a GPU.

• For high-volume inference services, a single CPU instance with a lot of memory, or a cluster of such instances, might be a better solution.

• If you're using a large model with a lot of data or a high batch size, then you need a larger instance with more memory. You can also distribute your model to a cluster of GPUs. You may find that using an instance with less memory is a better solution for you if you decrease your batch size. This may impact your accuracy and training speed.

• If you're interested in running machine learning applications using NVIDIA Collective Communications Library (NCCL) requiring high levels of inter-node communications at scale, you might want to use Elastic Fabric Adapter (EFA).

For more detail on instances, see EC2 Instance Types.

The following topics provide information about instance type considerations.

⚠️ **Important**

The Deep Learning AMIs include drivers, software, or toolkits developed, owned, or provided by NVIDIA Corporation. You agree to use these NVIDIA drivers, software, or toolkits only on Amazon EC2 instances that include NVIDIA hardware.

**Topics**

• Pricing for the DLAMI

• DLAMI Region Availability

• Recommended GPU Instances
Recommended CPU Instances
Recommended Inferentia Instances
Recommended Trainium Instances

Pricing for the DLAMI

The deep learning frameworks included in the DLAMI are free, and each has its own open-source licenses. Although the software included in the DLAMI is free, you still have to pay for the underlying Amazon EC2 instance hardware.

Some Amazon EC2 instance types are labeled as free. It is possible to run the DLAMI on one of these free instances. This means that using the DLAMI is entirely free when you only use that instance's capacity. If you need a more powerful instance with more CPU cores, more disk space, more RAM, or one or more GPUs, then you need an instance that is not in the free-tier instance class.

For more information about instance selection and pricing, see Amazon EC2 pricing.

DLAMI Region Availability

Each Region supports a different range of instance types and often an instance type has a slightly different cost in different Regions. DLAMIs are not available in every Region, but it is possible to copy DLAMIs to the Region of your choice. See Copying an AMI for more information. Note the Region selection list and be sure you pick a Region that's close to you or your customers. If you plan to use more than one DLAMI and potentially create a cluster, be sure to use the same Region for all of nodes in the cluster.

For a more info on Regions, visit EC2 Regions.

Next Up

Recommended GPU Instances

Recommended GPU Instances

We recommend a GPU instance for most deep learning purposes. Training new models is faster on a GPU instance than a CPU instance. You can scale sub-linearly when you have multi-GPU instances or if you use distributed training across many instances with GPUs.
The following instance types support the DLAMI. For information about GPU instance type options and their uses, see EC2 Instance Types and select Accelerated Computing.

⚠️ **Note**

The size of your model should be a factor in selecting an instance. If your model exceeds an instance's available RAM, select a different instance type with enough memory for your application.

- **Amazon EC2 P3 Instances** have up to 8 NVIDIA Tesla V100 GPUs.
- **Amazon EC2 P4 Instances** have up to 8 NVIDIA Tesla A100 GPUs.
- **Amazon EC2 P5 Instances** have up to 8 NVIDIA Tesla H100 GPUs.
- **Amazon EC2 G3 Instances** have up to 4 NVIDIA Tesla M60 GPUs.
- **Amazon EC2 G4 Instances** have up to 4 NVIDIA T4 GPUs.
- **Amazon EC2 G5 Instances** have up to 8 NVIDIA A10G GPUs.
- **Amazon EC2 G6 Instances** have up to 8 NVIDIA L4 GPUs.
- **Amazon EC2 G5g Instances** have Arm64-based AWS Graviton2 processors.

DLAMI instances provide tooling to monitor and optimize your GPU processes. For more information about monitoring your GPU processes, see GPU Monitoring and Optimization.

For specific tutorials on working with G5g instances, see The ARM64 DLAMI.

Next Up

Recommended CPU Instances

**Recommended CPU Instances**

Whether you're on a budget, learning about deep learning, or just want to run a prediction service, you have many affordable options in the CPU category. Some frameworks take advantage of Intel's MKL DNN, which speeds up training and inference on C5 (not available in all Regions) CPU instance types. For information about CPU instance types, see EC2 Instance Types and select Compute Optimized.
The size of your model should be a factor in selecting an instance. If your model exceeds an instance's available RAM, select a different instance type with enough memory for your application.

- **Amazon EC2 C5 Instances** have up to 72 Intel vCPUs. C5 instances excel at scientific modeling, batch processing, distributed analytics, high-performance computing (HPC), and machine and deep learning inference.

Next Up

Recommended Inferentia Instances

**Recommended Inferentia Instances**

AWS Inferentia instances are designed to provide high performance and cost efficiency for deep learning model inference workloads. Specifically, Inf2 instance types use AWS Inferentia chips and the AWS Neuron SDK, which is integrated with popular machine learning frameworks such as TensorFlow and PyTorch.

Customers can use Inf2 instances to run large scale machine learning inference applications such as search, recommendation engines, computer vision, speech recognition, natural language processing, personalization, and fraud detection, at the lowest cost in the cloud.

The size of your model should be a factor in selecting an instance. If your model exceeds an instance's available RAM, select a different instance type with enough memory for your application.

- **Amazon EC2 Inf2 Instances** have up to up to 16 AWS Inferentia chips and 100 Gbps of networking throughput.

For more information about getting started with AWS Inferentia DLAMIs, see [The AWS Inferentia Chip With DLAMI](https://aws.amazon.com/en_us/documentation/developer-guide/index.html#inferentia).
Recommended Trainium Instances

AWS Trainium instances are designed to provide high performance and cost efficiency for deep learning model inference workloads. Specifically, Trn1 instance types use AWS Trainium chips and the AWS Neuron SDK, which is integrated with popular machine learning frameworks such as TensorFlow and PyTorch.

Customers can use Trn1 instances to run large scale machine learning inference applications such as search, recommendation engines, computer vision, speech recognition, natural language processing, personalization, and fraud detection, at the lowest cost in the cloud.

Note

The size of your model should be a factor in selecting an instance. If your model exceeds an instance's available RAM, select a different instance type with enough memory for your application.

- Amazon EC2 Trn1 Instances have up to up to 16 AWS Trainium chips and 100 Gbps of networking throughput.
Framework Support Policy

AWS Deep Learning AMIs (DLAMIs) simplify image configuration for deep learning workloads and are optimized with the latest frameworks, hardware, drivers, libraries, and operating systems. This page details the framework support policy for DLAMIs. For a list of available DLAMIs, see Release Notes for DLAMI.

Supported Frameworks

Reference the following AWS Deep Learning AMI Framework Support Policy table to check which frameworks and versions are actively supported.

Refer to End of patch to check how long AWS supports current versions that are actively supported by the origin framework’s maintenance team. Frameworks and versions are available in single-framework DLAMIs, or multi-framework DLAMIs.

Note

In the framework version x.y.z, x refers to the major version, y refers to the minor version, and z refers to the patch version. For example, for TensorFlow 2.6.5, the major version is 2, the minor version is 6, and the patch version is 5.

Refer to the release notes for more details on specific images:

- Single-framework DLAMI release notes
- Multi-framework DLAMI release notes

Frequently Asked Questions

- What framework versions get security patches?
- What images does AWS publish when new framework versions are released?
- What images get new SageMaker/AWS features?
- How is current version defined in the Supported Frameworks table?
- What if I am running a version that is not in the Supported Frameworks table?
• Do DLAMIs support previous versions of TensorFlow?
• How can I find the latest patched image for a supported framework version?
• How frequently are new images released?
• Will my instance be patched in place while my workload is running?
• What happens when a new patched or updated framework version is available?
• Are dependencies updated without changing the framework version?
• When does active support for my framework version end?
• Will images with framework versions that are no longer actively maintained be patched?
• How do I use an older framework version?
• How do I stay up-to-date with support changes in frameworks and their versions?
• Do I need a commercial license to use the Anaconda Repository?

What framework versions get security patches?

If the framework version is labeled Supported in the AWS Deep Learning AMI Framework Support Policy table, it gets security patches.

What images does AWS publish when new framework versions are released?

We publish new DLAMIs soon after new versions of TensorFlow and PyTorch are released. This includes major versions, major-minor versions, and major-minor-patch versions of frameworks. We also update images when new versions of drivers and libraries become available. For more information on image maintenance, see When does active support for my framework version end?

What images get new SageMaker/AWS features?

New features typically release in the latest version of DLAMIs for PyTorch and TensorFlow. Refer to the release notes for a specific image for details on new SageMaker or AWS features. For a list of available DLAMIs, see Release Notes for DLAMI. For more information on image maintenance, see When does active support for my framework version end?

How is current version defined in the Supported Frameworks table?

The current version in the AWS Deep Learning AMI Framework Support Policy table refers to the newest framework version that AWS makes available on GitHub. Each latest release includes
updates to the drivers, libraries, and relevant packages in the DLAMI. For information on image maintenance, see [When does active support for my framework version end?](#)

**What if I am running a version that is not in the Supported Frameworks table?**

If you are running a version that is not in the [AWS Deep Learning AMI Framework Support Policy table](#), you may not have the most updated drivers, libraries, and relevant packages. For a more up-to-date version, we recommend that you upgrade to one of the supported frameworks available using the latest DLAMI of your choice. For a list of available DLAMIs, see [Release Notes for DLAMI](#).

**Do DLAMIs support previous versions of TensorFlow?**

No. We support the latest patch version of each framework’s latest major version released 365 days from its initial GitHub release as stated in the [AWS Deep Learning AMI Framework Support Policy table](#). For more information, see [What if I am running a version that is not in the Supported Frameworks table?](#)

**How can I find the latest patched image for a supported framework version?**

To use a DLAMI with the latest framework version, retrieve the [DLAMI ID](#) and use it to launch the DLAMI using the [EC2 Console](#). For sample AWS CLI commands to retrieve the AWS Deep Learning AMI ID, refer to the [Deep Learning Frameworks](#) section in the [AWS Deep Learning AMI Catalog](#). AWS CLI AMI ID queries are also included in the single-framework DLAMI release notes. The framework version that you choose must be labeled [Supported](#) in the [AWS Deep Learning AMI Framework Support Policy table](#).

**How frequently are new images released?**

Providing updated patch versions is our highest priority. We routinely create patched images at the earliest opportunity. We monitor for newly patched framework versions (ex. TensorFlow 2.9 to TensorFlow 2.9.1) and new minor release versions (ex. TensorFlow 2.9 to TensorFlow 2.10) and make them available at the earliest opportunity. When an existing version of TensorFlow is released with a new version of CUDA, we release a new DLAMI for that version of TensorFlow with support for the new CUDA version.
Will my instance be patched in place while my workload is running?

No. Patch updates for DLAMI are not “in-place” updates.

You must turn on a new EC2 instance, migrate your workloads and scripts, and then turn off your previous instance.

What happens when a new patched or updated framework version is available?

Regularly check the release notes page for your image. We encourage you to upgrade to new patched or updated frameworks when they are available. For a list of available DLAMIs, see Release Notes for DLAMI.

Are dependencies updated without changing the framework version?

We update dependencies without changing the framework version. However, if a dependency update causes an incompatibility, we create an image with a different version. Be sure to check the Release Notes for DLAMI for updated dependency information.

When does active support for my framework version end?

DLAMI images are immutable. Once they are created they do not change. There are four main reasons why active support for a framework version ends:

- Framework version (patch) upgrades
- AWS security patches
- End of patch date (Aging out)
- Dependency end-of-support

Note

Due to the frequency of version patch upgrades and security patches, we recommend checking the release notes page for your DLAMI often, and upgrading when changes are made.
Framework version (patch) upgrades

If you have a DLAMI workload based on TensorFlow 2.7.0 and TensorFlow releases version 2.7.1 on GitHub, then AWS releases a new DLAMI with TensorFlow 2.7.1. The previous images with 2.7.0 are no longer actively maintained once the new image with TensorFlow 2.7.1 is released. The DLAMI with TensorFlow 2.7.0 does not receive further patches. The DLAMI release notes page for TensorFlow 2.7 is then updated with the latest information. There is no individual release note page for each minor patch.

New DLAMIs created due to patch upgrades are designated with a new AMI ID.

AWS security patches

If you have a workload based on an image with TensorFlow 2.7.0 and AWS makes a security patch, then a new version of the DLAMI is released for TensorFlow 2.7.0. The previous version of the images with TensorFlow 2.7.0 is no longer actively maintained. For more information, see Will my instance be patched in place while my workload is running? For steps on finding the latest DLAMI, see How can I find the latest patched image for a supported framework version?

New DLAMIs created due to patch upgrades are designated with a new AMI ID.

End of patch date (Aging out)

DLAMIs hit their end of patch date 365 days after the GitHub release date.

For multi-framework DLAMIs, when one of the framework versions is updated, a new DLAMI with the updated version is required. The DLAMI with the old framework version is no longer actively maintained.

⚠️ Important

We make an exception when there is a major framework update. For example, if TensorFlow 1.15 updates to TensorFlow 2.0, then we continue to support the most recent version of TensorFlow 1.15 for a period of two years from the date of the GitHub release or six months after the origin framework maintenance team drops support, whichever date is earlier.
Dependency end-of-support

If you are running a workload on a TensorFlow 2.7.0 DLAMI image with Python 3.6 and that version of Python is marked for end-of-support, then all DLAMI images based on Python 3.6 will no longer be actively maintained. Similarly, if an OS version like Ubuntu 16.04 is marked for end-of-support, then all DLAMI images that are dependent on Ubuntu 16.04 will no longer be actively maintained.

Will images with framework versions that are no longer actively maintained be patched?

No. Images that are no longer actively maintained will not have new releases.

How do I use an older framework version?

To use a DLAMI with an older framework version, retrieve the DLAMI ID and use it to launch the DLAMI using the EC2 Console. For AWS CLI commands to retrieve the AMI ID, refer to the Deep Learning Frameworks section in the AWS Deep Learning AMI Catalog. AWS CLI AMI ID queries are also included in the single-framework DLAMI release notes.

How do I stay up-to-date with support changes in frameworks and their versions?

Stay up-to-date with DLAMI frameworks and versions using the AWS Deep Learning AMI Framework Support Policy table, the DLAMI release notes.

Do I need a commercial license to use the Anaconda Repository?

Anaconda shifted to a commercial licensing model for certain users. Actively maintained DLAMIs have been migrated to the publicly available open-source version of Conda (conda-forge) from the Anaconda channel.
Launching and Configuring a DLAMI

If you're here you should already have a good idea of which AMI you want to launch. If not, find a DLAMI and its related hardware, frameworks, and ID retrieval in the Release Notes for DLAMI.

You should also know which instance type and region you're going to choose. If not, browse Selecting the Instance Type for DLAMI.

ℹ️ Note

We will use p3.16xlarge as the default instance type in the examples. Just replace this with whichever instance type you have in mind.

⚠️ Important

If you plan to use Elastic Inference, you have Elastic Inference Setup that must be completed prior to launching your DLAMI.

Topics

- Step 1: Launch a DLAMI
- Step 2: Connect to the DLAMI
- Step 3: Test Your DLAMI
- Step 4: Manage Your DLAMI Instance
- Clean Up
- Set up a Jupyter Notebook Server

Step 1: Launch a DLAMI

ℹ️ Note

For this walkthrough, we might make references specific to the Deep Learning AMI (Ubuntu 18.04). Even if you select a different DLAMI, you should be able to follow this guide.
1. **Find the ID of your DLAMI**

2. **Launch an Amazon EC2 instance from your DLAMI**

   You will use the Amazon EC2 Console. Follow the instructions detailed in [Launch from Amazon EC2 Console](#).

   **Tip**

   *CLI Option:* If you choose to spin up a DLAMI using the AWS CLI, you will need the AMI's ID, the region and instance type, and your security token information. Be sure you have your AMI and instance IDs ready. If you haven't set up the AWS CLI yet, do that first using the guide for [Installing the AWS Command Line Interface](#).

3. After you have completed the steps of one of those options, wait for the instance to be ready. This usually takes only a few minutes. You can verify the status of the instance in the [EC2 Console](#).

### Retrieve the DLAMI ID

Each AMI possesses a unique identifier (ID). You can query the ID for the DLAMI of your choice with the AWS Command Line Interface (AWS CLI). If you do not already have the AWS CLI installed, see [Getting started with the AWS CLI](#).

**Note**

*Reminder:* You can find all DLAMIs and their related processor/accelerator, operating system, compute architecture, recommended Amazon EC2 instance families, support status, and ID retrieval queries, in the [AWS Deep Learning AMI Catalog](#). See also the DLAMI release notes in [Release Notes for DLAMI](#) for additional informations (drivers, python versions, Amazon EBS type).

1. Make sure that your AWS credentials are configured.

   ```
   aws configure
   ```

2. Use the following command to retrieve the ID of your DLAMI or find the query provided in the AWS Deep Learning AMI Catalog.
aws ec2 describe-images --region us-east-1 --owners amazon
--filters 'Name=name,Values=Deep Learning AMI (Ubuntu 18.04) Version ??.?'
  'Name=state,Values=available'
--query 'reverse(sort_by(Images, &CreationDate))[:1].ImageId' --output text

Note
You can specify a release version for a given framework or get the latest release by replacing the version number with a question mark.

3. The output should look similar to the following:

ami-094c089c38ed069f2

Copy this DLAMI ID and press q to exit the prompt.

Next Step

Launch from Amazon EC2 Console

Launch from Amazon EC2 Console

Note
To launch an instance with Elastic Fabric Adapter (EFA), refer to these steps.

1. Open the EC2 Console.

2. Note your current region in the top-most navigation. If this isn't your desired AWS Region, change this option before proceeding. For more information, see EC2 Regions.

3. Choose Launch Instance.

4. Enter a name for your instance and select the DLAMI that is right for you.
   a. Find an existing DLAMI in My AMIs or choose Quick Start.
   b. Search by DLAMI ID. Browse the options then select your choice.
5. Choose an instance type. You can find the recommended instance families for your DLAMI in the AWS Deep Learning AMI Catalog. For general recommendations on DLAMI instance types, see Instance Selection.

   **Note**
   If you want to use Elastic Inference (EI), click Configure Instance Details, select Add an Amazon EI accelerator, then select the size of the Amazon EI accelerator.

6. Choose Launch Instance.

   **Tip**
   Check out Get Started with Deep Learning Using the AWS Deep Learning AMI for a walkthrough with screenshots.

Next Step

**Step 2: Connect to the DLAMI**

Connect to the DLAMI that you launched from a client (Windows, MacOS, or Linux). For more information, see Connect to Your Linux Instance in the Amazon EC2 User Guide.

Keep a copy of the SSH login command handy if you want to do the Jupyter setup after logging in. You will use a variation of it to connect to the Jupyter webpage.

Next Step

**Step 3: Test Your DLAMI**

Depending on your DLAMI version, you have different testing options:

- Deep Learning AMI with Conda – go to Using the Deep Learning AMI with Conda.
- Deep Learning Base AMI – refer to your desired framework's installation documentation.
You can also create a Jupyter notebook, try out tutorials, or start coding in Python. For more information, see Set up a Jupyter Notebook Server.

**Step 4: Manage Your DLAMI Instance**

Always keep your operating system and other installed software up to date by applying patches and updates as soon as they become available.

If you are using Amazon Linux or Ubuntu, when you login to your DLAMI, you are notified if updates are available and see instructions for updating. For further information on Amazon Linux maintenance, see Updating Instance Software. For Ubuntu instances, refer to the official Ubuntu documentation.

On Windows, check Windows Update regularly for software and security updates. If you prefer, have updates applied automatically.

⚠️ **Important**

For information about the Meltdown and Spectre vulnerabilities and how to patch your operating system to address them, see Security Bulletin AWS-2018-013.

**Clean Up**

When you no longer need the DLAMI, you can stop it or terminate it to avoid incurring continuing charges. Stopping an instance will keep it around so you can resume it later. Your configurations, files, and other non-volatile information is being stored in a volume on Amazon S3. You will be charged the small S3 fee to retain the volume while the instance is stopped, but you will no longer be charged for the compute resources while it is in the stopped state. When your start the instance again, it will mount that volume and your data will be there. If you terminate an instance, it is gone, and you cannot start it again. Your data actually still resides on S3, so to prevent any further charges you need to delete the volume as well. For more instructions, see Terminate Your Instance in the Amazon EC2 User Guide.

**Set up a Jupyter Notebook Server**

A Jupyter notebook server enables you to create and run Jupyter notebooks from your DLAMI instance. With Jupyter notebooks, you can conduct machine learning (ML) experiments for training
and inference while using the AWS infrastructure and accessing packages built into the DLAMI. For more information about Jupyter notebooks, see the Jupyter Notebook documentation.

To set up a Jupyter notebook server, you must:

- Configure the Jupyter notebook server on your Amazon EC2 DLAMI instance.
- Configure your client so that you can connect to the Jupyter notebook server. We provide configuration instructions for Windows, macOS, and Linux clients.
- Test the setup by logging in to the Jupyter notebook server.

To complete the steps to set up a Jupyter, follow the instructions in the following topics. Once you've set up a Jupyter notebook server, see Running Jupyter Notebook Tutorials for information on running the example notebooks that ship in the DLAMI.

Topics

- Secure Your Jupyter Server
- Start the Jupyter notebook server
- Configure the Client to Connect to the Jupyter Server
- Test by Logging in to the Jupyter notebook server

Secure Your Jupyter Server

Here we set up Jupyter with SSL and a custom password.

Connect to the Amazon EC2 instance, and then complete the following procedure.

Configure the Jupyter server

1. Jupyter provides a password utility. Run the following command and enter your preferred password at the prompt.

```
$ jupyter notebook password
```

The output will look something like this:

```
Enter password:
Verify password:
```
2. Create a self-signed SSL certificate. Follow the prompts to fill out your locality as you see fit. You must enter . if you wish to leave a prompt blank. Your answers will not impact the functionality of the certificate.

```bash
$ cd ~
$ mkdir ssl
$ cd ssl
$ openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout mykey.key -out mycert.pem
```

---

**Note**

You might be interested in creating a regular SSL certificate that is third party signed and does not cause the browser to give you a security warning. This process is much more involved. Visit [Jupyter's documentation](https://jupyter.org) for more information.

---

**Next Step**

*Start the Jupyter notebook server*

**Start the Jupyter notebook server**

Now you can fire up the Jupyter server by logging in to the instance and running the following command that uses the SSL certificate you created in the previous step.

```bash
$ jupyter notebook --certfile=/~ssl/mycert.pem --keyfile=/~ssl/mykey.key
```

With the server started, you can now connect to it via an SSH tunnel from your client computer. When the server runs, you will see some output from Jupyter confirming that the server is running. At this point, ignore the callout that you can access the server via a localhost URL, because that won't work until you create the tunnel.
Next Step

Configure the Client to Connect to the Jupyter Server

Configure the Client to Connect to the Jupyter Server

After configuring your client to connect to the Jupyter notebook server, you can create and access notebooks on the server in your workspace and run your deep learning code on the server.

For configuration information, choose one of the following links.

Topics
• Configure a Windows Client
• Configure a Linux or macOS Client

Configure a Windows Client

Prepare

Be sure you have the following information, which you need to set up the SSH tunnel:

• The public DNS name of your Amazon EC2 instance. You can find the public DNS name in the EC2 console.
• The key pair for the private key file. For more information about accessing your key pair, see Amazon EC2 Key Pairs in the Amazon EC2 User Guide for Linux Instances.

Using Jupyter Notebooks from a Windows Client

Refer to these guides on connecting to your Amazon EC2 instance from a Windows client.

1. Troubleshooting Connecting to Your Instance
2. **Connecting to Your Linux Instance from Windows Using PuTTY**

To create a tunnel to a running Jupyter server, a recommended approach is to install Git Bash on your Windows client, then follow the Linux/macOS client instructions. However, you may use whatever approach you want for opening an SSH tunnel with port mapping. Refer to Jupyter's [documentation](https://jupyter.org) for further information.

**Next Step**

**Configure a Linux or macOS Client**

**Configure a Linux or macOS Client**

1. Open a terminal.

2. Run the following command to forward all requests on local port 8888 to port 8888 on your remote Amazon EC2 instance. Update the command by replacing the location of your key to access the Amazon EC2 instance and the public DNS name of your Amazon EC2 instance. Note, for an Amazon Linux AMI, the user name is `ec2-user` instead of `ubuntu`.

\[
\text{\$ ssh -i \~\/~mykeypair.pem -N -f -L 8888:localhost:8888 ubuntu@ec2-###-###-###.compute-1.amazonaws.com}
\]

This command opens a tunnel between your client and the remote Amazon EC2 instance that is running the Jupyter notebook server.

**Next Step**

**Test by Logging in to the Jupyter notebook server**

**Test by Logging in to the Jupyter notebook server**

Now you are ready to log in to the Jupyter notebook server.

*Your next step is to test the connection to the server through your browser.*

1. In the address bar of your browser, type the following URL, or click on this link: [https://localhost:8888](https://localhost:8888)

2. With a self signed SSL certificate, your browser will warn you and prompt you to avoid continuing to visit the website.
Since you set this up yourself, it is safe to continue. Depending your browser you will get an "advanced", "show details", or similar button.
Click on this, then click on the "proceed to localhost" link. If the connection is successful, you see the Jupyter notebook server webpage. At this point, you will be asked for the password you previously setup.

Now you have access to the Jupyter notebook server that is running on the DLAMI. You can create new notebooks or run the provided Tutorials.
Using a DLAMI

Topics

- Using the Deep Learning AMI with Conda

- Tutorials

The following sections describe how the Deep Learning AMI with Conda can be used to switch environments, run sample code from each of the frameworks, and run Jupyter so you can try out different notebook tutorials.

Using the Deep Learning AMI with Conda

Topics

- Introduction to the Deep Learning AMI with Conda
- Log in to Your DLAMI
- Start the TensorFlow Environment
- Switch to the PyTorch Python 3 Environment
- Removing Environments

Introduction to the Deep Learning AMI with Conda

Conda is an open source package management system and environment management system that runs on Windows, macOS, and Linux. Conda quickly installs, runs, and updates packages and their dependencies. Conda easily creates, saves, loads and switches between environments on your local computer.

The Deep Learning AMI with Conda has been configured for you to easily switch between deep learning environments. The following instructions guide you on some basic commands with conda. They also help you verify that the basic import of the framework is functioning, and that you can run a couple simple operations with the framework. You can then move on to more thorough
tutorials provided with the DLAMI or the frameworks' examples found on each frameworks' project site.

**Log in to Your DLAMI**

After you log in to your server, you will see a server "message of the day" (MOTD) describing various Conda commands that you can use to switch between the different deep learning frameworks. Below is an example MOTD. Your specific MOTD may vary as new versions of the DLAMI are released.

```
AMI Name: Deep Learning OSS Nvidia Driver AMI (Amazon Linux 2) Version 77
Supported EC2 instances: G4dn, G5, G6, Gr6, P4d, P4de, P5
  * To activate pre-built tensorflow environment, run: 'source activate tensorflow2_p310'
  * To activate pre-built pytorch environment, run: 'source activate pytorch_p310'
  * To activate pre-built python3 environment, run: 'source activate python3'

NVIDIA driver version: 535.161.08
CUDA versions available: cuda-11.7 cuda-11.8 cuda-12.0 cuda-12.1 cuda-12.2
Default CUDA version is 12.1

For a fully managed experience, check out Amazon SageMaker at https://aws.amazon.com/sagemaker
```

**Start the TensorFlow Environment**

**Note**

When you launch your first Conda environment, please be patient while it loads. The Deep Learning AMI with Conda automatically installs the most optimized version of the
1. Activate the TensorFlow virtual environment for Python 3.

   $ source activate tensorflow2_p310

2. Start the iPython terminal.

   (tensorflow2_p310)$ ipython

3. Run a quick TensorFlow program.

   ```python
   import tensorflow as tf
   hello = tf.constant('Hello, TensorFlow!')
   sess = tf.Session()
   print(sess.run(hello))
   ```

   You should see "Hello, Tensorflow!"

Next Up

Running Jupyter Notebook Tutorials

Switch to the PyTorch Python 3 Environment

If you're still in the iPython console, use quit(), then get ready to switch environments.

- Activate the PyTorch virtual environment for Python 3.

   $ source activate pytorch_p310

Test Some PyTorch Code

To test your installation, use Python to write PyTorch code that creates and prints an array.

1. Start the iPython terminal.
2. Import PyTorch.

```python
import torch
```

You might see a warning message about a third-party package. You can ignore it.

3. Create a 5x3 matrix with the elements initialized randomly. Print the array.

```python
x = torch.rand(5, 3)
print(x)
```

Verify the result.

```
tensor([[0.3105, 0.5983, 0.5410],
        [0.0234, 0.0934, 0.0371],
        [0.9740, 0.1439, 0.3107],
        [0.6461, 0.9035, 0.5715],
        [0.4401, 0.7990, 0.8913]])
```

Removing Environments

If you run out of space on the DLAMI, you can choose to uninstall Conda packages that you are not using:

```
conda env list
conda env remove --name <env_name>
```

Using the Deep Learning Base AMI

The Base AMI comes with a foundational platform of GPU drivers and acceleration libraries to deploy your own customized deep learning environment. By default the AMI is configured with any one NVIDIA CUDA version environment. You can also switch between different versions of CUDA. Refer to the following instructions for how to do this.
Configuring CUDA Versions

You can verify the CUDA version by running NVIDIA's `nvcc` program.

```
nvcc --version
```

You can select and verify a particular CUDA version with the following bash command:

```
sudo rm /usr/local/cuda
sudo ln -s /usr/local/cuda-12.0 /usr/local/cuda
```

For more information, see the Base DLAMI release notes.

Running Jupyter Notebook Tutorials

Tutorials and examples ship with each of the deep learning projects' source and in most cases they will run on any DLAMI. If you chose the Deep Learning AMI with Conda, you get the added benefit of a few hand-picked tutorials already set up and ready to try out.

⚠️ Important

To run the Jupyter notebook tutorials installed on the DLAMI, you will need to Set up a Jupyter Notebook Server.

Once the Jupyter server is running, you can run the tutorials through your web browser. If you are running the Deep Learning AMI with Conda or if you have set up Python environments, you can switch Python kernels from the Jupyter notebook interface. Select the appropriate kernel before trying to run a framework-specific tutorial. Further examples of this are provided for users of the Deep Learning AMI with Conda.

ℹ️ Note

Many tutorials require additional Python modules that may not be set up on your DLAMI. If you get an error like "xyz module not found", log in to the DLAMI, activate the environment as described above, then install the necessary modules.
Tip

Deep learning tutorials and examples often rely on one or more GPUs. If your instance type doesn't have a GPU, you may need to change some of the example's code to get it to run.

Navigating the Installed Tutorials

Once you're logged in to the Jupyter server and can see the tutorials directory (on Deep Learning AMI with Conda only), you will be presented with folders of tutorials by each framework name. If you don't see a framework listed, then tutorials are not available for that framework on your current DLAMI. Click on the name of the framework to see the listed tutorials, then click a tutorial to launch it.

The first time you run a notebook on the Deep Learning AMI with Conda, it will want to know which environment you would like to use. It will prompt you to select from a list. Each environment is named according to this pattern:

Environment (conda_framework_python-version)

For example, you might see Environment (conda_mxnet_p36), which signifies that the environment has MXNet and Python 3. The other variation of this would be Environment (conda_mxnet_p27), which signifies that the environment has MXNet and Python 2.

Tip

If you're concerned about which version of CUDA is active, one way to see it is in the MOTD when you first log in to the DLAMI.

Switching Environments with Jupyter

If you decide to try a tutorial for a different framework, be sure to verify the currently running kernel. This info can be seen in the upper right of the Jupyter interface, just below the logout button. You can change the kernel on any open notebook by clicking the Jupyter menu item Kernel, then Change Kernel, and then clicking the environment that suits the notebook you're running.
At this point you'll need to rerun any cells because a change in the kernel will erase the state of anything you've run previously.

**Tip**

Switching between frameworks can be fun and educational, however you can run out of memory. If you start running into errors, look at the terminal window that has the Jupyter server running. There are helpful messages and error logging here, and you may see an out-of-memory error. To fix this, you can go to the home page of your Jupyter server, click the **Running** tab, then click **Shutdown** for each of the tutorials that are probably still running in the background and eating up all of your memory.

**Tutorials**

The following are tutorials on how to use the Deep Learning AMI with Conda's software.

**Topics**

- 10 Minute Tutorials
- Activating Frameworks
- Distributed training using Elastic Fabric Adapter
- GPU Monitoring and Optimization
- The AWS Inferentia Chip With DLAMI
- The ARM64 DLAMI
- Inference
- Model Serving

**10 Minute Tutorials**

- Launch a AWS Deep Learning AMI (in 10 minutes)
- Train a Deep Learning model with DLC on Amazon EC2 (in 10 minutes)
Activating Frameworks

The following are the deep learning frameworks installed on the Deep Learning AMI with Conda. Click on a framework to learn how to activate it.

Topics

- PyTorch
- TensorFlow 2

PyTorch

Activating PyTorch

When a stable Conda package of a framework is released, it's tested and pre-installed on the DLAMI. If you want to run the latest, untested nightly build, you can [Install PyTorch's Nightly Build (experimental)](experimental) manually.

To activate the currently installed framework, follow these instructions on your Deep Learning AMI with Conda.

For PyTorch on Python 3 with CUDA and MKL-DNN, run this command:

```
$ source activate pytorch_p310
```

Start the iPython terminal.

```
(pytorch_p310)$ ipython
```

Run a quick PyTorch program.

```
import torch
x = torch.rand(5, 3)
print(x)
print(x.size())
y = torch.rand(5, 3)
print(torch.add(x, y))
```

You should see the initial random array printed, then its size, and then the addition of another random array.
Install PyTorch's Nightly Build (experimental)

How to install PyTorch from a nightly build

You can install the latest PyTorch build into either or both of the PyTorch Conda environments on your Deep Learning AMI with Conda.

1. (Option for Python 3) - Activate the Python 3 PyTorch environment:

   ```
   $ source activate pytorch_p310
   ```

2. The remaining steps assume you are using the `pytorch_p310` environment. Remove the currently installed PyTorch:

   ```
   (pytorch_p310)$ pip uninstall torch
   ```

3. (Option for GPU instances) - Install the latest nightly build of PyTorch with CUDA.0:

   ```
   (pytorch_p310)$ pip install torch_nightly -f https://download.pytorch.org/whl/nightly/cu100/torch_nightly.html
   ```

   • (Option for CPU instances) - Install the latest nightly build of PyTorch for instances with no GPUs:

   ```
   ```

4. To verify you have successfully installed latest nightly build, start the IPython terminal and check the version of PyTorch.

   ```
   (pytorch_p310)$ ipython
   ```

   ```python
   import torch
   print (torch.__version__)
   ```

   The output should print something similar to `1.0.0.dev20180922`

5. To verify that the PyTorch nightly build works well with the MNIST example, you can run a test script from PyTorch's examples repository:

   ```
   (pytorch_p310)$ cd ~
   ```
More Tutorials

For further tutorials and examples refer to the framework's official docs, PyTorch documentation, and the PyTorch website.

TensorFlow 2

This tutorial shows how to activate TensorFlow 2 on an instance running the Deep Learning AMI with Conda (DLAMI on Conda) and run a TensorFlow 2 program.

When a stable Conda package of a framework is released, it's tested and pre-installed on the DLAMI.

Activating TensorFlow 2

To run TensorFlow on the DLAMI with Conda

1. To activate TensorFlow 2, open an Amazon Elastic Compute Cloud (Amazon EC2) instance of the DLAMI with Conda.
2. For TensorFlow 2 and Keras 2 on Python 3 with CUDA 10.1 and MKL-DNN, run this command:

   $ source activate tensorflow2_p310

3. Start the iPython terminal:

   (tensorflow2_p310)$ ipython

4. Run a TensorFlow 2 program to verify that it is working properly:

   ```python
   import tensorflow as tf
   hello = tf.constant('Hello, TensorFlow!')
   tf.print(hello)
   
   Hello, TensorFlow! should appear on your screen.
   ```
More Tutorials

For more tutorials and examples, see the TensorFlow documentation for the TensorFlow Python API or see the TensorFlow website.

Distributed training using Elastic Fabric Adapter

An Elastic Fabric Adapter (EFA) is a network device that you can attach to your DLAMI instance to accelerate High Performance Computing (HPC) applications. EFA enables you to achieve the application performance of an on-premises HPC cluster, with the scalability, flexibility, and elasticity provided by the AWS Cloud.

The following topics show you how to get started using EFA with the DLAMI.

Note

Choose your DLAMI from this Base GPU DLAMI list

Topics

• Launching a AWS Deep Learning AMI Instance With EFA
• Using EFA on the DLAMI

Launching a AWS Deep Learning AMI Instance With EFA

The latest Base DLAMI is ready to use with EFA and comes with the required drivers, kernel modules, libfabric, openmpi and the NCCL OFI plugin for GPU instances.

You can find the supported CUDA versions of a Base DLAMI in the release notes.

Note:

• When running a NCCL Application using mpirun on EFA, you will have to specify the full path to the EFA supported installation as:

```
/opt/amazon/openmpi/bin/mpirun <command>
```

• To enable your application to use EFA, add FI_PROVIDER="efa" to the mpirun command as shown in Using EFA on the DLAMI.
Topics

- Prepare an EFA Enabled Security Group
- Launch Your Instance
- Verify EFA Attachment

Prepare an EFA Enabled Security Group

EFA requires a security group that allows all inbound and outbound traffic to and from the security group itself. For more information, see the EFA Documentation.

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Security Groups and then choose Create Security Group.
3. In the Create Security Group window, do the following:
   - For Security group name, enter a descriptive name for the security group, such as EFA-enabled security group.
   - (Optional) For Description, enter a brief description of the security group.
   - For VPC, select the VPC into which you intend to launch your EFA-enabled instances.
   - Choose Create.
4. Select the security group that you created, and on the Description tab, copy the Group ID.
5. On the Inbound and Outbound tabs, do the following:
   - Choose Edit.
   - For Type, choose All traffic.
   - For Source, choose Custom.
   - Paste the security group ID that you copied into the field.
   - Choose Save.
6. Enable inbound traffic referring to Authorizing Inbound Traffic for Your Linux Instances. If you skip this step, you won't be able to communicate with your DLAMI instance.

Launch Your Instance

EFA on the AWS Deep Learning AMI is currently supported with the following instance types and operating systems:
• P3dn.24xlarge: Amazon Linux 2, Ubuntu 20.04
• P4d.24xlarge: Amazon Linux 2, Ubuntu 20.04
• P5.48xlarge: Amazon Linux 2, Ubuntu 20.04

The following section shows how to launch an EFA enabled DLAMI instance. For more information on launching an EFA enabled instance, see Launch EFA-Enabled Instances into a Cluster Placement Group.

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. Choose Launch Instance.
3. On the Choose an AMI page, select a supported DLAMI found on the DLAMI Release Notes Page
4. On the Choose an Instance Type page, select one of the following supported instance types and then choose Next: Configure Instance Details. Refer to this link for the list of supported instances: Get started with EFA and MPI
5. On the Configure Instance Details page, do the following:
   • For Number of instances, enter the number of EFA-enabled instances that you want to launch.
   • For Network and Subnet, select the VPC and subnet into which to launch the instances.
   • [Optional] For Placement group, select Add instance to placement group. For best performance, launch the instances within a placement group.
   • [Optional] For Placement group name, select Add to a new placement group, enter a descriptive name for the placement group, and then for Placement group strategy, select cluster.
   • Make sure to enable the “Elastic Fabric Adapter” on this page. If this option is disabled, change the subnet to one that supports your selected instance type.
   • In the Network Interfaces section, for device eth0, choose New network interface. You can optionally specify a primary IPv4 address and one or more secondary IPv4 addresses. If you're launching the instance into a subnet that has an associated IPv6 CIDR block, you can optionally specify a primary IPv6 address and one or more secondary IPv6 addresses.
   • Choose Next: Add Storage.
6. On the **Add Storage** page, specify the volumes to attach to the instances in addition to the volumes specified by the AMI (such as the root device volume), and then choose **Next: Add Tags**.

7. On the **Add Tags** page, specify tags for the instances, such as a user-friendly name, and then choose **Next: Configure Security Group**.

8. On the **Configure Security Group** page, for **Assign a security group**, select **Select an existing security group**, and then select the security group that you created previously.

9. Choose **Review and Launch**.

10. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instances.

**Verify EFA Attachment**

**From the Console**

After launching the instance, check the instance details in the AWS Console. To do this, select the instance in the EC2 console and look at the Description Tab in the lower pane on the page. Find the parameter ‘Network Interfaces: eth0’ and click on eth0 which opens a pop-up. Make sure that ‘Elastic Fabric Adapter’ is enabled.

If EFA is not enabled, you can fix this by either:

- Terminating the EC2 instance and launching a new one with the same steps. Make sure the EFA is attached.
- Attach EFA to an existing instance.

1. In the EC2 Console, go to Network Interfaces.
2. Click on Create a Network Interface.
3. Select the same subnet that your instance is in.
4. Make sure to enable the ‘Elastic Fabric Adapter’ and click on Create.
5. Go back to the EC2 Instances Tab and select your instance.
6. Go to Actions: Instance State and stop the instance before you attach EFA.
8. Select the interface you just created and click on attach.
9. Restart your instance.
From the Instance

The following test script is already present on the DLAMI. Run it to ensure that the kernel modules are loaded correctly.

```
$ fi_info -p efa
```

Your output should look similar to the following.

```
provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-rdm
  version: 2.0
  type: FI_EP_RDM
  protocol: FI_PROTO_EFA
provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-dgrm
  version: 2.0
  type: FI_EP_DGRAM
  protocol: FI_PROTO_EFA
provider: efa;ofi_rxd
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-dgrm
  version: 1.0
  type: FI_EP_RDM
  protocol: FI_PROTO_RXD
```

Verify Security Group Configuration

The following test script is already present on the DLAMI. Run it to ensure that the security group you created is configured correctly.

```
$ cd /opt/amazon/efa/test/
$ ./efa_test.sh
```

Your output should look similar to the following.

```
Starting server...
Starting client...
bytes   #sent   #ack     total       time       MB/sec   usec/xfer   Mxfers/sec
```
If it stops responding or does not complete, ensure that your security group has the correct inbound/outbound rules.

**Using EFA on the DLAMI**

The following section describes how to use EFA to run multi-node applications on the AWS Deep Learning AMI.

**Running Multi-Node Applications with EFA**

To run an application across a cluster of nodes the following configuration is required

**Topics**

- [Enable Passwordless SSH](#)
- [Create Hosts File](#)
- [NCCL Tests](#)

**Enable Passwordless SSH**

Select one node in your cluster as the leader node. The remaining nodes are referred to as the member nodes.

1. On the leader node, generate the RSA keypair.

   ```
   ssh-keygen -t rsa -N "" -f ~/.ssh/id_rsa
   ```

2. Change the permissions of the private key on the leader node.

   ```
   chmod 600 ~/.ssh/id_rsa
   ```

3. Copy the public key `~/.ssh/id_rsa.pub` to and append it to `~/.ssh/authorized_keys` of the member nodes in the cluster.
4. You should now be able to directly login to the member nodes from the leader node using the private ip.

   ```
   ssh <member private ip>
   ```

5. Disable strictHostKeyChecking and enable agent forwarding on the leader node by adding the following to the ~/.ssh/config file on the leader node:

   ```
   Host *
   ForwardAgent yes
   Host *
   StrictHostKeyChecking no
   ```

6. On Amazon Linux 2 instances, run the following command on the leader node to provide correct permissions to the config file:

   ```
   chmod 600 ~/.ssh/config
   ```

### Create Hosts File

On the leader node, create a hosts file to identify the nodes in the cluster. The hosts file must have an entry for each node in the cluster. Create a file ~/hosts and add each node using the private ip as follows:

```
localhost slots=8
<private ip of node 1> slots=8
<private ip of node 2> slots=8
```

### NCCL Tests

**Note**

These tests have been run using EFA version 1.30.0 and OFI NCCL Plugin 1.7.4.

Listed below are a subset of NCCL Tests provided by Nvidia to test both functionality and performance over multiple compute nodes

**Supported Instances: P3dn, P4, P5**
Functionality Tests

NCCL Message Transfer Multi Node Test

The nccl_message_transfer is a simple test to ensure that the NCCL OFI Plugin is working as expected. The test validates functionality of NCCL's connection establishment and data transfer APIs. Make sure you use the complete path to mpirun as shown in the example while running NCCL applications with EFA. Change the params np and N based on the number of instances and GPUs in your cluster. For more information, see the AWS OFI NCCL documentation.

The following nccl_message_transfer test is for a generic CUDA xx.x version. You can run the commands for any available CUDA version in your Amazon EC2 instance by replacing the CUDA version in the script.

```bash
$opt/amazon/openmpi/bin/mpirun -n 2 -N 1 --hostfile hosts \
-x LD_LIBRARY_PATH=/usr/local/cuda-xx.x/efa/lib:/usr/local/cuda-xx.x/lib:/usr/\nlocal/cuda-xx.x/lib64:/usr/local/cuda-xx.x:$LD_LIBRARY_PATH \n--mca btl tcp,self --mca btl_tcp_if_exclude lo,docker0 --bind-to none \nopt/aws-ofi-nccl/tests/nccl_message_transfer
```

Your output should look like the following. You can check the output to see that EFA is being used as the OFI provider.

```
INFO: Function: nccl_net_ofi_init Line: 1069: NET/OFI Selected Provider is efa (found 4 nics)
INFO: Function: configure_nccl_proto Line: 227: NET/OFI Setting NCCL_PROTO to "simple"
INFO: Function: main Line: 91: NET/OFI Received 4 network devices
INFO: Function: main Line: 118: NET/OFI Server: Listening on dev 3
INFO: Function: main Line: 131: NET/OFI Send connection request to rank 1
INFO: Function: main Line: 173: NET/OFI Send connection request to rank 0
INFO: Function: main Line: 141: NET/OFI Successfully accepted connection from rank 1
INFO: Function: main Line: 145: NET/OFI Send 8 requests to rank 1
INFO: Function: main Line: 179: NET/OFI Server: Start accepting requests
```
INFO: Function: main Line: 183: NET/OFI Successfully accepted connection from rank 0
INFO: Function: main Line: 187: NET/OFI Rank 1 posting 8 receive buffers
INFO: Function: main Line: 161: NET/OFI Successfully sent 8 requests to rank 1
INFO: Function: main Line: 251: NET/OFI Got completions for 8 requests for rank 0
INFO: Function: main Line: 251: NET/OFI Got completions for 8 requests for rank 1

Performance Tests

Multi-node NCCL Performance Test on P4d.24xlarge

To check NCCL Performance with EFA, run the standard NCCL Performance test that is available on the official [NCCL-Tests Repo](https://github.com/nccl-tests). The DLAMI comes with this test already built for CUDA XX.X. You can similarly run your own script with EFA.

When constructing your own script, refer to the following guidance:

- Use the complete path to mpirun as shown in the example while running NCCL applications with EFA.
- Change the params np and N based on the number of instances and GPUs in your cluster.
- Add the NCCL_DEBUG=INFO flag and make sure that the logs indicate EFA usage as "Selected Provider is EFA".
- Set the Training Log Location to parse for validation

```
TRAINING_LOG="testEFA_$(date +"%N").log"
```

Use the command `watch nvidia-smi` on any of the member nodes to monitor GPU usage. The following `watch nvidia-smi` commands are for a generic CUDA xx.x version and depend on the Operating System of your instance. You can run the commands for any available CUDA version in your Amazon EC2 instance by replacing the CUDA version in the script.

- Amazon Linux 2:

```
$ /opt/amazon/openmpi/bin/mpirun -n 16 -N 8 -x NCCL_DEBUG=INFO -x --mca pml ^cm -x LD_LIBRARY_PATH=/usr/local/cuda-xx.x/efa/lib:/usr/local/cuda-xx.x/lib:/usr/local/cuda-xx.x/lib64:/usr/local/cuda-xx.x/efa/lib64:/opt/amazon/efa/lib64:/opt/amazon/openmpi/lib64:$LD_LIBRARY_PATH --hostfile hosts --mca btl tcp,self --mca btl_tcp_if_exclude lo,docker0 --bind-to none
```
/usr/local/cuda-xx.x/efa/test-cuda-xx.x/all_reduce_perf -b 8 -e 16 -f 2 -g 1 -c 1 -n 100 | tee ${TRAINING_LOG}

- Ubuntu 20.04:

```bash
$ /opt/amazon/openmpi/bin/mpirun -n 16 -N 8 \n-x NCCL_DEBUG=INFO -x --mca pml ^cm \n-x LD_LIBRARY_PATH=/usr/local/cuda-xx.x/efa/lib:/usr/local/cuda-xx.x/lib:/usr/local/cuda-xx.x/lib64:/usr/local/cuda-xx.x/opt/amazon/efa/lib:/opt/amazon/openmpi/lib:$LD_LIBRARY_PATH \n--hostfile hosts --mca btl tcp,self --mca btl_tcp_if_exclude lo,docker0 --bind-to none \n/usr/local/cuda-xx.x/efa/test-cuda-xx.x/all_reduce_perf -b 8 -e 16 -f 2 -g 1 -c 1 -n 100 | tee ${TRAINING_LOG}
```

Your output should look like the following:

```
# nThread 1 nGpus 1 minBytes 8 maxBytes 1073741824 step: 2(factor) warmup iters: 5
# iters: 100 agg iters: 1 validation: 1 graph: 0

Validation Tests

To Validate that the EFA tests returned a valid result, please use the following tests to confirm:

- Get the instance type using EC2 Instance Metadata:

```
```

- Run the Performance Tests

- Set the Following Parameters

  CUDA_VERSION  
  CUDA_RUNTIME_VERSION  
  NCCL_VERSION

- Validate the Results as shown:

```
RETURN_VAL=`echo $?`
if [ ${RETURN_VAL} -eq 0 ]; then
    # Information on how the version come from logs
    #
    # ip-172-31-27-205:6427:6427 [0] NCCL INFO cudaDriverVersion 12020
    # NCCL version 2.16.2+cuda11.8
    # ip-172-31-27-205:6427:6820 [0] NCCL INFO NET/OFI Initializing aws-ofi-nccl 1.7.1-aws
    # ip-172-31-27-205:6427:6820 [0] NCCL INFO NET/OFI Using CUDA runtime version 11060
```
# cudaDriverVersion 12020 --> This is max supported cuda version by nvidia driver
# NCCL version 2.16.2+cuda11.8 --> This is NCCL version compiled with cuda version
# Using CUDA runtime version 11060 --> This is selected cuda version

# Validation of logs

elif [[ $\{INSTANCE\_TYPE\} == "p5.48xlarge" ]]; then
  grep "NET/AWS Libfabric/0/GDRDMA" $\{TRAINING\_LOG\} || { echo "Avg bus bandwidth text not found"; exit 1; }
grep "NET/OFI Selected Provider is efa (found 32 nics)" $\{TRAINING\_LOG\} || { echo "Avg bus bandwidth text not found"; exit 1; }
grep "aws-ofi-nccl/xml/p5.48xl-topo.xml" $\{TRAINING\_LOG\} || { echo "Topology file not found"; exit 1; }
elif [[ $\{INSTANCE\_TYPE\} == "p3dn.24xlarge" ]]; then
Deep Learning AMI Developer Guide

GREP "NET/OFI Selected Provider is efa (found 4 nics)" ${TRAINING_LOG} ||
{ echo "Selected Provider is efa text not found"; exit 1; }
fi
echo "*****************************************************************************
check_efa_nccl_all_reduce passed for cuda version ${CUDA_VERSION} *****************************************************************************"
else
echo "*****************************************************************************
check_efa_nccl_all_reduce failed for cuda version ${CUDA_VERSION} *****************************************************************************"
fi

• To access the benchmark data, we can parse the final row of table output from the Multi Node all_reduce test:

```
benchmark=$(sudo cat ${TRAINING_LOG} | grep '1073741824' | tail -n1 | awk -F " " '{print $12}' | sed 's/ //g' | sed 's/ 5e-07//')
if [[ -z "${benchmark}" ]]; then
echo "benchmark variable is empty"
exit 1
fi
echo "Benchmark throughput: ${benchmark}"
```

GPU Monitoring and Optimization

The following section will guide you through GPU optimization and monitoring options. This section is organized like a typical workflow with monitoring overseeing preprocessing and training.

• Monitoring
  • Monitor GPUs with CloudWatch

• Optimization
  • Preprocessing
  • Training

Monitoring

Your DLAMI comes preinstalled with several GPU monitoring tools. This guide also mentions tools that are available to download and install.
Monitor GPUs with CloudWatch - a preinstalled utility that reports GPU usage statistics to Amazon CloudWatch.

nvidia-smi CLI - a utility to monitor overall GPU compute and memory utilization. This is preinstalled on your AWS Deep Learning AMI (DLAMI).

NVML C library - a C-based API to directly access GPU monitoring and management functions. This used by the nvidia-smi CLI under the hood and is preinstalled on your DLAMI. It also has Python and Perl bindings to facilitate development in those languages. The gpumon.py utility preinstalled on your DLAMI uses the pynvml package from nvidia-ml-py.

NVIDIA DCGM - A cluster management tool. Visit the developer page to learn how to install and configure this tool.

Tip

Check out NVIDIA's developer blog for the latest info on using the CUDA tools installed your DLAMI:

- Monitoring TensorCore utilization using Nsight IDE and nvprof.

Monitor GPUs with CloudWatch

When you use your DLAMI with a GPU you might find that you are looking for ways to track its usage during training or inference. This can be useful for optimizing your data pipeline, and tuning your deep learning network.

There are two ways to configure GPU metrics with CloudWatch:

- Configure metrics with the AWS CloudWatch agent (Recommended)
- Configure metrics with the preinstalled gpumon.py script

Configure metrics with the AWS CloudWatch agent (Recommended)

Integrate your DLAMI with the unified CloudWatch agent to configure GPU metrics and monitor the utilization of GPU coprocesses in Amazon EC2 accelerated instances.

There are four ways to configure GPU metrics with your DLAMI:

- Configure minimal GPU metrics
• Configure partial GPU metrics
• Configure all available GPU metrics
• Configure custom GPU metrics

For information on updates and security patches, see Security patching for the AWS CloudWatch agent

Prerequisites

To get started, you must configure Amazon EC2 instance IAM permissions that allow your instance to push metrics to CloudWatch. For detailed steps, see Create IAM roles and users for use with the CloudWatch agent.

Configure minimal GPU metrics

Configure minimal GPU metrics using the dlami-cloudwatch-agent@minimal systemd service. This service configures the following metrics:

• utilization_gpu
• utilization_memory

You can find the systemd service for minimal preconfigured GPU metrics in the following location:

/opt/aws/amazon-cloudwatch-agent/etc/dlami-amazon-cloudwatch-agent-minimal.json

Enable and start the systemd service with the following commands:

```
sudo systemctl enable dlami-cloudwatch-agent@minimal
sudo systemctl start dlami-cloudwatch-agent@minimal
```

Configure partial GPU metrics

Configure partial GPU metrics using the dlami-cloudwatch-agent@partial systemd service. This service configures the following metrics:

• utilization_gpu
• utilization_memory
• memory_total
• memory_used
• memory_free

You can find the systemd service for partial preconfigured GPU metrics in the following location:

```
/opt/aws/amazon-cloudwatch-agent/etc/dlami-amazon-cloudwatch-agent-partial.json
```

Enable and start the systemd service with the following commands:

```
sudo systemctl enable dlami-cloudwatch-agent@partial
sudo systemctl start dlami-cloudwatch-agent@partial
```

**Configure all available GPU metrics**

Configure all available GPU metrics using the `dlami-cloudwatch-agent@all` systemd service. This service configures the following metrics:

• utilization_gpu
• utilization_memory
• memory_total
• memory_used
• memory_free
• temperature_gpu
• power_draw
• fan_speed
• pcie_link_gen_current
• pcie_link_width_current
• encoder_stats_session_count
• encoder_stats_average_fps
• encoder_stats_average_latency
• clocks_current_graphics
• clocks_current_sm
• clocks_current_memory
• clocks_current_video

You can find the systemd service for all available preconfigured GPU metrics in the following location:

```
/opt/aws/amazon-cloudwatch-agent/etc/dlami-amazon-cloudwatch-agent-all.json
```

Enable and start the systemd service with the following commands:

```
sudo systemctl enable dlami-cloudwatch-agent@all
sudo systemctl start dlami-cloudwatch-agent@all
```

**Configure custom GPU metrics**

If the preconfigured metrics do not meet your requirements, you can create a custom CloudWatch agent configuration file.

**Create a custom configuration file**

To create a custom configuration file, refer to the detailed steps in [Manually create or edit the CloudWatch agent configuration file](#).

For this example, assume that the schema definition is located at `/opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.json`.

**Configure metrics with your custom file**

Run the following command to configure the CloudWatch agent according to your custom file:

```
sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-ctl \
-a fetch-config -m ec2 -s -c file:/opt/aws/amazon-cloudwatch-agent/etc/amazon-cloudwatch-agent.json
```

**Security patching for the AWS CloudWatch agent**

Newly released DLAMIs are configured with the latest available AWS CloudWatch agent security patches. Refer to the following sections to update your current DLAMI with the latest security patches depending on your operating system of choice.
Amazon Linux 2

Use `yum` to get the latest AWS CloudWatch agent security patches for an Amazon Linux 2 DLAMI.

```
sudo yum update
```

Ubuntu

To get the latest AWS CloudWatch security patches for a DLAMI with Ubuntu, it is necessary to reinstall the AWS CloudWatch agent using an Amazon S3 download link.

```
```

For more information on installing the AWS CloudWatch agent using Amazon S3 download links, see [Installing and running the CloudWatch agent on your servers](#).

Configure metrics with the preinstalled `gpumon.py` script

A utility called `gpumon.py` is preinstalled on your DLAMI. It integrates with CloudWatch and supports monitoring of per-GPU usage: GPU memory, GPU temperature, and GPU Power. The script periodically sends the monitored data to CloudWatch. You can configure the level of granularity for data being sent to CloudWatch by changing a few settings in the script. Before starting the script, however, you will need to setup CloudWatch to receive the metrics.

How to setup and run GPU monitoring with CloudWatch

1. Create an IAM user, or modify an existing one to have a policy for publishing the metric to CloudWatch. If you create a new user please take note of the credentials as you will need these in the next step.

   The IAM policy to search for is “cloudwatch:PutMetricData”. The policy that is added is as follows:

   ```json
   {
     "Version": "2012-10-17",
     "Statement": [
       {
         "Action": ["cloudwatch:PutMetricData"]
       },
   ```
Tip

For more information on creating an IAM user and adding policies for CloudWatch, refer to the CloudWatch documentation.

2. On your DLAMI, run AWS configure and specify the IAM user credentials.

   $ aws configure

3. You might need to make some modifications to the gpumon utility before you run it. You can find the gpumon utility and README in the location defined in the following code block. For more information on the gpumon.py script, see the Amazon S3 location of the script.

   Folder: ~/tools/GPUCloudWatchMonitor
   Files: ~/tools/GPUCloudWatchMonitor/gpumon.py
         ~/tools/GPUCloudWatchMonitor/README

Options:

- Change the region in gpumon.py if your instance is NOT in us-east-1.
- Change other parameters such as the CloudWatch namespace or the reporting period with store_reso.

4. Currently the script only supports Python 3. Activate your preferred framework's Python 3 environment or activate the DLAMI general Python 3 environment.

   $ source activate python3

5. Run the gpumon utility in background.

   (python3)$ python gpumon.py &

6. Open your browser to the https://console.aws.amazon.com/cloudwatch/ then select metric. It will have a namespace 'DeepLearningTrain'.
Tip

You can change the namespace by modifying gpumon.py. You can also modify the reporting interval by adjusting `store_reso`.

The following is an example CloudWatch chart reporting on a run of gpumon.py monitoring a training job on p2.8xlarge instance.

You might be interested in these other topics on GPU monitoring and optimization:

- **Monitoring**
  - Monitor GPUs with CloudWatch
- **Optimization**
  - Preprocessing
  - Training

**Optimization**

To make the most of your GPUs, you can optimize your data pipeline and tune your deep learning network. As the following chart describes, a naive or basic implementation of a neural network might use the GPU inconsistently and not to its fullest potential. When you optimize your
preprocessing and data loading, you can reduce the bottleneck from your CPU to your GPU. You can adjust the neural network itself, by using hybridization (when supported by the framework), adjusting batch size, and synchronizing calls. You can also use multiple-precision (float16 or int8) training in most frameworks, which can have a dramatic effect on improving throughput.

The following chart shows the cumulative performance gains when applying different optimizations. Your results will depend on the data you are processing and the network you are optimizing.

Example GPU performance optimizations. Chart source: [Performance Tricks with MXNet Gluon](#)

The following guides introduce options that will work with your DLAMI and help you boost GPU performance.

**Topics**
- Preprocessing
- Training

### Preprocessing

Data preprocessing through transformations or augmentations can often be a CPU-bound process, and this can be the bottleneck in your overall pipeline. Frameworks have built-in operators for image processing, but DALI (Data Augmentation Library) demonstrates improved performance over frameworks’ built-in options.

- NVIDIA Data Augmentation Library (DALI): DALI offloads data augmentation to the GPU. It is not preinstalled on the DLAMI, but you can access it by installing it or loading a supported
Deep Learning AMI framework container on your DLAMI or other Amazon Elastic Compute Cloud instance. Refer to the [DALI project page](https://docs.nvidia.com/dali) on the NVIDIA website for details. For an example use-case and to download code samples, see the [SageMaker Preprocessing Training Performance](https://docs.aws.amazon.com/sagemaker/latest/dg/preprocessing-training-performance.html) sample.

- **nvJPEG**: a GPU-accelerated JPEG decoder library for C programmers. It supports decoding single images or batches as well as subsequent transformation operations that are common in deep learning. nvJPEG comes built-in with DALI, or you can download from the [NVIDIA website's nvjpeg page](https://docs.nvidia.com/deeplearning/sdk/nvjpeg/index.html) and use it separately.

You might be interested in these other topics on GPU monitoring and optimization:

- **Monitoring**
  - Monitor GPUs with CloudWatch
- **Optimization**
  - Preprocessing
  - Training

**Training**

With mixed-precision training you can deploy larger networks with the same amount of memory, or reduce memory usage compared to your single or double precision network, and you will see compute performance increases. You also get the benefit of smaller and faster data transfers, an important factor in multiple node distributed training. To take advantage of mixed-precision training you need to adjust data casting and loss scaling. The following are guides describing how to do this for the frameworks that support mixed-precision.

**Tip**

Be sure to check the website for your framework of choice, and search for "mixed precision" or "fp16" for the latest optimization techniques. Here are some mixed-precision guides you might find helpful:

• **Mixed-precision training using float16 with MXNet** - an FAQ article on the MXNet website.
• **NVIDIA Apex: a tool for easy mixed-precision training with PyTorch** - a blog article on the NVIDIA website.

**The AWS Inferentia Chip With DLAMI**

AWS Inferentia is a custom machine learning chip designed by AWS that you can use for high-performance inference predictions. In order to use the chip, set up an Amazon Elastic Compute Cloud instance and use the AWS Neuron software development kit (SDK) to invoke the Inferentia chip. To provide customers with the best Inferentia experience, Neuron has been built into the AWS Deep Learning AMI (DLAMI).

The following topics show you how to get started using Inferentia with the DLAMI.

**Contents**

• [Launching a DLAMI Instance with AWS Neuron](#)
• [Using the DLAMI with AWS Neuron](#)

**Launching a DLAMI Instance with AWS Neuron**

The latest DLAMI is ready to use with AWS Inferentia and comes with the AWS Neuron API package. To launch a DLAMI instance, see [Launching and Configuring a DLAMI](#). After you have a DLAMI, use the steps here to ensure that your AWS Inferentia chip and AWS Neuron resources are active.

**Contents**

• [Verify Your Instance](#)
• **Identifying AWS Inferentia Devices**

• **View Resource Usage**

• **Using Neuron Monitor (neuron-monitor)**

• **Upgrading Neuron Software**

### Verify Your Instance

Before using your instance, verify that it's properly setup and configured with Neuron.

#### Identifying AWS Inferentia Devices

To identify the number of Inferentia devices on your instance, use the following command:

```bash
euron-1s
```

If your instance has Inferentia devices attached to it, your output will look similar to the following:

```
+--------+--------+--------+-----------+--------------+
| NEURON | NEURON | NEURON | CONNECTED |     PCI      |
| DEVICE | CORES  | MEMORY |  DEVICES  |     BDF      |
+--------+--------+--------+-----------+--------------+
| 0      | 4      | 8 GB   | 1         | 0000:00:1c.0 |
| 1      | 4      | 8 GB   | 2, 0      | 0000:00:1d.0 |
| 2      | 4      | 8 GB   | 3, 1      | 0000:00:1e.0 |
| 3      | 4      | 8 GB   | 2         | 0000:00:1f.0 |
+--------+--------+--------+-----------+--------------+
```

The supplied output is taken from an Inf1.6xlarge instance and includes the following columns:

- **NEURON DEVICE**: The logical ID assigned to the NeuronDevice. This ID is used when configuring multiple runtimes to use different NeuronDevices.
- **NEURON CORES**: The number of NeuronCores present in the NeuronDevice.
- **NEURON MEMORY**: The amount of DRAM memory in the NeuronDevice.
- **CONNECTED DEVICES**: Other NeuronDevices connected to the NeuronDevice.
- **PCI BDF**: The PCI Bus Device Function (BDF) ID of the NeuronDevice.
View Resource Usage

View useful information about NeuronCore and vCPU utilization, memory usage, loaded models, and Neuron applications with the `neuron-top` command. Launching `neuron-top` with no arguments will show data for all machine learning applications that utilize NeuronCores.

```
neuron-top
```

When an application is using four NeuronCores, the output should look similar to the following image:

For more information on resources to monitor and optimize Neuron-based inference applications, see [Neuron Tools](#).

### Using Neuron Monitor (neuron-monitor)

Neuron Monitor collects metrics from the Neuron runtimes running on the system and streams the collected data to stdout in JSON format. These metrics are organized into metric groups that you
configure by providing a configuration file. For more information on Neuron Monitor, see the User Guide for Neuron Monitor.

**Upgrading Neuron Software**

For information on how to update Neuron SDK software within DLAMI, see the AWS Neuron Setup Guide.

**Next Step**

*Using the DLAMI with AWS Neuron*

**Using the DLAMI with AWS Neuron**

A typical workflow with the AWS Neuron SDK is to compile a previously trained machine learning model on a compilation server. After this, distribute the artifacts to the Inf1 instances for execution. AWS Deep Learning AMI (DLAMI) comes pre-installed with everything you need to compile and run inference in an Inf1 instance that uses Inferentia.

The following sections describe how to use the DLAMI with Inferentia.

**Contents**

- **Using TensorFlow-Neuron and the AWS Neuron Compiler**
- **Using AWS Neuron TensorFlow Serving**
- **Using MXNet-Neuron and the AWS Neuron Compiler**
- **Using MXNet-Neuron Model Serving**
- **Using PyTorch-Neuron and the AWS Neuron Compiler**

**Using TensorFlow-Neuron and the AWS Neuron Compiler**

This tutorial shows how to use the AWS Neuron compiler to compile the Keras ResNet-50 model and export it as a saved model in SavedModel format. This format is a typical TensorFlow model interchangeable format. You also learn how to run inference on an Inf1 instance with example input.

For more information about the Neuron SDK, see the AWS Neuron SDK documentation.

**Contents**

- **Prerequisites**
• **Activate the Conda environment**

• **Resnet50 Compilation**

• **ResNet50 Inference**

**Prerequisites**

Before using this tutorial, you should have completed the set up steps in [Launching a DLAMI Instance with AWS Neuron](#). You should also have a familiarity with deep learning and using the DLAMI.

**Activate the Conda environment**

Activate the TensorFlow-Neuron conda environment using the following command:

```
source activate aws_neuron_tensorflow_p36
```

To exit the current conda environment, run the following command:

```
source deactivate
```

**Resnet50 Compilation**

Create a Python script called `tensorflow_compile_resnet50.py` that has the following content. This Python script compiles the Keras ResNet50 model and exports it as a saved model.

```python
import os
import time
import shutil
import tensorflow as tf
import tensorflow.neuron as tfn
import tensorflow.compat.v1.keras as keras
from tensorflow.keras.applications.resnet50 import ResNet50
from tensorflow.keras.applications.resnet50 import preprocess_input

# Create a workspace
WORKSPACE = './ws_resnet50'
```
os.makedirs(WORKSPACE, exist_ok=True)

# Prepare export directory (old one removed)
model_dir = os.path.join(WORKSPACE, 'resnet50')
compiled_model_dir = os.path.join(WORKSPACE, 'resnet50_neuron')
shutil.rmtree(model_dir, ignore_errors=True)
shutil.rmtree(compiled_model_dir, ignore_errors=True)

# Instantiate Keras ResNet50 model
keras.backend.set_learning_phase(0)
model = ResNet50(weights='imagenet')

# Export SavedModel
tf.saved_model.simple_save(
    session = keras.backend.get_session(),
    export_dir = model_dir,
    inputs = {'input': model.inputs[0]},
    outputs = {'output': model.outputs[0]})

# Compile using Neuron
tfn.saved_model.compile(model_dir, compiled_model_dir)

# Prepare SavedModel for uploading to Inf1 instance
shutil.make_archive(compiled_model_dir, 'zip', WORKSPACE, 'resnet50_neuron')

Compile the model using the following command:

```
python tensorflow_compile_resnet50.py
```

The compilation process will take a few minutes. When it completes, your output should look like the following:

```
... INFO:tensorflow:fusing subgraph neuron_op_d6f098c01c780733 with neuron-cc
INFO:tensorflow:Number of operations in TensorFlow session: 4638
INFO:tensorflow:Number of operations after tf.neuron optimizations: 556
INFO:tensorflow:Number of operations placed on Neuron runtime: 554
INFO:tensorflow:Successfully converted ./ws_resnet50/resnet50 to ./ws_resnet50/resnet50_neuron
...```
After compilation, the saved model is zipped at `ws_resnet50/resnet50_neuron.zip`. Unzip the model and download the sample image for inference using the following commands:

```
unzip ws_resnet50/resnet50_neuron.zip -d .
```

### ResNet50 Inference

Create a Python script called `tensorflow_infer_resnet50.py` that has the following content. This script runs inference on the downloaded model using a previously compiled inference model.

```python
import os
import numpy as np
import tensorflow as tf
from tensorflow.keras.preprocessing import image
from tensorflow.keras.applications import resnet50

# Create input from image
img_sgl = image.load_img('kitten_small.jpg', target_size=(224, 224))
img_arr = image.img_to_array(img_sgl)
img_arr2 = np.expand_dims(img_arr, axis=0)
img_arr3 = resnet50.preprocess_input(img_arr2)

# Load model
COMPILED_MODEL_DIR = './ws_resnet50/resnet50_neuron/
predictor_inferentia = tf.contrib.predictor.from_saved_model(COMPILED_MODEL_DIR)

# Run inference
model_feed_dict={'input': img_arr3}
infa_rslts = predictor_inferentia(model_feed_dict);

# Display results
print(resnet50.decode_predictions(infa_rslts['output'], top=5)[0])
```

Run inference on the model using the following command:

```
python tensorflow_infer_resnet50.py
```

Your output should look like the following:

```
AWS Inferentia
71
```
Next Step

Using AWS Neuron TensorFlow Serving

Using AWS Neuron TensorFlow Serving

This tutorial shows how to construct a graph and add an AWS Neuron compilation step before exporting the saved model to use with TensorFlow Serving. TensorFlow Serving is a serving system that allows you to scale-up inference across a network. Neuron TensorFlow Serving uses the same API as normal TensorFlow Serving. The only difference is that a saved model must be compiled for AWS Inferentia and the entry point is a different binary named `tensorflow_model_server_neuron`. The binary is found at `/usr/local/bin/tensorflow_model_server_neuron` and is pre-installed in the DLAMI.

For more information about the Neuron SDK, see the AWS Neuron SDK documentation.

Contents

- Prerequisites
- Activate the Conda environment
- Compile and Export the Saved Model
- Serving the Saved Model
- Generate inference requests to the model server

Prerequisites

Before using this tutorial, you should have completed the set up steps in Launching a DLAMI Instance with AWS Neuron. You should also have a familiarity with deep learning and using the DLAMI.

Activate the Conda environment

Activate the TensorFlow-Neuron conda environment using the following command:
source activate aws_neuron_tensorflow_p36

If you need to exit the current conda environment, run:

source deactivate

**Compile and Export the Saved Model**

Create a Python script called `tensorflow-model-server-compile.py` with the following content. This script constructs a graph and compiles it using Neuron. It then exports the compiled graph as a saved model.

```python
import tensorflow as tf
import tensorflow.neuron
import os
tf.keras.backend.set_learning_phase(0)
model = tf.keras.applications.ResNet50(weights='imagenet')
sess = tf.keras.backend.get_session()
inputs = {'input': model.inputs[0]}
outputs = {'output': model.outputs[0]}

# save the model using tf.saved_model.simple_save
modelfile = './resnet50/1'
tf.saved_model.simple_save(sess, modelfile, inputs, outputs)

# compile the model for Inferentia
neuron_modelfile = os.path.join(os.path.expanduser('~'), 'resnet50_inf1', '1')
tf.neuron.saved_model.compile(modelfile, neuron_modelfile, batch_size=1)
```

Compile the model using the following command:

```bash
python tensorflow-model-server-compile.py
```

Your output should look like the following:
... INFO:tensorflow:fusing subgraph neuron_op_d6f098c01c780733 with neuron-cc
INFO:tensorflow:Number of operations in TensorFlow session: 4638
INFO:tensorflow:Number of operations after tf.neuron optimizations: 556
INFO:tensorflow:Number of operations placed on Neuron runtime: 554
INFO:tensorflow:Successfully converted ./resnet50/1 to /home/ubuntu/resnet50_inf1/1

Serving the Saved Model

Once the model has been compiled, you can use the following command to serve the saved model with the tensorflow_model_server_neuron binary:

tensorflow_model_server_neuron --model_name=resnet50_inf1 \
   --model_base_path=$HOME/resnet50_inf1/ --port=8500 &

Your output should look like the following. The compiled model is staged in the Inferentia device's DRAM by the server to prepare for inference.

... 2019-11-22 01:20:32.075856: I external/org_tensorflow/tensorflow/cc/saved_model/ 
   saved_model_warmup.cc:105] No warmup data file found at /home/ubuntu/resnet50_inf1/1/
   assets.extra/tf_serving_warmup_requests
 2019-11-22 01:20:32.075950: I tensorflow_serving/core/loader_harness.cc:87] 
   Successfully loaded servable version {name: resnet50_inf1 version: 1}
 2019-11-22 01:20:32.077859: I tensorflow_serving/model_servers/ 
   server.cc:353] Running gRPC ModelServer at 0.0.0.0:8500 ...

Generate inference requests to the model server

Create a Python script called tensorflow-model-server-infer.py with the following content. This script runs inference via gRPC, which is service framework.

import numpy as np
import grpc
import tensorflow as tf
from tensorflow.keras.preprocessing import image
from tensorflow.keras.applications.resnet50 import preprocess_input
from tensorflow_serving.apis import predict_pb2
from tensorflow_serving.apis import prediction_service_pb2_grpc
from tensorflow.keras.applications.resnet50 import decode_predictions

if __name__ == '__main__':
    channel = grpc.insecure_channel('localhost:8500')
    stub = prediction_service_pb2_grpc.PredictionServiceStub(channel)
    img_file = tf.keras.utils.get_file('kitten_small.jpg',
        'https://raw.githubusercontent.com/awslabs/mxnet-model-server/master/docs/images/kitten_small.jpg')
    img = image.load_img(img_file, target_size=(224, 224))
    img_array = preprocess_input(image.img_to_array(img)[None, ...])
    request = predict_pb2.PredictRequest()
    request.model_spec.name = 'resnet50_inf1'
    request.inputs['input'].CopyFrom(
        tf.contrib.util.make_tensor_proto(img_array, shape=img_array.shape))
    result = stub.Predict(request)
    prediction = tf.make_ndarray(result.outputs['output'])
    print(decode_predictions(prediction))

Run inference on the model by using gRPC with the following command:

    python tensorflow-model-server-infer.py

Your output should look like the following:

    [[('n02123045', 'tabby', 0.6918919), ('n02127052', 'lynx', 0.12770271), ('n02123159', 'tiger_cat', 0.08277027), ('n02124075', 'Egyptian_cat', 0.06418919), ('n02128757', 'snow_leopard', 0.009290541)]]

Using MXNet-Neuron and the AWS Neuron Compiler

The MXNet-Neuron compilation API provides a method to compile a model graph that you can run on an AWS Inferentia device.

In this example, you use the API to compile a ResNet-50 model and use it to run inference.

For more information about the Neuron SDK, see the [AWS Neuron SDK documentation](https://aws.amazon.com/solutions/en-sg/awstro-npu-sdk/).
Contents

- Prerequisites
- Activate the Conda Environment
- Resnet50 Compilation
- ResNet50 Inference

Prerequisites

Before using this tutorial, you should have completed the set up steps in Launching a DLAMI Instance with AWS Neuron. You should also have a familiarity with deep learning and using the DLAMI.

Activate the Conda Environment

Activate the MXNet-Neuron conda environment using the following command:

```bash
source activate aws_neuron_mxnet_p36
```

To exit the current conda environment, run:

```bash
source deactivate
```

Resnet50 Compilation

Create a Python script called `mxnet_compile_resnet50.py` with the following content. This script uses the MXNet-Neuron compilation Python API to compile a ResNet-50 model.

```python
import mxnet as mx
import numpy as np
print("downloading...")
path='http://data.mxnet.io/models/imagenet/
mx.test_utils.download(path+'resnet/50-layers/resnet-50-0000.params')
xm.test_utils.download(path+'resnet/50-layers/resnet-50-symbol.json')
print("download finished.")
sym, args, aux = mx.model.load_checkpoint('resnet-50', 0)
```
print("compile for inferentia using neuron... this will take a few minutes...")
inputs = { "data" : mx.nd.ones([1,3,224,224], name='data', dtype='float32') }

sym, args, aux = mx.contrib.neuron.compile(sym, args, aux, inputs)

print("save compiled model...")
mx.model.save_checkpoint("compiled_resnet50", 0, sym, args, aux)

Compile the model using the following command:

```python
python mxnet_compile_resnet50.py
```

Compilation will take a few minutes. When compilation has finished, the following files will be in your current directory:

```
resnet-50-0000.params
resnet-50-symbol.json
compiled_resnet50-0000.params
compiled_resnet50-symbol.json
```

**ResNet50 Inference**

Create a Python script called `mxnet_infer_resnet50.py` with the following content. This script downloads a sample image and uses it to run inference with the compiled model.

```python
import mxnet as mx
import numpy as np

path='http://data.mxnet.io/models/imagenet/
mx.test_utils.download(path+'synset.txt')

fname = mx.test_utils.download('https://raw.githubusercontent.com/awslabs/mxnet-model-server/master/docs/images/kitten_small.jpg')
img = mx.image.imread(fname)

# convert into format (batch, RGB, width, height)
img = mx.image.imresize(img, 224, 224)
# resize
```
```python
img = img.transpose((2, 0, 1))
# Channel first
img = img.expand_dims(axis=0)
# batchify
img = img.astype(dtype='float32')

sym, args, aux = mx.model.load_checkpoint('compiled_resnet50', 0)
softmax = mx.nd.random_normal(shape=(1,))
args['softmax_label'] = softmax
args['data'] = img
# Inferentia context
ctx = mx.neuron()

exe = sym.bind(ctx=ctx, args=args, aux_states=aux, grad_req='null')
with open('synset.txt', 'r') as f:
    labels = [l.rstrip() for l in f]

exe.forward(data=img)
prob = exe.outputs[0].asnumpy()
# print the top-5
prob = np.squeeze(prob)
a = np.argsort(prob)[::-1]
for i in a[0:5]:
    print('probability=%f, class=%s' % (prob[i], labels[i]))
```

Run inference with the compiled model using the following command:

```bash
python mxnet_infer_resnet50.py
```

Your output should look like the following:

```plaintext
probability=0.642454, class=n02123045 tabby, tabby cat
probability=0.189407, class=n02123159 tiger cat
probability=0.100798, class=n02124075 Egyptian cat
probability=0.030649, class=n02127052 lynx, catamount
probability=0.016278, class=n02129604 tiger, Panthera tigris
```

**Next Step**

[Using MXNet-Neuron Model Serving](#)
Using MXNet-Neuron Model Serving

In this tutorial, you learn to use a pre-trained MXNet model to perform real-time image classification with Multi Model Server (MMS). MMS is a flexible and easy-to-use tool for serving deep learning models that are trained using any machine learning or deep learning framework. This tutorial includes a compilation step using AWS Neuron and an implementation of MMS using MXNet.

For more information about the Neuron SDK, see the AWS Neuron SDK documentation.

Contents

- Prerequisites
- Activate the Conda Environment
- Download the Example Code
- Compile the Model
- Run Inference

Prerequisites

Before using this tutorial, you should have completed the set up steps in Launching a DLAMI Instance with AWS Neuron. You should also have a familiarity with deep learning and using the DLAMI.

Activate the Conda Environment

Activate the MXNet-Neuron conda environment by using the following command:

```
source activate aws_neuron_mxnet_p36
```

To exit the current conda environment, run:

```
source deactivate
```

Download the Example Code

To run this example, download the example code using the following commands:

```
git clone https://github.com/awslabs/multi-model-server
cd multi-model-server/examples/mxnet_vision
```
Compile the Model

Create a Python script called `multi-model-server-compile.py` with the following content. This script compiles the ResNet50 model to the Inferentia device target.

```python
import mxnet as mx
from mxnet.contrib import neuron
import numpy as np

path='http://data.mxnet.io/models/imagenet/
mx.test_utils.download(path+'resnet/50-layers/resnet-50-0000.params')
mx.test_utils.download(path+'resnet/50-layers/resnet-50-symbol.json')
mx.test_utils.download(path+'synset.txt')

nn_name = "resnet-50"

#Load a model
sym, args, auxs = mx.model.load_checkpoint(nn_name, 0)

#Define compilation parameters#  - input shape and dtype
inputs = {'data' : mx.nd.zeros([1,3,224,224], dtype='float32') }

# compile graph to inferentia target
csym, cargs, cauxs = neuron.compile(sym, args, auxs, inputs)

# save compiled model
mx.model.save_checkpoint(nn_name + "_compiled", 0, csym, cargs, cauxs)
```

To compile the model, use the following command:

```bash
python multi-model-server-compile.py
```

Your output should look like the following:

```
...[21:18:40] src/nnvm/legacy_json_util.cc:209: Loading symbol saved by previous version v0.8.0. Attempting to upgrade...
[21:19:00] src/nnvm/legacy_json_util.cc:209: Loading symbol saved by previous version v0.8.0. Attempting to upgrade...
```
Create a file named `signature.json` with the following content to configure the input name and shape:

```json
{
  "inputs": [
    {
      "data_name": "data",
      "data_shape": [1, 3, 224, 224]
    }
  ]
}
```

Download the `synset.txt` file by using the following command. This file is a list of names for ImageNet prediction classes.

```
curl -0 https://s3.amazonaws.com/model-server/model_archive_1.0/examples/squeezenet_v1.1/synset.txt
```

Create a custom service class following the template in the `model_server_template` folder. Copy the template into your current working directory by using the following command:

```
cp -r ../model_service_template/* .
```

Edit the `mxnet_model_service.py` module to replace the `mx.cpu()` context with the `mx.neuron()` context as follows. You also need to comment out the unnecessary data copy for `model_input` because MXNet-Neuron does not support the NDArray and Gluon APIs.

```python
... 
self.mxnet_ctx = mx.neuron() if gpu_id is None else mx.gpu(gpu_id)
... 
#model_input = [item.as_in_context(self.mxnet_ctx) for item in model_input]
```

Package the model with model-archiver using the following commands:
Run Inference

Start the Multi Model Server and load the model that uses the RESTful API by using the following commands. Ensure that `neuron-rtd` is running with the default settings.

```
cd ~/multi-model-server/
multi-model-server --start --model-store examples > /dev/null # Pipe to log file if you want to keep a log of MMS
sleep 10 # allow sufficient time to load model
```

Run inference using an example image with the following commands:

```
curl -X POST http://127.0.0.1:8080/predictions/resnet-50_compiled -T kitten_small.jpg
```

Your output should look like the following:

```
[
  {
    "probability": 0.6388034820556641,
    "class": "n02123045 tabby, tabby cat"
  },
  {
    "probability": 0.16900072991847992,
    "class": "n02123159 tiger cat"
  },
  {
    "probability": 0.12221276015043259,
    "class": "n02124075 Egyptian cat"
  },
  {
    "probability": 0.028706775978207588,
    "class": "n02127052 lynx, catamount"
  }
]
```
To cleanup after the test, issue a delete command via the RESTful API and stop the model server using the following commands:

```bash
curl -X DELETE http://127.0.0.1:8081/models/resnet-50_compiled
```
```
multi-model-server --stop
```

You should see the following output:

```json
{
   "status": "Model "resnet-50_compiled" unregistered"
}
```

Model server stopped.
Found 1 models and 1 NCGs.
Unloading 10001 (MODEL_STATUS_STARTED) :: success
Destroying NCG 1 :: success

**Using PyTorch-Neuron and the AWS Neuron Compiler**

The PyTorch-Neuron compilation API provides a method to compile a model graph that you can run on an AWS Inferentia device.

A trained model must be compiled to an Inferentia target before it can be deployed on Inf1 instances. The following tutorial compiles the torchvision ResNet50 model and exports it as a saved TorchScript module. This model is then used to run inference.

For convenience, this tutorial uses an Inf1 instance for both compilation and inference. In practice, you may compile your model using another instance type, such as the c5 instance family. You must then deploy your compiled model to the Inf1 inference server. For more information, see the [AWS Neuron PyTorch SDK Documentation](#).

**Contents**

- [Prerequisites](#)
- [Activate the Conda Environment](#)
- [Resnet50 Compilation](#)
• **ResNet50 Inference**

**Prerequisites**

Before using this tutorial, you should have completed the set up steps in [Launching a DLAMI Instance with AWS Neuron](#). You should also have a familiarity with deep learning and using the DLAMI.

**Activate the Conda Environment**

Activate the PyTorch-Neuron conda environment using the following command:

```bash
source activate aws_neuron_pytorch_p36
```

To exit the current conda environment, run:

```bash
source deactivate
```

**Resnet50 Compilation**

Create a Python script called `pytorch_trace_resnet50.py` with the following content. This script uses the PyTorch-Neuron compilation Python API to compile a ResNet-50 model.

```python
import torch
import numpy as np
import os
import torch_neuron
from torchvision import models

image = torch.zeros([1, 3, 224, 224], dtype=torch.float32)
```

**Note**

There is a dependency between versions of torchvision and the torch package that you should be aware of when compiling torchvision models. These dependency rules can be managed through pip. Torchvision==0.6.1 matches the torch==1.5.1 release, while torchvision==0.8.2 matches the torch==1.7.1 release.
## Load a pretrained ResNet50 model

```python
model = models.resnet50(pretrained=True)
```

## Tell the model we are using it for evaluation (not training)

```python
model.eval()
```

```python
model_neuron = torch.neuron.trace(model, example_inputs=[image])
```

## Export to saved model

```python
model_neuron.save("resnet50_neuron.pt")
```

Run the compilation script.

```python
python pytorch_trace_resnet50.py
```

Compilation will take a few minutes. When compilation has finished, the compiled model is saved as `resnet50_neuron.pt` in the local directory.

**ResNet50 Inference**

Create a Python script called `pytorch_infer_resnet50.py` with the following content. This script downloads a sample image and uses it to run inference with the compiled model.

```python
import os
import time
import torch
import torch_neuron
import json
import numpy as np

from urllib import request
from torchvision import models, transforms, datasets

## Create an image directory containing a small kitten
os.makedirs("./torch_neuron_test/images", exist_ok=True)

## Fetch labels to output the top classifications
```
request.urlretrieve("https://s3.amazonaws.com/deep-learning-models/image-models/imagenet_class_index.json","imagenet_class_index.json")
idx2label = []

with open("imagenet_class_index.json", "r") as read_file:
    class_idx = json.load(read_file)
    idx2label = [class_idx[str(k)][1] for k in range(len(class_idx))]

## Import a sample image and normalize it into a tensor
normalize = transforms.Normalize(mean=[0.485, 0.456, 0.406],
                                      std=[0.229, 0.224, 0.225])

eval_dataset = datasets.ImageFolder(
    os.path.dirname("./torch_neuron_test/"),
    transforms.Compose([
        transforms.Resize([224, 224]),
        transforms.ToTensor(),
        normalize,
    ])
)

image, _ = eval_dataset[0]
image = torch.tensor(image.numpy()[np.newaxis, ...])

## Load model
model_neuron = torch.jit.load( 'resnet50_neuron.pt' )

## Predict
results = model_neuron( image )

# Get the top 5 results
top5_idx = results[0].sort()[1][-5:]

# Lookup and print the top 5 labels
top5_labels = [idx2label[idx] for idx in top5_idx]

print("Top 5 labels:
 {}".format(top5_labels))

Run inference with the compiled model using the following command:

python pytorch_infer_resnet50.py
Top 5 labels:
['tiger', 'lynx', 'tiger_cat', 'Egyptian_cat', 'tabby']

The ARM64 DLAMI

AWS ARM64 GPU DLAMIs are designed to provide high performance and cost efficiency for deep learning workloads. Specifically, the G5g instance type features the Arm64-based AWS Graviton2 processor, which was built from the ground up by AWS and optimized for how customers run their workloads in the cloud. AWS ARM64 GPU DLAMIs are pre-configured with Docker, NVIDIA Docker, NVIDIA Driver, CUDA, CuDNN, NCCL, as well as popular machine learning frameworks such as TensorFlow and PyTorch.

With the G5g instance type, you can take advantage of the price and performance benefits of Graviton2 to deploy GPU-accelerated deep learning models at a significantly lower cost when compared with x86-based instances with GPU acceleration.

Select a ARM64 DLAMI

Launch a G5g instance with the ARM64 DLAMI of your choice.

For step-by-step instructions on launching a DLAMI, see Launching and Configuring a DLAMI.

For a list of the most recent ARM64 DLAMIs, see the Release Notes for DLAMI.

Get Started

The following topics show you how to get started using the ARM64 DLAMI.

Contents

- Using the ARM64 GPU PyTorch DLAMI

Using the ARM64 GPU PyTorch DLAMI

The AWS Deep Learning AMI is ready to use with Arm64 processor-based GPUs, and comes optimized for PyTorch. The ARM64 GPU PyTorch DLAMI includes a Python environment pre-configured with PyTorch, TorchVision, and TorchServe for deep learning training and inference use cases.
Contents

- Verify PyTorch Python Environment
- Run Training Sample with PyTorch
- Run Inference Sample with PyTorch

Verify PyTorch Python Environment

Connect to your G5g instance and activate the base Conda environment with the following command:

```
source activate base
```

Your command prompt should indicate that you are working in the base Conda environment, which contains PyTorch, TorchVision, and other libraries.

```
(base) $
```

Verify the default tool paths of the PyTorch environment:

```
(base) $ which python
(base) $ which pip
(base) $ which conda
(base) $ which mamba
>>> import torch, torchvision
>>> torch.__version__
>>> torchvision.__version__
>>> v = torch.autograd.Variable(torch.randn(10, 3, 224, 224))
>>> v = torch.autograd.Variable(torch.randn(10, 3, 224, 224)).cuda()
>>> assert isinstance(v, torch.Tensor)
```

Run Training Sample with PyTorch

Run a sample MNIST training job:

```
git clone https://github.com/pytorch/examples.git
cd examples/mnist
python main.py
```
Your output should look similar to the following:

```
... 
Train Epoch: 14 [56320/60000 (94%)]    Loss: 0.021424 
Train Epoch: 14 [56960/60000 (95%)]    Loss: 0.023695 
Train Epoch: 14 [57600/60000 (96%)]    Loss: 0.001973 
Train Epoch: 14 [58240/60000 (97%)]    Loss: 0.007121 
Train Epoch: 14 [58880/60000 (98%)]    Loss: 0.003717 
Train Epoch: 14 [59520/60000 (99%)]    Loss: 0.001729 
Test set: Average loss: 0.0275, Accuracy: 9916/10000 (99%) 
```

**Run Inference Sample with PyTorch**

Use the following commands to download a pre-trained densenet161 model and run inference using TorchServe:

```
# Set up TorchServe
cd $HOME
git clone https://github.com/pytorch/serve.git
mkdir -p serve/model_store
cd serve

# Download a pre-trained densenet161 model
wget https://download.pytorch.org/models/densenet161-8d451a50.pth >/dev/null

# Save the model using torch-model-archiver
torch-model-archiver --model-name densenet161 \
   --version 1.0 \
   --model-file examples/image_classifier/densenet_161/model.py \
   --serialized-file densenet161-8d451a50.pth \
   --handler image_classifier \
   --extra-files examples/image_classifier/index_to_name.json \
   --export-path model_store

# Start the model server
torchserve --start --no-config-snapshots \
   --model-store model_store \
   --models densenet161=densenet161.mar &> torchserve.log

# Wait for the model server to start
sleep 30

# Run a prediction request
```
curl http://127.0.0.1:8080/predictions/densenet161 -T examples/image_classifier/kitten.jpg

Your output should look similar to the following:

```json
{
    "tiger_cat": 0.4693363308906555,
    "tabby": 0.4633873701095581,
    "Egyptian_cat": 0.06456123292446136,
    "lynx": 0.0012828150065615773,
    "plastic_bag": 0.00023322898778133094
}
```

Use the following commands to unregister the densenet161 model and stop the server:

```bash
curl -X DELETE http://localhost:8081/models/densenet161/1.0
torchserve --stop
```

Your output should look similar to the following:

```json
{
    "status": "Model "densenet161" unregistered"
}
```
TorchServe has stopped.

**Inference**

This section provides tutorials on how to run inference using the DLAMI's frameworks and tools.

**Inference Tools**

- [TensorFlow Serving](#)

**Model Serving**

The following are model serving options installed on the Deep Learning AMI with Conda. Click on one of the options to learn how to use it.

**Topics**

- [TensorFlow Serving](#)
TensorFlow Serving

TensorFlow Serving is a flexible, high-performance serving system for machine learning models.

The tensorflow-serving-api is pre-installed with Deep Learning AMI with Conda! You will find an example scripts to train, export, and serve an MNIST model in ~/examples/tensorflow-serving/.

To run any of these examples, first connect to your Deep Learning AMI with Conda and activate the TensorFlow environment.

```bash
$ source activate tensorflow2_p310
```

Now change directories to the serving example scripts folder.

```bash
$ cd ~/examples/tensorflow-serving/
```

Serve a Pretrained Inception Model

The following is an example you can try for serving different models like Inception. As a general rule, you need a servable model and client scripts to be already downloaded to your DLAMI.

Serve and Test Inference with an Inception Model

1. Download the model.

   ```bash
   $ curl -O https://s3-us-west-2.amazonaws.com/tf-test-models/INCEPTION.zip
   ```

2. Untar the model.

   ```bash
   $ unzip INCEPTION.zip
   ```

3. Download a picture of a husky.

   ```bash
   $ curl -O https://upload.wikimedia.org/wikipedia/commons/b/b5/Siberian_Husky_bicolored_Flickr.jpg
   ```

4. Launch the server. Note, that for Amazon Linux, you must change the directory used for model_base_path, from /home/ubuntu to /home/ec2-user.
5. With the server running in the foreground, you need to launch another terminal session to continue. Open a new terminal and activate TensorFlow with `source activate tensorflow2_p310`. Then use your preferred text editor to create a script that has the following content. Name it `inception_client.py`. This script will take an image filename as a parameter, and get a prediction result from the pre-trained model.

```python
from __future__ import print_function
import grpc
import tensorflow as tf
import argparse
from tensorflow_serving.apis import predict_pb2
from tensorflow_serving.apis import prediction_service_pb2_grpc

parser = argparse.ArgumentParser(description='TF Serving Test',
                                 formatter_class=argparse.ArgumentDefaultsHelpFormatter)
parser.add_argument('--server_address', default='localhost:9000',
                    help='Tensorflow Model Server Address')
parser.add_argument('--image', default='Siberian_Husky_bi-eyed_Flickr.jpg',
                    help='Path to the image')
args = parser.parse_args()

def main():
    channel = grpc.insecure_channel(args.server_address)
    stub = prediction_service_pb2_grpc.PredictionServiceStub(channel)
    # Send request
    with open(args.image, 'rb') as f:
        # See prediction_service.proto for gRPC request/response details.
        request = predict_pb2.PredictRequest()
        request.model_spec.name = 'INCEPTION'
        request.model_spec.signature_name = 'predict_images'
        input_name = 'images'
        input_shape = [1]
        input_data = f.read()
```
request.inputs[input_name].CopyFrom(
    tf.make_tensor_proto(input_data, shape=input_shape))
result = stub.Predict(request, 10.0)  # 10 secs timeout
print(result)
print("Inception Client Passed")
if __name__ == '__main__':
    main()

6. Now run the script passing the server location and port and the husky photo's filename as the parameters.

```
$ python3 inception_client.py --server=localhost:9000 --image Siberian_Husky_bied_Flickr.jpg
```

### Train and Serve an MNIST Model

For this tutorial we will export a model then serve it with the `tensorflow_model_server` application. Finally, you can test the model server with an example client script.

Run the script that will train and export an MNIST model. As the script's only argument, you need to provide a folder location for it to save the model. For now we can just put it in `mnist_model`. The script will create the folder for you.

```
$ python mnist_saved_model.py /tmp/mnist_model
```

Be patient, as this script may take a while before providing any output. When the training is complete and the model is finally exported you should see the following:

```
Done training!
Exporting trained model to mnist_model/1
Done exporting!
```

Your next step is to run `tensorflow_model_server` to serve the exported model.

```
$ tensorflow_model_server --port=9000 --model_name=mnist --model_base_path=/tmp/mnist_model
```
A client script is provided for you to test the server.

**To test it out, you will need to open a new terminal window.**

```
$ python mnist_client.py --num_tests=1000 --server=localhost:9000
```

**More Features and Examples**

If you are interested in learning more about TensorFlow Serving, check out the TensorFlow website.

You can also use TensorFlow Serving with Amazon Elastic Inference. Check out the guide on how to Use Elastic Inference with TensorFlow Serving for more info.

**TorchServe**

TorchServe is a flexible tool for serving deep learning models that have been exported from PyTorch. TorchServe comes preinstalled with the Deep Learning AMI with Conda.

For more information on using TorchServe, see Model Server for PyTorch Documentation.

**Topics**

**Serve an Image Classification Model on TorchServe**

This tutorial shows how to serve an image classification model with TorchServe. It uses a DenseNet-161 model provided by PyTorch. Once the server is running, it listens for prediction requests. When you upload an image, in this case, an image of a kitten, the server returns a prediction of the top 5 matching classes out of the classes that the model was trained on.

**To serve an example image classification model on TorchServe**

1. Connect to an Amazon Elastic Compute Cloud (Amazon EC2) instance with Deep Learning AMI with Conda v34 or later.
2. Activate the `pytorch_p310` environment.
   ```
   source activate pytorch_p310
   ```
3. Clone the TorchServe repository, then create a directory to store your models.
   ```
   git clone https://github.com/pytorch/serve.git
   mkdir model_store
   ```
4. Archive the model using the model archiver. The `extra-files` param uses a file from the TorchServe repo, so update the path if necessary. For more information about the model archiver, see [Torch Model archiver for TorchServe](#).

```
wget https://download.pytorch.org/models/densenet161-8d451a50.pth
torch-model-archiver --model-name densenet161 --version 1.0 --model-file .
serve/examples/image_classifier/densenet_161/model.py --serialized-file
densenet161-8d451a50.pth --export-path model_store --extra-files .serve/examples/
image_classifier/index_to_name.json --handler image_classifier
```

5. Run TorchServe to start an endpoint. Adding `> /dev/null` quiets the log output.

```
torchserve --start --ncs --model-store model_store --models densenet161.mar > /dev/null
```

6. Download an image of a kitten and send it to the TorchServe predict endpoint:

```
curl -O https://s3.amazonaws.com/model-server/inputs/kitten.jpg
curl http://127.0.0.1:8080/predictions/densenet161 -T kitten.jpg
```

The predict endpoint returns a prediction in JSON similar to the following top five predictions, where the image has a 47% probability of containing an Egyptian cat, followed by a 46% chance it has a tabby cat.

```
{
   "tiger_cat": 0.46933576464653015,
   "tabby": 0.463387668132782,
   "Egyptian_cat": 0.0645613968372345,
   "lynx": 0.0012828196631744504,
   "plastic_bag": 0.00023323058849200606
}
```

7. When you finish testing, stop the server:

```
torchserve --stop
```

**Other Examples**

TorchServe has a variety of examples that you can run on your DLAMI instance. You can view them on [the TorchServe project repository examples page](#).
More Info

For more TorchServe documentation, including how to set up TorchServe with Docker and the latest TorchServe features, see the TorchServe project page on GitHub.
Upgrading Your DLAMI

Here you will find information on upgrading your DLAMI and tips on updating software on your DLAMI.

Topics

- Upgrading to a New DLAMI Version
- Tips for Software Updates
- Receive Notifications on New Updates

Upgrading to a New DLAMI Version

DLAMI's system images are updated on a regular basis to take advantage of new deep learning framework releases, CUDA and other software updates, and performance tuning. If you have been using a DLAMI for some time and want to take advantage of an update, you would need to launch a new instance. You would also have to manually transfer any datasets, checkpoints, or other valuable data. Instead, you may use Amazon EBS to retain your data and attach it to a new DLAMI. In this way, you can upgrade often, while minimizing the time it takes to transition your data.

Note

When attaching and moving Amazon EBS volumes between DLAMIs, you must have both the DLAMIs and the new volume in the same Availability Zone.

1. Use the Amazon EC2console to create a new Amazon EBS volume. For detailed directions, see Creating an Amazon EBS Volume.
2. Attach your newly created Amazon EBS volume to your existing DLAMI. For detailed directions, see Attaching an Amazon EBS Volume.
3. Transfer your data, such as datasets, checkpoints, and configuration files.
4. Launch a DLAMI. For detailed directions, see Launching and Configuring a DLAMI.
5. Detach the Amazon EBS volume from your old DLAMI. For detailed directions, see Detaching an Amazon EBS Volume.
6. Attach the Amazon EBS volume to your new DLAMI. Follow the instructions from the Step 2 to attach the volume.
7. After you verify that your data is available on your new DLAMI, stop and terminate your old DLAMI. For detailed clean-up instructions, see Clean Up.

**Tips for Software Updates**

From time to time, you may want to manually update software on your DLAMI. It is generally recommended that you use pip to update Python packages. You should also use pip to update packages within a Conda environment on the Deep Learning AMI with Conda. Refer to the particular framework's or software's website for upgrading and installation instructions.

**Note**

We cannot guarantee that a package update will be successful. Attempting to update a package in an environment with incompatible dependencies can result in a failure. In such a case, you should contact the library maintainer to see if it is possible to update the package dependencies. Alternatively, you can attempt to modify the environment in such a way that allows the update. However, this modification will likely mean removing or updating existing packages, which means that we can no longer guarantee stability of this environment.

The AWS Deep Learning AMI comes with many Conda environments and many packages preinstalled. Due to the number of packages preinstalled, finding a set of packages that are guaranteed to be compatible is difficult. You may see a warning "The environment is inconsistent, please check the package plan carefully". DLAMI ensures that all the DLAMI-provided environments are correct, but cannot guarantee that any user installed packages will function correctly.

**Receive Notifications on New Updates**

**Note**

AWS Deep Learning AMIs have a weekly release cadence for security patches. Release notifications will be sent for these incremental security patches though they may not be included in official release notes.
You can receive notifications whenever a new DLAMI is released. Notifications are published with Amazon SNS using the following topic.

```
```

Messages are posted here when a new DLAMI is published. The version, metadata, and regional AMI ID's of the AMI will be included in the message.

These messages can be received using several different methods. We recommend that you use the following method.

1. Open the Amazon SNS console.
2. In the navigation bar, change the AWS Region to US West (Oregon), if necessary. You must select the region where the SNS notification that you're subscribing to was created.
3. In the navigation pane, choose Subscriptions, Create subscription.
4. For the Create subscription dialog box, do the following:
   a. For **Topic ARN**, copy and paste the following Amazon Resource Name (ARN): `arn:aws:sns:us-west-2:767397762724:dlami-updates`
   b. For **Protocol**, choose one from [Amazon SQS, AWS Lambda, Email, Email-JSON]
   c. For **Endpoint**, enter the email address or Amazon Resource Name (ARN) of resource that you will use to receive the notifications.
   d. Choose Create subscription.
5. You receive a confirmation email with the subject line AWS Notification - Subscription Confirmation. Open the email and choose Confirm subscription to complete your subscription.
Security in AWS Deep Learning AMI

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to DLAMI, see AWS Services in Scope by Compliance Program.

- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company’s requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using DLAMI. The following topics show you how to configure DLAMI to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your DLAMI resources.

For more information, see Security in Amazon EC2.

Topics

- Data Protection in AWS Deep Learning AMI

- Compliance Validation for AWS Deep Learning AMI
- Resilience in AWS Deep Learning AMI
- Infrastructure Security in AWS Deep Learning AMI
Data Protection in AWS Deep Learning AMI

The AWS shared responsibility model applies to data protection in AWS Deep Learning AMI. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers’ email addresses, into tags or free-form text fields such as a Name field. This includes when you work with DLAMI or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Identity and Access Management in AWS Deep Learning AMI

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be authenticated (signed in)
and authorized (have permissions) to use DLAMI resources. IAM is an AWS service that you can use with no additional charge.

For more information on Identity and Access Management, see Identity and Access Management for Amazon EC2.

Topics

- Authenticating With Identities
- Managing Access Using Policies
- IAM with Amazon EMR

Authenticating With Identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.

You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see How to sign in to your AWS account in the AWS Sign-In User Guide.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see Signing AWS API requests in the IAM User Guide.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Multi-factor authentication in the AWS IAM Identity Center User Guide and Using multi-factor authentication (MFA) in AWS in the IAM User Guide.
AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the IAM User Guide.

IAM Users and Groups

An IAM user is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the IAM User Guide.

An IAM group is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named IAMAdmins and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see When to create an IAM user (instead of a role) in the IAM User Guide.

IAM Roles

An IAM role is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

IAM roles with temporary credentials are useful in the following situations:
• **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see [Creating a role for a third-party Identity Provider](#) in the IAM User Guide. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see [Permission sets](#) in the AWS IAM Identity Center User Guide.

• **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.

• **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see [Cross account resource access in IAM](#) in the IAM User Guide.

• **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.

• **Forward access sessions (FAS)** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. When you use some services, you might perform an action that then initiates another action in a different service. FAS uses the permissions of the principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. FAS requests are only made when a service receives a request that requires interactions with other AWS services or resources to complete. In this case, you must have permissions to perform both actions. For policy details when making FAS requests, see [Forward access sessions](#).

• **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the IAM User Guide.

• **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.
• **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_instance-profiles.html) in the *IAM User Guide*.

To learn whether to use IAM roles or IAM users, see [When to create an IAM role (instead of a user)](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_manage.html) in the *IAM User Guide*.

### Managing Access Using Policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see [Overview of JSON policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_policiesoverview.html) in the *IAM User Guide*.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

### Identity-Based Policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Creating IAM policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_policiescreate-base_policy.html) in the *IAM User Guide*.
Identity-based policies can be further categorized as inline policies or managed policies. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choosing between managed policies and inline policies in the IAM User Guide.

**Resource-Based Policies**

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

**Access Control Lists (ACLs)**

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the Amazon Simple Storage Service Developer Guide.

**Other Policy Types**

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based
policies that specify the user or role in the Principal field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the IAM User Guide.

- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the AWS Organizations User Guide.

- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the IAM User Guide.

**Multiple Policy Types**

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the IAM User Guide.

**IAM with Amazon EMR**

You can use AWS Identity and Access Management with Amazon EMR to define users, AWS resources, groups, roles, and policies. You can also control which AWS services these users and roles can access.

For more information on using IAM with Amazon EMR, see AWS Identity and Access Management for Amazon EMR.

**Logging and Monitoring in AWS Deep Learning AMI**

Your AWS Deep Learning AMI instance comes with several GPU monitoring tools including a utility that reports GPU usage statistics to Amazon CloudWatch. For more information, see GPU Monitoring and Optimization and Monitoring Amazon EC2.
Usage Tracking

The following AWS Deep Learning AMI operating system distributions include code that allows AWS to collect instance type, instance ID, DLAMI type, and OS information. No information on the commands used within the DLAMI is collected or retained. No other information about the DLAMI is collected or retained.

- Ubuntu 16.04
- Ubuntu 18.04
- Ubuntu 20.04
- Amazon Linux 2

To opt out of usage tracking for your DLAMI, add a tag to your Amazon EC2 instance during launch. The tag should use the key OPT_OUT_TRACKING with the associated value set to true. For more information, see Tag your Amazon EC2 resources.

Compliance Validation for AWS Deep Learning AMI

Third-party auditors assess the security and compliance of AWS Deep Learning AMI as part of multiple AWS compliance programs. For information on the supported compliance programs, see Compliance Validation for Amazon EC2.

For a list of AWS services in scope of specific compliance programs, see AWS Services in Scope by Compliance Program. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using DLAMI is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- Security and Compliance Quick Start Guides – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- AWS Compliance Resources – This collection of workbooks and guides might apply to your industry and location.
• **Evaluating Resources with Rules** in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.

• **AWS Security Hub** – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.

### Resilience in AWS Deep Learning AMI

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see [AWS Global Infrastructure](https://aws.amazon.com/global-infrastructure/).

For information on features to help support your data resiliency and backup needs, see [Resilience in Amazon EC2](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/using-resilience.html).

### Infrastructure Security in AWS Deep Learning AMI

The infrastructure security of AWS Deep Learning AMI is backed by Amazon EC2. For more information, see [Infrastructure Security in Amazon EC2](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/using-security-with-ec2.html).
Important Changes to DLAMI

Frequently Asked Questions

- What is changing?
- Why is this change required?
- Which DLAMIs are affected by this change?
- What does this mean for you?
- When should you start using the new DLAMIs?
- Will there be any loss in functionality with the new DLAMIs?
- What about DLCs?

What is changing?

On 11/15/2023 AWS Deep Learning AMI (DLAMIs) will be split into two separate groups:

- DLAMIs that use Nvidia proprietary driver (to support P3, P3dn, G3).
- DLAMIs that use Nvidia OSS driver (to support G4dn, G5, P4, P5).

As a result, new DLAMIs will be created for each of the two categories with new names and new AMI IDs. These DLAMIs will not be interchangeable - i.e. DLAMIs from one group will not support instances supported by the other group e.g. the DLAMI supporting p5 will not support g3 and vice-versa.
Why is this change required?

Currently DLAMIs for NVIDIA GPUs include a proprietary kernel driver from NVIDIA. However, recently the upstream Linux kernel community accepted a change that isolates proprietary kernel drivers, such as the NVIDIA GPU driver, from communicating with other kernel drivers. This change disables GPUDirect RDMA on P4/P5 series instances, which is the mechanism that allows GPUs to efficiently use EFA for distributed training. As a result DLAMIs will use OpenRM driver (NVIDIA open source driver), linked against the open source EFA drivers to support G4dn,G5, P4 and P5. However, this OpenRM driver won't support older instances (P3, G3 etc.) Therefore, in order to ensure that we continue to provide current, performant and secure DLAMIs supporting both types of instances we will split DLAMIs into two groups - one with the OpenRM driver (supporting G4dn,G5, P4 and P5 ) and one with the older proprietary driver (supporting older instances P3, P3dn, G3).

Which DLAMIs are affected by this change?

All DLAMIs are affected by this change.
What does this mean for you?

The new DLAMIs will continue to provide functionality, performance and security of the current DLAMIs as long as they are run on a compatible instance type. If you are using DLAMIs then you will need to ensure that a DLAMI is launched on one of the compatible instances mentioned in the release notes of each DLAMI (see here). For example: you will need to accommodate this change to:

- Invoke DLAMIs with the right CLI queries (see below)
- Launch DLAMIs from console and CLI on a compatible instance type

If you are launching DLAMIs from EC2 console Quickstart: Each DLAMI description lists the types of instances supported in EC2 console. You should launch the DLAMIs on compatible instances.

If you are launching DLAMIs using CLI then you will have to modify your queries. For example:

Currently the following CLI query is used for base DLAMIs that support all instances [P3, P3dn, G3, G4dn, G5, P4, P5]:

```
aws ec2 describe-images --region us-east-1 --owners amazon \
--filters 'Name=name,Values=Deep Learning Base AMI (Amazon Linux 2) ?????' 'Name=state,Values=available' \ 
--query 'reverse(sort_by(Images, &CreationDate))[1].ImageId' --output text
```

The new CLI queries will be:

For base DLAMI supporting P3, P3dn, and G3:

```
aws ec2 describe-images --region us-east-1 --owners amazon \
--filters 'Name=name,Values=Deep Learning Base Proprietary Nvidia Driver AMI (Amazon Linux 2) Version ??.' 'Name=state,Values=available' \ 
--query 'reverse(sort_by(Images, &CreationDate))[1].ImageId' --output text
```
For base DLAMI supporting G4dn, G5, P4, and P5:

```bash
aws ec2 describe-images --region us-east-1 --owners amazon \
--filters 'Name=name,Values=Deep Learning Base OSS Nvidia Driver AMI (Amazon Linux 2) 
Version ??.?' 'Name=state,Values=available' \
--query 'reverse(sort_by(Images, &CreationDate))[1].ImageId' --output text
```

Please refer to updated release notes for new AMIs [here](#). For how to launch AMIs on EC2 instances please refer to instructions [here](#).

**When should you start using the new DLAMIs?**

You should start using the new DLAMIs as soon as possible for the latest frameworks, dependencies, patches and functionality. Optionally, if you are using Amazon Linux 2 DLAMIs released before 11/8/2023, then you may choose to continue live patching their DLAMIs (see instructions [here](#) until 11/30/2023.

**Will there be any loss in functionality with the new DLAMIs?**

No, there is no loss of functionality with the new DLAMIs. The new DLAMIs after the split will continue to provide all functionality, performance and security of the old DLAMIs before split, as long as they are run on a compatible instance. We are splitting the DLAMIs into two groups so that we continue to offer DLAMIs that are current, performant and secure for your use on a broad range of instances.

**What about DLCs?**

DLCs do not include the NVIDIA driver so they are not affected by this change. But you should ensure that the DLCs are run on AMIs that are compatible with the underlying instances.

FAQ

Q. How do I keep track of product announcements related to DLAMI?

Here are two suggestions for this:

- Bookmark this blog category, "AWS Deep Learning AMIs" found here: Updated List of Articles Related to Deep Learning AMIs.
- "Watch" the Forum: AWS Deep Learning AMIs

Q. Are the NVIDIA drivers and CUDA installed?

Yes. Some DLAMIs have different versions. The Deep Learning AMI with Conda has the most recent versions of any DLAMI. This is covered in more detail in CUDA Installations and Framework Bindings. You can also refer to the specific AMI's release notes to confirm what is installed.
• Q. Is cuDNN installed?

Yes.

• Q. How do I see that the GPUs are detected and their current status?

Run `nvidia-smi`. This will show one or more GPUs, depending on the instance type, along with their current memory consumption.

• Q. Are virtual environments set up for me?

Yes, but only on the Deep Learning AMI with Conda.

• Q. What version of Python is installed?

Each DLAMI has both Python 2 and 3. The Deep Learning AMI with Conda have environments for both versions for each framework.

• Q. Is Keras installed?

This depends on the AMI. The Deep Learning AMI with Conda has Keras available as a front end for each framework. The version of Keras depends on the framework's support for it.

• Q. Is it free?

All of the DLAMIs are free. However, depending on the instance type you choose, the instance may not be free. See Pricing for the DLAMI for more info.

• Q. I'm getting CUDA errors or GPU-related messages from my framework. What's wrong?

Check what instance type you used. It needs to have a GPU for many examples and tutorials to work. If running `nvidia-smi` shows no GPU, then you need to spin up another DLAMI using an instance with one or more GPUs. See Selecting the Instance Type for DLAMI for more info.

• Q. Can I use Docker?

Docker has been pre-installed since version 14 of the Deep Learning AMI with Conda. Note that you will want to use `nvidia-docker` on GPU instances to make use of the GPU.

• Q. What regions are Linux DLAMIs available in?

Release Notes for DLAMI

Note

AWS Deep Learning AMIs have a nightly release cadence for security patches. These incremental security patches are not included in official release notes.

Please reference the DLAMI Support Policy page for any unsupported framework release notes.

Base DLAMI

GPU

- X86
  - AWS Deep Learning Base AMI (Amazon Linux 2)
  - AWS Deep Learning Base AMI (Ubuntu 22.04)
  - AWS Deep Learning Base AMI (Ubuntu 20.04)

- ARM64
  - AWS Deep Learning Base ARM64 AMI (Ubuntu 22.04)
  - AWS Deep Learning Base ARM64 AMI (Amazon Linux 2)

AWS Neuron

- X86
  - AWS Deep Learning Base AMI Neuron (Amazon Linux 2)
  - AWS Deep Learning Base AMI Neuron (Ubuntu 20.04)

Qualcomm

- X86
  - AWS Deep Learning Base Qualcomm AMI (Amazon Linux 2)
Single-Framework DLAMI

PyTorch-Specific AMI

GPU

- **X86**
  - AWS Deep Learning AMI GPU PyTorch 2.3 (Ubuntu 20.04)
  - AWS Deep Learning AMI GPU PyTorch 2.3 (Amazon Linux 2)
  - AWS Deep Learning AMI GPU PyTorch 2.2 (Ubuntu 20.04)
  - AWS Deep Learning AMI GPU PyTorch 2.2 (Amazon Linux 2)
  - AWS Deep Learning AMI GPU PyTorch 1.13 (Amazon Linux 2)
  - AWS Deep Learning AMI GPU PyTorch 1.13 (Ubuntu 20.04)

- **ARM64**
  - AWS Deep Learning ARM64 AMI GPU PyTorch 2.3 (Ubuntu 22.04)
  - AWS Deep Learning ARM64 AMI GPU PyTorch 2.2 (Ubuntu 20.04)

AWS Neuron

- **X86**
  - AWS Deep Learning AMI Neuron PyTorch 1.13 (Amazon Linux 2)
  - AWS Deep Learning AMI Neuron PyTorch 1.13 (Ubuntu 20.04)

TensorFlow-Specific AMI

GPU

- **X86**
  - AWS Deep Learning AMI GPU TensorFlow 2.16 (Amazon Linux 2)
  - AWS Deep Learning AMI GPU TensorFlow 2.16 (Ubuntu 20.04)
  - AWS Deep Learning AMI GPU TensorFlow 2.15 (Amazon Linux 2)
  - AWS Deep Learning AMI GPU TensorFlow 2.15 (Ubuntu 20.04)
  - AWS Deep Learning AMI GPU TensorFlow 2.13 (Amazon Linux 2)
  - AWS Deep Learning AMI GPU TensorFlow 2.13 (Ubuntu 20.04)
AWS Neuron

- X86
  - AWS Deep Learning AMI Neuron TensorFlow 2.10 (Amazon Linux 2)
  - AWS Deep Learning AMI Neuron TensorFlow 2.10 (Ubuntu 20.04)

Multi-Framework DLAMI

**Note**

If you only use one machine learning framework, we recommend a Single-Framework DLAMI

GPU

- X86
  - AWS Deep Learning AMI (Amazon Linux 2)

AWS Neuron

- X86
  - AWS Deep Learning AMI Neuron (Ubuntu 22.04)
# DLAMI Deprecation Notices

The following table lists information on deprecated features in the AWS Deep Learning AMI.

<table>
<thead>
<tr>
<th>Deprecated Feature</th>
<th>Deprecation Date</th>
<th>Deprecation Notice</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ubuntu 16.04</td>
<td>10/07/2021</td>
<td>Ubuntu Linux 16.04 LTS reached the end of its five-year LTS window on April 30, 2021 and is no longer supported by its vendor. There are no longer updates to the Deep Learning Base AMI (Ubuntu 16.04) in new releases as of October 2021. Previous releases will continue to be available.</td>
</tr>
<tr>
<td>Amazon Linux</td>
<td>10/07/2021</td>
<td>Amazon Linux is end-of-life as of December 2020. There are no longer updates to the Deep Learning AMI (Amazon Linux) in new releases as of October 2021. Previous releases of the Deep Learning AMI (Amazon Linux) will continue to be available.</td>
</tr>
</tbody>
</table>
| Chainer            | 07/01/2020       | Chainer has announced the end of major releases as of December, 2019. Consequently, we will no longer include Chainer Conda environments on
<table>
<thead>
<tr>
<th>Deprecated Feature</th>
<th>Deprecation Date</th>
<th>Deprecation Notice</th>
</tr>
</thead>
<tbody>
<tr>
<td>the DLAMI starting July 2020. Previous releases of the DLAMI that contain these environments will continue to be available. We will provide updates to these environments only if there are security fixes published by the open source community for these frameworks.</td>
<td>06/15/2020</td>
<td>Due to customer requests, we are moving to Python 3.7 for new TF/MX/PT releases.</td>
</tr>
<tr>
<td>Python 3.7</td>
<td>01/01/2020</td>
<td>The Python open source community has officially ended support for Python 2. The TensorFlow, PyTorch, and MXNet communities have also announced that TensorFlow 1.15, TensorFlow 2.1, PyTorch 1.4, and MXNet 1.6.0 releases will be the last ones supporting Python 2.</td>
</tr>
</tbody>
</table>
## Document History for AWS Deep Learning AMI Developer Guide

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ARM64 DLAMI</strong></td>
<td>The AWS Deep Learning AMI now supports images on Arm64 processor-based GPUs.</td>
<td>November 29, 2021</td>
</tr>
<tr>
<td><strong>TensorFlow 2</strong></td>
<td>The Deep Learning AMI with Conda now comes with TensorFlow 2 with CUDA 10.</td>
<td>December 3, 2019</td>
</tr>
<tr>
<td><strong>AWS Inferentia</strong></td>
<td>The Deep Learning AMI now supports AWS Inferentia hardware and the AWS Neuron SDK.</td>
<td>December 3, 2019</td>
</tr>
<tr>
<td><strong>Using TensorFlow Serving with an Inception Model</strong></td>
<td>An example for using inference with an Inception model was added for TensorFlow Serving, for both with and without Elastic Inference.</td>
<td>November 28, 2018</td>
</tr>
<tr>
<td><strong>Elastic Inference</strong></td>
<td>Elastic inference prerequisites and related info was added to the setup guide.</td>
<td>November 28, 2018</td>
</tr>
<tr>
<td><strong>Installing PyTorch from a Nightly Build</strong></td>
<td>A tutorial was added that covers how you can uninstall PyTorch, then install a nightly build of PyTorch on your Deep Learning AMI with Conda.</td>
<td>September 25, 2018</td>
</tr>
<tr>
<td><strong>Docker is now pre-installed on your DLAMI</strong></td>
<td>Since v14 of the Deep Learning AMI with Conda,</td>
<td>September 25, 2018</td>
</tr>
</tbody>
</table>
Docker and NVIDIA's version of Docker for GPUs has been pre-installed.

Conda Tutorial
The example MOTD was updated to reflect a more recent release. July 23, 2018

Earlier Updates:

The following table describes important changes in each release of the AWS Deep Learning AMI before July, 2018.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>TensorFlow with Horovod</td>
<td>Added a tutorial for training ImageNet with TensorFlow and Horovod.</td>
<td>June 6, 2018</td>
</tr>
<tr>
<td>Upgrading guide</td>
<td>Added the upgrading guide.</td>
<td>May 15, 2018</td>
</tr>
<tr>
<td>New regions and new 10 minute tutorial</td>
<td>New regions added: US West (N. California), South America, Canada (Central), EU (London), and EU (Paris). Also, the first release of a 10-minute tutorial titled: &quot;Getting Started with Deep Learning AMI&quot;.</td>
<td>April 26, 2018</td>
</tr>
<tr>
<td>Chainer tutorial</td>
<td>A tutorial for using Chainer in multi-GPU, single GPU, and CPU modes was added. CUDA integration was upgraded from CUDA 8 to CUDA 9 for several frameworks.</td>
<td>February 28, 2018</td>
</tr>
<tr>
<td>Change</td>
<td>Description</td>
<td>Date</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>Linux AMIs v3.0, plus introduction of MXNet Model Server, TensorFlow Serving, and TensorBoard</td>
<td>Added tutorials for Conda AMIs with new model and visualization serving capabilities using MXNet Model Server v0.1.5, TensorFlow Serving v1.4.0, and TensorBoard v0.4.0. AMI and framework CUDA capabilities described in Conda and CUDA overviews. Latest release notes moved to <a href="https://aws.amazon.com/releases/">https://aws.amazon.com/releases/</a></td>
<td>January 25, 2018</td>
</tr>
<tr>
<td>Linux AMIs v2.0</td>
<td>Base, Source, and Conda AMIs updated with NCCL 2.1. Source and Conda AMIs updated with MXNet v1.0, PyTorch 0.3.0, and Keras 2.0.9.</td>
<td>December 11, 2017</td>
</tr>
<tr>
<td>Two Windows AMI options added</td>
<td>Windows 2012 R2 and 2016 AMIs released: added to AMI selection guide and added to release notes.</td>
<td>November 30, 2017</td>
</tr>
<tr>
<td>Initial documentation release</td>
<td>Detailed description of change with link to topic/section that was changed.</td>
<td>November 15, 2017</td>
</tr>
</tbody>
</table>
