# About Amazon EMR Releases

An Amazon EMR release is a set of open-source applications from the big-data ecosystem. Each release comprises different big-data applications, components, and features that you select to have Amazon EMR install and configure when you create a cluster. Applications are packaged using a system based on [Apache BigTop](#), which is an open-source project associated with the Hadoop ecosystem. This guide provides information for applications included in Amazon EMR releases.

For more information about getting started and working with Amazon EMR, see the [Amazon EMR Management Guide](#).

When you launch a cluster, you can choose from multiple releases of Amazon EMR. This allows you to test and use application versions that fit your compatibility requirements. You specify the release number with the *release label*. Release labels are in the form `emr-x.x.x`. For example, `emr-7.0.0`.

Beginning with Amazon EMR 5.18.0, you can use the Amazon EMR artifact repository to build your job code against the exact versions of libraries and dependencies that are available with specific Amazon EMR releases. For more information, see [Checking dependencies using the Amazon EMR artifact repository](#).

To get updates when a new Amazon EMR release is available, subscribe to the [RSS feed for Amazon EMR release notes](#).

- [Amazon EMR Release 6.15.0](#)
- [Amazon EMR Release 5.36.1](#)

## Note

New Amazon EMR releases are made available in different Regions over a period of several days, beginning with the first Region on the initial release date. The latest release version may not be available in your Region during this period.

## Amazon EMR 7.x release versions

This section contains application versions, release notes, component versions, and configuration classifications available in each Amazon EMR 7.x release version.

When you launch a cluster, you can choose from multiple releases of Amazon EMR. This allows you to test and use application versions that fit your compatibility requirements. You specify the release number with the *release label*. Release labels are in the form `emr-x.x.x`. For example, `emr-7.0.0`.

New Amazon EMR releases are made available in different Regions over a period of several days, beginning with the first Region on the initial release date. The latest release version may not be available in your Region during this period.

## 7.0.0 release notes

The following release notes include information for Amazon EMR release 7.0.0. Changes are relative to 6.15.0.

### New features

- **Application upgrades** – Amazon EMR 7.0.0 application upgrades include Python 3.9, Spark 3.5, Flink 1.18, and Delta 3.0. This release also adds support for the [Amazon CloudWatch agent](#) application and removes support for Ganglia.
- **Amazon Corretto 17** – Amazon EMR releases 7.0 and higher ship with Amazon Corretto 17 (built on OpenJDK) by default for applications that support Corretto 17 (JDK 17), with the exception of Apache Livy. For more information about the supported JDK versions for applications in this release, see [7.0.0 default Java versions](#).
- **Amazon Linux 2023** – With the 7.0 release, Amazon EMR clusters now run on AL2023 by default. For information on how this affects the default AMI version, see [Software update considerations](#) in the *Amazon EMR Management Guide*. Also note that AL2023 removed Python 2.7, so any components that require Python should now be written with Python 3.
- **S3 on Outposts with s3a** – Amazon EMR now supports Amazon S3 on Outposts buckets with the s3a file system. For more information about S3 on Outposts, see [What is S3 on Outposts?](#) in the *Amazon Simple Storage Service User Guide*.

## Known issues

- Note that you can't run more than one line at a time if you are using PySpark with Python versions 3.10 or later. You must run each line one at a time.

## Changes, enhancements, and resolved issues

- To maintain the state of all the instances in a cluster, Amazon EMR integrates with Apache YARN, Apache HDFS, and Kerberos. With 7.0, we enhanced these integrations to reliably remove the state of instances that are terminated due to scaling or other operations. This is particularly important for long-lived clusters that have managed scaling enabled, as they scale frequently and accumulate thousands of terminated instances over their lifetimes.
- This release improves the Kerberos configuration to only include support for AES-based ciphers. Kerberos KDC with non-AES based ciphers are no longer supported with EMR clusters that run on Amazon EMR releases 7.0.0 and higher. AES-based ciphers offer the strongest security for your clusters.
- As part of the AWS SDK 2.x migration, Amazon EMR 7.0 includes an update to the Spark Kinesis connector for compatibility. This update isn't available in the community version of Apache Spark. If you use the Spark Kinesis connector from an Amazon EMR release lower than 7.0, you must migrate your application codes to run on SDK 2.x before you can migrate your workloads to Amazon EMR 7.0. For more information, see [Migrating Spark Kinesis connector to SDK 2.x for Amazon EMR 7.0](#).
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

## 7.0.0 default Java versions

Amazon EMR release 7.0 and higher ships with Amazon Corretto 17 (built on OpenJDK) by default for applications that support Corretto 17 (JDK 17), with the exception of Apache Livy.

The following table shows the default Java versions for applications in Amazon EMR 7.0.0. If you want to change the default JVM on your cluster, follow the instructions in [Configure applications to use a specific Java Virtual Machine](#) for each application that runs on the cluster. You can only use one Java runtime version for a cluster. Amazon EMR doesn't support running different nodes or applications on different runtime versions on the same cluster.

## 7.0.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## Amazon EMR 6.x release versions

This section contains application versions, release notes, component versions, and configuration classifications available in each Amazon EMR 6.x release version.

When you launch a cluster, you can choose from multiple releases of Amazon EMR. This allows you to test and use application versions that fit your compatibility requirements. You specify the release number with the *release label*. Release labels are in the form `emr-x.x.x`. For example, `emr-7.0.0`.

New Amazon EMR releases are made available in different Regions over a period of several days, beginning with the first Region on the initial release date. The latest release version may not be available in your Region during this period.

For a comprehensive table of application versions in every Amazon EMR 6.x release, see [Application versions in Amazon EMR 6.x releases](#).

## 6.15.0 release notes

The following release notes include information for Amazon EMR release 6.15.0. Changes are relative to 6.14.0. For information on the release timeline, see the [6.15.0 change log](#).

### New features

- **Application upgrades** – Amazon EMR 6.15.0 application upgrades include Apache Hadoop 3.3.6, Apache Hudi 0.14.0-amzn-0, Iceberg 1.4.0-amzn-0, and Trino 426.
- **[Faster launches for EMR clusters that run on EC2](#)** – It's now up to 35% faster to launch an Amazon EMR on EC2 cluster. With this improvement, most customers can launch their clusters in 5 minutes or less.
- **[CodeWhisperer for EMR Studio](#)** – You can now use Amazon CodeWhisperer with Amazon EMR Studio to get real-time recommendations as you write code in JupyterLab. CodeWhisperer can complete your comments, finish single lines of code, make line-by-line recommendations, and generate fully-formed functions.
- **[Faster job restart times with Flink](#)** – With Amazon EMR 6.15.0 and higher, several new mechanisms are available for Apache Flink to improve the job restart time during task recovery

or scaling operations. This optimizes the speed of recovery and restart of execution graphs to improve job stability.

- **[Table-level and fine-grained access control for open-table formats](#)** – With Amazon EMR 6.15.0 and higher, when you run Spark jobs on Amazon EMR on EC2 clusters that access data in the AWS Glue Data Catalog, you can use AWS Lake Formation to apply table, row, column, and cell level permissions on Hudi, Iceberg, or Delta Lake based tables.
- **Hadoop upgrade** – Amazon EMR 6.15.0 includes an upgrade of Apache Hadoop to version 3.3.6. Hadoop 3.3.6 was the latest version at the time of the Amazon EMR 6.15 deployment, released by Apache in June 2023. Prior releases of Amazon EMR (6.9.0 to 6.14.x) used Hadoop 3.3.3.

The upgrade includes hundreds of improvements and fixes, and features that include reconfigurable datanode parameters, DFSAdmin option to initiate bulk reconfiguration operations on all live datanodes, and a vectored API that allows seek-heavy readers to specify multiple ranges to read. Hadoop 3.3.6 also adds support for HDFS APIs and semantics for its write-ahead log (WAL), so that HBase can run on other storage system implementations. For more information, see the changelogs for versions [3.3.4](#), [3.3.5](#), and [3.3.6](#) in the *Apache Hadoop documentation*.

- **Support for AWS SDK for Java, version 2** - Amazon EMR 6.15.0 applications can use AWS SDK for Java versions [1.12.569](#) or [2.20.160](#) if the application supports v2. The AWS SDK for Java 2.x is a major rewrite of the version 1.x code base. It's built on top of Java 8+ and adds several frequently requested features. These include support for non-blocking I/O, and the ability to plug in a different HTTP implementation at runtime. For more information, including a **Migration Guide from SDK for Java v1 to v2**, see the [AWS SDK for Java, version 2](#) guide.

## Changes, enhancements, and resolved issues

- To improve your high-availability EMR clusters, this release enables connectivity to Amazon EMR daemons on local host that use IPv6 endpoints.
- This release enables TLS 1.2 for communication with ZooKeeper provisioned on all the primary nodes of your high-availability cluster.
- This release improves the management of ZooKeeper transaction log files that are maintained on primary nodes to minimize scenarios where the log files grow out of bounds and interrupt cluster operations.
- This release makes intra-node communication more resilient for high-availability EMR clusters. This improvement reduces the chance of bootstrap action failures or cluster start failures.

- Tez in Amazon EMR 6.15.0 introduces configurations that you can specify to asynchronously open the input splits in a Tez grouped split. This results in faster performance of read queries when there are a large number of input splits in a single Tez grouped split. For more information, see [Tez asynchronous split opening](#).
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

## 6.15.0 default Java versions

Amazon EMR releases 6.12.0 and higher support all applications with Amazon Corretto 8 by default, except for Trino. For Trino, Amazon EMR supports Amazon Corretto 17 by default starting with Amazon EMR release 6.9.0. Amazon EMR also supports some applications with Amazon Corretto 11 and 17. Those applications are listed in the following table. If you want to change the default JVM on your cluster, follow the instructions in [Configure applications to use a specific Java Virtual Machine](#) for each application that runs on the cluster. You can only use one Java runtime version for a cluster. Amazon EMR doesn't support running different nodes or applications on different runtime versions on the same cluster.

While Amazon EMR supports both Amazon Corretto 11 and 17 on Apache Spark, Apache Hadoop, and Apache Hive, performance might regress for some workloads when you use these versions of Corretto. We recommend that you test your workloads before you change defaults.

The following table shows the default Java versions for applications in Amazon EMR 6.15.0:

Application	Java / Amazon Corretto version (default is bold)
Delta	17, 11, <b>8</b>
Flink	11, <b>8</b>

## 6.15.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.15.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.14.0 release notes

The following release notes include information for Amazon EMR release 6.14.0. Changes are relative to 6.13.0. For information on the release timeline, see the [6.14.0 change log](#).

### New features

- Amazon EMR 6.14.0 supports Apache Spark 3.4.1, Apache Spark RAPIDS 23.06.0-amzn-2, Flink 1.17.1, Iceberg 1.3.1, and Trino 422.
- [Amazon EMR managed scaling](#) is now available in the ap-southeast-3 Asia Pacific (Jakarta) Region for clusters that you create with Amazon EMR 6.14.0 and higher.

## Changes, enhancements, and resolved issues

- The 6.14.0 release optimizes log management with Amazon EMR running on Amazon EC2. As a result, you might see a slight reduction in storage costs for your cluster logs.
- The 6.14.0 release improves the scaling workflow to account for different core instances that have a substantial variation in size for their Amazon EBS volumes. This improvement applies to core nodes only; scale-down operations for task nodes aren't affected.
- The 6.14.0 release improves the way that Amazon EMR interacts with open-source applications such as Apache Hadoop YARN ResourceManager and HDFS NameNode. This improvement reduces the risk of operational delays with cluster scaling, and mitigates startup failures that occur due to connectivity issues with the open-source applications.
- The 6.14.0 release optimizes application installation at cluster launch. This improves the cluster startup times for certain combinations of Amazon EMR applications.
- The 6.14.0 release fixes an issue where cluster scale-down operations might stall when a cluster that's running in a VPC with a custom domain encounters a core or task node restart.
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

## 6.14.0 default Java versions

Amazon EMR releases 6.12.0 and higher support all applications with Amazon Corretto 8 by default, except for Trino. For Trino, Amazon EMR supports Amazon Corretto 17 by default starting

with Amazon EMR release 6.9.0. Amazon EMR also supports some applications with Amazon Corretto 11 and 17. Those applications are listed in the following table. If you want to change the default JVM on your cluster, follow the instructions in [Configure applications to use a specific Java Virtual Machine](#) for each application that runs on the cluster. You can only use one Java runtime version for a cluster. Amazon EMR doesn't support running different nodes or applications on different runtime versions on the same cluster.

While Amazon EMR supports both Amazon Corretto 11 and 17 on Apache Spark, Apache Hadoop, and Apache Hive, performance might regress for some workloads when you use these versions of Corretto. We recommend that you test your workloads before you change defaults.

The following table shows the default Java versions for applications in Amazon EMR 6.14.0:

Application	Java / Amazon Corretto version (default is bold)

## 6.14.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.14.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.13.0 release notes

The following release notes include information for Amazon EMR release 6.13.0. Changes are relative to 6.12.0. For information on the release timeline, see the [6.13.0 change log](#).

### New features

- Amazon EMR 6.13.0 supports Apache Spark 3.4.1, Apache Spark RAPIDS 23.06.0-amzn-1, CUDA Toolkit 11.8.0, and JupyterHub 1.5.0.

### Changes, enhancements, and resolved issues

- The 6.13.0 release improves the Amazon EMR log management daemon to ensure that all logs are uploaded at a regular cadence to Amazon S3 when a cluster termination command is issued. This facilitates faster cluster terminations.
- The 6.13.0 release enhances Amazon EMR log management capabilities to ensure consistent and timely upload of all log files to Amazon S3. This especially benefits long-running EMR clusters.
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

### 6.13.0 default Java versions

Amazon EMR releases 6.12.0 and higher support all applications with Amazon Corretto 8 by default, except for Trino. For Trino, Amazon EMR supports Amazon Corretto 17 by default starting

with Amazon EMR release 6.9.0. Amazon EMR also supports some applications with Amazon Corretto 11 and 17. Those applications are listed in the following table. If you want to change the default JVM on your cluster, follow the instructions in [Configure applications to use a specific Java Virtual Machine](#) for each application that runs on the cluster. You can only use one Java runtime version for a cluster. Amazon EMR doesn't support running different nodes or applications on different runtime versions on the same cluster.

While Amazon EMR supports both Amazon Corretto 11 and 17 on Apache Spark, Apache Hadoop, and Apache Hive, performance might regress for some workloads when you use these versions of Corretto. We recommend that you test your workloads before you change defaults.

The following table shows the default Java versions for applications in Amazon EMR 6.13.0:

Application	Java / Amazon Corretto version (default is bold)
Delta	17, 11, <b>8</b>

### 6.13.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

### 6.13.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.12.0 release notes

The following release notes include information for Amazon EMR release 6.12.0. Changes are relative to 6.11.0. For information on the release timeline, see the [6.12.0 change log](#).

### New features

- Amazon EMR 6.12.0 supports Apache Spark 3.4.0, Apache Spark RAPIDS 23.06.0-amzn-0, CUDA 11.8.0, Apache Hudi 0.13.1-amzn-0, Apache Iceberg 1.3.0-amzn-0, Trino 414, and PrestoDB 0.281.
- Amazon EMR releases 6.12.0 and higher support LDAP integration with Apache Livy, Apache Hive through HiveServer2 (HS2), Trino, Presto, and Hue. You can also install Apache Spark and Apache Hadoop on an EMR cluster that uses 6.12.0 or higher and configure them to use LDAP. For more information, see [Use Active Directory or LDAP servers for authentication with Amazon EMR](#).

### Changes, enhancements, and resolved issues

- Amazon EMR releases 6.12.0 and higher provide Java 11 runtime support for Flink. For more information, see [Configure Flink to run with Java 11](#).
- The 6.12.0 release adds a new retry mechanism to the cluster scaling workflow for EMR clusters that run Presto or Trino. This improvement reduces the risk that cluster resizing will indefinitely stall due to a single failed resize operation. It also improves cluster utilization, because your cluster scales up and down faster.
- The 6.12.0 release fixes an issue where cluster scale-down operations might stall when a core node that is undergoing graceful decommissioning turns unhealthy for any reason before it fully decommissions.

- The 6.12.0 release improves cluster scale-down logic so that your cluster doesn't attempt a scale-down of core nodes below the HDFS replication factor setting for the cluster. This aligns with your data redundancy requirements, and reduces the chance that a scaling operation might stall.
- The 6.12.0 release enhances the performance and efficiency of the health monitoring service for Amazon EMR by increasing the speed at which it logs state changes for instances. This improvement reduces the chance of degraded performance for cluster nodes that are running multiple custom client tools or third-party applications.
- The 6.12.0 release improves the performance of the on-cluster log management daemon for Amazon EMR. As a result, there is less chance for degraded performance with EMR clusters that run steps with high concurrency.
- With Amazon EMR release 6.12.0, the log management daemon has been upgraded to identify all logs that are in active use with open file handles on the local instance storage, and the associated processes. This upgrade ensures that Amazon EMR properly deletes the files and reclaims storage space after the logs are archived to Amazon S3.
- The 6.12.0 release includes a log-management daemon enhancement that deletes empty, unused steps directories in the local cluster file system. An excessively large number of empty directories can degrade the performance of Amazon EMR daemons and result in disk over-utilization.
- The 6.12.0 release enables log rotation for YARN Timeline Server logs. This minimizes disk over-utilization scenarios, especially for long-running clusters.
- The default root volume size has increased to 15 GB in Amazon EMR 6.10.0 and higher. Earlier releases have default root volume size of 10 GB.
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

## 6.12.0 default Java versions

Amazon EMR releases 6.12.0 and higher support all applications with Amazon Corretto 8 by default, except for Trino. For Trino, Amazon EMR supports Amazon Corretto 17 by default starting with Amazon EMR release 6.9.0. Amazon EMR also supports some applications with Amazon Corretto 11 and 17. Those applications are listed in the following table. If you want to change the

default JVM on your cluster, follow the instructions in [Configure applications to use a specific Java Virtual Machine](#) for each application that runs on the cluster. You can only use one Java runtime version for a cluster. Amazon EMR doesn't support running different nodes or applications on different runtime versions on the same cluster.

While Amazon EMR supports both Amazon Corretto 11 and 17 on Apache Spark, Apache Hadoop, and Apache Hive, performance might regress for some workloads when you use these versions of Corretto. We recommend that you test your workloads before you change defaults.

The following table shows the default Java versions for applications in Amazon EMR 6.12.0:

Application	Java / Amazon Corretto version (default is bold)
Delta	17, 11, <b>8</b>
Flink	11, <b>8</b>

## 6.12.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.12.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.11.1 release notes

The following release notes include information for Amazon EMR release 6.11.1. Changes are relative to 6.11.0. For information on the release timeline, see the [6.11.1 change log](#).

### Changes, enhancements, and resolved issues

- Due to lock contention, a node can enter into a deadlock if it's added or removed at the same time that it attempts to decommission. As a result, the Hadoop Resource Manager (YARN) becomes unresponsive, and affects all the incoming and currently-running containers.
- This release includes a change that allows high-availability clusters to recover from failed state after restart.
- This release includes security fixes for Hue and HBase.
- This release fixes an issue where clusters that are running workloads on Spark with Amazon EMR might silently receive incorrect results with `contains`, `startsWith`, `endsWith`, and `like`. This issue occurs when you use the expressions on partitioned fields that have metadata in the Amazon EMR Hive3 Metastore Server (HMS).
- This release fixes an issue with throttling on the Glue side when there are no user-defined functions (UDF).
- This release fixes an issue that deletes container logs by the node log aggregation service before log pusher can push them to S3 in case of YARN decommissioning.

- This release fixes an issue with FairShare Scheduler metrics when Node Label is enabled for Hadoop.
- This release fixes an issue that impacted Spark performance when you set a default `true` value for the `spark.yarn.heterogeneousExecutors.enabled` config in `spark-defaults.conf`.
- This release fixes an issue with Reduce Task failing to read shuffle data. The issue caused Hive query failures with a corrupted memory error.
- This release adds a new retry mechanism to the cluster scaling workflow for EMR clusters that run Presto or Trino. This improvement reduces the risk that cluster resizing will indefinitely stall due to a single failed resize operation. It also improves cluster utilization, because your cluster scales up and down faster.
- This release improves cluster scale-down logic so that your cluster doesn't attempt a scale-down of core nodes below the HDFS replication factor setting for the cluster. This aligns with your data redundancy requirements, and reduces the chance that a scaling operation might stall.
- The log management daemon has been upgraded to identify all logs that are in active use with open file handles on the local instance storage, and the associated processes. This upgrade ensures that Amazon EMR properly deletes the files and reclaims storage space after the logs are archived to Amazon S3.
- This release includes a log-management daemon enhancement that deletes empty, unused steps directories in the local cluster file system. An excessively large number of empty directories can degrade the performance of Amazon EMR daemons and result in disk over-utilization.
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

### 6.11.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

### 6.11.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.11.0 release notes

The following release notes include information for Amazon EMR release 6.11.0. Changes are relative to 6.10.0. For information on the release timeline, see the [change log](#).

### New features

- Amazon EMR 6.11.0 supports Apache Spark 3.3.2-amzn-0, Apache Spark RAPIDS 23.02.0-amzn-0, CUDA 11.8.0, Apache Hudi 0.13.0-amzn-0, Apache Iceberg 1.2.0-amzn-0, Trino 410-amzn-0, and PrestoDB 0.279-amzn-0.

## Changes, enhancements, and resolved issues

- With Amazon EMR 6.11.0, the DynamoDB connector has been upgraded to version 5.0.0. Version 5.0.0 uses AWS SDK for Java 2.x. Previous releases used AWS SDK for Java 1.x. As a result of this upgrade, we strongly advise you to test your code before you use the DynamoDB connector with Amazon EMR 6.11.
- When the DynamoDB connector for Amazon EMR 6.11.0 calls the DynamoDB service, it uses the `Region` value that you provide for the `dynamodb.endpoint` property. We recommend that you also configure `dynamodb.region` when you use `dynamodb.endpoint`, and that both properties target the same AWS Region. If you use `dynamodb.endpoint` and you don't configure `dynamodb.region`, the DynamoDB connector for Amazon EMR 6.11.0 will return an invalid Region exception and attempt to reconcile your AWS Region information from the Amazon EC2 instance metadata service (IMDS). If the connector can't retrieve the Region from IMDS, it defaults to US East (N. Virginia) (`us-east-1`). The following error is an example of the invalid Region exception that you might get if you don't properly configure the `dynamodb.region` property: `software.amazon.awssdk.services.dynamodb.model.DynamoDbException: Credential should be scoped to a valid region. For more information on the classes that are affected by the AWS SDK for Java upgrade to 2.x, see the Upgrade AWS SDK for Java from 1.x to 2.x \(#175\) commit in the GitHub repo for the Amazon EMR - DynamoDB connector.`
- This release fixes an issue where column data becomes NULL when you use Delta Lake to store Delta table data in Amazon S3 after column rename operation. For more information about this experimental feature in Delta Lake, see [Column rename operation](#) in the Delta Lake User Guide.
- The 6.11.0 release fixes an issue that might occur when you create an edge node by replicating one of the primary nodes from a cluster with multiple primary nodes. The replicated edge node could cause delays with scale-down operations, or result in high memory-utilization on the primary nodes. For more information on how to create an edge node to communicate with your EMR cluster, see [Edge Node Creator](#) in the `aws-samples` repo on GitHub.
- The 6.11.0 release improves the automation process that Amazon EMR uses to re-mount Amazon EBS volumes to an instance after a reboot.
- The 6.11.0 release fixes an issue that resulted in intermittent gaps in the Hadoop metrics that Amazon EMR publishes to Amazon CloudWatch.
- The 6.11.0 release fixes an issue with EMR clusters where an update to the YARN configuration file that contains the exclusion list of nodes for the cluster is interrupted due to disk over-

utilization. The incomplete update hinders future cluster scale-down operations. This release ensures that your cluster remains healthy, and that scaling operations work as expected.

- The default root volume size has increased to 15 GB in Amazon EMR 6.10.0 and higher. Earlier releases have default root volume size of 10 GB.
- Hadoop 3.3.3 introduced a change in YARN ([YARN-9608](#)) that keeps nodes where containers ran in a decommissioning state until the application completes. This change ensures that local data such as shuffle data doesn't get lost, and you don't need to re-run the job. This approach might also lead to underutilization of resources on clusters with or without managed scaling enabled.

With Amazon EMR releases 6.11.0 and higher as well as 6.8.1, 6.9.1, and 6.10.1, the value of `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-applications` is set to `false` in `yarn-site.xml` to resolve this issue.

While the fix addresses the issues that were introduced by YARN-9608, it might cause Hive jobs to fail due to shuffle data loss on clusters that have managed scaling enabled. We've mitigated that risk in this release by also setting `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-shuffle-data` for Hive workloads. This config is only available with Amazon EMR releases 6.11.0 and higher.

- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

#### Note

This release no longer gets automatic AMI updates since it has been succeeded by 1 more more patch releases. The patch release is denoted by the number after the second decimal point (6.8.*1*). To see if you're using the latest patch release, check the available releases in the [Release Guide](#), or check the **Amazon EMR release** dropdown when you create a cluster in the console, or use the [ListReleaseLabels](#) API or [list-release-labels](#) CLI action. To get updates about new releases, subscribe to the RSS feed on the [What's new?](#) page.

## 6.11.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the

most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## 6.11.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.10.1 release notes

The following release notes include information for Amazon EMR release 6.10.1. Changes are relative to 6.10.0. For information on the release timeline, see the [6.10.1 change log](#).

## Changes, enhancements, and resolved issues

- Due to lock contention, a node can enter into a deadlock if it's added or removed at the same time that it attempts to decommission. As a result, the Hadoop Resource Manager (YARN) becomes unresponsive, and affects all the incoming and currently-running containers.
- Hadoop 3.3.3 introduced a change in YARN ([YARN-9608](#)) that keeps nodes where containers ran in a decommissioning state until the application completes. This change ensures that local data such as shuffle data doesn't get lost, and you don't need to re-run the job. This approach might also lead to underutilization of resources on clusters with or without managed scaling enabled.

With Amazon EMR releases 6.11.0 and higher as well as 6.8.1, 6.9.1, and 6.10.1, the value of `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-applications` is set to `false` in `yarn-site.xml` to resolve this issue.

While the fix addresses the issues that were introduced by YARN-9608, it might cause Hive jobs to fail due to shuffle data loss on clusters that have managed scaling enabled. We've mitigated that risk in this release by also setting `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-shuffle-data` for Hive workloads. This config is only available with Amazon EMR releases 6.11.0 and higher.

- Metrics collector will not send any metrics to the control plane after failover of primary node in clusters with the instance groups configuration.
- This release includes a change that allows high-availability clusters to recover from failed state after restart.
- This release includes security fixes for Hue and HBase.
- This release fixes an issue where clusters that are running workloads on Spark with Amazon EMR might silently receive incorrect results with `contains`, `startsWith`, `endsWith`, and `like`. This issue occurs when you use the expressions on partitioned fields that have metadata in the Amazon EMR Hive3 Metastore Server (HMS).
- This release fixes an issue with throttling on the Glue side when there are no user-defined functions (UDF).
- This release fixes an issue that deletes container logs by the node log aggregation service before log pusher can push them to S3 in case of YARN decommissioning.
- This release fixes an issue with FairShare Scheduler metrics when Node Label is enabled for Hadoop.

- This release fixes an issue that impacted Spark performance when you set a default `true` value for the `spark.yarn.heterogeneousExecutors.enabled` config in `spark-defaults.conf`.
- This release fixes an issue with Reduce Task failing to read shuffle data. The issue caused Hive query failures with a corrupted memory error.
- This release adds a new retry mechanism to the cluster scaling workflow for EMR clusters that run Presto or Trino. This improvement reduces the risk that cluster resizing will indefinitely stall due to a single failed resize operation. It also improves cluster utilization, because your cluster scales up and down faster.
- This release improves cluster scale-down logic so that your cluster doesn't attempt a scale-down of core nodes below the HDFS replication factor setting for the cluster. This aligns with your data redundancy requirements, and reduces the chance that a scaling operation might stall.
- The log management daemon has been upgraded to identify all logs that are in active use with open file handles on the local instance storage, and the associated processes. This upgrade ensures that Amazon EMR properly deletes the files and reclaims storage space after the logs are archived to Amazon S3.
- This release includes a log-management daemon enhancement that deletes empty, unused steps directories in the local cluster file system. An excessively large number of empty directories can degrade the performance of Amazon EMR daemons and result in disk over-utilization.
- This release fixes an issue that might occur when you create an edge node by replicating one of the primary nodes from a cluster with multiple primary nodes. The replicated edge node could cause delays with scale-down operations, or result in high memory-utilization on the primary nodes. For more information on how to create an edge node to communicate with your EMR cluster, see [Edge Node Creator](#) in the `aws-samples` repo on GitHub.
- This release improves the automation process that Amazon EMR uses to re-mount Amazon EBS volumes to an instance after a reboot.
- This release fixes an issue that resulted in intermittent gaps in the Hadoop metrics that Amazon EMR publishes to Amazon CloudWatch.
- This release fixes an issue with EMR clusters where an update to the YARN configuration file that contains the exclusion list of nodes for the cluster is interrupted due to disk over-utilization. The incomplete update hinders future cluster scale-down operations. This release ensures that your cluster remains healthy, and that scaling operations work as expected.
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2

release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

## 6.10.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

### 6.10.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.10.0 release notes

The following release notes include information for Amazon EMR release 6.10.0. Changes are relative to 6.9.0. For information on the release timeline, see the [change log](#).

### New features

- Amazon EMR 6.10.0 supports Apache Spark 3.3.1, Apache Spark RAPIDS 22.12.0, CUDA 11.8.0, Apache Hudi 0.12.2-amzn-0, Apache Iceberg 1.1.0-amzn-0, Trino 403, and PrestoDB 0.278.1.
- Amazon EMR 6.10.0 includes a native Trino-Hudi connector that provides read access to data in Hudi tables. You can activate the connector with `trino-cli --catalog hudi`, and configure the connector for your requirements with `trino-connector-hudi`. The native integration with Amazon EMR means that you no longer need to use `trino-connector-hive` to query Hudi

tables. For a list of supported configurations with the new connector, see the [Hudi connector](#) page of the Trino documentation.

- Amazon EMR releases 6.10.0 and higher support Apache Zeppelin integration with Apache Flink. See [Working with Flink jobs from Zeppelin in Amazon EMR](#) for more information.

## Known Issues

- Hadoop 3.3.3 introduced a change in YARN ([YARN-9608](#)) that keeps nodes where containers ran in a decommissioning state until the application completes. This change ensures that local data such as shuffle data doesn't get lost, and you don't need to re-run the job. This approach might also lead to underutilization of resources on clusters with or without managed scaling enabled.

To work around this issue in Amazon EMR 6.10.0, you can set the value of `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-applications` to `false` in `yarn-site.xml`. In Amazon EMR releases 6.11.0 and higher as well as 6.8.1, 6.9.1, and 6.10.1, the config is set to `false` by default to resolve this issue.

## Changes, enhancements, and resolved issues

- Amazon EMR 6.10.0 removes the dependency on `minimal-json.jar` for the [Amazon Redshift integration for Apache Spark](#), and automatically adds the required Spark-Redshift related jars to the executor class path for Spark: `spark-redshift.jar`, `spark-avro.jar`, and `RedshiftJDBC.jar`.
- The 6.10.0 release improves the on-cluster log management daemon to monitor additional log folders in your EMR cluster. This improvement minimizes disk over-utilization scenarios.
- The 6.10.0 release automatically restarts the on-cluster log management daemon when it stops. This improvement reduces the risk for nodes to appear unhealthy due to disk over-utilization.
- Amazon EMR 6.10.0 supports regional endpoints for EMRFS user mapping.
- The default root volume size has increased to 15 GB in Amazon EMR 6.10.0 and higher. Earlier releases have default root volume size of 10 GB.
- The 6.10.0 release fixes an issue that caused Spark jobs to stall when all remaining Spark executors are on a decommissioning host with the YARN resource manager.
- With Amazon EMR 6.6.0 through 6.9.x, INSERT queries with dynamic partition and an ORDER BY or SORT BY clause will always have two reducers. This issue is caused by OSS change [HIVE-20703](#), which puts dynamic sort partition optimization under cost-based decision. If

your workload doesn't require sorting of dynamic partitions, we recommend that you set the `hive.optimize.sort.dynamic.partition.threshold` property to `-1` to disable the new feature and get the correctly calculated number of reducers. This issue is fixed in OSS Hive as part of [HIVE-22269](#) and is fixed in Amazon EMR 6.10.0.

- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

### Note

This release no longer gets automatic AMI updates since it has been succeeded by 1 more more patch releases. The patch release is denoted by the number after the second decimal point (6.8.**1**). To see if you're using the latest patch release, check the available releases in the [Release Guide](#), or check the **Amazon EMR release** dropdown when you create a cluster in the console, or use the [ListReleaseLabels](#) API or [list-release-labels](#) CLI action. To get updates about new releases, subscribe to the RSS feed on the [What's new?](#) page.

## 6.10.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## 6.10.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.9.1 release notes

The following release notes include information for Amazon EMR release 6.9.1. Changes are relative to 6.9.0. For information on the release timeline, see the [6.9.1 change log](#).

## Changes, enhancements, and resolved issues

- Hadoop 3.3.3 introduced a change in YARN ([YARN-9608](#)) that keeps nodes where containers ran in a decommissioning state until the application completes. This change ensures that local data such as shuffle data doesn't get lost, and you don't need to re-run the job. This approach might also lead to underutilization of resources on clusters with or without managed scaling enabled.

With Amazon EMR releases 6.11.0 and higher as well as 6.8.1, 6.9.1, and 6.10.1, the value of `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-applications` is set to `false` in `yarn-site.xml` to resolve this issue.

While the fix addresses the issues that were introduced by YARN-9608, it might cause Hive jobs to fail due to shuffle data loss on clusters that have managed scaling enabled. We've mitigated that risk in this release by also setting `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-shuffle-data` for Hive workloads. This config is only available with Amazon EMR releases 6.11.0 and higher.

- Metrics collector won't send any metrics to the control plane after failover of primary node in clusters with the instance groups configuration.
- This release eliminates retries on failed HTTP requests to metrics collector endpoints.
- This release includes a change that allows high-availability clusters to recover from failed state after restart.
- This release fixes an issue where large user-created UIDs caused overflow exceptions.
- This release fixes timeout issues with the Amazon EMR reconfiguration process.
- This release includes security fixes.
- This release fixes an issue where clusters that are running workloads on Spark with Amazon EMR might silently receive incorrect results with `contains`, `startsWith`, `endsWith`, and `like`. This issue occurs when you use the expressions on partitioned fields that have metadata in the Amazon EMR Hive3 Metastore Server (HMS).
- With Amazon EMR 6.6.0 through 6.9.x, INSERT queries with dynamic partition and an ORDER BY or SORT BY clause will always have two reducers. This issue is caused by OSS change [HIVE-20703](#), which puts dynamic sort partition optimization under cost-based decision. If your workload doesn't require sorting of dynamic partitions, we recommend that you set the `hive.optimize.sort.dynamic.partition.threshold` property to `-1` to disable the new feature and get the correctly calculated number of reducers. This issue is fixed in OSS Hive as part of [HIVE-22269](#) and is fixed in Amazon EMR 6.10.0.

- Hive might experience data loss when you use HDFS as a scratch directory and you have enabled merge small files, and the table contains static partition paths.
- This release fixes a performance issue with Hive if merge small files (disabled by default) is enabled at the end of ETL job.
- This release fixes an issue with throttling on the Glue side when there are no user-defined functions (UDF).
- This release fixes an issue that deletes container logs by the node log aggregation service before log pusher can push them to S3 in case of YARN decommissioning.
- This release fixes handling of compacted/archived files with persistent storefile tracking for HBase.
- This release fixes an issue that impacted Spark performance when you set a default `true` value for the `spark.yarn.heterogeneousExecutors.enabled` config in `spark-defaults.conf`.
- This release fixes an issue with Reduce Task failing to read shuffle data. The issue caused Hive query failures with a corrupted memory error.
- This release fixes an issue that caused the node provisioner to fail if the HDFS NameNode (NN) service was stuck in safemode during node replacement.
- This release adds a new retry mechanism to the cluster scaling workflow for EMR clusters that run Presto or Trino. This improvement reduces the risk that cluster resizing will indefinitely stall due to a single failed resize operation. It also improves cluster utilization, because your cluster scales up and down faster.
- This release improves cluster scale-down logic so that your cluster doesn't attempt a scale-down of core nodes below the HDFS replication factor setting for the cluster. This aligns with your data redundancy requirements, and reduces the chance that a scaling operation might stall.
- The log management daemon has been upgraded to identify all logs that are in active use with open file handles on the local instance storage, and the associated processes. This upgrade ensures that Amazon EMR properly deletes the files and reclaims storage space after the logs are archived to Amazon S3.
- This release includes a log-management daemon enhancement that deletes empty, unused steps directories in the local cluster file system. An excessively large number of empty directories can degrade the performance of Amazon EMR daemons and result in disk over-utilization.
- This release fixes an issue that might occur when you create an edge node by replicating one of the primary nodes from a cluster with multiple primary nodes. The replicated edge node could cause delays with scale-down operations, or result in high memory-utilization on the primary

nodes. For more information on how to create an edge node to communicate with your EMR cluster, see [Edge Node Creator](#) in the `aws-samples` repo on GitHub.

- This release improves the automation process that Amazon EMR uses to re-mount Amazon EBS volumes to an instance after a reboot.
- This release fixes an issue that resulted in intermittent gaps in the Hadoop metrics that Amazon EMR publishes to Amazon CloudWatch.
- This release fixes an issue with EMR clusters where an update to the YARN configuration file that contains the exclusion list of nodes for the cluster is interrupted due to disk over-utilization. The incomplete update hinders future cluster scale-down operations. This release ensures that your cluster remains healthy, and that scaling operations work as expected.
- This release improves the on-cluster log management daemon to monitor additional log folders in your EMR cluster. This improvement minimizes disk over-utilization scenarios.
- This release automatically restarts the on-cluster log management daemon when it stops. This improvement reduces the risk for nodes to appear unhealthy due to disk over-utilization.
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

### 6.9.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

Component	Version	Description
aws-sagemaker-spark-sdk	1.4.2	Amazon SageMaker Spark SDK
delta	2.1.0	Delta lake is an open table format for huge analytic datasets

## 6.9.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

- Amazon EMR release 6.9.0 includes a new open-source application, [Delta Lake](#) 2.1.0.
- The Amazon Redshift integration for Apache Spark is included in Amazon EMR releases 6.9.0 and later. Previously an open-source tool, the native integration is a Spark connector that you can use to build Apache Spark applications that read from and write to data in Amazon Redshift and Amazon Redshift Serverless. For more information, see [Using Amazon Redshift integration for Apache Spark with Amazon EMR](#).
- Amazon EMR release 6.9.0 adds support for archiving logs to Amazon S3 during cluster scale-down. Previously, you could only archive log files to Amazon S3 during cluster termination. The new capability ensures that log files generated on the cluster persist on Amazon S3 even after the node is terminated. For more information, see [Configure cluster logging and debugging](#).
- To support long running queries, Trino now includes a fault-tolerant execution mechanism. Fault-tolerant execution mitigates query failures by retrying failed queries or their component tasks. For more information, see [Fault-tolerant execution in Trino](#).

- You can use Apache Flink on Amazon EMR for unified BATCH and STREAM processing of Apache Hive Tables or metadata of any Flink tablesource such as Iceberg, Kinesis or Kafka. You can specify the AWS Glue Data Catalog as the metastore for Flink using the AWS Management Console, AWS CLI, or Amazon EMR API. For more information, see [Configuring Flink in Amazon EMR](#).
- You can now specify AWS Identity and Access Management (IAM) runtime roles and AWS Lake Formation-based access control for Apache Spark, Apache Hive, and Presto queries on Amazon EMR on EC2 clusters with Amazon SageMaker Studio. For more information, see [Configure runtime roles for Amazon EMR steps](#).

## Known Issues

- For Amazon EMR release 6.9.0, Trino does not work on clusters enabled for Apache Ranger. If you need to use Trino with Ranger, contact [AWS Support](#).
- If you use the the Amazon Redshift integration for Apache Spark and have a time, timetz, timestamp, or timestampz with microsecond precision in Parquet format, the connector rounds the time values to the nearest millisecond value. As a workaround, use the text unload format `unload_s3_format` parameter.
- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

- Connections to Amazon EMR clusters from Amazon SageMaker Studio may intermittently fail with a **403 Forbidden** response code. This error happens when setup of the IAM role on the cluster takes longer than 60 seconds. As a workaround, you can install an Amazon EMR patch to enable retries and increase the timeout to a minimum of 300 seconds. Use the following steps to apply the bootstrap action when you launch your cluster.

1. Download the bootstrap script and RPM files from the following Amazon S3 URIs.

```
s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/gcsc/replace-rpms.sh  
s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/gcsc/emr-secret-agent-1.18.0-SNAPSHOT20221121212949.noarch.rpm
```

2. Upload the files from the previous step to an Amazon S3 bucket that you own. The bucket must be in the same AWS Region where you plan to launch the cluster.
3. Include the following bootstrap action when you launch your EMR cluster. Replace *bootstrap\_URI* and *RPM\_URI* with the corresponding URIs from Amazon S3.

```
--bootstrap-actions "Path=bootstrap_URI,Args=[RPM_URI]"
```

- With Amazon EMR releases 5.36.0 and 6.6.0 through 6.9.0, SecretAgent and RecordServer service components may experience log data loss due to an incorrect file name pattern configuration in Log4j2 properties. The incorrect configuration causes the components to generate only one log file per day. When the rotation strategy occurs, it overwrites the existing file instead of generating a new log file as expected. As a workaround, use a bootstrap action to generate log files each hour and append an auto-increment integer in the file name to handle the rotation.

For Amazon EMR 6.6.0 through 6.9.0 releases, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-6x/replace-puppet.sh,Args=[]"
```

For Amazon EMR 5.36.0, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-5x/replace-puppet.sh,Args=[]"
```

- Apache Flink provides Native S3 FileSystem and Hadoop FileSystem Connectors, which let applications create a FileSink and write the data into Amazon S3. This FileSink fails with one of the following two exceptions.

```
java.lang.UnsupportedOperationException: Recoverable writers on Hadoop are only supported for HDFS
```

```
Caused by: java.lang.NoSuchMethodError:
  org.apache.hadoop.io.retry.RetryPolicies.retryOtherThanRemoteAndSaslException(Lorg/
  apache/hadoop/io/retry/RetryPolicy;Ljava/util/Map;)Lorg/apache/hadoop/io/retry/
  RetryPolicy;
                                at
  org.apache.hadoop.yarn.client.RMProxy.createRetryPolicy(RMProxy.java:302) ~[hadoop-
  yarn-common-3.3.3-amzn-0.jar:?]
```

As a workaround, you can install an Amazon EMR patch, which fixes the above issue in Flink. To apply the bootstrap action when you launch your cluster, complete the following steps.

1. Download the flink-rpm to your Amazon S3 bucket. Your RPM path is `s3://DOC-EXAMPLE-BUCKET/rpms/flink/`.
2. Download the bootstrap script and RPM files from Amazon S3 using the following URI. Replace *regionName* with the AWS Region where you plan to launch the cluster.

```
s3://emr-data-access-control-regionName/customer-bootstrap-actions/gcsc/replace-
rpms.sh
```

3. Hadoop 3.3.3 introduced a change in YARN ([YARN-9608](#)) that keeps nodes where containers ran in a decommissioning state until the application completes. This change ensures that local data such as shuffle data doesn't get lost, and you don't need to re-run the job. In Amazon EMR 6.8.0 and 6.9.0, this approach might also lead to underutilization of resources on clusters with or without managed scaling enabled.

With [Amazon EMR 6.10.0](#), there's a workaround for this issue to set the value of `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-applications` to `false` in `yarn-site.xml`. In Amazon EMR releases 6.11.0 and higher as well as 6.8.1, 6.9.1, and 6.10.1, the config is set to `false` by default to resolve this issue.

## Changes, Enhancements, and Resolved Issues

- For Amazon EMR release 6.9.0 and later, all components installed by Amazon EMR that use Log4j libraries use Log4j version 2.17.1 or later.
- When you use the DynamoDB connector with Spark on Amazon EMR versions 6.6.0, 6.7.0, and 6.8.0, all reads from your table return an empty result, even though the input split references non-empty data. Amazon EMR release 6.9.0 fixes this issue.
- Amazon EMR 6.9.0 adds limited support for Lake Formation-based access control with Apache Hudi when reading data using Spark SQL. The support is for SELECT queries using Spark SQL and is limited to column-level access control. For more information, see [Hudi and Lake Formation](#).
- When you use Amazon EMR 6.9.0 to create a Hadoop cluster with [Node Labels](#) enabled, the [YARN metrics API](#) returns aggregated information across all partitions, instead of the default partition. For more information, see [YARN-11414](#).
- With Amazon EMR release 6.9.0, we've updated Trino to version 398, which uses Java 17. The previous supported version of Trino for Amazon EMR 6.8.0 was Trino 388 running on Java 11. For more information about this change, see [Trino updates to Java 17](#) on the Trino blog.
- This release fixes a timing sequence mismatch issue between Apache BigTop and the Amazon EMR on EC2 cluster startup sequence. This timing sequence mismatch occurs when a system attempts to perform two or more operations at the same time instead of doing them in the proper sequence. As a result, certain cluster configurations experienced instance startup timeouts and slower cluster startup times.
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

### Note

This release no longer gets automatic AMI updates since it has been succeeded by 1 more more patch releases. The patch release is denoted by the number after the second decimal point (6.8.**1**). To see if you're using the latest patch release, check the available releases in the [Release Guide](#), or check the **Amazon EMR release** dropdown when you create a cluster in the console, or use the [ListReleaseLabels](#) API or [list-release-labels](#) CLI action. To get updates about new releases, subscribe to the RSS feed on the [What's new?](#) page.

## 6.9.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## 6.9.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.8.1 release notes

The following release notes include information for Amazon EMR release 6.8.1. Changes are relative to 6.8.0. For information on the release timeline, see the [6.8.1 change log](#).

### Changes, enhancements, and resolved issues

- Hadoop 3.3.3 introduced a change in YARN ([YARN-9608](#)) that keeps nodes where containers ran in a decommissioning state until the application completes. This change ensures that local data

such as shuffle data doesn't get lost, and you don't need to re-run the job. This approach might also lead to underutilization of resources on clusters with or without managed scaling enabled.

With Amazon EMR releases 6.11.0 and higher as well as 6.8.1, 6.9.1, and 6.10.1, the value of `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-applications` is set to `false` in `yarn-site.xml` to resolve this issue.

While the fix addresses the issues that were introduced by YARN-9608, it might cause Hive jobs to fail due to shuffle data loss on clusters that have managed scaling enabled. We've mitigated that risk in this release by also setting `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-shuffle-data` for Hive workloads. This config is only available with Amazon EMR releases 6.11.0 and higher.

- Metrics collector won't send any metrics to the control plane after failover of primary node in clusters with the instance groups configuration.
- This release eliminates retries on failed HTTP requests to metrics collector endpoints.
- This release includes a change that allows high-availability clusters to recover from failed state after restart.
- This release fixes an issue where large user-created UIDs caused overflow exceptions.
- This release fixes timeout issues with the Amazon EMR reconfiguration process.
- This release prevents an issue where failed reconfiguration might break other, unrelated processes.
- This release includes security fixes.
- This release fixes an issue where clusters that are running workloads on Spark with Amazon EMR might silently receive incorrect results with `contains`, `startsWith`, `endsWith`, and `like`. This issue occurs when you use the expressions on partitioned fields that have metadata in the Amazon EMR Hive3 Metastore Server (HMS).
- With Amazon EMR 6.6.0 through 6.9.x, INSERT queries with dynamic partition and an ORDER BY or SORT BY clause will always have two reducers. This issue is caused by OSS change [HIVE-20703](#), which puts dynamic sort partition optimization under cost-based decision. If your workload doesn't require sorting of dynamic partitions, we recommend that you set the `hive.optimize.sort.dynamic.partition.threshold` property to `-1` to disable the new feature and get the correctly calculated number of reducers. This issue is fixed in OSS Hive as part of [HIVE-22269](#) and is fixed in Amazon EMR 6.10.0.
- Hive might experience data loss when you use HDFS as a scratch directory and you have enabled merge small files, and the table contains static partition paths.

- This release fixes a performance issue with Hive if merge small files (disabled by default) is enabled at the end of ETL job.
- This release fixes an issue with throttling on the Glue side when there are no user-defined functions (UDF).
- This release fixes an issue that deletes container logs by the node log aggregation service before log pusher can push them to S3 in case of YARN decommissioning.
- This release fixes handling of compacted/archived files with persistent storefile tracking for HBase.
- This release fixes an issue that impacted Spark performance when you set a default `true` value for the `spark.yarn.heterogeneousExecutors.enabled` config in `spark-defaults.conf`.
- This release fixes an issue with Reduce Task failing to read shuffle data. The issue caused Hive query failures with a corrupted memory error.
- This release fixes an issue that caused the node provisioner to fail if the HDFS NameNode (NN) service was stuck in safemode during node replacement.
- This release adds a new retry mechanism to the cluster scaling workflow for EMR clusters that run Presto or Trino. This improvement reduces the risk that cluster resizing will indefinitely stall due to a single failed resize operation. It also improves cluster utilization, because your cluster scales up and down faster.
- This release improves cluster scale-down logic so that your cluster doesn't attempt a scale-down of core nodes below the HDFS replication factor setting for the cluster. This aligns with your data redundancy requirements, and reduces the chance that a scaling operation might stall.
- The log management daemon has been upgraded to identify all logs that are in active use with open file handles on the local instance storage, and the associated processes. This upgrade ensures that Amazon EMR properly deletes the files and reclaims storage space after the logs are archived to Amazon S3.
- This release includes a log-management daemon enhancement that deletes empty, unused steps directories in the local cluster file system. An excessively large number of empty directories can degrade the performance of Amazon EMR daemons and result in disk over-utilization.
- This release fixes an issue that might occur when you create an edge node by replicating one of the primary nodes from a cluster with multiple primary nodes. The replicated edge node could cause delays with scale-down operations, or result in high memory-utilization on the primary nodes. For more information on how to create an edge node to communicate with your EMR cluster, see [Edge Node Creator](#) in the `aws-samples` repo on GitHub.

- This release improves the automation process that Amazon EMR uses to re-mount Amazon EBS volumes to an instance after a reboot.
- This release fixes an issue that resulted in intermittent gaps in the Hadoop metrics that Amazon EMR publishes to Amazon CloudWatch.
- This release fixes an issue with EMR clusters where an update to the YARN configuration file that contains the exclusion list of nodes for the cluster is interrupted due to disk over-utilization. The incomplete update hinders future cluster scale-down operations. This release ensures that your cluster remains healthy, and that scaling operations work as expected.
- This release improves the on-cluster log management daemon to monitor additional log folders in your EMR cluster. This improvement minimizes disk over-utilization scenarios.
- This release automatically restarts the on-cluster log management daemon when it stops. This improvement reduces the risk for nodes to appear unhealthy due to disk over-utilization.
- This release adds support for archiving logs to Amazon S3 during cluster scale-down. Previously, you could only archive log files to Amazon S3 during cluster termination. The new capability ensures that log files generated on the cluster persist on Amazon S3 even after the node is terminated. For more information, see [Configure cluster logging and debugging](#).
- This release fixes an issue that occurred when the Amazon S3 URI for a bootstrap action ended with a port number, for example: a . b . c . d : 4345. Amazon EMR was incorrectly parsing these URIs, so any associated bootstrap actions would fail.
- This release fixes a timing sequence mismatch issue between Apache BigTop and the Amazon EMR on EC2 cluster startup sequence. This timing sequence mismatch occurs when a system attempts to perform two or more operations at the same time instead of doing them in the proper sequence. As a result, certain cluster configurations experienced instance startup timeouts and slower cluster startup times.
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

### 6.8.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

### 6.8.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.8.0 release notes

The following release notes include information for Amazon EMR release 6.8.0. Changes are relative to 6.7.0.

### New Features

- Amazon EMR steps feature now supports Apache Livy endpoint and JDBC/ODBC clients. For more information, see [Configure runtime roles for Amazon EMR steps](#).
- Amazon EMR release 6.8.0 comes with Apache HBase release 2.4.12. With this HBase release, you can both archive and delete your HBase tables. The Amazon S3 archive process renames all table files to the archive directory. This can be a costly and lengthy process. Now, you can skip the archive process and quickly drop and delete large tables. For more information, see [Using the HBase shell](#).

### Known Issues

- Hadoop 3.3.3 introduced a change in YARN ([YARN-9608](#)) that keeps nodes where containers ran in a decommissioning state until the application completes. This change ensures that local data such as shuffle data doesn't get lost, and you don't need to re-run the job. In Amazon EMR 6.8.0 and 6.9.0, this approach might also lead to underutilization of resources on clusters with or without managed scaling enabled.

With [Amazon EMR 6.10.0](#), there's a workaround for this issue to set the value of `yarn.resourcemanager.decommissioning-nodes-watcher.wait-for-applications` to `false` in `yarn-site.xml`. In Amazon EMR releases 6.11.0 and higher as well as 6.8.1, 6.9.1, and 6.10.1, the config is set to `false` by default to resolve this issue.

## Changes, Enhancements, and Resolved Issues

- When Amazon EMR release 6.5.0, 6.6.0, or 6.7.0 read Apache Phoenix tables through the Apache Spark shell, Amazon EMR produced a `NoSuchMethodError`. Amazon EMR release 6.8.0 fixes this issue.
- Amazon EMR release 6.8.0 comes with [Apache Hudi](#) 0.11.1; however, Amazon EMR 6.8.0 clusters are also compatible with the open-source `hudi-spark3.3-bundle_2.12` from Hudi 0.12.0.
- Amazon EMR release 6.8.0 comes with Apache Spark 3.3.0. This Spark release uses Apache Log4j 2 and the `log4j2.properties` file to configure Log4j in Spark processes. If you use Spark in the cluster or create EMR clusters with custom configuration parameters, and you want to upgrade to Amazon EMR release 6.8.0, you must migrate to the new `spark-log4j2` configuration classification and key format for Apache Log4j 2. For more information, see [Migrating from Apache Log4j 1.x to Log4j 2.x](#).
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

### Note

This release no longer gets automatic AMI updates since it has been succeeded by 1 more more patch releases. The patch release is denoted by the number after the second decimal point (6.8.*1*). To see if you're using the latest patch release, check the available releases in the [Release Guide](#), or check the **Amazon EMR release** dropdown when you create a cluster in the console, or use the [ListReleaseLabels](#) API or [list-release-labels](#) CLI action. To get updates about new releases, subscribe to the RSS feed on the [What's new?](#) page.

## Known Issues

- When you use the DynamoDB connector with Spark on Amazon EMR versions 6.6.0, 6.7.0, and 6.8.0, all reads from your table return an empty result, even though the input split references non-empty data. This is because Spark 3.2.0 sets `spark.hadoopRDD.ignoreEmptySplits` to `true` by default. As a workaround, explicitly set `spark.hadoopRDD.ignoreEmptySplits` to `false`. Amazon EMR release 6.9.0 fixes this issue.

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the

`spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

- With Amazon EMR releases 5.36.0 and 6.6.0 through 6.9.0, `SecretAgent` and `RecordServer` service components may experience log data loss due to an incorrect file name pattern configuration in `Log4j2` properties. The incorrect configuration causes the components to generate only one log file per day. When the rotation strategy occurs, it overwrites the existing file instead of generating a new log file as expected. As a workaround, use a bootstrap action to generate log files each hour and append an auto-increment integer in the file name to handle the rotation.

For Amazon EMR 6.6.0 through 6.9.0 releases, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-6x/replace-puppet.sh,Args=[]"
```

For Amazon EMR 5.36.0, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-5x/replace-puppet.sh,Args=[]"
```

For more information on the release timeline, see the [change log](#).

## 6.8.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.8.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.7.0 release notes

The following release notes include information for Amazon EMR release 6.7.0. Changes are relative to 6.6.0.

Initial release date: July 15, 2022

## New Features

- Amazon EMR now supports Apache Spark 3.2.1, Apache Hive 3.1.3, HUDI 0.11, PrestoDB 0.272, and Trino 0.378.
- Supports IAM Role and Lake Formation-based access controls with EMR steps (Spark, Hive) for Amazon EMR on EC2 clusters.
- Supports Apache Spark data definition statements on Apache Ranger enabled clusters. This now includes support for Trino applications reading and writing Apache Hive metadata on Apache Ranger enabled clusters. For more information, see [Enable federated governance using Trino and Apache Ranger on Amazon EMR](#).
- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

## Known Issues

- When Amazon EMR release 6.5.0, 6.6.0, or 6.7.0 read Apache Phoenix tables through the Apache Spark shell, a `NoSuchMethodError` occurs because Amazon EMR uses an incorrect `Hbase.compat.version`. Amazon EMR release 6.8.0 fixes this issue.
- When you use the DynamoDB connector with Spark on Amazon EMR versions 6.6.0, 6.7.0, and 6.8.0, all reads from your table return an empty result, even though the input split references non-empty data. This is because Spark 3.2.0 sets `spark.hadoopRDD.ignoreEmptySplits` to

`true` by default. As a workaround, explicitly set `spark.hadoopRDD.ignoreEmptySplits` to `false`. Amazon EMR release 6.9.0 fixes this issue.

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the

`spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

- With Amazon EMR releases 5.36.0 and 6.6.0 through 6.9.0, `SecretAgent` and `RecordServer` service components may experience log data loss due to an incorrect file name pattern configuration in `Log4j2` properties. The incorrect configuration causes the components to generate only one log file per day. When the rotation strategy occurs, it overwrites the existing file instead of generating a new log file as expected. As a workaround, use a bootstrap action to generate log files each hour and append an auto-increment integer in the file name to handle the rotation.

For Amazon EMR 6.6.0 through 6.9.0 releases, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-6x/replace-puppet.sh,Args=[]"
```

For Amazon EMR 5.36.0, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-5x/replace-puppet.sh,Args=[]"
```

- The `GetClusterSessionCredentials` API isn't supported with clusters that run on Amazon EMR 6.7 or lower.

## 6.7.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.7.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

- With Amazon EMR 6.6 and later, applications that use Log4j 1.x and Log4j 2.x are upgraded to use Log4j 1.2.17 (or higher) and Log4j 2.17.1 (or higher) respectively, and do not require using the [bootstrap actions](#) provided to mitigate the CVE issues.
- **[Managed scaling] Spark shuffle data managed scaling optimization** - For Amazon EMR versions 5.34.0 and later, and EMR versions 6.4.0 and later, managed scaling is now Spark shuffle data aware (data that Spark redistributes across partitions to perform specific operations). For more information on shuffle operations, see [Using EMR managed scaling in Amazon EMR](#) in the *Amazon EMR Management Guide* and [Spark Programming Guide](#).

- Starting with Amazon EMR 5.32.0 and 6.5.0, dynamic executor sizing for Apache Spark is enabled by default. To turn this feature on or off, you can use the `spark.yarn.heterogeneousExecutors.enabled` configuration parameter.

## Changes, Enhancements, and Resolved Issues

- Amazon EMR reduces cluster startup time by up to 80 seconds on average for clusters that use the EMR default AMI option and only install common applications, such as Apache Hadoop, Apache Spark and Apache Hive.

## Known Issues

- When Amazon EMR release 6.5.0, 6.6.0, or 6.7.0 read Apache Phoenix tables through the Apache Spark shell, a `NoSuchMethodError` occurs because Amazon EMR uses an incorrect `Hbase.compat.version`. Amazon EMR release 6.8.0 fixes this issue.
- When you use the DynamoDB connector with Spark on Amazon EMR versions 6.6.0, 6.7.0, and 6.8.0, all reads from your table return an empty result, even though the input split references non-empty data. This is because Spark 3.2.0 sets `spark.hadoopRDD.ignoreEmptySplits` to `true` by default. As a workaround, explicitly set `spark.hadoopRDD.ignoreEmptySplits` to `false`. Amazon EMR release 6.9.0 fixes this issue.
- On Trino long-running clusters, Amazon EMR 6.6.0 enables Garbage Collection logging parameters in the Trino `jvm.config` to get better insights from the Garbage Collection logs. This change appends many Garbage Collection logs to the `launcher.log` (`/var/log/trino/launcher.log`) file. If you are running Trino clusters in Amazon EMR 6.6.0, you may encounter nodes running out of disk space after the cluster has been running for a couple of days due to the appended logs.

The workaround for this issue is to run the script below as a Bootstrap Action to disable the Garbage Collection logging parameters in `jvm.config` while creating or cloning the cluster for Amazon EMR 6.6.0.

```
#!/bin/bash
set -ex
PRESTO_PUPPET_DIR='/var/aws/emr/bigtop-deploy/puppet/modules/trino'
sudo bash -c "sed -i '/-Xlog/d' ${PRESTO_PUPPET_DIR}/templates/jvm.config"
```

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an

issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:

- Two or more partitions are scanned from the same table.
- At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
- The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the

`spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

- With Amazon EMR releases 5.36.0 and 6.6.0 through 6.9.0, `SecretAgent` and `RecordServer` service components may experience log data loss due to an incorrect file name pattern configuration in `Log4j2` properties. The incorrect configuration causes the components to generate only one log file per day. When the rotation strategy occurs, it overwrites the existing file instead of generating a new log file as expected. As a workaround, use a bootstrap action to generate log files each hour and append an auto-increment integer in the file name to handle the rotation.

For Amazon EMR 6.6.0 through 6.9.0 releases, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-6x/replace-puppet.sh,Args=[]"
```

For Amazon EMR 5.36.0, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-5x/replace-puppet.sh,Args=[]"
```

## 6.6.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.6.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.5.0 release notes

The following release notes include information for Amazon EMR release 6.5.0. Changes are relative to 6.4.0.

Initial release date: January 20, 2022

Updated release date: March 21, 2022

### New Features

- **[Managed scaling] Spark shuffle data managed scaling optimization** - For Amazon EMR versions 5.34.0 and later, and EMR versions 6.4.0 and later, managed scaling is now Spark shuffle data aware (data that Spark redistributes across partitions to perform specific operations). For more information on shuffle operations, see [Using EMR managed scaling in Amazon EMR](#) in the *Amazon EMR Management Guide* and [Spark Programming Guide](#).
- Starting with Amazon EMR 5.32.0 and 6.5.0, dynamic executor sizing for Apache Spark is enabled by default. To turn this feature on or off, you can use the `spark.yarn.heterogeneousExecutors.enabled` configuration parameter.
- Support for Apache Iceberg open table format for huge analytic datasets.
- Support for ranger-trino-plugin 2.0.1-amzn-1
- Support for toree 0.5.0

### Changes, Enhancements, and Resolved Issues

- Amazon EMR 6.5 release version now supports Apache Iceberg 0.12.0, and provides runtime improvements with Amazon EMR Runtime for Apache Spark, Amazon EMR Runtime for Presto, and Amazon EMR Runtime for Apache Hive.

- [Apache Iceberg](#) is an open table format for large data sets in Amazon S3 and provides fast query performance over large tables, atomic commits, concurrent writes, and SQL-compatible table evolution. With EMR 6.5, you can use Apache Spark 3.1.2 with the Iceberg table format.
- Apache Hudi 0.9 adds Spark SQL DDL and DML support. This allows you to create, upsert Hudi tables using just SQL statements. Apache Hudi 0.9 also includes query side and writer side performance improvements.
- Amazon EMR Runtime for Apache Hive improves Apache Hive performance on Amazon S3 by removing rename operations during staging operations, and improves performance for metastore check (MSCK) commands used for repairing tables.

## Known Issues

- When Amazon EMR release 6.5.0, 6.6.0, or 6.7.0 read Apache Phoenix tables through the Apache Spark shell, a `NoSuchMethodError` occurs because Amazon EMR uses an incorrect `Hbase.compat.version`. Amazon EMR release 6.8.0 fixes this issue.
- Hbase bundle clusters in high availability (HA) fail to provision with the default volume size and instance type. The workaround for this issue is to increase the root volume size.
- To use Spark actions with Apache Oozie, you must add the following configuration to your Oozie `workflow.xml` file. Otherwise, several critical libraries such as Hadoop and EMRFS will be missing from the classpath of the Spark executors that Oozie launches.

```
<spark-opts>--conf spark.yarn.populateHadoopClasspath=true</spark-opts>
```

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

## 6.5.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.5.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## New features

- **[Managed scaling] Spark shuffle data managed scaling optimization** - For Amazon EMR versions 5.34.0 and later, and EMR versions 6.4.0 and later, managed scaling is now Spark shuffle data aware (data that Spark redistributes across partitions to perform specific operations). For

more information on shuffle operations, see [Using EMR managed scaling in Amazon EMR](#) in the *Amazon EMR Management Guide* and [Spark Programming Guide](#).

- On Apache Ranger-enabled Amazon EMR clusters, you can use Apache Spark SQL to insert data into or update the Apache Hive metastore tables using `INSERT INTO`, `INSERT OVERWRITE`, and `ALTER TABLE`. When using `ALTER TABLE` with Spark SQL, a partition location must be the child directory of a table location. Amazon EMR does not currently support inserting data into a partition where the partition location is different from the table location.
- PrestoSQL has been [renamed to Trino](#).
- Hive: Execution of simple `SELECT` queries with `LIMIT` clause are accelerated by stopping the query execution as soon as the number of records mentioned in `LIMIT` clause is fetched. Simple `SELECT` queries are queries that do not have `GROUP BY / ORDER BY` clause or queries that do not have a reducer stage. For example, `SELECT * from <TABLE> WHERE <Condition> LIMIT <Number>`.

## Hudi Concurrency Control

- Hudi now supports Optimistic Concurrency Control (OCC), which can be leveraged with write operations like `UPSERT` and `INSERT` to allow changes from multiple writers to the same Hudi table. This is file-level OCC, so any two commits (or writers) can write to the same table, if their changes do not conflict. For more information, see the [Hudi concurrency control](#).
- Amazon EMR clusters have Zookeeper installed, which can be leveraged as the lock provider for OCC. To make it easier to use this feature, Amazon EMR clusters have the following properties pre-configured:

```
hoodie.write.lock.provider=org.apache.hudi.client.transaction.lock.ZookeeperBasedLockProvider
hoodie.write.lock.zookeeper.url=<EMR Zookeeper URL>
hoodie.write.lock.zookeeper.port=<EMR Zookeeper Port>
hoodie.write.lock.zookeeper.base_path=/hudi
```

To enable OCC, you need to configure the following properties either with their Hudi job options or at the cluster-level using the Amazon EMR configurations API:

```
hoodie.write.concurrency.mode=optimistic_concurrency_control
hoodie.cleaner.policy.failed.writes=LAZY (Performs cleaning of failed writes lazily instead of inline with every write)
hoodie.write.lock.zookeeper.lock_key=<Key to uniquely identify the Hudi table> (Table Name is a good option)
```

## Hudi Monitoring: Amazon CloudWatch integration to report Hudi Metrics

- Amazon EMR supports publishing Hudi Metrics to Amazon CloudWatch. It is enabled by setting the following required configurations:

```
hoodie.metrics.on=true
hoodie.metrics.reporter.type=CLOUDWATCH
```

- The following are optional Hudi configurations that you can change:

Setting	Description	Value
hoodie.metrics.cloudwatch.report.period.seconds	Frequency (in seconds) at which to report metrics to Amazon CloudWatch	Default value is 60s, which is fine for the default one minute resolution offered by Amazon CloudWatch
hoodie.metrics.cloudwatch.metric.prefix	Prefix to be added to each metric name	Default value is empty (no prefix)
hoodie.metrics.cloudwatch.namespace	Amazon CloudWatch namespace under which metrics are published	Default value is Hudi
hoodie.metrics.cloudwatch.maxDatumsPerRequest	Maximum number of datums to be included in one request to Amazon CloudWatch	Default value is 20, which is same as Amazon CloudWatch default

## Amazon EMR Hudi configurations support and improvements

- Customers can now leverage EMR Configurations API and Reconfiguration feature to configure Hudi configurations at cluster level. A new file based configuration support has been introduced via `/etc/hudi/conf/hudi-defaults.conf` along the lines of other applications like Spark, Hive etc. EMR configures few defaults to improve user experience:

— `hoodie.datasource.hive_sync.jdbcurl` is configured to the cluster Hive server URL and no longer needs to be specified. This is particularly useful when running a job in Spark cluster mode, where you previously had to specify the Amazon EMR master IP.

- HBase specific configurations, which are useful for using HBase index with Hudi.
- Zookeeper lock provider specific configuration, as discussed under concurrency control, which makes it easier to use Optimistic Concurrency Control (OCC).
- Additional changes have been introduced to reduce the number of configurations that you need to pass, and to infer automatically where possible:
  - The `partitionBy` keyword can be used to specify the partition column.
  - When enabling Hive Sync, it is no longer mandatory to pass `HIVE_TABLE_OPT_KEY`, `HIVE_PARTITION_FIELDS_OPT_KEY`, `HIVE_PARTITION_EXTRACTOR_CLASS_OPT_KEY`. Those values can be inferred from the Hudi table name and partition field.
  - `KEYGENERATOR_CLASS_OPT_KEY` is not mandatory to pass, and can be inferred from simpler cases of `SimpleKeyGenerator` and `ComplexKeyGenerator`.

## Hudi Caveats

- Hudi does not support vectorized execution in Hive for Merge on Read (MoR) and Bootstrap tables. For example, `count(*)` fails with Hudi realtime table when `hive.vectorized.execution.enabled` is set to true. As a workaround, you can disable vectorized reading by setting `hive.vectorized.execution.enabled` to false.
- Multi-writer support is not compatible with the Hudi bootstrap feature.
- Flink Streamer and Flink SQL are experimental features in this release. These features are not recommended for use in production deployments.

## Changes, enhancements, and resolved issues

This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

- Previously, manual restart of the resource manager on a multi-master cluster caused Amazon EMR on-cluster daemons, like Zookeeper, to reload all previously decommissioned or lost nodes in the Zookeeper znode file. This caused default limits to be exceeded in certain situations. Amazon EMR now removes the decommissioned or lost node records older than one hour from the Zookeeper file and the internal limits have been increased.

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- **Configuring a cluster to fix Apache YARN Timeline Server version 1 and 1.5 performance issues**

Apache YARN Timeline Server version 1 and 1.5 can cause performance issues with very active, large EMR clusters, particularly with `yarn.resourcemanager.system-metrics-publisher.enabled=true`, which is the default setting in Amazon EMR. An open source YARN Timeline Server v2 solves the performance issue related to YARN Timeline Server scalability.

Other workarounds for this issue include:

- Configuring `yarn.resourcemanager.system-metrics-publisher.enabled=false` in `yarn-site.xml`.
- Enabling the fix for this issue when creating a cluster, as described below.

The following Amazon EMR releases contain a fix for this YARN Timeline Server performance issue.

EMR 5.30.2, 5.31.1, 5.32.1, 5.33.1, 5.34.x, 6.0.1, 6.1.1, 6.2.1, 6.3.1, 6.4.x

To enable the fix on any of the above specified Amazon EMR releases, set these properties to `true` in a configurations JSON file that is passed in using the [aws emr create-cluster](#)

**command parameter:** `--configurations file:///./configurations.json`. Or enable the fix using the [reconfiguration console UI](#).

Example of the `configurations.json` file contents:

```
[
  {
    "Classification": "yarn-site",
    "Properties": {
      "yarn.resourcemanager.system-metrics-publisher.timeline-server-v1.enable-batch":
        "true",
      "yarn.resourcemanager.system-metrics-publisher.enabled": "true"
    },
    "Configurations": []
  }
]
```

- WebHDFS and HttpFS server are disabled by default. You can re-enable WebHDFS using the Hadoop configuration, `dfs.webhdfs.enabled`. HttpFS server can be started by using `sudo systemctl start hadoop-httpfs`.
- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPCE policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos-$region/*` to your policy (replace `$region` with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).
- Hive: Write query performance is improved by enabling the use of a scratch directory on HDFS for the last job. The temporary data for final job is written to HDFS instead of Amazon S3 and performance is improved because the data is moved from HDFS to the final table location (Amazon S3) instead of between Amazon S3 devices.
- Hive: Query compilation time improvement up to 2.5x with Glue metastore Partition Pruning.
- By default, when built-in UDFs are passed by Hive to the Hive Metastore Server, only a subset of those built-in UDFs are passed to the Glue Metastore since Glue supports only limited expression operators. If you set `hive.glue.partition.pruning.client=true`, then all partition pruning happens on the client side. If the you set `hive.glue.partition.pruning.server=true`, then all partition pruning happens on the server side.

## Known issues

- Hue queries do not work in Amazon EMR 6.4.0 because Apache Hadoop HttpFS server is disabled by default. To use Hue on Amazon EMR 6.4.0, either manually start HttpFS server on the Amazon EMR primary node using `sudo systemctl start hadoop-httpfs`, or [use an Amazon EMR step](#).
- The Amazon EMR Notebooks feature used with Livy user impersonation does not work because HttpFS is disabled by default. In this case, the EMR notebook cannot connect to the cluster that has Livy impersonation enabled. The workaround is to start HttpFS server before connecting the EMR notebook to the cluster using `sudo systemctl start hadoop-httpfs`.
- In Amazon EMR version 6.4.0, Phoenix does not support the Phoenix connectors component.
- To use Spark actions with Apache Oozie, you must add the following configuration to your Oozie `workflow.xml` file. Otherwise, several critical libraries such as Hadoop and EMRFS will be missing from the classpath of the Spark executors that Oozie launches.

```
<spark-opts>--conf spark.yarn.populateHadoopClasspath=true</spark-opts>
```

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

## 6.4.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.4.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

### 6.3.1 release notes

This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

#### Changes, Enhancements, and Resolved Issues

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node

state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.

- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPCE policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos-$region/*` to your policy (replace `$region` with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).

## Known issues

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

### 6.3.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

### 6.3.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

Using your Amazon S3 Access Point alias, you can simplify your data access at scale on Amazon EMR. You can use Amazon S3 Access Points with all versions of Amazon EMR at no additional cost in all AWS regions where Amazon EMR is available. To learn more about Amazon S3 Access Points and Access Point aliases, see [Using a bucket-style alias for your access point](#) in the *Amazon S3 User Guide*.
- New `DescribeReleaseLabel` and `ListReleaseLabel` API parameters provide Amazon EMR release label details. You can programmatically list releases available in the region where the API request is run, and list the available applications for a specific Amazon EMR release label. The

release label parameters also list Amazon EMR releases that support a specified application, such as Spark. This information can be used to programmatically launch Amazon EMR clusters. For example, you can launch a cluster using the latest release version from the `ListReleaseLabel` results. For more information, see [DescribeReleaseLabel](#) and [ListReleaseLabels](#) in the *Amazon EMR API Reference*.

- With Amazon EMR 6.3.0, you can launch a cluster that natively integrates with Apache Ranger. Apache Ranger is an open-source framework to enable, monitor, and manage comprehensive data security across the Hadoop platform. For more information, see [Apache Ranger](#). With native integration, you can bring your own Apache Ranger to enforce fine-grained data access control on Amazon EMR. See [Integrate Amazon EMR with Apache Ranger](#) in the Amazon EMR Management Guide.
- Scoped managed policies: To align with AWS best practices, Amazon EMR has introduced v2 EMR-scoped default managed policies as replacements for policies that will be deprecated. See [Amazon EMR Managed Policies](#).
- Instance Metadata Service (IMDS) V2 support status: For Amazon EMR 6.2 or later, Amazon EMR components use IMDSv2 for all IMDS calls. For IMDS calls in your application code, you can use both IMDSv1 and IMDSv2, or configure the IMDS to use only IMDSv2 for added security. If you disable IMDSv1 in earlier Amazon EMR 6.x releases, it causes cluster startup failure.

## Changes, enhancements, and resolved issues

- This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.
- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.

- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- Spark SQL UI explain mode default changed from extended to formatted in [Spark 3.1](#). Amazon EMR reverted it back to extended to include logical plan information in the Spark SQL UI. This can be reverted by setting `spark.sql.ui.explainMode` to `formatted`.
- The following commits were backported from the Spark master branch.
  - [\[SPARK-34752\]](#)[BUILD] Bump Jetty to 9.4.37 to address CVE-2020-27223.
  - [\[SPARK-34534\]](#) Fix blockIds order when use FetchShuffleBlocks to fetch blocks.
  - [\[SPARK-34681\]](#) [SQL] Fix bug for full outer shuffled hash join when building left side with non-equal condition.
  - [\[SPARK-34497\]](#) [SQL] Fix built-in JDBC connection providers to restore JVM security context changes.
- To improve interoperability with Nvidia Spark RAPIDS plugin, Added workaround to address an issue preventing dynamic partition pruning from triggering when using Nvidia Spark RAPIDS with adaptive query execution disabled, see [RAPIDS issue #1378](#) and [RAPIDS issue ##1386](#). For details of the new configuration `spark.sql.optimizer.dynamicPartitionPruning.enforceBroadcastReuse`, see [RAPIDS issue ##1386](#).
- The file output committer default algorithm has been changed from the v2 algorithm to the v1 algorithm in open source Spark 3.1. For more information, see this [Amazon EMR optimizing Spark performance - dynamic partition pruning](#).
- Amazon EMR reverted to the v2 algorithm, the default used in prior Amazon EMR 6.x releases, to prevent performance regression. To restore the open source Spark 3.1 behavior, set `spark.hadoop.mapreduce.fileoutputcommitter.algorithm.version` to 1. Open source Spark made this change because task commit in file output committer algorithm v2 is not atomic, which can cause an output data correctness issue in some cases. However, task commit in algorithm v1 is also not atomic. In some scenarios task commit includes a delete performed before a rename. This can result in a silent data correctness issue.

- Fixed Managed Scaling issues in earlier Amazon EMR releases and made improvements so application failure rates are significantly reduced.
- Installed the AWS Java SDK Bundle on each new cluster. This is a single jar containing all service SDKs and their dependencies, instead of individual component jars. For more information, see [Java SDK Bundled Dependency](#).

## Known issues

- For Amazon EMR 6.3.0 and 6.2.0 private subnet clusters, you cannot access the Ganglia web UI. You will get an "access denied (403)" error. Other web UIs, such as Spark, Hue, JupyterHub, Zeppelin, Livy, and Tez are working normally. Ganglia web UI access on public subnet clusters are also working normally. To resolve this issue, restart httpd service on the primary node with `sudo systemctl restart httpd`. This issue is fixed in Amazon EMR 6.4.0.
- When AWS Glue Data Catalog is enabled, using Spark to access a AWS Glue DB with null string location URI may fail. This happens to earlier Amazon EMR releases, but SPARK-31709 (<https://issues.apache.org/jira/browse/SPARK-31709>) makes it apply to more cases. For example, when creating a table within the default AWS Glue DB whose location URI is a null string, `spark.sql("CREATE TABLE mytest (key string) location '/table_path';")` fails with the message, "Cannot create a Path from an empty string." To work around this, manually set a location URI of your AWS Glue databases, then create tables within these databases using Spark.
- In Amazon EMR 6.3.0, PrestoSQL has upgraded from version 343 to version 350. There are two security related changes from the open source that relate to this version change. File-based catalog access control is changed from deny to allow when table, schema, or session property rules are not defined. Also, file-based system access control is changed to support files without catalog rules defined. In this case, all access to catalogs is allowed.

For more information, see [Release 344 \(9 Oct 2020\)](#).

- Note that the Hadoop user directory (`/home/hadoop`) is readable by everyone. It has Unix 755 (`drwxr-xr-x`) directory permissions to allow read access by frameworks like Hive. You can put files in `/home/hadoop` and its subdirectories, but be aware of the permissions on those directories to protect sensitive information.
- **Lower "Max open files" limit on older AL2 [fixed in newer releases].** Amazon EMR releases: `emr-5.30.x`, `emr-5.31.0`, `emr-5.32.0`, `emr-6.0.0`, `emr-6.1.0`, and `emr-6.2.0` are based on older versions of Amazon Linux 2 (AL2), which have a lower `ulimit` setting for "Max open files" when Amazon EMR clusters are created with the default AMI. Amazon EMR releases `5.30.1`, `5.30.2`,

5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default ulimit setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower ulimit setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the ulimit setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

### Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

### Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
sudo mkdir -p /etc/systemd/system/$proc.service.d/
```

```
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
sudo systemctl daemon-reload
```

### Important

EMR clusters that run Amazon Linux or Amazon Linux 2 Amazon Machine Images (AMIs) use default Amazon Linux behavior, and do not automatically download and install important and critical kernel updates that require a reboot. This is the same behavior as other Amazon EC2 instances that run the default Amazon Linux AMI. If new Amazon Linux software updates that require a reboot (such as kernel, NVIDIA, and CUDA updates) become available after an Amazon EMR release becomes available, EMR cluster instances that run the default AMI do not automatically download and install those updates. To get kernel updates, you can [customize your Amazon EMR AMI](#) to [use the latest Amazon Linux AMI](#).

- To use Spark actions with Apache Oozie, you must add the following configuration to your Oozie `workflow.xml` file. Otherwise, several critical libraries such as Hadoop and EMRFS will be missing from the classpath of the Spark executors that Oozie launches.

```
<spark-opts>--conf spark.yarn.populateHadoopClasspath=true</spark-opts>
```

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that

there are 14 other non-control characters: !"#%&'()\*+,-. For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

### 6.3.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

### 6.3.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.2.1 release notes

This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

### Changes, Enhancements, and Resolved Issues

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPCE policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos-$region/*` to your policy (replace `$region` with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).

## Known issues

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

### 6.2.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.2.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## New features

- HBase: Removed rename in commit phase and added persistent HFile tracking. See [Persistent HFile Tracking](#) in the *Amazon EMR Release Guide*.
- HBase: Backported [Create a config that forces to cache blocks on compaction](#).
- PrestoDB: Improvements to Dynamic Partition Pruning. Rule-based Join Reorder works on non-partitioned data.
- Scoped managed policies: To align with AWS best practices, Amazon EMR has introduced v2 EMR-scoped default managed policies as replacements for policies that will be deprecated. See [Amazon EMR Managed Policies](#).
- Instance Metadata Service (IMDS) V2 support status: For Amazon EMR 6.2 or later, Amazon EMR components use IMDSv2 for all IMDS calls. For IMDS calls in your application code, you can use

both IMDSv1 and IMDSv2, or configure the IMDS to use only IMDSv2 for added security. If you disable IMDSv1 in earlier Amazon EMR 6.x releases, it causes cluster startup failure.

## Changes, enhancements, and resolved issues

- This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.
- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- Spark: Performance improvements in Spark runtime.

## Known issues

- Amazon EMR 6.2 has incorrect permissions set on the `/etc/cron.d/libinstance-controller-java` file in EMR 6.2.0. Permissions on the file are 645 (-rw-r--r-x), when they should be 644 (-rw-r--r--). As a result, Amazon EMR version 6.2 does not log instance-state logs, and the `/emr/instance-logs` directory is empty. This issue is fixed in Amazon EMR 6.3.0 and later.

To work around this issue, run the following script as a bootstrap action at cluster launch.

```
#!/bin/bash
sudo chmod 644 /etc/cron.d/libinstance-controller-java
```

- For Amazon EMR 6.2.0 and 6.3.0 private subnet clusters, you cannot access the Ganglia web UI. You will get an "access denied (403)" error. Other web UIs, such as Spark, Hue, JupyterHub, Zeppelin, Livy, and Tez are working normally. Ganglia web UI access on public subnet clusters are also working normally. To resolve this issue, restart httpd service on the primary node with `sudo systemctl restart httpd`. This issue is fixed in Amazon EMR 6.4.0.
- There is an issue in Amazon EMR 6.2.0 where httpd continuously fails, causing Ganglia to be unavailable. You get a "cannot connect to the server" error. To fix a cluster that is already running with this issue, SSH to the cluster primary node and add the line `Listen 80` to the file `httpd.conf` located at `/etc/httpd/conf/httpd.conf`. This issue is fixed in Amazon EMR 6.3.0.
- HTTPD fails on EMR 6.2.0 clusters when you use a security configuration. This makes the Ganglia web application user interface unavailable. To access the Ganglia web application user interface, add `Listen 80` to the `/etc/httpd/conf/httpd.conf` file on the primary node of your cluster. For information about connecting to your cluster, see [Connect to the Primary Node Using SSH](#).

EMR Notebooks also fail to establish a connection with EMR 6.2.0 clusters when you use a security configuration. The notebook will fail to list kernels and submit Spark jobs. We recommend that you use EMR Notebooks with another version of Amazon EMR instead.

- **Lower "Max open files" limit on older AL2 [fixed in newer releases].** Amazon EMR releases: `emr-5.30.x`, `emr-5.31.0`, `emr-5.32.0`, `emr-6.0.0`, `emr-6.1.0`, and `emr-6.2.0` are based on older versions of Amazon Linux 2 (AL2), which have a lower `ulimit` setting for "Max open files" when Amazon EMR clusters are created with the default AMI. Amazon EMR releases `5.30.1`, `5.30.2`, `5.31.1`, `5.32.1`, `6.0.1`, `6.1.1`, `6.2.1`, `5.33.0`, `6.3.0` and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default `ulimit` setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower `ulimit` setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the `ulimit` setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

### Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

### Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
sudo mkdir -p /etc/systemd/system/$proc.service.d/
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
```

```
sudo systemctl daemon-reload
```

• **⚠ Important**

Amazon EMR 6.1.0 and 6.2.0 include a performance issue that can critically affect all Hudi insert, upsert, and delete operations. If you plan to use Hudi with Amazon EMR 6.1.0 or 6.2.0, you should contact AWS support to obtain a patched Hudi RPM.

• **⚠ Important**

EMR clusters that run Amazon Linux or Amazon Linux 2 Amazon Machine Images (AMIs) use default Amazon Linux behavior, and do not automatically download and install important and critical kernel updates that require a reboot. This is the same behavior as other Amazon EC2 instances that run the default Amazon Linux AMI. If new Amazon Linux software updates that require a reboot (such as kernel, NVIDIA, and CUDA updates) become available after an Amazon EMR release becomes available, EMR cluster instances that run the default AMI do not automatically download and install those updates. To get kernel updates, you can [customize your Amazon EMR AMI](#) to [use the latest Amazon Linux AMI](#).

- Amazon EMR 6.2.0 Maven artifacts are not published. They will be published with a future release of Amazon EMR.
- Persistent HFile tracking using the HBase storefile system table does not support the HBase region replication feature. For more information about HBase region replication, see [Timeline-consistent High Available Reads](#).
- Amazon EMR 6.x and EMR 5.x Hive bucketing version differences

EMR 5.x uses OOS Apache Hive 2, while in EMR 6.x uses OOS Apache Hive 3. The open source Hive2 uses Bucketing version 1, while open source Hive3 uses Bucketing version 2. This bucketing version difference between Hive 2 (EMR 5.x) and Hive 3 (EMR 6.x) means Hive bucketing hashing functions differently. See the example below.

The following table is an example created in EMR 6.x and EMR 5.x, respectively.

```
-- Using following LOCATION in EMR 6.x
CREATE TABLE test_bucketing (id INT, desc STRING)
PARTITIONED BY (day STRING)
CLUSTERED BY(id) INTO 128 BUCKETS
```

```
LOCATION 's3://your-own-s3-bucket/emr-6-bucketing/';

-- Using following LOCATION in EMR 5.x
LOCATION 's3://your-own-s3-bucket/emr-5-bucketing/';
```

Inserting the same data in both EMR 6.x and EMR 5.x.

```
INSERT INTO test_bucketing PARTITION (day='01') VALUES(66, 'some_data');
INSERT INTO test_bucketing PARTITION (day='01') VALUES(200, 'some_data');
```

Checking the S3 location, shows the bucketing file name is different, because the hashing function is different between EMR 6.x (Hive 3) and EMR 5.x (Hive 2).

```
[hadoop@ip-10-0-0-122 ~]$ aws s3 ls s3://your-own-s3-bucket/emr-6-bucketing/day=01/
2020-10-21 20:35:16          13 000025_0
2020-10-21 20:35:22          14 000121_0
[hadoop@ip-10-0-0-122 ~]$ aws s3 ls s3://your-own-s3-bucket/emr-5-bucketing/day=01/
2020-10-21 20:32:07          13 000066_0
2020-10-21 20:32:51          14 000072_0
```

You can also see the version difference by running the following command in Hive CLI in EMR 6.x. Note that it returns bucketing version 2.

```
hive> DESCRIBE FORMATTED test_bucketing;
...
Table Parameters:
  bucketing_version      2
...
```

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.

- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

## 6.2.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the

most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## 6.2.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 6.1.1 release notes

This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

### Changes, Enhancements, and Resolved Issues

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.

- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPCE policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos-$region/*` to your policy (replace `$region` with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).

## 6.1.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## New features

- ARM instance types are supported starting with Amazon EMR version 5.30.0 and Amazon EMR version 6.1.0.
- M6g general purpose instance types are supported starting with Amazon EMR versions 6.1.0 and 5.30.0. For more information, see [Supported Instance Types](#) in the *Amazon EMR Management Guide*.
- The EC2 placement group feature is supported starting with Amazon EMR version 5.23.0 as an option for multiple primary node clusters. Currently, only primary node types are supported by the placement group feature, and the SPREAD strategy is applied to those primary nodes. The SPREAD strategy places a small group of instances across separate underlying hardware to guard against the loss of multiple primary nodes in the event of a hardware failure. For more information, see [EMR Integration with EC2 Placement Group](#) in the *Amazon EMR Management Guide*.
- Managed Scaling – With Amazon EMR version 6.1.0, you can enable Amazon EMR managed scaling to automatically increase or decrease the number of instances or units in your cluster based on workload. Amazon EMR continuously evaluates cluster metrics to make scaling decisions that optimize your clusters for cost and speed. Managed Scaling is also available on

Amazon EMR version 5.30.0 and later, except 6.0.0. For more information, see [Scaling Cluster Resources](#) in the *Amazon EMR Management Guide*.

- PrestoSQL version 338 is supported with EMR 6.1.0. For more information, see [Presto](#).
  - PrestoSQL is supported on EMR 6.1.0 and later versions only, not on EMR 6.0.0 or EMR 5.x.
  - The application name, Presto continues to be used to install PrestoDB on clusters. To install PrestoSQL on clusters, use the application name PrestoSQL.
  - You can install either PrestoDB or PrestoSQL, but you cannot install both on a single cluster. If both PrestoDB and PrestoSQL are specified when attempting to create a cluster, a validation error occurs and the cluster creation request fails.
  - PrestoSQL is supported on both single-master and multi-master clusters. On multi-master clusters, an external Hive metastore is required to run PrestoSQL or PrestoDB. See [Supported applications in an EMR cluster with multiple primary nodes](#).
- ECR auto authentication support on Apache Hadoop and Apache Spark with Docker: Spark users can use Docker images from Docker Hub and Amazon Elastic Container Registry (Amazon ECR) to define environment and library dependencies.

[Configure Docker](#) and [Run Spark Applications with Docker Using Amazon EMR 6.x](#).

- EMR supports Apache Hive ACID transactions: Amazon EMR 6.1.0 adds support for Hive ACID transactions so it complies with the ACID properties of a database. With this feature, you can run INSERT, UPDATE, DELETE, and MERGE operations in Hive managed tables with data in Amazon Simple Storage Service (Amazon S3). This is a key feature for use cases like streaming ingestion, data restatement, bulk updates using MERGE, and slowly changing dimensions. For more information, including configuration examples and use cases, see [Amazon EMR supports Apache Hive ACID transactions](#).

## Changes, enhancements, and resolved issues

- This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.
- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.

- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- Apache Flink is not supported on EMR 6.0.0, but it is supported on EMR 6.1.0 with Flink 1.11.0. This is the first version of Flink to officially support Hadoop 3. See [Apache Flink 1.11.0 Release Announcement](#).
- Ganglia has been removed from default EMR 6.1.0 package bundles.

## Known issues

- **Lower "Max open files" limit on older AL2 [fixed in newer releases]**. Amazon EMR releases: emr-5.30.x, emr-5.31.0, emr-5.32.0, emr-6.0.0, emr-6.1.0, and emr-6.2.0 are based on older versions of Amazon Linux 2 (AL2), which have a lower ulimit setting for "Max open files" when Amazon EMR clusters are created with the default AMI. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default ulimit setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower ulimit setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the ulimit setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

## Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

## Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
sudo mkdir -p /etc/systemd/system/$proc.service.d/
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
sudo systemctl daemon-reload
```

**⚠ Important**

Amazon EMR 6.1.0 and 6.2.0 include a performance issue that can critically affect all Hudi insert, upsert, and delete operations. If you plan to use Hudi with Amazon EMR 6.1.0 or 6.2.0, you should contact AWS support to obtain a patched Hudi RPM.

- If you set custom garbage collection configuration with `spark.driver.extraJavaOptions` and `spark.executor.extraJavaOptions`, this will result in driver/executor launch failure with EMR 6.1 due to conflicting garbage collection configuration. With EMR Release 6.1.0, you should specify custom Spark garbage collection configuration for drivers and executors with the properties `spark.driver.defaultJavaOptions` and `spark.executor.defaultJavaOptions` instead. Read more in [Apache Spark Runtime Environment](#) and [Configuring Spark Garbage Collection on Amazon EMR 6.1.0](#).
- Using Pig with Oozie (and within Hue, since Hue uses Oozie actions to run Pig scripts), generates an error that a native-lzo library cannot be loaded. This error message is informational and does not block Pig from running.
- Hudi Concurrency Support: Currently Hudi doesn't support concurrent writes to a single Hudi table. In addition, Hudi rolls back any changes being done by in-progress writers before allowing a new writer to start. Concurrent writes can interfere with this mechanism and introduce race conditions, which can lead to data corruption. You should ensure that as part of your data processing workflow, there is only a single Hudi writer operating against a Hudi table at any time. Hudi does support multiple concurrent readers operating against the same Hudi table.
- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

**Workaround:**

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

- There is an issue in Amazon EMR 6.1.0 that affects clusters running Presto. After an extended period of time (days), the cluster may throw errors such as, "su: failed to execute /bin/bash: Resource temporarily unavailable" or "shell request failed on channel 0". This issue is caused by an internal Amazon EMR process (InstanceController) that is spawning too many Light Weight Processes (LWP), which eventually causes the Hadoop user to exceed their nproc limit. This prevents the user from opening additional processes. The solution for this issue is to upgrade to EMR 6.2.0.

## 6.1.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 6.0.1 release notes

This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

### Changes, Enhancements, and Resolved Issues

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.

- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPCE policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos-$region/*` to your policy (replace `$region` with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).

## 6.0.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

**New features**

- YARN Docker Runtime Support - YARN applications, such as Spark jobs, can now run in the context of a Docker container. This allows you to easily define dependencies in a Docker image without the need to install custom libraries on your Amazon EMR cluster. For more information, see [Configure Docker Integration](#) and [Run Spark applications with Docker using Amazon EMR 6.0.0](#).
- Hive LLAP Support - Hive now supports the LLAP execution mode for improved query performance. For more information, see [Using Hive LLAP](#).

**Changes, enhancements, and resolved issues**

- This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.
- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node

state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.

- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- Amazon Linux
  - Amazon Linux 2 is the operating system for the EMR 6.x release series.
  - `systemd` is used for service management instead of `upstart` used in Amazon Linux 1.
- Java Development Kit (JDK)
  - Corretto JDK 8 is the default JDK for the EMR 6.x release series.
- Scala
  - Scala 2.12 is used with Apache Spark and Apache Livy.
- Python 3
  - Python 3 is now the default version of Python in EMR.
- YARN node labels
  - Beginning with Amazon EMR 6.x release series, the YARN node labels feature is disabled by default. The application master processes can run on both core and task nodes by default. You can enable the YARN node labels feature by configuring following properties: `yarn.node-labels.enabled` and `yarn.node-labels.am.default-node-label-expression`. For more information, see [Understanding Primary, Core, and Task Nodes](#).

## Known issues

- **Lower "Max open files" limit on older AL2 [fixed in newer releases].** Amazon EMR releases: emr-5.30.x, emr-5.31.0, emr-5.32.0, emr-6.0.0, emr-6.1.0, and emr-6.2.0 are based on older versions of Amazon Linux 2 (AL2), which have a lower ulimit setting for "Max open files" when Amazon EMR clusters are created with the default AMI. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default ulimit setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower ulimit setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the ulimit setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

### Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

### Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
```

```
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
sudo mkdir -p /etc/systemd/system/$proc.service.d/
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
sudo systemctl daemon-reload
```

- Spark interactive shell, including PySpark, SparkR, and spark-shell, does not support using Docker with additional libraries.
- To use Python 3 with Amazon EMR version 6.0.0, you must add `PATH` to `yarn.nodemanager.env-whitelist`.
- The Live Long and Process (LLAP) functionality is not supported when you use the AWS Glue Data Catalog as the metastore for Hive.
- When using Amazon EMR 6.0.0 with Spark and Docker integration, you need to configure the instances in your cluster with the same instance type and the same amount of EBS volumes to avoid failure when submitting a Spark job with Docker runtime.
- In Amazon EMR 6.0.0, HBase on Amazon S3 storage mode is impacted by the [HBASE-24286](#) issue. HBase master cannot initialize when the cluster is created using existing S3 data.
- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

#### Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.

- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 6.0.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## Amazon EMR 5.x release versions

This section contains application versions, release notes, component versions, and configuration classifications available in each Amazon EMR 5.x release version.

When you launch a cluster, you can choose from multiple releases of Amazon EMR. This allows you to test and use application versions that fit your compatibility requirements. You specify the release number with the *release label*. Release labels are in the form `emr-x.x.x`. For example, `emr-7.0.0`.

New Amazon EMR releases are made available in different Regions over a period of several days, beginning with the first Region on the initial release date. The latest release version may not be available in your Region during this period.

For a comprehensive table of application versions in every Amazon EMR 5.x release, see [Application versions in Amazon EMR 5.x releases](#).

## 5.36.1 release notes

The following release notes include information for Amazon EMR release 5.36.1. Changes are relative to 5.36.0. For information on the release timeline, see the [change log](#).

### Changes, enhancements, and resolved issues

- Amazon EMR release 5.36.1 adds support for archiving logs to Amazon S3 during cluster scale-down. In previous 5.x releases, you could only archive log files to Amazon S3 during cluster termination. This improvement ensures that log files generated on the cluster persist on Amazon S3 even after the node is terminated. For more information, see [Configure cluster logging and debugging](#).
- The 5.36.1 release improves the on-cluster log management daemon to monitor additional log folders in your EMR cluster. This improvement minimizes disk over-utilization scenarios.
- The 5.36.1 release automatically restarts the on-cluster log management daemon when it stops. This improvement reduces the risk for nodes to appear unhealthy due to disk over-utilization.
- The 5.36.1 release fixes an issue where Amazon EMR daemons on the primary node would maintain stale metadata for terminated instances in the cluster. Maintaining stale data might cause on-cluster CPU and memory usage to grow without bounds, and ultimately cause cluster failures.
- For clusters that are launched with multiple primary nodes, the 5.36.1 release fixes an issue where an Amazon EC2 hardware failure on one of the primary nodes could cause a second primary node to fail and render your cluster unstable.
- For clusters that are configured with in-transit encryption, Managed Scaling is now *Spark shuffle data* aware. Spark shuffle data is data that Spark redistributes across partitions to perform specific operations. During scale down, Managed Scaling ignores the instances with shuffle data.

This prevents job re-attempts and re-computations, which are costly for price and performance. For more information on shuffle operations, see the [Spark Programming Guide](#).

- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

### 5.36.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

### 5.36.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

The following release notes include information for Amazon EMR release 5.36.0. Changes are relative to 5.35.0.

Initial release date: June 15, 2022

### New Features

- Amazon EMR release 5.36.0 adds support for data definition language (DDL) with Apache Spark on Apache Ranger enabled clusters. This allows you to use Apache Ranger for managing access for operations like creating, altering and dropping databases and tables from an Amazon EMR cluster.

- When you launch a cluster with *the latest patch release* of Amazon EMR 5.36 or higher, 6.6 or higher, or 7.0 or higher, Amazon EMR uses the latest Amazon Linux 2023 or Amazon Linux 2 release for the default Amazon EMR AMI. For more information, see [Using the default Amazon Linux AMI for Amazon EMR](#).

 **Note**

This release no longer gets automatic AMI updates since it has been succeeded by 1 more more patch releases. The patch release is denoted by the number after the second decimal point (6.8.**1**). To see if you're using the latest patch release, check the available releases in the [Release Guide](#), or check the **Amazon EMR release** dropdown when you create a cluster in the console, or use the [ListReleaseLabels](#) API or [list-release-labels](#) CLI action. To get updates about new releases, subscribe to the RSS feed on the [What's new?](#) page.

## Changes, Enhancements, and Resolved Issues

- Amazon EMR 5.36.0 upgrades now support: aws-sdk 1.12.206, Hadoop 2.10.1-amzn-4, Hive 2.3.9-amzn-2, Hudi 0.10.1-amzn-1, Spark 2.4.8-amzn-2, Presto 0.267-amzn-1, Amazon Glue connector 1.18.0, EMRFS 2.51.0.

## Known issues

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the

`spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

- With Amazon EMR releases 5.36.0 and 6.6.0 through 6.9.0, `SecretAgent` and `RecordServer` service components may experience log data loss due to an incorrect file name pattern configuration in `Log4j2` properties. The incorrect configuration causes the components to generate only one log file per day. When the rotation strategy occurs, it overwrites the existing file instead of generating a new log file as expected. As a workaround, use a bootstrap action to generate log files each hour and append an auto-increment integer in the file name to handle the rotation.

For Amazon EMR 6.6.0 through 6.9.0 releases, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-6x/replace-puppet.sh,Args=[]"
```

For Amazon EMR 5.36.0, use the following bootstrap action when you launch a cluster.

```
--bootstrap-actions "Path=s3://emr-data-access-control-us-east-1/customer-bootstrap-actions/log-rotation-emr-5x/replace-puppet.sh,Args=[]"
```

## 5.36.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.36.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## Known issues

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

## 5.35.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.35.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 5.34.0 release notes

The following release notes include information for Amazon EMR release 5.34.0. Changes are relative to 5.33.1.

Initial release date: January 20, 2022

Updated release date: March 21, 2022

### New Features

- **[Managed scaling] Spark shuffle data managed scaling optimization** - For Amazon EMR versions 5.34.0 and later, and EMR versions 6.4.0 and later, managed scaling is now Spark shuffle data aware (data that Spark redistributes across partitions to perform specific operations). For more information on shuffle operations, see [Using EMR managed scaling in Amazon EMR](#) in the *Amazon EMR Management Guide* and [Spark Programming Guide](#).
- [Hudi] Improvements to simplify Hudi configuration. Disabled optimistic concurrency control by default.

### Changes, Enhancements, and Resolved Issues

- This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.
- Previously, manual restart of the resource manager on a multi-master cluster caused Amazon EMR on-cluster daemons, like Zookeeper, to reload all previously decommissioned or lost nodes in the Zookeeper znode file. This caused default limits to be exceeded in certain situations. Amazon EMR now removes the decommissioned or lost node records older than one hour from the Zookeeper file and the internal limits have been increased.
- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.

- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Zeppelin upgraded to version 0.10.0.
- Livy Fix - upgraded to 0.7.1
- Spark performance improvement - heterogeneous executors are disabled when certain Spark configuration values are overridden in EMR 5.34.0.
- WebHDFS and HttpFS server are disabled by default. You can re-enable WebHDFS using the Hadoop configuration, `dfs.webhdfs.enabled`. HttpFS server can be started by using `sudo systemctl start hadoop-httpfs`.

## Known Issues

- The Amazon EMR Notebooks feature used with Livy user impersonation does not work because HttpFS is disabled by default. In this case, the EMR notebook cannot connect to the cluster that has Livy impersonation enabled. The workaround is to start HttpFS server before connecting the EMR notebook to the cluster using `sudo systemctl start hadoop-httpfs`.
- Hue queries do not work in Amazon EMR 6.4.0 because Apache Hadoop HttpFS server is disabled by default. To use Hue on Amazon EMR 6.4.0, either manually start HttpFS server on the Amazon EMR primary node using `sudo systemctl start hadoop-httpfs`, or [use an Amazon EMR step](#).
- The Amazon EMR Notebooks feature used with Livy user impersonation does not work because HttpFS is disabled by default. In this case, the EMR notebook cannot connect to the cluster that has Livy impersonation enabled. The workaround is to start HttpFS server before connecting the EMR notebook to the cluster using `sudo systemctl start hadoop-httpfs`.
- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:

- Two or more partitions are scanned from the same table.
- At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
- The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

### 5.34.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

### 5.34.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

### Changes, enhancements, and resolved issues

- This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- **Configuring a cluster to fix Apache YARN Timeline Server version 1 and 1.5 performance issues**

Apache YARN Timeline Server version 1 and 1.5 can cause performance issues with very active, large EMR clusters, particularly with `yarn.resourcemanager.system-metrics-publisher.enabled=true`, which is the default setting in Amazon EMR. An open source YARN Timeline Server v2 solves the performance issue related to YARN Timeline Server scalability.

Other workarounds for this issue include:

- Configuring `yarn.resourcemanager.system-metrics-publisher.enabled=false` in `yarn-site.xml`.
- Enabling the fix for this issue when creating a cluster, as described below.

The following Amazon EMR releases contain a fix for this YARN Timeline Server performance issue.

EMR 5.30.2, 5.31.1, 5.32.1, 5.33.1, 5.34.x, 6.0.1, 6.1.1, 6.2.1, 6.3.1, 6.4.x

To enable the fix on any of the above specified Amazon EMR releases, set these properties to `true` in a configurations JSON file that is passed in using the [aws emr create-cluster command parameter](#): `--configurations file:///./configurations.json`. Or enable the fix using the [reconfiguration console UI](#).

Example of the configurations.json file contents:

```
[
  {
    "Classification": "yarn-site",
    "Properties": {
      "yarn.resourcemanager.system-metrics-publisher.timeline-server-v1.enable-batch":
        "true",
      "yarn.resourcemanager.system-metrics-publisher.enabled": "true"
    },
    "Configurations": []
  }
]
```

- Spark runtime is now faster when fetching partition locations from Hive Metastore for Spark insert queries.
- Upgraded component versions. For a list of component versions, see [About Amazon EMR Releases](#) in this guide.
- Installed the AWS Java SDK Bundle on each new cluster. This is a single jar containing all service SDKs and their dependencies, instead of individual component jars. For more information, see [Java SDK Bundled Dependency](#).
- Fixed Managed Scaling issues in earlier Amazon EMR releases and made improvements so application failure rates are significantly reduced.
- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPCE policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos-$region/*` to your policy (replace `$region` with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).

## New features

- Amazon EMR supports Amazon S3 Access Points, a feature of Amazon S3 that allows you to easily manage access for shared data lakes. Using your Amazon S3 Access Point alias, you can simplify your data access at scale on Amazon EMR. You can use Amazon S3 Access Points with all versions of Amazon EMR at no additional cost in all AWS regions where Amazon EMR is available. To learn more about Amazon S3 Access Points and Access Point aliases, see [Using a bucket-style alias for your access point](#) in the *Amazon S3 User Guide*.
- Amazon EMR-5.33 supports new Amazon EC2 instance types: c5a, c5ad, c6gn, c6gd, m6gd, d3, d3en, m5zn, r5b, r6gd. See [Supported Instance Types](#).

## Known issues

- **Lower "Max open files" limit on older AL2 [fixed in newer releases].** Amazon EMR releases: emr-5.30.x, emr-5.31.0, emr-5.32.0, emr-6.0.0, emr-6.1.0, and emr-6.2.0 are based on older versions of Amazon Linux 2 (AL2), which have a lower ulimit setting for "Max open files" when Amazon EMR clusters are created with the default AMI. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default ulimit setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower ulimit setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the ulimit setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

### Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

## Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
sudo mkdir -p /etc/systemd/system/$proc.service.d/
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
sudo systemctl daemon-reload
```

- For Amazon EMR 6.3.0 and 6.2.0 private subnet clusters, you cannot access the Ganglia web UI. You will get an "access denied (403)" error. Other web UIs, such as Spark, Hue, JupyterHub, Zeppelin, Livy, and Tez are working normally. Ganglia web UI access on public subnet clusters are also working normally. To resolve this issue, restart httpd service on the primary node with `sudo systemctl restart httpd`. This issue is fixed in Amazon EMR 6.4.0.

### Important

EMR clusters that run Amazon Linux or Amazon Linux 2 Amazon Machine Images (AMIs) use default Amazon Linux behavior, and do not automatically download and install important and critical kernel updates that require a reboot. This is the same behavior as other Amazon EC2 instances that run the default Amazon Linux AMI. If new Amazon

Linux software updates that require a reboot (such as kernel, NVIDIA, and CUDA updates) become available after an Amazon EMR release becomes available, EMR cluster instances that run the default AMI do not automatically download and install those updates. To get kernel updates, you can [customize your Amazon EMR AMI](#) to [use the latest Amazon Linux AMI](#).

- Console support to create a security configuration that specifies the AWS Ranger integration option is currently not supported in the GovCloud Region. Security configuration can be done using the CLI. See [Create the EMR Security Configuration](#) in the *Amazon EMR Management Guide*.
- Scoped managed policies: To align with AWS best practices, Amazon EMR has introduced v2 EMR-scoped default managed policies as replacements for policies that will be deprecated. See [Amazon EMR Managed Policies](#).
- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

### 5.33.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

### 5.33.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 5.33.0 release notes

### 5.33.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

### 5.33.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 5.32.1 release notes

This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

### Changes, Enhancements, and Resolved Issues

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPCE policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos-$region/*` to your policy (replace `$region` with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).

## Known issues

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

### 5.32.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

### 5.32.1 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

### Changes, enhancements, and resolved issues

- This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- Upgraded component versions.
- For a list of component versions, see [About Amazon EMR Releases](#) in this guide.

## New features

- Starting with Amazon EMR 5.32.0 and 6.5.0, dynamic executor sizing for Apache Spark is enabled by default. To turn this feature on or off, you can use the `spark.yarn.heterogeneousExecutors.enabled` configuration parameter.
- Instance Metadata Service (IMDS) V2 support status: Amazon EMR 5.23.1, 5.27.1 and 5.32 or later components use IMDSv2 for all IMDS calls. For IMDS calls in your application code, you can use both IMDSv1 and IMDSv2, or configure the IMDS to use only IMDSv2 for added security. For other 5.x EMR releases, disabling IMDSv1 causes cluster startup failure.
- Beginning with Amazon EMR 5.32.0, you can launch a cluster that natively integrates with Apache Ranger. Apache Ranger is an open-source framework to enable, monitor, and manage comprehensive data security across the Hadoop platform. For more information, see [Apache](#)

[Ranger](#). With native integration, you can bring your own Apache Ranger to enforce fine-grained data access control on Amazon EMR. See [Integrate Amazon EMR with Apache Ranger](#) in the *Amazon EMR Release Guide*.

- Amazon EMR Release 5.32.0 supports Amazon EMR on EKS. For more details on getting started with EMR on EKS, see [What is Amazon EMR on EKS](#).
- Amazon EMR Release 5.32.0 supports Amazon EMR Studio (Preview). For more details on getting started with EMR Studio, see [Amazon EMR Studio \(Preview\)](#).
- Scoped managed policies: To align with AWS best practices, Amazon EMR has introduced v2 EMR-scoped default managed policies as replacements for policies that will be deprecated. See [Amazon EMR Managed Policies](#).

## Known issues

- For Amazon EMR 6.3.0 and 6.2.0 private subnet clusters, you cannot access the Ganglia web UI. You will get an "access denied (403)" error. Other web UIs, such as Spark, Hue, JupyterHub, Zeppelin, Livy, and Tez are working normally. Ganglia web UI access on public subnet clusters are also working normally. To resolve this issue, restart httpd service on the primary node with `sudo systemctl restart httpd`. This issue is fixed in Amazon EMR 6.4.0.
- **Lower "Max open files" limit on older AL2 [fixed in newer releases]**. Amazon EMR releases: emr-5.30.x, emr-5.31.0, emr-5.32.0, emr-6.0.0, emr-6.1.0, and emr-6.2.0 are based on older versions of Amazon Linux 2 (AL2), which have a lower ulimit setting for "Max open files" when Amazon EMR clusters are created with the default AMI. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default ulimit setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower ulimit setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the ulimit setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

## Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

## Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
sudo mkdir -p /etc/systemd/system/$proc.service.d/
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
sudo systemctl daemon-reload
```

**⚠ Important**

EMR clusters that run Amazon Linux or Amazon Linux 2 Amazon Machine Images (AMIs) use default Amazon Linux behavior, and do not automatically download and install important and critical kernel updates that require a reboot. This is the same behavior as other Amazon EC2 instances that run the default Amazon Linux AMI. If new Amazon Linux software updates that require a reboot (such as kernel, NVIDIA, and CUDA updates) become available after an Amazon EMR release becomes available, EMR cluster instances that run the default AMI do not automatically download and install those updates. To get kernel updates, you can [customize your Amazon EMR AMI](#) to [use the latest Amazon Linux AMI](#).

- Console support to create a security configuration that specifies the AWS Ranger integration option is currently not supported in the GovCloud Region. Security configuration can be done using the CLI. See [Create the EMR Security Configuration](#) in the *Amazon EMR Management Guide*.
- When AtRestEncryption or HDFS encryption is enabled on a cluster that uses Amazon EMR 5.31.0 or 5.32.0, Hive queries result in the following runtime exception.

```
TaskAttempt 3 failed, info=[Error: Error while running task ( failure ) :
attempt_1604112648850_0001_1_01_000000_3:java.lang.RuntimeException:
java.lang.RuntimeException: Hive Runtime Error while closing
operators: java.io.IOException: java.util.ServiceConfigurationError:
org.apache.hadoop.security.token.TokenIdentifier: Provider
org.apache.hadoop.hbase.security.token.AuthenticationTokenIdentifier not found
```

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

## 5.32.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.32.0 configuration classifications

Configuration classifications allow you to customize applications. These often correspond to a configuration XML file for the application, such as `hive-site.xml`. For more information, see [Configure applications](#).

Reconfiguration actions occur when you specify a configuration for instance groups in a running cluster. Amazon EMR only initiates reconfiguration actions for the classifications that you modify. For more information, see [Reconfigure an instance group in a running cluster](#).

## 5.31.1 release notes

This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

### Changes, Enhancements, and Resolved Issues

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.

- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPC policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos- $\$$ region/*` to your policy (replace  $\$$ region with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).

## Known issues

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

### 5.31.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2

has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

### Changes, enhancements, and resolved issues

- This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.
- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.

- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- [Hive column statistics](#) are supported for Amazon EMR versions 5.31.0 and later.
- Upgraded component versions.
- EMRFS S3EC V2 Support in Amazon EMR 5.31.0. In S3 Java SDK releases 1.11.837 and later, encryption client Version 2 (S3EC V2) has been introduced with various security enhancements. For more information, see the following:
  - S3 blog post: [Updates to the Amazon S3 encryption client](#).
  - AWS SDK for Java Developer Guide: [Migrate encryption and decryption clients to V2](#).
  - EMR Management Guide: [Amazon S3 client-side encryption](#).

Encryption Client V1 is still available in the SDK for backward compatibility.

## New features

- **Lower "Max open files" limit on older AL2 [fixed in newer releases].** Amazon EMR releases: emr-5.30.x, emr-5.31.0, emr-5.32.0, emr-6.0.0, emr-6.1.0, and emr-6.2.0 are based on older versions of Amazon Linux 2 (AL2), which have a lower ulimit setting for "Max open files" when Amazon EMR clusters are created with the default AMI. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default ulimit setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower ulimit setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the ulimit setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

### Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

### Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
sudo mkdir -p /etc/systemd/system/$proc.service.d/
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
```

```
sudo systemctl daemon-reload
```

- With Amazon EMR 5.31.0, you can launch a cluster that integrates with Lake Formation. This integration provides fine-grained, column-level data filtering to databases and tables in the AWS Glue Data Catalog. It also enables federated single sign-on to EMR Notebooks or Apache Zeppelin from an enterprise identity system. For more information, see [Integrating Amazon EMR with AWS Lake Formation](#) in the *Amazon EMR Management Guide*.

Amazon EMR with Lake Formation is currently available in 16 AWS Regions: US East (Ohio and N. Virginia), US West (N. California and Oregon), Asia Pacific (Mumbai, Seoul, Singapore, Sydney, and Tokyo), Canada (Central), Europe (Frankfurt, Ireland, London, Paris, and Stockholm), South America (São Paulo).

## Known issues

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

### Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

**Note**

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

- When AtRestEncryption or HDFS encryption is enabled on a cluster that uses Amazon EMR 5.31.0 or 5.32.0, Hive queries result in the following runtime exception.

```
TaskAttempt 3 failed, info=[Error: Error while running task ( failure ) :
attempt_1604112648850_0001_1_01_000000_3:java.lang.RuntimeException:
java.lang.RuntimeException: Hive Runtime Error while closing
operators: java.io.IOException: java.util.ServiceConfigurationError:
org.apache.hadoop.security.token.TokenIdentifier: Provider
org.apache.hadoop.hbase.security.token.AuthenticationTokenIdentifier not found
```

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

## 5.31.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system

processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.30.2 release notes

This is a release to fix issues with Amazon EMR Scaling when it fails to scale up/scale down a cluster successfully or causes application failures.

### Changes, Enhancements, and Resolved Issues

- Fixed an issue where scaling requests failed for a large, highly utilized cluster when Amazon EMR on-cluster daemons were running health checking activities, such as gathering YARN node state and HDFS node state. This was happening because on-cluster daemons were not able to communicate the health status data of a node to internal Amazon EMR components.
- Improved EMR on-cluster daemons to correctly track the node states when IP addresses are reused to improve reliability during scaling operations.
- [SPARK-29683](#). Fixed an issue where job failures occurred during cluster scale-down as Spark was assuming all available nodes were deny-listed.
- [YARN-9011](#). Fixed an issue where job failures occurred due to a race condition in YARN decommissioning when cluster tried to scale up or down.
- Fixed issue with step or job failures during cluster scaling by ensuring that the node states are always consistent between the Amazon EMR on-cluster daemons and YARN/HDFS.
- Fixed an issue where cluster operations such as scale down and step submission failed for Amazon EMR clusters enabled with Kerberos authentication. This was because the Amazon EMR on-cluster daemon did not renew the Kerberos ticket, which is required to securely communicate with HDFS/YARN running on the primary node.
- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- HTTPS is now enabled by default for Amazon Linux repositories. If you are using an Amazon S3 VPCE policy to restrict access to specific buckets, you must add the new Amazon Linux bucket ARN `arn:aws:s3:::amazonlinux-2-repos-$region/*` to your policy (replace `$region` with the region where the endpoint is). For more information, see this topic in the AWS discussion forums. [Announcement: Amazon Linux 2 now supports the ability to use HTTPS while connecting to package repositories](#).

## Known issues

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

### 5.30.2 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.30.1 release notes

The following release notes include information for Amazon EMR release 5.30.1. Changes are relative to 5.30.0.

Initial release date: June 30, 2020

Last updated date: August 24, 2020

### Changes, enhancements, and resolved issues

- Newer Amazon EMR releases fix the issue with a lower "Max open files" limit on older AL2 in Amazon EMR. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later now include a permanent fix with a higher "Max open files" setting.
- Fixed issue where instance controller process spawned infinite number of processes.
- Fixed issue where Hue was unable to run an Hive query, showing a "database is locked" message and preventing the execution of queries.

- Fixed a Spark issue to enable more tasks to run concurrently on the EMR cluster.
- Fixed a Jupyter notebook issue causing a "too many files open error" in the Jupyter server.
- Fixed an issue with cluster start times.

## New features

- Tez UI and YARN timeline server persistent application interfaces are available with Amazon EMR versions 6.x, and EMR version 5.30.1 and later. One-click link access to persistent application history lets you quickly access job history without setting up a web proxy through an SSH connection. Logs for active and terminated clusters are available for 30 days after the application ends. For more information, see [View Persistent Application User Interfaces](#) in the *Amazon EMR Management Guide*.
- EMR Notebook execution APIs are available to execute EMR notebooks via a script or command line. The ability to start, stop, list, and describe EMR notebook executions without the AWS console enables you programmatically control an EMR notebook. Using a parameterized notebook cell, you can pass different parameter values to a notebook without having to create a copy of the notebook for each new set of parameter values. See [EMR API Actions](#). For sample code, see [Sample commands to execute EMR Notebooks programmatically](#).

## Known issues

- **Lower "Max open files" limit on older AL2 [fixed in newer releases].** Amazon EMR releases: emr-5.30.x, emr-5.31.0, emr-5.32.0, emr-6.0.0, emr-6.1.0, and emr-6.2.0 are based on older versions of Amazon Linux 2 (AL2), which have a lower ulimit setting for "Max open files" when Amazon EMR clusters are created with the default AMI. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default ulimit setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower ulimit setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the ulimit setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

## Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

## Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
sudo mkdir -p /etc/systemd/system/$proc.service.d/
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
sudo systemctl daemon-reload
```

- **EMR Notebooks**

The feature that allows you to install kernels and additional Python libraries on the cluster primary node is disabled by default on EMR version 5.30.1. For more information about this feature, see [Installing Kernels and Python Libraries on a Cluster Primary Node](#).

To enable the feature, do the following:

1. Make sure that the permissions policy attached to the service role for EMR Notebooks allows the following action:

```
elasticmapreduce:ListSteps
```

For more information, see [Service Role for EMR Notebooks](#).

2. Use the AWS CLI to run a step on the cluster that sets up EMR Notebooks as shown in the following example. Replace *us-east-1* with the Region in which your cluster resides. For more information, see [Adding Steps to a Cluster Using the AWS CLI](#).

```
aws emr add-steps --cluster-id MyClusterID --steps
  Type=CUSTOM_JAR,Name=EMRNotebooksSetup,ActionOnFailure=CONTINUE,Jar=s3://us-
east-1.elasticmapreduce/libs/script-runner/script-runner.jar,Args=["s3://
  awssupportdatasvcs.com/bootstrap-actions/EMRNotebooksSetup/emr-notebooks-setup.sh"]
```

- **Managed scaling**

Managed scaling operations on 5.30.0 and 5.30.1 clusters without Presto installed may cause application failures or cause a uniform instance group or instance fleet to stay in the ARRESTED state, particularly when a scale down operation is followed quickly by a scale up operation.

As a workaround, choose Presto as an application to install when you create a cluster with Amazon EMR releases 5.30.0 and 5.30.1, even if your job does not require Presto.

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

## 5.30.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the

most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## New features

- **EMR Notebooks** – When used with EMR clusters created using 5.30.0, EMR notebook kernels run on cluster. This improves notebook performance and allows you to install and customize kernels. You can also install Python libraries on the cluster primary node. For more information, see [Installing and Using Kernels and Libraries](#) in the *EMR Management Guide*.
- **Managed Scaling** – With Amazon EMR version 5.30.0 and later, you can enable EMR managed scaling to automatically increase or decrease the number of instances or units in your cluster based on workload. Amazon EMR continuously evaluates cluster metrics to make scaling decisions that optimize your clusters for cost and speed. For more information, see [Scaling Cluster Resources](#) in the *Amazon EMR Management Guide*.
- **Encrypt log files stored in Amazon S3** – With Amazon EMR version 5.30.0 and later, you can encrypt log files stored in Amazon S3 with an AWS KMS customer managed key. For more information, see [Encrypt log files stored in Amazon S3](#) in the *Amazon EMR Management Guide*.

- **Amazon Linux 2 support** – In EMR version 5.30.0 and later, EMR uses Amazon Linux 2 OS. New custom AMIs (Amazon Machine Image) must be based on the Amazon Linux 2 AMI. For more information, see [Using a Custom AMI](#).
- **Presto Graceful Auto Scale** – EMR clusters using 5.30.0 can be set with an auto scaling timeout period that gives Presto tasks time to finish running before their node is decommissioned. For more information, see [Using Presto automatic scaling with Graceful Decommission](#).
- **Fleet Instance creation with new allocation strategy option** – A new allocation strategy option is available in EMR version 5.12.1 and later. It offers faster cluster provisioning, more accurate spot allocation, and less spot instance interruption. Updates to non-default EMR service roles are required. See [Configure Instance Fleets](#).
- **sudo systemctl stop and sudo systemctl start commands** – In EMR version 5.30.0 and later, which use Amazon Linux 2 OS, EMR uses `sudo systemctl stop` and `sudo systemctl start` commands to restart services. For more information, see [How do I restart a service in Amazon EMR?](#)

## Changes, enhancements, and resolved issues

- EMR version 5.30.0 doesn't install Ganglia by default. You can explicitly select Ganglia to install when you create a cluster.
- Spark performance optimizations.
- Presto performance optimizations.
- Python 3 is the default for Amazon EMR version 5.30.0 and later.
- The default managed security group for service access in private subnets has been updated with new rules. If you use a custom security group for service access, you must include the same rules as the default managed security group. For more information, see [Amazon EMR-Managed Security Group for Service Access \(Private Subnets\)](#). If you use a custom service role for Amazon EMR, you must grant permission to `ec2:describeSecurityGroups` so that EMR can validate if the security groups are correctly created. If you use the `EMR_DefaultRole`, this permission is already included in the default managed policy.

## Known issues

- **Lower "Max open files" limit on older AL2 [fixed in newer releases]**. Amazon EMR releases: `emr-5.30.x`, `emr-5.31.0`, `emr-5.32.0`, `emr-6.0.0`, `emr-6.1.0`, and `emr-6.2.0` are based on older versions of Amazon Linux 2 (AL2), which have a lower `ulimit` setting for "Max open files" when

Amazon EMR clusters are created with the default AMI. Amazon EMR releases 5.30.1, 5.30.2, 5.31.1, 5.32.1, 6.0.1, 6.1.1, 6.2.1, 5.33.0, 6.3.0 and later include a permanent fix with a higher "Max open files" setting. Releases with the lower open file limit causes a "Too many open files" error when submitting Spark job. In the impacted releases, the Amazon EMR default AMI has a default ulimit setting of 4096 for "Max open files," which is lower than the 65536 file limit in the latest Amazon Linux 2 AMI. The lower ulimit setting for "Max open files" causes Spark job failure when the Spark driver and executor try to open more than 4096 files. To fix the issue, Amazon EMR has a bootstrap action (BA) script that adjusts the ulimit setting at cluster creation.

If you are using an older Amazon EMR version that doesn't have the permanent fix for this issue, the following workaround lets you to explicitly set the instance-controller ulimit to a maximum of 65536 files.

### Explicitly set a ulimit from the command line

1. Edit `/etc/systemd/system/instance-controller.service` to add the following parameters to Service section.

```
LimitNOFILE=65536
```

```
LimitNPROC=65536
```

2. Restart InstanceController

```
$ sudo systemctl daemon-reload
```

```
$ sudo systemctl restart instance-controller
```

### Set a ulimit using bootstrap action (BA)

You can also use a bootstrap action (BA) script to configure the instance-controller ulimit to 65536 files at cluster creation.

```
#!/bin/bash
for user in hadoop spark hive; do
sudo tee /etc/security/limits.d/$user.conf << EOF
$user - nofile 65536
$user - nproc 65536
EOF
done
for proc in instancecontroller logpusher; do
```

```
sudo mkdir -p /etc/systemd/system/$proc.service.d/
sudo tee /etc/systemd/system/$proc.service.d/override.conf << EOF
[Service]
LimitNOFILE=65536
LimitNPROC=65536
EOF
pid=$(pgrep -f aws157.$proc.Main)
sudo prlimit --pid $pid --nofile=65535:65535 --nproc=65535:65535
done
sudo systemctl daemon-reload
```

- **Managed scaling**

Managed scaling operations on 5.30.0 and 5.30.1 clusters without Presto installed may cause application failures or cause a uniform instance group or instance fleet to stay in the ARRESTED state, particularly when a scale down operation is followed quickly by a scale up operation.

As a workaround, choose Presto as an application to install when you create a cluster with Amazon EMR releases 5.30.0 and 5.30.1, even if your job does not require Presto.

- **Known issue in clusters with multiple primary nodes and Kerberos authentication**

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

**Note**

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

- The default database engine for Hue 4.6.0 is SQLite, which causes issues when you try to use Hue with an external database. To fix this, set `engine` in your `hue-ini` configuration classification to `mysql`. This issue has been fixed in Amazon EMR version 5.30.1.
- When you use Spark with Hive partition location formatting to read data in Amazon S3, and you run Spark on Amazon EMR releases 5.30.0 to 5.36.0, and 6.2.0 to 6.9.0, you might encounter an issue that prevents your cluster from reading data correctly. This can happen if your partitions have all of the following characteristics:
  - Two or more partitions are scanned from the same table.
  - At least one partition directory path is a prefix of at least one other partition directory path, for example, `s3://bucket/table/p=a` is a prefix of `s3://bucket/table/p=a b`.
  - The first character that follows the prefix in the other partition directory has a UTF-8 value that's less than the `/` character (U+002F). For example, the space character (U+0020) that occurs between `a` and `b` in `s3://bucket/table/p=a b` falls into this category. Note that there are 14 other non-control characters: `!"#$%&'()*+,-.` For more information, see [UTF-8 encoding table and Unicode characters](#).

As a workaround to this issue, set the `spark.sql.sources.fastS3PartitionDiscovery.enabled` configuration to `false` in the `spark-defaults` classification.

## 5.30.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0.

For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## 5.29.0 release notes

The following release notes include information for Amazon EMR release 5.29.0. Changes are relative to 5.28.1.

Initial release date: Jan 17, 2020

### Upgrades

- Upgraded AWS SDK for Java to version 1.11.682
- Upgraded Hive to version 2.3.6
- Upgraded Flink to version 1.9.1
- Upgraded EmrFS to version 2.38.0

- Upgraded EMR DynamoDB Connector to version 4.13.0

## Changes, enhancements, and resolved issues

- Spark
  - Spark performance optimizations.
- EMRFS
  - Management Guide updates to emrfs-site.xml default settings for consistent view.

## Known issues

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

### Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.29.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.28.0 release notes

The following release notes include information for Amazon EMR release 5.28.0. Changes are relative to 5.27.0.

Initial release date: Nov 12, 2019

### Upgrades

- Upgraded Flink to version 1.9.0

- Upgraded Hive to version 2.3.6
- Upgraded MXNet to version 1.5.1
- Upgraded Phoenix to version 4.14.3
- Upgraded Presto to version 0.227
- Upgraded Zeppelin to version 0.8.2

## New features

- [Apache Hudi](#) is now available for Amazon EMR to install when you create a cluster. For more information, see [Hudi](#).
- (Nov 25, 2019) You can now choose to run multiple steps in parallel to improve cluster utilization and save cost. You can also cancel both pending and running steps. For more information, see [Work with Steps Using the AWS CLI and Console](#).
- (Dec 3, 2019) You can now create and run EMR clusters on AWS Outposts. AWS Outposts enables native AWS services, infrastructure, and operating models in on-premises facilities. In AWS Outposts environments, you can use the same AWS APIs, tools, and infrastructure that you use in the AWS cloud. For more information, see [EMR clusters on AWS Outposts](#).
- (Mar 11, 2020) Beginning with Amazon EMR version 5.28.0, you can create and run Amazon EMR clusters on an AWS Local Zones subnet as a logical extension of an AWS Region that supports Local Zones. A Local Zone enables Amazon EMR features and a subset of AWS services, like compute and storage services, to be located closer to users, providing very low latency access to applications running locally. For a list of available Local Zones, see [AWS Local Zones](#). For information about accessing available AWS Local Zones, see [Regions, Availability Zones, and Local Zones](#).

Local Zones do not currently support Amazon EMR Notebooks and do not support connections directly to Amazon EMR using interface VPC endpoint (AWS PrivateLink).

## Changes, enhancements, and resolved issues

- Expanded Application Support for High Availability Clusters
  - For more information, see [Supported applications in an EMR cluster with Multiple Primary Nodes](#) in the *Amazon EMR Management Guide*.
- Spark
  - Performance optimizations

- Hive
  - Performance optimizations
- Presto
  - Performance optimizations

## Known issues

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.28.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the

most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## 5.27.1 release notes

This is a patch release. All applications and components are the same as the previous Amazon EMR release.

Instance Metadata Service (IMDS) V2 support status: Amazon EMR 5.23.1, 5.27.1 and 5.32 or later components use IMDSv2 for all IMDS calls. For IMDS calls in your application code, you can use both IMDSv1 and IMDSv2, or configure the IMDS to use only IMDSv2 for added security. For other 5.x EMR releases, disabling IMDSv1 causes cluster startup failure.

## 5.27.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.27.0 release notes

The following release notes include information for Amazon EMR release 5.27.0. Changes are relative to 5.26.0.

Initial release date: Sep 23, 2019

### Upgrades

- AWS SDK for Java 1.11.615
- Flink 1.8.1
- JupyterHub 1.0.0
- Spark 2.4.4
- Tensorflow 1.14.0
- Connectors and drivers:
  - DynamoDB Connector 4.12.0

## New features

- (Oct 24, 2019) The following New features in EMR notebooks are available with all Amazon EMR releases.
  - You can now associate Git repositories with EMR notebooks to store your notebooks in a version controlled environment. You can share code with peers and reuse existing Jupyter notebooks through remote Git repositories. For more information, see [Associate Git Repositories with Amazon EMR Notebooks](#) in the *Amazon EMR Management Guide*.
  - The [nbdime utility](#) is now available in EMR notebooks to simplify comparing and merging notebooks.
  - EMR notebooks now support JupyterLab. JupyterLab is a web-based interactive development environment fully compatible with Jupyter notebooks. You can now choose to open your notebook in either JupyterLab or Jupyter notebook editor.
- (Oct 30, 2019) With Amazon EMR versions 5.25.0 and later, you can connect to Spark history server UI from the cluster **Summary** page or the **Application history** tab in the console. Instead of setting up a web proxy through an SSH connection, you can quickly access the Spark history server UI to view application metrics and access relevant log files for active and terminated clusters. For more information, see [Off-cluster access to persistent application user interfaces](#) in the *Amazon EMR Management Guide*.

## Changes, enhancements, and resolved issues

- Amazon EMR cluster with multiple primary nodes
  - You can install and run Flink on an Amazon EMR cluster with multiple primary nodes. For more information, see [Supported applications and features](#).
  - You can configure HDFS transparent encryption on an Amazon EMR cluster with multiple primary nodes. For more information, see [HDFS Transparent Encryption on EMR clusters with Multiple Primary Nodes](#).
  - You can now modify the configuration of applications running on an Amazon EMR cluster with multiple primary nodes. For more information, see [Supplying a Configuration for an Instance Group in a Running Cluster](#).
- Amazon EMR-DynamoDB Connector
  - Amazon EMR-DynamoDB Connector now supports the following DynamoDB data types: boolean, list, map, item, null. For more information, see [Set Up a Hive Table to Run Hive Commands](#).

## Known issues

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.27.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2

## 5.26.0 release notes

The following release notes include information for Amazon EMR release 5.26.0. Changes are relative to 5.25.0.

Initial release date: Aug 8, 2019

Last updated date: Aug 19, 2019

### Upgrades

- AWS SDK for Java 1.11.595
- HBase 1.4.10
- Phoenix 4.14.2
- Connectors and drivers:
  - DynamoDB Connector 4.11.0
  - MariaDB Connector 2.4.2
  - Amazon Redshift JDBC Driver 1.2.32.1056

### New features

- (Beta) With Amazon EMR 5.26.0, you can launch a cluster that integrates with Lake Formation. This integration provides fine-grained, column-level access to databases and tables in the AWS Glue Data Catalog. It also enables federated single sign-on to EMR Notebooks or Apache Zeppelin from an enterprise identity system. For more information, see [Integrating Amazon EMR with AWS Lake Formation \(Beta\)](#).
- (Aug 19, 2019) Amazon EMR block public access is now available with all Amazon EMR releases that support security groups. Block public access is an account-wide setting applied to each AWS Region. Block public access prevents a cluster from launching when any security group associated with the cluster has a rule that allows inbound traffic from IPv4 0.0.0.0/0 or IPv6 ::/0 (public access) on a port, unless a port is specified as an exception. Port 22 is an exception by default. For more information, see [Using Amazon EMR Block Public Access](#) in the *Amazon EMR Management Guide*.

### Changes, enhancements, and resolved issues

- EMR Notebooks

- With EMR 5.26.0 and later, EMR Notebooks supports notebook-scoped Python libraries in addition to the default Python libraries. You can install notebook-scoped libraries from within the notebook editor without having to re-create a cluster or re-attach a notebook to a cluster. Notebook-scoped libraries are created in a Python virtual environment, so they apply only to the current notebook session. This allows you to isolate notebook dependencies. For more information, see [Using Notebook Scoped Libraries](#) in the *Amazon EMR Management Guide*.
- EMRFS
  - You can enable an ETag verification feature (Beta) by setting `fs.s3.consistent.metadata.etag.verification.enabled` to `true`. With this feature, EMRFS uses Amazon S3 ETags to verify that objects being read are the latest available version. This feature is helpful for read-after-update use cases in which files on Amazon S3 are overwritten while retaining the same name. This ETag verification capability currently does not work with S3 Select. For more information, see [Configure Consistent View](#).
- Spark
  - The following optimizations are now enabled by default: dynamic partition pruning, DISTINCT before INTERSECT, improvements in SQL plan statistics inference for JOIN followed by DISTINCT queries, flattening scalar subqueries, optimized join reorder, and bloom filter join. For more information, see [Optimizing Spark Performance](#).
  - Improved whole stage code generation for Sort Merge Join.
  - Improved query fragment and subquery reuse.
  - Improvements to pre-allocate executors on Spark start up.
  - Bloom filter joins are no longer applied when the smaller side of the join includes a broadcast hint.
- Tez
  - Resolved an issue with Tez. Tez UI now works on an Amazon EMR cluster with multiple primary nodes.

## Known issues

- The improved whole stage code generation capabilities for Sort Merge Join can increase memory pressure when enabled. This optimization improves performance, but may result in job retries or failures if the `spark.yarn.executor.memoryOverheadFactor` is not tuned to provide enough memory. To disable this feature, set `spark.sql.sortMergeJoinExec.extendedCodegen.enabled` to `false`.

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

#### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.25.0 release notes

The following release notes include information for Amazon EMR release 5.25.0. Changes are relative to 5.24.1.

Initial release date: July 17, 2019

Last updated date: Oct 30, 2019

### Amazon EMR 5.25.0

#### Upgrades

- AWS SDK for Java 1.11.566
- Hive 2.3.5
- Presto 0.220
- Spark 2.4.3

- TensorFlow 1.13.1
- Tez 0.9.2
- Zookeeper 3.4.14

## New features

- (Oct 30, 2019) Beginning with Amazon EMR version 5.25.0, you can connect to Spark history server UI from the cluster **Summary** page or the **Application history** tab in the console. Instead of setting up a web proxy through an SSH connection, you can quickly access the Spark history server UI to view application metrics and access relevant log files for active and terminated clusters. For more information, see [Off-cluster access to persistent application user interfaces](#) in the *Amazon EMR Management Guide*.

## Changes, enhancements, and resolved issues

- Spark
  - Improved the performance of some joins by using Bloom filters to pre-filter inputs. The optimization is disabled by default and can be enabled by setting the Spark configuration parameter `spark.sql.bloomFilterJoin.enabled` to `true`.
  - Improved the performance of grouping by string type columns.
  - Improved the default Spark executor memory and cores configuration of R4 instance types for clusters without HBase installed.
  - Resolved a previous issue with the dynamic partition pruning feature where the pruned table has to be on the left side of the join.
  - Improved DISTINCT before INTERSECT optimization to apply to additional cases involving aliases.
  - Improved SQL plan statistics inference for JOIN followed by DISTINCT queries. This improvement is disabled by default and can be enabled by setting the Spark configuration parameter `spark.sql.statsImprovements.enabled` to `true`. This optimization is required by the Distinct before Intersect feature and will be enabled automatically when `spark.sql.optimizer.distinctBeforeIntersect.enabled` is set to `true`.
  - Optimized join order based on table size and filters. This optimization is disabled by default and can be enabled by setting the Spark configuration parameter `spark.sql.optimizer.sizeBasedJoinReorder.enabled` to `true`.

For more information, see [Optimizing Spark Performance](#).

- EMRFS
  - The EMRFS setting, `fs.s3.buckets.create.enabled`, is now disabled by default. With testing, we found that disabling this setting improves performance and prevents unintentional creation of S3 buckets. If your application relies on this functionality, you can enable it by setting the property `fs.s3.buckets.create.enabled` to `true` in the `emrfs-site` configuration classification. For information, see [Supplying a Configuration when Creating a Cluster](#).
- Local Disk Encryption and S3 Encryption Improvements in Security Configurations (August 5, 2019)
  - Separated Amazon S3 encryption settings from local disk encryption settings in security configuration setup.
  - Added an option to enable EBS encryption with release 5.24.0 and later. Selecting this option encrypts the root device volume in addition to storage volumes. Previous versions required using a custom AMI to encrypt the root device volume.
  - For more information, see [Encryption Options](#) in the *Amazon EMR Management Guide*.

## Known issues

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

### Workaround:

- SSH as `hadoop` user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for `hadoop` user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.25.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.24.1 release notes

The following release notes include information for Amazon EMR release 5.24.1. Changes are relative to 5.24.0.

Initial release date: June 26, 2019

### Changes, enhancements, and resolved issues

- Updated the default Amazon Linux AMI for Amazon EMR to include important Linux kernel security updates, including the TCP SACK Denial of Service Issue ([AWS-2019-005](#)).

### Known issues

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem

impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.24.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.24.0 release notes

The following release notes include information for Amazon EMR release 5.24.0. Changes are relative to 5.23.0.

Initial release date: June 11, 2019

Last updated date: August 5, 2019

### Upgrades

- Flink 1.8.0
- Hue 4.4.0
- JupyterHub 0.9.6
- Livy 0.6.0
- MxNet 1.4.0
- Presto 0.219
- Spark 2.4.2
- AWS SDK for Java 1.11.546
- Connectors and drivers:
  - DynamoDB Connector 4.9.0
  - MariaDB Connector 2.4.1

- Amazon Redshift JDBC Driver 1.2.27.1051

## Changes, enhancements, and resolved issues

- Spark
  - Added optimization to dynamically prune partitions. The optimization is disabled by default. To enable it, set the Spark configuration parameter `spark.sql.dynamicPartitionPruning.enabled` to `true`.
  - Improved performance of INTERSECT queries. This optimization is disabled by default. To enable it, set the Spark configuration parameter `spark.sql.optimizer.distinctBeforeIntersect.enabled` to `true`.
  - Added optimization to flatten scalar subqueries with aggregates that use the same relation. The optimization is disabled by default. To enable it, set the Spark configuration parameter `spark.sql.optimizer.flattenScalarSubqueriesWithAggregates.enabled` to `true`.
  - Improved whole stage code generation.

For more information, see [Optimizing Spark Performance](#).

- Local Disk Encryption and S3 Encryption Improvements in Security Configurations (August 5, 2019)
  - Separated Amazon S3 encryption settings from local disk encryption settings in security configuration setup.
  - Added an option to enable EBS encryption. Selecting this option encrypts the root device volume in addition to storage volumes. Previous versions required using a custom AMI to encrypt the root device volume.
  - For more information, see [Encryption Options](#) in the *Amazon EMR Management Guide*.

## Known issues

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem

impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

#### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.24.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. ## 5.23.1 release notes

This is a patch release. All applications and components are the same as the previous Amazon EMR release.

Instance Metadata Service (IMDS) V2 support status: Amazon EMR 5.23.1, 5.27.1 and 5.32 or later components use IMDSv2 for all IMDS calls. For IMDS calls in your application code, you can use both IMDSv1 and IMDSv2, or configure the IMDS to use only IMDSv2 for added security. For other 5.x EMR releases, disabling IMDSv1 causes cluster startup failure.

## 5.23.1 component versions

Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. ## 5.23.0 release notes

The following release notes include information for Amazon EMR release 5.23.0. Changes are relative to 5.22.0.

Initial release date: April 01, 2019

Last updated date: April 30, 2019

### Upgrades

- AWS SDK for Java 1.11.519

### New features

- (April 30, 2019) With Amazon EMR 5.23.0 and later, you can launch a cluster with three primary nodes to support high availability of applications like YARN Resource Manager, HDFS NameNode, Spark, Hive, and Ganglia. The primary node is no longer a potential single point of failure with this feature. If one of the primary nodes fails, Amazon EMR automatically fails over to a standby primary node and replaces the failed primary node with a new one with the same configuration and bootstrap actions. For more information, see [Plan and Configure Primary Nodes](#).

## Known issues

- Tez UI (Fixed in Amazon EMR release 5.26.0)

Tez UI does not work on an EMR cluster with multiple primary nodes.

- Hue (Fixed in Amazon EMR release 5.24.0)
  - Hue running on Amazon EMR does not support Solr. Beginning with Amazon EMR release 5.20.0, a misconfiguration issue causes Solr to be enabled and a harmless error message to appear similar to the following:

```
Solr server could not be contacted properly:
HTTPConnectionPool('host=ip-xx-xx-xx-xx.ec2.internal',
port=1978): Max retries exceeded with url: /solr/admin/info/
system?user.name=hue&doAs=administrator&wt=json (Caused by
NewConnectionError(': Failed to establish a new connection: [Errno 111]
Connection refused',))
```

### To prevent the Solr error message from appearing:

1. Connect to the primary node command line using SSH.
2. Use a text editor to open the `hue.ini` file. For example:

```
sudo vim /etc/hue/conf/hue.ini
```

3. Search for the term `appblacklist` and modify the line to the following:

```
appblacklist = search
```

4. Save your changes and restart Hue as shown in the following example:

```
sudo stop hue; sudo start hue
```

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

**Workaround:**

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

**Note**

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.23.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.22.0 release notes

The following release notes include information for Amazon EMR release 5.22.0. Changes are relative to 5.21.0.

### Important

Beginning with Amazon EMR release 5.22.0, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. Earlier Amazon EMR releases use AWS Signature Version 2 in some cases, unless the release notes indicate that Signature Version 4 is used exclusively. For more information, see [Authenticating Requests \(AWS Signature Version 4\)](#) and [Authenticating Requests \(AWS Signature Version 2\)](#) in the *Amazon Simple Storage Service Developer Guide*.

Initial release date: March 20, 2019

### Upgrades

- Flink 1.7.1
- HBase 1.4.9
- Oozie 5.1.0
- Phoenix 4.14.1

- Zeppelin 0.8.1
- Connectors and drivers:
  - DynamoDB Connector 4.8.0
  - MariaDB Connector 2.2.6
  - Amazon Redshift JDBC Driver 1.2.20.1043

## New features

- Modified the default EBS configuration for EC2 instance types with EBS-only storage. When you create a cluster using Amazon EMR release 5.22.0 and later, the default amount of EBS storage increases based on the size of the instance. In addition, we split increased storage across multiple volumes, giving increased IOPS performance. If you want to use a different EBS instance storage configuration, you can specify it when you create an EMR cluster or add nodes to an existing cluster. For more information about the amount of storage and number of volumes allocated by default for each instance type, see [Default EBS Storage for Instances](#) in the *Amazon EMR Management Guide*.

## Changes, enhancements, and resolved issues

- Spark
  - Introduced a new configuration property for Spark on YARN, `spark.yarn.executor.memoryOverheadFactor`. The value of this property is a scale factor that sets the value of memory overhead to a percentage of executor memory, with a minimum of 384 MB. If memory overhead is set explicitly using `spark.yarn.executor.memoryOverhead`, this property has no effect. The default value is `0.1875`, representing 18.75%. This default for Amazon EMR leaves more space in YARN containers for executor memory overhead than the 10% default set internally by Spark. The Amazon EMR default of 18.75% empirically showed fewer memory-related failures in TPC-DS benchmarks.
  - Backported [SPARK-26316](#) to improve performance.
- In Amazon EMR version 5.19.0, 5.20.0, and 5.21.0, YARN node labels are stored in an HDFS directory. In some situations, this leads to core node startup delays and then causes cluster time-out and launch failure. Beginning with Amazon EMR 5.22.0, this issue is resolved. YARN node labels are stored on the local disk of each cluster node, avoiding dependencies on HDFS.

## Known issues

- Hue (Fixed in Amazon EMR release 5.24.0)
  - Hue running on Amazon EMR does not support Solr. Beginning with Amazon EMR release 5.20.0, a misconfiguration issue causes Solr to be enabled and a harmless error message to appear similar to the following:

```
Solr server could not be contacted properly:
HTTPConnectionPool('host=ip-xx-xx-xx-xx.ec2.internal',
port=1978): Max retries exceeded with url: /solr/admin/info/
system?user.name=hue&doAs=administrator&wt=json (Caused by
NewConnectionError(': Failed to establish a new connection: [Errno 111]
Connection refused',))
```

### To prevent the Solr error message from appearing:

1. Connect to the primary node command line using SSH.
2. Use a text editor to open the `hue.ini` file. For example:

```
sudo vim /etc/hue/conf/hue.ini
```

3. Search for the term `appblacklist` and modify the line to the following:

```
appblacklist = search
```

4. Save your changes and restart Hue as shown in the following example:

```
sudo stop hue; sudo start hue
```

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

### Workaround:

- SSH as `hadoop` user to the lead primary node of the EMR cluster with multiple primary nodes.

- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.22.0 component versions

## 5.21.2 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.21.2 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.21.1 release notes

The following release notes include information for Amazon EMR release 5.21.1. Changes are relative to 5.21.0.

Initial release date: July 18, 2019

### Changes, enhancements, and resolved issues

- Updated the default Amazon Linux AMI for Amazon EMR to include important Linux kernel security updates, including the TCP SACK Denial of Service Issue ([AWS-2019-005](#)).

### Known issues

- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.21.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.21.0 release notes

The following release notes include information for Amazon EMR release 5.21.0. Changes are relative to 5.20.0.

Initial release date: February 18, 2019

Last updated date: April 3, 2019

## Upgrades

- Flink 1.7.0
- Presto 0.215
- AWS SDK for Java 1.11.479

## New features

- (April 3, 2019) With Amazon EMR version 5.21.0 and later, you can override cluster configurations and specify additional configuration classifications for each instance group in a running cluster. You do this by using the Amazon EMR console, the AWS Command Line Interface (AWS CLI), or the AWS SDK. For more information, see [Supplying a Configuration for an Instance Group in a Running Cluster](#).

## Changes, enhancements, and resolved issues

- Zeppelin
  - Backported [ZEPPELIN-3878](#).

## Known issues

- Hue (Fixed in Amazon EMR release 5.24.0)
  - Hue running on Amazon EMR does not support Solr. Beginning with Amazon EMR release 5.20.0, a misconfiguration issue causes Solr to be enabled and a harmless error message to appear similar to the following:

```
Solr server could not be contacted properly:
HTTPConnectionPool('host=ip-xx-xx-xx-xx.ec2.internal',
port=1978): Max retries exceeded with url: /solr/admin/info/
system?user.name=hue&doAs=administrator&wt=json (Caused by
NewConnectionError(': Failed to establish a new connection: [Errno 111]
Connection refused',))
```

**To prevent the Solr error message from appearing:**

1. Connect to the primary node command line using SSH.
2. Use a text editor to open the `hue.ini` file. For example:

```
sudo vim /etc/hue/conf/hue.ini
```

3. Search for the term `appblacklist` and modify the line to the following:

```
appblacklist = search
```

4. Save your changes and restart Hue as shown in the following example:

```
sudo stop hue; sudo start hue
```

- Tez

- This issue was fixed in Amazon EMR 5.22.0.

When you connect to the Tez UI at `http://MasterDNS:8080/tez-ui` through an SSH connection to the cluster primary node, the error "Adapter operation failed - Timeline server (ATS) is out of reach. Either it is down, or CORS is not enabled" appears, or tasks unexpectedly show N/A.

This is caused by the Tez UI making requests to the YARN Timeline Server using `localhost` rather than the host name of the primary node. As a workaround, a script is available to run as a bootstrap action or step. The script updates the host name in the Tez configs `.env` file. For more information and the location of the script, see the [Bootstrap Instructions](#).

- In Amazon EMR version 5.19.0, 5.20.0, and 5.21.0, YARN node labels are stored in an HDFS directory. In some situations, this leads to core node startup delays and then causes cluster time-out and launch failure. Beginning with Amazon EMR 5.22.0, this issue is resolved. YARN node labels are stored on the local disk of each cluster node, avoiding dependencies on HDFS.
- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

Workaround:

- SSH as `hadoop` user to the lead primary node of the EMR cluster with multiple primary nodes.

- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

### Note

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.21.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.20.1 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.20.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.20.0 release notes

The following release notes include information for Amazon EMR release 5.20.0. Changes are relative to 5.19.0.

Initial release date: December 18, 2018

Last updated date: January 22, 2019

### Upgrades

- Flink 1.6.2
- HBase 1.4.8
- Hive 2.3.4
- Hue 4.3.0
- MXNet 1.3.1
- Presto 0.214
- Spark 2.4.0
- TensorFlow 1.12.0
- Tez 0.9.1
- AWS SDK for Java 1.11.461

### New features

- (January 22, 2019) Kerberos in Amazon EMR has been improved to support authenticating principals from an external KDC. This centralizes principal management because multiple clusters can share a single, external KDC. In addition, the external KDC can have a cross-realm trust with an Active Directory domain. This allows all clusters to authenticate principals from

Active Directory. For more information, see [Use Kerberos Authentication](#) in the *Amazon EMR Management Guide*.

## Changes, enhancements, and resolved issues

- Default Amazon Linux AMI for Amazon EMR
  - Python3 package was upgraded from python 3.4 to 3.6.
- The EMRFS S3-optimized committer
  - The EMRFS S3-optimized committer is now enabled by default, which improves write performance. For more information, see [Use the EMRFS S3-optimized committer](#).
- Hive
  - Backported [HIVE-16686](#).
- Glue with Spark and Hive
  - In EMR 5.20.0 or later, parallel partition pruning is enabled automatically for Spark and Hive when AWS Glue Data Catalog is used as the metastore. This change significantly reduces query planning time by executing multiple requests in parallel to retrieve partitions. The total number of segments that can be executed concurrently range between 1 and 10. The default value is 5, which is a recommended setting. You can change it by specifying the property `aws.glue.partition.num.segments` in `hive-site` configuration classification. If throttling occurs, you can turn off the feature by changing the value to 1. For more information, see [AWS Glue Segment Structure](#).

## Known issues

- Hue (Fixed in Amazon EMR release 5.24.0)
  - Hue running on Amazon EMR does not support Solr. Beginning with Amazon EMR release 5.20.0, a misconfiguration issue causes Solr to be enabled and a harmless error message to appear similar to the following:

```
Solr server could not be contacted properly:
HTTPConnectionPool('host=ip-xx-xx-xx-xx.ec2.internal',
port=1978): Max retries exceeded with url: /solr/admin/info/
system?user.name=hue&doAs=administrator&wt=json (Caused by
NewConnectionError(': Failed to establish a new connection: [Errno 111]
Connection refused',))
```

### To prevent the Solr error message from appearing:

1. Connect to the primary node command line using SSH.
2. Use a text editor to open the `hue.ini` file. For example:

```
sudo vim /etc/hue/conf/hue.ini
```

3. Search for the term `appblacklist` and modify the line to the following:

```
appblacklist = search
```

4. Save your changes and restart Hue as shown in the following example:

```
sudo stop hue; sudo start hue
```

- Tez

- This issue was fixed in Amazon EMR 5.22.0.

When you connect to the Tez UI at `http://MasterDNS:8080/tez-ui` through an SSH connection to the cluster primary node, the error "Adapter operation failed - Timeline server (ATS) is out of reach. Either it is down, or CORS is not enabled" appears, or tasks unexpectedly show N/A.

This is caused by the Tez UI making requests to the YARN Timeline Server using `localhost` rather than the host name of the primary node. As a workaround, a script is available to run as a bootstrap action or step. The script updates the host name in the Tez `configs.env` file. For more information and the location of the script, see the [Bootstrap Instructions](#).

- In Amazon EMR version 5.19.0, 5.20.0, and 5.21.0, YARN node labels are stored in an HDFS directory. In some situations, this leads to core node startup delays and then causes cluster time-out and launch failure. Beginning with Amazon EMR 5.22.0, this issue is resolved. YARN node labels are stored on the local disk of each cluster node, avoiding dependencies on HDFS.
- Known issue in clusters with multiple primary nodes and Kerberos authentication

If you run clusters with multiple primary nodes and Kerberos authentication in Amazon EMR releases 5.20.0 and later, you may encounter problems with cluster operations such as scale down or step submission, after the cluster has been running for some time. The time period depends on the Kerberos ticket validity period that you defined. The scale-down problem impacts both automatic scale-down and explicit scale down requests that you submitted. Additional cluster operations can also be impacted.

**Workaround:**

- SSH as hadoop user to the lead primary node of the EMR cluster with multiple primary nodes.
- Run the following command to renew Kerberos ticket for hadoop user.

```
kinit -kt <keytab_file> <principal>
```

Typically, the keytab file is located at `/etc/hadoop.keytab` and the principal is in the form of `hadoop/<hostname>@<REALM>`.

**Note**

This workaround will be effective for the time period the Kerberos ticket is valid. This duration is 10 hours by default, but can be configured by your Kerberos settings. You must re-run the above command once the Kerberos ticket expires.

## 5.19.1 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.19.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.19.0 release notes

The following release notes include information for Amazon EMR release 5.19.0. Changes are relative to 5.18.0.

Initial release date: November 7, 2018

Last updated date: November 19, 2018

### Upgrades

- Hadoop 2.8.5
- Flink 1.6.1
- JupyterHub 0.9.4
- MXNet 1.3.0
- Presto 0.212
- TensorFlow 1.11.0
- Zookeeper 3.4.13
- AWS SDK for Java 1.11.433

### New features

- (Nov. 19, 2018) EMR Notebooks is a managed environment based on Jupyter Notebook. It supports Spark magic kernels for PySpark, Spark SQL, Spark R, and Scala. EMR Notebooks can be used with clusters created using Amazon EMR release 5.18.0 and later. For more information, see [Using EMR Notebooks](#) in the *Amazon EMR Management Guide*.

- The EMRFS S3-optimized committer is available when writing Parquet files using Spark and EMRFS. This committer improves write performance. For more information, see [Use the EMRFS S3-optimized committer](#).

## Changes, enhancements, and resolved issues

- YARN
  - Modified the logic that limits the application master process to running on core nodes. This functionality now uses the YARN node labels feature and properties in the `yarn-site` and `capacity-scheduler` configuration classifications. For information, see <https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-plan-instances-guidelines.html#emr-plan-spot-YARN>.
- Default Amazon Linux AMI for Amazon EMR
  - `ruby18`, `php56`, and `gcc48` are no longer installed by default. These can be installed if desired using `yum`.
  - The `aws-sdk` ruby gem is no longer installed by default. It can be installed using `gem install aws-sdk`, if desired. Specific components can also be installed. For example, `gem install aws-sdk-s3`.

## Known issues

- **EMR Notebooks**—In some circumstances, with multiple notebook editors open, the notebook editor may appear unable to connect to the cluster. If this happens, clear browser cookies and then reopen notebook editors.
- **CloudWatch ContainerPending Metric and Automatic Scaling**—(Fixed in 5.20.0) Amazon EMR may emit a negative value for `ContainerPending`. If `ContainerPending` is used in an automatic scaling rule, automatic scaling does not behave as expected. Avoid using `ContainerPending` with automatic scaling.
- In Amazon EMR version 5.19.0, 5.20.0, and 5.21.0, YARN node labels are stored in an HDFS directory. In some situations, this leads to core node startup delays and then causes cluster time-out and launch failure. Beginning with Amazon EMR 5.22.0, this issue is resolved. YARN node labels are stored on the local disk of each cluster node, avoiding dependencies on HDFS.

## 5.19.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.18.1 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.18.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp`-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.18.0 release notes

The following release notes include information for Amazon EMR release 5.18.0. Changes are relative to 5.17.0.

Initial release date: October 24, 2018

### Upgrades

- Flink 1.6.0
- HBase 1.4.7
- Presto 0.210
- Spark 2.3.2

- Zeppelin 0.8.0

## New features

- Beginning with Amazon EMR 5.18.0, you can use the Amazon EMR artifact repository to build your job code against the exact versions of libraries and dependencies that are available with specific Amazon EMR releases. For more information, see [Checking dependencies using the Amazon EMR artifact repository](#).

## Changes, enhancements, and resolved issues

- Hive
  - Added support for S3 Select. For more information, see [Using S3 Select with Hive to improve performance](#).
- Presto
  - Added support for [S3 Select](#) Pushdown. For more information, see [Using S3 Select Pushdown with Presto to improve performance](#).
- Spark
  - The default log4j configuration for Spark has been changed to roll container logs hourly for Spark streaming jobs. This helps prevent the deletion of logs for long-running Spark streaming jobs.

## 5.18.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.17.2 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.17.2 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.17.0 release notes

The following release notes include information for Amazon EMR release 5.17.0. Changes are relative to 5.16.0.

Initial release date: August 30, 2018

### Upgrades

- Flink 1.5.2

- HBase 1.4.6
- Presto 0.206

## New features

- Added support for Tensorflow. For more information, see [TensorFlow](#).

## Changes, enhancements, and resolved issues

- JupyterHub
  - Added support for notebook persistence in Amazon S3. For more information, see [Configuring persistence for notebooks in Amazon S3](#).
- Spark
  - Added support for [S3 Select](#). For more information, see [Use S3 Select with Spark to improve query performance](#).
- Resolved the issues with the Cloudwatch metrics and the automatic scaling feature in Amazon EMR version 5.14.0, 5.15.0, or 5.16.0.

## Known issues

- When you create a kerberized cluster with Livy installed, Livy fails with an error that simple authentication is not enabled. Rebooting the Livy server resolves the issue. As a workaround, add a step during cluster creation that runs `sudo restart livy-server` on the primary node.
- If you use a custom Amazon Linux AMI based on an Amazon Linux AMI with a creation date of 2018-08-11, the Oozie server fails to start. If you use Oozie, create a custom AMI based on an Amazon Linux AMI ID with a different creation date. You can use the following AWS CLI command to return a list of Image IDs for all HVM Amazon Linux AMIs with a 2018.03 version, along with the release date, so that you can choose an appropriate Amazon Linux AMI as your base. Replace `MyRegion` with your Region identifier, such as `us-west-2`.

```
aws ec2 --region MyRegion describe-images --owner amazon --query 'Images[?
Name!=`null`][?starts_with(Name, `amzn-ami-hvm-2018.03`) == `true`].
[CreationDate,ImageId,Name]' --output text | sort -rk1
```

## 5.17.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.16.1 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.16.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.16.0 release notes

The following release notes include information for Amazon EMR release 5.16.0. Changes are relative to 5.15.0.

Initial release date: July 19, 2018

### Upgrades

- Hadoop 2.8.4
- Flink 1.5.0
- Livy 0.5.0
- MXNet 1.2.0

- Phoenix 4.14.0
- Presto 0.203
- Spark 2.3.1
- AWS SDK for Java 1.11.336
- CUDA 9.2
- Redshift JDBC Driver 1.2.15.1025

## Changes, enhancements, and resolved issues

- HBase
  - Backported [HBASE-20723](#)
- Presto
  - Configuration changes to support LDAP authentication. For more information, see [Using LDAP authentication for Presto on Amazon EMR](#).
- Spark
  - Apache Spark version 2.3.1, available beginning with Amazon EMR release 5.16.0, addresses [CVE-2018-8024](#) and [CVE-2018-1334](#). We recommend that you migrate earlier versions of Spark to Spark version 2.3.1 or later.

## Known issues

- This release version does not support the c1.medium or m1.small instance types. Clusters using either of these instance types fail to start. As a workaround, specify a different instance type or use a different release version.
- When you create a kerberized cluster with Livy installed, Livy fails with an error that simple authentication is not enabled. Rebooting the Livy server resolves the issue. As a workaround, add a step during cluster creation that runs `sudo restart livy-server` on the primary node.
- After the primary node reboots or the instance controller restarts, the CloudWatch metrics will not be collected and the automatic scaling feature will not be available in Amazon EMR version 5.14.0, 5.15.0, or 5.16.0. This issue is fixed in Amazon EMR 5.17.0.

## 5.16.0 component versions

Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.15.1 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.15.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.15.0 release notes

The following release notes include information for Amazon EMR release 5.15.0. Changes are relative to 5.14.0.

Initial release date: June 21, 2018

### Upgrades

- Upgraded HBase to 1.4.4
- Upgraded Hive to 2.3.3
- Upgraded Hue to 4.2.0
- Upgraded Oozie to 5.0.0
- Upgraded Zookeeper to 3.4.12
- Upgraded AWS SDK to 1.11.333

## Changes, enhancements, and resolved issues

- Hive
  - Backported [HIVE-18069](#)
- Hue
  - Updated Hue to correctly authenticate with Livy when Kerberos is enabled. Livy is now supported when using Kerberos with Amazon EMR.
- JupyterHub
  - Updated JupyterHub so that Amazon EMR installs LDAP client libraries by default.
  - Fixed an error in the script that generates self-signed certificates.

## Known issues

- This release version does not support the c1.medium or m1.small instance types. Clusters using either of these instance types fail to start. As a workaround, specify a different instance type or use a different release version.
- After the primary node reboots or the instance controller restarts, the CloudWatch metrics will not be collected and the automatic scaling feature will not be available in Amazon EMR version 5.14.0, 5.15.0, or 5.16.0. This issue is fixed in Amazon EMR 5.17.0.

## 5.15.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

Component	Version	Description

## 5.14.2 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.14.2 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.14.1 release notes

The following release notes include information for Amazon EMR release 5.14.1. Changes are relative to 5.14.0.

Initial release date: October 17, 2018

Updated the default AMI for Amazon EMR to address potential security vulnerabilities.

## 5.14.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.14.0 release notes

The following release notes include information for Amazon EMR release 5.14.0. Changes are relative to 5.13.0.

Initial release date: June 4, 2018

### Upgrades

- Upgraded Apache Flink to 1.4.2
- Upgraded Apache MXnet to 1.1.0
- Upgraded Apache Sqoop to 1.4.7

### New features

- Added JupyterHub support. For more information, see [JupyterHub](#).

### Changes, enhancements, and resolved issues

- EMRFS
  - The userAgent string in requests to Amazon S3 has been updated to contain the user and group information of the invoking principal. This can be used with AWS CloudTrail logs for more comprehensive request tracking.
- HBase
  - Included [HBASE-20447](#), which addresses an issue that could cause cache issues, especially with split Regions.
- MXnet

- Added OpenCV libraries.
- Spark
  - When Spark writes Parquet files to an Amazon S3 location using EMRFS, the FileOutputCommitter algorithm has been updated to use version 2 instead of version 1. This reduces the number of renames, which improves application performance. This change does not affect:
    - Applications other than Spark.
    - Applications that write to other file systems, such as HDFS (which still use version 1 of FileOutputCommitter).
    - Applications that use other output formats, such as text or csv, that already use EMRFS direct write.

## Known issues

- JupyterHub
  - Using configuration classifications to set up JupyterHub and individual Jupyter notebooks when you create a cluster is not supported. Edit the `jupyterhub_config.py` and `jupyter_notebook_config.py` files for each user manually. For more information, see [Configuring JupyterHub](#).
  - JupyterHub fails to start on clusters within a private subnet, failing with the message `Error: ENOENT: no such file or directory, open '/etc/jupyter/conf/server.crt'`. This is caused by an error in the script that generates self-signed certificates. Use the following workaround to generate self-signed certificates. All commands are executed while connected to the primary node.

1. Copy the certificate generation script from the container to the primary node:

```
sudo docker cp jupyterhub:/tmp/gen_self_signed_cert.sh ./
```

2. Use a text editor to change line 23 to change public hostname to local hostname as shown below:

```
local hostname=$(curl -s $EC2_METADATA_SERVICE_URI/local-hostname)
```

3. Run the script to generate self-signed certificates:

```
sudo bash ./gen_self_signed_cert.sh
```

4. Move the certificate files that the script generates to the `/etc/jupyter/conf/` directory:

```
sudo mv /tmp/server.crt /tmp/server.key /etc/jupyter/conf/
```

You can tail the `jupyter.log` file to verify that JupyterHub restarted and is returning a 200 response code. For example:

```
tail -f /var/log/jupyter/jupyter.log
```

This should return a response similar to the following:

```
# [I 2018-06-14 18:56:51.356 JupyterHub app:1581] JupyterHub is now running at
https://:9443/
# 19:01:51.359 - info: [ConfigProxy] 200 GET /api/routes
```

- After the primary node reboots or the instance controller restarts, the CloudWatch metrics will not be collected and the automatic scaling feature will not be available in Amazon EMR version 5.14.0, 5.15.0, or 5.16.0. This issue is fixed in Amazon EMR 5.17.0.

## 5.13.1 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.13.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.12.2 release notes

The following release notes include information for Amazon EMR release 5.12.2. Changes are relative to 5.12.1.

Initial release date: August 29, 2018

### Changes, enhancements, and resolved issues

- This release addresses a potential security vulnerability.

## 5.12.2 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. ## 5.12.0 release notes

The following release notes include information for the Amazon EMR release 5.12.0. Changes are relative to 5.11.1.

### Upgrades

- AWS SDK for Java 1.11.238 ⇒ 1.11.267. For more information, see the [AWS SDK for Java Change Log](#) on GitHub.
- Hadoop 2.7.3 ⇒ 2.8.3. For more information, see [Apache Hadoop Releases](#).
- Flink 1.3.2 ⇒ 1.4.0. For more information, see the [Apache Flink 1.4.0 Release Announcement](#).
- HBase 1.3.1 ⇒ 1.4.0. For more information, see the [HBase Release Announcement](#).
- Hue 4.0.1 ⇒ 4.1.0. For more information, see the [Release Notes](#).
- MxNet 0.12.0 ⇒ 1.0.0. For more information, see the [MXNet Change Log](#) on GitHub.
- Presto 0.187 ⇒ 0.188. For more information, see the [Release Notes](#).

### Changes, enhancements, and resolved issues

- **Hadoop**
  - The `yarn.resourcemanager.decommissioning.timeout` property has changed to `yarn.resourcemanager.nodemanager-graceful-decommission-timeout-secs`.

You can use this property to customize cluster scale-down. For more information, see [Cluster Scale-Down](#) in the *Amazon EMR Management Guide*.

- The Hadoop CLI added the `-d` option to the `cp` (copy) command, which specifies direct copy. You can use this to avoid creating an intermediary `.COPYING` file, which makes copying data between Amazon S3 faster. For more information, see [HADOOP-12384](#).
- **Pig**
  - Added the `pig-env` configuration classification, which simplifies the configuration of Pig environment properties. For more information, see [Configure applications](#).
- **Presto**
  - Added the `presto-connector-redshift` configuration classification, which you can use to configure values in the Presto `redshift.properties` configuration file. For more information, see [Redshift Connector](#) in Presto documentation, and [Configure applications](#).
  - Presto support for EMRFS has been added and is the default configuration. Earlier Amazon EMR releases used `PrestoS3FileSystem`, which was the only option. For more information, see [EMRFS and PrestoS3FileSystem configuration](#).

#### Note

If you query underlying data in Amazon S3 with Amazon EMR version 5.12.0, Presto errors can occur. This is because Presto fails to pick up configuration classification values from `emrfs-site.xml`. As a workaround, create an `emrfs` subdirectory under `usr/lib/presto/plugin/hive-hadoop2/` and create a symlink in `usr/lib/presto/plugin/hive-hadoop2/emrfs` to the existing `/usr/share/aws/emr/emrfs/conf/emrfs-site.xml` file. Then restart the `presto-server` process (`sudo presto-server stop` followed by `sudo presto-server start`).

- **Spark**
  - Backported [SPARK-22036: BigDecimal multiplication sometimes returns null](#).

## Known issues

- MXNet does not include OpenCV libraries.
- SparkR is not available for clusters created using a custom AMI because R is not installed by default on cluster nodes.

## 5.12.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.11.4 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.11.4 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## 5.11.0 release notes

The following release notes include information for the Amazon EMR release 5.11.0. Changes are relative to 5.10.0.

### Upgrades

- Hive 2.3.2
- Spark 2.2.1

- SDK for Java 1.11.238

## New features

- Spark
  - Added `spark.decommissioning.timeout.threshold` setting, which improves Spark decommissioning behavior when using Spot Instances. For more information, see [Configuring node decommissioning behavior](#).
  - Added the `aws-sagemaker-spark-sdk` component to Spark, which installs Amazon SageMaker Spark and associated dependencies for Spark integration with [Amazon SageMaker](#). You can use Amazon SageMaker Spark to construct Spark machine learning (ML) pipelines using Amazon SageMaker stages. For more information, see the [SageMaker Spark Readme](#) on GitHub and [Using Apache Spark with Amazon SageMaker](#) in the *Amazon SageMaker Developer Guide*.

## Known issues

- MXNet does not include OpenCV libraries.
- Hive 2.3.2 sets `hive.compute.query.using.stats=true` by default. This causes queries to get data from existing statistics rather than directly from data, which could be confusing. For example, if you have a table with `hive.compute.query.using.stats=true` and upload new files to the table LOCATION, running a `SELECT COUNT(*)` query on the table returns the count from the statistics, rather than picking up the added rows.

As a workaround, use the `ANALYZE TABLE` command to gather new statistics, or set `hive.compute.query.using.stats=false`. For more information, see [Statistics in Hive](#) in the Apache Hive documentation.

## 5.11.0 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form *CommunityVersion*-amzn-*EmrVersion*. The *EmrVersion* starts at 0. For example, if open source community component named myapp-component with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as 2.2-amzn-2.

## 5.10.1 release notes

This is a patch release to add AWS Signature Version 4 authentication for requests to Amazon S3. All applications and components are the same as the previous Amazon EMR release.

### Important

In this release version, Amazon EMR uses AWS Signature Version 4 exclusively to authenticate requests to Amazon S3. For more information, see [Whats New](#).

## 5.10.1 component versions

The components that Amazon EMR installs with this release are listed below. Some are installed as part of big-data application packages. Others are unique to Amazon EMR and installed for system processes and features. These typically start with `emr` or `aws`. Big-data application packages in the most recent Amazon EMR release are usually the latest version found in the community. We make community releases available in Amazon EMR as quickly as possible.

Some components in Amazon EMR differ from community versions. These components have a version label in the form `CommunityVersion-amzn-EmrVersion`. The `EmrVersion` starts at 0. For example, if open source community component named `myapp-component` with version 2.2 has been modified three times for inclusion in different Amazon EMR releases, its release version is listed as `2.2-amzn-2`.

## 5.10.0 release notes

The following release notes include information for the Amazon EMR version 5.10.0 release. Changes are relative to the Amazon EMR 5.9.0 release.

## Upgrades

- AWS SDK for Java 1.11.221
- Hive 2.3.1
- Presto 0.187

## New features

- Added support for Kerberos authentication. For more information, see [Use Kerberos Authentication](#) in the *Amazon EMR Management Guide*
- Added support for IAM roles for EMRFS. For more information, see [Configure IAM Roles for EMRFS Requests to Amazon S3](#) in the *Amazon EMR Management Guide*
- Added support for GPU-based P2 and P3 instance types. For more information, see [Amazon EC2 P2 Instances](#) and [Amazon EC2 P3 Instances](#). NVIDIA driver 384.81 and CUDA driver 9.0.176 are installed on these instance types by default.
- Added support for [Apache MXNet](#).

## Changes, enhancements, and resolved issues

- Presto
  - Added support for using the AWS Glue Data Catalog as the default Hive metastore. For more information, see [Using Presto with the AWS Glue Data Catalog](#).
  - Added support for [geospatial functions](#).
  - Added [spill to disk](#) support for joins.
  - Added support for the [Redshift connector](#).
- Spark
  - Backported [SPARK-20640](#), which makes the rpc timeout and the retries for shuffle registration values configurable using `spark.shuffle.registration.timeout` and `spark.shuffle.registration.maxAttempts` properties.
  - Backported [SPARK-21549](#), which corrects an error that occurs when writing custom `OutputFormat` to non-HDFS locations.
- Backported [Hadoop-13270](#)

- The Numpy, Scipy, and Matplotlib libraries have been removed from the base Amazon EMR AMI. If these libraries are required for your application, they are available in the application repository, so you can use a bootstrap action to install them on all nodes using `yum install`.
- The Amazon EMR base AMI no longer has application RPM packages included, so the RPM packages are no longer present on cluster nodes. Custom AMIs and the Amazon EMR base AMI now reference the RPM package repository in Amazon S3.
- Because of the introduction of per-second billing in Amazon EC2, the default **Scale down behavior** is now **Terminate at task completion** rather than **Terminate at instance hour**. For more information, see [Configure Cluster Scale-Down](#).

## Known issues

- MXNet does not include OpenCV libraries.
- Hive 2.3.1 sets `hive.compute.query.using.stats=true` by default. This causes queries to get data from existing statistics rather than directly from data, which could be confusing. For example, if you have a table with `hive.compute.query.using.stats=true` and upload new files to the table LOCATION, running a `SELECT COUNT(*)` query on the table returns the count from the statistics, rather than picking up the added rows.

As a workaround, use the `ANALYZE TABLE` command to gather new statistics, or set `hive.compute.query.using.stats=false`. For more information, see [Statistics in Hive](#) in the Apache Hive documentation.
