What are the AWS Tools for PowerShell?

The AWS Tools for PowerShell are a set of PowerShell modules that are built on the functionality exposed by the AWS SDK for .NET. The AWS Tools for PowerShell enable you to script operations on your AWS resources from the PowerShell command line.

The cmdlets provide an idiomatic PowerShell experience for specifying parameters and handling results even though they are implemented using the various AWS service HTTP query APIs. For example, the cmdlets for the AWS Tools for PowerShell support PowerShell pipelining—that is, you can pipe PowerShell objects in and out of the cmdlets.

The AWS Tools for PowerShell are flexible in how they enable you to handle credentials, including support for the AWS Identity and Access Management (IAM) infrastructure. You can use the tools with IAM user credentials, temporary security tokens, and IAM roles.

The AWS Tools for PowerShell support the same set of services and AWS Regions that are supported by the SDK. You can install the AWS Tools for PowerShell on computers running Windows, Linux, or macOS operating systems.

️ Note

AWS Tools for PowerShell version 4 is the latest major release, and is a backward-compatible update to AWS Tools for PowerShell version 3.3. It adds significant improvements while maintaining existing cmdlet behavior. Your existing scripts should continue to work after upgrading to the new version, but we do recommend that you test them thoroughly before upgrading. For more information about the changes in version 4, see Migrating from AWS Tools for PowerShell Version 3.3 to Version 4.

The AWS Tools for PowerShell are available as the following three distinct packages:

- AWS.Tools
- AWSPowerShell.NetCore
- AWSPowerShell
Maintenance and support for SDK major versions

For information about maintenance and support for SDK major versions and their underlying dependencies, see the following in the AWS SDKs and Tools Reference Guide:

- AWS SDKs and tools maintenance policy
- AWS SDKs and tools version support matrix

AWS.Tools - A modularized version of the AWS Tools for PowerShell

This version of AWS Tools for PowerShell is the recommended version for any computer running PowerShell in a production environment. Because it’s modularized, you need to download and load only the modules for the services you want to use. This reduces download times, memory usage, and, in most cases, enables auto-importing of AWS.Tools cmdlets without the need to manually call Import-Module first.

This is the latest version of AWS Tools for PowerShell and runs on all supported operating systems, including Windows, Linux, and macOS. This package provides one installation module, AWS.Tools.Installer, one common module, AWS.Tools.Common, and one module for each AWS service, for example, AWS.Tools.EC2, AWS.Tools.IdentityManagement, AWS.Tools.S3, and so on.

The AWS.Tools.Installer module provides cmdlets that enable you to install, update, and remove the modules for each of the AWS services. The cmdlets in this module automatically ensure that you have all the dependent modules required to support the modules you want to use.

The AWS.Tools.Common module provides cmdlets for configuration and authentication that are not service specific. To use the cmdlets for an AWS service, you just run the command. PowerShell automatically imports the AWS.Tools.Common module and the module for the AWS service whose cmdlet you want to run. This module is automatically installed if you use the AWS.Tools.Installer module to install the service modules.

You can install this version of AWS Tools for PowerShell on computers that are running:
• PowerShell Core 6.0 or later on Windows, Linux, or macOS.

• Windows PowerShell 5.1 or later on Windows with the .NET Framework 4.7.2 or later.

Throughout this guide, when we need to specify this version only, we refer to it by its module name: *AWS.Tools*.

**AWSPowerShell.NetCore - A single-module version of the AWS Tools for PowerShell**

This version consists of a single, large module that contains support for all AWS services. Before you can use this module, you must manually import it.

You can install this version of AWS Tools for PowerShell on computers that are running:

• PowerShell Core 6.0 or later on Windows, Linux, or macOS.

• Windows PowerShell 3.0 or later on Windows with the .NET Framework 4.7.2 or later.

Throughout this guide, when we need to specify this version only, we refer to it by its module name: *AWSPowerShell.NetCore*.

**AWSPowerShell - A single-module version for Windows PowerShell**

This version of AWS Tools for PowerShell is compatible with and installable on only Windows computers that are running Windows PowerShell versions 2.0 through 5.1. It is not compatible with PowerShell Core 6.0 or later, or any other operating system (Linux or macOS). This version consists of a single, large module that contains support for all AWS services.
Throughout this guide, when we need to specify this version only, we refer to it by its module name: AWS PowerShell.

How to use this guide

The guide is divided into the following major sections.

Installing the AWS Tools for PowerShell

This section explains how to install the AWS Tools for PowerShell. It includes how to sign up for AWS if you don't already have an account, and how to create an IAM user that you can use to run the cmdlets.

Get started with the AWS Tools for Windows PowerShell

This section describes the fundamentals of using the AWS Tools for PowerShell, such as specifying credentials and AWS Regions, finding cmdlets for a particular service, and using aliases for cmdlets.

Work with AWS services in the AWS Tools for PowerShell

This section includes information about using the AWS Tools for PowerShell to perform some of the most common AWS tasks.
Installing the AWS Tools for PowerShell

To successfully install and use the AWS Tools for PowerShell cmdlets, see the steps in the following topics.

Topics

• Installing the AWS Tools for PowerShell on Windows
• Installing AWS Tools for PowerShell on Linux or macOS
• Migrating from AWS Tools for PowerShell Version 3.3 to Version 4

Installing the AWS Tools for PowerShell on Windows

A Windows-based computer can run any of the AWS Tools for PowerShell package options:

• **AWS.Tools** - The modularized version of AWS Tools for PowerShell. Each AWS service is supported by its own individual, small module, with shared support modules AWS.Tools.Common and AWS.Tools.Installer.

• **AWSPowerShell.NetCore** - The single, large-module version of AWS Tools for PowerShell. All AWS services are supported by this single, large module.

  ⚠️ **Note**

  Be aware that the single module might be too large to use with **AWS Lambda** functions. Instead, use the modularized version shown above.

• **AWSPowerShell** - The legacy Windows-specific, single, large-module version of AWS Tools for PowerShell. All AWS services are supported by this single, large module.

The package you choose depends on the release and edition of Windows that you're running.

⚠️ **Note**

The Tools for Windows PowerShell (AWSPowerShell module) are installed by default on all Windows-based Amazon Machine Images (AMIs).
Setting up the AWS Tools for PowerShell involves the following high-level tasks, described in detail in this topic.

1. Install the AWS Tools for PowerShell package option that's appropriate for your environment.
2. Verify that script execution is enabled by running the `Get-ExecutionPolicy` cmdlet.
3. Import the AWS Tools for PowerShell module into your PowerShell session.

**Prerequisites**

Newer versions of PowerShell, including PowerShell Core, are available as downloads from Microsoft at [Installing various versions of PowerShell](https://docs.microsoft.com/en-us/powershell/scripting/install/install-powershell) on Microsoft's Web site.

**Install AWS.Tools on Windows**

You can install the modularized version of AWS Tools for PowerShell on computers that are running Windows with Windows PowerShell 5.1, or PowerShell Core 6.0 or later. For information about how to install PowerShell Core, see [Installing various versions of PowerShell](https://docs.microsoft.com/en-us/powershell/scripting/install/install-powershell) on Microsoft's Web site.

You can install AWS.Tools in one of three ways:

- **Using the cmdlets in the AWS.Tools.Installer module.** This module simplifies the installation and update of other AWS.Tools modules. AWS.Tools.Installer requires PowerShellGet, and automatically downloads and installs an updated version of it. AWS.Tools.Installer automatically keeps your module versions in sync. When you install or update to a newer version of one module, the cmdlets in AWS.Tools.Installer automatically update all of your other AWS.Tools modules to the same version.

  This method is described in the procedure that follows.

- **Downloading the modules from AWS.Tools.zip and extracting them in one of the module folders.** You can discover your module folders by displaying the value of the PSMODULEPATH environment variable.

- **Installing each service module from the PowerShell Gallery using the Install-Module cmdlet.**

**To install AWS.Tools on Windows using the AWS.Tools.Installer module**

1. Start a PowerShell session.
Note

We recommend that you don’t run PowerShell as an administrator with elevated permissions except when required by the task at hand. This is because of the potential security risk and is inconsistent with the principle of least privilege.

2. To install the modularized AWS.Tools package, run the following command.

```powershell
PS > Install-Module -Name AWS.Tools.Installer
```

Untrusted repository
You are installing the modules from an untrusted repository. If you trust this repository, change its InstallationPolicy value by running the Set-PSRepository cmdlet. Are you sure you want to install the modules from 'PSGallery'? [Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "N"): y

If you are notified that the repository is "untrusted", it asks you if you want to install anyway. Enter y to allow PowerShell to install the module. To avoid the prompt and install the module without trusting the repository, you can run the command with the -Force parameter.

```powershell
PS > Install-Module -Name AWS.Tools.Installer -Force
```

3. You can now install the module for each AWS service that you want to use by using the Install-AWSToolsModule cmdlet. For example, the following command installs the Amazon EC2 and Amazon S3 modules. This command also installs any dependent modules that are required for the specified module to work. For example, when you install your first AWS.Tools service module, it also installs AWS.Tools.Common. This is a shared module required by all AWS service modules. It also removes older versions of the modules, and updates other modules to the same newer version.

```powershell
PS > Install-AWSToolsModule AWS.Tools.EC2,AWS.Tools.S3 -CleanUp
```

Confirm
Are you sure you want to perform this action?

Note

The Install-AWSToolsModule cmdlet downloads all requested modules from the PSRepository named PSGallery (https://www.powershellgallery.com/) and considers it a trusted source. Use the command Get-PSRepository -Name PSGallery for more information about this PSRepository.

By default, the previous command installs modules into the %USERPROFILE%\Documents \WindowsPowerShell\Modules folder. To install the AWS Tools for PowerShell for all users of a computer, you must run the following command in a PowerShell session that you started as an administrator. For example, the following command installs the IAM module to the %ProgramFiles%\WindowsPowerShell\Modules folder that is accessible by all users.

PS > Install-AWSToolsModule AWS.Tools.IdentityManagement -Scope AllUsers

To install other modules, run similar commands with the appropriate module names, as found in the PowerShell Gallery.

Install AWSPowerShell.NetCore on Windows

You can install the AWSPowerShell.NetCore on computers that are running Windows with PowerShell version 3 through 5.1, or PowerShell Core 6.0 or later. For information about how to install PowerShell Core, see Installing various versions of PowerShell on the Microsoft PowerShell website.
You can install AWSPowerShell.NetCore in one of two ways

- Downloading the module from AWSPowerShell.NetCore.zip and extracting it in one of the module directories. You can discover your module directories by displaying the value of the PSModulePath environment variable.
- Installing from the PowerShell Gallery using the Install-Module cmdlet, as described in the following procedure.

**To install AWSPowerShell.NetCore from the PowerShell Gallery using the Install-Module cmdlet**

To install the AWSPowerShell.NetCore from the PowerShell Gallery, your computer must be running PowerShell 5.0 or later, or running PowerShellGet on PowerShell 3 or later. Run the following command.

```powershell
PS > Install-Module -name AWSPowerShell.NetCore
```

If you're running PowerShell as administrator, the previous command installs AWS Tools for PowerShell for all users on the computer. If you're running PowerShell as a standard user without administrator permissions, that same command installs AWS Tools for PowerShell for only the current user.

To install for only the current user when that user has administrator permissions, run the command with the -Scope CurrentUser parameter set, as follows.

```powershell
PS > Install-Module -name AWSPowerShell.NetCore -Scope CurrentUser
```

Although PowerShell 3.0 and later releases typically load modules into your PowerShell session the first time you run a cmdlet in the module, the AWSPowerShell.NetCore module is too large to support this functionality. You must instead explicitly load the AWSPowerShell.NetCore Core module into your PowerShell session by running the following command.

```powershell
PS > Import-Module AWSPowerShell.NetCore
```

To load the AWSPowerShell.NetCore module into a PowerShell session automatically, add that command to your PowerShell profile. For more information about editing your PowerShell profile, see About Profiles in the PowerShell documentation.
Install AWSPowerShell on Windows PowerShell

You can install the AWS Tools for Windows PowerShell in one of two ways:

- Downloading the module from [AWSPowerShell.zip](#) and extracting it in one of the module directories. You can discover your module directories by displaying the value of the `PSModulePath` environment variable.
- Installing from the PowerShell Gallery using the `Install-Module` cmdlet as described in the following procedure.

**To install AWSPowerShell from the PowerShell Gallery using the Install-Module cmdlet**

You can install the AWSPowerShell from the PowerShell Gallery if you're running PowerShell 5.0 or later, or have installed [PowerShellGet](#) on PowerShell 3 or later. You can install and update AWSPowerShell from Microsoft's [PowerShell Gallery](#) by running the following command.

```
PS > Install-Module -Name AWSPowerShell
```

To load the AWSPowerShell module into a PowerShell session automatically, add the previous `import-module` cmdlet to your PowerShell profile. For more information about editing your PowerShell profile, see [About Profiles](#) in the PowerShell documentation.

**Note**
The Tools for Windows PowerShell are installed by default on all Windows-based Amazon Machine Images (AMIs).

Enable Script Execution

To load the AWS Tools for PowerShell modules, you must enable PowerShell script execution. To enable script execution, run the `Set-ExecutionPolicy` cmdlet to set a policy of RemoteSigned.

For more information, see [About Execution Policies](#) on the Microsoft Technet website.

**Note**
This is a requirement only for computers that are running Windows. The `ExecutionPolicy` security restriction is not present on other operating systems.
To enable script execution

1. Administrator rights are required to set the execution policy. If you are not logged in as a user with administrator rights, open a PowerShell session as Administrator. Choose Start, and then choose All Programs. Choose Accessories, and then choose Windows PowerShell. Right-click Windows PowerShell, and on the context menu, choose Run as administrator.

2. At the command prompt, enter the following.

   ```powershell
   PS > Set-ExecutionPolicy RemoteSigned
   ```

   **Note**
   On a 64-bit system, you must do this separately for the 32-bit version of PowerShell, Windows PowerShell (x86).

If you don't have the execution policy set correctly, PowerShell shows the following error whenever you try to run a script, such as your profile.

```powershell
File C:\Users\username\Documents\WindowsPowerShell\Microsoft.PowerShell_profile.ps1 cannot be loaded because the execution of scripts is disabled on this system. Please see "get-help about_signing" for more details.
At line:1 char:2
+ . 'C:\Users\username\Documents\WindowsPowerShell\Microsoft.PowerShell_profile.ps1'
   + CategoryInfo          : NotSpecified: (:) [], PSSecurityException
   + FullyQualifiedErrorId : RuntimeException
```

The Tools for Windows PowerShell installer automatically updates the PSMODULEPATH to include the location of the directory that contains the AWSPowerShell module.

Because the PSMODULEPATH includes the location of the AWS module's directory, the Get-Module -ListAvailable cmdlet shows the module.

```powershell
PS > Get-Module -ListAvailable
```

AWS releases new versions of the AWS Tools for PowerShell periodically to support new AWS services and features. To determine the version of the Tools that you have installed, run the `Get-AWSPowerShellVersion` cmdlet.

```
Get-AWSPowerShellVersion
```

Updating the AWS Tools for PowerShell on Windows

Periodically, as updated versions of the AWS Tools for PowerShell are released, you should update the version that you are running locally.

Update the modularized AWS.Tools modules

To update your AWS.Tools modules to the latest version, run the following command:

```
PS > Update-AWSToolsModule -CleanUp
```

This command updates all of the currently installed AWS.Tools modules and, after a successful update, removes other installed versions.

Note

The Update-AWSToolsModule cmdlet downloads all modules from the PSRepository named PSGallery (https://www.powershellgallery.com/) and considers it a trusted source. Use the command: Get-PSRepository -Name PSGallery for more information on this PSRepository.

Update the Tools for PowerShell Core

Run the Get-AWSPowerShellVersion cmdlet to determine the version that you are running, and compare that with the version of Tools for Windows PowerShell that is available on the PowerShell Gallery website. We suggest you check every two to three weeks. Support for new commands and AWS services is available only after you update to a version with that support.

Before you install a newer release of AWSPowerShell.NetCore, uninstall the existing module. Close any open PowerShell sessions before you uninstall the existing package. Run the following command to uninstall the package.

```
PS > Uninstall-Module -Name AWSPowerShell.NetCore -AllVersions
```

After the package is uninstalled, install the updated module by running the following command.

```
PS > Install-Module -Name AWSPowerShell.NetCore
```
After installation, run the command `Import-Module AWSPowerShell.NetCore` to load the updated cmdlets into your PowerShell session.

## Update the Tools for Windows PowerShell

Run the `Get-AWSPowerShellVersion` cmdlet to determine the version that you are running, and compare that with the version of Tools for Windows PowerShell that is available on the [PowerShell Gallery](https://www.microsoft.com) website. We suggest you check every two to three weeks. Support for new commands and AWS services is available only after you update to a version with that support.

- If you installed by using the `Install-Module` cmdlet, run the following commands.

  ```powershell
  PS > Uninstall-Module -Name AWSPowerShell -AllVersions
  PS > Install-Module -Name AWSPowerShell
  ```

- If you installed by using a downloaded ZIP file:
  1. Download the most recent version from the [Tools for PowerShell](https://aws.amazon.com) web site. Compare the package version number in the downloaded file name with the version number you get when you run the `Get-AWSPowerShellVersion` cmdlet.
  2. If the download version is a higher number than the version you have installed, close all Tools for Windows PowerShell consoles.
  3. Install the newer version of the Tools for Windows PowerShell.

After installation, run `Import-Module AWSPowerShell` to load the updated cmdlets into your PowerShell session. Or run the custom AWS Tools for PowerShell console from your Start menu.

## Installing AWS Tools for PowerShell on Linux or macOS

This topic provides instructions on how to install the AWS Tools for PowerShell on Linux or macOS.

### Overview of Setup

To install AWS Tools for PowerShell on a Linux or macOS computer, you can choose from two package options:

- **AWS.Tools** – The modularized version of AWS Tools for PowerShell. Each AWS service is supported by its own individual, small module, with shared support modules `AWS.Tools.Common`.
• **AWSPowerShell.NetCore** – The single, large-module version of AWS Tools for PowerShell. All AWS services are supported by this single, large module.

Note
Be aware that the single module might be too large to use with AWS Lambda functions. Instead, use the modularized version shown above.

Setting either of these up on a computer running Linux or macOS involves the following tasks, described in detail later in this topic:

1. Install PowerShell Core 6.0 or later on a supported system.
2. After installing PowerShell Core, start PowerShell by running `pwsh` in your system shell.
3. Install either AWS.Tools or AWSPowerShell.NetCore.
4. Run the appropriate `Import-Module` cmdlet to import the module into your PowerShell session.
5. Run the `Initialize-AWSDefaultConfiguration` cmdlet to provide your AWS credentials.

**Prerequisites**

To run the AWS Tools for PowerShell Core, your computer must be running PowerShell Core 6.0 or later.

- For a list of supported Linux platform releases and for information about how to install the latest version of PowerShell on a Linux-based computer, see [Installing PowerShell on Linux](https://docs.microsoft.com/en-us/powershell/scripting/install/install-powershell) on Microsoft's website. Some Linux-based operating systems, such as Arch, Kali, and Raspbian, are not officially supported, but have varying levels of community support.
- For information about supported macOS versions and about how to install the latest version of PowerShell on macOS, see [Installing PowerShell on macOS](https://docs.microsoft.com/en-us/powershell/scripting/install/install-powershell) on Microsoft's website.

**Install AWS.Tools on Linux or macOS**

You can install the modularized version of AWS Tools for PowerShell on computers that are running PowerShell Core 6.0 or later. For information about how to install PowerShell Core, see [Installing various versions of PowerShell](https://docs.microsoft.com/en-us/powershell/scripting/install/install-powershell) on the Microsoft PowerShell website.
You can install AWS.Tools in one of three ways:

- Using the cmdlets in the AWS.Tools.Installer module. This module simplifies the installation and update of other AWS.Tools modules. AWS.Tools.Installer requires PowerShellGet, and automatically downloads and installs an updated version of it. AWS.Tools.Installer automatically keeps your module versions in sync. When you install or update to a newer version of one module, the cmdlets in AWS.Tools.Installer automatically update all of your other AWS.Tools modules to the same version.

  This method is described in the procedure that follows.

- Downloading the modules from AWS.Tools.zip and extracting them in one of the module directories. You can discover your module directories by printing the value of the $Env:PSModulePath variable.

- Installing each service module from the PowerShell Gallery using the Install-Module cmdlet.

To install AWS.Tools on Linux or macOS using the AWS.Tools.Installer module

1. Start a PowerShell Core session by running the following command.

   $ pwsh

   **Note**
   
   We recommend that you *don’t* run PowerShell as an administrator with elevated permissions except when required by the task at hand. This is because of the potential security risk and is inconsistent with the principle of least privilege.

2. To install the modularized AWS.Tools package using the AWS.Tools.Installer module, run the following command.

   PS > Install-Module -Name AWS.Tools.Installer

   Untrusted repository
   You are installing the modules from an untrusted repository. If you trust this repository, change its InstallationPolicy value by running the Set-PSRepository cmdlet. Are you sure you want to install the modules from 'PSGallery'?
If you are notified that the repository is "untrusted", you're asked if you want to install anyway. Enter y to allow PowerShell to install the module. To avoid the prompt and install the module without trusting the repository, you can run the following command.

```
PS > Install-Module -Name AWS.Tools.Installer -Force
```

3. You can now install the module for each service that you want to use. For example, the following command installs the Amazon EC2 and Amazon S3 modules. This command also installs any dependent modules that are required for the specified module to work. For example, when you install your first AWS.Tools service module, it also installs AWS.Tools.Common. This is a shared module required by all AWS service modules. It also removes older versions of the modules, and updates other modules to the same newer version.

```
PS > Install-AWSToolsModule AWS.Tools.EC2,AWS.Tools.S3 -CleanUp
Confirm

**Note**

The Install-AWSToolsModule cmdlet downloads all requested modules from the PSRepository named PSGallery (https://www.powershellgallery.com/) and
considers the repository as a trusted source. Use the command `Get-PSRepository -Name PSGallery` for more information about this PSRepository.

The previous command installs modules into the default directories on your system. The actual directories depend on your operating system distribution and version and on the version of PowerShell you installed. For example, if you installed PowerShell 7 on a RHEL-like system, the default modules are most likely located in `/opt/microsoft/powershell/7/Modules` (or `$PSHOME/Modules`) and user modules are most likely located in `~/.local/share/powershell/Modules`. For more information, see Install PowerShell on Linux on the Microsoft PowerShell website. To see where modules are installed, run the following command:

```
PS > Get-Module -ListAvailable
```

To install other modules, run similar commands with the appropriate module names, as found in the PowerShell Gallery.

---

**Install AWSPowerShell.NetCore on Linux or macOS**

To upgrade to a newer release of AWSPowerShell.NetCore, follow the instructions in Updating the AWS Tools for PowerShell on Linux or macOS. Uninstall earlier versions of AWSPowerShell.NetCore first.

You can install AWSPowerShell.NetCore in one of two ways:

- Downloading the module from [AWSPowerShell.NetCore.zip](#) and extracting it in one of the module directories. You can discover your module directories by printing the value of the `$Env:PSModulePath` variable.
- Installing from the PowerShell Gallery using the `Install-Module` cmdlet as described in the following procedure.

**To install AWSPowerShell.NetCore on Linux or macOS using the Install-Module cmdlet**

Start a PowerShell Core session by running the following command.

```
$ pwsh
```
**Note**

We recommend that you *don’t* start PowerShell by running `sudo pwsh` to run PowerShell with elevated, administrator rights. This is because of the potential security risk and is inconsistent with the principle of least privilege.

To install the AWSPowerShell.NetCore single-module package from the PowerShell Gallery, run the following command.

```
PS > Install-Module -Name AWSPowerShell.NetCore
```

Untrusted repository

You are installing the modules from an untrusted repository. If you trust this repository, change its InstallationPolicy value by running the `Set-PSRepository` cmdlet. Are you sure you want to install the modules from 'PSGallery'? [Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is "N"): y

If you are notified that the repository is "untrusted", you’re asked if you want to install anyway. Enter *y* to allow PowerShell to install the module. To avoid the prompt without trusting the repository, you can run the following command.

```
PS > Install-Module -Name AWSPowerShell.NetCore -Force
```

You don’t have to run this command as root, unless you want to install the AWS Tools for PowerShell for all users of a computer. To do this, run the following command in a PowerShell session that you have started with `sudo pwsh`.

```
PS > Install-Module -Scope AllUsers -Name AWSPowerShell.NetCore -Force
```

**Script Execution**

The `Set-ExecutionPolicy` command isn’t available on non-Windows systems. You can run `Get-ExecutionPolicy`, which shows that the default execution policy setting in PowerShell Core running on non-Windows systems is *Unrestricted*. For more information, see [About Execution Policies](#) on the Microsoft Technet website.
Because the PSModulePath includes the location of the AWS module's directory, the Get-Module -ListAvailable cmdlet shows the module that you installed.

**AWS.Tools**

```powershell
PS > Get-Module -ListAvailable

Configure a PowerShell Console to Use the AWS Tools for PowerShell Core (AWSPowerShell.NetCore Only)

PowerShell Core typically loads modules automatically whenever you run a cmdlet in the module. But this doesn't work for AWSPowerShell.NetCore because of its large size. To start running AWSPowerShell.NetCore cmdlets, you must first run the Import-Module AWSPowerShell.NetCore command. This isn't required for cmdlets in AWS.Tools modules.

Initialize Your PowerShell Session

When you start PowerShell on a Linux-based or macOS-based system after you have installed the AWS Tools for PowerShell, you must run Initialize-AWSDefaultConfiguration to specify which AWS access key to use. For more information about Initialize-AWSDefaultConfiguration, see Using AWS Credentials.
Note

In earlier (before 3.3.96.0) releases of the AWS Tools for PowerShell, this cmdlet was named Initialize-AWSDefaults.

Versioning

AWS releases new versions of the AWS Tools for PowerShell periodically to support new AWS services and features. To determine the version of the AWS Tools for PowerShell that you have installed, run the `Get-AWSPowerShellVersion` cmdlet.

```
PS > Get-AWSPowerShellVersion
```

Updating the AWS Tools for PowerShell on Linux or macOS

Periodically, as updated versions of the AWS Tools for PowerShell are released, you should update the version that you're running locally.

Update the modularized AWS.Tools modules

To update your AWS.Tools modules to the latest version, run the following command:

```powershell
PS > Update-AWSToolsModule -CleanUp
```

This command updates all of the currently installed AWS.Tools modules and, for those modules that were successfully updated, removes the earlier versions.

ℹ️ Note

The Update-AWSToolsModule cmdlet downloads all modules from the PSRepository named PSGallery (https://www.powershellgallery.com/) and considers it a trusted source. Use the command Get-PSRepository -Name PSGallery for more information about this PSRepository.

Update the Tools for PowerShell Core

Run the Get-AWSPowerShellVersion cmdlet to determine the version that you are running, and compare that with the version of Tools for Windows PowerShell that is available on the PowerShell Gallery website. We suggest you check every two to three weeks. Support for new commands and AWS services is available only after you update to a version with that support.

Before you install a newer release of AWSPowerShell.NetCore, uninstall the existing module. Close any open PowerShell sessions before you uninstall the existing package. Run the following command to uninstall the package.
After the package is uninstalled, install the updated module by running the following command.

```
PS > Install-Module -Name AWSPowerShell.NetCore
```

After installation, run the command `Import-Module AWSPowerShell.NetCore` to load the updated cmdlets into your PowerShell session.

**Migrating from AWS Tools for PowerShell Version 3.3 to Version 4**

AWS Tools for PowerShell version 4 is a backward-compatible update to AWS Tools for PowerShell version 3.3. It adds significant improvements while maintaining existing cmdlet behavior.

Your existing scripts should continue to work after upgrading to the new version, but we do recommend that you test them thoroughly before upgrading your production environments.

This section describes the changes and explains how they might impact your scripts.

**New Fully Modularized AWS.Tools Version**

The AWSPowerShell.NetCore and AWSPowerShell packages were "monolithic". This meant that all of the AWS services were supported in the same module, making it very large, and growing larger as each new AWS service and feature was added. The new AWS.Tools package is broken up into smaller modules that give you the flexibility to download and install only those that you require for the AWS services that you use. The package includes a shared AWS.Tools.Common module that is required by all of the other modules, and an AWS.Tools.Installer module that simplifies installing, updating, and removing modules as needed.

This also enables auto-importing of cmdlets on first call, without having to first call `Import-Module`. However, to interact with the associated .NET objects before calling a cmdlet, you must still call `Import-Module` to let PowerShell know about the relevant .NET types.
For example, the following command has a reference to Amazon.EC2.Model.Filter. This type of reference can't trigger auto-importing, so you must call Import-Module first or the command fails.

```
PS > $filter = [Amazon.EC2.Model.Filter]@{Name="vpc-id";Values="vpc-1234abcd"}
InvalidOperation: Unable to find type [Amazon.EC2.Model.Filter].
```

```
PS > Import-Module AWS.Tools.EC2
PS > $filter = [Amazon.EC2.Model.Filter]@{Name="vpc-id";Values="vpc-1234abcd"}
PS > Get-EC2Instance -Filter $filter -Select Reservations.Instances.InstanceId
i-0123456789abcdefg
i-0123456789hijklmn
```

**New Get-AWSService cmdlet**

To help you discover the names of the modules for each AWS service in the AWS.Tools collection of modules, you can use the Get-AWSService cmdlet.

```
PS > Get-AWSService
Service : ACMPCA
  CmdletNounPrefix : PCA
  ModuleName : AWS.Tools.ACMPCA
  SDKAssemblyVersion : 3.3.101.56
  ServiceName : Certificate Manager Private Certificate Authority

Service : AlexaForBusiness
  CmdletNounPrefix : ALXB
  ModuleName : AWS.Tools.AlexaForBusiness
  SDKAssemblyVersion : 3.3.106.26
  ServiceName : Alexa For Business
...
```

**New -Select Parameter to Control the Object Returned by a Cmdlet**

Most cmdlets in version 4 support a new -Select parameter. Each cmdlet calls the AWS service APIs for you using the AWS SDK for .NET. Then the AWS Tools for PowerShell client converts the response into an object that you can use in your PowerShell scripts and pipe to other commands. Sometimes the final PowerShell object has more fields or properties in the original response than you need, and other times you might want the object to include fields or properties of the response...
that are not there by default. The -Select parameter enables you to specify what is included in the .NET object returned by the cmdlet.

For example, the `Get-S3Object` cmdlet invokes the Amazon S3 SDK operation `ListObjects`. That operation returns a `ListObjectsResponse` object. However, by default, the `Get-S3Object` cmdlet returns only the `S3Objects` element of the SDK response to the PowerShell user. In the following example, that object is an array with two elements.

```
PS > Get-S3Object -BucketName mybucket

ETag        : "01234567890123456789012345678901111"
BucketName  : mybucket
Key         : file1.txt
LastModified: 9/30/2019 1:31:40 PM
Owner       : Amazon.S3.Model.Owner
Size        : 568
StorageClass: STANDARD

ETag        : "01234567890123456789012345678902222"
BucketName  : mybucket
Key         : file2.txt
LastModified: 7/15/2019 9:36:54 AM
Owner       : Amazon.S3.Model.Owner
Size        : 392
StorageClass: STANDARD
```

In AWS Tools for PowerShell version 4, you can specify `-Select *` to return the complete .NET response object returned by the SDK API call.

```
PS > Get-S3Object -BucketName mybucket -Select *

IsTruncated    : False
NextMarker     :
S3Objects      : {file1.txt, file2.txt}
Name           : mybucket
Prefix         :
MaxKeys        : 1000
CommonPrefixes : {}
Delimiter      :
```

You can also specify the path to the specific nested property you want. The following example returns only the `Key` property of each element in the `S3Objects` array.

```
```
In certain situations it can be useful to return a cmdlet parameter. You can do this with `-Select ^ParameterName`. This feature supplants the `-PassThru` parameter, which is still available but deprecated.

The reference topic for each cmdlet identifies whether it supports the `-Select` parameter.

**More Consistent Limiting of the Number of Items in the Output**

Earlier versions of AWS Tools for PowerShell enabled you to use the `-MaxItems` parameter to specify the maximum number of objects returned in the final output.

This behavior is removed from AWS.Tools.

This behavior is deprecated in AWSPowerShell.NetCore and AWSPowerShell, and will be removed from those versions in a future release.

If the underlying service API supports a `MaxItems` parameter, it's still available and functions as the API specifies. But it no longer has the added behavior of limiting the number of items returned in the output of the cmdlet.

To limit the number of items returned in the final output, pipe the output to the `Select-Object` cmdlet and specify the `-First n` parameter, where `n` is the maximum number of items to include in the final output.
Not all AWS services supported -MaxItems in the same way, so this removes that inconsistency and the unexpected results that sometimes occurred. Also, -MaxItems combined with the new -Select parameter could sometimes result in confusing results.

**Easier to Use Stream Parameters**

Parameters of type Stream or byte[] can now accept string, string[], or FileInfo values.

For example, you can use any of the following examples.

```
PS > Invoke-LMFunction -FunctionName MyTestFunction -PayloadStream '{
    >> "some": "json"
    >> }
PS > Invoke-LMFunction -FunctionName MyTestFunction -PayloadStream (ls .\some.json)
PS > Invoke-LMFunction -FunctionName MyTestFunction -PayloadStream @('{', '"some": "json"', ', '}')
```

AWS Tools for PowerShell converts all strings to byte[] using UTF-8 encoding.

**Extending the Pipe by Property Name**

To make the user experience more consistent, you can now pass pipeline input by specifying the property name for any parameter.

In the following example, we create a custom object with properties that have names that match the parameter names of the target cmdlet. When the cmdlet runs, it automatically consumes those properties as its parameters.

```
PS > [pscustomobject] @{ BucketName='myBucket'; Key='file1.txt'; PartNumber=1 } | Get-S3ObjectMetadata
```

⚠️ **Note**

Some properties supported this in earlier versions of AWS Tools for PowerShell. Version 4 makes this more consistent by enabling it for all parameters.
Static Common Parameters

To improve consistency in version 4.0 of AWS Tools for PowerShell, all parameters are static.

In earlier versions of AWS Tools for PowerShell, some common parameters such as `AccessKey`, `SecretKey`, `ProfileName`, or `Region`, were dynamic, while all other parameters were static. This could create problems because PowerShell binds static parameters before dynamic ones. For example, let's say you ran the following command.

```
PS > Get-EC2Region -Region us-west-2
```

Earlier versions of PowerShell bound the value `us-west-2` to the `-RegionName` static parameter instead of the `-Region` dynamic parameter. Likely, this could confuse users.

**AWS.Tools Declares and Enforces Manditory Parameters**

The AWS.Tools.* modules now declare and enforce mandatory cmdlet parameters. When an AWS Service declares that a parameter of an API is required, PowerShell prompts you for the corresponding cmdlet parameter if you didn't specify it. This applies only to AWS.Tools. To ensure backward compatibility, this does not apply to AWSPowerShell.NetCore or AWSPowerShell.

**All Parameters Are Nullable**

You can now assign `$null` to value type parameters (numbers and dates). This change should not affect existing scripts. This enables you to bypass the prompt for a mandatory parameter. Mandatory parameters are enforced in AWS.Tools only.

If you run the following example using version 4, it effectively bypasses client-side validation because you provide a "value" for each mandatory parameter. However, the Amazon EC2 API service call fails because the AWS service still requires that information.

```
PS > Get-EC2InstanceAttribute -InstanceId $null -Attribute $null
```

WARNING: You are passing $null as a value for parameter Attribute which is marked as required.
In case you believe this parameter was incorrectly marked as required, report this by opening an issue at [https://github.com/aws/aws-tools-for-powershell/issues](https://github.com/aws/aws-tools-for-powershell/issues).
WARNING: You are passing $null as a value for parameter InstanceId which is marked as required.
Removing Previously Deprecated Features

The following features were deprecated in previous releases of AWS Tools for PowerShell and are removed in version 4:

- Removed the `-Terminate` parameter from the `Stop-EC2Instance` cmdlet. Use `Remove-EC2Instance` instead.
- Removed the `-ProfileName` parameter from the `Clear-AWSCredential` cmdlet. Use `Remove-AWSCredentialProfile` instead.
- Removed `cmdlets Import-EC2Instance and Import-EC2Volume.`
Get started with the AWS Tools for Windows PowerShell

Some of the topics in this section describe the fundamentals of using the Tools for Windows PowerShell after you have installed the tools. For example, they explain how to specify which credentials and AWS Region the Tools for Windows PowerShell should use when interacting with AWS.

Other topics in this section provide information about advanced ways that you can configure the tools, your environment, and your projects.

Topics

- Configure tool authentication with AWS
- Specify AWS Regions
- Configure federated identity with the AWS Tools for PowerShell
- Cmdlet discovery and aliases
- Pipelining and $AWSHistory
- Credential and profile resolution
- Additional information about users and roles
- Using legacy credentials

Configure tool authentication with AWS

You must establish how your code authenticates with AWS when developing with AWS services. There are different ways in which you can configure programmatic access to AWS resources, depending on the environment and the AWS access available to you.

To see various methods of authentication for the Tools for PowerShell, see Authentication and access in the AWS SDKs and Tools Reference Guide.

This topic assumes that a new user is developing locally, has not been given a method of authentication by their employer, and will be using AWS IAM Identity Center to obtain temporary credentials. If your environment doesn't fall under these assumptions, some of the information in this topic might not apply to you, or some of the information might have already been given to you.
Configuring this environment requires several steps, which are summarized as follows:

1. **Enable and configure IAM Identity Center**
2. **Configure the Tools for PowerShell to use IAM Identity Center.**
3. **Start an AWS access portal session**

### Enable and configure IAM Identity Center

To use AWS IAM Identity Center, it must first be enabled and configured. To see details about how to do this for PowerShell, look at Step 1 in the topic for [IAM Identity Center authentication](#) in the AWS SDKs and Tools Reference Guide. Specifically, follow any necessary instructions under I do not have established access through IAM Identity Center.

### Configure the Tools for PowerShell to use IAM Identity Center.

**Note**

Starting with version 4.1.538 of the Tools for PowerShell, the recommended method to configure SSO credentials and start an AWS access portal session is to use the `Initialize-AWSSSOConfiguration` and `Invoke-AWSSSOLogin` cmdlets, as described in this topic. If you don't have access to that version of the Tools for PowerShell (or later) or can't use those cmdlets, you can still perform these tasks by using the AWS CLI. To find out how, see [Use the AWS CLI for portal login](#).

The following procedure updates the shared AWS config file with SSO information that the Tools for PowerShell uses to obtain temporary credentials. As a consequence of this procedure, an AWS access portal session is also started. If the shared config file already has SSO information and you just want to know how to start an access portal session using the Tools for PowerShell, see the next section in this topic, [Start an AWS access portal session](#).

1. If you haven't already done so, open PowerShell and install the AWS Tools for PowerShell as appropriate for your operating system and environment, including the common cmdlets. For information about how to do this, see [Installing the AWS Tools for PowerShell](#).

   For example, if installing the modularized version of the Tools for PowerShell on Windows, you would most likely run commands similar to the following:
2. Run the following command. Replace the example property values with values from your IAM Identity Center configuration. For information about these properties and how to find them, see IAM Identity Center credential provider settings in the AWS SDKs and Tools Reference Guide.

   ```powershell
   $params = @{
       ProfileName = 'my-sso-profile'
       AccountId = '111122223333'
       RoleName = 'SamplePermissionSet'
       SessionName = 'my-sso-session'
       StartUrl = 'https://provided-domain.awsapps.com/start'
       SSORegion = 'us-west-2'
       RegistrationScopes = 'sso:account:access'
   };
   Initialize-AWSSSOConfiguration @params
   ```

   Alternatively, you can simply use the cmdlet by itself, Initialize-AWSSSOConfiguration, and the Tools for PowerShell prompts you for the property values.

   Considerations for certain property values:
   
   - If you simply followed the instructions to enable and configure IAM Identity Center, the value for -RoleName might be PowerUserAccess. But if you created an IAM Identity Center permission set specifically for PowerShell work, use that instead.
   - Be sure to use the AWS Region where you have configured IAM Identity Center.

3. At this point, the shared AWS config file contains a profile called my-sso-profile with a set of configuration values that can be referenced from the Tools for PowerShell. To find the location of this file, see Location of the shared files in the AWS SDKs and Tools Reference Guide.

   The Tools for PowerShell uses the profile’s SSO token provider to acquire credentials before sending requests to AWS. The sso_role_name value, which is an IAM role connected to an IAM Identity Center permission set, should allow access to the AWS services used in your application.

   The following sample shows the profile that was created by using the command shown above. Some of the property values and their order might be different in your actual profile.
The profile's `sso-session` property refers to the section named `my-sso-session`, which contains settings to initiate an AWS access portal session.

```
[profile my-sso-profile]
sso_account_id=111122223333
sso_role_name=SamplePermissionSet
sso_session=my-sso-session

[sso-session my-sso-session]
sso_region=us-west-2
sso_registration_scopes=sso:account:access
sso_start_url=https://provided-domain.awsapps.com/start/
```

4. If you already have an active AWS access portal session, the Tools for PowerShell informs you that you are already logged in.

   If that's not the case, the Tools for PowerShell attempts to automatically open the SSO authorization page in your default web browser. Follow the prompts in your browser, which might include an SSO authorization code, username and password, and permission to access AWS IAM Identity Center accounts and permission sets.

   The Tools for PowerShell informs you that SSO login was successful.

**Start an AWS access portal session**

Before running commands that accesses AWS services, you need an active AWS access portal session so that the Tools for PowerShell can use IAM Identity Center authentication to resolve credentials. To sign in to the AWS access portal, run the following command in PowerShell, where `-ProfileName my-sso-profile` is the name of the profile that was created in the shared config file when you followed the procedure in the previous section of this topic.

```
Invoke-AWSSSOLogin -ProfileName my-sso-profile
```

If you already have an active AWS access portal session, the Tools for PowerShell informs you that you are already logged in.

If that's not the case, the Tools for PowerShell attempts to automatically open the SSO authorization page in your default web browser. Follow the prompts in your browser, which might
include an SSO authorization code, username and password, and permission to access AWS IAM Identity Center accounts and permission sets.

The Tools for PowerShell informs you that SSO login was successful.

To test if you already have an active session, run the following command after installing or importing the `AWS.Tools.SecurityToken` module as needed.

```powershell
Get-STSCallerIdentity -ProfileName my-sso-profile
```

The response to the `Get-STSCallerIdentity` cmdlet reports the IAM Identity Center account and permission set configured in the shared config file.

**Example**

The following is an example of how to use IAM Identity Center with the Tools for PowerShell. It assumes the following:

- You have enabled IAM Identity Center and configured it as described previously in this topic. The SSO properties are in the `my-sso-profile` profile, which was configured earlier in this topic.
- When you log in through the `Initialize-AWSSSOConfiguration` or `Invoke-AWSSSOLogin` cmdlets, the user has at least read-only permissions for Amazon S3.
- Some S3 buckets are available for that user to view.

Install or import the `AWS.Tools.S3` module as needed and then use the following PowerShell command to display a list of the S3 buckets.

```powershell
Get-S3Bucket -ProfileName my-sso-profile
```

Topics

- Use the AWS CLI for portal login

Use the AWS CLI for portal login

Starting with version 4.1.538 of the Tools for PowerShell, the recommended method to configure SSO credentials and start an AWS access portal session is to use the Initialize-AWSSSOSConfiguration and Invoke-AWSSSOLogin cmdlets, as described in Configure tool authentication with AWS. If you don't have access to that version of the Tools for PowerShell (or later) or can't use those cmdlets, you can still perform these tasks by using the AWS CLI.

Configure the Tools for PowerShell to use IAM Identity Center through the AWS CLI.

If you haven't already done so, be sure to Enable and configure IAM Identity Center before you proceed.

Information about how to configure the Tools for PowerShell to use IAM Identity Center through the AWS CLI is in Step 2 in the topic for IAM Identity Center authentication in the AWS SDKs and Tools Reference Guide. After you complete this configuration, your system should contain the following elements:

- The AWS CLI, which you use to start an AWS access portal session before you run your application.

- The shared AWS config file that contains a [default] profile with a set of configuration values that can be referenced from the Tools for PowerShell. To find the location of this file, see Location of the shared files in the AWS SDKs and Tools Reference Guide. The Tools for PowerShell uses the profile's SSO token provider to acquire credentials before sending requests to AWS. The sso_role_name value, which is an IAM role connected to an IAM Identity Center permission set, should allow access to the AWS services used in your application.
The following sample config file shows a [default] profile set up with an SSO token provider. The profile's sso_session setting refers to the named sso-session section. The sso-session section contains settings to initiate an AWS access portal session.

```
[default]
    sso_session = my-sso
    sso_account_id = 111122223333
    sso_role_name = SampleRole
    region = us-east-1
    output = json

[sso-session my-sso]
    sso_region = us-east-1
    sso_start_url = https://provided-domain.awsapps.com/start
    sso_registration_scopes = sso:account:access
```

⚠️ Important

Your PowerShell session must have the following modules installed and imported so that SSO resolution can work:

- AWS.Tools.SSO
- AWS.Tools.SSOOIDC

If you're using an older version of the Tools for PowerShell and you don't have these modules, you will get an error similar to the following: "Assembly AWSSDK.SSOOIDC could not be found...".

Start an AWS access portal session

Before running commands that accesses AWS services, you need an active AWS access portal session so that the Tools for Windows PowerShell can use IAM Identity Center authentication to resolve credentials. Depending on your configured session lengths, your access will eventually expire and the Tools for Windows PowerShell will encounter an authentication error. To sign in to the AWS access portal, run the following command in the AWS CLI.

```bash
Use the AWS CLI
```
AWS Tools for PowerShell

aws sso login

Since you are using the [default] profile, you do not need to call the command with the --profile option. If your SSO token provider configuration is using a named profile, the command is `aws sso login --profile named-profile` instead. For more information about named profiles, see the Profiles section in the AWS SDKs and Tools Reference Guide.

To test if you already have an active session, run the following AWS CLI command (with the same consideration for named profile):

```
aws sts get-caller-identity
```

The response to this command should report the IAM Identity Center account and permission set configured in the shared config file.

ℹ️ **Note**

If you already have an active AWS access portal session and run `aws sso login`, you will not be required to provide credentials. The sign-in process might prompt you to allow the AWS CLI access to your data. Because the AWS CLI is built on top of the SDK for Python, permission messages may contain variations of the botocore name.

**Example**

The following is an example of how to use IAM Identity Center with the Tools for PowerShell. It assumes the following:

- You have enabled IAM Identity Center and configured it as described previously in this topic. The SSO properties are in the [default] profile.
- When you log in through the AWS CLI by using `aws sso login`, that user has at least read-only permissions for Amazon S3.
- Some S3 buckets are available for that user to view.

Use the following PowerShell commands to display a list of the S3 buckets:
Install-Module AWS.Tools.Installer
Install-AWSToolsModule S3
# And if using an older version of the AWS Tools for PowerShell:
Install-AWSToolsModule SSO, SSOOIDC

# In older versions of the AWS Tools for PowerShell, we're not invoking a cmdlet from
# these modules directly,
# so we must import them explicitly:
Import-Module AWS.Tools.SSO
Import-Module AWS.Tools.SSOOIDC

# Older versions of the AWS Tools for PowerShell don't support the SSO login flow, so
login with the CLI
aws sso login

# Now we can invoke cmdlets using the SSO profile
Get-S3Bucket

As mentioned above, since you are using the [default] profile, you do not need to call the Get-
S3Bucket cmdlet with the -ProfileName option. If your SSO token provider configuration
is using a named profile, the command is Get-S3Bucket -ProfileName named-profile. For more information about named profiles, see the Profiles section in the AWS SDKs and Tools Reference Guide.

Additional information

- For more options on authentication for the Tools for PowerShell, such as the use of profiles and
  environment variables, see the configuration chapter in the AWS SDKs and Tools Reference Guide.

- Some commands require an AWS Region to be specified. There are a number of ways to do
  so, including the -Region cmdlet option, the [default] profile, and the AWS_REGION
  environment variable. For more information, see Specify AWS Regions in this guide and AWS
  Region in the AWS SDKs and Tools Reference Guide.

- To learn more about best practices, see Security best practices in IAM in the IAM User Guide.

- To learn about other credential providers, see Standardized credential providers in the AWS SDKs
  and Tools Reference Guide.
Specify AWS Regions

There are two ways to specify the AWS Region to use when running AWS Tools for PowerShell commands:

- Use the `-Region` common parameter on individual commands.
- Use the `Set-DefaultAWSRegion` command to set a default Region for all commands.

Many AWS cmdlets fail if the Tools for Windows PowerShell can't figure out what Region to use. Exceptions include cmdlets for Amazon S3, Amazon SES, and AWS Identity and Access Management, which automatically default to a global endpoint.

**To specify the region for a single AWS command**

Add the `-Region` parameter to your command, such as the following.

```
PS > Get-EC2Image -Region us-west-2
```

**To set a default region for all AWS CLI commands in the current session**

From the PowerShell command prompt, type the following command.

```
PS > Set-DefaultAWSRegion -Region us-west-2
```

⚠ **Note**

This setting persists only for the current session. To apply the setting to all of your PowerShell sessions, add this command to your PowerShell profile as you did for the `Import-Module` command.

**To view the current default region for all AWS CLI commands**

From the PowerShell command prompt, type the following command.

```
PS > Get-DefaultAWSRegion
```

<table>
<thead>
<tr>
<th>Region</th>
<th>Name</th>
<th>IsShellDefault</th>
</tr>
</thead>
<tbody>
<tr>
<td>------</td>
<td>----</td>
<td>---------------</td>
</tr>
</tbody>
</table>
To clear the current default Region for all AWS CLI commands

From the PowerShell command prompt, type the following command.

```
PS > Clear-DefaultAWSRegion
```

To view a list of all available AWS Regions

From the PowerShell command prompt, type the following command. The third column in the sample output identifies which Region is the default for your current session.

```
PS > Get-AWSRegion
```

<table>
<thead>
<tr>
<th>Region</th>
<th>Name</th>
<th>IsShellDefault</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap-east-1</td>
<td>Asia Pacific (Hong Kong)</td>
<td>False</td>
</tr>
<tr>
<td>ap-northeast-1</td>
<td>Asia Pacific (Tokyo)</td>
<td>False</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>us-east-2</td>
<td>US East (Ohio)</td>
<td>False</td>
</tr>
<tr>
<td>us-west-1</td>
<td>US West (N. California)</td>
<td>False</td>
</tr>
<tr>
<td>us-west-2</td>
<td>US West (Oregon)</td>
<td>True</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note**

Some Regions might be supported but not included in the output of the Get-AWSRegion cmdlet. For example, this is sometimes true of Regions that are not yet global. If you're not able to specify a Region by adding the -Region parameter to a command, try specifying the Region in a custom endpoint instead, as shown in the following section.

Specifying a Custom or Nonstandard Endpoint

Specify a custom endpoint as a URL by adding the -EndpointUrl common parameter to your Tools for Windows PowerShell command, in the following sample format.

```
PS > Some-AWS-PowerShellCmdlet -EndpointUrl "custom endpoint URL" -Other -Parameters
```
The following is an example using the `Get-EC2Instance` cmdlet. The custom endpoint is in the `us-west-2`, or US West (Oregon) Region in this example, but you can use any other supported AWS Region, including regions that are not enumerated by `Get-AWSRegion`.

```
PS > Get-EC2Instance -EndpointUrl "https://service-custom-url.us-west-2.amazonaws.com" -InstanceID "i-0555a30a2000000e1"
```

### Configure federated identity with the AWS Tools for PowerShell

To let users in your organization access AWS resources, you must configure a standard and repeatable authentication method for purposes of security, auditability, compliance, and the capability to support role and account separation. Although it's common to provide users with the ability to access AWS APIs, without federated API access, you would also have to create AWS Identity and Access Management (IAM) users, which defeats the purpose of using federation.

This topic describes SAML (Security Assertion Markup Language) support in the AWS Tools for PowerShell that eases your federated access solution.

SAML support in the AWS Tools for PowerShell lets you provide your users federated access to AWS services. SAML is an XML-based, open-standard format for transmitting user authentication and authorization data between services; in particular, between an identity provider (such as Active Directory Federation Services), and a service provider (such as AWS). For more information about SAML and how it works, see [SAML](#) on Wikipedia, or [SAML Technical Specifications](#) at the Organization for the Advancement of Structured Information Standards (OASIS) website. SAML support in the AWS Tools for PowerShell is compatible with SAML 2.0.

### Prerequisites

You must have the following in place before you try to use SAML support for the first time.

- A federated identity solution that is correctly integrated with your AWS account for console access by using only your organizational credentials. For more information about how to do this specifically for Active Directory Federation Services, see [About SAML 2.0 Federation](#) in the IAM
How an Identity-Federated User Gets Federated Access to AWS Service APIs

The following process describes, at a high level, how an Active Directory (AD) user is federated by AD FS to gain access to AWS resources.

1. The client on federated user's computer authenticates against AD FS.
2. If authentication succeeds, AD FS sends the user a SAML assertion.

User Guide, and the blog post, Enabling Federation to AWS Using Windows Active Directory, AD FS, and SAML 2.0. Although the blog post covers AD FS 2.0, the steps are similar if you are running AD FS 3.0.

- Version 3.1.31.0 or newer of the AWS Tools for PowerShell installed on your local workstation.
3. The user's client sends the SAML assertion to the AWS Security Token Service (STS) as part of a SAML federation request.

4. STS returns a SAML response that contains AWS temporary credentials for a role the user can assume.

5. The user accesses AWS service APIs by including those temporary credentials in request made by AWS Tools for PowerShell.

**How SAML Support Works in the AWS Tools for PowerShell**

This section describes how AWS Tools for PowerShell cmdlets enable configuration of SAML-based identity federation for users.

1. AWS Tools for PowerShell authenticates against AD FS by using the Windows user's current credentials, or interactively, when the user tries to run a cmdlet that requires credentials to call into AWS.

2. AD FS authenticates the user.

3. AD FS generates a SAML 2.0 authentication response that includes an assertion; the purpose of the assertion is to identify and provide information about the user. AWS Tools for PowerShell extracts the list of the user's authorized roles from the SAML assertion.
4. AWS Tools for PowerShell forwards the SAML request, including the requested role's Amazon Resource Names (ARN), to STS by making the AssumeRoleWithSAMLRequest API call.

5. If the SAML request is valid, STS returns a response that contains the AWS AccessKeyId, SecretAccessKey, and SessionToken. These credentials last for 3,600 seconds (1 hour).

6. The user now has valid credentials to work with any AWS service APIs that the user's role is authorized to access. AWS Tools for PowerShell automatically applies these credentials for any subsequent AWS API calls, and renews them automatically when they expire.

**Note**

When the credentials expire, and new credentials are required, AWS Tools for PowerShell automatically reauthenticates with AD FS, and obtains new credentials for a subsequent hour. For users of domain-joined accounts, this process occurs silently. For accounts that are not domain-joined, AWS Tools for PowerShell prompts users to enter their credentials before they can reauthenticate.

---

**How to Use the PowerShell SAML Configuration Cmdlets**

AWS Tools for PowerShell includes two new cmdlets that provide SAML support.

- **Set-AWSSamlEndpoint** configures your AD FS endpoint, assigns a friendly name to the endpoint, and optionally describes the authentication type of the endpoint.

- **Set-AWSSamlRoleProfile** creates or edits a user account profile that you want to associate with an AD FS endpoint, identified by specifying the friendly name you provided to the Set-AWSSamlEndpoint cmdlet. Each role profile maps to a single role that a user is authorized to perform.

  Just as with AWS credential profiles, you assign a friendly name to the role profile. You can use the same friendly name with the Set-AWS Credential cmdlet, or as the value of the -ProfileName parameter for any cmdlet that invokes AWS service APIs.

Open a new AWS Tools for PowerShell session. If you are running PowerShell 3.0 or newer, the AWS Tools for PowerShell module is automatically imported when you run any of its cmdlets. If you are running PowerShell 2.0, you must import the module manually by running the ``Import-Module`` cmdlet, as shown in the following example.
How to Run the Set-AWSSam1Endpoint and Set-AWSSamlRoleProfile Cmdlets

1. First, configure the endpoint settings for the AD FS system. The simplest way to do this is to store the endpoint in a variable, as shown in this step. Be sure to replace the placeholder account IDs and AD FS host name with your own account IDs and AD FS host name. Specify the AD FS host name in the Endpoint parameter.

   ```powershell
   ```

2. To create the endpoint settings, run the Set-AWSSam1Endpoint cmdlet, specifying the correct value for the AuthenticationType parameter. Valid values include Basic, Digest, Kerberos, Negotiate, and NTLM. If you do not specify this parameter, the default value is Kerberos.

   ```powershell
   PS > $epName = Set-AWSSam1Endpoint -Endpoint $endpoint -StoreAs ADFS-Demo -AuthenticationType NTLM
   ```

   The cmdlet returns the friendly name you assigned by using the -StoreAs parameter, so you can use it when you run Set-AWSSamlRoleProfile in the next line.

3. Now, run the Set-AWSSamlRoleProfile cmdlet to authenticate with the AD FS identity provider and get the set of roles (in the SAML assertion) that the user is authorized to perform.

   The Set-AWSSamlRoleProfile cmdlet uses the returned set of roles to either prompt the user to select a role to associate with the specified profile, or validate that role data provided in parameters is present (if not, the user is prompted to choose). If the user is authorized for only one role, the cmdlet associates the role with the profile automatically, without prompting the user. There is no need to provide a credential to set up a profile for domain-joined usage.

   ```powershell
   PS > Set-AWSSamlRoleProfile -StoreAs SAMLDemoProfile -EndpointName $epName
   ```

   Alternatively, for non-domain-joined accounts, you can provide Active Directory credentials, and then select an AWS role to which the user has access, as shown in the following line. This
is useful if you have different Active Directory user accounts to differentiate roles within your organization (for example, administration functions).

```
PS > $credential = Get-Credential -Message "Enter the domain credentials for the endpoint"
PS > Set-AWSSamlRoleProfile -EndpointName $epName -NetworkCredential $credential -StoreAs SAMLDemoProfile
```

4. In either case, the `Set-AWSSamlRoleProfile` cmdlet prompts you to choose which role should be stored in the profile. The following example shows two available roles: ADFS-Dev, and ADFS-Production. The IAM roles are associated with your AD login credentials by the AD FS administrator.

```
Select Role
Select the role to be assumed when this profile is active
```

Alternatively, you can specify a role without the prompt, by entering the `RoleARN`, `PrincipalARN`, and optional `NetworkCredential` parameters. If the specified role is not listed in the assertion returned by authentication, the user is prompted to choose from available roles.

```
PS > $params = @{ "NetworkCredential"=$credential, 
"PrincipalARN"="{arn:aws:iam::012345678912:saml-provider/ADFS}",
"RoleARN"="{arn:aws:iam::012345678912:role/ADFS-Dev}" }
PS > $epName | Set-AWSSamlRoleProfile @params -StoreAs SAMLDemoProfile1 -Verbose
```

5. You can create profiles for all roles in a single command by adding the `StoreAllRoles` parameter, as shown in the following code. Note that the role name is used as the profile name.

```
PS > Set-AWSSamlRoleProfile -EndpointName $epName -StoreAllRoles
ADFS-Dev
ADFS-Production
```

**How to Use Role Profiles to Run Cmdlets that Require AWS Credentials**

To run cmdlets that require AWS credentials, you can use role profiles defined in the AWS shared credential file. Provide the name of a role profile to `Set-AWSSCredentia`l (or as the value for...
any ProfileName parameter in the AWS Tools for PowerShell) to get temporary AWS credentials automatically for the role that is described in the profile.

Although you use only one role profile at a time, you can switch between profiles within a shell session. The Set-AWSCredential cmdlet does not authenticate and get credentials when you run it by itself; the cmdlet records that you want to use a specified role profile. Until you run a cmdlet that requires AWS credentials, no authentication or request for credentials occurs.

You can now use the temporary AWS credentials that you obtained with the SAMLDemoProfile profile to work with AWS service APIs. The following sections show examples of how to use role profiles.

**Example 1: Set a Default Role with Set-AWSCredential**

This example sets a default role for a AWS Tools for PowerShell session by using Set-AWSCredential. Then, you can run cmdlets that require credentials, and are authorized by the specified role. This example lists all Amazon Elastic Compute Cloud instances in the US West (Oregon) Region that are associated with the profile you specified with the Set-AWSCredential cmdlet.

```
PS > Set-AWSCredential -ProfileName SAMLDemoProfile
PS > Get-EC2Instance -Region us-west-2 | Format-Table -Property Instances,GroupNames

<table>
<thead>
<tr>
<th>Instances</th>
<th>GroupNames</th>
</tr>
</thead>
<tbody>
<tr>
<td>{TestInstance1}</td>
<td>{default}</td>
</tr>
<tr>
<td>{TestInstance2}</td>
<td>{}</td>
</tr>
<tr>
<td>{TestInstance3}</td>
<td>{launch-wizard-6}</td>
</tr>
<tr>
<td>{TestInstance4}</td>
<td>{default}</td>
</tr>
<tr>
<td>{TestInstance5}</td>
<td>{}</td>
</tr>
<tr>
<td>{TestInstance6}</td>
<td>{AWS-OpsWorks-Default-}</td>
</tr>
</tbody>
</table>
```

**Example 2: Change Role Profiles During a PowerShell Session**

This example lists all available Amazon S3 buckets in the AWS account of the role associated with the SAMLDemoProfile profile. The example shows that although you might have been using another profile earlier in your AWS Tools for PowerShell session, you can change profiles by specifying a different value for the -ProfileName parameter with cmdlets that support it. This is a common task for administrators who manage Amazon S3 from the PowerShell command line.
PS > Get-S3Bucket -ProfileName SAMLDemoProfile

<table>
<thead>
<tr>
<th>CreationDate</th>
<th>BucketName</th>
</tr>
</thead>
<tbody>
<tr>
<td>7/25/2013 3:16:56 AM</td>
<td>mybucket1</td>
</tr>
<tr>
<td>4/15/2015 12:46:50 AM</td>
<td>mybucket2</td>
</tr>
<tr>
<td>4/15/2015 6:15:53 AM</td>
<td>mybucket3</td>
</tr>
<tr>
<td>1/12/2015 11:20:16 PM</td>
<td>mybucket4</td>
</tr>
</tbody>
</table>

Note that the Get-S3Bucket cmdlet specifies the name of the profile created by running the Set-AWSSamlRoleProfile cmdlet. This command could be useful if you had set a role profile earlier in your session (for example, by running the Set-AWS Credential cmdlet) and wanted to use a different role profile for the Get-S3Bucket cmdlet. The profile manager makes temporary credentials available to the Get-S3Bucket cmdlet.

Although the credentials expire after 1 hour (a limit enforced by STS), AWS Tools for PowerShell automatically refreshes the credentials by requesting a new SAML assertion when the tool detects that the current credentials have expired.

For domain-joined users, this process occurs without interruption, because the current user's Windows identity is used during authentication. For non-domain-joined user accounts, AWS Tools for PowerShell shows a PowerShell credential prompt requesting the user password. The user provides credentials that are used to reauthenticate the user and get a new assertion.

**Example 3: Get Instances in a Region**

The following example lists all Amazon EC2 instances in the Asia Pacific (Sydney) Region that are associated with the account used by the ADFS-Production profile. This is a useful command for returning all Amazon EC2 instances in a region.

PS > (Get-Ec2Instance -ProfileName ADFS-Production -Region ap-southeast-2).Instances | Select InstanceType, @{Name="Servername";Expression={$_.tags | where key -eq "Name" | Select Value -Expand Value}}

<table>
<thead>
<tr>
<th>InstanceType</th>
<th>Servername</th>
</tr>
</thead>
<tbody>
<tr>
<td>t2.small</td>
<td>DC2</td>
</tr>
<tr>
<td>t1.micro</td>
<td>NAT1</td>
</tr>
<tr>
<td>t1.micro</td>
<td>RDGW1</td>
</tr>
<tr>
<td>t1.micro</td>
<td>RDGW2</td>
</tr>
<tr>
<td>t1.micro</td>
<td>NAT2</td>
</tr>
</tbody>
</table>

Cmdlet discovery and aliases

This section shows you how to list services that are supported by the AWS Tools for PowerShell, how to show the set of cmdlets provided by the AWS Tools for PowerShell in support of those services, and how to find alternative cmdlet names (also called aliases) to access those services.

Cmdlet Discovery

All AWS service operations (or APIs) are documented in the API Reference Guide for each service. For example, see the [IAM API Reference](#). There is, in most cases, a one-to-one correspondence between an AWS service API and an AWS PowerShell cmdlet. To get the cmdlet name that corresponds to an AWS service API name, run the AWS Get-AWSCmdletName cmdlet with the -ApiOperation parameter and the AWS service API name. For example, to get all possible cmdlet names that are based on any available DescribeInstances AWS service API, run the following command:

```powershell
PS > Get-AWSCmdletName -ApiOperation DescribeInstances
```

<table>
<thead>
<tr>
<th>CmdletName</th>
<th>ServiceOperation</th>
<th>ServiceName</th>
<th>CmdletNounPrefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get-EC2Instance</td>
<td>DescribeInstances</td>
<td>Amazon Elastic Compute Cloud</td>
<td>EC2</td>
</tr>
<tr>
<td>Get-GMLInstance</td>
<td>DescribeInstances</td>
<td>Amazon GameLift Service</td>
<td>GML</td>
</tr>
</tbody>
</table>

The -ApiOperation parameter is the default parameter, so you can omit the parameter name. The following example is equivalent to the previous one:

```powershell
PS > Get-AWSCmdletName DescribeInstances
```
If you know the names of both the API and the service, you can include the -Service parameter along with either the cmdlet noun prefix or part of the AWS service name. For example, the cmdlet noun prefix for Amazon EC2 is EC2. To get the cmdlet name that corresponds to the DescribeInstances API in the Amazon EC2 service, run one of the following commands. They are all result in the same output:

```
Get-AWSCmdletName -ApiOperation DescribeInstances -Service EC2
Get-AWSCmdletName -ApiOperation DescribeInstances -Service Compute
Get-AWSCmdletName -ApiOperation DescribeInstances -Service "Compute Cloud"
```

<table>
<thead>
<tr>
<th>CmdletName</th>

Parameter values in these commands are case-insensitive.

If you do not know the name of either the desired AWS service API or the AWS service, you can use the -ApiOperation parameter, along with the pattern to match, and the -MatchWithRegex parameter. For example, to get all available cmdlet names that contain SecurityGroup, run the following command:

```
Get-AWSCmdletName -ApiOperation SecurityGroup -MatchWithRegex
```

**Cmdlet Discovery**
If you know the name of the AWS service but not the AWS service API, include both the `-MatchWithRegex` parameter and the `-Service` parameter to scope the search down to a single service. For example, to get all cmdlet names that contain SecurityGroup in only the Amazon EC2 service, run the following command:

```
PS > Get-AWSCmdletName -ApiOperation SecurityGroup -MatchWithRegex -Service EC2
```

<table>
<thead>
<tr>

</tbody>
</table>
If you know the name of the AWS Command Line Interface (AWS CLI) command, you can use the `-AwsCliCommand` parameter and the desired AWS CLI command name to get the name of the cmdlet that's based on the same API. For example, to get the cmdlet name that corresponds to the authorize-security-group-ingress AWS CLI command call in the Amazon EC2 service, run the following command:

```
PS > Get-AWSCmdletName -AwsCliCommand "aws ec2 authorize-security-group-ingress"
```

<table>
<thead>
<tr>
<th>CmdletName</th>
<th>ServiceOperation</th>
<th>ServiceName</th>

<td>--------------------------------------</td>
<td>------------------------------------</td>
</tr>
<tr>
<td>Grant-EC2SecurityGroupIngress</td>
<td>AuthorizeSecurityGroupIngress</td>
<td>Amazon Elastic Compute Cloud EC2</td>
</tr>
</tbody>
</table>

The `Get-AWSCmdletName` cmdlet needs only enough of the AWS CLI command name to identify the service and the AWS API.

To get a list of all of the cmdlets in the Tools for PowerShell Core, run the PowerShell `Get-Command` cmdlet, as shown in the following example.

```
PS > Get-Command -Module AWSPowerShell.NetCore
```

You can run the same command with `-Module AWSPowerShell` to see the cmdlets in the AWS Tools for Windows PowerShell.

The `Get-Command` cmdlet generates the list of cmdlets in alphabetical order. Note that by default the list is sorted by PowerShell verb, rather than PowerShell noun.

To sort results by service instead, run the following command:

```
PS > Get-Command -Module AWSPowerShell.NetCore | Sort-Object Noun,Verb
```

To filter the cmdlets that are returned by the `Get-Command` cmdlet, pipe the output to the PowerShell `Select-String` cmdlet. For example, to view the set of cmdlets that work with AWS regions, run the following command:

```
PS > Get-Command -Module AWSPowerShell.NetCore | Select-String region
```

Clear-DefaultAWSRegion
You can also find cmdlets for a specific service by filtering for the service prefix of cmdlet nouns. To see the list of available service prefixes, run `Get-AWSPowerShellVersion -ListServiceVersionInfo`. The following example returns cmdlets that support the Amazon CloudWatch Events service.

```powershell
Get-Command -Module AWSPowerShell -Noun CWE*
```

**Cmdlet Naming and Aliases**

The cmdlets in the AWS Tools for PowerShell for each service are based on the methods provided by the AWS SDK for the service. However, because of PowerShell's mandatory naming conventions, the name of a cmdlet might be different from the name of the API call or method.
on which it is based. For example, the Get-EC2Instance cmdlet is based on the Amazon EC2DescribeInstances method.

In some cases, the cmdlet name may be similar to a method name, but it may actually perform a different function. For example, the Amazon S3GetObject method retrieves an Amazon S3 object. However, the Get-S3Object cmdlet returns *information* about an Amazon S3 object rather than the object itself.

```powershell
PS > Get-S3Object -BucketName text-content -Key aws-tech-docs

ETag         : "df0000002a0fe0000f3c0000004EXAMPLE"
BucketName   : aws-tech-docs
Key          : javascript/frameset.js
LastModified : 6/13/2011 1:24:18 PM
Owner        : Amazon.S3.Model.Owner
Size         : 512
StorageClass : STANDARD
```

To get an S3 object with the AWS Tools for PowerShell, run the Read-S3Object cmdlet:

```powershell
PS > Read-S3Object -BucketName text-content -Key text-object.txt -file c:\tmp\text-object-download.text

Mode          LastWriteTime            Length Name
----          -------------            ------ ----
-a---         11/5/2012   7:29 PM      20622  text-object-download.text
```

**Note**

The cmdlet help for an AWS cmdlet provides the name of the AWS SDK API on which the cmdlet is based.
For more information about standard PowerShell verbs and their meanings, see [Approved Verbs for PowerShell Commands](#).

All AWS cmdlets that use the Remove verb – and the Stop-EC2Instance cmdlet when you add the -Terminate parameter – prompt for confirmation before proceeding. To bypass confirmation, add the -Force parameter to your command.
Important

AWS cmdlets do not support the -WhatIf switch.

Aliases

Setup of the AWS Tools for PowerShell installs an aliases file that contains aliases for many of the AWS cmdlets. You might find these aliases to be more intuitive than the cmdlet names. For example, service names and AWS SDK method names replace PowerShell verbs and nouns in some aliases. An example is the EC2-DescribeInstances alias.

Other aliases use verbs that, though they do not follow standard PowerShell conventions, can be more descriptive of the actual operation. For example, the alias file maps the alias Get-S3Content to the cmdlet Read-S3Object.

```
PS > Set-Alias -Name Get-S3Content -Value Read-S3Object
```

The aliases file is located in the AWS Tools for PowerShell installation directory. To load the aliases into your environment, `dot-source` the file. The following is a Windows-based example.

```
PS > . "C:\Program Files (x86)\AWS Tools\PowerShell\AWSPowershell\AWSAliases.ps1"
```

For a Linux or macOS shell, it might look like this:

```
. ~/.local/share/powershell/Modules/AWSPowerShell.NetCore/3.3.563.1/AWSAliases.ps1
```

To show all AWS Tools for PowerShell aliases, run the following command. This command uses the `?` alias for the PowerShell Where-Object cmdlet and the `Source` property to filter for only aliases that come from the AWSPowerShell.NetCore module.

```
PS > Get-Alias | ? Source -like "AWSPowerShell.NetCore"
```

To add your own aliases to this file, you might need to raise the value of PowerShell's `$MaximumAliasCount` preference variable to a value greater than 5500. The default value is 4096; you can raise it to a maximum of 32768. To do this, run the following.

```powershell
PS > $MaximumAliasCount = 32768
```

To verify that your change was successful, enter the variable name to show its current value.

```powershell
PS > $MaximumAliasCount
32768
```
Pipelining and $AWSHistory

For AWS service calls that return collections, the objects within the collection are enumerated to the pipeline. Result objects that contain additional fields beyond the collection and which are not paging control fields have these fields added as Note properties for the calls. These Note properties are logged in the new $AWSHistory session variable, should you need to access this data. The $AWSHistory variable is described in the next section.

Note

In versions of the Tools for Windows PowerShell prior to v1.1, the collection object itself was emitted, which required the use of foreach {$_.getenumerator()} to continue pipelining.

Examples

The following example returns a list of AWS Regions and your Amazon EC2 machine images (AMIs) in each Region.

```
PS > Get-AWSRegion | % { Echo $_.Name; Get-EC2Image -Owner self -Region $_ }  
```

The following example stops all Amazon EC2 instances in the current default region.

```
PS > Get-EC2Instance | Stop-EC2Instance  
```

Because collections enumerate to the pipeline, the output from a given cmdlet might be $null, a single object, or a collection. If it is a collection, you can use the .Count property to determine the size of the collection. However, the .Count property is not present when only a single object is emitted. If your script needs to determine, in a consistent way, how many objects were emitted, you can check the EmittedObjectsCount property of the last command value in $AWSHistory.

$AWSHistory

To better support pipelining, output from AWS cmdlets is not reshaped to include the service response and result instances as Note properties on the emitted collection object. Instead, for those calls that emit a single collection as output, the collection is now enumerated to the
PowerShell pipeline. This means that the AWS SDK response and result data cannot exist in the pipe, because there is no containing collection object to which it can be attached.

Although most users probably won't need this data, it can be useful for diagnostic purposes, because you can see exactly what was sent to and received from the underlying AWS service calls made by the cmdlet.

Starting with version 1.1, this data and more is now available in a new shell variable named $AWSHistory. This variable maintains a record of AWS cmdlet invocations and the service responses that were received for each invocation. Optionally, this history can be configured to also record the service requests that each cmdlet made. Additional useful data, such as the overall execution time of the cmdlet, can also be obtained from each entry. For security reasons, requests and responses that contain sensitive data aren't recorded by default. However, the history can be configured to override this behavior if needed. For more information, see the Set-AWSHistoryConfiguration cmdlet shown below.

Each entry in the $AWSHistory. Commands list is of type AWSCmdletHistory. This type has the following useful members:

**CmdletName**

Name of the cmdlet.

**CmdletStart**

DateTime that the cmdlet was run.

**CmdletEnd**

DateTime that the cmdlet finished all processing.

**Requests**

If request recording is enabled, list of last service requests.

**Responses**

List of last service responses received.

**LastServiceResponse**

Helper to return the most recent service response.

**LastServiceRequest**

Helper to return the most recent service request, if available.
Note that the $AWSHistory variable is not created until an AWS cmdlet making a service call is used. It evaluates to $null until that time.

Note

Earlier versions of the Tools for Windows PowerShell emitted data related to service responses as Note properties on the returned object. These are now found on the response entries that are recorded for each invocation in the list.

**Set-AWSHistoryConfiguration**

A cmdlet invocation can hold zero or more service request and response entries. To limit memory impact, the $AWSHistory list keeps a record of only the last five cmdlet executions by default; and for each, the last five service responses (and if enabled, last five service requests). You can change these default limits by running the Set-AWSHistoryConfiguration cmdlet. It allows you to both control the size of the list, and whether service requests are also logged:

```
PS > Set-AWSHistoryConfiguration -MaxCmdletHistory <value> -MaxServiceCallHistory <value> -RecordServiceRequests -IncludeSensitiveData
```

All parameters are optional.

The MaxCmdletHistory parameter sets the maximum number of cmdlets that can be tracked at any time. A value of 0 turns off recording of AWS cmdlet activity. The MaxServiceCallHistory parameter sets the maximum number of service responses (and/or requests) that are tracked for each cmdlet. The RecordServiceRequests parameter, if specified, turns on tracking of service requests for each cmdlet. The IncludeSensitiveData parameter, if specified, turns on tracking of service responses and requests (if tracked) that contain sensitive data for each cmdlet.

If run with no parameters, Set-AWSHistoryConfiguration simply turns off any prior request recording, leaving the current list sizes unchanged.

To clear all entries in the current history list, run the Clear-AWSHistory cmdlet.

**$AWSHistory Examples**

Enumerate the details of the AWS cmdlets that are being held in the list to the pipeline.
Access the details of the last AWS cmdlet that was run:

```powershell
PS > $AWSHistory.Commands
```

Access the details of the last service response received by the last AWS cmdlet that was run. If an AWS cmdlet is paging output, it may make multiple service calls to obtain either all data or the maximum amount of data (determined by parameters on the cmdlet).

```powershell
PS > $AWSHistory.LastServiceResponse
```

Access the details of the last request made (again, a cmdlet may make more than one request if it is paging on the user's behalf). Yields $null unless service request tracing is enabled.

```powershell
PS > $AWSHistory.LastServiceRequest
```

### Automatic Page-to-Completion for Operations that Return Multiple Pages

For service APIs that impose a default maximum object return count for a given call or that support pageable result sets, all cmdlets "page-to-completion" by default. Each cmdlet makes as many calls as necessary on your behalf to return the complete data set to the pipeline.

In the following example, which uses `Get-S3Object`, the `$c` variable contains `S3Object` instances for every key in the bucket `test`, potentially a very large data set.

```powershell
PS > $c = Get-S3Object -BucketName test
```

If you want to retain control of the amount of data returned, you can use parameters on the individual cmdlets (for example, `MaxKey` on `Get-S3Object`) or you can explicitly handle paging yourself by using a combination of paging parameters on the cmdlets, and data placed in the `$AWSHistory` variable to get the service's next token data. The following example uses the `MaxKeys` parameter to limit the number of `S3Object` instances returned to no more than the first 500 found in the bucket.

```powershell
PS > $c = Get-S3Object -BucketName test -MaxKey 500
```
To know if more data was available but not returned, use the `$AWSHistory` session variable entry that recorded the service calls made by the cmdlet.

If the following expression evaluates to `$true`, you can find the next marker for the next set of results using `$AWSHistory.LastServiceResponse.NextMarker`:

```powershell
$AWSHistory.LastServiceResponse -ne $null && $AWSHistory.LastServiceResponse.IsTruncated
```

To manually control paging with `Get-S3Object`, use a combination of the `MaxKey` and `Marker` parameters for the cmdlet and the `IsTruncated/NextMarker` notes on the last recorded response. In the following example, the variable `$c` contains up to a maximum of 500 `S3Object` instances for the next 500 objects that are found in the bucket after the start of the specified key prefix marker.

```powershell
PS > $c = Get-S3Object -BucketName test -MaxKey 500 -Marker $AWSHistory.LastServiceResponse.NextMarker
```

## Credential and profile resolution

### Credentials Search Order

When you run a command, AWS Tools for PowerShell searches for credentials in the following order. It stops when it finds usable credentials.

1. Literal credentials that are embedded as parameters in the command line.

   We strongly recommend using profiles instead of putting literal credentials in your command lines.

2. A specified profile name or profile location.

   - If you specify only a profile name, the command looks for the specified profile in the AWS SDK store and, if that does not exist, the specified profile from the AWS shared credentials file in the default location.
   - If you specify only a profile location, the command looks for the default profile from that credentials file.
   - If you specify both a name and a location, the command looks for the specified profile in that credentials file.
If the specified profile or location is not found, the command throws an exception. Search proceeds to the following steps only if you did not specify a profile or location.

3. Credentials specified by the -Credential parameter.

4. The session profile, if one exists.

5. The default profile, in the following order:
   a. The default profile in the AWS SDK store.
   b. The default profile in the AWS shared credentials file.
   c. The AWS PS Default profile in the AWS SDK store.

6. If the command is running on an Amazon EC2 instance that is configured to use an IAM role, the EC2 instance's temporary credentials accessed from the instance profile.

   For more information about using IAM roles for Amazon EC2 instances, see the [AWS SDK for .NET](https://aws.amazon.com/sdk-for-net).

If this search fails to locate the specified credentials, the command throws an exception.

**Additional information about users and roles**

In order to run Tools for PowerShell commands on AWS, you need to have some combination of users, permission sets, and service roles that are appropriate for your tasks.

The specific users, permission sets, and service roles that you create, and the way in which you use them, will depend on your requirements. The following is some additional information about why they might be used and how to create them.

**Users and permission sets**

Although it's possible to use an IAM user account with long-term credentials to access AWS services, this is no longer a best practice and should be avoided. Even during development, it is a best practice to create users and permission sets in AWS IAM Identity Center and use temporary credentials provided by an identity source.

For development, you can use the user that you created or were given in Configure tool authentication. If you have appropriate AWS Management Console permissions, you can also create different permission sets with least privilege for that user or create new users specifically
for development projects, providing permission sets with least privilege. The course of action you choose, if any, depends on your circumstances.

For more information about these users and permissions sets and how to create them, see Authentication and access in the AWS SDKs and Tools Reference Guide and Getting started in the AWS IAM Identity Center User Guide.

Service roles

You can set up an AWS service role to access AWS services on behalf of users. This type of access is appropriate if multiple people will be running your application remotely; for example, on an Amazon EC2 instance that you have created for this purpose.

The process for creating a service role varies depending on the situation, but is essentially the following.

1. Sign in to the AWS Management Console and open the IAM console at https://console.aws.amazon.com/iam/.
2. Choose Roles, and then choose Create role.
3. Choose AWS service, find and select EC2 (for example), and then choose the EC2 use case (for example).
4. Choose Next and select the appropriate policies for the AWS services that your application will use.

⚠️ Warning

Do NOT choose the AdministratorAccess policy because that policy enables read and write permissions to almost everything in your account.

5. Choose Next. Enter a Role name, Description, and any tags you want.

   You can find information about tags in Controlling access using AWS resource tags in the IAM User Guide.

6. Choose Create role.

You can find high-level information about IAM roles in IAM Identities (users, user groups, and roles) in the IAM User Guide. Find detailed information about roles in the IAM roles topic.
Using legacy credentials

The topics in this section provide information about using long-term or short-term credentials without using AWS IAM Identity Center.

⚠️ Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

🔍 Note

The information in these topics is for circumstances where you need to obtain and manage short-term or long-term credentials manually. For additional information about short-term and long-term credentials, see Other ways to authenticate in the AWS SDKs and Tools Reference Guide.

For best security practices, use AWS IAM Identity Center, as described in Configure tool authentication.

Important warnings and guidance for credentials

Warnings for credentials

- **Do NOT** use your account's root credentials to access AWS resources. These credentials provide unrestricted account access and are difficult to revoke.

- **Do NOT** put literal access keys or credential information in your commands or scripts. If you do, you create a risk of accidentally exposing your credentials.

- Be aware that any credentials stored in the shared AWS credentials file, are stored in plaintext.
Additional guidance for securely managing credentials

For a general discussion of how to securely manage AWS credentials, see AWS security credentials in the AWS General Reference and Security best practices and use cases in the IAM User Guide. In addition to those discussions, consider the following:

- Create additional users, such as users in IAM Identity Center, and use their credentials instead of using your AWS root user credentials. Credentials for other users can be revoked if necessary or are temporary by nature. In addition, you can apply a policy to each user for access to only certain resources and actions and thereby take a stance of least-privilege permissions.

- Use IAM roles for tasks for Amazon Elastic Container Service (Amazon ECS) tasks.

- Use IAM roles for applications that are running on Amazon EC2 instances.

• Shared Credentials in AWS Tools for PowerShell

Using AWS Credentials

Each AWS Tools for PowerShell command must include a set of AWS credentials, which are used to cryptographically sign the corresponding web service request. You can specify credentials per command, per session, or for all sessions.

⚠️ Warning
To avoid security risks, don’t use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

ℹ️ Note
The information in this topic is for circumstances where you need to obtain and manage short-term or long-term credentials manually. For additional information about short-
term and long-term credentials, see Other ways to authenticate in the AWS SDKs and Tools Reference Guide.

For best security practices, use AWS IAM Identity Center, as described in Configure tool authentication.

As a best practice, to avoid exposing your credentials, do not put literal credentials in a command. Instead, create a profile for each set of credentials that you want to use, and store the profile in either of two credential stores. Specify the correct profile by name in your command, and the AWS Tools for PowerShell retrieves the associated credentials. For a general discussion of how to safely manage AWS credentials, see Best Practices for Managing AWS Access Keys in the Amazon Web Services General Reference.

**Note**

You need an AWS account to get credentials and use the AWS Tools for PowerShell. To create an AWS account, see Getting started: Are you a first-time AWS user? in the AWS Account Management Reference Guide.

**Credentials Store Locations**

The AWS Tools for PowerShell can use either of two credentials stores:

- The AWS SDK store, which encrypts your credentials and stores them in your home folder. In Windows, this store is located at: C:\Users\username\AppData\Local\AWSToolkit\RegisteredAccounts.json.

  The AWS SDK for .NET and Toolkit for Visual Studio can also use the AWS SDK store.
• The shared credentials file, which is also located in your home folder, but stores credentials as plain text.

By default, the credentials file is stored here:
• On Windows: C:\Users\username\.aws\credentials
• On Mac/Linux: ~/.aws/credentials

The AWS SDKs and the AWS Command Line Interface can also use the credentials file. If you're running a script outside of your AWS user context, be sure that the file that contains your credentials is copied to a location where all user accounts (local system and user) can access your credentials.

Managing Profiles

Profiles enable you to reference different sets of credentials with AWS Tools for PowerShell. You can use AWS Tools for PowerShell cmdlets to manage your profiles in the AWS SDK store. You can also manage profiles in the AWS SDK store by using the Toolkit for Visual Studio or programmatically by using the AWS SDK for .NET. For directions about how to manage profiles in the credentials file, see Best Practices for Managing AWS Access Keys.

Add a New profile

To add a new profile to the AWS SDK store, run the command `Set-AWSCredential`. It stores your access key and secret key in your default credentials file under the profile name you specify.

```
PS > Set-AWSCredential
    -AccessKey AKIA0123456787EXAMPLE
    -SecretKey wJalrXUttnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY
    -StoreAs MyNewProfile
```

• `-AccessKey`– The access key ID.
• `-SecretKey`– The secret key.
• `-StoreAs`– The profile name, which must be unique. To specify the default profile, use the name `default`.
Update a Profile

The AWS SDK store must be maintained manually. If you later change credentials on the service—for example, by using the [IAM console](https)—running a command with the locally stored credentials fails with the following error message:

```
The Access Key Id you provided does not exist in our records.
```

You can update a profile by repeating the `Set-AWSCredential` command for the profile, and passing it the new access and secret keys.

List Profiles

You can check the current list of names with the following command. In this example, a user named Shirley has access to three profiles that are all stored in the shared credentials file (~/.aws/credentials).

```
PS > Get-AWSCredential -ListProfileDetail

<table>
<thead>
<tr>
<th>ProfileName</th>
<th>StoreTypeName</th>
<th>ProfileLocation</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>SharedCredentialsFile</td>
<td>/Users/shirley/.aws/credentials</td>
</tr>
<tr>
<td>production</td>
<td>SharedCredentialsFile</td>
<td>/Users/shirley/.aws/credentials</td>
</tr>
<tr>
<td>test</td>
<td>SharedCredentialsFile</td>
<td>/Users/shirley/.aws/credentials</td>
</tr>
</tbody>
</table>
```

Remove a Profile

To remove a profile that you no longer require, use the following command.

```
PS > Remove-AWSCredentialProfile -ProfileName an-old-profile-I-do-not-need
```

The `-ProfileName` parameter specifies the profile that you want to delete.

The deprecated command `Clear-AWSCredential` is still available for backward compatibility, but `Remove-AWSCredentialProfile` is preferred.

Specifying Credentials

There are several ways to specify credentials. The preferred way is to identify a profile instead of incorporating literal credentials into your command line. AWS Tools for PowerShell locates the profile using a search order that is described in [Credentials Search Order](#).
On Windows, AWS credentials stored in the AWS SDK store are encrypted with the logged-in Windows user identity. They cannot be decrypted by using another account, or used on a device that's different from the one on which they were originally created. To perform tasks that require the credentials of another user, such as a user account under which a scheduled task will run, set up a credential profile, as described in the preceding section, that you can use when you log in to the computer as that user. Log in as the task-performing user to complete the credential setup steps, and create a profile that works for that user. Then log out and log in again with your own credentials to set up the scheduled task.

**Note**

Use the `-ProfileName` common parameter to specify a profile. This parameter is equivalent to the `-StoredCredentials` parameter in earlier AWS Tools for PowerShell releases. For backward compatibility, `-StoredCredentials` is still supported.

**Default Profile (Recommended)**

All AWS SDKs and management tools can find your credentials automatically on your local computer if the credentials are stored in a profile named `default`. For example, if you have a profile named `default` on the local computer, you don't have to run either the `Initialize-AWSDefaultConfiguration` cmdlet or the `Set-AWSCredential` cmdlet. The tools automatically use the access and secret key data stored in that profile. To use an AWS Region other than your default Region (the results of `Get-DefaultAWSRegion`), you can run `Set-DefaultAWSRegion` and specify a Region.

If your profile is not named `default`, but you want to use it as the default profile for the current session, run `Set-AWSCredential` to set it as the default profile.

Although running `Initialize-AWSDefaultConfiguration` lets you specify a default profile for every PowerShell session, the cmdlet loads credentials from your custom-named profile, but overwrites the default profile with the named profile.

We recommend that you do not run `Initialize-AWSDefaultConfiguration` unless you are running a PowerShell session on an Amazon EC2 instance that was not launched with an instance profile, and you want to set up the credential profile manually. Note that the credential profile in this scenario would not contain credentials. The credential profile that results from running `Initialize-AWSDefaultConfiguration` on an EC2 instance doesn't directly store credentials,
but instead points to instance metadata (that provides temporary credentials that automatically rotate). However, it does store the instance's Region. Another scenario that might require running Initialize-AWSDefaultConfiguration occurs if you want to run a call against a Region other than the Region in which the instance is running. Running that command permanently overrides the Region stored in the instance metadata.

```
PS > Initialize-AWSDefaultConfiguration -ProfileName MyProfileName -Region us-west-2
```

**Note**
The default credentials are included in the AWS SDK store under the default profile name. The command overwrites any existing profile with that name.

If your EC2 instance was launched with an instance profile, PowerShell automatically gets the AWS credentials and Region information from the instance profile. You don't need to run Initialize-AWSDefaultConfiguration. Running the Initialize-AWSDefaultConfiguration cmdlet on an EC2 instance launched with an instance profile isn't necessary, because it uses the same instance profile data that PowerShell already uses by default.

**Session Profile**

Use Set-AWSCredential to specify a default profile for a particular session. This profile overrides any default profile for the duration of the session. We recommend this if you want to use a custom-named profile in your session instead of the current default profile.

```
PS > Set-AWSCredential -ProfileName MyProfileName
```

**Note**
In versions of the Tools for Windows PowerShell that are earlier than 1.1, the Set-AWSCredential cmdlet did not work correctly, and would overwrite the profile specified by "MyProfileName". We recommend using a more recent version of the Tools for Windows PowerShell.
**Command Profile**

On individual commands, you can add the `-ProfileName` parameter to specify a profile that applies to only that one command. This profile overrides any default or session profiles, as shown in the following example.

```
PS > Get-EC2Instance -ProfileName MyProfileName
```

**Note**

When you specify a default or session profile, you can also add a `-Region` parameter to override a default or session Region. For more information, see [Specify AWS Regions](#). The following example specifies a default profile and Region.

```
PS > Initialize-AWSDefaultConfiguration -ProfileName MyProfileName -Region us-west-2
```

By default, the AWS shared credentials file is assumed to be in the user's home folder (`C:\Users\username\.aws` on Windows, or `~/.aws` on Linux). To specify a credentials file in a different location, include the `-ProfileLocation` parameter and specify the credentials file path. The following example specifies a non-default credentials file for a specific command.

```
PS > Get-EC2Instance -ProfileName MyProfileName -ProfileLocation C:\aws_service_credentials\credentials
```

**Note**

If you are running a PowerShell script during a time that you are not normally signed in to AWS—for example, you are running a PowerShell script as a scheduled task outside of your normal work hours—add the `-ProfileLocation` parameter when you specify the profile that you want to use, and set the value to the path of the file that stores your credentials. To be certain that your AWS Tools for PowerShell script runs with the correct account credentials, you should add the `-ProfileLocation` parameter whenever your script runs in a context or process that does not use an AWS account. You can also copy your credentials file to a location that is accessible to the local system or other account that your scripts use to perform tasks.
Credentials Search Order

When you run a command, AWS Tools for PowerShell searches for credentials in the following order. It stops when it finds usable credentials.

1. Literal credentials that are embedded as parameters in the command line.

   We strongly recommend using profiles instead of putting literal credentials in your command lines.

2. A specified profile name or profile location.
   - If you specify only a profile name, the command looks for the specified profile in the AWS SDK store and, if that does not exist, the specified profile from the AWS shared credentials file in the default location.
   - If you specify only a profile location, the command looks for the default profile from that credentials file.
   - If you specify both a name and a location, the command looks for the specified profile in that credentials file.

   If the specified profile or location is not found, the command throws an exception. Search proceeds to the following steps only if you did not specify a profile or location.

3. Credentials specified by the -Credential parameter.

4. The session profile, if one exists.

5. The default profile, in the following order:
   - The default profile in the AWS SDK store.
   - The default profile in the AWS shared credentials file.
   - The AWS PS Default profile in the AWS SDK store.

6. If the command is running on an Amazon EC2 instance that is configured to use an IAM role, the EC2 instance's temporary credentials accessed from the instance profile.

   For more information about using IAM roles for Amazon EC2 instances, see the AWS SDK for .NET.

If this search fails to locate the specified credentials, the command throws an exception.
Credential Handling in AWS Tools for PowerShell Core

Cmdlets in AWS Tools for PowerShell Core accept AWS access and secret keys or the names of credential profiles when they run, similarly to the AWS Tools for Windows PowerShell. When they run on Windows, both modules have access to the AWS SDK for .NET credential store file (stored in the per-user AppData\Local\AWSToolkit\RegisteredAccounts.json file).

This file stores your keys in encrypted format, and cannot be used on a different computer. It is the first file that the AWS Tools for PowerShell searches for a credential profile, and is also the file where the AWS Tools for PowerShell stores credential profiles. For more information about the AWS SDK for .NET credential store file, see Configuring AWS Credentials. The Tools for Windows PowerShell module does not currently support writing credentials to other files or locations.

Both modules can read profiles from the AWS shared credentials file that is used by other AWS SDKs and the AWS CLI. On Windows, the default location for this file is C:\Users\<userid>\.aws\credentials. On non-Windows platforms, this file is stored at ~/.aws/credentials. The -ProfileLocation parameter can be used to point to a non-default file name or file location.

The SDK credential store holds your credentials in encrypted form by using Windows cryptographic APIs. These APIs are not available on other platforms, so the AWS Tools for PowerShell Core module uses the AWS shared credentials file exclusively, and supports writing new credential profiles to the shared credential file.

The following example scripts that use the Set-AWSCredential cmdlet show the options for handling credential profiles on Windows with either the AWSPowerShell or AWSPowerShell.NetCore modules.

```powershell
# Writes a new (or updates existing) profile with name "myProfileName" # in the encrypted SDK store file
Set-AWSCredential -AccessKey akey -SecretKey skey -StoreAs myProfileName

# Checks the encrypted SDK credential store for the profile and then # falls back to the shared credentials file in the default location
Set-AWSCredential -ProfileName myProfileName

# Bypasses the encrypted SDK credential store and attempts to load the # profile from the ini-format credentials file "mycredentials" in the # folder C:\MyCustomPath
```
Set-AWSCredential -ProfileName myProfileName -ProfileLocation C:\MyCustomPath\mycredentials

The following examples show the behavior of the **AWSPowerShell.NetCore** module on the Linux or macOS operating systems.

```powershell
# Writes a new (or updates existing) profile with name "myProfileName"
# in the default shared credentials file ~/.aws/credentials
Set-AWSCredential -AccessKey akey -SecretKey skey -StoreAs myProfileName

# Writes a new (or updates existing) profile with name "myProfileName"
# into an ini-format credentials file "~/mycustompath/mycredentials"
Set-AWSCredential -AccessKey akey -SecretKey skey -StoreAs myProfileName -ProfileLocation ~/mycustompath/mycredentials

# Reads the default shared credential file looking for the profile "myProfileName"
Set-AWSCredential -ProfileName myProfileName

# Reads the specified credential file looking for the profile "myProfileName"
Set-AWSCredential -ProfileName myProfileName -ProfileLocation ~/mycustompath/mycredentials
```

**Shared Credentials in AWS Tools for PowerShell**

The Tools for Windows PowerShell support the use of the AWS shared credentials file, similarly to the AWS CLI and other AWS SDKs. The Tools for Windows PowerShell now support reading and writing of basic, session, and assume role credential profiles to both the .NET credentials file and the AWS shared credential file. This functionality is enabled by a new Amazon.Runtime.CredentialManagement namespace.

⚠️ **Warning**

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.
The information in this topic is for circumstances where you need to obtain and manage short-term or long-term credentials manually. For additional information about short-term and long-term credentials, see Other ways to authenticate in the AWS SDKs and Tools Reference Guide.

For best security practices, use AWS IAM Identity Center, as described in Configure tool authentication.

The new profile types and access to the AWS shared credential file are supported by the following parameters that have been added to the credentials-related cmdlets, Initialize-AWSDefaultConfiguration, New-AWSCredential, and Set-AWSCredential. In service cmdlets, you can refer to your profiles by adding the common parameter, -ProfileName.

Using an IAM Role with AWS Tools for PowerShell

The AWS shared credential file enables additional types of access. For example, you can access your AWS resources by using an IAM role instead of the long term credentials of an IAM user. To do this, you must have a standard profile that has permissions to assume the role. When you tell the AWS Tools for PowerShell to use a profile that specified a role, the AWS Tools for PowerShell looks up the profile identified by the SourceProfile parameter. Those credentials are used to request temporary credentials for the role specified by the RoleArn parameter. You can optionally require the use of an multi-factor authentication (MFA) device or an ExternalId code when the role is assumed by a third party.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExternalId</td>
<td>The user-defined external ID to be used when assuming a role, if required by the role. This is typically only required when you delegate access to your account to a third party. The third party must include the ExternalId as a parameter when assuming the assigned role. For more information, see How to Use an External ID When Granting Access to Your</td>
</tr>
</tbody>
</table>
### Parameter Name

<table>
<thead>
<tr>
<th>Parameter Name</th>

</tr>
</thead>
<tbody>
<tr>
<td>MfaSerial</td>
<td>The MFA serial number to be used when assuming a role, if required by the role. For more information, see <a href="https://docs.aws.amazon.com/identitymanagement/latest/UserGuide/IAM_MFA.html">Using Multi-Factor Authentication (MFA) in AWS</a> in the IAM User Guide.</td>
</tr>
<tr>
<td>RoleArn</td>
<td>The ARN of the role to assume for assume role credentials. For more information about creating and using roles, see <a href="https://docs.aws.amazon.com/IdentityManagement/latest/UserGuide/Role.html">IAM Roles</a> in the IAM User Guide.</td>
</tr>
<tr>
<td>SourceProfile</td>
<td>The name of the source profile to be used by assume role credentials. The credentials found in this profile are used to assume the role specified by the RoleArn parameter.</td>
</tr>
</tbody>
</table>

### Setup of profiles for assuming a role

The following is an example showing how to set up a source profile that enables directly assuming an IAM role.

The first command creates a source profile that is referenced by the role profile. The second command creates the role profile that which role to assume. The third command shows the credentials for the role profile.

```powershell
PS > Set-AWSCredential -StoreAs my_source_profile -AccessKey access_key_id -SecretKey secret_key
PS > Set-AWSCredential -StoreAs my_role_profile -SourceProfile my_source_profile -RoleArn arn:aws:iam::123456789012:role/role-i-want-to-assume
PS > Get-AWSCredential -ProfileName my_role_profile
SourceCredentials | RoleArn | RoleSessionName | Options
--------------------|--------|----------------|--------
--------------------|--------|----------------|--------
```
To use this role profile with the Tools for Windows PowerShell service cmdlets, add the `-ProfileName` common parameter to the command to reference the role profile. The following example uses the role profile defined in the previous example to access the `Get-S3Bucket` cmdlet. AWS Tools for PowerShell looks up the credentials in `my_source_profile`, uses those credentials to call `AssumeRole` on behalf of the user, and then uses those temporary role credentials to call `Get-S3Bucket`.

```powershell
PS > Get-S3Bucket -ProfileName my_role_profile

<table>
<thead>
<tr>
<th>CreationDate</th>
<th>BucketName</th>
</tr>
</thead>
<tbody>
<tr>
<td>2/27/2017 8:57:53 AM</td>
<td>4ba3578c-f88f-4d8b-b95f-92a8858dac58-bucket1</td>

<td>2091a504-66a9-4d69-8981-aaef812a02c3-bucket2</td>
</tr>
</tbody>
</table>
```

### Using the Credential Profile Types

To set a credential profile type, understand which parameters provide the information required by the profile type.

#### The ProfilesLocation Common Parameter

You can use `-ProfileLocation` to write to the shared credential file as well as instruct a cmdlet to read from the credential file. Adding the `-ProfileLocation` parameter controls whether Tools for Windows PowerShell uses the shared credential file or the .NET credential file. The following table describes how the parameter works in Tools for Windows PowerShell.

<table>
<thead>
<tr>
<th>Profile Location Value</th>
<th>Profile Resolution Behavior</th>

#### Save Credentials to a Credentials File

To write and save credentials to one of the two credential files, run the `Set-AWSCredential` cmdlet. The following example shows how to do this. The first command uses `Set-AWSCredential` with `-ProfileLocation` to add access and secret keys to a profile specified by the `-ProfileName` parameter. In the second line, run the `Get-Content` cmdlet to display the contents of the credentials file.

```powershell
PS > Set-AWSCredential -ProfileLocation C:\Users\auser\.aws\credentials -ProfileName basic_profile -AccessKey access_key2 -SecretKey secret_key2
PS > Get-Content C:\Users\auser\.aws\credentials
aws_access_key_id=access_key2
```
Displaying Your Credential Profiles

Run the `Get-AWSCredential` cmdlet and add the `-ListProfileDetail` parameter to return credential file types and locations, and a list of profile names.

```
PS > Get-AWSCredential -ListProfileDetail
```

<table>
<thead>
<tr>
<th>ProfileName</th>
<th>StoreTypeName</th>
<th>ProfileLocation</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_profile</td>
<td>NetSDKCredentialsFile</td>
<td></td>
</tr>
<tr>
<td>assume_role_profile</td>
<td>NetSDKCredentialsFile</td>
<td></td>
</tr>
<tr>
<td>basic_profile</td>
<td>SharedCredentialsFile</td>
<td>C:\Users\auser.aws\credentials</td>
</tr>
</tbody>
</table>

Removing Credential Profiles

To remove credential profiles, run the new `Remove-AWSCredentialProfile` cmdlet. `Clear-AWSCredential` is deprecated, but still available for backward compatibility.

Important Notes

Only `Initialize-AWSDefaultConfiguration`, `New-AWSCredential`, and `Set-AWSCredential` support the parameters for role profiles. You cannot specify the role parameters directly on a command such as `Get-S3Bucket -SourceProfile source_profile_name -RoleArn arn:aws:iam::999999999999:role/role_name`. That does not work because service cmdlets do not directly support the SourceProfile or RoleArn parameters. Instead, you must store those parameters in a profile, then call the command with the `-ProfileName` parameter.
Work with AWS services in the AWS Tools for PowerShell

This section provides examples of using the AWS Tools for PowerShell to access AWS services. These examples help demonstrate how to use the cmdlets to perform actual AWS tasks. These examples rely on cmdlets that the Tools for PowerShell provides. To see what cmdlets are available, see the [AWS Tools for PowerShell Cmdlet Reference](#).

PowerShell File Concatenation Encoding

Some cmdlets in the AWS Tools for PowerShell edit existing files or records that you have in AWS. An example is `Edit-R53ResourceRecordSet`, which calls the [ChangeResourceRecordSets](#) API for Amazon Route 53.

When you edit or concatenate files in PowerShell 5.1 or older releases, PowerShell encodes the output in UTF-16, not UTF-8. This can add unwanted characters and create results that are not valid. A hexadecimal editor can reveal the unwanted characters.

To avoid converting file output to UTF-16, you can pipe your command into PowerShell's `Out-File` cmdlet and specify UTF-8 encoding, as shown in the following example:

```
PS > *some file concatenation command* | Out-File filename.txt -Encoding utf8
```

If you are running AWS CLI commands from within the PowerShell console, the same behavior applies. You can pipe the output of an AWS CLI command into `Out-File` in the PowerShell console. Other cmdlets, such as `Export-Csv` or `Export-Clixml`, also have an `Encoding` parameter. For a complete list of cmdlets that have an `Encoding` parameter, and that allow you to correct the encoding of the output of a concatenated file, run the following command:

```
PS > Get-Command -ParameterName "Encoding"
```

**Note**

PowerShell 6.0 and newer, including PowerShell Core, automatically retains UTF-8 encoding for concatenated file output.
Returned Objects for the PowerShell Tools

To make AWS Tools for PowerShell more useful in a native PowerShell environment, the object returned by a AWS Tools for PowerShell cmdlet is a .NET object, not the JSON text object that is typically returned from the corresponding API in the AWS SDK. For example, `Get-S3Bucket` emits a `Buckets` collection, not an Amazon S3 JSON response object. The `Buckets` collection can be placed in the PowerShell pipeline and interacted with in appropriate ways. Similarly, `Get-EC2Instance` emits a `Reservation` .NET object collection, not a `DescribeEC2Instances` JSON result object. This behavior is by design and enables the AWS Tools for PowerShell experience to be more consistent with idiomatic PowerShell.

The actual service responses are available for you if you need them. They are stored as note properties on the returned objects. For API actions that support paging by using `NextToken` fields, these are also attached as note properties.

Amazon EC2

This section walks through the steps required to launch an Amazon EC2 instance including how to:

- Retrieve a list of Amazon Machine Images (AMIs).
- Create a key pair for SSH authentication.
- Create and configure an Amazon EC2 security group.
- Launch the instance and retrieve information about it.

Amazon S3

The section walks through the steps required to create a static website hosted in Amazon S3. It demonstrates how to:

- Create and delete Amazon S3 buckets.
- Upload files to an Amazon S3 bucket as objects.
- Delete objects from an Amazon S3 bucket.
- Designate an Amazon S3 bucket as a website.
AWS Lambda and AWS Tools for PowerShell

This section provides a brief overview of the AWS Lambda Tools for PowerShell module and describes the required steps for setting up the module.

Amazon SNS and Amazon SQS

This section walks through the steps required to subscribe an Amazon SQS queue to an Amazon SNS topic. It demonstrates how to:

- Create an Amazon SNS topic.
- Create an Amazon SQS queue.
- Subscribe the queue to the topic.
- Send a message to the topic.
- Receive the message from the queue.

CloudWatch

This section provides an example of how to publish custom data to CloudWatch.

Amazon S3 and Tools for Windows PowerShell

In this section, we create a static website using the AWS Tools for Windows PowerShell using Amazon S3 and CloudFront. In the process, we demonstrate a number of common tasks with these services. This walkthrough is modeled after the Getting Started Guide for Host a Static Website, which describes a similar process using the AWS Management Console.

The commands shown here assume that you have set default credentials and a default region for your PowerShell session. Therefore, credentials and regions are not included in the invocation of the cmdlets.

Note

There is currently no Amazon S3 API for renaming a bucket or object, and therefore, no single Tools for Windows PowerShell cmdlet for performing this task. To rename an object in S3, we recommend that you copy the object to one with a new name, by running the Copy-S3Object cmdlet, and then delete the original object by running the Remove-S3Object cmdlet.

Create an Amazon S3 Bucket, Verify Its Region, and Optionally Remove It

Use the New-S3Bucket cmdlet to create a new Amazon S3 bucket. The following examples creates a bucket named website-example. The name of the bucket must be unique across all regions. The example creates the bucket in the us-west-1 region.

```
PS > New-S3Bucket -BucketName website-example -Region us-west-2

CreationDate         BucketName
------------         ----------
8/16/19 8:45:38 PM   website-example
```

You can verify the region in which the bucket is located using the Get-S3BucketLocation cmdlet.

```
PS > Get-S3BucketLocation -BucketName website-example

Value
-----
us-west-2
```

When you're done with this tutorial, you can use the following line to remove this bucket. We suggest that you leave this bucket in place as we use it in subsequent examples.

```
PS > Remove-S3Bucket -BucketName website-example
```

Note that the bucket removal process can take some time to finish. If you try to re-create a same-named bucket immediately, the New-S3Bucket cmdlet can fail until the old one is completely gone.

Configure an Amazon S3 Bucket as a Website and Enable Logging

Use the Write-S3BucketWebsite cmdlet to configure an Amazon S3 bucket as a static website. The following example specifies a name of index.html for the default content web page and a name of error.html for the default error web page. Note that this cmdlet does not create those pages. They need to be uploaded as Amazon S3 objects.

```
PS > Write-S3BucketWebsite -BucketName website-example -
    WebsiteConfiguration_IndexDocumentSuffix index.html -WebsiteConfiguration_ErrorDocument
    error.html
RequestId : A1813E27995FFDDD

ResponseStream :
Headers       : {x-amz-id-2, x-amz-request-id, Content-Length, Date...}
Metadata       : {}
ResponseXml    :

Upload Objects to an Amazon S3 Bucket

Use the Write-S3Object cmdlet to upload files from your local file system to an Amazon S3 bucket as objects. The example below creates and uploads two simple HTML files to an Amazon S3 bucket, and verifies the existence of the uploaded objects. The -File parameter to Write-S3Object specifies the name of the file in the local file system. The -Key parameter specifies the name that the corresponding object will have in Amazon S3.

Amazon infers the content-type of the objects from the file extensions, in this case, ".html".

```
PS > # Create the two files using here-strings and the Set-Content cmdlet
PS > $index_html = @'
    <html>
    <body>
    <p>
```

$index_html | Set-Content index.html
$error_html = @"<html>
<body>
<p>This is an error page.</p>
</body>
</html>"
$error_html | Set-Content error.html
# Upload the files to Amazon S3 using a foreach loop
foreach ($f in "index.html", "error.html") {
    Write-S3Object -BucketName website-example -File $f -Key $f -CannedACLName public-read
}
# Verify that the files were uploaded
Get-S3BucketWebsite -BucketName website-example

<table>
<thead>
<tr>
<th>IndexDocumentSuffix</th>
<th>ErrorDocument</th>
</tr>
</thead>
<tbody>
<tr>
<td>index.html</td>
<td>error.html</td>
</tr>
</tbody>
</table>

Canned ACL Options

The values for specifying canned ACLs with the Tools for Windows PowerShell are the same as those used by the AWS SDK for .NET. Note, however, that these are different from the values used by the Amazon S3PutObject action. The Tools for Windows PowerShell support the following canned ACLs:

- NoACL
- private
- public-read
- public-read-write
• aws-exec-read
• authenticated-read
• bucket-owner-read
• bucket-owner-full-control
• log-delivery-write

For more information about these canned ACL settings, see Access Control List Overview.

**Note Regarding Multipart Upload**

If you use the Amazon S3 API to upload a file that is larger than 5 GB in size, you need to use multipart upload. However, the Write-S3Object cmdlet provided by the Tools for Windows PowerShell can transparently handle file uploads that are greater than 5 GB.

**Test the Website**

At this point, you can test the website by navigating to it using a browser. URLs for static websites hosted in Amazon S3 follow a standard format.

```
http://<bucket-name>.s3-website-<region>.amazonaws.com
```

For example:

```
http://website-example.s3-website-us-west-1.amazonaws.com
```

**Delete Amazon S3 Objects and Buckets**

This section describes how to delete the website that you created in preceding sections. You can simply delete the objects for the HTML files, and then delete the Amazon S3 bucket for the site.

First, run the Remove-S3Object cmdlet to delete the objects for the HTML files from the Amazon S3 bucket.
PS > foreach ( $obj in "index.html", "error.html" ) {
  >> Remove-S3Object -BucketName website-example -Key $obj
  >> }
  >>
  IsDeleteMarker
  --------------
  False

The False response is an expected artifact of the way that Amazon S3 processes the request. In this context, it does not indicate an issue.

Now you can run the Remove-S3Bucket cmdlet to delete the now-empty Amazon S3 bucket for the site.

PS > Remove-S3Bucket -BucketName website-example

RequestId      : E480ED92A2EC703D
AmazonId2      : k6tqaqC1nMkoeYwbuJXUx1/UDa49BJd6dfLN0Ls1mWYNPHjbc8/Nyvm6AGbWcc2P
ResponseStream : {x-amz-id-2, x-amz-request-id, Date, Server}
Metadata        : {}
ResponseXml     :

In 1.1 and newer versions of the AWS Tools for PowerShell, you can add the -DeleteBucketContent parameter to Remove-S3Bucket, which first deletes all objects and object versions in the specified bucket before trying to remove the bucket itself. Depending on the number of objects or object versions in the bucket, this operation can take a substantial amount of time. In versions of the Tools for Windows PowerShell older than 1.1, the bucket had to be empty before Remove-S3Bucket could delete it.

### Note

Unless you add the -Force parameter, AWS Tools for PowerShell prompts you for confirmation before the cmdlet runs.

Upload In-Line Text Content to Amazon S3

The Write-S3Object cmdlet supports the ability to upload in-line text content to Amazon S3. Using the -Content parameter (alias -Text), you can specify text-based content that should be uploaded to Amazon S3 without needing to place it into a file first. The parameter accepts simple one-line strings as well as here strings that contain multiple lines.

```
PS > # Specifying content in-line, single line text:
PS > write-s3object mybucket -key myobject.txt -content "file content"

PS > # Specifying content in-line, multi-line text: (note final newline needed to end in-line here-string)
PS > write-s3object mybucket -key myobject.txt -content @
>> line 1
>> line 2
>> line 3
>> "@
>>

PS > # Specifying content from a variable: (note final newline needed to end in-line here-string)
PS > $x = @
>> line 1
>> line 2
>> line 3
>> "@
>>

PS > write-s3object mybucket -key myobject.txt -content $x
```

Amazon EC2 and Tools for Windows PowerShell

You can perform common tasks related to Amazon EC2 using the AWS Tools for PowerShell.

The example commands shown here assume that you have set default credentials and a default region for your PowerShell session. Therefore, we don't include credentials or region when we invoke the cmdlets. For more information, see Get started with the AWS Tools for Windows PowerShell.

Topics
Creating a Key Pair

The following `New-EC2KeyPair` example creates a key pair and stores in the PowerShell variable `$myPSKeyPair`.

```
PS > $myPSKeyPair = New-EC2KeyPair -KeyName myPSKeyPair
```

Pipe the key pair object into the `Get-Member` cmdlet to see the object's structure.

```
PS > $myPSKeyPair | Get-Member

TypeName: Amazon.EC2.Model.KeyPair

<table>
<thead>
<tr>
<th>Name</th>
<th>MemberType</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equals</td>
<td>Method</td>
<td>bool Equals(System.Object obj)</td>
</tr>
<tr>
<td>GetHashCode</td>
<td>Method</td>
<td>int GetHashCode()</td>
</tr>
<tr>
<td>GetType</td>
<td>Method</td>
<td>type GetType()</td>
</tr>
<tr>
<td>ToString</td>
<td>Method</td>
<td>string ToString()</td>
</tr>
<tr>

<td>Property</td>
<td>System.String KeyMaterial {get;set;}</td>
</tr>
<tr>
<td>KeyName</td>
<td>Property</td>
<td>System.String KeyName {get;set;}</td>
</tr>
</tbody>
</table>
```

Pipe the key pair object into the `Format-List` cmdlet to view values of the `KeyName`, `KeyFingerprint`, and `KeyMaterial` members. (The output has been truncated for readability.)

```
PS > $myPSKeyPair | Format-List KeyName, KeyFingerprint, KeyMaterial

KeyName : myPSKeyPair
KeyMaterial : -----BEGIN RSA PRIVATE KEY----
MIIEogIBAAKCAQEAkK+ANYUS9c7niNjYfaCn6KYj/D0IGdjnFoQE...
Mz6btoxPcE7EMeH1wySU8nouA59xb1917+Vkd74bN9KmNcPa/Mu...
Zyn4Ve0Q5il/MpkrRogHq0B0rigeTeV5Yc3lv0RFFPu0Kz4kcm...
w3Jg8dKsWn0p10pX7V3sRC02KgJIbejQUvBFGi5QK9bm4tXBIeC...
```
The `KeyMaterial` member stores the private key for the key pair. The public key is stored in AWS. You can't retrieve the public key from AWS, but you can verify the public key by comparing the `KeyFingerprint` for the private key to that returned from AWS for the public key.

**Viewing the Fingerprint of Your Key Pair**

You can use the `Get-EC2KeyPair` cmdlet to view the fingerprint for your key pair.

```
PS > Get-EC2KeyPair -KeyName myPSKeyPair | format-list KeyName, KeyFingerprint
KeyName        : myPSKeyPair
```

**Storing Your Private Key**

To store the private key to a file, pipe the `KeyFingerMaterial` member to the `Out-File` cmdlet.

```
PS > $myPSKeyPair.KeyMaterial | Out-File -Encoding ascii myPSKeyPair.pem
```

You must specify `-Encoding` _ascii_ when writing the private key to a file. Otherwise, tools such as `openssl` might not be able to read the file correctly. You can verify that the format of the resulting file is correct by using a command such as the following:

```
create a key pair
```
Removing Your Key Pair

You need your key pair to launch and connect to an instance. When you are done using a key pair, you can remove it. To remove the public key from AWS, use the `Remove-EC2KeyPair` cmdlet. When prompted, press Enter to remove the key pair.

```
PS > Remove-EC2KeyPair -KeyName myPSKeyPair
```

Confirm

Performing the operation "Remove-EC2KeyPair (DeleteKeyPair)" on target "myPSKeyPair".

[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

The variable, `$myPSKeyPair`, still exists in the current PowerShell session and still contains the key pair information. The `myPSKeyPair.pem` file also exists. However, the private key is no longer valid because the public key for the key pair is no longer stored in AWS.

Create a Security Group Using Windows PowerShell

You can use the AWS Tools for PowerShell to create and configure a security group. When you create a security group, you specify whether it is for EC2-Classic or EC2-VPC. The response is the ID of the security group.

If you need to connect to your instance, you must configure the security group to allow SSH traffic (Linux) or RDP traffic (Windows).

Topics

- Prerequisites
- Creating a Security Group for EC2-Classic
- Creating a Security Group for EC2-VPC

Prerequisites

You need the public IP address of your computer, in CIDR notation. You can get the public IP address of your local computer using a service. For example, Amazon provides the following
service: http://checkip.amazonaws.com/ or https://checkip.amazonaws.com/. To locate another service that provides your IP address, use the search phrase "what is my IP address". If you are connecting through an ISP or from behind your firewall without a static IP address, you need to find the range of IP addresses that can be used by your client computers.

⚠️ Warning

If you specify 0.0.0.0/0, you are enabling traffic from any IP addresses in the world. For the SSH and RDP protocols, you might consider this acceptable for a short time in a test environment, but it's unsafe for production environments. In production, be sure to authorize access only from the appropriate individual IP address or range of addresses.

Creating a Security Group for EC2-Classic

⚠️ Warning

We are retiring EC2-Classic on August 15, 2022. We recommend that you migrate from EC2-Classic to a VPC. For more information, see Migrate from EC2-Classic to a VPC in the Amazon EC2 User Guide for Linux Instances or the Amazon EC2 User Guide for Windows Instances. Also see the blog post EC2-Classic Networking is Retiring – Here's How to Prepare.

The following example uses the New-EC2SecurityGroup cmdlet to create a security group for EC2-Classic.

```
PS > New-EC2SecurityGroup -GroupName myPSSecurityGroup -GroupDescription "EC2-Classic from PowerShell"
sg-0a346530123456789
```

To view the initial configuration of the security group, use the Get-EC2SecurityGroup cmdlet.

```
PS > Get-EC2SecurityGroup -GroupNames myPSSecurityGroup

Description : EC2-Classic from PowerShell
GroupId      : sg-0a346530123456789
```
To configure the security group to allow inbound traffic on TCP port 22 (SSH) and TCP port 3389, use the `Grant-EC2SecurityGroupIngress` cmdlet. For example, the following example script shows how you could enable SSH traffic from a single IP address, 203.0.113.25/32.

```powershell
$cidrBlocks = New-Object 'collections.generic.list[string]'
$cidrBlocks.add("203.0.113.25/32")
$ipPermissions = New-Object Amazon.EC2.Model.IpPermission
$ipPermissions.IpProtocol = "tcp"
$ipPermissions.FromPort = 22
$ipPermissions.ToPort = 22
$ipPermissions.IpRanges = $cidrBlocks
Grant-EC2SecurityGroupIngress -GroupName myPSSecurityGroup -IpPermissions $ipPermissions
```

To verify the security group was updated, run the `Get-EC2SecurityGroup` cmdlet again. Note that you can't specify an outbound rule for EC2-Classic.

```powershell
PS > Get-EC2SecurityGroup -GroupNames myPSSecurityGroup
```

To view the security group rule, use the `IpPermissions` property.

```powershell
PS > (Get-EC2SecurityGroup -GroupNames myPSSecurityGroup).IpPermissions
```

```
IpProtocol       : tcp
FromPort         : 22
```
Creating a Security Group for EC2-VPC

The following New-EC2SecurityGroup example adds the -VpcId parameter to create a security group for the specified VPC.

```
PS > $groupid = New-EC2SecurityGroup `  
    -VpcId "vpc-da0013b3" `  
    -GroupName "myPSSecurityGroup" `  
    -GroupDescription "EC2-VPC from PowerShell"
```

To view the initial configuration of the security group, use the Get-EC2SecurityGroup cmdlet. By default, the security group for a VPC contains a rule that allows all outbound traffic. Notice that you can't reference a security group for EC2-VPC by name.

```
PS > Get-EC2SecurityGroup -GroupId sg-5d293231
```

To define the permissions for inbound traffic on TCP port 22 (SSH) and TCP port 3389, use the New-Object cmdlet. The following example script defines permissions for TCP ports 22 and 3389 from a single IP address, 203.0.113.25/32.

```
$ip1 = new-object Amazon.EC2.Model.IpPermission
$ip1.IpProtocol = "tcp"
$ip1.FromPort = 22
$ip1.ToPort = 22
$ip1.IpRanges.Add("203.0.113.25/32")
$ip2 = new-object Amazon.EC2.Model.IpPermission
$ip2.IpProtocol = "tcp"
$ip2.FromPort = 3389
```
$ip2.ToPort = 3389
$ip2.IpRanges.Add("203.0.113.25/32")
Grant-EC2SecurityGroupIngress -GroupId $groupid -IpPermissions @( $ip1, $ip2 )

To verify the security group has been updated, use the Get-EC2SecurityGroup cmdlet again.

PS > Get-EC2SecurityGroup -GroupIds sg-5d293231

OwnerId             : 123456789012
GroupName           : myPSSecurityGroup
GroupId             : sg-5d293231
Description         : EC2-VPC from PowerShell
IpPermissions       : {Amazon.EC2.Model.IpPermission}
IpPermissionsEgress : {Amazon.EC2.Model.IpPermission}
VpcId               : vpc-da0013b3
Tags                : {}

To view the inbound rules, you can retrieve the IpPermissions property from the collection object returned by the previous command.

PS > (Get-EC2SecurityGroup -GroupIds sg-5d293231).IpPermissions

IpProtocol       : tcp
FromPort         : 22
ToPort           : 22
UserIdGroupPairs : {}
IpRanges         : {203.0.113.25/32}

IpProtocol       : tcp
FromPort         : 3389
ToPort           : 3389
UserIdGroupPairs : {}
IpRanges         : {203.0.113.25/32}

Find an Amazon Machine Image Using Windows PowerShell

When you launch an Amazon EC2 instance, you specify an Amazon Machine Image (AMI) to serve as a template for the instance. However, the IDs for the AWS Windows AMIs change frequently because AWS provides new AMIs with the latest updates and security enhancements. You can use the Get-EC2Image and Get-EC2ImageByName cmdlets to find the current Windows AMIs and get their IDs.
Topics

- Get-EC2Image
- Get-EC2ImageByName

Get-EC2Image

The Get-EC2Image cmdlet retrieves a list of AMIs that you can use.

Use the -Owner parameter with the array value amazon, self so that Get-EC2Image retrieves only AMIs that belong to Amazon or to you. In this context, you refers to the user whose credentials you used to invoke the cmdlet.

```
PS > Get-EC2Image -Owner amazon, self
```

You can scope the results using the -Filter parameter. To specify the filter, create an object of type Amazon.EC2.Model.Filter. For example, use the following filter to display only Windows AMIs.

```
$platform_values = New-Object 'collections.generic.list[string]'
$platform_values.add("windows")
$filter_platform = New-Object Amazon.EC2.Model.Filter -Property @
    {Name = "platform"; Values = $platform_values}
Get-EC2Image -Owner amazon, self -Filter $filter_platform
```

The following is an example of one of the AMIs returned by the cmdlet; the actual output of the previous command provides information for many AMIs.

The `Get-EC2ImageByName` cmdlet enables you to filter the list of AWS Windows AMIs based on the type of server configuration you are interested in.

Launch an Amazon EC2 Instance Using Windows PowerShell

To launch an Amazon EC2 instance, you need the key pair and security group that you created in the previous sections. You also need the ID of an Amazon Machine Image (AMI). For more information, see the following documentation:

- Creating a Key Pair
- Create a Security Group Using Windows PowerShell
- Find an Amazon Machine Image Using Windows PowerShell

⚠️ Important

If you launch an instance that is not within the Free Tier, you are billed after you launch the instance and charged for the time that the instance is running even if it remains idle.

Launching an Instance in EC2-Classic

⚠️ Warning

We are retiring EC2-Classic on August 15, 2022. We recommend that you migrate from EC2-Classic to a VPC. For more information, see Migrate from EC2-Classic to a VPC in the Amazon EC2 User Guide for Linux Instances or the Amazon EC2 User Guide for Windows.

The following command creates and launches a single `t1.micro` instance.

```powershell

    -MinCount 1
    -MaxCount 1
    -KeyName myPSKeyPair
    -SecurityGroups myPSSecurityGroup
    -InstanceType t1.micro

Your instance is in the pending state initially, but is in the running state after a few minutes. To view information about your instance, use the `Get-EC2Instance` cmdlet. If you have more than one instance, you can filter the results on the reservation ID using the `Filter` parameter. First, create an object of type `Amazon.EC2.Model.Filter`. Next, call `Get-EC2Instance` that uses the filter, and then displays the `Instances` property.

```powershell
PS > $reservation = New-Object 'collections.generic.list[string]'
PS > $reservation.add("r-5caa4371")
PS > $filter_reservation = New-Object Amazon.EC2.Model.Filter -Property @
    {
        Name = "reservation-id";
        Values = $reservation
    }
PS > (Get-EC2Instance -Filter $filter_reservation).Instances

### AWS Lambda and AWS Tools for PowerShell

By using the [AWSLambdaPSCore](https://aws.amazon.com/powershell/) module, you can develop AWS Lambda functions in PowerShell Core 6.0 using the .NET Core 2.1 runtime. PowerShell developers can manage AWS resources and write automation scripts in the PowerShell environment by using Lambda. PowerShell support in Lambda lets you run PowerShell scripts or functions in response to any Lambda event, such as an Amazon S3 event or Amazon CloudWatch scheduled event. The AWSLambdaPSCore module is a separate AWS module for PowerShell; it is not part of the AWS Tools for PowerShell, nor does installing the AWSLambdaPSCore module install the AWS Tools for PowerShell.
After you install the AWSLambdaPSCore module, you can use any available PowerShell cmdlets—or develop your own—to author serverless functions. The AWS Lambda Tools for PowerShell module includes project templates for PowerShell-based serverless applications, and tools to publish projects to AWS.

AWSLambdaPSCore module support is available in all regions that support Lambda. For more information about supported regions, see the AWS region table.

**Prerequisites**

The following steps are required before you can install and use the AWSLambdaPSCore module. For more detail about these steps, see Setting Up a PowerShell Development Environment in the AWS Lambda Developer Guide.

- **Install the correct release of PowerShell** – Lambda’s support for PowerShell is based on the cross-platform PowerShell Core 6.0 release. You can develop PowerShell Lambda functions on Windows, Linux, or Mac. If you don’t have at least this release of PowerShell installed, instructions are available on the Microsoft PowerShell documentation website.

- **Install the .NET Core 2.1 SDK** – Because PowerShell Core is based on .NET Core, the Lambda support for PowerShell uses the same .NET Core 2.1 Lambda runtime for both .NET Core and PowerShell Lambda functions. The Lambda PowerShell publishing cmdlets use the .NET Core 2.1 SDK to create the Lambda deployment package. The .NET Core 2.1 SDK is available from the Microsoft Download Center. Be sure to install the SDK, not the Runtime.

**Install the AWSLambdaPSCore Module**

After completing the prerequisites, you are ready to install the AWSLambdaPSCore module. Run the following command in a PowerShell Core session.

```
PS> Install-Module AWSLambdaPSCore -Scope CurrentUser
```

You are ready to start developing Lambda functions in PowerShell. For more information about how to get started, see Programming Model for Authoring Lambda Functions in PowerShell in the AWS Lambda Developer Guide.

Amazon SQS, Amazon SNS and Tools for Windows PowerShell

This section provides examples that show how to:

- Create an Amazon SQS queue and get queue ARN (Amazon Resource Name).
- Create an Amazon SNS topic.
- Give permissions to the SNS topic so that it can send messages to the queue.
- Subscribe the queue to the SNS topic
- Give IAM users or AWS accounts permissions to publish to the SNS topic and read messages from the SQS queue.
- Verify results by publishing a message to the topic and reading the message from the queue.

Create an Amazon SQS queue and get queue ARN

The following command creates an SQS queue in your default region. The output shows the URL of the new queue.

```powershell
PS > New-SQSQueue -QueueName myQueue
https://sqs.us-west-2.amazonaws.com/123456789012/myQueue
```

The following command retrieves the ARN of the queue.

```powershell
PS > Get-SQSQueueAttribute -QueueUrl https://sqs.us-west-2.amazonaws.com/123456789012/myQueue -AttributeName QueueArn
... QueueARN : arn:aws:sqs:us-west-2:123456789012:myQueue
...```
Create an Amazon SNS topic

The following command creates an SNS topic in your default region, and returns the ARN of the new topic.

```
PS > New-SNSTopic -Name myTopic
```

Give permissions to the SNS topic

The following example script creates both an SQS queue and an SNS topic, and grants permissions to the SNS topic so that it can send messages to the SQS queue:

```
# create the queue and topic to be associated
$qurl = New-SQSQueue -QueueName "myQueue"
$topicarn = New-SNSTopic -Name "myTopic"

# get the queue ARN to inject into the policy; it will be returned
# in the output's QueueARN member but we need to put it into a variable
# so text expansion in the policy string takes effect
$qarn = (Get-SQSQueueAttribute -QueueUrl $qurl -AttributeNames "QueueArn").QueueARN

# construct the policy and inject arns
$policy = @"{
    "Version": "2012-10-17",
    "Statement": {
        "Effect": "Allow",
        "Principal": "*",
        "Action": "SQS:SendMessage",
        "Resource": "$qarn",
        "Condition": { "ArnEquals": { "aws:SourceArn": "$topicarn" } }
    }
}
""

# set the policy
Set-SQSQueueAttribute -QueueUrl $qurl -Attribute @{ Policy=$policy }
```
Subscribe the queue to the SNS topic

The following command subscribes the queue myQueue to the SNS topic myTopic, and returns the Subscription ID:

```
PS > Connect-SNSNotification  
   -Protocol SQS  
arn:aws:sns:us-west-2:123456789012:myTopic:f8ff77c6-e719-4d70-8e5c-a54d41feb754
```

Give permissions

The following command grants permission to perform the sns:Publish action on the topic myTopic

```
PS > Add-SNSPermission  
   -Label ps-cmdlet-topic  
   -AWSAccountIds 123456789012  
   -ActionNames publish
```

The following command grants permission to perform the sqs:ReceiveMessage and sqs:DeleteMessage actions on the queue myQueue.

```
PS > Add-SQSPermission  
   -QueueUrl https://sqs.us-west-2.amazonaws.com/123456789012/myQueue  
   -AWSAccountId "123456789012"  
   -Label queue-permission  
   -ActionName SendMessage, ReceiveMessage
```

Verify results

The following command tests your new queue and topic by publishing a message to the SNS topic myTopic and returns the MessageId.

```
PS > Publish-SNSMessage  
   -Message "Have A Nice Day!"
```
The following command retrieves the message from the SQS queue myQueue and displays it.

```

CloudWatch from the AWS Tools for Windows PowerShell

This section shows an example of how to use the Tools for Windows PowerShell to publish custom metric data to CloudWatch.

This example assumes that you have set default credentials and a default region for your PowerShell session.

Publish a Custom Metric to Your CloudWatch Dashboard

The following PowerShell code initializes an CloudWatch MetricDatum object and posts it to the service. You can see the result of this operation by navigating to the CloudWatch console.

```powershell
$dat = New-Object Amazon.CloudWatch.Model.MetricDatum
$dat.Timestamp = (Get-Date).ToUniversalTime()
$dat.MetricName = "New Posts"
$dat.Unit = "Count"
$dat.Value = ".50"
Write-CWMetricData -Namespace "Usage Metrics" -MetricData $dat
```

Note the following:

- The date-time information that you use to initialize $dat.Timestamp must be in Universal Time (UTC).
- The value that you use to initialize $dat.Value can be either a string value enclosed in quotes, or a numeric value (no quotes). The example shows a string value.

Using the ClientConfig parameter in cmdlets

The ClientConfig parameter can be used to specify certain configuration settings when you connect to a service. Most of the possible properties of this parameter are defined in the `Amazon.Runtime.ClientConfig` class, which is inherited into the APIs for AWS services. For an example of simple inheritance, see the `Amazon.Keyspaces.AmazonKeyspacesConfig` class. In addition, some services define additional properties that are appropriate only for that service. For an example of additional properties that have been defined, see the `Amazon.S3.AmazonS3Config` class, specifically the `ForcePathStyle` property.

Using the ClientConfig parameter

To use the ClientConfig parameter, you can specify it on the command line as a ClientConfig object or use PowerShell splatting to pass a collection of parameter values to a command as a unit. These methods are shown in the following examples. The examples assume that the `AWS.Tools.S3` module has been installed and imported, and that you have a [default] credentials profile with appropriate permissions.

Defining a ClientConfig object

```powershell
$s3Config = New-Object -TypeName Amazon.S3.AmazonS3Config
$s3Config.ForcePathStyle = $true
$s3Config.Timeout = [TimeSpan]::FromMilliseconds(150000)
Get-S3Object -BucketName <BUCKET_NAME> -ClientConfig $s3Config
```

Adding ClientConfig properties by using PowerShell splatting

```powershell
$params=@{
    ClientConfig=@{
        ForcePathStyle=$true
        Timeout=[TimeSpan]::FromMilliseconds(150000)
    }
    BucketName="<BUCKET_NAME>"
}
Get-S3Object @params
```
Using an undefined property

When using PowerShell splatting, if you specify a ClientConfig property that doesn't exist, the AWS Tools for PowerShell doesn't detect the error until runtime, at which time it returns an exception. Modifying the example from above:

```powershell
$params = @{
    ClientConfig = @{
        ForcePathStyle = $true
        UndefinedProperty = "Value"
        Timeout = [TimeSpan]::FromMilliseconds(150000)
    }
    BucketName = "<BUCKET_NAME>"
}
Get-S3Object @params
```

This example produces an exception similar to the following:

```
Cannot bind parameter 'ClientConfig'. Cannot create object of type "Amazon.S3.AmazonS3Config". The UndefinedProperty property was not found for the Amazon.S3.AmazonS3Config object.
```

Specifying the AWS Region

You can use the ClientConfig parameter to set the AWS Region for the command. The Region is set through the RegionEndpoint property. The AWS Tools for PowerShell calculates the Region to use according to the following precedence:

1. The -Region parameter
2. The Region passed in the ClientConfig parameter
3. The PowerShell session state
4. The shared AWS config file
5. The environment variables
6. The Amazon EC2 instance metadata, if enabled.
Tools for PowerShell code examples

The code examples in this topic show you how to use the AWS Tools for PowerShell with AWS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Cross-service examples are sample applications that work across multiple AWS services.

### New-ACMCertificate

The following code example shows how to use `New-ACMCertificate`.

**Tools for PowerShell**

#### Example 1: Creates a new certificate. The service returns the ARN of the new certificate.

```powershell
New-ACMCertificate -DomainName "www.example.com"
```

**Output:**

```
arn:aws:acm:us-east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012
```

#### Example 2: Creates a new certificate. The service returns the ARN of the new certificate.

```powershell
New-ACMCertificate -DomainName "www.example.com" -SubjectAlternativeName "example.com","www.example.net"
```
Output:

```
arn:aws:acl:us-east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012
```

- For API details, see [RequestCertificate](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-ACMCertificate**

The following code example shows how to use `Remove-ACMCertificate`.

**Tools for PowerShell**

**Example 1:** Deletes the certificate identified by the supplied ARN and the associated private key. The cmdlet will prompt for confirmation before proceeding; add the -Force switch to suppress confirmation.

```
```

- For API details, see [DeleteCertificate](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Send-ACMValidationEmail**

The following code example shows how to use `Send-ACMValidationEmail`.

**Tools for PowerShell**

**Example 1:** Requests that the email to validate domain ownership for 'www.example.com' be sent. If your shell's $ConfirmPreference is set to 'Medium' or lower, the cmdlet will prompt for confirmation before proceeding. Add the -Force switch to suppress confirmation prompts.

```
$params = @{
    Domain="www.example.com"
    ValidationDomain="example.com"
}

AppStream 2.0 examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with AppStream 2.0.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

• Actions

Actions

Add-APSResourceTag

The following code example shows how to use Add-APSResourceTag.

Tools for PowerShell

Example 1: This sample adds a resource Tag to AppStream resource

Output:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>----</td>
<td>-----</td>
</tr>
<tr>
<td>StackState</td>
<td>Test</td>
</tr>
</tbody>
</table>
• For API details, see TagResource in AWS Tools for PowerShell Cmdlet Reference.

Copy-APSImage

The following code example shows how to use Copy-APSImage.

Tools for PowerShell

Example 1: This sample copies an image to other region

```powershell
Copy-APSImage -DestinationImageName TestImageCopy -DestinationRegion us-west-2 -SourceImageName Powershell
```

Output:

```
TestImageCopy
```

• For API details, see CopyImage in AWS Tools for PowerShell Cmdlet Reference.

Disable-APSUser

The following code example shows how to use Disable-APSUser.

Tools for PowerShell

Example 1: This sample disables an user in USERPOOL

```powershell
Disable-APSUser -AuthenticationType USERPOOL -UserName TestUser@lab.com
```

• For API details, see DisableUser in AWS Tools for PowerShell Cmdlet Reference.

Enable-APSUser

The following code example shows how to use Enable-APSUser.

Tools for PowerShell

Example 1: This sample enables a disabled user in USERPOOL
Enable-APSUser -AuthenticationType USERPOOL -UserName TestUser@lab.com

- For API details, see EnableUser in AWS Tools for PowerShell Cmdlet Reference.

Get-APSAssociatedFleetList

The following code example shows how to use Get-APSAssociatedFleetList.

Tools for PowerShell

Example 1: This sample displays fleet associated with a stack

Get-APSAssociatedFleetList -StackName PowershellStack

Output:

PowershellFleet

- For API details, see ListAssociatedFleets in AWS Tools for PowerShell Cmdlet Reference.

Get-APSAssociatedStackList

The following code example shows how to use Get-APSAssociatedStackList.

Tools for PowerShell

Example 1: This sample displays stack associated with a fleet

Get-APSAssociatedStackList -FleetName PowershellFleet

Output:

PowershellStack

- For API details, see ListAssociatedStacks in AWS Tools for PowerShell Cmdlet Reference.

Get-APSDirectoryConfigList

The following code example shows how to use Get-APSDirectoryConfigList.
Tools for PowerShell

Example 1: This sample displays Directory Configurations created in AppStream

Get-APSDirectoryConfigList | Select DirectoryName, OrganizationalUnitDistinguishedNames, CreatedTime

Output:

<table>
<thead>
<tr>
<th>DirectoryName</th>
<th>OrganizationalUnitDistinguishedNames</th>
<th>CreatedTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test.com</td>
<td>{OU=AppStream,DC=Test,DC=com}</td>

<td>{OU=AppStream,OU=contoso,DC=contoso,DC=com}</td>
<td>8/9/2019 9:08:50 AM</td>
</tr>
</tbody>
</table>

• For API details, see [DescribeDirectoryConfigs](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-APSFleetList

The following code example shows how to use Get-APSFleetList.

Tools for PowerShell

Example 1: This Sample displays details of a fleet

Get-APSFleetList -Name Test

Output:

<table>
<thead>
<tr>
<th>Arn</th>
<th>arn:aws:appstream:us-east-1:1234567890:fleet/Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>ComputeCapacityStatus</td>

</tr>
</tbody>
</table>
- For API details, see DescribeFleets in AWS Tools for PowerShell Cmdlet Reference.

Get-APSImageBuilderList

The following code example shows how to use Get-APSImageBuilderList.

Tools for PowerShell

Example 1: This Sample displays details of an ImageBuilder

```powershell
Get-APSImageBuilderList -Name TestImage
```

Output:

```
AccessEndpoints : {}
AppstreamAgentVersion : 06-19-2019
CreatedTime      : 1/14/2019 4:33:05 AM

Platform         : WINDOWS
State            : STOPPED
StateChangeReason :
VpcConfig        : Amazon.AppStream.Model.VpcConfig
```

- For API details, see DescribeImageBuilders in AWS Tools for PowerShell Cmdlet Reference.
Get-APSImageList

The following code example shows how to use Get-APSImageList.

Tools for PowerShell

Example 1: This sample displays private AppStream Images

```powershell
Get-APSImageList -Type PRIVATE | select DisplayName, ImageBuilderName, Visibility, arn
```

Output:

<table>
<thead>
<tr>
<th>DisplayName</th>
<th>ImageBuilderName</th>
<th>Visibility</th>
<th>Arn</th>
</tr>
</thead>
</table>

- For API details, see [DescribeImages](https://aws.amazon.com/tools/powershell/cmdlet-reference) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-APSImagePermission

The following code example shows how to use Get-APSImagePermission.

Tools for PowerShell

Example 1: This sample displays Image permissions on a shared AppStream Image

```powershell
Get-APSImagePermission -Name Powershell | select SharedAccountId, @{n="AllowFleet";e={$_.ImagePermissions.AllowFleet}}, @{n="AllowImageBuilder";e={$_.ImagePermissions.AllowImageBuilder}}
```

Output:

<table>
<thead>
<tr>
<th>SharedAccountId</th>
<th>AllowFleet</th>
<th>AllowImageBuilder</th>
</tr>
</thead>
<tbody>
<tr>
<td>123456789012</td>
<td>True</td>
<td>True</td>
</tr>
</tbody>
</table>

- For API details, see [DescribeImagePermissions](https://aws.amazon.com/tools/powershell/cmdlet-reference) in *AWS Tools for PowerShell Cmdlet Reference*.
Get-APSSessionList

The following code example shows how to use Get-APSSessionList.

Tools for PowerShell

Example 1: This sample displays list of sessions to a fleet

```powershell
Get-APSSessionList -FleetName PowershellFleet -StackName PowershellStack
```

Output:

<table>
<thead>
<tr>
<th>AuthenticationType</th>
<th>: API</th>
</tr>

</tr>
</tbody>
</table>

For API details, see [DescribeSessions](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-APSStackList

The following code example shows how to use Get-APSStackList.

Tools for PowerShell

Example 1: This sample displays list of AppStream Stack

```powershell
Get-APSStackList | Select DisplayName, Arn, CreatedTime
```

Output:

<table>
<thead>
<tr>
<th>DisplayName</th>
<th>Arn</th>
<th>CreatedTime</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
For API details, see \(\text{DescribeStacks}\) in \(\text{AWS Tools for PowerShell Cmdlet Reference}\).

**Get-APSTagsForResourceList**

The following code example shows how to use \(\text{Get-APSTagsForResourceList}\).

**Tools for PowerShell**

**Example 1:** This sample displays tags on an AppStream resource

```
```

**Output:**

```
Key       Value
---       -----  
StackState Test
```

For API details, see \(\text{ListTagsForResource}\) in \(\text{AWS Tools for PowerShell Cmdlet Reference}\).

**Get-APSUsageReportSubscription**

The following code example shows how to use \(\text{Get-APSUsageReportSubscription}\).

**Tools for PowerShell**

**Example 1:** This sample displays AppStreamUsageReport configuration details

```
Get-APSUsageReportSubscription
```

**Output:**

```
LastGeneratedReportDate S3BucketName Schedule
SubscriptionErrors
```

AppStream 2.0
Get-APSUser

The following code example shows how to use Get-APSUser.

**Tools for PowerShell**

**Example 1: This Sample displays list of users with enabled status**

```
Get-APSUser -AuthenticationType USERPOOL | Select-Object UserName, AuthenticationType, Enabled
```

**Output:**

<table>
<thead>
<tr>
<th>UserName</th>
<th>AuthenticationType</th>

</tr>
</tbody>
</table>

**For API details, see [DescribeUsageReportSubscriptions](#) in AWS Tools for PowerShell Cmdlet Reference.**

Get-APSUserStackAssociation

The following code example shows how to use Get-APSUserStackAssociation.

**Tools for PowerShell**

**Example 1: This sample displays list of users assigned to a stack**

```
Get-APSUserStackAssociation -StackName PowershellStack
```

**Output:**
For API details, see [DescribeUserStackAssociations](#) in **AWS Tools for PowerShell Cmdlet Reference**.

### New-APSDirectoryConfig

The following code example shows how to use `New-APSDirectoryConfig`.

**Tools for PowerShell**

**Example 1: This sample creates a directory configuration in AppStream**

```powershell
New-APSDirectoryConfig -ServiceAccountCredentials_AccountName contoso\ServiceAccount
                        -ServiceAccountCredentials_AccountPassword MyPass -DirectoryName contoso.com
                        -OrganizationalUnitDistinguishedName "OU=AppStream,OU=Contoso,DC=Contoso,DC=com"
```

**Output:**

```
CreatedTime DirectoryName OrganizationalUnitDistinguishedNames
-------------- -------------- -------------------------------------
12/27/2019 11:00:30 AM contoso.com   {OU=AppStream,OU=Contoso,DC=Contoso,DC=com}
```

For API details, see [CreateDirectoryConfig](#) in **AWS Tools for PowerShell Cmdlet Reference**.

### New-APSFleet

The following code example shows how to use `New-APSFleet`.

**Tools for PowerShell**

**Example 1: This sample creates a new AppStream fleet**

```powershell
New-APSFleet -ComputeCapacity_DesiredInstance 1 -InstanceType stream.standard.medium
            -Name TestFleet -DisplayName TestFleet -FleetType ON_DEMAND
```

AppStream 2.0
EnableDefaultInternetAccess $True -VpcConfig_SubnetIds "subnet-123ce32","subnet-a1234cfd" -VpcConfig_SecurityGroupIds sg-4d012a34 -ImageName SessionScriptTest -Region us-west-2

Output:

</table>

- For API details, see [CreateFleet](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-APSImageBuilder

The following code example shows how to use New-APSImageBuilder.

#### Tools for PowerShell

**Example 1: This sample creates an Image Builder in AppStream**

```
New-APSImageBuilder -InstanceType stream.standard.medium -Name TestIB -DisplayName TestIB -ImageName AppStream-WinServer2012R2-12-12-2019 -EnableDefaultInternetAccess $True -VpcConfig_SubnetId subnet-a1234cfd -VpcConfig_SecurityGroupIds sg-2d012a34 -Region us-west-2
```
Output:

```
{ "AccessEndpoints": {},
  "AppstreamAgentVersion": "12-16-2019",
  "Description": {},
  "DisplayName": "TestIB",
  "DomainJoinInfo": {},
  "EnableDefaultInternetAccess": true,

  "VpcConfig": "Amazon.AppStream.Model.VpcConfig"
}
```

- For API details, see [CreateImageBuilder](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

### New-APSImageBuilderStreamingURL

The following code example shows how to use `New-APSImageBuilderStreamingURL`.

#### Tools for PowerShell

**Example 1: This sample creates an ImageBuilder streaming URL with validity of 2 hours**

```
New-APSImageBuilderStreamingURL -Name TestIB -Validity 7200 -Region us-west-2
```

**Output:**

```
Expires               StreamingURL
-------               ------------

```
For API details, see [CreateImageBuilderStreamingURL](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-APSStack

The following code example shows how to use `New-APSStack`.

#### Tools for PowerShell

**Example 1: This sample creates a new AppStream Stack**

```powershell
New-APSStack -Name TestStack -DisplayName TestStack -ApplicationSettings_Enabled $True -ApplicationSettings_SettingsGroup TestStack -Region us-west-2
```

**Output:**

```
AccessEndpoints : {}
ApplicationSettings : Amazon.AppStream.Model.ApplicationSettingsResponse
CreatedTime      : 12/27/2019 12:34:19 PM
Description      :

Amazon.AppStream.Model.UserSetting,
Amazon.AppStream.Model.UserSetting,
Amazon.AppStream.Model.UserSetting]
```

For API details, see [CreateStack](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-APSStreamingURL

The following code example shows how to use `New-APSStreamingURL`.

#### Tools for PowerShell

**Example 1: This sample creates a streaming URL of Stack**
New-APSStreamingURL -StackName SessionScriptTest -FleetName SessionScriptNew -UserId TestUser

Output:

<table>
<thead>
<tr>
<th>Expires</th>
<th>StreamingURL</th>
</tr>
</thead>
</table>

• For API details, see [CreateStreamingURL](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-APSUsageReportSubscription

The following code example shows how to use `New-APSUsageReportSubscription`.

**Tools for PowerShell**

**Example 1: This sample enables AppStream Usage Reports**

```powershell
New-APSUsageReportSubscription
```

**Output:**

<table>
<thead>
<tr>
<th>S3BucketName</th>
<th>Schedule</th>
</tr>
</thead>
<tbody>
<tr>
<td>appstream-logs-us-east-1-123456789012-sik2hnxe</td>
<td>DAILY</td>
</tr>
</tbody>
</table>

• For API details, see [CreateUsageReportSubscription](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-APSUser

The following code example shows how to use `New-APSUser`.

**Tools for PowerShell**

**Example 1: This sample creates a user in USERPOOL**
New-APSUser -UserName Test@lab.com -AuthenticationType USERPOOL -FirstName 'kt' -LastName 'aws' -Select ^UserName

Output:

Test@lab.com

- For API details, see [CreateUser](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-APSFleet**

The following code example shows how to use `Register-APSFleet`.

**Tools for PowerShell**

**Example 1:** This sample registers fleet with a stack

`Register-APSFleet -StackName TestStack -FleetName TestFleet -Region us-west-2`

- For API details, see [AssociateFleet](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-APSUserStackBatch**

The following code example shows how to use `Register-APSUserStackBatch`.

**Tools for PowerShell**

**Example 1:** This sample assigns stack to a user in USERPOOL

`Register-APSUserStackBatch -UserStackAssociation @{AuthenticationType="USERPOOL";SendEmailNotification=$False;StackName="PowershellStack";UserName="TestUser1@lab.com"}`

- For API details, see [BatchAssociateUserStack](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-APSDirectoryConfig**

The following code example shows how to use `Remove-APSDirectoryConfig`.
Tools for PowerShell

Example 1: This sample removes AppStream Directory configuration

```
Remove-APSDirectoryConfig -DirectoryName contoso.com
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-APSDirectoryConfig (DeleteDirectoryConfig)" on target "contoso.com".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): A
```

- For API details, see [DeleteDirectoryConfig](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-APSFleet

The following code example shows how to use Remove-APSFleet.

Tools for PowerShell

Example 1: This sample removes deletes an AppStream fleet

```
Remove-APSFleet -Name TestFleet -Region us-west-2
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-APSFleet (DeleteFleet)" on target "TestFleet".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): A
```

- For API details, see [DeleteFleet](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-APSImage

The following code example shows how to use Remove-APSImage.
Tools for PowerShell

Example 1: This sample deletes an Image

Remove-APSImage -Name TestImage -Region us-west-2

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-APSImage (DeleteImage)" on target "TestImage".

Remove-APSImagePermission

The following code example shows how to use Remove-APSImagePermission.

Tools for PowerShell

Example 1: This sample removes permissions of an Image
Remove-APSImagePermission -Name Powershell -SharedAccountId 123456789012

**Output:**

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-APSImagePermission (DeleteImagePermissions)" on target "Powershell".

**Remove-APSResourceTag**

The following code example shows how to use Remove-APSResourceTag.

**Tools for PowerShell**

**Example 1: This sample removes a resource tag from AppStream resource**

**Output:**

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-APSResourceTag (UntagResource)" on target "arn:aws:appstream:us-east-1:123456789012:stack/SessionScriptTest".

• For API details, see [UntagResource](#) in AWS Tools for PowerShell Cmdlet Reference.

**Remove-APSStack**

The following code example shows how to use Remove-APSStack.
Tools for PowerShell

Example 1: This sample deletes a Stack

```
Remove-APSStack -Name TestStack -Region us-west-2
```

Output:

```
Confirm Are you sure you want to perform this action?
Performing the operation "Remove-APSStack (DeleteStack)" on target "TestStack". [Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is "Y"): A
```

- For API details, see `DeleteStack` in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-APSUsageReportSubscription

The following code example shows how to use Remove-APSUsageReportSubscription.

Tools for PowerShell

Example 1: This sample disables AppStream Usage Report subscription

```
Remove-APSUsageReportSubscription
```

Output:

```
Confirm Are you sure you want to perform this action?
Performing the operation "Remove-APSUsageReportSubscription (DeleteUsageReportSubscription)" on target "". [Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is "Y"): A
```

- For API details, see `DeleteUsageReportSubscription` in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-APSUser

The following code example shows how to use Remove-APSUser.
Tools for PowerShell

Example 1: This sample deletes a user from USERPOOL

Remove-APSUser -UserName TestUser@lab.com -AuthenticationType USERPOOL

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-APSUser (DeleteUser)" on target "TestUser@lab.com". [Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): A

- For API details, see DeleteUser in AWS Tools for PowerShell Cmdlet Reference.

Revoke-APSSession

The following code example shows how to use Revoke-APSSession.

Tools for PowerShell

Example 1: This sample revokes a session to AppStream fleet

Revoke-APSSession -SessionId 6cd2f9a3-f948-4aa1-8014-8a7dcde14877

- For API details, see ExpireSession in AWS Tools for PowerShell Cmdlet Reference.

Start-APSFleet

The following code example shows how to use Start-APSFleet.

Tools for PowerShell

Example 1: This sample starts a fleet

Start-APSFleet -Name PowershellFleet

- For API details, see StartFleet in AWS Tools for PowerShell Cmdlet Reference.
Start-APSImageBuilder

The following code example shows how to use Start-APSImageBuilder.

Tools for PowerShell

Example 1: This sample starts an ImageBuilder

Start-APSImageBuilder -Name TestImage

Output:

```
Unregister-APSFleet -StackName TestStack -FleetName TestFleet -Region us-west-2
```

• For API details, see [DisassociateFleet](https://aws.amazon.com) in **AWS Tools for PowerShell Cmdlet Reference**.

Unregister-APSUserStackBatch

The following code example shows how to use Unregister-APSUserStackBatch.

Tools for PowerShell

Example 1: This sample removes an user from an assigned Stack

```
Unregister-APSUserStackBatch -UserStackAssociation @

```

• For API details, see [BatchDisassociateUserStack](https://aws.amazon.com) in **AWS Tools for PowerShell Cmdlet Reference**.

Update-APSDirectoryConfig

The following code example shows how to use Update-APSDirectoryConfig.

Tools for PowerShell

Example 1: This sample updates the Directory configuration created in AppStream

```
Update-APSDirectoryConfig -ServiceAccountCredentials_AccountName contoso

### Aurora examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Aurora.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Get-ASScalingActivity

The following code example shows how to use Get-ASScalingActivity.

Tools for PowerShell

Example 1: This example describes the scaling activities for the last six weeks for the specified Auto Scaling group.

Output:

Auto Scaling groups.

Get-ASScalingActivity

• For API details, see DescribeScalingActivities in AWS Tools for PowerShell Cmdlet Reference.

Get-ASScalingProcessType

The following code example shows how to use Get-ASScalingProcessType.

Tools for PowerShell

Example 1: This example lists the process types that are supported by Auto Scaling.

Get-ASScalingProcessType

Output:

- For API details, see [DescribeScalingProcessTypes](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-ASScheduledAction

The following code example shows how to use Get-ASScheduledAction.

**Tools for PowerShell**

**Example 1:** This example describes the scheduled scaling actions for the specified Auto Scaling group.

```
Get-ASScheduledAction -AutoScalingGroupName my-asg
```

**Output:**

```
AutoScalingGroupName : my-asg
DesiredCapacity      : 10
EndTime              :

```

**Example 2:** This example describes the specified scheduled scaling actions.
Example 3: This example describes the scheduled scaling actions that start by the specified time.

Get-ASScheduledAction -StartTime "2015-12-01T08:00:00Z"

Example 4: This example describes the scheduled scaling actions that end by the specified time.

Get-ASScheduledAction -EndTime "2015-12-30T08:00:00Z"

Example 5: This example describes the scheduled scaling actions for all your Auto Scaling groups.

Get-ASScheduledAction

For API details, see DescribeScheduledActions in AWS Tools for PowerShell Cmdlet Reference.

Get-ASTag

The following code example shows how to use Get-ASTag.

Tools for PowerShell

Example 1: This example describes the tags with a key value of either 'myTag' or 'myTag2'. The possible values for the filter name are 'auto-scaling-group', 'key', 'value', and 'propagate-at-launch'. The syntax used by this example requires PowerShell version 3 or later.

Get-ASTag -Filter @( @{ Name="key"; Values=(@"myTag", "myTag2") } )

Output:

<table>
<thead>
<tr>
<th>Key</th>
<th>myTag2</th>
</tr>
</thead>
<tbody>
<tr>
<td>PropagateAtLaunch</td>
<td>True</td>
</tr>
</tbody>
</table>
Example 2: With PowerShell version 2, you must use New-Object to create the filter for the Filter parameter.

```powershell
$keys = New-Object string[] 2
$keys[0] = "myTag"
$keys[1] = "myTag2"
$filter = New-Object Amazon.AutoScaling.Model.Filter
$filter.Name = "key"
$filter.Values = $keys
Get-ASTag -Filter @( $filter )
```

Example 3: This example describes all tags for all your Auto Scaling groups.

Get-ASTag

* For API details, see [DescribeTags](https://docs.aws.amazon.com/AWSToolsForPowerShell/latest/LatestCmdletReference/Amazon.AutoScaling/DescribeTags) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-ASTerminationPolicyType**

The following code example shows how to use `Get-ASTerminationPolicyType`.

**Tools for PowerShell**

Example 1: This example lists the termination policies that are supported by Auto Scaling.

Get-ASTerminationPolicyType

**Output:**

`ClosestToNextInstanceHour`
Mount-ASInstance

The following code example shows how to use Mount-ASInstance.

Tools for PowerShell

Example 1: This example attaches the specified instance to the specified Auto Scaling group. Auto Scaling automatically increases the desired capacity of the Auto Scaling group.

Mount-ASInstance -InstanceId i-93633f9b -AutoScalingGroupName my-asg

- For API details, see AttachInstances in AWS Tools for PowerShell Cmdlet Reference.

New-ASAutoScalingGroup

The following code example shows how to use New-ASAutoScalingGroup.

Tools for PowerShell

Example 1: This example creates an Auto Scaling group with the specified name and attributes. The default desired capacity is the minimum size. Therefore, this Auto Scaling group launches two instances, one in each of the specified two Availability Zones.

New-ASAutoScalingGroup -AutoScalingGroupName my-asg -LaunchConfigurationName my-lc -MinSize 2 -MaxSize 6 -AvailabilityZone @("us-west-2a", "us-west-2b")

- For API details, see CreateAutoScalingGroup in AWS Tools for PowerShell Cmdlet Reference.

New-ASLaunchConfiguration

The following code example shows how to use New-ASLaunchConfiguration.
Tools for PowerShell

Example 1: This example creates a launch configuration named 'my-lc'. The EC2 instances launched by Auto Scaling groups that use this launch configuration use specified instance type, AMI, security group, and IAM role.

New-ASLaunchConfiguration -LaunchConfigurationName my-lc -InstanceType "m3.medium" -ImageId "ami-12345678" -SecurityGroup "sg-12345678" -IamInstanceProfile "myIamRole"

- For API details, see CreateLaunchConfiguration in AWS Tools for PowerShell Cmdlet Reference.

Remove-ASAutoScalingGroup

The following code example shows how to use Remove-ASAutoScalingGroup.

Example 1: This example deletes the specified Auto Scaling group if it has no running instances. You are prompted for confirmation before the operation proceeds.

Remove-ASAutoScalingGroup -AutoScalingGroupName my-asg

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ASAutoScalingGroup (DeleteAutoScalingGroup)" on Target "my-asg".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

Example 2: If you specify the Force parameter, you are not prompted for confirmation before the operation proceeds.

Remove-ASAutoScalingGroup -AutoScalingGroupName my-asg -Force

Example 3: This example deletes the specified Auto Scaling group and terminates any running instances that it contains.

Remove-ASAutoScalingGroup -AutoScalingGroupName my-asg -ForceDelete $true -Force
• For API details, see DeleteAutoScalingGroup in AWS Tools for PowerShell Cmdlet Reference.

Remove-ASLaunchConfiguration

The following code example shows how to use Remove-ASLaunchConfiguration.

Tools for PowerShell

Example 1: This example deletes the specified launch configuration if it is not attached to an Auto Scaling group. You are prompted for confirmation before the operation proceeds.

```
Remove-ASLaunchConfiguration -LaunchConfigurationName my-lc
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ASLaunchConfiguration (DeleteLaunchConfiguration)") on Target "my-lc".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):
```

Example 2: If you specify the Force parameter, you are not prompted for confirmation before the operation proceeds.

```
Remove-ASLaunchConfiguration -LaunchConfigurationName my-lc -Force
```

• For API details, see DeleteLaunchConfiguration in AWS Tools for PowerShell Cmdlet Reference.

Remove-ASLifecycleHook

The following code example shows how to use Remove-ASLifecycleHook.

Tools for PowerShell

Example 1: This example deletes the specified lifecycle hook for the specified Auto Scaling group. You are prompted for confirmation before the operation proceeds.

```
Remove-ASLifecycleHook -AutoScalingGroupName my-asg -LifecycleHookName myLifecycleHook
```
Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ASLifecycleHook (DeleteLifecycleHook)" on Target "myLifecycleHook".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

Example 2: If you specify the Force parameter, you are not prompted for confirmation before the operation proceeds.

Remove-ASLifecycleHook -AutoScalingGroupName my-asg -LifecycleHookName myLifecycleHook -Force

For API details, see [DeleteLifecycleHook](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Remove-ASNotificationConfiguration

The following code example shows how to use Remove-ASNotificationConfiguration.

Tools for PowerShell

Example 1: This example deletes the specified notification action. You are prompted for confirmation before the operation proceeds.

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ASNotificationConfiguration (DeleteNotificationConfiguration)" on Target "arn:aws:sns:us-west-2:123456789012:my-topic".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

Example 2: If you specify the Force parameter, you are not prompted for confirmation before the operation proceeds.

- For API details, see DeleteNotificationConfiguration in AWS Tools for PowerShell Cmdlet Reference.

Remove-ASPolicy

The following code example shows how to use Remove-ASPolicy.

Tools for PowerShell

Example 1: This example deletes the specified policy for the specified Auto Scaling group. You are prompted for confirmation before the operation proceeds.

Remove-ASPolicy -AutoScalingGroupName my-asg -PolicyName myScaleInPolicy

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ASPolicy (DeletePolicy)" on Target "myScaleInPolicy".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

Example 2: If you specify the Force parameter, you are not prompted for confirmation before the operation proceeds.

Remove-ASPolicy -AutoScalingGroupName my-asg -PolicyName myScaleInPolicy -Force

- For API details, see DeletePolicy in AWS Tools for PowerShell Cmdlet Reference.

Remove-ASScheduledAction

The following code example shows how to use Remove-ASScheduledAction.

Tools for PowerShell

Example 1: This example deletes the specified scheduled action for the specified Auto Scaling group. You are prompted for confirmation before the operation proceeds.
Remove-ASScheduledAction -AutoScalingGroupName my-asg -ScheduledAction "myScheduledAction"

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ASScheduledAction (DeleteScheduledAction)" on Target "myScheduledAction".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

Example 2: If you specify the Force parameter, you are not prompted for confirmation before the operation proceeds.

Remove-ASScheduledAction -AutoScalingGroupName my-asg -ScheduledAction "myScheduledAction" -Force

• For API details, see DeleteScheduledAction in AWS Tools for PowerShell Cmdlet Reference.

Remove-ASTag

The following code example shows how to use Remove-ASTag.

Tools for PowerShell

Example 1: This example removes the specified tag from the specified Auto Scaling group. You are prompted for confirmation before the operation proceeds. The syntax used by this example requires PowerShell version 3 or later.

Remove-ASTag -Tag @( @{ResourceType="auto-scaling-group"; ResourceId="my-asg"; Key="myTag" } )

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-ASTag (DeleteTags)" on target "Amazon.AutoScaling.Model.Tag".
Example 2: If you specify the Force parameter, you are not prompted for confirmation before the operation proceeds.

Remove-ASTag -Tag @( @{ResourceType="auto-scaling-group"; ResourceId="my-asg"; Key="myTag" } ) -Force

Example 3: With Powershell version 2, you must use New-Object to create the tag for the Tag parameter.

$tag = New-Object Amazon.AutoScaling.Model.Tag
$tag.ResourceType = "auto-scaling-group"
$tag.ResourceId = "my-asg"
$tag.Key = "myTag"
Remove-ASTag -Tag $tag -Force

• For API details, see [DeleteTags](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

**Resume-ASProcess**

The following code example shows how to use Resume-ASProcess.

**Tools for PowerShell**

Example 1: This example resumes the specified Auto Scaling process for the specified Auto Scaling group.

Resume-ASProcess -AutoScalingGroupName my-asg -ScalingProcess "AlarmNotification"

Example 2: This example resumes all suspended Auto Scaling processes for the specified Auto Scaling group.

Resume-ASProcess -AutoScalingGroupName my-asg

• For API details, see [ResumeProcesses](#) in [AWS Tools for PowerShell Cmdlet Reference](#).
**Set-ASDesiredCapacity**

The following code example shows how to use `Set-ASDesiredCapacity`.

**Tools for PowerShell**

**Example 1:** This example sets the size of the specified Auto Scaling group.

```powershell
Set-ASDesiredCapacity -AutoScalingGroupName my-asg -DesiredCapacity 2
```

**Example 2:** This example sets the size of the specified Auto Scaling group and waits for the cooldown period to complete before scaling to the new size.

```powershell
Set-ASDesiredCapacity -AutoScalingGroupName my-asg -DesiredCapacity 2 -HonorCooldown $true
```

- For API details, see `SetDesiredCapacity` in *AWS Tools for PowerShell Cmdlet Reference*.

**Set-ASInstanceHealth**

The following code example shows how to use `Set-ASInstanceHealth`.

**Tools for PowerShell**

**Example 1:** This example sets the status of the specified instance to 'Unhealthy', taking it out of service. Auto Scaling terminates and replaces the instance.

```powershell
Set-ASInstanceHealth -HealthStatus Unhealthy -InstanceId i-93633f9b
```

**Example 2:** This example sets the status of the specified instance to 'Healthy', keeping it in service. Any health check grace period for the Auto Scaling group is not honored.

```powershell
Set-ASInstanceHealth -HealthStatus Healthy -InstanceId i-93633f9b -ShouldRespectGracePeriod $false
```

- For API details, see `SetInstanceHealth` in *AWS Tools for PowerShell Cmdlet Reference*.

**Set-ASInstanceProtection**

The following code example shows how to use `Set-ASInstanceProtection`.
**Tools for PowerShell**

**Example 1:** This example enables instance protection for the specified instance.

Set-ASInstanceProtection -AutoScalingGroupName my-asg -InstanceId i-12345678 -ProtectedFromScaleIn $true

**Example 2:** This example disables instance protection for the specified instance.

Set-ASInstanceProtection -AutoScalingGroupName my-asg -InstanceId i-12345678 -ProtectedFromScaleIn $false

• For API details, see [SetInstanceProtection](https://aws.amazon.com/tools/powershell-cmdlet-reference/) in **AWS Tools for PowerShell Cmdlet Reference**.

**Set-ASTag**

The following code example shows how to use Set-ASTag.

**Example 1:** This example adds a single tag to the specified Auto Scaling group. The tag key is 'myTag' and the tag value is 'myTagValue'. Auto Scaling propagates this tag to the subsequent EC2 instances launched by the Auto Scaling group. The syntax used by this example requires PowerShell version 3 or later.

Set-ASTag -Tag @( @{ResourceType="auto-scaling-group"; ResourceId="my-asg"; Key="myTag"; Value="myTagValue"; PropagateAtLaunch=$true} )

**Example 2:** With PowerShell version 2, you must use New-Object to create the tag for the Tag parameter.

$tag = New-Object Amazon.AutoScaling.Model.Tag
$tag.ResourceType = "auto-scaling-group"
$tag.ResourceId = "my-asg"
$tag.Key = "myTag"
$tag.Value = "myTagValue"
$tag.PropagateAtLaunch = $true
Set-ASTag -Tag $tag

• For API details, see [CreateOrUpdateTags](https://aws.amazon.com/tools/powershell-cmdlet-reference/) in **AWS Tools for PowerShell Cmdlet Reference**.
**Start-ASPolicy**

The following code example shows how to use Start-ASPolicy.

**Tools for PowerShell**

**Example 1:** This example executes the specified policy for the specified Auto Scaling group.

```
Start-ASPolicy -AutoScalingGroupName my-asg -PolicyName "myScaleInPolicy"
```

**Example 2:** This example executes the specified policy for the specified Auto Scaling group, after waiting for the cooldown period to complete.

```
Start-ASPolicy -AutoScalingGroupName my-asg -PolicyName "myScaleInPolicy" -HonorCooldown $true
```

- For API details, see [ExecutePolicy](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Stop-ASInstanceInAutoScalingGroup**

The following code example shows how to use Stop-ASInstanceInAutoScalingGroup.

**Tools for PowerShell**

**Example 1:** This example terminates the specified instance and decreases the desired capacity of its Auto Scaling group so that Auto Scaling does not launch a replacement instance.

```
Stop-ASInstanceInAutoScalingGroup -InstanceId i-93633f9b -ShouldDecrementDesiredCapacity $true
```

**Output:**

<table>

</tbody>
</table>
Example 2: This example terminates the specified instance without decreasing the desired capacity of its Auto Scaling group. Auto Scaling launches a replacement instance.

Stop-ASInstanceInAutoScalingGroup -InstanceId i-93633f9b -ShouldDecrementDesiredCapacity $false

Output:

• For API details, see [TerminateInstanceInAutoScalingGroup](#) in **AWS Tools for PowerShell Cmdlet Reference**.

**Suspend-ASProcess**

The following code example shows how to use **Suspend-ASProcess**.

**Tools for PowerShell**

Example 1: This example suspends the specified Auto Scaling process for the specified Auto Scaling group.
Suspend-ASProcess -AutoScalingGroupName my-asg -ScalingProcess "AlarmNotification"

Example 2: This example suspends all Auto Scaling processes for the specified Auto Scaling group.

Suspend-ASProcess -AutoScalingGroupName my-asg

• For API details, see SuspendProcesses in AWS Tools for PowerShell Cmdlet Reference.

Update-ASAutoScalingGroup

The following code example shows how to use Update-ASAutoScalingGroup.

Tools for PowerShell

Example 1: This example updates the minimum and maximum size of the specified Auto Scaling group.

Update-ASAutoScalingGroup -AutoScalingGroupName my-asg -MaxSize 5 -MinSize 1

Example 2: This example updates the default cooldown period of the specified Auto Scaling group.

Update-ASAutoScalingGroup -AutoScalingGroupName my-asg -DefaultCooldown 10

Example 3: This example updates the Availability Zones of the specified Auto Scaling group.

Update-ASAutoScalingGroup -AutoScalingGroupName my-asg -AvailabilityZone @("us-west-2a", "us-west-2b")

Example 4: This example updates the specified Auto Scaling group to use Elastic Load Balancing health checks.

Update-ASAutoScalingGroup -AutoScalingGroupName my-asg -HealthCheckType ELB -HealthCheckGracePeriod 60

• For API details, see UpdateAutoScalingGroup in AWS Tools for PowerShell Cmdlet Reference.
Write-ASLifecycleActionHeartbeat

The following code example shows how to use Write-ASLifecycleActionHeartbeat.

Tools for PowerShell

Example 1: This example records a heartbeat for the specified lifecycle action. This keeps the instance in a pending state until you complete the custom action.

```powershell
Write-ASLifecycleActionHeartbeat -AutoScalingGroupName my-asg -LifecycleHookName myLifecycleHook -LifecycleActionToken bcd2f1b8-9a78-44d3-8a7a-4dd07d7cf635
```

- For API details, see [RecordLifecycleActionHeartbeat](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Write-ASLifecycleHook

The following code example shows how to use Write-ASLifecycleHook.

Tools for PowerShell

Example 1: This example adds the specified lifecycle hook to the specified Auto Scaling group.

```powershell
```

- For API details, see [PutLifecycleHook](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Write-ASNotificationConfiguration

The following code example shows how to use Write-ASNotificationConfiguration.

Tools for PowerShell

Example 1: This example configures the specified Auto Scaling group to send a notification to the specified SNS topic when it launches EC2 instances.
Example 2: This example configures the specified Auto Scaling group to send a notification to the specified SNS topic when it launches or terminates EC2 instances.

```
```

Example 2: This example configures the specified Auto Scaling group to send a notification to the specified SNS topic when it launches or terminates EC2 instances.

```
```

- For API details, see [PutNotificationConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Write-ASScalingPolicy**

The following code example shows how to use `Write-ASScalingPolicy`.

**Tools for PowerShell**

**Example 1:** This example adds the specified policy to the specified Auto Scaling group. The specified adjustment type determines how to interpret the ScalingAdjustment parameter. With 'ChangeInCapacity', a positive value increases the capacity by the specified number of instances and a negative value decreases the capacity by the specified number of instances.

```
Write-ASScalingPolicy -AutoScalingGroupName my-asg -AdjustmentType "ChangeInCapacity" -PolicyName "myScaleInPolicy" -ScalingAdjustment -1
```

Output:

```
```

- For API details, see [PutScalingPolicy](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Write-ASScheduledUpdateGroupAction**

The following code example shows how to use `Write-ASScheduledUpdateGroupAction`.
Tools for PowerShell

Example 1: This example creates or updates a one-time scheduled action to change the desired capacity at the specified start time.

```powershell
Write-ASScheduledUpdateGroupAction -AutoScalingGroupName my-asg -ScheduledActionName "myScheduledAction" -StartTime "2015-12-01T00:00:00Z" -DesiredCapacity 10
```

- For API details, see [PutScheduledUpdateGroupAction](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

AWS Budgets examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with AWS Budgets.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

```

**Output:**
Example 2: This example gets information about the owner of the specified AWS Cloud9 development environment.

```
Get-C9EnvironmentMembershipList -EnvironmentId ffd88420d4824eeea8a04bfde8cEX -Permission owner
```

Output:

```
EnvironmentId : ffd88420d4824eeea8a04bfde8cEX
LastAccess     : 1/1/0001 12:00:00 AM
Permissions    : owner
UserArn        : arn:aws:iam::123456789012:user/MyDemoUser
UserId         : AIDAJ3LOROMOUXTBSU6EX
```

Example 3: This example gets information about the specified environment member for multiple AWS Cloud9 development environments.

```
Get-C9EnvironmentMembershipList -UserArn arn:aws:iam::123456789012:user/MyDemoUser
```

Output:

```
EnvironmentId : 1980b80e5f584920801c0908667f0EX
```
For API details, see [DescribeEnvironmentMemberships](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-C9EnvironmentStatus

The following code example shows how to use `Get-C9EnvironmentStatus`.

#### Tools for PowerShell

**Example 1:** This example gets status information for the specified AWS Cloud9 development environment.

```
Get-C9EnvironmentStatus -EnvironmentId 349c86d4579e4e7298d500ff57a6b2EX
```

#### Output:

<table>
<thead>
<tr>
<th>Message</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment is ready to use</td>
<td>ready</td>
</tr>
</tbody>
</table>

For API details, see [DescribeEnvironmentStatus](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-C9EnvironmentEC2

The following code example shows how to use `New-C9EnvironmentEC2`.

#### Tools for PowerShell

**Example 1:** This example creates an AWS Cloud9 development environment with the specified settings, launches an Amazon Elastic Compute Cloud (Amazon EC2) instance, and then connects from the instance to the environment.

```
New-C9EnvironmentEC2 -Name my-demo-env -AutomaticStopTimeMinutes 60 -Description "My demonstration development environment." -InstanceType t2.micro -OwnerArn arn:aws:iam::123456789012:user/MyDemoUser -SubnetId subnet-d43a46EX
```
Output:

```
ffd88420d4824eeeaeaa8a04bfde8cEX
```

- For API details, see [CreateEnvironmentEc2](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-C9EnvironmentMembership

The following code example shows how to use `New-C9EnvironmentMembership`.

**Tools for PowerShell**

**Example 1:** This example adds the specified environment member to the specified AWS Cloud9 development environment.

```
New-C9EnvironmentMembership -UserArn arn:aws:iam::123456789012:user/AnotherDemoUser -EnvironmentId ffd88420d4824eeeaeaa8a04bfde8cEX -Permission read-write
```

**Output:**

```
EnvironmentId : ffd88420d4824eeeaeaa8a04bfde8cEX
LastAccess    : 1/1/0001 12:00:00 AM
Permissions   : read-write
UserArn       : arn:aws:iam::123456789012:user/AnotherDemoUser
UserId        : AIDAJ3BA6GQ2FMJWCMUXHEX
```

- For API details, see [CreateEnvironmentMembership](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Remove-C9Environment

The following code example shows how to use `Remove-C9Environment`.

**Tools for PowerShell**

**Example 1:** This example deletes the specified AWS Cloud9 development environment. If an Amazon EC2 instance is connected to the environment, also terminates the instance.

```
Remove-C9Environment -EnvironmentId ffd88420d4824eeeaeaa8a04bfde8cEX
```
- For API details, see [DeleteEnvironment](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-C9EnvironmentMembership**

The following code example shows how to use Remove-C9EnvironmentMembership.

**Tools for PowerShell**

**Example 1:** This example deletes the specified environment member from the specified AWS Cloud9 development environment.

```powershell
Remove-C9EnvironmentMembership -UserArn arn:aws:iam::123456789012:user/AnotherDemoUser -EnvironmentId ffd88420d4824e824ee8aa8a04bfde8cEX
```

- For API details, see [DeleteEnvironmentMembership](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Update-C9Environment**

The following code example shows how to use Update-C9Environment.

**Tools for PowerShell**

**Example 1:** This example changes the specified settings of the specified existing AWS Cloud9 development environment.

```powershell
Update-C9Environment -EnvironmentId ffd88420d4824e824ee8aa8a04bfde8cEX -Description "My changed demonstration development environment." -Name my-changed-demo-env
```

- For API details, see [UpdateEnvironment](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Update-C9EnvironmentMembership**

The following code example shows how to use Update-C9EnvironmentMembership.

**Tools for PowerShell**

**Example 1:** This example changes the settings of the specified existing environment member for the specified AWS Cloud9 development environment.
Update-C9EnvironmentMembership -UserArn arn:aws:iam::123456789012:user/AnotherDemoUser -EnvironmentId ffd88420d4824eeea8a04bfde8cEX -Permission read-only

Output:

- EnvironmentId : ffd88420d4824eeea8a04bfde8cEX
- LastAccess    : 1/1/0001 12:00:00 AM
- Permissions   : read-only
- UserArn       : arn:aws:iam::123456789012:user/AnotherDemoUser
- UserId        : AIDAJ3BA6O2FMJWEX

- For API details, see [UpdateEnvironmentMembership](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**AWS CloudFormation examples using Tools for PowerShell**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with AWS CloudFormation.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

**Actions**

**Get-CFNS**

The following code example shows how to use Get-CFNS.
Tools for PowerShell

**Example 1:** Returns a collection of Stack instances describing all of the user's stacks.

```powershell
Get-CFNStack
```

**Example 2:** Returns a Stack instance describing the specified stack

```powershell
Get-CFNStack -StackName "myStack"
```

**Example 3:** Returns a collection of Stack instances describing all of the user's stacks using manual paging. The starting token for the next page is retrieved after every call with $null indicating no more details remain to be retrieved.

```powershell
$nextToken = $null
do {
    Get-CFNStack -NextToken $nextToken
    $nextToken = $AWSHistory.LastServiceResponse.NextToken
} while ($nextToken -ne $null)
```

- For API details, see [DescribeStacks](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-CFNStackEvent**

The following code example shows how to use Get-CFNStackEvent.

Tools for PowerShell

**Example 1:** Returns all stack related events for the specified stack.

```powershell
Get-CFNStackEvent -StackName "myStack"
```

**Example 2:** Returns all stack related events for the specified stack using manual paging starting at the specified token. The starting token for the next page is retrieved after every call with $null indicating no more events remain to be retrieved.

```powershell
$nextToken = $null
do {
    Get-CFNStackEvent -StackName "myStack" -NextToken $nextToken
```
$nextToken = $AWSHistory.LastServiceResponse.NextToken
} while ($nextToken -ne $null)

- For API details, see `DescribeStackEvents` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-CFNStackResource

The following code example shows how to use Get-CFNStackResource.

**Tools for PowerShell**

Example 1: Returns the description of a resource identified in the template associated with the specified stack by the logical ID "MyDBInstance".

```
Get-CFNStackResource -StackName "myStack" -LogicalResourceId "MyDBInstance"
```

- For API details, see `DescribeStackResource` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-CFNStackResourceList

The following code example shows how to use Get-CFNStackResourceList.

**Tools for PowerShell**

Example 1: Returns the AWS resource descriptions for up to 100 resources associated with the specified stack. To obtain details of all resources associated with a stack use the Get-CFNStackResourceSummary, which also supports manual paging of the results.

```
Get-CFNStackResourceList -StackName "myStack"
```

Example 2: Returns the description of the Amazon EC2 instance identified in the template associated with the specified stack by the logical ID "Ec2Instance".

```
Get-CFNStackResourceList -StackName "myStack" -LogicalResourceId "Ec2Instance"
```

Example 3: Returns the description of up to 100 resources associated with the stack containing an Amazon EC2 instance identified by instance ID "i-123456". To obtain details of all resources associated with a stack use the Get-CFNStackResourceSummary, which also supports manual paging of the results.
Example 4: Returns the description of the Amazon EC2 instance identified by the logical ID "Ec2Instance" in the template for a stack. The stack is identified using the physical resource ID of a resource it contains, in this case also an Amazon EC2 instance with instance ID "i-123456". A different physical resource could also be used to identify the stack depending on the template content, for example an Amazon S3 bucket.

```
Get-CFNStackResourceList -PhysicalResourceId "i-123456" -LogicalResourceId "Ec2Instance"
```

- For API details, see [DescribeStackResources](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-CFNStackResourceSummary

The following code example shows how to use Get-CFNStackResourceSummary.

**Tools for PowerShell**

**Example 1:** Returns descriptions of all the resources associated with the specified stack.

```
Get-CFNStackResourceSummary -StackName "myStack"
```

**Example 2:** Returns descriptions of all the resources associated with the specified stack using manual paging of the results. The starting token for the next page is retrieved after every call with $null indicating no more details remain to be retrieved.

```
$nextToken = $null
do {
    Get-CFNStackResourceSummary -StackName "myStack" -NextToken $nextToken
    $nextToken = $AWSHistory.LastServiceResponse.NextToken
} while ($nextToken -ne $null)
```

- For API details, see [ListStackResources](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-CFNStackSummary

The following code example shows how to use Get-CFNStackSummary.
Tools for PowerShell

Example 1: Returns summary information for all stacks.

Get-CFNStackSummary

Example 2: Returns summary information for all stacks that are currently being created.

Get-CFNStackSummary -StackStatusFilter "CREATE_IN_PROGRESS"

Example 3: Returns summary information for all stacks that are currently being created or updated.

Get-CFNStackSummary -StackStatusFilter @("CREATE_IN_PROGRESS", "UPDATE_IN_PROGRESS")

Example 4: Returns summary information for all stacks that are currently being created or updated using manual paging of the results. The starting token for the next page is retrieved after every call with $null indicating no more details remain to be retrieved.

```
$nextToken = $null
do {
    Get-CFNStackSummary -StackStatusFilter @("CREATE_IN_PROGRESS", "UPDATE_IN_PROGRESS") -NextToken $nextToken
    $nextToken = $AWSHistory.LastServiceResponse.NextToken
} while ($nextToken -ne $null)
```

- For API details, see [ListStacks](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-CFNTemplate

The following code example shows how to use Get-CFNTemplate.

Tools for PowerShell

Example 1: Returns the template associated with the specified stack.

Get-CFNTemplate -StackName "myStack"

- For API details, see [GetTemplate](#) in *AWS Tools for PowerShell Cmdlet Reference*. 
Measure-CFNTemplateCost

The following code example shows how to use Measure-CFNTemplateCost.

Tools for PowerShell

**Example 1:** Returns an AWS Simple Monthly Calculator URL with a query string that describes the resources required to run the template. The template is obtained from the specified Amazon S3 URL and the single customization parameter applied. The parameter can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'.

```powershell
 Measure-CFNTemplateCost -TemplateURL https://s3.amazonaws.com/mytemplates/templatefile.template ` `-Region us-west-1 ` `-Parameter @{ ParameterKey="KeyName"; ParameterValue="myKeyPairName" }`
```

**Example 2:** Returns an AWS Simple Monthly Calculator URL with a query string that describes the resources required to run the template. The template is parsed from the supplied content and the customization parameters applied (this example assumes the template content would have declared two parameters, 'KeyName' and 'InstanceType'). The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'.

```powershell
 Measure-CFNTemplateCost -TemplateBody "{TEMPLATE CONTENT HERE}" ` `-Parameter @( @{ ParameterKey="KeyName"; ParameterValue="myKeyPairName" },` `@{ ParameterKey="InstanceType"; ParameterValue="m1.large" } )`
```

**Example 3:** Uses New-Object to build the set of template parameters and returns an AWS Simple Monthly Calculator URL with a query string that describes the resources required to run the template. The template is parsed from the supplied content, with customization parameters (this example assumes the template content would have declared two parameters, 'KeyName' and 'InstanceType').

```powershell
$p1 = New-Object -Type Amazon.CloudFormation.Model.Parameter
$p1.ParameterKey = "KeyName"
$p1.ParameterValue = "myKeyPairName"
```
For API details, see EstimateTemplateCost in AWS Tools for PowerShell Cmdlet Reference.

New-CFNStack

The following code example shows how to use New-CFNStack.

Tools for PowerShell

Example 1: Creates a new stack with the specified name. The template is parsed from the supplied content with customization parameters ('PK1' and 'PK2' represent the names of parameters declared in the template content, 'PV1' and 'PV2' represent the values for those parameters. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'. If creation of the stack fails, it will not be rolled back.

```powershell
New-CFNStack -StackName "myStack" ` -TemplateBody "{TEMPLATE CONTENT HERE}" ` -Parameter @(
    @{ ParameterKey="PK1"; ParameterValue="PV1" },
    @{ ParameterKey="PK2"; ParameterValue="PV2" }) ` -DisableRollback $true
```

Example 2: Creates a new stack with the specified name. The template is parsed from the supplied content with customization parameters ('PK1' and 'PK2' represent the names of parameters declared in the template content, 'PV1' and 'PV2' represent the values for those parameters. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'. If creation of the stack fails, it will be rolled back.

```powershell
$p1 = New-Object -Type Amazon.CloudFormation.Model.Parameter
$p1.ParameterKey = "PK1"
$p1.ParameterValue = "PV1"

$p2 = New-Object -Type Amazon.CloudFormation.Model.Parameter
$p2.ParameterKey = "InstanceType"
$p2.ParameterValue = "m1.large"
```

Measure-CFNTemplateCost -TemplateBody "{TEMPLATE CONTENT HERE}" -Parameter @($p1, $p2)
Example 3: Creates a new stack with the specified name. The template is obtained from the Amazon S3 URL with customization parameters ('PK1' represents the name of a parameter declared in the template content, 'PV1' represents the value for the parameter. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'. If creation of the stack fails, it will be rolled back (same as specifying -DisableRollback $false).

```
New-CFNStack -StackName "myStack" `  
   -TemplateURL https://s3.amazonaws.com/mytemplates/templatefile.template `  
   -Parameter @{ ParameterKey="PK1"; ParameterValue="PV1" }
```

Example 4: Creates a new stack with the specified name. The template is obtained from the Amazon S3 URL with customization parameters ('PK1' represents the name of a parameter declared in the template content, 'PV1' represents the value for the parameter. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'. If creation of the stack fails, it will be rolled back (same as specifying -DisableRollback $false). The specified notification AENs will receive published stack-related events.

```
New-CFNStack -StackName "myStack" `  
   -TemplateURL https://s3.amazonaws.com/mytemplates/templatefile.template `  
   -Parameter @{ ParameterKey="PK1"; ParameterValue="PV1" } `  
   -NotificationARN @( "arn1", "arn2" )
```

- For API details, see CreateStack in AWS Tools for PowerShell Cmdlet Reference.

Remove-CFNStack

The following code example shows how to use Remove-CFNStack.
Tools for PowerShell

Example 1: Deletes the specified stack.

Remove-CFNStack -StackName "myStack"

- For API details, see DeleteStack in AWS Tools for PowerShell Cmdlet Reference.

Resume-CFNUpdateRollback

The following code example shows how to use Resume-CFNUpdateRollback.

Tools for PowerShell

Example 1: Continues rollback of the named stack, which should be in the state 'UPDATE_ROLLBACK_FAILED'. If the continued rollback is successful, the stack will enter state 'UPDATE_ROLLBACK_COMPLETE'.

Resume-CFNUpdateRollback -StackName "myStack"

- For API details, see ContinueUpdateRollback in AWS Tools for PowerShell Cmdlet Reference.

Stop-CFNUpdateStack

The following code example shows how to use Stop-CFNUpdateStack.

Tools for PowerShell

Example 1: Cancels an update on the specified stack.

Stop-CFNUpdateStack -StackName "myStack"

- For API details, see CancelUpdateStack in AWS Tools for PowerShell Cmdlet Reference.

Test-CFNTemplate

The following code example shows how to use Test-CFNTemplate.
Tools for PowerShell

Example 1: Validates the specified template content. The output details the capabilities, description and parameters of the template.

Test-CFNTemplate -TemplateBody "{{TEMPLATE CONTENT HERE}}"

Example 2: Validates the specified template accessed via an Amazon S3 URL. The output details the capabilities, description and parameters of the template.

- For API details, see ValidateTemplate in AWS Tools for PowerShell Cmdlet Reference.

Update-CFNSStack

The following code example shows how to use Update-CFNSStack.

Tools for PowerShell

Example 1: Updates the stack 'myStack' with the specified template and customization parameters. 'PK1' represents the name of a parameter declared in the template and 'PV1' represents its value. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'.

Update-CFNSStack -StackName "myStack" ` 
   -TemplateBody "{{Template Content Here}}" ` 
   -Parameter @{ ParameterKey="PK1"; ParameterValue="PV1" } 

Example 2: Updates the stack 'myStack' with the specified template and customization parameters. 'PK1' and 'PK2' represent the names of parameters declared in the template, 'PV1' and 'PV2' represent their requested values. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'.

Update-CFNSStack -StackName "myStack" ` 
   -TemplateBody "{{Template Content Here}}" ` 
   -Parameter @{ ParameterKey="PK1"; ParameterValue="PV1" }, 
   @{ ParameterKey="PK2"; ParameterValue="PV2" } )
Example 3: Updates the stack 'myStack' with the specified template and customization parameters. 'PK1' represents the name of a parameter declared in the template and 'PV2' represents its value. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'.

```powershell
Update-CFNStack -StackName "myStack" -TemplateBody "{Template Content Here}" -Parameters @{ ParameterKey="PK1"; ParameterValue="PV1" }
```

Example 4: Updates the stack 'myStack' with the specified template, obtained from Amazon S3, and customization parameters. 'PK1' and 'PK2' represent the names of parameters declared in the template, 'PV1' and 'PV2' represents their requested values. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'.

```powershell
Update-CFNStack -StackName "myStack" -TemplateURL https://s3.amazonaws.com/mytemplates/templatefile.template -Parameter @(
    @{ ParameterKey="PK1"; ParameterValue="PV1" },
    @{ ParameterKey="PK2"; ParameterValue="PV2" })
```

Example 5: Updates the stack 'myStack', which is assumed in this example to contain IAM resources, with the specified template, obtained from Amazon S3, and customization parameters. 'PK1' and 'PK2' represent the names of parameters declared in the template, 'PV1' and 'PV2' represents their requested values. The customization parameters can also be specified using 'Key' and 'Value' instead of 'ParameterKey' and 'ParameterValue'. Stacks containing IAM resources require you to specify the -Capabilities "CAPABILITY_IAM" parameter otherwise the update will fail with an 'InsufficientCapabilities' error.

```powershell
Update-CFNStack -StackName "myStack" -TemplateURL https://s3.amazonaws.com/mytemplates/templatefile.template -Parameter @(
    @{ ParameterKey="PK1"; ParameterValue="PV1" },
    @{ ParameterKey="PK2"; ParameterValue="PV2" }) -Capabilities "CAPABILITY_IAM"
```

- For API details, see [UpdateStack](#) in *AWS Tools for PowerShell Cmdlet Reference.*

### Actions

**Get-CFCloudFrontOriginAccessIdentity**

The following code example shows how to use Get-CFCloudFrontOriginAccessIdentity.

#### Tools for PowerShell

**Example 1:** This example returns a specific Amazon CloudFront origin access identity, specified by the `-Id` parameter. Although the `-Id` parameter is not required, if you do not specify it, no results are returned.

```powershell
Get-CFCloudFrontOriginAccessIdentity -Id E3XXXXXXXXXRT
```

**Output:**

```
CloudFrontOriginAccessIdentityConfig    Id
S3CanonicalUserId                      --
--------------------------------------
Amazon.CloudFront.Model.CloudFrontOr... E3XXXXXXXXXRT
4b6e...
```
For API details, see [GetCloudFrontOriginAccessIdentity](aws_tools_powershell) in *AWS Tools for PowerShell Cmdlet Reference*.

---

**Get-CFCloudFrontOriginAccessIdentityConfig**

The following code example shows how to use Get-CFCloudFrontOriginAccessIdentityConfig.

**Tools for PowerShell**

**Example 1:** This example returns configuration information about a single Amazon CloudFront origin access identity, specified by the `-Id` parameter. Errors occur if no `-Id` parameter is specified.

```powershell
Get-CFCloudFrontOriginAccessIdentityConfig -Id E3XXXXXXRT
```

**Output:**

<table>
<thead>
<tr>
<th>CallerReference</th>
<th>Comment</th>
</tr>
</thead>
</table>

For API details, see [GetCloudFrontOriginAccessIdentityConfig](aws_tools_powershell) in *AWS Tools for PowerShell Cmdlet Reference*.

---

**Get-CFCloudFrontOriginAccessIdentityList**

The following code example shows how to use Get-CFCloudFrontOriginAccessIdentityList.

**Tools for PowerShell**

**Example 1:** This example returns a list of Amazon CloudFront origin access identities. Because the `-MaxItem` parameter specifies a value of 2, the results include two identities.

```powershell
Get-CFCloudFrontOriginAccessIdentityList -MaxItem 2
```

**Output:**

---
AWS Tools for PowerShell

IsTruncated : True
Items       : {E326XXXXXXXXXT, E1YWXXXXXXXX9B}
Marker      :
MaxItems    : 2
NextMarker  : E1YXXXXXXXXX9B
Quantity    : 2

- For API details, see ListCloudFrontOriginAccessIdentities in AWS Tools for PowerShell Cmdlet Reference.

Get-CFDistribution

The following code example shows how to use Get-CFDistribution.

Tools for PowerShell

Example 1: Retrieves the information for a specific distribution.

Get-CFDistribution -Id EXAMPLE0000ID

- For API details, see GetDistribution in AWS Tools for PowerShell Cmdlet Reference.

Get-CFDistributionConfig

The following code example shows how to use Get-CFDistributionConfig.

Tools for PowerShell

Example 1: Retrieves the configuration for a specific distribution.

Get-CFDistributionConfig -Id EXAMPLE0000ID

- For API details, see GetDistributionConfig in AWS Tools for PowerShell Cmdlet Reference.

Get-CFDistributionList

The following code example shows how to use Get-CFDistributionList.

Tools for PowerShell

Example 1: Returns distributions.
Get-CFDistributionList

- For API details, see `ListDistributions` in *AWS Tools for PowerShell Cmdlet Reference*.

**New-CFDistribution**

The following code example shows how to use `New-CFDistribution`.

**Tools for PowerShell**

**Example 1: Creates a basic CloudFront distribution, configured with logging and caching.**

```powershell
$origin = New-Object Amazon.CloudFront.Model.Origin
$origin.DomainName = "ps-cmdlet-sample.s3.amazonaws.com"
$origin.Id = "UniqueOrigin1"
$origin.S3OriginConfig.OriginAccessIdentity = ""
New-CFDistribution
    -DistributionConfig_Enabled $true
    -DistributionConfig_Comment "Test distribution"
    -Origins_Item $origin
    -Origins_Quantity 1
    -Logging_Enabled $true
    -Logging_IncludeCookie $true
    -Logging_Bucket ps-cmdlet-sample-logging.s3.amazonaws.com
    -Logging_Prefix "help/"
    -DistributionConfig_CallerReference Client1
    -DistributionConfig_DefaultRootObject index.html
    -DefaultCacheBehavior_TargetOriginId $origin.Id
    -ForwardedValues_QueryString $true
    -Cookies_Forward all
    -WhitelistedNames_Quantity 0
    -TrustedSigners Enabled $false
    -TrustedSigners_Quantity 0

    -DefaultCacheBehavior_MinTTL 1000
    -DistributionConfig_PriceClass "PriceClass_All"
    -CacheBehaviors_Quantity 0
    -Aliases_Quantity 0
```

- For API details, see `CreateDistribution` in *AWS Tools for PowerShell Cmdlet Reference*. 
New-CFInvalidation

The following code example shows how to use New-CFInvalidation.

Tools for PowerShell

Example 1: This example creates a new invalidation on a distribution with an ID of EXAMPLENSTXAXE. The CallerReference is a unique ID chosen by the user; in this case, a time stamp representing May 15, 2019 at 9:00 a.m. is used. The $Paths variable stores three paths to image and media files that the user does not want as part of the distribution's cache. The -Paths_Quantity parameter value is the total number of paths specified in the -Paths_Item parameter.

```powershell
$Paths = "/images/*.gif", "/images/image1.jpg", "/videos/*.mp4"
New-CFInvalidation -DistributionId "EXAMPLENSTXAXE" -InvalidationBatch_CallerReference 20190515090000 -Paths_Item $Paths -Paths_Quantity 3
```

Output:

```
<table>
<thead>
<tr>
<th>Invalidation</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon.CloudFront.Model.Invalidation</td>
<td></td>
</tr>
</tbody>
</table>
```

- For API details, see [CreateInvalidation](#) in AWS Tools for PowerShell Cmdlet Reference.

New-CFSignedCookie

The following code example shows how to use New-CFSignedCookie.

Tools for PowerShell

Example 1: Creates a signed cookie to the specified resource using a canned policy. The cookie will be valid for one year.

```
$params = @{
    "ResourceUri"="http://xyz.cloudfront.net/image1.jpeg"
}
```
"KeyPairId"="AKIAIOSFODNN7EXAMPLE"
"PrivateKeyFile"="C:\pk-AKIAIOSFODNN7EXAMPLE.pem"
"ExpiresOn"=(Get-Date).AddYears(1)
}
New-CFSignedCookie @params

Output:

Expires
-------
[CloudFront-Expires, 1472227284]

Example 2: Creates a signed cookie to the specified resources using a custom policy. The cookie will be valid in 24 hours and will expire one week afterward.

$start = (Get-Date).AddHours(24)
$params = @{
    "ResourceUri"="http://xyz.cloudfront.net/content/*.jpeg"
    "KeyPairId"="AKIAIOSFODNN7EXAMPLE"
    "PrivateKeyFile"="C:\pk-AKIAIOSFODNN7EXAMPLE.pem"
    "ExpiresOn"=$start.AddDays(7)
    "ActiveFrom"=$start
}
New-CFSignedCookie @params

Output:

New-CFSignedUrl

The following code example shows how to use New-CFSignedUrl.

Tools for PowerShell

Example 1: Creates a signed url to the specified resource using a canned policy. The url will be valid for one hour. A System.Uri object containing the signed url is emitted to the pipeline.

$params = @{
    "ResourceUri"="https://cdn.example.com/index.html"

CloudTrail examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios
by using the AWS Tools for PowerShell with CloudTrail.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you
how to call individual service functions, you can see actions in context in their related scenarios and
cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple
functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run
the code in context.

### Find-CTEvent

The following code example shows how to use Find-CTEvent.

#### Tools for PowerShell

**Example 1:** Returns all events that have occurred over the last seven days. The cmdlet by default automatically makes multiple calls to deliver all events, exiting when the service indicates no further data is available.

```powershell
Find-CTEvent
```

**Example 2:** Returns all events that have occurred over the last seven days specifying a region that is not the current shell default.

```powershell
Find-CTEvent -Region eu-central-1
```

**Example 3:** Returns all events that are associated with the RunInstances API call.

```powershell
Find-CTEvent -LookupAttribute @{ AttributeKey="EventName"; AttributeValue="RunInstances" }
```

**Example 4:** Returns the first 5 available events. The token to use to retrieve further events is attached as a note property named 'NextToken' to the `$AWSHistory.LastServiceResponse` member.

```powershell
Find-CTEvent -MaxResult 5
```

**Example 5:** Returns the next 10 events using the 'next page' token from a previous call to indicate where to start returning events from in the sequence.

```powershell
Find-CTEvent -MaxResult 10 -NextToken $AWSHistory.LastServiceResponse.NextToken
```

**Example 6:** This example shows how to loop through the available events using manual paging, fetching a maximum of 5 events per call.
$nextToken = $null
do{
    Find-CTEvent -MaxResult 5 -NextToken $nextToken
    $nextToken = $AWSHistory.LastServiceResponse.NextToken
} while ($nextToken -ne $null)

• For API details, see LookupEvents in AWS Tools for PowerShell Cmdlet Reference.

Get-CTTrail

The following code example shows how to use Get-CTTrail.

Tools for PowerShell

Example 1: Returns the settings of all trails associated with the current region for your account.

Get-CTTrail

Example 2: Returns the settings for the specified trails.

Get-CTTrail -TrailNameList trail1,trail2

Example 3: Returns the settings for the specified trails that were created in a region other than the current shell default (in this case the Frankfurt (eu-central-1) region).

Get-CTTrail -TrailNameList trailABC,trailDEF -Region eu-central-1

• For API details, see DescribeTrails in AWS Tools for PowerShell Cmdlet Reference.

Get-CTTrailStatus

The following code example shows how to use Get-CTTrailStatus.

Tools for PowerShell

Example 1: Returns status information for the trail with name 'myExampleTrail'. Returned data includes information on delivery errors, Amazon SNS and Amazon S3 errors, and start...
and stop logging times for the trail. This example assumes the trail was created in the same region as the current shell default.

Get-CTTrailStatus -Name myExampleTrail

Example 2: Returns status information for a trail that was created in a region other than the current shell default (in this case, the Frankfurt (eu-central-1) region).

Get-CTTrailStatus -Name myExampleTrail -Region eu-central-1

- For API details, see GetTrailStatus in AWS Tools for PowerShell Cmdlet Reference.

New-CTTrail

The following code example shows how to use New-CTTrail.

Tools for PowerShell

Example 1: Creates a trail that will use the bucket 'mycloudtrailbucket' for log file storage.

New-CTTrail -Name="awscloudtrail-example" -S3BucketName="mycloudtrailbucket"

Example 2: Creates a trail that will use the bucket 'mycloudtrailbucket' for log file storage. The S3 objects representing the logs will have a common key prefix of 'mylogs'. When new logs are delivered to the bucket a notification will be sent to the SNS topic 'mlog-deliverytopic'. This example using splatting to supply the parameter values to the cmdlet.

$params = @{
    Name="awscloudtrail-example"
    S3BucketName="mycloudtrailbucket"
    S3KeyPrefix="mylogs"
    SnsTopicName="mlog-deliverytopic"
}
New-CTTrail @params

- For API details, see CreateTrail in AWS Tools for PowerShell Cmdlet Reference.

Remove-CTTrail

The following code example shows how to use Remove-CTTrail.
Tools for PowerShell

Example 1: Deletes the specified trail. You will be prompted for confirmation before the command is run. To suppress confirmation, add the -Force switch parameter.

``` powershell
Remove-CTTrail -Name "awscloudtrail-example"
```

- For API details, see [DeleteTrail](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Start-CTLogging

The following code example shows how to use Start-CTLogging.

Tools for PowerShell

Example 1: Starts the recording of AWS API calls and log file delivery for the trail named 'myExampleTrail'. This example assumes the trail was created in the same region as the current shell default.

``` powershell
Start-CTLogging -Name myExampleTrail
```

Example 2: Starts the recording of AWS API calls and log file delivery for a trail that was created in a region other than the current shell default (in this case, the Frankfurt (eu-central-1) region).

``` powershell
Start-CTLogging -Name myExampleTrail -Region eu-central-1
```

- For API details, see [StartLogging](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Stop-CTLogging

The following code example shows how to use Stop-CTLogging.

Tools for PowerShell

Example 1: Suspends the recording of AWS API calls and log file delivery for the trail named 'myExampleTrail'. This example assumes the trail was created in the same region as the current shell default.
Stop-CTLogging -Name myExampleTrail

Example 2: Suspends the recording of AWS API calls and log file delivery for a trail that was created in a region other than the current shell default (in this case, the Frankfurt (eu-central-1) region).

Stop-CTLogging -Name myExampleTrail -Region eu-central-1

• For API details, see StopLogging in AWS Tools for PowerShell Cmdlet Reference.

Update-CTTrail

The following code example shows how to use Update-CTTrail.

Tools for PowerShell

Example 1: Updates the specified trail so that global service events (such as those from IAM) are recorded and changes the common key prefix of the log files going forwards to be 'globallogs'.

Update-CTTrail -Name "awscloudtrail-example" -IncludeGlobalServiceEvents $true -S3KeyPrefix "globallogs"

Example 2: Updates the specified trail so notifications about new log deliveries are sent to the specified SNS topic.

Update-CTTrail -Name "awscloudtrail-example" -SnsTopicName "mlog-deliverytopic2"

Example 3: Updates the specified trail so logs are delivered to a different bucket.

Update-CTTrail -Name "awscloudtrail-example" -S3BucketName "otherlogs"

• For API details, see UpdateTrail in AWS Tools for PowerShell Cmdlet Reference.

CloudWatch examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with CloudWatch.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Get-CWDashboard

The following code example shows how to use Get-CWDashboard.

Tools for PowerShell

Example 1: Returns the arn the body of the specified dashboard.

Get-CWDashboard -DashboardName Dashboard1

Output:

<table>
<thead>
<tr>
<th>DashboardArn</th>
<th>DashboardBody</th>
</tr>

</tr>
</tbody>
</table>

• For API details, see GetDashboard in AWS Tools for PowerShell Cmdlet Reference.

Get-CWDashboardList

The following code example shows how to use Get-CWDashboardList.

Tools for PowerShell

Example 1: Returns the collection of dashboards for your account.
Get-CWDashboardList

Output:

<table>
<thead>
<tr>
<th>DashboardArn</th>
<th>DashboardName</th>
<th>LastModified</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>arn:...</td>
<td>Dashboard1</td>
<td>7/6/2017 8:14:15 PM</td>
<td>252</td>
</tr>
</tbody>
</table>

Example 2: Returns the collection of dashboards for your account whose names start with the prefix 'dev'.

Get-CWDashboardList -DashboardNamePrefix dev

- For API details, see ListDashboards in AWS Tools for PowerShell Cmdlet Reference.

Remove-CWDashboard

The following code example shows how to use Remove-CWDashboard.

Tools for PowerShell

Example 1: Deletes the specified dashboard, promoting for confirmation before proceeding. To bypass confirmation add the -Force switch to the command.

Remove-CWDashboard -DashboardName Dashboard1

- For API details, see DeleteDashboards in AWS Tools for PowerShell Cmdlet Reference.

Write-CWDashboard

The following code example shows how to use Write-CWDashboard.

Tools for PowerShell

Example 1: Creates or updates the dashboard named 'Dashboard1' to include two metric widgets side by side.

```powershell
$dashBody = @
{
    "widgets":[
```
```json
[
  {
    "type": "metric",
    "x": 0,
    "y": 0,

    "properties": {
      "metrics": [
        ["AWS/EC2",
         "CPUUtilization",
         "InstanceId",
         "i-012345"
        ],
        ["AWS/S3",
         "BucketSizeBytes",
         "BucketName",
         "MyBucketName"
        ],
        ],
      "period": 300,
      "stat": "Average",
      "region": "us-east-1",
      "title": "EC2 Instance CPU"
    }
  },
  {

        ],
      "period": 86400,
      "stat": "Maximum",
      "region": "us-east-1",
      "title": "MyBucketName bytes"
    }
  }
]
```
Example 2: Creates or updates the dashboard, piping the content describing the dashboard into the cmdlet.

```powershell
$dashBody =@
{
...
}@ $dashBody | Write-CWDashboard -DashboardName Dashboard1
```

### Write-CWMetricData

The following code example shows how to use Write-CWMetricData.

**Tools for PowerShell**

**Example 1: Creates a new MetricDatum object, and writes it to Amazon Web Services CloudWatch Metrics.**

```powershell
### Create a MetricDatum .NET object
$Metric = New-Object -TypeName Amazon.CloudWatch.Model.MetricDatum
$Metric.Timestamp = [DateTime]::UtcNow
$Metric.MetricName = 'CPU'
$Metric.Value = 50

### Write the metric data to the CloudWatch service
Write-CWMetricData -Namespace instance1 -MetricData $Metric
```

- For API details, see [PutMetricData](https://aws.amazon.com/tools/powershell) in AWS Tools for PowerShell Cmdlet Reference.

### CodeCommit examples using Tools for PowerShell

Get-CDDeploymentConfigList

The following code example shows how to use Get-CDDeploymentConfigList.

Tools for PowerShell

Example 1: This example gets a list of available deployment configurations.

```
Get-CDDeploymentConfigList
```

Output:

```

**Get-CDDeploymentGroupList**

The following code example shows how to use `Get-CDDeploymentGroupList`.

**Tools for PowerShell**

**Example 1: This example gets a list of deployment groups for the specified application.**

```powershell
Get-CDDeploymentGroupList -ApplicationName CodeDeployDemoApplication
```

**Output:**

```

i-274e22EX
i-3b4e22EX

• For API details, see ListDeploymentInstances in AWS Tools for PowerShell Cmdlet Reference.
Get-CDDeploymentList

The following code example shows how to use Get-CDDeploymentList.

Tools for PowerShell

Example 1: This example gets a list of deployment IDs for the specified application and deployment group.

```powershell
Get-CDDeploymentList -ApplicationName CodeDeployDemoApplication -DeploymentGroupName CodeDeployDemoFleet
```

Output:

```

```

- For API details, see ListDeployments in AWS Tools for PowerShell Cmdlet Reference.

Get-CDOnPremiseInstance

The following code example shows how to use Get-CDOnPremiseInstance.

Tools for PowerShell

Example 1: This example gets information about the specified on-premises instance.

```powershell
Get-CDOnPremiseInstance -InstanceName AssetTag12010298EX
```

Output:

Get-CDOnPremiseInstanceList

The following code example shows how to use Get-CDOnPremiseInstanceList.

Tools for PowerShell

Example 1: This example gets a list of available on-premises instance names.

```powershell
Get-CDOnPremiseInstanceList
```
Output:

AssetTag12010298EX

- For API details, see [ListOnPremisesInstances](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-CDApplication**

The following code example shows how to use `New-CDApplication`.

**Tools for PowerShell**

**Example 1: This example creates a new application with the specified name.**

```
New-CDApplication -ApplicationName MyNewApplication
```

**Output:**

```
f19e4b61-2231-4328-b0fd-e57f5EXAMPLE
```

- For API details, see [CreateApplication](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-CDDeployment**

The following code example shows how to use `New-CDDeployment`.

**Tools for PowerShell**

**Example 1: This example creates a new deployment for the specified application and deployment group with the specified deployment configuration and application revision.**

```
New-CDDeployment -ApplicationName MyNewApplication -S3Location_Bucket MyBucket -S3Location_BundleType zip -DeploymentConfigName CodeDeployDefault.OneAtATime -DeploymentGroupName MyNewDeploymentGroup -IgnoreApplicationStopFailures $True -S3Location_Key aws-codedeploy_linux-master.zip -RevisionType S3
```

**Output:**
Example 2: This example shows how to specify groups of EC2 instance tags that an instance must be identified by in order for it to be included in the replacement environment for a blue/green deployment.

```powershell
New-CDDeployment -ApplicationName MyNewApplication -S3Location_Bucket MyBucket -S3Location_BundleType zip -DeploymentConfigName CodeDeployDefault.OneAtATime -DeploymentGroupName MyNewDeploymentGroup -IgnoreApplicationStopFailures $True -S3Location_Key aws-codedeploy_linux-master.zip -RevisionType S3 -Ec2TagSetList @(@{Key="key1";Type="KEY_ONLY"},@{Key="Key2";Type="KEY_AND_VALUE";Value="Value2"}),@({Key="Key3";Type="VALUE_ONLY";Value="Value3"})

- For API details, see [CreateDeployment](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-CDDeploymentConfig

The following code example shows how to use `New-CDDeploymentConfig`.

**Tools for PowerShell**

Example 1: This example creates a new deployment configuration with the specified name and behavior.

```powershell
New-CDDeploymentConfig -DeploymentConfigName AtLeastTwoHealthyHosts -MinimumHealthyHosts_Type HOST_COUNT -MinimumHealthyHosts_Value 2
```

**Output:**

- For API details, see [CreateDeploymentConfig](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-CDDeploymentGroup

The following code example shows how to use `New-CDDeploymentGroup`.
Tools for PowerShell

**Example 1:** This example creates a deployment group with the specified name, Auto Scaling group, deployment configuration, tag, and service role, for the specified application.

```powershell
-DeploymentGroupName MyNewDeploymentGroup -Ec2TagFilter @{Key="Name"; Type="KEY_AND_VALUE"; Value="CodeDeployDemo"} -ServiceRoleArn arn:aws:iam::80398EXAMPLE:role/CodeDeployDemo
```

**Output:**

16bbf199-95fd-40fc-a909-0bbcfEXAMPLE

**Example 2:** This example shows how to specify groups of EC2 instance tags that an instance must be identified by in order for it to be included in the replacement environment for a blue/green deployment.

```powershell
-DeploymentGroupName MyNewDeploymentGroup -Ec2TagFilter @{Key="Name"; Type="KEY_AND_VALUE"; Value="CodeDeployDemo"} -ServiceRoleArn arn:aws:iam::80398EXAMPLE:role/CodeDeployDemo -Ec2TagSetList @({Key="key1";Type="KEY_ONLY"},@{Key="Key2";Type="KEY_AND_VALUE";Value="Value2"}),@({Key="key3"; Type="VALUE_ONLY"; Value="Value3"})
```

**Output:**

16bbf199-95fd-40fc-a909-0bbcfEXAMPLE

- For API details, see [CreateDeploymentGroup](#) in AWS Tools for PowerShell Cmdlet Reference.

**Register-CDApplicationRevision**

The following code example shows how to use Register-CDApplicationRevision.

Tools for PowerShell

**Example 1:** This example registers an application revision with the specified Amazon S3 location, for the specified application.
Register-CDApplicationRevision -ApplicationName MyNewApplication -S3Location_Bucket MyBucket -S3Location_BundleType zip -S3Location_Key aws-codedeploy_linux-master.zip -Revision_RevisionType S3

- For API details, see `RegisterApplicationRevision` in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-CDOnPremiseInstance**

The following code example shows how to use `Register-CDOnPremiseInstance`.

**Tools for PowerShell**

**Example 1:** This example registers an on-premises instance with the specified name and IAM user.

```
Register-CDOnPremiseInstance -IamUserArn arn:aws:iam::80398EXAMPLE:user/CodeDeployDemoUser -InstanceName AssetTag12010298EX
```

- For API details, see `RegisterOnPremisesInstance` in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-CDApplication**

The following code example shows how to use `Remove-CDApplication`.

**Tools for PowerShell**

**Example 1:** This example deletes the application with the specified name. The command will prompt for confirmation before proceeding. Add the -Force parameter to delete the application without a prompt.

```
Remove-CDApplication -ApplicationName MyNewApplication
```

- For API details, see `DeleteApplication` in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-CDDeploymentConfig**

The following code example shows how to use `Remove-CDDeploymentConfig`. 
Tools for PowerShell

Example 1: This example deletes the deployment configuration with the specified name. The command will prompt for confirmation before proceeding. Add the -Force parameter to delete the deployment configuration without a prompt.

```powershell
Remove-CDDeploymentConfig -DeploymentConfigName AtLeastTwoHealthyHosts
```

- For API details, see [DeleteDeploymentConfig](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-CDDeploymentGroup

The following code example shows how to use Remove-CDDeploymentGroup.

Tools for PowerShell

Example 1: This example deletes the deployment group with the specified name for the specified application. The command will prompt for confirmation before proceeding. Add the -Force parameter to delete the deployment group without a prompt.

```powershell
Remove-CDDeploymentGroup -ApplicationName MyNewApplication -DeploymentGroupName MyNewDeploymentGroup
```

- For API details, see [DeleteDeploymentGroup](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-CDOnPremiseInstanceTag

The following code example shows how to use Remove-CDOnPremiseInstanceTag.

Tools for PowerShell

Example 1: This example deletes the specified tag for the on-premises instance with the specified name. The command will prompt for confirmation before proceeding. Add the -Force parameter to delete the tag without a prompt.

```powershell
Remove-CDOnPremiseInstanceTag -InstanceName AssetTag12010298EX -Tag @{"Key" = "Name"; "Value" = "CodeDeployDemo-OnPrem"}
```

- For API details, see [RemoveTagsFromOnPremisesInstances](#) in *AWS Tools for PowerShell Cmdlet Reference*. 
Stop-CDDeployment

The following code example shows how to use Stop-CDDeployment.

Tools for PowerShell

Example 1: This example attempts to stop the deployment with the specified deployment ID.

```
Stop-CDDeployment -DeploymentId d-LJQNREYEX
```

Output:

<table>
<thead>
<tr>
<th>Status</th>
<th>StatusMessage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>Stopping Pending. Stopping to schedule commands in the deployment instances</td>
</tr>
</tbody>
</table>

- For API details, see StopDeployment in AWS Tools for PowerShell Cmdlet Reference.

Unregister-CDOnPremiseInstance

The following code example shows how to use Unregister-CDOnPremiseInstance.

Tools for PowerShell

Example 1: This example deregisters the on-premises instance with the specified name.

```
Unregister-CDOnPremiseInstance -InstanceName AssetTag12010298EX
```

- For API details, see DeregisterOnPremisesInstance in AWS Tools for PowerShell Cmdlet Reference.

Update-CDAplication

The following code example shows how to use Update-CDAplication.

Tools for PowerShell

Example 1: This example changes the name of the specified application.
Update-CDApplication -ApplicationName MyNewApplication -NewApplicationName MyNewApplication-2

- For API details, see UpdateApplication in AWS Tools for PowerShell Cmdlet Reference.

Update-CDDeploymentGroup

The following code example shows how to use Update-CDDeploymentGroup.

Tools for PowerShell

Example 1: This example changes the name of the specified deployment group for the specified application.

Example 2: This example shows how to specify groups of EC2 instance tags that an instance must be identified by in order for it to be included in the replacement environment for a blue/green deployment.

Update-CDDeploymentGroup -ApplicationName MyNewApplication -CurrentDeploymentGroupName MyNewDeploymentGroup -NewDeploymentGroupName MyNewDeploymentGroup-2 -Ec2TagSetList @(@{Key="key1";Type="KEY_ONLY"},@{Key="Key2";Type="KEY_AND_VALUE";Value="Value2"}),@(@{Key="Key3";Type="VALUE_ONLY";Value="Value3"})

- For API details, see UpdateDeploymentGroup in AWS Tools for PowerShell Cmdlet Reference.

CodePipeline examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with CodePipeline.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.
Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Disable-CPStageTransition**

The following code example shows how to use `Disable-CPStageTransition`.

**Tools for PowerShell**

**Example 1:** This example disables the inbound transition for the specified stage in the specified pipeline.

```powershell
Disable-CPStageTransition -PipelineName CodePipelineDemo -Reason "Disabling temporarily." -StageName Beta -TransitionType Inbound
```

- For API details, see **DisableStageTransition** in *AWS Tools for PowerShell Cmdlet Reference*. 
Enable-CPStageTransition

The following code example shows how to use Enable-CPStageTransition.

Tools for PowerShell

Example 1: This example enables the inbound transition for the specified stage in the specified pipeline.

```powershell
Enable-CPStageTransition -PipelineName CodePipelineDemo -StageName Beta -TransitionType Inbound
```

- For API details, see [EnableStageTransition](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-CPActionType

The following code example shows how to use Get-CPActionType.

Tools for PowerShell

Example 1: This example gets information about all available actions for the specified owner.

```powershell

**Amazon Cognito Identity examples using Tools for PowerShell**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Amazon Cognito Identity.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

• For API details, see DescribeIdentityPool in AWS Tools for PowerShell Cmdlet Reference.

Get-CGIIdentityPoolList

The following code example shows how to use Get-CGIIdentityPoolList.

Tools for PowerShell

Example 1: Retrieves a list of existing Identity Pools.

Get-CGIIdentityPoolList

Output:
Identity Pool Id | Identity Pool Name

Get-CFGAggregateComplianceByConfigRuleList

The following code example shows how to use Get-CFGAggregateComplianceByConfigRuleList.

**Tools for PowerShell**

**Example 1:** This example fetches the details from ConfigurationAggregator 'kaju' filtering for the given config rule and expands/returns the 'Compliance' of the rule.

```powershell
Get-CFGAggregateComplianceByConfigRuleList -ConfigurationAggregatorName kaju -Filters_ConfigRuleName ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK | Select-Object -ExpandProperty Compliance

The following code example shows how to use Get-CFGAggregateConfigRuleComplianceSummary.

**Tools for PowerShell**

**Example 1:** This example returns the number of noncompliant rules for the given aggregator.

```powershell
```

**Output:**

<table>
<thead>
<tr>
<th>CapExceeded</th>
<th>CappedCount</th>

• For API details, see `GetAggregateConfigRuleComplianceSummary` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-CFGAggregateDiscoveredResourceCount

The following code example shows how to use Get-CFGAggregateDiscoveredResourceCount.

**Tools for PowerShell**

**Example 1:** This example returns the resource count for the given aggregator filtered for region us-east-1.

```powershell
Get-CFGAggregateDiscoveredResourceCount -ConfigurationAggregatorName Master -Filters Region us-east-1
```
Output:

Example 2: This example returns the resource count grouped by RESOURCE_TYPE for the filtered region for the given aggregator.

```powershell
Get-CFGAggregateDiscoveredResourceCount -ConfigurationAggregatorName Master -Filters_Region us-east-1 -GroupByKey RESOURCE_TYPE | Select-Object -ExpandProperty GroupedResourceCounts
```

Output:

### Get-CFGAggregateDiscoveredResourceList

The following code example shows how to use `Get-CFGAggregateDiscoveredResourceList`.

**Tools for PowerShell**

**Example 1:** This example returns the resource identifiers for the given resource type aggregated in 'Ireland' aggregator. For the list of resource types, please check [https://docs.aws.amazon.com/sdkfornet/v3/apidocs/index.html?page=ConfigService/TConfigServiceResourceType.html&tocid=Amazon_ConfigService_ResourceType](https://docs.aws.amazon.com/sdkfornet/v3/apidocs/index.html?page=ConfigService/TConfigServiceResourceType.html&tocid=Amazon_ConfigService_ResourceType).

```powershell
Get-CFGAggregateDiscoveredResourceList -ConfigurationAggregatorName Ireland - ResourceType ([Amazon.ConfigService.ResourceType]::AWSAutoScalingAutoScalingGroup)
```

**Output:**

<table>
<thead>
<tr>
<th>ResourceId</th>

</tr>
</tbody>
</table>

**Example 2:** This example returns the resource type `AwsEC2SecurityGroup` named 'default' for the given aggregator filtered with region us-east-1.

```powershell
Get-CFGAggregateDiscoveredResourceList -ConfigurationAggregatorName raju - ResourceType ([Amazon.ConfigService.ResourceType]::AWSEC2SecurityGroup) - FiltersRegion us-east-1 -FiltersResourceName default
```

**Output:**

### Get-CFGAggregateResourceConfig

The following code example shows how to use Get-CFGAggregateResourceConfig.

#### Tools for PowerShell

**Example 1: This example returns the Configuration Item for the given resource aggregated and expands Configuration.**

```
(Get-CFGAggregateResourceConfig -ResourceIdentifier_SourceRegion us-east-1 -ResourceIdentifier_SourceAccountId 123456789012 -ResourceIdentifier_ResourceId sg-4fc1d234 -ResourceIdentifier_ResourceType ([Amazon.ConfigService.ResourceType]::AWSEC2SecurityGroup) -ConfigurationAggregatorName raju).Configuration | ConvertFrom-Json
```

**Output:**

```json

```
For API details, see GetAggregateResourceconfig-service in AWS Tools for PowerShell Cmdlet Reference.

**Get-CFGAggregateResourceConfigBatch**

The following code example shows how to use Get-CFGAggregateResourceConfigBatch.

**Tools for PowerShell**

**Example 1:** This example fetches current configuration item for resource (identified) present in the given aggregator.

```powershell
$resIdentifier=[Amazon.ConfigService.Model.AggregateResourceIdentifier]@{
    ResourceId= "i-012e3cb4df567e8aa"
    ResourceName = "arn:aws:ec2:eu-west-1:123456789012:instance/i-012e3cb4df567e8aa"
    ResourceType = [Amazon.ConfigService.ResourceType]::AWSEC2Instance
    SourceAccountId = "123456789012"
    SourceRegion = "eu-west-1"
}

Get-CFGAggregateResourceConfigBatch -ResourceIdentifier $resIdentifier -ConfigurationAggregatorName raju
```

**Output:**

```
BaseConfigurationItems UnprocessedResourceIdentifiers
---------------------- ------------------------------
{}                     {arn:aws:ec2:eu-west-1:123456789012:instance/i-012e3cb4df567e8aa}
```

For API details, see BatchGetAggregateResourceconfig-service in AWS Tools for PowerShell Cmdlet Reference.

**Get-CFGAggregationAuthorizationList**

The following code example shows how to use Get-CFGAggregationAuthorizationList.
Example 1: This example retrieves authorizations granted to aggregators.

```
Get-CFGAggregationAuthorizationList
```

Output:

```
AggregationAuthorizationArn         AuthorizedAccountId AuthorizedAwsRegion CreationTime
---------------------------------- ------------------- ------------------- --------------------------
```

- For API details, see [DescribeAggregationAuthorizations](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-CFGComplianceByConfigRule

The following code example shows how to use Get-CFGComplianceByConfigRule.

Example 1: This example retrieves compliances details for the rule ebs-optimized-instance, for which there is no current evaluation results for the rule, hence it returns INSUFFICIENT_DATA

```
(Get-CFGComplianceByConfigRule -ConfigRuleName ebs-optimized-instance).Compliance
```

Output:

```
ComplianceContributorCount ComplianceType
---------------------------------- --------------
INSUFFICIENT_DATA
```

Example 2: This example returns the number of non-compliant resources for the rule ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK.
(Get-CFGComplianceByConfigRule -ConfigRuleName ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK -ComplianceType NON_COMPLIANT).Compliance.ComplianceContributorCount

Output:

<table>
<thead>
<tr>
<th>CapExceeded</th>
<th>CappedCount</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>2</td>
</tr>
</tbody>
</table>

- For API details, see `DescribeComplianceByConfigRule` in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-CFGComplianceByResource**

The following code example shows how to use `Get-CFGComplianceByResource`.

**Tools for PowerShell**

**Example 1**: This example checks the `AWS::SSM::ManagedInstanceInventory` resource type for 'COMPLIANT' compliance type.

Get-CFGComplianceByResource -ComplianceType COMPLIANT -ResourceType AWS::SSM::ManagedInstanceInventory

Output:

<table>
<thead>
<tr>
<th>Compliance</th>
<th>ResourceId</th>
<th>ResourceType</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon.ConfigService.Model.Compliance</td>
<td>i-0123bcf4b567890e3</td>

<td>i-0a1234f6f5d6b78f7</td>
<td>AWS::SSM::ManagedInstanceInventory</td>
</tr>
</tbody>
</table>

- For API details, see `DescribeComplianceByResource` in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-CFGComplianceDetailsByConfigRule**

The following code example shows how to use `Get-CFGComplianceDetailsByConfigRule`.

AWS Config

277
Example 1: This example obtains the evaluation results for the rule access-keys-rotated and returns the output grouped by compliance-type

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-keys-rotated | Group-Object ComplianceType
```

Output:

```
Count Name                      Group
----- ----                      ----- 
  2 COMPLIANT                 {Amazon.ConfigService.Model.EvaluationResult,
                               Amazon.ConfigService.Model.EvaluationResult}
  5 NON_COMPLIANT             {Amazon.ConfigService.Model.EvaluationResult,
                               Amazon.ConfigService.Model.EvaluationResult,
```

Example 2: This example queries compliance details for the rule access-keys-rotated for COMPLIANT resources.

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-keys-rotated -ComplianceType COMPLIANT | ForEach-Object
   {$_ .EvaluationResultIdentifier.EvaluationResultQualifier}
```

Output:

```
ConfigRuleName      ResourceId            ResourceType
--------------      ----------            ------------
access-keys-rotated BCAB1CDJ2LITAPVEW3JAH AWS::IAM::User
access-keys-rotated BCAB1CDJ2LITL3EHREM4Q  AWS::IAM::User
```

- For API details, see [GetComplianceDetailsByConfigRule](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-CFGComplianceDetailsByResource

The following code example shows how to use Get-CFGComplianceDetailsByResource.
Tools for PowerShell

Example 1: This example evaluation results for the given resource.

```powershell
Get-CFGComplianceDetailsByResource -ResourceId ABCD5STJ4EFGHIVEW6JAH -ResourceType 'AWS::IAM::User'
```

Output:

```
Annotation :

ResultToken : 
```

- For API details, see [GetComplianceDetailsByResource](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-CFGComplianceSummaryByConfigRule

The following code example shows how to use Get-CFGComplianceSummaryByConfigRule.

Tools for PowerShell

Example 1: This sample returns the number of Config rules that are non-compliant.

```powershell
Get-CFGComplianceSummaryByConfigRule -Select ComplianceSummary.NonCompliantResourceCount
```

Output:

```
CapExceeded CappedCount
------------ -----------
False        9
```

- For API details, see [GetComplianceSummaryByConfigRule](#) in *AWS Tools for PowerShell Cmdlet Reference*.
Get-CFGComplianceSummaryByResourceType

The following code example shows how to use Get-CFGComplianceSummaryByResourceType.

Tools for PowerShell

**Example 1:** This sample returns the number of resources that are compliant or noncompliant and converts the output to json.

```powershell
Get-CFGComplianceSummaryByResourceType -Select ComplianceSummariesByResourceType.ComplianceSummary | ConvertTo-Json
{
    "ComplianceSummaryTimestamp": "2019-12-14T06:14:49.778Z",
    "CompliantResourceCount": {
        "CapExceeded": false,
        "CappedCount": 2
    },
    "NonCompliantResourceCount": {
        "CapExceeded": true,
        "CappedCount": 100
    }
}
```

- For API details, see [GetComplianceSummaryByResourceType](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-CFGConfigRule

The following code example shows how to use Get-CFGConfigRule.

Tools for PowerShell

**Example 1:** This sample lists config rules for the account, with selected properties.

```powershell
Get-CFGConfigRule | Select-Object ConfigRuleName, ConfigRuleId, ConfigRuleArn, ConfigRuleState
```

**Output:**

<table>
<thead>
<tr>
<th>ConfigRuleName</th>
<th>ConfigRuleId</th>
<th>ConfigRuleArn</th>
<th>ConfigRuleState</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Get-CFGConfigRuleEvaluationStatus

The following code example shows how to use Get-CFGConfigRuleEvaluationStatus.

**Tools for PowerShell**

**Example 1:** This sample returns the status information for the given config rules.

```
Get-CFGConfigRuleEvaluationStatus -ConfigRuleName root-account-mfa-enabled, vpc-flow-logs-enabled
```

**Output:**

```
ConfigRuleArn                          : arn:aws:config:eu-west-1:123456789012:config-rule/config-rule-kvq1wk

• For API details, see DescribeConfigurationAggregators in AWS Tools for PowerShell Cmdlet Reference.
Get-CFGConfigurationAggregatorSourcesStatus

The following code example shows how to use Get-CFGConfigurationAggregatorSourcesStatus.

Tools for PowerShell

Example 1: This sample displays requested fields for the sources in the given aggregator.

```
Get-CFGConfigurationAggregatorSourcesStatus -ConfigurationAggregatorName raju | select SourceType, LastUpdateStatus, LastUpdateTime, SourceId
```

Output:

Get-CFGConfigurationRecorder

The following code example shows how to use Get-CFGConfigurationRecorder.

Tools for PowerShell

Example 1: This example returns the details of configuration recorders.

```
Get-CFGConfigurationRecorder | Format-List
```

Output:

| Name : default |
RecordingGroup : Amazon.ConfigService.Model.RecordingGroup
RoleARN        : arn:aws:iam::123456789012:role/aws-service-role/config.amazonaws.com/AWSServiceRoleForConfig

- For API details, see [DescribeConfigurationRecorders](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-CFGConfigurationRecorderStatus

The following code example shows how to use Get-CFGConfigurationRecorderStatus.

**Tools for PowerShell**

**Example 1:** This sample returns status of the configuration recorders.

```powershell
Get-CFGConfigurationRecorderStatus
```

**Output:**

```
LastErrorCode : 
LastErrorMessage : 
LastStatus     : Success

- For API details, see [DescribeConfigurationRecorderStatus](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-CFGConformancePack

The following code example shows how to use Get-CFGConformancePack.

**Tools for PowerShell**

**Example 1:** This sample lists all conformance packs.

```powershell
Get-CFGConformancePack
```
Output:

<table>

- For API details, see DescribeConformancePacks in AWS Tools for PowerShell Cmdlet Reference.

Get-CFGDeliveryChannel

The following code example shows how to use Get-CFGDeliveryChannel.

Tools for PowerShell

Example 1: This example retrieves the delivery channel for the region and displays details.

```
Get-CFGDeliveryChannel -Region eu-west-1 | Select-Object Name, S3BucketName, S3KeyPrefix, @{N="DeliveryFrequency";E={$_.ConfigSnapshotDeliveryProperties.DeliveryFrequency}}
```

Output:

- For API details, see DescribeDeliveryChannels in AWS Tools for PowerShell Cmdlet Reference.

Get-CFGResourceTag

The following code example shows how to use Get-CFGResourceTag.

Tools for PowerShell

Example 1: This example lists associated tags for the given resource

AWS Config
Get-CFGResourceTag -ResourceArn $rules[0].ConfigRuleArn

**Output:**

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>

- For API details, see [ListTagsForResource](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Remove-CFGConformancePack

The following code example shows how to use `Remove-CFGConformancePack`.

**Tools for PowerShell**

**Example 1:** This sample removes the given conformance pack, along with all the rules, remediation actions and evaluation results for the pack.

```powershell
Remove-CFGConformancePack -ConformancePackName dono
```

**Output:**

Confirm
Are you sure you want to perform this action?

- For API details, see [DeleteConformancePack](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Write-CFGConformancePack

The following code example shows how to use `Write-CFGConformancePack`.

**Tools for PowerShell**

**Example 1:** This sample creates conformance pack, fetching template from the given yaml file.
Write-CFGConformancePack -ConformancePackName dono -DeliveryS3Bucket kt-ps-examples -TemplateBody (Get-Content C:\windows\temp\template.yaml -Raw)

- For API details, see PutConformancePack in AWS Tools for PowerShell Cmdlet Reference.

Write-CFGDeliveryChannel

The following code example shows how to use Write-CFGDeliveryChannel.

Tools for PowerShell

Example 1: This example changes the deliveryFrequency property of an existing delivery channel.

Write-CFGDeliveryChannel -ConfigSnapshotDeliveryProperties_DeliveryFrequency TwentyFour_Hours -DeliveryChannelName default -DeliveryChannel_S3BucketName config-bucket-NA -DeliveryChannel_S3KeyPrefix my

- For API details, see PutDeliveryChannel in AWS Tools for PowerShell Cmdlet Reference.

Device Farm examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Device Farm.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Example 1: This command adds the Resource Tag to the specified Directory-id

```
Add-DSResourceTag -ResourceId d-123456ijkl -Tag @{Key="myTag"; Value="mytgValue"}
```

- For API details, see AddTagsToResource in AWS Tools for PowerShell Cmdlet Reference.

Approve-DSTrust

The following code example shows how to use Approve-DSTrust.

Example 1: This example calls the AWS Directory Service VerifyTrust API operation for specified Trustid.

```
Approve-DSTrust -TrustId t-9067157123
```

- For API details, see VerifyTrust in AWS Tools for PowerShell Cmdlet Reference.
Confirm-DSSharedDirectory

The following code example shows how to use Confirm-DSSharedDirectory.

**Tools for PowerShell**

**Example 1:** This example accepts a directory sharing request sent from the directory owner AWS account.

```
Confirm-DSSharedDirectory -SharedDirectoryId d-9067012345
```

**Output:**

```
CreatedDateTime    : 12/30/2019 4:20:27 AM
LastUpdatedDateTime: 12/30/2019 4:21:40 AM
OwnerAccountId     : 123456781234
OwnerDirectoryId   : d-123456ijkl
SharedAccountId    : 123456784321
SharedDirectoryId  : d-9067012345
ShareMethod        :
ShareNotes         : This is test sharing
ShareStatus        : Sharing
```

- For API details, see [AcceptSharedDirectory](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Connect-DSDirectory

The following code example shows how to use Connect-DSDirectory.

**Tools for PowerShell**

**Example 1:** This example creates an AD Connector to connect to an on-premises directory.

```
Connect-DSDirectory -Name contoso.com -ConnectSettings_CustomerUserName Administrator -Password $Password -ConnectSettings_CustomerDnsIp 172.31.36.96 -ShortName CONTOSO -Size Small -ConnectSettings_VpcId vpc-123459da -ConnectSettings_SubnetId subnet-1234ccaa, subnet-5678ffbb
```

- For API details, see [ConnectDirectory](#) in *AWS Tools for PowerShell Cmdlet Reference*. 
Deny-DSSharedDirectory

The following code example shows how to use Deny-DSSharedDirectory.

Tools for PowerShell

**Example 1:** This example rejects a directory sharing request that was sent from the directory owner account.

```powershell
Deny-DSSharedDirectory -SharedDirectoryId d-9067012345
```

**Output:**

d-9067012345

- For API details, see [RejectSharedDirectory](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Disable-DSDirectoryShare

The following code example shows how to use Disable-DSDirectoryShare.

Tools for PowerShell

**Example 1:** This example stops the directory sharing between the directory owner and consumer account.

```powershell
Disable-DSDirectoryShare -DirectoryId d-123456ijkl -UnshareTarget_Id 123456784321 -UnshareTarget_Type ACCOUNT
```

**Output:**

d-9067012345

- For API details, see [UnshareDirectory](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Disable-DSDLAPS

The following code example shows how to use Disable-DSDLAPS.
Tools for PowerShell

Example 1: This example deactivates LDAP secure calls for the specified directory.

```
Disable-DSLDAPS -DirectoryId d-123456ijkl -Type Client
```

- For API details, see DisableLDAPS in AWS Tools for PowerShell Cmdlet Reference.

Disable-DSRadius

The following code example shows how to use Disable-DSRadius.

Tools for PowerShell

Example 1: This example disables RADIUS server configured for an AD Connector or Microsoft AD directory.

```
Disable-DSRadius -DirectoryId d-123456ijkl
```

- For API details, see DisableRadius in AWS Tools for PowerShell Cmdlet Reference.

Disable-DSSso

The following code example shows how to use Disable-DSSso.

Tools for PowerShell

Example 1: This example disables single sign-on for a directory.

```
Disable-DSSso -DirectoryId d-123456ijkl
```

- For API details, see DisableSso in AWS Tools for PowerShell Cmdlet Reference.

Enable-DSDirectoryShare

The following code example shows how to use Enable-DSDirectoryShare.

Tools for PowerShell

Example 1: This example shares a specified directory in your AWS account with another AWS Account using Handshake method.
Enable-DSDirectoryShare -DirectoryId d-123456ijkl -ShareTarget_Id 123456784321 -ShareMethod HANDSHAKE -ShareTarget_Type ACCOUNT

Output:

d-9067012345

- For API details, see [ShareDirectory](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Enable-DSLDAPS**

The following code example shows how to use Enable-DSLDAPS.

**Tools for PowerShell**

**Example 1:** This example activates the switch for the specific directory to always use LDAP secure calls.

Enable-DSLDAPS -DirectoryId d-123456ijkl -Type Client

- For API details, see [EnableLDAPS](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Enable-DSRadius**

The following code example shows how to use Enable-DSRadius.

**Tools for PowerShell**

**Example 1:** This example enables multi-factor authentication (MFA) with the provided RADIUS server configuration for an AD Connector or Microsoft AD directory.

Enable-DSRadius -DirectoryId d-123456ijkl
-RadiusSettings_AuthenticationProtocol PAP
-RadiusSettings_DisplayLabel Radius
-RadiusSettings_RadiusPort 1812
-RadiusSettings_RadiusRetry 4
-RadiusSettings_RadiusServer 10.4.185.113
-RadiusSettings_RadiusTimeout 50
-RadiusSettings_SharedSecret wJalrXUtnFEMI
Enable-DSSso

The following code example shows how to use Enable-DSSso.

Tools for PowerShell

Example 1: This example enables single sign-on for a directory.

Enable-DSSso -DirectoryId d-123456ijkl

Get-DSCertificate

The following code example shows how to use Get-DSCertificate.

Tools for PowerShell

Example 1: This example displays information about the certificate registered for a secured LDAP connection.

Get-DSCertificate -DirectoryId d-123456ijkl -CertificateId c-906731e34f

Output:

CertificateId : c-906731e34f
CommonName    : contoso-EC2AMAZ-CTGG2NM-CA
ExpiryDateTime: 4/15/2025 6:34:15 PM
RegisteredDateTime: 4/15/2020 6:38:56 PM
State          : Registered
StateReason    : Certificate registered successfully.

Get-DSCertificateList

The following code example shows how to use Get-DSCertificateList.
Example 1: This example lists all the certificates registered for a secured LDAP connection for specified directory.

```powershell
Get-DSCertificateList -DirectoryId d-123456ijkl
```

Output:

<table>
<thead>
<tr>
<th>CertificateId</th>
<th>CommonName</th>
<th>ExpiryDateTime</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>c-906731e34f</td>
<td>contoso-EC2AMAZ-CTGG2NM-CA</td>

</tr>
</tbody>
</table>

- For API details, see [ListCertificates](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-DSCConditionalForwarder

The following code example shows how to use Get-DSCConditionalForwarder.

Tools for PowerShell

Example 1: This command gets all configured Conditional Forwarders of given Directory-id.

```powershell
Get-DSCConditionalForwarder -DirectoryId d-123456ijkl
```

Output:

<table>
<thead>
<tr>
<th>DnsIpAddr</th>
<th>RemoteDomainName</th>
<th>ReplicationScope</th>
</tr>
</thead>
<tbody>
<tr>
<td>{172.31.77.239}</td>
<td>contoso.com</td>
<td>Domain</td>
</tr>
</tbody>
</table>

- For API details, see [DescribeConditionalForwarders](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-DSDirectory

The following code example shows how to use Get-DSDirectory.
Tools for PowerShell

Example 1: This command Obtains information about the directories that belong to this account.

Get-DSDirectory | Select-Object DirectoryId, Name, DnsIpAddrs, Type

Output:

<table>
<thead>
<tr>
<th>DirectoryId</th>
<th>Name</th>
<th>DnsIpAddrs</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>d-123456abcd</td>
<td>abcd.example.com</td>

</tr>
</tbody>
</table>

• For API details, see DescribeDirectories in AWS Tools for PowerShell Cmdlet Reference.

Get-DSDirectoryLimit

The following code example shows how to use Get-DSDirectoryLimit.

Tools for PowerShell

Example 1: This example displays the directory limit information for the us-east-1 region.

Get-DSDirectoryLimit -Region us-east-1

Output:

<table>
<thead>
<tr>
<th>CloudOnlyDirectoriesCurrentCount</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>CloudOnlyDirectoriesLimit</td>
<td>10</td>
</tr>
<tr>
<td>CloudOnlyDirectoriesLimitReached</td>

<tr>
<td>CloudOnlyMicrosoftADLimit</td>
<td>20</td>
</tr>
<tr>
<td>CloudOnlyMicrosoftADLimitReached</td>
<td>False</td>
</tr>
<tr>
<td>ConnectedDirectoriesCurrentCount</td>
<td>1</td>
</tr>
<tr>
<td>ConnectedDirectoriesLimit</td>
<td>10</td>
</tr>
</tbody>
</table>

• For API details, see GetDirectoryLimits in AWS Tools for PowerShell Cmdlet Reference.
Get-DSDomainControllerList

The following code example shows how to use Get-DSDomainControllerList.

Tools for PowerShell

Example 1: This command gets the detailed list of Domain Controllers launched for mentioned directory-id

Get-DSDomainControllerList -DirectoryId d-123456ijkl

Output:

```
AvailabilityZone          : us-east-1b
DirectoryId               : d-123456ijkl

VpcId                     : vpc-123459d
```

• For API details, see DescribeDomainControllers in AWS Tools for PowerShell Cmdlet Reference.

Get-DSEventTopic

The following code example shows how to use Get-DSEventTopic.
Tools for PowerShell

Example 1: This command shows information of configured SNS Topic for notification while directory status changes.

Get-DSEventTopic -DirectoryId d-123456ijkl

Output:

- For API details, see [DescribeEventTopics](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-DSIpRouteList

The following code example shows how to use Get-DSIpRouteList.

Tools for PowerShell

Example 1: This command gets the public IP address blocks configured in Directory IP Routing

Get-DSIpRouteList -DirectoryId d-123456ijkl

Output:

- For API details, see [ListIpRoutes](#) in *AWS Tools for PowerShell Cmdlet Reference*.
Get-DSLDAPSSetting

The following code example shows how to use Get-DSLDAPSSetting.

Tools for PowerShell

Example 1: This example describes the status of LDAP security for the specified directory.

Get-DSLDAPSSetting -DirectoryId d-123456ijkl

Output:

LastUpdatedDateTime  LDAPSStatus  LDAPSStatusReason
-------------------  -----------  -----------------
4/15/2020 6:51:03 PM Enabled     LDAPS is enabled successfully.

• For API details, see DescribeLDAPSSettings in AWS Tools for PowerShell Cmdlet Reference.

Get-DSLogSubscriptionList

The following code example shows how to use Get-DSLogSubscriptionList.

Tools for PowerShell

Example 1: This command gets the log subscriptions information of specified directory-id

Get-DSLogSubscriptionList -DirectoryId d-123456ijkl

Output:

DirectoryId  LogGroupName  SubscriptionCreatedDateTime
-----------  ---------------  ---------------------------
d-123456ijkl /aws/directoryservice/d-123456ijkl-lan2.example.com 12/14/2019 9:05:23 AM

• For API details, see ListLogSubscriptions in AWS Tools for PowerShell Cmdlet Reference.
Get-DSResourceTag

The following code example shows how to use Get-DSResourceTag.

**Tools for PowerShell**

**Example 1: This command gets all the Tags of specified Directory.**

```
Get-DSResourceTag -ResourceId d-123456ijkl
```

**Output:**

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>---</td>
<td>-----</td>
</tr>
<tr>
<td>myTag</td>
<td>myTagValue</td>
</tr>
</tbody>
</table>

- For API details, see [ListTagsForResource](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-DSSchemaExtension

The following code example shows how to use Get-DSSchemaExtension.

**Tools for PowerShell**

**Example 1: This example lists all schema extensions applied to a Microsoft AD Directory.**

```
Get-DSSchemaExtension -DirectoryId d-123456ijkl
```

**Output:**

- Description                 : ManagedADSchemaExtension
- DirectoryId                 : d-123456ijkl
- EndDateTime                 : 4/12/2020 10:30:49 AM
- SchemaExtensionId           : e-9067306643
- SchemaExtensionStatus       : Completed
- SchemaExtensionStatusReason : Schema updates are complete.
- StartDateTime               : 4/12/2020 10:28:42 AM

- For API details, see [ListSchemaExtensions](#) in *AWS Tools for PowerShell Cmdlet Reference*.
Get-DSSharedDirectory

The following code example shows how to use Get-DSSharedDirectory.

Tools for PowerShell

Example 1: This example gets the shared directories of your AWS Account

```
Get-DSSharedDirectory -OwnerDirectoryId d-123456ijkl -SharedDirectoryId d-9067012345
```

Output:

```
CreatedDateTime     : 12/30/2019 4:34:37 AM
LastUpdatedDateTime : 12/30/2019 4:35:22 AM
OwnerAccountId      : 123456781234
OwnerDirectoryId    : d-123456ijkl
SharedAccountId     : 123456784321
SharedDirectoryId   : d-9067012345
ShareMethod         : HANDSHAKE
ShareNotes          : This is a test Sharing
ShareStatus         : Shared
```

- For API details, see [DescribeSharedDirectories](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-DSSnapshot

The following code example shows how to use Get-DSSnapshot.

Tools for PowerShell

Example 1: This command gets information about the specified directory snapshots that belong to this account.

```
Get-DSSnapshot -DirectoryId d-123456ijkl
```

Output:

```
DirectoryId : d-123456ijkl
Name        :
SnapshotId  : s-9064bd1234
StartTime   : 12/13/2019 6:33:01 PM
Status      : Completed
```
For API details, see [DescribeSnapshots](#) in *AWS Tools for PowerShellCmdlet Reference*.

**Get-DSSnapshotLimit**

The following code example shows how to use `Get-DSSnapshotLimit`.

**Tools for PowerShell**

**Example 1:** This command gets the manual snapshot limits for a specified directory.

```powershell
Get-DSSnapshotLimit -DirectoryId d-123456ijkl
```

**Output:**

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>5</td>
<td>False</td>
</tr>
</tbody>
</table>

For API details, see [GetSnapshotLimits](#) in *AWS Tools for PowerShellCmdlet Reference*.

**Get-DSTrust**

The following code example shows how to use `Get-DSTrust`.

**Tools for PowerShell**

**Example 1:** This command gets the information of trust relationships created for specified directory-id.

```powershell
Get-DSTrust -DirectoryId d-123456abcd
```

**Output:**
New-DSAlias

The following code example shows how to use New-DSAlias.

Tools for PowerShell

Example 1: This command creates an alias for a directory and assigns the alias to the specified directory-id.

```
New-DSAlias -DirectoryId d-123456ijkl -Alias MyOrgName
```

Output:

```
Alias     DirectoryId
-----     -----------
myorgname d-123456ijkl
```

• For API details, see `DescribeTrusts` in `AWS Tools for PowerShell Cmdlet Reference`.

New-DSComputer

The following code example shows how to use New-DSComputer.

Tools for PowerShell

Example 1: This example creates a new Active Directory computer object.
New-DSComputer -DirectoryName d-123456ijkl -ComputerName ADMemberServer -Password $Password

Output:

<table>
<thead>
<tr>
<th>ComputerAttributes</th>
<th>ComputerId</th>
</tr>
</thead>
<tbody>
<tr>
<td>ComputerName</td>
<td></td>
</tr>
</tbody>
</table>

{WindowsSamName, DistinguishedName} S-1-5-21-1191241402-978882507-2717148213-1662 ADMemberServer

- For API details, see CreateComputer in AWS Tools for PowerShell Cmdlet Reference.

New-DSConditionalForwarder

The following code example shows how to use New-DSConditionalForwarder.

Tools for PowerShell

Example 1: This example creates a Conditional forwarder in specified AWS Directory-id.

New-DSConditionalForwarder -DirectoryId d-123456ijkl -DnsIpAddr 172.31.36.96,172.31.10.56 -RemoteDomainName contoso.com

- For API details, see CreateConditionalForwarder in AWS Tools for PowerShell Cmdlet Reference.

New-DSDirectory

The following code example shows how to use New-DSDirectory.

Tools for PowerShell

Example 1: This example create a new Simple AD directory.

New-DSDirectory -Name corp.example.com -Password $Password -Size Small -VpcSettings_VpcId vpc-123459d -VpcSettings_SubnetIds subnet-1234kkaa,subnet-5678ffbb

- For API details, see CreateDirectory in AWS Tools for PowerShell Cmdlet Reference.
New-DSLogSubscription

The following code example shows how to use New-DSLogSubscription.

Tools for PowerShell

Example 1: This example creates a subscription to forward real-time Directory Service domain controller security logs to the specified Amazon CloudWatch log group in your AWS account.

```powershell
New-DSLogSubscription -DirectoryId d-123456ijkl -LogGroupName /aws/directoryservice/d-123456ijkl-lan2.example.com
```

- For API details, see [CreateLogSubscription](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-DSMicrosoftAD

The following code example shows how to use New-DSMicrosoftAD.

Tools for PowerShell

Example 1: This example creates new Microsoft AD Directory in AWS Cloud.

```powershell
New-DSMicrosoftAD -Name corp.example.com -Password $Password -edition Standard -VpcSettings_VpcId vpc-123459d -VpcSettings_SubnetIds subnet-1234kkaa,subnet-5678ffbb
```

- For API details, see [CreateMicrosoftAD](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-DSSnapshot

The following code example shows how to use New-DSSnapshot.

Tools for PowerShell

Example 1: This example creates a directory snapshot

```powershell
New-DSSnapshot -DirectoryId d-123456ijkl
```

- For API details, see [CreateSnapshot](#) in *AWS Tools for PowerShell Cmdlet Reference*. 
New-DSTrust

The following code example shows how to use New-DSTrust.

**Tools for PowerShell**

**Example 1:** This example creates Two-Way Forestwide trust between your AWS Managed Microsoft AD directory, and existing on-premises Microsoft Active Directory.

```powershell
New-DSTrust -DirectoryId d-123456ijkl -RemoteDomainName contoso.com -TrustDirection Two-Way -TrustType Forest -TrustPassword $Password -ConditionalForwarderIpAddr 172.31.36.96
```

Output:

t-9067157123

- For API details, see [CreateTrust](https://aws.amazon.com/tools/powershell-cmdlet-reference/) in *AWS Tools for PowerShell Cmdlet Reference*.

Register-DSCertificate

The following code example shows how to use Register-DSCertificate.

**Tools for PowerShell**

**Example 1:** This example registers a certificate for secured LDAP connection.

```powershell
$Certificate = Get-Content contoso.cer -Raw
Register-DSCertificate -DirectoryId d-123456ijkl -CertificateData $Certificate
```

Output:

c-906731e350

- For API details, see [RegisterCertificate](https://aws.amazon.com/tools/powershell-cmdlet-reference/) in *AWS Tools for PowerShell Cmdlet Reference*.

Register-DSEventTopic

The following code example shows how to use Register-DSEventTopic.
Tools for PowerShell

Example 1: This example associate a directory as a publisher with an SNS topic.

```
Register-DSEventTopic -DirectoryId d-123456ijkl -TopicName snstopicname
```

- For API details, see RegisterEventTopic in AWS Tools for PowerShell Cmdlet Reference.

Remove-DSConditionalForwarder

The following code example shows how to use Remove-DSConditionalForwarder.

Tools for PowerShell

Example 1: This example removes the conditional forwarder that has been set up for your AWS Directory.

```
Remove-DSConditionalForwarder -DirectoryId d-123456ijkl -RemoteDomainName contoso.com
```

- For API details, see DeleteConditionalForwarder in AWS Tools for PowerShell Cmdlet Reference.

Remove-DSDirectory

The following code example shows how to use Remove-DSDirectory.

Tools for PowerShell

Example 1: This example deletes an AWS Directory service directory (Simple AD/Microsoft AD/AD Connector)

```
Remove-DSDirectory -DirectoryId d-123456ijkl
```

- For API details, see DeleteDirectory in AWS Tools for PowerShell Cmdlet Reference.

Remove-DSIpRoute

The following code example shows how to use Remove-DSIpRoute.
Example 1: This command removes the specified IP from Configured IP routes of Directory-id.

```powershell
Remove-DSIpRoute -DirectoryId d-123456ijkl -CidrIp 203.0.113.5/32
```

For API details, see [RemoveIpRoutes](#) in *AWS Tools for PowerShell Cmdlet Reference*.

---

**Remove-DSLogSubscription**

The following code example shows how to use Remove-DSLogSubscription.

Tools for PowerShell

Example 1: This command removes the Log Subscription of specified Directory-id

```powershell
Remove-DSLogSubscription -DirectoryId d-123456ijkl
```

For API details, see [DeleteLogSubscription](#) in *AWS Tools for PowerShell Cmdlet Reference*.

---

**Remove-DSResourceTag**

The following code example shows how to use Remove-DSResourceTag.

Tools for PowerShell

Example 1: This command removes the Resource Tag assigned to the specified Directory-id

```powershell
Remove-DSResourceTag -ResourceId d-123456ijkl -TagKey myTag
```

For API details, see [RemoveTagsFromResource](#) in *AWS Tools for PowerShell Cmdlet Reference*.

---

**Remove-DSSnapshot**

The following code example shows how to use Remove-DSSnapshot.

Tools for PowerShell

Example 1: This example removes the manually created snapshot.
Remove-DSSnapshot -SnapshotId s-9068b488kc

- For API details, see DeleteSnapshot in AWS Tools for PowerShell Cmdlet Reference.

Remove-DSTrust

The following code example shows how to use Remove-DSTrust.

Tools for PowerShell

Example 1: This example removes the existing trust relationship between your AWS Managed AD Directory and an external domain.

Get-DSTrust -DirectoryId d-123456ijkl -Select Trusts.TrustId | Remove-DSTrust

Output:

t-9067157123

- For API details, see DeleteTrust in AWS Tools for PowerShell Cmdlet Reference.

Reset-DSUserPassword

The following code example shows how to use Reset-DSUserPassword.

Tools for PowerShell

Example 1: This example resets the password of Active Directory user named ADUser in AWS Managed microsoft AD or Simple AD Directory

Reset-DSUserPassword -UserName ADuser -DirectoryId d-123456ijkl -NewPassword $Password

- For API details, see ResetUserPassword in AWS Tools for PowerShell Cmdlet Reference.

Restore-DSFromSnapshot

The following code example shows how to use Restore-DSFromSnapshot.
Tools for PowerShell

Example 1: This example restores a directory using an existing directory snapshot.

```
Restore-DSFromSnapshot -SnapshotId s-9068b488kc
```

- For API details, see `RestoreFromSnapshot` in *AWS Tools for PowerShell Cmdlet Reference*.

Set-DSDomainControllerCount

The following code example shows how to use `Set-DSDomainControllerCount`.

Tools for PowerShell

Example 1: This example sets the number of domain controller to 3 for specified directory-id.

```
Set-DSDomainControllerCount -DirectoryId d-123456ijkl -DesiredNumber 3
```

- For API details, see `UpdateNumberOfDomainControllers` in *AWS Tools for PowerShell Cmdlet Reference*.

Start-DSSchemaExtension

The following code example shows how to use `Start-DSSchemaExtension`.

Tools for PowerShell

Example 1: This Example Applies a schema extension to a Microsoft AD directory.

```
$ldif = Get-Content D:\Users\Username\Downloads\ExtendedSchema.1df -Raw
Start-DSSchemaExtension -DirectoryId d-123456ijkl -
CreateSnapshotBeforeSchemaExtension $true -Description ManagedADSchemaExtension -
LdifContent $ldif
```

Output:

```
e-9067306643
```
• For API details, see StartSchemaExtension in AWS Tools for PowerShell Cmdlet Reference.

Stop-DSSchemaExtension

The following code example shows how to use Stop-DSSchemaExtension.

Tools for PowerShell

Example 1: This example cancels an in-progress schema extension to a Microsoft AD directory.

Stop-DSSchemaExtension -DirectoryId d-123456ijkl -SchemaExtensionId e-9067306643

• For API details, see CancelSchemaExtension in AWS Tools for PowerShell Cmdlet Reference.

Unregister-DSCertificate

The following code example shows how to use Unregister-DSCertificate.

Tools for PowerShell

Example 1: This example deletes from the system the certificate that was registered for a secured LDAP connection.

Unregister-DSCertificate -DirectoryId d-123456ijkl -CertificateId c-906731e34f

• For API details, see DeregisterCertificate in AWS Tools for PowerShell Cmdlet Reference.

Unregister-DSEventTopic

The following code example shows how to use Unregister-DSEventTopic.

Tools for PowerShell

Example 1: This example removes the specified directory as a publisher to the specified SNS topic.

Unregister-DSEventTopic -DirectoryId d-123456ijkl -TopicName snstopicname

• For API details, see DeregisterEventTopic in AWS Tools for PowerShell Cmdlet Reference.
**Update-DSConditionalForwarder**

The following code example shows how to use Update-DSConditionalForwarder.

**Tools for PowerShell**

**Example 1: This example updates a conditional forwarder that has been set up for your AWS directory.**

```
Update-DSConditionalForwarder -DirectoryId d-123456ijkl -DnsIpAddr 172.31.36.96,172.31.16.108 -RemoteDomainName contoso.com
```

**Update-DSRadius**

The following code example shows how to use Update-DSRadius.

**Tools for PowerShell**

**Example 1: This example updates RADIUS server information for an AD Connector or Microsoft AD directory.**

```
Update-DSRadius -DirectoryId d-123456ijkl -RadiusSettings_RadiusRetry 3
```

**Update-DSTrust**

The following code example shows how to use Update-DSTrust.

**Tools for PowerShell**

**Example 1: This example updates the SelectiveAuth parameter of specified trust-id from Disabled to Enabled.**

```
Update-DSTrust -TrustId t-9067157123 -SelectiveAuth Enabled
```

**AWS DMS examples using Tools for PowerShell**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with AWS DMS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### New-DMSReplicationTask

The following code example shows how to use `New-DMSReplicationTask`.

**Tools for PowerShell**

Example 1: This example creates a new AWS Database Migration Service replication task that uses CdcStartTime instead of CdcStartPosition. The MigrationType is set to "full-load-and-cdc", meaning the target table must be empty. The new task is tagged with a tag that has a key of Stage and a key value of Test. For more information about the values used by this cmdlet, see Creating a Task (https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Tasks.Creating.html) in the AWS Database Migration Service User Guide.

**Add-DDBIndexSchema**

The following code example shows how to use Add-DDBIndexSchema.
Tools for PowerShell

Example 1: Creates an empty TableSchema object and adds a new local secondary index definition to it before writing the TableSchema object to the pipeline.

```powershell
$schema | Add-DDBIndexSchema -IndexName "LastPostIndex" -RangeKeyName "LastPostDateTime" -RangeKeyDataType "S" -ProjectionType "keys_only"
$schema = New-DDBTableSchema
```

Output:

```
AttributeSchema                             KeySchema
LocalSecondaryIndexSchema                   --------
{LastPostDateTime}                          {}
{LastPostIndex}
```

Example 2: Adds a new local secondary index definition to the supplied TableSchema object before writing the TableSchema object back to the pipeline. The TableSchema object can also be supplied using the -Schema parameter.

```powershell
New-DDBTableSchema | Add-DDBIndexSchema -IndexName "LastPostIndex" -RangeKeyName "LastPostDateTime" -RangeKeyDataType "S" -ProjectionType "keys_only"
```

Output:

```
AttributeSchema                             KeySchema
LocalSecondaryIndexSchema                   --------
{LastPostDateTime}                          {}
{LastPostIndex}
```

Add-DDBKeySchema

The following code example shows how to use `Add-DDBKeySchema`.
Tools for PowerShell

Example 1: Creates an empty TableSchema object and adds key and attribute definition entries to it using the specified key data before writing the TableSchema object to the pipeline. The key type is declared to be 'HASH' by default; use the -KeyType parameter with a value of 'RANGE' to declare a range key.

```powershell
$schema = New-DDBTableSchema
$schema | Add-DDBKeySchema -KeyName "ForumName" -KeyDataType "S"
```

Output:

```
AttributeSchema                             KeySchema
LocalSecondaryIndexSchema
---------------                             ---------
{ForumName}                                 {ForumName}
{}                                           {}
```

Example 2: Adds new key and attribute definition entries to the supplied TableSchema object before writing the TableSchema object to the pipeline. The key type is declared to be 'HASH' by default; use the -KeyType parameter with a value of 'RANGE' to declare a range key. The TableSchema object can also be supplied using the -Schema parameter.

```powershell
New-DDBTableSchema | Add-DDBKeySchema -KeyName "ForumName" -KeyDataType "S"
```

Output:

```
AttributeSchema                             KeySchema
LocalSecondaryIndexSchema
---------------                             ---------
{ForumName}                                 {ForumName}
{}                                           {}
```

- For API details, see [Add-DDBKeySchema](#) in AWS Tools for PowerShell Cmdlet Reference.

ConvertFrom-DDBItem

The following code example shows how to use ConvertFrom-DDBItem.
Tools for PowerShell

Example 1: ConvertFrom-DDBItem is used to convert the result of Get-DDBItem from a hashtable of DynamoDB AttributeValues to a hashtable of common types like string and double.

```powershell
@{
    SongTitle = 'Somewhere Down The Road'
    Artist    = 'No One You Know'
} | ConvertTo-DDBItem
Get-DDBItem -TableName 'Music' -Key $key | ConvertFrom-DDBItem
```

Output:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Genre</td>
<td>Country</td>
</tr>
<tr>
<td>Artist</td>
<td>No One You Know</td>
</tr>
<tr>
<td>Price</td>
<td>1.94</td>
</tr>
<tr>
<td>CriticRating</td>
<td>9</td>
</tr>
<tr>
<td>SongTitle</td>
<td>Somewhere Down The Road</td>
</tr>
<tr>
<td>AlbumTitle</td>
<td>Somewhat Famous</td>
</tr>
</tbody>
</table>

- For API details, see [ConvertFrom-DDBItem](#) in AWS Tools for PowerShell Cmdlet Reference.

ConvertTo-DDBItem

The following code example shows how to use ConvertTo-DDBItem.

Tools for PowerShell

Example 1: An example for converting a hashtable into a dictionary of DynamoDB attribute values.

```powershell
@{
    SongTitle = 'Somewhere Down The Road'
    Artist    = 'No One You Know'
} | ConvertTo-DDBItem
```
Example 2: An example for converting a hashtable into a dictionary of DynamoDB attribute values.

```powershell
@{
    MyMap        = @{
        MyString = 'my string'
    }
    MyStringSet  = [System.Collections.Generic.HashSet[String]]@('my', 'string')
    MyNumericSet = [System.Collections.Generic.HashSet[Int]]@(1, 2, 3)
        ([IO.MemoryStream]::new([Text.Encoding]::UTF8.GetBytes('my'))),
        ([IO.MemoryStream]::new([Text.Encoding]::UTF8.GetBytes('string')))
    MyList1      = @('my', 'string')
    MyList2      = [System.Collections.Generic.List[Int]]@(1, 2)
    MyList3      = [System.Collections.ArrayList]@('one', 2, $true)
}| ConvertTo-DDBItem
```

Output:

<table>

</tr>
</tbody>
</table>

- For API details, see [ConvertTo-DDBItem](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-DDBBatchItem**

The following code example shows how to use Get-DDBBatchItem.
Tools for PowerShell

Example 1: Gets the item with the SongTitle "Somewhere Down The Road" from the DynamoDB tables 'Music' and 'Songs'.

```powershell
$key = @{ SongTitle = 'Somewhere Down The Road' Artist = 'No One You Know' } | ConvertTo-DDBItem

$keysAndAttributes = New-Object Amazon.DynamoDBv2.Model.KeysAndAttributes
$list.Add($key)
$keysAndAttributes.Keys = $list

$batchItems = Get-DDBBatchItem -RequestItem $requestItem $batchItems.GetEnumerator() | ForEach-Object {{$PSItem.Value} | ConvertFrom-DDBItem

Output:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Artist</td>
<td>No One You Know</td>
</tr>
<tr>
<td>SongTitle</td>
<td>Somewhere Down The Road</td>

</tr>
<tr>
<td>CriticRating</td>
<td>10</td>
</tr>
<tr>
<td>Genre</td>
<td>Country</td>
</tr>
<tr>
<td>Price</td>
<td>1.94</td>
</tr>
</tbody>
</table>

• For API details, see [BatchGetItem](https://aws.docs) in AWS Tools for PowerShell Cmdlet Reference.
Get-DDBItem

The following code example shows how to use Get-DDBItem.

Tools for PowerShell

Example 1: Returns the DynamoDB item with the partition key SongTitle and the sort key Artist.

```powershell
$key = @{
    SongTitle = 'Somewhere Down The Road'
    Artist = 'No One You Know'
 } | ConvertTo-DDBItem

Get-DDBItem -TableName 'Music' -Key $key | ConvertFrom-DDBItem
```

Output:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Genre</td>
<td>Country</td>
</tr>
<tr>
<td>SongTitle</td>
<td>Somewhere Down The Road</td>
</tr>
<tr>
<td>Price</td>
<td>1.94</td>
</tr>
<tr>
<td>Artist</td>
<td>No One You Know</td>
</tr>
<tr>
<td>CriticRating</td>
<td>9</td>
</tr>
<tr>
<td>AlbumTitle</td>
<td>Somewhat Famous</td>
</tr>
</tbody>
</table>

- For API details, see GetItem in AWS Tools for PowerShell Cmdlet Reference.

Get-DDBTable

The following code example shows how to use Get-DDBTable.

Tools for PowerShell

Example 1: Returns details of the specified table.

```powershell
Get-DDBTable -TableName "myTable"
```

- For API details, see DescribeTable in AWS Tools for PowerShell Cmdlet Reference.
Get-DDBTableList

The following code example shows how to use Get-DDBTableList.

Tools for PowerShell

Example 1: Returns details of all tables, automatically iterating until the service indicates no further tables exist.

Example 2: Manually iterates for details of all tables, returning up to 10 tables per call until the service indicates no further tables exist.

```
$nextToken = $null
do {
    Get-DDBTableList -ExclusiveStartTableName $nextToken -Limit 10
    $nextToken = $AWSHistory.LastServiceResponse.LastEvaluatedTableName
} while ($nextToken -ne $null)
```

- For API details, see ListTables in AWS Tools for PowerShell Cmdlet Reference.

Invoke-DDBQuery

The following code example shows how to use Invoke-DDBQuery.

Tools for PowerShell

Example 1: Invokes a query that returns DynamoDB items with the specified SongTitle and Artist.

```
$invokeDDBQuery = @{
    TableName = 'Music'
    KeyConditionExpression = ' SongTitle = :SongTitle and Artist = :Artist'
    ExpressionAttributeValues = @(
        ':SongTitle' = 'Somewhere Down The Road'
        ':Artist' = 'No One You Know'
    ) | ConvertTo-DDBItem
} | Invoke-DDBQuery @invokeDDBQuery | ConvertFrom-DDBItem
```
Output:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>----</td>
<td>----</td>
</tr>
<tr>
<td>Genre</td>
<td>Country</td>
</tr>
<tr>
<td>Artist</td>
<td>No One You Know</td>
</tr>
<tr>
<td>Price</td>

</tr>
<tr>
<td>CriticRating</td>
<td>9</td>
</tr>
<tr>
<td>SongTitle</td>
<td>Somewhere Down The Road</td>
</tr>
<tr>
<td>AlbumTitle</td>
<td>Somewhat Famous</td>
</tr>
</tbody>
</table>

- For API details, see [Query](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Invoke-DDBScan**

The following code example shows how to use *Invoke-DDBScan*.

**Tools for PowerShell**

**Example 1: Returns all items in the Music table.**

```
Invoke-DDBScan -TableName 'Music' | ConvertFrom-DDBItem
```

**Output:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>----</td>
<td>----</td>
</tr>
<tr>
<td>Genre</td>
<td>Country</td>
</tr>
<tr>
<td>Artist</td>
<td>No One You Know</td>
</tr>
<tr>
<td>Price</td>
<td>1.94</td>
</tr>
<tr>
<td>CriticRating</td>
<td>9</td>
</tr>
<tr>
<td>SongTitle</td>
<td>Somewhere Down The Road</td>
</tr>
<tr>
<td>AlbumTitle</td>
<td>Somewhat Famous</td>
</tr>
<tr>
<td>Genre</td>
<td>Country</td>
</tr>
<tr>
<td>Artist</td>
<td>No One You Know</td>
</tr>
<tr>
<td>Price</td>
<td>1.98</td>
</tr>
<tr>
<td>CriticRating</td>
<td>8.4</td>
</tr>
<tr>
<td>SongTitle</td>
<td>My Dog Spot</td>
</tr>
<tr>
<td>AlbumTitle</td>
<td>Hey Now</td>
</tr>
</tbody>
</table>

**Example 2: Returns items in the Music table with a CriticRating greater than or equal to nine.**
```powershell
$scanFilter = @{
    CriticRating = [Amazon.DynamoDBv2.Model.Condition]@{
        AttributeValueList = @({N = '9'})
        ComparisonOperator = 'GE'
    }
}
Invoke-DDBScan -TableName 'Music' -ScanFilter $scanFilter | ConvertFrom-DDBItem
```

**Output:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Genre</td>
<td>Country</td>
</tr>
<tr>
<td>Artist</td>
<td>No One You Know</td>
</tr>
<tr>
<td>Price</td>
<td>1.94</td>
</tr>
<tr>
<td>CriticRating</td>
<td>9</td>
</tr>
<tr>
<td>SongTitle</td>
<td>Somewhere Down The Road</td>
</tr>
<tr>
<td>AlbumTitle</td>
<td>Somewhat Famous</td>
</tr>
</tbody>
</table>

- For API details, see [Scan](#) in AWS Tools for PowerShell Cmdlet Reference.

**New-DDBTable**

The following code example shows how to use New-DDBTable.

**Tools for PowerShell**

**Example 1:** This example creates a table named Thread that has a primary key consisting of 'ForumName' (key type hash) and 'Subject' (key type range). The schema used to construct the table can be piped into each cmdlet as shown or specified using the -Schema parameter.

```
$schema = New-DDBTableSchema
$schema | Add-DDBKeySchema -KeyName "ForumName" -KeyDataType "S"
$schema | Add-DDBKeySchema -KeyName "Subject" -KeyType RANGE -KeyDataType "S"
$schema | New-DDBTable -TableName "Thread" -ReadCapacity 10 -WriteCapacity 5
```

**Output:**

```
AttributeDefinitions   : {ForumName, Subject}
TableName              : Thread
KeySchema              : {ForumName, Subject}
```
Example 2: This example creates a table named Thread that has a primary key consisting of 'ForumName' (key type hash) and 'Subject' (key type range). A local secondary index is also defined. The key of the local secondary index will be set automatically from the primary hash key on the table (ForumName). The schema used to construct the table can be piped into each cmdlet as shown or specified using the -Schema parameter.

```powershell
$schema = New-DDBTableSchema
$schema | Add-DDBKeySchema -KeyName "ForumName" -KeyDataType "S"
$schema | Add-DDBKeySchema -KeyName "Subject" -KeyDataType "S"
$schema | Add-DDBIndexSchema -IndexName "LastPostIndex" -RangeKeyName "LastPostDateTime" -RangeKeyDataType "S" -ProjectionType "keys_only"
$schema | New-DDBTable -TableName "Thread" -ReadCapacity 10 -WriteCapacity 5
```

Output:

```
AttributeDefinitions : {ForumName, LastPostDateTime, Subject}
TableName            : Thread
KeySchema            : {ForumName, Subject}
TableStatus          : CREATING
CreationDateTime     : 10/28/2013 4:39:49 PM
ProvisionedThroughput: Amazon.DynamoDBv2.Model.ProvisionedThroughputDescription
TableSizeBytes       : 0
ItemCount            : 0
LocalSecondaryIndexes: {LastPostIndex}
```

Example 3: This example shows how to use a single pipeline to create a table named Thread that has a primary key consisting of 'ForumName' (key type hash) and 'Subject' (key type range) and a local secondary index. The Add-DDBKeySchema and Add-DDBIndexSchema create a new TableSchema object for you if one is not supplied from the pipeline or the -Schema parameter.

```powershell
New-DDBTableSchema | Add-DDBKeySchema -KeyName "ForumName" -KeyDataType "S" | Add-DDBKeySchema -KeyName "Subject" -KeyDataType "S" |
```
Add-DDBIndexSchema -IndexName "LastPostIndex" `
  -RangeKeyName "LastPostDateTime" `
  -RangeKeyDataType "S" `
  -ProjectionType "keys_only" |
New-DDBTable -TableName "Thread" -ReadCapacity 10 -WriteCapacity 5

Output:

```
AttributeDefinitions : {ForumName, LastPostDateTime, Subject}
TableName            : Thread
KeySchema             : {ForumName, Subject}
TableStatus           : CREATING
CreationDateTime      : 10/28/2013 4:39:49 PM
ProvisionedThroughput : Amazon.DynamoDBv2.Model.ProvisionedThroughputDescription
TableSizeBytes        : 0
ItemCount             : 0
LocalSecondaryIndexes : {LastPostIndex}
```

- For API details, see [CreateTable](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-DDBTableSchema**

The following code example shows how to use New-DDBTableSchema.

**Tools for PowerShell**

**Example 1:** Creates an empty TableSchema object ready to accept key and index definitions for use in creating a new Amazon DynamoDB table. The returned object can be piped into the Add-DDBKeySchema, Add-DDBIndexSchema and New-DDBTable cmdlets or passed to them using the -Schema parameter on each cmdlet.

```
New-DDBTableSchema
```

**Output:**

```
AttributeSchema                             KeySchema
LocalSecondaryIndexSchema                   
-----------------------------              ---------
{}                                          {}            
{()                                         {}          }
```
Remove-DDBItem

The following code example shows how to use Remove-DDBItem.

**Tools for PowerShell**

**Example 1:** Removes the DynamoDB item that matches the provided key.

```powershell
$key = @{
    SongTitle = 'Somewhere Down The Road'
    Artist = 'No One You Know'
} | ConvertTo-DDBItem
Remove-DDBItem -TableName 'Music' -Key $key -Confirm:$false
```

- For API details, see *DeleteItem* in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-DDBTable

The following code example shows how to use Remove-DDBTable.

**Tools for PowerShell**

**Example 1:** Deletes the specified table. You are prompted for confirmation before the operation proceeds.

```powershell
Remove-DDBTable -TableName "myTable"
```

**Example 2:** Deletes the specified table. You are not prompted for confirmation before the operation proceeds.

```powershell
Remove-DDBTable -TableName "myTable" -Force
```

- For API details, see *DeleteTable* in *AWS Tools for PowerShell Cmdlet Reference*.

Set-DDBBatchItem

The following code example shows how to use Set-DDBBatchItem.
Tools for PowerShell

Example 1: Creates a new item, or replaces an existing item with a new item in the DynamoDB tables Music and Songs.

```powershell
$item = @{
    SongTitle = 'Somewhere Down The Road'
    Artist = 'No One You Know'
    AlbumTitle = 'Somewhat Famous'
    Price = 1.94
    Genre = 'Country'
    CriticRating = 10.0
} | ConvertTo-DDBItem

writeRequest = New-Object Amazon.DynamoDBv2.Model.WriteRequest

Output:

$writeRequest = New-Object Amazon.DynamoDBv2.Model.WriteRequest

Set-DDBBatchItem -RequestItem $requestItem
```

- For API details, see [BatchWriteItem](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Set-DDBItem

The following code example shows how to use `Set-DDBItem`.

Tools for PowerShell

Example 1: Creates a new item, or replaces an existing item with a new item.

```powershell
$item = @{
    SongTitle = 'Somewhere Down The Road'
    Artist = 'No One You Know'
    AlbumTitle = 'Somewhat Famous'
    Price = 1.94
    Genre = 'Country'
} | ConvertTo-DDBItem
```
CriticRating = 9.0
} | ConvertTo-DDBItem
Set-DDBItem -TableName 'Music' -Item $item

- For API details, see [PutItem](https://aws.amazon.com/tools/powerShell.Cmdlet Reference) in *AWS Tools for PowerShell Cmdlet Reference*.

### Update-DDBItem

The following code example shows how to use Update-DDBItem.

#### Tools for PowerShell

**Example 1: Sets the genre attribute to 'Rap' on the DynamoDB item with the partition key SongTitle and the sort key Artist.**

```powershell
$key = @{
    SongTitle = 'Somewhere Down The Road'
    Artist = 'No One You Know'
} | ConvertTo-DDBItem

$updateDdbItem = @{
    TableName = 'Music'
    Key = $key
    UpdateExpression = 'set Genre = :val1'
    ExpressionAttributeValue = (@{
        ':val1' = ([Amazon.DynamoDBv2.Model.AttributeValue]'Rap')
    })
}

Update-DDBItem @updateDdbItem
```

**Output:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Genre</td>
<td>Rap</td>
</tr>
</tbody>
</table>

- For API details, see [UpdateItem](https://aws.amazon.com/tools/powerShell.Cmdlet Reference) in *AWS Tools for PowerShell Cmdlet Reference*.

### Update-DDBTable

The following code example shows how to use Update-DDBTable.

DynamoDB
Tools for PowerShell

Example 1: Updates the provisioned throughput for the given table.

```
Update-DDBTable -TableName "myTable" -ReadCapacity 10 -WriteCapacity 5
```

- For API details, see UpdateTable in AWS Tools for PowerShell Cmdlet Reference.

Amazon EC2 examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Add-EC2InternetGateway

The following code example shows how to use Add-EC2InternetGateway.

Tools for PowerShell

**Example 1:** This example attaches the specified Internet gateway to the specified VPC.

Add-EC2InternetGateway -InternetGatewayId igw-1a2b3c4d -VpcId vpc-12345678

**Example 2:** This example creates a VPC and an Internet gateway, and then attaches the Internet gateway to the VPC.

```
$Vpc = New-EC2Vpc -CidrBlock 10.0.0.0/16
New-EC2InternetGateway | Add-EC2InternetGateway -VpcId $Vpc.VpcId
```

• For API details, see [AttachInternetGateway](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Add-EC2NetworkInterface

The following code example shows how to use Add-EC2NetworkInterface.
Tools for PowerShell

**Example 1:** This example attaches the specified network interface to the specified instance.

```
Add-EC2NetworkInterface -NetworkInterfaceId eni-12345678 -InstanceId i-1a2b3c4d -DeviceIndex 1
```

**Output:**

```
eni-attach-1a2b3c4d
```

- For API details, see [AttachNetworkInterface](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Add-EC2Volume**

The following code example shows how to use Add-EC2Volume.

Tools for PowerShell

**Example 1:** This example attaches the specified volume to the specified instance and exposes it with the specified device name.

```
Add-EC2Volume -VolumeId vol-12345678 -InstanceId i-1a2b3c4d -Device /dev/sdh
```

**Output:**

```
AttachTime          : 12/22/2015 1:53:58 AM
DeleteOnTermination : False
Device              : /dev/sdh
InstanceId          : i-1a2b3c4d
State               : attaching
VolumeId            : vol-12345678
```

- For API details, see [AttachVolume](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Add-EC2VpnGateway**

The following code example shows how to use Add-EC2VpnGateway.
Tools for PowerShell

Example 1: This example attaches the specified virtual private gateway to the specified VPC.

Add-EC2VpnGateway -VpnGatewayId vgw-1a2b3c4d -VpcId vpc-12345678

Output:

<table>
<thead>
<tr>
<th>State</th>
<th>VpcId</th>
</tr>

</tr>
</tbody>
</table>

- For API details, see AttachVpnGateway in AWS Tools for PowerShell Cmdlet Reference.

Approve-EC2VpcPeeringConnection

The following code example shows how to use Approve-EC2VpcPeeringConnection.

Tools for PowerShell

Example 1: This example approves the requested VpcPeeringConnectionId pcx-1dfad234b56ff78be

Approve-EC2VpcPeeringConnection -VpcPeeringConnectionId pcx-1dfad234b56ff78be

Output:

AccepterVpcInfo : Amazon.EC2.Model.VpcPeeringConnectionVpcInfo
ExpirationTime   : 1/1/0001 12:00:00 AM
RequesterVpcInfo : Amazon.EC2.Model.VpcPeeringConnectionVpcInfo
Status           : Amazon.EC2.Model.VpcPeeringConnectionStateReason
Tags             : {}
VpcPeeringConnectionId : pcx-1dfad234b56ff78be

- For API details, see AcceptVpcPeeringConnection in AWS Tools for PowerShell Cmdlet Reference.

Confirm-EC2ProductInstance

The following code example shows how to use Confirm-EC2ProductInstance.
Tools for PowerShell

Example 1: This example determines whether the specified product code is associated with the specified instance.

```powershell
Confirm-EC2ProductInstance -ProductCode 774F4FF8 -InstanceId i-12345678
```

- For API details, see `ConfirmProductInstance` in *AWS Tools for PowerShell Cmdlet Reference*.

Copy-EC2Image

The following code example shows how to use Copy-EC2Image.

Tools for PowerShell

Example 1: This example copies the specified AMI in the 'EU (Ireland)' region to the 'US West (Oregon)' region. If -Region is not specified, the current default region is used as the destination region.

```powershell
Copy-EC2Image -SourceRegion eu-west-1 -SourceImageId ami-12345678 -Region us-west-2
-Name "Copy of ami-12345678"
```

Output:

```powershell
ami-87654321
```

- For API details, see `CopyImage` in *AWS Tools for PowerShell Cmdlet Reference*.

Copy-EC2Snapshot

The following code example shows how to use Copy-EC2Snapshot.

Tools for PowerShell

Example 1: This example copies the specified snapshot from the EU (Ireland) region to the US West (Oregon) region.

```powershell
Copy-EC2Snapshot -SourceRegion eu-west-1 -SourceSnapshotId snap-12345678 -Region us-west-2
```
Example 2: If you set a default region and omit the Region parameter, the default destination region is the default region.

```powershell
Set-DefaultAWSRegion us-west-2
Copy-EC2Snapshot -SourceRegion eu-west-1 -SourceSnapshotId snap-12345678
```

- For API details, see [CopySnapshot](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Deny-EC2VpcPeeringConnection**

The following code example shows how to use Deny-EC2VpcPeeringConnection.

**Tools for PowerShell**

**Example 1:** The above example denies the request for VpcPeering request id pcx-01a2b3ce45fe67eb8

```powershell
Deny-EC2VpcPeeringConnection -VpcPeeringConnectionId pcx-01a2b3ce45fe67eb8
```

- For API details, see [RejectVpcPeeringConnection](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Disable-EC2VgwRoutePropagation**

The following code example shows how to use Disable-EC2VgwRoutePropagation.

**Tools for PowerShell**

**Example 1:** This example disables the VGW from automatically propagating routes to the specified routing table.

```powershell
Disable-EC2VgwRoutePropagation -RouteTableId rtb-12345678 -GatewayId vgw-1a2b3c4d
```

- For API details, see [DisableVgwRoutePropagation](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Disable-EC2VpcClassicLink**

The following code example shows how to use Disable-EC2VpcClassicLink.
Tools for PowerShell

Example 1: This example disables EC2VpcClassicLink for the vpc-01e23c4a5d6db78e9. It returns either True or False

```
Disable-EC2VpcClassicLink -VpcId vpc-01e23c4a5d6db78e9
```

Disable-EC2VpcClassicLinkDnsSupport

The following code example shows how to use Disable-EC2VpcClassicLinkDnsSupport.

Tools for PowerShell

Example 1: This example disables ClassicLink DNS support for the vpc-0b12d3456a7e8910d

```
Disable-EC2VpcClassicLinkDnsSupport -VpcId vpc-0b12d3456a7e8910d
```

Dismount-EC2InternetGateway

The following code example shows how to use Dismount-EC2InternetGateway.

Tools for PowerShell

Example 1: This example detaches the specified Internet gateway from the specified VPC.

```
Dismount-EC2InternetGateway -InternetGatewayId igw-1a2b3c4d -VpcId vpc-12345678
```

Dismount-EC2NetworkInterface

The following code example shows how to use Dismount-EC2NetworkInterface.
Tools for PowerShell

Example 1: This example removes the specified attachment between a network interface and an instance.

```powershell
Dismount-EC2NetworkInterface -AttachmentId eni-attach-1a2b3c4d -Force
```

- For API details, see [DetachNetworkInterface](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Dismount-EC2Volume

The following code example shows how to use Dismount-EC2Volume.

Tools for PowerShell

Example 1: This example detaches the specified volume.

```powershell
Dismount-EC2Volume -VolumeId vol-12345678
```

Output:

```
AttachTime          : 12/22/2015 1:53:58 AM
DeleteOnTermination : False
Device              : /dev/sdh
InstanceId          : i-1a2b3c4d
State               : detaching
VolumeId            : vol-12345678
```

Example 2: You can also specify the instance ID and device name to ensure that you are detaching the correct volume.

```powershell
Dismount-EC2Volume -VolumeId vol-12345678 -InstanceId i-1a2b3c4d -Device /dev/sdh
```

- For API details, see [DetachVolume](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Dismount-EC2VpnGateway

The following code example shows how to use Dismount-EC2VpnGateway.
Tools for PowerShell

Example 1: This example detaches the specified virtual private gateway from the specified VPC.

Dismount-EC2VpnGateway -VpnGatewayId vgw-1a2b3c4d -VpcId vpc-12345678

- For API details, see DetachVpnGateway in AWS Tools for PowerShell Cmdlet Reference.

Edit-EC2CapacityReservation

The following code example shows how to use Edit-EC2CapacityReservation.

Tools for PowerShell

Example 1: This example modifies the CapacityReservationId cr-0c1f2345db6f7cdba by changing the instance count to 1

Edit-EC2CapacityReservation -CapacityReservationId cr-0c1f2345db6f7cdba -InstanceCount 1

Output:

True

- For API details, see ModifyCapacityReservation in AWS Tools for PowerShell Cmdlet Reference.

Edit-EC2Host

The following code example shows how to use Edit-EC2Host.

Tools for PowerShell

Example 1: This example modifies the AutoPlacement settings to off for the dedicated host h-01e23f4cd567890f3

Edit-EC2Host -HostId h-03e09f8cd681609f3 -AutoPlacement off

Output:
Successful            Unsuccessful
----------            ------------
{h-01e23f4cd567890f3} {}
Edit-EC2ImageAttribute -ImageId ami-12345678 -Attribute launchPermission -OperationType remove -UserGroup all

Example 4: This example grants launch permission to the specified AWS account.

Edit-EC2ImageAttribute -ImageId ami-12345678 -Attribute launchPermission -OperationType add -UserId 111122223333

Example 5: This example removes launch permission from the specified AWS account.

Edit-EC2ImageAttribute -ImageId ami-12345678 -Attribute launchPermission -OperationType remove -UserId 111122223333

- For API details, see ModifyImageAttribute in AWS Tools for PowerShell Cmdlet Reference.

Edit-EC2InstanceAttribute

The following code example shows how to use Edit-EC2InstanceAttribute.

Tools for PowerShell

Example 1: This example modifies the instance type of the specified instance.

Edit-EC2InstanceAttribute -InstanceId i-12345678 -InstanceType m3.medium

Example 2: This example enables enhanced networking for the specified instance, by specifying "simple" as the value of the single root I/O virtualization (SR-IOV) network support parameter, -SriovNetSupport.

Edit-EC2InstanceAttribute -InstanceId i-12345678 -SriovNetSupport "simple"

Example 3: This example modifies the security groups for the specified instance. The instance must be in a VPC. You must specify the ID of each security group, not the name.

Edit-EC2InstanceAttribute -InstanceId i-12345678 -Group @("sg-12345678", "sg-45678901")
Example 4: This example enables EBS I/O optimization for the specified instance. This feature isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

```
Edit-EC2InstanceAttribute -InstanceId i-12345678 -EbsOptimized $true
```

Example 5: This example enables source/destination checking for the specified instance. For a NAT instance to perform NAT, the value must be 'false'.

```
Edit-EC2InstanceAttribute -InstanceId i-12345678 -SourceDestCheck $true
```

Example 6: This example disables termination for the specified instance.

```
Edit-EC2InstanceAttribute -InstanceId i-12345678 -DisableApiTermination $true
```

Example 7: This example changes the specified instance so that it terminates when shutdown is initiated from the instance.

```
Edit-EC2InstanceAttribute -InstanceId i-12345678 -InstanceInitiatedShutdownBehavior terminate
```

- For API details, see ModifyInstanceAttribute in AWS Tools for PowerShell Cmdlet Reference.

**Edit-EC2InstanceCreditSpecification**

The following code example shows how to use Edit-EC2InstanceCreditSpecification.

**Tools for PowerShell**

Example 1: This enables T2 unlimited credits for instance i-01234567890abcdef.

```
$Credit = New-Object -TypeName Amazon.EC2.Model.InstanceCreditSpecificationRequest
$Credit.InstanceId = "i-01234567890abcdef"
$Credit.CpuCredits = "unlimited"
Edit-EC2InstanceCreditSpecification -InstanceCreditSpecification $Credit
```

- For API details, see ModifyInstanceCreditSpecification in AWS Tools for PowerShell Cmdlet Reference.
**Edit-EC2NetworkInterfaceAttribute**

The following code example shows how to use `Edit-EC2NetworkInterfaceAttribute`.

**Tools for PowerShell**

Example 1: This example modifies the specified network interface so that the specified attachment is deleted on termination.

```
Edit-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-1a2b3c4d -Attachment_AttachmentId eni-attach-1a2b3c4d -Attachment_DeleteOnTermination $true
```

Example 2: This example modifies the description of the specified network interface.

```
Edit-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-1a2b3c4d -Description "my description"
```

Example 3: This example modifies the security group for the specified network interface.

```
Edit-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-1a2b3c4d -Groups sg-1a2b3c4d
```

Example 4: This example disables source/destination checking for the specified network interface.

```
Edit-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-1a2b3c4d -SourceDestCheck $false
```

- For API details, see [ModifyNetworkInterfaceAttribute](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Edit-EC2ReservedInstance**

The following code example shows how to use `Edit-EC2ReservedInstance`.

**Tools for PowerShell**

Example 1: This example modifies the Availability Zone, instance count, and platform for the specified Reserved instances.

```
$config = New-Object Amazon.EC2.Model.ReservedInstancesConfiguration
```

---

Amazon EC2
$config.AvailabilityZone = "us-west-2a"
$config.InstanceCount = 1
$config.Platform = "EC2-VPC"

Edit-EC2ReservedInstance
  -ReservedInstancesId @("FE32132D-70D5-4795-B400-AE435EXAMPLE", "0CC556F3-7AB8-4C00-B0E5-98666EXAMPLE")
  -TargetConfiguration $config

• For API details, see ModifyReservedInstances in AWS Tools for PowerShell Cmdlet Reference.

Edit-EC2SnapshotAttribute

The following code example shows how to use Edit-EC2SnapshotAttribute.

Tools for PowerShell

Example 1: This example makes the specified snapshot public by setting its CreateVolumePermission attribute.

Edit-EC2SnapshotAttribute -SnapshotId snap-12345678 -Attribute CreateVolumePermission -OperationType Add -GroupName all

• For API details, see ModifySnapshotAttribute in AWS Tools for PowerShell Cmdlet Reference.

Edit-EC2SpotFleetRequest

The following code example shows how to use Edit-EC2SpotFleetRequest.

Tools for PowerShell

Example 1: This example updates the target capacity of the specified Spot fleet request.

Edit-EC2SpotFleetRequest -SpotFleetRequestId sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE -TargetCapacity 10

Output:

True

• For API details, see ModifySpotFleetRequest in AWS Tools for PowerShell Cmdlet Reference.
**Edit-EC2SubnetAttribute**

The following code example shows how to use `Edit-EC2SubnetAttribute`.

**Tools for PowerShell**

- **Example 1:** This example enables public IP addressing for the specified subnet.
  ```powershell
  Edit-EC2SubnetAttribute -SubnetId subnet-1a2b3c4d -MapPublicIpOnLaunch $true
  ```

- **Example 2:** This example disables public IP addressing for the specified subnet.
  ```powershell
  Edit-EC2SubnetAttribute -SubnetId subnet-1a2b3c4d -MapPublicIpOnLaunch $false
  ```

  - For API details, see [ModifySubnetAttribute](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Edit-EC2VolumeAttribute**

The following code example shows how to use `Edit-EC2VolumeAttribute`.

**Tools for PowerShell**

- **Example 1:** This example modifies the specified attribute of the specified volume. I/O operations for the volume are automatically resumed after being suspended due to potentially inconsistent data.
  ```powershell
  Edit-EC2VolumeAttribute -VolumeId vol-12345678 -AutoEnableIO $true
  ```

  - For API details, see [ModifyVolumeAttribute](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Edit-EC2VpcAttribute**

The following code example shows how to use `Edit-EC2VpcAttribute`.

**Tools for PowerShell**

- **Example 1:** This example enables support for DNS hostnames for the specified VPC.
  ```powershell
  Edit-EC2VpcAttribute -VpcId vpc-12345678 -EnableDnsHostnames $true
  ```
Example 2: This example disables support for DNS hostnames for the specified VPC.

```
Edit-EC2VpcAttribute -VpcId vpc-12345678 -EnableDnsHostnames $false
```

Example 3: This example enables support for DNS resolution for the specified VPC.

```
Edit-EC2VpcAttribute -VpcId vpc-12345678 -EnableDnsSupport $true
```

Example 4: This example disables support for DNS resolution for the specified VPC.

```
Edit-EC2VpcAttribute -VpcId vpc-12345678 -EnableDnsSupport $false
```

• For API details, see [ModifyVpcAttribute](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Enable-EC2VgwRoutePropagation

The following code example shows how to use Enable-EC2VgwRoutePropagation.

**Tools for PowerShell**

Example 1: This example enables the specified VGW to propagate routes automatically to the specified routing table.

```
Enable-EC2VgwRoutePropagation -RouteTableId rtb-12345678 -GatewayId vgw-1a2b3c4d
```

• For API details, see [EnableVgwRoutePropagation](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Enable-EC2VolumeIO

The following code example shows how to use Enable-EC2VolumeIO.

**Tools for PowerShell**

Example 1: This example enables I/O operations for the specified volume, if I/O operations were disabled.

```
Enable-EC2VolumeIO -VolumeId vol-12345678
```

• For API details, see [EnableVolumeIo](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Amazon EC2
Enable-EC2VpcClassicLink

The following code example shows how to use Enable-EC2VpcClassicLink.

Tools for PowerShell

Example 1: This example enables VPC vpc-0123456b789b0d12f for ClassicLink

Enable-EC2VpcClassicLink -VpcId vpc-0123456b789b0d12f

Output:

True

- For API details, see EnableVpcClassicLink in AWS Tools for PowerShell Cmdlet Reference.

Enable-EC2VpcClassicLinkDnsSupport

The following code example shows how to use Enable-EC2VpcClassicLinkDnsSupport.

Tools for PowerShell

Example 1: This example enables vpc-0b12d3456a7e8910d to support DNS hostname resolution for ClassicLink

Enable-EC2VpcClassicLinkDnsSupport -VpcId vpc-0b12d3456a7e8910d -Region eu-west-1

- For API details, see EnableVpcClassicLinkDnsSupport in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2AccountAttribute

The following code example shows how to use Get-EC2AccountAttribute.

Tools for PowerShell

Example 1: This example describes whether you can launch instances into EC2-Classic and EC2-VPC in the region, or only into EC2-VPC.

(Get-EC2AccountAttribute -AttributeName supported-platforms).AttributeValues
Output:

<table>
<thead>
<tr>
<th>AttributeValue</th>
<th>--------------</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC2</td>
<td>VPC</td>
</tr>
</tbody>
</table>

**Example 2:** This example describes your default VPC, or is 'none' if you do not have a default VPC in the region.

```
(Get-EC2AccountAttribute -AttributeName default-vpc).AttributeValue
```

**Output:**

<table>
<thead>
<tr>
<th>AttributeValue</th>
<th>--------------</th>
</tr>
</thead>
<tbody>
<tr>
<td>vpc-12345678</td>
<td></td>
</tr>
</tbody>
</table>

**Example 3:** This example describes the maximum number of On-Demand instances that you can run.

```
(Get-EC2AccountAttribute -AttributeName max-instances).AttributeValue
```

**Output:**

<table>
<thead>
<tr>
<th>AttributeValue</th>
<th>--------------</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td></td>
</tr>
</tbody>
</table>

- For API details, see [DescribeAccountAttributes](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2Address**

The following code example shows how to use Get-EC2Address.

**Tools for PowerShell**

**Example 1:** This example describes the specified Elastic IP address for instances in EC2-Classic.
Get-EC2Address -AllocationId eipalloc-12345678

Output:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllocationId</td>

</tr>
<tr>
<td>PrivateIpAddress</td>
<td>10.0.2.172</td>
</tr>
<tr>
<td>PublicIp</td>
<td>198.51.100.2</td>
</tr>
</tbody>
</table>

Example 2: This example describes your Elastic IP addresses for instances in a VPC. This syntax requires PowerShell version 3 or later.

Get-EC2Address -Filter @{ Name="domain";Values="vpc" }

Example 3: This example describes the specified Elastic IP address for instances in EC2-Classic.

Get-EC2Address -PublicIp 203.0.113.17

Output:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>

</tbody>
</table>

Example 4: This example describes your Elastic IP addresses for instances in EC2-Classic. This syntax requires PowerShell version 3 or later.

Get-EC2Address -Filter @{ Name="domain";Values="standard" }
Example 5: This example describes all your Elastic IP addresses.

```
Get-EC2Address
```

Example 6: This example returns the public and private IP for the instance id provided in filter

```
Get-EC2Address -Region eu-west-1 -Filter @{Name="instance-id";Values="i-0c12d3f4f567f8b9"} | Select-Object PrivateIpAddress, PublicIp
```

Output:

```
PrivateIpAddress   PublicIp
-----------------   --------
10.0.0.99           63.36.5.227
```

Example 7: This example retrieves all the Elastic IPs with its allocation id, association id and instance ids

```
Get-EC2Address -Region eu-west-1 | Select-Object InstanceId, AssociationId, AllocationId, PublicIp
```

Output:

```

Get-EC2AvailabilityZone

The following code example shows how to use Get-EC2AvailabilityZone.

Tools for PowerShell

Example 1: This example describes the Availability Zones for the current region that are available to you.

```powershell
Get-EC2AvailabilityZone
```

Output:

<table>
<thead>
<tr>
<th>Messages</th>
<th>RegionName</th>
<th>State</th>
<th>ZoneName</th>

Example 2: This example describes any Availability Zones that are in an impaired state. The syntax used by this example requires PowerShell version 3 or higher.

```powershell
Get-EC2AvailabilityZone -Filter @{ Name="state";Values="impaired" }
```

Example 3: With PowerShell version 2, you must use New-Object to create the filter.

```powershell
$filter = New-Object Amazon.EC2.Model.Filter
$filter.Name = "state"
$filter.Values = "impaired"

Get-EC2AvailabilityZone -Filter $filter
```

- For API details, see [DescribeAvailabilityZones](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2BundleTask

The following code example shows how to use Get-EC2BundleTask.

**Tools for PowerShell**

**Example 1:** This example describes the specified bundle task.

```powershell
Get-EC2BundleTask -BundleId bun-12345678
```

**Example 2:** This example describes the bundle tasks whose state is either 'complete' or 'failed'.

```powershell
$filter = New-Object Amazon.EC2.Model.Filter
$filter.Name = "state"
$filter.Values = @( "complete", "failed" )

Get-EC2BundleTask -Filter $filter
```

- For API details, see [DescribeBundleTasks](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2CapacityReservation

The following code example shows how to use Get-EC2CapacityReservation.
Tools for PowerShell

Example 1: This example describes one or more of your Capacity Reservations for the region

Get-EC2CapacityReservation -Region eu-west-1

Output:

<table>
<thead>
<tr>
<th>AvailabilityZone</th>
<th>eu-west-1b</th>
</tr>
</thead>
<tbody>
<tr>
<td>AvailableInstanceCount</td>
<td>2</td>
</tr>
<tr>

Get-EC2ConsoleOutput

The following code example shows how to use Get-EC2ConsoleOutput.

Tools for PowerShell

Example 1: This example gets the console output for the specified Linux instance. The console output is encoded.

Get-EC2ConsoleOutput -InstanceId i-0e19abcd47c123456

Output:

<table>
<thead>
<tr>
<th>InstanceId</th>
<th>Output</th>
</tr>
</thead>
</table>
Example 2: This example stores the encoded console output in a variable and then decodes it.

```powershell
$Output_encoded = (Get-EC2ConsoleOutput -InstanceId i-0e19abcd47c123456).Output
[System.Text.Encoding]::UTF8.GetString([System.Convert]::FromBase64String($Output_encoded))
```

- For API details, see **GetConsoleOutput** in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-EC2CustomerGateway

The following code example shows how to use Get-EC2CustomerGateway.

#### Tools for PowerShell

**Example 1:** This example describes the specified customer gateway.

```powershell
Get-EC2CustomerGateway -CustomerGatewayId cgw-1a2b3c4d
```

**Output:**

```
BgpAsn            : 65534
CustomerGatewayId : cgw-1a2b3c4d
IpAddress         : 203.0.113.12
State             : available
Tags              : {}
Type              : ipsec.1
```

**Example 2:** This example describes any customer gateway whose state is either pending or available.

```powershell
$filter = New-Object Amazon.EC2.Model.Filter
$filter.Name = "state"
$filter.Values = @( "pending", "available" )
Get-EC2CustomerGateway -Filter $filter
```

**Example 3:** This example describes all your customer gateways.
Get-EC2CustomerGateway

- For API details, see [DescribeCustomerGateways](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2DhcpOption

The following code example shows how to use Get-EC2DhcpOption.

Tools for PowerShell

**Example 1:** This example lists your DHCP options sets.

```powershell
Get-EC2DhcpOption
```

**Output:**

<table>
<thead>
<tr>
<th>DhcpConfigurations</th>
<th>DhcpOptionsId</th>
<th>Tag</th>
</tr>

<td>{}</td>
</tr>
<tr>
<td>{domain-name-servers}</td>
<td>dopt-3a4b5c6d</td>
<td>{}</td>
</tr>
</tbody>
</table>

**Example 2:** This example gets configuration details for the specified DHCP options set.

```powershell
(Get-EC2DhcpOption -DhcpOptionsId dopt-1a2b3c4d).DhcpConfigurations
```

**Output:**

<table>
<thead>
<tr>
<th>Key</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain-name</td>
<td>{abc.local}</td>
</tr>
<tr>
<td>domain-name-servers</td>

</tbody>
</table>

- For API details, see [DescribeDhcpOptions](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2FlowLog

The following code example shows how to use Get-EC2FlowLog.
Example 1: This example describes one or more flow logs with log destination type 's3'

Get-EC2FlowLog -Filter @{Name="log-destination-type";Values="s3"}

Output:

<table>
<thead>
<tr>
<th>CreationTime</th>

Get-EC2Host

The following code example shows how to use Get-EC2Host.

Example 1: This example returns the EC2 host details

Get-EC2Host

Output:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

- For API details, see [DescribeHosts](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-EC2HostReservationOffering

The following code example shows how to use Get-EC2HostReservationOffering.

Tools for PowerShell

Example 1: This example describes the Dedicated Host reservations that are available to purchase for the given filter 'instance-family' where PaymentOption is 'NoUpfront'

Get-EC2HostReservationOffering -Filter @{Name="instance-family";Values="m4"} | Where-Object PaymentOption -eq NoUpfront

Output:

<table>

PaymentOption  : NoUpfront
UpfrontPrice   : 0.000

• For API details, see DescribeHostReservationOfferings in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2HostReservationPurchasePreview

The following code example shows how to use Get-EC2HostReservationPurchasePreview.

Tools for PowerShell

Example 1: This example previews a reservation purchase with configurations that match those of your Dedicated Host h-01e23f4cd567890f1

Get-EC2HostReservationPurchasePreview -OfferingId hro-0c1f23456789d0ab -HostIdSet h-01e23f4cd567890f1

Output:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

• For API details, see GetHostReservationPurchasePreview in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2IdFormat

The following code example shows how to use Get-EC2IdFormat.

Tools for PowerShell

Example 1: This example describes the ID format for the specified resource type.
Get-EC2IdFormat -Resource instance

**Output:**

<table>
<thead>
<tr>
<th>Resource</th>
<th>UseLongIds</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance</td>
<td>False</td>
</tr>
</tbody>
</table>

**Example 2:** This example describes the ID formats for all resource types that support longer IDs.

Get-EC2IdFormat

**Output:**

<table>
<thead>
<tr>
<th>Resource</th>
<th>UseLongIds</th>
</tr>
</thead>
<tbody>
<tr>
<td>reservation</td>
<td>False</td>
</tr>
<tr>
<td>instance</td>
<td>False</td>
</tr>
</tbody>
</table>

- For API details, see [DescribeIdFormat](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2IdentityIdFormat**

The following code example shows how to use Get-EC2IdentityIdFormat.

**Tools for PowerShell**

**Example 1:** This example returns the ID format for the resource 'image' for the role given

Get-EC2IdentityIdFormat -PrincipalArn arn:aws:iam::123456789511:role/JDBC -Resource image

**Output:**

<table>
<thead>
<tr>
<th>Deadline</th>
<th>Resource</th>
<th>UseLongIds</th>
</tr>
</thead>
<tbody>
<tr>
<td>8/2/2018 11:30:00 PM</td>
<td>image</td>
<td>True</td>
</tr>
</tbody>
</table>

- For API details, see [DescribeIdentityIdFormat](#) in *AWS Tools for PowerShell Cmdlet Reference*.
Get-EC2Image

The following code example shows how to use Get-EC2Image.

Tools for PowerShell

Example 1: This example describes the specified AMI.

Get-EC2Image -ImageId ami-12345678

Output:

Architecture : x86_64
BlockDeviceMappings : [/dev/xvda]
CreationDate : 2014-10-20T00:56:28.000Z
Description : My image
Hypervisor : xen

Public : False
RamdiskId :
RootDeviceName : /dev/xvda
RootDeviceType : ebs
SriovNetSupport : simple
State : available
StateReason :
Tags : {Name}
VirtualizationType : hvm

Example 2: This example describes the AMIs that you own.

Get-EC2Image -owner self

Example 3: This example describes the public AMIs that run Microsoft Windows Server.
Get-EC2Image -Filter @{ Name="platform"; Values="windows" }  

**Example 4:** This example describes all public AMIs in the 'us-west-2' region.

Get-EC2Image -Region us-west-2

- For API details, see *DescribeImages* in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2ImageAttribute**

The following code example shows how to use Get-EC2ImageAttribute.

**Tools for PowerShell**

**Example 1:** This example gets the description for the specified AMI.

Get-EC2ImageAttribute -ImageId ami-12345678 -Attribute description

**Output:**

BlockDeviceMappings : {}
Description : My image description
ImageId : ami-12345678
KernelId :
LaunchPermissions : {}
ProductCodes : {}
RamdiskId :
SriovNetSupport :

**Example 2:** This example gets the launch permissions for the specified AMI.

Get-EC2ImageAttribute -ImageId ami-12345678 -Attribute launchPermission

**Output:**

BlockDeviceMappings : {}
Description :
ImageId : ami-12345678
KernelId :
LaunchPermissions : {all}
ProductCodes : {}
Example 3: This example test whether enhanced networking is enabled.

Get-EC2ImageAttribute -ImageId ami-12345678 -Attribute sriovNetSupport

Output:

BlockDeviceMappings : {}
Description           : 
ImageId               : ami-12345678
KernelId              :

RamdiskId             : 
SriovNetSupport       : simple

- For API details, see DescribeImageAttribute in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2ImageByName

The following code example shows how to use Get-EC2ImageByName.

Tools for PowerShell

Example 1: This example describes the complete set of filter names that are currently supported.

Get-EC2ImageByName

Output:

WINDOWS_2016_BASE
WINDOWS_2016_NANO
WINDOWS_2016_CORE
WINDOWS_2016_CONTAINER
WINDOWS_2016_SQL_SERVER.Enterprise_2016
WINDOWS_2016_SQL_SERVER.Standard_2016
WINDOWS_2016_SQL_SERVER.Web_2016
WINDOWS_2016_SQL_SERVER.Express_2016
Example 2: This example describes the specified AMI. Using this command to locate an AMI is helpful because AWS releases new Windows AMIs with the latest updates each month. You can specify the 'ImageId' to New-EC2Instance to launch an instance using the current AMI for the specified filter.

Get-EC2ImageByName -Names WINDOWS_2016_BASE

Output:

Architecture : x86_64
For API details, see `Get-EC2ImageByName` in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2ImportImageTask**

The following code example shows how to use `Get-EC2ImportImageTask`.

**Tools for PowerShell**

**Example 1: This example describes the specified image import task.**

```
Get-EC2ImportImageTask -ImportTaskId import-ami-hgfedcba
```

**Output:**

```
Architecture    : x86_64
Description     : Windows Image 2
Hypervisor      :
ImageId         : ami-1a2b3c4d

Get-EC2ImportSnapshotTask

The following code example shows how to use Get-EC2ImportSnapshotTask.
Tools for PowerShell

Example 1: This example describes the specified snapshot import task.

Get-EC2ImportSnapshotTask -ImportTaskId import-snap-abcdefgh

Output:

<table>

Get-EC2InstanceAttribute

The following code example shows how to use Get-EC2InstanceAttribute.

Tools for PowerShell

Example 1: This example describes the instance type of the specified instance.

```powershell
Get-EC2InstanceAttribute -InstanceId i-12345678 -Attribute instanceType
```

Output:

```
InstanceType : t2.micro
```

Example 2: This example describes whether enhanced networking is enabled for the specified instance.

```powershell
Get-EC2InstanceAttribute -InstanceId i-12345678 -Attribute sriovNetSupport
```

Output:

```
SriovNetSupport : simple
```

Example 3: This example describes the security groups for the specified instance.

```powershell
(Get-EC2InstanceAttribute -InstanceId i-12345678 -Attribute groupSet).Groups
```

Output:

```
GroupId
-------
sg-12345678
sg-45678901
```

Example 4: This example describes whether EBS optimization is enabled for the specified instance.

```powershell
Get-EC2InstanceAttribute -InstanceId i-12345678 -Attribute ebsOptimized
```

Output:
Example 5: This example describes the 'disableApiTermination' attribute of the specified instance.

```powershell
Get-EC2InstanceAttribute -InstanceId i-12345678 -Attribute disableApiTermination
```

Output:

```powershell
DisableApiTermination : False
```

Example 6: This example describes the 'instanceInitiatedShutdownBehavior' attribute of the specified instance.

```powershell
Get-EC2InstanceAttribute -InstanceId i-12345678 -Attribute instanceInitiatedShutdownBehavior
```

Output:

```powershell
InstanceInitiatedShutdownBehavior : stop
```

- For API details, see [DescribeInstanceAttribute](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2InstanceMetadata**

The following code example shows how to use Get-EC2InstanceMetadata.

**Tools for PowerShell**

Example 1: Lists the available categories of instance metadata that can be queried.

```powershell
Get-EC2InstanceMetadata -ListCategory
```

Output:

```powershell
AmiId
LaunchIndex
ManifestPath
```
Example 2: Returns the id of the Amazon Machine Image (AMI) that was used to launch the instance.

Get-EC2InstanceMetadata -Category AmiId

Output:

ami-b2e756ca

Example 3: This example queries the JSON-formatted identity document for the instance.

Get-EC2InstanceMetadata -Category IdentityDocument
{
    "availabilityZone" : "us-west-2a",
    "devpayProductCodes" : null,
    "marketplaceProductCodes" : null,
    "version" : "2017-09-30",
    "instanceId" : "i-01ed50f7e2607f09e",
    "billingProducts" : [ "bp-6ba54002" ],
    "instanceType" : "t2.small"
Example 4: This example uses a path query to obtain the network interface macs for the instance.

Get-EC2InstanceMetadata -Path "/network/interfaces/macs"

Output:

02:80:7f:ef:4c:e0/

Example 5: If there is an IAM role associated with the instance, returns information about the last time the instance profile was updated, including the instance's LastUpdated date, InstanceProfileArn, and InstanceProfileId.

Get-EC2InstanceMetadata -Path "/iam/info"

Output:

{  
"Code" : "Success",
"LastUpdated" : "2018-03-08T03:38:40Z",
"InstanceProfileArn" : "arn:aws:iam::111122223333:instance-profile/MyLaunchRole_Profile",
"InstanceProfileId" : "AIPAI4...WVK2RW"
}

- For API details, see [Get-EC2InstanceMetadata](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-EC2InstanceStatus

The following code example shows how to use Get-EC2InstanceStatus.
**Example 1: This example describes the status of the specified instance.**

```powershell
Get-EC2InstanceStatus -InstanceId i-12345678

**Get-EC2InternetGateway**

The following code example shows how to use Get-EC2InternetGateway.

**Tools for PowerShell**

**Example 1: This example describes the specified Internet gateway.**

```powershell
Get-EC2InternetGateway -InternetGatewayId igw-1a2b3c4d
```

**Output:**

<table>

For API details, see [DescribeInternetGateways](#) in **AWS Tools for PowerShell Cmdlet Reference**.

**Get-EC2KeyPair**

The following code example shows how to use Get-EC2KeyPair.

**Tools for PowerShell**

**Example 1: This example describes the specified key pair.**

```powershell
Get-EC2KeyPair
```
Get-EC2KeyPair -KeyName my-key-pair

Output:

<table>
<thead>
<tr>
<th>KeyFingerprint</th>
<th>KeyName</th>
</tr>
</thead>

Example 2: This example describes all your key pairs.

Get-EC2KeyPair

- For API details, see [DescribeKeyPairs](https://aws.amazon.com/tools/powershell-cmdlet-reference/) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2NetworkAcl

The following code example shows how to use Get-EC2NetworkAcl.

Tools for PowerShell

Example 1: This example describes the specified network ACL.

Get-EC2NetworkAcl -NetworkAclId acl-12345678

Output:

- Associations : {aclassoc-1a2b3c4d}
- IsDefault : False
- NetworkAclId : acl-12345678
- Tags : {Name}
- VpcId : vpc-12345678

Example 2: This example describes the rules for the specified network ACL.

(Get-EC2NetworkAcl -NetworkAclId acl-12345678).Entries

Output:
Example 3: This example describes all your network ACLs.

```
Get-EC2NetworkAcl
```

- For API details, see [DescribeNetworkAcls](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2NetworkInterface

The following code example shows how to use Get-EC2NetworkInterface.

**Tools for PowerShell**

Example 1: This example describes the specified network interface.

```
Get-EC2NetworkInterface -NetworkInterfaceId eni-12345678
```

**Output:**

```
Association : 
Attachment    : Amazon.EC2.Model.NetworkInterfaceAttachment
AvailabilityZone : us-west-2c

TagSet             : {}
VpcId              : vpc-12345678

Example 2: This example describes all your network interfaces.

Get-EC2NetworkInterface

- For API details, see DescribeNetworkInterfaces in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2NetworkInterfaceAttribute

The following code example shows how to use Get-EC2NetworkInterfaceAttribute.

Tools for PowerShell

Example 1: This example describes the specified network interface.

Get-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-12345678 -Attribute Attachment

Output:

Attachment : Amazon.EC2.Model.NetworkInterfaceAttachment

Example 2: This example describes the specified network interface.

Get-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-12345678 -Attribute Description

Output:
**Example 3:** This example describes the specified network interface.

```powershell
Get-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-12345678 -Attribute GroupSet
```

**Output:**

```
Groups             : {my-security-group}
```

**Example 4:** This example describes the specified network interface.

```powershell
Get-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-12345678 -Attribute SourceDestCheck
```

**Output:**

```
SourceDestCheck    : True
```

- For API details, see [DescribeNetworkInterfaceAttribute](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2PasswordData**

The following code example shows how to use Get-EC2PasswordData.

**Tools for PowerShell**

**Example 1:** This example decrypts the password that Amazon EC2 assigned to the Administrator account for the specified Windows instance. As a pem file was specified, the setting of the `-Decrypt` switch is automatically assumed.

```powershell
Get-EC2PasswordData -InstanceId i-12345678 -PemFile C:\path\my-key-pair.pem
```

**Output:**

```
mYZ(PA9?C)Q
```
Example 2: (Windows PowerShell only) Inspects the instance to determine the name of the keypair used to launch the instance and then attempts to find the corresponding keypair data in the configuration store of the AWS Toolkit for Visual Studio. If the keypair data is found the password is decrypted.

```
Get-EC2PasswordData -InstanceId i-12345678 -Decrypt
```

Output:

```
mYZ(PA9?C)Q
```

Example 3: Returns the encrypted password data for the instance.

```
Get-EC2PasswordData -InstanceId i-12345678
```

Output:

```
iVz3BAK/WAXV.....dqt8WeMA==
```

- For API details, see [GetPasswordData](#) in AWS Tools for PowerShell Cmdlet Reference.

### Get-EC2PlacementGroup

The following code example shows how to use Get-EC2PlacementGroup.

#### Tools for PowerShell

**Example 1: This example describes the specified placement group.**

```
Get-EC2PlacementGroup -GroupName my-placement-group
```

Output:

```
<table>
<thead>
<tr>
<th>GroupName</th>
<th>State</th>
<th>Strategy</th>
</tr>
</thead>
<tbody>
<tr>
<td>my-placement-group</td>
<td>available</td>
<td>cluster</td>
</tr>
</tbody>
</table>
```

- For API details, see [DescribePlacementGroups](#) in AWS Tools for PowerShell Cmdlet Reference.
Get-EC2PrefixList

The following code example shows how to use Get-EC2PrefixList.

Tools for PowerShell

**Example 1:** This example fetches the available AWS services in a prefix list format for the region

```powershell
Get-EC2PrefixList
```

**Output:**

<table>
<thead>
<tr>
<th>Cidrs</th>
<th>PrefixListId</th>
<th>PrefixListName</th>
</tr>
</thead>
<tbody>
<tr>
<td>{52.94.5.0/24, 52.119.240.0/21, 52.94.24.0/23}</td>

<td>pl-6da54004</td>
<td>com.amazonaws.eu-west-1.s3</td>
</tr>
</tbody>
</table>

* For API details, see [DescribePrefixLists](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2Region

The following code example shows how to use Get-EC2Region.

Tools for PowerShell

**Example 1:** This example describes the regions that are available to you.

```powershell
Get-EC2Region
```

**Output:**

<table>
<thead>
<tr>
<th>Endpoint</th>
<th>RegionName</th>
</tr>
</thead>
<tbody>
<tr>
<td>ec2.eu-west-1.amazonaws.com</td>
<td>eu-west-1</td>
</tr>

<td>ap-southeast-2</td>
</tr>
<tr>
<td>ec2.eu-central-1.amazonaws.com</td>
<td>eu-central-1</td>
</tr>
</tbody>
</table>
Get-EC2RouteTable

The following code example shows how to use Get-EC2RouteTable.

**Tools for PowerShell**

**Example 1:** This example describes all your route tables.

```powershell
Get-EC2RouteTable
```

**Output:**

```
DestinationCidrBlock    : 10.0.0.0/16
DestinationPrefixListId :
GatewayId               : local
InstanceId              :

```

**Example 2:** This example returns details for the specified route table.
Example 3: This example describes the route tables for the specified VPC.

Get-EC2RouteTable -RouteTableId rtb-1a2b3c4d

Output:

Associations    : {rtbassoc-12345678}
PropagatingVgws : {}
Routes          : {, }
RouteTableId    : rtb-1a2b3c4d
Tags            : {}
VpcId           : vpc-1a2b3c4d

For API details, see [DescribeRouteTables](https://docs.aws.amazon.com/powershell/latest/about/Get-EC2RouteTable.html) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2ScheduledInstance

The following code example shows how to use Get-EC2ScheduledInstance.

Tools for PowerShell

Example 1: This example describes the specified Scheduled Instance.

Get-EC2ScheduledInstance -ScheduledInstanceId sci-1234-1234-1234-1234-123456789012

Output:

AvailabilityZone : us-west-2b
CreateDate       : 1/25/2016 1:43:38 PM
HourlyPrice      : 0.095
InstanceCount    : 1

Recurrence       : Amazon.EC2.Model.ScheduledInstanceRecurrence
Example 2: This example describes all your Scheduled Instances.

Get-EC2ScheduledInstance

- For API details, see [DescribeScheduledInstances](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EC2ScheduledInstanceAvailability

The following code example shows how to use Get-EC2ScheduledInstanceAvailability.

Tools for PowerShell

Example 1: This example describes a schedule that occurs every week on Sunday, starting on the specified date.

Get-EC2ScheduledInstanceAvailability -Recurrence_Frequency Weekly -Recurrence_Interval 1 -Recurrence_OccurrenceDay 1 -FirstSlotStartTimeRange_EarliestTime 2016-01-31T00:00:00Z -FirstSlotStartTimeRange_LatestTime 2016-01-31T04:00:00Z

Output:

| SlotDurationInHours    | 23         |
Example 2: To narrow the results, you can add filters for criteria such as operating system, network, and instance type.

-Filter @{ Name="platform";Values="Linux/UNIX" },@{ Name="network-platform";Values="EC2-VPC" },@{ Name="instance-type";Values="c4.large" }

- For API details, see [DescribeScheduledInstanceAvailability](#) in AWS Tools for PowerShell Cmdlet Reference.

### Get-EC2SecurityGroup

The following code example shows how to use Get-EC2SecurityGroup.

#### Tools for PowerShell

Example 1: This example describes the specified security group for a VPC. When working with security groups belonging to a VPC you must use the security group ID (-GroupId parameter), not name (-GroupName parameter), to reference the group.

```
Get-EC2SecurityGroup -GroupId sg-12345678
```

**Output:**

<table>
<thead>
<tr>
<th>Description</th>
<th>default VPC security group</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupId</td>
<td>sg-12345678</td>
</tr>
<tr>
<td>GroupName</td>

</tr>
<tr>
<td>Tags</td>
<td>{}</td>
</tr>
<tr>
<td>VpcId</td>
<td>vpc-12345678</td>
</tr>
</tbody>
</table>

Example 2: This example describes the specified security group for EC2-Classic. When working with security groups for EC2-Classic you may use either the group name (-GroupName parameter) or group ID (-GroupId parameter) to reference the security group.
Get-EC2SecurityGroup -GroupName my-security-group

Output:

<table>
<thead>
<tr>
<th>Description</th>
<th>my security group</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupId</td>
<td>sg-45678901</td>
</tr>
<tr>
<td>GroupName</td>

</tr>
<tr>
<td>OwnerId</td>
<td>123456789012</td>
</tr>
<tr>
<td>Tags</td>
<td>{}</td>
</tr>
<tr>
<td>VpcId</td>
<td></td>
</tr>
</tbody>
</table>

Example 3: This example retrieves all the security groups for the vpc-0fc1ff23456b789eb

Get-EC2SecurityGroup -Filter @{Name="vpc-id";Values="vpc-0fc1ff23456b789eb"}

- For API details, see DescribeSecurityGroups in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2Snapshot

The following code example shows how to use Get-EC2Snapshot.

Tools for PowerShell

Example 1: This example describes the specified snapshot.

Get-EC2Snapshot -SnapshotId snap-12345678

Output:

<table>
<thead>
<tr>
<th>DataEncryptionKeyId</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Created by CreateImage(i-1a2b3c4d) for ami-12345678 from vol-12345678</td>

<td></td>
</tr>
<tr>
<td>OwnerId</td>
<td>123456789012</td>
</tr>
<tr>
<td>Progress</td>
<td>100%</td>
</tr>
</tbody>
</table>
Example 2: This example describes the snapshots that have a 'Name' tag.

Get-EC2Snapshot | ? { $_.Tags.Count -gt 0 -and $_.Tags.Key -eq "Name" }

Example 3: This example describes the snapshots that have a 'Name' tag with the value 'TestValue'.

Example 4: This example describes all your snapshots.

Get-EC2Snapshot -Owner self

• For API details, see DescribeSnapshots in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2SnapshotAttribute

The following code example shows how to use Get-EC2SnapshotAttribute.

Tools for PowerShell

Example 1: This example describes the specified attribute of the specified snapshot.

Get-EC2SnapshotAttribute -SnapshotId snap-12345678 -Attribute ProductCodes

Output:

<table>
<thead>
<tr>
<th>CreateVolumePermissions</th>
<th>ProductCodes</th>
<th>SnapshotId</th>
</tr>
</thead>
<tbody>
<tr>
<td>------------------------</td>
<td>--------------</td>
<td>------------</td>
</tr>
<tr>
<td>Amazon EC2</td>
<td>384</td>

</tr>
</tbody>
</table>
Example 2: This example describes the specified attribute of the specified snapshot.

```powershell
(Get-EC2SnapshotAttribute -SnapshotId snap-12345678 -Attribute CreateVolumePermission).CreateVolumePermissions
```

**Output:**

<table>
<thead>
<tr>
<th>Group</th>
<th>UserId</th>
</tr>
</thead>
<tbody>
<tr>
<td>-----</td>
<td>------</td>
</tr>
<tr>
<td>all</td>
<td>------</td>
</tr>
</tbody>
</table>

- For API details, see [DescribeSnapshotAttribute](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-EC2SpotDatafeedSubscription

The following code example shows how to use `Get-EC2SpotDatafeedSubscription`.

**Tools for PowerShell**

**Example 1: This example describes your Spot instance data feed.**

```powershell
Get-EC2SpotDatafeedSubscription
```

**Output:**

```
Bucket : my-s3-bucket
Fault  :
OwnerId : 123456789012
Prefix : spotdata
State  : Active
```

- For API details, see [DescribeSpotDatafeedSubscription](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-EC2SpotFleetInstance

The following code example shows how to use `Get-EC2SpotFleetInstance`. 
Example 1: This example describes the instances associated with the specified Spot fleet request.

Get-EC2SpotFleetInstance -SpotFleetRequestId sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE

Output:

<table>
<thead>
<tr>
<th>InstanceId</th>
<th>InstanceType</th>

</tbody>
</table>

For API details, see [DescribeSpotFleetInstances](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-EC2SpotFleetRequest

The following code example shows how to use Get-EC2SpotFleetRequest.

Example 1: This example describes the specified Spot fleet request.

Get-EC2SpotFleetRequest -SpotFleetRequestId sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE | format-list

Output:

ConfigData : Amazon.EC2.Model.SpotFleetRequestConfigData
CreateTime : 12/26/2015 8:23:33 AM
SpotFleetRequestId : sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
SpotFleetRequestState : active

Example 2: This example describes all your Spot fleet requests.

Get-EC2SpotFleetRequest

For API details, see [DescribeSpotFleetRequests](#) in [AWS Tools for PowerShell Cmdlet Reference](#).
Get-EC2SpotFleetRequestHistory

The following code example shows how to use Get-EC2SpotFleetRequestHistory.

Example 1: This example describes the history of the specified Spot fleet request.

```powershell
Get-EC2SpotFleetRequestHistory -SpotFleetRequestId sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE -StartTime 2015-12-26T00:00:00Z
```

Output:

```

- For API details, see [DescribeSpotFleetRequestHistory](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2SpotInstanceRequest

The following code example shows how to use Get-EC2SpotInstanceRequest.
Tools for PowerShell

Example 1: This example describes the specified Spot instance request.

Get-EC2SpotInstanceRequest -SpotInstanceRequestId sir-12345678

Output:

- ActualBlockHourlyPrice : 
- AvailabilityZoneGroup : 
- BlockDurationMinutes : 0
- CreateTime : 4/8/2015 2:51:33 PM
- Fault : 
- InstanceId : i-12345678

- SpotPrice : 0.020000
- State : active
- Status : Amazon.EC2.Model.SpotInstanceStatus
- Tags : {Name}
- Type : one-time

Example 2: This example describes all your Spot instance requests.

Get-EC2SpotInstanceRequest

- For API details, see DescribeSpotInstanceRequests in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2SpotPriceHistory

The following code example shows how to use Get-EC2SpotPriceHistory.

Tools for PowerShell

Example 1: This example gets the last 10 entries in the Spot price history for the specified instance type and Availability Zone. Note that the value specified for the -AvailabilityZone
parameter must be valid for the region value supplied to either the cmdlet's -Region parameter (not shown in the example) or set as default in the shell. This example command assumes a default region of 'us-west-2' has been set in the environment.

```
Get-EC2SpotPriceHistory -InstanceType c3.large -AvailabilityZone us-west-2a -MaxResult 10
```

Output:

```
AvailabilityZone   : us-west-2a
InstanceType       : c3.large

...
```

- For API details, see [DescribeSpotPriceHistory](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2Subnet**

The following code example shows how to use Get-EC2Subnet.

**Tools for PowerShell**

**Example 1:** This example describes the specified subnet.

```
Get-EC2Subnet -SubnetId subnet-1a2b3c4d
```

Output:
Example 2: This example describes all your subnets.

Get-EC2Subnet

- For API details, see DescribeSubnets in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2Tag

The following code example shows how to use Get-EC2Tag.

Tools for PowerShell

Example 1: This example fetches the tags for resource-type 'image'

Get-EC2Tag -Filter @{Name="resource-type";Values="image"}

Output:

<table>
<thead>
<tr>
<th>Key</th>
<th>ResourceId</th>
<th>ResourceType</th>
<th>Value</th>

<td>ami-0a123b4ccbb567a8ea</td>
<td>image</td>
<td>never</td>
</tr>
</tbody>
</table>

Example 2: This example fetches all the tags for all the resources and groups them by resource type

Get-EC2Tag | Group-Object resourcetype

Output:
Example 3: This example displays all the resources with tag 'auto-delete' with value 'no' for the given region

Get-EC2Tag -Region eu-west-1 -Filter @{Name="tag:auto-delete";Values="no"}

Output:

<table>
<thead>
<tr>
<th>Key</th>
<th>ResourceId</th>
<th>ResourceType</th>
<th>Value</th>

</tr>
</tbody>
</table>
Example 4: This example obtains all the resources with tag 'auto-delete' with 'no' value and further filters in the next pipe to parse only 'instance' resource types and eventually creates 'ThisInstance' tag for each instance resources with value being the instance id itself

```
Get-EC2Tag -Region eu-west-1 -Filter @{Name="tag:auto-delete";Values="no"} | Where-Object ResourceType -eq "instance" | ForEach-Object {New-EC2Tag -ResourceId $_.ResourceId -Tag @{Key="ThisInstance";Value=$_.ResourceId}}
```

Example 5: This example fetches tags for all the instance resources as well as 'Name' keys and displays them in a table format

```
Get-EC2Tag -Filter @{Name="resource-type";Values="instance"},@{Name="key";Values="Name"} | Select-Object ResourceId, @{Name="Name-Tag";Expression={$PSItem.Value}} | Format-Table -AutoSize
```

Output:

Get-EC2Volume

The following code example shows how to use Get-EC2Volume.

Tools for PowerShell

**Example 1: This example describes the specified EBS volume.**

```
Get-EC2Volume -VolumeId vol-12345678
```

Output:

```
Attachments : {}
AvailabilityZone : us-west-2c
CreateTime : 7/17/2015 4:35:19 PM
Encrypted : False
Iops : 90
```
Example 2: This example describes your EBS volumes that have the status 'available'.

Get-EC2Volume -Filter @{ Name="status"; Values="available" }  

Output:

Attachments : {}  
AvailabilityZone : us-west-2c  
CreateTime : 12/21/2015 2:31:29 PM

Get-EC2Volume

- For API details, see DescribeVolumes in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2VolumeAttribute

The following code example shows how to use Get-EC2VolumeAttribute.

Tools for PowerShell

Example 1: This example describes the specified attribute of the specified volume.
Get-EC2VolumeAttribute -VolumeId vol-12345678 -Attribute AutoEnableIO

Output:

**Get-EC2Vpc**

The following code example shows how to use Get-EC2Vpc.

**Tools for PowerShell**

**Example 1:** This example describes the specified VPC.

```powershell
Get-EC2Vpc -VpcId vpc-12345678
```

**Output:**

- **CidrBlock**: 10.0.0.0/16
- **DhcpOptionsId**: dopt-1a2b3c4d
- **InstanceTenancy**: default
- **IsDefault**: False
- **State**: available
- **Tags**: {Name}
- **VpcId**: vpc-12345678

**Example 2:** This example describes the default VPC (there can be only one per region). If your account supports EC2-Classic in this region, there is no default VPC.

```powershell
Get-EC2Vpc -Filter @{Name="isDefault"; Values="true"}
```

**Output:**

- **CidrBlock**: 172.31.0.0/16
- **DhcpOptionsId**: dopt-12345678
- **InstanceTenancy**: default
- **IsDefault**: True
- **State**: available
- **Tags**: {}
Example 3: This example describes the VPCs that match the specified filter (that is, have a CIDR that matches the value '10.0.0.0/16' and are in the state 'available').

Get-EC2Vpc -Filter @{Name="cidr"; Values="10.0.0.0/16"},@{Name="state";Values="available"}

Example 4: This example describes all your VPCs.

Get-EC2Vpc

- For API details, see [DescribeVpcs](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2VpcAttribute

The following code example shows how to use Get-EC2VpcAttribute.

Tools for PowerShel

Example 1: This example describes the 'enableDnsSupport' attribute.

Get-EC2VpcAttribute -VpcId vpc-12345678 -Attribute enableDnsSupport

Output:

EnableDnsSupport  
---------------- 
True

Example 2: This example describes the 'enableDnsHostnames' attribute.

Get-EC2VpcAttribute -VpcId vpc-12345678 -Attribute enableDnsHostnames

Output:

EnableDnsHostnames  
------------------- 
True
• For API details, see DescribeVpcAttribute in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2VpcClassicLink

The following code example shows how to use Get-EC2VpcClassicLink.

Tools for PowerShell

Example 1: Above example returns all the VPCs with their ClassicLinkEnabled state for the region

Get-EC2VpcClassicLink -Region eu-west-1

Output:

<table>
<thead>
<tr>
<th>ClassicLinkEnabled</th>
<th>Tags</th>
<th>VpcId</th>

</table>

• For API details, see DescribeVpcClassicLink in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2VpcClassicLinkDnsSupport

The following code example shows how to use Get-EC2VpcClassicLinkDnsSupport.

Tools for PowerShell

Example 1: This example describes the ClassicLink DNS support status of VPCs for the region eu-west-1

Get-EC2VpcClassicLinkDnsSupport -VpcId vpc-b12d3456a7e8901d -Region eu-west-1

Output:

<table>
<thead>
<tr>
<th>ClassicLinkDnsSupported</th>
<th>VpcId</th>
</tr>
</thead>
</table>
• For API details, see [DescribeVpcClassicLinkDnsSupport](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2VpcEndpoint**

The following code example shows how to use Get-EC2VpcEndpoint.

**Tools for PowerShell**

**Example 1:** This example describes one or more of your VPC endpoints for the region eu-west-1. It then pipes the output to the next command, which select the VpcEndpointId property and returns array VPC ID as string array

```powershell
Get-EC2VpcEndpoint -Region eu-west-1 | Select-Object -ExpandProperty VpcEndpointId
```

**Output:**

<table>
<thead>
<tr>
<th>VpcEndpointId</th>
<th>VpcId</th>
<th>ServiceName</th>
</tr>
</thead>
<tbody>
<tr>
<td>vpce-01a2ab3f4f5cc6f7d</td>

<td></td>
<td></td>
</tr>
<tr>
<td>vpce-0c123db4567890123</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example 2:** This example describes all the vpc endpoints for the region eu-west-1 and selects VpcEndpointId, VpcId, ServiceName and PrivateDnsEnabled properties to present it in a tabular format

```powershell
Get-EC2VpcEndpoint -Region eu-west-1 | Select-Object VpcEndpointId, VpcId, ServiceName, PrivateDnsEnabled | Format-Table -AutoSize
```

**Output:**

<table>
<thead>
<tr>
<th>VpcEndpointId</th>
<th>VpcId</th>
<th>ServiceName</th>
</tr>
</thead>
<tbody>
<tr>
<td>-----------------------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>-----</td>
<td>------------</td>
</tr>
<tr>
<td></td>
<td>------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
Example 3: This example exports the policy document for the VPC Endpoint vpce-01a2ab3f4f5cc6f7d into a json file

Get-EC2VpcEndpoint -Region eu-west-1 -VpcEndpointId vpce-01a2ab3f4f5cc6f7d | Select-Object -Expand PolicyDocument | Out-File vpce_policyDocument.json

- For API details, see [DescribeVpcEndpoints](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2VpcEndpointService

The following code example shows how to use Get-EC2VpcEndpointService.

Tools for PowerShell

Example 1: This example describes EC2 VPC endpoint service with the given filter, in this case com.amazonaws.eu-west-1.ecs. Further, it also expands the ServiceDetails property and displays the details

Get-EC2VpcEndpointService -Region eu-west-1 -MaxResult 5 -Filter @{Name="serviceName";Values="com.amazonaws.eu-west-1.ecs"} | Select-Object -ExpandProperty ServiceDetails

Output:

```
AcceptanceRequired : False
AvailabilityZones  : {eu-west-1a, eu-west-1b, eu-west-1c}
BaseEndpointDnsNames : {ecs.eu-west-1.vpce.amazonaws.com}
Owner              : amazon
PrivateDnsName     : ecs.eu-west-1.amazonaws.com
ServiceName        : com.amazonaws.eu-west-1.ecs
ServiceType        : {Amazon.EC2.Model.ServiceTypeDetail}
VpcEndpointPolicySupported : False
```
Example 2: This example retrieves all the EC2 VPC Endpoint services and returns the ServiceNames matching "ssm"

```
Get-EC2VpcEndpointService -Region eu-west-1 | Select-Object -ExpandProperty Servicenames | Where-Object { -match "ssm"}
```

Output:

```
com.amazonaws.eu-west-1.ssm
com.amazonaws.eu-west-1.ssmmessages
```

- For API details, see [DescribeVpcEndpointServices](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-EC2VpnConnection

The following code example shows how to use Get-EC2VpnConnection.

Tools for PowerShell

Example 1: This example describes the specified VPN connection.

```
Get-EC2VpnConnection -VpnConnectionId vpn-12345678
```

Output:

```
CustomerGatewayConfiguration : [XML document]
CustomerGatewayId           : cgw-1a2b3c4d
Options                     : Amazon.EC2.Model.VpnConnectionOptions
Routes                      : {Amazon.EC2.Model.VpnStaticRoute}
State                       : available
Tags                        : {} 
Type                         : ipsec.1
VpnConnectionId             : vpn-12345678
VpnGatewayId                : vgw-1a2b3c4d
```

Example 2: This example describes any VPN connection whose state is either pending or available.
$filter = New-Object Amazon.EC2.Model.Filter
$filter.Name = "state"
$filter.Values = @( "pending", "available" )

Get-EC2VpnConnection -Filter $filter

**Example 3:** This example describes all your VPN connections.

Get-EC2VpnConnection

- For API details, see [DescribeVpnConnections](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-EC2VpnGateway**

The following code example shows how to use Get-EC2VpnGateway.

**Tools for PowerShell**

**Example 1:** This example describes the specified virtual private gateway.

Get-EC2VpnGateway -VpnGatewayId vgw-1a2b3c4d

**Output:**

```
AvailabilityZone :
State : available
Tags : {}
Type : ipsec.1
VpcAttachments : {vpc-12345678}
VpnGatewayId : vgw-1a2b3c4d
```

**Example 2:** This example describes any virtual private gateway whose state is either pending or available.

$filter = New-Object Amazon.EC2.Model.Filter
$filter.Name = "state"
$filter.Values = @( "pending", "available" )

Get-EC2VpnGateway -Filter $filter
Example 3: This example describes all your virtual private gateways.

Get-EC2VpnGateway

- For API details, see DescribeVpnGateways in AWS Tools for PowerShell Cmdlet Reference.

Grant-EC2SecurityGroupEgress

The following code example shows how to use Grant-EC2SecurityGroupEgress.

Tools for PowerShell

Example 1: This example defines an egress rule for the specified security group for EC2-VPC. The rule grants access to the specified IP address range on TCP port 80. The syntax used by this example requires PowerShell version 3 or higher.

```powershell
$ip = @{ IpProtocol="tcp"; FromPort="80"; ToPort="80"; IpRanges="203.0.113.0/24" }
Grant-EC2SecurityGroupEgress -GroupId sg-12345678 -IpPermission $ip
```

Example 2: With PowerShell version 2, you must use New-Object to create the IpPermission object.

```powershell
$ip = New-Object Amazon.EC2.Model.IpPermission
$ip.IpProtocol = "tcp"
$ip.FromPort = 80
$ip.ToPort = 80
$ip.IpRanges.Add("203.0.113.0/24")
Grant-EC2SecurityGroupEgress -GroupId sg-12345678 -IpPermission $ip
```

Example 3: This example grants access to the specified source security group on TCP port 80.

```powershell
$ug = New-Object Amazon.EC2.Model.UserIdGroupPair
$ug.GroupId = "sg-1a2b3c4d"
$ug.UserId = "123456789012"
Grant-EC2SecurityGroupEgress -GroupId sg-12345678 -IpPermission @( @{ IpProtocol="tcp"; FromPort="80"; ToPort="80"; UserIdGroupPairs=$ug } )
```

- For API details, see AuthorizeSecurityGroupEgress in AWS Tools for PowerShell Cmdlet Reference.
Grant-EC2SecurityGroupIngress

The following code example shows how to use Grant-EC2SecurityGroupIngress.

Tools for PowerShell

Example 1: This example defines ingress rules for a security group for EC2-VPC. These rules grant access to a specific IP address for SSH (port 22) and RDC (port 3389). Note that you must identify security groups for EC2-VPC using the security group ID not the security group name. The syntax used by this example requires PowerShell version 3 or higher.

```powershell
$ip1 = @{ IpProtocol="tcp"; FromPort="22"; ToPort="22"; IpRanges="203.0.113.25/32" }
$ip2 = @{ IpProtocol="tcp"; FromPort="3389"; ToPort="3389";
IpRanges="203.0.113.25/32" }
Grant-EC2SecurityGroupIngress -GroupId sg-12345678 -IpPermission @( $ip1, $ip2 )
```

Example 2: With PowerShell version 2, you must use New-Object to create the IpPermission objects.

```powershell
$ip1 = New-Object Amazon.EC2.Model.IpPermission
$ip1.IpProtocol = "tcp"
$ip1.FromPort = 22
$ip1.ToPort = 22
$ip1.IpRanges.Add("203.0.113.25/32")

$ip2 = New-Object Amazon.EC2.Model.IpPermission
$ip2.IpProtocol = "tcp"
$ip2.FromPort = 3389
$ip2.ToPort = 3389
$ip2.IpRanges.Add("203.0.113.25/32")
Grant-EC2SecurityGroupIngress -GroupId sg-12345678 -IpPermission @( $ip1, $ip2 )
```

Example 3: This example defines ingress rules for a security group for EC2-Classic. These rules grant access to a specific IP address for SSH (port 22) and RDC (port 3389). The syntax used by this example requires PowerShell version 3 or higher.

```powershell
$ip1 = @{ IpProtocol="tcp"; FromPort="22"; ToPort="22"; IpRanges="203.0.113.25/32" }
$ip2 = @{ IpProtocol="tcp"; FromPort="3389"; ToPort="3389";
IpRanges="203.0.113.25/32" }
```
Example 4: With PowerShell version 2, you must use New-Object to create the IpPermission objects.

```powershell
$ip1 = New-Object Amazon.EC2.Model.IpPermission
$ip1.IpProtocol = "tcp"
$ip1.FromPort = 22
$ip1.ToPort = 22
$ip1.IpRanges.Add("203.0.113.25/32")

$ip2 = New-Object Amazon.EC2.Model.IpPermission
$ip2.IpProtocol = "tcp"
$ip2.FromPort = 3389
$ip2.ToPort = 3389
$ip2.IpRanges.Add("203.0.113.25/32")

Grant-EC2SecurityGroupIngress -GroupName "my-security-group" -IpPermission @($ip1, $ip2)
```

Example 5: This example grants TCP port 8081 access from the specified source security group (sg-1a2b3c4d) to the specified security group (sg-12345678).

```powershell
$ug = New-Object Amazon.EC2.Model.UserIdGroupPair
$ug.GroupId = "sg-1a2b3c4d"
$ug.UserId = "123456789012"

Grant-EC2SecurityGroupIngress -GroupId sg-12345678 -IpPermission @{ IpProtocol="tcp"; FromPort="8081"; ToPort="8081"; UserIdGroupPairs=$ug }]
```

Example 6: This example adds the CIDR 5.5.5.5/32 to the Ingress rules of security Group sg-1234abcd for TCP port 22 traffic with a description.

```powershell
$ipRange = New-Object -TypeName Amazon.EC2.Model.IpRange
$ipRange.CidrIp = "5.5.5.5/32"
$ipRange.Description = "SSH from Office"
$ipPermission = New-Object Amazon.EC2.Model.IpPermission
$ipPermission.IpProtocol = "tcp"
$ipPermission.ToPort = 22
$ipPermission.FromPort = 22
$ipPermission.Ipv4Ranges = $ipRange
```
Grant-EC2SecurityGroupIngress -GroupId sg-1234abcd -IpPermission $IpPermission

- For API details, see AuthorizeSecurityGroupIngress in AWS Tools for PowerShell Cmdlet Reference.

**Import-EC2Image**

The following code example shows how to use Import-EC2Image.

**Tools for PowerShell**

**Example 1:** This example imports a single-disk virtual machine image from the specified Amazon S3 bucket to Amazon EC2 with an idempotency token. The example requires that a VM Import Service Role with the default name 'vmimport' exists, with a policy allowing Amazon EC2 access to the specified bucket, as explained in the VM Import Prequisites topic. To use a custom role, specify the role name using the -RoleName parameter.

```powershell
$container = New-Object Amazon.EC2.Model.ImageDiskContainer
$container.Format="VMDK"
$container.UserBucket.S3Bucket = "myVirtualMachineImages"
$container.UserBucket.S3Key = "Win_2008_Server_Standard_SP2_64-bit-disk1.vmdk"

$parms = @{
    "ClientToken"="idempotencyToken"
    "Description"="Windows 2008 Standard Image Import"
    "Platform"="Windows"
    "LicenseType"="AWS"
}

Import-EC2Image -DiskContainer $container @parms
```

**Output:**

### Import-EC2KeyPair

The following code example shows how to use `Import-EC2KeyPair`.

**Tools for PowerShell**

**Example 1:** This example imports a public key to EC2. The first line stores the contents of the public key file (*.pub) in the variable `$publickey`. Next, the example converts the UTF8 format of the public key file to a Base64-encoded string, and stores the converted string in the variable `$pkbase64`. In the last line, the converted public key is imported to EC2. The cmdlet returns the key fingerprint and name as results.

```
$publickey=[Io.File]::ReadAllText("C:\Users\TestUser\.ssh\id_rsa.pub")
$pkbase64 = [System.Convert]::ToBase64String([System.Text.Encoding]::UTF8.GetBytes($publickey))
Import-EC2KeyPair -KeyName Example-user-key -PublicKey $pkbase64
```

**Output:**

<table>
<thead>
<tr>
<th>KeyFingerprint</th>
<th>KeyName</th>
</tr>
</thead>
<tbody>
<tr>
<td>do:d0:15:8f:79:97:12:be:00:fd:df:31:z3:b1:42:z1</td>
<td>Example-user-key</td>
</tr>
</tbody>
</table>

- For API details, see [ImportKeyPair](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Import-EC2Snapshot

The following code example shows how to use `Import-EC2Snapshot`.

**Tools for PowerShell**

**Example 1:** This example imports a VM disk image of format 'VMDK' to an Amazon EBS snapshot. The example requires a VM Import Service Role with the default name...
'vmimport', with a policy allowing Amazon EC2 access to the specified bucket, as explained in the VM Import Prequisites topic in http://docs.aws.amazon.com/AWSEC2/latest/WindowsGuide/VMImportPrerequisites.html. To use a custom role, specify the role name using the -RoleName parameter.

```powershell
$params = @{
    "ClientToken"="idempotencyToken"
    "Description"="Disk Image Import"
    "DiskContainer_Description" = "Data disk"
    "DiskContainer_Format" = "VMDK"
    "DiskContainer_S3Bucket" = "myVirtualMachineImages"
    "DiskContainer_S3Key" = "datadiskimage.vmdk"
}
Import-EC2Snapshot @parms
```

Output:

<table>
<thead>
<tr>
<th>Description</th>
<th>ImportTaskId</th>
<th>SnapshotTaskDetail</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk Image Import</td>
<td>import-snap-abcdefgh</td>
<td>Amazon.EC2.Model.SnapshotTaskDetail</td>
</tr>
</tbody>
</table>

- For API details, see ImportSnapshot in AWS Tools for PowerShell Cmdlet Reference.

**Move-EC2AddressToVpc**

The following code example shows how to use Move-EC2AddressToVpc.

**Tools for PowerShell**

**Example 1:** This example moves an EC2 instance with a public IP address of 12.345.67.89 to the EC2-VPC platform in the US East (Northern Virginia) region.

```powershell
Move-EC2AddressToVpc -PublicIp 12.345.67.89 -Region us-east-1
```

**Example 2:** This example pipes the results of a Get-EC2Instance command to the Move-EC2AddressToVpc cmdlet. The Get-EC2Instance command gets an instance that is specified by instance ID, then returns the public IP address property of the instance.
For API details, see [MoveAddressToVpc](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-EC2Address

The following code example shows how to use `New-EC2Address`.

**Tools for PowerShell**

**Example 1:** This example allocates an Elastic IP address to use with an instance in a VPC.

```powershell
New-EC2Address -Domain Vpc
```

**Output:**

```
AllocationId          Domain       PublicIp
------------          ------       --------
eipalloc-12345678    vpc          198.51.100.2
```

**Example 2:** This example allocates an Elastic IP address to use with an instance in EC2-Classic.

```powershell
New-EC2Address
```

**Output:**

```
AllocationId          Domain       PublicIp
------------          ------       --------
standard             standard     203.0.113.17
```

For API details, see [AllocateAddress](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-EC2CustomerGateway

The following code example shows how to use `New-EC2CustomerGateway`.

```powershell
(Get-EC2Instance -Instance i-12345678).Instances.PublicIPAddress | Move-EC2AddressToVpc
```
Tools for PowerShell

Example 1: This example creates the specified customer gateway.

```
New-EC2CustomerGateway -Type ipsec.1 -PublicIp 203.0.113.12 -BgpAsn 65534
```

Output:

```
BgpAsn            : 65534
CustomerGatewayId : cgw-1a2b3c4d
IpAddress         : 203.0.113.12
State             : available
Tags              : {}
Type              : ipsec.1
```

- For API details, see [CreateCustomerGateway](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-EC2DhcpOption

The following code example shows how to use New-EC2DhcpOption.

Tools for PowerShell

Example 1: This example creates the specified set of DHCP options. The syntax used by this example requires PowerShell version 3 or later.

```
$options = @( @{Key="domain-name";Values=@("abc.local")}, @{Key="domain-name-servers";Values=@("10.0.0.101","10.0.0.102")})
New-EC2DhcpOption -DhcpConfiguration $options
```

Output:

```
DhcpConfigurations                    DhcpOptionsId    Tags
------------------                    -------------    ----
{domain-name, domain-name-servers}    dopt-1a2b3c4d    {}
```

Example 2: With PowerShell version 2, you must use New-Object to create each DHCP option.

```
$option1 = New-Object Amazon.EC2.Model.DhcpConfiguration
$option1.Key = "domain-name"
```
$option1.Values = "abc.local"

$option2 = New-Object Amazon.EC2.Model.DhcpConfiguration
$option2.Key = "domain-name-servers"
$option2.Values = @("10.0.0.101","10.0.0.102")

New-EC2DhcpOption -DhcpConfiguration @($option1, $option2)

Output:

<table>
<thead>
<tr>
<th>DhcpConfigurations</th>
<th>DhcpOptionsId</th>
<th>Tags</th>
</tr>
</thead>
<tbody>
<tr>
<td>{domain-name, domain-name-servers}</td>
<td>dopt-2a3b4c5d</td>
<td>{}</td>
</tr>
</tbody>
</table>

- For API details, see [CreateDhcpOptions](https://aws.amazon.com/aws-sdk-for-powershell/#CreateDhcpOptions) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-EC2FlowLog**

The following code example shows how to use New-EC2FlowLog.

**Tools for PowerShell**

**Example 1:** This example creates EC2 flowlog for the subnet subnet-1d234567 to the cloud-watch-log named 'subnet1-log' for all 'REJECT' traffic using the permissions of the 'Admin' role

New-EC2FlowLog -ResourceId "subnet-1d234567" -LogDestinationType cloud-watch-logs -LogGroupName subnet1-log -TrafficType "REJECT" -ResourceType Subnet -DeliverLogsPermissionArn "arn:aws:iam::98765432109:role/Admin"

Output:

<table>
<thead>
<tr>
<th>ClientToken</th>
<th>FlowLogIds</th>
<th>Unsuccessful</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

- For API details, see [CreateFlowLogs](https://aws.amazon.com/aws-sdk-for-powershell/#CreateFlowLogs) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-EC2Host**

The following code example shows how to use New-EC2Host.
Tools for PowerShell

Example 1: This example allocates a Dedicated Host to your account for the given instance type and availability zone

```powershell
New-EC2Host -AutoPlacement on -AvailabilityZone eu-west-1b -InstanceType m4.xlarge -Quantity 1
```

Output:

```
h-01e23f4cd567890f3
```

- For API details, see [AllocateHosts](https://aws.amazon.com/tools/powershell/cmdlet-reference/allocatehosts) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-EC2HostReservation**

The following code example shows how to use `New-EC2HostReservation`.

Tools for PowerShell

Example 1: This example purchases the reservation offering hro-0c1f23456789d0ab with configurations that match those of your Dedicated Host h-01e23f4cd567890f1

```powershell
New-EC2HostReservation -OfferingId hro-0c1f23456789d0ab HostIdSet h-01e23f4cd567890f1
```

Output:

```
ClientToken       :
CurrencyCode      :
Purchase           : {hr-0123f4b5d67bedc89}
TotalHourlyPrice  : 1.307
TotalUpfrontPrice : 0.000
```

- For API details, see [PurchaseHostReservation](https://aws.amazon.com/tools/powershell/cmdlet-reference/purchasehostreservation) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-EC2Image**

The following code example shows how to use `New-EC2Image`.
Example 1: This example creates an AMI with the specified name and description, from the specified instance. Amazon EC2 attempts to cleanly shut down the instance before creating the image, and restarts the instance on completion.

```powershell
New-EC2Image -InstanceId i-12345678 -Name "my-web-server" -Description "My web server AMI"
```

Example 2: This example creates an AMI with the specified name and description, from the specified instance. Amazon EC2 creates the image without shutting down and restarting the instance; therefore, file system integrity on the created image can't be guaranteed.

```powershell
New-EC2Image -InstanceId i-12345678 -Name "my-web-server" -Description "My web server AMI" -NoReboot $true
```

Example 3: This example creates an AMI with three volumes. The first volume is based on an Amazon EBS snapshot. The second volume is an empty 100 GiB Amazon EBS volume. The third volume is an instance store volume. The syntax used by this example requires PowerShell version 3 or higher.

```powershell
$ebsBlock1 = @{SnapshotId="snap-1a2b3c4d"}
$ebsBlock2 = @{VolumeSize=100}

New-EC2Image -InstanceId i-12345678 -Name "my-web-server" -Description "My web server AMI" -BlockDeviceMapping @( @{DeviceName="/dev/sdf";Ebs=$ebsBlock1}, @{DeviceName="/dev/sdg";Ebs=$ebsBlock2}, @{DeviceName="/dev/sdc";VirtualName="ephemeral0"})
```

- For API details, see [CreateImage](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-EC2Instance

The following code example shows how to use New-EC2Instance.

Tools for PowerShell

Example 1: This example launches a single instance of the specified AMI in EC2-Classic or a default VPC.
New-EC2Instance -ImageId ami-12345678 -MinCount 1 -MaxCount 1 -InstanceType m3.medium -KeyName my-key-pair -SecurityGroup my-security-group

Example 2: This example launches a single instance of the specified AMI in a VPC.

New-EC2Instance -ImageId ami-12345678 -MinCount 1 -MaxCount 1 -SubnetId subnet-12345678 -InstanceType t2.micro -KeyName my-key-pair -SecurityGroupId sg-12345678

Example 3: To add an EBS volume or an instance store volume, define a block device mapping and add it to the command. This example adds an instance store volume.

```powershell
$bdm = New-Object Amazon.EC2.Model.BlockDeviceMapping
$bdm.VirtualName = "ephemeral0"
$bdm.DeviceName = "/dev/sdf"
New-EC2Instance -ImageId ami-12345678 -BlockDeviceMapping $bdm ...
```

Example 4: To specify one of the current Windows AMIs, get its AMI ID using Get-EC2ImageByName. This example launches an instance from the current base AMI for Windows Server 2016.

```powershell
$ami = Get-EC2ImageByName WINDOWS_2016_BASE
New-EC2Instance -ImageId $ami.ImageId ...
```

Example 5: Launches an instance into the specified dedicated host environment.

```powershell
New-EC2Instance -ImageId ami-1a2b3c4d -InstanceType m4.large -KeyName my-key-pair -SecurityGroupId sg-1a2b3c4d -AvailabilityZone us-west-1a -Tenancy host -HostID h-1a2b3c4d5e6f1a2b3
```

Example 6: This request launches two instances and applies a tag with a key of webserver and a value of production to the instances. The request also applies a tag with a key of cost-center and a value of cc123 to the volumes that are created (in this case, the root volume for each instance).

```powershell
$tag1 = @{ Key="webserver"; Value="production" }
$tag2 = @{ Key="cost-center"; Value="cc123" }
```
$tagspec1 = new-object Amazon.EC2.Model.TagSpecification
$tagspec1.ResourceType = "instance"
$tagspec1.Tags.Add($tag1)

$tagspec2 = new-object Amazon.EC2.Model.TagSpecification
$tagspec2.ResourceType = "volume"
$tagspec2.Tags.Add($tag2)

New-EC2Instance -ImageId "ami-1a2b3c4d" -KeyName "my-key-pair" -MaxCount 2 -
InstanceType "t2.large" -SubnetId "subnet-1a2b3c4d" -TagSpecification $tagspec1, $tagspec2

- For API details, see RunInstances in AWS Tools for PowerShell Cmdlet Reference.

**New-EC2InstanceExportTask**

The following code example shows how to use New-EC2InstanceExportTask.

**Tools for PowerShell**

**Example 1:** This example exports a stopped instance, i-0800b00a00EXAMPLE, as a virtual
hard disk (VHD) to the S3 bucket testbucket-export-instances-2019. The target
environment is Microsoft, and the region parameter is added because the instance is in the
us-east-1 region, while the user's default AWS Region is not us-east-1. To get the status of
the export task, copy the ExportTaskId value from the results of this command, then run
Get-EC2ExportTask -ExportTaskId export_task_ID_from_results.

New-EC2InstanceExportTask -InstanceId i-0800b00a00EXAMPLE -
ExportToS3Task_DiskImageFormat VHD -ExportToS3Task_S3Bucket "testbucket-export-
instances-2019" -TargetEnvironment Microsoft -Region us-east-1

New-EC2InternetGateway

The following code example shows how to use New-EC2InternetGateway.

Tools for PowerShell

Example 1: This example creates an Internet gateway.

```powershell
New-EC2InternetGateway
```

Output:

<table>
<thead>
<tr>
<th>Attachments</th>
<th>InternetGatewayId</th>
<th>Tags</th>

New-EC2KeyPair

The following code example shows how to use New-EC2KeyPair.

Tools for PowerShell

Example 1: This example creates a key pair and captures the PEM-encoded RSA private key in a file with the specified name. When you are using PowerShell, the encoding must be set to ascii to generate a valid key. For more information, see Create, Display, and Delete Amazon EC2 Key Pairs (https://docs.aws.amazon.com/cli/latest/userguide/cli-services-ec2-keypairs.html) in the AWS Command Line Interface User Guide.

```powershell
(New-EC2KeyPair -KeyName "my-key-pair").KeyMaterial | Out-File -Encoding ascii -FilePath C:\path\my-key-pair.pem
```

New-EC2NetworkAcl

The following code example shows how to use New-EC2NetworkAcl.
Tools for PowerShell

Example 1: This example creates a network ACL for the specified VPC.

New-EC2NetworkAcl -VpcId vpc-12345678

Output:

Associations : {}
IsDefault    : False
NetworkAclId : acl-12345678
Tags         : {}
VpcId        : vpc-12345678

- For API details, see CreateNetworkAcl in AWS Tools for PowerShell Cmdlet Reference.

New-EC2NetworkAclEntry

The following code example shows how to use New-EC2NetworkAclEntry.

Tools for PowerShell

Example 1: This example creates an entry for the specified network ACL. The rule allows inbound traffic from anywhere (0.0.0.0/0) on UDP port 53 (DNS) into any associated subnet.

New-EC2NetworkAclEntry -NetworkAclId acl-12345678 -Egress $false -RuleNumber 100 -Protocol 17 -PortRange_From 53 -PortRange_To 53 -CidrBlock 0.0.0.0/0 -RuleAction allow

- For API details, see CreateNetworkAclEntry in AWS Tools for PowerShell Cmdlet Reference.

New-EC2NetworkInterface

The following code example shows how to use New-EC2NetworkInterface.

Tools for PowerShell

Example 1: This example creates the specified network interface.
New-EC2NetworkInterface -SubnetId subnet-1a2b3c4d -Description "my network interface" -Group sg-12345678 -PrivateIpAddress 10.0.0.17

Output:

**New-EC2PlacementGroup**

The following code example shows how to use `New-EC2PlacementGroup`.

**Tools for PowerShell**

**Example 1: This example creates a placement group with the specified name.**

```
New-EC2PlacementGroup -GroupName my-placement-group -Strategy cluster
```

- For API details, see [CreatePlacementGroup](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-EC2Route**

The following code example shows how to use `New-EC2Route`. 

---

Amazon EC2
Tools for PowerShell

Example 1: This example creates the specified route for the specified route table. The route matches all traffic and sends it to the specified Internet gateway.

```
New-EC2Route -RouteTableId rtb-1a2b3c4d -DestinationCidrBlock 0.0.0.0/0 -GatewayId igw-1a2b3c4d

**New-EC2SecurityGroup**

The following code example shows how to use New-EC2SecurityGroup.

**Tools for PowerShell**

**Example 1:** This example creates a security group for the specified VPC.

```
New-EC2SecurityGroup -GroupName my-security-group -Description "my security group" -VpcId vpc-12345678

**Example 2:** This example creates a security group for EC2-Classic.

```
New-EC2SecurityGroup -GroupName my-security-group -Description "my security group"
```

**Output:**

sg-45678901

For API details, see CreateSecurityGroup in AWS Tools for PowerShell Cmdlet Reference.

**New-EC2Snapshot**

The following code example shows how to use New-EC2Snapshot.

**Tools for PowerShell**

**Example 1:** This example creates a snapshot of the specified volume.
New-EC2Snapshot -VolumeId vol-12345678 -Description "This is a test"

Output:

New-EC2SpotDatafeedSubscription

The following code example shows how to use `New-EC2SpotDatafeedSubscription`.

Tools for PowerShell

**Example 1: This example creates a Spot instance data feed.**

New-EC2SpotDatafeedSubscription -Bucket my-s3-bucket -Prefix spotdata

Output:

Bucket : my-s3-bucket

State : Active

For API details, see [CreateSpotDatafeedSubscription](#) in *AWS Tools for PowerShell Cmdlet Reference.*
New-EC2Subnet

The following code example shows how to use New-EC2Subnet.

Tools for PowerShell

Example 1: This example creates a subnet with the specified CIDR.

```
New-EC2Subnet -VpcId vpc-12345678 -CidrBlock 10.0.0.0/24
```

Output:

```

New-EC2Tag

The following code example shows how to use New-EC2Tag.

Tools for PowerShell

Example 1: This example adds a single tag to the specified resource. The tag key is 'myTag' and the tag value is 'myTagValue'. The syntax used by this example requires PowerShell version 3 or higher.

```
New-EC2Tag -Resource i-12345678 -Tag @{ Key="myTag"; Value="myTagValue" }
```

Example 2: This example updates or adds the specified tags to the specified resource. The syntax used by this example requires PowerShell version 3 or higher.

```
New-EC2Tag -Resource i-12345678 -Tag @(

                                                            @
                                                            
                                                                @
                                                                
                                                                    @
                                                                    
                                                                        @
                                                                        
                                                                            
```

Amazon EC2
Example 3: With PowerShell version 2, you must use New-Object to create the tag for the Tag parameter.

```powershell
$tag = New-Object Amazon.EC2.Model.Tag
$tag.Key = "myTag"
$tag.Value = "myTagValue"

New-EC2Tag -Resource i-12345678 -Tag $tag
```

- For API details, see CreateTags in AWS Tools for PowerShell Cmdlet Reference.

New-EC2Volume

The following code example shows how to use New-EC2Volume.

Tools for PowerShell

Example 1: This example creates the specified volume.

```powershell
New-EC2Volume -Size 50 -AvailabilityZone us-west-2a -VolumeType gp2
```

Output:

Example 2: This example request creates a volume and applies a tag with a key of stack and a value of production.

```powershell
$tag = @{ Key="stack"; Value="production" }
```
$tagspec = new-object Amazon.EC2.Model.TagSpecification
$tagspec.ResourceType = "volume"
$tagspec.Tags.Add($tag)

New-EC2Volume -Size 80 -AvailabilityZone "us-west-2a" -TagSpecification $tagspec

- For API details, see [CreateVolume](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-EC2Vpc

The following code example shows how to use New-EC2Vpc.

**Tools for PowerShell**

**Example 1:** This example creates a VPC with the specified CIDR. Amazon VPC also creates the following for the VPC: a default DHCP options set, a main route table, and a default network ACL.

New-EC2VPC -CidrBlock 10.0.0.0/16

**Output:**

<table>
<thead>
<tr>
<th>CidrBlock</th>
<th>10.0.0.0/16</th>

- For API details, see [CreateVpc](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-EC2VpcEndpoint

The following code example shows how to use New-EC2VpcEndpoint.

**Tools for PowerShell**

**Example 1:** This example create a new VPC Endpoint for the service com.amazonaws.eu-west-1.s3 in the VPC vpc-0fc1ff23f45b678eb
New-EC2VpcEndpoint -ServiceName com.amazonaws.eu-west-1.s3 -VpcId vpc-0fc1ff23f45b678eb

Output:

**New-EC2VpnConnection**

The following code example shows how to use New-EC2VpnConnection.

**Tools for PowerShell**

**Example 1:** This example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The output includes the configuration information that your network administrator needs, in XML format.

```
New-EC2VpnConnection -Type ipsec.1 -CustomerGatewayId cgw-1a2b3c4d -VpnGatewayId vgw-1a2b3c4d
```

Output:

```

VpnGatewayId                 : vgw-1a2b3c4d
```

**Example 2:** This example creates the VPN connection and captures the configuration in a file with the specified name.
Example 3: This example creates a VPN connection, with static routing, between the specified virtual private gateway and the specified customer gateway.

```powershell
New-EC2VpnConnection -Type ipsec.1 -CustomerGatewayId cgw-1a2b3c4d -VpnGatewayId vgw-1a2b3c4d -Options_StaticRoutesOnly $true
```

For API details, see [CreateVpnConnection](https://awsdocs.amazonwebsservices.com/en_us/ServicesGuide/ServicesGuide.html#CreateVpnConnection) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-EC2VpnConnectionRoute

The following code example shows how to use `New-EC2VpnConnectionRoute`.

**Tools for PowerShell**

**Example 1: This example creates the specified static route for the specified VPN connection.**

```powershell
New-EC2VpnConnectionRoute -VpnConnectionId vpn-12345678 -DestinationCidrBlock 11.12.0.0/16
```

For API details, see [CreateVpnConnectionRoute](https://awsdocs.amazonwebsservices.com/en_us/ServicesGuide/ServicesGuide.html#CreateVpnConnectionRoute) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-EC2VpnGateway

The following code example shows how to use `New-EC2VpnGateway`.

**Tools for PowerShell**

**Example 1: This example creates the specified virtual private gateway.**

```powershell
New-EC2VpnGateway -Type ipsec.1
```

**Output:**

```
AvailabilityZone : 
State : available
Tags : {}
```
Type             : ipsec.1
VpcAttachments   : {}
VpnGatewayId     : vgw-1a2b3c4d

- For API details, see [CreateVpnGateway](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-EC2Address**

The following code example shows how to use `Register-EC2Address`.

**Tools for PowerShell**

**Example 1:** This example associates the specified Elastic IP address with the specified instance in a VPC.

```
C:\> Register-EC2Address -InstanceId i-12345678 -AllocationId eipalloc-12345678
```

**Output:**

```
eipassoc-12345678
```

**Example 2:** This example associates the specified Elastic IP address with the specified instance in EC2-Classic.

```
C:\> Register-EC2Address -InstanceId i-12345678 -PublicIp 203.0.113.17
```

- For API details, see [AssociateAddress](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-EC2DhcpOption**

The following code example shows how to use `Register-EC2DhcpOption`.

**Tools for PowerShell**

**Example 1:** This example associates the specified DHCP options set with the specified VPC.

```
Register-EC2DhcpOption -DhcpOptionsId dopt-1a2b3c4d -VpcId vpc-12345678
```

**Example 2:** This example associates the default DHCP options set with the specified VPC.
Register-EC2DhcpOption -DhcpOptionsId default -VpcId vpc-12345678

- For API details, see AssociateDhcpOptions in AWS Tools for PowerShell Cmdlet Reference.

Register-EC2Image

The following code example shows how to use Register-EC2Image.

Tools for PowerShell

Example 1: This example registers an AMI using the specified manifest file in Amazon S3.

Register-EC2Image -ImageLocation my-s3-bucket/my-web-server-ami/image.manifest.xml -Name my-web-server-ami

- For API details, see RegisterImage in AWS Tools for PowerShell Cmdlet Reference.

Register-EC2PrivateIpAddress

The following code example shows how to use Register-EC2PrivateIpAddress.

Tools for PowerShell

Example 1: This example assigns the specified secondary private IP address to the specified network interface.

Register-EC2PrivateIpAddress -NetworkInterfaceId eni-1a2b3c4d -PrivateIpAddress 10.0.0.82

Example 2: This example creates two secondary private IP addresses and assigns them to the specified network interface.

Register-EC2PrivateIpAddress -NetworkInterfaceId eni-1a2b3c4d -SecondaryPrivateIpAddressCount 2

- For API details, see AssignPrivateIpAddresses in AWS Tools for PowerShell Cmdlet Reference.

Register-EC2RouteTable

The following code example shows how to use Register-EC2RouteTable.
Tools for PowerShell

Example 1: This example associates the specified route table with the specified subnet.

```
Register-EC2RouteTable -RouteTableId rtb-1a2b3c4d -SubnetId subnet-1a2b3c4d
```

Output:

```
rtbassoc-12345678
```

- For API details, see [AssociateRouteTable](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-EC2Address

The following code example shows how to use Remove-EC2Address.

Tools for PowerShell

Example 1: This example releases the specified Elastic IP address for instances in a VPC.

```
Remove-EC2Address -AllocationId eipalloc-12345678 -Force
```

Example 2: This example releases the specified Elastic IP address for instances in EC2-Classica.

```
Remove-EC2Address -PublicIp 198.51.100.2 -Force
```

- For API details, see [ReleaseAddress](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-EC2CapacityReservation

The following code example shows how to use Remove-EC2CapacityReservation.

Tools for PowerShell

Example 1: This example cancels the capacity reservation cr-0c1f2345db6f7cdba

```
Remove-EC2CapacityReservation -CapacityReservationId cr-0c1f2345db6f7cdba
```

Output:
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-EC2CapacityReservation (CancelCapacityReservation)"

- For API details, see [CancelCapacityReservation](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-EC2CustomerGateway**

The following code example shows how to use Remove-EC2CustomerGateway.

**Tools for PowerShell**

**Example 1:** This example deletes the specified customer gateway. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```
Remove-EC2CustomerGateway -CustomerGatewayId cgw-1a2b3c4d
```

**Output:**

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2CustomerGateway (DeleteCustomerGateway)" on Target "cgw-1a2b3c4d".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): y

- For API details, see [DeleteCustomerGateway](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-EC2DhcpOption**

The following code example shows how to use Remove-EC2DhcpOption.

**Tools for PowerShell**

**Example 1:** This example deletes the specified DHCP options set. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.
Remove-EC2DhcpOption -DhcpOptionsId dopt-1a2b3c4d

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2DhcpOption (DeleteDhcpOptions)" on Target "dopt-1a2b3c4d".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

• For API details, see DeleteDhcpOptions in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2FlowLog

The following code example shows how to use Remove-EC2FlowLog.

Tools for PowerShell

Example 1: This example removes the given FlowLogId fl-01a2b3456a789c01

Remove-EC2FlowLog -FlowLogId fl-01a2b3456a789c01

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-EC2FlowLog (DeleteFlowLogs)" on target "fl-01a2b3456a789c01".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

• For API details, see DeleteFlowLogs in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2Host

The following code example shows how to use Remove-EC2Host.

Tools for PowerShell

Example 1: This example releases the given host ID h-0badafd1dcb2f3456
Remove-EC2Host -HostId h-0badafd1dcb2f3456

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-EC2Host (ReleaseHosts)" on target "h-0badafd1dcb2f3456".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y

Remove-EC2Instance

The following code example shows how to use Remove-EC2Instance.

Tools for PowerShell

Example 1: This example terminates the specified instance (the instance may be running or in 'stopped' state). The cmdlet will prompt for confirmation before proceeding; use the -Force switch to suppress the prompt.

Remove-EC2Instance -InstanceId i-12345678

Output:

CurrentState                      InstanceId    PreviousState
------------                      ----------    -------------

• For API details, see TerminateInstances in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2InternetGateway

The following code example shows how to use Remove-EC2InternetGateway.
Tools for PowerShell

Example 1: This example deletes the specified Internet gateway. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```
Remove-EC2InternetGateway -InternetGatewayId igw-1a2b3c4d
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2InternetGateway (DeleteInternetGateway)" on Target "igw-1a2b3c4d".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

- For API details, see DeleteInternetGateway in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2KeyPair

The following code example shows how to use Remove-EC2KeyPair.

Tools for PowerShell

Example 1: This example deletes the specified key pair. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```
Remove-EC2KeyPair -KeyName my-key-pair
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2KeyPair (DeleteKeyPair)" on Target "my-key-pair".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):
```

- For API details, see DeleteKeyPair in AWS Tools for PowerShell Cmdlet Reference.
Remove-EC2NetworkAcl

The following code example shows how to use Remove-EC2NetworkAcl.

Tools for PowerShell

Example 1: This example deletes the specified network ACL. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```
Remove-EC2NetworkAcl -NetworkAclId acl-12345678
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2NetworkAcl (DeleteNetworkAcl)" on Target "acl-12345678".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

• For API details, see DeleteNetworkAcl in AWS Tools for PowerShell Cmdlet Reference.
```

Remove-EC2NetworkAclEntry

The following code example shows how to use Remove-EC2NetworkAclEntry.

Tools for PowerShell

Example 1: This example removes the specified rule from the specified network ACL. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```
Remove-EC2NetworkAclEntry -NetworkAclId acl-12345678 -Egress $false -RuleNumber 100
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2NetworkAclEntry (DeleteNetworkAclEntry)" on Target "acl-12345678".
```
For API details, see [DeleteNetworkAclEntry](https://aws.amazon.com/tools-for-powershell-cmdlet-reference) in AWS Tools for PowerShell Cmdlet Reference.

### Remove-EC2NetworkInterface

The following code example shows how to use Remove-EC2NetworkInterface.

**Tools for PowerShell**

**Example 1:** This example deletes the specified network interface. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```
Remove-EC2NetworkInterface -NetworkInterfaceId eni-12345678
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2NetworkInterface (DeleteNetworkInterface)" on Target "eni-12345678".

### Remove-EC2PlacementGroup

The following code example shows how to use Remove-EC2PlacementGroup.

**Tools for PowerShell**

**Example 1:** This example deletes the specified placement group. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```
Remove-EC2PlacementGroup -GroupName my-placement-group
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2PlacementGroup (DeletePlacementGroup)" on Target "my-placement-group".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

For API details, see DeletePlacementGroup in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2Route

The following code example shows how to use Remove-EC2Route.

Tools for PowerShell

Example 1: This example deletes the specified route from the specified route table. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

Remove-EC2Route -RouteTableId rtb-1a2b3c4d -DestinationCidrBlock 0.0.0.0/0

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2Route (DeleteRoute)" on Target "rtb-1a2b3c4d".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

For API details, see DeleteRoute in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2RouteTable

The following code example shows how to use Remove-EC2RouteTable.

Tools for PowerShell

Example 1: This example deletes the specified route table. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.
Remove-EC2RouteTable -RouteTableId rtb-1a2b3c4d

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2RouteTable (DeleteRouteTable)" on Target "rtb-1a2b3c4d".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

• For API details, see DeleteRouteTable in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2SecurityGroup

The following code example shows how to use Remove-EC2SecurityGroup.

Tools for PowerShell

Example 1: This example deletes the specified security group for EC2-VPC. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

Remove-EC2SecurityGroup -GroupId sg-12345678

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2SecurityGroup (DeleteSecurityGroup)" on Target "sg-12345678".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

Example 2: This example deletes the specified security group for EC2-Classic.

Remove-EC2SecurityGroup -GroupName my-security-group -Force

• For API details, see DeleteSecurityGroup in AWS Tools for PowerShell Cmdlet Reference.
Remove-EC2Snapshot

The following code example shows how to use Remove-EC2Snapshot.

Tools for PowerShell

Example 1: This example deletes the specified snapshot. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```powershell
Remove-EC2Snapshot -SnapshotId snap-12345678
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-EC2Snapshot (DeleteSnapshot)" on target "snap-12345678".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):
```

- For API details, see [DeleteSnapshot](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-EC2SpotDatafeedSubscription

The following code example shows how to use Remove-EC2SpotDatafeedSubscription.

Tools for PowerShell

Example 1: This example deletes your Spot instance data feed. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```powershell
Remove-EC2SpotDatafeedSubscription
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2SpotDatafeedSubscription (DeleteSpotDatafeedSubscription)" on Target ".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):
```
• For API details, see `DeleteSpotDatafeedSubscription` in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-EC2Subnet**

The following code example shows how to use Remove-EC2Subnet.

**Tools for PowerShell**

**Example 1:** This example deletes the specified subnet. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```powershell
Remove-EC2Subnet -SubnetId subnet-1a2b3c4d
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2Subnet (DeleteSubnet)" on Target "subnet-1a2b3c4d". [Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):
```

• For API details, see `DeleteSubnet` in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-EC2Tag**

The following code example shows how to use Remove-EC2Tag.

**Tools for PowerShell**

**Example 1:** This example deletes the specified tag from the specified resource, regardless of the tag value. The syntax used by this example requires PowerShell version 3 or later.

```powershell
Remove-EC2Tag -Resource i-12345678 -Tag @{ Key="myTag" } -Force
```

**Example 2:** This example deletes the specified tag from the specified resource, but only if the tag value matches. The syntax used by this example requires PowerShell version 3 or later.
Remove-EC2Tag -Resource i-12345678 -Tag @{ Key="myTag";Value="myTagValue" } -Force

Example 3: This example deletes the specified tag from the specified resource, regardless of the tag value.

```powershell
$tag = New-Object Amazon.EC2.Model.Tag
$tag.Key = "myTag"
Remove-EC2Tag -Resource i-12345678 -Tag $tag -Force
```

Example 4: This example deletes the specified tag from the specified resource, but only if the tag value matches.

```powershell
$tag = New-Object Amazon.EC2.Model.Tag
$tag.Key = "myTag"
$tag.Value = "myTagValue"
Remove-EC2Tag -Resource i-12345678 -Tag $tag -Force
```

- For API details, see [DeleteTags](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-EC2Volume**

The following code example shows how to use Remove-EC2Volume.

**Tools for PowerShell**

Example 1: This example detaches the specified volume. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```powershell
Remove-EC2Volume -VolumeId vol-12345678
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-EC2Volume (DeleteVolume)" on target "vol-12345678".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):
```
• For API details, see DeleteVolume in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2Vpc

The following code example shows how to use Remove-EC2Vpc.

**Tools for PowerShell**

**Example 1:** This example deletes the specified VPC. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

Remove-EC2Vpc -VpcId vpc-12345678

**Output:**

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2Vpc (DeleteVpc)" on Target "vpc-12345678".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

• For API details, see DeleteVpc in AWS Tools for PowerShell Cmdlet Reference.

Remove-EC2VpnConnection

The following code example shows how to use Remove-EC2VpnConnection.

**Tools for PowerShell**

**Example 1:** This example deletes the specified VPN connection. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

Remove-EC2VpnConnection -VpnConnectionId vpn-12345678

**Output:**

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2VpnConnection (DeleteVpnConnection)" on Target "vpn-12345678".
• For API details, see [DeleteVpnConnection](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

### Remove-EC2VpnConnectionRoute

The following code example shows how to use Remove-EC2VpnConnectionRoute.

**Tools for PowerShell**

**Example 1:** This example removes the specified static route from the specified VPN connection. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```powershell
Remove-EC2VpnConnectionRoute -VpnConnectionId vpn-12345678 -DestinationCidrBlock 11.12.0.0/16
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2VpnConnectionRoute (DeleteVpnConnectionRoute)" on Target "vpn-12345678".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

• For API details, see [DeleteVpnConnectionRoute](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

### Remove-EC2VpnGateway

The following code example shows how to use Remove-EC2VpnGateway.

**Tools for PowerShell**

**Example 1:** This example deletes the specified virtual private gateway. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```powershell
Remove-EC2VpnGateway -VpnGatewayId vgw-1a2b3c4d
```
Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-EC2VpnGateway (DeleteVpnGateway)" on Target
"vgw-1a2b3c4d".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

- For API details, see [DeleteVpnGateway](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

**Request-EC2SpotFleet**

The following code example shows how to use **Request-EC2SpotFleet**.

**Tools for PowerShell**

**Example 1:** This example creates a Spot fleet request in the Availability Zone with the lowest price for the specified instance type. If your account supports EC2-VPC only, the Spot fleet launches the instances in the lowest-priced Availability Zone that has a default subnet. If your account supports EC2-Classic, the Spot fleet launches the instances in EC2-Classic in the lowest-priced Availability Zone. Note that the price you pay will not exceed the specified Spot price for the request.

```powershell
$sg = New-Object Amazon.EC2.Model.GroupIdentifier
$sg.GroupId = "sg-12345678"
$lc = New-Object Amazon.EC2.Model.SpotFleetLaunchSpecification
$lc.ImageId = "ami-12345678"
$lc.InstanceType = "m3.medium"
$lc.SecurityGroups.Add($sg)

**Request-EC2SpotInstance**

The following code example shows how to use **Request-EC2SpotInstance**.
Tools for PowerShell

Example 1: This example requests a one-time Spot instance in the specified subnet. Note that the security group must be created for the VPC that contains the specified subnet, and it must be specified by ID using the network interface. When you specify a network interface, you must include the subnet ID using the network interface.

```powershell
$n = New-Object Amazon.EC2.Model.InstanceNetworkInterfaceSpecification
$n.DeviceIndex = 0
$n.SubnetId = "subnet-12345678"
$n.Groups.Add("sg-12345678")
Request-EC2SpotInstance -InstanceCount 1 -SpotPrice 0.050 -Type one-time 
-IamInstanceProfile_Arn arn:aws:iam::123456789012:instance-profile/my-iam-role 
-LaunchSpecification_ImageId ami-12345678 
-LaunchSpecification_InstanceType m3.medium 
-LaunchSpecification_NetworkInterface $n
```

Output:

Reset-EC2ImageAttribute

The following code example shows how to use Reset-EC2ImageAttribute.
Tools for PowerShell

Example 1: This example resets the 'launchPermission' attribute to its default value. By default, AMIs are private.

```powershell
Reset-EC2ImageAttribute -ImageId ami-12345678 -Attribute launchPermission
```

- For API details, see [ResetImageAttribute](https://docs.aws.amazon.com/powershell/latest/userguide/AWS-Tools-PowerShell.html) in *AWS Tools for PowerShell Cmdlet Reference*.

---

**Reset-EC2InstanceAttribute**

The following code example shows how to use Reset-EC2InstanceAttribute.

Tools for PowerShell

Example 1: This example resets the 'sriovNetSupport' attribute for the specified instance.

```powershell
Reset-EC2InstanceAttribute -InstanceId i-12345678 -Attribute sriovNetSupport
```

Example 2: This example resets the 'ebsOptimized' attribute for the specified instance.

```powershell
Reset-EC2InstanceAttribute -InstanceId i-12345678 -Attribute ebsOptimized
```

Example 3: This example resets the 'sourceDestCheck' attribute for the specified instance.

```powershell
Reset-EC2InstanceAttribute -InstanceId i-12345678 -Attribute sourceDestCheck
```

Example 4: This example resets the 'disableApiTermination' attribute for the specified instance.

```powershell
Reset-EC2InstanceAttribute -InstanceId i-12345678 -Attribute disableApiTermination
```

Example 5: This example resets the 'instanceInitiatedShutdownBehavior' attribute for the specified instance.

```powershell
Reset-EC2InstanceAttribute -InstanceId i-12345678 -Attribute instanceInitiatedShutdownBehavior
```
• For API details, see `ResetInstanceAttribute` in *AWS Tools for PowerShell Cmdlet Reference*.

**Reset-EC2NetworkInterfaceAttribute**

The following code example shows how to use `Reset-EC2NetworkInterfaceAttribute`.

**Tools for PowerShell**

**Example 1:** This example resets source/destination checking for the specified network interface.

```
Reset-EC2NetworkInterfaceAttribute -NetworkInterfaceId eni-1a2b3c4d -SourceDestCheck
```

• For API details, see `ResetNetworkInterfaceAttribute` in *AWS Tools for PowerShell Cmdlet Reference*.

**Reset-EC2SnapshotAttribute**

The following code example shows how to use `Reset-EC2SnapshotAttribute`.

**Tools for PowerShell**

**Example 1:** This example resets the specified attribute of the specified snapshot.

```
Reset-EC2SnapshotAttribute -SnapshotId snap-12345678 -Attribute CreateVolumePermission
```

• For API details, see `ResetSnapshotAttribute` in *AWS Tools for PowerShell Cmdlet Reference*.

**Restart-EC2Instance**

The following code example shows how to use `Restart-EC2Instance`.

**Tools for PowerShell**

**Example 1:** This example reboots the specified instance.

```
Restart-EC2Instance -InstanceId i-12345678
```
• For API details, see RebootInstances in AWS Tools for PowerShell Cmdlet Reference.

Revoke-EC2SecurityGroupEgress

The following code example shows how to use Revoke-EC2SecurityGroupEgress.

Tools for PowerShell

Example 1: This example removes the rule for the specified security group for EC2-VPC. This revokes access to the specified IP address range on TCP port 80. The syntax used by this example requires PowerShell version 3 or higher.

```powershell
$ip = @{ IpProtocol="tcp"; FromPort="80"; ToPort="80"; IpRanges="203.0.113.0/24" }
Revoke-EC2SecurityGroupEgress -GroupId sg-12345678 -IpPermission $ip
```

Example 2: With PowerShell version 2, you must use New-Object to create the IpPermission object.

```powershell
$ip = New-Object Amazon.EC2.Model.IpPermission
$ip.IpProtocol = "tcp"
$ip.FromPort = 80
$ip.ToPort = 80
$ip.IpRanges.Add("203.0.113.0/24")
Revoke-EC2SecurityGroupEgress -GroupId sg-12345678 -IpPermission $ip
```

Example 3: This example revokes access to the specified source security group on TCP port 80.

```powershell
$ug = New-Object Amazon.EC2.Model.UserIdGroupPair
$ug.GroupId = "sg-1a2b3c4d"
$ug.UserId = "123456789012"
Revoke-EC2SecurityGroupEgress -GroupId sg-12345678 -IpPermission @( @{ IpProtocol="tcp"; FromPort="80"; ToPort="80"; UserIdGroupPairs=$ug } )
```

• For API details, see RevokeSecurityGroupEgress in AWS Tools for PowerShell Cmdlet Reference.

Revoke-EC2SecurityGroupIngress

The following code example shows how to use Revoke-EC2SecurityGroupIngress.
Tools for PowerShell

Example 1: This example revokes access to TCP port 22 from the specified address range for the specified security group for EC2-VPC. Note that you must identify security groups for EC2-VPC using the security group ID not the security group name. The syntax used by this example requires PowerShell version 3 or higher.

```powershell
$ip = @{ IpProtocol="tcp"; FromPort="22"; ToPort="22"; IpRanges="203.0.113.0/24" }
Revoke-EC2SecurityGroupIngress -GroupId sg-12345678 -IpPermission $ip
```

Example 2: With PowerShell version 2, you must use New-Object to create the IpPermission object.

```powershell
$ip = New-Object Amazon.EC2.Model.IpPermission
$ip.IpProtocol = "tcp"
$ip.FromPort = 22
$ip.ToPort = 22
$ip.IpRanges.Add("203.0.113.0/24")
Revoke-EC2SecurityGroupIngress -GroupId sg-12345678 -IpPermission $ip
```

Example 3: This example revokes access to TCP port 22 from the specified address range for the specified security group for EC2-Classic. The syntax used by this example requires PowerShell version 3 or higher.

```powershell
$ip = @{ IpProtocol="tcp"; FromPort="22"; ToPort="22"; IpRanges="203.0.113.0/24" }
Revoke-EC2SecurityGroupIngress -GroupName "my-security-group" -IpPermission $ip
```

Example 4: With PowerShell version 2, you must use New-Object to create the IpPermission object.

```powershell
$ip = New-Object Amazon.EC2.Model.IpPermission
$ip.IpProtocol = "tcp"
$ip.FromPort = 22
$ip.ToPort = 22
$ip.IpRanges.Add("203.0.113.0/24")
Revoke-EC2SecurityGroupIngress -GroupName "my-security-group" -IpPermission $ip
```
Send-EC2InstanceStatus

The following code example shows how to use Send-EC2InstanceStatus.

Tools for PowerShell

Example 1: This example reports status feedback for the specified instance.

Send-EC2InstanceStatus -Instance i-12345678 -Status impaired -ReasonCode unresponsive

- For API details, see ReportInstanceStatus in AWS Tools for PowerShell Cmdlet Reference.

Set-EC2NetworkAclAssociation

The following code example shows how to use Set-EC2NetworkAclAssociation.

Tools for PowerShell

Example 1: This example associates the specified network ACL with the subnet for the specified network ACL association.

Set-EC2NetworkAclAssociation -NetworkAclId acl-12345678 -AssociationId aclassoc-1a2b3c4d

Output:

aclassoc-87654321

- For API details, see ReplaceNetworkAclAssociation in AWS Tools for PowerShell Cmdlet Reference.

Set-EC2NetworkAclEntry

The following code example shows how to use Set-EC2NetworkAclEntry.
## Tools for PowerShell

**Example 1:** This example replaces the specified entry for the specified network ACL. The new rule allows inbound traffic from the specified address to any associated subnet.

```powershell
Set-EC2NetworkAclEntry -NetworkAclId acl-12345678 -Egress $false -RuleNumber 100 -Protocol 17 -PortRange_From 53 -PortRange_To 53 -CidrBlock 203.0.113.12/24 -RuleAction allow
```

- For API details, see [ReplaceNetworkAclEntry](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Set-EC2Route

The following code example shows how to use `Set-EC2Route`.

**Tools for PowerShell**

**Example 1:** This example replaces the specified route for the specified route table. The new route sends the specified traffic to the specified virtual private gateway.

```powershell
Set-EC2Route -RouteTableId rtb-1a2b3c4d -DestinationCidrBlock 10.0.0.0/24 -GatewayId vgw-1a2b3c4d
```

- For API details, see [ReplaceRoute](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Set-EC2RouteTableAssociation

The following code example shows how to use `Set-EC2RouteTableAssociation`.

**Tools for PowerShell**

**Example 1:** This example associates the specified route table with the subnet for the specified route table association.

```powershell
Set-EC2RouteTableAssociation -RouteTableId rtb-1a2b3c4d -AssociationId rtbassoc-12345678
```

**Output:**

```
rtbassoc-87654321
```
For API details, see `ReplaceRouteTableAssociation` in *AWS Tools for PowerShell Cmdlet Reference*.

**Start-EC2Instance**

The following code example shows how to use `Start-EC2Instance`.

**Tools for PowerShell**

**Example 1:** This example starts the specified instance.

```
Start-EC2Instance -InstanceId i-12345678
```

**Output:**

<table>
<thead>
<tr>
<th>CurrentState</th>
<th>InstanceId</th>
<th>PreviousState</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon.EC2.Model.InstanceState</td>
<td>i-12345678</td>
<td>Amazon.EC2.Model.InstanceState</td>
</tr>
</tbody>
</table>

**Example 2:** This example starts the specified instances.

```
@("i-12345678", "i-76543210") | Start-EC2Instance
```

**Example 3:** This example starts the set of instances that are currently stopped. The Instance objects returned by `Get-EC2Instance` are piped to `Start-EC2Instance`. The syntax used by this example requires PowerShell version 3 or higher.

```
(Get-EC2Instance -Filter @{ Name="instance-state-name"; Values="stopped"}).Instances | Start-EC2Instance
```

**Example 4:** With PowerShell version 2, you must use `New-Object` to create the filter for the `Filter` parameter.

```
$filter = New-Object Amazon.EC2.Model.Filter
$filter.Name = "instance-state-name"
$filter.Values = "stopped"

(Get-EC2Instance -Filter $filter).Instances | Start-EC2Instance
```

For API details, see `StartInstances` in *AWS Tools for PowerShell Cmdlet Reference*.  

Amazon EC2
Start-EC2InstanceMonitoring

The following code example shows how to use Start-EC2InstanceMonitoring.

Tools for PowerShell

Example 1: This example enables detailed monitoring for the specified instance.

Start-EC2InstanceMonitoring -InstanceId i-12345678

Output:

<table>
<thead>
<tr>
<th>InstanceId</th>
<th>Monitoring</th>
</tr>
</thead>
<tbody>
<tr>
<td>i-12345678</td>
<td>Amazon.EC2.Model.Monitoring</td>
</tr>
</tbody>
</table>

For API details, see MonitorInstances in AWS Tools for PowerShell Cmdlet Reference.

Stop-EC2ImportTask

The following code example shows how to use Stop-EC2ImportTask.

Tools for PowerShell

Example 1: This example cancels the specified import task (either snapshot or image import). If required, a reason can be providing using the -CancelReason parameter.

Stop-EC2ImportTask -ImportTaskId import-ami-abcdefgh

For API details, see CancelImportTask in AWS Tools for PowerShell Cmdlet Reference.

Stop-EC2Instance

The following code example shows how to use Stop-EC2Instance.

Tools for PowerShell

Example 1: This example stops the specified instance.

Stop-EC2Instance -InstanceId i-12345678
CurrentState                      InstanceId    PreviousState
------------                      ----------    -------------
Amazon.EC2.Model.InstanceState    i-12345678    Amazon.EC2.Model.InstanceState

• For API details, see StopInstances in AWS Tools for PowerShell Cmdlet Reference.

Stop-EC2InstanceMonitoring

The following code example shows how to use Stop-EC2InstanceMonitoring.

Tools for PowerShell

Example 1: This example disables detailed monitoring for the specified instance.

Stop-EC2InstanceMonitoring -InstanceId i-12345678

Output:

InstanceId    Monitoring
----------    ----------
i-12345678    Amazon.EC2.Model.Monitoring

• For API details, see UnmonitorInstances in AWS Tools for PowerShell Cmdlet Reference.

Stop-EC2SpotFleetRequest

The following code example shows how to use Stop-EC2SpotFleetRequest.

Tools for PowerShell

Example 1: This example cancels the specified Spot fleet request and terminates the associated Spot instances.

Stop-EC2SpotFleetRequest -SpotFleetRequestId sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE -TerminateInstance $true

Example 2: This example cancels the specified Spot fleet request without terminating the associated Spot instances.
Stop-EC2SpotFleetRequest -SpotFleetRequestId sfr-73fbd2ce-
  aa30-494c-8788-1cee4EXAMPLE -TerminateInstance $false

- For API details, see CancelSpotFleetRequests in AWS Tools for PowerShell Cmdlet Reference.

Stop-EC2SpotInstanceRequest

The following code example shows how to use Stop-EC2SpotInstanceRequest.

Tools for PowerShell

Example 1: This example cancels the specified Spot instance request.

Stop-EC2SpotInstanceRequest -SpotInstanceRequestId sir-12345678

Output:

<table>
<thead>
<tr>
<th>SpotInstanceRequestId</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>sir-12345678</td>
<td>cancelled</td>
</tr>
</tbody>
</table>

- For API details, see CancelSpotInstanceRequests in AWS Tools for PowerShell Cmdlet Reference.

Unregister-EC2Address

The following code example shows how to use Unregister-EC2Address.

Tools for PowerShell

Example 1: This example disassociates the specified Elastic IP address from the specified instance in a VPC.

Unregister-EC2Address -AssociationId eipassoc-12345678

Example 2: This example disassociates the specified Elastic IP address from the specified instance in EC2-Classic.

Unregister-EC2Address -PublicIp 203.0.113.17
• For API details, see DisassociateAddress in AWS Tools for PowerShell Cmdlet Reference.

Unregister-EC2Image

The following code example shows how to use Unregister-EC2Image.

Tools for PowerShell

Example 1: This example deregisters the specified AMI.

Unregister-EC2Image -ImageId ami-12345678

• For API details, see DeregisterImage in AWS Tools for PowerShell Cmdlet Reference.

Unregister-EC2PrivateIpAddress

The following code example shows how to use Unregister-EC2PrivateIpAddress.

Tools for PowerShell

Example 1: This example unassigns the specified private IP address from the specified network interface.

Unregister-EC2PrivateIpAddress -NetworkInterfaceId eni-1a2b3c4d -PrivateIpAddress 10.0.0.82

• For API details, see UnassignPrivatIpAddresses in AWS Tools for PowerShell Cmdlet Reference.

Unregister-EC2RouteTable

The following code example shows how to use Unregister-EC2RouteTable.

Tools for PowerShell

Example 1: This example removes the specified association between a route table and a subnet.

Unregister-EC2RouteTable -AssociationId rtbassoc-1a2b3c4d

• For API details, see DisassociateRouteTable in AWS Tools for PowerShell Cmdlet Reference.
Amazon ECR examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Amazon ECR.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Get-ECRLoginCommand

The following code example shows how to use Get-ECRLoginCommand.

Tools for PowerShell

**Example 1:** Returns a PSObject containing login information that can be used to authenticate to any Amazon ECR registry that your IAM principal has access to. The credentials and region endpoint required for the call to obtain the authorization token are obtained from the shell defaults (set up by the `Set-AWSCredential/Set-DefaultAWSRegion` or `Initialize-AWSDefaultConfiguration` cmdlets). You can use the Command property with Invoke-Expression to log in to the specified registry or use the returned credentials in other tools requiring login.

```
Get-ECRLoginCommand
```

**Output:**

```
Username : AWS
```
Example 2: Retrieves a PSObject containing login information that you use as an input to a docker login command. You can specify any Amazon ECR registry URI to authenticate to as long as your IAM principal has access to that registry.

(Get-ECRLoginCommand).Password | docker login --username AWS --password-stdin 012345678910.dkr.ecr.us-east-1.amazonaws.com

- For API details, see Get-ECRLoginCommand in AWS Tools for PowerShell Cmdlet Reference.

Get-ECSClusterDetail

The following code example shows how to use Get-ECSClusterDetail.
Tools for PowerShell

Example 1: This cmdlet describes one or more of your ECS clusters.

```
Get-ECSClusterDetail -Cluster "LAB-ECS-CL" -Include SETTINGS | Select-Object *
```

Output:

```

Get-ECSClusterList

The following code example shows how to use Get-ECSClusterList.

Tools for PowerShell

Example 1: This cmdlet returns a list of existing ECS clusters.

```
Get-ECSClusterList
```

Output:

```
```

• For API details, see [ListClusters](aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-ECSClusterService

The following code example shows how to use Get-ECSClusterService.

Tools for PowerShell

Example 1: This example lists all services running in your default cluster.
Get-ECSClusterService

**Example 2:** This example lists all services running in the specified cluster.

Get-ECSClusterService -Cluster myCluster

**Example 3:** This example lists the services running in the specified cluster, fetching a maximum of 10 service details at a time.

```powershell
$nextToken = $null
do {
    Get-ECSClusterService -Cluster myCluster -MaxResult 10 -NextToken $nextToken
    $nextToken = $AWSHistory.LastServiceResponse.NextToken

**Example 1:** This example shows how to retrieve details of a specific service from your default cluster.

Get-ECSService -Service my-hhtp-service

**Example 2:** This example shows how to retrieve details of a specific service running in the named cluster.

Get-ECSService -Cluster myCluster -Service my-hhtp-service

- For API details, see [DescribeServices](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-ECSCluster

The following code example shows how to use New-ECSCluster.
**Tools for PowerShell**

**Example 1: This cmdlet creates a new Amazon ECS cluster.**

```powershell

**New-ECSService**

The following code example shows how to use New-ECSService.

**Tools for PowerShell**

**Example 1: This example command creates a service in your default cluster called `ecs-simple-service`. The service uses the `ecs-demo` task definition and it maintains 10 instantiations of that task.**

```powershell
New-ECSService -ServiceName ecs-simple-service -TaskDefinition ecs-demo -DesiredCount 10
```
Example 2: This example command creates a service behind a load balancer in your default cluster called `ecs-simple-service`. The service uses the `ecs-demo` task definition and it maintains 10 instantiations of that task.

```powershell
$lb = @{
    LoadBalancerName = "EC2Contai-EcsElast-S06278JGSJCM"
    ContainerName = "simple-demo"
    ContainerPort = 80
}
New-ECSService -ServiceName ecs-simple-service -TaskDefinition ecs-demo -DesiredCount 10 -LoadBalancer $lb
```

- For API details, see [CreateService](https://docs.aws.amazon.com/tools/latest/dyt工具/AWS-Tools-for-PowerShell-Cmdlet-Reference.html#CreateService) in AWS Tools for PowerShell Cmdlet Reference.

**Remove-ECSCluster**

The following code example shows how to use Remove-ECSCluster.

**Tools for PowerShell**

**Example 1:** This cmdlet deletes the specified ECS cluster. You must deregister all container instances from this cluster before you may delete it.

```powershell
Remove-ECSCluster -Cluster "LAB-ECS"
```

**Output:**

```

- For API details, see [DeleteCluster](https://docs.aws.amazon.com/tools/latest/dyt工具/AWS-Tools-for-PowerShell-Cmdlet-Reference.html#DeleteCluster) in AWS Tools for PowerShell Cmdlet Reference.

**Remove-ECSService**

The following code example shows how to use Remove-ECSService.
Tools for PowerShell

Example 1: Deletes the service named 'my-http-service' in the default cluster. The service must have a desired count and running count of 0 before you can delete it. You are prompted for confirmation before the command proceeds. To bypass the confirmation prompt add the -Force switch.

```
Remove-ECSService -Service my-http-service
```

Example 2: Deletes the service named 'my-http-service' in the named cluster.

```
Remove-ECSService -Cluster myCluster -Service my-http-service
```

- For API details, see `DeleteService` in **AWS Tools for PowerShell Cmdlet Reference**.

Update-ECSClusterSetting

The following code example shows how to use Update-ECSClusterSetting.

Tools for PowerShell

Example 1: This cmdlet modifies the settings to use for an ECS cluster.

```
Update-ECSClusterSetting -Cluster "LAB-ECS-CL" -Setting @
{Name="containerInsights"; Value="disabled"}
```

**Output:**

```
ActiveServicesCount : 0
Attachments         : {}

Settings            : {containerInsights}
```
- For API details, see UpdateClusterSettings in AWS Tools for PowerShell Cmdlet Reference.

**Update-ECSService**

The following code example shows how to use Update-ECSService.

**Tools for PowerShell**

**Example 1:** This example command updates the `my-http-service` service to use the `amazon-ecs-sample` task definition.

```
Update-ECSService -Service my-http-service -TaskDefinition amazon-ecs-sample
```

**Example 2:** This example command updates the desired count of the `my-http-service` service to 10.

```
Update-ECSService -Service my-http-service -DesiredCount 10
```

- For API details, see UpdateService in AWS Tools for PowerShell Cmdlet Reference.

- **FileSystemId**: fs-1a2b3c4d
- **LifeCycleState**: available
- **Name**: 

Amazon EFS
Example 2: Returns the details of the specified file system.

Get-EFSFileSystem -FileSystemId fs-1a2b3c4d

Example 3: Returns the details of a file system using the idempotency creation token that was specified at the time the file system was created.

Get-EFSFileSystem -CreationToken 1a2bff54-85e0-4747-bd95-7bc172c4f555

• For API details, see DescribeFileSystems in AWS Tools for PowerShell Cmdlet Reference.

Get-EFSMountTarget

The following code example shows how to use Get-EFSMountTarget.

Tools for PowerShell

Example 1: Returns the collection of mount targets associated with the specified file system.

Get-EFSMountTarget -FileSystemId fs-1a2b3c4d

Output:

<table>

</tr>
</tbody>
</table>
For API details, see [DescribeMountTargets](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EFSMountTargetSecurityGroup

The following code example shows how to use Get-EFSMountTargetSecurityGroup.

**Tools for PowerShell**

**Example 1: Returns the ids of the security groups currently assigned to the network interface associated with the mount target.**

```powershell
Get-EFSMountTargetSecurityGroup -MountTargetId fsmt-1a2b3c4d
```

**Output:**

```
sg-1a2b3c4d
```

For API details, see [DescribeMountTargetSecurityGroups](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-EFSTag

The following code example shows how to use Get-EFSTag.

**Tools for PowerShell**

**Example 1: Returns the collection of tags currently associated with the specified file system.**

```powershell
Get-EFSTag -FileSystemId fs-1a2b3c4d
```

**Output:**

```
<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
```

For API details, see [DescribeTags](#) in *AWS Tools for PowerShell Cmdlet Reference*. 
New-EFSFileSystem

The following code example shows how to use New-EFSFileSystem.

Tools for PowerShell

Example 1: Creates a new, empty file system. The token used to ensure idempotent creation will be generated automatically and can be accessed from the CreationToken member of the returned object.

```
New-EFSFileSystem
```

Output:

```
CreationTime : 5/26/2015 4:02:38 PM
CreationToken : 1a2bff54-85e0-4747-bd95-7bc172c4f555
FileSystemId : fs-1a2b3c4d
LifeCycleState : creating
Name : 
NumberOfMountTargets : 0
OwnerId : 123456789012
```

Example 2: Creates a new, empty file system using a custom token to ensure idempotent creation.

```
New-EFSFileSystem -CreationToken "MyUniqueToken"
```

- For API details, see CreateFileSystem in AWS Tools for PowerShell Cmdlet Reference.

New-EFSMountTarget

The following code example shows how to use New-EFSMountTarget.

Tools for PowerShell

Example 1: Creates a new mount target for a file system. The specified subnet will be used to determine the Virtual Private Cloud (VPC) that the mount target will be created in and the IP address that will be auto-assigned (from the address range of the subnet). The assigned
IP address can be used to then mount this file system on an Amazon EC2 instance. As no security groups were specified the network interface created for the target is associated with the default security group for the subnet’s VPC.

```powershell
New-EFSMountTarget -FileSystemId fs-1a2b3c4d -SubnetId subnet-1a2b3c4d
```

**Output:**

```
FileSystemId       : fs-1a2b3c4d
IpAddress          : 10.0.0.131
LifeCycleState     : creating
MountTargetId      : fsmt-1a2b3c4d
NetworkInterfaceId : eni-1a2b3c4d
OwnerId            : 123456789012
SubnetId           : subnet-1a2b3c4d
```

**Example 2:** Creates a new mount target for the specified file system with auto-assigned IP address. The network interface created for the mount target is associated with the specified security groups (up to 5, in the format "sg-xxxxxxx", may be specified).

```powershell
New-EFSMountTarget -FileSystemId fs-1a2b3c4d -SubnetId subnet-1a2b3c4d -SecurityGroup sg-group1,sg-group2,sg-group3
```

**Example 3:** Creates a new mount target for the specified file system with the specified IP address.

```powershell
New-EFSMountTarget -FileSystemId fs-1a2b3c4d -SubnetId subnet-1a2b3c4d -IpAddress 10.0.0.131
```

- For API details, see [CreateMountTarget](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-EFSTag**

The following code example shows how to use New-EFSTag.

**Tools for PowerShell**

**Example 1:** Applies the collection of tags to the specified file system. If a tag with key specified already exists on the file system the value of the tag is updated.
Example 2: Sets the name tag for the specified file system. This value is returned along with other file system details when the Get-EFSFilesystem cmdlet is used.

```
New-EFSTag -FileSystemId fs-1a2b3c4d -Tag @{Key="tagkey1";Value="tagvalue1"},@{Key="tagkey2";Value="tagvalue2"}
```

Example 2 continues...

```
New-EFSTag -FileSystemId fs-1a2b3c4d -Tag @{Key="Name";Value="My File System"}
```

- For API details, see `CreateTags` in AWS Tools for PowerShell Cmdlet Reference.

### Remove-EFSFilesystem

The following code example shows how to use Remove-EFSFilesystem.

**Tools for PowerShell**

Example 1: Deletes the specified file system that is no longer in use (if the file system has mount targets they must be removed first). You are prompted for confirmation before the cmdlet proceeds - to suppress confirmation, use the -Force switch.

```
Remove-EFSFilesystem -FileSystemId fs-1a2b3c4d
```

- For API details, see `DeleteFileSystem` in AWS Tools for PowerShell Cmdlet Reference.

### Remove-EFSMountTarget

The following code example shows how to use Remove-EFSMountTarget.

**Tools for PowerShell**

Example 1: Deletes the specified mount target. You are prompted for confirmation before the operation proceeds. To suppress the prompt use the -Force switch. Note that this operation forcibly breaks any mounts of the file system via the target - you may want to consider unmounting the file system before running this command, if feasible.

```
Remove-EFSMountTarget -MountTargetId fsmt-1a2b3c4d
```

- For API details, see `DeleteMountTarget` in AWS Tools for PowerShell Cmdlet Reference.
Remove-EFSTag

The following code example shows how to use Remove-EFSTag.

Tools for PowerShell

Example 1: Deletes the collection of one or more tags from a file system. You are prompted for confirmation before the cmdlet proceeds - to suppress confirmation, use the -Force switch.

Remove-EFSTag -FileSystemId fs-1a2b3c4d -TagKey "tagkey1","tagkey2"

• For API details, see DeleteTags in AWS Tools for PowerShell Cmdlet Reference.

Amazon EKS examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Amazon EKS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Add-EKSResourceTag

The following code example shows how to use Add-EKSResourceTag.
### Tools for PowerShell

**Example 1:** This cmdlet associates the specified tags to a resource with the specified resourceArn.

```powershell
```

- For API details, see [TagResource](#) in *AWS Tools for PowerShell Cmdlet Reference*.

#### Get-EKSCluster

The following code example shows how to use `Get-EKSCluster`.

**Example 1:** This cmdlet returns descriptive information about an Amazon EKS cluster.

```powershell
Get-EKSCluster -Name "PROD"

Amazon EKS
Get-EKSClusterList

The following code example shows how to use Get-EKSClusterList.

Tools for PowerShell

Example 1: This cmdlet lists the Amazon EKS clusters in your AWS account in the specified Region.

Get-EKSClusterList

Output:

PROD

- For API details, see ListClusters in AWS Tools for PowerShell Cmdlet Reference.

Get-EKSFargateProfile

The following code example shows how to use Get-EKSFargateProfile.

Tools for PowerShell

Example 1: This cmdlet returns descriptive information about an AWS Fargate profile.

Get-EKSFargateProfile -FargateProfileName "EKSFargate" -ClusterName "TEST"

Output:

ClusterName : TEST
CreatedAt : 12/26/2019 12:34:47 PM

Get-EKSFargateProfileList

The following code example shows how to use Get-EKSFargateProfileList.

Tools for PowerShell

Example 1: This cmdlet lists the AWS Fargate profiles associated with the specified cluster in your AWS account in the specified Region.

```powershell
Get-EKSFargateProfileList -ClusterName "TEST"
```

Output:

```
EKSFargate
EKSFargateProfile

For API details, see ListFargateProfiles in AWS Tools for PowerShell Cmdlet Reference.

Get-EKSNodegroup

The following code example shows how to use Get-EKSNodegroup.

Tools for PowerShell

Example 1: This cmdlet returns descriptive information about an Amazon EKS node group.

```powershell
Get-EKSNodegroup -NodegroupName "ProdEKSNodeGroup" -ClusterName "PROD"
```

Output:

• For API details, see DescribeNodegroup in AWS Tools for PowerShell Cmdlet Reference.

Get-EKSNodegroupList

The following code example shows how to use Get-EKSNodegroupList.

Tools for PowerShell

Example 1: This cmdlet lists the Amazon EKS node groups associated with the specified cluster in your AWS account in the specified Region.

Get-EKSNodegroupList -ClusterName PROD

Output:

ProdEKSNodeGroup

• For API details, see ListNodegroups in AWS Tools for PowerShell Cmdlet Reference.

Get-EKSRessourceTag

The following code example shows how to use Get-EKSRessourceTag.

Tools for PowerShell

Example 1: This cmdlet list the tags for an Amazon EKS resource.

Output:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>EKSPRODCLUSTER</td>
</tr>
</tbody>

- For API details, see ListTagsForResource in AWS Tools for PowerShell Cmdlet Reference.

Get-EKSUpdate

The following code example shows how to use Get-EKSUpdate.

Tools for PowerShell

Example 1: This cmdlet returns descriptive information about an update against your Amazon EKS cluster or associated managed node group.

Get-EKSUpdate -Name "PROD" -UpdateId "ee708232-7d2e-4ed7-9270-d0b5176f0726"

Output:

Get-EKSUpdateList

The following code example shows how to use Get-EKSUpdateList.

Tools for PowerShell

Example 1: This cmdlet lists the updates associated with an Amazon EKS cluster or managed node group in your AWS account, in the specified Region.
Get-EKSUpdateList -Name "PROD"

Output:

```
ee708232-7d2e-4ed7-9270-d0b5176f0726
```

- For API details, see [ListUpdates](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-EKSCluster**

The following code example shows how to use New-EKSCluster.

**Tools for PowerShell**

**Example 1: This example creates a new cluster called 'prod'.**

```
New-EKSCluster -Name prod -ResourcesVpcConfig
    @{SubnetIds=@("subnet-0a1b2c3d","subnet-3a2b1c0d");SecurityGroupIds="sg-6979fe18"}

- For API details, see [CreateCluster](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-EKSFargateProfile**

The following code example shows how to use New-EKSFargateProfile.
Tools for PowerShell

Example 1: This cmdlet creates an AWS Fargate profile for your Amazon EKS cluster. You must have at least one Fargate profile in a cluster to be able to schedule pods on Fargate infrastructure.

```powershell
New-EKSFargateProfile -FargateProfileName EKSFargateProfile -ClusterName TEST -Subnet "subnet-02f6ff500ff2067a0", "subnet-0cd976f08d5fbfaae" -PodExecutionRoleArn arn:aws:iam::012345678912:role/AmazonEKSFargatePodExecutionRole -Selector @{Namespace="default"}
```

Output:

```

- For API details, see [CreateFargateProfile](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-EKSNodeGroup

The following code example shows how to use New-EKSNodeGroup.

Tools for PowerShell

Example 1: This cmdlet creates a managed worker node group for an Amazon EKS cluster. You can only create a node group for your cluster that is equal to the current Kubernetes version for the cluster. All node groups are created with the latest AMI release version for the respective minor Kubernetes version of the cluster.

```
New-EKSNodeGroup -NodeGroupName "ProdEKSNodeGroup" -AmiType "AL2_x86_64" -DiskSize 40 -ClusterName "PROD" -ScalingConfig_DesiredSize 2 -ScalingConfig_MinSize 2 -ScalingConfig_MaxSize 5 -InstanceType t3.large
```

**Remove-EKSCluster**

The following code example shows how to use Remove-EKSCluster.

**Tools for PowerShell**

**Example 1: This cmdlet deletes the Amazon EKS cluster control plane.**

```
Remove-EKSCluster -Name "DEV-KUBE-CL"
```

**Output:**

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-EKSCluster (DeleteCluster)" on target "DEV-KUBE-CL".

Remove-EKSFargateProfile

The following code example shows how to use Remove-EKSFargateProfile.

Tools for PowerShell

Example 1: This cmdlet deletes an AWS Fargate profile. When you delete a Fargate profile, any pods running on Fargate that were created with the profile are deleted.

Remove-EKSFargateProfile -FargateProfileName "EKSFargate" -ClusterName "TEST"

Output:

Elastic Load Balancing - Version 1 examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Elastic Load Balancing - Version 1.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

Add-ELBLoadBalancerToSubnet

The following code example shows how to use Add-ELBLoadBalancerToSubnet.

Tools for PowerShell

Example 1: This example adds the specified subnet to the set of subnets configured for the specified load balancer. The output includes the complete list of subnets.

Add-ELBLoadBalancerToSubnet -LoadBalancerName my-load-balancer -Subnet subnet-12345678

Output:

subnet-12345678
subnet-87654321

• For API details, see AttachLoadBalancerToSubnets in AWS Tools for PowerShell Cmdlet Reference.
Add-ELBResourceTag

The following code example shows how to use Add-ELBResourceTag.

Tools for PowerShell

Example 1: This example adds the specified tags to the specified load balancer. The syntax used by this example requires PowerShell version 3 or later.

```powershell
Add-ELBResourceTag -LoadBalancerName my-load-balancer -Tag @{ Key="project";Value="lima" },@{ Key="department";Value="digital-media" }
```

Example 2: With PowerShell version 2, you must use New-Object to create a tag for the Tag parameter.

```powershell
$tag = New-Object Amazon.ElasticLoadBalancing.Model.Tag
$tag.Key = "project"
$tag.Value = "lima"
Add-ELBResourceTag -LoadBalancerName my-load-balancer -Tag $tag
```

- For API details, see [AddTags](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Disable-ELBAvailabilityZoneForLoadBalancer

The following code example shows how to use Disable-ELBAvailabilityZoneForLoadBalancer.

Tools for PowerShell

Example 1: This example removes the specified Availability Zone from the specified load balancer. The output includes the remaining Availability Zones.

```powershell
Disable-ELBAvailabilityZoneForLoadBalancer -LoadBalancerName my-load-balancer -AvailabilityZone us-west-2a
```

Output:

```
us-west-2b
```

- For API details, see [DisableAvailabilityZonesForLoadBalancer](#) in *AWS Tools for PowerShell Cmdlet Reference*.
Dismount-ELBLoadBalancerFromSubnet

The following code example shows how to use Dismount-ELBLoadBalancerFromSubnet.

Tools for PowerShell

**Example 1:** This example removes the specified subnet from the set of subnets configured for the specified load balancer. The output includes the remaining subnets.

Dismount-ELBLoadBalancerFromSubnet -LoadBalancerName my-load-balancer -Subnet subnet-12345678

Output:

subnet-87654321

• For API details, see [DetachLoadBalancerFromSubnets](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Edit-ELBLoadBalancerAttribute

The following code example shows how to use Edit-ELBLoadBalancerAttribute.

Tools for PowerShell

**Example 1:** This example enables cross-zone load balancing for the specified load balancer.

Edit-ELBLoadBalancerAttribute -LoadBalancerName my-load-balancer -CrossZoneLoadBalancing_Enabled $true

**Example 2:** This example disables connection draining for the specified load balancer.

Edit-ELBLoadBalancerAttribute -LoadBalancerName my-load-balancer -ConnectionDraining_Enabled $false

**Example 3:** This example enables access logging for the specified load balancer.

Edit-ELBLoadBalancerAttribute -LoadBalancerName my-load-balancer` ` >> -AccessLog_Enabled $true` `
For API details, see [ModifyLoadBalancerAttributes](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

### Enable-ELBAvailabilityZoneForLoadBalancer

The following code example shows how to use Enable-ELBAvailabilityZoneForLoadBalancer.

**Tools for PowerShell**

**Example 1:** This example adds the specified Availability Zone to the specified load balancer. The output includes the complete list of Availability Zones.

```powershell
Enable-ELBAvailabilityZoneForLoadBalancer -LoadBalancerName my-load-balancer -AvailabilityZone us-west-2a
```

**Output:**

```
us-west-2a
us-west-2b
```

For API details, see [EnableAvailabilityZonesForLoadBalancer](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

### Get-ELBInstanceHealth

The following code example shows how to use Get-ELBInstanceHealth.

**Tools for PowerShell**

**Example 1:** This example describes the state of the instances registered with the specified load balancer.

```powershell
Get-ELBInstanceHealth -LoadBalancerName my-load-balancer
```
Output:

<table>
<thead>
<tr>
<th>Description</th>
<th>InstanceId</th>
<th>ReasonCode</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>i-87654321</td>
<td>N/A</td>
</tr>
<tr>
<td>InService</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Instance has failed at least the UnhealthyThreshold number of health checks consecutively.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example 2: This example describes the state of the specified instance registered with the specified load balancer.

Get-ELBInstanceHealth -LoadBalancerName my-load-balancer -Instance i-12345678

Example 3: This example displays the complete description of the state of the specified instance.

(Get-ELBInstanceHealth -LoadBalancerName my-load-balancer -Instance i-12345678).Description

Output:

Instance has failed at least the UnhealthyThreshold number of health checks consecutively.

- For API details, see [DescribeInstanceHealth](#) in AWS Tools for PowerShell Cmdlet Reference.

**Get-ELBLoadBalancer**

The following code example shows how to use Get-ELBLoadBalancer.

**Tools for PowerShell**

Example 1: This example lists the names of your load balancers.

Get-ELBLoadBalancer | format-table -property LoadBalancerName
Output:

LoadBalancerName
----------------
my-load-balancer
my-other-load-balancer
my-internal-load-balancer

Example 2: This example describes the specified load balancer.

Get-ELBLoadBalancer -LoadBalancerName my-load-balancer

Output:

AvailabilityZones : {us-west-2a, us-west-2b}
BackendServerDescriptions :
   {Amazon.ElasticLoadBalancing.Model.BackendServerDescription}
CanonicalHostedZoneName : my-load-balancer-1234567890.us-west-2.elb.amazonaws.com
CanonicalHostedZoneNameID : Z3DZXE0EXAMPLE

ListenerDescriptions : {Amazon.ElasticLoadBalancing.Model.ListenerDescription}
LoadBalancerName : my-load-balancer
Scheme : internet-facing
SecurityGroups : {sg-a61988c3}
Subnets : {subnet-15aaab61}
VPCId : vpc-a01106c2

Example 3: This example describes all your load balancers in the current AWS region.

Get-ELBLoadBalancer

Example 4: This example describes all your load balancers across all available AWS Regions.

Get-AWSRegion | % { Get-ELBLoadBalancer -Region $_.Region }

For API details, see DescribeLoadBalancers in AWS Tools for PowerShell Cmdlet Reference.
Get-ELBLoadBalancerAttribute

The following code example shows how to use Get-ELBLoadBalancerAttribute.

Tools for PowerShell

Example 1: This example describes the attributes for the specified load balancer.

```powershell
Get-ELBLoadBalancerAttribute -LoadBalancerName my-load-balancer
```

Output:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AdditionalAttributes</td>
<td>{}</td>
</tr>
<tr>
<td>ConnectionDraining</td>
<td>Amazon.ElasticLoadBalancing.Model.ConnectionDraining</td>
</tr>
<tr>

<td>Amazon.ElasticLoadBalancing.Model.ConnectionSettings</td>
</tr>
<tr>
<td>CrossZoneLoadBalancing</td>
<td>Amazon.ElasticLoadBalancing.Model.CrossZoneLoadBalancing</td>
</tr>
</tbody>
</table>

- For API details, see [DescribeLoadBalancerAttributes](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-ELBLoadBalancerPolicy

The following code example shows how to use Get-ELBLoadBalancerPolicy.

Tools for PowerShell

Example 1: This example describes the policies associated with the specified load balancer.

```powershell
Get-ELBLoadBalancerPolicy -LoadBalancerName my-load-balancer
```

Output:

<table>
<thead>
<tr>
<th>PolicyAttributeDescriptions</th>
<th>PolicyName</th>
</tr>
</thead>
<tbody>
<tr>
<td>PolicyTypeName</td>

<tr>
<td>{CookieName}</td>
<td>my-app-cookie-policy</td>
</tr>
<tr>
<td>AppCookieStickinessPolicyType</td>
<td></td>
</tr>
</tbody>
</table>

Elastic Load Balancing - Version 1
Example 2: This example describes the attributes of the specified policy.

```
(Get-ELBLoadBalancerPolicy -LoadBalancerName my-load-balancer -PolicyName my-ProxyProtocol-policy).PolicyAttributeDescriptions
```

**Output:**

<table>
<thead>
<tr>
<th>AttributeName</th>
<th>AttributeValue</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProxyProtocol</td>
<td>true</td>
</tr>
</tbody>
</table>

Example 3: This example describes the predefined policies, including the sample policies. The names of the sample policies have the ELBSample- prefix.

```
Get-ELBLoadBalancerPolicy
```

**Output:**

<table>
<thead>
<tr>
<th>PolicyAttributeDescriptions</th>
<th>PolicyName</th>
</tr>
</thead>
<tbody>
<tr>
<td>PolicyTypeName</td>
<td></td>
</tr>
<tr>
<td>---------------------------</td>
<td>--------------------------</td>
</tr>
</tbody>
</table>

- For API details, see [DescribeLoadBalancerPolicies](#) in AWS Tools for PowerShell Cmdlet Reference.
Get-ELBLoadBalancerPolicyType

The following code example shows how to use Get-ELBLoadBalancerPolicyType.

Tools for PowerShell

Example 1: This example gets the policy types supported by Elastic Load Balancing.

Get-ELBLoadBalancerPolicyType

Output:

<table>
<thead>
<tr>
<th>Description</th>
<th>PolicyAttributeTypeDescriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>PolicyTypeName</td>

</tbody>
</table>

Example 2: This example describes the specified policy type.

Get-ELBLoadBalancerPolicyType -PolicyTypeName ProxyProtocolPolicyType

Output:

<table>
<thead>
<tr>
<th>Description</th>
<th>PolicyAttributeTypeDescriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>PolicyTypeName</td>
<td></td>
</tr>
<tr>
<td>Policy that controls whether to incl...</td>
<td>{ProxyProtocol}</td>
</tr>
<tr>
<td>ProxyProtocolPolicyType</td>

</tr>
</tbody>
</table>
Example 3: This example displays the complete description of the specified policy type.

```
(Get-ELBLoadBalancerPolicyType -PolicyTypeName).Description
```

Output:

```
Policy that controls whether to include the IP address and port of the originating request for TCP messages.
This policy operates on TCP/SSL listeners only.
```

- For API details, see [DescribeLoadBalancerPolicyTypes](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

**Get-ELBResourceTag**

The following code example shows how to use `Get-ELBResourceTag`.

**Tools for PowerShell**

**Example 1: This example lists the tags for the specified load balancers.**

```
Get-ELBResourceTag -LoadBalancerName @("my-load-balancer","my-internal-load-balancer")
```

Output:

```
LoadBalancerName             Tags
----------------             ----
my-load-balancer             {project, department}
my-internal-load-balancer    {project, department}
```

**Example 2: This example describes the tags for the specified load balancer.**

```
(Get-ELBResourceTag -LoadBalancerName my-load-balancer).Tags
```

Output:

```
Key           Value
---           -----
• For API details, see [DescribeTags](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Join-ELBSecurityGroupToLoadBalancer**

The following code example shows how to use `Join-ELBSecurityGroupToLoadBalancer`.

**Tools for PowerShell**

**Example 1**: This example replaces the current security group for the specified load balancer with the specified security group.

```
Join-ELBSecurityGroupToLoadBalancer -LoadBalancerName my-load-balancer -SecurityGroup sg-87654321
```

**Output**:

```
sg-87654321
```

**Example 2**: To keep the current security group and specify an additional security group, specify both the existing and new security groups.

```
Join-ELBSecurityGroupToLoadBalancer -LoadBalancerName my-load-balancer -SecurityGroup @("sg-12345678", "sg-87654321")
```

**Output**:

```
sg-12345678
sg-87654321
```

• For API details, see [ApplySecurityGroupsToLoadBalancer](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-ELBAppCookieStickinessPolicy**

The following code example shows how to use `New-ELBAppCookieStickinessPolicy`.

---

**Elastic Load Balancing - Version 1**

493
Tools for PowerShell

Example 1: This example creates a stickiness policy that follows the sticky session lifetimes of the specified application-generated cookie.

```powershell
New-ELBApplCookieStickinessPolicy -LoadBalancerName my-load-balancer -PolicyName my-app-cookie-policy -CookieName my-app-cookie
```

- For API details, see `CreateAppCookieStickinessPolicy` in AWS Tools for PowerShell Cmdlet Reference.

New-ELBLBCookieStickinessPolicy

The following code example shows how to use New-ELBLBCookieStickinessPolicy.

Tools for PowerShell

Example 1: This example creates a stickiness policy with sticky session lifetimes controlled by the specified expiration period (in seconds).

```powershell
New-ELBLBCookieStickinessPolicy -LoadBalancerName my-load-balancer -PolicyName my-duration-cookie-policy -CookieExpirationPeriod 60
```

Example 2: This example creates a stickiness policy with sticky session lifetimes controlled by the lifetime of the browser (user-agent).

```powershell
New-ELBLBCookieStickinessPolicy -LoadBalancerName my-load-balancer -PolicyName my-duration-cookie-policy
```

- For API details, see `CreateLbCookieStickinessPolicy` in AWS Tools for PowerShell Cmdlet Reference.

New-ELBLoadBalancer

The following code example shows how to use New-ELBLoadBalancer.

Tools for PowerShell

Example 1: This example creates a load balancer with an HTTP listener in a VPC.

```powershell
$httpListener = New-Object Amazon.ElasticLoadBalancing.Model.Listener
```
$httpListener.Protocol = "http"
$httpListener.LoadBalancerPort = 80
$httpListener.InstanceProtocol = "http"
$httpListener.InstancePort = 80

my-vpc-load-balancer-1234567890.us-west-2.elb.amazonaws.com

Example 2: This example creates a load balancer with an HTTP listener in EC2-Classic.

New-ELBLoadBalancer -LoadBalancerName my-classic-load-balancer -AvailabilityZone us-west-2a -Listener $httpListener

Output:

my-classic-load-balancer-123456789.us-west-2.elb.amazonaws.com

Example 3: This example creates a load balancer with an HTTPS listener.

$httpsListener = New-Object Amazon.ElasticLoadBalancing.Model.Listener
$httpsListener.Protocol = "https"
$httpsListener.LoadBalancerPort = 443
$httpsListener.InstanceProtocol = "http"
$httpsListener.InstancePort = 80
$httpsListener.SSLCertificateId="arn:aws:iam::123456789012:server-certificate/my-server-cert"
New-ELBLoadBalancer -LoadBalancerName my-load-balancer -AvailabilityZone us-west-2a -Listener $httpsListener

my-load-balancer-123456789.us-west-2.elb.amazonaws.com

• For API details, see CreateLoadBalancer in AWS Tools for PowerShell Cmdlet Reference.

New-ELBLoadBalancerListener

The following code example shows how to use New-ELBLoadBalancerListener.

Tools for PowerShell

Example 1: This example adds an HTTPS listener to the specified load balancer.
$httpsListener = New-Object Amazon.ElasticLoadBalancing.Model.Listener
$httpsListener.Protocol = "https"
$httpsListener.LoadBalancerPort = 443
$httpsListener.InstanceProtocol = "https"
$httpsListener.InstancePort = 443
$httpsListener.SSLCertificateId = "arn:aws:iam::123456789012:server-certificate/my-server-cert"
New-ELBLoadBalancerListener -LoadBalancerName my-load-balancer -Listener $httpsListener

- For API details, see [CreateLoadBalancerListeners](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

### New-ELBLoadBalancerPolicy

The following code example shows how to use New-ELBLoadBalancerPolicy.

#### Tools for PowerShell

**Example 1:** This example creates a new proxy protocol policy for a specified load balancer.

```
    AttributeName = "ProxyProtocol"
    AttributeValue = "True"
}
New-ELBLoadBalancerPolicy -LoadBalancerName my-load-balancer -PolicyName my-ProxyProtocol-policy -PolicyTypeName ProxyProtocolPolicyType -PolicyAttribute $attribute
```

- For API details, see [CreateLoadBalancerPolicy](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

### Register-ELBInstanceWithLoadBalancer

The following code example shows how to use Register-ELBInstanceWithLoadBalancer.

#### Tools for PowerShell

**Example 1:** This example registers the specified EC2 instance with the specified load balancer.
Register-ELBInstanceWithLoadBalancer -LoadBalancerName my-load-balancer -Instance i-12345678

Output:

<table>
<thead>
<tr>
<th>InstanceId</th>
</tr>
</thead>
<tbody>
<tr>
<td>i-12345678</td>
</tr>
<tr>
<td>i-87654321</td>
</tr>
</tbody>
</table>

- For API details, see [RegisterInstancesWithLoadBalancer](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-ELBInstanceFromLoadBalancer**

The following code example shows how to use Remove-ELBInstanceFromLoadBalancer.

**Tools for PowerShell**

**Example 1:** This example removes the specified EC2 instance from the specified load balancer. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

Remove-ELBInstanceFromLoadBalancer -LoadBalancerName my-load-balancer -Instance i-12345678

Output:

```
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ELBInstanceFromLoadBalancer (DeregisterInstancesFromLoadBalancer)" on Target "Amazon.ElasticLoadBalancing.Model.Instance".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

InstanceId

i-87654321
```
For API details, see `DeregisterInstancesFromLoadBalancer` in `AWS Tools for PowerShell Cmdlet Reference`.

Remove-ELBLoadBalancer

The following code example shows how to use Remove-ELBLoadBalancer.

Tools for PowerShell

Example 1: This example deletes the specified load balancer. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```powershell
Remove-ELBLoadBalancer -LoadBalancerName my-load-balancer
```

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ELBLoadBalancer (DeleteLoadBalancer)" on Target "my-load-balancer".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

For API details, see `DeleteLoadBalancer` in `AWS Tools for PowerShell Cmdlet Reference`.

Remove-ELBLoadBalancerListener

The following code example shows how to use Remove-ELBLoadBalancerListener.

Tools for PowerShell

Example 1: This example deletes the listener on port 80 for the specified load balancer. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

```powershell
Remove-ELBLoadBalancerListener -LoadBalancerName my-load-balancer -LoadBalancerPort 80
```

Output:
Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ELBLoadBalancerListener (DeleteLoadBalancerListeners)"
on Target "80".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

• For API details, see DeleteLoadBalancerListeners in AWS Tools for PowerShell Cmdlet Reference.

Remove-ELBLoadBalancerPolicy

The following code example shows how to use Remove-ELBLoadBalancerPolicy.

Tools for PowerShell

Example 1: This example deletes the specified policy from the specified load balancer. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter.

Remove-ELBLoadBalancerPolicy -LoadBalancerName my-load-balancer -PolicyName my-duration-cookie-policy

Output:

Confirm
Are you sure you want to perform this action?
Performing operation "Remove-ELBLoadBalancerPolicy (DeleteLoadBalancerPolicy)" on Target "my-duration-cookie-policy".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

• For API details, see DeleteLoadBalancerPolicy in AWS Tools for PowerShell Cmdlet Reference.

Remove-ELBResourceTag

The following code example shows how to use Remove-ELBResourceTag.
Tools for PowerShell

Example 1: This example removes the specified tag from the specified load balancer. You are prompted for confirmation before the operation proceeds, unless you also specify the Force parameter. The syntax used by this example requires PowerShell version 3 or later.

```powershell
Remove-ELBResourceTag -LoadBalancerName my-load-balancer -Tag @{ Key="project" }
```

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-ELBResourceTag (RemoveTags)" on target "Amazon.ElasticLoadBalancing.Model.TagKeyOnly".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"):

Example 2: With Powershell version 2, you must use New-Object to create the tag for the Tag parameter.

```powershell
$tag = New-Object Amazon.ElasticLoadBalancing.Model.TagKeyOnly
$tag.Key = "project"
Remove-ELBResourceTag -Tag $tag -Force
```

- For API details, see RemoveTags in AWS Tools for PowerShell Cmdlet Reference.

Set-ELBHealthCheck

The following code example shows how to use Set-ELBHealthCheck.

Tools for PowerShell

Example 1: This example configures the health check settings for the specified load balancer.

```powershell
Set-ELBHealthCheck -LoadBalancerName my-load-balancer `
>> -HealthCheck_HealthyThreshold 2 `
>> -HealthCheck_UnhealthyThreshold 2 `
>> -HealthCheck_Target "HTTP:80/ping" `
>> -HealthCheck_Interval 30 `
>> -HealthCheck_Timeout 3
```
**Output:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>HealthyThreshold</td>
<td>2</td>
</tr>
<tr>
<td>Interval</td>
<td>30</td>
</tr>
<tr>
<td>Target</td>
<td>HTTP:80/ping</td>
</tr>
<tr>
<td>Timeout</td>
<td>3</td>
</tr>
<tr>
<td>UnhealthyThreshold</td>
<td>2</td>
</tr>
</tbody>
</table>

- For API details, see [ConfigureHealthCheck](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Set-ELBLoadBalancerListenerSSLCertificate

The following code example shows how to use `Set-ELBLoadBalancerListenerSSLCertificate`.

**Tools for PowerShell**

**Example 1:** This example replaces the certificate that terminates the SSL connections for the specified listener.

```powershell
```

- For API details, see [SetLoadBalancerListenerSslCertificate](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Set-ELBLoadBalancerPolicyForBackendServer

The following code example shows how to use `Set-ELBLoadBalancerPolicyForBackendServer`.

**Tools for PowerShell**

**Example 1:** This example replaces the policies for the specified port with the specified policy.

```powershell
Set-ELBLoadBalancerPolicyForBackendServer -LoadBalancerName my-load-balancer -InstancePort 80 -PolicyName my-ProxyProtocol-policy
```
Example 2: This example removes all policies associated with the specified port.

```
Set-ELBLoadBalancerPolicyForBackendServer -LoadBalancerName my-load-balancer -InstancePort 80
```

- For API details, see [SetLoadBalancerPoliciesForBackendServer](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Set-ELBLoadBalancerPolicyOfListener**

The following code example shows how to use `Set-ELBLoadBalancerPolicyOfListener`.

**Tools for PowerShell**

**Example 1:** This example replaces the policies for the specified listener with the specified policy.

```
Set-ELBLoadBalancerPolicyOfListener -LoadBalancerName my-load-balancer -LoadBalancerPort 443 -PolicyName my-SSLNegotiation-policy
```

**Example 2:** This example removes all policies associated with the specified listener.

```
Set-ELBLoadBalancerPolicyOfListener -LoadBalancerName my-load-balancer -LoadBalancerPort 443
```

- For API details, see [SetLoadBalancerPoliciesOfListener](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Add-ELB2ListenerCertificate**

The following code example shows how to use `Add-ELB2ListenerCertificate`.

**Tools for PowerShell**

**Example 1: This example adds additional certificate to the specified Listener.**

```powershell
```

**Output:**

<table>
<thead>
<tr>
<th>CertificateArn</th>
<th>IsDefault</th>

- For API details, see [AddListenerCertificates](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Add-ELB2Tag**

The following code example shows how to use `Add-ELB2Tag`.

**Tools for PowerShell**

**Example 1: This example add new Tag to specified AWS.Tools.ElasticLoadBalancingV2 resource.**
Add-ELB2Tag -ResourceArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/app/test-alb/3651b4394dd9a24f' -Tag @{Key = 'productVersion'; Value = '1.0.0'}

- For API details, see [AddTags](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Edit-ELB2Listener**

The following code example shows how to use `Edit-ELB2Listener`.

**Tools for PowerShell**

**Example 1:** This example modifies the specified listeners default action to fixed-response.

```powershell
    "FixedResponseConfig" = @{
        "ContentType" = "text/plain"
        "MessageBody" = "Hello World"
        "StatusCode" = "200"
    }
    "Type" = [Amazon.ElasticLoadBalancingV2.ActionTypeEnum]::FixedResponse
}

Edit-ELB2Listener -ListenerArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/testALB/3e2f03b558e19676/d19f2f14974db685' -Port 8080 -DefaultAction $newDefaultAction
```

**Output:**

**Elastic Load Balancing - Version 2**
**Edit-ELB2LoadBalancerAttribute**

The following code example shows how to use `Edit-ELB2LoadBalancerAttribute`.

**Tools for PowerShell**

**Example 1: This example modifies the Attributes of the specified load balancer.**

```powershell
Edit-ELB2LoadBalancerAttribute -LoadBalancerArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/app/test-alb/3651b4394dd9a24f' -Attribute @{'Key = 'deletion_protection.enabled'; Value = 'true'}
```

**Output:**

<table>

**Edit-ELB2Rule**

The following code example shows how to use `Edit-ELB2Rule`.

**Tools for PowerShell**

**Example 1: This example modifies the specified Listener rule configurations.**

```powershell
    "PathPatternConfig" = @{
        "Values" = "/login1", "/login2", "/login3"
    }
    "Field" = "path-pattern"

- For API details, see ModifyRule in AWS Tools for PowerShell Cmdlet Reference.

Edit-ELB2TargetGroup

The following code example shows how to use Edit-ELB2TargetGroup.

Tools for PowerShell

Example 1: This example modifies the properties of the specified Target Group.

Output:

HealthCheckEnabled : True
HealthCheckIntervalSeconds : 60
HealthCheckPath : /index.html
HealthCheckPort : 8080
HealthCheckProtocol : HTTP
HealthCheckTimeoutSeconds : 5

For API details, see [ModifyTargetGroup](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Edit-ELB2TargetGroupAttribute**

The following code example shows how to use `Edit-ELB2TargetGroupAttribute`.

**Tools for PowerShell**

**Example 1:** This example modifies the deregistration_delay attribute of the specified Target Group.

```powershell
Edit-ELB2TargetGroupAttribute -TargetGroupArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:targetgroup/test-tg/a4e04b3688be1970' -Attribute @{Key = 'deregistration_delay.timeout_seconds'; Value = 600}

**Get-ELB2AccountLimit**

The following code example shows how to use `Get-ELB2AccountLimit`.

**Tools for PowerShell**

**Example 1:** This command lists ELB2 account limits for a given region.
Get-ELB2AccountLimit

Output:

Get-ELB2Listener

The following code example shows how to use Get-ELB2Listener.

Tools for PowerShell

Example 1: This examples describes listeners of the specified ALB/NLB.

Output:

Certificates : {}

Get-ELB2ListenerCertificate

The following code example shows how to use Get-ELB2ListenerCertificate.

Tools for PowerShell

Example 1: This examples describes the certificate for the specified listener.

Get-ELB2ListenerCertificate -ListenerArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/test-alb/3651b4394dd9a24f/66e10e3aaf5b6d9b'

- For API details, see DescribeListenerCertificates in AWS Tools for PowerShell Cmdlet Reference.
Get-ELB2LoadBalancer

The following code example shows how to use Get-ELB2LoadBalancer.

Tools for PowerShell

Example 1: This sample displays all the load balancers for the given region.

```powershell
Get-ELB2LoadBalancer
```

Output:

```powershell
AvailabilityZones       : {us-east-1c}
 CanonicalHostedZoneId  : Z2GRNL4YFTOTI

Get-ELB2LoadBalancerAttribute

The following code example shows how to use Get-ELB2LoadBalancerAttribute.

Tools for PowerShell

Example 1: This command describes the attributes of given Load balancer.

```powershell
```

Output:
<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>

**Get-ELB2Rule**

The following code example shows how to use Get-ELB2Rule.

**Tools for PowerShell**

**Example 1: This example describes the listener rules for the specified Listener ARN.**

```powershell
Get-ELB2Rule -ListenerArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/test-alb/3651b4394dd9a24f/66e10e3aaf5b6d9b'

- For API details, see DescribeRules in AWS Tools for PowerShell Cmdlet Reference.

Get-ELB2SSLPolicy

The following code example shows how to use Get-ELB2SSLPolicy.

Tools for PowerShell

Example 1: This examples lists all available listener policies for ElasticLoadBalancingV2.

Get-ELB2SSLPolicy

Output:

<table>
<thead>
<tr>
<th>Ciphers</th>
<th>Name</th>
<th>SslProtocols</th>
</tr>
</thead>
<tbody>
<tr>
<td>{ECDHE-ECDSA-AES128-GCM-SHA256, ECDHE-RSA-AES128-GCM-SHA256, ECDHE-ECDSA-AES128-SHA256, ECDHE-RSA-AES128-SHA256}</td>

### Get-ELB2Tag

The following code example shows how to use Get-ELB2Tag.

**Tools for PowerShell**

**Example 1:** This example lists the Tags for the specified resource.

```powershell
Get-ELB2Tag -ResourceArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/app/test-alb/3651b4394dd9a24f'

</tr>
</tbody>
</table>

For API details, see [DescribeTags](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-ELB2TargetGroup

The following code example shows how to use Get-ELB2TargetGroup.

**Tools for PowerShell**

**Example 1:** This example describes the specified Target Group.

```powershell
Get-ELB2TargetGroup -TargetGroupArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:targetgroup/test-tg/a4e04b3688be1970'

**Get-ELB2TargetGroupAttribute**

The following code example shows how to use Get-ELB2TargetGroupAttribute.

**Tools for PowerShell**

**Example 1: This example describes the attributes of the specified Target Group.**

```
Get-ELB2TargetGroupAttribute -TargetGroupArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:targetgroup/test-tg/a4e04b3688be1970'

For API details, see `DescribeTargetGroupAttributes` in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-ELB2TargetHealth**

The following code example shows how to use Get-ELB2TargetHealth.

**Tools for PowerShell**

**Example 1:** This example returns the health status of the Targets present in the specified Target Group.

```powershell
Get-ELB2TargetHealth -TargetGroupArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:targetgroup/test-tg/a4e04b3688be1970'
```

**Output:**

```

For API details, see `DescribeTargetHealth` in *AWS Tools for PowerShell Cmdlet Reference*.

**New-ELB2Listener**

The following code example shows how to use New-ELB2Listener.

**Tools for PowerShell**

**Example 1:** This example creates new ALB listener with the default action 'Forward' to send traffic to specified Target Group.

```powershell
    ForwardConfig = @{
        TargetGroups = @(
```
@{ TargetGroupArn = "arn:aws:elasticloadbalancing:us-east-1:123456789012:targetgroup/testAlbTG/3d61c2f20aa5bccb" }

SslPolicy : 

- For API details, see CreateListener in AWS Tools for PowerShell Cmdlet Reference.

New-ELB2LoadBalancer

The following code example shows how to use New-ELB2LoadBalancer.

Tools for PowerShell

Example 1: This example creates new internet facing Application load balancer with two subnets.

New-ELB2LoadBalancer -Type application -Scheme internet-facing -IpAddressType ipv4 -Name 'New-Test-ALB' -SecurityGroup 'sg-07c3414abb8811cbd' -subnet 'subnet-c37a67a6','subnet-fc02eea0'

### New-ELB2Rule

The following code example shows how to use New-ELB2Rule.

#### Tools for PowerShell

**Example 1:** This example creates new Listener rule with fixed-response action based on the customer header value for the specified Listener.

```powershell
  "FixedResponseConfig" = @{
    "ContentType" = "text/plain"
    "MessageBody" = "Hello World"
    "StatusCode" = "200"
  }
  "Type" = [Amazon.ElasticLoadBalancingV2.ActionTypeEnum]::FixedResponse
}

  "httpHeaderConfig" = @{
    "HttpHeaderName" = "customHeader"
    "Values" = "header2","header1"
  }
  "Field" = "http-header"
}
New-ELB2Rule -ListenerArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/testALB/3e2f03b558e19676/1c84f02aec143e80' -Action $newRuleAction -Condition $newRuleCondition -Priority 10

Output:

- For API details, see CreateRule in AWS Tools for PowerShell Cmdlet Reference.

New-ELB2TargetGroup

The following code example shows how to use New-ELB2TargetGroup.

Tools for PowerShell

Example 1: This example creates new Target group with the provided parameters.

New-ELB2TargetGroup -HealthCheckEnabled 1 -HealthCheckIntervalSeconds 30 -HealthCheckPath '/index.html' -HealthCheckPort 80 -HealthCheckTimeoutSecond 5 -HealthyThresholdCount 2 -UnhealthyThresholdCount 5 -Port 80 -Protocol 'HTTP' -TargetType instance -VpcId 'vpc-2cfd7000' -Name 'NewTargetGroup'

Output:

- For API details, see [CreateTargetGroup](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-ELB2Target**

The following code example shows how to use `Register-ELB2Target`.

**Tools for PowerShell**

**Example 1:** This example registers 'i-0672a4c4cdeae3111' instance with the specified target group.

```
Register-ELB2Target -TargetGroupArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:targetgroup/test-tg/a4e04b3688be1970' -Target @{Port = 80; Id = 'i-0672a4c4cdeae3111'}
```

- For API details, see [RegisterTargets](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-ELB2Listener**

The following code example shows how to use `Remove-ELB2Listener`.

**Tools for PowerShell**

**Example 1:** This example deletes the specified Listener.

```
Remove-ELB2Listener -ListenerArn 'arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/test-alb/3651b4394dd9a24f/66e10e3aaf5b6d9b'

New-GLUEJob

The following code example shows how to use New-GLUEJob.

Tools for PowerShell

Example 1: This example creates a new job in AWS Glue. The command name value is always glueet1. AWS Glue supports running job scripts written in Python or Scala. In this example, the job script (MyTestGlueJob.py) is written in Python. Python parameters are specified in the $DefArgs variable, and then passed to the PowerShell command in the DefaultArguments parameter, which accepts a hashtable. The parameters in the $JobParams variable come from the CreateJob API, documented in the Jobs (https://docs.aws.amazon.com/glue/latest/dg/aws-glue-api-jobs-job.html) topic of the AWS Glue API reference.

```powershell
$Command = New-Object Amazon.Glue.Model.JobCommand
$Command.Name = 'glueet1'
$Command.ScriptLocation = 's3://aws-glue-scripts-000000000000-us-west-2/admin/MyTestGlueJob.py'
```
```powershell

Get-HLTHEvent

The following code example shows how to use Get-HLTHEvent.

Tools for PowerShell

Example 1: This command returns events from AWS Personal Health Dashboard. The user adds the -Region parameter to see events available to the service in the US East (N. Virginia) Region, but the -Filter_Region parameter filters for events that are logged in the EU (London) and US West (Oregon) Regions (eu-west-2 and us-west-2). The -Filter_StartTime parameter filters for a range of times that events can start, while the -Filter_EndTime parameter filters for a range of times that events can end. The result is a scheduled maintenance event for RDS that starts within the specified -Filter_StartTime range, and ends within the scheduled -Filter_EndTime range.

```powershell
Get-HLTHEvent -Region us-east-1 -Filter_Region "eu-west-2","us-west-2" -Filter_StartTime @{from="3/14/2019 6:30:00AM";to="3/15/2019 5:00:00PM"} -Filter_EndTime @{from="3/21/2019 7:00:00AM";to="3/21/2019 5:00:00PM"}

Example 1: This command adds the role named S3Access to an existing instance profile named webserver. To create the instance profile, use the New-IAMInstanceProfile command. After you create the instance profile and associate it with a role using this command, you can attach it to an EC2 instance. To do that, use the New-EC2Instance cmdlet with either the InstanceProfile_Arn or the InstanceProfile_Name parameter to launch the new instance.

Add-IAMRoleToInstanceProfile -RoleName "S3Access" -InstanceProfileName "webserver"

• For API details, see AddRoleToInstanceProfile in AWS Tools for PowerShell Cmdlet Reference.

Add-IAMUserTag

The following code example shows how to use Add-IAMUserTag.

Tools for PowerShell

Example 1: This example adds tag to User in Identity Management Service
Add-IAMUserTag -UserName joe -Tag @{ Key = 'abac'; Value = 'testing'}

- For API details, see TagUser in AWS Tools for PowerShell Cmdlet Reference.

Add-IAMUserToGroup

The following code example shows how to use Add-IAMUserToGroup.

Tools for PowerShell

Example 1: This command adds the user named Bob to the group named Admins.

Add-IAMUserToGroup -UserName "Bob" -GroupName "Admins"

- For API details, see AddUserToGroup in AWS Tools for PowerShell Cmdlet Reference.

Disable-IAMMFADevice

The following code example shows how to use Disable-IAMMFADevice.

Tools for PowerShell

Example 1: This command disables the hardware MFA device associated with the user Bob that has the serial number 123456789012.

Disable-IAMMFADevice -UserName "Bob" -SerialNumber "123456789012"

Example 2: This command disables the virtual MFA device associated with the user David that has the ARN arn:aws:iam::210987654321:mfa/David. Note that virtual MFA device is not deleted from the account. The virtual device is still present and appears in the output of the Get-IAMVirtualMFADevice command. Before you can create a new virtual MFA device for the same user, you must delete the old one by using the Remove-IAMVirtualMFADevice command.

Disable-IAMMFADevice -UserName "David" -SerialNumber "arn:aws:iam::210987654321:mfa/David"

- For API details, see DeactivateMfaDevice in AWS Tools for PowerShell Cmdlet Reference.
Edit-IAMPassword

The following code example shows how to use Edit-IAMPassword.

Tools for PowerShell

Example 1: This command changes the password for the user that is running the command. This command can be called by IAM users only. If this command is called when you are signed-in with AWS account (root) credentials, the command returns an InvalidUserType error.

```
Edit-IAMPassword -OldPassword "MyOldP@ssw0rd" -NewPassword "MyNewP@ssw0rd"
```

- For API details, see ChangePassword in AWS Tools for PowerShell Cmdlet Reference.

Enable-IAMMFADevice

The following code example shows how to use Enable-IAMMFADevice.

Tools for PowerShell

Example 1: This command enables the hardware MFA device with the serial number 987654321098 and associates the device with the user Bob. It includes the first two codes in sequence from the device.

```
Enable-IAMMFADevice -UserName "Bob" -SerialNumber "987654321098" -AuthenticationCode1 "12345678" -AuthenticationCode2 "87654321"
```

Example 2: This example creates and enables a virtual MFA device. The first command creates the virtual device and returns the device's object representation in the variable $MFADevice. You can use the .Base32StringSeed or QRCodePng properties to configure the user's software application. The final command assigns the device to the user David, identifying the device by its serial number. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
$MFADevice = New-IAMVirtualMFADevice -VirtualMFADeviceName "MyMFADevice"
# see example for New-IAMVirtualMFADevice to see how to configure the software program with PNG or base32 seed code
```
Enable-IAMMFADevice -UserName "David" -SerialNumber -SerialNumber $MFADevice.SerialNumber -AuthenticationCode1 "24681357" -AuthenticationCode2 "13572468"

- For API details, see EnableMfaDevice in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMAccessKey

The following code example shows how to use Get-IAMAccessKey.

Tools for PowerShell

Example 1: This command lists the access keys for the IAM user named Bob. Note that you cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys with the New-IAMAccessKey cmdlet.

Get-IAMAccessKey -UserName "Bob"

Output:

<table>
<thead>
<tr>
<th>AccessKeyId</th>
<th>CreateDate</th>
<th>Status</th>
<th>UserName</th>
</tr>
</thead>
<tbody>
<tr>
<td>AKIAIOSFODNN7EXAMPLE</td>
<td>12/3/2014 10:53:41 AM</td>

<td>6/6/2013 8:42:26 PM</td>
<td>Inactive</td>
<td>Bob</td>
</tr>
</tbody>
</table>

- For API details, see ListAccessKeys in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMAccessKeyLastUsed

The following code example shows how to use Get-IAMAccessKeyLastUsed.

Tools for PowerShell

Example 1: Returns the owning user name and last-usage information for the supplied access key.

Get-IAMAccessKeyLastUsed -AccessKeyId ABCDEXAMPLE

- For API details, see GetAccessKeyLastUsed in AWS Tools for PowerShell Cmdlet Reference.
Get-IAMAccountAlias

The following code example shows how to use Get-IAMAccountAlias.

**Tools for PowerShell**

**Example 1:** This command returns the account alias for the AWS account.

```
Get-IAMAccountAlias
```

Output:

```
ExampleCo
```

- For API details, see ListAccountAliases in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMAccountAuthorizationDetail

The following code example shows how to use Get-IAMAccountAuthorizationDetail.

**Tools for PowerShell**

**Example 1:** This example gets authorization details about the identities in the AWS account, and displays the element list of the returned object, including users, groups, and roles. For example, the UserDetailList property displays details about the users. Similar information is available in the RoleDetailList and GroupDetailList properties.

```
$Details=Get-IAMAccountAuthorizationDetail
$Details
```

Output:

```
GroupDetailList: {Administrators, Developers, Testers, Backup}
IsTruncated: False
Marker:
RoleDetailList: {TestRole1, AdminRole, TesterRole, clirole...}
UserDetailList: {Administrator, Bob, BackupToS3, }$
```

```
$Details.UserDetailList

• For API details, see GetAccountAuthorizationDetails in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMAccountPasswordPolicy

The following code example shows how to use Get-IAMAccountPasswordPolicy.

Tools for PowerShell

Example 1: This example returns details about the password policy for the current account. If no password policy is defined for the account, the command returns a NoSuchEntity error.

Get-IAMAccountPasswordPolicy

Output:
AllowUsersToChangePassword : True
ExpirePasswords            : True
HardExpiry                 : False

- For API details, see [GetAccountPasswordPolicy](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-IAMAccountSummary**

The following code example shows how to use Get-IAMAccountSummary.

**Tools for PowerShell**

**Example 1:** This example returns information about the current IAM entity usage and current IAM entity quotas in the AWS account.

```
Get-IAMAccountSummary
```

**Output:**

**Get-IAMAttachedGroupPolicyList**

The following code example shows how to use Get-IAMAttachedGroupPolicyList.

**Tools for PowerShell**

**Example 1:** This command returns the names and ARNs of the managed policies that are attached to the IAM group named Admins in the AWS account. To see the list of inline policies embedded in the group, use the Get-IAMGroupPolicyList command.

```
Get-IAMAttachedGroupPolicyList -GroupName "Admins"
```

**Output:**

<table>
<thead>
<tr>

</tbody>
</table>
• For API details, see [ListAttachedGroupPolicies](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-IAMAttachedRolePolicyList**

The following code example shows how to use Get-IAMAttachedRolePolicyList.

**Tools for PowerShell**

**Example 1**: This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account. To see the list of inline policies that are embedded in the role, use the `Get-IAMRolePolicyList` command.

```powershell
Get-IAMAttachedRolePolicyList -RoleName "SecurityAuditRole"
```

**Output:**

<table>
<thead>
<tr>
<th>PolicyArn</th>
<th>PolicyName</th>
</tr>
</thead>
<tbody>
<tr>

• For API details, see [ListAttachedRolePolicies](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-IAMAttachedUserPolicyList**

The following code example shows how to use Get-IAMAttachedUserPolicyList.

**Tools for PowerShell**

**Example 1**: This command returns the names and ARNs of the managed policies for the IAM user named `Bob` in the AWS account. To see the list of inline policies that are embedded in the IAM user, use the `Get-IAMUserPolicyList` command.

```powershell
Get-IAMAttachedUserPolicyList -UserName "Bob"
```

**Output:**

<table>
<thead>
<tr>
<th>PolicyArn</th>
<th>PolicyName</th>
</tr>
</thead>
<tbody>
<tr>
<td>arn:aws:iam::aws:policy/TesterPolicy</td>
<td>TesterPolicy</td>
</tr>
</tbody>
</table>
For API details, see ListAttachedUserPolicies in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMContextKeysForCustomPolicy

The following code example shows how to use Get-IAMContextKeysForCustomPolicy.

Tools for PowerShell

Example 1: This example fetches all the context keys present in the provided policy json. In order to provide multiple policies you can provide as comma separated list of values.

```powershell
$policy1 = '{"Version":"2012-10-17","Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-west-2:123456789012:table/","Condition":{"DateGreaterThan":{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17","Statement":
Get-IAMContextKeysForCustomPolicy -PolicyInputList $policy1,$policy2
```

For API details, see GetContextKeysForCustomPolicy in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMContextKeysForPrincipalPolicy

The following code example shows how to use Get-IAMContextKeysForPrincipalPolicy.

Tools for PowerShell

Example 1: This example fetches all the context keys present in the provided policy json and the policies attached to IAM entity(user/role etc.). For -PolicyInputList you can provide multiple values list as comma separated values.

```powershell
$policy1 = '{"Version":"2012-10-17","Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-west-2:123456789012:table/","Condition":{"DateGreaterThan":{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
$policy2 = '{"Version":"2012-10-17","Statement":
```
Get-IAMContextKeysForPrincipalPolicy -PolicyInputList $policy1,$policy2 -PolicySourceArn arn:aws:iam::852640994763:user/TestUser

- For API details, see `GetContextKeysForPrincipalPolicy` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-IAMCredentialReport

The following code example shows how to use Get-IAMCredentialReport.

Tools for PowerShell

Example 1: This example opens the returned report and outputs it to the pipeline as an array of text lines. The first line is the header with comma-separated column names. Each successive row is the detail row for one user, with each field separated by commas. Before you can view the report, you must generate it with the `Request-IAMCredentialReport` cmdlet. To retrieve the report as a single string, use -Raw instead of -AsTextArray. The alias -SplitLines is also accepted for the -AsTextArray switch. For the full list of columns in the output consult the service API reference. Note that if you do not use -AsTextArray or -SplitLines, then you must extract the text from the .Content property using the .NET StreamReader class.

Request-IAMCredentialReport

Output:

<table>
<thead>
<tr>
<th>Description</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>No report exists. Starting a new report generation task</td>
<td>STARTED</td>
</tr>

For API details, see [GetCredentialReport](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-IAMEntitiesForPolicy**

The following code example shows how to use Get-IAMEntitiesForPolicy.

**Tools for PowerShell**

**Example 1:** This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
Get-IAMEntitiesForPolicy -PolicyArn "arn:aws:iam::123456789012:policy/TestPolicy"
```

**Output:**

- IsTruncated : False
- Marker : 
- PolicyGroups : {}
- PolicyRoles : {testRole}
- PolicyUsers : {Bob, Theresa}

For API details, see [ListEntitiesForPolicy](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-IAMGroup**

The following code example shows how to use Get-IAMGroup.

**Tools for PowerShell**

**Example 1:** This example returns details about the IAM group Testers, including a collection of all the IAM users that belong to the group.

```
$results = Get-IAMGroup -GroupName "Testers"
$results
```

**Output:**

- IsTruncated : False
- Marker :

- For API details, see [GetGroup](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-IAMGroupForUser**

The following code example shows how to use Get-IAMGroupForUser.
Tools for PowerShell

Example 1: This example returns the list of IAM groups that the IAM user David belongs to.

Get-IAMGroupForUser -UserName David

Output:

- For API details, see ListGroupsForUser in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMGroupList

The following code example shows how to use Get-IAMGroupList.

Tools for PowerShell

Example 1: This example returns a collection of all the IAM groups defined in the current AWS account.

Get-IAMGroupList

Output:
For API details, see ListGroups in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMGroupPolicy

The following code example shows how to use Get-IAMGroupPolicy.

Tools for PowerShell

Example 1: This example returns details about the embedded inline policy named PowerUserAccess-Testers for the group Testers. The PolicyDocument property is URL encoded. It is decoded in this example with the UrlDecode .NET method.

```powershell
$results = Get-IAMGroupPolicy -GroupName Testers -PolicyName PowerUserAccess-Testers
$results
```

Output:

<table>

        }
    ]
}

• For API details, see GetGroupPolicy in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMGroupPolicyList

The following code example shows how to use Get-IAMGroupPolicyList.

Tools for PowerShell

Example 1: This example returns a list of the inline policies that are embedded in the group Testers. To get the managed policies that are attached to the group, use the command Get-IAMAttachedGroupPolicyList.

Get-IAMGroupPolicyList -GroupName Testers

Output:

Deny-Assume-S3-Role-In-Production
PowerUserAccess-Testers

• For API details, see ListGroupPolicies in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMInstanceProfile

The following code example shows how to use Get-IAMInstanceProfile.

Tools for PowerShell

Example 1: This example returns details of the instance profile named ec2instanceprofile that is defined in the current AWS account.
Get-IAMInstanceProfile -InstanceProfileName ec2instancerole

Output:

- Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
- CreateDate          : 2/17/2015 2:49:04 PM

- Roles               : {ec2instancerole}

- For API details, see GetInstanceProfile in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMInstanceProfileForRole

The following code example shows how to use Get-IAMInstanceProfileForRole.

Tools for PowerShell

Example 1: This example returns details of the instance profile associated with the role ec2instancerole.

Get-IAMInstanceProfileForRole -RoleName ec2instancerole

Output:

- Arn                 : arn:aws:iam::123456789012:instance-profile/ec2instancerole
- CreateDate          : 2/17/2015 2:49:04 PM

- Roles               : {ec2instancerole}

- For API details, see ListInstanceProfilesForRole in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMInstanceProfileList

The following code example shows how to use Get-IAMInstanceProfileList.
Tools for PowerShell

Example 1: This example returns a collection of the instance profiles defined in the current AWS account.

Get-IAMInstanceProfileList

Output:

- For API details, see ListInstanceProfiles in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMLoginProfile

The following code example shows how to use Get-IAMLoginProfile.

Tools for PowerShell

Example 1: This example returns the password creation date and whether a password reset is required for the IAM user David.

Get-IAMLoginProfile -UserName David

Output:

<table>
<thead>
<tr>
<th>CreateDate</th>
<th>PasswordResetRequired</th>
<th>UserName</th>
</tr>
</thead>
<tbody>
<tr>
<td>12/10/2014 3:39:44 PM</td>
<td>False</td>
<td>David</td>
</tr>
</tbody>
</table>

- For API details, see GetLoginProfile in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMMFADevice

The following code example shows how to use Get-IAMMFADevice.
Tools for PowerShell

Example 1: This example returns details about the MFA device assigned to the IAM user David. In this example you can tell that it is a virtual device because the SerialNumber is an ARN instead of a physical device's actual serial number.

```
Get-IAMMFADevice -UserName David
```

Output:

<table>
<thead>
<tr>
<th>EnableDate</th>
<th>SerialNumber</th>
<th>UserName</th>
</tr>
</thead>
</table>

• For API details, see [ListMfaDevices](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-IAMOpenIDConnectProvider

The following code example shows how to use `Get-IAMOpenIDConnectProvider`.

Tools for PowerShell

Example 1: This example returns details about the OpenID Connect provider whose ARN is arn:aws:iam::123456789012:oidc-provider/accounts.google.com. The ClientIDList property is a collection that contains all the Client IDs defined for this provider.

```
Get-IAMOpenIDConnectProvider -OpenIDConnectProviderArn

Get-IAMOpenIDConnectProviderList

The following code example shows how to use Get-IAMOpenIDConnectProviderList.

Tools for PowerShell

Example 1: This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

Get-IAMOpenIDConnectProviderList

Output:

<table>
<thead>
<tr>
<th>Arn</th>
</tr>
</thead>
<tbody>
<tr>
<td>arn:aws:iam::123456789012:oidc-provider/server.example.com</td>
</tr>

</tr>
</tbody>
</table>

• For API details, see ListOpenIdConnectProviders in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMPolicy

The following code example shows how to use Get-IAMPolicy.

Tools for PowerShell

Example 1: This example returns details about the managed policy whose ARN is arn:aws:iam::123456789012:policy/MySamplePolicy.

Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy

Output:

**Get-IAMPolicyList**

The following code example shows how to use `Get-IAMPolicyList`.

**Tools for PowerShell**

**Example 1:** This example returns a collection of the first three managed policies available in the current AWS account. Because `-scope` is not specified, it defaults to `all` and includes both AWS managed and customer managed policies.

```powershell
Get-IAMPolicyList -MaxItem 3
```

**Output:**

```
Arn              : arn:aws:iam::aws:policy/AWSDirectConnectReadOnlyAccess
AttachmentCount  : 0

CreateDate       : 2/6/2015 10:40:27 AM
DefaultVersionId : v1
Description      :
IsAttachable     : True
```
Example 2: This example returns a collection of the first two customer managed policies available in current AWS account. It uses `-Scope local` to limit the output to only customer managed policies.

```
Get-IAMPolicyList -Scope local -MaxItem 2
```

**Output:**

```
Arn              : arn:aws:iam::123456789012:policy/MyLocalPolicy

• For API details, see ListPolicies in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMPolicyVersion

The following code example shows how to use Get-IAMPolicyVersion.

Tools for PowerShell

Example 1: This example returns the policy document for the v2 version of the policy whose ARN is arn:aws:iam::123456789012:policy/MyManagedPolicy. The policy document in the Document property is URL encoded and is decoded in this example with the UrlDecode .NET method.

```
$results

Output:

<table>
<thead>
<tr>

• For API details, see GetPolicyVersion in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMPolicyVersionList

The following code example shows how to use Get-IAMPolicyVersionList.

Tools for PowerShell

Example 1: This example returns the list of available versions of the policy whose ARN is arn:aws:iam::123456789012:policy/MyManagedPolicy. To get the policy document for a specific version, use the Get-IAMPolicyVersion command and specify the VersionId of the one you want.

Output:

<table>
<thead>
<tr>
<th>CreateDate</th>
<th>Document</th>
<th>IsDefaultVersion</th>
</tr>

<td>False</td>
</tr>
</tbody>
</table>

• For API details, see ListPolicyVersions in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMRole

The following code example shows how to use Get-IAMRole.

Tools for PowerShell

Example 1: This example returns the details of the lambda_exec_role. It includes the trust policy document that specifies who can assume this role. The policy document is URL encoded and can be decoded using the .NET UrlDecode method. In this example, the
original policy had all white space removed before it was uploaded to the policy. To see the permissions policy documents that determine what someone who assumes the role can do, use the `Get-IAMRolePolicy` for inline policies, and `Get-IAMPolicyVersion` for attached managed policies.

```powershell
$results = Get-IamRole -RoleName lambda_exec_role
$results | Format-List
```

**Output:**

<table>
<thead>
<tr>
<th>Arn</th>
<th>arn:aws:iam::123456789012:role/lambda_exec_role</th>

```

- For API details, see [GetRole](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

---

**Get-IAMRoleList**

The following code example shows how to use `Get-IAMRoleList`.

**Tools for PowerShell**

**Example 1:** This example retrieves a list of all of the IAM roles in the AWS account.
Get-IAMRoleList

Example 2: This example code snippet retrieves a list of IAM roles in the AWS account and displays them three at a time, and waits for you to press Enter between each group. It passes the Marker value from the previous call to specify where the next group should begin.

```powershell
$nextMarker = $null
Do
{
    $results = Get-IAMRoleList -MaxItem 3 -Marker $nextMarker
    $nextMarker = $AWSHistory.LastServiceResponse.Marker
    $results
    Read-Host
}
while ($nextMarker -ne $null)
```

- For API details, see [ListRoles](#) in **AWS Tools for PowerShell Cmdlet Reference**.

Get-IAMRolePolicy

The following code example shows how to use Get-IAMRolePolicy.

Tools for PowerShell

Example 1: This example returns the permissions policy document for the policy named `oneClick_lambda_exec_role_policy` that is embedded in the IAM role `lambda_exec_role`. The resulting policy document is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```powershell
$results = Get-IAMRolePolicy -RoleName lambda_exec_role -PolicyName oneClick_lambda_exec_role_policy
$results
```

Output:

<table>
<thead>
<tr>

            ],
            "Resource": ["arn:aws:s3:::*"
        ]
    ]
}
```

- For API details, see [GetRolePolicy](#) in AWS Tools for PowerShell Cmdlet Reference.

**Get-IAMRolePolicyList**

The following code example shows how to use Get-IAMRolePolicyList.

**Tools for PowerShell**

**Example 1:** This example returns the list of names of inline policies that are embedded in the IAM role `lambda_exec_role`. To see the details of an inline policy, use the command `Get-IAMRolePolicy`. 
Get-IAMRolePolicyList -RoleName lambda_exec_role

Output:

oneClick_lambda_exec_role_policy

- For API details, see ListRolePolicies in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMRoleTagList

The following code example shows how to use Get-IAMRoleTagList.

Tools for PowerShell

Example 1: This example fetches the tag associated with the role.

Get-IAMRoleTagList -RoleName MyRoleName

- For API details, see ListRoleTags in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMSAMLProvider

The following code example shows how to use Get-IAMSAMLProvider.

Tools for PowerShell

Example 1: This example retrieves the details about the SAML 2.0 provider whose ARM is arn:aws:iam::123456789012:saml-provider/SAMLADFS. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

Get-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/SAMLADFS

Output:

<table>
<thead>
<tr>

</tbody>
</table>
For API details, see [GetSamlProvider](#) in AWS Tools for PowerShell Cmdlet Reference.

### Get-IAMSAMLProviderList

The following code example shows how to use Get-IAMSAMLProviderList.

#### Tools for PowerShell

**Example 1:** This example retrieves the list of SAML 2.0 providers created in the current AWS account. It returns the ARN, creation date, and expiration date for each SAML provider.

Get-IAMSAMLProviderList

#### Output:

<table>
<thead>
<tr>
<th>Arn</th>
<th>CreateDate</th>
</tr>
</thead>
</table>

For API details, see [ListSAMLProviders](#) in AWS Tools for PowerShell Cmdlet Reference.

### Get-IAMServerCertificate

The following code example shows how to use Get-IAMServerCertificate.

#### Tools for PowerShell

**Example 1:** This example retrieves details about the server certificate named MyServerCertificate. You can find the certificate details in the CertificateBody and ServerCertificateMetadata properties.

```powershell
$result = Get-IAMServerCertificate -ServerCertificateName MyServerCertificate
$result | format-list
```

Get-IAMServerCertificateList

The following code example shows how to use Get-IAMServerCertificateList.

Tools for PowerShell

Example 1: This example retrieves the list of server certificates that have been uploaded to the current AWS account.

Get-IAMServerCertificateList

Output:

Get-IAMServiceLastAccessedDetail

The following code example shows how to use Get-IAMServiceLastAccessedDetail.

Tools for PowerShell

Example 1: This example provides details of the service last accessed by the IAM entity(user, group, role or policy) associated in Request call.

Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser
Output:

```

---

**Get-IAMServiceLastAccessedDetailWithEntity**

The following code example shows how to use `Get-IAMServiceLastAccessedDetailWithEntity`.

**Tools for PowerShell**

**Example 1:** This example provides the last accessed timestamp for the service in the request by that respective IAM entity.

```powershell
$results = Get-IAMServiceLastAccessedDetailWithEntity -JobId f0b7a819-eab0-929b-dc26-ca598911cb9f -ServiceNamespace ec2

- For API details, see GetServiceLastAccessedDetailsWithEntities in AWS Tools for PowerShell Cmdlet Reference.

Get-IAMSigningCertificate

The following code example shows how to use Get-IAMSigningCertificate.

Tools for PowerShell

Example 1: This example retrieves details about the signing certificate that is associated with the user named Bob.

Get-IAMSigningCertificate -UserName Bob

Output:

### Get-IAMUser

The following code example shows how to use Get-IAMUser.

#### Tools for PowerShell

**Example 1:** This example retrieves details about the user named **David**.

```powershell
Get-IAMUser -UserName David
```

**Output:**

**Get-IAMUserPolicy**

The following code example shows how to use Get-IAMUserPolicy.
Example 1: This example retrieves the details of the inline policy named Davids_IAM_Admin_Policy that is embedded in the IAM user named David. The policy document is URL encoded.

```powershell
$results = Get-IAMUserPolicy -PolicyName Davids_IAM_Admin_Policy -UserName David
$results

```

- For API details, see [GetUserPolicy](#) in AWS Tools for PowerShell Cmdlet Reference.

**Get-IAMUserPolicyList**

The following code example shows how to use Get-IAMUserPolicyList.
Tools for PowerShell

Example 1: This example retrieves the list of names of the inline policies that are embedded in the IAM user named David.

```
Get-IAMUserPolicyList -UserName David
```

Output:

```

- For API details, see [ListUserPolicies](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-IAMUserTagList

The following code example shows how to use Get-IAMUserTagList.

Tools for PowerShell

Example 1: This example fetches the tag associated with the user.

```
Get-IAMUserTagList -UserName joe
```

- For API details, see [ListUserTags](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-IAMVirtualMFADevice

The following code example shows how to use Get-IAMVirtualMFADevice.

Tools for PowerShell

Example 1: This example retrieves a collection of the virtual MFA devices that are assigned to users in the AWS account. The `User` property of each is an object with details of the IAM user to which the device is assigned.

```
Get-IAMVirtualMFADevice -AssignmentStatus Assigned

• For API details, see ListVirtualMfaDevices in AWS Tools for PowerShell Cmdlet Reference.

New-IAMAccessKey

The following code example shows how to use New-IAMAccessKey.

Tools for PowerShell

Example 1: This example creates a new access key and secret access key pair and assigns it to the user David. Ensure that you save the AccessKeyId and SecretAccessKey values to a file because this is the only time you can obtain the SecretAccessKey. You cannot retrieve it later. If you lose the secret key, you must create a new access key pair.

New-IAMAccessKey -UserName David

Output:

AccessKeyId     : AKIAIOSFODNN7EXAMPLE
CreateDate      : 4/13/2015 1:00:42 PM
SecretAccessKey : wJalrXUtncFEMI/K7MDENG/bPxFfCYEXAMPLEKEY
Status          : Active
UserName        : David

• For API details, see CreateAccessKey in AWS Tools for PowerShell Cmdlet Reference.

New-IAMAccountAlias

The following code example shows how to use New-IAMAccountAlias.
Tools for PowerShell

Example 1: This example changes the account alias for your AWS account to mycompanyaws. The address of the user logon page changes to https://mycompanyaws.signin.aws.amazon.com/console. The original URL using your account ID number instead of the alias (https://<accountidnumber>.signin.aws.amazon.com/console) continues to work. However, any previously defined alias-based URLs stop working.

New-IAMAccountAlias -AccountAlias mycompanyaws

- For API details, see CreateAccountAlias in AWS Tools for PowerShell Cmdlet Reference.

New-IAMGroup

The following code example shows how to use New-IAMGroup.

Tools for PowerShell

Example 1: This example creates a new IAM group named Developers.

New-IAMGroup -GroupName Developers

Output:

<table>
<thead>
<tr>
<th>Arn</th>
<th>arn:aws:iam::123456789012:group/Developers</th>
</tr>
</thead>
<tbody>
<tr>
<td>CreateDate</td>
<td>4/14/2015 11:21:31 AM</td>
</tr>
<tr>
<td>GroupId</td>
<td>QNEJ5PM4NFSQCEXAMPLE1</td>
</tr>
<tr>
<td>GroupName</td>
<td>Developers</td>
</tr>
<tr>
<td>Path</td>
<td>/</td>
</tr>
</tbody>
</table>

- For API details, see CreateGroup in AWS Tools for PowerShell Cmdlet Reference.

New-IAMInstanceProfile

The following code example shows how to use New-IAMInstanceProfile.

Tools for PowerShell

Example 1: This example creates a new IAM instance profile named ProfileForDevEC2Instance. You must separately run the Add-
IAMRoleToInstanceProfile command to associate the instance profile with an existing IAM role that provides permissions to the instance. Finally, attach the instance profile to an EC2 instance when you launch it. To do that, use the New-EC2Instance cmdlet with either the InstanceProfile_Arn or InstanceProfile_Name parameter.

```
New-IAMInstanceProfile -InstanceProfileName ProfileForDevEC2Instance
```

Output:

```
Arn                 : arn:aws:iam::123456789012:instance-profile/ProfileForDevEC2Instance
CreateDate          : 4/14/2015 11:31:39 AM
InstanceProfileId   : DYMFXL556EY46EXAMPLE1
InstanceProfileName : ProfileForDevEC2Instance
Path                : /
Roles               : {}
```

- For API details, see [CreateInstanceProfile](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-IAMLoginProfile**

The following code example shows how to use New-IAMLoginProfile.

**Tools for PowerShell**

**Example 1:** This example creates a (temporary) password for the IAM user named Bob, and sets the flag that requires the user to change the password the next time Bob signs in.

```
New-IAMLoginProfile -UserName Bob -Password P@ssw0rd -PasswordResetRequired $true
```

Output:

```
CreateDate                    PasswordResetRequired                UserName
----------                    ---------------------                --------
4/14/2015 12:26:30 PM         True                                 Bob
```

- For API details, see [CreateLoginProfile](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*. 

New-IAMOpenIDConnectProvider

The following code example shows how to use New-IAMOpenIDConnectProvider.

Tools for PowerShell

Example 1: This example creates an IAM OIDC provider associated with the OIDC compatible provider service found at the URL https://example.oidcprovider.com and the client ID my-testapp-1. The OIDC provider supplies the thumbprint. To authenticate the thumbprint, follow the steps at http://docs.aws.amazon.com/IAM/latest/UserGuide/identity-providers-oidc-obtain-thumbprint.html.

```
New-IAMOpenIDConnectProvider -Url https://example.oidcprovider.com -ClientIDList my-testapp-1 -ThumbprintList 990F419EXAMPLEECF12DDEDA5EXAMPLE52F20D9E
```

Output:

```
arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```

- For API details, see CreateOpenIdConnectProvider in AWS Tools for PowerShell Cmdlet Reference.

New-IAMPolicy

The following code example shows how to use New-IAMPolicy.

Tools for PowerShell

Example 1: This example creates a new IAM policy in the current AWS account named MySamplePolicy. The file MySamplePolicy.json provides the policy content. Note that you must use the -Raw switch parameter to successfully process the JSON policy file.

```
New-IAMPolicy -PolicyName MySamplePolicy -PolicyDocument (Get-Content -Raw MySamplePolicy.json)
```

Output:

```
Arn : arn:aws:iam::123456789012:policy/MySamplePolicy
```
For API details, see [CreatePolicy](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-IAMPolicyVersion**

The following code example shows how to use New-IAMPolicyVersion.

**Tools for PowerShell**

**Example 1:** This example creates a new "v2" version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version. The `NewPolicyVersion.json` file provides the policy content. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file.

```powershell
```

**Output:**

<table>
<thead>
<tr>
<th>CreateDate</th>
<th>Document</th>
<th>IsDefaultVersion</th>
</tr>
</thead>
<tbody>
<tr>
<td>4/15/2015 10:54:54 AM</td>
<td>v2</td>
<td>True</td>
</tr>
</tbody>
</table>

For API details, see [CreatePolicyVersion](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-IAMRole**

The following code example shows how to use New-IAMRole.
Example 1: This example creates a new role named `MyNewRole` and attaches to it the policy found in the file `NewRoleTrustPolicy.json`. Note that you must use the `-Raw` switch parameter to successfully process the JSON policy file. The policy document displayed in the output is URL encoded. It is decoded in this example with the `UrlDecode` .NET method.

```
$results = New-IAMRole -AssumeRolePolicyDocument (Get-Content -raw NewRoleTrustPolicy.json) -RoleName MyNewRole
$results
```

Output:

```
Arn                      : arn:aws:iam::123456789012:role/MyNewRole
AssumeRolePolicyDocument : %7B%0D%0A%20%20%22Version%22%3A%20%222012-10-17%22%2C%0D%0A%20%20%22Statement%22

CreateDate               : 4/15/2015 11:04:23 AM
Path                     : /
RoleId                   : V5PAJI2KPN4EAEXAMPLE1
RoleName                 : MyNewRole

{
   "Version": "2012-10-17",
   "Statement": [
       {
           "Sid": "",
           "Effect": "Allow",
           "Principal": {
               "AWS": "arn:aws:iam::123456789012:David"
           },
```
"Action": "sts:AssumeRole"

For API details, see CreateRole in AWS Tools for PowerShell Cmdlet Reference.

New-IAMSAMLProvider

The following code example shows how to use New-IAMSAMLProvider.

Tools for PowerShell

Example 1: This example creates a new SAML provider entity in IAM. It is named MySAMLProvider and is described by the SAML metadata document found in the file SAMLMetaData.xml, which was separately downloaded from the SAML service provider's web site.

New-IAMSAMLProvider -Name MySAMLProvider -SAMLMetadataDocument (Get-Content -Raw SAMLMetaData.xml)

Output:

arn:aws:iam::123456789012:saml-provider/MySAMLProvider

For API details, see CreateSAMLProvider in AWS Tools for PowerShell Cmdlet Reference.

New-IAMServiceLinkedRole

The following code example shows how to use New-IAMServiceLinkedRole.

Tools for PowerShell

Example 1: This example creates a servicelinked role for autoscaling service.

New-IAMServiceLinkedRole -AWSServiceName autoscaling.amazonaws.com -CustomSuffix RoleNameEndsWithThis -Description "My service-linked role to support autoscaling"

For API details, see CreateServiceLinkedRole in AWS Tools for PowerShell Cmdlet Reference.
**New-IAMUser**

The following code example shows how to use New-IAMUser.

**Tools for PowerShell**

**Example 1:** This example creates an IAM user named Bob. If Bob needs to sign in to the AWS console, then you must separately run the command New-IAMLoginProfile to create a sign-in profile with a password. If Bob needs to run AWS PowerShell or cross-platform CLI commands or make AWS API calls, then you must separately run the New-IAMAccessKey command to create access keys.

```
New-IAMUser -UserName Bob
```

**Output:**

```
Arn              : arn:aws:iam::123456789012:user/Bob
CreateDate       : 4/22/2015 12:02:11 PM
PasswordLastUsed : 1/1/0001 12:00:00 AM
Path             : /
UserId           : AIDAJWGEFDFMEMEXAMPLE1
UserName         : Bob
```

- For API details, see [CreateUser](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-IAMVirtualMFADevice**

The following code example shows how to use New-IAMVirtualMFADevice.

**Tools for PowerShell**

**Example 1:** This example creates a new virtual MFA device. Lines 2 and 3 extract the Base32StringSeed value that the virtual MFA software program needs to create an account (as an alternative to the QR code). After you configure the program with the value, get two sequential authentication codes from the program. Finally, use the last command to link the virtual MFA device to the IAM user Bob and synchronize the account with the two authentication codes.

```
$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$SR = New-Object System.IO.StreamReader($Device.Base32StringSeed)
$base32stringseed = $SR.ReadToEnd()
```

IAM 582
$base32stringseed
CZWZMCQNW4DEXAMPLE3V0UGXJFZYSUW7EXAMPLECR4NJFD65GX2SLUDW2EXAMPLE

Output:

-- Pause here to enter base-32 string seed code into virtual MFA program to register account. --

Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012

Example 2: This example creates a new virtual MFA device. Lines 2 and 3 extract the QRCODEPNG value and write it to a file. This image can be scanned by the virtual MFA software program to create an account (as an alternative to manually entering the Base32StringSeed value). After you create the account in your virtual MFA program, get two sequential authentication codes and enter them in the last commands to link the virtual MFA device to the IAM user Bob and synchronize the account.

$Device = New-IAMVirtualMFADevice -VirtualMFADeviceName BobsMFADevice
$BR = New-Object System.IO.BinaryReader($Device.QRCodePNG)
$BR.ReadBytes($BR.BaseStream.Length) | Set-Content -Encoding Byte -Path QRCODE.png

Output:

-- Pause here to scan PNG with virtual MFA program to register account. --

Enable-IAMMFADevice -SerialNumber $Device.SerialNumber -UserName Bob -
AuthenticationCode1 123456 -AuthenticationCode2 789012

- For API details, see CreateVirtualMfaDevice in AWS Tools for PowerShell Cmdlet Reference.

Publish-IAMServerCertificate

The following code example shows how to use Publish-IAMServerCertificate.

Tools for PowerShell

Example 1: This example uploads a new server certificate to the IAM account. The files containing the certificate body, the private key, and (optionally) the certificate chain must all be PEM encoded. Note that the parameters require the actual content of the files rather
than the file names. You must use the `-Raw` switch parameter to successfully process the file contents.

```powershell
Publish-IAMServerCertificate -ServerCertificateName MyTestCert -CertificateBody (Get-Content -Raw server.crt) -PrivateKey (Get-Content -Raw server.key)
```

Output:

<table>
<thead>
<tr>
<th>Arn</th>
<th>arn:aws:iam::123456789012:server-certificate/MyTestCert</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expiration</td>

</tr>
<tr>
<td>ServerCertificateName</td>
<td>MyTestCert</td>
</tr>
<tr>
<td>UploadDate</td>
<td>4/21/2015 11:14:16 AM</td>
</tr>
</tbody>
</table>

- For API details, see [UploadServerCertificate](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Publish-IAMSigningCertificate**

The following code example shows how to use `Publish-IAMSigningCertificate`.

**Tools for PowerShell**

**Example 1:** This example uploads a new X.509 signing certificate and associates it with the IAM user named Bob. The file containing the certificate body is PEM encoded. The `CertificateBody` parameter requires the actual contents of the certificate file rather than the file name. You must use the `-Raw` switch parameter to successfully process the file.

```powershell
Publish-IAMSigningCertificate -UserName Bob -CertificateBody (Get-Content -Raw SampleSigningCert.pem)
```

Output:

```plaintext

- For API details, see [UploadSigningCertificate](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-IAMGroupPolicy**

The following code example shows how to use `Register-IAMGroupPolicy`.

**Tools for PowerShell**

**Example 1:** This example attaches the customer managed policy named `TesterPolicy` to the IAM group `Testers`. The users in that group are immediately affected by the permissions defined in the default version of that policy.

```
Register-IAMGroupPolicy -GroupName Testers -PolicyArn arn:aws:iam::123456789012:policy/TesterPolicy
```

**Example 2:** This example attaches the AWS managed policy named `AdministratorAccess` to the IAM group `Admins`. The users in that group are immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMGroupPolicy -GroupName Admins -PolicyArn arn:aws:iam::aws:policy/AdministratorAccess
```

- For API details, see [AttachGroupPolicy](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-IAMRolePolicy**

The following code example shows how to use `Register-IAMRolePolicy`.
Tools for PowerShell

Example 1: This example attaches the AWS managed policy named SecurityAudit to the IAM role CoSecurityAuditors. The users who assume that role are immediately affected by the permissions defined in the latest version of that policy.

```
```

- For API details, see AttachRolePolicy in AWS Tools for PowerShell Cmdlet Reference.

Register-IAMUserPolicy

The following code example shows how to use Register-IAMUserPolicy.

Tools for PowerShell

Example 1: This example attaches the AWS managed policy named AmazonCognitoPowerUser to the IAM user Bob. The user is immediately affected by the permissions defined in the latest version of that policy.

```
Register-IAMUserPolicy -UserName Bob -PolicyArn arn:aws:iam::aws:policy/AmazonCognitoPowerUser
```

- For API details, see AttachUserPolicy in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMAccessKey

The following code example shows how to use Remove-IAMAccessKey.

Tools for PowerShell

Example 1: This example deletes the AWS access key pair with the key ID AKIAI0SF0DNN7EXAMPLE from the user named Bob.

```
Remove-IAMAccessKey -AccessKeyId AKIAI0SF0DNN7EXAMPLE -UserName Bob -Force
```

- For API details, see DeleteAccessKey in AWS Tools for PowerShell Cmdlet Reference.
Remove-IAMAccountAlias

The following code example shows how to use Remove-IAMAccountAlias.

Tools for PowerShell

Example 1: This example removes the account alias from your AWS account. The user sign in page with the alias at https://mycompanyaws.signin.aws.amazon.com/console no longer works. You must instead use the original URL with your AWS account ID number at https://<accountidnumber>.signin.aws.amazon.com/console.

Remove-IAMAccountAlias -AccountAlias mycompanyaws

- For API details, see DeleteAccountAlias in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMAccountPasswordPolicy

The following code example shows how to use Remove-IAMAccountPasswordPolicy.

Tools for PowerShell

Example 1: This example deletes the password policy for the AWS account and resets all values to their original defaults. If a password policy does not currently exist, the following error message appears: The account policy with name PasswordPolicy cannot be found.

Remove-IAMAccountPasswordPolicy

- For API details, see DeleteAccountPasswordPolicy in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMClientIDFromOpenIDConnectProvider

The following code example shows how to use Remove-IAMClientIDFromOpenIDConnectProvider.

Tools for PowerShell

Example 1: This example removes the client ID My-TestApp-3 from the list of client IDs associated with the IAM OIDC provider whose ARN is arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com.
Remove-IAMClientIDFromOpenIDConnectProvider -ClientID My-TestApp-3
-OpenIDConnectProviderArn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com

- For API details, see RemoveClientIDFromOpenIdConnectProvider in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMGroup

The following code example shows how to use Remove-IAMGroup.

Tools for PowerShell

Example 1: This example deletes the IAM group named MyTestGroup. The first command removes any IAM users that are members of the group, and the second command deletes the IAM group. Both commands work without any prompts for confirmation.

(Get-IAMGroup -GroupName MyTestGroup).Users | Remove-IAMUserFromGroup -GroupName MyTestGroup -Force
Remove-IAMGroup -GroupName MyTestGroup -Force

- For API details, see DeleteGroup in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMGroupPolicy

The following code example shows how to use Remove-IAMGroupPolicy.

Tools for PowerShell

Example 1: This example removes the inline policy named TesterPolicy from the IAM group Testers. The users in that group immediately lose the permissions defined in that policy.

Remove-IAMGroupPolicy -GroupName Testers -PolicyName TestPolicy

- For API details, see DeleteGroupPolicy in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMInstanceProfile

The following code example shows how to use Remove-IAMInstanceProfile.
**Tools for PowerShell**

**Example 1:** This example deletes the EC2 instance profile named MyAppInstanceProfile. The first command detaches any roles from the instance profile, and then the second command deletes the instance profile.

```
(Get-IAMInstanceProfile -InstanceProfileName MyAppInstanceProfile).Roles | Remove-IAMRoleFromInstanceProfile -InstanceProfileName MyAppInstanceProfile
Remove-IAMInstanceProfile -InstanceProfileName MyAppInstanceProfile
```

- For API details, see [DeleteInstanceProfile](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-IAMLoginProfile**

The following code example shows how to use Remove-IAMLoginProfile.

**Tools for PowerShell**

**Example 1:** This example deletes the login profile from the IAM user named Bob. This prevents the user from signing-in to the AWS console. It does not prevent the user from running any AWS CLI, PowerShell, or API calls using AWS access keys that might still be attached to the user account.

```
Remove-IAMLoginProfile -UserName Bob
```

- For API details, see [DeleteLoginProfile](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-IAMOpenIDConnectProvider**

The following code example shows how to use Remove-IAMOpenIDConnectProvider.

**Tools for PowerShell**

**Example 1:** This example deletes the IAM OIDC provider that connects to the provider example.oidcprovider.com. Ensure that you update or delete any roles that reference this provider in the Principal element of the role's trust policy.

```
Remove-IAMOpenIDConnectProvider -OpenIDConnectProviderArn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com
```
• For API details, see `DeleteOpenIdConnectProvider` in `AWS Tools for PowerShell Cmdlet Reference`.

**Remove-IAMPolicy**

The following code example shows how to use Remove-IAMPolicy.

**Tools for PowerShell**

**Example 1:** This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`. Before you can delete the policy, you must first delete all versions except the default by running `Remove-IAMPolicyVersion`. You must also detach the policy from any IAM users, groups, or roles.

```
Remove-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
```

**Example 2:** This example deletes a policy by first deleting all the non-default policy versions, detaching it from all attached IAM entities, and finally deleting the policy itself. The first line retrieves the policy object. The second line retrieves all the policy versions that are not flagged as the default version into a collection and then deletes each policy in the collection. The third line retrieves all of the IAM users, groups, and roles to which the policy is attached. Lines four through six detach the policy from each attached entity. The last line uses this command to remove the managed policy as well as the remaining default version. The example includes the `-Force` switch parameter on any line that needs it to suppress prompts for confirmation.

```
$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
$attached = Get-IAMEntitiesForPolicy -PolicyArn $pol.Arn
$attached.PolicyGroups | Unregister-IAMGroupPolicy -PolicyArn $pol.arn
$attached.PolicyRoles | Unregister-IAMRolePolicy -PolicyArn $pol.arn
$attached.PolicyUsers | Unregister-IAMUserPolicy -PolicyArn $pol.arn
Remove-IAMPolicy $pol.Arn -Force
```

• For API details, see `DeletePolicy` in `AWS Tools for PowerShell Cmdlet Reference`.
Remove-IAMPolicyVersion

The following code example shows how to use Remove-IAMPolicyVersion.

Tools for PowerShell

Example 1: This example deletes the version identified as v2 from the policy whose ARN is arn:aws:iam::123456789012:policy/MySamplePolicy.

Example 2: This example deletes a policy by first deleting all non-default policy versions and then deleting the policy itself. The first line retrieves the policy object. The second line retrieves all of the policy versions that are not flagged as the default into a collection and then uses this command to delete each policy in the collection. The last line removes the policy itself as well as the remaining default version. Note that to successfully delete a managed policy, you must also detach the policy from any users, groups, or roles by using the Unregister-IAMUserPolicy, Unregister-IAMGroupPolicy, and Unregister-IAMRolePolicy commands. See the example for the Remove-IAMPolicy cmdlet.

$pol = Get-IAMPolicy -PolicyArn arn:aws:iam::123456789012:policy/MySamplePolicy
Get-IAMPolicyVersions -PolicyArn $pol.Arn | where {-not $_.IsDefaultVersion} |
Remove-IAMPolicyVersion -PolicyArn $pol.Arn -force
Remove-IAMPolicy -PolicyArn $pol.Arn -force

• For API details, see DeletePolicyVersion in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMRole

The following code example shows how to use Remove-IAMRole.

Tools for PowerShell

Example 1: This example deletes the role named MyNewRole from the current IAM account. Before you can delete the role you must first use the Unregister-IAMRolePolicy command to detach any managed policies. Inline policies are deleted with the role.

Remove-IAMRole -RoleName MyNewRole
Example 2: This example detaches any managed policies from the role named MyNewRole and then deletes the role. The first line retrieves any managed policies attached to the role as a collection and then detaches each policy in the collection from the role. The second line deletes the role itself. Inline policies are deleted along with the role.

```
Get-IAMAttachedRolePolicyList -RoleName MyNewRole | Unregister-IAMRolePolicy -RoleName MyNewRole
Remove-IAMRole -RoleName MyNewRole
```

- For API details, see [DeleteRole](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-IAMRoleFromInstanceProfile

The following code example shows how to use Remove-IAMRoleFromInstanceProfile.

Tools for PowerShell

Example 1: This example deletes the role named MyNewRole from the EC2 instance profile named MyNewRole. An instance profile that is created in the IAM console always has the same name as the role, as in this example. If you create them in the API or CLI, then they can have different names.

```
Remove-IAMRoleFromInstanceProfile -InstanceProfileName MyNewRole -RoleName MyNewRole -Force
```

- For API details, see [RemoveRoleFromInstanceProfile](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-IAMRolePermissionsBoundary

The following code example shows how to use Remove-IAMRolePermissionsBoundary.

Tools for PowerShell

Example 1: This example shows how to remove the permission boundary attached to an IAM role.

```
Remove-IAMRolePermissionsBoundary -RoleName MyRoleName
```
• For API details, see [DeleteRolePermissionsBoundary](https://docs.aws.amazon.com/powershell/latest/referenceguide/DeleteRolePermissionsBoundary.html) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-IAMRolePolicy**

The following code example shows how to use `Remove-IAMRolePolicy`.

**Tools for PowerShell**

Example 1: This example deletes the inline policy `S3AccessPolicy` that is embedded in the IAM role `S3BackupRole`.

```
Remove-IAMRolePolicy -PolicyName S3AccessPolicy -RoleName S3BackupRole
```

• For API details, see [DeleteRolePolicy](https://docs.aws.amazon.com/powershell/latest/referenceguide/DeleteRolePolicy.html) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-IAMRoleTag**

The following code example shows how to use `Remove-IAMRoleTag`.

**Tools for PowerShell**

Example 1: This example removes the tag from the role named "MyRoleName" with tag key as "abac". To remove multiple tags, provide a comma separated tag keys list.

```
Remove-IAMRoleTag -RoleName MyRoleName -TagKey "abac","xyzw"
```

• For API details, see [UntagRole](https://docs.aws.amazon.com/powershell/latest/referenceguide/UntagRole.html) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-IAMSAMLProvider**

The following code example shows how to use `Remove-IAMSAMLProvider`.

**Tools for PowerShell**

Example 1: This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
Remove-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```
• For API details, see [DeleteSAMLProvider](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

**Remove-IAMServerCertificate**

The following code example shows how to use `Remove-IAMServerCertificate`.

**Tools for PowerShell**

**Example 1:** This example deletes the server certificate named *MyServerCert*.

```powershell
Remove-IAMServerCertificate -ServerCertificateName MyServerCert
```

• For API details, see [DeleteServerCertificate](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

**Remove-IAMServiceLinkedRole**

The following code example shows how to use `Remove-IAMServiceLinkedRole`.

**Tools for PowerShell**

**Example 1:** This example deleted the service linked role. Please note that if the service is still using this role, then this command results in a failure.

```powershell
Remove-IAMServiceLinkedRole -RoleName AWSServiceRoleForAutoScaling_RoleNameEndsWithThis
```

• For API details, see [DeleteServiceLinkedRole](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

**Remove-IAMSigningCertificate**

The following code example shows how to use `Remove-IAMSigningCertificate`.

**Tools for PowerShell**

**Example 1:** This example deletes the signing certificate with the ID *Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU* from the IAM user named *Bob*.

```powershell
Remove-IAMSigningCertificate -UserName Bob -CertificateId Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU
```
For API details, see [DeleteSigningCertificate](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Remove-IAMUser

The following code example shows how to use Remove-IAMUser.

#### Tools for PowerShell

**Example 1:** This example deletes the IAM user named Bob.

```powershell
Remove-IAMUser -UserName Bob
```

**Example 2:** This example deletes the IAM user named Theresa along with any elements that must be deleted first.

```powershell
$name = "Theresa"

# find any groups and remove user from them
$groups = Get-IAMGroupForUser -UserName $name
foreach ($group in $groups) { Remove-IAMUserFromGroup -GroupName $group.GroupName -UserName $name -Force }

# find any inline policies and delete them
$inlinepols = Get-IAMUserPolicies -UserName $name
foreach ($pol in $inlinepols) { Remove-IAMUserPolicy -PolicyName $pol -UserName $name -Force } # find any managed polices and detach them
$managedpols = Get-IAMAttachedUserPolicies -UserName $name
foreach ($pol in $managedpols) { Unregister-IAMUserPolicy -PolicyArn $pol.PolicyArn -UserName $name }

# find any signing certificates and delete them
$certs = Get-IAMSigningCertificate -UserName $name
foreach ($cert in $certs) { Remove-IAMSigningCertificate -CertificateId $cert.CertificateId -UserName $name -Force }

# find any access keys and delete them
$keys = Get-IAMAccessKey -UserName $name
foreach ($key in $keys) { Remove-IAMAccessKey -AccessKeyId $key.AccessKeyId -UserName $name -Force }
```
# delete the user's login profile, if one exists - note: need to use try/catch to suppress not found error
try { $prof = Get-IAMLoginProfile -UserName $name -ea 0 } catch { out-null }
if ($prof) { Remove-IAMLoginProfile -UserName $name -Force }

# find any MFA device, detach it, and if virtual, delete it.
$mfa = Get-IAMMFADevice -UserName $name
if ($mfa) {
    Disable-IAMMFADevice -SerialNumber $mfa.SerialNumber -UserName $name
    if ($mfa.SerialNumber -like "arn:*") { Remove-IAMVirtualMFADevice -SerialNumber $mfa.SerialNumber }
}

# finally, remove the user
Remove-IAMUser -UserName $name -Force

• For API details, see `DeleteUser` in `AWS Tools for PowerShell Cmdlet Reference`.

### Remove-IAMUserFromGroup

The following code example shows how to use `Remove-IAMUserFromGroup`.

#### Tools for PowerShell

**Example 1:** This example removes the IAM user Bob from the group Testers.

Remove-IAMUserFromGroup -GroupName Testers -UserName Bob

**Example 2:** This example finds any groups of which IAM user Theresa is a member, and then removes Theresa from those groups.

```
$groups = Get-IAMGroupForUser -UserName Theresa
foreach ($group in $groups) { Remove-IAMUserFromGroup -GroupName $group.GroupName -UserName Theresa -Force }
```

**Example 3:** This example shows an alternate way of removing the IAM user Bob from the Testers group.

```
Get-IAMGroupForUser -UserName Bob | Remove-IAMUserFromGroup -UserName Bob -GroupName Testers -Force
```
• For API details, see RemoveUserFromGroup in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMUserPermissionsBoundary

The following code example shows how to use Remove-IAMUserPermissionsBoundary.

Tools for PowerShell

Example 1: This example shows how to remove the permission boundary attached to an IAM user.

```
Remove-IAMUserPermissionsBoundary -UserName joe
```

• For API details, see DeleteUserPermissionsBoundary in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMUserPolicy

The following code example shows how to use Remove-IAMUserPolicy.

Tools for PowerShell

Example 1: This example deletes the inline policy named AccessToEC2Policy that is embedded in the IAM user named Bob.

```
Remove-IAMUserPolicy -PolicyName AccessToEC2Policy -UserName Bob
```

Example 2: This example finds all of the inline policies that are embedded in the IAM user named Theresa and then deletes them.

```
$inlinepols = Get-IAMUserPolicies -UserName Theresa
foreach ($pol in $inlinepols) { Remove-IAMUserPolicy -PolicyName $pol -UserName Theresa -Force}
```

• For API details, see DeleteUserPolicy in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMUserTag

The following code example shows how to use Remove-IAMUserTag.
Tools for PowerShell

Example 1: This example removes the tag from the user named "joe" with tag key as "abac" and "xyzw". To remove multiple tags, provide a comma separated tag keys list.

Remove-IAMUserTag -UserName joe -TagKey "abac","xyzw"

- For API details, see UntagUser in AWS Tools for PowerShell Cmdlet Reference.

Remove-IAMVirtualMFADevice

The following code example shows how to use Remove-IAMVirtualMFADevice.

Tools for PowerShell

Example 1: This example deletes the IAM virtual MFA device whose ARN is arn:aws:iam::123456789012:mfa/bob.

Remove-IAMVirtualMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/bob

Example 2: This example checks to see whether the IAM user Theresa has an MFA device assigned. If one is found, the device is disabled for the IAM user. If the device is virtual, then it is also deleted.

$mfa = Get-IAMMFADevice -UserName Theresa
if ($mfa) {
    Disable-IAMMFADevice -SerialNumber $mfa.SerialNumber -UserName $name
    if ($mfa.SerialNumber -like "arn:*") { Remove-IAMVirtualMFADevice -SerialNumber $mfa.SerialNumber }
}

- For API details, see DeleteVirtualMfaDevice in AWS Tools for PowerShell Cmdlet Reference.

Request-IAMCredentialReport

The following code example shows how to use Request-IAMCredentialReport.
Tools for PowerShell

Example 1: This example requests generation of a new report, which can be done every four hours. If the last report is still recent the State field reads COMPLETE. Use Get-IAMCredentialReport to view the completed report.

Request-IAMCredentialReport

Output:

<table>
<thead>
<tr>
<th>Description</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>No report exists. Starting a new report generation task</td>
<td>STARTED</td>
</tr>
</tbody>
</table>

- For API details, see [GenerateCredentialReport](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Request-IAMServiceLastAccessedDetail

The following code example shows how to use Request-IAMServiceLastAccessedDetail.

Tools for PowerShell

Example 1: This example is equivalent cmdlet of GenerateServiceLastAccessedDetails API. This provides with a job id which can be used in Get-IAMServiceLastAccessedDetail and Get-IAMServiceLastAccessedDetailWithEntity

Request-IAMServiceLastAccessedDetail -Arn arn:aws:iam::123456789012:user/TestUser

- For API details, see [GenerateServiceLastAccessedDetails](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Set-IAMDefaultPolicyVersion

The following code example shows how to use Set-IAMDefaultPolicyVersion.

Tools for PowerShell

Example 1: This example sets the v2 version of the policy whose ARN is arn:aws:iam::123456789012:policy/MyPolicy as the default active version.

- For API details, see SetDefaultPolicyVersion in AWS Tools for PowerShell Cmdlet Reference.

Set-IAMRolePermissionsBoundary

The following code example shows how to use Set-IAMRolePermissionsBoundary.

**Tools for PowerShell**

**Example 1:** This example shows how to set the Permission boundary for a IAM Role. You can set AWS Managed policies or Custom policies as permission boundary.

Set-IAMRolePermissionsBoundary -RoleName MyRoleName -PermissionsBoundary arn:aws:iam::123456789012:policy/intern-boundary

- For API details, see PutRolePermissionsBoundary in AWS Tools for PowerShell Cmdlet Reference.

Set-IAMUserPermissionsBoundary

The following code example shows how to use Set-IAMUserPermissionsBoundary.

**Tools for PowerShell**

**Example 1:** This example shows how to set the Permission boundary for the user. You can set AWS Managed policies or Custom policies as permission boundary.

Set-IAMUserPermissionsBoundary -UserName joe -PermissionsBoundary arn:aws:iam::123456789012:policy/intern-boundary

- For API details, see PutUserPermissionsBoundary in AWS Tools for PowerShell Cmdlet Reference.

Sync-IAMMFADevice

The following code example shows how to use Sync-IAMMFADevice.
Tools for PowerShell

Example 1: This example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/bob` with an authenticator program that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber arn:aws:iam::123456789012:mfa/theresa -AuthenticationCode1 123456 -AuthenticationCode2 987654 -UserName Bob
```

Example 2: This example synchronizes the IAM MFA device that is associated with the IAM user Theresa with a physical device that has the serial number ABCD12345678 and that provided the two authentication codes.

```
Sync-IAMMFADevice -SerialNumber ABCD12345678 -AuthenticationCode1 123456 -AuthenticationCode2 987654 -UserName Theresa
```

- For API details, see [ResyncMfaDevice](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Unregister-IAMGroupPolicy

The following code example shows how to use Unregister-IAMGroupPolicy.

Tools for PowerShell

Example 1: This example detaches the managed group policy whose ARN is `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group named Testers.

```
```

Example 2: This example finds all the managed policies that are attached to the group named Testers and detaches them from the group.

```
Get-IAMAttachedGroupPolicies -GroupName Testers | Unregister-IAMGroupPolicy -GroupName Testers
```

- For API details, see [DetachGroupPolicy](#) in *AWS Tools for PowerShell Cmdlet Reference*.
Unregister-IAMRolePolicy

The following code example shows how to use Unregister-IAMRolePolicy.

Tools for PowerShell

Example 1: This example detaches the managed group policy whose ARN is `arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy` from the role named FedTesterRole.

```
```

Example 2: This example finds all of the managed policies that are attached to the role named FedTesterRole and detaches them from the role.

```
Get-IAMAttachedRolePolicyList -RoleName FedTesterRole | Unregister-IAMRolePolicy -Rolename FedTesterRole
```

Unregister-IAMUserPolicy

The following code example shows how to use Unregister-IAMUserPolicy.

Tools for PowerShell

Example 1: This example detaches the managed policy whose ARN is `arn:aws:iam::123456789012:policy/TesterPolicy` from the IAM user named Bob.

```
Unregister-IAMUserPolicy -UserName Bob -PolicyArn arn:aws:iam::123456789012:policy/TesterPolicy
```

Example 2: This example finds all the managed policies that are attached to the IAM user named Theresa and detaches those policies from the user.

```
Get-IAMAttachedUserPolicyList -UserName Theresa | Unregister-IAMUserPolicy -Username Theresa
```

Update-IAMAccessKey

The following code example shows how to use Update-IAMAccessKey.

Tools for PowerShell

Example 1: This example changes the status of the access key AKIAIOSFODNN7EXAMPLE for the IAM user named Bob to Inactive.

Update-IAMAccessKey -UserName Bob -AccessKeyId AKIAIOSFODNN7EXAMPLE -Status Inactive

• For API details, see UpdateAccessKey in AWS Tools for PowerShell Cmdlet Reference.

Update-IAMAccountPasswordPolicy

The following code example shows how to use Update-IAMAccountPasswordPolicy.

Tools for PowerShell

Example 1: This example updates the password policy for the account with the specified settings. Note that any parameters that are not included in the command are not left unmodified. Instead, they are reset to default values.

Update-IAMAccountPasswordPolicy -AllowUsersToChangePasswords $true -HardExpiry $false -MaxPasswordAge 90 -MinimumPasswordLength 8 -PasswordReusePrevention 20 -RequireLowercaseCharacters $true -RequireNumbers $true -RequireSymbols $true -RequireUppercaseCharacters $true

• For API details, see UpdateAccountPasswordPolicy in AWS Tools for PowerShell Cmdlet Reference.

Update-IAMAssumeRolePolicy

The following code example shows how to use Update-IAMAssumeRolePolicy.

Tools for PowerShell

Example 1: This example updates the IAM role named ClientRole with a new trust policy, the contents of which come from the file ClientRolePolicy.json. Note that you must use the -Raw switch parameter to successfully process the contents of the JSON file.
Update-IAMAssumeRolePolicy -RoleName ClientRole -PolicyDocument (Get-Content -raw ClientRolePolicy.json)

- For API details, see UpdateAssumeRolePolicy in AWS Tools for PowerShell Cmdlet Reference.

**Update-IAMGroup**

The following code example shows how to use Update-IAMGroup.

**Tools for PowerShell**

**Example 1:** This example renames the IAM group Testers to AppTesters.

Update-IAMGroup -GroupName Testers -NewGroupName AppTesters

**Example 2:** This example changes the path of the IAM group AppTesters to /Org1/Org2/. This changes the ARN for the group to arn:aws:iam::123456789012:group/Org1/Org2/AppTesters.

Update-IAMGroup -GroupName AppTesters -NewPath /Org1/Org2/

- For API details, see UpdateGroup in AWS Tools for PowerShell Cmdlet Reference.

**Update-IAMLoginProfile**

The following code example shows how to use Update-IAMLoginProfile.

**Tools for PowerShell**

**Example 1:** This example sets a new temporary password for the IAM user Bob, and requires the user to change the password the next time the user signs in.

Update-IAMLoginProfile -UserName Bob -Password "P@ssw0rd1234" -PasswordResetRequired $true

- For API details, see UpdateLoginProfile in AWS Tools for PowerShell Cmdlet Reference.
Update-IAMOpenIDConnectProviderThumbprint

The following code example shows how to use Update-IAMOpenIDConnectProviderThumbprint.

Tools for PowerShell

Example 1: This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint. The OIDC provider shares the new value when the certificate that is associated with the provider changes.

```
Update-IAMOpenIDConnectProviderThumbprint -OpenIDConnectProviderArn arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com -ThumbprintList 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

- For API details, see [UpdateOpenIdConnectProviderThumbprint](https://aws.amazon.com) in AWS Tools for PowerShell Cmdlet Reference.

Update-IAMRole

The following code example shows how to use Update-IAMRole.

Tools for PowerShell

Example 1: This example updates the role description and the maximum session duration value (in seconds) for which a role's session can be requested.

```
Update-IAMRole -RoleName MyRoleName -Description "My testing role" -MaxSessionDuration 43200
```

- For API details, see [UpdateRole](https://aws.amazon.com) in AWS Tools for PowerShell Cmdlet Reference.

Update-IAMRoleDescription

The following code example shows how to use Update-IAMRoleDescription.

Tools for PowerShell

Example 1: This example updates the description of an IAM role in your account.
Update-IAMRoleDescription -RoleName MyRoleName -Description "My testing role"

- For API details, see UpdateRoleDescription in AWS Tools for PowerShell Cmdlet Reference.

Update-IAMSAMLProvider

The following code example shows how to use Update-IAMSAMLProvider.

Tools for PowerShell

Example 1: This example updates the SAML provider in IAM whose ARN is arn:aws:iam::123456789012:saml-provider/SAMLADFS with a new SAML metadata document from the file SAMLMetaData.xml. Note that you must use the -Raw switch parameter to successfully process the contents of the JSON file.

Update-IAMSAMLProvider -SAMLProviderArn arn:aws:iam::123456789012:saml-provider/SAMLADFS -SAMLMetadataDocument (Get-Content -Raw SAMLMetaData.xml)

- For API details, see UpdateSamlProvider in AWS Tools for PowerShell Cmdlet Reference.

Update-IAMServerCertificate

The following code example shows how to use Update-IAMServerCertificate.

Tools for PowerShell

Example 1: This example renames the certificate named MyServerCertificate to MyRenamedServerCertificate.

Example 2: This example moves the certificate named MyServerCertificate to the path /Org1/Org2/. This changes the ARN for the resource to arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyServerCertificate.

For API details, see UpdateServerCertificate in AWS Tools for PowerShell Cmdlet Reference.

**Update-IAMSigningCertificate**

The following code example shows how to use Update-IAMSigningCertificate.

**Tools for PowerShell**

Example 1: This example updates the certificate that is associated with the IAM user named Bob and whose certificate ID is Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU to mark it as inactive.

```
Update-IAMSigningCertificate -CertificateId Y3EK7RMEXAMPLESV33FCREXAMPLEMJLU -UserName Bob -Status Inactive
```

For API details, see UpdateSigningCertificate in AWS Tools for PowerShell Cmdlet Reference.

**Update-IAMUser**

The following code example shows how to use Update-IAMUser.

**Tools for PowerShell**

Example 1: This example renames the IAM user Bob to Robert.

```
Update-IAMUser -UserName Bob -NewUserName Robert
```

Example 2: This example changes the path of the IAM User Bob to /Org1/Org2/, which effectively changes the ARN for the user to arn:aws:iam::123456789012:user/Org1/Org2/bob.

```
Update-IAMUser -UserName Bob -NewPath /Org1/Org2/
```

For API details, see UpdateUser in AWS Tools for PowerShell Cmdlet Reference.

**Write-IAMGroupPolicy**

The following code example shows how to use Write-IAMGroupPolicy.
Tools for PowerShell

Example 1: This example creates an inline policy named AppTesterPolicy and embeds it in the IAM group AppTesters. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes from the file apptesterpolicy.json. Note that you must use the -Raw parameter to successfully process the content of the JSON file.

```
Write-IAMGroupPolicy -GroupName AppTesters -PolicyName AppTesterPolicy -PolicyDocument (Get-Content -Raw apptesterpolicy.json)
```

• For API details, see PutGroupPolicy in AWS Tools for PowerShell Cmdlet Reference.

Write-IAMRolePolicy

The following code example shows how to use Write-IAMRolePolicy.

Tools for PowerShell

Example 1: This example creates an inline policy named FedTesterRolePolicy and embeds it in the IAM role FedTesterRole. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes from the file FedTesterPolicy.json. Note that you must use the -Raw parameter to successfully process the content of the JSON file.

```
Write-IAMRolePolicy -RoleName FedTesterRole -PolicyName FedTesterRolePolicy -PolicyDocument (Get-Content -Raw FedTesterPolicy.json)
```

• For API details, see PutRolePolicy in AWS Tools for PowerShell Cmdlet Reference.

Write-IAMUserPolicy

The following code example shows how to use Write-IAMUserPolicy.

Tools for PowerShell

Example 1: This example creates an inline policy named EC2AccessPolicy and embeds it in the IAM user Bob. If an inline policy with the same name already exists, then it is overwritten. The JSON policy content comes from the file EC2AccessPolicy.json. Note that you must use the -Raw parameter to successfully process the content of the JSON file.
Write-IAMUserPolicy -UserName Bob -PolicyName EC2AccessPolicy -PolicyDocument (Get-Content -Raw EC2AccessPolicy.json)

- For API details, see PutUserPolicy in AWS Tools for PowerShell Cmdlet Reference.

Kinesis examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Kinesis.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Get-KINRecord**

The following code example shows how to use Get-KINRecord.

**Tools for PowerShell**

**Example 1:** This example shows how to return and extract data from a series of one or more records. The iterator supplied to Get-KINRecord determines the starting position of the records to return which in this example are captured into a variable, $records. Each individual record can then be accessed by indexing the $records collection. Assuming the data in the record is UTF-8 encoded text, the final command shows how you can extract the data from the MemoryStream in the object and return it as text to the console.

$records
$records = Get-KINRecord -ShardIterator "AAAAAAAAAGIc....9VnbiRNaP"

Output:

MillisBehindLatest NextShardIterator            Records
------------------ -----------------            -------
0                  AAAAAAAAAAERNIq...uDn11HuUs  {Key1, Key2}

$records.Records[0]

Output:

ApproximateArrivalTimestamp Data                   PartitionKey SequenceNumber
--------------------------- ----                   ------------ --------------
3/7/2016 5:14:33 PM         System.IO.MemoryStream Key1
4955986459776...931586

[Text.Encoding]::UTF8.GetString($records.Records[0].Data.ToArray())

Output:

test data from string

• For API details, see GetRecords in AWS Tools for PowerShell Cmdlet Reference.

Get-KINShardIterator

The following code example shows how to use Get-KINShardIterator.

Tools for PowerShell

Example 1: Returns a shard iterator for the specified shard and starting position. Details of the shard identifiers and sequence numbers can be obtained from the output of the Get-KINStream cmdlet, by referencing the Shards collection of the returned stream object. The returned iterator can be used with the Get-KINRecord cmdlet to pull data records in the shard.

Get-KINShardIterator -StreamName "mystream" -ShardId "shardId-000000000000" -ShardIteratorType AT_SEQUENCE_NUMBER -StartingSequenceNumber "495598645..."
Output:

**Get-KINStream**

The following code example shows how to use Get-KINStream.

**Tools for PowerShell**

**Example 1: Returns details of the specified stream.**

```
Get-KINStream -StreamName "mystream"
```

Output:

```
HasMoreShards        : False
RetentionPeriodHours : 24
Shards               : {}
StreamName           : mystream
StreamStatus         : ACTIVE
```

For API details, see [DescribeStream](https://aws-tools-for-powershell.readthedocs.io/en/latest/#describe-stream) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-KINStream**

The following code example shows how to use New-KINStream.

**Tools for PowerShell**

**Example 1: Creates a new stream. By default this cmdlet returns no output so the -PassThru switch is added to return the value supplied to the -StreamName parameter for subsequent use.**

```
$streamName = New-KINStream -StreamName "mystream" -ShardCount 1 -PassThru
```

For API details, see [CreateStream](https://aws-tools-for-powershell.readthedocs.io/en/latest/#create-stream) in *AWS Tools for PowerShell Cmdlet Reference*. 
Remove-KINStream

The following code example shows how to use Remove-KINStream.

**Tools for PowerShell**

**Example 1:** Deletes the specified stream. You are prompted for confirmation before the command executes. To suppress confirmation prompting use the -Force switch.

```powershell
Remove-KINStream -StreamName "mystream"
```

- For API details, see [DeleteStream](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Write-KINRecord

The following code example shows how to use Write-KINRecord.

**Tools for PowerShell**

**Example 1:** Writes a record containing the string supplied to the -Text parameter.

```powershell
Write-KINRecord -Text "test data from string" -StreamName "mystream" -PartitionKey "Key1"
```

**Example 2:** Writes a record containing the data contained in the specified file. The file is treated as a sequence of bytes so if it contains text, it should be written with any necessary encoding before using it with this cmdlet.

```powershell
Write-KINRecord -FilePath "C:\TestData.txt" -StreamName "mystream" -PartitionKey "Key2"
```

- For API details, see [PutRecord](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Lambda examples using Tools for PowerShell**

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Lambda.
**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

**Add-LMResourceTag**

The following code example shows how to use `Add-LMResourceTag`.

**Tools for PowerShell**

**Example 1:** Adds the three tags (Washington, Oregon and California) and their associated values to the specified function identified by its ARN.

```
```

- For API details, see [TagResource](https://aws.amazon.com/) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-LMAccountSetting**

The following code example shows how to use `Get-LMAccountSetting`.

**Tools for PowerShell**

**Example 1:** This sample displays to compare the Account Limit and Account Usage...
Get-LMAcountSetting | Select-Object

• For API details, see [GetAccountSettings](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-LMAlias

The following code example shows how to use Get-LMAlias.

Tools for PowerShell

**Example 1:** This example retrieves the Routing Config weights for a specific Lambda Function Alias.

Get-LMAlias -FunctionName "MylambdaFunction123" -Name "newlabel1" -Select RoutingConfig

Output:

• For API details, see [GetAlias](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-LMFunctionConcurrency

The following code example shows how to use Get-LMFunctionConcurrency.

Tools for PowerShell

**Example 1:** This example gets the Reserved concurrency for the Lambda Function

Lambda

Lambda
Get-LMFunctionConcurrency -FunctionName "MylambdaFunction123" -Select *

**Output:**

**Get-LMFunctionConfiguration**

The following code example shows how to use `Get-LMFunctionConfiguration`.

**Tools for PowerShell**

**Example 1:** This example returns the version specific configuration of a Lambda Function.

```powershell
Get-LMFunctionConfiguration -FunctionName "MylambdaFunction123" -Qualifier "PowershellAlias"
```

**Output:**

### Get-LMFunctionList

The following code example shows how to use `Get-LMFunctionList`.

**Tools for PowerShell**

**Example 1: This sample displays all the Lambda functions with sorted code size**

```
Get-LMFunctionList | Sort-Object -Property CodeSize | Select-Object FunctionName, RunTime, Timeout, CodeSize
```

**Output:**

<table>
<thead>
<tr>
<th>FunctionName</th>
<th>Runtime</th>
<th>Timeout</th>

### Get-LMPolicy

The following code example shows how to use `Get-LMPolicy`.
**Tools for PowerShell**

**Example 1: This sample displays the Function policy of the Lambda function**

Get-LMPolicy -FunctionName test -Select Policy

**Output:**

```json

        }
    ]
}
```

- For API details, see [GetPolicy](#) in **AWS Tools for PowerShell Cmdlet Reference**.

**Get-LMProvisionedConcurrencyConfig**

The following code example shows how to use Get-LMProvisionedConcurrencyConfig.

**Tools for PowerShell**

**Example 1: This example gets the provisioned Concurrency Configuration for the specified Alias of the Lambda Function.**

C:\>Get-LMProvisionedConcurrencyConfig -FunctionName "MylambdaFunction123" -Qualifier "NewAlias1"

**Output:**

- AllocatedProvisionedConcurrentExecutions : 0
- AvailableProvisionedConcurrentExecutions : 0
- LastModified : 2020-01-15T03:21:26+0000
- RequestedProvisionedConcurrentExecutions : 70
- Status : IN_PROGRESS
- StatusReason :

- For API details, see [GetProvisionedConcurrencyConfig](#) in **AWS Tools for PowerShell Cmdlet Reference**.
Get-LMProvisionedConcurrencyConfigList

The following code example shows how to use Get-LMProvisionedConcurrencyConfigList.

Tools for PowerShell

Example 1: This example retrieves the list of provisioned concurrency configurations for a Lambda function.

```
Get-LMProvisionedConcurrencyConfigList -FunctionName "MylambdaFunction123"
```

- For API details, see ListProvisionedConcurrencyConfigs in AWS Tools for PowerShell Cmdlet Reference.

Get-LMResourceTag

The following code example shows how to use Get-LMResourceTag.

Tools for PowerShell

Example 1: Retrieves the tags and their values currently set on the specified function.

```
```

Output:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>

<tbody>
<tr>
<td>California</td>
<td>Sacramento</td>
</tr>
<tr>
<td>Oregon</td>
<td>Salem</td>
</tr>
<tr>

Get-LMVersionsByFunction

The following code example shows how to use Get-LMVersionsByFunction.
Example 1: This example returns the list of version specific configurations for each version of the Lambda Function.

Get-LMVersionsByFunction -FunctionName "MylambdaFunction123"

Output:

- For API details, see [ListVersionsByFunction](#) in *AWS Tools for PowerShell Cmdlet Reference*.

New-LMAlias

The following code example shows how to use New-LMAlias.

Example 1: This example creates a New Lambda Alias for specified version and routing configuration to specify the percentage of invocation requests that it receives.

New-LMAlias -FunctionName "MylambdaFunction123" -RoutingConfig_AdditionalVersionWeight @{Name="1";Value="0.6"} -Description "Alias for version 4" -FunctionVersion 4 -Name "PowershellAlias"

- For API details, see [CreateAlias](#) in *AWS Tools for PowerShell Cmdlet Reference*.
Publish-LMFunction

The following code example shows how to use Publish-LMFunction.

Tools for PowerShell

Example 1: This example creates a new C# (dotnetcore1.0 runtime) function named MyFunction in AWS Lambda, providing the compiled binaries for the function from a zip file on the local file system (relative or absolute paths may be used).
C# Lambda functions specify the handler for the function using the designation AssemblyName::Namespace::ClassName::MethodName. You should replace the assembly name (without .dll suffix), namespace, class name and method name parts of the handler spec appropriately. The new function will have environment variables 'envvar1' and 'envvar2' set up from the provided values.

```
Publish-LMFunction -Description "My C# Lambda Function" `  
   -FunctionName MyFunction `  
   -ZipFilename .\MyFunctionBinaries.zip `  
   -Handler "AssemblyName::Namespace::ClassName::MethodName" `  
   -Role "arn:aws:iam::123456789012:role/LambdaFullExecRole" `  
   -Runtime dotnetcore1.0 `  
   -Environment_Variable @{ "envvar1"="value";"envvar2"="value" }
```

Output:

- CodeSha256: /NgBMd...gq71I=
- CodeSize: 214784
- DeadLetterConfig:
- Description: My C# Lambda Function
- FunctionName: MyFunction
- Handler: AssemblyName::Namespace::ClassName::MethodName
- KMSKeyArn: :
- LastModified: 2016-12-29T23:50:14.207+0000
- MemorySize: 128
- Role: arn:aws:iam::123456789012:role/LambdaFullExecRole
- Runtime: dotnetcore1.0
- Timeout: 3
- Version: $LATEST
- VpcConfig:
Example 2: This example is similar to the previous one except the function binaries are first uploaded to an Amazon S3 bucket (which must be in the same region as the intended Lambda function) and the resulting S3 object is then referenced when creating the function.

```
Write-S3Object -BucketName mybucket -Key MyFunctionBinaries.zip -File .\MyFunctionBinaries.zip
Publish-LMFunction -Description "My C# Lambda Function" 
    -FunctionName MyFunction 
    -BucketName mybucket 
    -Key MyFunctionBinaries.zip 
    -Handler "AssemblyName::Namespace.ClassName::MethodName" 
    -Role "arn:aws:iam::123456789012:role/LambdaFullExecRole" 
    -Runtime dotnetcore1.0 
    -Environment_Variable @{ "envvar1"="value";"envvar2"="value" }
```

- For API details, see [CreateFunction](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

**Publish-LMVersion**

The following code example shows how to use **Publish-LMVersion**.

**Tools for PowerShell**

**Example 1: This example creates a version for the existing snapshot of Lambda Function Code**

```
Publish-LMVersion -FunctionName "MylambdaFunction123" -Description "Publishing Existing Snapshot of function code as a new version through Powershell"
```

- For API details, see [PublishVersion](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-LMAlias**

The following code example shows how to use **Remove-LMAlias**.

**Tools for PowerShell**

**Example 1: This example deletes the Lambda function Alias mentioned in the command.**

```
Remove-LMAlias -FunctionName "MylambdaFunction123" -Name "NewAlias"
```
• For API details, see DeleteAlias in AWS Tools for PowerShell Cmdlet Reference.

Remove-LMFunction

The following code example shows how to use Remove-LMFunction.

Tools for PowerShell

Example 1: This example deletes a specific version of a Lambda function

Remove-LMFunction -FunctionName "MylambdaFunction123" -Qualifier '3'

• For API details, see DeleteFunction in AWS Tools for PowerShell Cmdlet Reference.

Remove-LMFunctionConcurrency

The following code example shows how to use Remove-LMFunctionConcurrency.

Tools for PowerShell

Example 1: This example removes the Function Concurrency of the Lambda Function.

Remove-LMFunctionConcurrency -FunctionName "MylambdaFunction123"

• For API details, see DeleteFunctionConcurrency in AWS Tools for PowerShell Cmdlet Reference.

Remove-LMPermission

The following code example shows how to use Remove-LMPermission.

Tools for PowerShell

Example 1: This example removes the function policy for the specified StatementId of a Lambda Function.

$policy = Get-LMPolicy -FunctionName "MylambdaFunction123" -Select Policy | ConvertFrom-Json| Select-Object -ExpandProperty Statement
Remove-LMPermission -FunctionName "MylambdaFunction123" -StatementId $policy[0].Sid

• For API details, see RemovePermission in AWS Tools for PowerShell Cmdlet Reference.
Remove-LMProvisionedConcurrencyConfig

The following code example shows how to use Remove-LMProvisionedConcurrencyConfig.

Tools for PowerShell

Example 1: This example removes the Provisioned Concurrency Configuration for a specific Alias.

```powershell
Remove-LMProvisionedConcurrencyConfig -FunctionName "MylambdaFunction123" -Qualifier "NewAlias1"
```

• For API details, see DeleteProvisionedConcurrencyConfig in AWS Tools for PowerShell Cmdlet Reference.

Remove-LMResourceTag

The following code example shows how to use Remove-LMResourceTag.

Tools for PowerShell

Example 1: Removes the supplied tags from a function. The cmdlet will prompt for confirmation before proceeding unless the -Force switch is specified. A single call is made to the service to remove the tags.

```powershell
```

Example 2: Removes the supplied tags from a function. The cmdlet will prompt for confirmation before proceeding unless the -Force switch is specified. Once call to the service is made per supplied tag.

```powershell
```

• For API details, see UntagResource in AWS Tools for PowerShell Cmdlet Reference.

Update-LMAlias

The following code example shows how to use Update-LMAlias.
Tools for PowerShell

Example 1: This example updates the Configuration of an existing Lambda function Alias. It updates the RoutingConfiguration value to shift 60% (0.6) of traffic to version 1

```
Update-LMAlias -FunctionName "MylambdaFunction123" -Description "Alias for version 2" -FunctionVersion 2 -Name "newlabel1" -RoutingConfig_AdditionalVersionWeight @{Name="1";Value="0.6"}
```

- For API details, see UpdateAlias in AWS Tools for PowerShell Cmdlet Reference.

Update-LMFunctonCode

The following code example shows how to use Update-LMFunctonCode.

Tools for PowerShell

Example 1: Updates the function named 'MyFunction' with new content contained in the specified zip file. For a C# .NET Core Lambda function the zip file should contain the compiled assembly.

```
Update-LMFunctonCode -FunctionName MyFunction -ZipFilename .\UpdatedCode.zip
```

Example 2: This example is similar to the previous one but uses an Amazon S3 object containing the updated code to update the function.

```
Update-LMFunctonCode -FunctionName MyFunction -BucketName mybucket -Key UpdatedCode.zip
```

- For API details, see UpdateFunctionCode in AWS Tools for PowerShell Cmdlet Reference.

Update-LMFunctonConfiguration

The following code example shows how to use Update-LMFunctonConfiguration.

Tools for PowerShell

Example 1: This example updates the existing Lambda Function Configuration

```
Update-LMFunctonConfiguration -FunctionName "MylambdaFunction123" -Handler "lambda_function.launch_instance" -Timeout 600 -Environment_Variable
```

Lambda
AWS Tools for PowerShell

Example of code:
```powershell
@{ "envvar1"="value";"envvar2"="value" } -Role arn:aws:iam::123456789101:role/service-role/lambda -DeadLetterConfig_TargetArn arn:aws:sns:us-east-1:123456789101:MyfirstTopic
```

- For API details, see [UpdateFunctionConfiguration](#) in *[AWS Tools for PowerShell Cmdlet Reference]*.

### Write-LMFunctionConcurrency

The following code example shows how to use `Write-LMFunctionConcurrency`.

#### Tools for PowerShell

#### Example 1: This example applies the concurrency settings for the Function as a whole.

```powershell
Write-LMFunctionConcurrency -FunctionName "MylambdaFunction123" -ReservedConcurrentExecution 100
```

- For API details, see [PutFunctionConcurrency](#) in *[AWS Tools for PowerShell Cmdlet Reference]*.

### Write-LMProvisionedConcurrencyConfig

The following code example shows how to use `Write-LMProvisionedConcurrencyConfig`.

#### Tools for PowerShell

#### Example 1: This example adds a provisioned concurrency configuration to a Function's Alias

```powershell
Write-LMProvisionedConcurrencyConfig -FunctionName "MylambdaFunction123" -ProvisionedConcurrentExecution 20 -Qualifier "NewAlias1"
```

- For API details, see [PutProvisionedConcurrencyConfig](#) in *[AWS Tools for PowerShell Cmdlet Reference]*.

### Amazon ML examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Amazon ML.
Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Tools for PowerShell

Example 1: Returns the detailed metadata for a batch prediction with id ID.

Get-MLBatchPrediction -BatchPredictionId ID

- For API details, see GetBatchPrediction in AWS Tools for PowerShell Cmdlet Reference.

Get-MLBatchPredictionList

The following code example shows how to use Get-MLBatchPredictionList.

Tools for PowerShell

Example 1: Returns a list of all BatchPredictions and their associated data records that match the search criterion given in the request.

Get-MLBatchPredictionList

Example 2: Returns a list of all BatchPredictions with a status of COMPLETED.
Get-MLBatchPredictionList -FilterVariable Status -EQ COMPLETED

- For API details, see DescribeBatchPredictions in AWS Tools for PowerShell Cmdlet Reference.

Get-MLDataSource

The following code example shows how to use Get-MLDataSource.

Tools for PowerShell

Example 1: Returns the metadata, status, and data file information for a DataSource with the id ID

Get-MLDataSource -DataSourceId ID

- For API details, see GetDataSource in AWS Tools for PowerShell Cmdlet Reference.

Get-MLDataSourceList

The following code example shows how to use Get-MLDataSourceList.

Tools for PowerShell

Example 1: Returns a list of all DataSources and their associated data records.

Get-MLDataSourceList

Example 2: Returns a list of all DataSources with a status of COMPLETED.

Get-MLDataSourceList -FilterVariable Status -EQ COMPLETED

- For API details, see DescribeDataSources in AWS Tools for PowerShell Cmdlet Reference.

Get-MLEvaluation

The following code example shows how to use Get-MLEvaluation.

Tools for PowerShell

Example 1: Returns metadata and status for an Evaluation with id ID.
Get-MLEvaluation -EvaluationId ID

- For API details, see GetEvaluation in AWS Tools for PowerShell Cmdlet Reference.

Get-MLEvaluationList

#### New-OPSDeployment

The following code example shows how to use `New-OPSDeployment`.

### Tools for PowerShell

**Example 1:** This command creates a new app deployment on all of the Linux-based instances in a layer in AWS OpsWorks Stacks. Even if you specify a layer ID, you must specify a stack ID, too. The command lets the deployment restart the instances if required.
New-OPSDeployment -StackID "724z93zz-zz78-4zzz-8z9z-1290123zzz1z" -LayerId "511b99c5-ec78-4caa-8a9d-1440116fffd1b" -AppId "0f7a109c-bf68-4336-8cb9-d37fe0b8c61d" -Command_Name deploy -Command_Arg @{Name="allow_reboot";Value="true"}

Example 2: This command deploys the appsetup recipe from the phpapp cookbook, and the secbaseline recipe from the testcookbook cookbook. The deployment target is one instance, but the stack ID and layer ID are also required. The Command_Arg parameter allow_reboot attribute is set to true, which lets the deployment restart the instances if required.

$commandArgs = '{ "Name":"execute_recipes", "Args"{ "recipes": ["phpapp::appsetup","testcookbook::secbaseline"] } }'
New-OPSDeployment -StackID "724z93zz-zz78-4zzz-8z9z-1290123zzz1z" -LayerId "511b99c5-ec78-4caa-8a9d-1440116fffd1b" -InstanceId "d89a6118-0007-4ccf-a51e-59f844127021" -Command_Name $commandArgs -Command_Arg @{Name="allow_reboot";Value="true"

The following code example shows how to use Get-RGGroup.

Tools for PowerShell

**Example 1: This example retrieves resource group as per the group name**

Get-RGGroup -GroupName auto-no

Output:

<table>
<thead>
<tr>
<th>Description</th>
<th>GroupArn</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>arn:aws:resource-groups:eu-west-1:123456789012:group/auto-no</td>

</table>

• For API details, see [GetGroup](/docs/aws-tools-for-powershell/getgroup) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-RGGroupList

The following code example shows how to use Get-RGGroupList.

Tools for PowerShell

**Example 1: This example lists resource group already created.**

Get-RGGroupList

Output:
For API details, see [ListGroups](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-RGGroupQuery

The following code example shows how to use `Get-RGGroupQuery`.

**Tools for PowerShell**

**Example 1: This example fetches the resource query for the given resource group**

```
Get-RGGroupQuery -GroupName auto-no | Select-Object -ExpandProperty ResourceQuery
```

**Output:**

```
Query
-----

{"ResourceTypeFilters":["AWS::EC2::Instance"],"TagFilters":[{"Key":"auto","Values": ["no"]}]}
```

For API details, see [GetGroupQuery](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-RGGroupResourceList

The following code example shows how to use `Get-RGGroupResourceList`.

**Tools for PowerShell**

**Example 1: This example lists group resources on the basis of filtered by resource type**

```
Get-RGGroupResourceList -Filter @{Name="resource-type";Values="AWS::EC2::Instance"}
-GroupName auto-yes | Select-Object -ExpandProperty ResourceIdentifiers
```

**Output:**
<table>
<thead>
<tr>
<th>ResourceArn</th>
<th>ResourceType</th>

### Get-RGResourceTag

The following code example shows how to use `Get-RGResourceTag`.

**Tools for PowerShell**

**Example 1: This example lists tags for the given resource group arn**

```
```

**Output:**

```
Key       Value
---       -----
Instances workboxes
```

- For API details, see [GetTags](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-RGGroup

The following code example shows how to use `New-RGGroup`.

**Tools for PowerShell**

**Example 1: This example creates a new tag-based AWS Resource Groups resource group named TestPowerShellGroup. The group includes Amazon EC2 instances in the current region that are tagged with the tag key "Name", and tag value "test2". The command returns the query and type of group, and the results of the operation.**

```
$ResourceQuery = New-Object -TypeName Amazon.ResourceGroups.Model.ResourceQuery
```
$ResourceQuery.Type = "TAG_FILTERS_1_0"
$ResourceQuery.Query = '{"ResourceTypeFilters": ["AWS::EC2::Instance"], "TagFilters": [{"Key": "Name", "Values": ["test2"]}]}'
$ResourceQuery

New-RGGroup -Name TestPowerShellGroup -ResourceQuery $ResourceQuery -Description "Test resource group."

Output:

Resource Groups Tagging API examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Resource Groups Tagging API.

**Actions** are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

**Scenarios** are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Add-RGTResourceTag**

The following code example shows how to use Add-RGTResourceTag.

**Tools for PowerShell**

**Example 1:** This example adds the tag keys "stage" and "version" with values "beta" and "preprod_test" to an Amazon S3 bucket and an Amazon DynamoDB table. A single call is made to the service to apply the tags.

```powershell
$arn1 = "arn:aws:s3:::mybucket"
```
Add-RGTResourceTag -ResourceARNList $arn1,$arn2 -Tag @{ "stage"="beta"; "version"="preprod_test" }

Example 2: This example adds the specified tags and values to an Amazon S3 bucket and an Amazon DynamoDB table. Two calls are made to the service, one for each resource ARN piped into the cmdlet.

$arn1 = "arn:aws:s3:::mybucket"

$arn1,$arn2 | Add-RGTResourceTag -Tag @{ "stage"="beta"; "version"="preprod_test" }

• For API details, see TagResources in AWS Tools for PowerShell Cmdlet Reference.

Get-RGTResource

The following code example shows how to use Get-RGTResource.

Tools for PowerShell

Example 1: Returns all the tagged resources in a region and the tag keys associated with the resource. If no -Region parameter is supplied to the cmdlet it will attempt to infer region from the shell or EC2 instance metadata.

Get-RGTResource

Output:

<table>
<thead>
<tr>
<th>ResourceARN</th>
<th>Tags</th>
</tr>
</thead>
<tbody>
<tr>
<td>arn:aws:dynamodb:us-west-2:123456789012:table/mytable</td>
<td>{stage, version}</td>
</tr>
<tr>
<td>arn:aws:s3:::mybucket</td>
<td>{stage, version, othertag}</td>
</tr>
</tbody>
</table>

Example 2: Returns all the tagged resources of the specified type in a region. The string for each service name and resource type is the same as that embedded in a resource's Amazon Resource Name (ARN).

Get-RGTResource -ResourceType "s3"
Example 3: Returns all the tagged resources of the specified type in a region. Note that when the resource types are piped into the cmdlet, one call to the service is made for each supplied resource type.

"dynamodb","s3" | Get-RGTResource

Output:

<table>
<thead>
<tr>
<th>ResourceARN</th>
<th>Tags</th>
</tr>
</thead>
<tbody>
<tr>
<td>arn:aws:dynamodb:us-west-2:123456789012:table/mytable</td>
<td>{stage, version}</td>
</tr>
<tr>
<td>arn:aws:s3:::mybucket</td>
<td>{stage, version, othertag}</td>
</tr>
</tbody>
</table>

Example 4: Returns all the tagged resources that match the specified filter.

Get-RGTResource -TagFilter @{ Key="stage" }

Output:

<table>
<thead>
<tr>
<th>ResourceARN</th>
<th>Tags</th>
</tr>
</thead>
<tbody>
<tr>
<td>arn:aws:s3:::mybucket</td>
<td>{stage, version, othertag}</td>
</tr>
</tbody>
</table>

Example 5: Returns all the tagged resources that match the specified filter and resource type.

Get-RGTResource -TagFilter @{ Key="stage" } -ResourceType "dynamodb"

Output:
Example 6: Returns all the tagged resources that match the specified filter.

```powershell
Get-RGTResource -TagFilter @{ Key="stage"; Values=@("beta","gamma") }
```

Output:

<table>
<thead>
<tr>
<th>ResourceARN</th>
<th>Tags</th>
</tr>
</thead>
<tbody>
<tr>
<td>arn:aws:dynamodb:us-west-2:123456789012:table/mytable</td>
<td>{stage, version}</td>
</tr>
</tbody>
</table>

- For API details, see [GetResources](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-RGTTagKey

The following code example shows how to use Get-RGTTagKey.

**Tools for PowerShell**

Example 1: Returns all tag keys in the specified region. If the -Region parameter is not specified the cmdlet will attempt to infer the region from the default shell region or EC2 instance metadata. Note that the tag keys are not returned in any specific order.

```powershell
Get-RGTTagKey -region us-west-2
```

Output:

<table>
<thead>
<tr>
<th>version</th>
</tr>
</thead>
<tbody>
<tr>
<td>stage</td>
</tr>
</tbody>
</table>

- For API details, see [GetTagKeys](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-RGTTagValue

The following code example shows how to use Get-RGTTagValue.
Tools for PowerShell

Example 1: Returns the value for the specified tag in a region. If the -Region parameter is not specified the cmdlet will attempt to infer the region from the default shell region or EC2 instance metadata.

```
Get-RGTTagValue -Key "stage" -Region us-west-2
```

Output:

```
beta
```

- For API details, see [GetTagValues](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-RGTRSourceTag

The following code example shows how to use Remove-RGTRSourceTag.

Tools for PowerShell

Example 1: Removes the tag keys "stage" and "version", and the associated values, from an Amazon S3 bucket and an Amazon DynamoDB table. A single call is made to the service to remove the tags. Before the tags are removed the cmdlet will prompt for confirmation. To bypass confirmation add the -Force parameter.

```
$arn1 = "arn:aws:s3:::mybucket"
Remove-RGTRSourceTag -ResourceARNList $arn1,$arn2 -TagKey "stage","version"
```

Example 2: Removes the tag keys "stage" and "version", and the associated values, from an Amazon S3 bucket and an Amazon DynamoDB table. Two calls are made to the service, one for each resource ARN piped into the cmdlet. Before each call the cmdlet will prompt for confirmation. To bypass confirmation add the -Force parameter.

```
$arn1 = "arn:aws:s3:::mybucket"
$arn1,$arn2 | Remove-RGTRSourceTag -TagKey "stage","version"
```

Edit-R53ResourceRecordSet

The following code example shows how to use Edit-R53ResourceRecordSet.

Tools for PowerShell

Example 1: This example creates an A record for www.example.com and changes the A record for test.example.com from 192.0.2.3 to 192.0.2.1. Note that values for changes TXT-type records must be in double quotes. See the Amazon Route 53 documentation for more details. You can use the Get-R53Change cmdlet to poll to determine when the changes are complete.

```powershell
$change1 = New-Object Amazon.Route53.Model.Change
$change1.Action = "CREATE"
$change1.ResourceRecordSet = New-Object Amazon.Route53.Model.ResourceRecordSet
$change1.ResourceRecordSet.Name = "www.example.com"
$change1.ResourceRecordSet.Type = "TXT"
```
Example 2: This example shows how to create alias resource record sets. 'Z2222222222' is the ID of the Amazon Route 53 hosted zone in which you're creating the alias resource record set. 'example.com' is the zone apex for which you want to create an alias and 'www.example.com' is a subdomain for which you also want to create an alias. 'Z11111111111111' is an example of a hosted zone ID for the load balancer and 'example-load-balancer-1111111111.us-east-1.elb.amazonaws.com' is an example of a load balancer domain name with which Amazon Route 53 responds to queries for example.com and www.example.com. See the Amazon Route 53 documentation for more details. You can use the Get-R53Change cmdlet to poll to determine when the changes are complete.
Example 3: This example creates two A records for www.example.com. One-fourth of the time (1/(1+3)), Amazon Route 53 responds to queries for www.example.com with the two values for the first resource record set (192.0.2.9 and 192.0.2.10). Three-fourths of the time (3/(1+3)) Amazon Route 53 responds to queries for www.example.com with the two values for the second resource record set (192.0.2.11 and 192.0.2.12). See the Amazon Route 53 documentation for more details. You can use the Get-R53Change cmdlet to poll to determine when the changes are complete.
```powershell
$change1.ResourceRecordSet.Weight = 1
$change1.ResourceRecordSet.TTL = 600
$change1.ResourceRecordSet.ResourceRecords.Add(@{Value="192.0.2.9"})
$change1.ResourceRecordSet.ResourceRecords.Add(@{Value="192.0.2.10"})

$change2 = New-Object Amazon.Route53.Model.Change
$change2.Action = "CREATE"
$change2.ResourceRecordSet = New-Object Amazon.Route53.Model.ResourceRecordSet
$change2.ResourceRecordSet.Name = "www.example.com"
$change2.ResourceRecordSet.Type = "A"
$change2.ResourceRecordSet.SetIdentifier = "Rack 5, Positions 1 and 2"
$change2.ResourceRecordSet.Weight = 3
$change2.ResourceRecordSet.TTL = 600
$change2.ResourceRecordSet.ResourceRecords.Add(@{Value="192.0.2.11"})
$change2.ResourceRecordSet.ResourceRecords.Add(@{Value="192.0.2.12"})

$params = @{
    HostedZoneId="Z1PA6795UKMFR9"
    ChangeBatch_Comment="This change creates two weighted resource record sets, each of which has two values."
    ChangeBatch_Change=$change1,$change2
}

Edit-R53ResourceRecordSet @params
```

Example 4: This example shows how to create weighted alias resource record sets assuming that example.com is the domain for which you want to create weighted alias resource record sets. SetIdentifier differentiates the two weighted alias resource record sets from one another. This element is required because the Name and Type elements have the same values for both resource record sets. Z1111111111111111 and Z3333333333333333 are examples of hosted zone IDs for the ELB load balancer specified by the value of DNSName. example-load-balancer-2222222222.us-east-1.elb.amazonaws.com and example-load-balancer-4444444444.us-east-1.elb.amazonaws.com are examples of Elastic Load Balancing domains from which Amazon Route 53 responds to queries for example.com. See the Amazon Route 53 documentation for more details. You can use the Get-R53Change cmdlet to poll to determine when the changes are complete.

```powershell
$change1 = New-Object Amazon.Route53.Model.Change
$change1.Action = "CREATE"
$change1.ResourceRecordSet = New-Object Amazon.Route53.Model.ResourceRecordSet
$change1.ResourceRecordSet.Name = "example.com"
```
$change1.ResourceRecordSet.Type = "A"
$change1.ResourceRecordSet.SetIdentifier = "1"
$change1.ResourceRecordSet.Weight = 3
$change1.ResourceRecordSet.AliasTarget.HostedZoneId = "Z1111111111111"
$change1.ResourceRecordSet.AliasTarget.DNSName = "example-load-balancer-2222222222.us-east-1.elb.amazonaws.com."
$change1.ResourceRecordSet.AliasTarget.EvaluateTargetHealth = $true

$change2 = New-Object Amazon.Route53.Model.Change
$change2.Action = "CREATE"
$change2.ResourceRecordSet = New-Object Amazon.Route53.Model.ResourceRecordSet
$change2.ResourceRecordSet.Name = "example.com"
$change2.ResourceRecordSet.Type = "A"
$change2.ResourceRecordSet.SetIdentifier = "2"
$change2.ResourceRecordSet.Weight = 1
$change2.ResourceRecordSet.AliasTarget.HostedZoneId = "Z3333333333333"
$change2.ResourceRecordSet.AliasTarget.DNSName = "example-load-balancer-4444444444.us-east-1.elb.amazonaws.com."
$change2.ResourceRecordSet.AliasTarget.EvaluateTargetHealth = $false

$params = @{
    HostedZoneId="Z55555555555"

Edit-R53ResourceRecordSet @params

Example 5: This example creates two latency alias resource record sets, one for an ELB load balancer in the US West (Oregon) region (us-west-2), and another for a load balancer in the Asia Pacific (Singapore) region (ap-southeast-1). See the Amazon Route 53 documentation for more details. You can use the Get-R53Change cmdlet to poll to determine when the changes are complete.

Get-R53HostedZonesByName

The following code example shows how to use Get-R53HostedZonesByName.
Tools for PowerShell

Example 1: Returns all of your public and private hosted zones in ASCII order by domain name.

Get-R53HostedZonesByName

Example 2: Returns your public and private hosted zones, in ASCII order by domain name, starting at the specified DNS name.

Get-R53HostedZonesByName -DnsName example2.com

Example 3: This example shows how to manually enumerate the hosted zones by first retrieving a single item and then iterating two at a time until all zones have been returned, using marker properties attached to the service response in the $AWSHistory stack after each call.

Get-R53HostedZonesByName -MaxItem 1

Get-R53QueryLoggingConfigList

The following code example shows how to use Get-R53QueryLoggingConfigList.

Tools for PowerShell

Example 1: This example returns all the configurations for DNS query logging that are associated with the current AWS account.

Get-R53QueryLoggingConfigList
Output:

<table>
<thead>
<tr>
<th>Id</th>
<th>HostedZoneId</th>
<th>CloudWatchLogsLogGroupArn</th>
</tr>
</thead>
<tbody>

</table>

- For API details, see [ListQueryLoggingConfigs](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-R53ReusableDelegationSet**

The following code example shows how to use `Get-R53ReusableDelegationSet`.

**Tools for PowerShell**

**Example 1:** This example retrieves information about the specified delegation set including the four name servers that are assigned to the delegation set.

```
Get-R53ReusableDelegationSet -Id N23DS9X4AYEAAA
```

**Output:**

<table>
<thead>
<tr>
<th>Id</th>
<th>CallerReference</th>
<th>NameServers</th>
</tr>
</thead>
<tbody>
<tr>
<td>/delegationset/N23DS9X4AYEAAA</td>
<td>testcaller</td>

</tr>
</tbody>
</table>

- For API details, see [GetReusableDelegationSet](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-R53HostedZone**

The following code example shows how to use `New-R53HostedZone`.

**Tools for PowerShell**

**Example 1:** Creates a new hosted zone named 'example.com', associated with a reusable delegation set. Note that you must supply a value for the CallerReference parameter so that
requests that need to be retried if necessary without the risk of executing the operation twice. Because the hosted zone is being created in a VPC it is automatically private and you should not set the -HostedZoneConfig_PrivateZone parameter.

```powershell
$params = @{
    Name="example.com"
    CallerReference="myUniqueIdentifier"
    HostedZoneConfig_Comment="This is my first hosted zone"
    DelegationSetId="NZ8X2CISAMPLE"
    VPC_VPCId="vpc-1a2b3c4d"
    VPC_VPCRegion="us-east-1"
}

New-R53HostedZone @params
```

- For API details, see [CreateHostedZone](https://docs.aws.amazon.com/powershell/latest/reference/cmdlets/R53HostedZone.html) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-R53QueryLoggingConfig

The following code example shows how to use New-R53QueryLoggingConfig.

**Tools for PowerShell**

**Example 1:** This example creates a new Route53 DNS query logging configuration for the specified hosted zone. Amazon Route53 will publish DNS query logs to the specified Cloudwatch log group.

```powershell
```

**Output:**

```
----------------------------------  ------------
QueryLoggingConfig                  Location
----------------------------------  ------------
```

- For API details, see [CreateQueryLoggingConfig](https://docs.aws.amazon.com/powershell/latest/reference/cmdlets/R53QueryLoggingConfig.html) in *AWS Tools for PowerShell Cmdlet Reference*. 
New-R53ReusableDelegationSet

The following code example shows how to use New-R53ReusableDelegationSet.

Tools for PowerShell

Example 1: This example creates a reusable delegation set of 4 name servers that can be resused by multiple hosted zones.

```powershell
New-R53ReusableDelegationSet -CallerReference testcallerreference
```

Output:

<table>
<thead>
<tr>
<th>DelegationSet</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>--------------</td>
<td>----------</td>
</tr>
</tbody>
</table>

- For API details, see [CreateReusableDelegationSet](https://docs.aws.amazon.com/powershell/latest/rlt/r53VRT.html) in [AWS Tools for PowerShell Cmdlet Reference](https://docs.aws.amazon.com/powershell/latest/rlt/index.html).

Register-R53VPCWithHostedZone

The following code example shows how to use Register-R53VPCWithHostedZone.

Tools for PowerShell

Example 1: This example associates the specified VPC with the private hosted zone.

```powershell
Register-R53VPCWithHostedZone -HostedZoneId Z3MEQ8T7HAAAAAF -VPC_VPCId vpc-f1b9aaaa -VPC_VPCRegion us-east-1
```

Output:

<table>

- For API details, see [AssociateVPCWithHostedZone](https://docs.aws.amazon.com/powershell/latest/rlt/r53VRT.html) in [AWS Tools for PowerShell Cmdlet Reference](https://docs.aws.amazon.com/powershell/latest/rlt/index.html).
**Remove-R53HostedZone**

The following code example shows how to use Remove-R53HostedZone.

**Tools for PowerShell**

Example 1: Deletes the hosted zone with the specified ID. You will be prompted for confirmation before the command proceeds unless you add the -Force switch parameter.

```powershell
Remove-R53HostedZone -Id Z1PA6795UKMFR9
```

- For API details, see [DeleteHostedZone](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-R53QueryLoggingConfig**

The following code example shows how to use Remove-R53QueryLoggingConfig.

**Tools for PowerShell**

Example 1: This example removes the specified configuration for DNS query logging.

```powershell
Remove-R53QueryLoggingConfig -Id ee528e95-4e03-4fdc-9d28-9e24daaa20063
```

- For API details, see [DeleteQueryLoggingConfig](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-R53ReusableDelegationSet**

The following code example shows how to use Remove-R53ReusableDelegationSet.

**Tools for PowerShell**

Example 1: This example deletes the specified reusable delegation set.

```powershell
Remove-R53ReusableDelegationSet -Id N23DS9X4AYAAAM
```

- For API details, see [DeleteReusableDelegationSet](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Unregister-R53VPCFromHostedZone**

The following code example shows how to use Unregister-R53VPCFromHostedZone.
Tools for PowerShell

Example 1: This example disassociates the specified VPC from the private hosted zone.

```
Unregister-R53VPCFromHostedZone -HostedZoneId Z3MEQ8T7HAAAAAFA -VPC_VPCIId vpc-f1b9aaaa
-VPC_VPCRegion us-east-1
```

Output:
```

- For API details, see [DisassociateVPCFromHostedZone](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Update-R53HostedZoneComment

The following code example shows how to use Update-R53HostedZoneComment.

Tools for PowerShell

Example 1: This command updates the comment for the specified hosted zone.

```
Update-R53HostedZoneComment -Id Z385PDS6AAAAAR -Comment "This is my first hosted zone"
```

Output:
```
Id                     : /hostedzone/Z385PDS6AAAAAR
Name                   : example.com.

- For API details, see [UpdateHostedZoneComment](#) in *AWS Tools for PowerShell Cmdlet Reference*.
Amazon S3 examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Amazon S3.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**
- *Actions*

**Actions**

**Copy-S3Object**

The following code example shows how to use *Copy-S3Object*.

**Tools for PowerShell**

Example 1: This command copies the object "sample.txt" from bucket "test-files" to the same bucket but with a new key of "sample-copy.txt".

```
Copy-S3Object -BucketName test-files -Key sample.txt -DestinationKey sample-copy.txt
```

Example 2: This command copies the object "sample.txt" from bucket "test-files" to the bucket "backup-files" with a key of "sample-copy.txt".

```
Copy-S3Object -BucketName test-files -Key sample.txt -DestinationKey sample-copy.txt -DestinationBucket backup-files
```

Example 3: This command downloads the object "sample.txt" from bucket "test-files" to a local file with name "local-sample.txt".

```
```
Example 4: Downloads the single object to the specified file. The downloaded file will be found at `c:\downloads\data\archive.zip`.

```
Copy-S3Object -BucketName test-files -Key sample.txt -LocalFile local-sample.txt
```

Example 5: Downloads all objects that match the specified key prefix to the local folder. The relative key hierarchy will be preserved as subfolders in the overall download location.

```
Copy-S3Object -BucketName test-files -KeyPrefix data -LocalFolder c:\downloads
```

- For API details, see `CopyObject` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3ACL

The following code example shows how to use Get-S3ACL.

**Tools for PowerShell**

**Example 1:** The command gets the details of the object owner of the S3 object.

```
Get-S3ACL -BucketName 's3casetestbucket' -key 'initialize.ps1' -Select AccessControlList.Owner
```

**Output:**

```
DisplayName        Id
----------------------
testusername  9988776a6554433d22f1100112e334acb45566778899009e9887bd7f66c5f544
```

- For API details, see `GetACL` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3Bucket

The following code example shows how to use Get-S3Bucket.

**Tools for PowerShell**

**Example 1:** This command returns all S3 buckets.
Get-S3Bucket

Example 2: This command returns bucket named "test-files"

Get-S3Bucket -BucketName test-files

- For API details, see [ListBuckets](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3BucketAccelerateConfiguration

The following code example shows how to use Get-S3BucketAccelerateConfiguration.

Tools for PowerShell

Example 1: This command returns the value Enabled, if the transfer acceleration settings is enabled for the bucket specified.

Get-S3BucketAccelerateConfiguration -BucketName 's3testbucket'

Output:

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
</tr>
</tbody>
</table>

- For API details, see [GetBucketAccelerateConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3BucketAnalyticsConfiguration

The following code example shows how to use Get-S3BucketAnalyticsConfiguration.

Tools for PowerShell

Example 1: This command returns the details of the analytics filter with the name 'testfilter' in the given S3 bucket.

Get-S3BucketAnalyticsConfiguration -BucketName 's3testbucket' -AnalyticsId 'testfilter'
• For API details, see **GetBucketAnalyticsConfiguration** in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-S3BucketAnalyticsConfigurationList

The following code example shows how to use Get-S3BucketAnalyticsConfigurationList.

**Tools for PowerShell**

**Example 1:** This command returns the first 100 analytics configurations of the given S3 bucket.

```powershell
Get-S3BucketAnalyticsConfigurationList -BucketName 's3casetestbucket'
```

• For API details, see **ListBucketAnalyticsConfigurations** in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-S3BucketEncryption

The following code example shows how to use Get-S3BucketEncryption.

**Tools for PowerShell**

**Example 1:** This command returns all the server side encryption rules associated with the given bucket.

```powershell
Get-S3BucketEncryption -BucketName 's3casetestbucket'
```

• For API details, see **GetBucketEncryption** in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-S3BucketInventoryConfiguration

The following code example shows how to use Get-S3BucketInventoryConfiguration.

**Tools for PowerShell**

**Example 1:** This command returns the details of the inventory named 'testinventory' for the given S3 bucket.
Get-S3BucketInventoryConfiguration -BucketName 's3testbucket' -InventoryId 'testinventory'

• For API details, see GetBucketInventoryConfiguration in AWS Tools for PowerShell Cmdlet Reference.

Get-S3BucketInventoryConfigurationList

The following code example shows how to use Get-S3BucketInventoryConfigurationList.

Tools for PowerShell

Example 1: This command returns the first 100 inventory configurations of the given S3 bucket.

Get-S3BucketInventoryConfigurationList -BucketName 's3testbucket'

• For API details, see ListBucketInventoryConfigurations in AWS Tools for PowerShell Cmdlet Reference.

Get-S3BucketLocation

The following code example shows how to use Get-S3BucketLocation.

Tools for PowerShell

Example 1: This command returns the location constraint for the bucket 's3testbucket', if a constraint exists.

Get-S3BucketLocation -BucketName 's3testbucket'

Output:

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap-south-1</td>
</tr>
</tbody>
</table>

• For API details, see GetBucketLocation in AWS Tools for PowerShell Cmdlet Reference.
Get-S3BucketLogging

The following code example shows how to use Get-S3BucketLogging.

Tools for PowerShell

Example 1: This command returns the logging status for the specified bucket.

```
Get-S3BucketLogging -BucketName 's3testbucket'
```

Output:

<table>
<thead>
<tr>
<th>TargetBucketName</th>
<th>Grants</th>
<th>TargetPrefix</th>
</tr>
</thead>
<tbody>
<tr>
<td>testbucket1</td>
<td>{}</td>
<td>testprefix</td>
</tr>
</tbody>
</table>

- For API details, see [GetBucketLogging](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3BucketMetricsConfiguration

The following code example shows how to use Get-S3BucketMetricsConfiguration.

Tools for PowerShell

Example 1: This command returns the details about the metrics filter named 'testfilter' for the given S3 bucket.

```
Get-S3BucketMetricsConfiguration -BucketName 's3testbucket' -MetricsId 'testfilter'
```

- For API details, see [GetBucketMetricsConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3BucketNotification

The following code example shows how to use Get-S3BucketNotification.

Tools for PowerShell

Example 1: This example retrieves notification configuration of the given bucket.
Get-S3BucketNotification -BucketName kt-tools | select -ExpandProperty TopicConfigurations

Output:

<table>
<thead>
<tr>
<th>Id</th>
<th>Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>mimo</td>
<td>arn:aws:sns:eu-west-1:123456789012:topic-1</td>
</tr>
</tbody>
</table>

- For API details, see [GetBucketNotification](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-S3BucketPolicy

The following code example shows how to use Get-S3BucketPolicy.

**Tools for PowerShell**

**Example 1:** This command outputs the bucket policy associated with the given S3 bucket.

```powershell
Get-S3BucketPolicy -BucketName 's3testbucket'
```

- For API details, see [GetBucketPolicy](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-S3BucketPolicyStatus

The following code example shows how to use Get-S3BucketPolicyStatus.

**Tools for PowerShell**

**Example 1:** This command returns policy status for the given S3 bucket, indicating whether the bucket is public.

```powershell
Get-S3BucketPolicyStatus -BucketName 's3casetestbucket'
```

- For API details, see [GetBucketPolicyStatus](#) in AWS Tools for PowerShell Cmdlet Reference.

Get-S3BucketReplication

The following code example shows how to use Get-S3BucketReplication.
Tools for PowerShell

Example 1: Returns the replication configuration information set on the bucket named 'mybucket'.

```powershell
Get-S3BucketReplication -BucketName mybucket
```

- For API details, see `GetBucketReplication` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3BucketRequestPayment

The following code example shows how to use Get-S3BucketRequestPayment.

Tools for PowerShell

Example 1: Returns the request payment configuration for the bucket named 'mybucket'. By default, the bucket owner pays for downloads from the bucket.

```powershell
Get-S3BucketRequestPayment -BucketName mybucket
```

- For API details, see `GetBucketRequestPayment` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3BucketTagging

The following code example shows how to use Get-S3BucketTagging.

Tools for PowerShell

Example 1: This command returns all the tags associated with the given bucket.

```powershell
Get-S3BucketTagging -BucketName 's3casetestbucket'
```

- For API details, see `GetBucketTagging` in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3BucketVersioning

The following code example shows how to use Get-S3BucketVersioning.

Tools for PowerShell

Example 1: This command returns the status of versioning with respect to the given bucket.
Get-S3BucketVersioning -BucketName 's3testbucket'

- For API details, see [GetBucketVersioning](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-S3BucketWebsite**

The following code example shows how to use Get-S3BucketWebsite.

**Tools for PowerShell**

**Example 1:** This command returns the details of the static website configurations of the given S3 bucket.

Get-S3BucketWebsite -BucketName 's3testbucket'

- For API details, see [GetBucketWebsite](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-S3CORSConfiguration**

The following code example shows how to use Get-S3CORSConfiguration.

**Tools for PowerShell**

**Example 1:** This command returns an object that contains all the CORS configuration rules corresponding to the given S3 Bucket.

Get-S3CORSConfiguration -BucketName 's3testbucket' -Select Configuration.Rules

**Output:**

```plaintext
AllowedMethods : {PUT, POST, DELETE}
AllowedOrigins : {http://www.example1.com}
Id :
ExposeHeaders : {}
MaxAgeSeconds : 0
AllowedHeaders : [*]

AllowedMethods : {PUT, POST, DELETE}

• For API details, see [GetCORSConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-S3LifecycleConfiguration**

The following code example shows how to use Get-S3LifecycleConfiguration.

**Tools for PowerShell**

**Example 1:** This example retrieves lifecycle configuration for the bucket.

```powershell
Get-S3LifecycleConfiguration -BucketName test-bla
```

**Output:**

```
Rules
-----
{Remove-in-150-days, Archive-to-Glacier-in-30-days}
```

• For API details, see [GetLifecycleConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-S3Object**

The following code example shows how to use Get-S3Object.

**Tools for PowerShell**

**Example 1:** This command retrieves the information about all of the items in the bucket "test-files".
Example 2: This command retrieves the information about the item "sample.txt" from bucket "test-files".

```
Get-S3Object -BucketName test-files -Key sample.txt
```

Example 3: This command retrieves the information about all items with the prefix "sample" from bucket "test-files".

```
Get-S3Object -BucketName test-files -KeyPrefix sample
```

- For API details, see ListObjects in AWS Tools for PowerShell Cmdlet Reference.

Get-S3ObjectLockConfiguration

The following code example shows how to use Get-S3ObjectlockConfiguration.

Tools for PowerShell

Example 1: This command returns the value 'Enabled' if Object lock configuration is enabled for the given S3 bucket.

```
Get-S3ObjectLockConfiguration -BucketName 's3buckettesting' -Select ObjectLockConfiguration.ObjectLockEnabled
```

Output:

```
Value
-----
Enabled
```

- For API details, see GetObjectLockConfiguration in AWS Tools for PowerShell Cmdlet Reference.

Get-S3ObjectMetadata

The following code example shows how to use Get-S3ObjectMetadata.
Example 1: This command returns the metadata of the object with key 'ListTrusts.txt' in the given S3 bucket.

```
Get-S3ObjectMetadata -BucketName 's3testbucket' -Key 'ListTrusts.txt'
```

Output:

- For API details, see [GetObjectMetadata](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-S3ObjectRetention

The following code example shows how to use Get-S3ObjectRetention.
Tools for PowerShell

Example 1: The command returns the mode and date till the object would be retained.

```
Get-S3ObjectRetention -BucketName 's3buckettesting' -Key 'testfile.txt'
```

- For API details, see [GetObjectRetention](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-S3ObjectTagSet

The following code example shows how to use Get-S3ObjectTagSet.

Tools for PowerShell

Example 1: The sample returns the tags associated with the object present on the given S3 bucket.

```
Get-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'testbucket123'
```

Output:

```
Key    Value
---    -----  
test    value
```

- For API details, see [GetObjectTagging](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-S3PreSignedURL

The following code example shows how to use Get-S3PreSignedURL.

Tools for PowerShell

Example 1: The command returns pre-signed URL for a specified key and an expiration date.

```
Get-S3PreSignedURL -BucketName 's3testbucket' -Key 'testkey' -Expires '2023-11-16'
```

Example 2: The command returns pre-signed URL for a Directory Bucket with specified key and an expiration date.
AWS Tools for PowerShell

[Amazon.AWSConfigsS3]::UseSignatureVersion4 = $true
Get-S3PreSignedURL -BucketName sampledirectorybucket--use1-az5--x-s3 -Key 'testkey' -Expire '2023-11-17'

- For API details, see GetPreSignedURL in AWS Tools for PowerShell Cmdlet Reference.

Get-S3PublicAccessBlock

The following code example shows how to use Get-S3PublicAccessBlock.

Tools for PowerShell

   Example 1: The command returns the public access block configuration of the given S3 bucket.

Get-S3PublicAccessBlock -BucketName 's3testbucket'

- For API details, see GetPublicAccessBlock in AWS Tools for PowerShell Cmdlet Reference.

Get-S3Version

The following code example shows how to use Get-S3Version.

Tools for PowerShell

   Example 1: This command returns the metadata about all of the versions of objects in the given S3 bucket.

Get-S3Version -BucketName 's3testbucket'

Output:

   IsTruncated : False
   KeyMarker   :
   VersionIdMarker :
   NextKeyMarker :

- For API details, see [ListVersions](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**New-S3Bucket**

The following code example shows how to use `New-S3Bucket`.

### Tools for PowerShell

**Example 1:** This command creates a new private bucket named "sample-bucket".

```powershell
New-S3Bucket -BucketName sample-bucket
```

**Example 2:** This command creates a new bucket named "sample-bucket" with read-write permissions.

```powershell
New-S3Bucket -BucketName sample-bucket -PublicReadWrite
```

**Example 3:** This command creates a new bucket named "sample-bucket" with read-only permissions.

```powershell
New-S3Bucket -BucketName sample-bucket -PublicReadOnly
```

**Example 4:** This command creates a new Directory bucket named "samplebucket--use1-az5--x-s3" with `PutBucketConfiguration`.

```powershell
$bucketConfiguration = @{
    BucketInfo = @{
        DataRedundancy = 'SingleAvailabilityZone'
        Type = 'Directory'
    }
    Location = @{
        Name = 'use1-az5'
        Type = 'AvailabilityZone'
    }
}
```
New-S3Bucket -BucketName samplebucket --use1-az5 -x-s3 -BucketConfiguration $bucketConfiguration -Region us-east-1

- For API details, see PutBucket in AWS Tools for PowerShell Cmdlet Reference.

Read-S3Object

The following code example shows how to use Read-S3Object.

Tools for PowerShell

Example 1: This command retrieves item "sample.txt" from bucket "test-files" and saves it to a file named "local-sample.txt" in the current location. The file "local-sample.txt" does not have to exist before this command is called.

Read-S3Object -BucketName test-files -Key sample.txt -File local-sample.txt

Example 2: This command retrieves virtual directory "DIR" from bucket "test-files" and saves it to a folder named "Local-DIR" in the current location. The folder "Local-DIR" does not have to exist before this command is called.

Read-S3Object -BucketName test-files -KeyPrefix DIR -Folder Local-DIR

Example 3: Downloads all objects with keys ending in '.json' from buckets with 'config' in the bucket name to files in the specified folder. The object keys are used to set the filenames.

Get-S3Bucket | ? { $_.BucketName -like '*config*' } | Get-S3Object | ? { $_.Key -like '*\.json' } | Read-S3Object -Folder C:\ConfigObjects

- For API details, see GetObject in AWS Tools for PowerShell Cmdlet Reference.

Remove-S3Bucket

The following code example shows how to use Remove-S3Bucket.

Tools for PowerShell

Example 1: This command removes all objects and object versions from the bucket 'test-files' and then deletes the bucket. The command will prompt for confirmation before
proceeding. Add the -Force switch to suppress confirmation. Note that buckets that are not empty cannot be deleted.

Remove-S3Bucket -BucketName test-files -DeleteBucketContent

- For API details, see DeleteBucket in AWS Tools for PowerShell Cmdlet Reference.

Remove-S3BucketAnalyticsConfiguration

The following code example shows how to use Remove-S3BucketAnalyticsConfiguration.

Tools for PowerShell

Example 1: The command removes the analytics filter with name 'testfilter' in the given S3 bucket.

Remove-S3BucketAnalyticsConfiguration -BucketName 's3testbucket' -AnalyticsId 'testfilter'

- For API details, see DeleteBucketAnalyticsConfiguration in AWS Tools for PowerShell Cmdlet Reference.

Remove-S3BucketEncryption

The following code example shows how to use Remove-S3BucketEncryption.

Tools for PowerShell

Example 1: This disables the encryption enabled for the S3 bucket provided.

Remove-S3BucketEncryption -BucketName 's3casetestbucket'

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketEncryption (DeleteBucketEncryption)" on target "s3casetestbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y
• For API details, see `DeleteBucketEncryption` in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-S3BucketInventoryConfiguration**

The following code example shows how to use `Remove-S3BucketInventoryConfiguration`.

**Tools for PowerShell**

**Example 1:** This command removes the inventory named 'testInventoryName' corresponding to the given S3 bucket.

```powershell
Remove-S3BucketInventoryConfiguration -BucketName 's3testbucket' -InventoryId 'testInventoryName'
```

**Output:**

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketInventoryConfiguration (DeleteBucketInventoryConfiguration)" on target "s3testbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y

• For API details, see `DeleteBucketInventoryConfiguration` in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-S3BucketMetricsConfiguration**

The following code example shows how to use `Remove-S3BucketMetricsConfiguration`.

**Tools for PowerShell**

**Example 1:** The command removes the metrics filter with name 'testmetrics' in the given S3 bucket.

```powershell
Remove-S3BucketMetricsConfiguration -BucketName 's3testbucket' -MetricsId 'testmetrics'
```

• For API details, see `DeleteBucketMetricsConfiguration` in *AWS Tools for PowerShell Cmdlet Reference*. 
Remove-S3BucketPolicy

The following code example shows how to use Remove-S3BucketPolicy.

**Tools for PowerShell**

Example 1: The command removes the bucket policy associated with the given S3 bucket.

Remove-S3BucketPolicy -BucketName 's3testbucket'

- For API details, see [DeleteBucketPolicy](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-S3BucketReplication

The following code example shows how to use Remove-S3BucketReplication.

**Tools for PowerShell**

Example 1: Deletes the replication configuration associated with the bucket named 'mybucket'. Note that this operation requires permission for the s3:DeleteReplicationConfiguration action. You will be prompted for confirmation before the operation proceeds - to suppress confirmation, use the -Force switch.

Remove-S3BucketReplication -BucketName mybucket

- For API details, see [DeleteBucketReplication](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-S3BucketTagging

The following code example shows how to use Remove-S3BucketTagging.

**Tools for PowerShell**

Example 1: This command removes all the tags associated with the given S3 bucket.

Remove-S3BucketTagging -BucketName 's3testbucket'

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketTagging (DeleteBucketTagging)" on target "s3testbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y

- For API details, see DeleteBucketTagging in AWS Tools for PowerShell Cmdlet Reference.

Remove-S3BucketWebsite

The following code example shows how to use Remove-S3BucketWebsite.

Tools for PowerShell

Example 1: This command disables the static website hosting property of the given S3 bucket.

Remove-S3BucketWebsite -BucketName 's3testbucket'

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketWebsite (DeleteBucketWebsite)" on target "s3testbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y

- For API details, see DeleteBucketWebsite in AWS Tools for PowerShell Cmdlet Reference.

Remove-S3CORSConfiguration

The following code example shows how to use Remove-S3CORSConfiguration.

Tools for PowerShell

Example 1: This command removes the CORS configuration for the given S3 bucket.

Remove-S3CORSConfiguration -BucketName 's3testbucket'

Output:
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3CORSConfiguration (DeleteCORSConfiguration)" on target "s3testbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y

- For API details, see [DeleteCORSConfiguration](https://aws.amazon.com/tools/powershell/cmdlet-reference) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-S3LifecycleConfiguration**

The following code example shows how to use `Remove-S3LifecycleConfiguration`.

**Tools for PowerShell**

**Example 1:** The command removes all the lifecycle rules for the given S3 bucket.

```powershell
Remove-S3LifecycleConfiguration -BucketName 's3testbucket'
```

- For API details, see [DeleteLifecycleConfiguration](https://aws.amazon.com/tools/powershell/cmdlet-reference) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-S3MultipartUpload**

The following code example shows how to use `Remove-S3MultipartUpload`.

**Tools for PowerShell**

**Example 1:** This command aborts multipart uploads created earlier than 5 days ago.

```powershell
Remove-S3MultipartUpload -BucketName test-files -DaysBefore 5
```

**Example 2:** This command aborts multipart uploads created earlier than January 2nd, 2014.

```powershell
Remove-S3MultipartUpload -BucketName test-files -InitiatedDate "Thursday, January 02, 2014"
```

**Example 3:** This command aborts multipart uploads created earlier than January 2nd, 2014, 10:45:37.
Remove-S3MultipartUpload -BucketName test-files -InitiatedDate "2014/01/02 10:45:37"

- For API details, see AbortMultipartUpload in AWS Tools for PowerShell Cmdlet Reference.

Remove-S3Object

The following code example shows how to use Remove-S3Object.

Tools for PowerShell

**Example 1:** This command removes the object "sample.txt" from bucket "test-files". You are prompted for confirmation before the command executes; to suppress the prompt use the -Force switch.

Remove-S3Object -BucketName test-files -Key sample.txt

**Example 2:** This command removes the specified version of object "sample.txt" from bucket "test-files", assuming the bucket has been configured to enable object versions.

Remove-S3Object -BucketName test-files -Key sample.txt -VersionId HLbxnx6V9omT6AqYVps8mmFKQcejpqt

**Example 3:** This command removes objects "sample1.txt", "sample2.txt" and "sample3.txt" from bucket "test-files" as a single batch operation. The service response will list all keys processed, regardless of the success or error status of the deletion. To obtain only errors for keys that were not able to be processed by the service add the -ReportErrorsOnly parameter (this parameter can also be specified with the alias -Quiet).

Remove-S3Object -BucketName test-files -KeyCollection @( "sample1.txt", "sample2.txt", "sample3.txt" )

**Example 4:** This example uses an inline expression with the -KeyCollection parameter to obtain the keys of the objects to delete. Get-S3Object returns a collection of Amazon.S3.Model.S3Object instances, each of which has a Key member of type string identifying the object.

Remove-S3Object -bucketname "test-files" -KeyCollection (Get-S3Object "test-files" -KeyPrefix "prefix/subprefix" | select -ExpandProperty Key)
Example 5: This example obtains all objects that have a key prefix "prefix/subprefix" in the bucket and deletes them. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.

```powershell
Get-S3Object -BucketName "test-files" -KeyPrefix "prefix/subprefix" | Remove-S3Object -Force
```

Example 6: This example pipes a collection of Amazon.S3.Model.S3ObjectVersion instances that represent delete markers to the cmdlet for deletion. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.

```powershell
(Get-S3Version -BucketName "test-files").Versions | Where {$_ .IsDeleteMarker -eq "True"} | Remove-S3Object -Force
```

Example 7: This script shows how to perform a batch delete of a set of objects (in this case delete markers) by constructing an array of objects to be used with the -KeyAndVersionCollection parameter.

```powershell
$keyVersions = @()
$markers = (Get-S3Version -BucketName $BucketName).Versions | Where {$_ .IsDeleteMarker -eq "True"}
foreach ($marker in $markers) {
    $keyVersions += @(
        Key = $marker.Key;
        VersionId = $marker.VersionId
    )
}
Remove-S3Object -BucketName $BucketName -KeyAndVersionCollection $keyVersions -Force
```

- For API details, see [DeleteObjects](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-S3ObjectTagSet**

The following code example shows how to use Remove-S3ObjectTagSet.

**Tools for PowerShell**

**Example 1:** This command removes all the tags associated with the object with key 'testfile.txt' in the given S3 Bucket.
Remove-S3ObjectTagSet -Key 'testfile.txt' -BucketName 's3testbucket' -Select '^Key'

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3ObjectTagSet (DeleteObjectTagging)" on target "testfile.txt".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y

testfile.txt

• For API details, see DeleteObjectTagging in AWS Tools for PowerShell Cmdlet Reference.

Remove-S3PublicAccessBlock

The following code example shows how to use Remove-S3PublicAccessBlock.

Tools for PowerShell

Example 1: This command turns off the block public access setting for the given bucket.

Remove-S3PublicAccessBlock -BucketName 's3testbucket' -Force -Select '^BucketName'

Output:

s3testbucket

• For API details, see DeletePublicAccessBlock in AWS Tools for PowerShell Cmdlet Reference.

Set-S3BucketEncryption

The following code example shows how to use Set-S3BucketEncryption.

Tools for PowerShell

Example 1: This command enables default AES256 server side encryption with Amazon S3 Managed Keys(SSE-S3) on the given bucket.
$Encryptionconfig = @{ServerSideEncryptionByDefault = @{ServerSideEncryptionAlgorithm = "AES256"}}
Set-S3BucketEncryption -BucketName 's3testbucket' -
ServerSideEncryptionConfiguration_ServerSideEncryptionRule $Encryptionconfig

- For API details, see [PutBucketEncryption](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Test-S3Bucket**

The following code example shows how to use Test-S3Bucket.

**Tools for PowerShell**

**Example 1:** This command returns True if the bucket exists, False otherwise. The command returns True even if the bucket does not belong to the user.

```
Test-S3Bucket -BucketName test-files
```

- For API details, see [Test-S3Bucket](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Write-S3BucketAccelerateConfiguration**

The following code example shows how to use Write-S3BucketAccelerateConfiguration.

**Tools for PowerShell**

**Example 1:** This command enables the transfer acceleration for the given S3 bucket.

```
$statusVal = New-Object Amazon.S3.BucketAccelerateStatus('Enabled')
Write-S3BucketAccelerateConfiguration -BucketName 's3testbucket' -
AccelerateConfiguration_Status $statusVal
```

- For API details, see [PutBucketAccelerateConfiguration](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Write-S3BucketNotification**

The following code example shows how to use Write-S3BucketNotification.
Tools for PowerShell

Example 1: This example configures the SNS topic configuration for the S3 event ObjectRemovedDelete and enables notification for the given s3 bucket

```
    Id = "delete-event"
    Topic = "arn:aws:sns:eu-west-1:123456789012:topic-1"
    Event = [Amazon.S3.EventType]::ObjectRemovedDelete
}
Write-S3BucketNotification -BucketName kt-tools -TopicConfiguration $topic
```

Example 2: This example enables notifications of ObjectCreatedAll for the given bucket sending it to Lambda function.

```
    Events = "s3:ObjectCreated:*"
    FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:rdplock"
    Id = "ObjectCreated-Lambda"
    Filter = @{
        S3KeyFilter = @{
            FilterRules = @(               
                @{$Name="Prefix";Value="dada"}
                @{$Name="Suffix";Value=".pem"}
            )
        }
    }
}
Write-S3BucketNotification -BucketName ssm-editor -LambdaFunctionConfiguration $lambdaConfig
```

Example 3: This example creates 2 different Lambda configuration on the basis of different key-suffix and configured both in a single command.

```
#Lambda Config 1

    Events = "s3:ObjectCreated:*"
    FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifynet"
    Id = "ObjectCreated-dada-ps1"
```

Filter = @{
    S3KeyFilter = @{
        FilterRules = @(
            @{Name="Prefix";Value="dada"}
            @{Name="Suffix";Value=".ps1"}
        )
    }
}

#Lambda Config 2

    Events = [Amazon.S3.EventType]::ObjectCreatedAll
    FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifyssm"
    Id = "ObjectCreated-dada-json"
    Filter = @{
        S3KeyFilter = @{
            FilterRules = @(
                @{Name="Prefix";Value="dada"}
                @{Name="Suffix";Value=".json"}
            )
        }
    }
}

Write-S3BucketNotification -BucketName ssm-editor -LambdaFunctionConfiguration $firstLambdaConfig,$secondlambdaConfig

- For API details, see [PutBucketNotification](https://docs.aws.amazon.com/goto/WebAPI/s3/2006-03-01/PutBucketNotification) in *AWS Tools for PowerShell Cmdlet Reference*.

**Write-S3BucketReplication**

The following code example shows how to use Write-S3BucketReplication.

**Tools for PowerShell**

**Example 1:** This example sets a replication configuration with a single rule enabling replication to the 'exampletargetbucket' bucket any new objects created with the key name prefix "TaxDocs" in the bucket 'examplebucket'.

```
rule1 = New-Object Amazon.S3.Model.ReplicationRule
```
Example 2: This example sets a replication configuration with multiple rules enabling replication to the 'exampletargetbucket' bucket any new objects created with either the key name prefix "TaxDocs" or "OtherDocs". The key prefixes must not overlap.

```powershell
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @(
    BucketArn = "arn:aws:s3:::exampletargetbucket"
)

$rule2 = New-Object Amazon.S3.Model.ReplicationRule
$rule2.ID = "Rule-2"
$rule2.Status = "Enabled"
$rule2.Prefix = "OtherDocs"
$rule2.Destination = @(
    BucketArn = "arn:aws:s3:::exampletargetbucket"
)

$params = @(
    BucketName = "examplebucket"
    Configuration_Role = "arn:aws:iam::35667example:role/CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1,$rule2
}

Write-S3BucketReplication @params
```

Example 3: This example updates the replication configuration on the specified bucket to disable the rule controlling replication of objects with the key name prefix "TaxDocs" to the bucket 'exampletargetbucket'.

```powershell
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @(
    BucketArn = "arn:aws:s3:::exampletargetbucket"
)

$params = @(
    BucketName = "examplebucket"
    Configuration_Role = "arn:aws:iam::35667example:role/CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1
}

Write-S3BucketReplication @params
```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Disabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::exampletargetbucket" }

$params = @{
  BucketName = "examplebucket"
  Configuration_Role = "arn:aws:iamp:35667example:role/
  CrossRegionReplicationRoleForS3"
  Configuration_Rule = $rule1
}

Write-S3BucketReplication @params

- For API details, see [PutBucketReplication](#) in AWS Tools for PowerShell Cmdlet Reference.

### Write-S3BucketRequestPayment

The following code example shows how to use `Write-S3BucketRequestPayment`.

**Tools for PowerShell**

**Example 1:** Updates the request payment configuration for the bucket named 'mybucket' so that the person requesting downloads from the bucket will be charged for the download. By default the bucket owner pays for downloads. To set the request payment back to the default use 'BucketOwner' for the RequestPaymentConfiguration_Payer parameter.

```powershell
Write-S3BucketRequestPayment -BucketName mybucket -RequestPaymentConfiguration_Payer Requester
```

- For API details, see [PutBucketRequestPayment](#) in AWS Tools for PowerShell Cmdlet Reference.

### Write-S3BucketTagging

The following code example shows how to use `Write-S3BucketTagging`.

**Tools for PowerShell**

**Example 1:** This command applies two tags to a bucket named `cloudtrail-test-2018`: a tag with a key of Stage and a value of Test, and a tag with a key of Environment and a value
of Alpha. To verify that the tags were added to the bucket, run `Get-S3BucketTagging -BucketName bucket_name`. The results should show the tags that you applied to the bucket in the first command. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket. To add or delete individual tags, run the Resource Groups and Tagging API cmdlets, `Add-RGTResourceTag` and `Remove-RGTResourceTag`. Alternatively, use Tag Editor in the AWS Management Console to manage S3 bucket tags.

```powershell
Write-S3BucketTagging -BucketName cloudtrail-test-2018 -TagSet @( @{ Key="Stage"; Value="Test" }, @{ Key="Environment"; Value="Alpha" } )
```

**Example 2:** This command pipes a bucket named `cloudtrail-test-2018` into the `Write-S3BucketTagging` cmdlet. It applies tags Stage:Production and Department:Finance to the bucket. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket.

```powershell
Get-S3Bucket -BucketName cloudtrail-test-2018 | Write-S3BucketTagging -TagSet @( @{ Key="Stage"; Value="Production" }, @{ Key="Department"; Value="Finance" } )
```

**Write-S3BucketVersioning**

The following code example shows how to use `Write-S3BucketVersioning`.

**Tools for PowerShell**

**Example 1:** The command enables versioning for the given S3 bucket.

```powershell
Write-S3BucketVersioning -BucketName 's3testbucket' -VersioningConfig_Status Enabled
```

**Write-S3BucketWebsite**

The following code example shows how to use `Write-S3BucketWebsite`.

**Tools for PowerShell**

**Example 1:** The command enables website hosting for the given bucket with the index document as 'index.html' and error document as 'error.html'.

Amazon S3
Write-S3BucketWebsite -BucketName 's3testbucket' -
WebsiteConfiguration_IndexDocumentSuffix 'index.html' -
WebsiteConfiguration_ErrorDocument 'error.html'

- For API details, see [PutBucketWebsite](#) in AWS Tools for PowerShell Cmdlet Reference.

**Write-S3LifecycleConfiguration**

The following code example shows how to use Write-S3LifecycleConfiguration.

**Tools for PowerShell**

**Example 1:** This example writes / replaces the configuration provided in the $NewRule. This configuration is making sure to limit the scope objects with given prefix and tag values.

```powershell
    Expiration = @{
        Days = 50
    }
    Id = "Test-From-Write-cmdlet-1"
    Filter = @{
        LifecycleFilterPredicate = [Amazon.S3.Model.LifecycleAndOperator] @{
            Operands = @(  
                [Amazon.S3.Model.LifecyclePrefixPredicate] @{
                    "Prefix" = "py"
                },  
                [Amazon.S3.Model.LifecycleTagPredicate] @{
                    "Tag" = @{
                        "Key" = "non-use"
                        "Value" = "yes"
                    }
                }
            )
        }
    }
    "Status" = 'Enabled'
    NoncurrentVersionExpiration = @{
        NoncurrentDays = 75
    }
}
```
Write-S3LifecycleConfiguration -BucketName my-review-scrap -Configuration_Rule $NewRule

Example 2: This example sets multiple rules with filtering. $ArchiveRule sets the objects to archive in 30 days to Glacier and 120 to DeepArchive. $ExpireRule expires both current and previous versions in 150 days for objects with 'py' prefix and tag: key 'archieved' set to 'yes'.

```powershell
    Expiration = @{
        Days= 150
    }
    Id = "Remove-in-150-days"
    Filter= @{
        LifecycleFilterPredicate = [Amazon.S3.Model.LifecycleAndOperator]@{

**Write-S3Object**

The following code example shows how to use `Write-S3Object`.

**Tools for PowerShell**

**Example 1:** This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files".

```powershell
Write-S3Object -BucketName test-files -Key "sample.txt" -File .\local-sample.txt
```
Example 2: This command uploads the single file "sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files". If the -Key parameter is not supplied, the filename is used as the S3 object key.

Write-S3Object -BucketName test-files -File .\sample.txt

Example 3: This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "prefix/to/sample.txt" in bucket "test-files".

Write-S3Object -BucketName test-files -Key "prefix/to/sample.txt" -File .\local-sample.txt

Example 4: This command uploads all files in the subdirectory "Scripts" to the bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename" where 'filename' varies.

Write-S3Object -BucketName test-files -Folder .\Scripts -KeyPrefix SampleScripts\ 

Example 5: This command uploads all *.ps1 files in the local directory "Scripts" to bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename.ps1" where 'filename' varies.

Write-S3Object -BucketName test-files -Folder .\Scripts -KeyPrefix SampleScripts\ -SearchPattern *.ps1

Example 6: This command creates a new S3 object containing the specified content string with key 'sample.txt'.

Write-S3Object -BucketName test-files -Key "sample.txt" -Content "object contents"

Example 7: This command uploads the specified file (the filename is used as the key) and applies the specified tags to the new object.

Write-S3Object -BucketName test-files -File "sample.txt" -TagSet @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}

Example 8: This command recursively uploads the specified folder and applies the specified tags to all the new objects.
Write-S3Object -BucketName test-files -Folder . -KeyPrefix "TaggedFiles" -Recurse -TagSet @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}

- For API details, see PutObject in AWS Tools for PowerShell Cmdlet Reference.

Write-S3ObjectRetention

The following code example shows how to use Write-S3ObjectRetention.

Tools for PowerShell

Example 1: The command enables governance retention mode until the date '31st Dec 2019 00:00:00' for 'testfile.txt' object in the given S3 bucket.

Write-S3ObjectRetention -BucketName 's3buckettesting' -Key 'testfile.txt' -Retention_Mode GOVERNANCE -Retention_RetainUntilDate "2019-12-31T00:00:00"

- For API details, see PutObjectRetention in AWS Tools for PowerShell Cmdlet Reference.

**Get-GLCJob**

The following code example shows how to use `Get-GLCJob`.

**Tools for PowerShell**

Example 1: Returns details of the specified job. When the job completes successfully the `Read-GCJobOutput` cmdlet can be used to retrieve the contents of the job (an archive or inventory list) to the local file system.

```powershell
Get-GLCJob -VaultName myvault -JobId "op1x...JSbthM"
```

**Output:**

- For API details, see [DescribeJob](#) in *AWS Tools for PowerShell Cmdlet Reference*. 
New-GLCVault

The following code example shows how to use New-GLCVault.

Tools for PowerShell

Example 1: Creates a new vault for the user's account. As no value was supplied to the -AccountId parameter the cmdlets uses a default of "-" indicating the current account.

```
New-GLCVault -VaultName myvault
```

Output:

```
/01234567812/vaults/myvault
```

- For API details, see CreateVault in AWS Tools for PowerShell Cmdlet Reference.

Read-GLCJobOutput

The following code example shows how to use Read-GLCJobOutput.

Tools for PowerShell

Example 1: Downloads the archive content that was scheduled for retrieval in the specified job and stores the contents into a file on disk. The download validates the checksum for you, if one is available. If required the checksum can be obtained from the service response history like so (assuming this cmdlet was the last run): $AWSHistory.LastServiceResponse. If the cmdlet was not the most recently run, inspect the $AWSHistory.Commands collection to obtain the relevant service response.

```
Read-GLCJobOutput -VaultName myvault -JobId "HSWjArc...Zq2XLiW" -FilePath "c:\temp\blue.bin"
```

- For API details, see GetJobOutput in AWS Tools for PowerShell Cmdlet Reference.

Start-GLCJob

The following code example shows how to use Start-GLCJob.
Tools for PowerShell

Example 1: Starts a job to retrieve an archive from the specified vault owned by the user. The status of the job can be checked using the Get-GLCJob cmdlet. When the job completes successfully the Read-GCJobOutput cmdlet can be used to retrieve the contents of the archive to the local file system.

```
Start-GLCJob -VaultName myvault -JobType "archive-retrieval" -JobDescription "archive retrieval" -ArchiveId "o9O9j...TX-TpIhQJw"
```

Output:

Write-GLCArchive

The following code example shows how to use Write-GLCArchive.

Tools for PowerShell

Example 1: Uploads a single file to the specified vault, returning the archive ID and computed checksum.

```
Write-GLCArchive -VaultName myvault -FilePath c:\temp\blue.bin
```

Output:

<table>
<thead>
<tr>
<th>FilePath</th>
<th>ArchiveId</th>
<th>Checksum</th>

</thead>
<tbody>
<tr>
<td>C:\temp\blue.bin</td>
<td>o9O9jUU...TTX-TpIhQjw</td>
<td>79f3e...f4395b</td>
</tr>
</tbody>
</table>

Example 2: Uploads the contents of a folder hierarchy to the specified vault in the user's account. For each file uploaded the cmdlet emits the filename, corresponding archive ID and the computed checksum of the archive.

```
Write-GLCArchive -VaultName myvault -FolderPath . -Recurse
```
Output:

<table>
<thead>
<tr>
<th>FilePath</th>
<th>ArchiveId</th>
<th>Checksum</th>

**Get-SESIdentity**

The following code example shows how to use Get-SESIdentity.

**Tools for PowerShell**

**Example 1:** This command returns a list containing all of the identities (email addresses and domains) for a specific AWS Account, regardless of verification status.
Get-SESIdentity

- For API details, see ListIdentities in AWS Tools for PowerShell Cmdlet Reference.

Get-SESSendQuota

The following code example shows how to use Get-SESSendQuota.

Tools for PowerShell

Example 1: This command returns the user's current sending limits.

Get-SESSendQuota

- For API details, see GetSendQuota in AWS Tools for PowerShell Cmdlet Reference.

Get-SESSendStatistic

The following code example shows how to use Get-SESSendStatistic.

Tools for PowerShell

Example 1: This command returns the user's sending statistics. The result is a list of data points, representing the last two weeks of sending activity. Each data point in the list contains statistics for a 15-minute interval.

Get-SESSendStatistic

- For API details, see GetSendStatistics in AWS Tools for PowerShell Cmdlet Reference.

### Publish-SNSMessage

The following code example shows how to use `Publish-SNSMessage`.

### Tools for PowerShell

#### Example 1: This example shows publishing a message with a single MessageAttribute declared inline.

```powershell
```

#### Example 2: This example shows publishing a message with multiple MessageAttributes declared in advance.

```powershell
$cityAttributeValue.DataType = "String"
$cityAttributeValue.StringValue = "AnyCity"

$populationAttributeValue = New-Object Amazon.SimpleNotificationService.Model.MessageAttributeValue
$populationAttributeValue.DataType = "Number"
$populationAttributeValue.StringValue = "1250800"

$messageAttributes = New-Object System.Collections.Hashtable
$messageAttributes.Add("City", $cityAttributeValue)
$messageAttributes.Add("Population", $populationAttributeValue)
```

Add-SQSPermission

The following code example shows how to use Add-SQSPermission.

Tools for PowerShell

Example 1: This example allows the specified AWS account to send messages from the specified queue.

Add-SQSPermission -Action SendMessage -AWSAccountID 80398EXAMPLE -Label SendMessagesFromMyQueue -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue

- For API details, see AddPermission in AWS Tools for PowerShell Cmdlet Reference.
Clear-SQSQueue

The following code example shows how to use Clear-SQSQueue.

**Tools for PowerShell**

Example 1: This example deletes all messages from the specified queue.

```powershell
Clear-SQSQueue -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue
```

• For API details, see [PurgeQueue](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Edit-SQSMessageVisibility

The following code example shows how to use Edit-SQSMessageVisibility.

**Tools for PowerShell**

Example 1: This example changes the visibility timeout for the message with the specified receipt handle in the specified queue to 10 hours (10 hours * 60 minutes * 60 seconds = 36000 seconds).

```powershell
Edit-SQSMessageVisibility -QueueUrl https://sqs.us-east-1.amazonaws.com/8039EXAMPLE/MyQueue -ReceiptHandle AQEBgGDh...J/Iqww== -VisibilityTimeout 36000
```

• For API details, see [ChangeMessageVisibility](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Edit-SQSMessageVisibilityBatch

The following code example shows how to use Edit-SQSMessageVisibilityBatch.

**Tools for PowerShell**

Example 1: This example changes the visibility timeout for 2 messages with the specified receipt handles in the specified queue. The first message's visibility timeout is changed to 10 hours (10 hours * 60 minutes * 60 seconds = 36000 seconds). The second message's visibility timeout is changed to 5 hours (5 hours * 60 minutes * 60 seconds = 18000 seconds).

```powershell
$changeVisibilityRequest1 = New-Object Amazon.SQS.Model.ChangeMessageVisibilityBatchRequestEntry
```
$changeVisibilityRequest1.Id = "Request1"
$changeVisibilityRequest1.ReceiptHandle = "AQEBd329...v6gl8Q=="
$changeVisibilityRequest1.VisibilityTimeout = 36000

$changeVisibilityRequest2 = New-Object
    Amazon.SQS.Model.ChangeMessageVisibilityBatchRequestEntry
$changeVisibilityRequest2.Id = "Request2"
$changeVisibilityRequest2.ReceiptHandle = "AQEBgGDh...J/Iqww=="
$changeVisibilityRequest2.VisibilityTimeout = 18000

Edit-SQSMessageVisibilityBatch -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue -Entry $changeVisibilityRequest1, $changeVisibilityRequest2

Output:

**Get-SQSDeadLetterSourceQueue**

The following code example shows how to use `Get-SQSDeadLetterSourceQueue`.

**Tools for PowerShell**

**Example 1:** This example lists the URLs of any queues that rely on the specified queue as their dead letter queue.

```powershell
Get-SQSDeadLetterSourceQueue -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue -Entry $changeVisibilityRequest1, $changeVisibilityRequest2
```

**Output:**

- https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue
- https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyOtherQueue
For API details, see ListDeadLetterSourceQueues in AWS Tools for PowerShell Cmdlet Reference.

Get-SQSQueue

The following code example shows how to use Get-SQSQueue.

Tools for PowerShell

**Example 1:** This example lists all queues.

```
Get-SQSQueue

**Get-SQSQueueUrl**

The following code example shows how to use Get-SQSQueueUrl.

**Tools for PowerShell**

**Example 1: This example lists the URL of the queue with the specified name.**

```
Get-SQSQueueUrl -QueueName MyQueue
```

**Output:**

• For API details, see [GetQueueUrl](#) in *AWS Tools for PowerShell Cmdlet Reference*. 

Amazon SQS
New-SQSQueue

The following code example shows how to use New-SQSQueue.

Tools for PowerShell

Example 1: This example creates a queue with the specified name.

New-SQSQueue -QueueName MyQueue

Output:

https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue

• For API details, see CreateQueue in AWS Tools for PowerShell Cmdlet Reference.

Receive-SQSMessage

The following code example shows how to use Receive-SQSMessage.

Tools for PowerShell

Example 1: This example lists information for up to the next 10 messages to be received for the specified queue. The information will contain values for the specified message attributes, if they exist.

Receive-SQSMessage -AttributeName SenderId, SentTimestamp -MessageAttributeName StudentName, StudentGrade -MessageCount 10 -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue

Output:

 Attributes : {

• For API details, see ReceiveMessage in AWS Tools for PowerShell Cmdlet Reference.

**Remove-SQSMessage**

The following code example shows how to use Remove-SQSMessage.

**Tools for PowerShell**

**Example 1:** This example deletes the message with the specified receipt handle from the specified queue.

```powershell
Remove-SQSMessage -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue -ReceiptHandle AQEBd329...v6g18Q==
```

• For API details, see DeleteMessage in AWS Tools for PowerShell Cmdlet Reference.

**Remove-SQSMessageBatch**

The following code example shows how to use Remove-SQSMessageBatch.

**Tools for PowerShell**

**Example 1:** This example deletes 2 messages with the specified receipt handles from the specified queue.

```powershell
$deleteMessageRequest1 = New-Object Amazon.SQS.Model.DeleteMessageBatchRequestEntry
$deleteMessageRequest1.Id = "Request1"
$deleteMessageRequest1.ReceiptHandle = "AQEBX2g4...wtJSQg=="

$deleteMessageRequest2 = New-Object Amazon.SQS.Model.DeleteMessageBatchRequestEntry
$deleteMessageRequest2.Id = "Request2"
$deleteMessageRequest2.ReceiptHandle = "AQEBqOVY...KTsLYg=="

Remove-SQSMessageBatch -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue -Entry $deleteMessageRequest1, $deleteMessageRequest2
```

**Output:**

```

```
For API details, see [DeleteMessageBatch](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-SQSPermission**

The following code example shows how to use Remove-SQSPermission.

### Tools for PowerShell

**Example 1:** This example removes the permission settings with the specified label from the specified queue.

```
Remove-SQSPermission -Label SendMessagesFromMyQueue -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue
```

For API details, see [RemovePermission](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Remove-SQSQueue**

The following code example shows how to use Remove-SQSQueue.

### Tools for PowerShell

**Example 1:** This example deletes the specified queue.

```

```

For API details, see [DeleteQueue](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Send-SQSMessage**

The following code example shows how to use Send-SQSMessage.

### Tools for PowerShell

**Example 1:** This example sends a message with the specified attributes and message body to the specified queue with message delivery delayed for 10 seconds.
$cityAttributeValue = New-Object Amazon.SQS.Model.MessageAttributeValue
$cityAttributeValue.DataType = "String"
$cityAttributeValue.StringValue = "AnyCity"

$populationAttributeValue = New-Object Amazon.SQS.Model.MessageAttributeValue
$populationAttributeValue.DataType = "Number"
$populationAttributeValue.StringValue = "1250800"

$messageAttributes = New-Object System.Collections.Hashtable
$messageAttributes.Add("City", $cityAttributeValue)
$messageAttributes.Add("Population", $populationAttributeValue)

Send-SQSMessage -DelayInSeconds 10 -MessageAttributes $messageAttributes -MessageBody "Information about the largest city in Any Region." -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue

Output:

</tbody>
</table>

**Send-SQSMessageBatch**

The following code example shows how to use Send-SQSMessageBatch.

**Tools for PowerShell**

**Example 1**: This example sends 2 messages with the specified attributes and message bodies to the specified queue. Delivery is delayed for 15 seconds for the first message and 10 seconds for the second message.

@student1NameAttributeValue = New-Object Amazon.SQS.Model.MessageAttributeValue
@student1NameAttributeValue.DataType = "String"
@student1NameAttributeValue.StringValue = "John Doe"

$message2 = New-Object Amazon.SQS.Model.SendMessageBatchRequestEntry
$message2.DelaySeconds = 10
$message2.Id = "SecondMessage"
$message2.MessageAttributes.Add("StudentName", $student2NameAttributeValue)
$message2.MessageAttributes.Add("StudentGrade", $student2GradeAttributeValue)
$message2.MessageBody = "Information about Jane Doe's grade."

Send-SQSMessageBatch -QueueUrl https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue -Entry $message1, $message2

**Set-SQSQueueAttribute**

The following code example shows how to use `Set-SQSQueueAttribute`.

Tools for PowerShell

Example 1: This example shows how to set a policy subscribing a queue to an SNS topic. When a message is published to the topic, a message is sent to the subscribed queue.

```powershell
# create the queue and topic to be associated
$qurl = New-SQSQueue -QueueName "myQueue"
$topicarn = New-SNSTopic -Name "myTopic"

# get the queue ARN to inject into the policy; it will be returned
# in the output's QueueARN member but we need to put it into a variable
# so text expansion in the policy string takes effect
$qarn = (Get-SQSQueueAttribute -QueueUrl $qurl -AttributeName "QueueArn").QueueARN

# construct the policy and inject arns
$policy = @"{
  "Version": "2008-10-17",
  "Id": "$qarn/SQSPOLICY",
  "Statement": [
    {
      "Sid": "1",
      "Effect": "Allow",
      "Principal": "*",
      "Action": "SQS:SendMessage",
      "Resource": "$qarn",

AWS STS examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with AWS STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

Convert-STSAuthorizationMessage

The following code example shows how to use Convert-STSAuthorizationMessage.

Tools for PowerShell

Example 1: Decodes the additional information contained in the supplied encoded message content that was returned in response to a request. The additional information is encoded because details of the authorization status can constitute privileged information that the user who requested the action should not see.

Convert-STSAuthorizationMessage -EncodedMessage "...encoded message..."

• For API details, see DecodeAuthorizationMessage in AWS Tools for PowerShell Cmdlet Reference.
Get-STSFederationToken

The following code example shows how to use Get-STSFederationToken.

Tools for PowerShell

Example 1: Requests a federated token valid for one hour using "Bob" as the name of the federated user. This name can be used to reference the federated user name in a resource-based policy (such as an Amazon S3 bucket policy). The supplied IAM policy, in JSON format, is used to scope down the permissions that are available to the IAM user. The supplied policy cannot grant more permissions than those granted to the requesting user, with the final permissions for the federated user being the most restrictive set based on the intersection of the passed policy and the IAM user policy.

Get-STSFederationToken -Name "Bob" -Policy "...JSON policy..." -DurationInSeconds 3600

- For API details, see GetFederationToken in AWS Tools for PowerShell Cmdlet Reference.

Get-STSSessionToken

The following code example shows how to use Get-STSSessionToken.

Tools for PowerShell

Example 1: Returns an Amazon.RuntimeAWSCredentials instance containing temporary credentials valid for a set period of time. The credentials used to request temporary credentials are inferred from the current shell defaults. To specify other credentials, use the -ProfileName or -AccessKey/-SecretKey parameters.

Get-STSSessionToken

Output:

<table>
<thead>
<tr>
<th>AccessKeyId</th>
<th>Expiration</th>
</tr>
</thead>
<tbody>
<tr>
<td>SecretAccessKey</td>
<td>SessionToken</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------</td>

<td>EXAMPLEACCESSKEYID</td>
<td>2/16/2015 9:12:28 PM</td>
</tr>
<tr>
<td>examplesecretaccesskey...</td>
<td>SampleTokeN.....</td>
</tr>
</tbody>
</table>
Example 2: Returns an `Amazon.RuntimeAWSCredentials` instance containing temporary credentials valid for one hour. The credentials used to make the request are obtained from the specified profile.

```
Get-STSSessionToken -DurationInSeconds 3600 -ProfileName myprofile
```

Output:

<table>
<thead>
<tr>
<th>AccessKeyId</th>
<th>Expiration</th>
</tr>
</thead>
<tbody>
<tr>
<td>SecretAccessKey</td>
<td>SessionToken</td>
</tr>
<tr>
<td>ExampleAccessKeyId</td>
<td>2/16/2015 9:12:28 PM</td>
</tr>
<tr>
<td>ExampleSecretAccessKeyId...</td>
<td>SampleToken.....</td>
</tr>
</tbody>
</table>

Example 3: Returns an `Amazon.RuntimeAWSCredentials` instance containing temporary credentials valid for one hour using the identification number of the MFA device associated with the account whose credentials are specified in the profile 'myprofilename' and the value provided by the device.

```
Get-STSSessionToken -DurationInSeconds 3600 -ProfileName myprofile -SerialNumber YourMFADeviceSerialNumber -TokenCode 123456
```

Output:

<table>
<thead>
<tr>
<th>AccessKeyId</th>
<th>Expiration</th>
</tr>
</thead>
<tbody>
<tr>
<td>SecretAccessKey</td>
<td>SessionToken</td>
</tr>
<tr>
<td>ExampleAccessKeyId</td>
<td>2/16/2015 9:12:28 PM</td>
</tr>
<tr>
<td>ExampleSecretAccessKeyId...</td>
<td>SampleToken.....</td>
</tr>
</tbody>
</table>

- For API details, see [GetSessionToken](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Use-STSRole**

The following code example shows how to use Use-STSRole.
Tools for PowerShell

Example 1: Returns a set of temporary credentials (access key, secret key and session token) that can be used for one hour to access AWS resources that the requesting user might not normally have access to. The returned credentials have the permissions that are allowed by the access policy of the role being assumed and the policy that was supplied (you cannot use the supplied policy to grant permissions in excess of those defined by the access policy of the role being assumed).

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo" -Policy "...JSON policy..." -DurationInSeconds 3600
```

Example 2: Returns a set of temporary credentials, valid for one hour, that have the same permissions that are defined in the access policy of the role being assumed.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo" -DurationInSeconds 3600
```

Example 3: Returns a set of temporary credentials supplying the serial number and generated token from an MFA associated with the user credentials used to execute the cmdlet.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo" -DurationInSeconds 3600 -SerialNumber "GAHT12345678" -TokenCode "123456"
```

Example 4: Returns a set of temporary credentials that have assumed a role defined in a customer account. For each role that the third party can assume, the customer account must create a role using an identifier that must be passed in the -ExternalId parameter each time the role is assumed.

```
Use-STSRole -RoleSessionName "Bob" -RoleArn "arn:aws:iam::123456789012:role/demo" -DurationInSeconds 3600 -ExternalId "ABC123"
```

- For API details, see AssumeRole in AWS Tools for PowerShell Cmdlet Reference.

Use-STSWebIdentityRole

The following code example shows how to use Use-STSWebIdentityRole.
Tools for PowerShell

Example 1: Returns a temporary set of credentials, valid for one hour, for a user who has been authenticated with the Login with Amazon identity provider. The credentials assume the access policy associated with the role identified by the role ARN. Optionally, you can pass a JSON policy to the -Policy parameter that further refine the access permissions (you cannot grant more permissions than are available in the permissions associated with the role). The value supplied to the -WebIdentityToken is the unique user identifier that was returned by the identity provider.

```
Use-STSWebIdentityRole -DurationInSeconds 3600 -ProviderId "www.amazon.com" -RoleSessionName "app1" -RoleArn "arn:aws:iam::123456789012:role/FederatedWebIdentityRole" -WebIdentityToken "Atza...DVI0r1"
```

- For API details, see [AssumeRoleWithWebIdentity](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Add-ASACommunicationToCase

The following code example shows how to use Add-ASACommunicationToCase.

Tools for PowerShell

Example 1: Adds the body of an email communication to the specified case.

```
Add-ASACommunicationToCase -CaseId "case-12345678910-2013-c4c1d2bf33c5cf47" -CommunicationBody "Some text about the case"
```

Example 2: Adds the body of an email communication to the specified case plus one or more email addresses contained in the CC line of the email.

```
Add-ASACommunicationToCase -CaseId "case-12345678910-2013-c4c1d2bf33c5cf47" -CcEmailAddress @("email1@address.com", "email2@address.com") -CommunicationBody "Some text about the case"
```

• For API details, see AddCommunicationToCase in AWS Tools for PowerShell Cmdlet Reference.

Get-ASACase

The following code example shows how to use Get-ASACase.

Tools for PowerShell

Example 1: Returns the details of all support cases.

```
Get-ASACase
```

Example 2: Returns the details of all support cases since the specified date and time.

```
Get-ASACase -AfterTime "2013-09-10T03:06Z"
```

Example 3: Returns the details of the first 10 support cases, including those that have been resolved.

```
Get-ASACase -MaxResult 10 -IncludeResolvedCases $true
```
Example 4: Returns the details of the single specified support case.

Get-ASACase -CaseIdList "case-12345678910-2013-c4c1d2bf33c5cf47"

Example 5: Returns the details of specified support cases.

Get-ASACase -CaseIdList @("case-12345678910-2013-c4c1d2bf33c5cf47", "case-18929034710-2011-c4fdeabf33c5cf47")

Example 6: Returns all support cases using manual paging. The cases are retrieved in batches of 20.

```
$nextToken = $null
do {
    Get-ASACase -NextToken $nextToken -MaxResult 20
    $nextToken = $AWSHistory.LastServiceResponse.NextToken
} while ($nextToken -ne $null)
```

- For API details, see [DescribeCases](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-ASACommunication

The following code example shows how to use Get-ASACommunication.

Tools for PowerShell

Example 1: Returns all communications for the specified case.

Get-ASACommunication -CaseId "case-12345678910-2013-c4c1d2bf33c5cf47"

Example 2: Returns all communications since midnight UTC on January 1st 2012 for the specified case.

Get-ASACommunication -CaseId "case-12345678910-2013-c4c1d2bf33c5cf47" -AfterTime "2012-01-10T00:00Z"

Example 3: Returns all communications since midnight UTC on January 1st 2012 for the specified case, using manual paging. The communications are retrieved in batches of 20.

```
$nextToken = $null
```
do {
    Get-ASACommunication -CaseId "case-12345678910-2013-c4c1d2bf33c5cf47" -NextToken $nextToken -MaxResult 20
    $nextToken = $AWSHistory.LastServiceResponse.NextToken
} while ($nextToken -ne $null)

• For API details, see [DescribeCommunications](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-ASAService

The following code example shows how to use `Get-ASAService`.

**Tools for PowerShell**

**Example 1:** Returns all available service codes, names and categories.

```
Get-ASAService
```

**Example 2:** Returns the name and categories for the service with the specified code.

```
Get-ASAService -ServiceCodeList "amazon-cloudfront"
```

**Example 3:** Returns the name and categories for the specified service codes.

```
Get-ASAService -ServiceCodeList @("amazon-cloudfront", "amazon-cloudwatch")
```

**Example 4:** Returns the name and categories (in Japanese) for the specified service codes. Currently English ("en") and Japanese ("ja") language codes are supported.

```
Get-ASAService -ServiceCodeList @("amazon-cloudfront", "amazon-cloudwatch") -Language "ja"
```

• For API details, see [DescribeServices](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-ASASeverityLevel

The following code example shows how to use `Get-ASASeverityLevel`.

**Tools for PowerShell**

**Example 1:** Returns the list of severity levels that can be assigned to an AWS Support case.
Get-ASASeverityLevel

**Example 2:** Returns the list of severity levels that can be assigned to an AWS Support case. The names of the levels are returned in Japanese.

Get-ASASeverityLevel -Language "ja"

- For API details, see [DescribeSeverityLevels](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-ASATrustedAdvisorCheck

The following code example shows how to use Get-ASATrustedAdvisorCheck.

**Tools for PowerShell**

**Example 1:** Returns the collection of Trusted Advisor checks. You must specify the Language parameter which can accept either "en" for English output or "ja" for Japanese output.

Get-ASATrustedAdvisorCheck -Language "en"

- For API details, see [DescribeTrustedAdvisorChecks](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-ASATrustedAdvisorCheckRefreshStatus

The following code example shows how to use Get-ASATrustedAdvisorCheckRefreshStatus.

**Tools for PowerShell**

**Example 1:** Returns the current status of refresh requests for the specified checks. Request-ASATrustedAdvisorCheckRefresh can be used to request that the status information of the checks be refreshed.

Get-ASATrustedAdvisorCheckRefreshStatus -CheckId @("checkid1", "checkid2")

- For API details, see [DescribeTrustedAdvisorCheckRefreshStatuses](#) in *AWS Tools for PowerShell Cmdlet Reference*. 
Get-ASATrustedAdvisorCheckResult

The following code example shows how to use Get-ASATrustedAdvisorCheckResult.

Tools for PowerShell

Example 1: Returns the results of a Trusted Advisor check. The list of available Trusted Advisor checks can be obtained using Get-ASATrustedAdvisorChecks. The output is the overall status of the check, the timestamp at which the check was last run and the unique checkid for the specific check. To have the results output in Japanese, add the -Language "ja" parameter.

```
Get-ASATrustedAdvisorCheckResult -CheckId "checkid1"
```

- For API details, see DescribeTrustedAdvisorCheckResult in AWS Tools for PowerShell Cmdlet Reference.

Get-ASATrustedAdvisorCheckSummary

The following code example shows how to use Get-ASATrustedAdvisorCheckSummary.

Tools for PowerShell

Example 1: Returns the latest summary for the specified Trusted Advisor check.

```
Get-ASATrustedAdvisorCheckSummary -CheckId "checkid1"
```

Example 2: Returns the latest summaries for the specified Trusted Advisor checks.

```
Get-ASATrustedAdvisorCheckSummary -CheckId @("checkid1", "checkid2")
```

- For API details, see DescribeTrustedAdvisorCheckSummaries in AWS Tools for PowerShell Cmdlet Reference.

New-ASACase

The following code example shows how to use New-ASACase.
Tools for PowerShell

Example 1: Creates a new case in the AWS Support Center. Values for the -ServiceCode and -CategoryCode parameters can be obtained using the Get-ASAService cmdlet. The value for the -SeverityCode parameter can be obtained using the Get-ASASeverityLevel cmdlet. The -IssueType parameter value can be either "customer-service" or "technical". If successful the AWS Support case number is output. By default the case will be handled in English, to use Japanese add the -Language "ja" parameter. The -ServiceCode, -CategoryCode, -Subject and -CommunicationBody parameters are mandatory.

New-ASACase -ServiceCode "amazon-cloudfront" -CategoryCode "APIs" -SeverityCode "low" -Subject "subject text" -CommunicationBody "description of the case" -CcEmailAddress @("email1@domain.com", "email2@domain.com") -IssueType "technical"

- For API details, see CreateCase in AWS Tools for PowerShell Cmdlet Reference.

Request-ASATrustedAdvisorCheckRefresh

The following code example shows how to use Request-ASATrustedAdvisorCheckRefresh.

Tools for PowerShell

Example 1: Requests a refresh for the specified Trusted Advisor check.

Request-ASATrustedAdvisorCheckRefresh -CheckId "checkid1"

- For API details, see RefreshTrustedAdvisorCheck in AWS Tools for PowerShell Cmdlet Reference.

Resolve-ASACase

The following code example shows how to use Resolve-ASACase.

Tools for PowerShell

Example 1: Returns the initial state of the specified case and the current state after the call to resolve it is completed.

Resolve-ASACase -CaseId "case-12345678910-2013-c4c1d2bf33c5cf47"

**Add-SSMResourceTag**

The following code example shows how to use `Add-SSMResourceTag`.

**Tools for PowerShell**

**Example 1:** This example updates a maintenance window with new tags. There is no output if the command succeeds. The syntax used by this example requires PowerShell version 3 or later.

```powershell
$options1 = @{Key="Stack";Value= @("Production")}
Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType "MaintenanceWindow" -Tag $options1
```

**Example 2:** With PowerShell version 2, you must use `New-Object` to create each tag. There is no output if the command succeeds.

```powershell
$tag1 = New-Object Amazon.SimpleSystemsManagement.Model.Tag
```

For API details, see [ResolveCase](#) in *AWS Tools for PowerShell Cmdlet Reference*.
$tag1.Key = "Stack"
$tag1.Value = "Production"

Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType "MaintenanceWindow" -Tag $tag1

- For API details, see AddTagsToResource in AWS Tools for PowerShell Cmdlet Reference.

**Edit-SSMDocumentPermission**

The following code example shows how to use Edit-SSMDocumentPermission.

**Tools for PowerShell**

**Example 1:** This example adds "share" permissions to all accounts for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScript" -PermissionType "Share" -AccountIdsToAdd all
```

**Example 2:** This example adds "share" permissions to a specific account for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScriptNew" -PermissionType "Share" -AccountIdsToAdd "123456789012"
```

- For API details, see ModifyDocumentPermission in AWS Tools for PowerShell Cmdlet Reference.

**Get-SSMAActivation**

The following code example shows how to use Get-SSMAActivation.

**Tools for PowerShell**

**Example 1:** This example provides details about the activations on your account.

```
Get-SSMAActivation
```

**Output:**
For API details, see [DescribeActivations](#) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-SSMAssociation

The following code example shows how to use `Get-SSMAssociation`.

**Tools for PowerShell**

**Example 1: This example describes the association between an instance and a document.**

```powershell
Get-SSMAssociation -InstanceId "i-0000293fffd8c57862" -Name "AWS-UpdateSSMAgent"
```

**Output:**

**Get-SSMAvailablePatch**

The following code example shows how to use `Get-SSMAvailablePatch`.

**Tools for PowerShell**

**Example 1:** This example gets all available patches for Windows Server 2012 that have a MSRC severity of Critical. The syntax used by this example requires PowerShell version 3 or later.

```powershell
$filter1 = @{Key="PRODUCT";Values=@("WindowsServer2012")}
$filter2 = @{Key="MSRC_SEVERITY";Values=@("Critical")}

Get-SSMAvailablePatch -Filter $filter1,$filter2
```

**Output:**

- Classification : SecurityUpdates
- ContentUrl : https://support.microsoft.com/en-us/kb/2727528
- Description : A security issue has been identified that could allow an unauthenticated remote attacker to compromise your system and gain control over it. You can help protect your system by installing this update from Microsoft. After you install this update, you may have to restart your system.
- Id : 1eb507be-2040-4eeb-803d-abc55700b715
- KbNumber : KB2727528
- Language : All
- MsrrcNumber : MS12-072
- MsrrcSeverity : Critical
- Product : WindowsServer2012
Example 2: With PowerShell version 2, you must use New-Object to create each filter.

```powershell
$filter1 = New-Object Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter1.Key = "PRODUCT"
$filter1.Values = "WindowsServer2012"
$filter2.Key = "MSRC_SEVERITY"
$filter2.Values = "Critical"

Get-SSMAvailablePatch -Filter $filter1,$filter2
```

Example 3: This example fetches all the updates which are released in last 20 days and applicable to products matching WindowsServer2019

```powershell
```

Output:

<table>
<thead>
<tr>
<th>ReleaseDate</th>
<th>Product</th>

### Get-SSMComplianceSummaryList

The following code example shows how to use `Get-SSMComplianceSummaryList`.

#### Tools for PowerShell

**Example 1:** This example returns a summary count of compliant and non-compliant resources for all compliance types.

```powershell
Get-SSMComplianceSummaryList
```

**Output:**

```

### Get-SSMConnectionStatus

The following code example shows how to use `Get-SSMConnectionStatus`.

---

*Systems Manager*
Tools for PowerShell

Example 1: This example retrieves the Session Manager connection status for an instance to determine whether it is connected and ready to receive Session Manager connections.

Get-SSMConnectionStatus -Target i-0a1caf234f12d3dc4

Output:

<table>
<thead>
<tr>
<th>Status</th>
<th>Target</th>

• For API details, see [GetConnectionStatus](https://docs.aws.amazon.com/ssm/latest/powershell.CmdletReference.html) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-SSMDefaultPatchBaseline

The following code example shows how to use Get-SSMDefaultPatchBaseline.

Tools for PowerShell

Example 1: This example displays the default patch baseline.

Get-SSMDefaultPatchBaseline

Output:

• For API details, see [GetDefaultPatchBaseline](https://docs.aws.amazon.com/ssm/latest/powershell.CmdletReference.html) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-SSMDeployablePatchSnapshotForInstance

The following code example shows how to use Get-SSMDeployablePatchSnapshotForInstance.

Tools for PowerShell

Example 1: This example displays the current snapshot for the patch baseline used by an Instance. This command must be run from the instance using the instance Systems Manager.
credentials. To ensure it uses the instance credentials, the example passes an Amazon.Runtime.InstanceProfileAWSCredentials object to the Credentials parameter.

```powershell

</tr>
</tbody>
</table>

Example 2: This example shows how to get the full SnapshotDownloadUrl. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example configures the PowerShell session to use an Amazon.Runtime.InstanceProfileAWSCredentials object.

```powershell
Set-AWSCredential -Credential ([Amazon.Runtime.InstanceProfileAWSCredentials]::new())
(Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f").SnapshotDownloadUrl

- For API details, see `GetDeployablePatchSnapshotForInstance` in AWS Tools for PowerShell Cmdlet Reference.

Get-SSMDocument

The following code example shows how to use Get-SSMDocument.

Tools for PowerShell

Example 1: This example returns the content of a document.
Get-SSMDocument -Name "RunShellScript"

Output:

Get-SSMDocumentList

The following code example shows how to use Get-SSMDocumentList.

Tools for PowerShell

Example 1: Lists all the configuration documents in your account.

```powershell
Get-SSMDocumentList
```

Output:
Example 2: This example retrieves all automation documents with name matching 'Platform'

Get-SSMDocumentList -DocumentFilterList @{Key="DocumentType";Value="Automation"} | Where-Object Name -Match "Platform"

Output:

**Get-SSMEffectivePatchesForPatchBaseline**

The following code example shows how to use Get-SSMEffectivePatchesForPatchBaseline.

**Tools for PowerShell**

**Example 1:** This example lists all patch baselines, with a maximum result list of 1.

```
Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -MaxResult 1
```

**Output:**

### Get-SSMInstanceAssociationsStatus

The following code example shows how to use `Get-SSMInstanceAssociationsStatus`.

**Tools for PowerShell**

**Example 1:** This example shows details of the associations for an instance.

```
Get-SSMInstanceAssociationsStatus -InstanceId "i-0000293ffd8c57862"
```

**Output:**

Example 4: This example lists ssm managed instances and exports InstanceId, PingStatus, LastPingDateTime and PlatformName to a csv file.

```
Get-SSMInstanceInformation | Select-Object InstanceId, PingStatus, LastPingDateTime, PlatformName | Export-Csv Instance-details.csv -NoTypeInformation
```

- For API details, see [DescribeInstanceInformation](https://aws.amazon.com) in *AWS Tools for PowerShell Cmdlet Reference*.
Get-SSMInstancePatch

The following code example shows how to use Get-SSMInstancePatch.

**Tools for PowerShell**

**Example 1: This example gets the patch compliance details for an instance.**

```powershell
Get-SSMInstancePatch -InstanceId "i-08ee91c0b17045407"
```

- For API details, see [DescribeInstancePatches](https://docs.aws.amazon.com/powershell/latest/awstools-powershell-cmdlet-reference.html) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-SSMInstancePatchState

The following code example shows how to use Get-SSMInstancePatchState.

**Tools for PowerShell**

**Example 1: This example gets the patch summary states for an instance.**

```powershell
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407"
```

**Example 2: This example gets the patch summary states for two instances.**

```powershell
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407","i-09a618aec652973a9"
```

- For API details, see [DescribeInstancePatchStates](https://docs.aws.amazon.com/powershell/latest/awstools-powershell-cmdlet-reference.html) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-SSMInstancePatchStatesForPatchGroup

The following code example shows how to use Get-SSMInstancePatchStatesForPatchGroup.

**Tools for PowerShell**

**Example 1: This example gets the patch summary states per-instance for a patch group.**

```powershell
Get-SSMInstancePatchStatesForPatchGroup -PatchGroup "Production"
```
For API details, see DescribeInstancePatchStatesForPatchGroup in AWS Tools for PowerShell Cmdlet Reference.

Get-SSMInventory

The following code example shows how to use Get-SSMInventory.

Tools for PowerShell

Example 1: This example gets the custom metadata for your inventory.

```powershell
Get-SSMInventory
```

Output:

```
Data   Id
----   ----
{[AWS:InstanceInformation,
   Amazon.SimpleSystemsManagement.Model.InventoryResultItem]} i-0cb2b964d3e14fd9f
```

For API details, see GetInventory in AWS Tools for PowerShell Cmdlet Reference.

Get-SSMInventoryEntriesList

The following code example shows how to use Get-SSMInventoryEntriesList.

Tools for PowerShell

Example 1: This example lists all the custom inventory entries for an instance.

```powershell
Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName "Custom:RackInfo"
```

Output:

```
CaptureTime : 2016-08-22T10:01:01Z

- For API details, see [ListInventoryEntries] in [AWS Tools for PowerShell Cmdlet Reference].

---

### Get-SSMInventorySchema

The following code example shows how to use `Get-SSMInventorySchema`.

**Tools for PowerShell**

**Example 1:** This example returns a list of inventory type names for the account.

```powershell
Get-SSMInventorySchema
```

- For API details, see [GetInventorySchema] in [AWS Tools for PowerShell Cmdlet Reference].

### Get-SSMLatestEC2Image

The following code example shows how to use `Get-SSMLatestEC2Image`.

**Tools for PowerShell**

**Example 1:** This example lists all the lastest Windows AMIs.

```powershell
PS Get-SSMLatestEC2Image -Path ami-windows-latest
```
Output:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>

</tr>
</tbody>
</table>

Example 2: This example retrieves the AMI id of a specific Amazon Linux image for the us-west-2 region.

PS Get-SSMLatestEC2Image -Path ami-amazon-linux-latest -ImageName amzn-ami-hvm-x86_64-ebs -Region us-west-2

Output:

ami-09b92cd132204c704

Example 3: This example lists all the latest Windows AMIs matching the specified wildcard expression.

Get-SSMLatestEC2Image -Path ami-windows-latest -ImageName *Windows*2019*English*

Output:

Get-SSMMaintenanceWindow

The following code example shows how to use Get-SSMMaintenanceWindow.

Tools for PowerShell

**Example 1: This example gets details about a maintenance window.**

```
Get-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d"
```

**Output:**

```

```

- For API details, see [GetMaintenanceWindow](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Get-SSMMaintenanceWindowExecution

The following code example shows how to use Get-SSMMaintenanceWindowExecution.

Tools for PowerShell

**Example 1: This example lists information about a task executed as part of a maintenance window execution.**

```
Get-SSMMaintenanceWindowExecution -WindowExecutionId "518d5565-5969-4cca-8f0e-da3b2a638355"
```

**Output:**

```

- For API details, see GetMaintenanceWindowExecution in AWS Tools for PowerShell Cmdlet Reference.

Get-SSMMaintenanceWindowExecutionList

The following code example shows how to use Get-SSMMaintenanceWindowExecutionList.

Tools for PowerShell

Example 1: This example lists all of the executions for a maintenance window.

Get-SSMMaintenanceWindowExecutionList -WindowId "mw-03eb9db42890fb82d"

Output:

EndTime           : 2/20/2017 6:30:17 PM

Example 2: This example lists all of the executions for a maintenance window before a specified date.

$option1 = @{Key="ExecutedBefore";Values=@("2016-11-04T05:00:00Z")}
Get-SSMMaintenanceWindowExecutionList -WindowId "mw-03eb9db42890fb82d" -Filter $option1

Example 3: This example lists all of the executions for a maintenance window after a specified date.

$option1 = @{Key="ExecutedAfter";Values=@("2016-11-04T05:00:00Z")}
Get-SSMMaintenanceWindowExecutionList -WindowId "mw-03eb9db42890fb82d" -Filter $option1
• For API details, see DescribeMaintenanceWindowExecutions in AWS Tools for PowerShell Cmdlet Reference.

Get-SSMMaintenanceWindowExecutionTask

The following code example shows how to use Get-SSMMaintenanceWindowExecutionTask.

Tools for PowerShell

Example 1: This example lists information about a task that was part of a maintenance window execution.

```powershell
Get-SSMMaintenanceWindowExecutionTask -TaskId "ac0c6ae1-daa3-4a89-832e-d384503b6586" -WindowExecutionId "518d5565-5969-4cca-8f0e-da3b2a638355"

Get-SSMMaintenanceWindowExecutionTaskInvocationList

The following code example shows how to use Get-SSMMaintenanceWindowExecutionTaskInvocationList.
Tools for PowerShell

Example 1: This example lists the invocations for a task executed as part of a maintenance window execution.

```powershell
Get-SSMMaintenanceWindowExecutionTaskInvocationList -TaskId "ac0c6ae1-daa3-4a89-832e-d384503b6586" -WindowExecutionId "518d5565-5969-4cca-8f0e-da3b2a638355"

Get-SSMMaintenanceWindowExecutionTaskList

The following code example shows how to use `Get-SSMMaintenanceWindowExecutionTaskList`.

Tools for PowerShell

Example 1: This example lists the tasks associated with a maintenance window execution.

```powershell
Get-SSMMaintenanceWindowExecutionTaskList -WindowExecutionId "518d5565-5969-4cca-8f0e-da3b2a638355"
```

Output:
For API details, see [DescribeMaintenanceWindowExecutionTasks](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-SSMMaintenanceWindowList**

The following code example shows how to use `Get-SSMMaintenanceWindowList`.

**Tools for PowerShell**

**Example 1:** This example lists all maintenance windows on your account.

```
Get-SSMMaintenanceWindowList
```

**Output:**

```
Cutoff : 1
Duration : 4
Enabled : True
Name : My-First-Maintenance-Window
WindowId : mw-06d59c1a07c022145
```

For API details, see [DescribeMaintenanceWindows](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Get-SSMMaintenanceWindowTarget**

The following code example shows how to use `Get-SSMMaintenanceWindowTarget`.

**Tools for PowerShell**

**Example 1:** This example lists all of the targets for a maintenance window.
Get-SSMMaintenanceWindowTarget -WindowId "mw-06cf17cbefcb4bf4f"

Output:

OwnerInformation : Single instance
ResourceType     : INSTANCE
Targets          : {InstanceIds}
WindowId         : mw-06cf17cbefcb4bf4f

• For API details, see DescribeMaintenanceWindowTargets in AWS Tools for PowerShell Cmdlet Reference.

Get-SSMMaintenanceWindowTaskList

The following code example shows how to use Get-SSMMaintenanceWindowTaskList.

Tools for PowerShell

Example 1: This example lists all of the tasks for a maintenance window.

Get-SSMMaintenanceWindowTaskList -WindowId "mw-06cf17cbefcb4bf4f"

Output:

LoggingInfo    :
MaxConcurrency : 1
MaxErrors      : 1

TaskParameters : {[commands,
    Amazon.SimpleSystemsManagement.Model.MaintenanceWindowTaskParameterValueExpression]}
Get-SSMParameterHistory

The following code example shows how to use Get-SSMParameterHistory.

Tools for PowerShell

Example 1: This example lists the value history for a parameter.

Get-SSMParameterHistory -Name "Welcome"

Output:

Description : 
KeyId : 
LastModifiedDate : 3/3/2017 6:55:25 PM 
LastModifiedUser : arn:aws:iam::123456789012:user/admin

Type : String 
Value : helloWorld

• For API details, see GetParameterHistory in AWS Tools for PowerShell Cmdlet Reference.

Get-SSMParameterList

The following code example shows how to use Get-SSMParameterList.

Tools for PowerShell

Example 1: This example lists all parameters.

Get-SSMParameterList

Output:
Get-SSMPatchBaseline

The following code example shows how to use Get-SSMPatchBaseline.

Tools for PowerShell

Example 1: This example lists the values for a parameter.

Get-SSMPatchBaseline -Name "Welcome"

Output:

InvalidParameters Parameters
----------------- ----------
{}                {Welcome}

Example 2: This example lists the details of the value.

(Get-SSMPatchBaseline -Name "Welcome" ).Parameters

Output:

Name    Type    Value
----    ----    ----- 
Welcome String Good day, Sunshine!

• For API details, see GetParameters in AWS Tools for PowerShell Cmdlet Reference.
Tools for PowerShell

Example 1: This example lists all patch baselines.

Get-SSMPatchBaseline

Output:

<table>

Example 2: This example lists all patch baselines provided by AWS. The syntax used by this example requires PowerShell version 3 or later.

$filter1 = @{Key="OWNER";Values=@("AWS"))

Output:

Get-SSMPatchBaseline -Filter $filter1

Example 3: This example lists all patch baselines with you as the owner. The syntax used by this example requires PowerShell version 3 or later.

$filter1 = @{Key="OWNER";Values=@("Self")))

Output:

Get-SSMPatchBaseline -Filter $filter1

Example 4: With PowerShell version 2, you must use New-Object to create each tag.
$filter1 = New-Object Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter1.Key = "OWNER"
$filter1.Values = "AWS"

Get-SSMPatchBaseline -Filter $filter1

Output:

- For API details, see [GetPatchBaseline](#) in AWS Tools for PowerShell Cmdlet Reference.

**Get-SSMPatchBaselineForPatchGroup**

The following code example shows how to use Get-SSMPatchBaselineForPatchGroup.

**Tools for PowerShell**

**Example 1:** This example displays the patch baseline for a patch group.

```powershell
Get-SSMPatchBaselineForPatchGroup -PatchGroup "Production"
```

**Output:**

<table>
<thead>
<tr>
<th>BaselineId</th>
<th>PatchGroup</th>

**Get-SSMPatchGroup**

The following code example shows how to use Get-SSMPatchGroup.

**Tools for PowerShell**

**Example 1:** This example lists the patch group registrations.

```powershell
Get-SSMPatchGroup
```

**Output:**

<table>
<thead>
<tr>
<th>BaselineIdentity</th>
<th>PatchGroup</th>

Systems Manager
Get-SSMPatchGroupState

The following code example shows how to use Get-SSMPatchGroupState.

Tools for PowerShell

Example 1: This example gets the high-level patch compliance summary for a patch group.

Get-SSMPatchGroupState -PatchGroup "Production"

Output:

Instances                          : 4
InstancesWithFailedPatches         : 1
InstancesWithInstalledOtherPatches : 4
InstancesWithInstalledPatches      : 3
InstancesWithMissingPatches        : 0
InstancesWithNotApplicablePatches  : 0

Get-SSMResourceComplianceSummaryList

The following code example shows how to use Get-SSMResourceComplianceSummaryList.

Tools for PowerShell

Example 1: This example gets a resource-level summary count. The summary includes information about compliant and non-compliant statuses and detailed compliance-item severity counts for products that match "Windows10". Because the MaxResult default is 100 if the parameter is not specified, and this value is not valid, MaxResult parameter is added, and the value is set to 50.

$FilterValues = @{
    "Key"="Product"
    "Type"="EQUAL"
    "Values"="Windows10"
}
For API details, see [ListResourceComplianceSummaries](https://docs.aws.amazon.com/systemsmanager/latest/userguide/aws-cli-list-resource-compliance-summaries.html) in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-SSMResourceTag

The following code example shows how to use `Get-SSMResourceTag`.

**Tools for PowerShell**

**Example 1:** This example lists the tags for a maintenance window.

```powershell
Get-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType "MaintenanceWindow"
```

**Output:**

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>

<tbody>
<tr>
<td>Stack</td>
<td>Production</td>
</tr>
</tbody>
</table>

For API details, see [ListTagsForResource](https://docs.aws.amazon.com/systemsmanager/latest/userguide/aws-cli-list-tags-resource.html) in *AWS Tools for PowerShell Cmdlet Reference*.

### New-SSMAActivation

The following code example shows how to use `New-SSMAActivation`.

**Tools for PowerShell**

**Example 1:** This example creates a managed instance.

```powershell
New-SSMAActivation -DefaultInstanceName "MyWebServers" -IamRole "SSMAutomationRole" -RegistrationLimit 10
```

**Output:**

<table>
<thead>
<tr>
<th>ActivationCode</th>
<th>ActivationId</th>

</tbody>
</table>
New-SSMAssociation

The following code example shows how to use New-SSMAssociation.

Tools for PowerShell

Example 1: This example associates a configuration document with an instance, using instance IDs.

New-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-UpdateSSMAgent"

Output:

Name                  : AWS-UpdateSSMAgent
InstanceId            : i-0000293ff0d8c57862

Example 2: This example associates a configuration document with an instance, using targets.

$target = @{Key="instanceids";Values=@("i-0cb2b964d3e14fd9f")}
New-SSMAssociation -Name "AWS-UpdateSSMAgent" -Target $target

Output:

Name                  : AWS-UpdateSSMAgent
InstanceId            :
Date                  : 3/1/2017 6:22:21 PM
Status.Name           :
Status.Date           :
Status.Message        :

$params = @{
    "action" = "configure"
    "mode" = "ec2"
    "optionalConfigurationSource" = "ssm"
    "optionalConfigurationLocation" = ""
    "optionalRestart" = "yes"
}
New-SSMAssociation -Name "Configure-CloudWatch" -AssociationName "CWConfiguration" -Target $target -Parameter $params
```

Output:

<table>
<thead>
<tr>

Example 4: This example creates an association with all instances in the region, with AWS-GatherSoftwareInventory. It also provides custom files and registry locations in the parameters to collect

```powershell
$params["windowsRegistry"] = '[["Path":"HKEY_LOCAL_MACHINE\SOFTWARE\Amazon\MachineImage","Recursive":false,"ValueNames":["AMIName"]]]'
$params["files"] = '[["Path":"C:\Program Files","Pattern": ["*.exe"],"Recursive":true}, {"Path":"C:\ProgramData","Pattern": ["*.log"],"Recursive":true}]'
New-SSMAssociation -AssociationName new-in-mum -Name AWS-GatherSoftwareInventory -Target @{Key="instanceids";Values="*"} -Parameter $params -region ap-south-1 -ScheduleExpression "rate(720 minutes)"
```

Output:

| Name                  | AWS-GatherSoftwareInventory |
New-SSMAssociationFromBatch

The following code example shows how to use New-SSMAssociationFromBatch.

**Tools for PowerShell**

**Example 1:** This example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

```powershell
$option1 = @{'InstanceId'='i-0cb2b964d3e14fd9f';'Name'=@('AWS-UpdateSSMAgent')}
$option2 = @{'InstanceId'='i-0000293ffd8c57862';'Name'=@('AWS-UpdateSSMAgent')}
New-SSMAssociationFromBatch -Entry $option1,$option2
```

**Output:**

```
Failed  Successful  
-------  ----------
{}      {Amazon.SimpleSystemsManagement.Model.FailedCreateAssociation,
         Amazon.SimpleSystemsManagement.Model.FailedCreateAsso...}
```

**Example 2:** This example will show the full details of a successful operation.

```powershell
$option1 = @{'InstanceId'='i-0cb2b964d3e14fd9f';'Name'=@('AWS-UpdateSSMAgent')}
$option2 = @{'InstanceId'='i-0000293ffd8c57862';'Name'=@('AWS-UpdateSSMAgent')}
(New-SSMAssociationFromBatch -Entry $option1,$option2).Successful
```

- For API details, see [CreateAssociation] in AWS Tools for PowerShell Cmdlet Reference.

New-SSMDocument

The following code example shows how to use New-SSMDocument.
Tools for PowerShell

Example 1: This example creates a document in your account. The document must be in JSON format. For more information about writing a configuration document, see Configuration Document in the SSM API Reference.

```
New-SSMDocument -Content (Get-Content -Raw "c:\temp\RunShellScript.json") -Name "RunShellScript" -DocumentType "Command"
```

Output:

```

- For API details, see CreateDocument in AWS Tools for PowerShell Cmdlet Reference.

New-SSMMaintenanceWindow

The following code example shows how to use New-SSMMaintenanceWindow.

Example 1: This example creates a new maintenance window with the specified name that runs at 4 PM on every Tuesday for 4 hours, with a 1 hour cutoff, and that allows unassociated targets.

```
New-SSMMaintenanceWindow -Name "MyMaintenanceWindow" -Duration 4 -Cutoff 1 -AllowUnassociatedTarget $true -Schedule "cron(0 16 ? * TUE *)"
```
Output:

```powershell
code

For API details, see `CreateMaintenanceWindow` in *AWS Tools for PowerShell Cmdlet Reference*.

**New-SSMPatchBaseline**

The following code example shows how to use `New-SSMPatchBaseline`.

**Tools for PowerShell**

**Example 1:** This example creates a patch baseline that approves patches, seven days after they are released by Microsoft, for managed instances running Windows Server 2019 in a production environment.

```powershell
code

$rule = New-Object Amazon.SimpleSystemsManagement.Model.PatchRule
$rule.ApproveAfterDays = 7

$ruleFilters = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilterGroup

$patchFilter.Key = "PRODUCT"
$patchFilter.Values = "WindowsServer2019"

$severityFilter.Key = "MSRC_SEVERITY"
$severityFilter.Values.Add("Critical")
$severityFilter.Values.Add("Important")
$severityFilter.Values.Add("Moderate")

$classificationFilter.Key = "CLASSIFICATION"
$classificationFilter.Values.Add("SecurityUpdates")
$classificationFilter.Values.Add("Updates")
$classificationFilter.Values.Add("UpdateRollups")
$classificationFilter.Values.Add("CriticalUpdates")

$ruleFilters.PatchFilters.Add($severityFilter)
$ruleFilters.PatchFilters.Add($classificationFilter)
$ruleFilters.PatchFilterGroup = $ruleFilters

code
```
```
New-SSMPatchBaseline -Name "Production-Baseline-Windows2019" -Description "Baseline containing all updates approved for production systems" -ApprovalRules_PatchRule $rule
```

**Output:**

```
pb-0z4z6221c4296b23z
```

- For API details, see [CreatePatchBaseline](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-SSMDefaultPatchBaseline**

The following code example shows how to use `Register-SSMDefaultPatchBaseline`.

**Tools for PowerShell**

**Example 1:** This example registers a patch baseline as the default patch baseline.

```
Register-SSMDefaultPatchBaseline -BaselineId "pb-03da896ca3b68b639"
```

**Output:**

```
pb-03da896ca3b68b639
```

- For API details, see [RegisterDefaultPatchBaseline](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-SSMPatchBaselineForPatchGroup**

The following code example shows how to use `Register-SSMPatchBaselineForPatchGroup`.

**Tools for PowerShell**

**Example 1:** This example registers a patch baseline for a patch group.

```
Register-SSMPatchBaselineForPatchGroup -BaselineId "pb-03da896ca3b68b639" -PatchGroup "Production"
```

**Output:**
BaselineId           PatchGroup

pb-03da896ca3b68b639 Production

- For API details, see [RegisterPatchBaselineForPatchGroup](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Register-SSMTargetWithMaintenanceWindow**

The following code example shows how to use `Register-SSMTargetWithMaintenanceWindow`.

**Tools for PowerShell**

**Example 1:** This example registers an instance with a maintenance window.

```powershell
$options1 = @{Key="InstanceIds";Values=@("i-0000293ffd8c57862")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target $options1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

**Output:**

d8e47760-23ed-46a5-9f28-927337725398

**Example 2:** This example registers multiple instances with a maintenance window.

```powershell
$options1 =
@{Key="InstanceIds";Values=@("i-0000293ffd8c57862","i-0cb2b964d3e14fd9f")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target $options1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

**Output:**

6ab5c208-9fc4-4697-84b7-b02a6cc25f7d

**Example 3:** This example registers an instance with a maintenance window using EC2 tags.

```powershell
$options1 = @{Key="tag:Environment";Values@("Production")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target $options1 -OwnerInformation "Production Web Servers" -ResourceType "INSTANCE"
```
Output:

- For API details, see RegisterTargetWithMaintenanceWindow in AWS Tools for PowerShell Cmdlet Reference.

Register-SSMTaskWithMaintenanceWindow

The following code example shows how to use Register-SSMTaskWithMaintenanceWindow.

Tools for PowerShell

Example 1: This example registers a task with a maintenance window using an instance ID. The output is the Task ID.

```powershell
$parameters = @{} $parameterValues = New-Object Amazon.SimpleSystemsManagement.Model.MaintenanceWindowTaskParameterValueExpression $parameterValues.Values = @("Install") $parameters.Add("Operation", $parameterValues) Register-SSMTaskWithMaintenanceWindow -WindowId "mw-03a342e62c96d31b0" -ServiceRoleArn "arn:aws:iam::123456789012:role/MaintenanceWindowsRole" -MaxConcurrency 1 -MaxError 1 -TaskArn "AWS-RunShellScript" -Target @{ Key="InstanceId";Values="i-0000293ff8c57862" } -TaskType "RUN_COMMAND" -Priority 10 -TaskParameter $parameters
```

Output:

f34a2c47-ddfd-4c85-a88d-72366b69af1b

Example 2: This example registers a task with a maintenance window using a target ID. The output is the Task ID.

```powershell
$parameters = @{} $parameterValues = New-Object Amazon.SimpleSystemsManagement.Model.MaintenanceWindowTaskParameterValueExpression $parameterValues.Values = @("Install") $parameters.Add("Operation", $parameterValues) Register-SSMTaskWithMaintenanceWindow -WindowId "mw-03a342e62c96d31b0" -ServiceRoleArn "arn:aws:iam::123456789012:role/MaintenanceWindowsRole" -MaxConcurrency 1 -MaxError 1 -TaskArn "AWS-RunShellScript" -Target @{ Key="InstanceId";Values="i-0000293ff8c57862" } -TaskType "RUN_COMMAND" -Priority 10 -TaskParameter $parameters
```

Output:

f34a2c47-ddfd-4c85-a88d-72366b69af1b
Example 3: This example creates a parameter object for the run command document AWS-RunPowerShellScript and creates a task with given maintenance window using target ID. The return output is the task ID.

```powershell

$props = @{
    WindowId = "mw-0123e4cbe56ff7ae"
    ServiceRoleArn = "arn:aws:iam::123456789012:role/MaintenanceWindowsRole"

Remove-SSMAssociation
The following code example shows how to use Remove-SSMAssociation.

Tools for PowerShell

Example 1: This example deletes the association between an instance and a document. There is no output if the command succeeds.

Remove-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-UpdateSSMAgent"

• For API details, see DeleteActivation in AWS Tools for PowerShell Cmdlet Reference.
• For API details, see DeleteAssociation in AWS Tools for PowerShell Cmdlet Reference.

Remove-SSMDocument

The following code example shows how to use Remove-SSMDocument.

Tools for PowerShell

Example 1: This example deletes a document. There is no output if the command succeeds.

Remove-SSMDocument -Name "RunShellScript"

• For API details, see DeleteDocument in AWS Tools for PowerShell Cmdlet Reference.

Remove-SSMMaintenanceWindow

The following code example shows how to use Remove-SSMMaintenanceWindow.

Tools for PowerShell

Example 1: This example removes a maintenance window.

Remove-SSMMaintenanceWindow -WindowId "mw-06d59c1a07c022145"

Output:

mw-06d59c1a07c022145

• For API details, see DeleteMaintenanceWindow in AWS Tools for PowerShell Cmdlet Reference.

Remove-SSMParameter

The following code example shows how to use Remove-SSMParameter.

Tools for PowerShell

Example 1: This example deletes a parameter. There is no output if the command succeeds.

Remove-SSMParameter -Name "helloWorld"

• For API details, see DeleteParameter in AWS Tools for PowerShell Cmdlet Reference.
Remove-SSMPatchBaseline

The following code example shows how to use Remove-SSMPatchBaseline.

Tools for PowerShell

Example 1: This example deletes a patch baseline.

```
Remove-SSMPatchBaseline -BaselineId "pb-045f10b4f382baeda"
```

Output:

```
pb-045f10b4f382baeda
```

- For API details, see [DeletePatchBaseline](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-SSMResourceTag

The following code example shows how to use Remove-SSMResourceTag.

Tools for PowerShell

Example 1: This example removes a tag from a maintenance window. There is no output if the command succeeds.

```
Remove-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType "MaintenanceWindow" -TagKey "Production"
```

- For API details, see [RemoveTagsFromResource](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Send-SSMCommand

The following code example shows how to use Send-SSMCommand.

Tools for PowerShell

Example 1: This example runs an echo command on a target instance.

```
Send-SSMCommand -DocumentName "AWS-RunPowerShellScript" -Parameter @{commands = "echo helloWorld"} -Target @{Key="instanceids";Values=('@"i-0cb2b964d3e14fd9f"')}
```

@[ sourceType='GitHub';sourceInfo='{"owner": "me","repository": "amazon-ssm","path": "Examples/Install-Win32OpenSSH"}; "commandLine"=".\Install-Win32OpenSSH.ps1" -InstanceId i-0cb2b964d3e14fd9f
```

- For API details, see [SendCommand](#) in AWS Tools for PowerShell Cmdlet Reference.

**Start-SSMAutomationExecution**

The following code example shows how to use `Start-SSMAutomationExecution`.

**Tools for PowerShell**

Example 1: This example runs a document specifying an Automation role, an AMI source ID, and an Amazon EC2 instance role.
Start-SSMAutomationExecution -DocumentName AWS-UpdateLinuxAmi - Parameter @{'AutomationAssumeRole'='arn:aws:iam::123456789012:role/SSMAutomationRole';'SourceAmiId'='ami-f173cc91';'InstanceIamRole'=EC2InstanceRole'}

Output:

- For API details, see StartAutomationExecution in AWS Tools for PowerShell Cmdlet Reference.

Stop-SSMAutomationExecution

The following code example shows how to use Stop-SSMAutomationExecution.

Tools for PowerShell

Example 1: This example stops an Automation Execution. There is no output if the command succeeds.

Stop-SSMAutomationExecution -AutomationExecutionId "4105a4fc-f944-11e6-9d32-8fb2db27a909"

- For API details, see StopAutomationExecution in AWS Tools for PowerShell Cmdlet Reference.

Stop-SSMCommand

The following code example shows how to use Stop-SSMCommand.

Tools for PowerShell

Example 1: This example attempts to cancel a command. There is no output if the operation succeeds.

Stop-SSMCommand -CommandId "9ded293e-e792-4440-8e3e-7b8ec5feaa38"

- For API details, see CancelCommand in AWS Tools for PowerShell Cmdlet Reference.

Unregister-SSMManagedInstance

The following code example shows how to use Unregister-SSMManagedInstance.
Tools for PowerShell

Example 1: This example deregisters a managed instance. There is no output if the command succeeds.

```
Unregister-SSMManagedInstance -InstanceId "mi-08ab247cdf1046573"
```

* For API details, see [DeregisterManagedInstance](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Unregister-SSMPatchBaselineForPatchGroup**

The following code example shows how to use Unregister-SSMPatchBaselineForPatchGroup.

Tools for PowerShell

Example 1: This example deregisters a patch group from a patch baseline.

```
Unregister-SSMPatchBaselineForPatchGroup -BaselineId "pb-045f10b4f382baeda" -PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup

* For API details, see [DeregisterPatchBaselineForPatchGroup](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Unregister-SSMTargetFromMaintenanceWindow**

The following code example shows how to use Unregister-SSMTargetFromMaintenanceWindow.

Tools for PowerShell

Example 1: This example removes a target from a maintenance window.
Unregister-SSMTargetFromMaintenanceWindow -WindowTargetId "6ab5c208-9fc4-4697-84b7-b02a6cc25f7d" -WindowId "mw-06cf17cbe4bf4f"

Unregister-SSMTaskFromMaintenanceWindow

The following code example shows how to use Unregister-SSMTaskFromMaintenanceWindow.

Tools for PowerShell

**Example 1:** This example removes a task from a maintenance window.

```
Unregister-SSMTaskFromMaintenanceWindow -WindowTaskId "f34a2c47-ddfd-4c85-a88d-72366b69af1b" -WindowId "mw-03a342e62c96d31b0"

- For API details, see [DeregisterTaskFromMaintenanceWindow](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Update-SSMAssociation

The following code example shows how to use Update-SSMAssociation.

Tools for PowerShell

**Example 1:** This example updates an association with a new document version.
Update-SSMAssociation -AssociationId "93285663-92df-44cb-9f26-2292d4ecc439" -DocumentVersion "1"

Output:

- For API details, see UpdateAssociation in AWS Tools for PowerShell Cmdlet Reference.

Update-SSMAssociationStatus

The following code example shows how to use Update-SSMAssociationStatus.

Tools for PowerShell

**Example 1:** This example updates the association status of the association between an instance and a configuration document.

```powershell
Update-SSMAssociationStatus -Name "AWS-UpdateSSMAgent" -InstanceId "i-0000293ffd8c57862" -AssociationStatus_Date "2015-02-20T08:31:11Z" -AssociationStatus_Name "Pending" -AssociationStatus_Message "temporary_status_change" -AssociationStatus_AdditionalInfo "Additional-Config-Needed"
```

Output:

- For API details, see UpdateAssociationStatus in AWS Tools for PowerShell Cmdlet Reference.
Update-SSMDocument

The following code example shows how to use Update-SSMDocument.

Tools for PowerShell

Example 1: This creates a new version of a document with the updated contents of the json file you specify. The document must be in JSON format. You can obtain the document version with the "Get-SSMDocumentVersionList" cmdlet.

```powershell
Update-SSMDocument -Name RunShellScript -DocumentVersion "1" -Content (Get-Content -Raw "c:\temp\RunShellScript.json")
```

Output:

```

```

- For API details, see UpdateDocument in AWS Tools for PowerShell Cmdlet Reference.

Update-SSMDocumentDefaultVersion

The following code example shows how to use Update-SSMDocumentDefaultVersion.

Tools for PowerShell

Example 1: This updates the default version of a document. You can obtain the available document versions with the "Get-SSMDocumentVersionList" cmdlet.
Update-SSMDocumentDefaultVersion -Name "RunShellScript" -DocumentVersion "2"

Output:

<table>
<thead>
<tr>
<th>DefaultVersion</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>

</table>

- For API details, see [UpdateDocumentDefaultVersion](#) in AWS Tools for PowerShell Cmdlet Reference.

**Update-SSMMaintenanceWindow**

The following code example shows how to use `Update-SSMMaintenanceWindow`.

**Tools for PowerShell**

**Example 1: This example updates the name of a maintenance window.**

```powershell
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Name "My-Renamed-MW"
```

Output:

```
AllowUnassociatedTargets : False
Cutoff                   : 1
Duration                 : 2
Enabled                  : True

WindowId                 : mw-03eb9db42890fb82d
```

**Example 2: This example enables a maintenance window.**

```powershell
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Enabled $true
```

Output:

```
AllowUnassociatedTargets : False
Cutoff                   : 1
Duration                 : 2
```
Example 3: This example disables a maintenance window.

```
Update-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d" -Enabled $false
```

**Output:**

```
AllowUnassociatedTargets : False
Cutoff                   : 1
Duration                 : 2
Enabled                  : False

WindowId                 : mw-03eb9db42890fb82d
```

- For API details, see [UpdateMaintenanceWindow](https://docs.aws.amazon.com/tools/latest/dw_ps/awsupdatemaintenancewindow.html) in *AWS Tools for PowerShell Cmdlet Reference*.

### Update-SSMManagedInstanceRole

The following code example shows how to use `Update-SSMManagedInstanceRole`.

**Tools for PowerShell**

Example 1: This example updates the role of a managed instance. There is no output if the command succeeds.

```
Update-SSMManagedInstanceRole -InstanceId "mi-08ab247cdf1046573" -IamRole "AutomationRole"
```

- For API details, see [UpdateManagedInstanceRole](https://docs.aws.amazon.com/tools/latest/dw_ps/awsupdatemanagedinstance_role.html) in *AWS Tools for PowerShell Cmdlet Reference*.

### Update-SSMPatchBaseline

The following code example shows how to use `Update-SSMPatchBaseline`.
Tools for PowerShell

Example 1: This example adds two patches as rejected and one patch as approved to an existing patch baseline.

Update-SSMPatchBaseline -BaselineId "pb-03da896ca3b68b639" -RejectedPatch "KB2032276","MS10-048" -ApprovedPatch "KB2124261"

Output:

ApprovedPatches : {KB2124261}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
ModifiedDate    : 3/3/2017 5:22:10 PM
Name            : Production-Baseline
RejectedPatches : {KB2032276, MS10-048}

• For API details, see UpdatePatchBaseline in AWS Tools for PowerShell Cmdlet Reference.

Write-SSMComplianceItem

The following code example shows how to use Write-SSMComplianceItem.

Tools for PowerShell

Example 1: This example writes a custom compliance item for the given managed instance

$item = [Amazon.SimpleSystemsManagement.Model.ComplianceItemEntry]:.new()
$item.Id = "07Jun2019-3"
$item.Severity="LOW"
$item.Status="COMPLIANT"
$item.Title="Fin-test-1 - custom"
Write-SSMComplianceItem -ResourceId mi-012dcb3ecea45b678 -ComplianceType Custom:VSSCompliant2 -ResourceType ManagedInstance -Item $item -ExecutionSummary_ExecutionTime "07-Jun-2019"

• For API details, see PutComplianceItems in AWS Tools for PowerShell Cmdlet Reference.
Write-SSMInventory

The following code example shows how to use Write-SSMInventory.

Tools for PowerShell

Example 1: This example assigns rack location information to an instance. There is no output if the command succeeds.

```powershell
$data.Add("RackLocation", "Bay B/Row C/Rack D/Shelf F")

$items.Add($data)

$customInventoryItem = New-Object Amazon.SimpleSystemsManagement.Model.InventoryItem
$customInventoryItem.CaptureTime = "2016-08-22T10:01:01Z"
$customInventoryItem.Content = $items
$customInventoryItem.TypeName = "Custom:TestRackInfo2"
$customInventoryItem.SchemaVersion = "1.0"

$inventoryItems = @($customInventoryItem)

Write-SSMInventory -InstanceId "i-0cb2b964d3e14fd9f" -Item $inventoryItems
```

• For API details, see PutInventory in AWS Tools for PowerShell Cmdlet Reference.

Write-SSMPParameter

The following code example shows how to use Write-SSMPParameter.

Tools for PowerShell

Example 1: This example creates a parameter. There is no output if the command succeeds.

```powershell
Write-SSMPParameter -Name "Welcome" -Type "String" -Value "helloWorld"
```

Example 2: This example changes a parameter. There is no output if the command succeeds.
Write-SSMParameter -Name "Welcome" -Type "String" -Value "Good day, Sunshine!" - Overwrite $true

- For API details, see PutParameter in AWS Tools for PowerShell Cmdlet Reference.

Amazon Translate examples using Tools for PowerShell

The following code examples show you how to perform actions and implement common scenarios by using the AWS Tools for PowerShell with Amazon Translate.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**New-WAF2WebACL**

The following code example shows how to use `New-WAF2WebACL`.

**Tools for PowerShell**

*Example 1:* This command creates a new web ACL named "waf-test". Kindly note that as per service API documentation, 'DefaultAction' is a required property. Hence, value for either '-DefaultAction_Allow' and/or '-DefaultAction_Block' should be specified. Since '-DefaultAction_Allow' and '-DefaultAction_Block' are not the required properties, value '@{}' could be used as placeholder as shown in above example.

```powershell
tools" waf-test" -Description "Test" -DefaultAction_Allow @{}
```

**Output:**

```
ARN         : arn:aws:wafv2:eu-west-1:139480602983:regional/webacl/waf-

Approve-WKSIpRule

The following code example shows how to use Approve-WKSIpRule.

Tools for PowerShell

Example 1: This sample adds rules to an existing IP Group

```powershell
$Rule = @(
    @{IPRule = "10.1.0.0/0"; RuleDesc = "First Rule Added"},
    @{IPRule = "10.2.0.0/0"; RuleDesc = "Second Rule Added"}

- For API details, see [AuthorizeIpRules](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Copy-WKSWorkspaceImage**

The following code example shows how to use `Copy-WKSWorkspaceImage`.

**Tools for PowerShell**

**Example 1:** This sample copies workspace Image with specified ID from us-west-2 to the current region with the name "CopiedImageTest"

```powershell
Copy-WKSWorkspaceImage -Name CopiedImageTest -SourceRegion us-west-2 -SourceImageId wsi-djfoedhw6
```

**Output:**

```

```

- For API details, see [CopyWorkspaceImage](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Edit-WKSClientProperty**

The following code example shows how to use `Edit-WKSClientProperty`.

**Tools for PowerShell**

**Example 1:** This sample enables Reconnection for the Workspaces Client

```powershell
Edit-WKSClientProperty -Region us-west-2 -ClientProperties_ReconnectEnabled "ENABLED" -ResourceId d-123414a369
```

- For API details, see [ModifyClientProperties](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Edit-WKSSelfServicePermission**

The following code example shows how to use `Edit-WKSSelfServicePermission`.
Tools for PowerShell

Example 1: This sample enables self service permissions to Change compute type and Increase Volume Size for the specified Directory

```
Edit-WKSSelfservicePermission -Region us-west-2 -ResourceId d-123454a369 -SelfservicePermissions_ChangeComputeType ENABLED -SelfservicePermissions_IncreaseVolumeSize ENABLED
```

- For API details, see ModifySelfservicePermissions in AWS Tools for PowerShell Cmdlet Reference.

**Edit-WKSWorkspaceAccessProperty**

The following code example shows how to use Edit-WKSWorkspaceAccessProperty.

Tools for PowerShell

Example 1: This sample enables Workspace access on Android and Chrome OS for the specified Directory

```
```

- For API details, see ModifyWorkspaceAccessProperties in AWS Tools for PowerShell Cmdlet Reference.

**Edit-WKSWorkspaceCreationProperty**

The following code example shows how to use Edit-WKSWorkspaceCreationProperty.

Tools for PowerShell

Example 1: This sample enables Internet Access and Maintenance Mode to true as default values while creating a Workspace

```
Edit-WKSWorkspaceCreationProperty -Region us-west-2 -ResourceId d-123454a369 -WorkspaceCreationProperties_EnableInternetAccess $true -WorkspaceCreationProperties_EnableMaintenanceMode $true
```
AWS Tools for PowerShell

- For API details, see ModifyWorkspaceCreationProperties in AWS Tools for PowerShell Cmdlet Reference.

**Edit-WKSWorkspaceProperty**

The following code example shows how to use Edit-WKSWorkspaceProperty.

**Tools for PowerShell**

**Example 1:** This Sample changes the Workspace Running Mode Property to Auto Stop for the specified Workspace

```
Edit-WKSWorkspaceProperty -WorkspaceId ws-w361s100v -Region us-west-2 -WorkspaceProperties_RunningMode AUTO_STOP
```

- For API details, see ModifyWorkspaceProperties in AWS Tools for PowerShell Cmdlet Reference.

**Edit-WKSWorkspaceState**

The following code example shows how to use Edit-WKSWorkspaceState.

**Tools for PowerShell**

**Example 1:** This sample changes the state of the specified Workspace to Available

```
Edit-WKSWorkspaceState -WorkspaceId ws-w361s100v -Region us-west-2 -WorkspaceState AVAILABLE
```

- For API details, see ModifyWorkspaceState in AWS Tools for PowerShell Cmdlet Reference.

**Get-WKSClientProperty**

The following code example shows how to use Get-WKSClientProperty.

**Tools for PowerShell**

**Example 1:** This sample gets the Client Properties of the Workspace Client for the specified Directory

```
Get-WKSClientProperty -ResourceId d-223562a123
```
• For API details, see `DescribeClientProperties` in *AWS Tools for PowerShell Cmdlet Reference*.

### Get-WKSIpGroup

The following code example shows how to use Get-WKSIpGroup.

**Tools for PowerShell**

**Example 1: This sample gets the details of the specified IP Group in the specified region**

```
Get-WKSIpGroup -Region us-east-1 -GroupId wsipg-8m1234v45
```

**Output:**

```

Get-WKSWorkspace

The following code example shows how to use Get-WKSWorkspace.

Tools for PowerShell

Example 1: Retrieves details of all your WorkSpaces to the pipeline.

```powershell
Get-WKSWorkspace
```

Output:

```
BundleId                : wsb-1a2b3c4d

UserVolumeEncryptionEnabled : False
VolumeEncryptionKey    : 
WorkspaceId            : ws-1a2b3c4d
WorkspaceProperties    : Amazon.WorkSpaces.Model.WorkspaceProperties
```

Example 2: This command shows the values of child properties of WorkSpaceProperties for a workspace in the us-west-2 region. For more information about the child properties of WorkSpaceProperties, see https://docs.aws.amazon.com/workspaces/latest/api/API_WorkspaceProperties.html.

```powershell
(Get-WKSWorkspace -Region us-west-2 -WorkSpaceId ws-xfdaf7hc9s).WorkspaceProperties
```

Output:

```
ComputeTypeName                     : STANDARD
RootVolumeSizeGib                   : 80
RunningMode                         : AUTO_STOP

```
Example 3: This command shows the value of the child property RootVolumeSizeGib of WorkSpaceProperties for a workspace in the us-west-2 region. The root volume size, in GiB, is 80.

```
(Get-WKSWorkspace -Region us-west-2 -WorkSpaceId ws-xdaf7hc9s).WorkspaceProperties.RootVolumeSizeGib
```

Output:

```
80
```

- For API details, see [DescribeWorkspaces](#) in [AWS Tools for PowerShell Cmdlet Reference](#).

Get-WKSWorkspaceBundle

The following code example shows how to use Get-WKSWorkspaceBundle.

Tools for PowerShell

Example 1: This sample fetches details of all the Workspace bundles in the current region

```
Get-WKSWorkspaceBundle
```

Output:

```
BundleId : wsb-sfhdv342

Get-WKSWorkspaceImage

The following code example shows how to use Get-WKSWorkspaceImage.

Example 1: This sample fetches all the details of all images in the region

Get-WKSWorkspaceImage

Output:
Description : This image is copied from another image

- For API details, see DescribeWorkspaceImages in AWS Tools for PowerShell Cmdlet Reference.

Get-WKSWorkspaceSnapshot

The following code example shows how to use Get-WKSWorkspaceSnapshot.

Tools for PowerShell

Example 1: This sample shows the timestamp of the most recent snapshot created for the specified Workspace

Get-WKSWorkspaceSnapshot -WorkspaceId ws-w361s100v

Output:

<table>

Get-WKSWorkspacesConnectionStatus

The following code example shows how to use Get-WKSWorkspacesConnectionStatus.

Tools for PowerShell

Example 1: This sample fetches the connection status for the specified Workspace

Get-WKSWorkspacesConnectionStatus -WorkspaceId ws-w123s234r
For API details, see `DescribeWorkspacesConnectionStatus` in *AWS Tools for PowerShell Cmdlet Reference*.

**New-WKSIpGroup**

The following code example shows how to use New-WKSIpGroup.

**Tools for PowerShell**

**Example 1:** This sample creates an empty IP group named FreshEmptyIpGroup

```powershell
New-WKSIpGroup -GroupName "FreshNewIPGroup"
```

**Output:**
```
wsipg-w45rty4ty
```

For API details, see `CreateIpGroup` in *AWS Tools for PowerShell Cmdlet Reference*.

**New-WKSTag**

The following code example shows how to use New-WKSTag.

**Tools for PowerShell**

**Example 1:** This example adds a new tag to a workspace named ws-wsname. The tag has a key of "Name", and a key value of AWS_Workspace.

```powershell
$tag = New-Object Amazon.WorkSpaces.Model.Tag
$tag.Key = "Name"
$tag.Value = "AWS_Workspace"
New-WKSTag -Region us-west-2 -WorkspaceId ws-wsname -Tag $tag
```

**Example 2:** This example adds multiple tags to a workspace named ws-wsname. One tag has a key of "Name" and a key value of AWS_Workspace; the other tag has a tag key of "Stage" and a key value of "Test".

```powershell
$tag = New-Object Amazon.WorkSpaces.Model.Tag
```
$tag.Key = "Name"
$tag.Value = "AWS_Workspace"

$tag2 = New-Object Amazon.WorkSpaces.Model.Tag
$tag2.Key = "Stage"
$tag2.Value = "Test"
New-WKSTag -Region us-west-2 -WorkspaceId ws-wsname -Tag $tag,$tag2

- For API details, see CreateTags in AWS Tools for PowerShell Cmdlet Reference.

New-WKSWorkspace

The following code example shows how to use New-WKSWorkspace.

Tools for PowerShell

Example 1: Create a WorkSpace for the supplied bundle, directory, and user.

New-WKSWorkspace -Workspace @{"BundleID" = "wsb-1a2b3c4d"; "DirectoryId" = "d-1a2b3c4d"; "UserName" = "USERNAME"}

Example 2: This example creates multiple WorkSpaces

New-WKSWorkspace -Workspace @{"BundleID" = "wsb-1a2b3c4d"; "DirectoryId" = "d-1a2b3c4d"; "UserName" = "USERNAME_1"},@{"BundleID" = "wsb-1a2b3c4d"; "DirectoryId" = "d-1a2b3c4d"; "UserName" = "USERNAME_2"}

- For API details, see CreateWorkspaces in AWS Tools for PowerShell Cmdlet Reference.

Register-WKSIpGroup

The following code example shows how to use Register-WKSIpGroup.

Tools for PowerShell

Example 1: This sample registers the specified IP Group with the specified Directory

Register-WKSIpGroup -GroupId wsipg-23ahsdres -DirectoryId d-123412e123

- For API details, see AssociateIpGroups in AWS Tools for PowerShell Cmdlet Reference.
Register-WKSSWorkspaceDirectory

The following code example shows how to use Register-WKSSWorkspaceDirectory.

**Tools for PowerShell**

**Example 1: This sample registers the specified directory for Workspaces Service**

```
Register-WKSSWorkspaceDirectory -DirectoryId d-123412a123 -EnableWorkDoc $false
```

- For API details, see [RegisterWorkspaceDirectory](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-WKSIpGroup

The following code example shows how to use Remove-WKSIpGroup.

**Tools for PowerShell**

**Example 1: This sample deletes the specified IP Group**

```
Remove-WKSIpGroup -GroupId wsipg-32fhgtred
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-WKSIpGroup (DeleteIpGroup)" on target "wsipg-32fhgtred".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y
```

- For API details, see [DeleteIpGroup](#) in *AWS Tools for PowerShell Cmdlet Reference*.

Remove-WKSTag

The following code example shows how to use Remove-WKSTag.

**Tools for PowerShell**

**Example 1: This sample removes the tag associated with the Workspace**
Remove-WKSTag -ResourceId ws-w10b3abcd -TagKey "Type"

Output:

Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-WKSTag (DeleteTags)" on target "ws-w10b3abcd".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is "Y"): Y

• For API details, see DeleteTags in AWS Tools for PowerShell Cmdlet Reference.

Remove-WKSWorkspace

The following code example shows how to use Remove-WKSWorkspace.

Tools for PowerShell

Example 1: Terminates multiple WorkSpaces. use of the -Force switch stops the cmdlet from prompting for confirmation.

Remove-WKSWorkspace -WorkspaceId "ws-1a2b3c4d5","ws-6a7b8c9d0" -Force

Example 2: Retrieves the collection of all your WorkSpaces and pipes the IDs to the -WorkspaceId parameter of Remove-WKSWorkspace, terminating all of the WorkSpaces. The cmdlet will prompt before each WorkSpace is terminated. To suppress the confirmation prompt add the -Force switch.

Get-WKSWorkspaces | Remove-WKSWorkspace

Example 3: This example shows how to pass TerminateRequest objects defining the WorkSpaces to be terminated. The cmdlet will prompt for confirmation before proceeding, unless the -Force switch parameter is also specified.

$arrRequest = @()
$request1 = New-Object Amazon.WorkSpaces.Model.TerminateRequest
$request1.WorkspaceId = 'ws-12345678'
$arrRequest += $request1
$request2 = New-Object Amazon.WorkSpaces.Model.TerminateRequest
$request2.WorkspaceId = 'ws-abcdefgh'
$arrRequest += $request2
Remove-WKSWorkspace -Request $arrRequest

- For API details, see [TerminateWorkspaces](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Reset-WKSWorkspace**

The following code example shows how to use Reset-WKSWorkspace.

**Tools for PowerShell**

**Example 1:** Rebuilds the specified WorkSpace.

```powershell
Reset-WKSWorkspace -WorkspaceId "ws-1a2b3c4d"
```

**Example 2:** Retrieves the collection of all your WorkSpaces and pipes the IDs to the -WorkspaceId parameter of Reset-WKSWorkspace, causing the WorkSpaces to be rebuilt.

```powershell
Get-WKSWorkspaces | Reset-WKSWorkspace
```

- For API details, see [RebuildWorkspaces](#) in *AWS Tools for PowerShell Cmdlet Reference*.

**Restart-WKSWorkspace**

The following code example shows how to use Restart-WKSWorkspace.

**Tools for PowerShell**

**Example 1:** Reboots the specified WorkSpace.

```powershell
Restart-WKSWorkspace -WorkspaceId "ws-1a2b3c4d"
```

**Example 2:** Reboots multiple WorkSpaces.

```powershell
Restart-WKSWorkspace -WorkspaceId "ws-1a2b3c4d","ws-5a6b7c8d"
```

**Example 3:** Retrieves the collection of all your WorkSpaces and pipes the IDs to the -WorkspaceId parameter of Restart-WKSWorkspace, causing the WorkSpaces to be restarted.
Get-WKSWorkspaces | Restart-WKSWorkspace

- For API details, see RebootWorkspaces in AWS Tools for PowerShell Cmdlet Reference.

Stop-WKSWorkspace

The following code example shows how to use Stop-WKSWorkspace.

Tools for PowerShell

**Example 1:** Stops multiple WorkSpaces.

```
Stop-WKSWorkspace -WorkspaceId "ws-1a2b3c4d5","ws-6a7b8c9d0"
```

**Example 2:** Retrieves the collection of all your WorkSpaces and pipes the IDs to the -WorkspaceId parameter of Stop-WKSWorkspace causing the WorkSpaces to be stopped.

```
Get-WKSWorkspaces | Stop-WKSWorkspace
```

**Example 3:** This example shows how to pass StopRequest objects defining the WorkSpaces to be stopped.

```
$arrRequest = @()
$request1 = New-Object Amazon.WorkSpaces.Model.StopRequest
$request1.WorkspaceId = 'ws-12345678'
$arrRequest += $request1
$request2 = New-Object Amazon.WorkSpaces.Model.StopRequest
$request2.WorkspaceId = 'ws-abcdefgh'
$arrRequest += $request2
Stop-WKSWorkspace -Request $arrRequest
```

- For API details, see StopWorkspaces in AWS Tools for PowerShell Cmdlet Reference.

Unregister-WKSIpGroup

The following code example shows how to use Unregister-WKSIpGroup.

Tools for PowerShell

**Example 1:** This sample unregisters the specified IP Group from the specified Directory WorkSpaces.
Unregister-WKSIpGroup -GroupId wsipg-12abcdphq -DirectoryId d-123454b123

- For API details, see [DisassociateIpGroups](#) in *AWS Tools for PowerShell Cmdlet Reference*. 
Security for this AWS Product or Service

Cloud security at Amazon Web Services (AWS) is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations. Security is a shared responsibility between AWS and you. The Shared Responsibility Model describes this as Security of the Cloud and Security in the Cloud.

**Security of the Cloud** – AWS is responsible for protecting the infrastructure that runs all of the services offered in the AWS Cloud and providing you with services that you can use securely. Our security responsibility is the highest priority at AWS, and the effectiveness of our security is regularly tested and verified by third-party auditors as part of the AWS Compliance Programs.

**Security in the Cloud** – Your responsibility is determined by the AWS service you are using, and other factors including the sensitivity of your data, your organization's requirements, and applicable laws and regulations.

This AWS product or service follows the shared responsibility model through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the AWS service security documentation page and AWS services that are in scope of AWS compliance efforts by compliance program.

**Topics**

- Data protection in this AWS product or service
- Identity and Access Management
- Compliance Validation for this AWS Product or Service
- Enforcing a minimum TLS version in the Tools for PowerShell
- Additional security considerations for the Tools for PowerShell

**Data protection in this AWS product or service**

The AWS shared responsibility model applies to data protection in this AWS product or service. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy.
FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a Name field. This includes when you work with this AWS product or service or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Data encryption

A key feature of any secure service is that information is encrypted when it is not being actively used.

Encryption at Rest

The AWS Tools for PowerShell does not itself store any customer data other than the credentials it needs to interact with the AWS services on the user's behalf.
If you use the AWS Tools for PowerShell to invoke an AWS service that transmits customer data to your local computer for storage, then refer to the Security & Compliance chapter in that service's User Guide for information on how that data is stored, protected, and encrypted.

**Encryption in Transit**

By default, all data transmitted from the client computer running the AWS Tools for PowerShell and AWS service endpoints is encrypted by sending everything through an HTTPS/TLS connection.

You don't need to do anything to enable the use of HTTPS/TLS. It is always enabled.

**Identity and Access Management**

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use AWS resources. IAM is an AWS service that you can use with no additional charge.

**Topics**

- Troubleshooting AWS identity and access

**Audience**

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in AWS.

**Service user** – If you use AWS services to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more AWS features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in AWS, see Troubleshooting AWS identity and access or the user guide of the AWS service you are using.

**Service administrator** – If you’re in charge of AWS resources at your company, you probably have full access to AWS. It's your job to determine which AWS features and resources your service users
should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with AWS, see the user guide of the AWS service you are using.

IAM administrator – If you’re an IAM administrator, you might want to learn details about how you can write policies to manage access to AWS. To view example AWS identity-based policies that you can use in IAM, see the user guide of the AWS service you are using.

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.

You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see How to sign in to your AWS account in the AWS Sign-In User Guide.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see Signing AWS API requests in the IAM User Guide.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Multi-factor authentication in the AWS IAM Identity Center User Guide and Using multi-factor authentication (MFA) in AWS in the IAM User Guide.
AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the IAM User Guide.

Federated identity

As a best practice, require human users, including users that require administrator access, to use federation with an identity provider to access AWS services by using temporary credentials.

A federated identity is a user from your enterprise user directory, a web identity provider, the AWS Directory Service, the Identity Center directory, or any user that accesses AWS services by using credentials provided through an identity source. When federated identities access AWS accounts, they assume roles, and the roles provide temporary credentials.

For centralized access management, we recommend that you use AWS IAM Identity Center. You can create users and groups in IAM Identity Center, or you can connect and synchronize to a set of users and groups in your own identity source for use across all your AWS accounts and applications. For information about IAM Identity Center, see What is IAM Identity Center? in the AWS IAM Identity Center User Guide.

IAM users and groups

An IAM user is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the IAM User Guide.

An IAM group is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named IAMAdmins and give that group permissions to administer IAM resources.
Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see When to create an IAM user (instead of a role) in the IAM User Guide.

IAM roles

An IAM role is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see Creating a role for a third-party Identity Provider in the IAM User Guide. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see Permission sets in the AWS IAM Identity Center User Guide.

- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.

- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.

- **Forward access sessions (FAS)** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. When you use some services, you might perform an
action that then initiates another action in a different service. FAS uses the permissions of the principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. FAS requests are only made when a service receives a request that requires interactions with other AWS services or resources to complete. In this case, you must have permissions to perform both actions. For policy details when making FAS requests, see Forward access sessions.

- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the IAM User Guide.

To learn whether to use IAM roles or IAM users, see When to create an IAM role (instead of a user) in the IAM User Guide.

### Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the IAM User Guide.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.
By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

### Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Creating IAM policies](https://docs.aws.amazon.com/iam/latest/userguide/creating-iam-policies.html) in the IAM User Guide.

Identity-based policies can be further categorized as *inline policies* or *managed policies*. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see [Choosing between managed policies and inline policies](https://docs.aws.amazon.com/iam/latest/userguide/choosing-between-managed-policies-and-inline-policies.html) in the IAM User Guide.

### Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must [specify a principal](https://docs.aws.amazon.com/iam/latest/userguide/using-policies-to-control-access.html) in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.
Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the Amazon Simple Storage Service Developer Guide.

Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the Principal field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the IAM User Guide.

- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the AWS Organizations User Guide.

- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the IAM User Guide.
Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the IAM User Guide.

How AWS services work with IAM

To get a high-level view of how AWS services work with most IAM features, see AWS services that work with IAM in the IAM User Guide.

To learn how to use a specific AWS service with IAM, see the security section of the relevant service's User Guide.

Troubleshooting AWS identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS and IAM.

Topics

- I am not authorized to perform an action in AWS
- I am not authorized to perform iam:PassRole
- I want to allow people outside of my AWS account to access my AWS resources

I am not authorized to perform an action in AWS

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the mateojackson IAM user tries to use the console to view details about a fictional my-example-widget resource but doesn't have the fictional awes: GetWidget permissions.

User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform: awes:GetWidget on resource: my-example-widget

In this case, the policy for the mateojackson user must be updated to allow access to the my-example-widget resource by using the awes: GetWidget action.
If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

**I am not authorized to perform iam:PassRole**

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to AWS.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named *marymajor* tries to use the console to perform an action in AWS. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform: iam:PassRole

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

**I want to allow people outside of my AWS account to access my AWS resources**

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether AWS supports these features, see [How AWS services work with IAM](#).
- To learn how to provide access to your resources across AWS accounts that you own, see [Providing access to an IAM user in another AWS account that you own](#) in the IAM User Guide.
- To learn how to provide access to your resources to third-party AWS accounts, see [Providing access to AWS accounts owned by third parties](#) in the IAM User Guide.
- To learn how to provide access through identity federation, see [Providing access to externally authenticated users (identity federation)](#) in the IAM User Guide.
• To learn the difference between using roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

**Compliance Validation for this AWS Product or Service**

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

• **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.

• **Architecting for HIPAA Security and Compliance on Amazon Web Services** – This whitepaper describes how companies can use AWS to create HIPAA-eligible applications.

  **Note**

  Not all AWS services are HIPAA eligible. For more information, see the HIPAA Eligible Services Reference.

• **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.

• **AWS Customer Compliance Guides** – Understand the shared responsibility model through the lens of compliance. The guides summarize the best practices for securing AWS services and map the guidance to security controls across multiple frameworks (including National Institute of Standards and Technology (NIST), Payment Card Industry Security Standards Council (PCI), and International Organization for Standardization (ISO)).

• **Evaluating Resources with Rules** in the AWS Config Developer Guide – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
• **AWS Security Hub** – This AWS service provides a comprehensive view of your security state within AWS. Security Hub uses security controls to evaluate your AWS resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see [Security Hub controls reference](#).

• **AWS Audit Manager** – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

### Enforcing a minimum TLS version in the Tools for PowerShell

To increase security when communicating with AWS services, you should configure the Tools for PowerShell to use the appropriate TLS version. For information about how to do this, see [Enforcing a minimum TLS version](#) in the [AWS SDK for .NET Developer Guide](#).

### Additional security considerations for the Tools for PowerShell

This topic contains security considerations in addition to the security topics covered in earlier sections.

#### Logging of sensitive information

Some operations of this tool might return information that could be considered sensitive, including information from environment variables. The exposure of this information might represent a security risk in certain scenarios; for example, the information could be included in continuous integration and continuous deployment (CI/CD) logs. It is therefore important that you review when you are including such output as part of your logs, and suppress the output when not needed. For additional information about protecting sensitive data, see [Data protection in this AWS product or service](#).

Consider the following best practices:

• Do not use environment variables to store sensitive values for your serverless resources. Instead have your serverless code programmatically retrieve the secret from a secrets store (for example, AWS Secrets Manager).
• Review the contents of your build logs to ensure they do not contain sensitive information. Consider approaches such as piping to /dev/null or capturing the output as a bash or PowerShell variable to suppress command outputs.

• Consider the access of your logs and scope the access appropriately for your use case.
Cmdlet reference for the Tools for PowerShell

The Tools for PowerShell provides cmdlets that you can use to access AWS services. To see what cmdlets are available, see the AWS Tools for PowerShell Cmdlet Reference.
# Document history

This topic describes significant changes to the documentation for the AWS Tools for PowerShell.

We also update the documentation periodically in response to customer feedback. To send feedback about a topic, use the feedback buttons next to "Did this page help you?" located at the bottom of each page.

For additional information about changes and updates to the AWS Tools for PowerShell, see the release notes.

Collection output from cmdlets is always enumerated to the PowerShell pipeline. Automatic support for pageable service calls. New $AWSHistory shell variable collects service responses and optionally service requests. AWSRegion instances use Region field instead of SystemName to aid pipelining. Remove-S3Bucket supports a -DeleteObjects switch option. Fixed usability issue with Set-AWSCredentials. Initialize-AWSDefaults reports from where it obtained credentials and region data. Stop-EC2Instance accepts Amazon(EC2.Model.Reservation instances as input. Generic List<T> parameter types replaced with array types (T[]). Cmdlets that delete or terminate resources prompt for confirmation prior to deletion. Write-S3Object supports in-line text content to upload to Amazon S3.
The install location of the Tools for Windows PowerShell module has changed so that environments using Windows PowerShell version 3 can take advantage of auto-loading. The module and supporting files are now installed to an AWS PowerShell subfolder beneath AWS ToolsPowerShell. Files from previous versions that exist in the AWS ToolsPowerShell folder are automatically removed by the installer. The PSModulePath for Windows PowerShell (all versions) is updated in this release to contain the parent folder of the module (AWS ToolsPowerShell). For systems with Windows PowerShell version 2, the Start Menu shortcut is updated to import the module from the new location and then run Initialize-AWSDefaults. For systems with Windows PowerShell version 3, the Start Menu shortcut is updated to remove the Import-Module command, leaving just Initialize-AWSDefaults. If you edited your PowerShell profile to perform an Import-Mo
module of the AWS PowerShell.ps1 file, you will need to update it to point to the file's new location (or, if using PowerShell version 3, remove the Import-Module statement as it is no longer needed). As a result of these changes, the Tools for Windows PowerShell module is now listed as an available module when executing Get-Module -ListAvailable. In addition, for users of Windows PowerShell version 3, the execution of any cmdlet exported by the module will automatically load the module in the current PowerShell shell without needing to use Import-Module first. This enables interactive use of the cmdlets on a system with an execution policy that disallows script execution.
