Evaluating migration readiness

Migration specialists, Amazon Web Services (AWS)

August 2019 ([document history](#))

A migration readiness assessment is a process of gaining insights into how far along an organization is in their cloud journey, understanding their current cloud-readiness strengths and weaknesses, and building an action plan to close identified gaps. You can use the Amazon Web Services (AWS) Cloud Adoption Framework (AWS CAF) and its six perspectives (business, people, governance, platform, security, and operations) as a framework to help ensure that you have a holistic view of the transformation initiative that is required for an effective move to the cloud.

The AWS Prescriptive Guidance migration strategy uses Migration Readiness Assessment (MRA) as the prescriptive model for the assessment phase. Although other methods are available, they might compromise the completeness or depth of the review.

Three outcomes are expected from a readiness review:

- An understanding of where an organization is in its cloud journey
- Identified areas of strength and weakness from a cloud-readiness perspective
- An action plan to resolve the identified gaps, so the organization can migrate at scale without having to pause to solve foundational issues

In addition, there are often these additional outcomes:

- Alignment and consensus building within the team
- Identification of best practices within the organization that can be leveraged and scaled
- A reduction in roadblocks that can disrupt progress

Targeted business outcomes

This section discusses the three expected outcomes from a cloud-readiness review: understanding the current state, identifying strengths and weaknesses, and creating an action plan.

Understanding the current state of the cloud journey

When organizations contemplate large-scale migration to AWS, they generally fall somewhere along the path of what is called the *stages of adoption*, as illustrated in the following diagram. The four stages—project, foundation, migration, and reinvention—are discussed in the blog post [The Journey Toward Cloud-First & the Stages of Adoption](#) on the AWS Cloud Enterprise Strategy blog. The purpose of a readiness assessment is to determine how far along in the stages of adoption the organization is currently at, and which parts of the organization's environment are sufficiently mature to move to the next stage.

Example:

If an organization is planning their first workload to move to the cloud, they're considered to be in the project (or proof of concept) phase. This phase doesn't require a unified account structure or other foundational constructs. However, to prepare a larger migration initiative, foundational aspects such as proper tagging should be in place. Otherwise, there is a risk of having to delay migrations to solve foundational issues.

Identifying areas of strength and weakness

Identifying areas of strength and weakness is the second main outcome of a readiness assessment. Strengths determine the teams and practices that are ready for broad adoption across the

organization. These are areas that don't require further work to enable successful cloud migrations at scale. Weaknesses are areas where actions need to be taken to improve the practices or capabilities to enable cloud migrations. Solving gaps early ensures a smooth migration process and eliminates the risk of project delays in building out foundational capabilities. The heat map illustrated in the following figure shows areas of strength and weakness across an organization. Action plans will need to be put in place for areas highlighted in yellow or red.

Example:

An IT team might build an account structure that is well suited to cover the upcoming needs of the organization, but application developers and owners might not be aware that their application will be migrated to the AWS Cloud, and might not have the skill set to operate that application in the AWS Cloud. This example illustrates a gap in application owner buy-in and development team preparedness, and the organization should plan corrective actions during readiness assessment.

Creating an action plan to enable scale and speed

After you identify strengths and weaknesses, you will need to put an action plan in place to close the gaps and scale identified areas of strength within the organization. The plan should have assigned owners and due dates to ensure that the project drives forward. We recommend that you engage your internal process improvement and organizational change teams to help drive the cloud initiative forward. These teams usually have toolkits for baselining current capabilities, establishing communications, handling buy-in planning, and similar processes, which will be useful.

Note

The AWS Professional Services team provides a program called *Mobilize*. This prescriptive model guides your organization to develop foundational capabilities across all areas of AWS CAF to address the areas identified in the Migration Readiness Assessment (MRA).

The AWS Partner community also provides services that can help you in your migration readiness efforts.

Readiness assessment process

A readiness assessment consists of these four steps:

1. Schedule the readiness assessment meeting and require attendance.
2. Facilitate discussions by using an AWS CAF-aligned set of questions to guide the conversation.
3. Analyze the gathered information, document observations, and determine next steps.
4. Schedule and conduct a debrief.

The following sections discuss these steps in more detail.

Note

These steps are part of the AWS Migration Readiness Assessment (MRA) process; other approaches will vary.

Before you begin

- Understand your organization's strategy and scope for the assessment.
- Gain buy-in to support the assessment process.

Tasks

1. **Schedule the readiness assessment meeting with the required attendees.** See [Choosing Attendees](#) in the next section.
2. **Facilitate discussions by using an AWS CAF-aligned set of discussion starters (like the [AWS Assessment Tool](#)).** We recommend a 4-6 hour meeting with good cross-representation across your organization. This is a great opportunity to build consensus regarding the organization's current readiness state, identify and align around next actions, and determine any risks.
3. **Analyze the results, and build observations and next steps.** After the MRA meeting, the team facilitating the MRA should meet and compare notes, analyze the results, and build the out-brief pitch that contains the summary observations and next steps to fill the identified gaps. This is also a good time to build a statement of work (SoW) for closing the identified gaps and completing the suggested next steps.

4. **Schedule and conduct a debrief.** This can be done in as little as an hour, but be sure to bring any new attendees up-to-date on the process, share and review outputs, and agree on next steps.

Outputs

- An out-brief deck that summarizes observations, and next steps
- A scheduled meeting to review outputs and next steps
- (Optional but recommended) Estimates and a proposal (for example, a SoW) for the work that needs to be completed

Guidelines

The following sections discuss the tasks listed in the [readiness assessment process](#) in more detail, and provide guidelines, tactics, and recommendations for each step.

- [Conducting the assessment meeting](#)
- [Analyzing the results and identifying actions](#)
- [Presenting the results](#)

Conducting the assessment meeting

We recommend that you include all parties who will be involved in the migration effort in the assessment meeting. One of the primary outcomes of this activity is alignment on the current state of capabilities, and this consensus is best built through dialog with all interested parties.

Scheduling a meeting with a large number of attendees can take some coordination, so be sure to start planning and coordinating attendance two to three weeks before the meeting.

An experienced facilitator can conduct an MRA meeting in 4-6 hours. The ideal scenario is to have everyone in the same room to ensure maximum participation and to enable consensus building. Be sure to arrange comfortable seating with tables, and provide meals and breaks as needed.

Lastly, consider the timing of when particular individuals will be in the room. For example, if the CIO and head of IT Finance can't attend the entire meeting, plan topics accordingly. Strategy, business case, and budgeting are often the first topics to discuss, followed by account structure and tagging questions for bill-back or show-back considerations.

Choosing attendees

Keeping the intent of consensus in mind, we recommend that you invite people who can provide both horizontal and vertical representation across the organization. Suggested attendees:

- CEO
- CTO / chief architect
- CIO
- Managing director

- Business unit owners
- IT finance
- Security leader
- Network leader
- Application development leader
- Infrastructure leader
- Operations leader
- Application owners (first few)

Facilitating the meeting

The meeting should begin with general introductions, to make sure that everyone is aware of who is representing which part of the organization, and to confirm that the proper people are in the room. After introductions, the CIO or their delegate can provide an overview of the cloud strategy and motivation behind the planned migration. This will be followed by detailed MRA discussions for alignment and buy-in.

Example agenda:

MRA Agenda		
9:30	Introductions	
9:45	Review business and technology goals and objectives	Review goals for migrating applications to AWS. Discuss short-term and long-term objectives, risks, and issues related to IT and business application migrations.
10:00 (with breaks every hour)	Assess migration readiness	Review current AWS footprint , applications, operational processes, and integration. Focus your discussions on the following topics:

MRA Agenda

		<ul style="list-style-type: none"> • Total cost of ownership • Business • Governance • People • Platform • Operations • Security
15:00	Summarize feedback and actions	
15:30	Adjourn	

Note

AWS uses a list of around 70 questions that align to the AWS CAF and engage participants through the various areas under evaluation. These questions cover around 24 areas of readiness, and each area is assessed with 2-3 questions.

You can request an MRA facilitation or the list of questions from your AWS Account Manager. To see the questions or to do a self-assessment with a smaller subset of questions, see the [AWS Cloud Adoption Readiness Tool \(CART\)](#).

Analyzing the results and identifying actions

At the conclusion of the MRA session, you will have collected data across the dimensions of the AWS CAF and you can present observations as an executive summary of the general conversation. It isn't necessary at this stage to provide deep technical solutions for each area.

Identify actions for each area to help the organization get to a state where they are ready for migration. The key is to ensure a smooth migration experience for the first few applications they are planning to migrate. During this first pass, don't attempt to provide an action plan to solve every aspect of every application; an iterative approach will help maintain quality and security while providing agility and speed.

For each action, provide a due date and an owner at the minimum. Ideally, a project should be created and started to ensure the timely closing of actions.

Note

Use the [AWS Assessment Tool](#) to gain access to questions. This tool also provides a report generator that assists in analyzing results, summarizing observations and recommended actions, and building a presentation.

Presenting the results

Generally, presenting the observations, actions, and next steps takes about an hour. This session should include the attendees of the MRA discussion session and additional stakeholders if needed.

Start the discussion with a reminder of the business objectives and outcomes that are being pursued. This helps set the right tone as the observations and activities that follow help deliver those outcomes. Follow this up with a general summary and high-level summaries across the areas that were analyzed. Focus on highlighting the broad areas of strength and weakness, and then share the plan that addresses the weaknesses, to enable the organization to meet the level of readiness required for a successful migration. The objective of the session is alignment and agreement on next steps to dive deeper into certain areas and start implementing and building momentum.

Note

If you're following the AWS MRA methodology and tools, areas will be identified by green, red, or yellow (see the [heat map](#) earlier in this guide) to indicate their level of readiness. You can remedy red and yellow scores by completing the activities of the mobilize phase. These scores are not a reflection of the current on-premises status of the application.

Next steps

In this guide, we discussed Migration Readiness Assessment (MRA), which is a method for identifying where an enterprise is in their cloud journey. Using the AWS CAF ensures that you're looking at your enterprise's environment holistically and considering buy-in and business concerns instead of focusing solely on the technical aspects of migration. To learn more, contact an AWS Account Manager.

After a readiness assessment, you should complete the identified actions and implement the defined plan. If you're following AWS methodologies, this would include implementing the mobilize phase of the migration project.

Getting workloads migrated should be the objective of activities after the MRA. To help facilitate this, identify low-risk or easy-to-move workloads that can move in early stages while other actions are being completed. This enables the team to start building up success stories to help gain buy-in and excitement from other teams.

FAQ

This section provides answers to commonly raised questions about migration readiness assessment.

How can I accurately assess my environment?

Consider the volume of resources used by each application, and automate the assessment process to confirm that it is done rapidly and accurately. Assessing your environment manually is a time-consuming process. It exposes your organization to human error. Automating the process will give you insight into what you don't know, and will help you more clearly understand and define these uncertainties so they can be factored into your migration strategy.

AWS Prescriptive Guidance glossary

The following are commonly used terms in strategies, guides, and patterns provided by AWS Prescriptive Guidance. To suggest entries, please use the **Provide feedback** link at the end of the glossary.

Numbers

7 Rs

Seven common migration strategies for moving applications to the cloud. These strategies build upon the 5 Rs that Gartner identified in 2011 and consist of the following:

- Refactor/re-architect – Move an application and modify its architecture by taking full advantage of cloud-native features to improve agility, performance, and scalability. This typically involves porting the operating system and database. Example: Migrate your on-premises Oracle database to the Amazon Aurora PostgreSQL-Compatible Edition.
- Replatform (lift and reshape) – Move an application to the cloud, and introduce some level of optimization to take advantage of cloud capabilities. Example: Migrate your on-premises Oracle database to Amazon Relational Database Service (Amazon RDS) for Oracle in the AWS Cloud.
- Repurchase (drop and shop) – Switch to a different product, typically by moving from a traditional license to a SaaS model. Example: Migrate your customer relationship management (CRM) system to Salesforce.com.
- Rehost (lift and shift) – Move an application to the cloud without making any changes to take advantage of cloud capabilities. Example: Migrate your on-premises Oracle database to Oracle on an EC2 instance in the AWS Cloud.
- Relocate (hypervisor-level lift and shift) – Move infrastructure to the cloud without purchasing new hardware, rewriting applications, or modifying your existing operations. You migrate servers from an on-premises platform to a cloud service for the same platform. Example: Migrate a Microsoft Hyper-V application to AWS.
- Retain (revisit) – Keep applications in your source environment. These might include applications that require major refactoring, and you want to postpone that work until a later time, and legacy applications that you want to retain, because there's no business justification for migrating them.

- Retire – Decommission or remove applications that are no longer needed in your source environment.

active-active migration

A database migration method in which the source and target databases are kept in sync (by using a bidirectional replication tool or dual write operations), and both databases handle transactions from connecting applications during migration. This method supports migration in small, controlled batches instead of requiring a one-time cutover. It's more flexible but requires more work than [active-passive migration](#).

A framework of guidelines and best practices from AWS to help organizations develop an efficient and effective plan to move successfully to the cloud. AWS CAF organizes guidance into six focus areas called perspectives: business, people, governance, platform, security, and operations. The business, people, and governance perspectives focus on business skills and processes; the platform, security, and operations perspectives focus on technical skills and processes. For example, the people perspective targets stakeholders who handle human resources (HR), staffing functions, and people management. A single CI/CD pipeline can use multiple repositories.

defense-in-depth

An information security approach in which a series of security mechanisms and controls are thoughtfully layered throughout a computer network to protect the confidentiality, integrity, and availability of the network and the data within. For more information, see [Detective controls](#) in *Implementing security controls on AWS*.

development value stream mapping (DVSM)

A target metric that represents the health of a service, as measured by a [service-level indicator](#).

shared responsibility model

A model describing the responsibility you share with AWS for cloud security and compliance. AWS is responsible for security *of* the cloud, whereas you are responsible for security *in* the cloud. For more information, see [Shared responsibility model](#).

SIEM

See [security information and event management system](#).

single point of failure (SPOF)

A failure in a single, critical component of an application that can disrupt the system.

SLA

See [service-level agreement](#).

SLI

See [service-level indicator](#).

SLO

See [service-level objective](#).

split-and-seed model

A pattern for scaling and accelerating modernization projects. As new features and product releases are defined, the core team splits up to create new product teams. This helps scale your organization's capabilities and services, improves developer productivity, and supports rapid innovation. For more information, see [Phased approach to modernizing applications in the AWS Cloud](#).

SPOF

See [single point of failure](#).

star schema

A database organizational structure that uses one large fact table to store transactional or measured data and uses one or more smaller dimensional tables to store data attributes. This structure is designed for use in a [data warehouse](#) or for business intelligence purposes.

strangler fig pattern

An approach to modernizing monolithic systems by incrementally rewriting and replacing system functionality until the legacy system can be decommissioned. This pattern uses the analogy of a fig vine that grows into an established tree and eventually overcomes and replaces its host. The pattern was [introduced by Martin Fowler](#) as a way to manage risk when rewriting monolithic systems. For an example of how to apply this pattern, see [Modernizing legacy Microsoft ASP.NET \(ASMX\) web services incrementally by using containers and Amazon API Gateway](#).

subnet

A range of IP addresses in your VPC. A subnet must reside in a single Availability Zone.

supervisory control and data acquisition (SCADA)

In manufacturing, a system that uses hardware and software to monitor physical assets and production operations.

symmetric encryption

An encryption algorithm that uses the same key to encrypt and decrypt the data.

synthetic testing

Testing a system in a way that simulates user interactions to detect potential issues or to monitor performance. You can use [Amazon CloudWatch Synthetics](#) to create these tests.

T

tags

Key-value pairs that act as metadata for organizing your AWS resources. Tags can help you manage, identify, organize, search for, and filter resources. For more information, see [Tagging your AWS resources](#).

target variable

The value that you are trying to predict in supervised ML. This is also referred to as an *outcome variable*. For example, in a manufacturing setting the target variable could be a product defect.

task list

A tool that is used to track progress through a runbook. A task list contains an overview of the runbook and a list of general tasks to be completed. For each general task, it includes the estimated amount of time required, the owner, and the progress.

test environment

See [environment](#).

training

To provide data for your ML model to learn from. The training data must contain the correct answer. The learning algorithm finds patterns in the training data that map the input data attributes to the target (the answer that you want to predict). It outputs an ML model that captures these patterns. You can then use the ML model to make predictions on new data for which you don't know the target.

transit gateway

A network transit hub that you can use to interconnect your VPCs and on-premises networks. For more information, see [What is a transit gateway](#) in the AWS Transit Gateway documentation.

trunk-based workflow

An approach in which developers build and test features locally in a feature branch and then merge those changes into the main branch. The main branch is then built to the development, preproduction, and production environments, sequentially.

trusted access

Granting permissions to a service that you specify to perform tasks in your organization in AWS Organizations and in its accounts on your behalf. The trusted service creates a service-linked role in each account, when that role is needed, to perform management tasks for you. For more information, see [Using AWS Organizations with other AWS services](#) in the AWS Organizations documentation.

tuning

To change aspects of your training process to improve the ML model's accuracy. For example, you can train the ML model by generating a labeling set, adding labels, and then repeating these steps several times under different settings to optimize the model.

two-pizza team

A small DevOps team that you can feed with two pizzas. A two-pizza team size ensures the best possible opportunity for collaboration in software development.

U

uncertainty

A concept that refers to imprecise, incomplete, or unknown information that can undermine the reliability of predictive ML models. There are two types of uncertainty: *Epistemic uncertainty* is caused by limited, incomplete data, whereas *aleatoric uncertainty* is caused by the noise and randomness inherent in the data. For more information, see the [Quantifying uncertainty in deep learning systems](#) guide.

undifferentiated tasks

Also known as *heavy lifting*, work that is necessary to create and operate an application but that doesn't provide direct value to the end user or provide competitive advantage. Examples of undifferentiated tasks include procurement, maintenance, and capacity planning.

upper environments

See [environment](#).

V

vacuuming

A database maintenance operation that involves cleaning up after incremental updates to reclaim storage and improve performance.

version control

Processes and tools that track changes, such as changes to source code in a repository.

VPC peering

A connection between two VPCs that allows you to route traffic by using private IP addresses. For more information, see [What is VPC peering](#) in the Amazon VPC documentation.

vulnerability

A software or hardware flaw that compromises the security of the system.

W

warm cache

A buffer cache that contains current, relevant data that is frequently accessed. The database instance can read from the buffer cache, which is faster than reading from the main memory or disk.

warm data

Data that is infrequently accessed. When querying this kind of data, moderately slow queries are typically acceptable.

window function

A SQL function that performs a calculation on a group of rows that relate in some way to the current record. Window functions are useful for processing tasks, such as calculating a moving average or accessing the value of rows based on the relative position of the current row.

workload

A collection of resources and code that delivers business value, such as a customer-facing application or backend process.

workstream

Functional groups in a migration project that are responsible for a specific set of tasks. Each workstream is independent but supports the other workstreams in the project. For example, the portfolio workstream is responsible for prioritizing applications, wave planning, and collecting migration metadata. The portfolio workstream delivers these assets to the migration workstream, which then migrates the servers and applications.

WORM

See [write once, read many](#).

WQF

See [AWS Workload Qualification Framework](#).

write once, read many (WORM)

A storage model that writes data a single time and prevents the data from being deleted or modified. Authorized users can read the data as many times as needed, but they cannot change it. This data storage infrastructure is considered [immutable](#).

Z

zero-day exploit

An attack, typically malware, that takes advantage of a [zero-day vulnerability](#).

zero-day vulnerability

An unmitigated flaw or vulnerability in a production system. Threat actors can use this type of vulnerability to attack the system. Developers frequently become aware of the vulnerability as a result of the attack.

zombie application

An application that has an average CPU and memory usage below 5 percent. In a migration project, it is common to retire these applications.
