Welcome

Overview

This is an interface reference for Amazon Redshift. It contains documentation for one of the programming or command line interfaces you can use to manage Amazon Redshift clusters. Note that Amazon Redshift is asynchronous, which means that some interfaces may require techniques, such as polling or asynchronous callback handlers, to determine when a command has been applied. In this reference, the parameter descriptions indicate whether a change is applied immediately, on the next instance reboot, or during the next maintenance window. For a summary of the Amazon Redshift cluster management interfaces, go to Using the Amazon Redshift Management Interfaces.

Amazon Redshift manages all the work of setting up, operating, and scaling a data warehouse: provisioning capacity, monitoring and backing up the cluster, and applying patches and upgrades to the Amazon Redshift engine. You can focus on using your data to acquire new insights for your business and customers.

If you are a first-time user of Amazon Redshift, we recommend that you begin by reading the Amazon Redshift Getting Started Guide.

If you are a database developer, the Amazon Redshift Database Developer Guide explains how to design, build, query, and maintain the databases that make up your data warehouse.

This document was last published on November 15, 2023.
Actions

The following actions are supported:

- `AcceptReservedNodeExchange` (p. 5)
- `AddPartner` (p. 8)
- `AssociateDataShareConsumer` (p. 11)
- `AuthorizeClusterSecurityGroupIngress` (p. 14)
- `AuthorizeDataShare` (p. 17)
- `AuthorizeEndpointAccess` (p. 20)
- `AuthorizeSnapshotAccess` (p. 23)
- `BatchDeleteClusterSnapshots` (p. 26)
- `BatchModifyClusterSnapshots` (p. 28)
- `CancelResize` (p. 31)
- `CopyClusterSnapshot` (p. 35)
- `CreateAuthenticationProfile` (p. 39)
- `CreateCluster` (p. 41)
- `CreateClusterParameterGroup` (p. 54)
- `CreateClusterSecurityGroup` (p. 57)
- `CreateClusterSnapshot` (p. 60)
- `CreateClusterSubnetGroup` (p. 64)
- `CreateCustomDomainAssociation` (p. 68)
- `CreateEndpointAccess` (p. 71)
- `CreateEventSubscription` (p. 75)
- `CreateHsmClientCertificate` (p. 80)
- `CreateHsmConfiguration` (p. 83)
- `CreateScheduledAction` (p. 86)
- `CreateSnapshotCopyGrant` (p. 90)
- `CreateSnapshotSchedule` (p. 93)
- `CreateTags` (p. 97)
- `CreateUsageLimit` (p. 99)
- `DeleteAuthenticationProfile` (p. 106)
- `DeleteCluster` (p. 108)
- `DeleteClusterParameterGroup` (p. 112)
- `DeleteClusterSecurityGroup` (p. 114)
- `DeleteClusterSnapshot` (p. 116)
- `DeleteClusterSubnetGroup` (p. 119)
- `DeleteCustomDomainAssociation` (p. 121)
- `DeleteEndpointAccess` (p. 123)
- `DeleteEventSubscription` (p. 126)
- `DeleteHsmClientCertificate` (p. 128)
- `DeleteHsmConfiguration` (p. 130)
- `DeletePartner` (p. 132)

AcceptReservedNodeExchange

Exchanges a DC1 Reserved Node for a DC2 Reserved Node with no changes to the configuration (term, payment type, or number of nodes) and no additional costs.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ReservedNodeId

A string representing the node identifier of the DC1 Reserved Node to be exchanged.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

TargetReservedNodeOfferingId

The unique identifier of the DC2 Reserved Node offering to be used for the exchange. You can obtain the value for the parameter by calling GetReservedNodeExchangeOfferings (p. 301)

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following element is returned by the service.

ExchangedReservedNode

Type: ReservedNode (p. 504) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

DependentServiceUnavailableFault

Your request cannot be completed because a dependent internal service is temporarily unavailable. Wait 30 to 60 seconds and try again.

HTTP Status Code: 400

InvalidReservedNodeState

Indicates that the Reserved Node being exchanged is not in an active state.

HTTP Status Code: 400
ReservedNodeAlreadyExists

User already has a reservation with the given identifier.

HTTP Status Code: 404

ReservedNodeAlreadyMigrated

Indicates that the reserved node has already been exchanged.

HTTP Status Code: 400

ReservedNodeNotFound

The specified reserved compute node not found.

HTTP Status Code: 404

ReservedNodeOfferingNotFound

Specified offering does not exist.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of AcceptReservedNodeExchange.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=AcceptReservedNodeExchange
&ReservedNodeId=12345678-12ab-12a1-1a2a-12ab-12a12aEXAMPLE

AddPartner

Adds a partner integration to a cluster. This operation authorizes a partner to push status updates for the specified database. To complete the integration, you also set up the integration on the partner website.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

AccountId

The AWS account ID that owns the cluster.
Type: String
Length Constraints: Fixed length of 12.
Pattern: ^\[0-9\]+$
Required: Yes

ClusterIdentifier

The cluster identifier of the cluster that receives data from the partner.
Type: String
Length Constraints: Maximum length of 63.
Pattern: ^[a-zA-Z0-9\-\ ]+$
Required: Yes

DatabaseName

The name of the database that receives data from the partner.
Type: String
Length Constraints: Maximum length of 127.
Pattern: ^[p{L}\_][p{L}\p{N}@\$\#\_]+$
Required: Yes

PartnerName

The name of the partner that is authorized to send data.
Type: String
Length Constraints: Maximum length of 255.
Pattern: ^[a-zA-Z0-9\-\_]+$
Required: Yes

Response Elements

The following elements are returned by the service.
**DatabaseName**

The name of the database that receives data from the partner.

Type: String

Length Constraints: Maximum length of 127.

Pattern: `^[\p{L}_][\p{L}\p{N}@$_]+$`

**PartnerName**

The name of the partner that is authorized to send data.

Type: String

Length Constraints: Maximum length of 255.

Pattern: `^[a-zA-Z0-9\- _]+$`

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 552)](#).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**PartnerNotFound**

The name of the partner was not found.

HTTP Status Code: 404

**UnauthorizedPartnerIntegration**

The partner integration is not authorized.

HTTP Status Code: 401

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

AssociateDataShareConsumer

From a datashare consumer account, associates a datashare with the account (AssociateEntireAccount) or the specified namespace (ConsumerArn). If you make this association, the consumer can consume the datashare.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

DataShareArn

The Amazon Resource Name (ARN) of the datashare that the consumer is to use with the account or the namespace.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

AssociateEntireAccount

A value that specifies whether the datashare is associated with the entire account.

Type: Boolean

Required: No

ConsumerArn

The Amazon Resource Name (ARN) of the consumer that is associated with the datashare.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ConsumerRegion

From a datashare consumer account, associates a datashare with all existing and future namespaces in the specified AWS Region.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.

AllowPubliclyAccessibleConsumers

A value that specifies whether the datashare can be shared to a publicly accessible cluster.

Type: Boolean
DataShareArn

An Amazon Resource Name (ARN) that references the datashare that is owned by a specific namespace of the producer cluster. A datashare ARN is in the `arn:aws:redshift:{region}:{account-id}:{datashare}:{namespace-guid}/{datashare-name}` format.

Type: String

Length Constraints: Maximum length of 2147483647.

DataShareAssociations.member.N

A value that specifies when the datashare has an association between producer and data consumers.

Type: Array of DataShareAssociation (p. 460) objects

ManagedBy

The identifier of a datashare to show its managing entity.

Type: String

Length Constraints: Maximum length of 2147483647.

ProducerArn

The Amazon Resource Name (ARN) of the producer.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidDataShareFault

There is an error with the datashare.

HTTP Status Code: 400

InvalidNamespaceFault

The namespace isn't valid because the namespace doesn't exist. Provide a valid namespace.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of AssociateDataShareConsumer.

Sample Request

```
AssociateDataShareConsumer&AssociateEntireAccount=true&DataShareArn=arn%3Aaws%3Aredshift%3Aus-east-1%3A827630067164%3Adatashare%3Aa1c54ed4-8323-4d14-b5dd-927cb596dc0e%2Ftestshare&Version=2012-12-01
```
Sample Response

```xml
<AssociateDataShareConsumerResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <AssociateDataShareConsumerResult>
    <ProducerNamespaceArn>arn:aws:redshift:us-east-1:827630067164:namespace:a1c54ed4-8323-4d14-b5dd-927cb596dc0e</ProducerNamespaceArn>
    <AllowPubliclyAccessibleConsumers>false</AllowPubliclyAccessibleConsumers>
    <DataShareArn>arn:aws:redshift:us-east-1:827630067164:datashare:a1c54ed4-8323-4d14-b5dd-927cb596dc0e/testshare</DataShareArn>

AuthorizeClusterSecurityGroupIngress

Adds an inbound (ingress) rule to an Amazon Redshift security group. Depending on whether the application accessing your cluster is running on the Internet or an Amazon EC2 instance, you can authorize inbound access to either a Classless Interdomain Routing (CIDR)/Internet Protocol (IP) range or to an Amazon EC2 security group. You can add as many as 20 ingress rules to an Amazon Redshift security group.

If you authorize access to an Amazon EC2 security group, specify EC2SecurityGroupName and EC2SecurityGroupOwnerId. The Amazon EC2 security group and Amazon Redshift cluster must be in the same AWS Region.

If you authorize access to a CIDR/IP address range, specify CIDRIP. For an overview of CIDR blocks, see the Wikipedia article on Classless Inter-Domain Routing.

You must also associate the security group with a cluster so that clients running on these IP addresses or the EC2 instance are authorized to connect to the cluster. For information about managing security groups, go to Working with Security Groups in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ClusterSecurityGroupName**

The name of the security group to which the ingress rule is added.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**CIDRIP**

The IP range to be added the Amazon Redshift security group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**EC2SecurityGroupName**

The EC2 security group to be added the Amazon Redshift security group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**EC2SecurityGroupOwnerId**

The AWS account number of the owner of the security group specified by the EC2SecurityGroupName parameter. The AWS Access Key ID is not an acceptable value.

Example: 111122223333
Response Elements

The following element is returned by the service.

**ClusterSecurityGroup**

Describes a security group.

Type: [ClusterSecurityGroup](p. 450) object

Errors

For information about the errors that are common to all actions, see [Common Errors](p. 552).

**AuthorizationAlreadyExists**

The specified CIDR block or EC2 security group is already authorized for the specified cluster security group.

HTTP Status Code: 400

**AuthorizationQuotaExceeded**

The authorization quota for the cluster security group has been reached.

HTTP Status Code: 400

**ClusterSecurityGroupNotFound**

The cluster security group name does not refer to an existing cluster security group.

HTTP Status Code: 404

**InvalidClusterSecurityGroupState**

The state of the cluster security group is not available.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of AuthorizeClusterSecurityGroupIngress.

**Sample Request**

```bash
https://redshift.us-east-2.amazonaws.com/
?Action=AuthorizeClusterSecurityGroupIngress
&CIDRIP=10.24.34.0/24
&ClusterSecurityGroupName=example-security-group
```
Sample Response

```xml
<AuthorizeClusterSecurityGroupIngressResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
    <AuthorizeClusterSecurityGroupIngressResult>
        <ClusterSecurityGroup>
            <Tags/>
            <EC2SecurityGroups/>
            <IPRanges>
                <IPRange>
                    <CIDRIP>10.24.34.0/24</CIDRIP>
                    <Status>authorized</Status>
                </IPRange>
            </IPRanges>
            <Description>Example security group</Description>
            <ClusterSecurityGroupName>example-security-group</ClusterSecurityGroupName>
        </ClusterSecurityGroup>
    </AuthorizeClusterSecurityGroupIngressResult>
    <ResponseMetadata>
        <RequestId>534d1bce-46ac-11e5-b673-31d855cc98c6</RequestId>
    </ResponseMetadata>
</AuthorizeClusterSecurityGroupIngressResponse>
```

AuthorizeDataShare

From a data producer account, authorizes the sharing of a datashare with one or more consumer accounts or managing entities. To authorize a datashare for a data consumer, the producer account must have the correct access permissions.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ConsumerIdentifier

The identifier of the data consumer that is authorized to access the datashare. This identifier is an AWS account ID or a keyword, such as ADX.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

DataShareArn

The Amazon Resource Name (ARN) of the datashare that producers are to authorize sharing for.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following elements are returned by the service.

AllowPubliclyAccessibleConsumers

A value that specifies whether the datashare can be shared to a publicly accessible cluster.

Type: Boolean

DataShareArn

An Amazon Resource Name (ARN) that references the datashare that is owned by a specific namespace of the producer cluster. A datashare ARN is in the arn:aws:redshift:{region}:{account-id}:{datashare}:{namespace-guid}/{datashare-name} format.

Type: String

Length Constraints: Maximum length of 2147483647.

DataShareAssociations.member.N

A value that specifies when the datashare has an association between producer and data consumers.

Type: Array of DataShareAssociation (p. 460) objects

ManagedBy

The identifier of a datashare to show its managing entity.
Amazon Redshift API Reference

Errors

Type: String
Length Constraints: Maximum length of 2147483647.

ProducerArn

The Amazon Resource Name (ARN) of the producer.
Type: String
Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidDataShareFault

There is an error with the datashare.
HTTP Status Code: 400

Examples

AuthorizeEndpointAccess

Grants access to a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Account

The AWS account ID to grant access to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

ClusterIdentifier

The cluster identifier of the cluster to grant access to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

VpcIds.VpcIdentifier.N

The virtual private cloud (VPC) identifiers to grant access to.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.

AllowedAllVPCs

Indicates whether all VPCs in the grantee account are allowed access to the cluster.

Type: Boolean

AllowedVPCs.VpcIdentifier.N

The VPCs allowed access to the cluster.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

AuthorizeTime

The time (UTC) when the authorization was created.
Type: Timestamp

**ClusterIdentifier**

The cluster identifier.

Type: String

Length Constraints: Maximum length of 2147483647.

**ClusterStatus**

The status of the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

**EndpointCount**

The number of Redshift-managed VPC endpoints created for the authorization.

Type: Integer

**Grantee**

The AWS account ID of the grantee of the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

**Grantor**

The AWS account ID of the cluster owner.

Type: String

Length Constraints: Maximum length of 2147483647.

**Status**

The status of the authorization action.

Type: String

Valid Values: Authorized | Revoking

---

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 552)](#).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**EndpointAuthorizationAlreadyExists**

The authorization already exists for this endpoint.

HTTP Status Code: 400

**EndpointAuthorizationsPerClusterLimitExceeded**

The number of endpoint authorizations per cluster has exceeded its limit.
HTTP Status Code: 400

**InvalidAuthorizationState**

The status of the authorization is not valid.

HTTP Status Code: 400

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

AuthorizeSnapshotAccess

Authorizes the specified AWS account to restore the specified snapshot.

For more information about working with snapshots, go to Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**AccountWithRestoreAccess**

The identifier of the AWS account authorized to restore the specified snapshot.

To share a snapshot with AWS Support, specify amazon-redshift-support.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**SnapshotArn**

The Amazon Resource Name (ARN) of the snapshot to authorize access to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SnapshotClusterIdentifier**

The identifier of the cluster the snapshot was created from. This parameter is required if your IAM user has a policy containing a snapshot resource element that specifies anything other than * for the cluster name.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SnapshotIdentifier**

The identifier of the snapshot the account is authorized to restore.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.
Snapshot

Describes a snapshot.

Type: Snapshot (p. 525) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

AuthorizationAlreadyExists

The specified CIDR block or EC2 security group is already authorized for the specified cluster security group.

HTTP Status Code: 400

AuthorizationQuotaExceeded

The authorization quota for the cluster security group has been reached.

HTTP Status Code: 400

ClusterSnapshotNotFound

The snapshot identifier does not refer to an existing cluster snapshot.

HTTP Status Code: 404

DependentServiceRequestThrottlingFault

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.

HTTP Status Code: 400

InvalidClusterSnapshotState

The specified cluster snapshot is not in the available state, or other accounts are authorized to access the snapshot.

HTTP Status Code: 400

LimitExceededFault

The encryption key has exceeded its grant limit in AWS KMS.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

BatchDeleteClusterSnapshots

Deletes a set of cluster snapshots.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Identifiers.DeleteClusterSnapshotMessage.N

A list of identifiers for the snapshots that you want to delete.

Type: Array of DeleteClusterSnapshotMessage (p. 466) objects

Required: Yes

Response Elements

The following elements are returned by the service.

Errors.SnapshotErrorMessage.N

A list of any errors returned.

Type: Array of SnapshotErrorMessage (p. 532) objects

Resources.String.N

A list of the snapshot identifiers that were deleted.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

BatchDeleteRequestSizeExceeded

The maximum number for a batch delete of snapshots has been reached. The limit is 100.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of BatchDeleteClusterSnapshots.

Sample Request

https://redshift.us-east-2.amazonaws.com/
Sample Response

```xml
<?xml version="1.0" encoding="UTF-8"?>
<BatchDeleteClusterSnapshotsResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <BatchDeleteClusterSnapshotsResult>
    <Resources>
      <String>mysnapshotid1</String>
      <String>mysnapshotid2</String>
    </Resources>
  </BatchDeleteClusterSnapshotsResult>
  <ResponseMetadata>
    <RequestId>5b43fc38-282e-11ea-8cc9-43f1872b4b75</RequestId>
  </ResponseMetadata>
</BatchDeleteClusterSnapshotsResponse>
```

BatchModifyClusterSnapshots

Modifies the settings for a set of cluster snapshots.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

SnapshotIdentifierList.String.N

A list of snapshot identifiers you want to modify.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: Yes

Force

A boolean value indicating whether to override an exception if the retention period has passed.

Type: Boolean

Required: No

ManualSnapshotRetentionPeriod

The number of days that a manual snapshot is retained. If you specify the value -1, the manual snapshot is retained indefinitely.

The number must be either -1 or an integer between 1 and 3,653.

If you decrease the manual snapshot retention period from its current value, existing manual snapshots that fall outside of the new retention period will return an error. If you want to suppress the errors and delete the snapshots, use the force option.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

Errors.SnapshotErrorMessage.N

A list of any errors returned.

Type: Array of SnapshotErrorMessage (p. 532) objects

Resources.String.N

A list of the snapshots that were modified.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

BatchModifyClusterSnapshotsLimitExceededFault

The maximum number for snapshot identifiers has been reached. The limit is 100.

HTTP Status Code: 400

InvalidRetentionPeriodFault

The retention period specified is either in the past or is not a valid value.

The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of BatchModifyClusterSnapshots.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=BatchModifyClusterSnapshots
&SnapshotIdentifierList.String.1=mysnapshotid1
&SnapshotIdentifierList.String.2=mysnapshotid2
&ManualSnapshotRetentionPeriod=30
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678dd8dd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<BatchModifyClusterSnapshotsResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <BatchModifyClusterSnapshotsResult>
    <Resources>
      <String>mysnapshotid1</String>
      <String>mysnapshotid2</String>
    </Resources>
    <Errors/>
  </BatchModifyClusterSnapshotsResult>
  <ResponseMetadata>
    <RequestId>c10326d1-282d-11ea-8314-974e2ba81189</RequestId>
  </ResponseMetadata>
</BatchModifyClusterSnapshotsResponse>
```

CancelResize

Cancels a resize operation for a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier for the cluster that you want to cancel a resize operation for.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

Response Elements

The following elements are returned by the service.

AvgResizeRateIn MegaBytesPerSecond

The average rate of the resize operation over the last few minutes, measured in megabytes per second. After the resize operation completes, this value shows the average rate of the entire resize operation.

Type: Double

DataTransferProgressPercent

The percent of data transferred from source cluster to target cluster.

Type: Double

ElapsedTimeInSeconds

The amount of seconds that have elapsed since the resize operation began. After the resize operation completes, this value shows the total actual time, in seconds, for the resize operation.

Type: Long

EstimatedTimeToCompletionInSeconds

The estimated time remaining, in seconds, until the resize operation is complete. This value is calculated based on the average resize rate and the estimated amount of data remaining to be processed. Once the resize operation is complete, this value will be 0.

Type: Long

ImportTablesCompleted.member.N

The names of tables that have been completely imported.

Valid Values: List of table names.
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Response Elements

**ImportTablesInProgress.member.N**

The names of tables that are being currently imported.

Valid Values: List of table names.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

**ImportTablesNotStarted.member.N**

The names of tables that have not been yet imported.

Valid Values: List of table names

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

**Message**

An optional string to provide additional details about the resize action.

Type: String

Length Constraints: Maximum length of 2147483647.

**ProgressInMegaBytes**

While the resize operation is in progress, this value shows the current amount of data, in megabytes, that has been processed so far. When the resize operation is complete, this value shows the total amount of data, in megabytes, on the cluster, which may be more or less than TotalResizeDataInMegaBytes (the estimated total amount of data before resize).

Type: Long

**ResizeType**

An enum with possible values of ClassicResize and ElasticResize. These values describe the type of resize operation being performed.

Type: String

Length Constraints: Maximum length of 2147483647.

**Status**

The status of the resize operation.

Valid Values: NONE | IN_PROGRESS | FAILED | SUCCEEDED | CANCELLING

Type: String

Length Constraints: Maximum length of 2147483647.

**TargetClusterType**

The cluster type after the resize operation is complete.

Valid Values: multi-node | single-node

Type: String

Length Constraints: Maximum length of 2147483647.
**TargetEncryptionType**

The type of encryption for the cluster after the resize is complete.

Possible values are KMS and None.

Type: String

Length Constraints: Maximum length of 2147483647.

**TargetNodeType**

The node type that the cluster will have after the resize operation is complete.

Type: String

Length Constraints: Maximum length of 2147483647.

**TargetNumberOfNodes**

The number of nodes that the cluster will have after the resize operation is complete.

Type: Integer

**TotalResizeDataInMegaBytes**

The estimated total amount of data, in megabytes, on the cluster before the resize operation began.

Type: Long

---

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 552)](https://www.example.com).

**ClusterNotFound**

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

**ResizeNotFound**

A resize operation for the specified cluster is not found.

HTTP Status Code: 404

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

---

**Examples**

**Example**

This example illustrates one usage of CancelResize.
Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=CancelResize
&ClusterIdentifier=mycluster
&ManualSnapshotRetentionPeriod=30
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190825/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b

Sample Response

<CancelResizeResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <CancelResizeResult>
    <TargetNodeType>dc2.large</TargetNodeType>
    <TargetEncryptionType>NONE</TargetEncryptionType>
    <TargetClusterType>single-node</TargetClusterType>
    <ResizeType>ClassicResize</ResizeType>
    <Status>CANCELLING</Status>
  </CancelResizeResult>
  <ResponseMetadata>
    <RequestId>2bb73dd4-282d-11ea-9caa-c956bec1ce87</RequestId>
  </ResponseMetadata>
</CancelResizeResponse>

CopyClusterSnapshot

Copies the specified automated cluster snapshot to a new manual cluster snapshot. The source must be an automated snapshot and it must be in the available state.

When you delete a cluster, Amazon Redshift deletes any automated snapshots of the cluster. Also, when the retention period of the snapshot expires, Amazon Redshift automatically deletes it. If you want to keep an automated snapshot for a longer period, you can make a manual copy of the snapshot. Manual snapshots are retained until you delete them.

For more information about working with snapshots, go to Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**SourceSnapshotIdentifier**

The identifier for the source snapshot.

Constraints:
- Must be the identifier for a valid automated snapshot whose state is available.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**TargetSnapshotIdentifier**

The identifier given to the new manual snapshot.

Constraints:
- Cannot be null, empty, or blank.
- Must contain from 1 to 255 alphanumeric characters or hyphens.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.
- Must be unique for the AWS account that is making the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**ManualSnapshotRetentionPeriod**

The number of days that a manual snapshot is retained. If the value is -1, the manual snapshot is retained indefinitely.

The value must be either -1 or an integer between 1 and 3,653.

The default value is -1.

Type: Integer
Response Elements

The following element is returned by the service.

**Snapshot**

Describes a snapshot.

Type: [Snapshot](p. 525) object

Errors

For information about the errors that are common to all actions, see [Common Errors](p. 552).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**ClusterSnapshotAlreadyExists**

The value specified as a snapshot identifier is already used by an existing snapshot.

HTTP Status Code: 400

**ClusterSnapshotNotFound**

The snapshot identifier does not refer to an existing cluster snapshot.

HTTP Status Code: 404

**ClusterSnapshotQuotaExceeded**

The request would result in the user exceeding the allowed number of cluster snapshots.

HTTP Status Code: 400

**InvalidClusterSnapshotState**

The specified cluster snapshot is not in the available state, or other accounts are authorized to access the snapshot.

HTTP Status Code: 400
InvalidRetentionPeriodFault

The retention period specified is either in the past or is not a valid value.
The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of CopyClusterSnapshot.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=CopyClusterSnapshot
&SourceSnapshotIdentifier=mysnapshotid1
&TargetSnapshotIdentifier=mysnapshotid2
&SignatureMethod=HmacSHA256&SignatureVersion=4

- AWS SDK for Python
- AWS SDK for Ruby V3
CreateAuthenticationProfile

Creates an authentication profile with the specified parameters.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**AuthenticationProfileContent**

The content of the authentication profile in JSON format. The maximum length of the JSON string is determined by a quota for your account.

- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: Yes

**AuthenticationProfileName**

The name of the authentication profile to be created.

- Type: String
- Length Constraints: Maximum length of 63.
- Pattern: ^[a-zA-Z0-9\-]+$
- Required: Yes

**Response Elements**

The following elements are returned by the service.

**AuthenticationProfileContent**

The content of the authentication profile in JSON format.

- Type: String
- Length Constraints: Maximum length of 2147483647.

**AuthenticationProfileName**

The name of the authentication profile that was created.

- Type: String
- Length Constraints: Maximum length of 63.
- Pattern: ^[a-zA-Z0-9\-]+$

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 552).
AuthenticationProfileAlreadyExistsFault

The authentication profile already exists.

HTTP Status Code: 400

AuthenticationProfileQuotaExceededFault

The size or number of authentication profiles has exceeded the quota. The maximum length of the JSON string and maximum number of authentication profiles is determined by a quota for your account.

HTTP Status Code: 400

InvalidAuthenticationProfileRequestFault

The authentication profile request is not valid. The profile name can't be null or empty. The authentication profile API operation must be available in the AWS Region.

HTTP Status Code: 400

See Also

- AWS SDK for Ruby V3
CreateCluster

Creates a new cluster with the specified parameters.

To create a cluster in Virtual Private Cloud (VPC), you must provide a cluster subnet group name. The cluster subnet group identifies the subnets of your VPC that Amazon Redshift uses when creating the cluster. For more information about managing clusters, go to Amazon Redshift Clusters in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

A unique identifier for the cluster. You use this identifier to refer to the cluster for any subsequent cluster operations such as deleting or modifying. The identifier also appears in the Amazon Redshift console.

Constraints:
- Must contain from 1 to 63 alphanumeric characters or hyphens.
- Alphabetic characters must be lowercase.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.
- Must be unique for all clusters within an AWS account.

Example: myexamplecluster

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

MasterUsername

The user name associated with the admin user account for the cluster that is being created.

Constraints:
- Must be 1 - 128 alphanumeric characters or hyphens. The user name can't be PUBLIC.
- Must contain only lowercase letters, numbers, underscore, plus sign, period (dot), at symbol (@), or hyphen.
- The first character must be a letter.
- Must not contain a colon (:) or a slash (/).
- Cannot be a reserved word. A list of reserved words can be found in Reserved Words in the Amazon Redshift Database Developer Guide.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

NodeType

The node type to be provisioned for the cluster. For information about node types, go to Working with Clusters in the Amazon Redshift Cluster Management Guide.
Valid Values: ds2.xlarge | ds2.8xlarge | dc1.large | dc1.8xlarge | dc2.large | dc2.8xlarge | ra3.xlplus | ra3.4xlarge | ra3.16xlarge

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

AdditionalInfo
Reserved.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

AllowVersionUpgrade
If true, major version upgrades can be applied during the maintenance window to the Amazon Redshift engine that is running on the cluster.

When a new major version of the Amazon Redshift engine is released, you can request that the service automatically apply upgrades during the maintenance window to the Amazon Redshift engine that is running on your cluster.

Default: true

Type: Boolean
Required: No

AquaConfigurationStatus
This parameter is retired. It does not set the AQUA configuration status. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Type: String
Valid Values: enabled | disabled | auto
Required: No

AutomatedSnapshotRetentionPeriod
The number of days that automated snapshots are retained. If the value is 0, automated snapshots are disabled. Even if automated snapshots are disabled, you can still create manual snapshots when you want with CreateClusterSnapshot (p. 60).

You can't disable automated snapshots for RA3 node types. Set the automated retention period from 1-35 days.

Default: 1

Constraints: Must be a value from 0 to 35.

Type: Integer
Required: No

AvailabilityZone
The EC2 Availability Zone (AZ) in which you want Amazon Redshift to provision the cluster. For example, if you have several EC2 instances running in a specific Availability Zone, then you might want the cluster to be provisioned in the same zone in order to decrease network latency.
Default: A random, system-chosen Availability Zone in the region that is specified by the endpoint.

Example: us-east-2d

Constraint: The specified Availability Zone must be in the same region as the current endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**AvailabilityZoneRelocation**

The option to enable relocation for an Amazon Redshift cluster between Availability Zones after the cluster is created.

Type: Boolean

Required: No

**ClusterParameterGroupName**

The name of the parameter group to be associated with this cluster.

Default: The default Amazon Redshift cluster parameter group. For information about the default parameter group, go to [Working with Amazon Redshift Parameter Groups](#).

Constraints:
- Must be 1 to 255 alphanumeric characters or hyphens.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

A list of security groups to be associated with this cluster.

Default: The default cluster security group for Amazon Redshift.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**ClusterSubnetGroupName**

The name of a cluster subnet group to be associated with this cluster.

If this parameter is not provided the resulting cluster will be deployed outside virtual private cloud (VPC).

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
ClusterType

The type of the cluster. When cluster type is specified as
• single-node, the NumberOfNodes parameter is not required.
• multi-node, the NumberOfNodes parameter is required.

Valid Values: multi-node | single-node

Default: multi-node

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ClusterVersion

The version of the Amazon Redshift engine software that you want to deploy on the cluster.

The version selected runs on all the nodes in the cluster.

Constraints: Only version 1.0 is currently available.

Example: 1.0

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

DBName

The name of the first database to be created when the cluster is created.

To create additional databases after the cluster is created, connect to the cluster with a SQL client and use SQL commands to create a database. For more information, go to Create a Database in the Amazon Redshift Database Developer Guide.

Default: dev

Constraints:
• Must contain 1 to 64 alphanumeric characters.
• Must contain only lowercase letters.
• Cannot be a word that is reserved by the service. A list of reserved words can be found in Reserved Words in the Amazon Redshift Database Developer Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

DefaultIamRoleArn

The Amazon Resource Name (ARN) for the IAM role that was set as default for the cluster when the cluster was created.

Type: String
Length Constraints: Maximum length of 2147483647.

Required: No

**ElasticIp**

The Elastic IP (EIP) address for the cluster.

Constraints: The cluster must be provisioned in EC2-VPC and publicly-accessible through an Internet gateway. Don't specify the Elastic IP address for a publicly accessible cluster with availability zone relocation turned on. For more information about provisioning clusters in EC2-VPC, go to Supported Platforms to Launch Your Cluster in the Amazon Redshift Cluster Management Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Encrypted**

If true, the data in the cluster is encrypted at rest.

Default: false

Type: Boolean

Required: No

**EnhancedVpcRouting**

An option that specifies whether to create the cluster with enhanced VPC routing enabled. To create a cluster that uses enhanced VPC routing, the cluster must be in a VPC. For more information, see Enhanced VPC Routing in the Amazon Redshift Cluster Management Guide.

If this option is true, enhanced VPC routing is enabled.

Default: false

Type: Boolean

Required: No

**HsmClientCertificateIdentifier**

Specifies the name of the HSM client certificate the Amazon Redshift cluster uses to retrieve the data encryption keys stored in an HSM.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**HsmConfigurationIdentifier**

Specifies the name of the HSM configuration that contains the information the Amazon Redshift cluster can use to retrieve and store keys in an HSM.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
IamRoles.IamRoleArn.N

A list of AWS Identity and Access Management (IAM) roles that can be used by the cluster to access other AWS services. You must supply the IAM roles in their Amazon Resource Name (ARN) format.

The maximum number of IAM roles that you can associate is subject to a quota. For more information, go to [Quotas and limits](https://docs.aws.amazon.com/redshift/2012-12-01/userguide/quotas.html) in the Amazon Redshift Cluster Management Guide.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

IpAddressType

The IP address types that the cluster supports. Possible values are ipv4 and dualstack.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

KmsKeyId

The AWS Key Management Service (KMS) key ID of the encryption key that you want to use to encrypt data in the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

LoadSampleData

A flag that specifies whether to load sample data once the cluster is created.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaintenanceTrackName

An optional parameter for the name of the maintenance track for the cluster. If you don't provide a maintenance track name, the cluster is assigned to the current track.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ManageMasterPassword

If true, Amazon Redshift uses AWS Secrets Manager to manage this cluster's admin credentials. You can't use MasterUserPassword if ManageMasterPassword is true. If ManageMasterPassword is false or not set, Amazon Redshift uses MasterUserPassword for the admin user account's password.

Type: Boolean
ManualSnapshotRetentionPeriod

The default number of days to retain a manual snapshot. If the value is -1, the snapshot is retained indefinitely. This setting doesn't change the retention period of existing snapshots.

The value must be either -1 or an integer between 1 and 3,653.

Type: Integer

MasterPasswordSecretKeyId

The ID of the AWS Key Management Service (KMS) key used to encrypt and store the cluster's admin credentials secret. You can only use this parameter if ManageMasterPassword is true.

Type: String

Length Constraints: Maximum length of 2147483647.

MasterUserPassword

The password associated with the admin user account for the cluster that is being created.

You can't use MasterUserPassword if ManageMasterPassword is true.

Constraints:
• Must be between 8 and 64 characters in length.
• Must contain at least one uppercase letter.
• Must contain at least one lowercase letter.
• Must contain one number.
• Can be any printable ASCII character (ASCII code 33-126) except ' (single quote), " (double quote), \, /, or @.

Type: String

MultiAZ

If true, Amazon Redshift will deploy the cluster in two Availability Zones (AZ).

Type: Boolean

NumberOfNodes

The number of compute nodes in the cluster. This parameter is required when the ClusterType parameter is specified as multi-node.

For information about determining how many nodes you need, go to Working with Clusters in the Amazon Redshift Cluster Management Guide.

If you don't specify this parameter, you get a single-node cluster. When requesting a multi-node cluster, you must specify the number of nodes that you want in the cluster.

Default: 1
Constraints: Value must be at least 1 and no more than 100.
Type: Integer
Required: No

Port
The port number on which the cluster accepts incoming connections.
The cluster is accessible only via the JDBC and ODBC connection strings. Part of the connection string requires the port on which the cluster will listen for incoming connections.
Default: 5439
Valid Values: 1150-65535
Type: Integer
Required: No

PreferredMaintenanceWindow
The weekly time range (in UTC) during which automated cluster maintenance can occur.
Default: A 30-minute window selected at random from an 8-hour block of time per region, occurring on a random day of the week. For more information about the time blocks for each region, see Maintenance Windows in Amazon Redshift Cluster Management Guide.
Valid Days: Mon | Tue | Wed | Thu | Fri | Sat | Sun
Constraints: Minimum 30-minute window.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

PubliclyAccessible
If true, the cluster can be accessed from a public network.
Type: Boolean
Required: No

SnapshotScheduleIdentifier
A unique identifier for the snapshot schedule.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Tags.Tag.N
A list of tag instances.
Type: Array of Tag (p. 542) objects
Required: No
VpcSecurityGroupIds.VpcSecurityGroupId.N

A list of Virtual Private Cloud (VPC) security groups to be associated with the cluster.

Default: The default VPC security group is associated with the cluster.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterAlreadyExists

The account already has a cluster with the given identifier.

HTTP Status Code: 400

ClusterParameterGroupNotFound

The parameter group name does not refer to an existing parameter group.

HTTP Status Code: 404

ClusterQuotaExceeded

The request would exceed the allowed number of cluster instances for this account. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

ClusterSecurityGroupNotFound

The cluster security group name does not refer to an existing cluster security group.

HTTP Status Code: 404

ClusterSubnetGroupNotFoundFault

The cluster subnet group name does not refer to an existing cluster subnet group.

HTTP Status Code: 400

DependentServiceRequestThrottlingFault

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.
HTTP Status Code: 400
**HsmClientCertificateNotFoundFault**
There is no Amazon Redshift HSM client certificate with the specified identifier.

HTTP Status Code: 400
**HsmConfigurationNotFoundFault**
There is no Amazon Redshift HSM configuration with the specified identifier.

HTTP Status Code: 400
**InsufficientClusterCapacity**
The number of nodes specified exceeds the allotted capacity of the cluster.

HTTP Status Code: 400
**InvalidClusterSubnetGroupStateException**
The cluster subnet group cannot be deleted because it is in use.

HTTP Status Code: 400
**InvalidClusterTrack**
The provided cluster track name is not valid.

HTTP Status Code: 400
**InvalidElasticIpFault**
The Elastic IP (EIP) is invalid or cannot be found.

HTTP Status Code: 400
**InvalidRetentionPeriodFault**
The retention period specified is either in the past or is not a valid value.

The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400
**InvalidSubnet**
The requested subnet is not valid, or not all of the subnets are in the same VPC.

HTTP Status Code: 400
**InvalidTagFault**
The tag is invalid.

HTTP Status Code: 400
**InvalidVPCNetworkStateException**
The cluster subnet group does not cover all Availability Zones.

HTTP Status Code: 400
**Ipv6CidrBlockNotFoundFault**
There are no subnets in your VPC with associated IPv6 CIDR blocks. To use dual-stack mode, associate an IPv6 CIDR block with each subnet in your VPC.
LimitExceededFault

The encryption key has exceeded its grant limit in AWS KMS.
HTTP Status Code: 400

NumberOfNodesPerClusterLimitExceeded

The operation would exceed the number of nodes allowed for a cluster.
HTTP Status Code: 400

NumberOfNodesQuotaExceeded

The operation would exceed the number of nodes allotted to the account. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.
HTTP Status Code: 400

SnapshotScheduleNotFound

We could not find the specified snapshot schedule.
HTTP Status Code: 400

TagLimitExceededFault

You have exceeded the number of tags allowed.
HTTP Status Code: 400

UnauthorizedOperation

Your account is not authorized to perform the requested operation.
HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.
HTTP Status Code: 400

Examples

Example

This example illustrates one usage of CreateCluster.

Sample Request

https://redshift.us-east-2.amazonaws.com/?Action=CreateCluster

CreateClusterParameterGroup

Creates an Amazon Redshift parameter group.

Creating parameter groups is independent of creating clusters. You can associate a cluster with a parameter group when you create the cluster. You can also associate an existing cluster with a parameter group after the cluster is created by using ModifyCluster (p. 310).

Parameters in the parameter group define specific behavior that applies to the databases you create on the cluster. For more information about parameters and parameter groups, go to Amazon Redshift Parameter Groups in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Description

A description of the parameter group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

ParameterGroupFamily

The Amazon Redshift engine version to which the cluster parameter group applies. The cluster engine version determines the set of parameters.

To get a list of valid parameter group family names, you can call DescribeClusterParameterGroups (p. 152). By default, Amazon Redshift returns a list of all the parameter groups that are owned by your AWS account, including the default parameter groups for each Amazon Redshift engine version. The parameter group family names associated with the default parameter groups provide you the valid values. For example, a valid family name is "redshift-1.0".

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

ParameterGroupName

The name of the cluster parameter group.

Constraints:

• Must be 1 to 255 alphanumeric characters or hyphens
• First character must be a letter.
• Cannot end with a hyphen or contain two consecutive hyphens.
• Must be unique within your AWS account.

Note
This value is stored as a lower-case string.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

**Tags.Tag.N**
A list of tag instances.
Type: Array of [Tag](p. 542) objects
Required: No

**Response Elements**
The following element is returned by the service.

**ClusterParameterGroup**
Describes a parameter group.
Type: [ClusterParameterGroup](p. 446) object

**Errors**
For information about the errors that are common to all actions, see [Common Errors](p. 552).

**ClusterParameterGroupAlreadyExists**
A cluster parameter group with the same name already exists.
HTTP Status Code: 400

**ClusterParameterGroupQuotaExceeded**
The request would result in the user exceeding the allowed number of cluster parameter groups. For information about increasing your quota, go to [Limits in Amazon Redshift](in the [Amazon Redshift Cluster Management Guide](p. 567)).
HTTP Status Code: 400

**InvalidTagFault**
The tag is invalid.
HTTP Status Code: 400

**TagLimitExceededFault**
You have exceeded the number of tags allowed.
HTTP Status Code: 400

**Examples**

**Example**
This example illustrates one usage of CreateClusterParameterGroup.
Sample Request

```plaintext
https://redshift.us-east-2.amazonaws.com/
?Action=CreateClusterParameterGroup
&ParameterGroupName=myclusterparametergroup
&ParameterGroupFamily=redshift-1.0
&Description=My+first+cluster+parameter+group
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```xml
<CreateClusterParameterGroupResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <CreateClusterParameterGroupResult>
    <ClusterParameterGroup>
      <ParameterGroupName>myclusterparametergroup</ParameterGroupName>
      <Description>My first cluster parameter group</Description>
      <ParameterGroupFamily>redshift-1.0</ParameterGroupFamily>
      <Tags/>
    </ClusterParameterGroup>
  </CreateClusterParameterGroupResult>
  <ResponseMetadata>
    <RequestId>d52df43b-281e-11ea-8314-974e2ba81189</RequestId>
  </ResponseMetadata>
</CreateClusterParameterGroupResponse>
```

CreateClusterSecurityGroup

Creates a new Amazon Redshift security group. You use security groups to control access to non-VPC clusters.

For information about managing security groups, go to Amazon Redshift Cluster Security Groups in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ClusterSecurityGroupName**

The name for the security group. Amazon Redshift stores the value as a lowercase string.

Constraints:

- Must contain no more than 255 alphanumeric characters or hyphens.
- Must not be "Default".
- Must be unique for all security groups that are created by your AWS account.

Example: examplesecuritygroup

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Description**

A description for the security group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Tags.Tag.N**

A list of tag instances.

Type: Array of Tag (p. 542) objects

Required: No

Response Elements

The following element is returned by the service.

**ClusterSecurityGroup**

Describes a security group.

Type: ClusterSecurityGroup (p. 450) object
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterSecurityGroupAlreadyExists

A cluster security group with the same name already exists.

HTTP Status Code: 400

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400

QuotaExceeded.ClusterSecurityGroup

The request would result in the user exceeding the allowed number of cluster security groups. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

TagLimitExceededFault

You have exceeded the number of tags allowed.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of CreateClusterSecurityGroup.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=CreateClusterSecurityGroup
&ClusterSecurityGroupName=securitygroup1
&Description=my security group
&Version=2012-12-01
&x-amz-algorithm=AWS4-HMAC-SHA256
&x-amz-credential=AKIAIOSFODNN7EXAMPLE/20130123/us-east-2/redshift/aws4_request
&x-amz-date=20130123T005817Z
&x-amz-signedheaders=content-type;host;x-amz-date

Sample Response

CreateClusterSnapshot

Creates a manual snapshot of the specified cluster. The cluster must be in the available state.

For more information about working with snapshots, go to Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The cluster identifier for which you want a snapshot.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

SnapshotIdentifier

A unique identifier for the snapshot that you are requesting. This identifier must be unique for all snapshots within the AWS account.

Constraints:

- Cannot be null, empty, or blank
- Must contain from 1 to 255 alphanumeric characters or hyphens
- First character must be a letter
- Cannot end with a hyphen or contain two consecutive hyphens

Example: my-snapshot-id

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

ManualSnapshotRetentionPeriod

The number of days that a manual snapshot is retained. If the value is -1, the manual snapshot is retained indefinitely.

The value must be either -1 or an integer between 1 and 3,653.

The default value is -1.

Type: Integer

Required: No

Tags.Tag.N

A list of tag instances.

Type: Array of Tag (p. 542) objects

Required: No
Response Elements

The following element is returned by the service.

**Snapshot**

Describes a snapshot.

Type: [Snapshot](p. 525) object

Errors

For information about the errors that are common to all actions, see [Common Errors](p. 552).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**ClusterSnapshotAlreadyExists**

The value specified as a snapshot identifier is already used by an existing snapshot.

HTTP Status Code: 400

**ClusterSnapshotQuotaExceeded**

The request would result in the user exceeding the allowed number of cluster snapshots.

HTTP Status Code: 400

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

**InvalidRetentionPeriodFault**

The retention period specified is either in the past or is not a valid value.

The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400

**InvalidTagFault**

The tag is invalid.

HTTP Status Code: 400

**TagLimitExceededFault**

You have exceeded the number of tags allowed.

HTTP Status Code: 400

Examples

**Example**

CreateClusterSubnetGroup

Create a new Amazon Redshift subnet group. You must provide a list of one or more subnets in your existing Amazon Virtual Private Cloud (Amazon VPC) when creating Amazon Redshift subnet group.

For information about subnet groups, go to Amazon Redshift Cluster Subnet Groups in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterSubnetGroupName

The name for the subnet group. Amazon Redshift stores the value as a lowercase string.

Constraints:
- Must contain no more than 255 alphanumeric characters or hyphens.
- Must not be "Default".
- Must be unique for all subnet groups that are created by your AWS account.

Example: examplesubnetgroup

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

Description

A description for the subnet group.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

SubnetIds.SubnetIdentifier.N

An array of VPC subnet IDs. A maximum of 20 subnets can be modified in a single request.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: Yes

Tags.Tag.N

A list of tag instances.

Type: Array of Tag (p. 542) objects
Required: No

Response Elements

The following element is returned by the service.
ClusterSubnetGroup

Describes a subnet group.

Type: ClusterSubnetGroup (p. 455) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterSubnetGroupAlreadyExists

A ClusterSubnetGroupName is already used by an existing cluster subnet group.

HTTP Status Code: 400

ClusterSubnetGroupQuotaExceeded

The request would result in user exceeding the allowed number of cluster subnet groups. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

ClusterSubnetQuotaExceededFault

The request would result in user exceeding the allowed number of subnets in a cluster subnet groups. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

DependentServiceRequestThrottlingFault

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.

HTTP Status Code: 400

InvalidSubnet

The requested subnet is not valid, or not all of the subnets are in the same VPC.

HTTP Status Code: 400

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400

TagLimitExceededFault

You have exceeded the number of tags allowed.

HTTP Status Code: 400

UnauthorizedOperation

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400
Examples

Example

This example illustrates one usage of CreateClusterSubnetGroup.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=CreateClusterSubnetGroup
&ClusterSubnetGroupName=mysubnetgroup
&Description=My+subnet+group
&SubnetIds.SubnetIdentifier.1=subnet-a1b23abc
&SignatureMethod=HmacSHA256&SignatureVersion=4

CreateCustomDomainAssociation

Used to create a custom domain name for a cluster. Properties include the custom domain name, the cluster the custom domain is associated with, and the certificate Amazon Resource Name (ARN).

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The cluster identifier that the custom domain is associated with.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

CustomDomainCertificateArn

The certificate Amazon Resource Name (ARN) for the custom domain name association.

Type: String

Pattern: \[arn:([w+=/,.@-]+:acm:[\w+=/,.@-]*:[0-9]+:[\w+=/,.@-]*(/[\w+=/,.@-]*)*\]

Required: Yes

CustomDomainName

The custom domain name for a custom domain association.

Type: String

Pattern: ^(\(?!-\)[A-Za-z0-9-]\{0,62\}[A-Za-z0-9-]\)\./+\(?!-\)[A-Za-z0-9-]\{1,62\}[A-Za-z0-9-]\)$

Required: Yes

Response Elements

The following elements are returned by the service.

ClusterIdentifier

The identifier of the cluster that the custom domain is associated with.

Type: String

Length Constraints: Maximum length of 2147483647.

CustomDomainCertExpiryTime

The expiration time for the certificate for the custom domain.
CustomDomainCertificateArn

The Amazon Resource Name (ARN) for the certificate associated with the custom domain name.

Type: String

Pattern: \[\w+=/,.@-]+:acm:\[\w+=/,.@-]*:\[0-9]+:\[\w+=,.@-]+(\/[\w+=,.@-]+)*

CustomDomainName

The custom domain name for the association result.

Type: String

Pattern: ^((?!-)[A-Za-z0-9-]{0,62}[A-Za-z0-9-])\.+((?!-)[A-Za-z0-9-]{1,62}[A-Za-z0-9-])$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

CustomCnameAssociationFault

An error occurred when an attempt was made to change the custom domain association.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

CreateEndpointAccess

Creates a Redshift-managed VPC endpoint.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](#).

**EndpointName**

The Redshift-managed VPC endpoint name.

- **Type:** String
- **Length Constraints:** Maximum length of 2147483647.
- **Required:** Yes

**SubnetGroupName**

The subnet group from which Amazon Redshift chooses the subnet to deploy the endpoint.

- **Type:** String
- **Length Constraints:** Maximum length of 2147483647.
- **Required:** Yes

**ClusterIdentifier**

The cluster identifier of the cluster to access.

- **Type:** String
- **Length Constraints:** Maximum length of 2147483647.
- **Required:** No

**ResourceOwner**

The AWS account ID of the owner of the cluster. This is only required if the cluster is in another AWS account.

- **Type:** String
- **Length Constraints:** Maximum length of 2147483647.
- **Required:** No

**VpcSecurityGroupIds.VpcSecurityGroupId.N**

The security group that defines the ports, protocols, and sources for inbound traffic that you are authorizing into your endpoint.

- **Type:** Array of strings
- **Length Constraints:** Maximum length of 2147483647.
Required: No

Response Elements

The following elements are returned by the service.

Address

The DNS address of the endpoint.
Type: String
Length Constraints: Maximum length of 2147483647.

ClusterIdentifier

The cluster identifier of the cluster associated with the endpoint.
Type: String
Length Constraints: Maximum length of 2147483647.

EndpointCreateTime

The time (UTC) that the endpoint was created.
Type: Timestamp

EndpointName

The name of the endpoint.
Type: String
Length Constraints: Maximum length of 2147483647.

EndpointStatus

The status of the endpoint.
Type: String
Length Constraints: Maximum length of 2147483647.

Port

The port number on which the cluster accepts incoming connections.
Type: Integer

ResourceOwner

The AWS account ID of the owner of the cluster.
Type: String
Length Constraints: Maximum length of 2147483647.

SubnetGroupName

The subnet group name where Amazon Redshift chooses to deploy the endpoint.
Type: String
Length Constraints: Maximum length of 2147483647.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

AccessToClusterDenied

You are not authorized to access the cluster.

HTTP Status Code: 400

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

ClusterSubnetGroupNotFoundFault

The cluster subnet group name does not refer to an existing cluster subnet group.

HTTP Status Code: 400

EndpointAlreadyExists

The account already has a Redshift-managed VPC endpoint with the given identifier.

HTTP Status Code: 400

EndpointsPerAuthorizationLimitExceeded

The number of Redshift-managed VPC endpoints per authorization has exceeded its limit.

HTTP Status Code: 400

EndpointsPerClusterLimitExceeded

The number of Redshift-managed VPC endpoints per cluster has exceeded its limit.

HTTP Status Code: 400

InvalidClusterSecurityGroupState

The state of the cluster security group is not available.

HTTP Status Code: 400

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

UnauthorizedOperation

Your account is not authorized to perform the requested operation.
HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3
CreateEventSubscription

Creates an Amazon Redshift event notification subscription. This action requires an ARN (Amazon Resource Name) of an Amazon SNS topic created by either the Amazon Redshift console, the Amazon SNS console, or the Amazon SNS API. To obtain an ARN with Amazon SNS, you must create a topic in Amazon SNS and subscribe to the topic. The ARN is displayed in the SNS console.

You can specify the source type, and lists of Amazon Redshift source IDs, event categories, and event severities. Notifications will be sent for all events you want that match those criteria. For example, you can specify source type = cluster, source ID = my-cluster-1 and mycluster2, event categories = Availability, Backup, and severity = ERROR. The subscription will only send notifications for those ERROR events in the Availability and Backup categories for the specified clusters.

If you specify both the source type and source IDs, such as source type = cluster and source identifier = my-cluster-1, notifications will be sent for all the cluster events for my-cluster-1. If you specify a source type but do not specify a source identifier, you will receive notice of the events for the objects of that type in your AWS account. If you do not specify either the SourceType nor the SourceIdentifier, you will be notified of events generated from all Amazon Redshift sources belonging to your AWS account. You must specify a source type if you specify a source ID.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

SnsTopicArn

The Amazon Resource Name (ARN) of the Amazon SNS topic used to transmit the event notifications. The ARN is created by Amazon SNS when you create a topic and subscribe to it.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

SubscriptionName

The name of the event subscription to be created.

Constraints:
- Cannot be null, empty, or blank.
- Must contain from 1 to 255 alphanumeric characters or hyphens.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Enabled

A boolean value; set to true to activate the subscription, and set to false to create the subscription but not activate it.

Type: Boolean
Required: No

**EventCategories.EventCategory.N**

Specifies the Amazon Redshift event categories to be published by the event notification subscription.

Values: configuration, management, monitoring, security, pending

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**Severity**

Specifies the Amazon Redshift event severity to be published by the event notification subscription.

Values: ERROR, INFO

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SourceIds.SourceId.N**

A list of one or more identifiers of Amazon Redshift source objects. All of the objects must be of the same type as was specified in the source type parameter. The event subscription will return only events generated by the specified objects. If not specified, then events are returned for all objects within the source type specified.

Example: my-cluster-1, my-cluster-2

Example: my-snapshot-20131010

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**SourceType**

The type of source that will be generating the events. For example, if you want to be notified of events generated by a cluster, you would set this parameter to cluster. If this value is not specified, events are returned for all Amazon Redshift objects in your AWS account. You must specify a source type in order to specify source IDs.

Valid values: cluster, cluster-parameter-group, cluster-security-group, cluster-snapshot, and scheduled-action.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Tags.Tag.N**

A list of tag instances.
Response Elements

The following element is returned by the service.

**EventSubscription**

Describes event subscriptions.

Type: EventSubscription (p. 479) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

**EventSubscriptionQuotaExceeded**

The request would exceed the allowed number of event subscriptions for this account. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

**InvalidTagFault**

The tag is invalid.

HTTP Status Code: 400

**SNSInvalidTopic**

Amazon SNS has responded that there is a problem with the specified Amazon SNS topic.

HTTP Status Code: 400

**SNSNoAuthorization**

You do not have permission to publish to the specified Amazon SNS topic.

HTTP Status Code: 400

**SNSTopicArnNotFound**

An Amazon SNS topic with the specified Amazon Resource Name (ARN) does not exist.

HTTP Status Code: 404

**SourceNotFound**

The specified Amazon Redshift event source could not be found.

HTTP Status Code: 404

**SubscriptionAlreadyExist**

There is already an existing event notification subscription with the specified name.

HTTP Status Code: 400
SubscriptionCategoryNotFound

The value specified for the event category was not one of the allowed values, or it specified a category that does not apply to the specified source type. The allowed values are Configuration, Management, Monitoring, and Security.

HTTP Status Code: 404

SubscriptionEventIdNotFound

An Amazon Redshift event with the specified event ID does not exist.

HTTP Status Code: 404

SubscriptionSeverityNotFound

The value specified for the event severity was not one of the allowed values, or it specified a severity that does not apply to the specified source type. The allowed values are ERROR and INFO.

HTTP Status Code: 404

TagLimitExceededFault

You have exceeded the number of tags allowed.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of CreateEventSubscription.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=CreateEventSubscription
&SubscriptionName=mysubscription
&SnsTopicArn=arn%3Aaws%3Asns%3Aus-east-2%3A123456789012%3AMySNStopic
&SourceType=cluster
&SourceIds.SourceId.1=mycluster
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b

Sample Response

<CreateEventSubscriptionResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <CreateEventSubscriptionResult>
    <EventSubscription>
      <Severity>INFO</Severity>
      <CustSubscriptionId>mysubscription</CustSubscriptionId>
      <SourceType>cluster</SourceType>
      <SourceIdsList>
        <SourceId>mycluster</SourceId>
      </SourceIdsList>
    </EventSubscription>
  </CreateEventSubscriptionResult>
</CreateEventSubscriptionResponse>

CreateHsmClientCertificate

Creates an HSM client certificate that an Amazon Redshift cluster will use to connect to the client's HSM in order to store and retrieve the keys used to encrypt the cluster databases.

The command returns a public key, which you must store in the HSM. In addition to creating the HSM certificate, you must create an Amazon Redshift HSM configuration that provides a cluster the information needed to store and use encryption keys in the HSM. For more information, go to Hardware Security Modules in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

HsmClientCertificateIdentifier

The identifier to be assigned to the new HSM client certificate that the cluster will use to connect to the HSM to use the database encryption keys.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Tags.Tag.N

A list of tag instances.

Type: Array of Tag (p. 542) objects

Required: No

Response Elements

The following element is returned by the service.

HsmClientCertificate

Returns information about an HSM client certificate. The certificate is stored in a secure Hardware Storage Module (HSM), and used by the Amazon Redshift cluster to encrypt data files.

Type: HsmClientCertificate (p. 482) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

HsmClientCertificateAlreadyExistsFault

There is already an existing Amazon Redshift HSM client certificate with the specified identifier.

HTTP Status Code: 400
HsmClientCertificateQuotaExceededFault

The quota for HSM client certificates has been reached. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400

TagLimitExceededFault

You have exceeded the number of tags allowed.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of CreateHsmClientCertificate.

Sample Request

&HsmClientCertificateIdentifier=myhsmclientcert

&SignatureMethod=HmacSHA256&SignatureVersion=4

&Version=2012-12-01

&X-Amz-Algorithm=AWS4-HMAC-SHA256

&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request

&X-Amz-Date=20190825T160000Z

&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date

&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e66ff7f89012345a6bb7

Sample Response

<?xml version="1.0" encoding="UTF-8"?>
<CreateHsmClientCertificateResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01"/>
<CreateHsmClientCertificateResult/>
</CreateHsmClientCertificateResponse>

CreateHsmConfiguration

Creates an HSM configuration that contains the information required by an Amazon Redshift cluster to store and use database encryption keys in a Hardware Security Module (HSM). After creating the HSM configuration, you can specify it as a parameter when creating a cluster. The cluster will then store its encryption keys in the HSM.

In addition to creating an HSM configuration, you must also create an HSM client certificate. For more information, go to Hardware Security Modules in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Description

A text description of the HSM configuration to be created.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

HsmConfigurationIdentifier

The identifier to be assigned to the new Amazon Redshift HSM configuration.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

HsmIpAddress

The IP address that the Amazon Redshift cluster must use to access the HSM.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

HsmPartitionName

The name of the partition in the HSM where the Amazon Redshift clusters will store their database encryption keys.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

HsmPartitionPassword

The password required to access the HSM partition.

Type: String
Response Elements

The following element is returned by the service.

**HsmConfiguration**

Returns information about an HSM configuration, which is an object that describes to Amazon Redshift clusters the information they require to connect to an HSM where they can store database encryption keys.

Type: **HsmConfiguration (p. 483)** object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

**HsmConfigurationAlreadyExistsFault**

There is already an existing Amazon Redshift HSM configuration with the specified identifier.

HTTP Status Code: 400

**HsmConfigurationQuotaExceededFault**

The quota for HSM configurations has been reached. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

**InvalidTagFault**

The tag is invalid.

HTTP Status Code: 400

**TagLimitExceededFault**

You have exceeded the number of tags allowed.

HTTP Status Code: 400
Examples

Example

This example illustrates one usage of CreateHsmConfiguration.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
    ?Action=CreateHsmConfiguration
&HsmConfigurationIdentifier=myhsmconnection
&Description=My+HSM+connection
&HsmIpAddress=192.0.2.09
&HsmPartitionName=myhsmpartition
&HsmPartitionPassword=A1b2c3d4
&HsmServerPublicCertificate=myhsmclientcert
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d34e6ff789012345a6b7b
```

Sample Response

```
<CreateHsmConfigurationResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <CreateHsmConfigurationResult>
    <HsmConfiguration>
      <Description>My HSM connection</Description>
      <HsmPartitionName>myhsmpartition</HsmPartitionName>
      <HsmConfigurationIdentifier>myhsmconnection</HsmConfigurationIdentifier>
      <Tags/>
      <HsmIpAddress>192.0.2.09</HsmIpAddress>
    </HsmConfiguration>
  </CreateHsmConfigurationResult>
  <ResponseMetadata>
    <RequestId>e106be9e-2833-11ea-9caa-c956bec1ce87</RequestId>
  </ResponseMetadata>
</CreateHsmConfigurationResponse>
```

CreateScheduledAction

Creates a scheduled action. A scheduled action contains a schedule and an Amazon Redshift API action. For example, you can create a schedule of when to run the ResizeCluster API operation.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

IamRole

The IAM role to assume to run the target action. For more information about this parameter, see ScheduledAction (p. 520).

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Schedule

The schedule in at( ) or cron( ) format. For more information about this parameter, see ScheduledAction (p. 520).

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

ScheduledActionName

The name of the scheduled action. The name must be unique within an account. For more information about this parameter, see ScheduledAction (p. 520).

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

TargetAction

A JSON format string of the Amazon Redshift API operation with input parameters. For more information about this parameter, see ScheduledAction (p. 520).

Type: ScheduledActionType (p. 523) object

Required: Yes

Enable

If true, the schedule is enabled. If false, the scheduled action does not trigger. For more information about state of the scheduled action, see ScheduledAction (p. 520).

Type: Boolean

Required: No
Response Elements

The following elements are returned by the service.

**EndTime**

The end time in UTC when the schedule is no longer active. After this time, the scheduled action does not trigger.

Type: Timestamp

**IamRole**

The IAM role to assume to run the scheduled action. This IAM role must have permission to run the Amazon Redshift API operation in the scheduled action. This IAM role must allow the Amazon Redshift scheduler (Principal scheduler.redshift.amazonaws.com) to assume permissions on your behalf. For more information about the IAM role to use with the Amazon Redshift scheduler, see [Using Identity-Based Policies for Amazon Redshift](https://docs.aws.amazon.com/redshift/latest/dg/concepts/iam-policies.html) in the Amazon Redshift Cluster Management Guide.

Type: String

**NextInvocations.ScheduledActionTime.N**

List of times when the scheduled action will run.

Type: Array of timestamps

**Schedule**

The schedule for a one-time (at format) or recurring (cron format) scheduled action. Schedule invocations must be separated by at least one hour.
Format of at expressions is "at(yyyy-mm-ddThh:mm:ss)". For example, "at(2016-03-04T17:27:00)".

Format of cron expressions is "cron(Minutes Hours Day-of-month Month Day-of-week Year)". For example, "cron(0 10 ? * MON *)". For more information, see Cron Expressions in the Amazon CloudWatch Events User Guide.

Type: String

ScheduledActionDescription

The description of the scheduled action.

Type: String

ScheduledActionName

The name of the scheduled action.

Type: String

Start Time

The start time in UTC when the schedule is active. Before this time, the scheduled action does not trigger.

Type: Timestamp

State

The state of the scheduled action. For example, DISABLED.

Type: String

Valid Values: ACTIVE | DISABLED

TargetAction

A JSON format string of the Amazon Redshift API operation with input parameters.

"{"ResizeCluster":{"NodeType":"ds2.8xlarge","ClusterIdentifier":"my-test-cluster","NumberOfNodes":3}}"

Type: ScheduledActionType (p. 523) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidSchedule

The schedule you submitted isn't valid.
HTTP Status Code: 400
InvalidScheduledAction
The scheduled action is not valid.

HTTP Status Code: 400
ScheduledActionAlreadyExists
The scheduled action already exists.

HTTP Status Code: 400
ScheduledActionQuotaExceeded
The quota for scheduled actions exceeded.

HTTP Status Code: 400
ScheduledActionTypeUnsupported
The action type specified for a scheduled action is not supported.

HTTP Status Code: 400
UnauthorizedOperation
Your account is not authorized to perform the requested operation.

HTTP Status Code: 400
UnsupportedOperation
The requested operation isn't supported.

CreateSnapshotCopyGrant

Creates a snapshot copy grant that permits Amazon Redshift to use an encrypted symmetric key from AWS Key Management Service (KMS) to encrypt copied snapshots in a destination region.

For more information about managing snapshot copy grants, go to Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**SnapshotCopyGrantName**

The name of the snapshot copy grant. This name must be unique in the region for the AWS account.

Constraints:
- Must contain from 1 to 63 alphanumeric characters or hyphens.
- Alphabetic characters must be lowercase.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.
- Must be unique for all clusters within an AWS account.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**KmsKeyId**

The unique identifier of the encrypted symmetric key to which to grant Amazon Redshift permission. If no key is specified, the default key is used.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Tags.Tag.N**

A list of tag instances.

Type: Array of Tag (p. 542) objects

Required: No

Response Elements

The following element is returned by the service.

**SnapshotCopyGrant**

The snapshot copy grant that grants Amazon Redshift permission to encrypt copied snapshots with the specified encrypted symmetric key from AWS KMS in the destination region.
For more information about managing snapshot copy grants, go to Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

Type: SnapshotCopyGrant (p. 531) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

DependentServiceRequestThrottlingFault

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.

HTTP Status Code: 400

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400

LimitExceededFault

The encryption key has exceeded its grant limit in AWS KMS.

HTTP Status Code: 400

SnapshotCopyGrantAlreadyExistsFault

The snapshot copy grant can't be created because a grant with the same name already exists.

HTTP Status Code: 400

SnapshotCopyGrantQuotaExceededFault

The AWS account has exceeded the maximum number of snapshot copy grants in this region.

HTTP Status Code: 400

TagLimitExceededFault

You have exceeded the number of tags allowed.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of CreateSnapshotCopyGrant.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=CreateSnapshotCopyGrant
&SnapshotCopyGrantName=mysnapshotcopygrantnew
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b

Sample Response

```xml
<CreateSnapshotCopyGrantResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <CreateSnapshotCopyGrantResult>
    <SnapshotCopyGrant>
      <SnapshotCopyGrantName>mysnapshotcopygrantnew</SnapshotCopyGrantName>
      <KmsKeyId>arn:aws:kms:us-east-2:123456789012:key/bPxRfih3yCo8nvbEXAMPLEKEY</KmsKeyId>
      <Tags/>
    </SnapshotCopyGrant>
  </CreateSnapshotCopyGrantResult>
  <ResponseMetadata>
    <RequestId>085f3206-2837-11ea-9939-5fccefa818c0</RequestId>
  </ResponseMetadata>
</CreateSnapshotCopyGrantResponse>
```

CreateSnapshotSchedule

Create a snapshot schedule that can be associated to a cluster and which overrides the default system backup schedule.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**DryRun**

Type: Boolean

Required: No

**NextInvocations**

Type: Integer

Required: No

**ScheduleDefinitions.ScheduleDefinition.N**

The definition of the snapshot schedule. The definition is made up of schedule expressions, for example "cron(30 12 *)" or "rate(12 hours)".

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**ScheduleDescription**

The description of the snapshot schedule.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ScheduleIdentifier**

A unique identifier for a snapshot schedule. Only alphanumeric characters are allowed for the identifier.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Tags.Tag.N**

An optional set of tags you can use to search for the schedule.

Type: Array of Tag (p. 542) objects

Required: No
Response Elements

The following elements are returned by the service.

**AssociatedClusterCount**

The number of clusters associated with the schedule.

Type: Integer

**AssociatedClusters.ClusterAssociatedToSchedule.N**

A list of clusters associated with the schedule. A maximum of 100 clusters is returned.

Type: Array of ClusterAssociatedToSchedule (p. 442) objects

**NextInvocations.SnapshotTime.N**

Type: Array of timestamps

**ScheduleDefinitions.ScheduleDefinition.N**

A list of ScheduleDefinitions.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

**ScheduleDescription**

The description of the schedule.

Type: String

Length Constraints: Maximum length of 2147483647.

**ScheduleIdentifier**

A unique identifier for the schedule.

Type: String

Length Constraints: Maximum length of 2147483647.

**Tags.Tag.N**

An optional set of tags describing the schedule.

Type: Array of Tag (p. 542) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

**InvalidSchedule**

The schedule you submitted isn't valid.

HTTP Status Code: 400

**InvalidTagFault**

The tag is invalid.
HTTP Status Code: 400

ScheduleDefinitionTypeUnsupported

The definition you submitted is not supported.

HTTP Status Code: 400

SnapshotScheduleAlreadyExists

The specified snapshot schedule already exists.

HTTP Status Code: 400

SnapshotScheduleQuotaExceeded

You have exceeded the quota of snapshot schedules.

HTTP Status Code: 400

TagLimitExceededFault

You have exceeded the number of tags allowed.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of CreateSnapshotSchedule.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=CreateSnapshotSchedule
&amp;ScheduleDefinitions.ScheduleDefinition.1=rate%2812+hours%29
&amp;ScheduleIdentifier=mysnapshotschedule
&amp;ScheduleDescription=My+schedule+description
&amp;SignatureMethod=HmacSHA256&amp;SignatureVersion=4
&amp;Version=2012-12-01
&amp;X-Amz-Algorithm=AWS4-HMAC-SHA256

CreateTags

Adds tags to a cluster.

A resource can have up to 50 tags. If you try to create more than 50 tags for a resource, you will receive an error and the attempt will fail.

If you specify a key that already exists for the resource, the value for that key will be updated with the new value.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ResourceName**

The Amazon Resource Name (ARN) to which you want to add the tag or tags. For example, arn:aws:redshift:us-east-2:123456789:cluster:t1.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Tags.Tag**

One or more name/value pairs to add as tags to the specified resource. Each tag name is passed in with the parameter Key and the corresponding value is passed in with the parameter Value. The Key and Value parameters are separated by a comma (,). Separate multiple tags with a space. For example, --tags "Key"="owner", "Value"="admin" "Key"="environment", "Value"="test" "Key"="version", "Value"="1.0".

Type: Array of Tag (p. 542) objects

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

**InvalidTagFault**

The tag is invalid.

HTTP Status Code: 400

**ResourceNotFoundFault**

The resource could not be found.

HTTP Status Code: 404
TagLimitExceededException
You have exceeded the number of tags allowed.
HTTP Status Code: 400

Examples

Example
This example illustrates one usage of CreateTags.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=CreateTags
&ResourceName=arn%3Aaws%3Aredshift%3Aus-east-2%3A123456789012%3Acluster%3Amycluster
&Tags.Tag.1.Key=mytag
&Tags.Tag.1.Value=newtag
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<CreateTagsResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ResponseMetadata>
    <RequestId>bf5cbe2f-2837-11ea-9467-b9a67a99da45</RequestId>
  </ResponseMetadata>
</CreateTagsResponse>
```

CreateUsageLimit

Creates a usage limit for a specified Amazon Redshift feature on a cluster. The usage limit is identified by the returned usage limit identifier.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Amount

The limit amount. If time-based, this amount is in minutes. If data-based, this amount is in terabytes (TB). The value must be a positive number.

Type: Long

Required: Yes

ClusterIdentifier

The identifier of the cluster that you want to limit usage.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

FeatureType

The Amazon Redshift feature that you want to limit.

Type: String

Valid Values: spectrum | concurrency-scaling | cross-region-datasharing

Required: Yes

LimitType

The type of limit. Depending on the feature type, this can be based on a time duration or data size. If FeatureType is spectrum, then LimitType must be data-scanned. If FeatureType is concurrency-scaling, then LimitType must be time. If FeatureType is cross-region-datasharing, then LimitType must be data-scanned.

Type: String

Valid Values: time | data-scanned

Required: Yes

BreachAction

The action that Amazon Redshift takes when the limit is reached. The default is log. For more information about this parameter, see UsageLimit (p. 546).

Type: String

Valid Values: log | emit-metric | disable

Required: No
### Response Elements

The following elements are returned by the service.

#### Amount

The limit amount. If time-based, this amount is in minutes. If data-based, this amount is in terabytes (TB).

Type: Long

#### BreachAction

The action that Amazon Redshift takes when the limit is reached. Possible values are:
- **log** - To log an event in a system table. The default is log.
- **emit-metric** - To emit CloudWatch metrics.
- **disable** - To disable the feature until the next usage period begins.

Type: String

Valid Values: log | emit-metric | disable

#### ClusterIdentifier

The identifier of the cluster with a usage limit.

Type: String

Length Constraints: Maximum length of 2147483647.

#### FeatureType

The Amazon Redshift feature to which the limit applies.

Type: String

Valid Values: spectrum | concurrency-scaling | cross-region-datasharing

#### LimitType

The type of limit. Depending on the feature type, this can be based on a time duration or data size.

Type: String
Valid Values: `time` | `data-scanned`

**Period**

The time period that the amount applies to. A weekly period begins on Sunday. The default is monthly.

Type: String

Valid Values: `daily` | `weekly` | `monthly`

**Tags.Tag.N**

A list of tag instances.

Type: Array of [Tag](#) objects

**UsageLimitId**

The identifier of the usage limit.

Type: String

Length Constraints: Maximum length of 2147483647.

## Errors

For information about the errors that are common to all actions, see [Common Errors](#).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

**InvalidUsageLimit**

The usage limit is not valid.

HTTP Status Code: 400

**LimitExceededFault**

The encryption key has exceeded its grant limit in AWS KMS.

HTTP Status Code: 400

**TagLimitExceededFault**

You have exceeded the number of tags allowed.

HTTP Status Code: 400

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400
UsageLimitAlreadyExists

The usage limit already exists.

HTTP Status Code: 400

DeauthorizeDataShare

From a datashare producer account, removes authorization from the specified datashare.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](p. 550).

**ConsumerIdentifier**

The identifier of the data consumer that is to have authorization removed from the datashare. This identifier is an AWS account ID or a keyword, such as ADX.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**DataShareArn**

The Amazon Resource Name (ARN) of the datashare to remove authorization from.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Response Elements**

The following elements are returned by the service.

**AllowPubliclyAccessibleConsumers**

A value that specifies whether the datashare can be shared to a publicly accessible cluster.

Type: Boolean

**DataShareArn**

An Amazon Resource Name (ARN) that references the datashare that is owned by a specific namespace of the producer cluster. A datashare ARN is in the `arn:aws:redshift:{region}:{account-id}:{datashare}:{namespace-guid}/{datashare-name}` format.

Type: String

Length Constraints: Maximum length of 2147483647.

**DataShareAssociations/member.N**

A value that specifies when the datashare has an association between producer and data consumers.

Type: Array of [DataShareAssociation](p. 460) objects

**ManagedBy**

The identifier of a datashare to show its managing entity.

Type: String
Length Constraints: Maximum length of 2147483647.

**ProducerArn**

The Amazon Resource Name (ARN) of the producer.
Type: String
Length Constraints: Maximum length of 2147483647.

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 552)](#).

**InvalidDataShareFault**

There is an error with the datashare.
HTTP Status Code: 400

**Examples**

**Example**

This example illustrates one usage of DeauthorizeDataShare.

**Sample Request**

```xml
https://redshift.us-east-2.amazonaws.com/
?Action=DeauthorizeDataShare
&ConsumerIdentifier=275247490162
&DataShareArn=arn%3Aaws%3Aredshift%3Aus-east-1%3A827630067164%3Adatashare%3Af06285e-8a45-4ee9-b598-648c218c8ff1%2Ftestshare2
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date

DeleteAuthenticationProfile

Deletes an authentication profile.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

AuthenticationProfileName

The name of the authentication profile to delete.

Type: String

Length Constraints: Maximum length of 63.

Pattern: ^[a-zA-Z0-9\-\ ]+$

Required: Yes

Response Elements

The following element is returned by the service.

AuthenticationProfileName

The name of the authentication profile that was deleted.

Type: String

Length Constraints: Maximum length of 63.

Pattern: ^[a-zA-Z0-9\-\ ]+$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

AuthenticationProfileNotFoundFault

The authentication profile can't be found.

HTTP Status Code: 404

InvalidAuthenticationProfileRequestFault

The authentication profile request is not valid. The profile name can't be null or empty. The authentication profile API operation must be available in the AWS Region.

HTTP Status Code: 400

DeleteCluster

Deletes a previously provisioned cluster without its final snapshot being created. A successful response from the web service indicates that the request was received correctly. Use DescribeClusters (p. 161) to monitor the status of the deletion. The delete operation cannot be canceled or reverted once submitted. For more information about managing clusters, go to Amazon Redshift Clusters in the Amazon Redshift Cluster Management Guide.

If you want to shut down the cluster and retain it for future use, set SkipFinalClusterSnapshot to false and specify a name for FinalClusterSnapshotIdentifier. You can later restore this snapshot to resume using the cluster. If a final cluster snapshot is requested, the status of the cluster will be "final-snapshot" while the snapshot is being taken, then it's "deleting" once Amazon Redshift begins deleting the cluster.

For more information about managing clusters, go to Amazon Redshift Clusters in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster to be deleted.

Constraints:

- Must contain lowercase characters.
- Must contain from 1 to 63 alphanumeric characters or hyphens.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

FinalClusterSnapshotIdentifier

The identifier of the final snapshot that is to be created immediately before deleting the cluster. If this parameter is provided, SkipFinalClusterSnapshot must be false.

Constraints:

- Must be 1 to 255 alphanumeric characters.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

FinalClusterSnapshotRetentionPeriod

The number of days that a manual snapshot is retained. If the value is -1, the manual snapshot is retained indefinitely.
The value must be either -1 or an integer between 1 and 3,653.
The default value is -1.

Type: Integer
Required: No

**SkipFinalClusterSnapshot**

Determines whether a final snapshot of the cluster is created before Amazon Redshift deletes the cluster. If `true`, a final cluster snapshot is not created. If `false`, a final cluster snapshot is created before the cluster is deleted.

**Note**
The `FinalClusterSnapshotIdentifier` parameter must be specified if `SkipFinalClusterSnapshot` is `false`.

Default: false

Type: Boolean
Required: No

**Response Elements**

The following element is returned by the service.

**Cluster**
Describes a cluster.

Type: [Cluster](p. 432) object

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 552)].

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**ClusterSnapshotAlreadyExists**

The value specified as a snapshot identifier is already used by an existing snapshot.

HTTP Status Code: 400

**ClusterSnapshotQuotaExceeded**

The request would result in the user exceeding the allowed number of cluster snapshots.

HTTP Status Code: 400

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400
InvalidRetentionPeriodFault

The retention period specified is either in the past or is not a valid value.

The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400

Examples

DeleteClusterParameterGroup

Deletes a specified Amazon Redshift parameter group.

**Note**
You cannot delete a parameter group if it is associated with a cluster.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ParameterGroupName**

The name of the parameter group to be deleted.

Constraints:
- Must be the name of an existing cluster parameter group.
- Cannot delete a default cluster parameter group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 552).

**ClusterParameterGroupNotFound**

The parameter group name does not refer to an existing parameter group.

HTTP Status Code: 404

**InvalidClusterParameterGroupState**

The cluster parameter group action can not be completed because another task is in progress that involves the parameter group. Wait a few moments and try the operation again.

HTTP Status Code: 400

**Examples**

**Example**

This example illustrates one usage of DeleteClusterParameterGroup.

**Sample Request**

https://redshift.us-east-2.amazonaws.com/
?Action=DeleteClusterParameterGroup
&ParameterGroupName=myclusterparametergroup
&SignatureMethod=HmacSHA256&SignatureVersion=4
Sample Response

<!--DeleteClusterParameterGroupResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/"-->
<!--ResponseMetadata-->
   <!--RequestId>95c53381-2838-11ea-a07c-5d44c0d19e91</RequestId-->
<!--ResponseMetadata-->
</DeleteClusterParameterGroupResponse>

DeleteClusterSecurityGroup

Deletes an Amazon Redshift security group.

**Note**
You cannot delete a security group that is associated with any clusters. You cannot delete the default security group.

For information about managing security groups, go to [Amazon Redshift Cluster Security Groups](https://docs.aws.amazon.com/redshift/latest/userguide/security-groups.html) in the [Amazon Redshift Cluster Management Guide](https://docs.aws.amazon.com/redshift/latest/userguide/)

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](https://docs.aws.amazon.com/redshift/latest/userguide/api-common-parameters.html).

**ClusterSecurityGroupName**

The name of the cluster security group to be deleted.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Errors**

For information about the errors that are common to all actions, see [Common Errors](https://docs.aws.amazon.com/redshift/latest/userguide/api-common-errors.html).

**ClusterSecurityGroupNameNotFound**

The cluster security group name does not refer to an existing cluster security group.

HTTP Status Code: 404

**InvalidClusterSecurityGroupState**

The state of the cluster security group is not available.

HTTP Status Code: 400

**Examples**

**Example**

This example illustrates one usage of DeleteClusterSecurityGroup.

**Sample Request**

```
https://redshift.us-east-2.amazonaws.com/
  ?Action=DeleteClusterSecurityGroup
  &ClusterSecurityGroupName=securitygroup1
  &Version=2012-12-01
  &x-amz-algorithm=AWS4-HMAC-SHA256
  &x-amz-credential=AKIAIOSFODNN7EXAMPLE/20121208/us-east-2/redshift/aws4_request
```
Sample Response

```xml
<DeleteClusterSecurityGroupResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ResponseMetadata>
    <RequestId>e54e05dc-40da-11e2-955f-313c36e901d</RequestId>
  </ResponseMetadata>
</DeleteClusterSecurityGroupResponse>
```

DeleteClusterSnapshot

Deletes the specified manual snapshot. The snapshot must be in the available state, with no other users authorized to access the snapshot.

Unlike automated snapshots, manual snapshots are retained even after you delete your cluster. Amazon Redshift does not delete your manual snapshots. You must delete manual snapshot explicitly to avoid getting charged. If other accounts are authorized to access the snapshot, you must revoke all of the authorizations before you can delete the snapshot.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**SnapshotIdentifier**

The unique identifier of the manual snapshot to be deleted.

Constraints: Must be the name of an existing snapshot that is in the available, failed, or cancelled state.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**SnapshotClusterIdentifier**

The unique identifier of the cluster the snapshot was created from. This parameter is required if your IAM user has a policy containing a snapshot resource element that specifies anything other than * for the cluster name.

Constraints: Must be the name of valid cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.

**Snapshot**

Describes a snapshot.

Type: [Snapshot](p. 525) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).
ClusterSnapshotNotFound

The snapshot identifier does not refer to an existing cluster snapshot.

HTTP Status Code: 404

InvalidClusterSnapshotState

The specified cluster snapshot is not in the available state, or other accounts are authorized to access the snapshot.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DeleteClusterSnapshot.

Sample Request

https://redshift.us-east-2.amazonaws.com/
  ?Action=DeleteClusterSnapshot
&SnapshotIdentifier=mysnapshotid

DeleteClusterSubnetGroup

Deletes the specified cluster subnet group.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](p. 550).

**ClusterSubnetGroupName**

The name of the cluster subnet group name to be deleted.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Errors**

For information about the errors that are common to all actions, see [Common Errors](p. 552).

**ClusterSubnetGroupNameNotFoundFault**

The cluster subnet group name does not refer to an existing cluster subnet group.

HTTP Status Code: 400

**InvalidClusterSubnetGroupNameStateFault**

The state of the subnet is invalid.

HTTP Status Code: 400

**Examples**

**Example**

This example illustrates one usage of DeleteClusterSubnetGroup.

**Sample Request**

```text
https://redshift.us-east-2.amazonaws.com/
?Action=DeleteClusterSubnetGroup
&ClusterSubnetGroupName=mysubnetgroup
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
```
Sample Response

```xml
<DeleteClusterSubnetGroupResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ResponseMetadata>
    <RequestId>35a0d116-2839-11ea-9939-5fccefa818c0</RequestId>
  </ResponseMetadata>
</DeleteClusterSubnetGroupResponse>
```

DeleteCustomDomainAssociation

Contains information about deleting a custom domain association for a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster to delete a custom domain association for.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

CustomDomainName

The custom domain name for the custom domain association.

Type: String

Pattern: ^((?!-)[A-Za-z0-9-]{0,62}[A-Za-z0-9-])\.(?!-)[A-Za-z0-9-]{1,62}[A-Za-z0-9-]}1,62[A-Za-z0-9-]]$

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

CustomCnameAssociationFault

An error occurred when an attempt was made to change the custom domain association.

HTTP Status Code: 400

CustomDomainAssociationNotFoundFault

An error occurred. The custom domain name couldn't be found.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

DeleteEndpointAccess

Deletes a Redshift-managed VPC endpoint.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

EndpointName

The Redshift-managed VPC endpoint to delete.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following elements are returned by the service.

Address

The DNS address of the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

ClusterIdentifier

The cluster identifier of the cluster associated with the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

EndpointCreateTime

The time (UTC) that the endpoint was created.

Type: Timestamp

EndpointName

The name of the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

EndpointStatus

The status of the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.
Port

The port number on which the cluster accepts incoming connections.

Type: Integer

ResourceOwner

The AWS account ID of the owner of the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

SubnetGroupName

The subnet group name where Amazon Redshift chooses to deploy the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

VpcEndpoint

The connection endpoint for connecting to an Amazon Redshift cluster through the proxy.

Type: VpcEndpoint (p. 548) object

The security groups associated with the endpoint.

Type: Array of VpcSecurityGroupMembership (p. 549) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

EndpointNotFound

The endpoint name doesn't refer to an existing endpoint.

HTTP Status Code: 404

InvalidClusterSecurityGroupState

The state of the cluster security group is not available.

HTTP Status Code: 400

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

InvalidEndpointState

The status of the endpoint is not valid.

DeleteEventSubscription

Deletes an Amazon Redshift event notification subscription.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

SubscriptionName

The name of the Amazon Redshift event notification subscription to be deleted.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidSubscriptionStateException

The subscription request is invalid because it is a duplicate request. This subscription request is already in progress.

HTTP Status Code: 400

SubscriptionNotFoundException

An Amazon Redshift event notification subscription with the specified name does not exist.

HTTP Status Code: 404

Examples

Example

This example illustrates one usage of DeleteEventSubscription.

Sample Request

```plaintext
https://redshift.us-east-2.amazonaws.com/
?Action=DeleteEventSubscription
&SubscriptionName=mysubscription
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```
Sample Response

```xml
<DeleteEventSubscriptionResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ResponseMetadata>
    <RequestId>8beeeec-2839-11ea-9467-b9a67a99da45</RequestId>
  </ResponseMetadata>
</DeleteEventSubscriptionResponse>
```

DeleteHsmClientCertificate

Deletes the specified HSM client certificate.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

HsmClientCertificateIdentifier

The identifier of the HSM client certificate to be deleted.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

HsmClientCertificateNotFoundFault

There is no Amazon Redshift HSM client certificate with the specified identifier.

HTTP Status Code: 400

InvalidHsmClientCertificateStateFault

The specified HSM client certificate is not in the available state, or it is still in use by one or more Amazon Redshift clusters.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DeleteHsmClientCertificate.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=DeleteHsmClientCertificate
&HsmClientCertificateIdentifier=myhsmclientcert
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request

DeleteHsmConfiguration

Deletes the specified Amazon Redshift HSM configuration.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

HsmConfigurationIdentifier

The identifier of the Amazon Redshift HSM configuration to be deleted.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

HsmConfigurationNotFoundFault

There is no Amazon Redshift HSM configuration with the specified identifier.

HTTP Status Code: 400

InvalidHsmConfigurationStateFault

The specified HSM configuration is not in the available state, or it is still in use by one or more Amazon Redshift clusters.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DeleteHsmConfiguration.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=DeleteHsmConfiguration
&HsmConfigurationIdentifier=myhsmconnection
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request

DeletePartner

Deletes a partner integration from a cluster. Data can still flow to the cluster until the integration is deleted at the partner’s website.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

AccountId

The AWS account ID that owns the cluster.

Type: String

Length Constraints: Fixed length of 12.

Pattern: ^[0-9]+$

Required: Yes

ClusterIdentifier

The cluster identifier of the cluster that receives data from the partner.

Type: String

Length Constraints: Maximum length of 63.

Pattern: ^[a-zA-Z0-9-]+$

Required: Yes

DatabaseName

The name of the database that receives data from the partner.

Type: String

Length Constraints: Maximum length of 127.

Pattern: ^[^p{L}_][^p{L}\p{N}@#$_]+$

Required: Yes

PartnerName

The name of the partner that is authorized to send data.

Type: String

Length Constraints: Maximum length of 255.

Pattern: ^[a-zA-Z0-9-]+$

Required: Yes

Response Elements

The following elements are returned by the service.
DatabaseName

The name of the database that receives data from the partner.

Type: String

Length Constraints: Maximum length of 127.

Pattern: ^[\p{L}_][\p{L}\p{N}@$#_]+$

PartnerName

The name of the partner that is authorized to send data.

Type: String

Length Constraints: Maximum length of 255.

Pattern: ^[a-zA-Z0-9\-_]+$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

PartnerNotFound

The name of the partner was not found.

HTTP Status Code: 404

UnauthorizedPartnerIntegration

The partner integration is not authorized.

HTTP Status Code: 401

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

DeleteResourcePolicy

Deletes the resource policy for a specified resource.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ResourceArn

The Amazon Resource Name (ARN) of the resource of which its resource policy is deleted.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ResourceNotFoundException

The resource could not be found.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

DeleteScheduledAction

Deletes a scheduled action.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ScheduledActionName

The name of the scheduled action to delete.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ScheduledActionNotFound

The scheduled action cannot be found.

HTTP Status Code: 400

UnauthorizedOperation

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DeleteScheduledAction.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=DeleteScheduledAction
&ScheduledActionName=myscheduledaction
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z

API Version 2012-12-01
DeleteSnapshotCopyGrant

Deletes the specified snapshot copy grant.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**SnapshotCopyGrantName**

The name of the snapshot copy grant to delete.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 552).

**InvalidSnapshotCopyGrantStateFault**

The snapshot copy grant can't be deleted because it is used by one or more clusters.

HTTP Status Code: 400

**SnapshotCopyGrantNotFoundFault**

The specified snapshot copy grant can't be found. Make sure that the name is typed correctly and that the grant exists in the destination region.

HTTP Status Code: 400

**Examples**

**Example**

This example illustrates one usage of DeleteSnapshotCopyGrant.

**Sample Request**

```
https://redshift.us-east-2.amazonaws.com/
?Action=DeleteSnapshotCopyGrant
&SnapshotCopyGrantName=mysnapshotcopygrantname
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678dd desta2ff3aa45678b90c12d34e6ff789012345a6b7b
```
Sample Response

```xml
<DeleteSnapshotCopyGrantResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ResponseMetadata>
    <RequestId>a0c0f3ad-283c-11ea-a940-1b28a85fd753</RequestId>
  </ResponseMetadata>
</DeleteSnapshotCopyGrantResponse>
```

DeleteSnapshotSchedule

Deletes a snapshot schedule.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ScheduleIdentifier

A unique identifier of the snapshot schedule to delete.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidClusterSnapshotScheduleState

The cluster snapshot schedule state is not valid.

HTTP Status Code: 400

SnapshotScheduleNotFound

We could not find the specified snapshot schedule.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DeleteSnapshotSchedule.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=DeleteSnapshotSchedule
&ScheduleIdentifier=mysnapshotschedule
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678d901ee2ff3aa45678b90c12d345e6ff789012345a6b7b

API Version 2012-12-01

140
Sample Response

```xml
<DeleteSnapshotScheduleResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ResponseMetadata>
    <RequestId>165cd56f-283d-11ea-a940-1b28a85fd753</RequestId>
  </ResponseMetadata>
</DeleteSnapshotScheduleResponse>
```

DeleteTags

Deletes tags from a resource. You must provide the ARN of the resource from which you want to delete the tag or tags.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ResourceName

The Amazon Resource Name (ARN) from which you want to remove the tag or tags. For example, arn:aws:redshift:us-east-2:123456789:cluster:t1.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

TagKeys.TagKey.N

The tag key that you want to delete.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400

ResourceNotFoundFault

The resource could not be found.

HTTP Status Code: 404

Examples

Example

This example illustrates one usage of DeleteTags.

Sample Request

https://redshift.us-east-2.amazonaws.com/

DeleteUsageLimit

Deletes a usage limit from a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**UsageLimitId**

The identifier of the usage limit to delete.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

**UsageLimitNotFound**

The usage limit identifier can't be found.

HTTP Status Code: 404

DescribeAccountAttributes

Returns a list of attributes attached to an account

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

AttributeNames.AttributeName.N

A list of attribute names.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.

AccountAttributes.AccountAttribute.N

A list of attributes assigned to an account.

Type: Array of AccountAttribute (p. 424) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

Examples

Example

This example illustrates one usage of DescribeAccountAttributes.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=DescribeAccountAttributes
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678dddd901ee2ff3aa45678b90c12d35e6ff789012345a6b7b

Sample Response

<DescribeAccountAttributesResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
<DescribeAccountAttributesResult>
  <AccountAttributes>
    <AccountAttribute>
      <AttributeValues>
        <AttributeValueTarget>

DescribeAuthenticationProfiles

Describes an authentication profile.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](p. 550).

### AuthenticationProfileName

The name of the authentication profile to describe. If not specified then all authentication profiles owned by the account are listed.

Type: String
Length Constraints: Maximum length of 63.
Pattern: ^[a-zA-Z0-9\-]+$
Required: No

**Response Elements**

The following element is returned by the service.

### AuthenticationProfiles.member.N

The list of authentication profiles.

Type: Array of [AuthenticationProfile](p. 429) objects

**Errors**

For information about the errors that are common to all actions, see [Common Errors](p. 552).

### AuthenticationProfileNotFoundFault

The authentication profile can't be found.

HTTP Status Code: 404

### InvalidAuthenticationProfileRequestFault

The authentication profile request is not valid. The profile name can't be null or empty. The authentication profile API operation must be available in the AWS Region.

HTTP Status Code: 400

• AWS SDK for Ruby V3
DescribeClusterDbRevisions

Returns an array of ClusterDbRevision objects.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

A unique identifier for a cluster whose ClusterDbRevisions you are requesting. This parameter is case sensitive. All clusters defined for an account are returned by default.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point for returning a set of response records. When the results of a DescribeClusterDbRevisions request exceed the value specified in MaxRecords, Amazon Redshift returns a value in the marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the marker parameter and retrying the request.

Constraints: You can specify either the ClusterIdentifier parameter, or the marker parameter, but not both.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in the marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the marker parameter and retrying the request.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

ClusterDbRevisions.ClusterDbRevision.N

A list of revisions.
Type: Array of `ClusterDbRevision (p. 443)` objects

**Marker**

A string representing the starting point for the next set of revisions. If a value is returned in a response, you can retrieve the next set of revisions by providing the value in the `marker` parameter and retrying the command. If the `marker` field is empty, all revisions have already been returned.

Type: String

Length Constraints: Maximum length of 2147483647.

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 552)](#).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

**Examples**

### Example

This example illustrates one usage of `DescribeClusterDbRevisions`.

**Sample Request**

```plaintext
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeClusterDbRevisions
&ClusterIdentifier=mycluster
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

**Sample Response**

```xml
<DescribeClusterDbRevisionsResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <DescribeClusterDbRevisionsResult>
    <ClusterDbRevisions>
      <ClusterDbRevision>
        <DatabaseRevisionReleaseDate>2019-12-23T19:11:37.360Z</DatabaseRevisionReleaseDate>
        <ClusterIdentifier>mycluster</ClusterIdentifier>
        <RevisionTargets/>
        <CurrentDatabaseRevision>11978</CurrentDatabaseRevision>
      </ClusterDbRevision>
    </ClusterDbRevisions>
  </DescribeClusterDbRevisionsResult>
</DescribeClusterDbRevisionsResponse>
```

DescribeClusterParameterGroups

Returns a list of Amazon Redshift parameter groups, including parameter groups you created and the default parameter group. For each parameter group, the response includes the parameter group name, description, and parameter group family name. You can optionally specify a name to retrieve the description of a specific parameter group.

For more information about parameters and parameter groups, go to Amazon Redshift Parameter Groups in the Amazon Redshift Cluster Management Guide.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all parameter groups that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all parameter groups that have any combination of those values are returned.

If both tag keys and values are omitted from the request, parameter groups are returned regardless of whether they have tag keys or values associated with them.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**Marker**

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeClusterParameterGroups (p. 152) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

**ParameterGroupName**

The name of a specific parameter group for which to return details. By default, details about all parameter groups and the default parameter group are returned.

Type: String

Length Constraints: Maximum length of 2147483647.
Required: No

TagKeys.TagKey.N

A tag key or keys for which you want to return all matching cluster parameter groups that are associated with the specified key or keys. For example, suppose that you have parameter groups that are tagged with keys called owner and environment. If you specify both of these tag keys in the request, Amazon Redshift returns a response with the parameter groups that have either or both of these tag keys associated with them.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

TagValues.TagValue.N

A tag value or values for which you want to return all matching cluster parameter groups that are associated with the specified tag value or values. For example, suppose that you have parameter groups that are tagged with values called admin and test. If you specify both of these tag values in the request, Amazon Redshift returns a response with the parameter groups that have either or both of these tag values associated with them.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.

Marker

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

ParameterGroups.ClusterParameterGroup.N

A list of ClusterParameterGroup (p. 446) instances. Each instance describes one cluster parameter group.

Type: Array of ClusterParameterGroup (p. 446) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterParameterGroupNotFound

The parameter group name does not refer to an existing parameter group.
HTTP Status Code: 404

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeClusterParameterGroups.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=DescribeClusterParameterGroups
&SignatureMethod=HmacSHA256&SignatureVersion=4

• AWS SDK for Ruby V3
DescribeClusterParameters

Returns a detailed list of parameters contained within the specified Amazon Redshift parameter group. For each parameter the response includes information such as parameter name, description, data type, value, whether the parameter value is modifiable, and so on.

You can specify source filter to retrieve parameters of only specific type. For example, to retrieve parameters that were modified by a user action such as from ModifyClusterParameterGroup (p. 331), you can specify source equal to user.

For more information about parameters and parameter groups, go to Amazon Redshift Parameter Groups in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ParameterGroupName**

The name of a cluster parameter group for which to return details.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Marker**

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeClusterParameters (p. 156) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

**Source**

The parameter types to return. Specify user to show parameters that are different form the default. Similarly, specify engine-default to show parameters that are the same as the default parameter group.
Response Elements

The following elements are returned by the service.

**Marker**

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

**Parameters.Parameter.N**

A list of Parameter (p. 496) instances. Each instance lists the parameters of one cluster parameter group.

Type: Array of Parameter (p. 496) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

**ClusterParameterGroupNotFound**

The parameter group name does not refer to an existing parameter group.

HTTP Status Code: 404

Examples

DescribeClusters

Returns properties of provisioned clusters including general cluster properties, cluster database properties, maintenance and backup properties, and security and access properties. This operation supports pagination. For more information about managing clusters, go to Amazon Redshift Clusters in the Amazon Redshift Cluster Management Guide.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all clusters that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all clusters that have any combination of those values are returned.

If both tag keys and values are omitted from the request, clusters are returned regardless of whether they have tag keys or values associated with them.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of a cluster whose properties you are requesting. This parameter is case sensitive.

The default is that all clusters defined for an account are returned.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeClusters (p. 161) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Constraints: You can specify either the ClusterIdentifier parameter or the Marker parameter, but not both.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.
Type: Integer
Required: No

**TagKeys.TagKey.N**
A tag key or keys for which you want to return all matching clusters that are associated with the specified key or keys. For example, suppose that you have clusters that are tagged with keys called owner and environment. If you specify both of these tag keys in the request, Amazon Redshift returns a response with the clusters that have either or both of these tag keys associated with them.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

**TagValues.TagValue.N**
A tag value or values for which you want to return all matching clusters that are associated with the specified tag value or values. For example, suppose that you have clusters that are tagged with values called admin and test. If you specify both of these tag values in the request, Amazon Redshift returns a response with the clusters that have either or both of these tag values associated with them.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

### Response Elements

The following elements are returned by the service.

**Clusters.Cluster.N**
A list of Cluster objects, where each object describes one cluster.

Type: Array of [Cluster](p. 432) objects

**Marker**
A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.

### Errors

For information about the errors that are common to all actions, see [Common Errors](p. 552).

**ClusterNotFound**
The ClusterIdentifier parameter does not refer to an existing cluster.
HTTP Status Code: 404
invalidTagFault
The tag is invalid.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeClusters.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeClusters
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<DescribeClustersResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
 <DescribeClustersResult>
  <Clusters>
   <Cluster>
    <AllowVersionUpgrade>true</AllowVersionUpgrade>
    <ClusterIdentifier>mycluster</ClusterIdentifier>
    <ClusterRevisionNumber>11978</ClusterRevisionNumber>
    <NumberOfNodes>1</NumberOfNodes>
    <ClusterPublicKey>ssh-rsa AAAABexamplepublickey...LzrwzEXAMPLE Amazon-Redshift</ClusterPublicKey>
    <AvailabilityZone>us-east-2f</AvailabilityZone>
    <ClusterVersion>1.0</ClusterVersion>
    <ManualSnapshotRetentionPeriod>-1</ManualSnapshotRetentionPeriod>
    <ClusterAvailabilityStatus>Available</ClusterAvailabilityStatus>
    <Endpoint>
     <Port>5439</Port>
     <Address>mycluster.cmeasqwquae.us-east-2.redshift.amazonaws.com</Address>
    </Endpoint>
    <VpcId>vpc-alabc1al</VpcId>
   </Cluster>
  </Clusters>
 </DescribeClustersResult>
</DescribeClustersResponse>

DescribeClusterSecurityGroups

Returns information about Amazon Redshift security groups. If the name of a security group is specified, the response will contain only information about only that security group.

For information about managing security groups, go to Amazon Redshift Cluster Security Groups in the Amazon Redshift Cluster Management Guide.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all security groups that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all security groups that have any combination of those values are returned.

If both tag keys and values are omitted from the request, security groups are returned regardless of whether they have tag keys or values associated with them.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterSecurityGroupName

The name of a cluster security group for which you are requesting details. You must specify either the Marker parameter or a ClusterSecurityGroupName parameter, but not both.

Example: securitygroup1

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeClusterSecurityGroups request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Constraints: You must specify either the ClusterSecurityGroupName parameter or the Marker parameter, but not both.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.
Response Elements

The following elements are returned by the service.

A list of `ClusterSecurityGroup` instances.

Type: Array of `ClusterSecurityGroup` objects

**Marker**

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 552).

**ClusterSecurityGroupNotFound**

The cluster security group name does not refer to an existing cluster security group.
HTTP Status Code: 404
InvalidTagFault
The tag is invalid.
HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeClusterSecurityGroups.

• AWS SDK for Ruby V3
DescribeClusterSnapshots

Returns one or more snapshot objects, which contain metadata about your cluster snapshots. By default, this operation returns information about all snapshots of all clusters that are owned by your AWS account. No information is returned for snapshots owned by inactive AWS accounts.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all snapshots that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all snapshots that have any combination of those values are returned. Only snapshots that you own are returned in the response; shared snapshots are not returned with the tag key and tag value request parameters.

If both tag keys and values are omitted from the request, snapshots are returned regardless of whether they have tag keys or values associated with them.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterExists

A value that indicates whether to return snapshots only for an existing cluster. You can perform table-level restore only by using a snapshot of an existing cluster, that is, a cluster that has not been deleted. Values for this parameter work as follows:

- If ClusterExists is set to true, ClusterIdentifier is required.
- If ClusterExists is set to false and ClusterIdentifier isn't specified, all snapshots associated with deleted clusters (orphaned snapshots) are returned.
- If ClusterExists is set to false and ClusterIdentifier is specified for a deleted cluster, snapshots associated with that cluster are returned.
- If ClusterExists is set to false and ClusterIdentifier is specified for an existing cluster, no snapshots are returned.

Type: Boolean

Required: No

ClusterIdentifier

The identifier of the cluster which generated the requested snapshots.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

EndTime

A time value that requests only snapshots created at or before the specified time. The time value is specified in ISO 8601 format. For more information about ISO 8601, go to the ISO8601 Wikipedia page.

Example: 2012-07-16T18:00:00Z

Type: Timestamp

Required: No
Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeClusterSnapshots (p. 169) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

OwnerAccount

The AWS account used to create or copy the snapshot. Use this field to filter the results to snapshots owned by a particular account. To describe snapshots you own, either specify your AWS account, or do not specify the parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SnapshotArn

The Amazon Resource Name (ARN) of the snapshot associated with the message to describe cluster snapshots.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SnapshotIdentifier

The snapshot identifier of the snapshot about which to return information.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SnapshotType

The type of snapshots for which you are requesting information. By default, snapshots of all types are returned.
Valid Values: automated | manual

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SortingEntities.SnapshotSortingEntity.N**

Type: Array of [SnapshotSortingEntity](p. 535) objects

Required: No

**StartTime**

A value that requests only snapshots created at or after the specified time. The time value is specified in ISO 8601 format. For more information about ISO 8601, go to the [ISO8601 Wikipedia page](https://en.wikipedia.org/wiki/ISO_8601).

Example: 2012-07-16T18:00:00Z

Type: Timestamp

Required: No

**TagKeys.TagKey.N**

A tag key or keys for which you want to return all matching cluster snapshots that are associated with the specified key or keys. For example, suppose that you have snapshots that are tagged with keys called owner and environment. If you specify both of these tag keys in the request, Amazon Redshift returns a response with the snapshots that have either or both of these tag keys associated with them.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**TagValues.TagValue.N**

A tag value or values for which you want to return all matching cluster snapshots that are associated with the specified tag value or values. For example, suppose that you have snapshots that are tagged with values called admin and test. If you specify both of these tag values in the request, Amazon Redshift returns a response with the snapshots that have either or both of these tag values associated with them.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**Response Elements**

The following elements are returned by the service.

**Marker**

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned
marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.

Snapshots.Snapshot.N
A list of Snapshot instances.
Type: Array of Snapshot objects

Errors
For information about the errors that are common to all actions, see Common Errors.

ClusterNotFound
The ClusterIdentifier parameter does not refer to an existing cluster.
HTTP Status Code: 404

ClusterSnapshotNotFound
The snapshot identifier does not refer to an existing cluster snapshot.
HTTP Status Code: 404

InvalidTagFault
The tag is invalid.
HTTP Status Code: 400

UnsupportedOperation
The requested operation isn't supported.
HTTP Status Code: 400

DescribeClusterSubnetGroups

Returns one or more cluster subnet group objects, which contain metadata about your cluster subnet groups. By default, this operation returns information about all cluster subnet groups that are defined in your AWS account.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all subnet groups that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all subnet groups that have any combination of those values are returned.

If both tag keys and values are omitted from the request, subnet groups are returned regardless of whether they have tag keys or values associated with them.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterSubnetGroupName

The name of the cluster subnet group for which information is requested.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeClusterSubnetGroups request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

TagKeys.TagKey.N

A tag key or keys for which you want to return all matching cluster subnet groups that are associated with the specified key or keys. For example, suppose that you have subnet groups that are tagged
with keys called owner and environment. If you specify both of these tag keys in the request, Amazon Redshift returns a response with the subnet groups that have either or both of these tag keys associated with them.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

TagValues.TagValue.N
A tag value or values for which you want to return all matching cluster subnet groups that are associated with the specified tag value or values. For example, suppose that you have subnet groups that are tagged with values called admin and test. If you specify both of these tag values in the request, Amazon Redshift returns a response with the subnet groups that have either or both of these tag values associated with them.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements
The following elements are returned by the service.

ClusterSubnetGroups.ClusterSubnetGroup.N
A list of ClusterSubnetGroup (p. 455) instances.
Type: Array of ClusterSubnetGroup (p. 455) objects

Marker
A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.

Errors
For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterSubnetGroupNotFoundFault
The cluster subnet group name does not refer to an existing cluster subnet group.
HTTP Status Code: 400

InvalidTagFault
The tag is invalid.
HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeClusterSubnetGroups.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeClusterSubnetGroups
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678d3dd901ee2ff5aa4678b90c12d3456ff789012345a66b7b
```

Sample Response

```
<DescribeClusterSubnetGroupsResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <DescribeClusterSubnetGroupsResult>
    <ClusterSubnetGroups>
      <ClusterSubnetGroup>
        <VpcId>vpc-a1abc1a1</VpcId>
        <Description>default</Description>
        <Subnets>
          <Subnet>
            <SubnetStatus>Active</SubnetStatus>
            <SubnetIdentifier>subnet-a1b23aba</SubnetIdentifier>
            <SubnetAvailabilityZone>
              <Name>us-east-2a</Name>
            </SubnetAvailabilityZone>
          </Subnet>
          <Subnet>
            <SubnetStatus>Active</SubnetStatus>
            <SubnetIdentifier>subnet-a1b23abb</SubnetIdentifier>
            <SubnetAvailabilityZone>
              <Name>us-east-2b</Name>
            </SubnetAvailabilityZone>
          </Subnet>
          <Subnet>
            <SubnetStatus>Active</SubnetStatus>
            <SubnetIdentifier>subnet-a1b23abc</SubnetIdentifier>
            <SubnetAvailabilityZone>
              <Name>us-east-2c</Name>
            </SubnetAvailabilityZone>
          </Subnet>
        </Subnets>
        <ClusterSubnetGroupName>default</ClusterSubnetGroupName>
        <SubnetGroupStatus>Complete</SubnetGroupStatus>
        <Tags/>
      </ClusterSubnetGroup>
    </ClusterSubnetGroups>
  </DescribeClusterSubnetGroupsResult>
</DescribeClusterSubnetGroupsResponse>
```

DescribeClusterTracks

Returns a list of all the available maintenance tracks.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

MaintenanceTrackName

The name of the maintenance track.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeClusterTracks request exceed the value specified in MaxRecords, Amazon Redshift returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

An integer value for the maximum number of maintenance tracks to return.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

MaintenanceTracks.MaintenanceTrack.N

A list of maintenance tracks output by the DescribeClusterTracks operation.

Type: Array of MaintenanceTrack (p. 490) objects

Marker

The starting point to return a set of response tracklist records. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidClusterTrack

The provided cluster track name is not valid.

HTTP Status Code: 400

UnauthorizedOperation

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeClusterTracks.

DescribeClusterVersions

Returns descriptions of the available Amazon Redshift cluster versions. You can call this operation even before creating any clusters to learn more about the Amazon Redshift versions. For more information about managing clusters, go to Amazon Redshift Clusters in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterParameterGroupFamily

The name of a specific cluster parameter group family to return details for.

Constraints:
- Must be 1 to 255 alphanumeric characters
- First character must be a letter
- Cannot end with a hyphen or contain two consecutive hyphens

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ClusterVersion

The specific cluster version to return.

Example: 1.0

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeClusterVersions (p. 182) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100
Response Elements

The following elements are returned by the service.

**ClusterVersions.ClusterVersion.N**

A list of `Version` elements.

Type: Array of `ClusterVersion` objects

**Marker**

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the `Marker` parameter and retrying the command. If the `Marker` field is empty, all response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 552)](#).

DescribeCustomDomainAssociations

Contains information about custom domain associations for a cluster.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](p. 550).

**CustomDomainCertificateArn**

The certificate Amazon Resource Name (ARN) for the custom domain association.

Type: String

Pattern: `arn:[^\w+=/,.@-]+:acm:[^\w+=/,.@-]*:[0-9]+:[^\w+=,.@-]+(/[^\w+=,.@-]+)*`

Required: No

**CustomDomainName**

The custom domain name for the custom domain association.

Type: String

Pattern: `^(((?!-)[A-Za-z0-9-]{0,62}[A-Za-z0-9-])\.|(?!-)[A-Za-z0-9-]{1,62}[A-Za-z0-9-])$`

Required: No

**Marker**

The marker for the custom domain association.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum records setting for the associated custom domain.

Type: Integer

Required: No

**Response Elements**

The following elements are returned by the service.

**Associations.Association.N**

The associations for the custom domain.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

CustomDomainAssociationNotFoundFault

An error occurred. The custom domain name couldn't be found.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

See Also

DescribeDataShares

Shows the status of any inbound or outbound datashares available in the specified account.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

DataShareArn

The identifier of the datashare to describe details of.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeDataShares (p. 187) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

DataShares.member.N

The results returned from describing datashares.

Type: Array of DataShare (p. 458) objects

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeDataShares (p. 187) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidDataShareFault

There is an error with the datashare.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeDataShares.

Sample Request

```plaintext
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeDataShares
&NamespaceArn=arn:aws:redshift:us-east-2:3A827630067164%3Adatashare
&DataShareRelationship=PRODUCER
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256

DescribeDataSharesForConsumer

Returns a list of datashares where the account identifier being called is a consumer account identifier.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ConsumerArn**

The Amazon Resource Name (ARN) of the consumer that returns in the list of datashares.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Marker**

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeDataSharesForConsumer (p. 190) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a Marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Type: Integer

Required: No

**Status**

An identifier giving the status of a datashare in the consumer cluster. If this field is specified, Amazon Redshift returns the list of datashares that have the specified status.

Type: String

Valid Values: ACTIVE | AVAILABLE

Required: No

Response Elements

The following elements are returned by the service.
DataShares.member.N

Shows the results of datashares available for consumers.

Type: Array of DataShare (p. 458) objects

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeDataSharesForConsumer (p. 190) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidNamespaceFault

The namespace isn't valid because the namespace doesn't exist. Provide a valid namespace.

HTTP Status Code: 400

See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
DescribeDataSharesForProducer

Returns a list of datashares when the account identifier being called is a producer account identifier.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeDataSharesForProducer (p. 192) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Type: Integer
Required: No

ProducerArn

The Amazon Resource Name (ARN) of the producer that returns in the list of datashares.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Status

An identifier giving the status of a datashare in the producer. If this field is specified, Amazon Redshift returns the list of datashares that have the specified status.

Type: String
Valid Values: ACTIVE | AUTHORIZED | PENDING_AUTHORIZATION | DEAUTHORIZED | REJECTED
Required: No

Response Elements

The following elements are returned by the service.
DataShares.member.N

Shows the results of datashares available for producers.

Type: Array of DataShare (p. 458) objects

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeDataSharesForProducer (p. 192) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidNamespaceFault

The namespace isn't valid because the namespace doesn't exist. Provide a valid namespace.

HTTP Status Code: 400

DescribeDefaultClusterParameters

Returns a list of parameter settings for the specified parameter group family.

For more information about parameters and parameter groups, go to Amazon Redshift Parameter Groups in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ParameterGroupFamily

The name of the cluster parameter group family.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeDefaultClusterParameters (p. 194) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

Response Elements

The following element is returned by the service.

DefaultClusterParameters

Describes the default cluster parameters for a parameter group family.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

Examples

Example

This example illustrates one usage of DescribeDefaultClusterParameters.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeDefaultClusterParameters
&ParameterGroupFamily=redshift-1.0
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256

DescribeEndpointAccess

Describes a Redshift-managed VPC endpoint.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](p. 550).

**ClusterIdentifier**

The cluster identifier associated with the described endpoint.

- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**EndpointName**

The name of the endpoint to be described.

- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**Marker**

An optional pagination token provided by a previous `DescribeEndpointAccess` request. If this parameter is specified, the response includes only records beyond the marker, up to the value specified by the `MaxRecords` parameter.

- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**MaxRecords**

The maximum number of records to include in the response. If more records exist than the specified `MaxRecords` value, a pagination token called a Marker is included in the response so that the remaining results can be retrieved.

- Type: Integer
- Required: No

**ResourceOwner**

The AWS account ID of the owner of the cluster.

- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**VpcId**

The virtual private cloud (VPC) identifier with access to the cluster.
Response Elements

The following elements are returned by the service.

**EndpointAccessList.member.N**

The list of endpoints with access to the cluster.

Type: Array of [EndpointAccess](#) objects

**Marker**

An optional pagination token provided by a previous `DescribeEndpointAccess` request. If this parameter is specified, the response includes only records beyond the marker, up to the value specified by the `MaxRecords` parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see [Common Errors](#).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**EndpointNotFound**

The endpoint name doesn't refer to an existing endpoint.

HTTP Status Code: 404

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

DescribeEndpointAuthorization

Describes an endpoint authorization.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**Account**

The AWS account ID of either the cluster owner (grantor) or grantee. If `Grantee` parameter is true, then the `Account` value is of the grantor.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ClusterIdentifier**

The cluster identifier of the cluster to access.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Grantee**

Indicates whether to check authorization from a grantor or grantee point of view. If true, Amazon Redshift returns endpoint authorizations that you've been granted. If false (default), checks authorization from a grantor point of view.

Type: Boolean

Required: No

**Marker**

An optional pagination token provided by a previous DescribeEndpointAuthorization request. If this parameter is specified, the response includes only records beyond the marker, up to the value specified by the `MaxRecords` parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of records to include in the response. If more records exist than the specified `MaxRecords` value, a pagination token called a `Marker` is included in the response so that the remaining results can be retrieved.

Type: Integer

Required: No
Response Elements

The following elements are returned by the service.

EndpointAuthorizationList.member.N

  The authorizations to an endpoint.

  Type: Array of EndpointAuthorization (p. 472) objects

Marker

  An optional pagination token provided by a previous DescribeEndpointAuthorization request. If this parameter is specified, the response includes only records beyond the marker, up to the value specified by the MaxRecords parameter.

  Type: String

  Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

  The ClusterIdentifier parameter does not refer to an existing cluster.

  HTTP Status Code: 404

UnsupportedOperation

  The requested operation isn't supported.

  HTTP Status Code: 400

DescribeEventCategories

Displays a list of event categories for all event source types, or for a specified source type. For a list of the event categories and source types, go to Amazon Redshift Event Notifications.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

SourceType

The source type, such as cluster or parameter group, to which the described event categories apply.

Valid values: cluster, cluster-snapshot, cluster-parameter-group, cluster-security-group, and scheduled-action.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.

EventCategoriesMapList.EventCategoriesMap.N

A list of event categories descriptions.

Type: Array of EventCategoriesMap (p. 476) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

API Version 2012-12-01

204
DescribeEvents

Returns events related to clusters, security groups, snapshots, and parameter groups for the past 14 days. Events specific to a particular cluster, security group, snapshot or parameter group can be obtained by providing the name as a parameter. By default, the past hour of events are returned.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Duration

The number of minutes prior to the time of the request for which to retrieve events. For example, if the request is sent at 18:00 and you specify a duration of 60, then only events which have occurred after 17:00 will be returned.

Default: 60
Type: Integer
Required: No

EndTime

The end of the time interval for which to retrieve events, specified in ISO 8601 format. For more information about ISO 8601, go to the ISO8601 Wikipedia page.

Example: 2009-07-08T18:00Z
Type: Timestamp
Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeEvents (p. 205) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100
Constraints: minimum 20, maximum 100.
Type: Integer
Required: No
SourceIdentifier

The identifier of the event source for which events will be returned. If this parameter is not specified, then all sources are included in the response.

Constraints:

If SourceIdentifier is supplied, SourceType must also be provided.

• Specify a cluster identifier when SourceType is cluster.
• Specify a cluster security group name when SourceType is cluster-security-group.
• Specify a cluster parameter group name when SourceType is cluster-parameter-group.
• Specify a cluster snapshot identifier when SourceType is cluster-snapshot.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SourceType

The event source to retrieve events for. If no value is specified, all events are returned.

Constraints:

If SourceType is supplied, SourceIdentifier must also be provided.

• Specify cluster when SourceIdentifier is a cluster identifier.
• Specify cluster-security-group when SourceIdentifier is a cluster security group name.
• Specify cluster-parameter-group when SourceIdentifier is a cluster parameter group name.
• Specify cluster-snapshot when SourceIdentifier is a cluster snapshot identifier.

Type: String

Valid Values: cluster | cluster-parameter-group | cluster-security-group | cluster-snapshot | scheduled-action

Required: No

StartTime

The beginning of the time interval to retrieve events for, specified in ISO 8601 format. For more information about ISO 8601, go to the ISO8601 Wikipedia page.

Example: 2009-07-08T18:00Z

Type: Timestamp

Required: No

Response Elements

The following elements are returned by the service.

Events.Event.N

A list of Event instances.

Type: Array of Event (p. 474) objects
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

Examples

Example

This example illustrates one usage of DescribeEvents.

DescribeEventSubscriptions

Lists descriptions of all the Amazon Redshift event notification subscriptions for a customer account. If you specify a subscription name, lists the description for that subscription.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all event notification subscriptions that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all subscriptions that have any combination of those values are returned.

If both tag keys and values are omitted from the request, subscriptions are returned regardless of whether they have tag keys or values associated with them.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**Marker**

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeEventSubscriptions request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

**SubscriptionName**

The name of the Amazon Redshift event notification subscription to be described.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TagKeys.TagKey.N**

A tag key or keys for which you want to return all matching event notification subscriptions that are associated with the specified key or keys. For example, suppose that you have subscriptions that
are tagged with keys called owner and environment. If you specify both of these tag keys in the 
request, Amazon Redshift returns a response with the subscriptions that have either or both of these 
tag keys associated with them.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

TagValues.TagValue.N

A tag value or values for which you want to return all matching event notification subscriptions 
that are associated with the specified tag value or values. For example, suppose that you have 
subscriptions that are tagged with values called admin and test. If you specify both of these tag 
values in the request, Amazon Redshift returns a response with the subscriptions that have either or 
both of these tag values associated with them.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.

EventSubscriptionsList.EventSubscription.N

A list of event subscriptions.

Type: Array of EventSubscription (p. 479) objects

Marker

A value that indicates the starting point for the next set of response records in a subsequent request. 
If a value is returned in a response, you can retrieve the next set of records by providing this returned 
marker value in the Marker parameter and retrying the command. If the Marker field is empty, all 
response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400

SubscriptionNotFound

An Amazon Redshift event notification subscription with the specified name does not exist.

HTTP Status Code: 404
Examples

Example

This example illustrates one usage of DescribeEventSubscriptions.

DescribeHsmClientCertificates

Returns information about the specified HSM client certificate. If no certificate ID is specified, returns information about all the HSM certificates owned by your AWS account.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all HSM client certificates that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all HSM client certificates that have any combination of those values are returned.

If both tag keys and values are omitted from the request, HSM client certificates are returned regardless of whether they have tag keys or values associated with them.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

HsmClientCertificateIdentifier

The identifier of a specific HSM client certificate for which you want information. If no identifier is specified, information is returned for all HSM client certificates owned by your AWS account.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeHsmClientCertificates (p. 214) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a Marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

TagKeys.TagKey.N

A tag key or keys for which you want to return all matching HSM client certificates that are associated with the specified key or keys. For example, suppose that you have HSM client certificates
that are tagged with keys called owner and environment. If you specify both of these tag keys in the request, Amazon Redshift returns a response with the HSM client certificates that have either or both of these tag keys associated with them.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

TagValues.TagValue.N
A tag value or values for which you want to return all matching HSM client certificates that are associated with the specified tag value or values. For example, suppose that you have HSM client certificates that are tagged with values called admin and test. If you specify both of these tag values in the request, Amazon Redshift returns a response with the HSM client certificates that have either or both of these tag values associated with them.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements
The following elements are returned by the service.

HsmClientCertificates.HsmClientCertificate.N
A list of the identifiers for one or more HSM client certificates used by Amazon Redshift clusters to store and retrieve database encryption keys in an HSM.

Type: Array of HsmClientCertificate objects

Marker
A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.

Errors
For information about the errors that are common to all actions, see Common Errors (p. 552).

HsmClientCertificateNotFoundFault
There is no Amazon Redshift HSM client certificate with the specified identifier.

HTTP Status Code: 400

InvalidTagFault
The tag is invalid.
HTTP Status Code: 400

DescribeHsmConfigurations

Returns information about the specified Amazon Redshift HSM configuration. If no configuration ID is specified, returns information about all the HSM configurations owned by your AWS account.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all HSM connections that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all HSM connections that have any combination of those values are returned.

If both tag keys and values are omitted from the request, HSM connections are returned regardless of whether they have tag keys or values associated with them.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

HsmConfigurationIdentifier

The identifier of a specific Amazon Redshift HSM configuration to be described. If no identifier is specified, information is returned for all HSM configurations owned by your AWS account.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeHsmConfigurations (p. 218) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

TagKeys.TagKey.N

A tag key or keys for which you want to return all matching HSM configurations that are associated with the specified key or keys. For example, suppose that you have HSM configurations that are
tagged with keys called owner and environment. If you specify both of these tag keys in the request, Amazon Redshift returns a response with the HSM configurations that have either or both of these tag keys associated with them.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

TagValues.TagValue.N

A tag value or values for which you want to return all matching HSM configurations that are associated with the specified tag value or values. For example, suppose that you have HSM configurations that are tagged with values called admin and test. If you specify both of these tag values in the request, Amazon Redshift returns a response with the HSM configurations that have either or both of these tag values associated with them.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements

The following elements are returned by the service.

HsmConfigurations.HsmConfiguration.N

A list of HsmConfiguration objects.

Type: Array of HsmConfiguration (p. 483) objects

Marker

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

HsmConfigurationNotFoundException

There is no Amazon Redshift HSM configuration with the specified identifier.

HTTP Status Code: 400

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400
Examples

This example illustrates one usage of DescribeHsmConfigurations.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeHsmConfigurations
&HsmConfigurationIdentifier=myhsmconnection
&SignatureMethod=HmacSHA256&SignatureVersion=4

DescribeInboundIntegrations

Returns a list of inbound integrations.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**IntegrationArn**

The Amazon Resource Name (ARN) of the inbound integration.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Marker**

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeInboundIntegrations (p. 221) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in the Marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

**TargetArn**

The Amazon Resource Name (ARN) of the target of an inbound integration.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.
InboundIntegrations.InboundIntegration.N

A list of InboundIntegration (p. 486) instances.

Type: Array of InboundIntegration (p. 486) objects

Marker

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

IntegrationNotFoundFault

The integration can't be found.

HTTP Status Code: 404

InvalidNamespaceFault

The namespace isn't valid because the namespace doesn't exist. Provide a valid namespace.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

See Also

- AWS SDK for Python
- AWS SDK for Ruby V3
DescribeLoggingStatus

Describes whether information, such as queries and connection attempts, is being logged for the specified Amazon Redshift cluster.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters (p. 550)]().

**ClusterIdentifier**

- The identifier of the cluster from which to get the logging status.
- Example: `examplecluster`
- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: Yes

**Response Elements**

The following elements are returned by the service.

**BucketName**

- The name of the S3 bucket where the log files are stored.
- Type: String
- Length Constraints: Maximum length of 2147483647.

**LastFailureMessage**

- The message indicating that logs failed to be delivered.
- Type: String
- Length Constraints: Maximum length of 2147483647.

**LastFailureTime**

- The last time when logs failed to be delivered.
- Type: Timestamp

**LastSuccessfulDeliveryTime**

- The last time that logs were delivered.
- Type: Timestamp

**LogDestinationType**

- The log destination type. An enum with possible values of `s3` and `cloudwatch`.
- Type: String
Valid Values: s3 | cloudwatch

**LogExports.member.N**

The collection of exported log types. Possible values are connectionlog, useractivitylog, and userlog.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

**LoggingEnabled**

true if logging is on, false if logging is off.

Type: Boolean

**S3KeyPrefix**

The prefix applied to the log file names.

Type: String

Length Constraints: Maximum length of 2147483647.

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 552)](p.552).

**ClusterNotFound**

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

**Examples**

**Example**

This example illustrates one usage of DescribeLoggingStatus.

**Sample Request**

```plaintext
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeLoggingStatus
&ClusterIdentifier=mycluster
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```
Sample Response

```xml
<DescribeLoggingStatusResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <DescribeLoggingStatusResult>
    <LoggingEnabled>false</LoggingEnabled>
  </DescribeLoggingStatusResult>
  <ResponseMetadata>
    <RequestId>9ed2dcec-28cc-11ea-b6af-7126da6f11af</RequestId>
  </ResponseMetadata>
</DescribeLoggingStatusResponse>
```

DescribeNodeConfigurationOptions

Returns properties of possible node configurations such as node type, number of nodes, and disk usage for the specified action type.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ActionType**

The action type to evaluate for possible node configurations. Specify "restore-cluster" to get configuration combinations based on an existing snapshot. Specify "recommend-node-config" to get configuration recommendations based on an existing cluster or snapshot. Specify "resize-cluster" to get configuration combinations for elastic resize based on an existing cluster.

Type: String

Valid Values: restore-cluster | recommend-node-config | resize-cluster

Required: Yes

**ClusterIdentifier**

The identifier of the cluster to evaluate for possible node configurations.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Filter.NodeConfigurationOptionsFilter.N**

A set of name, operator, and value items to filter the results.

Type: Array of NodeConfigurationOptionsFilter (p. 494) objects

Required: No

**Marker**

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeNodeConfigurationOptions (p. 226) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 500
Constraints: minimum 100, maximum 500.
Type: Integer
Required: No

OwnerAccount
The AWS account used to create or copy the snapshot. Required if you are restoring a snapshot you
do not own, optional if you own the snapshot.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SnapshotArn
The Amazon Resource Name (ARN) of the snapshot associated with the message to describe node
configuration.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SnapshotIdentifier
The identifier of the snapshot to evaluate for possible node configurations.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements
The following elements are returned by the service.

Marker
A value that indicates the starting point for the next set of response records in a subsequent request.
If a value is returned in a response, you can retrieve the next set of records by providing this returned
marker value in the Marker parameter and retrying the command. If the Marker field is empty, all
response records have been retrieved for the request.
Type: String
Length Constraints: Maximum length of 2147483647.

NodeConfigurationOptionList.NodeConfigurationOption.N
A list of valid node configurations.
Type: Array of NodeConfigurationOption (p. 493) objects

Errors
For information about the errors that are common to all actions, see Common Errors (p. 552).
AccessToSnapshotDenied

The owner of the specified snapshot has not authorized your account to access the snapshot.

HTTP Status Code: 400

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

ClusterSnapshotNotFound

The snapshot identifier does not refer to an existing cluster snapshot.

HTTP Status Code: 404

InvalidClusterSnapshotState

The specified cluster snapshot is not in the available state, or other accounts are authorized to access the snapshot.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeNodeConfigurationOptions.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeNodeConfigurationOptions
&ActionType=restore-cluster
&SnapshotIdentifier=mysnapshotid
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date

DescribeOrderableClusterOptions

Returns a list of orderable cluster options. Before you create a new cluster you can use this operation to find what options are available, such as the EC2 Availability Zones (AZ) in the specific AWS Region that you can specify, and the node types you can request. The node types differ by available storage, memory, CPU and price. With the cost involved you might want to obtain a list of cluster options in the specific region and specify values when creating a cluster. For more information about managing clusters, go to Amazon Redshift Clusters in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterVersion

The version filter value. Specify this parameter to show only the available offerings matching the specified version.

Default: All versions.

Constraints: Must be one of the version returned from DescribeClusterVersions (p. 182).

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeOrderableClusterOptions (p. 230) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

NodeType

The node type filter value. Specify this parameter to show only the available offerings matching the specified node type.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements

The following elements are returned by the service.

Marker

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.

OrderableClusterOptions.OrderableClusterOption.N

An OrderableClusterOption structure containing information about orderable options for the cluster.

Type: Array of OrderableClusterOption (p. 495) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

DescribePartners

Returns information about the partner integrations defined for a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Accountld

The AWS account ID that owns the cluster.

Type: String
Length Constraints: Fixed length of 12.
Pattern: ^[0-9]+$
Required: Yes

ClusterIdentifier

The cluster identifier of the cluster whose partner integration is being described.

Type: String
Length Constraints: Maximum length of 63.
Pattern: ^[a-zA-Z0-9-]+$
Required: Yes

DatabaseName

The name of the database whose partner integration is being described. If database name is not specified, then all databases in the cluster are described.

Type: String
Length Constraints: Maximum length of 127.
Pattern: ^[\p{L}_.][\p{L}\p{N}@#$]+$
Required: No

PartnerName

The name of the partner that is being described. If partner name is not specified, then all partner integrations are described.

Type: String
Length Constraints: Maximum length of 255.
Pattern: ^[a-zA-Z0-9-._]+$
Required: No

Response Elements

The following element is returned by the service.
PartnerIntegrationInfoList.PartnerIntegrationInfo.N

A list of partner integrations.

Type: Array of PartnerIntegrationInfo (p. 498) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

UnauthorizedPartnerIntegration

The partner integration is not authorized.

HTTP Status Code: 401

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

DescribeReservedNodeExchangeStatus

Returns exchange status details and associated metadata for a reserved-node exchange. Statuses include such values as in progress and requested.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Marker

An optional pagination token provided by a previous DescribeReservedNodeExchangeStatus request. If this parameter is specified, the response includes only records beyond the marker, up to the value specified by the MaxRecords parameter. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a Marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Type: Integer

Required: No

ReservedNodeExchangeRequestId

The identifier of the reserved-node exchange request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ReservedNodeId

The identifier of the source reserved node in a reserved-node exchange request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.

Marker

A pagination token provided by a previous DescribeReservedNodeExchangeStatus request.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ReservedNodeExchangeNotFond

The reserved-node exchange status wasn't found.

HTTP Status Code: 404

ReservedNodeNotFound

The specified reserved compute node not found.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

DescribeReservedNodeOfferings

Returns a list of the available reserved node offerings by Amazon Redshift with their descriptions including the node type, the fixed and recurring costs of reserving the node and duration the node will be reserved for you. These descriptions help you determine which reserve node offering you want to purchase. You then use the unique offering ID in you call to PurchaseReservedNodeOffering (p. 369) to reserve one or more nodes for your Amazon Redshift cluster.

For more information about reserved node offerings, go to Purchasing Reserved Nodes in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeReservedNodeOfferings (p. 238) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100
Constraints: minimum 20, maximum 100.
Type: Integer
Required: No

ReservedNodeOfferingId

The unique identifier for the offering.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements

The following elements are returned by the service.
Marker

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

ReservedNodeOfferings.ReservedNodeOffering.N

A list of ReservedNodeOffering objects.

Type: Array of ReservedNodeOffering objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

DependentServiceUnavailableFault

Your request cannot be completed because a dependent internal service is temporarily unavailable. Wait 30 to 60 seconds and try again.

HTTP Status Code: 400

ReservedNodeOfferingNotFound

Specified offering does not exist.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeReservedNodeOfferings.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=DescribeReservedNodeOfferings
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01

DescribeReservedNodes

Returns the descriptions of the reserved nodes.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeReservedNodes (p. 242) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

ReservedNodeid

Identifier for the node reservation.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.

Marker

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.

**ReservedNodes.ReservedNode.N**

The list of ReservedNode objects.

Type: Array of [ReservedNode (p. 504)](p. 504) objects

## Errors

For information about the errors that are common to all actions, see [Common Errors (p. 552)](p. 552).

**DependentServiceUnavailableFault**

Your request cannot be completed because a dependent internal service is temporarily unavailable. Wait 30 to 60 seconds and try again.

HTTP Status Code: 400

**ReservedNodeNotFound**

The specified reserved compute node not found.

HTTP Status Code: 404

## Examples

### Example

This example illustrates one usage of DescribeReservedNodes.

**Sample Request**

```plaintext
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeReservedNodes
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

**Sample Response**

```xml
<DescribeReservedNodesResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <DescribeReservedNodesResult>
    <ReservedNodes>
      <ReservedNode>
        <ReservedNodeId>12345678-12ab-12a1-1a2a-12ab-12a12aEXAMPLE</ReservedNodeId>
        <OfferingType>All Upfront</OfferingType>
        <ReservedNodeOfferingType>Regular</ReservedNodeOfferingType>
        <RecurringCharges>
          <RecurringCharge>
            <RecurringChargeAmount>0.0</RecurringChargeAmount>
            <RecurringChargeFrequency>Hourly</RecurringChargeFrequency>
          </RecurringCharge>
        </RecurringCharges>
      </ReservedNode>

DescribeResize

Returns information about the last resize operation for the specified cluster. If no resize operation has ever been initiated for the specified cluster, a HTTP 404 error is returned. If a resize operation was initiated and completed, the status of the resize remains as SUCCEEDED until the next resize.

A resize operation can be requested using ModifyCluster (p. 310) and specifying a different number or type of nodes for the cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of a cluster whose resize progress you are requesting. This parameter is case-sensitive.

By default, resize operations for all clusters defined for an AWS account are returned.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following elements are returned by the service.

AvgResizeRateInMegaBytesPerSecond

The average rate of the resize operation over the last few minutes, measured in megabytes per second. After the resize operation completes, this value shows the average rate of the entire resize operation.

Type: Double

DataTransferProgressPercent

The percent of data transferred from source cluster to target cluster.

Type: Double

ElapsedTimeInSeconds

The amount of seconds that have elapsed since the resize operation began. After the resize operation completes, this value shows the total actual time, in seconds, for the resize operation.

Type: Long

EstimatedTimeToCompletionInSeconds

The estimated time remaining, in seconds, until the resize operation is complete. This value is calculated based on the average resize rate and the estimated amount of data remaining to be processed. Once the resize operation is complete, this value will be 0.

Type: Long
**ImportTablesCompleted.member.N**

The names of tables that have been completely imported.

Valid Values: List of table names.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

**ImportTablesInProgress.member.N**

The names of tables that are being currently imported.

Valid Values: List of table names.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

**ImportTablesNotStarted.member.N**

The names of tables that have not been yet imported.

Valid Values: List of table names

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

**Message**

An optional string to provide additional details about the resize action.

Type: String

Length Constraints: Maximum length of 2147483647.

**ProgressInMegaBytes**

While the resize operation is in progress, this value shows the current amount of data, in megabytes, that has been processed so far. When the resize operation is complete, this value shows the total amount of data, in megabytes, on the cluster, which may be more or less than TotalResizeDataInMegaBytes (the estimated total amount of data before resize).

Type: Long

**ResizeType**

An enum with possible values of ClassicResize and ElasticResize. These values describe the type of resize operation being performed.

Type: String

Length Constraints: Maximum length of 2147483647.

**Status**

The status of the resize operation.

Valid Values: NONE | IN_PROGRESS | FAILED | SUCCEEDED | CANCELLING

Type: String

Length Constraints: Maximum length of 2147483647.

**TargetClusterType**

The cluster type after the resize operation is complete.
Valid Values: multi-node | single-node
Type: String
Length Constraints: Maximum length of 2147483647.

**TargetEncryptionType**

The type of encryption for the cluster after the resize is complete.
Possible values are KMS and None.
Type: String
Length Constraints: Maximum length of 2147483647.

**TargetNodeType**

The node type that the cluster will have after the resize operation is complete.
Type: String
Length Constraints: Maximum length of 2147483647.

**TargetNumberOfNodes**

The number of nodes that the cluster will have after the resize operation is complete.
Type: Integer

**TotalResizeDataInMegaBytes**

The estimated total amount of data, in megabytes, on the cluster before the resize operation began.
Type: Long

### Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.
HTTP Status Code: 404

**ResizeNotFound**

A resize operation for the specified cluster is not found.
HTTP Status Code: 404

**UnsupportedOperation**

The requested operation isn't supported.
HTTP Status Code: 400

### Examples

**Example**

This example illustrates one usage of DescribeResize.
Sample Request

```
https://redshift.us-east-2.amazonaws.com/
  ?Action=DescribeResize
&ClusterIdentifier=mycluster
&SignatureMethod=HmacSHA256&SignatureVersion=4

DescribeScheduledActions

Describes properties of scheduled actions.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Active

If true, retrieve only active scheduled actions. If false, retrieve only disabled scheduled actions.

Type: Boolean

Required: No

EndTime

The end time in UTC of the scheduled action to retrieve. Only active scheduled actions that have invocations before this time are retrieved.

Type: Timestamp

Required: No

Filters.ScheduledActionFilter.N

List of scheduled action filters.

Type: Array of ScheduledActionFilter (p. 522) objects

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeScheduledActions (p. 249) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No
ScheduledActionName

The name of the scheduled action to retrieve.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

StartTime

The start time in UTC of the scheduled actions to retrieve. Only active scheduled actions that have
invocations after this time are retrieved.

Type: Timestamp

Required: No

TargetActionType

The type of the scheduled actions to retrieve.

Type: String

Valid Values: ResizeCluster | PauseCluster | ResumeCluster

Required: No

Response Elements

The following elements are returned by the service.

Marker

An optional parameter that specifies the starting point to return a set of response records. When the
results of a DescribeScheduledActions (p. 249) request exceed the value specified in MaxRecords,
AWS returns a value in the Marker field of the response. You can retrieve the next set of response
records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

ScheduledActions.ScheduledAction.N

List of retrieved scheduled actions.

Type: Array of ScheduledAction (p. 520) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ScheduledActionNotFound

The scheduled action cannot be found.

HTTP Status Code: 400
UnauthorizedOperation

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400

DescribeSnapshotCopyGrants

Returns a list of snapshot copy grants owned by the AWS account in the destination region.

For more information about managing snapshot copy grants, go to Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**Marker**

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeSnapshotCopyGrant request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Constraints: You can specify either the SnapshotCopyGrantName parameter or the Marker parameter, but not both.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100

Constraints: minimum 20, maximum 100.

Type: Integer

Required: No

**SnapshotCopyGrantName**

The name of the snapshot copy grant.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TagKeys.TagKey.N**

A tag key or keys for which you want to return all matching resources that are associated with the specified key or keys. For example, suppose that you have resources tagged with keys called owner and environment. If you specify both of these tag keys in the request, Amazon Redshift returns a response with all resources that have either or both of these tag keys associated with them.
Response Elements

The following elements are returned by the service.

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeSnapshotCopyGrant request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Constraints: You can specify either the SnapshotCopyGrantName parameter or the Marker parameter, but not both.

Type: String

Length Constraints: Maximum length of 2147483647.

SnapshotCopyGrants.SnapshotCopyGrant.N

The list of SnapshotCopyGrant objects.

Type: Array of SnapshotCopyGrant (p. 531) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidTagFault

The tag is invalid.

HTTP Status Code: 400

SnapshotCopyGrantNotFoundFault

The specified snapshot copy grant can't be found. Make sure that the name is typed correctly and that the grant exists in the destination region.

HTTP Status Code: 400
Examples

Example

This example illustrates one usage of DescribeSnapshotCopyGrants.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/

DescribeSnapshotSchedules

Returns a list of snapshot schedules.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters (p. 550)].

**ClusterIdentifier**

The unique identifier for the cluster whose snapshot schedules you want to view.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Marker**

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the marker parameter and retrying the command. If the marker field is empty, all response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number or response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Type: Integer

Required: No

**ScheduleIdentifier**

A unique identifier for a snapshot schedule.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TagKeys.TagKey.N**

The key value for a snapshot schedule tag.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.
Response Elements

The following elements are returned by the service.

**Marker**

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the `marker` parameter and retrying the command. If the `marker` field is empty, all response records have been retrieved for the request.

- **Type:** String
- **Length Constraints:** Maximum length of 2147483647.

**SnapshotSchedules.SnapshotSchedule.N**

A list of SnapshotSchedules.

- **Type:** Array of [SnapshotSchedule](p. 533) objects

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 552)](#).

Examples

Example

This example illustrates one usage of DescribeSnapshotSchedules.

Sample Request

```plaintext
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeSnapshotSchedules
&ClusterIdentifier=mycluster
&ScheduleIdentifier=mysnapshotschedule
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```
Sample Response

```xml
<DescribeSnapshotSchedulesResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <DescribeSnapshotSchedulesResult>
    <SnapshotSchedules>
      <SnapshotSchedule>
        <ScheduleDefinitions>
          <ScheduleDefinition>rate(12 hours)</ScheduleDefinition>
        </ScheduleDefinitions>
        <ScheduleDescription>My schedule description</ScheduleDescription>
        <AssociatedClusterCount>1</AssociatedClusterCount>
        <AssociatedClusters>
          <ClusterAssociatedToSchedule>
            <ScheduleAssociationState>ACTIVE</ScheduleAssociationState>
            <ClusterIdentifier>mycluster</ClusterIdentifier>
          </ClusterAssociatedToSchedule>
        </AssociatedClusters>
        <ScheduleIdentifier>mysnapshotschedule</ScheduleIdentifier>
        <Tags/>
      </SnapshotSchedule>
    </SnapshotSchedules>
  </DescribeSnapshotSchedulesResult>
  <ResponseMetadata>
    <RequestId>65030ae0-28d3-11ea-9caa-c956bec1ce87</RequestId>
  </ResponseMetadata>
</DescribeSnapshotSchedulesResponse>
```

DescribeStorage

Returns account level backups storage size and provisional storage.

Response Elements

The following elements are returned by the service.

TotalBackupSizeInMegaBytes

The total amount of storage currently used for snapshots.

Type: Double

TotalProvisionedStorageInMegaBytes

The total amount of storage currently provisioned.

Type: Double

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

Examples

Example

This example illustrates one usage of DescribeStorage.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeStorage
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<DescribeStorageResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <DescribeStorageResult>
    <TotalProvisionedStorageInMegaBytes>491520.0</TotalProvisionedStorageInMegaBytes>
    <TotalBackupSizeInMegaBytes>26.0</TotalBackupSizeInMegaBytes>
  </DescribeStorageResult>
  <ResponseMetadata>
    <RequestId>d6b087363-28d3-11ea-8397-219d1980588b</RequestId>
  </ResponseMetadata>
</DescribeStorageResponse>
```

DescribeTableRestoreStatus

Lists the status of one or more table restore requests made using the
RestoreTableFromClusterSnapshot (p. 401) API action. If you don't specify a value for the
TableRestoreRequestId parameter, then DescribeTableRestoreStatus returns the
status of all table restore requests ordered by the date and time of the request in ascending
order. Otherwise DescribeTableRestoreStatus returns the status of the table specified by
TableRestoreRequestId.

Request Parameters

For information about the parameters that are common to all actions, see Common
Parameters (p. 550).

ClusterIdentifier

The Amazon Redshift cluster that the table is being restored to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Marker

An optional pagination token provided by a previous DescribeTableRestoreStatus request. If
this parameter is specified, the response includes only records beyond the marker, up to the value
specified by the MaxRecords parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of records to include in the response. If more records exist than the specified
MaxRecords value, a pagination token called a marker is included in the response so that the
remaining results can be retrieved.

Type: Integer

Required: No

TableRestoreRequestId

The identifier of the table restore request to return status for. If you don't specify a
TableRestoreRequestId value, then DescribeTableRestoreStatus returns the status of all
in-progress table restore requests.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.
Marker

A pagination token that can be used in a subsequent DescribeTableRestoreStatus request.

Type: String

Length Constraints: Maximum length of 2147483647.

TableRestoreStatusDetails.TableRestoreStatus.N

A list of status details for one or more table restore requests.

Type: Array of TableRestoreStatus objects

Errors

For information about the errors that are common to all actions, see Common Errors.

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

TableRestoreNotFoundFault

The specified TableRestoreRequestId value was not found.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DescribeTableRestoreStatus.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeTableRestoreStatus
&ClusterIdentifier=mycluster
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff53aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<DescribeTableRestoreStatusResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <DescribeTableRestoreStatusResult>
    <TableRestoreStatusDetails>
      <TableRestoreStatus>
        <NewTableName>mytable-clone</NewTableName>
        <ClusterIdentifier>mycluster</ClusterIdentifier>
        <SnapshotIdentifier>mysnapshotid</SnapshotIdentifier>
      </TableRestoreStatus>
    </TableRestoreStatusDetails>
  </DescribeTableRestoreStatusResult>
</DescribeTableRestoreStatusResponse>
```

DescribeTags

Returns a list of tags. You can return tags from a specific resource by specifying an ARN, or you can return all tags for a given type of resource, such as clusters, snapshots, and so on.

The following are limitations for DescribeTags:

- You cannot specify an ARN and a resource-type value together in the same request.
- You cannot use the MaxRecords and Marker parameters together with the ARN parameter.
- The MaxRecords parameter can be a range from 10 to 50 results to return in a request.

If you specify both tag keys and tag values in the same request, Amazon Redshift returns all resources that match any combination of the specified keys and values. For example, if you have owner and environment for tag keys, and admin and test for tag values, all resources that have any combination of those values are returned.

If both tag keys and values are omitted from the request, resources are returned regardless of whether they have tag keys or values associated with them.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**Marker**

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the marker parameter and retrying the command. If the marker field is empty, all response records have been retrieved for the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number or response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Type: Integer

Required: No

**ResourceName**

The Amazon Resource Name (ARN) for which you want to describe the tag or tags. For example, arn:aws:redshift:us-east-2:123456789:cluster:t1.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
**ResourceType**

The type of resource with which you want to view tags. Valid resource types are:

- Cluster
- CIDR/IP
- EC2 security group
- Snapshot
- Cluster security group
- Subnet group
- HSM connection
- HSM certificate
- Parameter group
- Snapshot copy grant

For more information about Amazon Redshift resource types and constructing ARNs, go to [Specifying Policy Elements: Actions, Effects, Resources, and Principals](#) in the Amazon Redshift Cluster Management Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TagKeys.TagKey.N**

A tag key or keys for which you want to return all matching resources that are associated with the specified key or keys. For example, suppose that you have resources tagged with keys called `owner` and `environment`. If you specify both of these tag keys in the request, Amazon Redshift returns a response with all resources that have either or both of these tag keys associated with them.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**TagValues.TagValue.N**

A tag value or values for which you want to return all matching resources that are associated with the specified value or values. For example, suppose that you have resources tagged with values called `admin` and `test`. If you specify both of these tag values in the request, Amazon Redshift returns a response with all resources that have either or both of these tag values associated with them.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**Response Elements**

The following elements are returned by the service.

**Marker**

A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned
marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.

TaggedResources.TaggedResource.N
A list of tags with their associated resources.
Type: Array of TaggedResource (p. 543) objects

Errors
For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidTagFault
The tag is invalid.
HTTP Status Code: 400

ResourceNotFoundFault
The resource could not be found.
HTTP Status Code: 404

Examples

Example
This example illustrates one usage of DescribeTags.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=DescribeTags
&ResourceName=arn%3Aaws%3Aredshift%3Aus-east-2%3A123456789012%3Acluster%3Amycluster
&TagKeys.TagKey.1=mytag
&TagValues.TagValue.1=newtag
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date

DescribeUsageLimits

Shows usage limits on a cluster. Results are filtered based on the combination of input usage limit identifier, cluster identifier, and feature type parameters:

- If usage limit identifier, cluster identifier, and feature type are not provided, then all usage limit objects for the current account in the current region are returned.
- If usage limit identifier is provided, then the corresponding usage limit object is returned.
- If cluster identifier is provided, then all usage limit objects for the specified cluster are returned.
- If cluster identifier and feature type are provided, then all usage limit objects for the combination of cluster and feature are returned.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster for which you want to describe usage limits.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

FeatureType

The feature type for which you want to describe usage limits.

Type: String

Valid Values: spectrum | concurrency-scaling | cross-region-datasharing

Required: No

Marker

An optional parameter that specifies the starting point to return a set of response records. When the results of a DescribeUsageLimits (p. 268) request exceed the value specified in MaxRecords, AWS returns a value in the Marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaxRecords

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Default: 100
Constraints: minimum 20, maximum 100.
Type: Integer
Required: No
TagKeys.TagKey.N
A tag key or keys for which you want to return all matching usage limit objects that are associated with the specified key or keys. For example, suppose that you have parameter groups that are tagged with keys called owner and environment. If you specify both of these tag keys in the request, Amazon Redshift returns a response with the usage limit objects have either or both of these tag keys associated with them.
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No
TagValues.TagValue.N
A tag value or values for which you want to return all matching usage limit objects that are associated with the specified tag value or values. For example, suppose that you have parameter groups that are tagged with values called admin and test. If you specify both of these tag values in the request, Amazon Redshift returns a response with the usage limit objects that have either or both of these tag values associated with them.
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No
UsageLimitId
The identifier of the usage limit to describe.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements
The following elements are returned by the service.
Marker
A value that indicates the starting point for the next set of response records in a subsequent request. If a value is returned in a response, you can retrieve the next set of records by providing this returned marker value in the Marker parameter and retrying the command. If the Marker field is empty, all response records have been retrieved for the request.
Type: String
Length Constraints: Maximum length of 2147483647.
UsageLimits.member.N
Contains the output from the DescribeUsageLimits (p. 268) action.
Type: Array of usageLimit objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

See Also

DisableLogging

Stops logging information, such as queries and connection attempts, for the specified Amazon Redshift cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster on which logging is to be stopped.

Example: examplecluster

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following elements are returned by the service.

BucketName

The name of the S3 bucket where the log files are stored.

Type: String

Length Constraints: Maximum length of 2147483647.

LastFailureMessage

The message indicating that logs failed to be delivered.

Type: String

Length Constraints: Maximum length of 2147483647.

LastFailureTime

The last time when logs failed to be delivered.

Type: Timestamp

LastSuccessfulDeliveryTime

The last time that logs were delivered.

Type: Timestamp

LogDestinationType

The log destination type. An enum with possible values of s3 and cloudwatch.

Type: String

Valid Values: s3 | cloudwatch
LogExports.member.N

The collection of exported log types. Possible values are connectionlog, useractivitylog, and userlog.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

LoggingEnabled

true if logging is on, false if logging is off.

Type: Boolean

S3KeyPrefix

The prefix applied to the log file names.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

DisableSnapshotCopy

Disables the automatic copying of snapshots from one region to another region for a specified cluster.

If your cluster and its snapshots are encrypted using an encrypted symmetric key from AWS Key Management Service, use DeleteSnapshotCopyGrant (p. 138) to delete the grant that grants Amazon Redshift permission to the key in the destination region.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of the source cluster that you want to disable copying of snapshots to a destination region.

Constraints: Must be the valid name of an existing cluster that has cross-region snapshot copy enabled.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFoundException

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidClusterStateException

The specified cluster is not in the available state.

HTTP Status Code: 400

SnapshotCopyAlreadyDisabledFault

The cluster already has cross-region snapshot copy disabled.
HTTP Status Code: 400
**UnauthorizedOperation**
Your account is not authorized to perform the requested operation.

HTTP Status Code: 400
**UnsupportedOperation**
The requested operation isn't supported.

HTTP Status Code: 400

**Examples**

**Example**
This example illustrates one usage of DisableSnapshotCopy.

**Sample Request**

```
https://redshift.us-east-2.amazonaws.com/
?Action=DisableSnapshotCopy
&ClusterIdentifier=mycluster
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC_SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request

DisassociateDataShareConsumer

From a datashare consumer account, remove association for the specified datashare.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**DataShareArn**

The Amazon Resource Name (ARN) of the datashare to remove association for.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**ConsumerArn**

The Amazon Resource Name (ARN) of the consumer that association for the datashare is removed from.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ConsumerRegion**

From a datashare consumer account, removes association of a datashare from all the existing and future namespaces in the specified AWS Region.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**DisassociateEntireAccount**

A value that specifies whether association for the datashare is removed from the entire account.

Type: Boolean

Required: No

Response Elements

The following elements are returned by the service.

**AllowPubliclyAccessibleConsumers**

A value that specifies whether the datashare can be shared to a publicly accessible cluster.

Type: Boolean
DataShareArn

An Amazon Resource Name (ARN) that references the datashare that is owned by a specific namespace of the producer cluster. A datashare ARN is in the `arn:aws:redshift:{region}:{account-id}:{datashare}:{namespace-guid}/{datashare-name}` format.

Type: String

Length Constraints: Maximum length of 2147483647.

DataShareAssociations.member.N

A value that specifies when the datashare has an association between producer and data consumers.

Type: Array of DataShareAssociation (p. 460) objects

ManagedBy

The identifier of a datashare to show its managing entity.

Type: String

Length Constraints: Maximum length of 2147483647.

ProducerArn

The Amazon Resource Name (ARN) of the producer.

Type: String

Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidDataShareFault

There is an error with the datashare.

HTTP Status Code: 400

InvalidNamespaceFault

The namespace isn't valid because the namespace doesn't exist. Provide a valid namespace.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of DisassociateDataShareConsumer.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=DisassociateDataShareConsumer
&DataShareArn=arn%3Aaws%3Aredshift%3Aus-east-1%3A275247490162%3Adatashare
%3Afd59653e-4ace-4952-a102-286dad7263ca%2Ftestshare1

EnableLogging

Starts logging information, such as queries and connection attempts, for the specified Amazon Redshift cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster on which logging is to be started.

Example: examplecluster

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

BucketName

The name of an existing S3 bucket where the log files are to be stored.

Constraints:

- Must be in the same region as the cluster
- The cluster must have read bucket and put object permissions

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

LogDestinationType

The log destination type. An enum with possible values of s3 and cloudwatch.

Type: String

Valid Values: s3 | cloudwatch

Required: No

LogExports.member.N

The collection of exported log types. Possible values are connectionlog, useractivitylog, and userlog.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

S3KeyPrefix

The prefix applied to the log file names.
Constraints:
- Cannot exceed 512 characters
- Cannot contain spaces(), double quotes ("), single quotes ('), a backslash (\), or control characters. The hexadecimal codes for invalid characters are:
  - x00 to x20
  - x22
  - x27
  - x5c
  - x7f or larger
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements

The following elements are returned by the service.

BucketName
The name of the S3 bucket where the log files are stored.
Type: String
Length Constraints: Maximum length of 2147483647.

LastFailureMessage
The message indicating that logs failed to be delivered.
Type: String
Length Constraints: Maximum length of 2147483647.

LastFailureTime
The last time when logs failed to be delivered.
Type: Timestamp

LastSuccessfulDeliveryTime
The last time that logs were delivered.
Type: Timestamp

LogDestinationType
The log destination type. An enum with possible values of s3 and cloudwatch.
Type: String
Valid Values: s3 | cloudwatch

LogExports.member.N
The collection of exported log types. Possible values are connectionlog, useractivitylog, and userlog.
Type: Array of strings
Length Constraints: Maximum length of 2147483647.

**LoggingEnabled**
- true if logging is on, false if logging is off.

Type: Boolean

**S3KeyPrefix**
The prefix applied to the log file names.

Type: String

Length Constraints: Maximum length of 2147483647.

## Errors

For information about the errors that are common to all actions, see [Common Errors](#).

### BucketNotFoundFault
Could not find the specified S3 bucket.

HTTP Status Code: 400

### ClusterNotFound
The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

### InsufficientS3BucketPolicyFault
The cluster does not have read bucket or put object permissions on the S3 bucket specified when enabling logging.

HTTP Status Code: 400

### InvalidClusterState
The specified cluster is not in the available state.

HTTP Status Code: 400

### InvalidS3BucketNameFault
The S3 bucket name is invalid. For more information about naming rules, go to [Bucket Restrictions and Limitations](#) in the Amazon Simple Storage Service (S3) Developer Guide.

HTTP Status Code: 400

### InvalidS3KeyPrefixFault
The string specified for the logging S3 key prefix does not comply with the documented constraints.

HTTP Status Code: 400

### UnsupportedOperation
The requested operation isn't supported.

HTTP Status Code: 400

EnableSnapshotCopy

Enables the automatic copy of snapshots from one region to another region for a specified cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of the source cluster to copy snapshots from.

Constraints: Must be the valid name of an existing cluster that does not already have cross-region snapshot copy enabled.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

DestinationRegion

The destination AWS Region that you want to copy snapshots to.

Constraints: Must be the name of a valid AWS Region. For more information, see Regions and Endpoints in the Amazon Web Services General Reference.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

ManualSnapshotRetentionPeriod

The number of days to retain newly copied snapshots in the destination AWS Region after they are copied from the source AWS Region. If the value is -1, the manual snapshot is retained indefinitely.

The value must be either -1 or an integer between 1 and 3,653.

Type: Integer

Required: No

RetentionPeriod

The number of days to retain automated snapshots in the destination region after they are copied from the source region.

Default: 7.

Constraints: Must be at least 1 and no more than 35.

Type: Integer

Required: No

SnapshotCopyGrantName

The name of the snapshot copy grant to use when snapshots of an AWS KMS-encrypted cluster are copied to the destination region.
Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

CopyToRegionDisabledFault

Cross-region snapshot copy was temporarily disabled. Try your request again.

HTTP Status Code: 400

DependentServiceRequestThrottlingFault

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.

HTTP Status Code: 400

IncompatibleOrderableOptions

The specified options are incompatible.

HTTP Status Code: 400

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

InvalidRetentionPeriodFault

The retention period specified is either in the past or is not a valid value.

The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400

LimitExceededFault

The encryption key has exceeded its grant limit in AWS KMS.
HTTP Status Code: 400
**SnapshotCopyAlreadyEnabledFault**

The cluster already has cross-region snapshot copy enabled.

HTTP Status Code: 400
**SnapshotCopyGrantNotFoundFault**

The specified snapshot copy grant can't be found. Make sure that the name is typed correctly and that the grant exists in the destination region.

HTTP Status Code: 400
**UnauthorizedOperation**

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400
**UnknownSnapshotCopyRegionFault**

The specified region is incorrect or does not exist.

HTTP Status Code: 404

**Examples**

**Example**

This example illustrates one usage of EnableSnapshotCopy.

**Sample Request**

```
https://redshift.us-east-2.amazonaws.com/
?Action=EnableSnapshotCopy
&ClusterIdentifier=mycluster
&DestinationRegion=us-east-1
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01

FailoverPrimaryCompute

Fails over the primary compute unit of the specified Multi-AZ cluster to another Availability Zone.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ClusterIdentifier**

The unique identifier of the cluster for which the primary compute unit will be failed over to another Availability Zone.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Response Elements**

The following element is returned by the service.

**Cluster**

Describes a cluster.

Type: Cluster (p. 432) object

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 552).

**ClusterNotFound**

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

**UnauthorizedOperation**

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

GetClusterCredentials

Returns a database user name and temporary password with temporary authorization to log on to an Amazon Redshift database. The action returns the database user name prefixed with IAM: if AutoCreate is False or IAM: if AutoCreate is True. You can optionally specify one or more database user groups that the user will join at log on. By default, the temporary credentials expire in 900 seconds. You can optionally specify a duration between 900 seconds (15 minutes) and 3600 seconds (60 minutes). For more information, see Using IAM Authentication to Generate Database User Credentials in the Amazon Redshift Cluster Management Guide.

The AWS Identity and Access Management (IAM) user or role that runs GetClusterCredentials must have an IAM policy attached that allows access to all necessary actions and resources. For more information about permissions, see Resource Policies for GetClusterCredentials in the Amazon Redshift Cluster Management Guide.

If the DbGroups parameter is specified, the IAM policy must allow the redshift:JoinGroup action with access to the listed dbgroups.

In addition, if the AutoCreate parameter is set to True, then the policy must include the redshift:CreateClusterUser permission.

If the DbName parameter is specified, the IAM policy must allow access to the resource dbname for the specified database name.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**DbUser**

The name of a database user. If a user name matching DbUser exists in the database, the temporary user credentials have the same permissions as the existing user. If DbUser doesn't exist in the database and Autocreate is True, a new user is created using the value for DbUser with PUBLIC permissions. If a database user matching the value for DbUser doesn't exist and Autocreate is False, then the command succeeds but the connection attempt will fail because the user doesn't exist in the database.

For more information, see CREATE USER in the Amazon Redshift Database Developer Guide.

Constraints:

- Must be 1 to 64 alphanumeric characters or hyphens. The user name can't be PUBLIC.
- Must contain uppercase or lowercase letters, numbers, underscore, plus sign, period (dot), at symbol (@), or hyphen.
- First character must be a letter.
- Must not contain a colon (:) or slash (/).
- Cannot be a reserved word. A list of reserved words can be found in Reserved Words in the Amazon Redshift Database Developer Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**AutoCreate**

Create a database user with the name specified for the user named in DbUser if one does not exist.
Type: Boolean
Required: No

ClusterIdentifier

The unique identifier of the cluster that contains the database for which you are requesting credentials. This parameter is case sensitive.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

CustomDomainName

The custom domain name for the cluster credentials.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

DbGroups.DbGroup.N

A list of the names of existing database groups that the user named in DbUser will join for the current session, in addition to any group memberships for an existing user. If not specified, a new user is added only to PUBLIC.

Database group name constraints
- Must be 1 to 64 alphanumeric characters or hyphens
- Must contain only lowercase letters, numbers, underscore, plus sign, period (dot), at symbol (@), or hyphen.
- First character must be a letter.
- Must not contain a colon (:) or slash (/).
- Cannot be a reserved word. A list of reserved words can be found in Reserved Words in the Amazon Redshift Database Developer Guide.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

DbName

The name of a database that DbUser is authorized to log on to. If DbName is not specified, DbUser can log on to any existing database.

Constraints:
- Must be 1 to 64 alphanumeric characters or hyphens
- Must contain uppercase or lowercase letters, numbers, underscore, plus sign, period (dot), at symbol (@), or hyphen.
- First character must be a letter.
- Must not contain a colon (:) or slash (/).
- Cannot be a reserved word. A list of reserved words can be found in Reserved Words in the Amazon Redshift Database Developer Guide.

Type: String
Length Constraints: Maximum length of 2147483647.

Required: No

**DurationSeconds**

The number of seconds until the returned temporary password expires.

Constraint: minimum 900, maximum 3600.

Default: 900

Type: Integer

Required: No

**Response Elements**

The following elements are returned by the service.

**DbPassword**

A temporary password that authorizes the user name returned by DbUser to log on to the database DbName.

Type: String

Length Constraints: Maximum length of 2147483647.

**DbUser**

A database user name that is authorized to log on to the database DbName using the password DbPassword. If the specified DbUser exists in the database, the new user name has the same database permissions as the the user named in DbUser. By default, the user is added to PUBLIC. If the DbGroups parameter is specified, DbUser is added to the listed groups for any sessions created using these credentials.

Type: String

Length Constraints: Maximum length of 2147483647.

**Expiration**

The date and time the password in DbPassword expires.

Type: Timestamp

**Errors**

For information about the errors that are common to all actions, see [Common Errors](#).

**ClusterNotFound**

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400
Examples

Example

This example illustrates one usage of GetClusterCredentials.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=GetClusterCredentials
&ClusterIdentifier=mycluster
&DbUser=adminuser
&DbName=dev
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<GetClusterCredentialsResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <GetClusterCredentialsResult>
    <DbUser>IAM:adminuser</DbUser>
    <Expiration>2019-12-27T19:44:51.001Z</Expiration>
    <DbPassword>AMAFuyuros/QjxPTtgcsuQsqfiasdzJEN04aCtWDxX109dGmpkBtvEeqFly/EXAMPLE==</DbPassword>
  </GetClusterCredentialsResult>
  <ResponseMetadata>
    <RequestId>404b34b9-28df-11ea-a940-1b28a85fd753</RequestId>
  </ResponseMetadata>
</GetClusterCredentialsResponse>
```

GetClusterCredentialsWithIAM

Returns a database user name and temporary password with temporary authorization to log in to an Amazon Redshift database. The database user is mapped 1:1 to the source AWS Identity and Access Management (IAM) identity. For more information about IAM identities, see IAM Identities (users, user groups, and roles) in the AWS Identity and Access Management User Guide.

The AWS Identity and Access Management (IAM) identity that runs this operation must have an IAM policy attached that allows access to all necessary actions and resources. For more information about permissions, see Using identity-based policies (IAM policies) in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ClusterIdentifier**

The unique identifier of the cluster that contains the database for which you are requesting credentials.

Type: String

Required: No

**CustomDomainName**

The custom domain name for the IAM message cluster credentials.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**DbName**

The name of the database for which you are requesting credentials. If the database name is specified, the IAM policy must allow access to the resource dbname for the specified database name. If the database name is not specified, access to all databases is allowed.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

**DurationSeconds**

The number of seconds until the returned temporary password expires.

Type: Integer

Required: No
Response Elements

The following elements are returned by the service.

**DbPassword**

A temporary password that you provide when you connect to a database.

Type: String

**DbUser**

A database user name that you provide when you connect to a database. The database user is mapped 1:1 to the source IAM identity.

Type: String

**Expiration**

The time (UTC) when the temporary password expires. After this timestamp, a log in with the temporary password fails.

Type: Timestamp

**NextRefreshTime**

Reserved for future use.

Type: Timestamp

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

• AWS SDK for Ruby V3
GetReservedNodeExchangeConfigurationOptions

Gets the configuration options for the reserved-node exchange. These options include information about the source reserved node and target reserved node offering. Details include the node type, the price, the node count, and the offering type.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ActionType**

The action type of the reserved-node configuration. The action type can be an exchange initiated from either a snapshot or a resize.

Type: String

Valid Values: restore-cluster | resize-cluster

Required: Yes

**ClusterIdentifier**

The identifier for the cluster that is the source for a reserved-node exchange.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Marker**

An optional pagination token provided by a previous GetReservedNodeExchangeConfigurationOptions request. If this parameter is specified, the response includes only records beyond the marker, up to the value specified by the MaxRecords parameter. You can retrieve the next set of response records by providing the returned marker value in the Marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

The maximum number of response records to return in each call. If the number of remaining response records exceeds the specified MaxRecords value, a value is returned in a Marker field of the response. You can retrieve the next set of records by retrying the command with the returned marker value.

Type: Integer

Required: No

**SnapshotIdentifier**

The identifier for the snapshot that is the source for the reserved-node exchange.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements

The following elements are returned by the service.

Marker
A pagination token provided by a previous GetReservedNodeExchangeConfigurationOptions request.
Type: String
Length Constraints: Maximum length of 2147483647.

ReservedNodeConfigurationOptionList.ReservedNodeConfigurationOption.N
the configuration options for the reserved-node exchange. These options include information about the source reserved node and target reserved node. Details include the node type, the price, the node count, and the offering type.
Type: Array of ReservedNodeConfigurationOption (p. 507) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound
The ClusterIdentifier parameter does not refer to an existing cluster.
HTTP Status Code: 404

ClusterSnapshotNotFound
The snapshot identifier does not refer to an existing cluster snapshot.
HTTP Status Code: 404

DependentServiceUnavailableFault
Your request cannot be completed because a dependent internal service is temporarily unavailable. Wait 30 to 60 seconds and try again.
HTTP Status Code: 400

InvalidReservedNodeState
Indicates that the Reserved Node being exchanged is not in an active state.
HTTP Status Code: 400

ReservedNodeAlreadyMigrated
Indicates that the reserved node has already been exchanged.
HTTP Status Code: 400

ReservedNodeNotFound
The specified reserved compute node not found.
HTTP Status Code: 404
ReservedNodeOfferingNotFound
Specified offering does not exist.

HTTP Status Code: 404
UnsupportedOperation
The requested operation isn't supported.

HTTP Status Code: 400

GetReservedNodeExchangeOfferings

Returns an array of DC2 ReservedNodeOfferings that matches the payment type, term, and usage price of the given DC1 reserved node.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ReservedNodeId**

A string representing the node identifier for the DC1 Reserved Node to be exchanged.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Marker**

A value that indicates the starting point for the next set of ReservedNodeOfferings.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaxRecords**

An integer setting the maximum number of ReservedNodeOfferings to retrieve.

Type: Integer

Required: No

Response Elements

The following elements are returned by the service.

**Marker**

An optional parameter that specifies the starting point for returning a set of response records. When the results of a GetReservedNodeExchangeOfferings request exceed the value specified in MaxRecords, Amazon Redshift returns a value in the marker field of the response. You can retrieve the next set of response records by providing the returned marker value in the marker parameter and retrying the request.

Type: String

Length Constraints: Maximum length of 2147483647.

**ReservedNodeOfferings.ReservedNodeOffering.N**

Returns an array of ReservedNodeOffering (p. 510) objects.

Type: Array of ReservedNodeOffering (p. 510) objects
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

DependentServiceUnavailableFault

Your request cannot be completed because a dependent internal service is temporarily unavailable. Wait 30 to 60 seconds and try again.

HTTP Status Code: 400

InvalidReservedNodeState

Indicates that the Reserved Node being exchanged is not in an active state.

HTTP Status Code: 400

ReservedNodeAlreadyMigrated

Indicates that the reserved node has already been exchanged.

HTTP Status Code: 400

ReservedNodeNotFound

The specified reserved compute node not found.

HTTP Status Code: 404

ReservedNodeOfferingNotFound

Specified offering does not exist.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of GetReservedNodeExchangeOfferings.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=GetReservedNodeExchangeOfferings
&ReservedNodeId=12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddd901ee2ff3aa45678b90c12d35e6ff789012345a6b7b
Sample Response

```xml
<GetReservedNodeExchangeOfferingsResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <GetReservedNodeExchangeOfferingsResult>
    <ReservedNodeOfferings>
      <ReservedNodeOffering>
        <Duration>31536000</Duration>
        <UsagePrice>0.0</UsagePrice>
        <ReservedNodeOfferingId>12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE</ReservedNodeOfferingId>
        <OfferingType>All Upfront</OfferingType>
        <ReservedNodeOfferingType>Regular</ReservedNodeOfferingType>
        <RecurringCharges>
          <RecurringCharge>
            <RecurringChargeAmount>0.0</RecurringChargeAmount>
            <RecurringChargeFrequency>Hourly</RecurringChargeFrequency>
          </RecurringCharge>
        </RecurringCharges>
        <NodeType>dc2.large</NodeType>
        <FixedPrice>0.0</FixedPrice>
        <CurrencyCode>USD</CurrencyCode>
      </ReservedNodeOffering>
    </ReservedNodeOfferings>
  </GetReservedNodeExchangeOfferingsResult>
  <ResponseMetadata>
    <RequestId>c75f325d-282f-11ea-9caa-c956bec1ce87</RequestId>
  </ResponseMetadata>
</GetReservedNodeExchangeOfferingsResponse>
```

GetResourcePolicy

Get the resource policy for a specified resource.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ResourceArn

The Amazon Resource Name (ARN) of the resource of which its resource policy is fetched.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

Response Elements

The following element is returned by the service.

ResourcePolicy

The content of the resource policy.

Type: ResourcePolicy (p. 515) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidPolicyFault

The resource policy isn't valid.

HTTP Status Code: 400

ResourceNotFoundFault

The resource could not be found.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

- AWS SDK for Ruby V3
ModifyAquaConfiguration

This operation is retired. Calling this operation does not change AQUA configuration. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster to be modified.

Type: String
Length Constraints: Maximum length of 2147483647.

Required: Yes

AquaConfigurationStatus

This parameter is retired. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Type: String
Valid Values: enabled | disabled | auto

Required: No

Response Elements

The following element is returned by the service.

AquaConfiguration

This parameter is retired. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Type: AquaConfiguration (p. 426) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFoundException

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidClusterStateException

The specified cluster is not in the available state.

HTTP Status Code: 400
UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

- AWS SDK for Python
- AWS SDK for Ruby V3
ModifyAuthenticationProfile

Modifies an authentication profile.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**AuthenticationProfileContent**

The new content of the authentication profile in JSON format. The maximum length of the JSON string is determined by a quota for your account.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**AuthenticationProfileName**

The name of the authentication profile to replace.

Type: String

Length Constraints: Maximum length of 63.

Pattern: ^[a-zA-Z0-9\-\ ]+$

Required: Yes

Response Elements

The following elements are returned by the service.

**AuthenticationProfileContent**

The updated content of the authentication profile in JSON format.

Type: String

Length Constraints: Maximum length of 2147483647.

**AuthenticationProfileName**

The name of the authentication profile that was replaced.

Type: String

Length Constraints: Maximum length of 63.

Pattern: ^[a-zA-Z0-9\-\ ]+$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).
AuthenticationProfileNotFoundFault

The authentication profile can't be found.

HTTP Status Code: 404

AuthenticationProfileQuotaExceededFault

The size or number of authentication profiles has exceeded the quota. The maximum length of the JSON string and maximum number of authentication profiles is determined by a quota for your account.

HTTP Status Code: 400

InvalidAuthenticationProfileRequestFault

The authentication profile request is not valid. The profile name can't be null or empty. The authentication profile API operation must be available in the AWS Region.

HTTP Status Code: 400

- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
ModifyCluster

Modifies the settings for a cluster.

You can also change node type and the number of nodes to scale up or down the cluster. When resizing a cluster, you must specify both the number of nodes and the node type even if one of the parameters does not change.

You can add another security or parameter group, or change the admin user password. Resetting a cluster password or modifying the security groups associated with a cluster do not need a reboot. However, modifying a parameter group requires a reboot for parameters to take effect. For more information about managing clusters, go to Amazon Redshift Clusters in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of the cluster to be modified.

Example: examplecluster

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

AllowVersionUpgrade

If true, major version upgrades will be applied automatically to the cluster during the maintenance window.

Default: false

Type: Boolean

Required: No

AutomatedSnapshotRetentionPeriod

The number of days that automated snapshots are retained. If the value is 0, automated snapshots are disabled. Even if automated snapshots are disabled, you can still create manual snapshots when you want with CreateClusterSnapshot (p. 60).

If you decrease the automated snapshot retention period from its current value, existing automated snapshots that fall outside of the new retention period will be immediately deleted.

You can't disable automated snapshots for RA3 node types. Set the automated retention period from 1-35 days.

Default: Uses existing setting.

Constraints: Must be a value from 0 to 35.

Type: Integer
Required: No

**AvailabilityZone**

The option to initiate relocation for an Amazon Redshift cluster to the target Availability Zone.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**AvailabilityZoneRelocation**

The option to enable relocation for an Amazon Redshift cluster between Availability Zones after the cluster modification is complete.

Type: Boolean

Required: No

**ClusterParameterGroupName**

The name of the cluster parameter group to apply to this cluster. This change is applied only after the cluster is rebooted. To reboot a cluster use RebootCluster (p. 374).

Default: Uses existing setting.

Constraints: The cluster parameter group must be in the same parameter group family that matches the cluster version.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

A list of cluster security groups to be authorized on this cluster. This change is asynchronously applied as soon as possible.

Security groups currently associated with the cluster, and not in the list of groups to apply, will be revoked from the cluster.

Constraints:
- Must be 1 to 255 alphanumeric characters or hyphens
- First character must be a letter
- Cannot end with a hyphen or contain two consecutive hyphens

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**ClusterType**

The new cluster type.

When you submit your cluster resize request, your existing cluster goes into a read-only mode. After Amazon Redshift provisions a new cluster based on your resize requirements, there will be outage...
for a period while the old cluster is deleted and your connection is switched to the new cluster. You can use `DescribeResize` (p. 245) to track the progress of the resize request.

Valid Values: multi-node | single-node

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ClusterVersion**

The new version number of the Amazon Redshift engine to upgrade to.

For major version upgrades, if a non-default cluster parameter group is currently in use, a new cluster parameter group in the cluster parameter group family for the new version must be specified. The new cluster parameter group can be the default for that cluster parameter group family. For more information about parameters and parameter groups, go to Amazon Redshift Parameter Groups in the Amazon Redshift Cluster Management Guide.

Example: 1.0

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ElasticIp**

The Elastic IP (EIP) address for the cluster.

Constraints: The cluster must be provisioned in EC2-VPC and publicly-accessible through an Internet gateway. For more information about provisioning clusters in EC2-VPC, go to Supported Platforms to Launch Your Cluster in the Amazon Redshift Cluster Management Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Encrypted**

Indicates whether the cluster is encrypted. If the value is encrypted (true) and you provide a value for the KmsKeyId parameter, we encrypt the cluster with the provided KmsKeyId. If you don't provide a KmsKeyId, we encrypt with the default key.

If the value is not encrypted (false), then the cluster is decrypted.

Type: Boolean

Required: No

**EnhancedVpcRouting**

An option that specifies whether to create the cluster with enhanced VPC routing enabled. To create a cluster that uses enhanced VPC routing, the cluster must be in a VPC. For more information, see Enhanced VPC Routing in the Amazon Redshift Cluster Management Guide.

If this option is true, enhanced VPC routing is enabled.

Default: false
Type: Boolean
Required: No

**HsmClientCertificateIdentifier**

Specifies the name of the HSM client certificate the Amazon Redshift cluster uses to retrieve the data encryption keys stored in an HSM.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**HsmConfigurationIdentifier**

Specifies the name of the HSM configuration that contains the information the Amazon Redshift cluster can use to retrieve and store keys in an HSM.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**IpAddressType**

The IP address types that the cluster supports. Possible values are *ipv4* and *dualstack*.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**KmsKeyId**

The AWS Key Management Service (KMS) key ID of the encryption key that you want to use to encrypt data in the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**MaintenanceTrackName**

The name for the maintenance track that you want to assign for the cluster. This name change is asynchronous. The new track name stays in the *PendingModifiedValues* for the cluster until the next maintenance window. When the maintenance track changes, the cluster is switched to the latest cluster release available for the maintenance track. At this point, the maintenance track name is applied.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**ManageMasterPassword**

If *true*, Amazon Redshift uses AWS Secrets Manager to manage this cluster's admin credentials. You can't use *MasterUserPassword* if *ManageMasterPassword* is *true*. If *ManageMasterPassword*...
is false or not set, Amazon Redshift uses `MasterUserPassword` for the admin user account's password.

Type: Boolean

Required: No

**ManualSnapshotRetentionPeriod**

The default for number of days that a newly created manual snapshot is retained. If the value is -1, the manual snapshot is retained indefinitely. This value doesn't retroactively change the retention periods of existing manual snapshots.

The value must be either -1 or an integer between 1 and 3,653.

The default value is -1.

Type: Integer

Required: No

**MasterPasswordSecretKmsKeyId**

The ID of the AWS Key Management Service (KMS) key used to encrypt and store the cluster's admin credentials secret. You can only use this parameter if `ManageMasterPassword` is true.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MasterUserPassword**

The new password for the cluster admin user. This change is asynchronously applied as soon as possible. Between the time of the request and the completion of the request, the `MasterUserPassword` element exists in the `PendingModifiedValues` element of the operation response.

You can't use `MasterUserPassword` if `ManageMasterPassword` is true.

**Note**

Operations never return the password, so this operation provides a way to regain access to the admin user account for a cluster if the password is lost.

Default: Uses existing setting.

Constraints:

- Must be between 8 and 64 characters in length.
- Must contain at least one uppercase letter.
- Must contain at least one lowercase letter.
- Must contain one number.
- Can be any printable ASCII character (ASCII code 33-126) except ‘ (single quote), " (double quote), \, /, or @.

Type: String

Required: No

**MultiAZ**

If true and the cluster is currently only deployed in a single Availability Zone, the cluster will be modified to be deployed in two Availability Zones.
Amazon Redshift API Reference
Request Parameters

Type: Boolean
Required: No

**NewClusterIdentifier**

The new identifier for the cluster.

Constraints:
- Must contain from 1 to 63 alphanumeric characters or hyphens.
- Alphabetic characters must be lowercase.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.
- Must be unique for all clusters within an AWS account.

Example: examplecluster

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**NodeType**

The new node type of the cluster. If you specify a new node type, you must also specify the number of nodes parameter.

For more information about resizing clusters, go to Resizing Clusters in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

Valid Values: ds2.xlarge | ds2.8xlarge | dc1.large | dc1.8xlarge | dc2.large | dc2.8xlarge | ra3.xlplus | ra3.4xlarge | ra3.16xlarge

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**NumberOfNodes**

The new number of nodes of the cluster. If you specify a new number of nodes, you must also specify the node type parameter.

For more information about resizing clusters, go to Resizing Clusters in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

Valid Values: Integer greater than 0.

Type: Integer
Required: No

**Port**

The option to change the port of an Amazon Redshift cluster.

Type: Integer
Required: No
PreferredMaintenanceWindow

The weekly time range (in UTC) during which system maintenance can occur, if necessary. If system maintenance is necessary during the window, it may result in an outage.

This maintenance window change is made immediately. If the new maintenance window indicates the current time, there must be at least 120 minutes between the current time and end of the window in order to ensure that pending changes are applied.

Default: Uses existing setting.

Format: ddd:hh24:mi-ddd:hh24:mi, for example wed:07:30-wed:08:00.

Valid Days: Mon | Tue | Wed | Thu | Fri | Sat | Sun

Constraints: Must be at least 30 minutes.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

PubliclyAccessible

If true, the cluster can be accessed from a public network. Only clusters in VPCs can be set to be publicly available.

Type: Boolean

Required: No

VpcSecurityGroupIds.VpcSecurityGroupId.N

A list of virtual private cloud (VPC) security groups to be associated with the cluster. This change is asynchronously applied as soon as possible.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterAlreadyExists

The account already has a cluster with the given identifier.
HTTP Status Code: 400

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**ClusterParameterGroupNotFound**

The parameter group name does not refer to an existing parameter group.

HTTP Status Code: 404

**ClusterSecurityGroupNotFound**

The cluster security group name does not refer to an existing cluster security group.

HTTP Status Code: 404

**CustomCnameAssociationFault**

An error occurred when an attempt was made to change the custom domain association.

HTTP Status Code: 400

**DependentServiceRequestThrottlingFault**

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.

HTTP Status Code: 400

**HsmClientCertificateNotFoundFault**

There is no Amazon Redshift HSM client certificate with the specified identifier.

HTTP Status Code: 400

**HsmConfigurationNotFoundFault**

There is no Amazon Redshift HSM configuration with the specified identifier.

HTTP Status Code: 400

**InsufficientClusterCapacity**

The number of nodes specified exceeds the allotted capacity of the cluster.

HTTP Status Code: 400

**InvalidClusterSecurityGroupState**

The state of the cluster security group is not available.

HTTP Status Code: 400

**InvalidClusterState**

The specified cluster is not in the available state.

HTTP Status Code: 400

**InvalidClusterTrack**

The provided cluster track name is not valid.
HTTP Status Code: 400
**InvalidElasticIpFault**

The Elastic IP (EIP) is invalid or cannot be found.

HTTP Status Code: 400
**InvalidRetentionPeriodFault**

The retention period specified is either in the past or is not a valid value.

The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400
**Ipv6CidrBlockNotFoundFault**

There are no subnets in your VPC with associated IPv6 CIDR blocks. To use dual-stack mode, associate an IPv6 CIDR block with each subnet in your VPC.

HTTP Status Code: 400
**LimitExceededFault**

The encryption key has exceeded its grant limit in AWS KMS.

HTTP Status Code: 400
**NumberOfNodesPerClusterLimitExceeded**

The operation would exceed the number of nodes allowed for a cluster.

HTTP Status Code: 400
**NumberOfNodesQuotaExceeded**

The operation would exceed the number of nodes allotted to the account. For information about increasing your quota, go to [Limits in Amazon Redshift](#) in the *Amazon Redshift Cluster Management Guide*.

HTTP Status Code: 400
**TableLimitExceeded**

The number of tables in the cluster exceeds the limit for the requested new cluster node type.

HTTP Status Code: 400
**UnauthorizedOperation**

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400
**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400
**UnsupportedOptionFault**

A request option was specified that is not supported.

HTTP Status Code: 400
This example changes the weekly preferred maintenance window for a cluster to be the minimum four hour window starting Sundays at 11:15 PM, and ending Mondays at 3:15 AM.

**Sample Request**

```
https://redshift.us-east-2.amazonaws.com/
?Action=ModifyCluster
&ClusterIdentifier=mycluster
&PreferredMaintenanceWindow=Sun%3A23%3A15-Mon%3A03%3A15
&SignatureMethod=HmacSHA256&SignatureVersion=4

ModifyClusterDbRevision

Modifies the database revision of a cluster. The database revision is a unique revision of the database running in a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of a cluster whose database revision you want to modify.

Example: examplecluster

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

RevisionTarget

The identifier of the database revision. You can retrieve this value from the response to the DescribeClusterDbRevisions (p. 149) request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

ClusterOnLatestRevision

Cluster is already on the latest database revision.

HTTP Status Code: 400
InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

See Also

- AWS SDK for Java V2
- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
ModifyClusterIamRoles

Modifies the list of AWS Identity and Access Management (IAM) roles that can be used by the cluster to access other AWS services.

The maximum number of IAM roles that you can associate is subject to a quota. For more information, go to Quotas and limits in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of the cluster for which you want to associate or disassociate IAM roles.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

AddIamRoles.IamRoleArn.N

Zero or more IAM roles to associate with the cluster. The roles must be in their Amazon Resource Name (ARN) format.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

DefaultIamRoleArn

The Amazon Resource Name (ARN) for the IAM role that was set as default for the cluster when the cluster was last modified.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

RemovelamRoles.IamRoleArn.N

Zero or more IAM roles in ARN format to disassociate from the cluster.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.
Cluster

Describes a cluster.

Type: [Cluster](p. 432) object

Errors

For information about the errors that are common to all actions, see [Common Errors (p. 552)](p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

Examples

Example

This example removes an AWS Identity and Access Management (IAM) role from a cluster.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=ModifyClusterIamRoles
&ClusterIdentifier=mycluster
&RemoveIamRoles.IamRoleArn.1=arn%3Aaws%3Aiam%3A%3A123456789012%3Arole%2FmyRedshiftRole
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<ModifyClusterIamRolesResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ModifyClusterIamRolesResult>
    <Cluster>
      <AllowVersionUpgrade>true</AllowVersionUpgrade>
      <ClusterIdentifier>mycluster</ClusterIdentifier>
      <NumberOfNodes>1</NumberOfNodes>
      <AvailabilityZone>us-east-2a</AvailabilityZone>
      <ClusterVersion>1.0</ClusterVersion>
      <ExpectedNextSnapshotScheduleTimeStatus>OnTrack</ExpectedNextSnapshotScheduleTimeStatus>
      <ManualSnapshotRetentionPeriod>-1</ManualSnapshotRetentionPeriod>
      <ClusterAvailabilityStatus>Available</ClusterAvailabilityStatus>
      <Endpoint>
        <Port>5439</Port>
      </Endpoint>
    </Cluster>
  </ModifyClusterIamRolesResult>
</ModifyClusterIamRolesResponse>
```

ModifyClusterMaintenance

Modifies the maintenance settings of a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

A unique identifier for the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

DeferMaintenance

A boolean indicating whether to enable the deferred maintenance window.

Type: Boolean
Required: No

DeferMaintenanceDuration

An integer indicating the duration of the maintenance window in days. If you specify a duration, you can't specify an end time. The duration must be 45 days or less.

Type: Integer
Required: No

DeferMaintenanceEndTime

A timestamp indicating end time for the deferred maintenance window. If you specify an end time, you can't specify a duration.

Type: Timestamp
Required: No

DeferMaintenanceIdentifier

A unique identifier for the deferred maintenance window.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

DeferMaintenanceStartTime

A timestamp indicating the start time for the deferred maintenance window.

Type: Timestamp
Required: No
Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

Examples

Example

This example defers the maintenance of a cluster by duration of 30 days. You can also update or cancel a deferment.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=ModifyClusterMaintenance
&ClusterIdentifier=mycluster
&DeferMaintenance=true
&DeferMaintenanceDuration=30
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678d0dd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<ModifyClusterMaintenanceResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/"/>
<ModifyClusterMaintenanceResult>
<Cluster>
  <AllowVersionUpgrade>true</AllowVersionUpgrade>
  <ClusterIdentifier>mycluster</ClusterIdentifier>
  <NumberOfNodes>1</NumberOfNodes>
</Cluster>
```

ModifyClusterParameterGroup

Modifies the parameters of a parameter group. For the parameters parameter, it can't contain ASCII characters.

For more information about parameters and parameter groups, go to Amazon Redshift Parameter Groups in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ParameterGroupName

The name of the parameter group to be modified.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Parameters.Parameter.N

An array of parameters to be modified. A maximum of 20 parameters can be modified in a single request.

For each parameter to be modified, you must supply at least the parameter name and parameter value; other name-value pairs of the parameter are optional.

For the workload management (WLM) configuration, you must supply all the name-value pairs in the wlm_json_configuration parameter.

Type: Array of Parameter (p. 496) objects

Required: Yes

Response Elements

The following elements are returned by the service.

ParameterGroupName

The name of the cluster parameter group.

Type: String

Length Constraints: Maximum length of 2147483647.

ParameterGroupStatus

The status of the parameter group. For example, if you made a change to a parameter group name-value pair, then the change could be pending a reboot of an associated cluster.

Type: String

Length Constraints: Maximum length of 2147483647.
## Errors

For information about the errors that are common to all actions, see [Common Errors (p. 552)](https://docs.aws.amazon.com/redshift/latest/dg/API_Errors.html).

### ClusterParameterGroupNotFound

The parameter group name does not refer to an existing parameter group.

HTTP Status Code: 404

### InvalidClusterParameterGroupState

The cluster parameter group action can not be completed because another task is in progress that involves the parameter group. Wait a few moments and try the operation again.

HTTP Status Code: 400

## Examples

### Example

This example illustrates one usage of ModifyClusterParameterGroup.

#### Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=ModifyClusterParameterGroup
&ParameterGroupName=myclusterparametergroup
&Parameters.Parameter.1.ParameterName=auto_analyze
&Parameters.Parameter.1.ParameterValue=false
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

#### Sample Response

```
<ModifyClusterParameterGroupResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
 <ModifyClusterParameterGroupResult>
  <ParameterGroupName>myclusterparametergroup</ParameterGroupName>
  <ParameterGroupStatus>Your parameter group has been updated. If you changed only dynamic parameters, associated clusters are being modified now. If you changed static parameters, all updates, including dynamic parameters, will be applied when you reboot the associated clusters.</ParameterGroupStatus>
 </ModifyClusterParameterGroupResult>
</ModifyClusterParameterGroupResponse>
```

ModifyClusterSnapshot

Modifies the settings for a snapshot.

This example modifies the manual retention period setting for a cluster snapshot.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**SnapshotIdentifier**

The identifier of the snapshot whose setting you want to modify.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Force**

A Boolean option to override an exception if the retention period has already passed.

Type: Boolean

Required: No

**ManualSnapshotRetentionPeriod**

The number of days that a manual snapshot is retained. If the value is -1, the manual snapshot is retained indefinitely.

If the manual snapshot falls outside of the new retention period, you can specify the force option to immediately delete the snapshot.

The value must be either -1 or an integer between 1 and 3,653.

Type: Integer

Required: No

Response Elements

The following element is returned by the service.

**Snapshot**

Describes a snapshot.

Type: Snapshot (p. 525) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).
ClusterSnapshotNotFound

The snapshot identifier does not refer to an existing cluster snapshot.

HTTP Status Code: 404

InvalidClusterSnapshotState

The specified cluster snapshot is not in the available state, or other accounts are authorized to access the snapshot.

HTTP Status Code: 400

InvalidRetentionPeriodFault

The retention period specified is either in the past or is not a valid value.

The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of ModifyClusterSnapshot.

Sample Request

https://redshift.us-east-2.amazonaws.com/
  ?Action=ModifyClusterSnapshot
  &ClusterIdentifier=mycluster
  &SnapshotIdentifier=mysnapshotid
  &ManualSnapshotRetentionPeriod=10
  &SignatureMethod=HmacSHA256
  &SignatureVersion=4
  &Version=2012-12-01

API Version 2012-12-01
336
ModifyClusterSnapshotSchedule

Modifies a snapshot schedule for a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

A unique identifier for the cluster whose snapshot schedule you want to modify.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

DisassociateSchedule

A boolean to indicate whether to remove the association between the cluster and the schedule.

Type: Boolean

Required: No

ScheduleIdentifier

A unique alphanumeric identifier for the schedule that you want to associate with the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidClusterSnapshotScheduleState

The cluster snapshot schedule state is not valid.

HTTP Status Code: 400

SnapshotScheduleNotFound

We could not find the specified snapshot schedule.

HTTP Status Code: 400
Examples

Example

This example removes a snapshot schedule from a cluster.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=ModifyClusterSnapshotSchedule
&ClusterIdentifier=mycluster
&ScheduleIdentifier=mysnapshotschedule
&DisassociateSchedule=true
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678dddf901ee2ff3aa45678b90c12d3456ff789012345a6b7b

Sample Response

<ModifyClusterSnapshotScheduleResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ResponseMetadata>
    <RequestId>3ec38335-28ea-11ea-b6af-7126da6f1f1af</RequestId>
  </ResponseMetadata>
</ModifyClusterSnapshotScheduleResponse>

ModifyClusterSubnetGroup

Modifies a cluster subnet group to include the specified list of VPC subnets. The operation replaces the existing list of subnets with the new list of subnets.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterSubnetGroupName

The name of the subnet group to be modified.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

SubnetIds.SubnetIdentifier.N

An array of VPC subnet IDs. A maximum of 20 subnets can be modified in a single request.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: Yes

Description

A text description of the subnet group to be modified.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.

ClusterSubnetGroup

Describes a subnet group.

Type: ClusterSubnetGroup (p. 455) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterSubnetGroupNotFoundFault

The cluster subnet group name does not refer to an existing cluster subnet group.
HTTP Status Code: 400

**ClusterSubnetQuotaExceededFault**

The request would result in user exceeding the allowed number of subnets in a cluster subnet groups. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

**DependentServiceRequestThrottlingFault**

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.

HTTP Status Code: 400

**InvalidSubnet**

The requested subnet is not valid, or not all of the subnets are in the same VPC.

HTTP Status Code: 400

**SubnetAlreadyInUse**

A specified subnet is already in use by another cluster.

HTTP Status Code: 400

**UnauthorizedOperation**

Your account is not authorized to perform the requested operation.

Examples

**Example**

This example illustrates one usage of ModifyClusterSubnetGroup.

**Sample Request**

```xml
https://redshift.us-east-2.amazonaws.com/
?Action=ModifyClusterSubnetGroup
&ClusterSubnetGroupName=mysubnetgroup
&SubnetIds.SubnetIdentifier.1=subnet-a1b21abc
&SubnetIds.SubnetIdentifier.2=subnet-a1b22abc
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

**Sample Response**

```xml
<ModifyClusterSubnetGroupResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ModifyClusterSubnetGroupResult>
    <ClusterSubnetGroup>
      <...>
    </ClusterSubnetGroup>
  </ModifyClusterSubnetGroupResult>
</ModifyClusterSubnetGroupResponse>
```
<VpcId>vpc-a1abc1a1</VpcId>
<Description>My subnet group</Description>
<Subnets>
  <Subnet>
    <SubnetStatus>Active</SubnetStatus>
    <SubnetIdentifier>subnet-a1b21abc</SubnetIdentifier>
    <SubnetAvailabilityZone>
      <Name>us-east-2f</Name>
    </SubnetAvailabilityZone>
  </Subnet>
  <Subnet>
    <SubnetStatus>Active</SubnetStatus>
    <SubnetIdentifier>subnet-a1b22abc</SubnetIdentifier>
    <SubnetAvailabilityZone>
      <Name>us-east-2a</Name>
    </SubnetAvailabilityZone>
  </Subnet>
</Subnets>
<ClusterSubnetGroupName>mysubnetgroup</ClusterSubnetGroupName>
<SubnetGroupStatus>Complete</SubnetGroupStatus>
<Tags/>
</ClusterSubnetGroup>
</ModifyClusterSubnetGroupResult>
</ResponseMetadata>
</ModifyClusterSubnetGroupResponse>

ModifyCustomDomainAssociation

Contains information for changing a custom domain association.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster to change a custom domain association for.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

CustomDomainCertificateArn

The certificate Amazon Resource Name (ARN) for the changed custom domain association.

Type: String

Pattern: arn:[\w+=/,.@-]+:acm:[\w+=/,.@-]*:[0-9]+:[\w+=/,@-]+(/[\w+=/,@-]+)*

Required: Yes

CustomDomainName

The custom domain name for a changed custom domain association.

Type: String

Pattern: ^((?!-)[A-Za-z0-9-]{0,62}[A-Za-z0-9-])\.(\d+(?<!\.)[A-Za-z0-9-]{0,62}[A-Za-z0-9-])+$

Required: Yes

Response Elements

The following elements are returned by the service.

ClusterIdentifier

The identifier of the cluster associated with the result for the changed custom domain association.

Type: String

Length Constraints: Maximum length of 2147483647.

CustomDomainCertExpiryTime

The certificate expiration time associated with the result for the changed custom domain association.
Type: String
Length Constraints: Maximum length of 2147483647.

**CustomDomainCertificateArn**

The certificate Amazon Resource Name (ARN) associated with the result for the changed custom domain association.

Type: String
Pattern: `arn:[:\w+=/,.@-]+:acm[:\w+=/,.@-]*:[0-9]+[:\w+=/,.@-]+(/[:\w+=/,.@-]+)*`

**CustomDomainName**

The custom domain name associated with the result for the changed custom domain association.

Type: String
Pattern: `^((?!-)[A-Za-z0-9-]{0,62}[A-Za-z0-9]\.)+(?!-)[A-Za-z0-9-]{1,62}[A-Za-z0-9-].$`

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 552).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**CustomCnameAssociationFault**

An error occurred when an attempt was made to change the custom domain association.

HTTP Status Code: 400

**CustomDomainAssociationNotFoundFault**

An error occurred. The custom domain name couldn't be found.

HTTP Status Code: 404

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

ModifyEndpointAccess

Modifies a Redshift-managed VPC endpoint.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**EndpointName**

The endpoint to be modified.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**VpcSecurityGroupIds.VpcSecurityGroupId.N**

The complete list of VPC security groups associated with the endpoint after the endpoint is modified.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.

**Address**

The DNS address of the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

**ClusterIdentifier**

The cluster identifier of the cluster associated with the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

**EndpointCreateTime**

The time (UTC) that the endpoint was created.

Type: Timestamp

**EndpointName**

The name of the endpoint.

Type: String
Length Constraints: Maximum length of 2147483647.

**EndpointStatus**

The status of the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

**Port**

The port number on which the cluster accepts incoming connections.

Type: Integer

**ResourceOwner**

The AWS account ID of the owner of the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

**SubnetGroupName**

The subnet group name where Amazon Redshift chooses to deploy the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

**VpcEndpoint**

The connection endpoint for connecting to an Amazon Redshift cluster through the proxy.

Type: **VpcEndpoint** object

The security groups associated with the endpoint.

Type: Array of **VpcSecurityGroupMembership** objects

### Errors

For information about the errors that are common to all actions, see [Common Errors (p. 552)].

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**EndpointNotFound**

The endpoint name doesn't refer to an existing endpoint.

HTTP Status Code: 404

**InvalidClusterSecurityGroupState**

The state of the cluster security group is not available.

HTTP Status Code: 400

ModifyEventSubscription

Modifies an existing Amazon Redshift event notification subscription.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

SubscriptionName

The name of the modified Amazon Redshift event notification subscription.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Enabled

A Boolean value indicating if the subscription is enabled. true indicates the subscription is enabled

Type: Boolean

Required: No

EventCategories.EventCategory.N

Specifies the Amazon Redshift event categories to be published by the event notification subscription.

Values: configuration, management, monitoring, security, pending

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Severity

Specifies the Amazon Redshift event severity to be published by the event notification subscription.

Values: ERROR, INFO

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SnsTopicArn

The Amazon Resource Name (ARN) of the SNS topic to be used by the event notification subscription.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
SourcIds.SourcId.N

A list of one or more identifiers of Amazon Redshift source objects. All of the objects must be of the same type as was specified in the source type parameter. The event subscription will return only events generated by the specified objects. If not specified, then events are returned for all objects within the source type specified.

Example: my-cluster-1, my-cluster-2
Example: my-snapshot-20131010

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

SourceType

The type of source that will be generating the events. For example, if you want to be notified of events generated by a cluster, you would set this parameter to cluster. If this value is not specified, events are returned for all Amazon Redshift objects in your AWS account. You must specify a source type in order to specify source IDs.

Valid values: cluster, cluster-parameter-group, cluster-security-group, cluster-snapshot, and scheduled-action.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements

The following element is returned by the service.

EventSubscription

Describes event subscriptions.

Type: EventSubscription (p. 479) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidSubscriptionStateFault

The subscription request is invalid because it is a duplicate request. This subscription request is already in progress.

HTTP Status Code: 400

SNSInvalidTopic

Amazon SNS has responded that there is a problem with the specified Amazon SNS topic.

HTTP Status Code: 400
SNSNoAuthorization

You do not have permission to publish to the specified Amazon SNS topic.

HTTP Status Code: 400

SNSTopicArnNotFound

An Amazon SNS topic with the specified Amazon Resource Name (ARN) does not exist.

HTTP Status Code: 404

SourceNotFound

The specified Amazon Redshift event source could not be found.

HTTP Status Code: 404

SubscriptionCategoryNotFound

The value specified for the event category was not one of the allowed values, or it specified a category that does not apply to the specified source type. The allowed values are Configuration, Management, Monitoring, and Security.

HTTP Status Code: 404

SubscriptionEventIdNotFound

An Amazon Redshift event with the specified event ID does not exist.

HTTP Status Code: 404

SubscriptionNotFound

An Amazon Redshift event notification subscription with the specified name does not exist.

HTTP Status Code: 404

SubscriptionSeverityNotFound

The value specified for the event severity was not one of the allowed values, or it specified a severity that does not apply to the specified source type. The allowed values are ERROR and INFO.

HTTP Status Code: 404

Examples

Example

This example disables an event notification subscription.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=ModifyEventSubscription
&SubscriptionName=mysubscription
&Enabled=false
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
Sample Response

```xml
<ModifyEventSubscriptionResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ModifyEventSubscriptionResult>
    <EventSubscription>
      <Severity>ERROR</Severity>
      <CustSubscriptionId>mysubscription</CustSubscriptionId>
      <SourceIdsList/>
      <EventCategoriesList/>
      <SubscriptionCreationTime>2019-12-27T00:27:43.748Z</SubscriptionCreationTime>
      <Enabled>false</Enabled>
      <Tags/>
      <Status>active</Status>
      <CustomerAwsId>123456789012</CustomerAwsId>
    </EventSubscription>
  </ModifyEventSubscriptionResult>
  <ResponseMetadata>
    <RequestId>ab342788-28f2-11ea-a940-1b28a85fd753</RequestId>
  </ResponseMetadata>
</ModifyEventSubscriptionResponse>
```

ModifyScheduledAction

Modifies a scheduled action.

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](#).

**ScheduledActionName**

The name of the scheduled action to modify.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Enable**

A modified enable flag of the scheduled action. If true, the scheduled action is active. If false, the scheduled action is disabled.

Type: Boolean

Required: No

**EndTime**

A modified end time of the scheduled action. For more information about this parameter, see [ScheduledAction](#).

Type: Timestamp

Required: No

**IamRole**

A different IAM role to assume to run the target action. For more information about this parameter, see [ScheduledAction](#).

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Schedule**

A modified schedule in either \( \text{at}(\text{)} \) or \( \text{cron}(\text{)} \) format. For more information about this parameter, see [ScheduledAction](#).

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ScheduledActionDescription**

A modified description of the scheduled action.

Type: String
Response Elements

The following elements are returned by the service.

**EndTime**

The end time in UTC when the schedule is no longer active. After this time, the scheduled action does not trigger.

Type: Timestamp

**IamRole**

The IAM role to assume to run the scheduled action. This IAM role must have permission to run the Amazon Redshift API operation in the scheduled action. This IAM role must allow the Amazon Redshift scheduler (Principal scheduler.redshift.amazonaws.com) to assume permissions on your behalf. For more information about the IAM role to use with the Amazon Redshift scheduler, see Using Identity-Based Policies for Amazon Redshift in the Amazon Redshift Cluster Management Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

**NextInvocations.ScheduledActionTime.N**

List of times when the scheduled action will run.

Type: Array of timestamps

**Schedule**

The schedule for a one-time (at format) or recurring (cron format) scheduled action. Schedule invocations must be separated by at least one hour.

Format of at expressions is "at(yyyy-mm-ddThh:mm:ss)". For example, "at(2016-03-04T17:27:00)".

Format of cron expressions is "cron(Minutes Hours Day-of-month Month Day-of-week Year)". For example, "cron(0 10 ? * MON *)". For more information, see Cron Expressions in the Amazon CloudWatch Events User Guide.
Type: String
Length Constraints: Maximum length of 2147483647.

ScheduledActionDescription
The description of the scheduled action.
Type: String
Length Constraints: Maximum length of 2147483647.

ScheduledActionName
The name of the scheduled action.
Type: String
Length Constraints: Maximum length of 2147483647.

StartTime
The start time in UTC when the schedule is active. Before this time, the scheduled action does not trigger.
Type: Timestamp

State
The state of the scheduled action. For example, DISABLED.
Type: String
Valid Values: ACTIVE | DISABLED

TargetAction
A JSON format string of the Amazon Redshift API operation with input parameters.
"{""ResizeCluster"":{""NodeType"":"ds2.8xlarge",""ClusterIdentifier"":"my-test-cluster",""NumberOfNodes"":3}}".
Type: ScheduledActionType (p. 523) object

Errors
For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound
The ClusterIdentifier parameter does not refer to an existing cluster.
HTTP Status Code: 404

InvalidSchedule
The schedule you submitted isn't valid.
HTTP Status Code: 400

InvalidScheduledAction
The scheduled action is not valid.
HTTP Status Code: 400
ScheduledActionNotFound

The scheduled action cannot be found.

HTTP Status Code: 400

ScheduledActionTypeUnsupported

The action type specified for a scheduled action is not supported.

HTTP Status Code: 400

UnauthorizedOperation

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

Examples

Example

This example adds description to an existing scheduled action.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=ModifyScheduledAction
&ScheduledActionName=myscheduledaction
&ScheduledActionDescription=My+scheduled+action
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<ModifyScheduledActionResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ModifyScheduledActionResult>
    <IamRole>arn:aws:iam::123456789012:role/myRedshiftRole</IamRole>
    <Schedule>at(2019-12-31T00:00:00)</Schedule>
    <ScheduledActionName>myscheduledaction</ScheduledActionName>
    <TargetAction>
      <ResizeCluster>
        <ClusterType>multi-node</ClusterType>
        <ClusterIdentifier>mycluster</ClusterIdentifier>
        <Classic>true</Classic>
        <NumberOfNodes>3</NumberOfNodes>
        <NodeType>dc2.large</NodeType>
      </ResizeCluster>
    </TargetAction>
  </ModifyScheduledActionResult>
</ModifyScheduledActionResponse>
```

ModifySnapshotCopyRetentionPeriod

Modifies the number of days to retain snapshots in the destination AWS Region after they are copied from the source AWS Region. By default, this operation only changes the retention period of copied automated snapshots. The retention periods for both new and existing copied automated snapshots are updated with the new retention period. You can set the manual option to change only the retention periods of copied manual snapshots. If you set this option, only newly copied manual snapshots have the new retention period.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of the cluster for which you want to change the retention period for either automated or manual snapshots that are copied to a destination AWS Region.

Constraints: Must be the valid name of an existing cluster that has cross-region snapshot copy enabled.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

RetentionPeriod

The number of days to retain automated snapshots in the destination AWS Region after they are copied from the source AWS Region.

By default, this only changes the retention period of copied automated snapshots.

If you decrease the retention period for automated snapshots that are copied to a destination AWS Region, Amazon Redshift deletes any existing automated snapshots that were copied to the destination AWS Region and that fall outside of the new retention period.

Constraints: Must be at least 1 and no more than 35 for automated snapshots.

If you specify the manual option, only newly copied manual snapshots will have the new retention period.

If you specify the value of -1 newly copied manual snapshots are retained indefinitely.

Constraints: The number of days must be either -1 or an integer between 1 and 3,653 for manual snapshots.

Type: Integer

Required: Yes

Manual

Indicates whether to apply the snapshot retention period to newly copied manual snapshots instead of automated snapshots.
Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

InvalidRetentionPeriodFault

The retention period specified is either in the past or is not a valid value.

The value must be either -1 or an integer between 1 and 3,653.

HTTP Status Code: 400

SnapshotCopyDisabledFault

Cross-region snapshot copy was temporarily disabled. Try your request again.

HTTP Status Code: 400

UnauthorizedOperation

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of ModifySnapshotCopyRetentionPeriod.
Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=ModifySnapshotCopyRetentionPeriod
&ClusterIdentifier=mycluster
&RetentionPeriod=15
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256

ModifySnapshotSchedule

Modifies a snapshot schedule. Any schedule associated with a cluster is modified asynchronously.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ScheduleDefinitions.ScheduleDefinition.N

An updated list of schedule definitions. A schedule definition is made up of schedule expressions, for example, "cron(30 12 *)" or "rate(12 hours)".

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: Yes

ScheduleIdentifier

A unique alphanumeric identifier of the schedule to modify.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following elements are returned by the service.

AssociatedClusterCount

The number of clusters associated with the schedule.

Type: Integer

AssociatedClusters.ClusterAssociatedToSchedule.N

A list of clusters associated with the schedule. A maximum of 100 clusters is returned.

Type: Array of ClusterAssociatedToSchedule (p. 442) objects

NextInvocations.SnapshotTime.N

Type: Array of timestamps

ScheduleDefinitions.ScheduleDefinition.N

A list of ScheduleDefinitions.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

ScheduleDescription

The description of the schedule.
Type: String

Length Constraints: Maximum length of 2147483647.

ScheduleIdentifier

A unique identifier for the schedule.

Type: String

Length Constraints: Maximum length of 2147483647.

Tags.Tag.N

An optional set of tags describing the schedule.

Type: Array of Tag (p. 542) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidSchedule

The schedule you submitted isn't valid.

HTTP Status Code: 400

SnapshotScheduleNotFound

We could not find the specified snapshot schedule.

HTTP Status Code: 400

SnapshotScheduleUpdateInProgress

The specified snapshot schedule is already being updated.

HTTP Status Code: 400

Examples

Example

This example sets a snapshot schedule to the rate of every 10 hours.

Sample Request

https://redshift.us-east-2.amazonaws.com/
  ?Action=ModifySnapshotSchedule
  &ScheduleIdentifier=mysnapshotschedule
  &ScheduleDefinitions.ScheduleDefinition.1=rate%2810+hours%29
  &SignatureMethod=HmacSHA256&SignatureVersion=4
  &Version=2012-12-01
  &X-Amz-Algorithm=AWS4-HMAC-SHA256
  &X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
  &X-Amz-Date=20190825T160000Z
  &X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
  &X-Amz-Signature=0aa1234bb5cc678ddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
Sample Response

```xml
<ModifySnapshotScheduleResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ModifySnapshotScheduleResult>
    <ScheduleDefinitions>
      <ScheduleDefinition>rate(10 hours)</ScheduleDefinition>
    </ScheduleDefinitions>
    <ScheduleDescription>My schedule description</ScheduleDescription>
    <ScheduleIdentifier>mysnapshotschedule</ScheduleIdentifier>
    <Tags/>
  </ModifySnapshotScheduleResult>
  <ResponseMetadata>
    <RequestId>8c27532d-28f4-11ea-a940-1b28a85fd753</RequestId>
  </ResponseMetadata>
</ModifySnapshotScheduleResponse>
```

ModifyUsageLimit

Modifies a usage limit in a cluster. You can't modify the feature type or period of a usage limit.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

UsageLimitId

The identifier of the usage limit to modify.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Amount

The new limit amount. For more information about this parameter, see UsageLimit (p. 546).

Type: Long

Required: No

BreachAction

The new action that Amazon Redshift takes when the limit is reached. For more information about this parameter, see UsageLimit (p. 546).

Type: String

Valid Values: log | emit-metric | disable

Required: No

Response Elements

The following elements are returned by the service.

Amount

The limit amount. If time-based, this amount is in minutes. If data-based, this amount is in terabytes (TB).

Type: Long

BreachAction

The action that Amazon Redshift takes when the limit is reached. Possible values are:

- log - To log an event in a system table. The default is log.
- emit-metric - To emit CloudWatch metrics.
- disable - To disable the feature until the next usage period begins.

Type: String

Valid Values: log | emit-metric | disable
ClusterIdentifier

The identifier of the cluster with a usage limit.
Type: String
Length Constraints: Maximum length of 2147483647.

FeatureType

The Amazon Redshift feature to which the limit applies.
Type: String
Valid Values: spectrum | concurrency-scaling | cross-region-datasharing

LimitType

The type of limit. Depending on the feature type, this can be based on a time duration or data size.
Type: String
Valid Values: time | data-scanned

Period

The time period that the amount applies to. A weekly period begins on Sunday. The default is monthly.
Type: String
Valid Values: daily | weekly | monthly

Tags.Tag.N

A list of tag instances.
Type: Array of Tag objects

UsageLimitId

The identifier of the usage limit.
Type: String
Length Constraints: Maximum length of 2147483647.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidUsageLimit

The usage limit is not valid.
HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.
HTTP Status Code: 400

UsageLimitNotFound

The usage limit identifier can't be found.
HTTP Status Code: 404

See Also

PauseCluster

Pauses a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster to be paused.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

PurchaseReservedNodeOffering

Allows you to purchase reserved nodes. Amazon Redshift offers a predefined set of reserved node offerings. You can purchase one or more of the offerings. You can call the DescribeReservedNodeOfferings API to obtain the available reserved node offerings. You can call this API by providing a specific reserved node offering and the number of nodes you want to reserve.

For more information about reserved node offerings, go to Purchasing Reserved Nodes in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters.

ReservedNodeOfferingId

The unique identifier of the reserved node offering you want to purchase.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

NodeCount

The number of reserved nodes that you want to purchase.

Default: 1

Type: Integer

Required: No

Response Elements

The following element is returned by the service.

ReservedNode

Describes a reserved node. You can call the DescribeReservedNodeOfferings API to obtain the available reserved node offerings.

Type: ReservedNode object

Errors

For information about the errors that are common to all actions, see Common Errors.

ReservedNodeAlreadyExists

User already has a reservation with the given identifier.

HTTP Status Code: 404
ReservedNodeOfferingNotFound

Specified offering does not exist.
HTTP Status Code: 404

ReservedNodeQuotaExceeded

Request would exceed the user's compute node quota. For information about increasing your quota, go to [Limits in Amazon Redshift](https://docs.aws.amazon.com/redshift/latest/guides/redshift-limits.html) in the [Amazon Redshift Cluster Management Guide](https://docs.aws.amazon.com/redshift/latest/guides/cluster-management.html).
HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.
HTTP Status Code: 400

Examples

Example

This example illustrates one usage of PurchaseReservedNodeOffering.

Sample Request

```xml
https://redshift.us-east-2.amazonaws.com/
?Action=PurchaseReservedNodeOffering
&ReservedNodeOfferingId=12345678-12ab-12a1-1a2a-12ab-12a12bEXAMPLE
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```xml
<PurchaseReservedNodeOfferingResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <PurchaseReservedNodeOfferingResult>
    <ReservedNode>
      <ReservedNodeOfferingId>12345678-12ab-12a1-1a2a-12ab-12a12bEXAMPLE</ReservedNodeOfferingId>
      <OfferingType>All Upfront</OfferingType>
      <ReservedNodeOfferingType>Regular</ReservedNodeOfferingType>
      <RecurringCharges/>
      <NodeType>ds2.xlarge</NodeType>
      <FixedPrice>4295.0</FixedPrice>
      <Duration>31536000</Duration>
      <UsagePrice>0.0</UsagePrice>
      <ReservedNodeOfferingId>12345678-12ab-12a1-1a2a-12ab-12a12bEXAMPLE</ReservedNodeOfferingId>
      <NodeCount>1</NodeCount>
      <State>payment-pending</State>
      <CurrencyCode>USD</CurrencyCode>
    </ReservedNode>
  </PurchaseReservedNodeOfferingResult>
</PurchaseReservedNodeOfferingResponse>
```

PutResourcePolicy

Updates the resource policy for a specified resource.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

Policy

The content of the resource policy being updated.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

ResourceArn

The Amazon Resource Name (ARN) of the resource of which its resource policy is updated.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following element is returned by the service.

ResourcePolicy

The content of the updated resource policy.

Type: ResourcePolicy (p. 515) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ConflictPolicyUpdateFault

There is a conflict while updating the resource policy.

HTTP Status Code: 409

InvalidPolicyFault

The resource policy isn't valid.

HTTP Status Code: 400

ResourceNotFoundFault

The resource could not be found.
HTTP Status Code: 404

**UnsupportedOperation**

The requested operation isn't supported.

HTTP Status Code: 400

RebootCluster

Reboots a cluster. This action is taken as soon as possible. It results in a momentary outage to the cluster, during which the cluster status is set to rebooting. A cluster event is created when the reboot is completed. Any pending cluster modifications (see ModifyCluster (p. 310)) are applied at this reboot. For more information about managing clusters, go to Amazon Redshift Clusters in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

  The cluster identifier.

  Type: String

  Length Constraints: Maximum length of 2147483647.

  Required: Yes

Response Elements

The following element is returned by the service.

Cluster

  Describes a cluster.

  Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

  The ClusterIdentifier parameter does not refer to an existing cluster.

  HTTP Status Code: 404

InvalidClusterState

  The specified cluster is not in the available state.

  HTTP Status Code: 400

Examples

Example

This example illustrates one usage of RebootCluster.
Sample Request

https://redshift.us-east-2.amazonaws.com/
  ?Action=RebootCluster
&ClusterIdentifier=mycluster
&SignatureMethod=HmacSHA256
&SignatureVersion=4

RejectDataShare

From a datashare consumer account, rejects the specified datashare.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

DataShareArn

The Amazon Resource Name (ARN) of the datashare to reject.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following elements are returned by the service.

AllowPubliclyAccessibleConsumers

A value that specifies whether the datashare can be shared to a publicly accessible cluster.

Type: Boolean

DataShareArn

An Amazon Resource Name (ARN) that references the datashare that is owned by a specific namespace of the producer cluster. A datashare ARN is in the arn:aws:redshift:{region}:{account-id}:{datashare}:{namespace-guid}/{datashare-name} format.

Type: String

Length Constraints: Maximum length of 2147483647.

DataShareAssociations.member.N

A value that specifies when the datashare has an association between producer and data consumers.

Type: Array of DataShareAssociation (p. 460) objects

ManagedBy

The identifier of a datashare to show its managing entity.

Type: String

Length Constraints: Maximum length of 2147483647.

ProducerArn

The Amazon Resource Name (ARN) of the producer.

Type: String

Length Constraints: Maximum length of 2147483647.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

InvalidDataShareFault

There is an error with the datashare.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of RejectDataShare.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=RejectDataShare
&DataShareArn=arn%3Aaws%3Ardsh%3Aus-east-1%3A275247490162%3Adatashare

ResetClusterParameterGroup

Sets one or more parameters of the specified parameter group to their default values and sets the source values of the parameters to "engine-default". To reset the entire parameter group specify the ResetAllParameters parameter. For parameter changes to take effect you must reboot any associated clusters.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ParameterGroupName**

The name of the cluster parameter group to be reset.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Parameters.Parameter.N**

An array of names of parameters to be reset. If ResetAllParameters option is not used, then at least one parameter name must be supplied.

Constraints: A maximum of 20 parameters can be reset in a single request.

Type: Array of Parameter (p. 496) objects

Required: No

**ResetAllParameters**

If true, all parameters in the specified parameter group will be reset to their default values.

Default: true

Type: Boolean

Required: No

**Response Elements**

The following elements are returned by the service.

**ParameterGroupName**

The name of the cluster parameter group.

Type: String

Length Constraints: Maximum length of 2147483647.

**ParameterGroupStatus**

The status of the parameter group. For example, if you made a change to a parameter group name-value pair, then the change could be pending a reboot of an associated cluster.

Type: String
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterParameterGroupNotFound

The parameter group name does not refer to an existing parameter group.

HTTP Status Code: 404

InvalidClusterParameterGroupState

The cluster parameter group action can not be completed because another task is in progress that involves the parameter group. Wait a few moments and try the operation again.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of ResetClusterParameterGroup.

Sample Request

```
https://redshift.us-east-2.amazonaws.com/
?Action=ResetClusterParameterGroup
&ParameterGroupName=myclusterparametergroup
&ResetAllParameters=true
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45678b90c12d345e6ff789012345a6b7b
```

Sample Response

```
<ResetClusterParameterGroupResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <ResetClusterParameterGroupResult>
    <ParameterGroupName>myclusterparametergroup</ParameterGroupName>
    <ParameterGroupStatus>Your parameter group has been updated. If you changed only
dynamic parameters, associated clusters are being modified now. If you changed static
parameters, all updates, including dynamic parameters, will be applied when you reboot the
associated clusters.</ParameterGroupStatus>
  </ResetClusterParameterGroupResult>
  <ResponseMetadata>
    <RequestId>9e0e57b9-28f5-11ea-9caa-c956bec1ce87</RequestId>
  </ResponseMetadata>
</ResetClusterParameterGroupResponse>
```

ResizeCluster

Changes the size of the cluster. You can change the cluster's type, or change the number or type of nodes. The default behavior is to use the elastic resize method. With an elastic resize, your cluster is available for read and write operations more quickly than with the classic resize method.

Elastic resize operations have the following restrictions:

- You can only resize clusters of the following types:
  - dc1.large (if your cluster is in a VPC)
  - dc1.8xlarge (if your cluster is in a VPC)
  - dc2.large
  - dc2.8xlarge
  - ds2.xlarge
  - ds2.8xlarge
  - ra3.xlplus
  - ra3.4xlarge
  - ra3.16xlarge

- The type of nodes that you add must match the node type for the cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ClusterIdentifier**

The unique identifier for the cluster to resize.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**Classic**

A boolean value indicating whether the resize operation is using the classic resize process. If you don't provide this parameter or set the value to false, the resize type is elastic.

Type: Boolean

Required: No

**ClusterType**

The new cluster type for the specified cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**NodeType**

The new node type for the nodes you are adding. If not specified, the cluster's current node type is used.
Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

DependentServiceUnavailableFault

Your request cannot be completed because a dependent internal service is temporarily unavailable. Wait 30 to 60 seconds and try again.

HTTP Status Code: 400
InsufficientClusterCapacity

The number of nodes specified exceeds the allotted capacity of the cluster.

HTTP Status Code: 400

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

InvalidReservedNodeState

Indicates that the Reserved Node being exchanged is not in an active state.

HTTP Status Code: 400

LimitExceededFault

The encryption key has exceeded its grant limit in AWS KMS.

HTTP Status Code: 400

NumberOfNodesPerClusterLimitExceeded

The operation would exceed the number of nodes allowed for a cluster.

HTTP Status Code: 400

NumberOfNodesQuotaExceeded

The operation would exceed the number of nodes allotted to the account. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.

HTTP Status Code: 400

ReservedNodeAlreadyExists

User already has a reservation with the given identifier.

HTTP Status Code: 404

ReservedNodeAlreadyMigrated

Indicates that the reserved node has already been exchanged.

HTTP Status Code: 400

ReservedNodeNotFound

The specified reserved compute node not found.

HTTP Status Code: 404

ReservedNodeOfferingNotFound

Specified offering does not exist.

HTTP Status Code: 404

UnauthorizedOperation

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400
UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

UnsupportedOptionFault

A request option was specified that is not supported.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of ResizeCluster.

Sample Request

```xml
https://redshift.us-east-2.amazonaws.com/
?Action=ResizeCluster
&ClusterIdentifier=mycluster
&ClusterType=multi-node
&NodeType=dc2.large
&NumberOfNodes=6
&Classic=true

**RestoreFromClusterSnapshot**

Creates a new cluster from a snapshot. By default, Amazon Redshift creates the resulting cluster with the same configuration as the original cluster from which the snapshot was created, except that the new cluster is created with the default cluster security and parameter groups. After Amazon Redshift creates the cluster, you can use the [ModifyCluster](p. 310) API to associate a different security group and different parameter group with the restored cluster. If you are using a DS node type, you can also choose to change to another DS node type of the same size during restore.

If you restore a cluster into a VPC, you must provide a cluster subnet group where you want the cluster restored.

For more information about working with snapshots, go to [Amazon Redshift Snapshots](#) in the [Amazon Redshift Cluster Management Guide](#).

**Request Parameters**

For information about the parameters that are common to all actions, see [Common Parameters](p. 550).

**ClusterIdentifier**

The identifier of the cluster that will be created from restoring the snapshot.

Constraints:
- Must contain from 1 to 63 alphanumeric characters or hyphens.
- Alphabetic characters must be lowercase.
- First character must be a letter.
- Cannot end with a hyphen or contain two consecutive hyphens.
- Must be unique for all clusters within an AWS account.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**AdditionalInfo**

Reserved.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**AllowVersionUpgrade**

If true, major version upgrades can be applied during the maintenance window to the Amazon Redshift engine that is running on the cluster.

Default: true

Type: Boolean

Required: No
AquaConfigurationStatus

This parameter is retired. It does not set the AQUA configuration status. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Type: String

Valid Values: enabled | disabled | auto

Required: No

AutomatedSnapshotRetentionPeriod

The number of days that automated snapshots are retained. If the value is 0, automated snapshots are disabled. Even if automated snapshots are disabled, you can still create manual snapshots when you want with CreateClusterSnapshot (p. 60).

You can't disable automated snapshots for RA3 node types. Set the automated retention period from 1-35 days.

Default: The value selected for the cluster from which the snapshot was taken.

Constraints: Must be a value from 0 to 35.

Type: Integer

Required: No

AvailabilityZone

The Amazon EC2 Availability Zone in which to restore the cluster.

Default: A random, system-chosen Availability Zone.

Example: us-east-2a

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

AvailabilityZoneRelocation

The option to enable relocation for an Amazon Redshift cluster between Availability Zones after the cluster is restored.

Type: Boolean

Required: No

ClusterParameterGroupName

The name of the parameter group to be associated with this cluster.

Default: The default Amazon Redshift cluster parameter group. For information about the default parameter group, go to Working with Amazon Redshift Parameter Groups.

Constraints:

• Must be 1 to 255 alphanumeric characters or hyphens.
• First character must be a letter.
• Cannot end with a hyphen or contain two consecutive hyphens.

Type: String
Length Constraints: Maximum length of 2147483647.

Required: No

A list of security groups to be associated with this cluster.

Default: The default cluster security group for Amazon Redshift.

Cluster security groups only apply to clusters outside of VPCs.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**ClusterSubnetGroupName**

The name of the subnet group where you want to cluster restored.

A snapshot of cluster in VPC can be restored only in VPC. Therefore, you must provide subnet group name where you want the cluster restored.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**DefaultIamRoleArn**

The Amazon Resource Name (ARN) for the IAM role that was set as default for the cluster when the cluster was last modified while it was restored from a snapshot.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ElasticIp**

The Elastic IP (EIP) address for the cluster. Don't specify the Elastic IP address for a publicly accessible cluster with availability zone relocation turned on.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Encrypted**

Enables support for restoring an unencrypted snapshot to a cluster encrypted with AWS Key Management Service (KMS) and a customer managed key.

Type: Boolean

Required: No

**EnhancedVpcRouting**

An option that specifies whether to create the cluster with enhanced VPC routing enabled. To create a cluster that uses enhanced VPC routing, the cluster must be in a VPC. For more information, see [Enhanced VPC Routing](https://docs.aws.amazon.com/redshift/latest/gsg/enhanced-vpc-routing.html) in the Amazon Redshift Cluster Management Guide.
If this option is true, enhanced VPC routing is enabled.

Default: false
Type: Boolean
Required: No

**HsmClientCertificateIdentifier**

Specifies the name of the HSM client certificate the Amazon Redshift cluster uses to retrieve the data encryption keys stored in an HSM.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**HsmConfigurationIdentifier**

Specifies the name of the HSM configuration that contains the information the Amazon Redshift cluster can use to retrieve and store keys in an HSM.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**IamRoles.IamRoleArn.N**

A list of AWS Identity and Access Management (IAM) roles that can be used by the cluster to access other AWS services. You must supply the IAM roles in their Amazon Resource Name (ARN) format.

The maximum number of IAM roles that you can associate is subject to a quota. For more information, go to Quotas and limits in the Amazon Redshift Cluster Management Guide.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

**IpAddressType**

The IP address type for the cluster. Possible values are ipv4 and dualstack.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**KmsKeyId**

The AWS Key Management Service (KMS) key ID of the encryption key that encrypts data in the cluster restored from a shared snapshot. You can also provide the key ID when you restore from an unencrypted snapshot to an encrypted cluster in the same account. Additionally, you can specify a new KMS key ID when you restore from an encrypted snapshot in the same account in order to change it. In that case, the restored cluster is encrypted with the new KMS key ID.

Type: String
Length Constraints: Maximum length of 2147483647.
**Required:** No

**MaintenanceTrackName**

The name of the maintenance track for the restored cluster. When you take a snapshot, the snapshot inherits the `MaintenanceTrack` value from the cluster. The snapshot might be on a different track than the cluster that was the source for the snapshot. For example, suppose that you take a snapshot of a cluster that is on the current track and then change the cluster to be on the trailing track. In this case, the snapshot and the source cluster are on different tracks.

Type: String

Length Constraints: Maximum length of 2147483647.

**ManageMasterPassword**

If `true`, Amazon Redshift uses AWS Secrets Manager to manage the restored cluster's admin credentials. If `ManageMasterPassword` is false or not set, Amazon Redshift uses the admin credentials the cluster had at the time the snapshot was taken.

Type: Boolean

Required: No

**ManualSnapshotRetentionPeriod**

The default number of days to retain a manual snapshot. If the value is -1, the snapshot is retained indefinitely. This setting doesn't change the retention period of existing snapshots.

The value must be either -1 or an integer between 1 and 3,653.

Type: Integer

Required: No

**MasterPasswordSecretKmsKeyId**

The ID of the AWS Key Management Service (KMS) key used to encrypt and store the cluster's admin credentials secret. You can only use this parameter if `ManageMasterPassword` is true.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MultiAZ**

If true, the snapshot will be restored to a cluster deployed in two Availability Zones.

Type: Boolean

Required: No

**NodeType**

The node type that the restored cluster will be provisioned with.

Default: The node type of the cluster from which the snapshot was taken. You can modify this if you are using any DS node type. In that case, you can choose to restore into another DS node type of the same size. For example, you can restore `ds1.8xlarge` into `ds2.8xlarge`, or `ds1.xlarge` into `ds2.xlarge`. If you have a DC instance type, you must restore into that same instance type and size. In other words, you can only restore a `dc1.large` instance type into another `dc1.large` instance type or `dc2.large`.
instance type. You can't restore dc1.8xlarge to dc2.8xlarge. First restore to a dc1.8xlarge cluster, then resize to a dc2.8xlarge cluster. For more information about node types, see About Clusters and Nodes in the Amazon Redshift Cluster Management Guide.

**Type:** String

**Length Constraints:** Maximum length of 2147483647.

**Required:** No

**NumberOfNodes**

The number of nodes specified when provisioning the restored cluster.

**Type:** Integer

**Required:** No

**OwnerAccount**

The AWS account used to create or copy the snapshot. Required if you are restoring a snapshot you do not own, optional if you own the snapshot.

**Type:** String

**Length Constraints:** Maximum length of 2147483647.

**Required:** No

**Port**

The port number on which the cluster accepts connections.

Default: The same port as the original cluster.

**Constraints:** Must be between 1115 and 65535.

**Type:** Integer

**Required:** No

**PreferredMaintenanceWindow**

The weekly time range (in UTC) during which automated cluster maintenance can occur.

Default: The value selected for the cluster from which the snapshot was taken. For more information about the time blocks for each region, see Maintenance Windows in Amazon Redshift Cluster Management Guide.

**Valid Days:** Mon | Tue | Wed | Thu | Fri | Sat | Sun

**Constraints:** Minimum 30-minute window.

**Type:** String

**Length Constraints:** Maximum length of 2147483647.

**Required:** No

**PubliclyAccessible**

If true, the cluster can be accessed from a public network.

**Type:** Boolean
Request Parameters

**ReservedNodeId**
- The identifier of the target reserved node offering.
- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**SnapshotArn**
- The Amazon Resource Name (ARN) of the snapshot associated with the message to restore from a cluster. You must specify this parameter or snapshotIdentifier, but not both.
- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**SnapshotClusterIdentifier**
- The name of the cluster the source snapshot was created from. This parameter is required if your IAM user has a policy containing a snapshot resource element that specifies anything other than * for the cluster name.
- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**SnapshotIdentifier**
- The name of the snapshot from which to create the new cluster. This parameter isn't case sensitive. You must specify this parameter or snapshotArn, but not both.
- Example: my-snapshot-id
- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**SnapshotScheduleIdentifier**
- A unique identifier for the snapshot schedule.
- Type: String
- Length Constraints: Maximum length of 2147483647.
- Required: No

**TargetReservedNodeOfferingId**
- The identifier of the target reserved node offering.
- Type: String
- Length Constraints: Maximum length of 2147483647.
Required: No

VpcSecurityGroupIds.VpcSecurityGroupId.N
A list of Virtual Private Cloud (VPC) security groups to be associated with the cluster.
Default: The default VPC security group is associated with the cluster.
VPC security groups only apply to clusters in VPCs.
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

Response Elements
The following element is returned by the service.

Cluster
Describes a cluster.
Type: Cluster (p. 432) object

Errors
For information about the errors that are common to all actions, see Common Errors (p. 552).

AccessToSnapshotDenied
The owner of the specified snapshot has not authorized your account to access the snapshot.
HTTP Status Code: 400

ClusterAlreadyExists
The account already has a cluster with the given identifier.
HTTP Status Code: 400

ClusterParameterGroupNotFound
The parameter group name does not refer to an existing parameter group.
HTTP Status Code: 404

ClusterQuotaExceeded
The request would exceed the allowed number of cluster instances for this account. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.
HTTP Status Code: 400

ClusterSecurityGroupNotFound
The cluster security group name does not refer to an existing cluster security group.
HTTP Status Code: 404
ClusterSnapshotNotFoundException

The snapshot identifier does not refer to an existing cluster snapshot.

HTTP Status Code: 404

ClusterSubnetGroupNotFoundException

The cluster subnet group name does not refer to an existing cluster subnet group.

HTTP Status Code: 400

DependentServiceRequestThrottlingFault

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.

HTTP Status Code: 400

DependentServiceUnavailableFault

Your request cannot be completed because a dependent internal service is temporarily unavailable. Wait 30 to 60 seconds and try again.

HTTP Status Code: 400

HsmClientCertificateNotFoundException

There is no Amazon Redshift HSM client certificate with the specified identifier.

HTTP Status Code: 400

HsmConfigurationNotFoundException

There is no Amazon Redshift HSM configuration with the specified identifier.

HTTP Status Code: 400

InsufficientClusterCapacity

The number of nodes specified exceeds the allotted capacity of the cluster.

HTTP Status Code: 400

InvalidClusterSnapshotState

The specified cluster snapshot is not in the available state, or other accounts are authorized to access the snapshot.

HTTP Status Code: 400

InvalidClusterSubnetGroupStateException

The cluster subnet group cannot be deleted because it is in use.

HTTP Status Code: 400

InvalidClusterTrack

The provided cluster track name is not valid.

HTTP Status Code: 400

InvalidElasticIpFault

The Elastic IP (EIP) is invalid or cannot be found.

HTTP Status Code: 400
InvalidReservedNodeState
Indicates that the Reserved Node being exchanged is not in an active state.
HTTP Status Code: 400

InvalidRestore
The restore is invalid.
HTTP Status Code: 406

InvalidSubnet
The requested subnet is not valid, or not all of the subnets are in the same VPC.
HTTP Status Code: 400

InvalidTagFault
The tag is invalid.
HTTP Status Code: 400

InvalidVPCNetworkStateFault
The cluster subnet group does not cover all Availability Zones.
HTTP Status Code: 400

Ipv6CidrBlockNotFoundFault
There are no subnets in your VPC with associated IPv6 CIDR blocks. To use dual-stack mode, associate an IPv6 CIDR block with each subnet in your VPC.
HTTP Status Code: 400

LimitExceededFault
The encryption key has exceeded its grant limit in AWS KMS.
HTTP Status Code: 400

NumberOfNodesPerClusterLimitExceeded
The operation would exceed the number of nodes allowed for a cluster.
HTTP Status Code: 400

NumberOfNodesQuotaExceeded
The operation would exceed the number of nodes allotted to the account. For information about increasing your quota, go to Limits in Amazon Redshift in the Amazon Redshift Cluster Management Guide.
HTTP Status Code: 400

ReservedNodeAlreadyExists
User already has a reservation with the given identifier.
HTTP Status Code: 404

ReservedNodeAlreadyMigrated
Indicates that the reserved node has already been exchanged.
HTTP Status Code: 400
ReservedNodeNotFound

The specified reserved compute node not found.

HTTP Status Code: 404

ReservedNodeOfferingNotFound

Specified offering does not exist.

HTTP Status Code: 404

SnapshotScheduleNotFound

We could not find the specified snapshot schedule.

HTTP Status Code: 400

TagLimitExceededFault

You have exceeded the number of tags allowed.

HTTP Status Code: 400

UnauthorizedOperation

Your account is not authorized to perform the requested operation.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of RestoreFromClusterSnapshot.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=RestoreFromClusterSnapshot
&ClusterIdentifier=mycluster
&SnapshotIdentifier=mysnapshotid
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date

RestoreTableFromClusterSnapshot

Creates a new table from a table in an Amazon Redshift cluster snapshot. You must create the new table within the Amazon Redshift cluster that the snapshot was taken from.

You cannot use RestoreTableFromClusterSnapshot to restore a table with the same name as an existing table in an Amazon Redshift cluster. That is, you cannot overwrite an existing table in a cluster with a restored table. If you want to replace your original table with a new, restored table, then rename or drop your original table before you call RestoreTableFromClusterSnapshot. When you have renamed your original table, then you can pass the original name of the table as the NewTableName parameter value in the call to RestoreTableFromClusterSnapshot. This way, you can replace the original table with the table created from the snapshot.

You can't use this operation to restore tables with interleaved sort keys.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the Amazon Redshift cluster to restore the table to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

NewTableName

The name of the table to create as a result of the current request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

SnapshotIdentifier

The identifier of the snapshot to restore the table from. This snapshot must have been created from the Amazon Redshift cluster specified by the ClusterIdentifier parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

SourceDatabaseName

The name of the source database that contains the table to restore from.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes
**SourceTableName**

The name of the source table to restore from.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**EnableCaseSensitiveIdentifier**

Indicates whether name identifiers for database, schema, and table are case sensitive. If true, the names are case sensitive. If false (default), the names are not case sensitive.

Type: Boolean

Required: No

**SourceSchemaName**

The name of the source schema that contains the table to restore from. If you do not specify a SourceSchemaName value, the default is public.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TargetDatabaseName**

The name of the database to restore the table to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TargetSchemaName**

The name of the schema to restore the table to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Response Elements**

The following element is returned by the service.

**TableRestoreStatus**

Describes the status of a RestoreTableFromClusterSnapshot (p. 401) operation.

Type: TableRestoreStatus (p. 539) object

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 552).
ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

ClusterSnapshotNotFound

The snapshot identifier does not refer to an existing cluster snapshot.

HTTP Status Code: 404

InProgressTableRestoreQuotaExceededFault

You have exceeded the allowed number of table restore requests. Wait for your current table restore requests to complete before making a new request.

HTTP Status Code: 400

InvalidClusterSnapshotState

The specified cluster snapshot is not in the available state, or other accounts are authorized to access the snapshot.

HTTP Status Code: 400

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

InvalidTableRestoreArgument

The value specified for the sourceDatabaseName, sourceSchemaName, or sourceTableName parameter, or a combination of these, doesn't exist in the snapshot.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

Examples

Example

This example illustrates one usage of RestoreTableFromClusterSnapshot.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=RestoreTableFromClusterSnapshot
&ClusterIdentifier=mycluster
&SnapshotIdentifier=mysnapshotid
&SourceDatabaseName=dev
&SourceSchemaName=public
&SourceTableName=mytable
&TargetDatabaseName=dev
&TargetSchemaName=public
&NewTableName=mytable-clone
&SignatureMethod=HmacSHA256&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request

ResumeCluster

Resumes a paused cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The identifier of the cluster to be resumed.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

InsufficientClusterCapacity

The number of nodes specified exceeds the allotted capacity of the cluster.

HTTP Status Code: 400

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

RevokeClusterSecurityGroupIngress

RevokeClusterSecurityGroupIngress

Revokes an ingress rule in an Amazon Redshift security group for a previously authorized IP range or Amazon EC2 security group. To add an ingress rule, see AuthorizeClusterSecurityGroupIngress (p. 14). For information about managing security groups, go to Amazon Redshift Cluster Security Groups in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**ClusterSecurityGroupName**

The name of the security Group from which to revoke the ingress rule.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

**CIDRIP**

The IP range for which to revoke access. This range must be a valid Classless Inter-Domain Routing (CIDR) block of IP addresses. If CIDRIP is specified, EC2SecurityGroupName and EC2SecurityGroupOwnerId cannot be provided.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**EC2SecurityGroupName**

The name of the EC2 Security Group whose access is to be revoked. If EC2SecurityGroupName is specified, EC2SecurityGroupOwnerId must also be provided and CIDRIP cannot be provided.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**EC2SecurityGroupOwnerId**

The AWS account number of the owner of the security group specified in the EC2SecurityGroupName parameter. The AWS access key ID is not an acceptable value. If EC2SecurityGroupOwnerId is specified, EC2SecurityGroupName must also be provided, and CIDRIP cannot be provided.

Example: 111122223333

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
Response Elements
The following element is returned by the service.

ClusterSecurityGroup
Describes a security group.
Type: ClusterSecurityGroup (p. 450) object

Errors
For information about the errors that are common to all actions, see Common Errors (p. 552).

AuthorizationNotFound
The specified CIDR IP range or EC2 security group is not authorized for the specified cluster security group.
HTTP Status Code: 404

ClusterSecurityGroupNotFound
The cluster security group name does not refer to an existing cluster security group.
HTTP Status Code: 404

InvalidClusterSecurityGroupState
The state of the cluster security group is not available.
HTTP Status Code: 400

Examples

Example
This example illustrates one usage of RevokeClusterSecurityGroupIngress.

Sample Request

https://redshift.us-east-2.amazonaws.com/
?Action=RevokeClusterSecurityGroupIngress
&ClusterSecurityGroupName=securitygroup1
&CIDRIP=192.168.40.3/32
&Version=2012-12-01
&x-amz-algorithm=AWS4-HMAC-SHA256
&x-amz-credential=AKIAIOSFODNN7EXAMPLE/20130123/us-east-2/redshift/aws4_request
&x-amz-date=20130123T021606Z
&x-amz-signedheaders=content-type;host;x-amz-date

Sample Response

<RevokeClusterSecurityGroupIngressResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
  <RevokeClusterSecurityGroupIngressResult>
    <ResponseMetadata/>
  </RevokeClusterSecurityGroupIngressResult>
</RevokeClusterSecurityGroupIngressResponse>
<ClusterSecurityGroup>
  <EC2SecurityGroups/>
  <IPRanges/>
  <Description>my security group</Description>
  <ClusterSecurityGroupName>securitygroup1</ClusterSecurityGroupName>
</ClusterSecurityGroup>
</RevokeClusterSecurityGroupIngressResult>
<ResponseMetadata>
  <RequestId>d8eff363-6502-11e2-a8da-655adc216806</RequestId>
</ResponseMetadata>
</RevokeClusterSecurityGroupIngressResponse>

RevokeEndpointAccess

Revoke access to a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**Account**

The AWS account ID whose access is to be revoked.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ClusterIdentifier**

The cluster to revoke access from.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Force**

Indicates whether to force the revoke action. If true, the Redshift-managed VPC endpoints associated with the endpoint authorization are also deleted.

Type: Boolean

Required: No

**VpcIds.VpcIdentifier.N**

The virtual private cloud (VPC) identifiers for which access is to be revoked.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following elements are returned by the service.

**AllowedAllVPCs**

Indicates whether all VPCs in the grantee account are allowed access to the cluster.

Type: Boolean

**AllowedVPCs.VpcIdentifier.N**

The VPCs allowed access to the cluster.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFoundException

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

RevokeSnapshotAccess

Removes the ability of the specified AWS account to restore the specified snapshot. If the account is currently restoring the snapshot, the restore will run to completion.

For more information about working with snapshots, go to Amazon Redshift Snapshots in the Amazon Redshift Cluster Management Guide.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

AccountWithRestoreAccess

The identifier of the AWS account that can no longer restore the specified snapshot.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

SnapshotArn

The Amazon Resource Name (ARN) of the snapshot associated with the message to revoke access.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SnapshotClusterIdentifier

The identifier of the cluster the snapshot was created from. This parameter is required if your IAM user has a policy containing a snapshot resource element that specifies anything other than * for the cluster name.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SnapshotIdentifier

The identifier of the snapshot that the account can no longer access.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Response Elements

The following element is returned by the service.
Snapshot

Describes a snapshot.

Type: Snapshot (p. 525) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

AccessToSnapshotDenied

The owner of the specified snapshot has not authorized your account to access the snapshot.

HTTP Status Code: 400

AuthorizationNotFound

The specified CIDR IP range or EC2 security group is not authorized for the specified cluster security group.

HTTP Status Code: 404

ClusterSnapshotNotFound

The snapshot identifier does not refer to an existing cluster snapshot.

HTTP Status Code: 404

UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

RotateEncryptionKey

Rotates the encryption keys for a cluster.

Request Parameters

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

ClusterIdentifier

The unique identifier of the cluster that you want to rotate the encryption keys for.

Constraints: Must be the name of valid cluster that has encryption enabled.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

Response Elements

The following element is returned by the service.

Cluster

Describes a cluster.

Type: Cluster (p. 432) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 552).

ClusterNotFound

The ClusterIdentifier parameter does not refer to an existing cluster.

HTTP Status Code: 404

DependentServiceRequestThrottlingFault

The request cannot be completed because a dependent service is throttling requests made by Amazon Redshift on your behalf. Wait and retry the request.

HTTP Status Code: 400

InvalidClusterState

The specified cluster is not in the available state.

HTTP Status Code: 400

UnsupportedOperation

The requested operation isn't supported.
HTTP Status Code: 400

Examples

Example

This example illustrates one usage of RotateEncryptionKey.

Sample Request

https://redshift.us-east-2.amazonaws.com/
    ?Action=RotateEncryptionKey
&ClusterIdentifier=mycluster
&SignatureMethod=HmacSHA256
&SignatureVersion=4
&Version=2012-12-01
&X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE/20190817/us-east-2/redshift/aws4_request
&X-Amz-Date=20190825T160000Z
&X-Amz-SignedHeaders=content-type;host;user-agent;x-amz-content-sha256;x-amz-date
&X-Amz-Signature=0aa1234bb5cc678ddddd901ee2ff3aa45f78b90c12d345e6ff789012345a6b7b

Sample Response

<RotateEncryptionKeyResponse xmlns="http://redshift.amazonaws.com/doc/2012-12-01/">
    <RotateEncryptionKeyResult>
        <Cluster>
            <AllowVersionUpgrade>true</AllowVersionUpgrade>
            <ClusterIdentifier>mycluster</ClusterIdentifier>
            <NumberOfNodes>1</NumberOfNodes>
            <AvailabilityZone>us-east-2a</AvailabilityZone>
            <ClusterVersion>1.0</ClusterVersion>
            <ManualSnapshotRetentionPeriod>-1</ManualSnapshotRetentionPeriod>
            <ClusterAvailabilityStatus>Modifying</ClusterAvailabilityStatus>
            <Endpoint>

UpdatePartnerStatus

Updates the status of a partner integration.

**Request Parameters**

For information about the parameters that are common to all actions, see Common Parameters (p. 550).

**AccountId**

The AWS account ID that owns the cluster.

Type: String

Length Constraints: Fixed length of 12.

Pattern: ^[0-9]+$

Required: Yes

**ClusterIdentifier**

The cluster identifier of the cluster whose partner integration status is being updated.

Type: String

Length Constraints: Maximum length of 63.

Pattern: ^[a-zA-Z0-9-]+$

Required: Yes

**DatabaseName**

The name of the database whose partner integration status is being updated.

Type: String

Length Constraints: Maximum length of 127.

Pattern: ^[\p{L}_][\p{L}\p{N}@#$\-_]+$

Required: Yes

**PartnerName**

The name of the partner whose integration status is being updated.

Type: String

Length Constraints: Maximum length of 255.

Pattern: ^[a-zA-Z0-9-\-_]+$

Required: Yes

**Status**

The value of the updated status.

Type: String
Valid Values: Active | Inactive | RuntimeFailure | ConnectionFailure

Required: Yes

**StatusMessage**

The status message provided by the partner.

Type: String

Length Constraints: Maximum length of 262144.

Pattern: ^\[\x20-\x7E]+$

Required: No

**Response Elements**

The following elements are returned by the service.

**DatabaseName**

The name of the database that receives data from the partner.

Type: String

Length Constraints: Maximum length of 127.

Pattern: ^[^p{L}_][p{L}\p{N}@#$]+$

**PartnerName**

The name of the partner that is authorized to send data.

Type: String

Length Constraints: Maximum length of 255.

Pattern: ^[a-zA-Z0-9-9\-_-]+$

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 552)](#).

**ClusterNotFound**

The `ClusterIdentifier` parameter does not refer to an existing cluster.

HTTP Status Code: 404

**PartnerNotFound**

The name of the partner was not found.

HTTP Status Code: 404

**UnauthorizedPartnerIntegration**

The partner integration is not authorized.

HTTP Status Code: 401
UnsupportedOperation

The requested operation isn't supported.

HTTP Status Code: 400

Data Types

The Amazon Redshift API contains several data types that various actions use. This section describes each data type in detail.

**Note**
The order of each element in a data type structure is not guaranteed. Applications should not assume a particular order.

The following data types are supported:

- AccountAttribute (p. 424)
- AccountWithRestoreAccess (p. 425)
- AquaConfiguration (p. 426)
- Association (p. 427)
- AttributeValueTarget (p. 428)
- AuthenticationProfile (p. 429)
- AvailabilityZone (p. 430)
- CertificateAssociation (p. 431)
- Cluster (p. 432)
- ClusterAssociatedToSchedule (p. 442)
- ClusterDbRevision (p. 443)
- ClusterIAMRole (p. 444)
- ClusterNode (p. 445)
- ClusterParameterGroup (p. 446)
- ClusterParameterGroupStatus (p. 447)
- ClusterParameterStatus (p. 448)
- ClusterSecurityGroup (p. 450)
- ClusterSecurityGroupMembership (p. 452)
- ClusterSnapshotCopyStatus (p. 453)
- ClusterSubnetGroup (p. 455)
- ClusterVersion (p. 457)
- DataShare (p. 458)
- DataShareAssociation (p. 460)
- DataTransferProgress (p. 462)
- DefaultClusterParameters (p. 464)
- DeferredMaintenanceWindow (p. 465)
- DeleteClusterSnapshotMessage (p. 466)
- EC2SecurityGroup (p. 467)
- ElasticipStatus (p. 468)

• VpcSecurityGroupMembership (p. 549)
AccountAttribute

A name value pair that describes an aspect of an account.

Contents

**Note**
In the following list, the required parameters are described first.

**AttributeName**

The name of the attribute.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**AttributeValueValues.AttributeValueTarget.N**

A list of attribute values.

Type: Array of [AttributeValueTarget](p. 428) objects

Required: No

See Also

- [AWS SDK for Ruby V3](

API Version 2012-12-01

424
AccountWithRestoreAccess

Describes an AWS account authorized to restore a snapshot.

Contents

Note
In the following list, the required parameters are described first.

AccountAlias

The identifier of an AWS support account authorized to restore a snapshot. For AWS Support, the identifier is amazon-redshift-support.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

AccountId

The identifier of an AWS account authorized to restore a snapshot.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AquaConfiguration

The operation that uses this structure is retired. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Contents

Note
In the following list, the required parameters are described first.

**AquaConfigurationStatus**

This field is retired. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Type: String

Valid Values: enabled | disabled | auto

Required: No

**AquaStatus**

This field is retired. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Type: String

Valid Values: enabled | disabled | applying

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
Association

Contains information about the custom domain name association.

Contents

Note
In the following list, the required parameters are described first.

A list of all associated clusters and domain names tied to a specific certificate.

Type: Array of CertificateAssociation objects

Required: No

CustomDomainCertificateArn

The Amazon Resource Name (ARN) for the certificate associated with the custom domain.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

CustomDomainCertificate_expiryDate

The expiration date for the certificate.

Type: Timestamp

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AttributeValueTarget

Describes an attribute value.

Contents

Note

In the following list, the required parameters are described first.

AttributeValue

The value of the attribute.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
AuthenticationProfile

Describes an authentication profile.

Contents

**Note**

In the following list, the required parameters are described first.

**AuthenticationProfileContent**

The content of the authentication profile in JSON format. The maximum length of the JSON string is determined by a quota for your account.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**AuthenticationProfileName**

The name of the authentication profile.

Type: String

Length Constraints: Maximum length of 63.

Pattern: `^[a-zA-Z0-9-]+$`

Required: No

See Also

AvailabilityZone

Describes an availability zone.

Contents

Note
In the following list, the required parameters are described first.

Name

The name of the availability zone.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SupportedPlatforms.SupportedPlatform.N

Type: Array of SupportedPlatform (p. 538) objects

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
CertificateAssociation

A cluster ID and custom domain name tied to a specific certificate. These are typically returned in a list.

Contents

Note
In the following list, the required parameters are described first.

ClusterIdentifier
The cluster identifier for the certificate association.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

CustomDomainName
The custom domain name for the certificate association.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Cluster

Describes a cluster.

Contents

Note
In the following list, the required parameters are described first.

AllowVersionUpgrade
A boolean value that, if true, indicates that major version upgrades will be applied automatically to the cluster during the maintenance window.

Type: Boolean
Required: No

AquaConfiguration
This field is retired. Amazon Redshift automatically determines whether to use AQUA (Advanced Query Accelerator).

Type: AquaConfiguration (p. 426) object
Required: No

AutomatedSnapshotRetentionPeriod
The number of days that automatic cluster snapshots are retained.

Type: Integer
Required: No

AvailabilityZone
The name of the Availability Zone in which the cluster is located.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

AvailabilityZoneRelocationStatus
Describes the status of the Availability Zone relocation operation.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ClusterAvailabilityStatus
The availability status of the cluster for queries. Possible values are the following:
- Available - The cluster is available for queries.
- Unavailable - The cluster is not available for queries.
- Maintenance - The cluster is intermittently available for queries due to maintenance activities.
• Modifying - The cluster is intermittently available for queries due to changes that modify the cluster.
• Failed - The cluster failed and is not available for queries.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ClusterCreateTime

The date and time that the cluster was created.

Type: Timestamp
Required: No

ClusterIdentifier

The unique identifier of the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ClusterNamespaceArn

The namespace Amazon Resource Name (ARN) of the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ClusterNodes.member.N

The nodes in the cluster.

Type: Array of ClusterNode (p. 445) objects
Required: No

The list of cluster parameter groups that are associated with this cluster. Each parameter group in the list is returned with its status.

Type: Array of ClusterParameterGroupStatus (p. 447) objects
Required: No

ClusterPublicKey

The public key for the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No
ClusterRevisionNumber

The specific revision number of the database in the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

A list of cluster security group that are associated with the cluster. Each security group is represented by an element that contains ClusterSecurityGroup.Name and ClusterSecurityGroup.Status subelements.

Cluster security groups are used when the cluster is not created in an Amazon Virtual Private Cloud (VPC). Clusters that are created in a VPC use VPC security groups, which are listed by the VpcSecurityGroups parameter.

Type: Array of ClusterSecurityGroupMembership (p. 452) objects

Required: No

ClusterSnapshotCopyStatus

A value that returns the destination region and retention period that are configured for cross-region snapshot copy.

Type: ClusterSnapshotCopyStatus (p. 453) object

Required: No

ClusterStatus

The current state of the cluster. Possible values are the following:

- available
- available, prep-for-resize
- available, resize-cleanup
- cancelling-resize
- creating
- deleting
- final-snapshot
- hardware-failure
- incompatible-hsm
- incompatible-network
- incompatible-parameters
- incompatible-restore
- modifying
- paused
- rebooting
- renaming
- rescaling
- rotating-keys
- storage-full
- updating-hsm
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**ClusterSubnetGroupName**

The name of the subnet group that is associated with the cluster. This parameter is valid only when the cluster is in a VPC.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**ClusterVersion**

The version ID of the Amazon Redshift engine that is running on the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**CustomDomainCertificateArn**

The certificate Amazon Resource Name (ARN) for the custom domain name.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**CustomDomainCertificateExpiryDate**

The expiration date for the certificate associated with the custom domain name.

Type: Timestamp
Required: No

**CustomDomainName**

The custom domain name associated with the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**DataTransferProgress**

Type: `DataTransferProgress (p. 462)` object
Required: No

**DBName**

The name of the initial database that was created when the cluster was created. This same name is returned for the life of the cluster. If an initial database was not specified, a database named devdev was created by default.
**Default IAM Role ARN**

The Amazon Resource Name (ARN) for the IAM role set as default for the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Deferred Maintenance Windows**

Describes a group of `DeferredMaintenanceWindow` objects.

Type: Array of `DeferredMaintenanceWindow (p. 465)` objects

Required: No

**Elastic IP Status**

The status of the elastic IP (EIP) address.

Type: `ElasticIpStatus (p. 468)` object

Required: No

**Elastic Resize Number of Node Options**

The number of nodes that you can resize the cluster to with the elastic resize method.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Encrypted**

A boolean value that, if `true`, indicates that data in the cluster is encrypted at rest.

Type: Boolean

Required: No

**Endpoint**

The connection endpoint.

Type: `Endpoint (p. 469)` object

Required: No

**Enhanced VPC Routing**

An option that specifies whether to create the cluster with enhanced VPC routing enabled. To create a cluster that uses enhanced VPC routing, the cluster must be in a VPC. For more information, see `Enhanced VPC Routing` in the Amazon Redshift Cluster Management Guide.

If this option is `true`, enhanced VPC routing is enabled.

Default: false
Type: Boolean
Required: No

**ExpectedNextSnapshotScheduleTime**

The date and time when the next snapshot is expected to be taken for clusters with a valid snapshot schedule and backups enabled.

Type: Timestamp
Required: No

**ExpectedNextSnapshotScheduleTimeStatus**

The status of next expected snapshot for clusters having a valid snapshot schedule and backups enabled. Possible values are the following:
- OnTrack - The next snapshot is expected to be taken on time.
- Pending - The next snapshot is pending to be taken.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**HsmStatus**

A value that reports whether the Amazon Redshift cluster has finished applying any hardware security module (HSM) settings changes specified in a modify cluster command.

Values: active, applying

Type: [HsmStatus](p. 485) object
Required: No

**IamRoles.ClusterIamRole.N**

A list of AWS Identity and Access Management (IAM) roles that can be used by the cluster to access other AWS services.

Type: Array of [ClusterIamRole](p. 444) objects
Required: No

**IpAddressType**

The IP address type for the cluster. Possible values are ipv4 and dualstack.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**KmsKeyId**

The AWS Key Management Service (KMS) key ID of the encryption key used to encrypt data in the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No
**MaintenanceTrackName**

The name of the maintenance track for the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ManualSnapshotRetentionPeriod**

The default number of days to retain a manual snapshot. If the value is -1, the snapshot is retained indefinitely. This setting doesn't change the retention period of existing snapshots.

The value must be either -1 or an integer between 1 and 3,653.

Type: Integer

Required: No

**MasterPasswordSecretArn**

The Amazon Resource Name (ARN) for the cluster's admin user credentials secret.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MasterPasswordSecretKmsKeyId**

The ID of the AWS Key Management Service (KMS) key used to encrypt and store the cluster's admin credentials secret.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MasterUsername**

The admin user name for the cluster. This name is used to connect to the database that is specified in the **DBName** parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ModifyStatus**

The status of a modify operation, if any, initiated for the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MultiAZ**

A boolean value that, if true, indicates that the cluster is deployed in two Availability Zones.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**MultiAZSecondary**

The secondary compute unit of a cluster, if Multi-AZ deployment is turned on.

Type: `SecondaryClusterInfo` (p. 524) object

Required: No

**NextMaintenanceWindowStartTime**

The date and time in UTC when system maintenance can begin.

Type: Timestamp

Required: No

**NodeType**

The node type for the nodes in the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**NumberOfNodes**

The number of compute nodes in the cluster.

Type: Integer

Required: No

**PendingActions.member.N**

Cluster operations that are waiting to be started.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

**PendingModifiedValues**

A value that, if present, indicates that changes to the cluster are pending. Specific pending changes are identified by subelements.

Type: `PendingModifiedValues` (p. 501) object

Required: No

**PreferredMaintenanceWindow**

The weekly time range, in Universal Coordinated Time (UTC), during which system maintenance can occur.

Type: String

Length Constraints: Maximum length of 2147483647.
Required: No

**PubliclyAccessible**

A boolean value that, if true, indicates that the cluster can be accessed from a public network.

Type: Boolean

Required: No

**ReservedNodeExchangeStatus**

The status of the reserved-node exchange request. Statuses include in-progress and requested.

Type: [ReservedNodeExchangeStatus](p. 508) object

Required: No

**ResizeInfo**

Returns the following:
- AllowCancelResize: a boolean value indicating if the resize operation can be cancelled.
- ResizeType: Returns ClassicResize

Type: [ResizeInfo](p. 514) object

Required: No

**RestoreStatus**

A value that describes the status of a cluster restore action. This parameter returns null if the cluster was not created by restoring a snapshot.

Type: [RestoreStatus](p. 516) object

Required: No

**SnapshotScheduleIdentifier**

A unique identifier for the cluster snapshot schedule.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SnapshotScheduleState**

The current state of the cluster snapshot schedule.

Type: String

Valid Values: MODIFYING | ACTIVE | FAILED

Required: No

**Tags.Tag.N**

The list of tags for the cluster.

Type: Array of [Tag](p. 542) objects

Required: No

**TotalStorageCapacityInMegaBytes**

The total storage capacity of the cluster in megabytes.
Type: Long

Required: No

**VpcId**

The identifier of the VPC the cluster is in, if the cluster is in a VPC.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

A list of Amazon Virtual Private Cloud (Amazon VPC) security groups that are associated with the cluster. This parameter is returned only if the cluster is in a VPC.

Type: Array of [VpcSecurityGroupMembership (p. 549)] objects

Required: No

### See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterAssociatedToSchedule

Contents

Note
In the following list, the required parameters are described first.

ClusterIdentifier

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ScheduleAssociationState

Type: String
Valid Values: MODIFYING | ACTIVE | FAILED
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterDbRevision

Describes a ClusterDbRevision.

Contents

Note
In the following list, the required parameters are described first.

ClusterIdentifier
The unique identifier of the cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

CurrentDatabaseRevision
A string representing the current cluster version.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

DatabaseRevisionReleaseDate
The date on which the database revision was released.
Type: Timestamp
Required: No

RevisionTargets.RevisionTarget.N
A list of RevisionTarget objects, where each object describes the database revision that a cluster can be updated to.
Type: Array of RevisionTarget (p. 519) objects
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterIamRole

An AWS Identity and Access Management (IAM) role that can be used by the associated Amazon Redshift cluster to access other AWS services.

Contents

Note
In the following list, the required parameters are described first.

ApplyStatus

A value that describes the status of the IAM role's association with an Amazon Redshift cluster.

The following are possible statuses and descriptions.
• in-sync: The role is available for use by the cluster.
• adding: The role is in the process of being associated with the cluster.
• removing: The role is in the process of being disassociated with the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

IamRoleArn

The Amazon Resource Name (ARN) of the IAM role, for example, arn:aws:iam::123456789012:role/RedshiftCopyUnload.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
ClusterNode

The identifier of a node in a cluster.

Contents

Note
In the following list, the required parameters are described first.

NodeRole
Whether the node is a leader node or a compute node.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

PrivateIPAddress
The private IP address of a node within a cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

PublicIPAddress
The public IP address of a node within a cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterParameterGroup

Describes a parameter group.

Contents

Note
In the following list, the required parameters are described first.

Description
The description of the parameter group.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ParameterGroupFamily
The name of the cluster parameter group family that this cluster parameter group is compatible with.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ParameterGroupName
The name of the cluster parameter group.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Tags.Tag.N
The list of tags for the cluster parameter group.
Type: Array of Tag (p. 542) objects
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterParameterGroupStatus

Describes the status of a parameter group.

Contents

**Note**
In the following list, the required parameters are described first.

ClusterParameterStatusList.member.N

The list of parameter statuses.

For more information about parameters and parameter groups, go to Amazon Redshift Parameter Groups in the Amazon Redshift Cluster Management Guide.

Type: Array of ClusterParameterStatus (p. 448) objects

Required: No

ParameterApplyStatus

The status of parameter updates.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ParameterGroupName

The name of the cluster parameter group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterParameterStatus

Describes the status of a parameter group.

Contents

**Note**
In the following list, the required parameters are described first.

**ParameterApplyErrorDescription**

The error that prevented the parameter from being applied to the database.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ParameterApplyStatus**

The status of the parameter that indicates whether the parameter is in sync with the database, waiting for a cluster reboot, or encountered an error when being applied.

The following are possible statuses and descriptions.

- **in-sync**: The parameter value is in sync with the database.
- **pending-reboot**: The parameter value will be applied after the cluster reboots.
- **applying**: The parameter value is being applied to the database.
- **invalid-parameter**: Cannot apply the parameter value because it has an invalid value or syntax.
- **apply-deferred**: The parameter contains static property changes. The changes are deferred until the cluster reboots.
- **apply-error**: Cannot connect to the cluster. The parameter change will be applied after the cluster reboots.
- **unknown-error**: Cannot apply the parameter change right now. The change will be applied after the cluster reboots.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ParameterName**

The name of the parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterSecurityGroup

Describes a security group.

Contents

Note

In the following list, the required parameters are described first.

ClusterSecurityGroupName

The name of the cluster security group to which the operation was applied.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Description

A description of the security group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

EC2SecurityGroups.EC2SecurityGroup.N

A list of EC2 security groups that are permitted to access clusters associated with this cluster security group.

Type: Array of EC2SecurityGroup (p. 467) objects

Required: No

IPRanges.IPRange.N

A list of IP ranges (CIDR blocks) that are permitted to access clusters associated with this cluster security group.

Type: Array of IPRange (p. 489) objects

Required: No

Tags.Tag.N

The list of tags for the cluster security group.

Type: Array of Tag (p. 542) objects

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
See Also

- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterSecurityGroupMembership

Describes a cluster security group.

Contents

Note
In the following list, the required parameters are described first.

ClusterSecurityGroupName

The name of the cluster security group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Status

The status of the cluster security group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
ClusterSnapshotCopyStatus

Returns the destination region and retention period that are configured for cross-region snapshot copy.

Contents

**Note**

In the following list, the required parameters are described first.

**DestinationRegion**

The destination region that snapshots are automatically copied to when cross-region snapshot copy is enabled.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ManualSnapshotRetentionPeriod**

The number of days that automated snapshots are retained in the destination region after they are copied from a source region. If the value is -1, the manual snapshot is retained indefinitely.

The value must be either -1 or an integer between 1 and 3,653.

Type: Integer

Required: No

**RetentionPeriod**

The number of days that automated snapshots are retained in the destination region after they are copied from a source region.

Type: Long

Required: No

**SnapshotCopyGrantName**

The name of the snapshot copy grant.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
ClusterSubnetGroup

Describes a subnet group.

Contents

Note
In the following list, the required parameters are described first.

ClusterSubnetGroupName
The name of the cluster subnet group.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Description
The description of the cluster subnet group.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SubnetGroupStatus
The status of the cluster subnet group. Possible values are Complete, Incomplete and Invalid.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Subnets.Subnet.N
A list of the VPC Subnet elements.
Type: Array of Subnet objects
Required: No

SupportedClusterIpAddressTypes/item.N
The IP address types supported by this cluster subnet group. Possible values are ipv4 and dualstack.
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

Tags.Tag.N
The list of tags for the cluster subnet group.
Type: Array of Tag objects
Required: No

VpcId

The VPC ID of the cluster subnet group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ClusterVersion

Describes a cluster version, including the parameter group family and description of the version.

Contents

Note
In the following list, the required parameters are described first.

ClusterParameterGroupFamily
The name of the cluster parameter group family for the cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ClusterVersion
The version number used by the cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Description
The description of the cluster version.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DataShare

Contents

Note
In the following list, the required parameters are described first.

AllowPubliclyAccessibleConsumers
A value that specifies whether the datashare can be shared to a publicly accessible cluster.
Type: Boolean
Required: No

DataShareArn
An Amazon Resource Name (ARN) that references the datashare that is owned by a specific namespace of the producer cluster. A datashare ARN is in the arn:aws:redshift:{region}:{account-id}:{datashare}:{namespace-guid}/{datashare-name} format.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

DataShareAssociations.member.N
A value that specifies when the datashare has an association between producer and data consumers.
Type: Array of DataShareAssociation (p. 460) objects
Required: No

ManagedBy
The identifier of a datashare to show its managing entity.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ProducerArn
The Amazon Resource Name (ARN) of the producer.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
Amazon Redshift API Reference
See Also

- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DataShareAssociation

The association of a datashare from a producer account with a data consumer.

Contents

Note
In the following list, the required parameters are described first.

ConsumerIdentifier
The name of the consumer accounts that have an association with a producer datashare.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ConsumerRegion
The AWS Region of the consumer accounts that have an association with a producer datashare.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

CreatedDate
The creation date of the datashare that is associated.
Type: Timestamp
Required: No

Status
The status of the datashare that is associated.
Type: String
Valid Values: ACTIVE | PENDING_AUTHORIZATION | AUTHORIZED | DEAUTHORIZED | REJECTED | AVAILABLE
Required: No

StatusChangeDate
The status change data of the datashare that is associated.
Type: Timestamp
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
See Also

- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DataTransferProgress

Describes the status of a cluster while it is in the process of resizing with an incremental resize.

Contents

**Note**

In the following list, the required parameters are described first.

**CurrentRateInMegaBytesPerSecond**

Describes the data transfer rate in MB's per second.

Type: Double

Required: No

**DataTransferredInMegaBytes**

Describes the total amount of data that has been transferred in MB's.

Type: Long

Required: No

**ElapsedTimeInSeconds**

Describes the number of seconds that have elapsed during the data transfer.

Type: Long

Required: No

**EstimatedTimeToCompletionInSeconds**

Describes the estimated number of seconds remaining to complete the transfer.

Type: Long

Required: No

**Status**

Describes the status of the cluster. While the transfer is in progress the status is **transferringdata**.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TotalDataInMegaBytes**

Describes the total amount of data to be transferred in megabytes.

Type: Long

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:
See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DefaultClusterParameters

Describes the default cluster parameters for a parameter group family.

Contents

Note
In the following list, the required parameters are described first.

Marker
A value that indicates the starting point for the next set of response records in a subsequent request.
If a value is returned in a response, you can retrieve the next set of records by providing this returned
marker value in the Marker parameter and retrying the command. If the Marker field is empty, all
response records have been retrieved for the request.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ParameterGroupFamily
The name of the cluster parameter group family to which the engine default parameters apply.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Parameters.Parameter.N
The list of cluster default parameters.

Type: Array of Parameter (p. 496) objects
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeferredMaintenanceWindow

Describes a deferred maintenance window

Contents

Note
In the following list, the required parameters are described first.

DeferredMaintenanceEndTime

A timestamp for the end of the time period when we defer maintenance.

Type: Timestamp

Required: No

DeferredMaintenanceIdentifier

A unique identifier for the maintenance window.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

DeferredMaintenanceStartTime

A timestamp for the beginning of the time period when we defer maintenance.

Type: Timestamp

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
DeleteClusterSnapshotMessage

Contents

Note
In the following list, the required parameters are described first.

SnapshotIdentifier

The unique identifier of the manual snapshot to be deleted.

Constraints: Must be the name of an existing snapshot that is in the available, failed, or cancelled state.

Type: String
Length Constraints: Maximum length of 2147483647.

Required: Yes

SnapshotClusterIdentifier

The unique identifier of the cluster the snapshot was created from. This parameter is required if your IAM user has a policy containing a snapshot resource element that specifies anything other than * for the cluster name.

Constraints: Must be the name of valid cluster.

Type: String
Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**EC2SecurityGroup**

Describes an Amazon EC2 security group.

## Contents

**Note**
In the following list, the required parameters are described first.

- **EC2SecurityGroupName**
  - The name of the EC2 Security Group.
  - Type: String
  - Length Constraints: Maximum length of 2147483647.
  - Required: No

- **EC2SecurityGroupOwnerId**
  - The AWS account ID of the owner of the EC2 security group specified in the EC2SecurityGroupName field.
  - Type: String
  - Length Constraints: Maximum length of 2147483647.
  - Required: No

- **Status**
  - The status of the EC2 security group.
  - Type: String
  - Length Constraints: Maximum length of 2147483647.
  - Required: No

- **Tags.Tag.N**
  - The list of tags for the EC2 security group.
  - Type: Array of [Tag](#) objects
  - Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
ElasticIpStatus

Describes the status of the elastic IP (EIP) address.

Contents

**Note**

In the following list, the required parameters are described first.

**ElasticIp**

The elastic IP (EIP) address for the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Status**

The status of the elastic IP (EIP) address.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Endpoint

Describes a connection endpoint.

Contents

**Note**
In the following list, the required parameters are described first.

**Address**

The DNS address of the Cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Port**

The port that the database engine is listening on.

Type: Integer

Required: No

**VpcEndpoints.VpcEndpoint.N**

Describes a connection endpoint.

Type: Array of [VpcEndpoint](p. 548) objects

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
EndpointAccess

Describes a Redshift-managed VPC endpoint.

Contents

Note

In the following list, the required parameters are described first.

Address

The DNS address of the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ClusterIdentifier

The cluster identifier of the cluster associated with the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

EndpointCreateTime

The time (UTC) that the endpoint was created.

Type: Timestamp

Required: No

EndpointName

The name of the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

EndpointStatus

The status of the endpoint.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Port

The port number on which the cluster accepts incoming connections.

Type: Integer

Required: No
ResourceOwner

The AWS account ID of the owner of the cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SubnetGroupName

The subnet group name where Amazon Redshift chooses to deploy the endpoint.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

VpcEndpoint

The connection endpoint for connecting to an Amazon Redshift cluster through the proxy.
Type: VpcEndpoint (p. 548) object
Required: No

The security groups associated with the endpoint.
Type: Array of VpcSecurityGroupMembership (p. 549) objects
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
EndpointAuthorization

Describes an endpoint authorization for authorizing Redshift-managed VPC endpoint access to a cluster across AWS accounts.

Contents

Note
In the following list, the required parameters are described first.

AllowedAllVPCs
 Indicates whether all VPCs in the grantee account are allowed access to the cluster.
 Type: Boolean
 Required: No

AllowedVPCs.VpcIdentifier.N
 The VPCs allowed access to the cluster.
 Type: Array of strings
 Length Constraints: Maximum length of 2147483647.
 Required: No

AuthorizeTime
 The time (UTC) when the authorization was created.
 Type: Timestamp
 Required: No

ClusterIdentifier
 The cluster identifier.
 Type: String
 Length Constraints: Maximum length of 2147483647.
 Required: No

ClusterStatus
 The status of the cluster.
 Type: String
 Length Constraints: Maximum length of 2147483647.
 Required: No

EndpointCount
 The number of Redshift-managed VPC endpoints created for the authorization.
 Type: Integer
 Required: No
Grantee

The AWS account ID of the grantee of the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Grantor

The AWS account ID of the cluster owner.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Status

The status of the authorization action.

Type: String

Valid Values: Authorized | Revoking

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Event

Describes an event.

Contents

Note
In the following list, the required parameters are described first.

Date
The date and time of the event.
Type: Timestamp
Required: No

EventCategories.EventCategory.N
A list of the event categories.
Values: Configuration, Management, Monitoring, Security, Pending
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

EventId
The identifier of the event.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Message
The text of this event.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Severity
The severity of the event.
Values: ERROR, INFO
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SourceIdentifier
The identifier for the source of the event.
Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SourceType**

The source type for this event.

Type: String

Valid Values: `cluster` | `cluster-parameter-group` | `cluster-security-group` | `cluster-snapshot` | `scheduled-action`

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
EventCategoriesMap

Describes event categories.

Contents

**Note**
In the following list, the required parameters are described first.

**Events.EventInfoMap.N**

The events in the event category.

Type: Array of EventInfoMap (p. 477) objects

Required: No

**SourceType**

The source type, such as cluster or cluster-snapshot, that the returned categories belong to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
EventInfoMap

Describes event information.

Contents

Note
In the following list, the required parameters are described first.

EventCategories.EventCategory.N
The category of an Amazon Redshift event.
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

EventDescription
The description of an Amazon Redshift event.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

EventId
The identifier of an Amazon Redshift event.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Severity
The severity of the event.
Values: ERROR, INFO
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
EventSubscription

Describes event subscriptions.

Contents

Note
In the following list, the required parameters are described first.

CustomerAwsId
The AWS account associated with the Amazon Redshift event notification subscription.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

CustSubscriptionId
The name of the Amazon Redshift event notification subscription.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Enabled
A boolean value indicating whether the subscription is enabled; true indicates that the subscription is enabled.
Type: Boolean
Required: No

EventCategoriesList.EventCategory.N
The list of Amazon Redshift event categories specified in the event notification subscription.
Values: Configuration, Management, Monitoring, Security, Pending
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

Severity
The event severity specified in the Amazon Redshift event notification subscription.
Values: ERROR, INFO
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No
SnsTopicArn

The Amazon Resource Name (ARN) of the Amazon SNS topic used by the event notification subscription.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SourceIdsList.SOURCEId.N

A list of the sources that publish events to the Amazon Redshift event notification subscription.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

SourceType

The source type of the events returned by the Amazon Redshift event notification, such as cluster, cluster-snapshot, cluster-parameter-group, cluster-security-group, or scheduled-action.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Status

The status of the Amazon Redshift event notification subscription.

Constraints:
- Can be one of the following: active | no-permission | topic-not-exist
- The status "no-permission" indicates that Amazon Redshift no longer has permission to post to the Amazon SNS topic. The status "topic-not-exist" indicates that the topic was deleted after the subscription was created.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SubscriptionCreationTime

The date and time the Amazon Redshift event notification subscription was created.

Type: Timestamp

Required: No

Tags.Tag.N

The list of tags for the event subscription.

Type: Array of Tag (p. 542) objects

Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
HsmClientCertificate

Returns information about an HSM client certificate. The certificate is stored in a secure Hardware Storage Module (HSM), and used by the Amazon Redshift cluster to encrypt data files.

Contents

Note
In the following list, the required parameters are described first.

HsmClientCertificateIdentifier
The identifier of the HSM client certificate.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

HsmClientCertificatePublicKey
The public key that the Amazon Redshift cluster will use to connect to the HSM. You must register the public key in the HSM.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Tags.Tag.N
The list of tags for the HSM client certificate.
Type: Array of Tag (p. 542) objects
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
HsmConfiguration

Returns information about an HSM configuration, which is an object that describes to Amazon Redshift clusters the information they require to connect to an HSM where they can store database encryption keys.

Contents

Note
In the following list, the required parameters are described first.

Description
A text description of the HSM configuration.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

HsmConfigurationIdentifier
The name of the Amazon Redshift HSM configuration.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

HsmIpAddress
The IP address that the Amazon Redshift cluster must use to access the HSM.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

HsmPartitionName
The name of the partition in the HSM where the Amazon Redshift clusters will store their database encryption keys.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Tags.Tag.N
The list of tags for the HSM configuration.
Type: Array of Tag objects
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:
See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
HsmStatus

Describes the status of changes to HSM settings.

Contents

Note
In the following list, the required parameters are described first.

HsmClientCertificateIdentifier

Specifies the name of the HSM client certificate the Amazon Redshift cluster uses to retrieve the data encryption keys stored in an HSM.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

HsmConfigurationIdentifier

Specifies the name of the HSM configuration that contains the information the Amazon Redshift cluster can use to retrieve and store keys in an HSM.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Status

Reports whether the Amazon Redshift cluster has finished applying any HSM settings changes specified in a modify cluster command.

Values: active, applying

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
InboundIntegration

The content of an inbound integration.

Contents

Note
In the following list, the required parameters are described first.

CreateTime

The creation time of an inbound integration.

Type: Timestamp

Required: No

Errors.IntegrationError.N

The outstanding errors of an inbound integration. Each item is an "IntegrationError". This is null if there is no error.

Type: Array of IntegrationError (p. 488) objects

Required: No

IntegrationArn

The Amazon Resource Name (ARN) of an inbound integration.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SourceArn

The Amazon Resource Name (ARN) of the source of an inbound integration.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Status

The status of an inbound integration.

Type: String

Valid Values: creating | active | modifying | failed | deleting | syncing | needs_attention

Required: No

TargetArn

The Amazon Resource Name (ARN) of the target of an inbound integration.

Type: String

Length Constraints: Maximum length of 2147483647.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
IntegrationError

The error of an inbound integration.

Contents

Note
In the following list, the required parameters are described first.

ErrorCode
The error code of an inbound integration error.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

ErrorMessage
The error message of an inbound integration error.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
IPRange

Describes an IP range used in a security group.

Contents

Note
In the following list, the required parameters are described first.

CIDRIP
The IP range in Classless Inter-Domain Routing (CIDR) notation.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Status
The status of the IP range, for example, "authorized".
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Tags.Tag.N
The list of tags for the IP range.
Type: Array of Tag objects
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java V2
• AWS SDK for Ruby V3
MaintenanceTrack

Defines a maintenance track that determines which Amazon Redshift version to apply during a maintenance window. If the value for MaintenanceTrack is current, the cluster is updated to the most recently certified maintenance release. If the value is trailing, the cluster is updated to the previously certified maintenance release.

Contents

Note

In the following list, the required parameters are described first.

DatabaseVersion

The version number for the cluster release.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

MaintenanceTrackName

The name of the maintenance track. Possible values are current and trailing.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

UpdateTargets.UpdateTarget.N

An array of UpdateTarget (p. 545) objects to update with the maintenance track.

Type: Array of UpdateTarget (p. 545) objects

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NetworkInterface

Describes a network interface.

Contents

Note
In the following list, the required parameters are described first.

AvailabilityZone

The Availability Zone.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Ipv6Address

The IPv6 address of the network interface within the subnet.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

NetworkInterfaceId

The network interface identifier.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

PrivateIpAddress

The IPv4 address of the network interface within the subnet.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SubnetId

The subnet identifier.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:
See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NodeConfigurationOption

A list of node configurations.

Contents

Note
In the following list, the required parameters are described first.

EstimatedDiskUtilizationPercent

The estimated disk utilization percentage.

Type: Double

Required: No

Mode

The category of the node configuration recommendation.

Type: String

Valid Values: standard | high-performance

Required: No

NodeType

The node type, such as, "ds2.8xlarge".

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

NumberOfNodes

The number of nodes.

Type: Integer

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
NodeConfigurationOptionsFilter

A set of elements to filter the returned node configurations.

Contents

Note
In the following list, the required parameters are described first.

Name

The name of the element to filter.

Type: String

Valid Values: NodeType | NumberOfNodes | EstimatedDiskUtilizationPercent | Mode

Required: No

Operator

The filter operator. If filter Name is NodeType only the 'in' operator is supported. Provide one value to evaluate for 'eq', 'lt', 'le', 'gt', and 'ge'. Provide two values to evaluate for 'between'. Provide a list of values for 'in'.

Type: String

Valid Values: eq | lt | gt | le | ge | in | between

Required: No

Value.item.N

List of values. Compare Name using Operator to Values. If filter Name is NumberOfNodes, then values can range from 0 to 200. If filter Name is EstimatedDiskUtilizationPercent, then values can range from 0 to 100. For example, filter NumberOfNodes (name) GT (operator) 3 (values).

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
OrderableClusterOption

Describes an orderable cluster option.

Contents

Note
In the following list, the required parameters are described first.

AvailabilityZones.AvailabilityZone.N
A list of availability zones for the orderable cluster.
Type: Array of AvailabilityZone (p. 430) objects
Required: No

ClusterType
The cluster type, for example multi-node.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ClusterVersion
The version of the orderable cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

NodeType
The node type for the orderable cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Parameter

Describes a parameter in a cluster parameter group.

Contents

Note

In the following list, the required parameters are described first.

AllowedValues

The valid range of values for the parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ApplyType

Specifies how to apply the WLM configuration parameter. Some properties can be applied dynamically, while other properties require that any associated clusters be rebooted for the configuration changes to be applied. For more information about parameters and parameter groups, go to Amazon Redshift Parameter Groups in the Amazon Redshift Cluster Management Guide.

Type: String

Valid Values: static | dynamic

Required: No

DataType

The data type of the parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Description

A description of the parameter.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

IsModifiable

If true, the parameter can be modified. Some parameters have security or operational implications that prevent them from being changed.

Type: Boolean

Required: No

MinimumEngineVersion

The earliest engine version to which the parameter can apply.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**ParameterName**

The name of the parameter.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**ParameterValue**

The value of the parameter. If ParameterName is wlm_json_configuration, then the maximum size of ParameterValue is 8000 characters.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**Source**

The source of the parameter value, such as "engine-default" or "user".
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

---

---
PartnerIntegrationInfo

Describes a partner integration.

Contents

Note
In the following list, the required parameters are described first.

CreatedAt
The date (UTC) that the partner integration was created.
Type: Timestamp
Required: No

DatabaseName
The name of the database that receives data from a partner.
Type: String
Length Constraints: Maximum length of 127.
Pattern: ^[\p{L}_\()[\p{L}\p{N}@#$_]+$
Required: No

PartnerName
The name of the partner.
Type: String
Length Constraints: Maximum length of 255.
Pattern: ^[a-zA-Z0-9-_]+$
Required: No

Status
The partner integration status.
Type: String
Valid Values: Active | Inactive | RuntimeFailure | ConnectionFailure
Required: No

StatusMessage
The status message provided by the partner.
Type: String
Length Constraints: Maximum length of 262144.
Pattern: ^[^x20~\x7E]+$
Required: No
UpdatedAt

The date (UTC) that the partner integration status was last updated by the partner.

Type: Timestamp

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PauseClusterMessage

Describes a pause cluster operation. For example, a scheduled action to run the PauseCluster API operation.

Contents

Note
In the following list, the required parameters are described first.

ClusterIdentifier
The identifier of the cluster to be paused.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
PendingModifiedValues

Describes cluster attributes that are in a pending state. A change to one or more the attributes was requested and is in progress or will be applied.

Contents

Note
In the following list, the required parameters are described first.

AutomatedSnapshotRetentionPeriod

The pending or in-progress change of the automated snapshot retention period.

Type: Integer

Required: No

ClusterIdentifier

The pending or in-progress change of the new identifier for the cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ClusterType

The pending or in-progress change of the cluster type.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ClusterVersion

The pending or in-progress change of the service version.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

EncryptionType

The encryption type for a cluster. Possible values are: KMS and None.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

EnhancedVpcRouting

An option that specifies whether to create the cluster with enhanced VPC routing enabled. To create a cluster that uses enhanced VPC routing, the cluster must be in a VPC. For more information, see Enhanced VPC Routing in the Amazon Redshift Cluster Management Guide.
If this option is `true`, enhanced VPC routing is enabled.

Default: false
Type: Boolean
Required: No

**MaintenanceTrackName**

The name of the maintenance track that the cluster will change to during the next maintenance window.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**MasterUserPassword**

The pending or in-progress change of the admin user password for the cluster.

Type: String
Required: No

**NodeType**

The pending or in-progress change of the cluster's node type.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**NumberOfNodes**

The pending or in-progress change of the number of nodes in the cluster.

Type: Integer
Required: No

**PubliclyAccessible**

The pending or in-progress change of the ability to connect to the cluster from the public network.

Type: Boolean
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RecurringCharge

Describes a recurring charge.

Contents

Note
In the following list, the required parameters are described first.

RecurringChargeAmount
The amount charged per the period of time specified by the recurring charge frequency.

Type: Double
Required: No

RecurringChargeFrequency
The frequency at which the recurring charge amount is applied.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReservedNode

Describes a reserved node. You can call the DescribeReservedNodeOfferings (p. 238) API to obtain the available reserved node offerings.

Contents

**Note**
In the following list, the required parameters are described first.

**CurrencyCode**

The currency code for the reserved cluster.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Duration**

The duration of the node reservation in seconds.

Type: Integer

Required: No

**FixedPrice**

The fixed cost Amazon Redshift charges you for this reserved node.

Type: Double

Required: No

**NodeCount**

The number of reserved compute nodes.

Type: Integer

Required: No

**NodeType**

The node type of the reserved node.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**OfferingType**

The anticipated utilization of the reserved node, as defined in the reserved node offering.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
**RecurringCharges.RecurringCharge.N**

The recurring charges for the reserved node.

Type: Array of [RecurringCharge](p. 503) objects

Required: No

**ReservedNodeId**

The unique identifier for the reservation.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ReservedNodeOfferingId**

The identifier for the reserved node offering.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ReservedNodeOfferingType**

Type: String

Valid Values: Regular | Upgradable

Required: No

**StartTime**

The time the reservation started. You purchase a reserved node offering for a duration. This is the start time of that duration.

Type: Timestamp

Required: No

**State**

The state of the reserved compute node.

Possible Values:
- pending-payment-This reserved node has recently been purchased, and the sale has been approved, but payment has not yet been confirmed.
- active-This reserved node is owned by the caller and is available for use.
- payment-failed-Payment failed for the purchase attempt.
- retired-The reserved node is no longer available.
- exchanging-The owner is exchanging the reserved node for another reserved node.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
UsagePrice

The hourly rate Amazon Redshift charges you for this reserved node.

Type: Double

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
ReservedNodeConfigurationOption

Details for a reserved-node exchange. Examples include the node type for a reserved node, the price for a node, the node's state, and other details.

Contents

**Note**

In the following list, the required parameters are described first.

**SourceReservedNode**

Describes a reserved node. You can call the `DescribeReservedNodeOfferings (p. 238)` API to obtain the available reserved node offerings.

Type: `ReservedNode (p. 504)` object

Required: No

**TargetReservedNodeCount**

The target reserved-node count.

Type: Integer

Required: No

**TargetReservedNodeOffering**

Describes a reserved node offering.

Type: `ReservedNodeOffering (p. 510)` object

Required: No

See Also

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
ReservedNodeExchangeStatus

Reserved-node status details, such as the source reserved-node identifier, the target reserved-node identifier, the node type, the node count, and other details.

Contents

Note
In the following list, the required parameters are described first.

RequestTime
A date and time that indicate when the reserved-node exchange was requested.
Type: Timestamp
Required: No

ReservedNodeExchangeRequestId
The identifier of the reserved-node exchange request.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SourceReservedNodeCount
The source reserved-node count in the cluster.
Type: Integer
Required: No

SourceReservedNodeId
The identifier of the source reserved node.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SourceReservedNodeType
The source reserved-node type, for example ds2.xlarge.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Status
The status of the reserved-node exchange request. Statuses include in-progress and requested.
Type: String
Valid Values: REQUESTED | PENDING | IN_PROGRESS | RETRYING | SUCCEEDED | FAILED
Required: No

**TargetReservedNodeCount**

The count of target reserved nodes in the cluster.

Type: Integer

Required: No

**TargetReservedNodeOfferingId**

The identifier of the target reserved node offering.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TargetReservedNodeType**

The node type of the target reserved node, for example ra3.4xlarge.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ReservedNodeOffering

Describes a reserved node offering.

Contents

Note
In the following list, the required parameters are described first.

CurrencyCode
The currency code for the compute nodes offering.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Duration
The duration, in seconds, for which the offering will reserve the node.
Type: Integer
Required: No

FixedPrice
The upfront fixed charge you will pay to purchase the specific reserved node offering.
Type: Double
Required: No

NodeType
The node type offered by the reserved node offering.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

OfferingType
The anticipated utilization of the reserved node, as defined in the reserved node offering.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

RecurringCharges.RecurringCharge.N
The charge to your account regardless of whether you are creating any clusters using the node offering. Recurring charges are only in effect for heavy-utilization reserved nodes.
Type: Array of RecurringCharge (p. 503) objects
Required: No
ReservedNodeOfferingId

The offering identifier.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ReservedNodeOfferingType

Type: String

Valid Values: Regular | Upgradable

Required: No

UsagePrice

The rate you are charged for each hour the cluster that is using the offering is running.

Type: Double

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ResizeClusterMessage

Describes a resize cluster operation. For example, a scheduled action to run the ResizeCluster API operation.

Contents

Note
In the following list, the required parameters are described first.

ClusterIdentifier
The unique identifier for the cluster to resize.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: Yes

Classic
A boolean value indicating whether the resize operation is using the classic resize process. If you don't provide this parameter or set the value to false, the resize type is elastic.
Type: Boolean
Required: No

ClusterType
The new cluster type for the specified cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

NodeType
The new node type for the nodes you are adding. If not specified, the cluster's current node type is used.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

NumberOfNodes
The new number of nodes for the cluster. If not specified, the cluster's current number of nodes is used.
Type: Integer
Required: No

ReservedNodeId
The identifier of the reserved node.
Type: String
TargetReservedNodeOfferingId

The identifier of the target reserved node offering.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ResizeInfo

Describes a resize operation.

Contents

Note
In the following list, the required parameters are described first.

AllowCancelResize
A boolean value indicating if the resize operation can be cancelled.

Type: Boolean
Required: No

ResizeType
Returns the value ClassicResize.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
ResourcePolicy

The policy that is attached to a resource.

Contents

Note
In the following list, the required parameters are described first.

Policy
The content of a resource policy.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ResourceArn
The resources that a policy is attached to.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
**RestoreStatus**

Describes the status of a cluster restore action. Returns null if the cluster was not created by restoring a snapshot.

**Contents**

**Note**
In the following list, the required parameters are described first.

**CurrentRestoreRateInMegaBytesPerSecond**

The number of megabytes per second being transferred from the backup storage. Returns the average rate for a completed backup. This field is only updated when you restore to DC2 and DS2 node types.

Type: Double

Required: No

**ElapsedTimeInSeconds**

The amount of time an in-progress restore has been running, or the amount of time it took a completed restore to finish. This field is only updated when you restore to DC2 and DS2 node types.

Type: Long

Required: No

**EstimatedTimeToCompletionInSeconds**

The estimate of the time remaining before the restore will complete. Returns 0 for a completed restore. This field is only updated when you restore to DC2 and DS2 node types.

Type: Long

Required: No

**ProgressInMegaBytes**

The number of megabytes that have been transferred from snapshot storage. This field is only updated when you restore to DC2 and DS2 node types.

Type: Long

Required: No

**SnapshotSizeInMegaBytes**

The size of the set of snapshot data used to restore the cluster. This field is only updated when you restore to DC2 and DS2 node types.

Type: Long

Required: No

**Status**

The status of the restore action. Returns starting, restoring, completed, or failed.

Type: String

Length Constraints: Maximum length of 2147483647.
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ResumeClusterMessage

Describes a resume cluster operation. For example, a scheduled action to run the ResumeCluster API operation.

Contents

**Note**
In the following list, the required parameters are described first.

**ClusterIdentifier**

The identifier of the cluster to be resumed.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
RevisionTarget

Describes a RevisionTarget.

Contents

Note
In the following list, the required parameters are described first.

DatabaseRevision
A unique string that identifies the version to update the cluster to. You can use this value in ModifyClusterDbRevision (p. 321).

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

DatabaseRevisionReleaseDate
The date on which the database revision was released.

Type: Timestamp
Required: No

Description
A string that describes the changes and features that will be applied to the cluster when it is updated to the corresponding ClusterDbRevision (p. 443).

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ScheduledAction

Describes a scheduled action. You can use a scheduled action to trigger some Amazon Redshift API operations on a schedule. For information about which API operations can be scheduled, see ScheduledActionType (p. 523).

Contents

Note

In the following list, the required parameters are described first.

EndTime

The end time in UTC when the schedule is no longer active. After this time, the scheduled action does not trigger.

Type: Timestamp

Required: No

IamRole

The IAM role to assume to run the scheduled action. This IAM role must have permission to run the Amazon Redshift API operation in the scheduled action. This IAM role must allow the Amazon Redshift scheduler (Principal scheduler.redshift.amazonaws.com) to assume permissions on your behalf. For more information about the IAM role to use with the Amazon Redshift scheduler, see Using Identity-Based Policies for Amazon Redshift in the Amazon Redshift Cluster Management Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

NextInvocations.ScheduledActionTime.N

List of times when the scheduled action will run.

Type: Array of timestamps

Required: No

Schedule

The schedule for a one-time (at format) or recurring (cron format) scheduled action. Schedule invocations must be separated by at least one hour.

Format of at expressions is "at/yyyy-mm-ddThh:mm:ss). For example, "at(2016-03-04T17:27:00)".

Format of cron expressions is "cron(Mins Hrs Dayofmonth Month Dayofweek Year). For example, "cron(0 10 ? * MON *)". For more information, see Cron Expressions in the Amazon CloudWatch Events User Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
ScheduledActionDescription

The description of the scheduled action.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ScheduledActionName

The name of the scheduled action.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

StartTime

The start time in UTC when the schedule is active. Before this time, the scheduled action does not trigger.
Type: Timestamp
Required: No

State

The state of the scheduled action. For example, DISABLED.
Type: String
Valid Values: ACTIVE | DISABLED
Required: No

TargetAction

A JSON format string of the Amazon Redshift API operation with input parameters.
"{"ResizeCluster":{"NodeType":"ds2.8xlarge","ClusterIdentifier":"my-test-cluster","NumberOfNodes":3}}".
Type: ScheduledActionType (p. 523) object
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
ScheduledActionFilter

A set of elements to filter the returned scheduled actions.

Contents

**Note**
In the following list, the required parameters are described first.

**Name**

The type of element to filter.

Type: String

Valid Values: `cluster-identifier` | `iam-role`

Required: Yes

**Values.item.N**

List of values. Compare if the value (of type defined by Name) equals an item in the list of scheduled actions.

Type: Array of strings

Length Constraints: Maximum length of 2147483647.

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](https://docs.aws.amazon.com/redshift/latest/designsdk/api.html)
- [AWS SDK for Go](https://docs.aws.amazon.com/redshift/latest/designsdk/api.html)

- [AWS SDK for Ruby V3](https://docs.aws.amazon.com/redshift/latest/designsdk/api.html)
ScheduledActionType

The action type that specifies an Amazon Redshift API operation that is supported by the Amazon Redshift scheduler.

Contents

Note
In the following list, the required parameters are described first.

PauseCluster

An action that runs a PauseCluster API operation.

Type: PauseClusterMessage (p. 500) object

Required: No

ResizeCluster

An action that runs a ResizeCluster API operation.

Type: ResizeClusterMessage (p. 512) object

Required: No

ResumeCluster

An action that runs a ResumeCluster API operation.

Type: ResumeClusterMessage (p. 518) object

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SecondaryClusterInfo

The AvailabilityZone and ClusterNodes information of the secondary compute unit.

Contents

**Note**
In the following list, the required parameters are described first.

**AvailabilityZone**

The name of the Availability Zone in which the secondary compute unit of the cluster is located.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ClusterNodes.member.N**

The nodes in the secondary compute unit.

Type: Array of [ClusterNode](#) objects

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Snapshot

Describes a snapshot.

Contents

Note
In the following list, the required parameters are described first.

A list of the AWS accounts authorized to restore the snapshot. Returns null if no accounts are authorized. Visible only to the snapshot owner.

Type: Array of AccountWithRestoreAccess (p. 425) objects

Required: No

ActualIncrementalBackupSizeInMegaBytes
The size of the incremental backup.

Type: Double

Required: No

AvailabilityZone
The Availability Zone in which the cluster was created.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

BackupProgressInMegaBytes
The number of megabytes that have been transferred to the snapshot backup.

Type: Double

Required: No

ClusterCreateTime
The time (UTC) when the cluster was originally created.

Type: Timestamp

Required: No

ClusterIdentifier
The identifier of the cluster for which the snapshot was taken.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ClusterVersion
The version ID of the Amazon Redshift engine that is running on the cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**CurrentBackupRateInMegabytesPerSecond**

The number of megabytes per second being transferred to the snapshot backup. Returns 0 for a completed backup.

Type: Double
Required: No

**DBName**

The name of the database that was created when the cluster was created.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**ElapsedTimeInSeconds**

The amount of time an in-progress snapshot backup has been running, or the amount of time it took a completed backup to finish.

Type: Long
Required: No

**Encrypted**

If true, the data in the snapshot is encrypted at rest.

Type: Boolean
Required: No

**EncryptedWithHSM**

A boolean that indicates whether the snapshot data is encrypted using the HSM keys of the source cluster. true indicates that the data is encrypted using HSM keys.

Type: Boolean
Required: No

**EngineFullVersion**

The cluster version of the cluster used to create the snapshot. For example, 1.0.15503.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**EnhancedVpcRouting**

An option that specifies whether to create the cluster with enhanced VPC routing enabled. To create a cluster that uses enhanced VPC routing, the cluster must be in a VPC. For more information, see [Enhanced VPC Routing](https://docs.aws.amazon.com/redshift/latest/guide/cluster-management.html#cluster-management-enhanced-vpc-routing) in the Amazon Redshift Cluster Management Guide.
If this option is true, enhanced VPC routing is enabled.

Default: false

Type: Boolean

Required: No

**EstimatedSecondsToCompletion**

The estimate of the time remaining before the snapshot backup will complete. Returns 0 for a completed backup.

Type: Long

Required: No

**KmsKeyId**

The AWS Key Management Service (KMS) key ID of the encryption key that was used to encrypt data in the cluster from which the snapshot was taken.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**MaintenanceTrackName**

The name of the maintenance track for the snapshot.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ManualSnapshotRemainingDays**

The number of days until a manual snapshot will pass its retention period.

Type: Integer

Required: No

**ManualSnapshotRetentionPeriod**

The number of days that a manual snapshot is retained. If the value is -1, the manual snapshot is retained indefinitely.

The value must be either -1 or an integer between 1 and 3,653.

Type: Integer

Required: No

**MasterPasswordSecretArn**

The Amazon Resource Name (ARN) for the cluster's admin user credentials secret.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No
MasterPasswordSecretKmsKeyId

The ID of the AWS Key Management Service (KMS) key used to encrypt and store the cluster's admin credentials secret.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

MasterUsername

The admin user name for the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

NodeType

The node type of the nodes in the cluster.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

NumberOfNodes

The number of nodes in the cluster.

Type: Integer
Required: No

OwnerAccount

For manual snapshots, the AWS account used to create or copy the snapshot. For automatic snapshots, the owner of the cluster. The owner can perform all snapshot actions, such as sharing a manual snapshot.

Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

Port

The port that the cluster is listening on.

Type: Integer
Required: No

RestorableNodeTypes.NodeType.N

The list of node types that this cluster snapshot is able to restore into.

Type: Array of strings
Length Constraints: Maximum length of 2147483647.
**SnapshotCreateTime**

The time (in UTC format) when Amazon Redshift began the snapshot. A snapshot contains a copy of the cluster data as of this exact time.

Type: Timestamp

Required: No

**SnapshotIdentifier**

The snapshot identifier that is provided in the request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SnapshotRetentionStartTime**

A timestamp representing the start of the retention period for the snapshot.

Type: Timestamp

Required: No

**SnapshotType**

The snapshot type. Snapshots created using `CreateClusterSnapshot` and `CopyClusterSnapshot` are of type "manual".

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SourceRegion**

The source region from which the snapshot was copied.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Status**

The snapshot status. The value of the status depends on the API operation used:
- `CreateClusterSnapshot` and `CopyClusterSnapshot` returns status as "creating".
- `DescribeClusterSnapshots` returns status as "creating", "available", "final snapshot", or "failed".
- `DeleteClusterSnapshot` returns status as "deleted".

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Tags.Tag.N**

The list of tags for the cluster snapshot.
Type: Array of Tag (p. 542) objects
Required: No

**TotalBackupSizeInMegaBytes**

The size of the complete set of backup data that would be used to restore the cluster.
Type: Double
Required: No

**VpcId**

The VPC identifier of the cluster if the snapshot is from a cluster in a VPC. Otherwise, this field is not in the output.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SnapshotCopyGrant

The snapshot copy grant that grants Amazon Redshift permission to encrypt copied snapshots with the specified encrypted symmetric key from AWS KMS in the destination region.

For more information about managing snapshot copy grants, go to Amazon Redshift Database Encryption in the Amazon Redshift Cluster Management Guide.

Contents

**Note**

In the following list, the required parameters are described first.

**KmsKeyId**

The unique identifier of the encrypted symmetric key in AWS KMS to which Amazon Redshift is granted permission.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**SnapshotCopyGrantName**

The name of the snapshot copy grant.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Tags.Tag.N**

A list of tag instances.

Type: Array of Tag objects

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SnapshotErrorMessage

Describes the errors returned by a snapshot.

Contents

Note
In the following list, the required parameters are described first.

FailureCode
The failure code for the error.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

FailureReason
The text message describing the error.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SnapshotClusterIdentifier
A unique identifier for the cluster.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SnapshotIdentifier
A unique identifier for the snapshot returning the error.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SnapshotSchedule

Describes a snapshot schedule. You can set a regular interval for creating snapshots of a cluster. You can also schedule snapshots for specific dates.

Contents

Note
In the following list, the required parameters are described first.

AssociatedClusterCount
The number of clusters associated with the schedule.
Type: Integer
Required: No

AssociatedClusters.ClusterAssociatedToSchedule.N
A list of clusters associated with the schedule. A maximum of 100 clusters is returned.
Type: Array of ClusterAssociatedToSchedule (p. 442) objects
Required: No

NextInvocations.SnapshotTime.N
Type: Array of timestamps
Required: No

ScheduleDefinitions.ScheduleDefinition.N
A list of ScheduleDefinitions.
Type: Array of strings
Length Constraints: Maximum length of 2147483647.
Required: No

ScheduleDescription
The description of the schedule.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

ScheduleIdentifier
A unique identifier for the schedule.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No
Tags.Tag.N

An optional set of tags describing the schedule.

Type: Array of Tag (p. 542) objects

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SnapshotSortingEntity

Describes a sorting entity

Contents

Note
In the following list, the required parameters are described first.

Attribute
The category for sorting the snapshots.
Type: String
Valid Values: SOURCE_TYPE | TOTAL_SIZE | CREATE_TIME
Required: Yes

SortOrder
The order for listing the attributes.
Type: String
Valid Values: ASC | DESC
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
Subnet

Describes a subnet.

Contents

Note
In the following list, the required parameters are described first.

SubnetAvailabilityZone

Type: AvailabilityZone (p. 430) object

Required: No

SubnetIdentifier

The identifier of the subnet.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SubnetStatus

The status of the subnet.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
SupportedOperation

Describes the operations that are allowed on a maintenance track.

Contents

**Note**
In the following list, the required parameters are described first.

**OperationName**
A list of the supported operations.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- [AWS SDK for C++](#)
- [AWS SDK for Go](#)
- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
SupportedPlatform

A list of supported platforms for orderable clusters.

Contents

Note

In the following list, the required parameters are described first.

Name

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
TableRestoreStatus

Describes the status of a `RestoreTableFromClusterSnapshot` operation.

**Contents**

**Note**

In the following list, the required parameters are described first.

**ClusterIdentifier**

The identifier of the Amazon Redshift cluster that the table is being restored to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Message**

A description of the status of the table restore request. Status values include SUCCEEDED, FAILED, CANCELED, PENDING, IN_PROGRESS.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**NewTableName**

The name of the table to create as a result of the table restore request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**ProgressInMegaBytes**

The amount of data restored to the new table so far, in megabytes (MB).

Type: Long

Required: No

**RequestTime**

The time that the table restore request was made, in Universal Coordinated Time (UTC).

Type: Timestamp

Required: No

**SnapshotIdentifier**

The identifier of the snapshot that the table is being restored from.

Type: String

Length Constraints: Maximum length of 2147483647.
SourceDatabaseName

The name of the source database that contains the table being restored.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SourceSchemaName

The name of the source schema that contains the table being restored.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

SourceTableName

The name of the source table being restored.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Status

A value that describes the current state of the table restore request.

Valid Values: SUCCEEDED, FAILED, CANCELED, PENDING, IN_PROGRESS

Type: String

Valid Values: PENDING | IN_PROGRESS | SUCCEEDED | FAILED | CANCELED

Required: No

TableRestoreRequestId

The unique identifier for the table restore request.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

TargetDatabaseName

The name of the database to restore the table to.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

TargetSchemaName

The name of the schema to restore the table to.
Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**TotalDataInMegaBytes**

The total amount of data to restore to the new table, in megabytes (MB).

Type: Long

Required: No

---

**See Also**

- [AWS SDK for Ruby V3](#)
Tag

A tag consisting of a name/value pair for a resource.

Contents

**Note**
In the following list, the required parameters are described first.

**Key**

The key, or name, for the resource tag.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**Value**

The value for the resource tag.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

See Also

- [AWS SDK for Java V2](#)
- [AWS SDK for Ruby V3](#)
TaggedResource

A tag and its associated resource.

Contents

Note
In the following list, the required parameters are described first.

ResourceName

The Amazon Resource Name (ARN) with which the tag is associated, for example: arn:aws:redshift:us-east-2:123456789:cluster:t1.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

ResourceType

The type of resource with which the tag is associated. Valid resource types are:

• Cluster
• CIDR/IP
• EC2 security group
• Snapshot
• Cluster security group
• Subnet group
• HSM connection
• HSM certificate
• Parameter group

For more information about Amazon Redshift resource types and constructing ARNs, go to Constructing an Amazon Redshift Amazon Resource Name (ARN) in the Amazon Redshift Cluster Management Guide.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

Tag

The tag for the resource.

Type: Tag (p. 542) object

Required: No

See Also

• AWS SDK for C++
See Also

- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
UpdateTarget

A maintenance track that you can switch the current track to.

Contents

Note
In the following list, the required parameters are described first.

DatabaseVersion
The cluster version for the new maintenance track.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

MaintenanceTrackName
The name of the new maintenance track.
Type: String
Length Constraints: Maximum length of 2147483647.
Required: No

SupportedOperations.SupportedOperation.N
A list of operations supported by the maintenance track.
Type: Array of SupportedOperation (p. 537) objects
Required: No

See Also

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java V2
- AWS SDK for Ruby V3
UsageLimit

Describes a usage limit object for a cluster.

Contents

**Note**
In the following list, the required parameters are described first.

**Amount**

The limit amount. If time-based, this amount is in minutes. If data-based, this amount is in terabytes (TB).

Type: Long

Required: No

**BreachAction**

The action that Amazon Redshift takes when the limit is reached. Possible values are:

- **log** - To log an event in a system table. The default is log.
- **emit-metric** - To emit CloudWatch metrics.
- **disable** - To disable the feature until the next usage period begins.

Type: String

Valid Values: log | emit-metric | disable

Required: No

**ClusterIdentifier**

The identifier of the cluster with a usage limit.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**FeatureType**

The Amazon Redshift feature to which the limit applies.

Type: String

Valid Values: spectrum | concurrency-scaling | cross-region-datasharing

Required: No

**LimitType**

The type of limit. Depending on the feature type, this can be based on a time duration or data size.

Type: String

Valid Values: time | data-scanned

Required: No
Period

The time period that the amount applies to. A weekly period begins on Sunday. The default is monthly.

Type: String

Valid Values: daily | weekly | monthly

Required: No

Tags.Tag.N

A list of tag instances.

Type: Array of Tag (p. 542) objects

Required: No

UsageLimitId

The identifier of the usage limit.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

VpcEndpoint

The connection endpoint for connecting to an Amazon Redshift cluster through the proxy.

Contents

**Note**
In the following list, the required parameters are described first.

**NetworkInterfaces.NetworkInterface.N**

One or more network interfaces of the endpoint. Also known as an interface endpoint.

Type: Array of [NetworkInterface](p. 491) objects

Required: No

**VpcEndpointId**

The connection endpoint ID for connecting an Amazon Redshift cluster through the proxy.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**VpcId**

The VPC identifier that the endpoint is associated.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

API Version 2012-12-01
VpcSecurityGroupMembership

Describes the members of a VPC security group.

Contents

**Note**
In the following list, the required parameters are described first.

**Status**

The status of the VPC security group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

**VpcSecurityGroupId**

The identifier of the VPC security group.

Type: String

Length Constraints: Maximum length of 2147483647.

Required: No

API Version 2012-12-01

549
Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see Signing AWS API requests in the IAM User Guide.

**Action**

The action to be performed.

Type: string

Required: Yes

**Version**

The API version that the request is written for, expressed in the format YYYY-MM-DD.

Type: string

Required: Yes

**X-Amz-Algorithm**

The hash algorithm that you used to create the request signature.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Valid Values: AWS4-HMAC-SHA256

Required: Conditional

**X-Amz-Credential**

The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string (“aws4_request”). The value is expressed in the following format: access_key/YYYYMMDD/region/service/aws4_request.

For more information, see Create a signed AWS API request in the IAM User Guide.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

**X-Amz-Date**

The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: 20120325T120000Z.

Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see Elements of an AWS API request signature in the IAM User Guide.
Type: string

Required: Conditional

**X-Amz-Security-Token**

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS STS, see [AWS services that work with IAM in the IAM User Guide](https://docs.aws.amazon.com/IAM/latest/userguide/services-that-use-iam-credentials.html).

Condition: If you're using temporary security credentials from AWS STS, you must include the security token.

Type: string

Required: Conditional

**X-Amz-Signature**

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

**X-Amz-SignedHeaders**

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see [Create a signed AWS API request](https://docs.aws.amazon.com/IAM/latest/userguide/create-signed-api-requests.html) in the IAM User Guide.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional
Common Errors

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

**AccessDeniedException**
- You do not have sufficient access to perform this action.
  - HTTP Status Code: 400

**IncompleteSignature**
- The request signature does not conform to AWS standards.
  - HTTP Status Code: 400

**InternalFailure**
- The request processing has failed because of an unknown error, exception or failure.
  - HTTP Status Code: 500

**InvalidAction**
- The action or operation requested is invalid. Verify that the action is typed correctly.
  - HTTP Status Code: 400

**InvalidClientTokenId**
- The X.509 certificate or AWS access key ID provided does not exist in our records.
  - HTTP Status Code: 403

**InvalidParameterCombination**
- Parameters that must not be used together were used together.
  - HTTP Status Code: 400

**InvalidParameterValue**
- An invalid or out-of-range value was supplied for the input parameter.
  - HTTP Status Code: 400

**InvalidQueryParameter**
- The AWS query string is malformed or does not adhere to AWS standards.
  - HTTP Status Code: 400

**MalformedQueryString**
- The query string contains a syntax error.
  - HTTP Status Code: 404

**MissingAction**
- The request is missing an action or a required parameter.
  - HTTP Status Code: 400
**MissingAuthenticationToken**

The request must contain either a valid (registered) AWS access key ID or X.509 certificate.

HTTP Status Code: 403

**MissingParameter**

A required parameter for the specified action is not supplied.

HTTP Status Code: 400

**NotAuthorized**

You do not have permission to perform this action.

HTTP Status Code: 400

**OptInRequired**

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

**RequestExpired**

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

**ServiceUnavailable**

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

**ThrottlingException**

The request was denied due to request throttling.

HTTP Status Code: 400

**ValidationException**

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
