**Docker Registry Paths and Example Code for Europe (Frankfurt) (eu-central-1)**

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

**Topics**
• AutoGluon (algorithm) (p. 2941)
• BlazingText (algorithm) (p. 2942)
• Chainer (DLC) (p. 2942)
• Clarify (algorithm) (p. 2943)
• Data Wrangler (algorithm) (p. 2943)
• Debugger (algorithm) (p. 2943)
• DeepAR Forecasting (algorithm) (p. 2944)
• Factorization Machines (algorithm) (p. 2944)
• Hugging Face (algorithm) (p. 2944)
• IP Insights (algorithm) (p. 2947)
• Image classification (algorithm) (p. 2948)
• Inferentia MXNet (DLC) (p. 2948)
• Inferentia PyTorch (DLC) (p. 2948)
• K-Means (algorithm) (p. 2949)
• KNN (algorithm) (p. 2949)
• LDA (algorithm) (p. 2949)
• Linear Learner (algorithm) (p. 2950)
• MXNet (DLC) (p. 2950)
• MXNet Coach (DLC) (p. 2953)
• Model Monitor (algorithm) (p. 2953)
• NTM (algorithm) (p. 2954)
• Neo Image Classification (algorithm) (p. 2954)
• Neo MXNet (DLC) (p. 2954)
• Neo PyTorch (DLC) (p. 2955)
• Neo Tensorflow (DLC) (p. 2955)
• Neo XGBoost (algorithm) (p. 2956)
• Object Detection (algorithm) (p. 2956)
• Object2Vec (algorithm) (p. 2956)
• PCA (algorithm) (p. 2957)
• PyTorch (DLC) (p. 2957)
• Random Cut Forest (algorithm) (p. 2960)
• Ray PyTorch (DLC) (p. 2961)
• Scikit-learn (algorithm) (p. 2961)
• Semantic Segmentation (algorithm) (p. 2962)
• Seq2Seq (algorithm) (p. 2962)
• Spark (algorithm) (p. 2962)
• SparkML Serving (algorithm) (p. 2963)
• Tensorflow (DLC) (p. 2963)
• Tensorflow Coach (DLC) (p. 2972)
• Tensorflow Inferentia (DLC) (p. 2973)
• Tensorflow Ray (DLC) (p. 2973)
• VW (algorithm) (p. 2974)
• XGBoost (algorithm) (p. 2974)
AutoGluon (algorithm)

**IP Insights (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='ipinsights',region='eu-central-1')
```
### Image classification (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='image-classification',region='eu-central-1')
```

### Inferentia MXNet (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='inferentia-mxnet',region='eu-central-1',version='1.5.1',instance_type='ml.inf1.6xlarge')
```

### Inferentia PyTorch (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='inferentia-pytorch',region='eu-central-1',version='1.9',py_version='py3')
```
## K-Means (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='kmeans', region='eu-central-1')
```

<table>

Docker Registry Paths and Example Code for Europe (London) (eu-west-2)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

Topics

- AutoGluon (algorithm) (p. 3012)
- BlazingText (algorithm) (p. 3013)
- Chainer (DLC) (p. 3014)
- Clarify (algorithm) (p. 3014)
- Data Wrangler (algorithm) (p. 3014)
- Debugger (algorithm) (p. 3015)
- DeepAR Forecasting (algorithm) (p. 3015)
- Factorization Machines (algorithm) (p. 3015)
- Hugging Face (algorithm) (p. 3016)
- IP Insights (algorithm) (p. 3019)
- Image classification (algorithm) (p. 3019)
- Inferentia MXNet (DLC) (p. 3019)
- Inferentia PyTorch (DLC) (p. 3020)
- K-Means (algorithm) (p. 3020)
- KNN (algorithm) (p. 3021)
- LDA (algorithm) (p. 3021)
- Linear Learner (algorithm) (p. 3021)
- MXNet (DLC) (p. 3022)
- MXNet Coach (DLC) (p. 3024)
- Model Monitor (algorithm) (p. 3025)
- NTM (algorithm) (p. 3025)
- Neo Image Classification (algorithm) (p. 3025)
- Neo MXNet (DLC) (p. 3026)
Amazon SageMaker Developer Guide
Docker Registry Paths and Example Code

• Neo PyTorch (DLC) (p. 3026)
• Neo Tensorflow (DLC) (p. 3027)
• Neo XGBoost (algorithm) (p. 3027)
• Object Detection (algorithm) (p. 3028)
• Object2Vec (algorithm) (p. 3028)
• PCA (algorithm) (p. 3028)
• PyTorch (DLC) (p. 3028)
• Random Cut Forest (algorithm) (p. 3032)
• Ray PyTorch (DLC) (p. 3032)
• Scikit-learn (algorithm) (p. 3032)
• Semantic Segmentation (algorithm) (p. 3033)
• Seq2Seq (algorithm) (p. 3033)
• Spark (algorithm) (p. 3033)
• SparkML Serving (algorithm) (p. 3034)
• Tensorflow (DLC) (p. 3034)
• Tensorflow Coach (DLC) (p. 3043)
• Tensorflow Inferentia (DLC) (p. 3044)
• Tensorflow Ray (DLC) (p. 3044)
• VW (algorithm) (p. 3045)
• XGBoost (algorithm) (p. 3046)

AutoGluon (algorithm)

SageMaker Python SDK example to retrieve registry path.

<td>processing</td>
</tr>
</tbody>
</table>

Data Wrangler (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='data-wrangler', region='eu-west-2')
```
### Debugger (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='debugger', region='eu-west-2')
```

### DeepAR Forecasting (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='forecasting-deepar', region='eu-west-2')
```

### Factorization Machines (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='factorization-machines', region='eu-west-2')
```
<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>

### KNN (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='knn', region='eu-west-2')
```

### LDA (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='lda', region='eu-west-2')
```

### Linear Learner (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='linear-learner', region='eu-west-2')
```
## MXNet (DLC)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='mxnet', region='eu-west-2', version='1.4.1', py_version='py3', image_scope='inference', instance_type='ml.c5.4xlarge')
```

**Docker Registry Paths and Example Code for Europe (Paris) (eu-west-3)**

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

**Topics**
AutoGluon (algorithm) (p. 3047)
BlazingText (algorithm) (p. 3049)
Chainer (DLC) (p. 3049)
Clarify (algorithm) (p. 3050)
Data Wrangler (algorithm) (p. 3050)
Debugger (algorithm) (p. 3050)
DeepAR Forecasting (algorithm) (p. 3050)
Factorization Machines (algorithm) (p. 3051)
Hugging Face (algorithm) (p. 3051)
IP Insights (algorithm) (p. 3054)
Image classification (algorithm) (p. 3055)
Inferentia MXNet (DLC) (p. 3055)
Inferentia PyTorch (DLC) (p. 3055)
K-Means (algorithm) (p. 3056)
KNN (algorithm) (p. 3056)
Linear Learner (algorithm) (p. 3056)
MXNet (DLC) (p. 3057)
MXNet Coach (DLC) (p. 3060)
Model Monitor (algorithm) (p. 3060)
NTM (algorithm) (p. 3060)
Neo Image Classification (algorithm) (p. 3061)
Neo MXNet (DLC) (p. 3061)
Neo PyTorch (DLC) (p. 3061)
Neo Tensorflow (DLC) (p. 3062)
Neo XGBoost (algorithm) (p. 3062)
Object Detection (algorithm) (p. 3063)
Object2Vec (algorithm) (p. 3063)
PCA (algorithm) (p. 3063)
PyTorch (DLC) (p. 3064)
Random Cut Forest (algorithm) (p. 3067)
Scikit-learn (algorithm) (p. 3067)
Semantic Segmentation (algorithm) (p. 3068)
Seq2Seq (algorithm) (p. 3068)
Spark (algorithm) (p. 3068)
SparkML Serving (algorithm) (p. 3069)
Tensorflow (DLC) (p. 3069)
Tensorflow Coach (DLC) (p. 3078)
Tensorflow Inferentia (DLC) (p. 3079)
Tensorflow Ray (DLC) (p. 3079)
XGBoost (algorithm) (p. 3080)

**AutoGluon (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
```
image_uris.retrieve(framework='autogluon', region='eu-west-3', image_scope='inference', version='0.4')

**Docker Registry Paths and Example Code for Europe (Stockholm) (eu-north-1)**

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

**Topics**
Amazon SageMaker Developer Guide
Docker Registry Paths and Example Code

- AutoGluon (algorithm) (p. 3081)
- BlazingText (algorithm) (p. 3083)
- Chainer (DLC) (p. 3083)
- Clarify (algorithm) (p. 3084)
- Data Wrangler (algorithm) (p. 3084)
- Debugger (algorithm) (p. 3084)
- DeepAR Forecasting (algorithm) (p. 3084)
- Factorization Machines (algorithm) (p. 3085)
- Hugging Face (algorithm) (p. 3085)
- IP Insights (algorithm) (p. 3088)
- Image classification (algorithm) (p. 3089)
- Inferentia MXNet (DLC) (p. 3089)
- Inferentia PyTorch (DLC) (p. 3089)
- K-Means (algorithm) (p. 3090)
- KNN (algorithm) (p. 3090)
- Linear Learner (algorithm) (p. 3090)
- MXNet (DLC) (p. 3091)
- MXNet Coach (DLC) (p. 3094)
- Model Monitor (algorithm) (p. 3094)
- NTM (algorithm) (p. 3094)
- Neo Image Classification (algorithm) (p. 3095)
- Neo MXNet (DLC) (p. 3095)
- Neo PyTorch (DLC) (p. 3095)
- Neo Tensorflow (DLC) (p. 3096)
- Neo XGBoost (algorithm) (p. 3096)
- Object Detection (algorithm) (p. 3097)
- Object2Vec (algorithm) (p. 3097)
- PCA (algorithm) (p. 3097)
- PyTorch (DLC) (p. 3098)
- Random Cut Forest (algorithm) (p. 3101)
- Scikit-learn (algorithm) (p. 3101)
- Semantic Segmentation (algorithm) (p. 3102)
- Seq2Seq (algorithm) (p. 3102)
- Spark (algorithm) (p. 3102)
- SparkML Serving (algorithm) (p. 3103)
- Tensorflow (DLC) (p. 3103)
- Tensorflow Coach (DLC) (p. 3112)
- Tensorflow Inferentia (DLC) (p. 3113)
- Tensorflow Ray (DLC) (p. 3113)
- XGBoost (algorithm) (p. 3114)

**AutoGluon (algorithm)**

Docker Registry Paths and Example Code for Europe (Milan) (eu-south-1)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

Topics
• AutoGluon (algorithm) (p. 3115)
• BlazingText (algorithm) (p. 3117)
• Chainer (DLC) (p. 3117)
• Clarify (algorithm) (p. 3118)
• Data Wrangler (algorithm) (p. 3118)
• Debugger (algorithm) (p. 3118)
• DeepAR Forecasting (algorithm) (p. 3118)
• Factorization Machines (algorithm) (p. 3119)
• Hugging Face (algorithm) (p. 3119)
• IP Insights (algorithm) (p. 3122)
• Image classification (algorithm) (p. 3123)
• Inferentia MXNet (DLC) (p. 3123)
• Inferentia PyTorch (DLC) (p. 3123)
• K-Means (algorithm) (p. 3124)
• KNN (algorithm) (p. 3124)
• Linear Learner (algorithm) (p. 3124)
• MXNet (DLC) (p. 3125)
• MXNet Coach (DLC) (p. 3128)
• Model Monitor (algorithm) (p. 3128)
• NTM (algorithm) (p. 3128)
• Neo Image Classification (algorithm) (p. 3129)
• Neo MXNet (DLC) (p. 3129)
• Neo PyTorch (DLC) (p. 3129)
• Neo Tensorflow (DLC) (p. 3130)
• Neo XGBoost (algorithm) (p. 3130)
• Object Detection (algorithm) (p. 3131)
• Object2Vec (algorithm) (p. 3131)
• PCA (algorithm) (p. 3131)
• PyTorch (DLC) (p. 3132)
• Random Cut Forest (algorithm) (p. 3135)
• Scikit-learn (algorithm) (p. 3135)
• Semantic Segmentation (algorithm) (p. 3136)
• Seq2Seq (algorithm) (p. 3136)
• Spark (algorithm) (p. 3136)
• SparkKML Serving (algorithm) (p. 3137)
• Tensorflow (DLC) (p. 3137)
• Tensorflow Coach (DLC) (p. 3146)
• Tensorflow Inferentia (DLC) (p. 3147)
• Tensorflow Ray (DLC) (p. 3147)
• XGBoost (algorithm) (p. 3148)

AutoGluon (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
```
```python
image_uris.retrieve(framework='autogluon',region='eu-south-1',image_scope='inference',version='0.4')
```

<td></td>
<td>inference</td>
<td>inf</td>
<td>py3</td>
</tr>
</tbody>
</table>

**K-Means (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='kmeans', region='eu-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>
</tr>
</thead>
<tbody>
<tr>
<td>257386234256.dkr.ecr.eu-south-1.amazonaws.com/kmeans:&lt;tag&gt;</td>
<td></td>
<td>inference, training</td>
</tr>
</tbody>
</table>

**KNN (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='knn', region='eu-south-1')
```

<table>
<thead>
<tr>
<th>Registry path</th>
<th>Version</th>
<th>Job types (image scope)</th>

### Semantic Segmentation (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='semantic-segmentation',region='eu-south-1')
```

### Seq2Seq (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='seq2seq',region='eu-south-1')
```

### Spark (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='spark',region='eu-south-1',version='3.0',image_scope='processing')
```
### Docker Registry Paths and Example Code

<table>
<thead>
<tr>
<th>Registry path</th>

**Docker Registry Paths and Example Code for Middle East (Bahrain) (me-south-1)**

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

**Topics**
• AutoGluon (algorithm) (p. 3149)
• BlazingText (algorithm) (p. 3151)
• Chainer (DLC) (p. 3151)
• Clarify (algorithm) (p. 3152)
• Data Wrangler (algorithm) (p. 3152)
• Debugger (algorithm) (p. 3152)
• DeepAR Forecasting (algorithm) (p. 3152)
• Factorization Machines (algorithm) (p. 3153)
• Hugging Face (algorithm) (p. 3153)
• IP Insights (algorithm) (p. 3156)
• Image classification (algorithm) (p. 3157)
• Inferentia MXNet (DLC) (p. 3157)
• Inferentia PyTorch (DLC) (p. 3157)
• K-Means (algorithm) (p. 3158)
• KNN (algorithm) (p. 3158)
• Linear Learner (algorithm) (p. 3158)
• MXNet (DLC) (p. 3159)
• MXNet Coach (DLC) (p. 3162)
• Model Monitor (algorithm) (p. 3162)
• NTM (algorithm) (p. 3162)
• Neo Image Classification (algorithm) (p. 3163)
• Neo MXNet (DLC) (p. 3163)
• Neo PyTorch (DLC) (p. 3163)
• Neo Tensorflow (DLC) (p. 3164)
• Neo XGBoost (algorithm) (p. 3164)
• Object Detection (algorithm) (p. 3165)
• Object2Vec (algorithm) (p. 3165)
• PCA (algorithm) (p. 3165)
• PyTorch (DLC) (p. 3166)
• Random Cut Forest (algorithm) (p. 3169)
• Scikit-learn (algorithm) (p. 3169)
• Semantic Segmentation (algorithm) (p. 3170)
• Seq2Seq (algorithm) (p. 3170)
• Spark (algorithm) (p. 3170)
• SparkML Serving (algorithm) (p. 3171)
• Tensorflow (DLC) (p. 3171)
• Tensorflow Coach (DLC) (p. 3180)
• Tensorflow Inferentia (DLC) (p. 3181)
• Tensorflow Ray (DLC) (p. 3181)
• XGBoost (algorithm) (p. 3182)

AutoGluon (algorithm)

SageMaker Python SDK example to retrieve registry path.

**Docker Registry Paths and Example Code for South America (São Paulo) (sa-east-1)**

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

**Topics**
AutoGluon (algorithm) (p. 3183)
BlazingText (algorithm) (p. 3185)
Chainer (DLC) (p. 3185)
Clarify (algorithm) (p. 3186)
Data Wrangler (algorithm) (p. 3186)
Debugger (algorithm) (p. 3186)
DeepAR Forecasting (algorithm) (p. 3186)
Factorization Machines (algorithm) (p. 3187)
Hugging Face (algorithm) (p. 3187)
IP Insights (algorithm) (p. 3190)
Image classification (algorithm) (p. 3191)
Inferentia MXNet (DLC) (p. 3191)
Inferentia PyTorch (DLC) (p. 3191)
K-Means (algorithm) (p. 3192)
KNN (algorithm) (p. 3192)
Linear Learner (algorithm) (p. 3192)
MXNet (DLC) (p. 3193)
MXNet Coach (DLC) (p. 3196)
Model Monitor (algorithm) (p. 3196)
NTM (algorithm) (p. 3196)
Neo Image Classification (algorithm) (p. 3197)
Neo MXNet (DLC) (p. 3197)
Neo PyTorch (DLC) (p. 3197)
Neo Tensorflow (DLC) (p. 3198)
Neo XGBoost (algorithm) (p. 3198)
Object Detection (algorithm) (p. 3199)
Object2Vec (algorithm) (p. 3199)
PCA (algorithm) (p. 3199)
PyTorch (DLC) (p. 3200)
Random Cut Forest (algorithm) (p. 3203)
Scikit-learn (algorithm) (p. 3203)
Semantic Segmentation (algorithm) (p. 3204)
Seq2Seq (algorithm) (p. 3204)
Spark (algorithm) (p. 3204)
SparkML Serving (algorithm) (p. 3205)
Tensorflow (DLC) (p. 3205)
Tensorflow Coach (DLC) (p. 3214)
Tensorflow Inferentia (DLC) (p. 3215)
Tensorflow Ray (DLC) (p. 3215)
XGBoost (algorithm) (p. 3216)

**AutoGluon (algorithm)**

SageMaker Python SDK example to retrieve registry path.

**Random Cut Forest (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='randomcutforest',region='sa-east-1')
```

Registry path | Version | Job types (image scope) | Package version | Job types (image scope)
---|---|---|---|---
855470959533.dkr.ecr.sa-east-1.amazonaws.com/randomcutforest:<tag> | | inference, training | | |

**Scikit-learn (algorithm)**

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='sklearn',region='sa-east-1',version='0.23-1',image_scope='inference')
```

Registry path | Version | Package version | Job types (image scope)
---|---|---|---
737474898029.dkr.ecr.sa-east-1.amazonaws.com/sagemaker-scikit-learn:<tag> | 1.0.2 | | inference, training
737474898029.dkr.ecr.sa-east-1.amazonaws.com/sagemaker-scikit-learn:<tag> | 0.23.2 | | inference, training
## Semantic Segmentation (algorithm)

SageMaker Python SDK example to retrieve registry path.

```python
from sagemaker import image_uris
image_uris.retrieve(framework='semantic-segmentation', region='sa-east-1')
```

Docker Registry Paths and Example Code for AWS GovCloud (US-West) (us-gov-west-1)

The following topics list parameters for each of the algorithms and deep learning containers in this region provided by Amazon SageMaker.

Topics
• AutoGluon (algorithm) (p. 3217)
• BlazingText (algorithm) (p. 3219)
• Chainer (DLC) (p. 3219)
• Clarify (algorithm) (p. 3220)
• Debugger (algorithm) (p. 3220)
• DeepAR Forecasting (algorithm) (p. 3221)
• Factorization Machines (algorithm) (p. 3221)
• Hugging Face (algorithm) (p. 3221)
• IP Insights (algorithm) (p. 3225)
• Image classification (algorithm) (p. 3225)
• Inferentia MXNet (DLC) (p. 3226)
• Inferentia PyTorch (DLC) (p. 3226)
• K-Means (algorithm) (p. 3227)
• KNN (algorithm) (p. 3227)
• LDA (algorithm) (p. 3227)
• Linear Learner (algorithm) (p. 3228)
• MXNet (DLC) (p. 3228)
• MXNet Coach (DLC) (p. 3231)
• NTM (algorithm) (p. 3232)
• Neo Image Classification (algorithm) (p. 3232)
• Neo MXNet (DLC) (p. 3233)
• Neo PyTorch (DLC) (p. 3233)
• Neo Tensorflow (DLC) (p. 3234)
• Neo XGBoost (algorithm) (p. 3234)
• Object Detection (algorithm) (p. 3235)
• Object2Vec (algorithm) (p. 3235)
• PCA (algorithm) (p. 3235)
• PyTorch (DLC) (p. 3235)
• Random Cut Forest (algorithm) (p. 3239)
• Scikit-learn (algorithm) (p. 3240)
• Semantic Segmentation (algorithm) (p. 3240)
• Seq2Seq (algorithm) (p. 3241)
• Spark (algorithm) (p. 3241)
• SparkML Serving (algorithm) (p. 3241)
• Tensorflow (DLC) (p. 3242)
• Tensorflow Coach (DLC) (p. 3252)
• Tensorflow Inferentia (DLC) (p. 3253)
• Tensorflow Ray (DLC) (p. 3253)
• XGBoost (algorithm) (p. 3254)

**AutoGluon (algorithm)**

SageMaker Python SDK example to retrieve registry path.

Train a Deep Graph Network

In this overview, you learn how to get started with a deep graph network by using one of the DGL containers in Amazon Elastic Container Registry (Amazon ECR). You can also see links to practical examples for deep graph networks.

What Is a Deep Graph Network?

Deep graph networks refer to a type of neural network that is trained to solve graph problems. A deep graph network uses an underlying deep learning framework like PyTorch or MXNet. The potential for graph networks in practical AI applications is highlighted in the Amazon SageMaker tutorials for Deep Graph Library (DGL). Examples for training models on graph datasets include social networks, knowledge bases, biology, and chemistry.
Several examples are provided using Amazon SageMaker’s deep learning containers that are preconfigured with DGL. If you have special modules you want to use with DGL, you can also build your own container. The examples involve heterographs, which are graphs that have multiple types of nodes and edges, and draw on a variety of applications across disparate scientific fields, such as bioinformatics and social network analysis. DGL provides a wide array of graph neural network implementations for different types models. Some of the highlights include:

- Graph convolutional network (GCN)
- Relational graph convolutional network (R-GCN)
- Graph attention network (GAT)
- Deep generative models of graphs (DGMG)
- Junction tree neural network (JTNN)

**Get Started**

DGL is available as a deep learning container in Amazon ECR. You can select deep learning containers when you write your estimator function in an Amazon SageMaker notebook. You can also craft your own custom container with DGL by following the Bring Your Own Container guide. The easiest way to get started with a deep graph network uses one of the DGL containers in Amazon ECR.

**Note**

Backend framework support is limited to PyTorch and MXNet.

**Setup**
If you are using Amazon SageMaker Studio, you need to clone the examples repository first. If you are using a notebook instance, you can find the examples by choosing the SageMaker icon at bottom of the left toolbar.

**To clone the Amazon SageMaker SDK and notebook examples repository**

1. From the JupyterLab view in Amazon SageMaker, go to the File Browser at the top of the left toolbar. From the File Browser panel, you can see a new navigation at the top of the panel.
2. Choose the icon on the far right to clone a Git repository.
3. Add the repository URL: https://github.com/awslabs/amazon-sagemaker-examples.git
4. Browse the newly added folder and its contents. The DGL examples are stored in the sagemaker-python-sdk folder.

**Run a Graph Network Training Example**

**To train a deep graph network**

1. From the JupyterLab view in Amazon SageMaker, browse the example notebooks and look for DGL folders. Several files may be included to support an example. Examine the README for any prerequisites.
2. Run the .ipynb notebook example.
3. Find the estimator function, and note the line where it is using an Amazon ECR container for DGL and a specific instance type. You may want to update this to use a container in your preferred Region.
4. Run the function to launch the instance and use the DGL container for training a graph network. Charges are incurred for launching this instance. The instance self-terminates when the training is complete.

**Examples**

An example of knowledge graph embedding (KGE) is provided. It uses the Freebase dataset, a knowledge base of general facts. An example use case would be to graph the relationships of persons and predict their nationality.

An example implementation of a graph convolutional network (GCN) shows how you can train a graph network to predict toxicity. A physiology dataset, Tox21, provides toxicity measurements for how substances affect biological responses.

Another GCN example shows you how to train a graph network on a scientific publications bibliography dataset, known as Cora. You can use it to find relationships between authors, topics, and conferences.

The last example is a recommender system for movie reviews. It uses a graph convolutional matrix completion (GCMC) network trained on the MovieLens datasets. These datasets consist of movie titles, genres, and ratings by users.

**Use a Deep Learning Container with DGL**

The following example uses preconfigured deep learning containers. This is the easiest to try since it works out of the box on Amazon SageMaker.

- Semi-supervised classification of a knowledge base using a GCN
Bring Your Own Container with DGL

The following examples enable you to bring your own container (BYOC). Read the BYOC guide and familiarize yourself with that process before trying these. Configuration is required.

- Molecular property prediction of toxicity using a GCN
- Recommender system for movies using a GCMC implementation

Extend a Prebuilt Container

If a prebuilt SageMaker container doesn't fulfill all of your requirements, you can extend the existing image to accommodate your needs. Even if there is direct support for your environment or framework, you may want to add additional functionality or configure your container environment differently. By extending a prebuilt image, you can leverage the included deep learning libraries and settings without having to create an image from scratch. You can extend the container to add libraries, modify settings, and install additional dependencies.

The following tutorial shows how to extend a prebuilt SageMaker image and publish it to Amazon ECR.

Topics
- Requirements to Extend a Prebuilt Container (p. 3258)
- Extend SageMaker Containers to Run a Python Script (p. 3258)

Requirements to Extend a Prebuilt Container

To extend a pre-built SageMaker image, you need to set the following environment variables within your Dockerfile. For more information on environment variables with SageMaker containers, see the SageMaker Training Toolkit GitHub repo.

- SAGEMAKER_SUBMIT_DIRECTORY: The directory within the container in which the Python script for training is located.
- SAGEMAKER_PROGRAM: The Python script that should be invoked and used as the entry point for training.

You can also install additional libraries by including the following in your Dockerfile:

```bash
RUN pip install <library>
```

The following tutorial shows how to use these environment variables.

Extend SageMaker Containers to Run a Python Script

In this tutorial, you learn how to extend the SageMaker PyTorch container with a Python file that uses the CIFAR-10 dataset. By extending the SageMaker PyTorch container, you utilize the existing training solution made to work with SageMaker. This tutorial extends a training image, but the same steps can be taken to extend an inference image. For a full list of the available images, see Available Deep Learning Containers Images.

To run your own training model using the SageMaker containers, build a Docker container through a SageMaker Notebook instance.

Step 1: Create an SageMaker Notebook Instance

1. Open the SageMaker console.
2. In the left navigation pane, choose Notebook, choose Notebook instances, and then choose Create notebook instance.

3. On the Create notebook instance page, provide the following information:
   a. For Notebook instance name, enter RunScriptNotebookInstance.
   b. For Notebook Instance type, choose ml.t2.medium.
   c. In the Permissions and encryption section, do the following:
      i. For IAM role, choose Create a new role.
      ii. On the Create an IAM role page, choose Specific S3 buckets, specify an Amazon S3 bucket named sagemaker-run-script, and then choose Create role.

      SageMaker creates an IAM role named AmazonSageMaker-ExecutionRole-YYYYMMDDTHHmmsS, such as AmazonSageMaker-ExecutionRole-20190429T110788. Note that the execution role naming convention uses the date and time when the role was created, separated by a T.
   d. For Root Access, choose Enable.
   e. Choose Create notebook instance.

4. On the Notebook instances page, the Status is Pending. It can take a few minutes for Amazon CloudWatch Internet Monitor to launch a machine learning compute instance—in this case, it launches a notebook instance—and attach an ML storage volume to it. The notebook instance has a preconfigured Jupyter notebook server and a set of Anaconda libraries. For more information, see CreateNotebookInstance.

5. In the Permissions and encryption section, copy the IAM role ARN number, and paste it into a notepad file to save it temporarily. You use this IAM role ARN number later to configure a local training estimator in the notebook instance. The IAM role ARN number looks like the following: 'arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'

6. After the status of the notebook instance changes to InService, choose Open JupyterLab.

Step 2: Create and Upload the Dockerfile and Python Training Scripts

1. After JupyterLab opens, create a new folder in the home directory of your JupyterLab. In the upper-left corner, choose the New Folder icon, and then enter the folder name docker_test_folder.

2. Create a Dockerfile text file in the docker_test_folder directory.
   a. Choose the New Launcher icon (+) in the upper-left corner.
   b. In the right pane under the Other section, choose Text File.
   c. Paste the following Dockerfile sample code into your text file.

```
# SageMaker PyTorch image
FROM 763104351884.dkr.ecr.us-east-1.amazonaws.com/pytorch-training:1.5.1-cpu-py36-ubuntu16.04
ENV PATH="/opt/ml/code:${PATH}"

# this environment variable is used by the SageMaker PyTorch container to determine our user code directory.
ENV SAGEMAKER_SUBMIT_DIRECTORY /opt/ml/code

# /opt/ml and all subdirectories are utilized by SageMaker, use the /code subdirectory to store your user code.
COPY cifar10.py /opt/ml/code/cifar10.py
```
# Defines cifar10.py as script entrypoint
ENV SAGEMAKER_PROGRAM cifar10.py

The Dockerfile script performs the following tasks:

- `FROM 763104351884.dkr.ecr.us-east-1.amazonaws.com/pytorch-training:1.5.1-cpu-py36-ubuntu16.04` – Downloads the SageMaker PyTorch base image. You can replace this with any SageMaker base image you want to bring to build containers.
- `ENV SAGEMAKER_SUBMIT_DIRECTORY /opt/ml/code` – Sets /opt/ml/code as the training script directory.
- `COPY cifar10.py /opt/ml/code/cifar10.py` – Copies the script to the location inside the container that is expected by SageMaker. The script must be located in this folder.
- `ENV SAGEMAKER_PROGRAM cifar10.py` – Sets your cifar10.py training script as the entrypoint script.

On the left directory navigation pane, the text file name might automatically be named untitled.txt. To rename the file, right-click the file, choose Rename, rename the file as Dockerfile without the .txt extension, and then press Ctrl+s or Command+s to save the file.

3. Create or upload a training script cifar10.py in the docker_test_folder. You can use the following example script for this exercise.

```python
import ast
import argparse
import logging
import os
import torch
import torch.distributed as dist
import torch.nn as nn
import torch.nn.parallel
import torch.optim
import torch.utils.data
import torch.utils.data.distributed
import torchvision
import torchvision.models
import torchvision.transforms as transforms

_train(parser.parse_args())

**Step 3: Build the Container**

1. In the JupyterLab home directory, open a Jupyter notebook. To open a new notebook, choose the *New Launch* icon and then choose *conda_pytorch_p36* in the *Notebook* section.
2. Run the following command in the first notebook cell to change to the docker_test_folder directory:

   `% cd ~/SageMaker/docker_test_folder`

   This returns your current directory as follows:

   ```
   ! pwd
   output: /home/ec2-user/SageMaker/docker_test_folder
   ```

3. Log in to Docker to access the base container:

   ```
   ! aws ecr get-login-password --region us-east-1 | docker login --username AWS --password-stdin 763104351884.dkr.ecr.us-east-1.amazonaws.com
   ```

4. To build the Docker container, run the following Docker build command, including the space followed by a period at the end:

   ```
   ! docker build -t pytorch-extended-container-test .
   ```

   The Docker build command must be run from the Docker directory you created, in this case docker_test_folder.

   **Note**
   
   If you get the following error message that Docker cannot find the Dockerfile, make sure the Dockerfile has the correct name and has been saved to the directory.

   ```
   unable to prepare context: unable to evaluate symlinks in Dockerfile path: lstat /home/ec2-user/SageMaker/docker/Dockerfile: no such file or directory
   ```

   Remember that *docker* looks for a file specifically called Dockerfile without any extension within the current directory. If you named it something else, you can pass in the file name manually with the `-f` flag. For example, if you named your Dockerfile Dockerfile-text.txt, run the following command:

   ```
   ! docker build -t tf-custom-container-test -f Dockerfile-text.txt .
   ```

**Step 4: Test the Container**

1. To test the container locally in the notebook instance, open a Jupyter notebook. Choose *New Launcher* and choose *Notebook* in *conda_pytorch_p36* framework. The rest of the code snippets must run from the Jupyter notebook instance.
2. Download the CIFAR-10 dataset.
import torch
import torchvision
import torchvision.transforms as transforms

def _get_transform():
    return transforms.Compose([transforms.ToTensor(),
                               transforms.Normalize((0.5, 0.5, 0.5), (0.5, 0.5, 0.5))])

def get_train_data_loader(data_dir='/tmp/pytorch/cifar-10-data'):
    transform=_get_transform()
    trainset=torchvision.datasets.CIFAR10(root=data_dir, train=True,
                                           download=True, transform=transform)
    return torch.utils.data.DataLoader(trainset, batch_size=4,
                                        shuffle=True, num_workers=2)

def get_test_data_loader(data_dir='/tmp/pytorch/cifar-10-data'):
    transform=_get_transform()
    testset=torchvision.datasets.CIFAR10(root=data_dir, train=False,
                                          download=True, transform=transform)
    return torch.utils.data.DataLoader(testset, batch_size=4,
                                         shuffle=False, num_workers=2)

trainloader=get_train_data_loader('/tmp/pytorch-example/cifar-10-data')
testloader=get_test_data_loader('/tmp/pytorch-example/cifar-10-data')

3. Set role to the role used to create your Jupyter notebook. This is used to configure your SageMaker Estimator.

from sagemaker import get_execution_role
role=get_execution_role()

4. Paste the following example script into the notebook code cell to configure a SageMaker Estimator using your extended container.

from sagemaker.estimator import Estimator
hyperparameters={'epochs': 1}
estimator=Estimator(image_uri='pytorch-extended-container-test',
                    role=role,
                    instance_count=1,
                    instance_type='local',
                    hyperparameters=hyperparameters)
estimator.fit('file:///tmp/pytorch-example/cifar-10-data')

5. Run the code cell. This test outputs the training environment configuration, the values used for the environmental variables, the source of the data, and the loss and accuracy obtained during training.

Step 5: Push the Container to Amazon Elastic Container Registry (Amazon ECR)

1. After you successfully run the local mode test, you can push the Docker container to Amazon ECR and use it to run training jobs.
Run the following command lines in a notebook cell.

```bash
# Specify an algorithm name
algorithm_name=pytorch-extended-container-test
account=$(aws sts get-caller-identity --query Account --output text)
# Get the region defined in the current configuration (default to us-west-2 if none
defined)
region=$(aws configure get region)
fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"
# If the repository doesn't exist in ECR, create it.
aws ecr describe-repositories --repository-names "${algorithm_name}" > /dev/null 2>&1
if [ $? -ne 0 ]
then
    aws ecr create-repository --repository-name "${algorithm_name}" > /dev/null
fi
# Log into Docker
aws ecr get-login-password --region ${region}|docker login --username AWS --password-
stdin ${fullname}
# Build the docker image locally with the image name and then push it to ECR
# with the full name.
docker build -t ${algorithm_name} .
docker tag ${algorithm_name} ${fullname}
docker push ${fullname}
```

2. After you push the container, you can call the Amazon ECR image from anywhere in the SageMaker environment. Run the following code example in the next notebook cell.

If you want to use this training container with SageMaker Studio to use its visualization features, you can also run the following code in a Studio notebook cell to call the Amazon ECR image of your training container.

```python
import boto3
client=boto3.client('sts')
account=client.get_caller_identity()['Account']
my_session=boto3.session.Session()
region=my_session.region_name
algorithm_name="pytorch-extended-container-test"
ecr_image='{}.dkr.ecr.{}.amazonaws.com/{}:latest'.format(account, region,
algorithm_name)
ecr_image
# This should return something like
# 12-digits-of-your-account.dkr.ecr.us-east-2.amazonaws.com/tf-2.2-test:latest
```

3. Use the ecr_image retrieved from the previous step to configure a SageMaker estimator object. The following code sample configures a SageMaker PyTorch estimator.

```python
import sagemaker
```
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator

estimator=Estimator(  
    image_uri=ecr_image,  
    role=get_execution_role(),  
    base_job_name='pytorch-extended-container-test',  
    instance_count=1,  
    instance_type='ml.p2.xlarge'
)

# start training
estimator.fit()

# deploy the trained model
predictor=estimator.deploy(1, instance_type)

Step 6: Clean up Resources

To clean up resources when done with the Get Started example

1. Open the SageMaker console, choose the notebook instance RunScriptNotebookInstance, choose Actions, and choose Stop. It can take a few minutes for the instance to stop.
2. After the instance Status changes to Stopped, choose Actions, choose Delete, and then choose Delete in the dialog box. It can take a few minutes for the instance to be deleted. The notebook instance disappears from the table when it has been deleted.
3. Open the Amazon S3 console and delete the bucket that you created for storing model artifacts and the training dataset.
4. Open the IAM console and delete the IAM role. If you created permission policies, you can delete them, too.

Note
The Docker container shuts down automatically after it has run. You don't need to delete it.

Adapting Your Own Docker Container to Work with SageMaker

You can adapt an existing Docker image to work with SageMaker. You may need to use an existing, external Docker image with SageMaker when you have a container that satisfies feature or safety requirements that are not currently supported by a prebuilt SageMaker image. There are two toolkits that allow you to bring your own container and adapt it to work with SageMaker:

• SageMaker Training Toolkit
• SageMaker Inference Toolkit

The following topics show how to adapt your existing image using the SageMaker Training and Inference toolkits:

Topics
• Individual Framework Libraries (p. 3267)
• Using the SageMaker Training and Inference Toolkits (p. 3267)
• Adapting Your Own Training Container (p. 3268)
Individual Framework Libraries

In addition to the SageMaker Training Toolkit and SageMaker Inference Toolkit, SageMaker also provides toolkits specialized for TensorFlow, MXNet, PyTorch, and Chainer. The following table provides links to the GitHub repositories that contain the source code for each framework and their respective serving toolkits. The instructions linked are for using the Python SDK to run training algorithms and host models on SageMaker. The functionality for these individual libraries is included in the SageMaker Training Toolkit and SageMaker Inference Toolkit.

<table>
<thead>
<tr>
<th>Framework</th>
<th>Toolkit Source Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>TensorFlow</td>
<td>SageMaker TensorFlow Training</td>
</tr>
<tr>
<td></td>
<td>SageMaker TensorFlow Serving</td>
</tr>
<tr>
<td>MXNet</td>
<td>SageMaker MXNet Training</td>
</tr>
<tr>
<td></td>
<td>SageMaker MXNet Inference</td>
</tr>
<tr>
<td>PyTorch</td>
<td>SageMaker PyTorch Training</td>
</tr>
<tr>
<td></td>
<td>SageMaker PyTorch Inference</td>
</tr>
<tr>
<td>Chainer</td>
<td>SageMaker Chainer SageMaker Containers</td>
</tr>
</tbody>
</table>

Using the SageMaker Training and Inference Toolkits

The SageMaker Training and SageMaker Inference toolkits implement the functionality that you need to adapt your containers to run scripts, train algorithms, and deploy models on SageMaker. When installed, the library defines the following for users:

- The locations for storing code and other resources.
- The entry point that contains the code to run when the container is started. Your Dockerfile must copy the code that needs to be run into the location expected by a container that is compatible with SageMaker.
- Other information that a container needs to manage deployments for training and inference.

SageMaker Toolkits Containers Structure

When SageMaker trains a model, it creates the following file folder structure in the container’s /opt/ml directory.

```
/opt/ml
  ### input
  #   ### config
  #   #   ### hyperparameters.json
  #   #   ### resourceConfig.json
  #   ### data
  #       ### <channel_name>
  #           ### <input data>
  ### model
  #
```
Adapting Your Own Training Container

When you run a model training job, the SageMaker container uses the /opt/ml/input/ directory, which contains the JSON files that configure the hyperparameters for the algorithm and the network layout used for distributed training. The /opt/ml/input/ directory also contains files that specify the channels through which SageMaker accesses the data, which is stored in Amazon Simple Storage Service (Amazon S3). The SageMaker containers library places the scripts that the container will run in the /opt/ml/code/ directory. Your script should write the model generated by your algorithm to the /opt/ml/model/ directory. For more information, see Use Your Own Training Algorithms (p. 3283).

When you host a trained model on SageMaker to make inferences, you deploy the model to an HTTP endpoint. The model makes real-time predictions in response to inference requests. The container must contain a serving stack to process these requests.

In a hosting or batch transform container, the model files are located in the same folder to which they were written during training.

/opt/ml/model
#
### <model files>

For more information, see Use Your Own Inference Code (p. 3293).

**Single Versus Multiple Containers**

You can either provide separate Docker images for the training algorithm and inference code or you can use a single Docker image for both. When creating Docker images for use with SageMaker, consider the following:

- Providing two Docker images can increase storage requirements and cost because common libraries might be duplicated.
- In general, smaller containers start faster for both training and hosting. Models train faster and the hosting service can react to increases in traffic by automatically scaling more quickly.
- You might be able to write an inference container that is significantly smaller than the training container. This is especially common when you use GPUs for training, but your inference code is optimized for CPUs.
- SageMaker requires that Docker containers run without privileged access.
- Both Docker containers that you build and those provided by SageMaker can send messages to the Stdout and Stderr files. SageMaker sends these messages to Amazon CloudWatch logs in your AWS account.

For more information about how to create SageMaker containers and how scripts are executed inside them, see the SageMaker Training Toolkit and SageMaker Inference Toolkit repositories on GitHub. They also provide lists of important environmental variables and the environmental variables provided by SageMaker containers.

**Adapting Your Own Training Container**

To run your own training model, build a Docker container using the Amazon SageMaker Training Toolkit through an Amazon SageMaker notebook instance.
### Step 1: Create a SageMaker notebook instance

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the left navigation pane, choose Notebook, choose Notebook instances, and then choose Create notebook instance.
3. On the Create notebook instance page, provide the following information:
   a. For Notebook instance name, enter RunScriptNotebookInstance.
   b. For Notebook Instance type, choose ml.t2.medium.
   c. In the Permissions and encryption section, do the following:
      i. For IAM role, choose Create a new role.
      ii. On the Create an IAM role page, choose Specific S3 buckets, specify an Amazon S3 bucket named sagemaker-run-script, and then choose Create role.
      SageMaker creates an IAM role named AmazonSageMaker-ExecutionRole-YYYYMMDDTHHmmSS. For example, AmazonSageMaker-ExecutionRole-20190429T110788. Note that the execution role naming convention uses the date and time at which the role was created, separated by a T.
   d. For Root Access, choose Enable.
   e. Choose Create notebook instance.
4. On the Notebook instances page, the Status is Pending. It can take a few minutes for Amazon SageMaker to launch a machine learning compute instance—in this case, it launches a notebook instance—and attach an ML storage volume to it. The notebook instance has a preconfigured Jupyter notebook server and a set of Anaconda libraries. For more information, see CreateNotebookInstance.
5. In the Permissions and encryption section, copy the IAM role ARN number, and paste it into a notepad file to save it temporarily. You use this IAM role ARN number later to configure a local training estimator in the notebook instance. The IAM role ARN number looks like the following: 'arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'
6. After the status of the notebook instance changes to InService, choose Open JupyterLab.

### Step 2: Create and upload the Dockerfile and Python training scripts

1. After JupyterLab opens, create a new folder in the home directory of your JupyterLab. In the upper-left corner, choose the New Folder icon, and then enter the folder name docker_test_folder.
2. Create a Dockerfile text file in the docker_test_folder directory.
   a. Choose the New Launcher icon (+) in the upper-left corner.
   b. In the right pane under the Other section, choose Text File.
   c. Paste the following Dockerfile sample code into your text file.

```bash
FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3-jupyter
# Install sagemaker-training toolkit that contains the common functionality necessary to create a container compatible with SageMaker and the Python SDK.
RUN pip3 install sagemaker-training

# Copies the training code inside the container
COPY train.py /opt/ml/code/train.py
```

3269
Adapting Your Own Training Container

# Defines train.py as script entrypoint
ENV SAGEMAKER_PROGRAM train.py

The Dockerfile script performs the following tasks:

- **FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3-jupyter** – Downloads the TensorFlow Docker base image. You can replace this with any Docker base image you want to bring to build containers, as well as with AWS pre-built container base images.

- **RUN pip install sagemaker-training** – Installs SageMaker Training Toolkit that contains the common functionality necessary to create a container compatible with SageMaker.

- **COPY train.py /opt/ml/code/train.py** – Copies the script to the location inside the container that is expected by SageMaker. The script must be located in this folder.

- **ENV SAGEMAKER_PROGRAM train.py** – Takes your training script train.py as the entrypoint script copied in the /opt/ml/code folder of the container. This is the only environmental variable that you must specify when you build your own container.

3. On the left directory navigation pane, the text file name might automatically be named untitled.txt. To rename the file, right-click the file, choose Rename, rename the file as Dockerfile without the .txt extension, and then press Ctrl+s or Command+s to save the file.

3. Create or upload a training script train.py in the docker_test_folder. You can use the following example script for this exercise.

```python
import tensorflow as tf
mnist = tf.keras.datasets.mnist
(x_train, y_train), (x_test, y_test) = mnist.load_data()
x_train, x_test = x_train / 255.0, x_test / 255.0

model = tf.keras.models.Sequential([tf.keras.layers.Flatten(input_shape=(28, 28)),
                                      tf.keras.layers.Dense(128, activation='relu'),
                                      tf.keras.layers.Dropout(0.2),
                                      tf.keras.layers.Dense(10, activation='softmax')])

model.compile(optimizer='adam',
               loss='sparse_categorical_crossentropy',
               metrics=['accuracy'])

model.fit(x_train, y_train, epochs=1)
model.evaluate(x_test, y_test)
```

**Step 3: Build the container**

1. In the JupyterLab home directory, open a Jupyter notebook. To open a new notebook, choose the New Launch icon and then choose conda_tensorflow2_p36 in the Notebook section.

2. Run the following command in the first notebook cell to change to the docker_test_folder directory:

```bash
% cd ~/SageMaker/docker_test_folder
```
This returns your current directory as follows:

! pwd

output: /home/ec2-user/SageMaker/docker_test_folder

3. To build the Docker container, run the following Docker build command, including the space followed by a period at the end:

! docker build -t tf-custom-container-test .

The Docker build command must be run from the Docker directory you created, in this case docker_test_folder.

Note
If you get the following error message that Docker cannot find the Dockerfile, make sure the Dockerfile has the correct name and has been saved to the directory.

unable to prepare context: unable to evaluate symlinks in Dockerfile path: lstat /home/ec2-user/SageMaker/docker/Dockerfile: no such file or directory

Remember that docker looks for a file specifically called Dockerfile without any extension within the current directory. If you named it something else, you can pass in the file name manually with the -f flag. For example, if you named your Dockerfile as Dockerfile-text.txt, run the following command:

! docker build -t tf-custom-container-test -f Dockerfile-text.txt .

Step 4: Test the container

1. To test the container locally in the notebook instance, open a Jupyter notebook. Choose New Launcher and choose Notebook in conda_tensorflow_p36 framework.

2. Paste the following example script into the notebook code cell to configure a SageMaker Estimator.

SageMaker Python SDK v1

```python
from sagemaker.estimator import Estimator

estimator = Estimator(image_name='tf-custom-container-test',
                        role='arn:aws:iam::111122223333:role/role-name',
                        instance_count=1,
                        instance_type='local')

estimator.fit()
```

SageMaker Python SDK v2

```python
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri='tf-custom-container-test',
                        role='arn:aws:iam::111122223333:role/role-name',
                        instance_count=1,
                        instance_type='local')
```
estimator.fit()

3. Replace the 'Put_YourARN_Here' value with the IAM role ARN number you copied to a notepad file when you configured the notebook instance. The ARN should look like the following: 'arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'.

4. Run the code cell. This test outputs the training environment configuration, the values used for the environmental variables, the source of the data, and the loss and accuracy obtained during training.

Step 5: Push the container to Amazon Elastic Container Registry (Amazon ECR)

1. After you successfully run the local mode test, you can push the Docker container to Amazon ECR and use it to run training jobs.

Run the following command lines in a notebook cell.

```bash
%%sh

# Specify an algorithm name
algorithm_name=tf-custom-container-test

account=$(aws sts get-caller-identity --query Account --output text)

# Get the region defined in the current configuration (default to us-west-2 if none defined)
region=$(aws configure get region)
region=${region:-us-west-2}

fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"

# If the repository doesn't exist in ECR, create it.
aws ecr describe-repositories --repository-names "${algorithm_name}" > /dev/null 2>&1
if [ $? -ne 0 ]
then
    aws ecr create-repository --repository-name "${algorithm_name}" > /dev/null
fi

# Get the login command from ECR and execute it directly
aws ecr get-login-password --region ${region}|docker login --username AWS --password-stdin ${fullname}

# Build the docker image locally with the image name and then push it to ECR with the full name.
docker build -t ${algorithm_name} .
docker tag ${algorithm_name} ${fullname}
docker push ${fullname}
```

Note
This bash shell script may raise a permission issue similar to the following error message:

"denied: User: [ARN] is not authorized to perform: ecr:InitiateLayerUpload on resource: arn:aws:ecr:us-east-1:[id]:repository/tf-custom-container-test"
If this error occurs, you need to attach the AmazonEC2ContainerRegistryFullAccess policy to your IAM role. Go to the IAM console, choose Roles from the left navigation pane, look up the IAM role you used for the Notebook instance. Under the Permission tab, choose the Attach policies button, and search the AmazonEC2ContainerRegistryFullAccess policy. Mark the check box of the policy, and choose Attach policy to finish.

2. After you push the container, you can call the Amazon ECR image from anywhere in the SageMaker environment. Run the following code example in the next notebook cell.

If you want to use this training container with SageMaker Studio to use its visualization features, you can also run the following code in a Studio notebook cell to call the Amazon ECR image of your training container.

```python
import boto3
account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'tf-custom-container-test'
tag = 'latest'
region = boto3.session.Session().region_name
uri_suffix = 'amazonaws.com'
if region in ['cn-north-1', 'cn-northwest-1']:
    uri_suffix = 'amazonaws.com.cn'
byoc_image_uri = '{}.dkr.ecr.{}.{}/{}'.format(account_id, region, uri_suffix, ecr_repository + tag)
byoc_image_uri
```

# This should return something like
# 111122223333.dkr.ecr.us-east-2.amazonaws.com/sagemaker-byoc-test:latest

3. Use the ecr_image retrieved from the previous step to configure a SageMaker estimator object. The following code sample configures a SageMaker estimator with the byoc_image_uri and initiates a training job on an Amazon EC2 instance.

SageMaker Python SDK v1

```python
import sagemaker
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri=byoc_image_uri,
                      role=get_execution_role(),
                      base_job_name='tf-custom-container-test-job',
                      instance_count=1,
                      instance_type='ml.p2.xlarge')

# start training
estimator.fit()

# deploy the trained model
predictor = estimator.deploy(1, instance_type)
```

SageMaker Python SDK v2

```python
import sagemaker
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri=byoc_image_uri,
                      role=get_execution_role(),
                      base_job_name='tf-custom-container-test-job',
                      instance_count=1,
                      instance_type='ml.p2.xlarge')

# start training
estimator.fit()

# deploy the trained model
predictor = estimator.deploy(1, instance_type)
```
For a full example that shows how to test a custom container locally and push it to an Amazon ECR image, see the Building Your Own TensorFlow Container example notebook.

Tip
To profile and debug training jobs to monitor system utilization issues (such as CPU bottlenecks and GPU underutilization) and identify training issues (such as overfitting, overtraining, exploding tensors, and vanishing gradients), use Amazon SageMaker Debugger. For more information, see Amazon SageMaker Debugger is available for any deep learning models that you bring to Amazon SageMaker. The AWS CLI, SageMaker Estimator API, and the Debugger APIs enable you to use any Docker base images to build and customize containers to train your models. To use Debugger with customized containers, you need to make a minimal change to your training script to implement the Debugger hook callback and retrieve tensors from training jobs. You need the following resources to build a customized container with Debugger.

- Amazon SageMaker Python SDK
- The SMDebug open source client library
- A Docker base image of your choice
- Your training script with a Debugger hook registered – For more information about registering a Debugger hook to your training script, see Register Debugger Hook to Your Training Script (p. 1630).

For an end-to-end example of using Debugger with a custom training container, see the following example notebook.

- Build a Custom Training Container and Debug Training Jobs with Debugger

Tip
This custom container with Debugger guide is an extension of the Adapting Your Own Training Container (p. 3268) guide which walks you thorough how to build and push your custom training container to Amazon ECR.

Prepare to Build a Custom Training Container

To build a docker container, the basic structure of files should look like the following:

```bash
### debugger_custom_container_test_notebook.ipynb  # a notebook to run python snippet codes
```
Register Debugger Hook to Your Training Script

To debug your model training, you need to add a Debugger hook to your training script.

**Note**
This step is required to collect model parameters (output tensors) for debugging your model training. If you only want to monitor and profile, you can skip this hook registration step and exclude the `debugger_hook_config` parameter when constructing an estimator.

The following example code shows the structure of a training script using the Keras ResNet50 model and how to pass the Debugger hook as a Keras callback for debugging. To find a complete training script, see TensorFlow training script with SageMaker Debugger hook.

```python
# An example of training script (your-training-script.py)
import tensorflow.compat.v2 as tf
from tensorflow.keras.applications.resnet50 import ResNet50
import smdebug.tensorflow as smd

def train(batch_size, epoch, model, hook):
    ...

    model.fit(X_train, Y_train,
              batch_size=batch_size,
              epochs=epoch,
              validation_data=(X_valid, Y_valid),
              shuffle=True,

              # smdebug modification: Pass the Debugger hook in the main() as a Kera

              callbacks=[hook])
```

```bash
docker folder
### debugger_custom_container_test_folder # this is a
docker folder

### your-training-script.py # your
training script with Debugger hook

### Dockerfile # a
Dockerfile to build your own container
```
main()

For more information about registering the Debugger hook for the supported frameworks and algorithm, see the following links in the SMDebug client library:

- SMDebug TensorFlow hook
- SMDebug PyTorch hook
- SMDebug MXNet hook
- SMDebug XGBoost hook

In the following example notebooks' training scripts, you can find more examples about how to add the Debugger hooks to training scripts and collect output tensors in detail:

- Debugger in script mode with the TensorFlow 2.1 framework
  To see the difference between using Debugger in a Deep Learning Container and in script mode, open this notebook and put it and the previous Debugger in a Deep Learning Container TensorFlow v2.1 notebook example side by side.
  In script mode, the hook configuration part is removed from the script in which you set the estimator. Instead, the Debugger hook feature is merged into the training script, TensorFlow Keras ResNet training script in script mode. The training script imports the smdebug library in the required TensorFlow Keras environment to communicate with the TensorFlow ResNet50 algorithm. It also manually implements the smdebug hook functionality by adding the callbacks=[hook] argument inside the train function (in line 49), and by adding the manual hook configuration (in line 89) provided through SageMaker Python SDK.
  This script mode example runs the training job in the TF 2.1 framework for direct comparison with the zero script change in the TF 2.1 example. The benefit of setting up Debugger in script mode is the flexibility to choose framework versions not covered by AWS Deep Learning Containers.

- Using Amazon SageMaker Debugger in a PyTorch Container in Script Mode
  This notebook enables Debugger in script mode in PyTorch v1.3.1 framework. PyTorch v1.3.1 is supported by SageMaker containers, and this example shows details of how to modify a training script.
  The SageMaker PyTorch estimator is already in script mode by default. In the notebook, the line to activate script_mode is not included in the estimator configuration.
  This notebook shows detailed steps to change an original PyTorch training script to a modified version with Debugger enabled. Additionally, this example shows how you can use Debugger built-in rules to detect training issues such as the vanishing gradients problem, and the Debugger trial features to call and analyze the saved tensors.
Create and Configure a Dockerfile

Open your SageMaker JupyterLab and create a new folder, `debugger_custom_container_test_folder` in this example, to save your training script and Dockerfile. The following code example is a Dockerfile that includes essential docker build commands. Paste the following code into the Dockerfile text file and save it. Upload your training script to the same folder.

```bash
# Specify a docker base image
FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3
RUN /usr/bin/python3 -m pip install --upgrade pip
RUN pip install --upgrade protobuf

# Install required packages to enable the SageMaker Python SDK and the smdebug library
RUN pip install sagemaker-training
RUN pip install smdebug

CMD ["bin/bash"]
```

If you want to use a pre-built AWS Deep Learning Container image, see Available AWS Deep Learning Containers Images.

Build and Push the Custom Training Container to Amazon ECR

Create a test notebook, `debugger_custom_container_test_notebook.ipynb`, and run the following code in the notebook cell. This will access the `debugger_byoc_test_docker` directory, build the docker with the specified `algorithm_name`, and push the docker container to your Amazon ECR.

```python
import boto3

account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'sagemaker-debugger-mnist-byoc-tf2'
tag = ':latest'
region = boto3.Session().region_name
uri_suffix = 'amazonaws.com'

if region in ['cn-north-1', 'cn-northwest-1']:
    uri_suffix = 'amazonaws.com.cn'

byoc_image_uri = '{}.dkr.ecr.{}.{}/{}'.format(account_id, region, uri_suffix, ecr_repository + tag)

!docker build -t $ecr_repository docker
!$(aws ecr get-login --region $region --registry-ids $account_id --no-include-email)
!aws ecr create-repository --repository-name $ecr_repository
!docker tag {ecr_repository + tag} $byoc_image_uri
!docker push $byoc_image_uri
```

Tip
If you use one of the AWS Deep Learning Container base images, run the following code to log in to Amazon ECR and access to the Deep Learning Container image repository.
Run and Debug Training Jobs Using the Custom Training Container

After you build and push your docker container to Amazon ECR, configure a SageMaker estimator with your training script and the Debugger-specific parameters. After you execute the estimator.fit(), Debugger will collect output tensors, monitor them, and detect training issues. Using the saved tensors, you can further analyze the training job by using the smdebug core features and tools. Configuring a workflow of Debugger rule monitoring process with Amazon CloudWatch Events and AWS Lambda, you can automate a stopping training job process whenever the Debugger rules spots training issues.

```python
import sagemaker

from sagemaker.estimator import Estimator
from sagemaker.debugger import Rule, DebuggerHookConfig, CollectionConfig, rule_configs

profiler_config=ProfilerConfig(...)

d debugger_hook_config=DebuggerHookConfig(...)

rules=[
    Rule.sagemaker(rule_configsbuiltin_in_rule()),
    ProfilerRule.sagemaker(rule_configsBuiltInRule())
]

estimator=Estimator(
    image_uri=byoc_image_uri,
    entry_point="./debugger_custom_container_test_folder/your-training-script.py",
    role=sagemaker.get_execution_role(),
    base_job_name='debugger-custom-container-test',
    instance_count=1,
    instance_type='ml.p3.2xlarge',
)```

Step 6: Clean up resources

1. Open the SageMaker console, choose the notebook instance RunScriptNotebookInstance, choose Actions, and choose Stop. It can take a few minutes for the instance to stop.
2. After the instance Status changes to Stopped, choose Actions, choose Delete, and then choose Delete in the dialog box. It can take a few minutes for the instance to be deleted. The notebook instance disappears from the table when it has been deleted.
3. Open the Amazon S3 console and delete the bucket that you created for storing model artifacts and the training dataset.
4. Open the IAM console and delete the IAM role. If you created permission policies, you can delete them, too.

Note
The Docker container shuts down automatically after it has run. You don’t need to delete it.

Adapting Your Own Inference Container

If none of the Amazon SageMaker prebuilt inference containers suffice for your situation, and you want to use your own Docker container, use the SageMaker Inference Toolkit to adapt your container to work with SageMaker hosting. To adapt your container to work with SageMaker hosting, create the inference code in one or more Python script files and a Dockerfile that imports the inference toolkit.

The inference code includes an inference handler, a handler service, and an entrypoint. In this example, they are stored as three separate Python files. All three of these Python files must be in the same directory as your Dockerfile.

For an example Jupyter notebook that shows a complete example of extending a container by using the SageMaker inference toolkit, see Amazon SageMaker Multi-Model Endpoints using your own algorithm container.

Step 1: Create an Inference Handler

The SageMaker inference toolkit is built on the multi-model server (MMS). MMS expects a Python script that implements functions to load the model, pre-process input data, get predictions from the model, and process the output data in a model handler.

The model_fn Function

There are default implementations for the model_fn function, named default_model_fn, on the SageMaker PyTorch and MXNet Inference toolkits. The default implementation loads models saved using torchscript, of the form .pt or .pth. If your model requires custom methods to load, or you want to perform extra steps when loading your model, you must implement the model_fn function. The following simple example shows an implementation of a model_fn function that loads a PyTorch model:

```python
def model_fn(self, model_dir):
    import torch

    logger.info('model_fn')
    device = "cuda" if torch.cuda.is_available() else "cpu"
    with open(os.path.join(model_dir, 'model.pth'), 'rb') as f:
        model = torch.jit.load(f)
    return model.to(device)
```

The input_fn Function

The input_fn function is responsible for deserializing your input data so that it can be passed to your model. It takes input data and content type as parameters, and returns deserialized data. The SageMaker inference toolkit provides a default implementation that deserializes the following content types:

- JSON
- CSV
- Numpy array
NPZ

If your model requires a different content type, or you want to preprocess your input data before sending it to the model, you must implement the `input_fn` function. The following example shows a simple implementation of the `input_fn` function.

```python
from sagemaker_inference import content_types, decoder
def input_fn(self, input_data, content_type):
    """A default input_fn that can handle JSON, CSV and NPZ formats.
    Args:
    input_data: the request payload serialized in the content_type format
    content_type: the request content_type
    Returns: input_data deserialized into torch.FloatTensor or torch.cuda.FloatTensor depending if cuda is available.
    """
    return decoder.decode(input_data, content_type)
```

The `predict_fn` Function

The `predict_fn` function is responsible for getting predictions from the model. It takes the model and the data returned from `input_fn` as parameters, and returns the prediction. There is no default implementation for the `predict_fn`. You must implement it yourself. The following is a simple implementation of the `predict_fn` function for a PyTorch model.

```python
def predict_fn(self, data, model):
    """A default predict_fn for PyTorch. Calls a model on data deserialized in input_fn.
    Runs prediction on GPU if cuda is available.
    Args:
    data: input data (torch.Tensor) for prediction deserialized by input_fn
    model: PyTorch model loaded in memory by model_fn
    Returns: a prediction
    """
    return model(data)
```

The `output_fn` Function

The `output_fn` function is responsible for serializing the data that the `predict_fn` function returns as a prediction. The SageMaker inference toolkit implements a default `output_fn` function that serializes NumPy arrays, JSON, and CSV. If your model outputs any other content type, or you want to perform other post-processing of your data before sending it to the user, you must implement your own `output_fn` function. The following shows a simple `output_fn` function for a PyTorch model.

```python
from sagemaker_inference import encoder
def output_fn(self, prediction, accept):
    """A default output_fn for PyTorch. Serializes predictions from predict_fn to JSON, CSV or NPY format.
    Args:
    prediction: a prediction result from predict_fn
    accept: type which the output data needs to be serialized
    Returns: output data serialized
    """
    return encoder.encode(prediction, accept)
```
Step 2: Implement a Handler Service

The handler service is executed by the model server. The handler service implements `initialize` and `handle` methods. The `initialize` method is invoked when the model server starts, and the `handle` method is invoked for all incoming inference requests to the model server. For more information, see Custom Service in the Multi-model server documentation. The following is an example of a handler service for a PyTorch model server.

```python
from sagemaker_inference.default_handler_service import DefaultHandlerService
from sagemaker_inference.transformer import Transformer
from sagemaker_pytorch_serving_container.default_inference_handler import DefaultPytorchInferenceHandler

class HandlerService(DefaultHandlerService):
    """Handler service that is executed by the model server.
    Determines specific default inference handlers to use based on model being used.
    This class extends `DefaultHandlerService` which define the following:
    - The `handle` method is invoked for all incoming inference requests to the model server.
    - The `initialize` method is invoked at model server start up.
    Based on: https://github.com/awslabs/mxnet-model-server/blob/master/docs/custom_service.md
    """
    def __init__(self):
        transformer = Transformer(default_inference_handler=DefaultPytorchInferenceHandler())
        super(HandlerService, self).__init__(transformer=transformer)
```

Step 3: Implement an Entrypoint

The entrypoint starts the model server by invoking the handler service. You specify the location of the entrypoint in your Dockerfile. The following is an example of an entrypoint.

```python
from sagemaker_inference import model_server
model_server.start_model_server(handler_service=HANDLER_SERVICE)
```

Step 4: Write a Dockerfile

In your Dockerfile, copy the model handler from step 2 and specify the Python file from the previous step as the entrypoint in your Dockerfile. The following is an example of the lines you can add to your Dockerfile to copy the model handler and specify the entrypoint. For a full example of a Dockerfile for an inference container, see Dockerfile.

```bash
# Copy the default custom service file to handle incoming data and inference requests
COPY model_handler.py /home/model-server/model_handler.py

# Define an entrypoint script for the docker image
ENTRYPOINT ["python", "/usr/local/bin/entrypoint.py"]
```

Step 5: Build and Register Your Container

Now you can build your container and register it in Amazon Elastic Container Registry (Amazon ECR). The following shell script from the sample notebook builds the container and uploads it to an Amazon ECR repository in your AWS account.
Create a container with your own algorithms and models

If none of the existing SageMaker containers meet your needs and you don’t have an existing container of your own, you may need to create a new Docker container. The following sections show how to create Docker containers with your training and inference algorithms for use with SageMaker.

Topics

- Use Your Own Training Algorithms (p. 3283)
- Use Your Own Inference Code (p. 3293)
Use Your Own Training Algorithms

This section explains how Amazon SageMaker interacts with a Docker container that runs your custom training algorithm. Use this information to write training code and create a Docker image for your training algorithms.

Topics

- How Amazon SageMaker Runs Your Training Image (p. 3283)
- How Amazon SageMaker Provides Training Information (p. 3287)
- Run Training with EFA (p. 3290)
- How Amazon SageMaker Signals Algorithm Success and Failure (p. 3292)
- How Amazon SageMaker Processes Training Output (p. 3293)

How Amazon SageMaker Runs Your Training Image

Amazon SageMaker processes your training image using a Docker container entrypoint script. By default, SageMaker looks for a script called `train` inside your container. You can also provide your own custom entrypoint by using the `ContainerArguments` and `ContainerEntrypoint` parameters of the `AlgorithmSpecification` API. If you use your own custom entrypoint, you have the added flexibility to run it as a standalone script without rebuilding your images.

This section shows how to run a training image without using the SageMaker training toolkit library. If you're unfamiliar with manually configuring a Docker container, we recommend that you use the toolkit instead. For more information about how to use the training toolkit, see Adapting Your Own Training Container (p. 3268).

You have two options to manually configure your Docker container to run your image. You can use the `CreateTrainingJob` API and a Docker container with an entrypoint instruction contained inside of it. Alternatively, you can use the `CreateTrainingJob` API, and pass your training script from outside of your Docker container.

Run a training job with an entrypoint script bundled inside the Docker container

SageMaker can run an entrypoint script bundled inside your Docker container.

- By default, Amazon SageMaker runs the following container.

  ```
  docker run image train
  ```

- SageMaker overrides any default `CMD` statements in a container by specifying the `train` argument after the image name. In your Docker container, use the following `exec` form of the `ENTRYPOINT` instruction.

  ```
  ENTRYPOINT ["executable", "param1", "param2", ...]
  ```

  The following example shows how to specify a python entrypoint instruction called `k-means-algorithm.py`.

  ```
  ENTRYPOINT ["python", "k-means-algorithm.py"]
  ```

  The `exec` form of the `ENTRYPOINT` instruction starts the executable directly, not as a child of `/bin/sh`. This enables it to receive signals like `SIGTERM` and `SIGKILL` from SageMaker APIs. The following conditions apply when using the SageMaker APIs.
• The CreateTrainingJob API has a stopping condition that directs SageMaker to stop model training after a specific time.

• The following shows the StopTrainingJob API. This API issues the equivalent of the docker stop, with a 2-minute timeout command to gracefully stop the specified container.

```bash
docker stop -t 120
```

The command attempts to stop the running container by sending a SIGTERM signal. After the 2-minute timeout, the API sends SIGKILL and forcibly stops the containers. If the container handles the SIGTERM gracefully and exits within 120 seconds from receiving it, no SIGKILL is sent.

If you want access to the intermediate model artifacts after SageMaker stops the training, add code to handle saving artifacts in your SIGTERM handler.

• If you plan to use GPU devices for model training, make sure that your containers are nvidia-docker compatible. Include only the CUDA toolkit on containers; don't bundle NVIDIA drivers with the image. For more information about nvidia-docker, see NVIDIA/nvidia-docker.

• You can't use the tini initializer as your entrypoint script in SageMaker containers because it gets confused by the train and serve arguments.

• /opt/ml and all subdirectories are reserved by SageMaker training. When building your algorithm's Docker image, make sure that you don't place any data that's required by your algorithm in this directory. Because if you do, the data may no longer be visible during training.

### Run a training job with an entrypoint script outside the Docker container

You can use your own Docker container for training and pass in an entrypoint script from outside the Docker container. There are some benefits to structuring your entrypoint script outside the container. If you update your entrypoint script, you don't need to rebuild the Docker container. You can also use several different scripts to run in the same container.

Specify the location of your training script using the ContainerEntrypoint and ContainerArguments parameters of the AlgorithmSpecification API. These entrypoints and arguments behave in the same manner as Docker entrypoints and arguments. The values in these parameters override the corresponding ENTRYPOINT or CMD provided as part of the Docker container.

When you pass your custom entrypoint script to your Docker training container, the inputs that you provide determine the behavior of the container.

• For example, if you provide only ContainerEntrypoint, the request syntax using the CreateTrainingJob API is as follows.

```json
{
   "AlgorithmSpecification": {
      "ContainerEntrypoint": ["string"],
      ...
   }
}
```

Then, the SageMaker training backend runs your custom entrypoint as follows.

```bash
docker run --entrypoint <ContainerEntrypoint> image
```
Note
If `ContainerEntrypoint` is provided, the SageMaker training backend runs the image with
the given entrypoint and overrides the default `ENTRYPOINT` in the image.

- If you provide only `ContainerArguments`, SageMaker assumes that the Docker container contains an
  entrypoint script. The request syntax using the `CreateTrainingJob` API is as follows.

```json
{
   "AlgorithmSpecification": {
      "ContainerArguments": ["arg1", "arg2"],
      ...
   }
}
```

The SageMaker training backend runs your custom entrypoint as follows.

```bash
docker run image <ContainerArguments>
```

- If you provide both the `ContainerEntrypoint` and `ContainerArguments`, then the request
  syntax using the `CreateTrainingJob` API is as follows.

```json
{
   "AlgorithmSpecification": {
      "ContainerEntrypoint": ["string"],
      "ContainerArguments": ["arg1", "arg2"],
      ...
   }
}
```

The SageMaker training backend runs your custom entrypoint as follows.

```bash
docker run --entrypoint <ContainerEntrypoint> image <ContainerArguments>
```

You can use any supported `InputDataConfig` source in the `CreateTrainingJob` API to provide an
entrypoint script to run your training image.

To bundle your shell or Python scripts inside your Docker image, or to provide the script in an Amazon S3
bucket or by using the AWS Command Line Interface (CLI), continue to the following section.

**Bundle your shell script in a Docker container**

If you want to bundle your custom shell script inside your Docker image, use the following steps.

1. Bundle your shell script inside your Docker container. The following code snippet copies a custom
   entrypoint script `custom_entrypoint.sh` from the current working directory to a Docker container
   located in `mydir`. The following example assumes that the base Docker image has Python installed.

   ```bash
   FROM <base-docker-image>::<tag>
   # Copy custom entrypoint from current dir to /mydir on container
   COPY ./custom_entrypoint.sh /mydir/
   ```

2. Build and push a Docker container to the Amazon Elastic Container Registry (Amazon ECR) by
   following the instructions at [Pushing a Docker image in the Amazon ECR User Guide](#).

3. Launch the training job by running the following AWS CLI command.
Bundle your Python script in a Docker container

To bundle your custom Python script inside your Docker image, use the following steps.

1. Bundle your Python script in your Dockerfile. The following code snippet copies a custom entrypoint script `custom_entrypoint.py` from the current working directory to a Docker container located in `mydir`.

```bash
FROM <base-docker-image>:<tag>
# Copy custom entrypoint from current dir to /mydir on container
COPY ./custom_entrypoint.py /mydir/
```

2. Launch the training job by running the following AWS CLI command.

```bash
aws --region <your-region> sagemaker create-training-job \
--training-job-name <your-training-job-name> \
--role-arn <your-execution-role-arn> \
--algorithm-specification '{ \
  "TrainingInputMode": "File", \
  "TrainingImage": "<your-ecr-image>", \
  "ContainerEntrypoint": ["/bin/sh"], \
  "ContainerArguments": ["/mydir/custom_entrypoint.sh"]}' \
--output-data-config '{"S3OutputPath": "s3://custom-entrypoint-output-bucket/"}' \
--resource-config \
'{"VolumeSizeInGB":10,"InstanceCount":1,"InstanceType":"ml.m5.2xlarge"}' \
--stopping-condition '{"MaxRuntimeInSeconds": 180}'
```

Provide your entrypoint script in an Amazon S3 bucket

To provide a custom entrypoint script using an S3 bucket, use the `S3DataSource` parameter of the `DataSource` API to specify the location of the script. If you use the `S3DataSource` parameter, the following are required.

- The `InputMode` must be of the type `File`.
- The `S3DataDistributionType` must be `FullyReplicated`.

The following example has a script called `custom_entrypoint.sh` placed in a path to an S3 bucket `s3://<bucket-name>/<bucket prefix>/custom_entrypoint.sh`.

```bash
#!/bin/bash
echo "Running custom_entrypoint.sh"
echo "Hello you have provided the following arguments: "$@
```

Next, you must set the configuration of the input data channel to run a training job. Do this either by using the AWS CLI directly or with a JSON file.
Using AWS CLI with a JSON file

To use AWS CLI with a JSON file, ensure that all of the following fields use the request syntax defined in the CreateTrainingJob API.

```json
// run-my-training-job.json
{
    "AlgorithmSpecification": {
        "ContainerEntrypoint": ["/bin/sh"],
        "ContainerArguments": ["/opt/ml/input/data/<your_channel_name>/custom_entrypoint.sh"],
        ...
    },
    "InputDataConfig": [
        {
            "ChannelName": "<your_channel_name>",
            "DataSource": {
                "S3DataSource": {
                    "S3DataDistributionType": "FullyReplicated",
                    "S3DataType": "S3Prefix",
                    "S3Uri": "s3://<bucket-name>/<bucket_prefix>",
                },
            },
            "InputMode": "File",
        },
        ...
    }
}
```

Next, run the AWS CLI command to launch the training job from the JSON file as follows.

```
aws sagemaker create-training-job --cli-input-json file://run-my-training-job.json
```

Using AWS CLI directly

To use AWS CLI directly without a JSON file, use the following code structure.

```
aws --region <your-region> sagemaker create-training-job \
    --training-job-name <your-training-job-name> \
    --role-arn <your-execution-role-arn> \
    --algorithm-specification '{ \
        "TrainingInputMode": "File", \
        "TrainingImage": "<your-ecr-image>", \
        "ContainerEntrypoint": ["/bin/sh"], \
        "ContainerArguments": ["/opt/ml/input/data/<your_channel_name>/custom_entrypoint.sh"]}' \
    --input-data-config '[[ \
        "ChannelName": "<your_channel_name>", \
        "DataSource": { \
            "S3DataSource": { \
                "S3DataDistributionType": "FullyReplicated"},
        },
        "InputMode": "File",
    ],"DataLocationType": "S3Prefix", \
    "S3Uri": "s3://<bucket-name>/bucket_prefix",
    "S3DataType": "S3Prefix"]}' \
    --output-data-config '{"OutputChannelName": "<your-channel-name>"}' \
    --resource-config '{"VolumeSizeInGB": 1, "InstanceCount": 1, "InstanceType": "ml.m5.2xlarge"}' \
    --stopping-condition '{"MaxRuntimeInSeconds": 180}'
```

How Amazon SageMaker Provides Training Information

This section explains how SageMaker makes training information, such as training data, hyperparameters, and other configuration information, available to your Docker container.
When you send a `CreateTrainingJob` request to SageMaker to start model training, you specify the Amazon Elastic Container Registry (Amazon ECR) path of the Docker image that contains the training algorithm. You also specify the Amazon Simple Storage Service (Amazon S3) location where training data is stored and algorithm-specific parameters. SageMaker makes this information available to the Docker container so that your training algorithm can use it. This section explains how we make this information available to your Docker container. For information about creating a training job, see `CreateTrainingJob`. For more information on the way that SageMaker containers organize information, see Using the SageMaker Training and Inference Toolkits (p. 3267).

**Topics**

- Hyperparameters (p. 3288)
- Environment Variables (p. 3288)
- Input Data Configuration (p. 3288)
- Training Data (p. 3289)
- Distributed Training Configuration (p. 3290)

**Hyperparameters**

SageMaker makes the hyperparameters in a `CreateTrainingJob` request available in the Docker container in the `/opt/ml/input/config/hyperparameters.json` file.

**Environment Variables**

The following environment variables are set in the container:

- `TRAINING_JOB_NAME` – Specified in the `TrainingJobName` parameter of the `CreateTrainingJob` request.
- `TRAINING_JOB_ARN` – The Amazon Resource Name (ARN) of the training job returned as the `TrainingJobArn` in the `CreateTrainingJob` response.
- All environment variables specified in the `Environment` parameter in the `CreateTrainingJob` request.

**Input Data Configuration**

You specify data channel information in the `InputDataConfig` parameter in a `CreateTrainingJob` request. SageMaker makes this information available in the `/opt/ml/input/config/inputdataconfig.json` file in the Docker container.

For example, suppose that you specify three data channels (`train`, `evaluation`, and `validation`) in your request. SageMaker provides the following JSON:

```json
{
    "train" : {
        "ContentType": "trainingContentType",
        "TrainingInputMode": "File",
        "S3DistributionType": "FullyReplicated",
        "RecordWrapperType": "None"},
    "evaluation" : {
        "ContentType": "evalContentType",
        "TrainingInputMode": "File",
        "S3DistributionType": "FullyReplicated",
        "RecordWrapperType": "None"},
    "validation" : {
        "TrainingInputMode": "File",
        "S3DistributionType": "FullyReplicated",
        "RecordWrapperType": "None"}
}
```
Note
SageMaker provides only relevant information about each data channel (for example, the channel name and the content type) to the container, as shown. S3DistributionType will be set as FullyReplicated if specify EFS or FSxLustre as input data sources.

Training Data

The TrainingInputMode parameter in the AlgorithmSpecification of the CreateTrainingJob request specifies how the training dataset is made available. The following input modes are available:

- **File mode**
  - TrainingInputMode parameter written to inputdataconfig.json: "File"
  - Data channel directory in the Docker container: `/opt/ml/input/data/channel_name`
  - Supported data sources: Amazon Simple Storage Service (Amazon S3), Amazon Elastic File System (Amazon EFS), and Amazon FSx for Lustre

  A directory is created for each channel. For example, if you have three channels named training, validation, and testing, SageMaker makes three directories in the Docker container:
  
  - `/opt/ml/input/data/training`
  - `/opt/ml/input/data/validation`
  - `/opt/ml/input/data/testing`

  **Note**
  Channels that use file system data sources such as Amazon EFS and Amazon FSx must use File mode. If a file system is specified, the directory path provided in the channel is mounted at `/opt/ml/input/data/channel_name`.

- **FastFile mode**
  - TrainingInputMode parameter written to inputdataconfig.json: "FastFile"
  - Data channel directory in the Docker container: `/opt/ml/input/data/channel_name`
  - Supported data sources: Amazon S3

  The channel directory is mounted as read-only.

  Algorithms that support File mode can seamlessly work with FastFile mode with no code changes.

  **Note**
  Channels that use FastFile mode must use a S3DataType of "S3Prefix". FastFile mode presents a folder view that uses the forward slash (`/`) as the delimiter for grouping Amazon S3 objects into folders. S3Uri prefixes must not correspond to a partial folder name. For example, if an Amazon S3 dataset contains s3://my-bucket/train-01/data.csv, then neither s3://my-bucket/train nor s3://my-bucket/train-01 are allowed as S3Uri prefixes.
  
  A trailing forward slash is recommended to define a channel corresponding to a folder. For example, the s3://my-bucket/train-01/ channel for the train-01 folder. Without the trailing forward slash, the channel would be ambiguous if there existed another folder s3://my-bucket/train-011/ or file s3://my-bucket/train-01.txt/.

- **Pipe mode**
  - TrainingInputMode parameter written to inputdataconfig.json: "Pipe"
  - Data channel directory in the Docker container: `/opt/ml/input/data/channel_name_epoch_number`
  - Supported data sources: Amazon S3

  You need to read from a separate pipe for each channel. For example, if you have three channels named training, validation, and testing, you need to read from the following pipes:
  
  - `/opt/ml/input/data/training_0`
  - `/opt/ml/input/data/training_1`
  - ...
• /opt/ml/input/data/validation_0, /opt/ml/input/data/validation_1, ...
• /opt/ml/input/data/testing_0, /opt/ml/input/data/testing_1, ...

Read the pipes sequentially. For example, if you have a channel called training, read the pipes in this sequence:
1. Open /opt/ml/input/data/training_0 in read mode and read it to end-of-file (EOF) or, if you are done with the first epoch, close the pipe file early.
2. After closing the first pipe file, look for /opt/ml/input/data/training_1 and read it until you have completed the second epoch, and so on.

If the file for a given epoch doesn't exist yet, your code may need to retry until the pipe is created.

There is no sequencing restriction across channel types. For example, you can read multiple epochs for the training channel and only start reading the validation channel when you are ready. Or, you can read them simultaneously if your algorithm requires that.

For an example of a Jupyter notebook that shows how to use Pipe mode when bringing your own container, see Bring your own pipe-mode algorithm to Amazon SageMaker.

**Distributed Training Configuration**

If you're performing distributed training with multiple containers, SageMaker makes information available in the /opt/ml/input/config/resourceconfig.json file.

To enable inter-container communication, this JSON file contains information for all containers. SageMaker makes this file available for both File and Pipe mode algorithms. The file provides the following information:

• current_host—The name of the current container on the container network. For example, algo-1. Host values can change at any time. Don't write code with specific values for this variable.

• hosts—The list of names of all containers on the container network, sorted lexicographically. For example, ["algo-1", "algo-2", "algo-3"] for a three-node cluster. Containers can use these names to address other containers on the container network. Host values can change at any time. Don't write code with specific values for these variables.

• network_interface_name—The name of the network interface that is exposed to your container. For example, containers running the Message Passing Interface (MPI) can use this information to set the network interface name.

• Do not use the information in /etc/hostname or /etc/hosts because it might be inaccurate.

• Hostname information may not be immediately available to the algorithm container. We recommend adding a retry policy on hostname resolution operations as nodes become available in the cluster.

The following is an example file on node 1 in a three-node cluster:

```json
{
    "current_host": "algo-1",
    "hosts": ["algo-1","algo-2","algo-3"],
    "network_interface_name": "eth1"
}
```

**Run Training with EFA**

SageMaker provides integration with EFA devices to accelerate High Performance Computing (HPC) and machine learning applications. This integration allows you to leverage an EFA device when running your distributed training jobs. You can add EFA integration to an existing Docker container that you bring
Use Your Own Training Algorithms

The following information outlines how to configure your own container to use an EFA device for your distributed training jobs.

Prerequisites

Your container must satisfy the SageMaker Training container specification.

Install EFA and required packages

Your container must download and install the EFA software. This allows your container to recognize the EFA device, and provides compatible versions of Libfabric and Open MPI.

Any tools like MPI and NCCL must be installed and managed inside the container to be used as part of your EFA-enabled training job. The following example shows how to modify the Dockerfile of your EFA-enabled container to install EFA, MPI, OFI, NCCL, and NCCL-TEST.

Note
When using PyTorch with EFA on your container, the NCCL version of your container should match the NCCL version of your PyTorch installation. To verify the PyTorch NCCL version, use the following command:

```
torch.cuda.nccl.version()
```
Considerations when creating your container

The EFA device is mounted to the container as /dev/infiniband/uverbs0 under the list of devices accessible to the container. On P4d instances, the container has access to 4 EFA devices. The EFA devices can be found in the list of devices accessible to the container as:

- /dev/infiniband/uverbs0
- /dev/infiniband/uverbs1
- /dev/infiniband/uverbs2
- /dev/infiniband/uverbs3

To get information about hostname, peer hostnames, and network interface (for MPI) from the resourceconfig.json file provided to each container instances, see Distributed Training Configuration. Your container handles regular TCP traffic among peers through the default Elastic Network Interfaces (ENI), while handling OFI (kernel bypass) traffic through the EFA device.

Verify that your EFA device is recognized

To verify that the EFA device is recognized, run the following command from within your container.

```
/opt/amazon/efa/bin/fi_info -p efa
```

Your output should look similar to the following.

```
provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-rdm
  version: 2.0
  type: FI_EP_RDM
  protocol: FI_PROTO_EFA

provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-dgrm
  version: 2.0
  type: FI_EP_DGRAM
  protocol: FI_PROTO_EFA

provider: efa;ofi_rxd
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-dgrm
  version: 1.0
  type: FI_EP_RDM
  protocol: FI_PROTO_RXD
```

Running a training job with EFA

Once you've created an EFA-enabled container, you can run a training job with EFA using a SageMaker Estimator the same way as you would with any other Docker image. For more information on registering your container and using it for training, see Adapting Your Own Training Container.

How Amazon SageMaker Signals Algorithm Success and Failure

A training algorithm indicates whether it succeeded or failed using the exit code of its process.

A successful training execution should exit with an exit code of 0 and an unsuccessful training execution should exit with a non-zero exit code. These will be converted to Completed and Failed in the TrainingJobStatus returned by DescribeTrainingJob. This exit code convention is standard and is easily implemented in all languages. For example, in Python, you can use `sys.exit(1)` to signal a failure exit, and simply running to the end of the main routine will cause Python to exit with code 0.
In the case of failure, the algorithm can write a description of the failure to the failure file. See next section for details.

**How Amazon SageMaker Processes Training Output**

As your algorithm runs in a container, it generates output including the status of the training job and model and output artifacts. Your algorithm should write this information to the following files, which are located in the container's `/output` directory. Amazon SageMaker processes the information contained in this directory as follows:

- `/opt/ml/model` – Your algorithm should write all final model artifacts to this directory. SageMaker copies this data as a single object in compressed tar format to the S3 location that you specified in the `CreateTrainingJob` request. If multiple containers in a single training job write to this directory they should ensure no file/directory names clash. SageMaker aggregates the result in a TAR file and uploads to S3 at the end of the training job.

- `/opt/ml/output` – Your algorithm should write artifacts you want to store other than the final model to this directory. SageMaker copies this data as a single object in compressed tar format to the S3 location that you specified in the `CreateTrainingJob` request. If multiple containers in a single training job write to this directory they should ensure no file/directory names clash. SageMaker aggregates the result in a TAR file and uploads to S3 at the end of the training job.

- `/opt/ml/output/failure` – If training fails, after all algorithm output (for example, logging) completes, your algorithm should write the failure description to this file. In a `DescribeTrainingJob` response, SageMaker returns the first 1024 characters from this file as `FailureReason`.

**Use Your Own Inference Code**

You can use Amazon SageMaker to interact with Docker containers and run your own inference code in one of two ways:

- To use your own inference code with a persistent endpoint to get one prediction at a time, use SageMaker hosting services.
- To use your own inference code to get predictions for an entire dataset, use SageMaker batch transform.

**Topics**

- Use Your Own Inference Code with Hosting Services (p. 3293)
- Use Your Own Inference Code with Batch Transform (p. 3299)

**Use Your Own Inference Code with Hosting Services**

This section explains how Amazon SageMaker interacts with a Docker container that runs your own inference code for hosting services. Use this information to write inference code and create a Docker image.

**Topics**

- How SageMaker Runs Your Inference Image (p. 3294)
- How SageMaker Loads Your Model Artifacts (p. 3295)
- How Containers Serve Requests (p. 3295)
- How Your Container Should Respond to Inference Requests (p. 3295)
- How Your Container Should Respond to Health Check (Ping) Requests (p. 3295)
• Use a Private Docker Registry for Real-Time Inference Containers (p. 3296)

How SageMaker Runs Your Inference Image

To configure a container to run as an executable, use an ENTRYPOINT instruction in a Dockerfile. Note the following:

• For model inference, SageMaker runs the container as:

```
docker run image serve
```

SageMaker overrides default CMD statements in a container by specifying the serve argument after the image name. The serve argument overrides arguments that you provide with the CMD command in the Dockerfile.

• We recommend that you use the exec form of the ENTRYPOINT instruction:

```
ENTRYPOINT ["executable", "param1", "param2"]
```

For example:

```
ENTRYPOINT ["python", "k_means_inference.py"]
```

The exec form of the ENTRYPOINT instruction starts the executable directly, not as a child of /bin/sh. This enables it to receive signals like SIGTERM and SIGKILL from the SageMaker API operations, which is a requirement.

For example, when you use the CreateEndpoint API to create an endpoint, SageMaker provisions the number of ML compute instances required by the endpoint configuration, which you specify in the request. SageMaker runs the Docker container on those instances.

If you reduce the number of instances backing the endpoint (by calling the UpdateEndpointWeightsAnd Capacities API), SageMaker runs a command to stop the Docker container on the instances that are being terminated. The command sends the SIGTERM signal, then it sends the SIGKILL signal thirty seconds later.

If you update the endpoint (by calling the UpdateEndpoint API), SageMaker launches another set of ML compute instances and runs the Docker containers that contain your inference code on them. Then it runs a command to stop the previous Docker containers. To stop a Docker container, command sends the SIGTERM signal, then it sends the SIGKILL signal 30 seconds later.

• SageMaker uses the container definition that you provided in your CreateModel request to set environment variables and the DNS hostname for the container as follows:

• It sets environment variables using the ContainerDefinition.Environment string-to-string map.
• It sets the DNS hostname using the `ContainerDefinition.ContainerHostname`.

• If you plan to use GPU devices for model inferences (by specifying GPU-based ML compute instances in your `CreateEndpointConfig` request), make sure that your containers are `nvidia-docker` compatible. Don't bundle NVIDIA drivers with the image. For more information about `nvidia-docker`, see `NVIDIA/nvidia-docker`.

• You can't use the `tini` initializer as your entry point in SageMaker containers because it gets confused by the `train` and `serve` arguments.

How SageMaker Loads Your Model Artifacts

In your `CreateModel` request, the container definition includes the `ModelDataUrl` parameter, which identifies the S3 location where model artifacts are stored. SageMaker uses this information to determine from where to copy the model artifacts. It copies the artifacts to the `/opt/ml/model` directory for use by your inference code.

The `ModelDataUrl` must point to a tar.gz file. Otherwise, SageMaker won't download the file.

If you trained your model in SageMaker, the model artifacts are saved as a single compressed tar file in Amazon S3. If you trained your model outside SageMaker, you need to create this single compressed tar file and save it in a S3 location. SageMaker decompresses this tar file into `/opt/ml/model` directory before your container starts.

How Containers Serve Requests

Containers need to implement a web server that responds to `/invocations` and `/ping` on port 8080.

How Your Container Should Respond to Inference Requests

To obtain inferences, the client application sends a POST request to the SageMaker endpoint. For more information, see the `InvokeEndpoint` API. SageMaker passes the request to the container, and returns the inference result from the container to the client. Note the following:

• SageMaker strips all POST headers except those supported by `InvokeEndpoint`. SageMaker might add additional headers. Inference containers must be able to safely ignore these additional headers.

• To receive inference requests, the container must have a web server listening on port 8080 and must accept POST requests to the `/invocations` endpoint.

• A customer's model containers must accept socket connection requests within 250 ms.

• A customer's model containers must respond to requests within 60 seconds. The model itself can have a maximum processing time of 60 seconds before responding to the `/invocations`. If your model is going to take 50-60 seconds of processing time, the SDK socket timeout should be set to be 70 seconds.

How Your Container Should Respond to Health Check (Ping) Requests

The `CreateEndpoint` and `UpdateEndpoint` API calls result in SageMaker starting new inference containers. Soon after container startup, SageMaker starts sending periodic GET requests to the `/ping` endpoint.

The simplest requirement on the container is to respond with an HTTP 200 status code and an empty body. This indicates to SageMaker that the container is ready to accept inference requests at the `/invocations` endpoint.
If the container does not begin to pass health checks, by consistently responding with 200s, during the 4 minutes after startup, CreateEndPoint will fail, leaving the endpoint in a failed state, and the update requested by UpdateEndpoint will not be completed.

While the minimum bar is for the container to return a static 200, a container developer can use this functionality to perform deeper checks. The request timeout on `/ping` attempts is 2 seconds.

**Use a Private Docker Registry for Real-Time Inference Containers**

Amazon SageMaker hosting enables you to use images stored in Amazon ECR to build your containers for real-time inference by default. Optionally, you can build containers for real-time inference from images in a private Docker registry. The private registry must be accessible from an Amazon VPC in your account. Models that you create based on the images stored in your private Docker registry must be configured to connect to the same VPC where the private Docker registry is accessible. For information about connecting your model to a VPC, see [Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC](p. 3779).

Your Docker registry must be secured with a TLS certificate from a known public certificate authority (CA).

**Note**

Your private Docker registry must allow inbound traffic from the security groups you specify in the VPC configuration for your model, so that SageMaker hosting is able to pull model images from your registry. SageMaker can pull model images from DockerHub if there's a path to the open internet inside your VPC.

**Topics**

- Store Images in a Private Docker Registry other than Amazon Elastic Container Registry (p. 3296)
- Use an Image from a Private Docker Registry for Real-time Inference (p. 3296)
- Allow SageMaker to authenticate to a private Docker registry (p. 3298)
- Create the Lambda function (p. 3298)
- Give your execution role permission to Lambda (p. 3299)
- Create an interface VPC endpoint for Lambda (p. 3299)

**Store Images in a Private Docker Registry other than Amazon Elastic Container Registry**

To use a private Docker registry to store your images for SageMaker real-time inference, create a private registry that is accessible from your Amazon VPC. For information about creating a Docker registry, see [Deploy a registry server](https://docs.docker.com/articles/registry/) in the Docker documentation. The Docker registry must comply with the following:

- The registry must be a [Docker Registry HTTP API V2](https://docs.docker.com/registry/spec/api/) registry.
- The Docker registry must be accessible from the same VPC that you specify in the `VpcConfig` parameter that you specify when you create your model.

**Use an Image from a Private Docker Registry for Real-time Inference**

When you create a model and deploy it to SageMaker hosting, you can specify that it use an image from your private Docker registry to build the inference container. Specify this in the `ImageConfig` object in the `PrimaryContainer` parameter that you pass to a call to the `create_model` function.

**To use an image stored in your private Docker registry for your inference container**

1. Create the image configuration object and specify a value of `Vpc` for the `RepositoryAccessMode` field.
2. If your private Docker registry requires authentication, add a RepositoryAuthConfig object to the image configuration object. For the RepositoryCredentialsProviderArn field of the RepositoryAuthConfig object, specify the Amazon Resource Name (ARN) of an AWS Lambda function that provides credentials that allows SageMaker to authenticate to your private Docker Registry. For information about how to create the Lambda function to provide authentication, see Allow SageMaker to authenticate to a private Docker registry (p. 3298).

3. Create the primary container object that you want to pass to create_model, using the image configuration object that you created in the previous step.

   Provide your image in digest form. If you provide your image using the :latest tag, there is a risk that SageMaker pulls a newer version of the image than intended. Using the digest form ensures that SageMaker pulls the intended image version.

4. Specify the model name and the execution role that you want to pass to create_model.

5. Specify one or more security groups and subnets for the VPC configuration for your model. Your private Docker registry must allow inbound traffic from the security groups that you specify. The subnets that you specify must be in the same VPC as your private Docker registry.

7. Create the model by calling create_model, using the values you specified in the previous steps for the PrimaryContainer and VpcConfig parameters.
Use Your Own Inference Code

```python
    ExecutionRoleArn=execution_role_arn,
    VpcConfig=vpc_config,
)
except Exception as e:
    print(f'error calling CreateModel operation: {e}')
else:
    print(resp)
```

8. Finally, call `create_endpoint_config` and `create_endpoint` to create the hosting endpoint, using the model that you created in the previous step.

```python
endpoint_config_name = 'my-endpoint-config'
sm.create_endpoint_config(
    EndpointConfigName=endpoint_config_name,
    ProductionVariants=[
        {
            'VariantName': 'MyVariant',
            'ModelName': model_name,
            'InitialInstanceCount': 1,
            'InstanceType': 'ml.t2.medium'
        },
    ],
)
endpoint_name = 'my-endpoint'
sm.create_endpoint(
    EndpointName=endpoint_name,
    EndpointConfigName=endpoint_config_name,
)
sm.describe_endpoint(EndpointName=endpoint_name)
```

**Allow SageMaker to authenticate to a private Docker registry**

To pull an inference image from a private Docker registry that requires authentication, create an AWS Lambda function that provides credentials, and provide the Amazon Resource Name (ARN) of the Lambda function when you call `create_model`. When SageMaker runs `create_model`, it calls the Lambda function that you specified to get credentials to authenticate to your Docker registry.

**Create the Lambda function**

Create an AWS Lambda function that returns a response with the following form:

```python
def handler(event, context):
    response = {
        "Credentials": {"Username": "username", "Password": "password"}
    }
    return response
```

Depending on how you set up authentication for your private Docker registry, the credentials that your Lambda function returns can mean either of the following:

- If you set up your private Docker registry to use basic authentication, this is the `username` and `password` to authenticate to the registry.
- If you set up your private Docker registry to use bearer token authentication, the `username` and `password` are sent to your authorization server, which returns a Bearer token that can then be used to authenticate to the private Docker registry.
Give your execution role permission to Lambda

The execution role that you use to call `create_model` must have permissions to call AWS Lambda functions. Add the following to the permissions policy of your execution role.

```json
{
   "Effect": "Allow",
   "Action": [
      "lambda:InvokeFunction"
   ],
   "Resource": [
      "arn:aws:lambda:*:*:function:*myLambdaFunction*"
   ]
}
```

Where `myLambdaFunction` is the name of your Lambda function. For information about editing a role permissions policy, see [Modifying a role permissions policy (console)](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_roles_manage.html) in the AWS Identity and Access Management User Guide.

**Note**

An execution role with the `AmazonSageMakerFullAccess` managed policy attached to it has permission to call any Lambda function with `SageMaker` in its name.

Create an interface VPC endpoint for Lambda

Create an interface endpoint so that your Amazon VPC can communicate with your AWS Lambda function without sending traffic over the internet. For information about how to do this, see [Configuring interface VPC endpoints for Lambda](https://docs.aws.amazon.com/lambda/latest/dg/using-vpc-endpoints.html) in the AWS Lambda Developer Guide.

SageMaker hosting sends a request through your VPC to `lambda.region.amazonaws.com` to call your Lambda function. If you choose Private DNS Name when you create your interface endpoint, Amazon Route 53 routes the call to the Lambda interface endpoint. If you use a different DNS provider, make sure to map `lambda.region.amazonaws.com` to your Lambda interface endpoint.

**Use Your Own Inference Code with Batch Transform**

This section explains how Amazon SageMaker interacts with a Docker container that runs your own inference code for batch transform. Use this information to write inference code and create a Docker image.

**Topics**

- How SageMaker Runs Your Inference Image (p. 3299)
- How SageMaker Loads Your Model Artifacts (p. 3300)
- How Containers Serve Requests (p. 3301)
- How Your Container Should Respond to Inference Requests (p. 3301)
- How Your Container Should Respond to Health Check (Ping) Requests (p. 3302)

**How SageMaker Runs Your Inference Image**

To configure a container to run as an executable, use an `ENTRYPOINT` instruction in a Dockerfile. Note the following:

- For batch transforms, SageMaker runs the container as:

```
docker run image serve
```
SageMaker overrides default CMD statements in a container by specifying the serve argument after the image name. The serve argument overrides arguments that you provide with the CMD command in the Dockerfile.

- We recommend that you use the exec form of the ENTRYPOINT instruction:

```
ENTRYPOINT ["executable", "param1", "param2"]
```

For example:

```
ENTRYPOINT ["python", "k_means_inference.py"]
```

- SageMaker sets environment variables specified in CreateModel and CreateTransformJob on your container. Additionally, the following environment variables are populated:
  - SAGEMAKER_BATCH is always set to true when the container runs in Batch Transform.
  - SAGEMAKER_MAX_PAYLOAD_IN_MB is set to the largest size payload that is sent to the container via HTTP.
  - SAGEMAKER_BATCH_STRATEGY is set to SINGLE_RECORD when the container is sent a single record per call to invocations and MULTI_RECORD when the container gets as many records as will fit in the payload.
  - SAGEMAKER_MAX_CONCURRENT_TRANSFORMS is set to the maximum number of /invocations requests that can be opened simultaneously.

  **Note**
  The last three environment variables come from the API call made by the user. If the user doesn't set values for them, they aren't passed. In that case, either the default values or the values requested by the algorithm (in response to the /execution-parameters) are used.

- If you plan to use GPU devices for model inferences (by specifying GPU-based ML compute instances in your CreateTransformJob request), make sure that your containers are nvidia-docker compatible. Don't bundle NVIDIA drivers with the image. For more information about nvidia-docker, see NVIDIA/nvidia-docker.

- You can't use the init initializer as your entry point in SageMaker containers because it gets confused by the train and serve arguments.

**How SageMaker Loads Your Model Artifacts**

In a CreateModel request, container definitions include the ModelDataUrl parameter, which identifies the location in Amazon S3 where model artifacts are stored. When you use SageMaker to run inferences, it uses this information to determine from where to copy the model artifacts. It copies the artifacts to the /opt/ml/model directory in the Docker container for use by your inference code.

The ModelDataUrl parameter must point to a tar.gz file. Otherwise, SageMaker can't download the file. If you train a model in SageMaker, it saves the artifacts as a single compressed tar file in Amazon S3. If you train a model in another framework, you need to store the model artifacts in Amazon S3 as a compressed tar file. SageMaker decompresses this tar file and saves it in the /opt/ml/model directory in the container before the batch transform job starts.
How Containers Serve Requests

Containers must implement a web server that responds to invocations and ping requests on port 8080. For batch transforms, you have the option to set algorithms to implement execution-parameters requests to provide a dynamic runtime configuration to SageMaker. SageMaker uses the following endpoints:

- ping—Used to periodically check the health of the container. SageMaker waits for an HTTP 200 status code and an empty body for a successful ping request before sending an invocations request. You might use a ping request to load a model into memory to generate inference when invocations requests are sent.
- (Optional) execution-parameters—Allows the algorithm to provide the optimal tuning parameters for a job during runtime. Based on the memory and CPUs available for a container, the algorithm chooses the appropriate MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB values for the job.

Before calling the invocations request, SageMaker attempts to invoke the execution-parameters request. When you create a batch transform job, you can provide values for the MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB parameters. SageMaker determines the values for these parameters using this order of precedence:

1. The parameter values that you provide when you create the CreateTransformJob request.
2. The values that the model container returns when SageMaker invokes the execution-parameters endpoint.
3. The default parameter values, listed in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>MaxConcurrentTransforms</td>
<td>1</td>
</tr>
<tr>
<td>BatchStrategy</td>
<td>MULTI_RECORD</td>
</tr>
<tr>
<td>MaxPayloadInMB</td>
<td>6</td>
</tr>
</tbody>
</table>

The response for a GET execution-parameters request is a JSON object with keys for MaxConcurrentTransforms, BatchStrategy, and MaxPayloadInMB parameters. This is an example of a valid response:

```
{
   "MaxConcurrentTransforms": 8,
   "BatchStrategy": "MULTI_RECORD",
   "MaxPayloadInMB": 6
}
```

How Your Container Should Respond to Inference Requests

To obtain inferences, Amazon SageMaker sends a POST request to the inference container. The POST request body contains data from Amazon S3. Amazon SageMaker passes the request to the container, and returns the inference result from the container, saving the data from the response to Amazon S3.

To receive inference requests, the container must have a web server listening on port 8080 and must accept POST requests to the /invocations endpoint. The inference request timeout and max retries can be configured through ModelClientConfig.
How Your Container Should Respond to Health Check (Ping) Requests

The simplest requirement on the container is to respond with an HTTP 200 status code and an empty body. This indicates to SageMaker that the container is ready to accept inference requests at the /invocations endpoint.

While the minimum bar is for the container to return a static 200, a container developer can use this functionality to perform deeper checks. The request timeout on /ping attempts is 2 seconds.

Example Notebooks: Use Your Own Algorithm or Model

The following Jupyter notebooks show how to use your own algorithms or pretrained models from an Amazon SageMaker notebook instance. For links to the GitHub repositories with the prebuilt Dockerfiles for the TensorFlow, MXNet, Chainer, and PyTorch frameworks and instructions on using the AWS SDK for Python (Boto3) estimators to run your own training algorithms on SageMaker Learner and your own models on SageMaker hosting, see Prebuilt SageMaker Docker Images for Deep Learning (p. 2394)

Setup

1. Create a SageMaker notebook instance. For instructions on how to create and access Jupyter notebook instances, see Use Amazon SageMaker Notebook Instances (p. 358).
2. Open the notebook instance you created.
3. Choose the SageMaker Examples tab for a list of all SageMaker example notebooks.
4. Open the sample notebooks from the Advanced Functionality section in your notebook instance or from GitHub using the provided links. To open a notebook, choose its Use tab, then choose Create copy.

Host Models Trained in Scikit-learn

To learn how to host models trained in Scikit-learn for making predictions in SageMaker by injecting them into first-party k-means and XGBoost containers, see the following sample notebooks.

• kmeans_bring_your_own_model
• xgboost_bring_your_own_model

Package TensorFlow and Scikit-learn Models for Use in SageMaker

To learn how to package algorithms that you have developed in TensorFlow and scikit-learn frameworks for training and deployment in the SageMaker environment, see the following notebooks. They show you how to build, register, and deploy your own Docker containers using Dockerfiles.

• tensorflow_bring_your_own
• scikit_bring_your_own
Train and Deploy a Neural Network on SageMaker

To learn how to train a neural network locally using MXNet or TensorFlow, and then create an endpoint from the trained model and deploy it on SageMaker, see the following notebooks. The MXNet model is trained to recognize handwritten numbers from the MNIST dataset. The TensorFlow model is trained to classify irises.

- mxnet_mnist_byom
- tensorflow_iris_byom

Training Using Pipe Mode

To learn how to use a Dockerfile to build a container that calls the train.py script and uses pipe mode to custom train an algorithm, see the following notebook. In pipe mode, the input data is transferred to the algorithm while it is training. This can decrease training time compared to using file mode.

- pipe_bring_your_own

Bring Your Own R Model

To learn how to use an R container to train and host a model with the R kernel installed in a notebook, see the following notebook. To take advantage of the AWS SDK for Python (Boto3), we use Python within the notebook. You can achieve the same results in R by invoking command line arguments.

- r_bring_your_own

Extend a Prebuilt PyTorch Container Image

To learn how to extend a prebuilt SageMaker PyTorch container image when you have additional functional requirements for your algorithm or model that the prebuilt Docker image doesn't support, see the following notebook.

- pytorch_extending_our_containers

Train and Debug Training Jobs on a Custom Container

To learn how to train and debug training jobs using SageMaker Debugger, see the following notebook. A training script provided through this example uses the TensorFlow Keras ResNet 50 model and the CIFAR10 dataset. A Docker custom container is built with the training script and pushed to Amazon ECR. While the training job is running, Debugger collects tensor outputs and identifies debugging problems. With smdebug client library tools, you can set a smdebug trial object that calls the training job and debugging information, check the training and Debugger rule status, and retrieve tensors saved in an Amazon S3 bucket to analyze training issues.

- build_your_own_container_with_debugger
Troubleshooting your Docker containers

The following are common errors that you might run into when using Docker containers with SageMaker. Each error is followed by a solution to the error.

- **Error: SageMaker has lost the Docker daemon.**

  To fix this error, restart Docker using the following command.

  ```bash
  sudo service docker restart
  ```

- **Error: The /tmp directory of your Docker container has run out of space.**

  Docker containers use the `/` and `/tmp` partitions to store code. These partitions can fill up easily when using large code modules in local mode. The SageMaker Python SDK supports specifying a custom temp directory for your local mode root directory to avoid this issue.

  To specify the custom temp directory in the EBS volume storage, create a file at the following path `~/.sagemaker/config.yaml` and add the following configuration. The directory that you specify as `container_root` must already exist. The SageMaker Python SDK will not try to create it.

  ```yaml
  local:
      container_root: /home/ec2-user/SageMaker/temp
  ```

  With this configuration, local mode uses the `/temp` directory and not the default `/tmp` directory.
SageMaker Workflows

You can manage your Amazon SageMaker training and inference workflows using Amazon SageMaker Studio and the Amazon SageMaker Python SDK. With the available tools, you can simplify your SageMaker process and integrate it into your existing project.

The following workflow technologies are supported.

- **Amazon SageMaker Model Building Pipelines** (p. 3305): SageMaker's tool for building and managing end-to-end ML pipelines.
- **Airflow Workflows**: SageMaker APIs to export configurations for creating and managing Airflow workflows.
- **Kubernetes Orchestration** (p. 3424): SageMaker custom operators for your Kubernetes cluster, as well as custom components for Kubeflow Pipelines.
- **AWS Step Functions**: Create multi-step machine learning workflows in Python that orchestrate SageMaker infrastructure without having to provision your resources separately.

For more information on managing SageMaker training and inference, see Amazon SageMaker Python SDK Workflows.

**Topics**

- Amazon SageMaker Model Building Pipelines (p. 3305)
- Automate MLOps with SageMaker Projects (p. 3378)
- Amazon SageMaker ML Lineage Tracking (p. 3406)
- Kubernetes Orchestration (p. 3424)
- Notebook-based Workflows (p. 3482)
- Amazon SageMaker Workflows FAQ (p. 3496)

Amazon SageMaker Model Building Pipelines

Amazon SageMaker Model Building Pipelines is a tool for building machine learning pipelines that take advantage of direct SageMaker integration. Because of this integration, you can create a pipeline and set up SageMaker Projects for orchestration using a tool that handles much of the step creation and management for you. SageMaker Pipelines provides the following advantages over other AWS workflow offerings:

**SageMaker Integration**

SageMaker Pipelines is integrated directly with SageMaker, so you don't need to interact with any other AWS services. You also don't need to manage any resources because SageMaker Pipelines is a fully managed service, which means that it creates and manages resources for you.

**SageMaker Python SDK Integration**

Because SageMaker Pipelines is integrated with the SageMaker Python SDK, you can create your pipelines programmatically using a high-level Python interface that you might already be familiar
with. To view the SageMaker Python SDK API reference, see Pipelines. For SageMaker Python SDK code examples, see Amazon SageMaker Model Building Pipelines.

SageMaker Studio Integration

SageMaker Studio offers an environment to manage the end-to-end SageMaker Pipelines experience. Using Studio, you can bypass the AWS console for your entire workflow management. For more information on managing SageMaker Pipelines from SageMaker Studio, see View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3369).

Data Lineage Tracking

With SageMaker Pipelines you can track the history of your data within the pipeline execution. Amazon SageMaker ML Lineage Tracking lets you analyze where the data came from, where it was used as an input, and the outputs that were generated from it. For example, you can view the models created from an individual dataset, and you can view the datasets that went into creating an individual model. For more information, see Amazon SageMaker ML Lineage Tracking (p. 3406).

Step Reuse

With SageMaker Pipelines, you can designate steps for caching. When a step is cached, it is indexed for reuse later if the same step is executed again. As a result, you can reuse the output from previous step executions of the same step in the same pipeline without having to run the step again. For more information on step caching, see Caching Pipeline Steps (p. 3333).

Topics

- SageMaker Pipelines Overview (p. 3306)

SageMaker Pipelines Overview

An Amazon SageMaker Model Building Pipelines pipeline is a series of interconnected steps that are defined using the Pipelines SDK. This pipeline definition encodes a pipeline using a directed acyclic graph (DAG) that can be exported as a JSON definition. This DAG gives information on the requirements for and relationships between each step of your pipeline. The structure of a pipeline's DAG is determined by the data dependencies between steps. These data dependencies are created when the properties of a step's output are passed as the input to another step. The following image is an example of a pipeline DAG:
The following topics describe fundamental SageMaker Pipelines concepts. For a tutorial describing the implementation of these concepts, see Create and Manage SageMaker Pipelines (p. 3353).

**Pipeline Structure and Execution**

**Topics**

3307
Pipeline Overview

- Pipeline Structure (p. 3308)
- Pipeline Execution using Parallelism Configuration (p. 3308)

Pipeline Structure

An Amazon SageMaker Model Building Pipelines instance is composed of a name, parameters, and steps. Pipeline names must be unique within an (account, region) pair. All parameters used in step definitions must be defined in the pipeline. Pipeline steps listed automatically determine their order of execution by their data dependencies on one another. The SageMaker Pipelines service resolves the relationships between steps in the data dependency DAG to create a series of steps that the execution completes. The following is an example of a pipeline structure.

```python
from sagemaker.workflow.pipeline import Pipeline

pipeline_name = f"AbalonePipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_type,
        processing_instance_count,
        training_instance_type,
        model_approval_status,
        input_data,
        batch_data,
    ],
    steps=[step_process, step_train, step_eval, step_cond],
)
```

Pipeline Execution using Parallelism Configuration

By default, a pipeline performs all steps that are available to run in parallel. You can control this behavior by using the ParallelismConfiguration property when creating or updating a pipeline, as well as when starting or retrying a pipeline execution.

Parallelism configurations are applied per execution. For example, if two executions are started they can each run a maximum of 50 steps concurrently, for a total of 100 concurrently running steps. Also, ParallelismConfiguration(s) specified when starting, retrying or updating an execution take precedence over parallelism configurations defined in the pipeline.

Example Creating a pipeline execution with ParallelismConfiguration

```python
pipeline = Pipeline(
    name="myPipeline",
    steps=[step_process, step_train]
)

pipeline.create(role, parallelism_config={"MaxParallelExecutionSteps": 50})
```

IAM Access Management

The following sections describe the AWS Identity and Access Management (IAM) requirements for Amazon SageMaker Model Building Pipelines. For an example of how you can implement these permissions, see Prerequisites (p. 3354).

Topics
- Pipeline Role Permissions (p. 3309)
Pipeline Role Permissions

Your pipeline requires an IAM pipeline execution role that is passed to SageMaker Pipelines when you create a pipeline. The role for the SageMaker instance that is creating the pipeline must have the `iam:PassRole` permission for the pipeline execution role in order to pass it. For more information on IAM roles, see IAM Roles.

Your pipeline execution role requires the following permissions:

- To pass any role to a SageMaker job within a pipeline, the `iam:PassRole` permission for the role that is being passed.
- Create and Describe permissions for each of the job types in the pipeline.
- Amazon S3 permissions to use the JsonGet function. You control access to your Amazon S3 resources using resource-based policies and identity-based policies. A resource-based policy is applied to your Amazon S3 bucket and grants SageMaker Pipelines access to the bucket. An identity-based policy gives your pipeline the ability to make Amazon S3 calls from your account. For more information on resource-based policies and identity-based policies, see Identity-based policies and resource-based policies.

```
{
  "Action": [
    "s3:GetObject"
  ],
  "Resource": "arn:aws:s3:::<your-bucket-name>/*",
  "Effect": "Allow"
}
```

Pipeline Step Permissions

SageMaker Pipelines include steps that run SageMaker jobs. In order for the pipeline steps to run these jobs, they require an IAM role in your account that provides access for the needed resource. This role is passed to the SageMaker service principal by your pipeline. For more information on IAM roles, see IAM Roles.

By default, each step takes on the pipeline execution role. You can optionally pass a different role to any of the steps in your pipeline. This ensures that the code in each step does not have the ability to impact resources used in other steps unless there is a direct relationship between the two steps specified in the pipeline definition. You pass these roles when defining the processor or estimator for your step. For examples of how to include these roles in these definitions, see the SageMaker Python SDK documentation.

Service Control Policies with Pipelines

Service control policies (SCPs) are a type of organization policy that you can use to manage permissions in your organization. SCPs offer central control over the maximum available permissions for all accounts in your organization. By using SageMaker Pipelines within your organization, you can ensure that data scientists manage your pipeline executions without having to interact with the AWS console.

If you’re using a VPC with your SCP that restricts access to Amazon S3, you need to take steps to allow your pipeline to access other Amazon S3 resources.

To allow SageMaker Pipelines to access Amazon S3 outside of your VPC with the JsonGet function, update your organization’s SCP to ensure that the role using SageMaker Pipelines can access Amazon S3.
To do this, create an exception for roles that are being used by the SageMaker Pipelines executor via the pipeline execution role using a principal tag and condition key.

**To allow SageMaker Pipelines to access Amazon S3 outside of your VPC**

1. Create a unique tag for your pipeline execution role following the steps in Tagging IAM users and roles.
2. Grant an exception in your SCP using the `Aws:PrincipalTag` IAM condition key for the tag you created. For more information, see Creating, updating, and deleting service control policies.

**Cross-Account Support for SageMaker Pipelines**

You can use cross-account support for Amazon SageMaker Model Building Pipelines to share pipeline entities across AWS accounts and access shared pipelines through direct API calls.

**Set up cross-account pipeline sharing**

SageMaker uses AWS Resource Access Manager (AWS RAM) to help you securely share your pipeline entities across accounts.

**Create a resource share**

1. Select Create a resource share through the AWS RAM console.
2. When specifying resource share details, choose the SageMaker Pipelines resource type and select one or more pipelines that you want to share. When you share a pipeline with any other account, all of its executions are also shared implicitly.
3. Associate permissions with your resource share. Choose either the default read-only permission policy or the extended pipeline execution permission policy. For more detailed information, see Permission policies for SageMaker Pipelines resources (p. 3310).
   
   **Note**
   
   If you select the extended pipeline execution policy, note that any start, stop, and retry commands called by shared accounts use resources in the AWS account that shared the pipeline.
4. Use AWS account IDs to specify the accounts to which you want to grant access to your shared resources.
5. Review your resource share configuration and select Create resource share. It may take a few minutes for the resource share and principal associations to complete.

For more information, see Sharing your AWS resources in the AWS Resource Access Manager User Guide.

**Get responses to your resource share invitation**

Once the resource share and principal associations are set, the specified AWS accounts receive an invitation to join the resource share. The AWS accounts must accept the invite to gain access to any shared resources.

For more information on accepting a resource share invite through AWS RAM, see Using shared AWS resources in the AWS Resource Access Manager User Guide.

**Permission policies for SageMaker Pipelines resources**

When creating your resource share, choose one of two supported permission policies to associate with the SageMaker pipeline resource type. Both policies grant access to any selected pipeline and all of its executions.
Default read-only permissions

The AWSRAMDefaultPermissionSageMakerPipeline policy allows the following read-only actions:

```plaintext
"sagemaker:DescribePipeline"
"sagemaker:DescribePipelineDefinitionForExecution"
"sagemaker:DescribePipelineExecution"
"sagemaker:ListPipelineExecutions"
"sagemaker:ListPipelineExecutionSteps"
"sagemaker:ListPipelineParametersForExecution"
"sagemaker:Search"
```

Extended pipeline execution permissions

The AWSRAMPermissionSageMakerPipelineAllowExecution policy includes all of the read-only permissions from the default policy and also allows shared accounts to start, stop, and retry pipeline executions.

**Note**

Be mindful of AWS resource usage when using the extended pipeline execution permission policy. With this policy, shared accounts are allowed to start, stop, and retry pipeline executions. Any resources used for shared pipeline executions are consumed by the owner account.

The extended pipeline execution permission policy allows the following actions:

```plaintext
"sagemaker:DescribePipeline"
"sagemaker:DescribePipelineDefinitionForExecution"
"sagemaker:DescribePipelineExecution"
"sagemaker:ListPipelineExecutions"
"sagemaker:ListPipelineExecutionSteps"
"sagemaker:ListPipelineParametersForExecution"
"sagemaker:StartPipelineExecution"
"sagemaker:StopPipelineExecution"
"sagemaker:RetryPipelineExecution"
"sagemaker:Search"
```

Access shared pipeline entities through direct API calls

Once cross-account pipeline sharing is set up, you can call the following SageMaker API actions using a pipeline ARN:

**Note**

You can only call API commands if they are included in the permissions associated with your resource share. If you select the AWSRAMPermissionSageMakerPipelineAllowExecution policy, then the start, stop, and retry commands use resources in the AWS account that shared the pipeline.

- DescribePipeline
- DescribePipelineDefinitionForExecution
- DescribePipelineExecution
- ListPipelineExecutions
- ListPipelineExecutionSteps
- ListPipelineParametersForExecution
- StartPipelineExecution
- StopPipelineExecution
• **RetryPipelineExecution**

## Pipeline Parameters

You can introduce variables into your pipeline definition using parameters. You can reference parameters that you define throughout your pipeline definition. Parameters have a default value, which you can override by specifying parameter values when starting a pipeline execution. The default value must be an instance matching the parameter type. All parameters used in step definitions must be defined in your pipeline definition. Amazon SageMaker Model Building Pipelines supports the following parameter types:

- **ParameterString** – Representing a string parameter.
- **ParameterInteger** – Representing an integer parameter.
- **ParameterFloat** – Representing a float parameter.
- **ParameterBoolean** – Representing a Boolean Python type.

Parameters take the following format:

```python
<parameter> = <parameter_type>(
    name="<parameter_name>",
    default_value=<default_value>
)
```

The following example shows a sample parameter implementation.

```python
from sagemaker.workflow.parameters import (  
    ParameterInteger,  
    ParameterString,  
    ParameterFloat,  
    ParameterBoolean  
)

processing_instance_count = ParameterInteger(
    name="ProcessingInstanceCount",
    default_value=1
)
```

You pass the parameter when creating your pipeline as shown in the following example.

```python
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_count
    ],  
    steps=[step_process]
)
```

You can also pass a parameter value that differs from the default value to a pipeline execution, as shown in the following example.

```python
execution = pipeline.start(
    parameters=dict(
        ProcessingInstanceType="ml.c5.xlarge",
        ModelApprovalStatus="Approved"
    )
)
```
You can manipulate parameters with SageMaker Python SDK functions like `sagemaker.workflow.functions.Join`. For more information on parameters, see SageMaker Pipelines Parameters.

For known limitations of SageMaker Pipelines Parameters, see Limitations - Parameterization in the Amazon SageMaker Python SDK.

**Pipeline Steps**

SageMaker Pipelines are composed of steps. These steps define the actions that the pipeline takes and the relationships between steps using properties.

**Topics**

- Step Types (p. 3313)
- Step Properties (p. 3330)
- Step Parallelism (p. 3330)
- Data Dependency Between Steps (p. 3330)
- Custom Dependency Between Steps (p. 3331)
- Use a Custom Image in a Step (p. 3332)

**Step Types**

The following describes the requirements of each step type and provides an example implementation of the step. These are not functional implementations because they don't provide the resource and inputs needed. For a tutorial that implements these steps, see Create and Manage SageMaker Pipelines (p. 3353).

Amazon SageMaker Model Building Pipelines support the following step types:

- Processing (p. 3313)
- Training (p. 3315)
- Tuning (p. 3315)
- AutoML (p. 3316)
- Model (p. 3317)
- CreateModel (p. 3319)
- RegisterModel (p. 3319)
- Transform (p. 3320)
- Condition (p. 3321)
- Callback (p. 3321)
- Lambda (p. 3323)
- ClarifyCheck (p. 3325)
- QualityCheck (p. 3327)
- EMR (p. 3328)
- Fail (p. 3329)

**Processing Step**

Use a processing step to create a processing job for data processing. For more information on processing jobs, see Process Data and Evaluate Models.
A processing step requires a processor, a Python script that defines the processing code, outputs for processing, and job arguments. The following example shows how to create a ProcessingStep definition.

```python
from sagemaker.sklearn.processing import SKLearnProcessor
sklearn_processor = SKLearnProcessor(framework_version='1.0-1',
                                      role='<role>',
                                      instance_type='ml.m5.xlarge',
                                      instance_count=1)

from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep
inputs = [
    ProcessingInput(source='<input_data>', destination='/opt/ml/processing/input'),
]
outputs = [
    ProcessingOutput(output_name='train', source='/opt/ml/processing/train'),
    ProcessingOutput(output_name='validation', source='/opt/ml/processing/validation'),
    ProcessingOutput(output_name='test', source='/opt/ml/processing/test')
]
step_process = ProcessingStep(
    name='AbaloneProcess',
    step_args = sklearn_processor.run(inputs=inputs, outputs=outputs,
                                        code='abalone/preprocessing.py')
)
```

Pass runtime parameters

The following example shows how to pass runtime parameters from a PySpark processor to a ProcessingStep.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.spark.processing import PySparkProcessor
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep
pipeline_session = PipelineSession()
pyspark_processor = PySparkProcessor(
    framework_version='2.4',
    role='<role>',
    instance_type='ml.m5.xlarge',
    instance_count=1,
    sagemaker_session=pipeline_session,
)
step_args = pyspark_processor.run(
    inputs=[ProcessingInput(source='<input_data>', destination='/opt/ml/processing/input'),],
    outputs=[
        ProcessingOutput(output_name='train', source='/opt/ml/processing/train'),
        ProcessingOutput(output_name='validation', source='/opt/ml/processing/validation'),
        ProcessingOutput(output_name='test', source='/opt/ml/processing/test')
    ],
    code='preprocess.py',
    arguments=None,
)```
step_process = ProcessingStep(
    name="AbaloneProcess",
    step_args=step_args,
)

For more information on processing step requirements, see the sagemaker.workflow.steps.ProcessingStep documentation. For an in-depth example, see Define a Processing Step for Feature Engineering in the Orchestrate Jobs to Train and Evaluate Models with Amazon SageMaker Pipelines example notebook.

Training Step

You use a training step to create a training job to train a model. For more information on training jobs, see Train a Model with Amazon SageMaker.

A training step requires an estimator, as well as training and validation data inputs. The following example shows how to create a TrainingStep definition. For more information on training step requirements, see the sagemaker.workflow.steps.TrainingStep documentation.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TrainingStep
from sagemaker.xgboost.estimator import XGBoost
pipeline_session = PipelineSession()

xgb_estimator = XGBoost(..., sagemaker_session=pipeline_session)

step_args = xgb_estimator.fit(
    inputs={
        "train": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
            content_type="text/csv"
        ),
        "validation": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["validation"].S3Output.S3Uri,
            content_type="text/csv"
        )
    }
)

step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=step_args,
)
```

Tuning Step

You use a tuning step to create a hyperparameter tuning job, also known as hyperparameter optimization (HPO). A hyperparameter tuning job runs multiple training jobs, each one producing a model version. For more information on hyperparameter tuning, see Perform Automatic Model Tuning with SageMaker (p. 1654).

The tuning job is associated with the SageMaker experiment for the pipeline, with the training jobs created as trials. For more information, see Experiments Integration (p. 3348).
A tuning step requires a HyperparameterTuner and training inputs. You can retrain previous tuning jobs by specifying the warm_start_config parameter of the HyperparameterTuner. For more information on hyperparameter tuning and warm start, see Run a Warm Start Hyperparameter Tuning Job (p. 1678).

You use the get_top_model_s3_uri method of the sagemaker.workflow.steps.TuningStep class to get the model artifact from one of the top-performing model versions. For a notebook that shows how to use a tuning step in a SageMaker pipeline, see sagemaker-pipelines-tuning-step.ipynb.

**Important**

Tuning steps were introduced in Amazon SageMaker Python SDK v2.48.0 and Amazon SageMaker Studio v3.8.0. You must update Studio before you use a tuning step or the pipeline DAG doesn't display. To update Studio, see Shut down and Update SageMaker Studio (p. 185).

The following example shows how to create a TuningStep definition.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.tuner import HyperparameterTuner
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TuningStep

tuner = HyperparameterTuner(..., sagemaker_session=PipelineSession())
step_tuning = TuningStep(
    name = "HPTuning",
    step_args = tuner.fit(inputs=TrainingInput(s3_data="s3://my-bucket/my-data"))
)
```

Get the best model version

The following example shows how to get the best model version from the tuning job using the get_top_model_s3_uri method. At most, the top 50 performing versions are available ranked according to HyperParameterTuningJobObjective. The top_k argument is an index into the versions, where top_k=0 is the best-performing version and top_k=49 is the worst-performing version.

```python
best_model = Model(
    image_uri=image_uri,
    model_data=step_tuning.get_top_model_s3_uri(
        top_k=0,
        s3_bucket=sagemaker_session.default_bucket()
    ),
    ... )
```

For more information on tuning step requirements, see the sagemaker.workflow.steps.TuningStep documentation.

**AutoML Step**

Use the AutoML API to create an AutoML job to automatically train a model. For more information on AutoML jobs, see Automate model development with Amazon SageMaker Autopilot.

**Note**

Currently, the AutoML step supports only ensembling training mode.

The following example shows how to create a definition using AutoMLStep.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.workflow.steps import AutoMLStep
```
pipeline_session = PipelineSession()

auto_ml = AutoML(...,
    role="<role>",
    target_attribute_name="my_target_attribute_name",
    mode="ENSEMBLING",
    sagemaker_session=pipeline_session)

input_training = AutoMLInput(  
    inputs="s3://my-bucket/my-training-data",
    target_attribute_name="my_target_attribute_name",
    channel_type="training",  
)

input_validation = AutoMLInput(  
    inputs="s3://my-bucket/my-validation-data",
    target_attribute_name="my_target_attribute_name",
    channel_type="validation",  
)

step_args = auto_ml.fit(  
    inputs=[input_training, input_validation]  
)

step_automl = AutoMLStep(  
    name="AutoMLStep",
    step_args=step_args,  
)

Get the best model version

The AutoML step automatically trains several model candidates. You can get the model with the best objective metric from the AutoML job using the get_best_auto_ml_model method and an IAM role to access model artifacts as follows.

```
best_model = step_automl.get_best_auto_ml_model(role=<role>)
```

For more information, see the AutoML step in the SageMaker Python SDK.

Model Step

Use a ModelStep to create or register a SageMaker model. For more information on ModelStep requirements, see the sagemaker.workflow.model_step.ModelStep documentation.

Create a model

You can use a ModelStep to create a SageMaker model. A ModelStep requires model artifacts and information about the SageMaker instance type that you need to use to create the model. For more information on SageMaker models, see Train a Model with Amazon SageMaker.

The following example shows how to create a ModelStep definition.

```
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.model import Model
from sagemaker.workflow.model_step import ModelStep

step_train = TrainingStep(...)  
model = Model(  
    image_uri=pytorch_estimator.training_image_uri(),
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    sagemaker_session=PipelineSession(),
)```
Register a model

You can use a ModelStep to register a sagemaker.model.Model or a sagemaker.pipeline.PipelineModel with the Amazon SageMaker model registry. A PipelineModel represents an inference pipeline, which is a model composed of a linear sequence of containers that process inference requests. For more information about how to register a model, see Register and Deploy Models with Model Registry (p. 2232).

The following example shows how to create a ModelStep that registers a PipelineModel.

```python
import time
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.sklearn import SKLearnModel
from sagemaker.xgboost import XGBoostModel
pipeline_session = PipelineSession()

code_location = 's3://{0}/{1}/code'.format(bucket_name, prefix)
sklearn_model = SKLearnModel(
    model_data=processing_step.properties.ProcessingOutputConfig.Outputs['model'].S3Output.S3Uri,
    entry_point='inference.py',
    source_dir='sklearn_source_dir/',
    code_location=code_location,
    framework_version='1.0-1',
    role=role,
    sagemaker_session=pipeline_session,
    py_version='py3',
)
xgboost_model = XGBoostModel(
    model_data=training_step.properties.ModelArtifacts.S3ModelArtifacts,
    entry_point='inference.py',
    source_dir='xgboost_source_dir/',
    code_location=code_location,
    framework_version='0.90-2',
    py_version='py3',
    sagemaker_session=pipeline_session,
    role=role
)

from sagemaker.workflow.model_step import ModelStep
from sagemaker import PipelineModel
pipeline_model = PipelineModel(
    models=[sklearn_model, xgboost_model],
    role=role,sagemaker_session=pipeline_session,
)

register_model_step_args = pipeline_model.register(
    content_types=['application/json'],
    response_types=['application/json'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
)
model_package_group_name='sipgroup',
)

step_model_registration = ModelStep(
    name="AbaloneRegisterModel",
    step_args=register_model_step_args,
)

CreateModel Step

Important
We recommend using Model Step (p. 3317) to create models as of v2.90.0 of the SageMaker Python SDK. CreateModelStep will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

You use a CreateModel step to create a SageMaker model. For more information on SageMaker models, see Train a Model with Amazon SageMaker.

A create model step requires model artifacts and information about the SageMaker instance type that you need to use to create the model. The following example shows how to create a CreateModel step definition. For more information on CreateModel step requirements, see the sagemaker.workflow.steps.CreateModelStep documentation.

from sagemaker.workflow.steps import CreateModelStep
step_create_model = CreateModelStep(
    name="AbaloneCreateModel",
    model=best_model,
    inputs=inputs
)

RegisterModel Step

Important
We recommend using Model Step (p. 3317) to register models as of v2.90.0 of the SageMaker Python SDK. RegisterModel will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

You use a RegisterModel step to register a sagemaker.model.Model or a sagemaker.pipeline.PipelineModel with the Amazon SageMaker model registry. A PipelineModel represents an inference pipeline, which is a model composed of a linear sequence of containers that process inference requests.

For more information about how to register a model, see Register and Deploy Models with Model Registry (p. 2232). For more information on RegisterModel step requirements, see the sagemaker.workflow.step_collections.RegisterModel documentation.

The following example shows how to create a RegisterModel step that registers a PipelineModel.

import time
from sagemaker.sklearn import SKLearnModel
from sagemaker.xgboost import XGBoostModel
code_location = 's3://{}//[1]/code'.format(bu{name: 'bucket_name', prefix})

sklearn_model = SKLearnModel(model_data=processing_step.properties.ProcessingOutputConfig.Outputs['model'].S3Output.S3Uri,
entry_point='inference.py',
source_dir='sklearn_source_dir/',
code_location=code_location,
framework_version='1.0-1',

3319
xgboost_model = 
XGBoostModel(model_data=training_step.properties.ModelArtifacts.S3ModelArtifacts,
entry_point='inference.py',
source_dir='xgboost_source_dir/',
code_location=code_location,
framework_version='0.90-2',
py_version='py3',
sagemaker_session=sagemaker_session,
role=role)

from sagemaker.workflow.step_collections import RegisterModel
from sagemaker import PipelineModel
pipeline_model = 
PipelineModel(models=[sklearn_model,xgboost_model],role=role,sagemaker_session=sagemaker_session)

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    model=pipeline_model,
    content_types=['application/json'],
    response_types=['application/json'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
    model_package_group_name='sipgroup',
)

If model isn't provided, the register model step requires an estimator as shown in the following example.

from sagemaker.workflow.step_collections import RegisterModel

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    estimator=xgb_train,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    content_types=['text/csv'],
    response_types=['text/csv'],
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],
    transform_instances=['ml.m5.xlarge'],
    model_package_group_name=model_package_group_name,
    approval_status=model_approval_status,
    model_metrics=model_metrics
)

Transform Step

You use a transform step for batch transformation to run inference on an entire dataset. For more information about batch transformation, see Run Batch Transforms with Inference Pipelines (p. 2027).

A transform step requires a transformer and the data on which to run batch transformation. The following example shows how to create a Transform step definition. For more information on Transform step requirements, see the sagemaker.workflow.steps.TransformStep documentation.

from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.transformer import Transformer
from sagemaker.inputs import TransformInput
from sagemaker.workflow.steps import TransformStep
transformer = Transformer(...)
Condition Step

You use a condition step to evaluate the condition of step properties to assess which action should be taken next in the pipeline.

A condition step requires a list of conditions, a list of steps to run if the condition evaluates to true, and a list of steps to run if the condition evaluates to false. The following example shows how to create a ConditionStep definition.

Limitations

- SageMaker Pipelines doesn't support the use of nested condition steps. You can't pass a condition step as the input for another condition step.
- A condition step can't use identical steps in both branches. If you need the same step functionality in both branches, duplicate the step and give it a different name.

Callback Step

You use a Callback step to incorporate additional processes and AWS services into your workflow that aren't directly provided by Amazon SageMaker Model Building Pipelines. When a Callback step runs, the following procedure occurs:

- SageMaker Pipelines sends a message to a customer-specified Amazon Simple Queue Service (Amazon SQS) queue. The message contains a SageMaker Pipelines–generated token and a customer-supplied list of input parameters. After sending the message, SageMaker Pipelines waits for a response from the customer.
- The customer retrieves the message from the Amazon SQS queue and starts their custom process.
• When the process finishes, the customer calls one of the following APIs and submits the SageMaker Pipelines–generated token:
  • `SendPipelineExecutionStepSuccess`, along with a list of output parameters
  • `SendPipelineExecutionStepFailure`, along with a failure reason
• The API call causes SageMaker Pipelines to either continue the pipeline process or fail the process.

For more information on Callback step requirements, see the `sagemaker.workflow.callback_step.CallbackStep` documentation. For a complete solution, see Extend SageMaker Pipelines to include custom steps using callback steps.

**Important**
Callback steps were introduced in Amazon SageMaker Python SDK v2.45.0 and Amazon SageMaker Studio v3.6.2. You must update Studio before you use a Callback step or the pipeline DAG doesn't display. To update Studio, see Shut down and Update SageMaker Studio (p. 185).

The following sample demonstrates an implementation of the preceding procedure.

```python
from sagemaker.workflow.callback_step import CallbackStep

step_callback = CallbackStep(
    name="MyCallbackStep",
    sqs_queue_url="https://sqs.us-east-2.amazonaws.com/012345678901/MyCallbackQueue",
    inputs={...},
    outputs=[...]
)

callback_handler_code = '
    import boto3
    import json

    def handler(event, context):
        sagemaker_client=boto3.client("sagemaker")

        for record in event["Records"]:  
            payload=json.loads(record["body"])  
            token=payload["token"]

        # Custom processing

        # Call SageMaker to complete the step
        sagemaker_client.send_pipeline_execution_step_success(
            CallbackToken=token,
            OutputParameters={...}
        )

Note
Output parameters for CallbackStep should not be nested. For example, if you use a nested dictionary as your output parameter, then the dictionary is treated as a single string (ex. `{"output1": "{\"nested_output1\": "my-output\"}\"}`). If you provide a nested value, then when you try to refer to a particular output parameter, a non-retryable client error is thrown.

**Stopping behavior**
A pipeline process doesn't stop while a Callback step is running.

When you call `StopPipelineExecution` on a pipeline process with a running Callback step, SageMaker Pipelines sends an additional Amazon SQS message to the specified SQS queue. The body of the SQS
message contains a **Status** field, which is set to Stopping. The following shows an example SQS message body.

```json
{
    "token": "26vcYbeWsZ",
    "pipelineExecutionArn": "arn:aws:sagemaker:us-east-2:012345678901:pipeline/callback-pipeline/execution/7pinimwddh3a",
    "arguments": {
        "number": 5,
        "stringArg": "some-arg",
        "inputData": "s3://sagemaker-us-west-2-012345678901/abalone/abalone-dataset.csv"
    },
    "status": "Stopping"
}
```

You should add logic to your Amazon SQS message consumer to take any needed action (for example, resource cleanup) upon receipt of the message, followed by a call to `SendPipelineExecutionStepSuccess` or `SendPipelineExecutionStepFailure`. Only when SageMaker Pipelines receives one of these calls does it stop the pipeline process.

### Lambda Step

You use a Lambda step to run an AWS Lambda function. You can run an existing Lambda function, or SageMaker can create and run a new Lambda function. For a notebook that shows how to use a Lambda step in a SageMaker pipeline, see [sagemaker-pipelines-lambda-step.ipynb](https://github.com/aws-sagemaker/sagemaker-pipelines).

**Important**

Lambda steps were introduced in Amazon SageMaker Python SDK v2.51.0 and Amazon SageMaker Studio v3.9.1. You must update Studio before you use a Lambda step or the pipeline DAG doesn't display. To update Studio, see [Shut down and Update SageMaker Studio](p. 185).

SageMaker provides the `sagemaker.lambda_helper.Lambda` class to create, update, invoke, and delete Lambda functions. Lambda has the following signature.

```python
Lambda(
    function_arn,       # Only required argument to invoke an existing Lambda function
    # The following arguments are required to create a Lambda function:
    function_name,
    execution_role_arn,
    zipped_code_dir,    # Specify either zipped_code_dir and s3_bucket, OR script
    s3_bucket,          # S3 bucket where zipped_code_dir is uploaded
    script,             # Path of Lambda function script
    handler,            # Lambda handler specified as "lambda_script.lambda_handler"
    timeout,            # Maximum time the Lambda function can run before the lambda step fails
    ...)
```

The `sagemaker.workflow.lambda_step.LambdaStep` class has a `lambda_func` argument of type Lambda. To invoke an existing Lambda function, the only requirement is to supply the Amazon Resource Name (ARN) of the function to `function_arn`. If you don't supply a value for `function_arn`, you must specify `handler` and one of the following:

- `zipped_code_dir` – The path of the zipped Lambda function
- `s3_bucket` – Amazon S3 bucket where `zipped_code_dir` is to be uploaded
- `script` – The path of the Lambda function script file
The following example shows how to create a Lambda step definition that invokes an existing Lambda function.

```python
from sagemaker.workflow.lambda_step import LambdaStep
from sagemaker.lambda_helper import Lambda

step_lambda = LambdaStep(
    name="ProcessingLambda",
    lambda_func=Lambda(
    ),
    inputs={
        s3_bucket = s3_bucket,
        data_file = data_file
    },
    outputs=[
        "train_file", "test_file"
    ]
)
```

The following example shows how to create a Lambda step definition that creates and invokes a Lambda function using a Lambda function script.

```python
from sagemaker.workflow.lambda_step import LambdaStep
from sagemaker.lambda_helper import Lambda

step_lambda = LambdaStep(
    name="ProcessingLambda",
    lambda_func=Lambda(
        function_name="split-dataset-lambda",
        execution_role_arn=execution_role_arn,
        script="lambda_script.py",
        handler="lambda_script.lambda_handler",
        ...,
    ),
    inputs={
        s3_bucket = s3_bucket,
        data_file = data_file
    },
    outputs=[
        "train_file", "test_file"
    ]
)
```

**Inputs and outputs**

If your Lambda function has inputs or outputs, these must also be defined in your Lambda step.

**Note**

Input and output parameters should not be nested. For example, if you use a nested dictionary as your output parameter, then the dictionary is treated as a single string (ex. `{"output1": 
  {{"nested_output1": {"my-output": {}}}}}`). If you provide a nested value and try to refer to it later, a non-retryable client error is thrown.

When defining the Lambda step, inputs must be a dictionary of key-value pairs. Each value of the inputs dictionary must be a primitive type (string, integer, or float). Nested objects are not supported. If left undefined, the inputs value defaults to None.

The outputs value must be a list of keys. These keys refer to a dictionary defined in the output of the Lambda function. Like inputs, these keys must be primitive types, and nested objects are not supported.
Timeout and stopping behavior

The Lambda class has a timeout argument that specifies the maximum time that the Lambda function can run. The default value is 120 seconds with a maximum value of 10 minutes. If the Lambda function is running when the timeout is met, the Lambda step fails; however, the Lambda function continues to run.

A pipeline process can't be stopped while a Lambda step is running because the Lambda function invoked by the Lambda step can't be stopped. If you attempt to stop the process while the Lambda function is running, the pipeline waits for the Lambda function to finish or until the timeout is hit, whichever occurs first, and then stops. If the Lambda function finishes, the pipeline process status is Stopped. If the timeout is hit the pipeline process status is Failed.

ClarifyCheck Step

You can use the ClarifyCheck step to conduct baseline drift checks against previous baselines for bias analysis and model explainability. You can then generate and register your baselines with the model.register() method and pass the output of that method to Model Step (p. 3317) using step_args. These baselines for drift check can be used by Amazon SageMaker Model Monitor for your model endpoints so that you don't need to do a baseline suggestion separately. The ClarifyCheck step can also pull baselines for drift check from the model registry. The ClarifyCheck step leverages the Amazon SageMaker Clarify prebuilt container that provides a range of model monitoring capabilities, including constraint suggestion and constraint validation against a given baseline. For more information, see Getting Started with a SageMaker Clarify Container.

Configuring the ClarifyCheck step

You can configure the ClarifyCheck step to conduct only one of the following check types each time it's used in a pipeline.

• Data bias check
• Model bias check
• Model explainability check

You do this by setting the clarify_check_config parameter with one of the following check type values:

• DataBiasCheckConfig
• ModelBiasCheckConfig
• ModelExplainabilityCheckConfig

The ClarifyCheck step launches a processing job that runs the SageMaker Clarify prebuilt container and requires dedicated configurations for the check and the processing job. ClarifyCheckConfig and CheckJobConfig are helper functions for these configurations that are aligned with how the SageMaker Clarify processing job computes for checking model bias, data bias, or model explainability. For more information, see Run SageMaker Clarify Processing Jobs for Bias Analysis and Explainability (p. 1859).

Controlling step behaviors for drift check

The ClarifyCheck step requires the following two boolean flags to control its behavior:

• skip_check: This parameter indicates if the drift check against the previous baseline is skipped or not. If it is set to False, the previous baseline of the configured check type must be available.
• register_new_baseline: This parameter indicates if a newly calculated baseline can be accessed though step property BaselineUsedForDriftCheckConstraints. If it is set to False, the
previous baseline of the configured check type also must be available. This can be accessed through the BaselineUsedForDriftCheckConstraints property.

For more information, see Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines (p. 3341).

Working with baselines

You can optionally specify the model_package_group_name to locate the existing baseline and the ClarifyCheck step pulls the DriftCheckBaselines on the latest approved model package in the model package group. Or, you can provide a previous baseline through the supplied_baseline_constraints parameter. If you specify both the model_package_group_name and the supplied_baseline_constraints, the ClarifyCheck step uses the baseline specified by the supplied_baseline_constraints parameter.

For more information on using the ClarifyCheck step requirements, see the sagemaker.workflow.steps.ClarifyCheckStep in the Amazon SageMaker SageMaker SDK for Python. For an Amazon SageMaker Studio notebook that shows how to use ClarifyCheck step in SageMaker Pipelines, see sagemaker-pipeline-model-monitor-clarify-steps.ipynb.

Example Create a ClarifyCheck step for data bias check

```python
from sagemaker.workflow.check_job_config import CheckJobConfig
from sagemaker.workflow.clarify_check_step import DataBiasCheckConfig, ClarifyCheckStep
from sagemaker.workflow.execution_variables import ExecutionVariables

check_job_config = CheckJobConfig(
    role=role,
    instance_count=1,
    instance_type="ml.c5.xlarge",
    volume_size_in_gb=120,
    sagemaker_session=sagemaker_session,
)

data_bias_data_config = DataConfig(
    s3_data_input_path=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
    s3_output_path=Join(on='/', values=['s3://', your_bucket, base_job_prefix, ExecutionVariables.PIPELINE_EXECUTION_ID, 'databiascheckstep']),
    label=0,
    dataset_type="text/csv",
    s3_analysis_config_output_path=data_bias_analysis_cfg_output_path,
)

data_bias_config = BiasConfig(
    label_values_or_threshold=[15.0], facet_name=[8], facet_values_or_threshold=[[0.5]]
)

data_bias_check_config = DataBiasCheckConfig(
    data_config=data_bias_data_config,
    data_bias_config=data_bias_config,
)

data_bias_check_step = ClarifyCheckStep(
    name="DataBiasCheckStep",
    clarify_check_config=data_bias_check_config,
    check_job_config=check_job_config,
    skip_check=False,
    register_new_baseline=False,
    supplied_baseline_constraints="s3://sagemaker-us-west-2-111122223333/baseline/analysis.json",
    model_package_group_name="MyModelPackageGroup"
)```

3326
QualityCheck Step

You can use the QualityCheck step to conduct baseline suggestions and drift checks against a previous baseline for data quality or model quality in a pipeline. You can then generate and register your baselines with the model.register() method and pass the output of that method to Model Step (p. 3317) using step_args. Model Monitor can use these baselines for drift check for your model endpoints so that you don't need to do a baseline suggestion separately. The QualityCheck step can also pull baselines for drift check from the model registry. The QualityCheck step leverages the Amazon SageMaker Model Monitor prebuilt container, which has a range of model monitoring capabilities including constraint suggestion, statistics generation, and constraint validation against a baseline. For more information, see Amazon SageMaker Model Monitor prebuilt container (p. 2135).

Configuring the QualityCheck step

You can configure the QualityCheck step to conduct only one of the following check types each time it’s used in a pipeline.

• Data quality check
• Model quality check

You do this by setting the quality_check_config parameter with one of the following check type values:

• DataQualityCheckConfig
• ModelQualityCheckConfig

The QualityCheck step launches a processing job that runs the Model Monitor prebuilt container and requires dedicated configurations for the check and the processing job. The QualityCheckConfig and CheckJobConfig are helper functions for these configurations that are aligned with how Model Monitor creates a baseline for the model quality or data quality monitoring. For more information on the Model Monitor baseline suggestions, see Create a Baseline (p. 2100) and Create a Model Quality Baseline (p. 2106).

Controlling step behaviors for drift check

The QualityCheck step requires the following two Boolean flags to control its behavior:

• skip_check: This parameter indicates if the drift check against the previous baseline is skipped or not. If it is set to False, the previous baseline of the configured check type must be available.
• register_new_baseline: This parameter indicates if a newly calculated baseline can be accessed through step properties BaselineUsedForDriftCheckConstraints and BaselineUsedForDriftCheckStatistics. If it is set to False, the previous baseline of the configured check type must also be available. These can be accessed through the BaselineUsedForDriftCheckConstraints and BaselineUsedForDriftCheckStatistics properties.

For more information, see Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines (p. 3341).

Working with baselines

You can specify a previous baseline directly through the supplied_baseline_statistics and supplied_baseline_constraints parameters, or you can simply specify the
model_package_group_name and the QualityCheck step pulls the DriftCheckBaselines on the latest approved model package in the model package group. When you specify the model_package_group_name, the supplied_baseline_constraints, and supplied_baseline_statistics, the QualityCheck step uses the baseline specified by supplied_baseline_constraints and supplied_baseline_statistics on the check type of the QualityCheck step you are running.

For more information on using the QualityCheck step requirements, see the `sagemaker.workflow.steps.QualityCheckStep` in the *Amazon SageMaker SageMaker SDK for Python*. For an Amazon SageMaker Studio notebook that shows how to use QualityCheck step in SageMaker Pipelines, see `sagemaker-pipeline-model-monitor-clarify-steps.ipynb`.

Example Create a QualityCheck step for data quality check

```python
from sagemaker.workflow.check_job_config import CheckJobConfig
from sagemaker.workflow.quality_check_step import DataQualityCheckConfig, QualityCheckStep
from sagemaker.workflow.execution_variables import ExecutionVariables

check_job_config = CheckJobConfig(
    role=role,
    instance_count=1,
    instance_type="ml.c5.xlarge",
    volume_size_in_gb=120,
    sagemaker_session=sagemaker_session,
)

data_quality_check_config = DataQualityCheckConfig(
    baseline_dataset=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
    dataset_format=DatasetFormat.csv(header=False, output_columns_position="START"),
    output_s3_uri=Join(on='/', values=['s3://', your_bucket, base_job_prefix, ExecutionVariables.PIPELINE_EXECUTION_ID, 'dataqualitycheckstep'])
)

data_quality_check_step = QualityCheckStep(
    name="DataQualityCheckStep",
    skip_check=False,
    register_new_baseline=False,
    quality_check_config=data_quality_check_config,
    check_job_config=check_job_config,
    supplied_baseline_statistics="s3://sagemaker-us-west-2-555555555555/baseline/statistics.json",
    supplied_baseline_constraints="s3://sagemaker-us-west-2-555555555555/baseline/constraints.json",
    model_package_group_name="MyModelPackageGroup"
)
```

Amazon EMR Step

You can use the Amazon SageMaker Model Building Pipelines Amazon EMR step to process EMR steps to a running Amazon EMR cluster. For more information, see *Getting started with Amazon EMR*.

The Amazon EMR step requires an EMRStepConfig having the Amazon S3 location of the JAR to be used by the Amazon EMR cluster and any arguments to be passed, as well as the Amazon EMR cluster ID.

**Note**

- Amazon EMR steps require that the role passed to your pipeline has additional permissions. You should attach the AWS managed policy: `AmazonSageMakerPipelinesIntegrations` to your pipeline role, or ensure that the role includes the permissions in that policy.
- Amazon EMR on EKS is not supported.
• You can only run a EMR step on a cluster that is in one of the following states: STARTING, BOOTSTRAPPING, RUNNING, or WAITING.
• You can have at most 256 EMR steps in PENDING on an EMR cluster; EMR steps submitted beyond that limit result in the pipeline execution failing. You may consider using Retry Policy for Pipeline Steps (p. 3338).

Example Create an Amazon EMR step definition that launches a new job on a EMR cluster.

```python
from sagemaker.workflow.emr_step import EMRStep, EMRStepConfig

emr_config = EMRStepConfig(  
    jar="s3://path/to/jar/MyJar.jar", # required, S3 path to jar  
    args=['--verbose', '--force'], # optional list of arguments to pass to the jar  
    main_class="com.my.Main1", # optional main class, this can be omitted if jar above has a manifest  
    properties=[# optional list of Java properties that are set when the step runs  
        {  
            "key": "mapred.tasktracker.map.tasks.maximum",  
            "value": "2"  
        },  
        {  
            "key": "mapreduce.map.sort.spill.percent",  
            "value": "0.90"  
        },  
        {  
            "key": "mapreduce.tasktracker.reduce.tasks.maximum",  
            "value": "5"  
        }  
    ]  
)

step_emr = EMRStep (  
    name="EMRSampleStep", # required  
    cluster_id="j-1YONHTCP3YZK", # required  
    step_config=emr_config, # required  
    display_name="My EMR Step",  
    description="Pipeline step to execute EMR job"
)
```

Fail Step

You use a FailStep to stop an Amazon SageMaker Model Building Pipelines execution when a desired condition or state is not achieved and to mark that pipeline's execution as failed. The FailStep also allows you to enter a custom error message, indicating the cause of the pipeline's execution failure.

Note
When a FailStep and other pipeline steps execute concurrently, the pipeline does not terminate until all concurrent steps are completed.

Limitations for using FailStep

• You cannot add a FailStep to the DependsOn list of other steps. For more information, see Custom Dependency Between Steps (p. 3331).
• Other steps cannot reference the FailStep. It is always the last step in a pipeline's execution.
• You cannot retry a pipeline execution ending with a FailStep.

You can create the FailStep ErrorMessage in the form of a static text string. Alternatively, you can also use Pipeline Parameters a Join operation, or other step properties to create a more informative error message.
Example

The following example code snippet uses a FailStep with an ErrorMessage configured with Pipeline Parameters and a Join operation.

```python
from sagemaker.workflow.fail_step import FailStep
from sagemaker.workflow.functions import Join
from sagemaker.workflow.parameters import ParameterInteger

mse_threshold_param = ParameterInteger(name="MseThreshold", default_value=5)
step_fail = FailStep(
    name="AbaloneMSEFail",
    error_message=Join(
        on=" ", values=["Execution failed due to MSE >", mse_threshold_param]
    ),
)
```

Step Properties

The properties attribute is used to add data dependencies between steps in the pipeline. These data dependencies are then used by SageMaker Pipelines to construct the DAG from the pipeline definition. These properties can be referenced as placeholder values and are resolved at runtime.

The properties attribute of a SageMaker Pipelines step matches the object returned by a Describe call for the corresponding SageMaker job type. For each job type, the Describe call returns the following response object:

- ProcessingStep – DescribeProcessingJob
- TrainingStep – DescribeTrainingJob
- TransformStep – DescribeTransformJob

To check which properties are referrable for each step type during data dependency creation, see Data Dependency - Property Reference in the Amazon SageMaker Python SDK.

Step Parallelism

When a step does not depend on any other step, it is run immediately upon pipeline execution. However, executing too many pipeline steps in parallel can quickly exhaust available resources. Control the number of concurrent steps for a pipeline execution with ParallelismConfiguration.

The following example uses ParallelismConfiguration to set the concurrent step limit to five.

```python
pipeline.create(
    parallelism_config=ParallelismConfiguration(5),
)
```

Data Dependency Between Steps

You define the structure of your DAG by specifying the data relationships between steps. To create data dependencies between steps, pass the properties of one step as the input to another step in the pipeline. The step receiving the input isn’t started until after the step providing the input finishes running.

A data dependency uses JsonPath notation in the following format. This format traverses the JSON property file, which means you can append as many `<property>` instances as needed to reach the desired nested property in the file. For more information on JsonPath notation, see the JsonPath repo.

```markdown
<step_name>.properties.<property>.<property>
```
The following shows how to specify an Amazon S3 bucket using the `ProcessingOutputConfig` property of a processing step.

```python
step_process.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri
```

To create the data dependency, pass the bucket to a training step as follows.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
sklearn_train = SKLearn(..., sagemaker_session=PipelineSession())
step_train = TrainingStep(
    name="CensusTrain",
    step_args=sklearn_train.fit(inputs=TrainingInput(
        s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri
    ))
)
```

To check which properties are referrable for each step type during data dependency creation, see `Data Dependency - Property Reference` in the Amazon SageMaker Python SDK.

### Custom Dependency Between Steps

When you specify a data dependency, SageMaker Pipelines provides the data connection between the steps. Alternatively, one step can access the data from a previous step without directly using SageMaker Pipelines. In this case, you can create a custom dependency that tells SageMaker Pipelines not to start a step until after another step has finished running. You create a custom dependency by specifying a step's `DependsOn` attribute.

As an example, the following defines a step `C` that starts only after both step `A` and step `B` finish running.

```json
{
    'Steps': [
        {'Name':'A', ...},
        {'Name':'B', ...},
        {'Name':'C', 'DependsOn': ['A', 'B']}
    ]
}
```

SageMaker Pipelines throws a validation exception if the dependency would create a cyclic dependency.

The following example creates a training step that starts after a processing step finishes running.

```python
processing_step = ProcessingStep(...)  
training_step = TrainingStep(...)  
training_step.add_depends_on([processing_step])
```

The following example creates a training step that doesn't start until two different processing steps finish running.

```python
processing_step_1 = ProcessingStep(...)  
processing_step_2 = ProcessingStep(...)  
training_step = TrainingStep(...)  
```
training_step.add_depends_on([processing_step_1, processing_step_2])

The following provides an alternate way to create the custom dependency.

training_step.add_depends_on([processing_step_1])
training_step.add_depends_on([processing_step_2])

The following example creates a training step that receives input from one processing step and waits for a different processing step to finish running.

processing_step_1 = ProcessingStep(...) 
processing_step_2 = ProcessingStep(...) 
training_step = TrainingStep( 
    ...
    inputs=TrainingInput( 
        s3_data=processing_step_1.properties.ProcessingOutputConfig.Outputs[ 
            "train_data" 
        ].S3Output.S3Uri 
    )
)
training_step.add_depends_on([processing_step_2])

The following example shows how to retrieve a string list of the custom dependencies of a step.

custom_dependencies = training_step.depends_on

Use a Custom Image in a Step

You can use any of the available SageMaker Deep Learning Container images when you create a step in your pipeline.

You can also use your own container with pipeline steps. Because you can't create an image from within Amazon SageMaker Studio, you must create your image using another method before using it with Amazon SageMaker Model Building Pipelines.

To use your own container when creating the steps for your pipeline, include the image URI in the estimator definition. For more information on using your own container with SageMaker, see Using Docker Containers with SageMaker.

Property Files and JsonGet

Use property files to store information from the output of a processing step. This is particularly useful when analyzing the results of a processing step to decide how a conditional step should be executed. The JsonGet function processes a property file and enables you to use JsonPath notation to query the property JSON file. For more information on JsonPath notation, see the JsonPath repo.

To store a property file for later use, you must first create a PropertyFile instance with the following format. The path parameter is the name of the JSON file to which the property file is saved. Any output_name must match the output_name of the ProcessingOutput that you define in your processing step. This enables the property file to capture the ProcessingOutput in the step.

from sagemaker.workflow.properties import PropertyFile
<property_file_instance> = PropertyFile( 
    name="<property_file_name>", 
)
When you create your ProcessingStep instance, add the property_files parameter to list all of the parameter files that the Amazon SageMaker Model Building Pipelines service must index. This saves the property file for later use.

```python
property_files=['<property_file_instance>']
```

To use your property file in a condition step, add the property_file to the condition that you pass to your condition step as shown in the following example to query the JSON file for your desired property using the json_path parameter.

```python
cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step_name=step_eval.name,
        property_file='<property_file_instance>',
        json_path="mse"
    ),
    right=6.0
)
```

For more in-depth examples, see Property File in the Amazon SageMaker Python SDK.

### Caching Pipeline Steps

When you use step signature caching, SageMaker Pipelines tries to find a previous run of your current pipeline step with the same values for certain attributes. If found, SageMaker Pipelines propagates the outputs from the previous run rather than recomputing the step. The attributes checked are specific to the step type, and are listed in Default cache key attributes by pipeline step type (p. 3336).

You must opt in to step caching — it is off by default. When you turn on step caching, you must also define a timeout. This timeout defines how old a previous run can be to remain a candidate for reuse.

Step caching only considers successful runs — it never reuses failed runs. A previous run of a pipeline step is considered successful when the run itself and the entire pipeline are both successful. When multiple successful runs exist within the timeout period, SageMaker Pipelines uses the result for the most recent successful run. If no successful runs match in the timeout period, SageMaker Pipelines reruns the step. If the executor finds a previous run that meets the criteria but is still in progress, both steps continue running and update the cache if they're successful.

Step caching is only scoped for individual pipelines, so you can't reuse a step from another pipeline even if there is a step signature match.

Step caching is available for the following step types:

- Processing (p. 3313)
- Training (p. 3315)
- Tuning (p. 3315)
- AutoML (p. 3316)
- Transform (p. 3320)
- ClarifyCheck (p. 3325)
- QualityCheck (p. 3327)
Turn on step caching

To turn on step caching, you must add a CacheConfig property to the step definition.

CacheConfig properties use the following format in the pipeline definition file:

```json
{
    "CacheConfig": {
        "Enabled": false,
        "ExpireAfter": "<time>
    }
}
```

The Enabled field indicates whether caching is turned on for the particular step. You can set the field to true, which tells SageMaker to try to find a previous run of the step with the same attributes. Or, you can set the field to false, which tells SageMaker to run the step every time the pipeline runs. ExpireAfter is a string in ISO 8601 duration format that defines the timeout period. The ExpireAfter duration can be a year, month, week, day, hour, or minute value. Each value consists of a number followed by a letter indicating the unit of duration. For example:

- "30d" = 30 days
- "5y" = 5 years
- "T16m" = 16 minutes
- "30dT5h" = 30 days and 5 hours.

The following discussion describes the procedure to turn on caching for new or pre-existing pipelines using the Amazon SageMaker Python SDK.

**Turn on caching for new pipelines**

For new pipelines, initialize a CacheConfig instance with enable_caching=True and provide it as an input to your pipeline step. The following example turns on caching with a 1-hour timeout period for a training step:

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.workflow.steps import CacheConfig

cache_config = CacheConfig(enable_caching=True, expire_after="PT1H")
estimator = Estimator(..., sagemaker_session=PipelineSession())

step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=estimator.fit(inputs=inputs),
    cache_config=cache_config
)
```

**Turn on caching for pre-existing pipelines**
To turn on caching for pre-existing, already-defined pipelines, turn on the `enable_caching` property for the step, and set `expire_after` to a timeout value. Lastly, update the pipeline with `pipeline.upsert()` or `pipeline.update()`. Once you run it again, the following code example turns on caching with a 1-hour timeout period for a training step:

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.workflow.steps import CacheConfig
from sagemaker.workflow.pipeline import Pipeline

cache_config = CacheConfig(enable_caching=True, expire_after="PT1H")
estimator = Estimator(..., sagemaker_session=PipelineSession())

step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=estimator.fit(inputs=inputs),
    cache_config=cache_config
)

# define pipeline
pipeline = Pipeline(
    steps=[step_train]
)

# additional step for existing pipelines
pipeline.update()
# or, call upsert() to update the pipeline
# pipeline.upsert()
```

Alternatively, update the cache config after you have already defined the (pre-existing) pipeline, allowing one continuous code run. The following code sample demonstrates this method:

```python
# turn on caching with timeout period of one hour
pipeline.steps[0].cache_config.enable_caching = True
pipeline.steps[0].cache_config.expire_after = "PT1H"

# additional step for existing pipelines
pipeline.update()
# or, call upsert() to update the pipeline
# pipeline.upsert()
```

For more detailed code examples and a discussion about how Python SDK parameters affect caching, see Caching Configuration in the Amazon SageMaker Python SDK documentation.

### Turn off step caching

A pipeline step does not rerun if you change any attributes that are not listed in Default cache key attributes by pipeline step type (p. 3336) for its step type. However, you may decide that you want the pipeline step to rerun anyway. In this case, you need to turn off step caching.

To turn off step caching, set the `Enabled` attribute in the step definition's `CacheConfig` property in the step definition to `false`, as shown in the following code snippet:

```json
{
    "CacheConfig": {
        "Enabled": false,
        "ExpireAfter": "<time>"
    }
}
```

Note that the `ExpireAfter` attribute is ignored when `Enabled` is `false`. 
To turn off caching for a pipeline step using the Amazon SageMaker Python SDK, define the pipeline of your pipeline step, turn off the enable_caching property, and update the pipeline.

Once you run it again, the following code example turns off caching for a training step:

```python
from sagemaker.workflow.pipeline_context import PipelineSession
from sagemaker.workflow.steps import CacheConfig
from sagemaker.workflow.pipeline import Pipeline

cache_config = CacheConfig(enable_caching=False, expire_after="PT1H")
estimator = Estimator(..., sagemaker_session=PipelineSession())

step_train = TrainingStep(
    name="TrainAbaloneModel",
    step_args=estimator.fit(inputs=inputs),
    cache_config=cache_config
)

# define pipeline
pipeline = Pipeline(
    steps=[step_train]
)

# update the pipeline
pipeline.update()
# or, call upsert() to update the pipeline
# pipeline.upsert()
```

Alternatively, turn off the enable_caching property after you have already defined the pipeline, allowing one continuous code run. The following code sample demonstrates this solution:

```python
# turn off caching for the training step
pipeline.steps[0].cache_config.enable_caching = False

# update the pipeline
pipeline.update()
# or, call upsert() to update the pipeline
# pipeline.upsert()
```

For more detailed code examples and a discussion about how Python SDK parameters affect caching, see Caching Configuration in the Amazon SageMaker Python SDK documentation.

**Default cache key attributes by pipeline step type**

When deciding whether to reuse a previous pipeline step or rerun the step, SageMaker Pipelines checks to see if certain attributes have changed. If the set of attributes is different from all previous runs within the timeout period, the step runs again. These attributes include input artifacts, app or algorithm specification, and environment variables.

The following list shows each pipeline step type and the attributes that, if changed, initiate a rerun of the step. For more information about which Python SDK parameters are used to create the following attributes, see Caching Configuration in the Amazon SageMaker Python SDK documentation.

**Processing step**

- AppSpecification
- Environment
- ProcessingInputs. This attribute contains information about the preprocessing script. If the contents of the preprocessing script change, the processing step is rerun.
Training step

- AlgorithmSpecification
- CheckpointConfig
- DebugHookConfig
- DebugRuleConfigurations
- Environment
- HyperParameters
- InputDataConfig. This attribute contains information about the training script. If the contents of the training script change, the training step is rerun.

Tuning step

- HyperParameterTuningJobConfig
- TrainingJobDefinition. This attribute is composed of multiple child attributes, not all of which cause the step to rerun. The child attributes that could incur a rerun (if changed) are:
  - AlgorithmSpecification
  - HyperParameterRanges
  - InputDataConfig
  - StaticHyperParameters
  - TuningObjective
  - TrainingJobDefinitions

AutoML step

- AutoMLJobConfig. This attribute is composed of multiple child attributes, not all of which cause the step to rerun. The child attributes that could incur a rerun (if changed) are:
  - CompletionCriteria
  - CandidateGenerationConfig
  - DataSplitConfig
  - Mode
  - AutoMLJobObjective
  - InputDataConfig
  - ProblemType

Transform step

- DataProcessing
- Environment
- ModelName
- TransformInput

ClarifyCheck Step (p. 3325)

- ClarifyCheckConfig
• CheckJobConfig
• SkipCheck
• RegisterNewBaseline
• ModelPackageGroupName
• SuppliedBaselineConstraints

QualityCheck Step (p. 3327)
• QualityCheckConfig
• CheckJobConfig
• SkipCheck
• RegisterNewBaseline
• ModelPackageGroupName
• SuppliedBaselineConstraints
• SuppliedBaselineStatistics

EMR Step
• ClusterId
• StepConfig

Cached data access control

When a SageMaker pipeline runs, it caches the parameters and metadata associated with the SageMaker jobs launched by the pipeline and saves them for reuse in subsequent runs. This metadata is accessible through a variety of sources in addition to cached pipeline steps, and includes the following types:

• Describe*Job requests
• CloudWatch Logs
• CloudWatch Events
• CloudWatch Metrics
• SageMaker Search

Note that access to each data source in the list is controlled by its own set of IAM permissions. Removing a particular role’s access to one data source does not affect the level of access to the others. For example, an account admin might remove IAM permissions for Describe*Job requests from a caller’s role. While the caller can no longer make Describe*Job requests, they can still retrieve the metadata from a pipeline run with cached steps as long as they have permission to run the pipeline. If an account admin wants to remove access to the metadata from a particular SageMaker job completely, they need to remove permissions for each of the relevant services that provide access to the data.

Retry Policy for Pipeline Steps

Retry policies help you automatically retry your SageMaker Pipelines steps after an error occurs. Any pipeline step can encounter exceptions, and exceptions happen for various reasons. In some cases, a retry can resolve these issues. With a retry policy for pipeline steps, you can choose whether to retry a particular pipeline step or not.
The retry policy only supports the following pipeline steps:

- Processing Step (p. 3313)
- Training Step (p. 3315)
- Tuning Step (p. 3315)
- AutoML Step (p. 3316)
- CreateModel Step (p. 3319)
- RegisterModel Step (p. 3319)
- Transform Step (p. 3320)

**Note**
Jobs running inside both the tuning and AutoML steps conduct retries internally and will not retry the `SageMaker.JOB_INTERNAL_ERROR` exception type, even if a retry policy is configured. You can program your own Retry Strategy using the SageMaker API.

**Supported exception types for the retry policy**

The retry policy for pipeline steps supports the following exception types:

- **Step.SERVICE_FAULT**: These exceptions occur when an internal server error or transient error happens when calling downstream services. SageMaker Pipelines retries on this type of error automatically. With a retry policy, you can override the default retry operation for this exception type.
- **Step.THROTTLING**: Throttling exceptions can occur while calling the downstream services. SageMaker Pipelines retries on this type of error automatically. With a retry policy, you can override the default retry operation for this exception type.
- **SageMaker.JOB_INTERNAL_ERROR**: These exceptions occur when the SageMaker job returns `InternalServerError`. In this case, starting a new job may fix a transient issue.
- **SageMaker.CAPACITY_ERROR**: The SageMaker job may encounter Amazon EC2 `InsufficientCapacityErrors`, which leads to the SageMaker job's failure. You can retry by starting a new SageMaker job to avoid the issue.
- **SageMaker.RESOURCE_LIMIT**: You can exceed the resource limit quota when running a SageMaker job. You can wait and retry running the SageMaker job after a short period and see if resources are released.

**The JSON schema for the retry policy**

The retry policy for Pipelines has the following JSON schema:

```json
"RetryPolicy": {
  "ExceptionType": [String]
  "IntervalSeconds": Integer
  "BackoffRate": Double
  "MaxAttempts": Integer
  "ExpireAfterMin": Integer
}
```

- **ExceptionType**: This field requires the following exception types in a string array format.
  - Step.SERVICE_FAULT
  - Step.THROTTLING
  - SageMaker.JOB_INTERNAL_ERROR
  - SageMaker.CAPACITY_ERROR
  - SageMaker.RESOURCE_LIMIT
• IntervalSeconds (optional): The number of seconds before the first retry attempt (1 by default). IntervalSeconds has a maximum value of 43200 seconds (12 hours).

• BackoffRate (optional): The multiplier by which the retry interval increases during each attempt (2.0 by default).

• MaxAttempts (optional): A positive integer that represents the maximum number of retry attempts (5 by default). If the error recurs more times than MaxAttempts specifies, retries cease and normal error handling resumes. A value of 0 specifies that errors are never retried. MaxAttempts has a maximum value of 20.

• ExpireAfterMin (optional): A positive integer that represents the maximum timespan of retry. If the error recurs after ExpireAfterMin minutes counting from the step gets executed, retries cease and normal error handling resumes. A value of 0 specifies that errors are never retried. ExpireAfterMin has a maximum value of 14,400 minutes (10 days).

Note
Only one of MaxAttempts or ExpireAfterMin can be given, but not both; if both are not specified, MaxAttempts becomes the default. If both properties are identified within one policy, then the retry policy generates a validation error.

Configuring a retry policy

The following is an example of a training step with a retry policy.

```json
{
  "Steps": [
    {
      "Name": "MyTrainingStep",
      "Type": "Training",
      "RetryPolicies": [
        {
          "ExceptionType": [
            "SageMaker.JOB_INTERNAL_ERROR",
            "SageMaker.CAPACITY_ERROR"
          ],
          "IntervalSeconds": 1,
          "BackoffRate": 2,
          "MaxAttempts": 5
        }
      ]
    }
  ]
}
```

The following is an example of how to build a TrainingStep in SDK for Python (Boto3) with a retry policy.

```python
from sagemaker.workflow.retry import (StepRetryPolicy,
StepExceptionTypeEnum,
SageMakerJobExceptionTypeEnum,
SageMakerJobStepRetryPolicy)

step_train = TrainingStep(
    name="MyTrainingStep",
    xxx,
    retry_policies=[
        // override the default
        StepRetryPolicy(
            exception_types=[
```
Baseline calculation, drift detection and lifecycle with ClarifyCheck and QualityCheck steps in Amazon SageMaker Model Building Pipelines

The following topic discusses how baselines and model versions evolve in the Amazon SageMaker Model Building Pipelines when using the ClarifyCheck (p. 3325) and QualityCheck (p. 3327) steps.

For the ClarifyCheck step, a baseline is a single file that resides in the step properties with the suffix constraints. For the QualityCheck step, a baseline is a combination of two files that resides in the step properties: one with the suffix statistics and the other with the suffix constraints. In the following topics we discuss these properties with a prefix that describes how they are used, impacting baseline behavior and lifecycle in these two pipeline steps. For example, the ClarifyCheck step always calculates and assigns the new baselines in the CalculatedBaselineConstraints property and the QualityCheck step does the same in the CalculatedBaselineConstraints and CalculatedBaselineStatistics properties.

Baseline calculation and registration for ClarifyCheck and QualityCheck steps

Both the ClarifyCheck and QualityCheck steps always calculate new baselines based on step inputs through the underlying processing job run. These newly calculated baselines are accessed through the properties with the prefix CalculatedBaseline. You can record these properties as the ModelMetrics of your model package in the Model Step (p. 3317). This model package can be registered with 5 different baselines. You can register it with one for each check type: data bias, model bias, and model explainability from running the ClarifyCheck step and model quality, and data quality from running the QualityCheck step. The register_new_baseline parameter dictates the value set in the properties with the prefix BaselineUsedForDriftCheck after a step runs.

The following table of potential use cases shows different behaviors resulting from the step parameters you can set for the ClarifyCheck and QualityCheck steps:
### Possible use case that you may consider for selecting this configuration

<table>
<thead>
<tr>
<th>Possible use case that you may consider for selecting this configuration</th>
<th><code>skip_check / register_new_baseline</code></th>
<th>Does step do a drift check?</th>
<th>Value of step property</th>
<th>Value of step property</th>
</tr>
</thead>
<tbody>
<tr>
<td>You are doing regular retraining with checks enabled to get a new model version, but you want to carry over the previous baselines as the DriftCheckBaselines in the model registry for your new model version.</td>
<td>False/False</td>
<td>Drift check runs against existing baselines</td>
<td>New baselines calculated by running the step</td>
<td>Baseline from the latest approved model in Model Registry or the baseline supplied as step parameter</td>
</tr>
<tr>
<td>You are doing regular retraining with checks enabled to get a new model version, but you want to refresh the DriftCheckBaselines in the model registry with the newly calculated baselines for your new model version.</td>
<td>False/True</td>
<td>Drift check runs against existing baselines</td>
<td>New baselines calculated by running the step</td>
<td>Newly calculated baseline by running the step (value of property CalculatedBaseline)</td>
</tr>
<tr>
<td>You are initiating the pipeline to retrain a new model version because there is a violation detected by Amazon SageMaker Model Monitor on an endpoint for a particular type of check, and you want to skip this type of check against the previous baseline, but carry over the previous baseline as DriftCheckBaselines in the model</td>
<td>True/False</td>
<td>No drift check</td>
<td>New baselines calculated by running</td>
<td>Baseline from the latest approved model in the model registry or the baseline supplied as step parameter</td>
</tr>
</tbody>
</table>
### Possible use case that you may consider for selecting this configuration

<table>
<thead>
<tr>
<th>skip_check / register_new_baselines</th>
<th>Does step do a drift check?</th>
<th>Value of step property CalculatedBaseline</th>
<th>Value of step property BaselineUsedForDriftCheck registry for your new model version.</th>
</tr>
</thead>
<tbody>
<tr>
<td>True / True</td>
<td>No drift check</td>
<td>New baselines calculated by running the step</td>
<td>Newly calculated baseline by running the step (value of property CalculatedBaseline)</td>
</tr>
</tbody>
</table>

This happens in the following cases:

- You are starting the initial run of the pipeline, building your first model version, and generating the initial baselines.
- You are initiating the pipeline to retrain a new model version because there is a violation detected by Model Monitor on the endpoint for a particular type of check. If you want to **skip the check against the previous baseline and refresh the DriftCheckBaselines with the newly calculated baseline** in the model registry directly.

**Note**

If you use scientific notation in your constraint, you need to convert to float. For a preprocessing script example of how to do this, see Create a Model Quality Baseline.

When you register a model with Model Step (p. 3317), you can register the BaselineUsedForDriftCheck property as DriftCheckBaselines. These baseline files can then be used by Model Monitor for model and data quality checks. In addition, these baselines can also be used in the ClarifyCheckStep and QualityCheck step to compare newly trained models against the existing models that are registered in the model registry for future pipeline runs.
Drift Detection against Previous Baselines in SageMaker Pipelines

In the case of the QualityCheck step, when you initiate the pipeline for regular retraining to get a new model version, you may not want to run the training step if the data quality and the data bias has ???(p. 2104) on the baselines of your previous approved model version. You also may not want to register the newly trained model version if the model quality, model bias, or model explainability violates the registered baseline of your previous approved model version when running the ClarifyCheck step. In these cases, you can enable the checks you want by setting the skip_check property of the corresponding check step set to False, resulting in the ClarifyCheck and QualityCheck step failing if violation is detected against previous baselines. The pipeline process then does not proceed so that the model drifted from the baseline isn't registered. ClarifyCheck and QualityCheck steps are able to get DriftCheckBaselines of the latest approved model version of a given model package group against which to compare. Previous baselines can also be supplied directly through supplied_baseline_constraints (in addition to supplied_baseline_statistics if it is a QualityCheck step) and are always prioritized over any baselines pulled from the model package group.

Baseline and model version lifecycle and evolution with SageMaker Pipelines

By setting register_new_baseline of your ClarifyCheck and QualityCheck step to False, your previous baseline is accessible through the step property prefix BaselineUsedForDriftCheck. You can then register these baselines as the DriftCheckBaselines in the new model version when you register a model with Model Step (p. 3317). Once you approve this new model version in the model registry, the DriftCheckBaseline in this model version becomes available for the ClarifyCheck and QualityCheck steps in the next pipeline process. If you want to refresh the baseline of a certain check type for future model versions, you can set register_new_baseline to True so that the properties with prefix BaselineUsedForDriftCheck become the newly calculated baseline. In these ways, you can preserve your preferred baselines for a model trained in the future, or refresh the baselines for drift checks when needed, managing your baseline evolution and lifecycle throughout your model training iterations.

The following diagram illustrates a model-version-centric view of the baseline evolution and lifecycle.
Amazon EventBridge Integration

You can schedule your Amazon SageMaker Model Building Pipelines executions using Amazon EventBridge. Amazon SageMaker Model Building Pipelines is supported as a target in Amazon EventBridge. This allows you to initiate the execution of your model building pipeline based on any event in your event bus. With EventBridge, you can automate your pipeline executions and respond automatically to events such as training job or endpoint status changes. Events include a new file being uploaded to your Amazon S3 bucket, a change in status of your Amazon SageMaker endpoint due to drift, and Amazon Simple Notification Service (SNS) topics.

The following SageMaker Pipelines actions can be automatically initiated:

- **StartPipelineExecution**

For more information on scheduling SageMaker jobs, see Automating SageMaker with Amazon EventBridge.

Schedule a Pipeline with Amazon EventBridge

To start a pipeline execution with Amazon CloudWatch Events, you must create an EventBridge rule. When you create a rule for events, you specify a target action to take when EventBridge receives an event that matches the rule. When an event matches the rule, EventBridge sends the event to the specified target and initiates the action defined in the rule.

The following tutorials show how to schedule a pipeline execution with EventBridge using the EventBridge console or the AWS CLI.

Prerequisites

- A role that EventBridge can assume with the SageMaker::StartPipelineExecution permission. This role can be created automatically if you create a rule from the EventBridge console; otherwise, you need to create this role yourself. For information on creating a SageMaker role, see SageMaker Roles.
- An Amazon SageMaker Pipeline to schedule. To create an Amazon SageMaker Pipeline, see Define a Pipeline.

Create an EventBridge rule using the EventBridge console

The following procedure shows how to create an EventBridge rule using the EventBridge console.

1. Navigate to the EventBridge console.
2. Select Rules on the left hand side.
3. Select Create Rule.
4. Enter a name and description for your rule.
5. Select how you want to initiate this rule. You have the following choices for your rule:
   - **Event pattern**: Your rule is initiated when an event matching the pattern occurs. You can choose a predefined pattern that matches a certain type of event, or you can create a custom pattern. If you select a predefined pattern, you can edit the pattern to customize it. For more information on Event patterns, see Event Patterns in CloudWatch Events.
   - **Schedule**: Your rule is initiated regularly on a specified schedule. You can use a fixed-rate schedule that initiates regularly for a specified number of minutes, hour, or weeks. You can also use a cron expression to create a more fine-grained schedule, such as "the first Monday of each month at 8am." Schedule is not supported on a custom or partner event bus.
6. Select your desired Event bus.
7. Select the target(s) to invoke when an event matches your event pattern or when the schedule is initiated. You can add up to 5 targets per rule. Select SageMaker Pipeline in the target dropdown list.

8. Select the pipeline you want to initiate from the pipeline dropdown list.

9. Add parameters to pass to your pipeline execution using a name and value pair. Parameter values can be static or dynamic. For more information on Amazon SageMaker Pipeline parameters, see AWS::Events::Rule SagemakerPipelineParameters.

   • Static values are passed to the pipeline execution every time the pipeline is initiated. For example, if 
     
     ```json
     {"Name": "Instance_type", "Value": "ml.4xlarge"}
     ```
     
   is specified in the parameter list, then it is passed as a parameter in StartPipelineExecutionRequest every time EventBridge initiates the pipeline.

   • Dynamic values are specified using a JSON path. EventBridge parses the value from an event payload, then passes it to the pipeline execution. For example: 
     
     ```json
     $.detail.param.value
     ```

10. Select the role to use for this rule. You can either use an existing role or create a new one.

11. (Optional) Add tags.

12. Select Create to finalize your rule.

Your rule is now in effect and ready to initiate your pipeline executions.

Create an EventBridge rule using the AWS CLI

The following procedure shows how to create an EventBridge rule using the AWS CLI.

1. Create a rule to be initiated. When creating an EventBridge rule using the AWS CLI, you have two options for how your rule is initiated, event pattern and schedule.

   • **Event pattern**: Your rule is initiated when an event matching the pattern occurs. You can choose a predefined pattern that matches a certain type of event, or you can create a custom pattern. If you select a predefined pattern, you can edit the pattern to customize it. You can create a rule with event pattern using the following command:

     ```bash
     aws events put-rule --name <RULE_NAME> ----event-pattern <YOUR_EVENT_PATTERN> --description <RULE_DESCRIPTION> --role-arn <ROLE_TO_EXECUTE_PIPELINE> --tags <TAGS>
     ```

   • **Schedule**: Your rule is initiated regularly on a specified schedule. You can use a fixed-rate schedule that initiates regularly for a specified number of minutes, hour, or weeks. You can also use a cron expression to create a more fine-grained schedule, such as "the first Monday of each month at 8am." Schedule is not supported on a custom or partner event bus. You can create a rule with schedule using the following command:

     ```bash
     aws events put-rule --name <RULE_NAME> --schedule-expression <YOUR_CRON_EXPRESSION> --description <RULE_DESCRIPTION> --role-arn <ROLE_TO_EXECUTE_PIPELINE> --tags <TAGS>
     ```

2. Add target(s) to invoke when an event matches your event pattern or when the schedule is initiated. You can add up to 5 targets per rule. For each target, you must specify:

   • **ARN**: The resource ARN of your pipeline.
   
   • **Role ARN**: The ARN of the role EventBridge should assume to execute the pipeline.
   
   • **Parameters**: Amazon SageMaker pipeline parameters to pass.

3. Run the following command to pass a Amazon SageMaker pipeline as a target to your rule using put-targets:

     ```bash
     aws events put-targets --rule <RULE_NAME> --event-bus-name <EVENT_BUS_NAME> --targets "[{"Id": "ID", "Arn": "<RESOURCE_ARN>", "RoleArn": "<ROLE_ARN>"},
     ```

3347
Amazon SageMaker Experiments Integration

Amazon SageMaker Model Building Pipelines is closely integrated with Amazon SageMaker Experiments. By default, when SageMaker Pipelines creates and executes a pipeline, the following SageMaker Experiments entities are created if they don't exist:

- An experiment for the pipeline
- A run group for every execution of the pipeline
- A run that's added to the run group for each SageMaker job created in a pipeline execution step

You can compare metrics such as model training accuracy across multiple pipeline executions just as you can compare such metrics across multiple run groups of a SageMaker model training experiment.

The following sample shows the relevant parameters of the Pipeline class in the Amazon SageMaker Python SDK.

```python
Pipeline(
    name="MyPipeline",
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(
        ExecutionVariables.PIPELINE_NAME,
        ExecutionVariables.PIPELINE_EXECUTION_ID
    ),
    steps=[...]
)
```

If you don't want an experiment and run group created for the pipeline, set pipeline_experiment_config to None.

**Note**

Experiments integration was introduced in the Amazon SageMaker Python SDK v2.41.0.

The following naming rules apply based on what you specify for the ExperimentName and TrialName parameters of pipeline_experiment_config:

- If you don't specify ExperimentName, the pipeline name is used for the experiment name.
- If you do specify ExperimentName, it's used for the experiment name. If an experiment with that name exists, the pipeline-created run groups are added to the existing experiment. If an experiment with that name doesn't exist, a new experiment is created.
- If you don't specify TrialName, the pipeline execution ID is used for the run group name.
- If you do specify TrialName, it's used for the run group name. If a run group with that name exists, the pipeline-created runs are added to the existing run group. If a run group with that name doesn't exist, a new run group is created.

**Note**

The experiment entities aren't deleted when the pipeline that created the entities is deleted. You can use the SageMaker Experiments API to delete the entities. For more information, see Clean Up Amazon SageMaker Experiment Resources (p. 1467).
For information about how to view the SageMaker Experiment entities associated with a pipeline, see View Experiment Entities Created by SageMaker Pipelines (p. 3374). For more information on SageMaker Experiments, see Manage Machine Learning with Amazon SageMaker Experiments (p. 1455).

The following sections show examples of the previous rules and how they are represented in the pipeline definition file. For more information on pipeline definition files, see SageMaker Pipelines Overview (p. 3306).

Topics

- Default Behavior (p. 3349)
- Disable Experiments Integration (p. 3349)
- Specify a Custom Experiment Name (p. 3350)
- Specify a Custom Run Group Name (p. 3350)

Default Behavior

Create a pipeline

The `pipeline_experiment_config` is omitted. `ExperimentName` defaults to the pipeline name. `TrialName` defaults to the execution ID.

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    "Version": "2020-12-01",
    "Parameters": [
      {
        "Name": "InputDataSource"
      },
      {
        "Name": "InstanceCount",
        "Type": "Integer",
        "DefaultValue": 1
      }
    ],
    "PipelineExperimentConfig": {
      "ExperimentName": "{Get": "Execution.PipelineName"},
      "TrialName": "{Get": "Execution.PipelineExecutionId"}
    },
    "Steps": [...]
}
```

Disable Experiments Integration

Create a pipeline

The `pipeline_experiment_config` is set to None.

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
```
pipeline_experiment_config=None,
steps=[step_train]
)

Pipeline definition file

This is the same as the preceding default example, without the PipelineExperimentConfig.

Specify a Custom Experiment Name

A custom experiment name is used. The run group name is set to the execution ID, as with the default behavior.

Create a pipeline

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(
        "CustomExperimentName",
        ExecutionVariables.PIPELINE_EXECUTION_ID
    ),
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    ...
    "PipelineExperimentConfig": {
        "ExperimentName": "CustomExperimentName",
        "TrialName": {
            "Get": "Execution.PipelineExecutionId"
        }
    },
    "Steps": [...]
}
```

Specify a Custom Run Group Name

A custom run group name is used and appended with the execution ID. The experiment name is set to the pipeline name, as with the default behavior.

Create a pipeline

```python
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(
        ExecutionVariables.PIPELINE_NAME,
        Join(on="-", values=["CustomTrialName", ExecutionVariables.PIPELINE_EXECUTION_ID])
    ),
    steps=[step_train]
)
```

Pipeline definition file

```json
{
    ...
    "PipelineExperimentConfig": {
        "ExperimentName": {
            "Get": "Execution.PipelineName"
        }
    }
}
Local Mode

SageMaker Pipelines local mode is an easy way to test your training, processing and inference scripts, as well as the runtime compatibility of pipeline parameters before you execute your pipeline on the managed SageMaker service. By using local mode, you can test your SageMaker pipeline locally using a smaller dataset. This allows quick and easy debugging of errors in user scripts and the pipeline definition itself without incurring the costs of using the managed service.

Pipelines local mode leverages SageMaker jobs local mode under the hood. This is a feature in the SageMaker Python SDK that allows you to run SageMaker built-in or custom images locally using Docker containers. Pipelines local mode is built on top of SageMaker jobs local mode. Therefore, you can expect to see the same results as if you were running those jobs separately. For example, local mode still uses Amazon S3 to upload model artifacts and processing outputs. If you want data generated by local jobs to reside on local disk, you can use the setup mentioned in Local Mode.

Pipeline local mode currently supports the following step types:

- Training Step (p. 3315)
- Processing Step (p. 3313)
- Transform Step (p. 3320)
- Model Step (with Create Model arguments only)
- Condition Step (p. 3321)
- Fail Step (p. 3329)

As opposed to the managed Pipelines service which allows multiple steps to execute in parallel using Parallelism Configuration, the local pipeline executor runs the steps sequentially. Therefore, overall execution performance of a local pipeline may be poorer than one that runs on the cloud - this mostly depends on the size of the dataset, algorithm, as well as the power of your local computer. Also note that Pipelines runs in local mode are not recorded in SageMaker Experiments.

Note
Pipelines local mode is not compatible with SageMaker algorithms such as XGBoost. If you want to use these algorithms, you must use them in script mode.

In order to execute a pipeline locally, the sagemaker_session fields associated with the pipeline steps and the pipeline itself need to be of type LocalPipelineSession. The following example shows how you can define a SageMaker pipeline to execute locally.

```python
from sagemaker.workflow.pipeline_context import LocalPipelineSession

local_pipeline_session = LocalPipelineSession()

pytorch_estimator = PyTorch(
    sagemaker_session=local_pipeline_session,
    role=sagemaker.get_execution_role(),
    instance_type="ml.c5.xlarge",
)```
instance_count=1,
    framework_version="1.8.0",
    py_version="py36",
    entry_point="/entry_point.py",
  )

step = TrainingStep(
    name="MyTrainingStep",
    step_args=pytorch_estimator.fit(
      inputs=TrainingInput(s3_data="s3://my-bucket/my-data/train"),
    )
  )

pipeline = Pipeline(
    name="MyPipeline",
    steps=[step],
    sagemaker_session=local_pipeline_session
  )

pipeline.create(
    role_arn=sagemaker.get_execution_role(),
    description="local pipeline example"
  )

// pipeline will execute locally
execution = pipeline.start()
steps = execution.list_steps()
training_job_name = steps['PipelineExecutionSteps'][0]['Metadata']['TrainingJob']['Arn']
step_outputs = pipeline_session.sagemaker_client.describe_training_job(TrainingJobName = training_job_name)

Once you are ready to execute the pipeline on the managed SageMaker Pipelines service, you can do so by replacing LocalPipelineSession in the previous code snippet with PipelineSession (as shown in the following code sample) and rerunning the code.

```python
from sagemaker.workflow.pipeline_context import PipelineSession
pipeline_session = PipelineSession()
```

**Troubleshooting Amazon SageMaker Model Building Pipelines**

When using Amazon SageMaker Model Building Pipelines, you might run into issues for various reasons. This topic provides information about common errors and how to resolve them.

**Pipeline Definition Issues**

Your pipeline definition might not be formatted correctly. This can result in your execution failing or your job being inaccurate. These errors can be caught when the pipeline is created or when an execution occurs. If your definition doesn't validate, SageMaker Pipelines returns an error message identifying the character where the JSON file is malformed. To fix this problem, review the steps created using the SageMaker Python SDK for accuracy.

You can only include steps in a pipeline definition once. Because of this, steps cannot exist as part of a condition step and a pipeline in the same pipeline.

**Examining Pipeline Logs**

You can view the status of your steps using the following command:
Each step includes the following information:

- The ARN of the entity launched by the pipeline, such as SageMaker job ARN, model ARN, or model package ARN.
- The failure reason includes a brief explanation of the step failure.
- If the step is a condition step, it includes whether the condition is evaluated to true or false.
- If the execution reuses a previous job execution, the `CacheHit` lists the source execution.

You can also view the error messages and logs in the Amazon SageMaker Studio interface. For information about how to see the logs in Studio, see View a Pipeline Execution (p. 3371).

**Missing Permissions**

Correct permissions are required for the role that creates the pipeline execution, and the steps that create each of the jobs in your pipeline execution. Without these permissions, you may not be able to submit your pipeline execution or run your SageMaker jobs as expected. To ensure that your permissions are properly set up, see IAM Access Management (p. 3308).

**Job Execution Errors**

You may run into issues when executing your steps because of issues in the scripts that define the functionality of your SageMaker jobs. Each job has a set of CloudWatch logs. To view these logs from Studio, see View a Pipeline Execution (p. 3371). For information about using CloudWatch logs with SageMaker, see Log Amazon SageMaker Events with Amazon CloudWatch (p. 3830).

**Property File Errors**

You may have issues when incorrectly implementing property files with your pipeline. To ensure that your implementation of property files works as expected, see Property Files and JsonGet (p. 3332).

## Create and Manage SageMaker Pipelines

You can use Amazon SageMaker Model Building Pipelines to create end-to-end workflows that manage and deploy SageMaker jobs. SageMaker Pipelines comes with SageMaker Python SDK integration, so you can build each step of your pipeline using a Python-based interface.

After your pipeline is deployed, you can view the directed acyclic graph (DAG) for your pipeline and manage your executions using Amazon SageMaker Studio. Using SageMaker Studio, you can get information about your current and historical pipelines, compare executions, see the DAG for your executions, get metadata information, and more. To learn how to view pipelines from SageMaker Studio, see View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3369).

**Topics**

- Define a Pipeline (p. 3353)
- Run a pipeline (p. 3366)
- View, Track, and Execute SageMaker Pipelines in SageMaker Studio (p. 3369)

## Define a Pipeline

To orchestrate your workflows with Amazon SageMaker Model Building Pipelines, you need to generate a directed acyclic graph (DAG) in the form of a JSON pipeline definition. The following image is a representation of the pipeline DAG that you create in this tutorial:
You can generate your JSON pipeline definition using the SageMaker Python SDK. The following tutorial shows how to generate a pipeline definition for a pipeline that solves a regression problem to determine the age of an abalone based on its physical measurements. For a Jupyter notebook that includes the content in this tutorial that you can run, see Orchestrating Jobs with Amazon SageMaker Model Building Pipelines.

**Topics**
- Prerequisites (p. 3354)
- Create a Pipeline (p. 3355)

**Prerequisites**

To run the following tutorial you must do the following:

- Set up your notebook instance as outlined in Create a notebook instance. This gives your role permissions to read and write to Amazon S3, and create training, batch transform, and processing jobs in SageMaker.
- Grant your notebook permissions to get and pass its own role as shown in Modifying a role permissions policy. Add the following JSON snippet to attach this policy to your role. Replace `<your-role-arn>` with the ARN used to create your notebook instance.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
```
Trust the SageMaker service principal by following the steps in Modifying a role trust policy. Add the following statement fragment to the trust relationship of your role:

```
{
  "Sid": "",
  "Effect": "Allow",
  "Principal": {
    "Service": "sagemaker.amazonaws.com"
  },
  "Action": "sts:AssumeRole"
}
```

Set Up Your Environment

Create a new SageMaker session using the following code block. This returns the role ARN for the session. This role ARN should be the execution role ARN that you set up as a prerequisite.

```python
import boto3
import sagemaker
import sagemaker.session

region = boto3.Session().region_name
sagemaker_session = sagemaker.session.Session()
role = sagemaker_session.get_execution_role()
default_bucket = sagemaker_session.default_bucket()
model_package_group_name = f"AbaloneModelPackageGroupName"
```

Create a Pipeline

Run the following steps from your SageMaker notebook instance to create a pipeline including steps for preprocessing, training, evaluation, conditional evaluation, and model registration.

**Step 1: Download the Dataset**

This notebook uses the UCI Machine Learning Abalone Dataset. The dataset contains the following features:

- **length** – The longest shell measurement of the abalone.
- **diameter** – The diameter of the abalone perpendicular to its length.
- **height** – The height of the abalone with meat in the shell.
- **whole_weight** – The weight of the whole abalone.
- **shucked_weight** – The weight of the meat removed from the abalone.
- **viscera_weight** – The weight of the abalone viscera after bleeding.
- **shell_weight** – The weight of the abalone shell after meat removal and drying.
- **sex** – The sex of the abalone. One of 'M', 'F', or 'I', where 'I' is an infant abalone.
• rings – The number of rings in the abalone shell.

The number of rings in the abalone shell is a good approximation for its age using the formula 
\[
\text{age} = \text{rings} + 1.5
\]
However, obtaining this number is a time-consuming task. You must cut the shell 
through the cone, stain the section, and count the number of rings through a microscope. However, 
the other physical measurements are easier to determine. This notebook uses the dataset to build a 
predictive model of the variable rings using the other physical measurements.

**To download the dataset**

1. Download the dataset into your account's default Amazon S3 bucket.

```python
!mkdir -p data
local_path = "data/abalone-dataset.csv"

s3 = boto3.resource("s3")
s3.Bucket(f"sagemaker-servicecatalog-seedcode-{region}").download_file(
    "dataset/abalone-dataset.csv",
    local_path
)

base_uri = f"s3://{default_bucket}/abalone"
input_data_uri = sagemaker.s3.S3Uploader.upload(
    local_path=local_path,
    desired_s3_uri=base_uri,
)
print(input_data_uri)
```

2. Download a second dataset for batch transformation after your model is created.

```python
local_path = "data/abalone-dataset-batch"

s3 = boto3.resource("s3")
s3.Bucket(f"sagemaker-servicecatalog-seedcode-{region}").download_file(
    "dataset/abalone-dataset-batch",
    local_path
)

base_uri = f"s3://{default_bucket}/abalone"
batch_data_uri = sagemaker.s3.S3Uploader.upload(
    local_path=local_path,
    desired_s3_uri=base_uri,
)
print(batch_data_uri)
```

**Step 2: Define Pipeline Parameters**

This code block defines the following parameters for your pipeline:

• **processing_instance_count** – The instance count of the processing job.
• **input_data** – The Amazon S3 location of the input data.
• **batch_data** – The Amazon S3 location of the input data for batch transformation.
• **model_approval_status** – The approval status to register the trained model with for CI/CD. For 
  more information, see Automate MLOps with SageMaker Projects (p. 3378).

```python
from sagemaker.workflow.parameters import ( ParameterInteger,
```

3356
Step 3: Define a Processing Step for Feature Engineering

This section shows how to create a processing step to prepare the data from the dataset for training.

To create a processing step

1. Create a directory for the processing script.

```
!mkdir -p abalone
```

2. Create a file in the `/abalone` directory named `preprocessing.py` with the following content. This preprocessing script is passed in to the processing step for execution on the input data. The training step then uses the preprocessed training features and labels to train a model, and the evaluation step uses the trained model and preprocessed test features and labels to evaluate the model. The script uses scikit-learn to do the following:

   - Fill in missing sex categorical data and encode it so it's suitable for training.
   - Scale and normalize all numerical fields except for rings and sex.
   - Split the data into training, test, and validation datasets.

```
%%writefile abalone/preprocessing.py
import argparse
import os
import requests
import tempfile
import numpy as np
import pandas as pd
from sklearn.compose import ColumnTransformer
from sklearn.impute import SimpleImputer
from sklearn.pipeline import Pipeline
from sklearn.preprocessing import StandardScaler, OneHotEncoder

# Because this is a headerless CSV file, specify the column names here.
feature_columns_names = [
    "sex",
    "length",
    "diameter",
    "height",
    "rings"]
```
"whole_weight",
"shucked_weight",
"viscera_weight",
"shell_weight",
]
label_column = "rings"

feature_columns_dtype = {
  "sex": str,
  "length": np.float64,
  "diameter": np.float64,
  "height": np.float64,
  "whole_weight": np.float64,
  "shucked_weight": np.float64,
  "viscera_weight": np.float64,
  "shell_weight": np.float64
}

label_column_dtype = {"rings": np.float64}

def merge_two_dicts(x, y):
  z = x.copy()
  z.update(y)
  return z

if __name__ == "__main__":
  base_dir = "/opt/ml/processing"
  df = pd.read_csv(
    f"{base_dir}/input/abalone-dataset.csv",
    header=None,
    names=feature_columns_names + [label_column],
    dtype=merge_two_dicts(feature_columns_dtype, label_column_dtype)
  )
  numeric_features = list(feature_columns_names)
  numeric_features.remove("sex")
  numeric_transformer = Pipeline(
    steps=[
      ("imputer", SimpleImputer(strategy="median")),
      ("scaler", StandardScaler())
    ]
  )
  categorical_features = ["sex"]
  categorical_transformer = Pipeline(
    steps=[
      ("imputer", SimpleImputer(strategy="constant", fill_value="missing")),
      ("onehot", OneHotEncoder(handle_unknown="ignore"))
    ]
  )
  preprocess = ColumnTransformer(
    transformers=[
      ("num", numeric_transformer, numeric_features),
      ("cat", categorical_transformer, categorical_features)
    ]
  )
  y = df.pop("rings")
  X_pre = preprocess.fit_transform(df)
  y_pre = y.to_numpy().reshape(len(y), 1)
  X = np.concatenate((y_pre, X_pre), axis=1)
  np.random.shuffle(X)
train, validation, test = np.split(X, [int(.7*len(X)), int(.85*len(X))])

pd.DataFrame(train).to_csv(f"{base_dir}/train/train.csv", header=False, index=False)
pd.DataFrame(validation).to_csv(f"{base_dir}/validation/validation.csv", header=False, index=False)
pd.DataFrame(test).to_csv(f"{base_dir}/test/test.csv", header=False, index=False)

3. Create an instance of an SKLearnProcessor to pass in to the processing step.

```python
from sagemaker.sklearn.processing import SKLearnProcessor

framework_version = "0.23-1"

sklearn_processor = SKLearnProcessor(
    framework_version=framework_version,
    instance_type="ml.m5.xlarge",
    instance_count=processing_instance_count,
    base_job_name="sklearn-abalone-process",
    role=role,
)
```

4. Create a processing step. This step takes in the SKLearnProcessor, the input and output channels, and the preprocessing.py script that you created. This is very similar to a processor instance's run method in the SageMaker Python SDK. The input_data parameter passed into ProcessingStep is the input data of the step itself. This input data is used by the processor instance when it runs.

```
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep

step_process = ProcessingStep(
    name="AbaloneProcess",
    processor=sklearn_processor,
    inputs=[
        ProcessingInput(source=input_data, destination="/opt/ml/processing/input"),
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test"),
    ],
    code="abalone/preprocessing.py",
)
```

---

**Step 4: Define a Training step**

This section shows how to use the SageMaker XGBoost Algorithm to train a model on the training data output from the processing steps.

**To define a training step**

1. Specify the model path where you want to save the models from training.
model_path = f"s3://[default_bucket]/AbaloneTrain"

2. Configure an estimator for the XGBoost algorithm and the input dataset. The training instance type is passed into the estimator. A typical training script loads data from the input channels, configures training with hyperparameters, trains a model, and saves a model to `model_dir` so that it can be hosted later. SageMaker uploads the model to Amazon S3 in the form of a `model.tar.gz` at the end of the training job.

```python
from sagemaker.estimator import Estimator

image_uri = sagemaker.image_uris.retrieve(
    framework="xgboost",
    region=region,
    version="1.0-1",
    py_version="py3",
    instance_type="ml.m5.xlarge"
)

xgb_train = Estimator(
    image_uri=image_uri,
    instance_type="ml.m5.xlarge",
    instance_count=1,
    output_path=model_path,
    role=role,
)

xgb_train.set_hyperparameters(
    objective="reg:linear",
    num_round=50,
    max_depth=5,
    eta=0.2,
    gamma=4,
    min_child_weight=6,
    subsample=0.7,
    silent=0
)
```

3. Create a `TrainingStep` using the estimator instance and properties of the `ProcessingStep`. In particular, pass in the S3Uri of the "train" and "validation" output channel to the `TrainingStep`.

```python
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TrainingStep

step_train = TrainingStep(
    name="AbaloneTrain",
    estimator=xgb_train,
    inputs={
        "train": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["train"].S3Output.S3Uri,
            content_type="text/csv"
        ),
        "validation": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs["validation"].S3Output.S3Uri,
            content_type="text/csv"
        )
    }]
)```
Step 5: Define a Processing Step for Model Evaluation

This section shows how to create a processing step to evaluate the accuracy of the model. The result of this model evaluation is used in the condition step to determine which execute path to take.

To define a processing step for model evaluation

1. Create a file in the /abalone directory named evaluation.py. This script is used in a processing step to perform model evaluation. It takes a trained model and the test dataset as input, then produces a JSON file containing classification evaluation metrics.

```python
%%writefile abalone/evaluation.py
import json
import pathlib
import pickle
import tarfile
import joblib
import numpy as np
import pandas as pd
import xgboost

from sklearn.metrics import mean_squared_error

if __name__ == '__main__':
    model_path = f'/opt/ml/processing/model/model.tar.gz'
    with tarfile.open(model_path) as tar:
        tar.extractall(path='.')
    model = pickle.load(open('xgboost-model', 'rb'))
    test_path = '/opt/ml/processing/test/test.csv'
    df = pd.read_csv(test_path, header=None)
    y_test = df.iloc[:, 0].to_numpy()
    df.drop(df.columns[0], axis=1, inplace=True)
    X_test = xgboost.DMatrix(df.values)
    predictions = model.predict(X_test)
    mse = mean_squared_error(y_test, predictions)
    std = np.std(y_test - predictions)

    report_dict = {
        "regression_metrics": {
            "mse": {
                "value": mse,
                "standard_deviation": std
            }
        }
    }

    output_dir = "/opt/ml/processing/evaluation"
    pathlib.Path(output_dir).mkdir(parents=True, exist_ok=True)
    evaluation_path = f'{output_dir}/evaluation.json'
    with open(evaluation_path, "w") as f:
        f.write(json.dumps(report_dict))
```
2. Create an instance of a `ScriptProcessor` that is used to create a `ProcessingStep`.

```python
from sagemaker.processing import ScriptProcessor

script_eval = ScriptProcessor(
    image_uri=image_uri,
    command=["python3"],
    instance_type="ml.m5.xlarge",
    instance_count=1,
    base_job_name="script-abalone-eval",
    role=role,
)
```

3. Create a `ProcessingStep` using the processor instance, the input and output channels, and the `evaluation.py` script. In particular, pass in the `S3ModelArtifacts` property from the `step_train` training step, as well as the `S3Uri` of the "test" output channel of the `step_process` processing step. This is very similar to a processor instance's `run` method in the SageMaker Python SDK.

```python
from sagemaker.workflow.properties import PropertyFile

evaluation_report = PropertyFile(
    name="EvaluationReport",
    output_name="evaluation",
    path="evaluation.json"
)

step_eval = ProcessingStep(
    name="AbaloneEval",
    processor=script_eval,
    inputs=[
        ProcessingInput(
            source=step_train.properties.ModelArtifacts.S3ModelArtifacts,
            destination="/opt/ml/processing/model"
        ),
        ProcessingInput(
            source=step_process.properties.ProcessingOutputConfig.Outputs[
                "test"].S3Output.S3Uri,
            destination="/opt/ml/processing/test"
        ),
    ],
    outputs=[
        ProcessingOutput(output_name="evaluation", source="/opt/ml/processing/evaluation"),
    ],
    code="abalone/evaluation.py",
    property_files=[evaluation_report],
)
```

**Step 6: Define a `CreateModelStep` for Batch Transformation**

**Important**

We recommend using [Model Step (p. 3317)](https://docs.aws.amazon.com/sagemaker/latest/dg/model-step.html) to create models as of v2.90.0 of the SageMaker Python SDK. `CreateModelStep` will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

This section shows how to create a SageMaker model from the output of the training step. This model is used for batch transformation on a new dataset. This step is passed into the condition step and only executes if the condition step evaluates to true.
To define a CreateModelStep for batch transformation

```python
from sagemaker.model import Model

model = Model(  
    image_uri=image_uri,  
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,  
    sagemaker_session=sagemaker_session,  
    role=role,
)
```

2. Define the model input for your SageMaker model.

```python
from sagemaker.inputs import CreateModelInput

inputs = CreateModelInput(  
    instance_type="ml.m5.large",  
    accelerator_type="ml.eia1.medium",
)
```

3. Create your CreateModelStep using the CreateModelInput and SageMaker model instance you defined.

```python
from sagemaker.workflow.steps import CreateModelStep

step_create_model = CreateModelStep(  
    name="AbaloneCreateModel",  
    model=model,  
    inputs=inputs,
)
```

Step 7: Define a TransformStep to Perform Batch Transformation

This section shows how to create a TransformStep to perform batch transformation on a dataset after the model is trained. This step is passed into the condition step and only executes if the condition step evaluates to true.

To define a TransformStep to perform batch transformation

1. Create a transformer instance with the appropriate compute instance type, instance count, and desired output Amazon S3 bucket URI. Pass in the ModelName property from the step_create_model CreateModel step.

```python
from sagemaker.transformer import Transformer

transformer = Transformer(  
    model_name=step_create_model.properties.ModelName,  
    instance_type="ml.m5.xlarge",  
    instance_count=1,  
    output_path=f"s3://{default_bucket}/AbaloneTransform"
)
```
2. Create a TransformStep using the transformer instance you defined and the batch_data pipeline parameter.

```python
from sagemaker.inputs import TransformInput
from sagemaker workflow.steps import TransformStep

step_transform = TransformStep(  
    name="AbaloneTransform",  
    transformer=transformer,  
    inputs=TransformInput(data=batch_data)
)
```

**Step 8: Define a RegisterModel Step to Create a Model Package**

**Important**
We recommend using Model Step (p. 3317) to register models as of v2.90.0 of the SageMaker Python SDK. RegisterModel will continue to work in previous versions of the SageMaker Python SDK, but is no longer actively supported.

This section shows how to construct an instance of RegisterModel. The result of executing RegisterModel in a pipeline is a model package. A model package is a reusable model artifacts abstraction that packages all ingredients necessary for inference. It consists of an inference specification that defines the inference image to use along with an optional model weights location. A model package group is a collection of model packages. You can use a ModelPackageGroup for SageMaker Pipelines to add a new version and model package to the group for every pipeline execution. For more information about model registry, see Register and Deploy Models with Model Registry (p. 2232).

This step is passed into the condition step and only executes if the condition step evaluates to true.

**To define a RegisterModel step to create a model package**

- Construct a RegisterModel step using the estimator instance you used for the training step. Pass in the S3ModelArtifacts property from the step_train training step and specify a ModelPackageGroup. SageMaker Pipelines creates this ModelPackageGroup for you.

```python
from sagemaker.model_metrics import MetricsSource, ModelMetrics  
from sagemaker workflow.step_collections import RegisterModel

model_metrics = ModelMetrics(  
    model_statistics=MetricsSource(  
        s3_uri="{}//evaluation.json".format(  
            step_eval.arguments["ProcessingOutputConfig"]['Outputs'][0]['S3Output'])  
    ),  
    content_type="application/json"
)

step_register = RegisterModel(  
    name="AbaloneRegisterModel",  
    estimator=xgb_train,  
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,  
    content_types=['text/csv'],  
    response_types=['text/csv'],  
    inference_instances=['ml.t2.medium', 'ml.m5.xlarge'],  
    transform_instances=['ml.m5.xlarge'],  
    model_package_group_name=model_package_group_name,  
    approval_status=model_approval_status,  
    model_metrics=model_metrics
)
Step 9: Define a Condition Step to Verify Model Accuracy

A ConditionStep allows SageMaker Pipelines to support conditional execution in your pipeline DAG based on the condition of step properties. In this case, you only want to register a model package if the accuracy of that model, as determined by the model evaluation step, exceeds the required value. If the accuracy exceeds the required value, the pipeline also creates a SageMaker Model and runs batch transformation on a dataset. This section shows how to define the Condition step.

To define a condition step to verify model accuracy

1. Define a `ConditionLessThanOrEqualTo` condition using the accuracy value found in the output of the model evaluation processing step, `step_eval`. Get this output using the property file you indexed in the processing step and the respective JSONPath of the mean squared error value, "mse".

   ```python
   from sagemaker.workflow.conditions import ConditionLessThanOrEqualTo
   from sagemaker.workflow.condition_step import ConditionStep
   from sagemaker.workflow.functions import JsonGet

   cond_lte = ConditionLessThanOrEqualTo(
       left=JsonGet(
           step_name=step_eval.name,
           property_file=evaluation_report,
           json_path="regression_metrics.mse.value" ),
       right=6.0)
   ```

2. Construct a `ConditionStep`. Pass the `ConditionEquals` condition in, then set the model package registration and batch transformation steps as the next steps if the condition passes.

   ```python
   step_cond = ConditionStep(       
       name="AbaloneMSECond",
       conditions=[cond_lte],
       if_steps=[step_register, step_create_model, step_transform],
       else_steps=[],
   )
   ```

Step 10: Create a pipeline

Now that you’ve created all of the steps, combine them into a pipeline.

To create a pipeline

1. Define the following for your pipeline: name, parameters, and steps. Names must be unique within an (account, region) pair.

   **Note**
   A step can only appear once in either the pipeline's step list or the if/else step lists of the condition step. It cannot appear in both.

   ```python
   from sagemaker.workflow.pipeline import Pipeline

   pipeline_name = f"AbalonePipeline"
   ```
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_count,
        model_approval_status,
        input_data,
        batch_data,
    ],
    steps=[step_process, step_train, step_eval, step_cond],
)

2. (Optional) Examine the JSON pipeline definition to ensure that it's well-formed.

```python
import json
json.loads(pipeline.definition())
```

This pipeline definition is ready to submit to SageMaker. In the next tutorial, you submit this pipeline to SageMaker and start an execution.

**Next step: Run a pipeline (p. 3366)**

**Run a pipeline**

After you've created a pipeline definition using the SageMaker Python SDK, you can submit it to SageMaker to start your execution. The following tutorial shows how to submit a pipeline, start an execution, examine the results of that execution, and delete your pipeline.

**Topics**
- Prerequisites (p. 3366)
- Step 1: Start the Pipeline (p. 3366)
- Step 2: Examine a Pipeline Execution (p. 3367)
- Step 3: Override Default Parameters for a Pipeline Execution (p. 3368)
- Step 4: Stop and Delete a Pipeline Execution (p. 3369)

**Prerequisites**

This tutorial requires the following:

- A SageMaker notebook instance.
- A SageMaker Pipelines pipeline definition. This tutorial assumes you're using the pipeline definition created by completing the Define a Pipeline (p. 3353) tutorial.

**Step 1: Start the Pipeline**

First, you need to start the pipeline.

**To start the pipeline**

1. Examine the JSON pipeline definition to ensure that it's well-formed.
Step 2: Examine a Pipeline Execution

Next, you need to examine the pipeline execution.

To examine a pipeline execution
1. Describe the pipeline execution status to ensure that it has been created and started successfully.

description = execution.describe()

2. Wait for the execution to finish.

description = execution.wait()

3. List the execution steps and their status.

description = execution.list_steps()

Your output should look like the following:

```
[{'StepName': 'AbaloneTransform',
  'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 27, 870000, tzinfo=tzlocal()),
  'EndTime': datetime.datetime(2020, 11, 21, 2, 45, 50, 492000, tzinfo=tzlocal()),
  'StepStatus': 'Succeeded',
  'CacheHitResult': {'SourcePipelineExecutionArn': ''},
{'StepName': 'AbaloneRegisterModel',
  'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 929000, tzinfo=tzlocal()),
  'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 28, 15000, tzinfo=tzlocal()),
  'StepStatus': 'Succeeded',
  'CacheHitResult': {'SourcePipelineExecutionArn': ''},
  'Metadata': {'RegisterModel': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:model-package/abalonemodelpackagegroupname/1'}}},
{'StepName': 'AbaloneCreateModel',
  'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 895000, tzinfo=tzlocal()),
  'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 27, 708000, tzinfo=tzlocal()),
  'StepStatus': 'Succeeded',
  'CacheHitResult': {'SourcePipelineExecutionArn': ''},
  'Metadata': {'Model': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:model/pipelines-cfvy1tjuxdq8-abalonemodelfieldpackagename/1'}}},
{'StepName': 'AbaloneMSECond',
  'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 25, 558000, tzinfo=tzlocal()),
  'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 329000, tzinfo=tzlocal()),
  'StepStatus': 'Succeeded',
  'CacheHitResult': {'SourcePipelineExecutionArn': ''}},
```
4. After your pipeline execution is complete, download the resulting `evaluation.json` file from Amazon S3 to examine the report.

```python
evaluation_json = sagemaker.s3.S3Downloader.read_file("/evaluation.json".format(step_eval.arguments["ProcessingOutputConfig"]['Outputs'][0]['S3Output']['S3Uri']))
json.loads(evaluation_json)
```

---

**Step 3: Override Default Parameters for a Pipeline Execution**

You can run additional executions of the pipeline by specifying different pipeline parameters to override the defaults.

**To override default parameters**

1. Create the pipeline execution. This starts another pipeline execution with the model approval status override set to "Approved". This means that the model package version generated by the `RegisterModel` step is automatically ready for deployment through CI/CD pipelines, such as with SageMaker Projects. For more information, see Automate MLOps with SageMaker Projects (p. 3378).

```python
execution = pipeline.start(parameters=dict(
    ModelApprovalStatus="Approved",
))
```

2. Wait for the execution to finish.

```python
execution.wait()
```

3. List the execution steps and their status.

```python
execution.list_steps()
```

4. After your pipeline execution is complete, download the resulting `evaluation.json` file from Amazon S3 to examine the report.
Step 4: Stop and Delete a Pipeline Execution

When you're finished with your pipeline, you can stop any ongoing executions and delete the pipeline.

To stop and delete a pipeline execution

1. Stop the pipeline execution.
   
   ```python
   execution.stop()
   ```

2. Delete the pipeline.
   
   ```python
   pipeline.delete()
   ```

View, Track, and Execute SageMaker Pipelines in SageMaker Studio

To view, track, and execute Amazon SageMaker Pipelines in Amazon SageMaker Studio, you must sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 36).

Topics

- View a Pipeline (p. 3369)
- View a Pipeline Execution (p. 3371)
- View Experiment Entities Created by SageMaker Pipelines (p. 3374)
- Execute a Pipeline (p. 3375)
- Track the Lineage of a SageMaker ML Pipeline (p. 3376)

View a Pipeline

This procedure shows you how to directly find a pipeline and view its details page. You can also find pipelines that are part of a project listed in the project's details page. For information on finding a pipeline that is part of a project, see Automate MLOps with SageMaker Projects (p. 3378).

To view a list of pipelines

1. In the Studio sidebar, choose the Home icon (🏠).
2. Select Pipelines from the menu.
3. Use search to narrow the list of pipelines by name.
4. Select a pipeline name to view details about the pipeline. The pipeline details tab opens and displays a list of pipeline executions. You can start an execution or choose one of the other tabs for more information about the pipeline. Use the Property Inspector icon (🔧) to choose which columns to display.
5. From the pipeline details page, choose one of the following tabs to view details about the pipeline: 

• **Executions** – Details about the executions. You can create an execution from this tab or the **Graph** tab.

• **Graph** – The DAG for the pipeline.

• **Parameters** – Includes the model approval status.

• **Settings** – The metadata associated with the pipeline. You can download the pipeline definition file and edit the pipeline name and description from this tab.
View a Pipeline Execution

This procedure shows you how to view a pipeline execution. For information on how to view a list of pipeline executions, and how to use SageMaker search to narrow the executions in the list, see View a Pipeline (p. 3369).

To view details of a pipeline execution

1. In the execution list, open an execution to view details about the execution. The execution details tab opens and displays a graph of the steps in the pipeline. You can choose one of the other tabs to view information about the pipeline execution, which is similar to that shown when viewing the pipeline details.

2. Use search to find a step in the graph. Type characters that match a step name. You can drag the graph around or use the resizing icons on the lower-right side of the graph. The inset on the lower-right side of the graph displays where you are in the graph.
3. Choose one of the steps in the graph to see details about the step. In the preceding screenshot, a training step is chosen and displays the following tabs:

- **Input** – The training inputs. If an input source is from Amazon Simple Storage Service (Amazon S3), choose the link to view the file in the Amazon S3 console.

- **Output** – The training outputs, such as metrics, charts, files, and evaluation outcome. The graphs were produced using the Tracker APIs.
• **Logs** – The Amazon CloudWatch logs produced by the step.

- **Info** – The parameters and metadata associated with the step.

View Experiment Entities Created by SageMaker Pipelines

When you create a pipeline and specify `pipeline_experiment_config`, SageMaker Pipelines creates the following SageMaker Experiments entities by default if they don't exist:

- An experiment for the pipeline
- A run group for every execution of the pipeline
- A run for each SageMaker job created in a pipeline step
For information on how experiments are integrated with pipelines, see Amazon SageMaker Experiments Integration (p. 3348). For more information on SageMaker Experiments, see Manage Machine Learning with Amazon SageMaker Experiments (p. 1455).

You can get to the list of runs associated with a pipeline from either the pipeline executions list or the experiments list.

**To view the runs list from the pipeline executions list**

1. To view the pipeline executions list, follow the first four steps in View a Pipeline (p. 3369).
2. On the top right of the screen, choose the Filter icon (Filter).
3. Select **Experiment**. If experiment integration wasn't deactivated when the pipeline was created, the experiment name is displayed in the executions list.

   **Note**
   
   Experiments integration was introduced in v2.41.0 of the Amazon SageMaker Python SDK. Pipelines created with an earlier version of the SDK aren't integrated with experiments by default.

4. Select the experiment of your choice to view run groups and runs related to that experiment.

**To view the runs list from the experiments list**

1. In the left sidebar of Studio, choose the **Home** icon (Home).
2. Select **Experiments** from the menu.
3. Use search bar or Filter icon (Filter) to filter the list to experiments created by a pipeline.
4. Open an experiment name and view a list of runs created by the pipeline.

### Execute a Pipeline

This procedure shows you how to execute a pipeline. For information on how to view a list of pipeline executions, see View a Pipeline (p. 3369).

**To start a pipeline execution**

1. From the **Executions** or **Graph** tab in the execution list, choose **Create execution**.
2. Enter or update the following required information:
   - **Name** – Must be unique to your account in the AWS Region.
   - **ProcessingInstanceCount** – The number of instances to use for processing.
   - **ModelApprovalStatus** – For your convenience.
   - **InputDataUrl** – The S3 URI of the input data.
3. Choose **Start**.

   - To see details of the execution or to stop the execution, choose **View details** on the status banner.
   - To stop the execution, choose **Stop** on the status banner.
   - To resume the execution from where it was stopped, choose **Resume** on the status banner.
Note

If your pipeline fails, the status banner will show **Failed** status. After troubleshooting the failed step, choose **Retry** on the status banner to resume running the pipeline from that step.

For a list of registered models, see Automate MLOps with SageMaker Projects (p. 3378).

**Track the Lineage of a SageMaker ML Pipeline**

In this tutorial, you use Amazon SageMaker Studio to track the lineage of an Amazon SageMaker ML Pipeline.

The pipeline was created by the Orchestrating Jobs with Amazon SageMaker Model Building Pipelines notebook in the Amazon SageMaker example GitHub repository. For detailed information on how the pipeline was created, see Define a Pipeline (p. 3353).

Lineage tracking in Studio is centered around a directed acyclic graph (DAG). The DAG represents the steps in a pipeline. From the DAG you can track the lineage from any step to any other step. The following diagram displays the steps in the pipeline. These steps appear as a DAG in Studio.

**Prerequisites**

- Access to Amazon SageMaker Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 36).
- Familiarity with the SageMaker Studio user interface. For more information, see Amazon SageMaker Studio UI Overview (p. 118).
- (Recommended) A completed run of the example notebook.

**To track the lineage of a pipeline**

1. Sign in to SageMaker Studio.
2. In the left sidebar of Studio, choose the **Home** icon ( ).
3. In the menu, select **Pipelines**.
4. Use the **Search** box to filter the pipelines list.
5. Double-click the AbalonePipeline pipeline to view the execution list and other details about the pipeline. Choose the **Property Inspector** icon ( ) in the right sidebar to open the **TABLE PROPERTIES** pane, where you can choose which properties to view.
6. Choose the **Settings** tab and then choose **Download pipeline definition file**. You can view the file to see how the pipeline graph was defined.
7. On the **Execution** tab, double-click the first row in the execution list to view its execution graph and other details about the execution. Note that the graph matches the diagram displayed at the beginning of the tutorial.

You can drag the graph around (select an area not on the graph itself) or use the resizing icons on the lower-right side of the graph. The inset on the lower-right side of the graph displays your location in the graph.
8. On the **Graph** tab, choose the **AbaloneProcess** step to view details about the step.

9. Find the Amazon S3 paths to the training, validation, and test datasets in the **Output** tab, under **Files**.

   **Note**
   To get the full paths, right-click the path and then choose **Copy cell contents**.

```
s3://sagemaker-eu-west-1-acct-id/sklearn-abalone-process-2020-12-05-17-28-28-509/output/train
```
10. Choose the AbaloneTrain step.

11. Find the Amazon S3 path to the model artifact in the Output tab, under Files:

s3://sagemaker-eu-west-1-acct-id/AbaloneTrain/pipelines-6locnsq2bfu-AbaloneTrain-NtfEpI0Ahu/output/model.tar.gz

12. Choose the AbaloneRegisterModel step.

13. Find the ARN of the model package in the Output tab, under Files:

arn:aws:sagemaker:eu-west-1:acct-id:model-package/abalonemodelpackagegroupname/2

Automate MLOps with SageMaker Projects

Create end-to-end ML solutions with CI/CD by using SageMaker projects.

Use SageMaker projects to create an MLOps solution to orchestrate and manage:

- Building custom images for processing, training, and inference
- Data preparation and feature engineering
- Training models
- Evaluating models
- Deploying models
- Monitoring and updating models
Why MLOps?

As you move from running individual artificial intelligence and machine learning (AI/ML) projects to using AI/ML to transform your business at scale, the discipline of ML Operations (MLOps) can help. MLOps accounts for the unique aspects of AI/ML projects in project management, CI/CD, and quality assurance, helping you improve delivery time, reduce defects, and make data science more productive. MLOps refers to a methodology that is built on applying DevOps practices to machine learning workloads. For a discussion of DevOps principles, see the white paper Introduction to DevOps on AWS. To learn more about implementation using AWS services, see Practicing CI/CD on AWS and Infrastructure as Code.

Like DevOps, MLOps relies on a collaborative and streamlined approach to the machine learning development lifecycle where the intersection of people, process, and technology optimizes the end-to-end activities required to develop, build, and operate machine learning workloads.

MLOps focuses on the intersection of data science and data engineering in combination with existing DevOps practices to streamline model delivery across the machine learning development lifecycle. MLOps is the discipline of integrating ML workloads into release management, CI/CD, and operations. MLOps requires the integration of software development, operations, data engineering, and data science.

Challenges with MLOps

Although MLOps can provide valuable tools to help you scale your business, you might face certain issues as you integrate MLOps into your machine learning workloads.

Project management

- ML projects involve data scientists, a relatively new role, and one not often integrated into cross-functional teams. These new team members often speak a very different technical language than product owners and software engineers, compounding the usual problem of translating business requirements into technical requirements.

Communication and collaboration

- Building visibility on ML projects and enabling collaboration across different stakeholders such as data engineers, data scientists, ML engineers, and DevOps is becoming increasingly important to ensure successful outcomes.

Everything is code
• Use of production data in development activities, longer experimentation lifecycles, dependencies on data pipelines, retraining deployment pipelines, and unique metrics in evaluating the performance of a model.

• Models often have a lifecycle independent of the applications and systems integrating with those models.

• The entire end-to-end system is reproducible through versioned code and artifacts. DevOps projects use Infrastructure-as-Code (IaC) and Configuration-as-Code (CaC) to build environments, and Pipelines-as-Code (PaC) to ensure consistent CI/CD patterns. The pipelines have to integrate with Big Data and ML training workflows. That often means that the pipeline is a combination of a traditional CI/CD tool and another workflow engine. There are important policy concerns for many ML projects, so the pipeline may also need to enforce those policies. Biased input data produces biased results, an increasing concern for business stakeholders.

CI/CD

• In MLOps, the source data is a first-class input, along with source code. That's why MLOps calls for versioning the source data and initiating pipeline runs when the source or inference data changes.

• Pipelines must also version the ML models, along with inputs and other outputs, in order to provide for traceability.

• Automated testing must include proper validation of the ML model during build phases and when the model is in production.

• Build phases may include model training and retraining, a time-consuming and resource-intensive process. Pipelines must be granular enough to only perform a full training cycle when the source data or ML code changes, not when related components change.

• Because machine learning code is typically a small part of an overall solution, a deployment pipeline may also incorporate the additional steps required to package a model for consumption as an API by other applications and systems.

Monitoring and logging

• The feature engineering and model training phases needed to capture model training metrics as well as model experiments. Tuning an ML model requires manipulating the form of the input data as well as algorithm hyperparameters, and systematically capture those experiments. Experiment tracking helps data scientists work more effectively and gives a reproducible snapshot of their work.

• Deployed ML models require monitoring of the data passed to the model for inference, along with the standard endpoint stability and performance metrics. The monitoring system must also capture the quality of model output, as evaluated by an appropriate ML metric.

Benefits of MLOps

Adopting MLOps practices gives you faster time-to-market for ML projects by delivering the following benefits.

• **Productivity:** Providing self-service environments with access to curated data sets lets data engineers and data scientists move faster and waste less time with missing or invalid data.

• **Repeatability:** Automating all the steps in the MLDC helps you ensure a repeatable process, including how the model is trained, evaluated, versioned, and deployed.

• **Reliability:** Incorporating CI/CD practices allows for the ability to not only deploy quickly but with increased quality and consistency.

• **Auditability:** Versioning all inputs and outputs, from data science experiments to source data to trained model, means that we can demonstrate exactly how the model was built and where it was deployed.
• **Data and model quality**: MLOps lets us enforce policies that guard against model bias and track changes to data statistical properties and model quality over time.

### What is a SageMaker Project?

SageMaker Projects help organizations set up and standardize developer environments for data scientists and CI/CD systems for MLOps engineers. Projects also help organizations set up dependency management, code repository management, build reproducibility, and artifact sharing.

You can provision SageMaker Projects from the AWS Service Catalog using custom or SageMaker-provided templates. For information about the AWS Service Catalog, see [What Is AWS Service Catalog](#). With SageMaker Projects, MLOps engineers and organization admins can define their own templates or use SageMaker-provided templates. The SageMaker-provided templates bootstrap the ML workflow with source version control, automated ML pipelines, and a set of code to quickly start iterating over ML use cases.

### When Should You Use a SageMaker Project?

While notebooks are helpful for model building and experimentation, a team of data scientists and ML engineers sharing code needs a more scalable way to maintain code consistency and strict version control.

Every organization has its own set of standards and practices that provide security and governance for its AWS environment. SageMaker provides a set of first-party templates for organizations that want to quickly get started with ML workflows and CI/CD. The templates include projects that use AWS-native services for CI/CD, such as AWS CodeBuild, AWS CodePipeline, and AWS CodeCommit. The templates also offer the option to create projects that use third-party tools, such as Jenkins and GitHub. For a list of the project templates that SageMaker provides, see [Use SageMaker-Provided Project Templates](#). SageMaker Projects can help you manage your Git repositories so that you can collaborate more efficiently across teams, ensure code consistency, and support CI/CD.

SageMaker Projects can help you with the following tasks:

- Organize all entities of the ML lifecycle under one project.
- Establish a single-click approach to set up standard ML infrastructure for model training and deployment that incorporates best practices.
- Create and share templates for ML infrastructure to serve multiple use cases.
- Leverage SageMaker-provided pre-built templates to quickly start focusing on model building, or create custom templates with organization-specific resources and guidelines.
- Integrate with tools of your choice by extending the project templates. For an example, see [Create a SageMaker Project to integrate with GitLab and GitLab Pipelines](#).
- Organize all entities of the ML lifecycle under one project.
What is in a SageMaker Project?

Customers have the flexibility to set up their projects with the resources that best serve their use case. The example below showcases the MLOps setup for an ML workflow, including model training and deployment.

A typical project with a SageMaker-provided template might include the following:

- One or more repositories with sample code to build and deploy ML solutions. These are working examples that you can clone locally and modify for your needs. You own this code and can take advantage of the version-controlled repositories for your tasks.
- A SageMaker pipeline that defines steps for data preparation, training, model evaluation, and model deployment, as shown in the following diagram.

![SageMaker Pipelines Diagram](image-url)
• A CodePipeline or Jenkins pipeline that runs your SageMaker pipeline every time you check in a new version of the code. For information about CodePipeline, see What is AWS CodePipeline. For information about Jenkins, see Jenkins User Documentation.

• A model group that contains model versions. Every time you approve the resulting model version from a SageMaker pipeline run, you can deploy it to a SageMaker endpoint.

Each SageMaker project has a unique name and ID that are applied as tags to all of the SageMaker and AWS resources created in the project. With the name and ID, you can view all of the entities associated with your project. These include:

• Pipelines
• Registered models
• Deployed models (endpoints)
• Datasets
• AWS Service Catalog products
• CodePipeline and Jenkins pipelines
• CodeCommit and third-party Git repositories

Do I Need to Create a Project to Use SageMaker Pipelines?

No. SageMaker pipelines are standalone entities just like training jobs, processing jobs, and other SageMaker jobs. You can create, update, and run pipelines directly within a notebook by using the SageMaker Python SDK without using a SageMaker project.

Projects provide an additional layer to help you organize your code and adopt operational best practices that you need for a production-quality system.

SageMaker Studio Permissions Required to Use Projects

Users can view SageMaker provided project templates and create projects with those templates when you grant Projects permissions for users. You can grant these permissions when you onboard or update Amazon SageMaker Studio. There are two permissions to grant.

1. Grant Projects permissions for the Studio administrator to permit the Studio administrator to view the SageMaker-provided templates in the AWS Service Catalog console. The administrator can see what other Studio users create if you grant them permission to use SageMaker projects. The administrator can also view the AWS CloudFormation template that the SageMaker-provided project templates define in the AWS Service Catalog console. For information about using the AWS Service Catalog console, see What Is AWS Service Catalog in the AWS Service Catalog User Guide.

2. Allow Studio users who are configured to use the same execution role as the domain to create projects. This grants Studio users permission to use the SageMaker-provided project templates to create a project from within Studio.

Important
Do not manually create your roles. Always create roles through Studio Settings using the steps described in the following procedure.

For users who use any role other than the domain's execution role to view and use SageMaker-provided project templates, you need to grant Projects permissions to the individual user profiles.
The following procedures show how to grant Projects permissions after you onboard to Studio. For more information about onboarding to Studio, see Onboard to Amazon SageMaker Domain (p. 36).

To grant Projects permissions for the administrator and domain execution role users

1. Open the SageMaker console.
2. Choose Control Panel.
3. If you choose Quick setup to set up your SageMaker Domain, you have permissions to use project templates by default.
4. If you choose Standard setup to set up your SageMaker Domain, make sure you turn on the following options when you configure Studio settings:
   - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for this account
   - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for Studio users
   - Create the roles which are needed to use the latest updated AWS Service catalog of products for Projects and JumpStart
5. To confirm that your SageMaker Domain has active project template permissions:
   a. Open the SageMaker console.
   b. Choose Control Panel.
   c. Choose the Settings icon in the upper-right corner of the Domain card.
   d. Choose Studio Settings in the left side panel.
   e. Under Projects and JumpStart, make sure the following options are turned on:
      - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for this account
      - Enable Amazon SageMaker project templates and Amazon SageMaker JumpStart for Studio users
      - Create the roles which are needed to use the latest updated AWS Service catalog of products for Projects and JumpStart
6. To view a list of your roles:
   a. Open the SageMaker console.
   b. Choose Control Panel.

   A list of your roles appears in the Apps card under Projects.

   **Important**

   As of July 25, we require additional roles to use project templates. Here is the complete list of roles you should see under Projects:
   - AmazonSageMakerServiceCatalogProductsLaunchRole
   - AmazonSageMakerServiceCatalogProductsUseRole
   - AmazonSageMakerServiceCatalogProductsApiGatewayRole
   - AmazonSageMakerServiceCatalogProductsCloudformationRole
   - AmazonSageMakerServiceCatalogProductsCodeBuildRole
   - AmazonSageMakerServiceCatalogProductsCodePipelineRole
   - AmazonSageMakerServiceCatalogProductsEventsRole
   - AmazonSageMakerServiceCatalogProductsFirehoseRole
   - AmazonSageMakerServiceCatalogProductsGlueRole
Create an MLOps Project using Amazon SageMaker Studio

This procedure demonstrates how to create an MLOps project using Amazon SageMaker Studio.

Prerequisites

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 36).
- Permission to use SageMaker-provided project templates. For information, see SageMaker Studio Permissions Required to Use Projects (p. 3383).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).

To create a project in Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 36).
2. In the Studio sidebar, choose the Home icon (🏠).
3. Select Deployments from the menu, and then select Projects.
4. Choose Create project.

   The Create project tab opens displaying a list of available templates.
5. If not selected already, choose SageMaker templates. For more information about project templates, see MLOps Project Templates (p. 3385).
6. Choose MLOps template for model building, training, and deployment.
7. Choose Select project template.

   The Create project tab changes to display Project details.
8. Enter the following information:
   - For Project details, enter a name and description for your project.
   - Optionally, add tags, which are key-value pairs that you can use to track your projects.
9. Choose Create project and wait for the project to appear in the Projects list.

MLOps Project Templates

An Amazon SageMaker project template automates the setup and implementation of MLOps for your projects. A SageMaker project template is an AWS Service Catalog product that SageMaker makes available to Amazon SageMaker Studio users. These AWS Service Catalog products are visible in your AWS Service Catalog console after you enable permissions when you onboard or update Amazon SageMaker Studio. For information about enabling permissions to use SageMaker project templates, see SageMaker Studio Permissions Required to Use Projects (p. 3383). Use SageMaker project templates to create a project that is an end-to-end MLOps solution.

If you are an administrator, you can create custom project templates from scratch or modify one of the project templates provided by SageMaker. Studio users in your organization can use these custom project templates to create their projects.
Use SageMaker-Provided Project Templates

Amazon SageMaker provides project templates that create the infrastructure you need to create an MLOps solution for continuous integration and continuous deployment (CI/CD) of ML models. Use these templates to process data, extract features, train and test models, register the models in the SageMaker model registry, and deploy the models for inference. You can customize the seed code and the configuration files to suit your requirements.

Important
As of July 25, 2022, we require additional roles to use project templates. For a complete list of required roles and instructions on how to create them, see SageMaker Studio Permissions Required to Use Projects (p. 3383). If you do not have the new roles, you will get the error message CodePipeline is not authorized to perform AssumeRole on role arn:aws:iam::xxx:role/service-role/AmazonSageMakerServiceCatalogProductsCodePipelineRole when you try to create a new project and cannot proceed.

SageMaker project templates offer you the following choice of code repositories, workflow automation tools, and pipeline stages:

- **Code repository**: AWS CodeCommit or third-party Git repositories such as GitHub and Bitbucket
- **CI/CD workflow automation**: AWS CodePipeline or Jenkins
- **Pipeline stages**: Model building and training, model deployment, or both

The following discussion provides an overview of each template you can choose when you create your SageMaker project. You can also view the available templates in Studio by following Step 1: Create the Project of the Project walkthrough.

For step-by-step instructions on how to create a real project, you can follow one of the project walkthroughs:

- If you want to use the template **MLOps template for model building, training, and deployment** (p. 3387), see SageMaker MLOps Project Walkthrough (p. 3397).
- If you want to use the template **MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline** (p. 3390), see SageMaker MLOps Project Walkthrough Using Third-party Git Repos (p. 3402).
- If you want to use the template **MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins** (p. 3391), see Create Amazon SageMaker projects using third-party source control and Jenkins.

Topics

- MLOps template for model building, training, and deployment (p. 3387)
- MLOps template for model building, training, deployment, and Amazon SageMaker Model Monitor (p. 3389)
- MLOps template for image building, model building, and model deployment (p. 3390)
- MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline (p. 3390)
- MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins (p. 3391)
• Update SageMaker Projects to Use Third-Party Git Repositories (p. 3392)

MLOps template for model building, training, and deployment

This template is a combination of the following two templates, each of which can be used independently, and contains all of the resources provided in those templates.

• Code repository: AWS CodeCommit
• CI/CD workflow automation: AWS CodePipeline

MLOps template for model building and training

Use this template when you want an MLOps solution to process data, extract features, train and test models, and register the models in the SageMaker model registry.

This template provides the following resources:

• An AWS CodeCommit repository that contains sample code that creates an Amazon SageMaker Model Building Pipelines pipeline in Python code and shows how to create and update the SageMaker pipeline. This repository also has a Python Jupyter Notebook that you can open and run in Studio.

• An AWS CodePipeline pipeline that has source and build steps. The source step points to the CodeCommit repository. The build step gets the code from that repository, creates and updates the SageMaker pipeline, starts a pipeline execution, and waits for the pipeline execution to complete.

• An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.

The following diagram illustrates the workflow and AWS resources used by this template to help you build and train your models.
Use this template to automate the deployment of models in the SageMaker model registry to SageMaker endpoints for real-time inference. This template recognizes changes in the model registry. When a new model version is registered and approved, it automatically initiates a deployment.

The template provisions a CodeCommit repository with configuration files to specify the model deployment steps, AWS CloudFormation templates to define endpoints as infrastructure, and seed code for testing the endpoint.

This template provides the following resources:

- An AWS CodeCommit repository that contains sample code that deploys models to endpoints in staging and production environments.
- An AWS CodePipeline pipeline that has source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the CodeCommit repository, and the build step gets the code from that repository and generates CloudFormation stacks to deploy. The deploy-to-staging and deploy-to-production steps deploy the CloudFormation stacks to their respective environments. There is a manual approval step between the staging and production build steps, so that a MLOps engineer must approve the model before it is deployed to production.
- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.
- A CloudWatch event to initiate the pipeline when a model package version is approved or rejected.

The following diagram illustrates the workflow and AWS resources used by this template to help you deploy your models.
As previously mentioned, see Project Walkthrough for a demonstration that uses this template to create a real project.

**MLOps template for model building, training, deployment, and Amazon SageMaker Model Monitor**

This template is an extension of the MLOps template for model building, training, and deployment. It includes both the model building, training, and deployment components of the template, and an additional Amazon SageMaker Model Monitor template that provides the following types of monitoring:

- **Data Quality** – Monitor drift in data quality.
- **Model Quality** – Monitor drift in model quality metrics, such as accuracy.
- **Bias Drift for Models in Production** – Monitor bias in a model's predictions.

- **Code repository**: AWS CodeCommit
- **CI/CD workflow automation**: AWS CodePipeline

**MLOps template for Amazon SageMaker Model Monitor**

You can use this template for an MLOps solution to deploy one or more of the Amazon SageMaker data quality, model quality, model bias, and model explainability monitors to monitor a deployed model on a SageMaker inference endpoint.

This template provides the following resources:
• An AWS CodeCommit repository that contains sample Python code that gets the baselines used by the monitors from the SageMaker Model Registry, and updates the template’s parameters for the staging and production environments. It also contains a AWS CloudFormation template to create the Amazon SageMaker Model Monitors.

• An AWS CodePipeline pipeline that has source, build, and deploy steps. The source step points to the CodePipeline repository. The build step gets the code from that repository, gets the baseline from the Model Registry, and updates template parameters for the staging and production environments. The deploy steps deploy the configured monitors into the staging and production environments. The manual approval step, within the DeployStaging stage, requires you to verify that the production SageMaker endpoint is InService before approving and moving to the DeployProd stage.

• The template uses the same S3 bucket created by the MLOps template for model building, training, and deployment to store the monitors’ outputs.

• Two Amazon EventBridge events rules initiate the Amazon SageMaker Model Monitor AWS CodePipeline every time the staging SageMaker endpoint is updated, or a code change is committed to the CodePipeline repository.

MLOps template for image building, model building, and model deployment

This template is an extension of the MLOps template for model building, training, and deployment (p. 3387). It includes both the model building, training, and deployment components of that template and the following options:

• Include processing image–building pipeline
• Include training image–building pipeline
• Include inference image–building pipeline

For each of the components selected during project creation, the following are created by using the template:

• An Amazon ECR repository
• A SageMaker Image
• A CodeCommit repository containing a Dockerfile that you can customize
• A CodePipeline that is initiated by changes to the CodePipeline repository
• A CodeBuild project that builds a Docker image and registers it in the Amazon ECR repository
• An EventBridge rule that initiates the CodePipeline on a schedule

When the CodePipeline is initiated, it builds a new Docker container and registers it with an Amazon ECR repository. When a new container is registered with the Amazon ECR repository, a new ImageVersion is added to the SageMaker image. This initiates the model building pipeline, which in turn initiates the deployment pipeline.

The newly created image is used in the model building, training, and deployment portions of the workflow where applicable.

MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline

• Code repository: Third-party Git. Establish the AWS CodeStar connection from your AWS account to your GitHub user or organization. Add a tag with the key sagemaker and value true to this AWS CodeStar connection.

• CI/CD workflow automation: AWS CodePipeline
This template provides the following resources:

- Associations with one or more customer-specified Git repositories.
- An AWS CodePipeline pipeline that has source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the third-party Git repository and the build step gets the code from that repository and generates CloudFormation stacks to deploy. The deploy-to-staging and deploy-to-production steps deploy the CloudFormation stacks to their respective environments. There is a manual approval step between the staging and production build steps, so that a MLOps engineer must approve the model before it is deployed to production.
- An AWS CodeBuild project to populate the Git repositories with the seed code information. This requires an AWS CodeStar connection from your AWS account to your account on the Git repository host.
- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.

As previously mentioned, see Project Walkthrough Using Third-party Git Repos for a demonstration that uses this template to create a real project.

**MLOps template for model building, training, and deployment with third-party Git repositories using Jenkins**

- **Code repository**: Third-party Git. Establish the AWS CodeStar connection from your AWS account to your GitHub user or organization. Add a tag with the key `sagemaker` and value `true` to this AWS CodeStar connection.
- **CI/CD workflow automation**: Jenkins

This template provides the following resources:

- Associations with one or more customer-specified Git repositories.
- Seed code to generate Jenkins pipelines that have source, build, deploy-to-staging, and deploy-to-production steps. The source step points to the customer-specified Git repository. The build step gets the code from that repository and generates two CloudFormation stacks. The deploy steps deploy the CloudFormation stacks to their respective environments. There is an approval step between the staging step and the production step.
- An AWS CodeBuild project to populate the Git repositories with the seed code information. This requires an AWS CodeStar connection from your AWS account to your account on the Git repository host.
- An Amazon S3 bucket to store artifacts of the SageMaker project and SageMaker pipeline.

The template creates the association between your project and the source control repositories, but you need to perform additional manual steps to establish communication between your AWS account and Jenkins. For the detailed steps, see Create Amazon SageMaker projects using third-party source control and Jenkins.

The instructions help you build the architecture shown in the following diagram, with GitHub as the source control repository in this example. As shown, you are attaching your Git repository to the project to check in and manage code versions. Jenkins initiates the model build pipeline when it detects changes to the model build code in the Git repository. You are also connecting the project to Jenkins to orchestrate your model deployment steps, which start when you approve the model registered in the model registry, or when Jenkins detects changes to the model deployment code.
In summary, the steps guide you through the following tasks:

1. Establish the connection between your AWS and GitHub accounts.
2. Create the Jenkins account and import needed plugins.
3. Create the Jenkins IAM user and permissions policy.
4. Set the AWS credentials for the Jenkins IAM user on your Jenkins server.
5. Create an API token for communication with your Jenkins server.
6. Use a CloudFormation template to set up an EventBridge rule to monitor the model registry for newly-approved models.
7. Create the SageMaker project, which seeds your GitHub repositories with model build and deploy code.
8. Create your Jenkins model build pipeline with the model build seed code.
9. Create your Jenkins model deploy pipeline with the model deploy seed code.

**Update SageMaker Projects to Use Third-Party Git Repositories**

The managed policy attached to the AmazonSageMakerServiceCatalogProductsUseRole role was updated on July 27, 2021 for use with the third-party Git templates. Users who onboard to Amazon SageMaker Studio after this date and enable project templates use the new policy. Users who onboarded prior to this date must update the policy to use these templates. Use one of the following options to update the policy:

- **Delete role and toggle Studio settings**
  1. In the IAM console, delete AmazonSageMakerServiceCatalogProductsUseRole.
  2. In the Studio control panel, choose **Edit Settings**.
  3. Toggle both settings and then choose **Submit**.

- **In the IAM console, add the following permissions to AmazonSageMakerServiceCatalogProductsUseRole:**

```json
{
    "Effect": "Allow",
    "Action": ["codestar-connections:UseConnection"],
    "Resource": "arn:aws:codestar-connections::*::*:connection/**",
    "Condition": {
        "StringEqualsIgnoreCase": {
            "aws:ResourceTag/sagemaker": "true"
        }
    }
}
```
Create Custom Project Templates

If the SageMaker-provided templates do not meet your needs (for example, you want to have more complex orchestration in the CodePipeline with multiple stages or custom approval steps), create your own templates.

We recommend starting by using SageMaker-provided templates to understand how to organize your code and resources and build on top of it. To do this, after you enable administrator access to the SageMaker templates, log in to the https://console.aws.amazon.com/servicecatalog/, choose Portfolios, then choose Imported. For information about AWS Service Catalog, see Overview of AWS Service Catalog in the AWS Service Catalog User Guide.

Create your own project templates to customize your MLOps project. SageMaker project templates are AWS Service Catalog–provisioned products to provision the resources for your MLOps project.

To create a custom project template, complete the following steps.

1. Create a portfolio. For information, see Step 3: Create an AWS Service Catalog Portfolio.
2. Create a product. A product is a CloudFormation template. You can create multiple versions of the product. For information, see Step 4: Create an AWS Service Catalog Product.

For the product to work with SageMaker projects, add the following parameters to your product template.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SageMakerProjectName</td>
<td>String</td>
<td>Name of the project</td>
</tr>
<tr>
<td>SageMakerProjectId</td>
<td>String</td>
<td>Service generated Id of the project</td>
</tr>
</tbody>
</table>

**Important**

We recommend that you wrap the CodeCommit repository into the SageMaker code repository for the project’s repositories to be visible in VPC mode. The sample template and required addition are shown in the following code samples.

Original (sample) template:

```
ModelBuildCodeCommitRepository:
  Type: AWS::CodeCommit::Repository
  Properties:
    # Max allowed length: 100 chars
    RepositoryName: !Sub sagemaker-${SageMakerProjectName}-${SageMakerProjectId}-modelbuild # max: 10+33+15+10=68
    RepositoryDescription: !Sub SageMaker Model building workflow infrastructure as code for the Project ${SageMakerProjectName}
```
3. Add a launch constraint. A launch constraint designates an IAM role that AWS Service Catalog assumes when a user launches a product. For information, see Step 6: Add a Launch Constraint to Assign an IAM Role.

4. Provision the product on https://console.aws.amazon.com/servicecatalog/ to test the template. If you are satisfied with your template, continue to the next step to make the template available in Studio.

5. Grant access to the AWS Service Catalog portfolio that you created in step 1 to your Studio execution role. Use either the Studio domain execution role or a user role that has Studio access. For information about adding a role to the portfolio, see Step 7: Grant End Users Access to the Portfolio.

6. To make your project template available in your Organization templates list in Studio, create a tag with the following key and value to the AWS Service Catalog product you created in step 2.

   • key: sagemaker:studio-visibility
   • value: true

After you complete these steps, Studio users in your organization can create a project with the template you created by following the steps in Create an MLOps Project using Amazon SageMaker Studio (p. 3385) and choosing Organization templates when you choose a template.

View Project Resources

After you create a project, view the resources associated with the project in Amazon SageMaker Studio.

To create a project in Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 36).

2. In the Studio sidebar, choose the Home icon.

3. Select Deployments from the menu, and then select Projects.

4. Select the name of the project for which you want to view details.

   A tab with the project details appears.

On the project details tab, you can view the following entities associated with the project.

- Repositories: Code repositories (repos) associated with this project. If you use a SageMaker-provided template when you create your project, it creates a AWS CodeCommit repo or a third-party Git repo. For more information about CodeCommit, see What is AWS CodeCommit.
- Pipelines: SageMaker ML pipelines that define steps to prepare data, train, and deploy models. For information about SageMaker ML pipelines, see Create and Manage SageMaker Pipelines (p. 3353).
Update an MLOps Project

- Experiments: One or more Amazon SageMaker Autopilot experiments associated with the project. For information about Autopilot, see Automate model development with Amazon SageMaker Autopilot (p. 385).
- Model groups: Groups of model versions that were created by pipeline executions in the project. For information about model groups, see Create a Model Group (p. 2234).
- Endpoints: SageMaker endpoints that host deployed models for real-time inference. When a model version is approved, it is deployed to an endpoint.
- Settings: Settings for the project. This includes the name and description of the project, information about the project template and SourceModelPackageGroupName, and metadata about the project.

Update an MLOps Project in Amazon SageMaker Studio

This procedure demonstrates how to update an MLOps project in Amazon SageMaker Studio. You can update the Description, template version, and template parameters.

Prerequisites

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 36).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).
- Add the following custom inline policies to the specified roles:

  User-created role having AmazonSageMakerFullAccess

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "servicecatalog:CreateProvisionedProductPlan",
                "servicecatalog:DescribeProvisionedProductPlan",
                "servicecatalog:DeleteProvisionedProductPlan"
            ],
            "Resource": "*"
        }
    ]
}
```

AmazonSageMakerServiceCatalogProductsLaunchRole

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudformation:CreateChangeSet",
                "cloudformation:DeleteChangeSet",
                "cloudformation:DescribeChangeSet"
            ],
            "Resource": "arn:aws:cloudformation:*:*:stack/SC-**"
        }
    ]
}
```
Delete an MLOps Project using Amazon SageMaker Studio

This procedure demonstrates how to delete an MLOps project using Amazon SageMaker Studio.

Prerequisites

Note

You can only delete projects in Studio that you have created. This condition is part of the service catalog permission servicecatalog:TerminateProvisionedProduct in the AmazonSageMakerFullAccess policy. If needed, you can update this policy to remove this condition.

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 36).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).

To delete a project in Amazon SageMaker Studio

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 36).
2. In the Studio sidebar, choose the Home icon ( ).
3. Select Deployments from the menu, and then select Projects. A list of your projects appears.
4. Select the target project from the dropdown list. If you don't see your project, type the project name and apply the filter to find your project.
5. Once you've found your project, select the project name to view details.
6. Choose Delete from the Actions menu.
7. Confirm your choice by choosing Delete from the Delete Project window.

SageMaker MLOps Project Walkthrough

This walkthrough uses the template MLOps template for model building, training, and deployment (p. 3387) to demonstrate using MLOps projects to create a CI/CD system to build, train, and deploy models.

Prerequisites

To complete this walkthrough, you need:

- An IAM account or IAM Identity Center to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 36).
- Permission to use SageMaker-provided project templates. For information, see SageMaker Studio Permissions Required to Use Projects (p. 3383).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).

Topics

- Step 1: Create the Project (p. 3397)
- Step 2: Clone the Code Repository (p. 3398)
- Step 3: Make a Change in the Code (p. 3398)
- Step 4: Approve the Model (p. 3401)
- (Optional) Step 5: Deploy the Model Version to Production (p. 3401)
- Step 6: Clean Up Resources (p. 3401)

Step 1: Create the Project

In this step, you create a SageMaker MLOps project by using a SageMaker-provided project template to build, train, and deploy models.

To create the SageMaker MLOps project

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 36).
2. In the Studio sidebar, choose the Home icon (🏠).
3. Select Deployments from the menu, and then select Projects.
4. Choose Create project.
   
   The Create project tab appears.
5. If not selected already, choose SageMaker templates, then choose MLOps template for model building, training, and deployment.
6. For Project details, enter a name and description for your project.

When the project appears in the Projects list with a Status of Create completed, move on to the next step.
Important
As of July 25, 2022, we require additional roles to use project templates. If you see the error message **CodePipeline is not authorized to perform AssumeRole on role arn:aws:iam::xxx:role/service-role/AmazonSageMakerServiceCatalogProductsCodePipelineRole**, see Steps 5-6 of [SageMaker Studio Permissions Required to Use Projects (p. 3383)](#) for a complete list of required roles and instructions on how to create them.

**Step 2: Clone the Code Repository**

After you create the project, two CodeCommit repositories are created in the project. One of the repositories contains code to build and train a model, and one contains code to deploy the model. In this step, you clone the repository to your local SageMaker project that contains the code to build and train the model to the local Studio environment so that you can work with the code.

**To clone the code repository**

1. In the Studio sidebar, choose the **Home** icon (🏠).
2. Select **Deployments** from the menu, and then select **Projects**.
3. Select the project you created in the previous step to open the project tab for your project.
4. In the project tab, choose **Repositories**, and in the **Local path** column for the repository that ends with `modelbuild`, choose **clone repo**.
5. In the dialog box that appears, accept the defaults and choose **Clone repository**.

![Clone Repository](image)

When clone of the repository is complete, the local path appears in the **Local path** column. Choose the path to open the local folder that contains the repository code in Studio.

**Step 3: Make a Change in the Code**

Now make a change to the pipeline code that builds the model and check in the change to initiate a new pipeline run. The pipeline run registers a new model version.
To make a code change

1. In Studio, choose the file browser icon ( ), and navigate to the pipelines/abalone folder. Double-click pipeline.py to open the code file.

2. In the pipeline.py file, find the line that sets the training instance type.

   ```python
   training_instance_type = ParameterString(
       name="TrainingInstanceType", default_value="ml.m5.xlarge"
   )
   ```

   Change `ml.m5.xlarge` to `ml.m5.large`, then type Ctrl+S to save the change.

3. Choose the Git icon ( ). Stage, commit, and push the change in pipeline.py. Also, enter a summary in the Summary field and an optional description in the Description field. For information about using Git in Studio, see Clone a Git Repository in SageMaker Studio (p. 182).
Current Repository
sagemaker-myproject-p-kjwrqql05qn-modelbuild

Current Branch
master

Changes

Staged (1)

pipeline.py pipelines/abalone

Changed (0)

Untracked (4)

pipeline-checkpoint.py pipelines/abalone/.ipynb_checkpoints

Changed instance type

Description

Commit
After pushing your code change, the MLOps system initiates a run of the pipeline that creates a new model version. In the next step, you approve the new model version to deploy it to production.

**Step 4: Approve the Model**

Now you approve the new model version that was created in the previous step to initiate a deployment of the model version to a SageMaker endpoint.

**To approve the model version**

1. In the Studio sidebar, choose the Home icon (🏠).
2. Select Deployments from the menu, and then select Projects.
3. Select the name of the project you created in the first step to open the project tab for your project.
4. In the project tab, choose Model groups, then double-click the name of the model group that appears.

   The model group tab appears.
5. In the model group tab, double-click Version 1. The Version 1 tab opens. Choose Update status.
6. In the model Update model version status dialog box, in the Status dropdown list, select Approve, then choose Update status.

   Approving the model version causes the MLOps system to deploy the model to staging. To view the endpoint, choose the Endpoints tab on the project tab.

**(Optional) Step 5: Deploy the Model Version to Production**

Now you can deploy the model version to the production environment.

**Note**

To complete this step, you need to be an administrator in your Studio domain. If you are not an administrator, skip this step.

**To deploy the model version to the production environment**

1. Log in to the CodePipeline console at https://console.aws.amazon.com/codepipeline/
2. Choose Pipelines, then choose the pipeline with the name sagemaker-projectname-projectid-modeldeploy, where projectname is the name of your project, and projectid is the ID of your project.
3. In the DeployStaging stage, choose Review.
4. In the Review dialog box, choose Approve.

   Approving the DeployStaging stage causes the MLOps system to deploy the model to production. To view the endpoint, choose the Endpoints tab on the project tab in Studio.

**Step 6: Clean Up Resources**

To stop incurring charges, clean up the resources that were created in this walkthrough. To do this, complete the following steps.

**Note**

To delete the AWS CloudFormation stack and the Amazon S3 bucket, you need to be an administrator in Studio. If you are not an administrator, ask your administrator to complete those steps.
1. In the Studio sidebar, choose the Home icon (  ).
2. Select Deployments from the menu, and then select Projects.
3. Select the target project from the dropdown list. If you don’t see your project, type the project name and apply the filter to find your project.
4. You can delete a Studio project in one of the following ways:
   a. You can delete the project from the projects list.
      Right-click the target project and choose Delete from the dropdown list.
      Note
      This functionality is supported in Studio version v3.17.1 or higher. For more information, see Shut down and Update SageMaker Studio (p. 185).
   b. You can delete a project from the Project details section.
      i. When you’ve found your project, double-click it to view its details in the main panel.
      ii. Choose Delete from the Actions menu.
5. Confirm your choice by choosing Delete from the Delete Project window.
   This deletes the AWS Service Catalog provisioned product that the project created. This includes the CodeCommit, CodePipeline, and CodeBuild resources created for the project.
6. Delete the AWS CloudFormation stacks that the project created. There are two stacks, one for staging and one for production. The names of the stacks are sagemaker-projectname-project-id-deploy-staging and sagemaker-projectname-project-id-deploy-prod, where projectname is the name of your project, and project-id is the ID of your project.
   For information about how to delete a AWS CloudFormation stack, see Deleting a stack on the AWS CloudFormation console in the AWS CloudFormation User Guide.
7. Delete the Amazon S3 bucket that the project created. The name of the bucket is sagemaker-project-project-id, where project-id is the ID of your project.

SageMaker MLOps Project Walkthrough Using Third-party Git Repos

This walkthrough uses the template MLOps template for model building, training, and deployment with third-party Git repositories using CodePipeline (p. 3390) to demonstrate how to use MLOps projects to create a CI/CD system to build, train, and deploy models.

Prerequisites

To complete this walkthrough, you need:

- An IAM or IAM Identity Center account to sign in to Studio. For information, see Onboard to Amazon SageMaker Domain (p. 36).
- Permission to use SageMaker-provided project templates. For information, see SageMaker Studio Permissions Required to Use Projects (p. 3383).
- Basic familiarity with the Studio user interface. For information, see Amazon SageMaker Studio UI Overview (p. 118).
- Two GitHub repositories initialized with a README. You input these repositories into the project template, which will seed these repos with model build and deploy code.

Topics
• Step 1: Set up the GitHub connection (p. 3403)
• Step 2: Create the Project (p. 3403)
• Step 3: Make a Change in the Code (p. 3404)
• Step 4: Approve the Model (p. 3404)
• (Optional) Step 5: Deploy the Model Version to Production (p. 3405)
• Step 6: Clean Up Resources (p. 3405)

Step 1: Set up the GitHub connection

In this step, you connect to your GitHub repositories using an AWS CodeStar connection. The SageMaker project uses this connection to access your source code repositories.

To set up the GitHub connection:

1. Log in to the CodePipeline console at https://console.aws.amazon.com/codepipeline/
2. Under Settings in the navigation pane, choose Connections.
3. Choose Create connection.
4. For Select a provider, select GitHub.
5. For Connection name, enter a name.
6. Choose Connect to GitHub.
7. If the AWS Connector GitHub app isn’t previously installed, choose Install new app.

This displays a list of all the GitHub personal accounts and organizations to which you have access.
8. Choose the account where you want to establish connectivity for use with SageMaker projects and GitHub repositories.
9. Choose Configure.
10. You can optionally select your specific repositories or choose All repositories.
11. Choose Save. When the app is installed, you’re redirected to the Connect to GitHub page and the installation ID is automatically populated.
12. Choose Connect.
13. Add a tag with the key sagemaker and value true to this AWS CodeStar connection.
14. Copy the connection ARN to save for later. You use the ARN as a parameter in the project creation step.

Step 2: Create the Project

In this step, you create a SageMaker MLOps project by using a SageMaker-provided project template to build, train, and deploy models.

To create the SageMaker MLOps project

1. Sign in to Studio. For more information, see Onboard to Amazon SageMaker Domain (p. 36).
2. In the Studio sidebar, choose the Home icon ( ).
3. Select Deployments from the menu, and then select Projects.
4. Choose Create project.

The Create project tab appears.
5. For SageMaker project templates, choose MLOps template for model building, training, and deployment with third-party Git repositories.
6. Choose Select project template.
7. Under ModelBuild CodeRepository Info, provide the following parameters:
   - For URL, enter the URL of your Git repository for the model build code in https://git-url.git format.
   - For Branch, enter the branch to use from your Git repository for pipeline activities.
   - For Full Repository Name, enter the Git repository name in the format of username/repository name or organization/repository name.
   - For Codestar Connection ARN, enter the ARN of the AWS CodeStar connection you created in Step 1.
   - The Sample Code toggle switch lets you choose whether to populate the repository with model build seed code. We can leave it on for this demo.
8. Under ModelDeploy CodeRepository Info, provide the following parameters:
   - For URL, enter the URL of your Git repository for the model deploy code in https://git-url.git format.
   - For Branch, enter the branch to use from your Git repository for pipeline activities.
   - For Full Repository Name, enter the Git repository name in the format of username/repository name or organization/repository name.
   - For Codestar Connection ARN, enter the ARN of the AWS CodeStar connection you created in Step 1.
   - The Sample Code toggle switch lets you choose whether to populate the repository with model deployment seed code. We can leave it on for this demo.
9. Choose Create Project.

The project appears in the Projects list with a Status of Created.

**Step 3: Make a Change in the Code**

Now make a change to the pipeline code that builds the model and commit the change to initiate a new pipeline run. The pipeline run registers a new model version.

**To make a code change**

1. In your model build GitHub repo, navigate to the pipelines/abalone folder. Double-click pipeline.py to open the code file.
2. In the pipeline.py file, find the line that sets the training instance type.

   ```python
   training_instance_type = ParameterString(
       name="TrainingInstanceType", default_value="ml.m5.xlarge"
   )
   ``

   Open the file for editing, change ml.m5.xlarge to ml.m5.large, then commit.

After you commit your code change, the MLOps system initiates a run of the pipeline that creates a new model version. In the next step, you approve the new model version to deploy it to production.

**Step 4: Approve the Model**

Now you approve the new model version that was created in the previous step to initiate a deployment of the model version to a SageMaker endpoint.
To approve the model version

1. In the Studio sidebar, choose the Home icon ( ).
2. Select Deployments from the menu, and then select Projects.
3. Find the name of the project you created in the first step and double-click on it to open the project tab for your project.
4. In the project tab, choose Model groups, then double-click the name of the model group that appears.
   The model group tab appears.
5. In the model group tab, double-click Version 1. The Version 1 tab opens. Choose Update status.
6. In the model Update model version status dialog box, in the Status dropdown list, select Approve and then choose Update status.

   Approving the model version causes the MLOps system to deploy the model to staging. To view the endpoint, choose the Endpoints tab on the project tab.

(Optional) Step 5: Deploy the Model Version to Production

Now you can deploy the model version to the production environment.

Note
To complete this step, you need to be an administrator in your Studio domain. If you are not an administrator, skip this step.

To deploy the model version to the production environment

1. Log in to the CodePipeline console at https://console.aws.amazon.com/codepipeline/
2. Choose Pipelines, then choose the pipeline with the name sagemaker-projectname-projectid-modeldeploy, where projectname is the name of your project, and projectid is the ID of your project.
3. In the DeployStaging stage, choose Review.
4. In the Review dialog box, choose Approve.

   Approving the DeployStaging stage causes the MLOps system to deploy the model to production. To view the endpoint, choose the Endpoints tab on the project tab in Studio.

Step 6: Clean Up Resources

To stop incurring charges, clean up the resources that were created in this walkthrough.

Note
To delete the AWS CloudFormation stack and the Amazon S3 bucket, you need to be an administrator in Studio. If you are not an administrator, ask your administrator to complete those steps.

1. In the Studio sidebar, choose the Home icon ( ).
2. Select Deployments from the menu, and then select Projects.
3. Select the target project from the dropdown list. If you don’t see your project, type the project name and apply the filter to find your project.
4. Select your project to view its details in the main panel.
5. Choose Delete from the Actions menu.
6. Confirm your choice by choosing Delete from the Delete Project window.

This deletes the AWS Service Catalog provisioned product that the project created. This includes the
CodeCommit, CodePipeline, and CodeBuild resources created for the project.
7. Delete the AWS CloudFormation stacks that the project created. There are two stacks, one for
staging and one for production. The names of the stacks are sagemaker-projectname-project-
id-deploy-staging and sagemaker-projectname-project-id-deploy-prod, where
projectname is the name of your project, and project-id is the ID of your project.

For information about how to delete a AWS CloudFormation stack, see Deleting a stack on the AWS
CloudFormation console in the AWS CloudFormation User Guide.
8. Delete the Amazon S3 bucket that the project created. The name of the bucket is sagemaker-
project-project-id, where project-id is the ID of your project.

Amazon SageMaker ML Lineage Tracking

Amazon SageMaker ML Lineage Tracking creates and stores information about the steps of a machine
learning (ML) workflow from data preparation to model deployment. With the tracking information, you
can reproduce the workflow steps, track model and dataset lineage, and establish model governance and
audit standards.

With SageMaker Lineage Tracking data scientists and model builders can do the following:

- Keep a running history of model discovery experiments.
- Establish model governance by tracking model lineage artifacts for auditing and compliance
  verification.

The following diagram shows an example lineage graph that Amazon SageMaker automatically creates
in an end-to-end model training and deployment ML workflow.
Lineage Tracking Entities

Tracking entities maintain a representation of all the elements of your end-to-end machine learning workflow. You can use this representation to establish model governance, reproduce your workflow, and maintain a record of your work history.

Amazon SageMaker automatically creates tracking entities for trial components and their associated trials and experiments when you create SageMaker jobs such as processing jobs, training jobs, and batch transform jobs. In additional to auto tracking, you can also Manually Create Tracking Entities (p. 3411) to model custom steps in your workflow. For more information, see Manage Machine Learning with Amazon SageMaker Experiments (p. 1455).
SageMaker also automatically creates tracking entities for the other steps in a workflow so you can track the workflow from end to end. For more information, see Amazon SageMaker–Created Tracking Entities (p. 3409).

You can create additional entities to supplement those created by SageMaker. For more information, see Manually Create Tracking Entities (p. 3411).

SageMaker reuses any existing entities rather than creating new ones. For example, there can be only one artifact with a unique SourceUri.

**Key concepts for querying lineage**

- **Lineage** – Metadata that tracks the relationships between various entities in your ML workflows.
- **QueryLineage** – The action to inspect your lineage and discover relationships between entities.
- **Lineage entities** – The metadata elements of which your lineage is composed.
- **Cross-account lineage** – Your ML workflow may span more than one account. With cross-account lineage, you can configure multiple accounts to automatically create lineage associations between shared entity resources. QueryLineage then can return entities even from these shared accounts.

The following tracking entities are defined:

**Experiment entities**

- **Trial component** – A stage of a machine learning trial. Includes processing jobs, training jobs, and batch transform jobs.
- **Trial** – A combination of trial components that generally produces a model.
- **Experiment** – A grouping of trials generally focused on solving a specific use case.

**Lineage entities**

- **Trial Component** – Represents processing, training, and transform jobs in the lineage. Also part of experiment management.
- **Context** – Provides a logical grouping of other tracking or experiment entities. Conceptually, experiments and trials are contexts. Some examples are an endpoint and a model package.
- **Action** – Represents an action or activity. Generally, an action involves at least one input artifact or output artifact. Some examples are a workflow step and a model deployment.
- **Artifact** – Represents a URI addressable object or data. An artifact is generally either an input or an output to a trial component or action. Some examples include a dataset (S3 bucket URI), or an image (Amazon ECR registry path).
- **Association** – Links other tracking or experiment entities, such as an association between the location of training data and a training job.

An association has an optional AssociationType property. The following values are available along with the suggested use for each type. SageMaker places no restrictions on their use:

- **ContributedTo** – The source contributed to the destination or had a part in enabling the destination. For example, the training data contributed to the training job.
- **AssociatedWith** – The source is connected to the destination. For example, an approval workflow is associated with a model deployment.
- **DerivedFrom** – The destination is a modification of the source. For example, a digest output of a channel input for a processing job is derived from the original inputs.
- **Produced** – The source generated the destination. For example, a training job produced a model artifact.
• SameAs – When the same lineage entity used in different accounts.

Common properties

• Type property

The action, artifact, and context entities have a type property, ActionType, ArtifactType, and ContextType, respectively. This property is a custom string which can associate meaningful information with the entity and be used as a filter in the List APIs.

• Source property

The action, artifact, and context entities have a Source property. This property provides the underlying URI that the entity represents. Some examples are:

• An UpdateEndpoint action where the source is the EndpointArn.
• An image artifact for a processing job where the source is the ImageUri.
• An Endpoint context where the source is the EndpointArn.

• Metadata property

The action and artifact entities have an optional Metadata property which can provide the following information:

• ProjectId – For example, the ID of the SageMaker MLOps project to which a model belongs.
• GeneratedBy – For example, the SageMaker pipeline execution that registered a model package version.
• Repository – For example, the repository that contains an algorithm.
• CommitId – For example, the commit ID of an algorithm version.

Amazon SageMaker–Created Tracking Entities

Amazon SageMaker automatically creates tracking entities for SageMaker jobs, models, model packages, and endpoints if the data is available. There is no limit to the number of lineage entities created by SageMaker.

For information on how you can manually create tracking entities, see Manually Create Tracking Entities (p. 3411).

Topics

• Tracking Entities for SageMaker Jobs (p. 3409)
• Tracking Entities for Model Packages (p. 3410)
• Tracking Entities for Endpoints (p. 3410)

Tracking Entities for SageMaker Jobs

SageMaker creates a trial component for and associated with each SageMaker job. SageMaker creates artifacts to track the job metadata and associations between each artifact and the job.

Artifacts are created for the following job properties and associated with the Amazon Resource Name (ARN) of the SageMaker job. The artifact SourceUri is listed in parentheses.

Training Job

• The image that contains the training algorithm (TrainingImage).
SageMaker-Created Entities

• The data source of each input channel (S3Uri).
• The location for the model (S3OutputPath).
• The location for the managed spot checkpoint data (S3Uri).

Processing Job

• The container to be run by the processing job (ImageUri).
• The data location for each processing input and processing output (S3Uri).

Transform Job

• The input data source to be transformed (S3Uri).
• The results of the transform (S3OutputPath).

Note

Amazon Simple Storage Service (Amazon S3) artifacts are tracked based on the Amazon S3 URI values provided to the Create API, for example CreateTrainingJob, and not on the Amazon S3 key and hash or etag values from each file.

Tracking Entities for Model Packages

The following entities are created:

Model Packages

• A context for each model package group.
• An artifact for each model package.
• An association between each model package artifact and the context for each model package group to which the package belongs to.
• An action for the creation of a model package version.
• An association between the model package artifact and the creation action.
• An association between the model package artifact and each model package group context to which the package belongs to.
• Inference containers
  • An artifact for the image used in each container defined in the model package.
  • An artifact for the model used in each container.
  • An association between each artifact and the model package artifact.
• Algorithms
  • An artifact for each algorithm defined in the model package.
  • An artifact for the model created by each algorithm.
  • An association between each artifact and the model package artifact.

Tracking Entities for Endpoints

The following entities are created by Amazon SageMaker:

Endpoints

• A context for each endpoint
Manually Create Entities

- An action for the model deployment that created each endpoint
- An artifact for each model deployed to the endpoint
- An artifact for the image used in the model
- An artifact for the model package for the model
- An artifact for each image deployed to the endpoint
- An association between each artifact and the model deployment action

Manually Create Tracking Entities

You can manually create tracking entities for any property. For information on the tracking entities that Amazon SageMaker automatically creates, see Amazon SageMaker–Created Tracking Entities (p. 3409).

You can add tags to all entities except associations. Tags are arbitrary key-value pairs that provide custom information. You can filter or sort a list or search query by tags. For more information, see Tagging AWS resources in the AWS General Reference.

For a sample notebook that demonstrates how to create lineage entities, see the Amazon SageMaker Lineage notebook in the Amazon SageMaker example GitHub repository.

Topics
- Manually Create Entities (p. 3411)
- Manually Track a Workflow (p. 3412)
- Limits (p. 3413)

Manually Create Entities

The following procedure shows you how to create and associate artifacts between a SageMaker training job and endpoint. You perform the following steps:

Import tracking entities and associations

1. Import the lineage tracking entities.

```python
import sys
!{sys.executable} -m pip install -q sagemaker
from sagemaker import get_execution_role
from sagemaker.session import Session
from sagemaker.lineage import context, artifact, association, action
import boto3
boto_session = boto3.Session(region_name="region")
sagemaker_client = boto_session.client("sagemaker")
```

2. Create the input and output artifacts.

```python
code_location_arn = artifact.Artifact.create(
    artifact_name='source-code-location',
    source_uri='s3://...',
    artifact_type='code-location'
).artifact_arn

# Similar constructs for train_data_location_arn and test_data_location_arn
model_location_arn = artifact.Artifact.create(
```

---

3411
3. Train the model and get the `trial_component_arn` that represents the training job.
4. Associate the input artifacts and output artifacts with the training job (trial component).

```python
input_artifacts = [code_location_arn, train_data_location_arn, test_data_location_arn]
for artifact_arn in input_artifacts:
    try:
        association.Association.create(
            source_arn=artifact_arn,
            destination_arn=trial_component_arn,
            association_type='ContributedTo'
        )
    except:
        logging.info('association between {} and {} already exists', artifact_arn, trial_component_arn)

output_artifacts = [model_location_arn]
for artifact_arn in output_artifacts:
    try:
        association.Association.create(
            source_arn=trial_component_arn,
            destination_arn=artifact_arn,
            association_type='Produced'
        )
    except:
        logging.info('association between {} and {} already exists', artifact_arn, trial_component_arn)
```

5. Create the inference endpoint.

```python
predictor = mnist_estimator.deploy(initial_instance_count=1,
    instance_type='ml.m4.xlarge')
```

6. Create the endpoint context.

```python
from sagemaker.lineage import context
endpoint = sagemaker_client.describe_endpoint(EndpointName=predictor.endpoint_name)
endpoint_arn = endpoint['EndpointArn']
endpoint_context_arn = context.Context.create(
    context_name=predictor.endpoint_name,
    context_type='Endpoint',
    source_uri=endpoint_arn)
```

7. Associate the training job (trial component) and endpoint context.

```python
association.Association.create(
    source_arn=trial_component_arn,
    destination_arn=endpoint_context_arn
)
```

### Manually Track a Workflow

You can manually track the workflow created in the previous section.
Given the endpoint Amazon Resource Name (ARN) from the previous example, the following procedure shows you how to track the workflow back to the datasets used to train the model that was deployed to the endpoint. You perform the following steps:

**To track a workflow from endpoint to training data source**

1. Import the tracking entities.

   ```python
   import sys
   !(sys.executable) -m pip install -q sagemaker
   from sagemaker import get_execution_role
   from sagemaker.session import Session
   from sagemaker.lineage import context, artifact, association, action
   import boto3
   boto_session = boto3.Session(region_name=region)
   sagemaker_client = boto_session.client("sagemaker")
   ```

2. Get the endpoint context from the endpoint ARN.

   ```python
   endpoint_context_arn = sagemaker_client.list_contexts(
       SourceUri=endpoint_arn)['ContextSummaries'][0]['ContextArn']
   ```

3. Get the trial component from the association between the trial component and the endpoint context.

   ```python
   trial_component_arn = sagemaker_client.list_associations(
       DestinationArn=endpoint_context_arn)['AssociationSummaries'][0]['SourceArn']
   ```

4. Get the training data location artifact from the association between the trial component and the endpoint context.

   ```python
   train_data_location_artifact_arn = sagemaker_client.list_associations(
       DestinationArn=trial_component_arn, SourceType='Model')['AssociationSummaries'][0][
       'SourceArn']
   ```

5. Get the training data location from the training data location artifact.

   ```python
   train_data_location = sagemaker_client.describe_artifact(
       ArtifactArn=train_data_location_artifact_arn)['Source']
   print(train_data_location)
   ```

   Response:

   ```
   s3://sagemaker-sample-data-us-east-2/mxnet/mnist/train
   ```

**Limits**

You can create an association between any entities, experiment and lineage, except the following:

- You cannot create an association between two experiment entities. Experiment entities consist of experiments, trials, and trial components.
- You can create an association with another association.

An error occurs if you try to create an entity that already exists.
Maximum number of manually created lineage entities

- Actions: 3000
- Artifacts: 6000
- Associations: 6000
- Contexts: 500

There is no limit to the number of lineage entities automatically created by Amazon SageMaker.

Querying Lineage Entities

Amazon SageMaker automatically generates graphs of lineage entities as you use them. You can query this data to answer a variety of questions. You can query your lineage entities to:

- Retrieve all data sets that went into the creation of a model.
- Retrieve all jobs that went into the creation of an endpoint.
- Retrieve all models that use a data set.
- Retrieve all endpoints that use a model.
- Retrieve which endpoints are derived from a certain data set.
- Retrieve the pipeline execution that created a training job.
- Retrieve the relationships between entities for investigation, governance, and reproducibility.
- Retrieve all downstream trials that use the artifact.
- Retrieve all upstream trials that use the artifact.
- Retrieve a list of artifacts that use the provided S3 uri.
- Retrieve upstream artifacts that use the dataset artifact.
- Retrieve downstream artifacts that use the dataset artifact.
- Retrieve datasets that use the image artifact.
- Retrieve actions that use the context.
- Retrieve processing jobs that use the endpoint.
- Retrieve transform jobs that use the endpoint.
- Retrieve trial components that use the endpoint.
- Retrieve the ARN for the pipeline execution associated with the model package group.
- Retrieve all artifacts that use the action.
- Retrieve all upstream datasets that use the model package approval action.
- Retrieve model package from model package approval action.
- Retrieve downstream endpoint contexts that use the endpoint.
- Retrieve the ARN for the pipeline execution associated with the trial component.
- Retrieve datasets that use the trial component.
- Retrieve models that use the trial component.
- Explore your lineage for visualization.

Limitations

- Lineage querying is not available in the following Regions:
  - Africa (Cape Town) – af-south
  - Asia Pacific (Jakarta) – ap-southeast-3
  - Asia Pacific (Osaka) – ap-northeast-3
• Europe (Milan) – eu-south-1
• The maximum depth of relationships to discover is currently limited to 10.
• Filtering is limited to the following properties: last modified date, created date, type, and lineage entity type.

Topics
• Getting Started with Querying Lineage Entities (p. 3415)

Getting Started with Querying Lineage Entities

The easiest way to get started is either via the:

• Amazon SageMaker SDK for Python which has defined many common use cases.
• For a notebook that demonstrates how to use SageMaker Lineage APIs to query relationships across the lineage graph, see sagemaker-lineage-multihop-queries.ipynb.

The following examples show how to use the LineageQuery and LineageFilter APIs to construct queries to answer questions about the Lineage Graph and extract entity relationships for a few use cases.

Example Using the LineageQuery API to find entity associations

```python
from sagemaker.lineage.context import Context, EndpointContext
from sagemaker.lineage.action import Action
from sagemaker.lineage.association import Association
from sagemaker.lineage.artifact import Artifact, ModelArtifact, DatasetArtifact
from sagemaker.lineage.query import (LineageQuery,
                                    LineageFilter,
                                    LineageSourceEnum,
                                    LineageEntityEnum,
                                    LineageQueryDirectionEnum,
                                    )

# Find the endpoint context and model artifact that should be used for the lineage queries.
contexts = Context.list(source_uri=endpoint_arn)
context_name = list(contexts)[0].context_name
endpoint_context = EndpointContext.load(context_name=context_name)

# Define the LineageFilter to look for entities of type 'ARTIFACT' and the source of type 'DATASET'.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[LineageSourceEnum.DATASET]
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses through the given context `endpoint_context` and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
)
```

Example Find all the datasets associated with an endpoint

```python
# Define the LineageFilter to look for entities of type 'ARTIFACT' and the source of type 'DATASET'.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[LineageSourceEnum.DATASET]
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses through the given context `endpoint_context` and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
)```
Example Find the models associated with an endpoint

```python
# Define the LineageFilter to look for entities of type 'ARTIFACT' and the source of type
# 'MODEL'.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT], sources=[LineageSourceEnum.MODEL]
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses
# through the given context `endpoint_context`
# and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

# Parse through the query results to get the lineage objects corresponding to the model
model_artifacts = []
for vertex in query_result.vertices:
    model_artifacts.append(vertex.to_lineage_object().source.source_uri)

# The results of the `LineageQuery` API call return the ARN of the model deployed to the
# endpoint along with
# the S3 URI to the model.tar.gz file associated with the model
pp.pprint(model_artifacts)
```

Example Find the trial components associated with the endpoint

```python
# Define the LineageFilter to look for entities of type 'TRIAL_COMPONENT' and the source of
type 'TRAINING_JOB'.
query_filter = LineageFilter(
    entities=[LineageEntityEnum.TRIAL_COMPONENT],
    sources=[LineageSourceEnum.TRAINING_JOB],
)

# Providing this `LineageFilter` to the `LineageQuery` constructs a query that traverses
# through the given context `endpoint_context`
# and find all datasets.
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[endpoint_context.context_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

# Parse through the query results to get the ARNs of the training jobs associated with this
Endpoint
```
Example Changing the focal point of lineage

The LineageQuery can be modified to have different start_arns which changes the focal point of lineage. In addition, the LineageFilter can take multiple sources and entities to expand the scope of the query.

In the following we use the model as the lineage focal point and find the endpoints and datasets associated with it.

```python
# Get the ModelArtifact
model_artifact_summary = list(Artifact.list(source_uri=model_package_arn))[0]
model_artifact = ModelArtifact.load(artifact_arn=model_artifact_summary.artifact_arn)
query_filter = LineageFilter(  
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[LineageSourceEnum.ENDPOINT, LineageSourceEnum.DATASET],
)
query_result = LineageQuery(sagemaker_session).query(  
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
    # Find all the entities that descend from the model, i.e. the endpoint
    direction=LineageQueryDirectionEnum.DESCENDANTS,
    include_edges=False,
)

associations = []
for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)

query_result = LineageQuery(sagemaker_session).query(  
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
    # Find all the entities that ascend from the model, i.e. the datasets
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)

pp.pprint(associations)
```

Example Using LineageQueryDirectionEnum.BOTH to find ascendent and descendent relationships

When the direction is set to BOTH, the query traverses the graph to find ascendant and descendant relationships. This traversal takes place not only from the starting node, but from each node that is visited. For example; if a training job is run twice and both models generated by the training job are deployed to endpoints, the result of the query with direction set to BOTH shows both endpoints. This is because the same image is used for training and deploying the model. Since the image is common to the model, the start_arn and both the endpoints, appear in the query result.

```python
query_filter = LineageFilter(  
    entities=[LineageEntityEnum.ARTIFACT],
```
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],  # Model is the starting artifact
    query_filter=query_filter,
    # This specifies that the query should look for associations both ascending and
    descending for the start
direction=LineageQueryDirectionEnum.BOTH,
    include_edges=False,
)

associations = []
for vertex in query_result.vertices:
    associations.append(vertex.to_lineage_object().source.source_uri)
pp.pprint(associations)

Example Directions in LineageQuery - ASCENDANTS vs. DESCENDANTS

To understand the direction in the Lineage Graph, take the following entity relationship graph - Dataset -> Training Job -> Model -> Endpoint

The endpoint is a descendant of the model, and the model is a descendant of the dataset. Similarly, the model is an ascendant of the endpoint. The direction parameter can be used to specify whether the query should return entities that are descendants or ascendants of the entity in start_arns. If the start_arns contains a model and the direction is DESCENDANTS, the query returns the endpoint. If the direction is ASCENDANTS, the query returns the dataset.

# In this example, we'll look at the impact of specifying the direction as ASCENDANT or DESCENDANT in a 'LineageQuery'.

query_filter = LineageFilter(
    entities=[LineageEntityEnum.ARTIFACT],
    sources=[
        LineageSourceEnum.ENDPOINT,
        LineageSourceEnum.MODEL,
        LineageSourceEnum.DATASET,
        LineageSourceEnum.TRAINING_JOB,
    ],
)

query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.ASCENDANTS,
    include_edges=False,
)

ascendant_artifacts = []

# The lineage entity returned for the Training Job is a TrialComponent which can't be converted to a lineage object using the method 'to_lineage_object()' so we extract the TrialComponent ARN.

for vertex in query_result.vertices:
    try:
        ascendant_artifacts.append(vertex.to_lineage_object().source.source_uri)
    except:
        ascendant_artifacts.append(vertex.arn)

print("Ascendant artifacts :")
pp.pprint(ascendant_artifacts)
query_result = LineageQuery(sagemaker_session).query(
    start_arns=[model_artifact.artifact_arn],
    query_filter=query_filter,
    direction=LineageQueryDirectionEnum.DESCENDANTS,
    include_edges=False,
)

descendant_artifacts = []
for vertex in query_result.vertices:
    try:
        descendant_artifacts.append(vertex.to_lineage_object().source.source_uri)
    except:
        # Handling TrialComponents.
        descendant_artifacts.append(vertex.arn)
print("Descendant artifacts : ")
pp.pprint(descendant_artifacts)

Example SDK helper functions to make lineage queries easier

The classes EndpointContext, ModelArtifact, and DatasetArtifact have helper functions that are wrappers over the LineageQuery API to make certain lineage queries easier to leverage. The following example shows how to use these helper function.

# Find all the datasets associated with this endpoint

datasets = []
dataset_artifacts = endpoint_context.dataset_artifacts()
for dataset in dataset_artifacts:
    datasets.append(dataset.source.source_uri)
print("Datasets : ", datasets)

# Find the training jobs associated with the endpoint
training_job_artifacts = endpoint_context.training_job_arns()
training_jobs = []
for training_job in training_job_artifacts:
    training_jobs.append(training_job)
print("Training Jobs : ", training_jobs)

# Get the ARN for the pipeline execution associated with this endpoint (if any)
pipeline_executions = endpoint_context.pipeline_execution_arn()
if pipeline_executions:
    for pipeline in pipelines_executions:
        print(pipeline)

# Here we use the `ModelArtifact` class to find all the datasets and endpoints associated with the model

dataset_artifacts = model_artifact.dataset_artifacts()
endpoint_contexts = model_artifact.endpoint_contexts()
datasets = [dataset.source.source_uri for dataset in dataset_artifacts]
endpoints = [endpoint.source.source_uri for endpoint in endpoint_contexts]
print("Datasets associated with this model : ")
pp.pprint(datasets)
print("Endpoints associated with this model : ")
pp.pprint(endpoints)

# Here we use the `DatasetArtifact` class to find all the endpoints hosting models that were trained with a particular dataset
# Find the artifact associated with the dataset
dataset_artifact_arn = list(Artifact.list(source_uri=training_data))[0].artifact_arn
dataset_artifact = DatasetArtifact.load(artifact_arn=dataset_artifact_arn)

# Find the endpoints that used this training dataset
endpoints = [endpoint.source.source_uri for endpoint in endpoint_contexts]

print("Endpoints associated with the training dataset {}").format(training_data))
pp.pprint(endpoints)

Example Getting a Lineage graph visualization

A helper class `Visualizer` is provided in the sample notebook `visualizer.py` to help plot the lineage graph. When the query response is rendered, a graph with the lineage relationships from the `StartArns` is displayed. From the `StartArns` the visualization shows the relationships with the other lineage entities returned in the `query_lineage` API action.

```python
# Graph APIs
# Here we use the boto3 `query_lineage` API to generate the query response to plot.

from visualizer import Visualizer

query_response = sm_client.query_lineage(
    StartArns=[endpoint_context.context_arn], Direction="Ascendants", IncludeEdges=True
)

viz = Visualizer()
viz.render(query_response, "Endpoint")

query_response = sm_client.query_lineage(
    StartArns=[model_artifact.artifact_arn], Direction="Ascendants", IncludeEdges=True
)

viz.render(query_response, "Model")
```

Cross-Account Lineage Tracking

Amazon SageMaker supports tracking lineage entities from a different AWS account. Other AWS accounts can share their lineage entities with you and you can access these lineage entities through direct API calls or SageMaker lineage queries.

SageMaker uses AWS Resource Access Manager to help you securely share your lineage resources. You can share your resources through the AWS RAM console.

Set Up Cross-Account Lineage Tracking

You can group and share your

Tracking entities maintain a representation of all the elements of your end-to-end machine learning workflow. You can use this representation to establish model governance, reproduce your workflow, and maintain a record of your work history.

Amazon SageMaker automatically creates tracking entities for trial components and their associated trials and experiments when you create SageMaker jobs such as processing jobs, training jobs, and batch transform jobs. In additional to auto tracking, you can also Manually Create Tracking Entities (p. 3411) to model custom steps in your workflow. For more information, see Manage Machine Learning with Amazon SageMaker Experiments (p. 1455).
SageMaker also automatically creates tracking entities for the other steps in a workflow so you can track the workflow from end to end. For more information, see Amazon SageMaker–Created Tracking Entities (p. 3409).

You can create additional entities to supplement those created by SageMaker. For more information, see Manually Create Tracking Entities (p. 3411).

SageMaker reuses any existing entities rather than creating new ones. For example, there can be only one artifact with a unique SourceUri.

**Key concepts for querying lineage**

- **Lineage** – Metadata that tracks the relationships between various entities in your ML workflows.

- **QueryLineage** – The action to inspect your lineage and discover relationships between entities.

- **Lineage entities** – The metadata elements of which your lineage is composed.

- **Cross-account lineage** – Your ML workflow may span more than one account. With cross-account lineage, you can configure multiple accounts to automatically create lineage associations between shared entity resources. QueryLineage then can return entities even from these shared accounts.

The following tracking entities are defined:

**Experiment entities**

- **Trial component** – A stage of a machine learning trial. Includes processing jobs, training jobs, and batch transform jobs.

- **Trial** – A combination of trial components that generally produces a model.

- **Experiment** – A grouping of trials generally focused on solving a specific use case.

**Lineage entities**

- **Trial Component** – Represents processing, training, and transform jobs in the lineage. Also part of experiment management.

- **Context** – Provides a logical grouping of other tracking or experiment entities. Conceptually, experiments and trials are contexts. Some examples are an endpoint and a model package.

- **Action** – Represents an action or activity. Generally, an action involves at least one input artifact or output artifact. Some examples are a workflow step and a model deployment.

- **Artifact** – Represents a URI addressable object or data. An artifact is generally either an input or an output to a trial component or action. Some examples include a dataset (S3 bucket URI), or an image (Amazon ECR registry path).

- **Association** – Links other tracking or experiment entities, such as an association between the location of training data and a training job. An association has an optional AssociationType property. The following values are available along with the suggested use for each type. SageMaker places no restrictions on their use:
  - **ContributedTo** – The source contributed to the destination or had a part in enabling the destination. For example, the training data contributed to the training job.
  - **AssociatedWith** – The source is connected to the destination. For example, an approval workflow is associated with a model deployment.
• DerivedFrom - The destination is a modification of the source. For example, a digest output of a channel input for a processing job is derived from the original inputs.

• Produced – The source generated the destination. For example, a training job produced a model artifact.
• SameAs – When the same lineage entity used in different accounts.

Common properties

• Type property

The action, artifact, and context entities have a type property, ActionType, ArtifactType, and ContextType, respectively. This property is a custom string which can associate meaningful information with the entity and be used as a filter in the List APIs.

• Source property

The action, artifact, and context entities have a Source property. This property provides the underlying URI that the entity represents. Some examples are:
• An UpdateEndpoint action where the source is the EndpointArn.
• An image artifact for a processing job where the source is the ImageUri.
• An Endpoint context where the source is the EndpointArn.

• Metadata property

The action and artifact entities have an optional Metadata property which can provide the following information:
• ProjectId – For example, the ID of the SageMaker MLOps project to which a model belongs.
• GeneratedBy – For example, the SageMaker pipeline execution that registered a model package version.
• Repository – For example, the repository that contains an algorithm.
• CommitId – For example, the commit ID of an algorithm version.

(Note) through a lineage group in Amazon SageMaker. SageMaker supports only one default lineage group per account. SageMaker creates the default lineage group whenever a lineage entity is created in your account. Every lineage entity owned by your account is assigned to this default lineage group. To share lineage entities with another account, you share this default lineage group with that account.

Note
You can share all lineage tracking entities in a lineage group or none.

Create a resource share for your lineage entities using AWS Resource Access Manager console. For more information, see Sharing your AWS resources in the AWS Resource Access Manager User Guide.

Note
After the resource share is created, it can take a few minutes for the resource and principal associations to complete. Once the association is set, the shared account receives an invitation to join the resource share. The shared account must accept the invite to gain access to shared resources. For more information on accepting a resource share invite in AWS RAM, see Using shared AWS resources in the AWS Resource Access Manager User Guide.

Your cross-account lineage tracking resource policy

Amazon SageMaker supports only one type of resource policy. The SageMaker resource policy must allow all of the following operations:
Example The following is a SageMaker resource policy created using AWS Resource Access Manager for creating a resource share for an accounts lineage group.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "FullLineageAccess",
            "Effect": "Allow",
            "Principal": {
                "AWS": "123456789012"  #account-id
            },
            "Action": [
                "sagemaker:DescribeAction",
                "sagemaker:DescribeArtifact",
                "sagemaker:DescribeContext",
                "sagemaker:DescribeTrialComponent",
                "sagemaker:AddAssociation",
                "sagemaker:DeleteAssociation",
                "sagemaker:QueryLineage"
            ],
        }
    ]
}
```

**Tracking Cross-Account Lineage Entities**

With cross-account lineage tracking you can associate lineage entities in different accounts using the same AddAssociation API action. When you associate two lineage entities, SageMaker validates if you have permissions to perform the AddAssociation API action on both lineage entities. SageMaker then establishes the association. If you don't have the permissions, SageMaker does not create the association. Once the cross-account association is established, you can access either lineage entity from the other through the QueryLineage API action. For more information, see [Querying Lineage Entities](p. 3414).

In addition to SageMaker automatically creating lineage entities, if you have cross-account access, SageMaker connects artifacts that reference the same object or data. If the data from one account is used in lineage tracking by different accounts, SageMaker creates an artifact in each account to track that data. With cross-account lineage, whenever SageMaker creates new artifacts, SageMaker checks if there are other artifacts created for the same data that are also shared with you. SageMaker then establishes associations between the newly created artifact and each of the artifacts shared with you with the AssociationType set to SameAs. You can then use the QueryLineage API action to traverse the lineage entities in your own account to lineage entities shared with you but owned by a different AWS account. For more information, see [Querying Lineage Entities](p. 3414).

**Topics**

- Accessing lineage resources from a different accounts (p. 3424)
- Authorization for querying cross-account lineage entities (p. 3424)
Accessing lineage resources from a different accounts

Once the cross-account access for sharing lineage has been set up, you can call the following SageMaker API actions directly with the ARN to describe the shared lineage entities from another account:

- DescribeAction
- DescribeArtifact
- DescribeContext
- DescribeTrialComponent

You can also manage Associations for lineage entities owned by different accounts that are shared with you, using the following SageMaker API actions:

- AddAssociation
- DeleteAssociation

For a notebook that demonstrates how to use SageMaker Lineage APIs to query lineage across accounts, see sagemaker-lineage-cross-account-with-ram.ipynb.

Authorization for querying cross-account lineage entities

Amazon SageMaker must validate that you have permissions to perform the QueryLineage API action on the StartArns. This is enforced through the resource policy attached to the LineageGroup. The result from this action includes all the lineage entities to which you have access, whether they are owned by your account or shared by another account. For more information, see Querying Lineage Entities (p. 3414).

Kubernetes Orchestration

You can orchestrate your SageMaker training and inference jobs with SageMaker Operators for Kubernetes and SageMaker Components for Kubeflow Pipelines. SageMaker Operators for Kubernetes make it easier for developers and data scientists using Kubernetes to train, tune, and deploy machine learning (ML) models in SageMaker. SageMaker Components for Kubeflow Pipelines allow you to move your data processing and training jobs from the Kubernetes cluster to SageMaker’s machine learning-optimized managed service.

Contents

- SageMaker Operators for Kubernetes (p. 3424)
- SageMaker Components for Kubeflow Pipelines (p. 3467)

SageMaker Operators for Kubernetes

SageMaker Operators for Kubernetes make it easier for developers and data scientists using Kubernetes to train, tune, and deploy machine learning (ML) models in SageMaker. You can install these SageMaker Operators on your Kubernetes cluster in Amazon Elastic Kubernetes Service (Amazon EKS) to create SageMaker jobs natively using the Kubernetes API and command-line Kubernetes tools such as kubectl. This guide shows you how to set up the operators. The guide also explains how to use the operators to run model training, hyperparameter tuning, and inference (real-time and batch).

Important

The new version of SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK). For more information, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3464) or go directly to the ACK documentation.
There is no additional charge to use these operators. You do incur charges for any SageMaker resources that you use through these operators. The procedures and guidelines here assume you are familiar with Kubernetes and its basic commands.

Contents

• What is an operator? (p. 3425)
• Migrate resources to the new operator (p. 3427)
• IAM role-based setup and operator deployment (p. 3427)
• Clean up resources (p. 3435)
• Delete operators (p. 3436)
• Troubleshooting (p. 3437)
• Images and SMlogs in each Region (p. 3438)
• Using Amazon SageMaker Jobs (p. 3439)
• Migrate resources to the new SageMaker Operators for Kubernetes (p. 3464)

What is an operator?

Kubernetes is built on top of what is called the controller pattern. This pattern allows applications and tools to listen to a central state manager (ETCD) and act when something happens. Examples of such applications include cloud-controller-manager and controller-manager. The controller pattern allows you to create decoupled experiences and not have to worry about how other components are integrated. To add new capabilities to Kubernetes, developers can extend the Kubernetes API by creating a custom resource that contains their application-specific or domain-specific logic and components. Operators in Kubernetes allow users to natively invoke these custom resources and automate associated workflows.

Permissions overview

The SageMaker Operators for Kubernetes allow you to manage jobs in SageMaker from your Kubernetes cluster. The operators access SageMaker resources on your behalf. The IAM role that the operator assumes to interact with AWS resources differs from the credentials you use to access the Kubernetes cluster. The role also differs from the role that SageMaker assumes when running your machine learning jobs. The following image explains this design and flow.
Authentication Layers in the SageMaker Operator for Kubernetes

Developer machine authenticates with cluster via RBAC and AWS credentials (if using AWS)

Kubernetes Cluster

SageMaker Operator for Kubernetes

Operator authenticates with SageMaker via IAM Role+Authentication Provider with SageMakerFullAccess permissions.

Amazon SageMaker

Training Job

SageMaker accesses AWS resources by assuming an IAM role (TrainingJob.RoleArn)

Amazon S3

Amazon EC2 (+ other AWS services)
Migrate resources to the new operator

The new Amazon SageMaker Operators for Kubernetes use AWS Controllers for Kubernetes (ACK) to train, tune, and deploy machine learning models with Amazon SageMaker. The new operators are not backwards compatible, so be sure to migrate any existing SageMaker Operators for Kubernetes resources from the old operator to the new operator. To get started with migrating resources, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3464).

IAM role-based setup and operator deployment

The following sections describe the steps to set up and deploy the operator.

Warning
The following steps do not install the latest version of SageMaker Operators for Kubernetes. To install the new SageMaker Operators for Kubernetes, see Migrate resources to the new SageMaker Operators for Kubernetes (p. 3464).

Prerequisites

This guide assumes that you've completed the following prerequisites:

- Installed the following tools on the client machine used to access your Kubernetes cluster:
  - kubectl Version 1.13 or later. Use a kubectl version that is within one minor version of your Amazon EKS cluster control plane. For example, a 1.13 kubectl client works with Kubernetes 1.13 and 1.14 clusters. OpenID Connect (OIDC) is not supported in versions earlier than 1.13.
  - eksctl Version 0.7.0 or later
  - AWS CLI Version 1.16.232 or later
  - (optional) Helm Version 3.0 or later
  - aws-iam-authenticator
- Have IAM permissions to create roles and attach policies to roles.
- Created a Kubernetes cluster on which to run the operators. It should either be Kubernetes version 1.13 or 1.14. For automated cluster creation using eksctl, see Getting Started with eksctl. It takes 20 to 30 minutes to provision a cluster.

Cluster-scoped deployment

Before you can deploy your operator using an IAM role, associate an OpenID Connect (OIDC) provider with your role to authenticate with the IAM service.

Create an OpenID Connect Provider for Your Cluster

The following instructions show how to create and associate an OIDC provider with your Amazon EKS cluster.

1. Set the local CLUSTER_NAME and AWS_REGION environment variables as follows:

   ```bash
   # Set the Region and cluster
   export CLUSTER_NAME="<your cluster name>"
   export AWS_REGION="<your region>
   ```

2. Use the following command to associate the OIDC provider with your cluster. For more information, see Enabling IAM Roles for Service Accounts on your Cluster.

   ```bash
   eksctl util associate-iam-oidc-provider --cluster ${CLUSTER_NAME} \
   --region ${AWS_REGION} --approve
   ```

   Your output should look like the following:
Now that the cluster has an OIDC identity provider, you can create a role and give a Kubernetes ServiceAccount permission to assume the role.

**Get the OIDC ID**

To set up the ServiceAccount, obtain the OpenID Connect issuer URL using the following command:

```bash
aws eks describe-cluster --name ${CLUSTER_NAME} --region ${AWS_REGION} 
--query cluster.identity.oidc.issuer --output text
```

The command returns a URL like the following:

```bash
https://oidc.eks.${AWS_REGION}.amazonaws.com/id/D48675832CA65BD10A532F5970IDCID
```

In this URL, the value `D48675832CA65BD10A532F5970IDCID` is the OIDC ID. The OIDC ID for your cluster is different. You need this OIDC ID value to create a role.

If your output is None, it means that your client version is old. To work around this, run the following command:

```bash
aws eks describe-cluster --region ${AWS_REGION} --query cluster --name ${CLUSTER_NAME} --output text | grep OIDC
```

The OIDC URL is returned as follows:

```
OIDC https://oidc.eks.us-east-1.amazonaws.com/id/D48675832CA65BD10A532F5970IDCID
```

**Create an IAM Role**

1. Create a file named `trust.json` and insert the following trust relationship code block into it. Be sure to replace all `<OIDC ID>`, `<AWS account number>`, and `<EKS Cluster region>` placeholders with values corresponding to your cluster.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Federated": "arn:aws:iam::<AWS account number>:oidc-provider/oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>"
            },
            "Action": "sts:AssumeRoleWithWebIdentity",
            "Condition": {
                "StringEquals": {
                    "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:aud": "sts.amazonaws.com",
                }
            }
        }
    ]
}
```
2. Run the following command to create a role with the trust relationship defined in `trust.json`. This role enables the Amazon EKS cluster to get and refresh credentials from IAM.

```bash
aws iam create-role --region ${AWS_REGION} --role-name <role name> --assume-role-policy-document file://trust.json --output=text
```

Your output should look like the following:

```
ABCDEFSFODNN7EXAMPLE   my-role
ASSUMEROLEPOLICYDOCUMENT        2012-10-17
STATEMENT       sts:AssumeRoleWithWebIdentity   Allow
STRINGEQUALS    sts.amazonaws.com       system:serviceaccount:sagemaker-k8s-operator-
PRINCIPAL       arn:aws:iam::123456789012:oidc-provider/oidc.eks.us-
east-1.amazonaws.com/id/
```

Take note of ROLE ARN; you pass this value to your operator.

**Attach the AmazonSageMakerFullAccess Policy to the Role**

To give the role access to SageMaker, attach the `AmazonSageMakerFullAccess` policy. If you want to limit permissions to the operator, you can create your own custom policy and attach it.

To attach AmazonSageMakerFullAccess, run the following command:

```bash
aws iam attach-role-policy --role-name <role name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
```

The Kubernetes ServiceAccount `sagemaker-k8s-operator-default` should have AmazonSageMakerFullAccess permissions. Confirm this when you install the operator.

**Deploy the Operator**

When deploying your operator, you can use either a YAML file or Helm charts.

**Deploy the Operator Using YAML**

This is the simplest way to deploy your operators. The process is as follows:

1. Download the installer script using the following command:

   ```bash
   ```

2. Edit the `installer.yaml` file to replace `eks.amazonaws.com/role-arn`. Replace the ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.

3. Use the following command to deploy the cluster:

   ```bash
   kubectl apply -f installer.yaml
   ```

**Deploy the Operator Using Helm Charts**

Use the provided Helm Chart to install the operator.
1. Clone the Helm installer directory using the following command:

```bash
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/installer` folder. Edit the `rolebased/values.yaml` file, which includes high-level parameters for the chart. Replace the role ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you’ve created.

3. Install the Helm Chart using the following command:

```bash
kubectl create namespace sagemaker-k8s-operator-system
helm install --namespace sagemaker-k8s-operator-system sagemaker-operator rolebased/
```

If you decide to install the operator into a namespace other than the one specified, you need to adjust the namespace defined in the IAM role trust.json file to match.

4. After a moment, the chart is installed with a randomly generated name. Verify that the installation succeeded by running the following command:

```bash
helm ls
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>NAMESPACE</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-operator</td>
<td>sagemaker-k8s-operator-system</td>
<td>1</td>
<td>2019-11-20 23:14:59.6777082 +0000 UTC</td>
</tr>
</tbody>
</table>

**Verify the operator deployment**

1. You should be able to see the SageMaker Custom Resource Definitions (CRDs) for each operator deployed to your cluster by running the following command:

```bash
kubectl get crd | grep sagemaker
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>CRD</th>
<th>REVISION</th>
</tr>
</thead>
<tbody>
<tr>
<td>batchtransformjobs.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>endpointconfigs.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>hostingdeployments.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>hyperparametertuningjobs.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>models.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
<tr>
<td>trainingjobs.sagemaker.aws.amazon.com</td>
<td>2019-11-20T17:12:34Z</td>
</tr>
</tbody>
</table>

2. Ensure that the operator pod is running successfully. Use the following command to list all pods:

```bash
kubectl -n sagemaker-k8s-operator-system get pods
```

You should see a pod named `sagemaker-k8s-operator-controller-manager-*****` in the namespace `sagemaker-k8s-operator-system` as follows:

<table>
<thead>
<tr>
<th>NAME</th>
<th>READY</th>
<th>STATUS</th>
<th>RESTARTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-k8s-operator-controller-manager-12345678-r8abc</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
</tr>
</tbody>
</table>

23s
Namespace-scoped deployment

You have the option to install your operator within the scope of an individual Kubernetes namespace. In this mode, the controller only monitors and reconciles resources with SageMaker if the resources are created within that namespace. This allows for finer-grained control over which controller is managing which resources. This is useful for deploying to multiple AWS accounts or controlling which users have access to particular jobs.

This guide outlines how to install an operator into a particular, predefined namespace. To deploy a controller into a second namespace, follow the guide from beginning to end and change out the namespace in each step.

Create an OpenID Connect Provider for Your Amazon EKS cluster

The following instructions show how to create and associate an OIDC provider with your Amazon EKS cluster.

1. Set the local CLUSTER_NAME and AWS_REGION environment variables as follows:

```
# Set the region and cluster
export CLUSTER_NAME="<your cluster name>"
export AWS_REGION="<your region>"
```

2. Use the following command to associate the OIDC provider with your cluster. For more information, see Enabling IAM Roles for Service Accounts on your Cluster.

```
eksctl utils associate-iam-oidc-provider --cluster ${CLUSTER_NAME} \
   --region ${AWS_REGION} --approve
```

Your output should look like the following:

```
[...]
[...]
[...]
I AM OpenID Connect provider is associated with cluster "my-cluster" in "us-east-1"
```

Now that the cluster has an OIDC identity provider, create a role and give a Kubernetes ServiceAccount permission to assume the role.

Get your OIDC ID

To set up the ServiceAccount, first obtain the OpenID Connect issuer URL using the following command:

```
aws eks describe-cluster --name ${CLUSTER_NAME} --region ${AWS_REGION} \
   --query cluster.identity.oidc.issuer --output text
```

The command returns a URL like the following:

```
https://oidc.eks.${AWS_REGION}.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID
```

In this URL, the value D48675832CA65BD10A532F597OIDCID is the OIDC ID. The OIDC ID for your cluster will be different. You need this OIDC ID value to create a role.

If your output is None, it means that your client version is old. To work around this, run the following command:

```
aws eks describe-cluster --region ${AWS_REGION} --query cluster --name ${CLUSTER_NAME} --output text | grep OIDC
```
The OIDC URL is returned as follows:

```
OIDC https://oidc.eks.us-east-1.amazonaws.com/id/D48675B32CA65BD10A532F5970IDCID
```

Create your IAM Role

1. Create a file named `trust.json` and insert the following trust relationship code block into it. Be sure to replace all `<OIDC ID>`, `<AWS account number>`, `<EKS Cluster region>`, and `<Namespace>` placeholders with values corresponding to your cluster. For the purposes of this guide, `my-namespace` is used for the `<Namespace>` value.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Federated": "arn:aws:iam::<AWS account number>:oidc-provider/oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>"
            },
            "Action": "sts:AssumeRoleWithWebIdentity",
            "Condition": {
                "StringEquals": {
                    "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>":aud": "sts.amazonaws.com",
                    "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:sub": "system:serviceaccount:<Namespace>:sagemaker-k8s-operator-default"
                }
            }
        }
    ]
}
```

2. Run the following command to create a role with the trust relationship defined in `trust.json`. This role enables the Amazon EKS cluster to get and refresh credentials from IAM.

```
aws iam create-role --region ${AWS_REGION} --role-name <role name> --assume-role-policy-document file://trust.json --output=text
```

Your output should look like the following:

```
        ABCDEFSFODNN7EXAMPLE   my-role
ASSUMEROLEPOLICYDOCUMENT        2012-10-17
STATEMENT       sts:AssumeRoleWithWebIdentity   Allow
STRINGEQUALS    sts.amazonaws.com       system:serviceaccount:<Namespace>:sagemaker-k8s-operator-default
PRINCIPAL       arn:aws:iam::<AWS account number>:oidc-provider/oidc.eks.us-east-1.amazonaws.com/id/
```

Take note of ROLE ARN. You pass this value to your operator.

**Attach the AmazonSageMakerFullAccess Policy to your Role**

To give the role access to SageMaker, attach the `AmazonSageMakerFullAccess` policy. If you want to limit permissions to the operator, you can create your own custom policy and attach it.

To attach AmazonSageMakerFullAccess, run the following command:
aws iam attach-role-policy --role-name <role name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess

The Kubernetes ServiceAccount sagemaker-k8s-operator-default should have AmazonSageMakerFullAccess permissions. Confirm this when you install the operator.

**Deploy the Operator to Your Namespace**

When deploying your operator, you can use either a YAML file or Helm charts.

**Deploy the Operator to Your Namespace Using YAML**

There are two parts to deploying an operator within the scope of a namespace. The first is the set of CRDs that are installed at a cluster level. These resource definitions only need to be installed once per Kubernetes cluster. The second part is the operator permissions and deployment itself.

If you have not already installed the CRDs into the cluster, apply the CRD installer YAML using the following command:

```
kubectl apply -f https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/release/rolebased/namespaced/crd.yaml
```

To install the operator onto the cluster:

1. Download the operator installer YAML using the following command:

```
```

2. Update the installer YAML to place the resources into your specified namespace using the following command:

```
sed -i -e 's/PLACEHOLDER-NAMESPACE/<YOUR NAMESPACE>/g' operator.yaml
```

3. Edit the `operator.yaml` file to place resources into your `eks.amazonaws.com/role-arn`. Replace the ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.

4. Use the following command to deploy the cluster:

```
kubectl apply -f operator.yaml
```

**Deploy the Operator to Your Namespace Using Helm Charts**

There are two parts needed to deploy an operator within the scope of a namespace. The first is the set of CRDs that are installed at a cluster level. These resource definitions only need to be installed once per Kubernetes cluster. The second part is the operator permissions and deployment itself. When using helm charts you have to first create the namespace using `kubectl`.

1. Clone the Helm installer directory using the following command:

```
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/installer/namespaced` folder. Edit the `rolebased/values.yaml` file, which includes high-level parameters for the chart. Replace the role ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.
3. Install the Helm Chart using the following command:

```
helm install crds crd_chart/
```

4. Create the required namespace and install the operator using the following command:

```
kubectl create namespace <namespace>
helm install --namespace <namespace> operator_chart/
```

5. After a moment, the chart is installed with the name sagemaker-operator. Verify that the installation succeeded by running the following command:

```
helm ls
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>NAMESPACE</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-operator</td>
<td>my-namespace</td>
<td>1</td>
<td>2019-11-20 23:14:59.677860 +0000 UTC deployed</td>
</tr>
</tbody>
</table>

Verify the operator deployment to your namespace

1. You should be able to see the SageMaker Custom Resource Definitions (CRDs) for each operator deployed to your cluster by running the following command:

```
kubectl get crd | grep sagemaker
```

Your output should look like the following:

| batchtransformjobs.sagemaker.aws.amazon.com | 2019-11-20T17:12:34Z |
| endpointconfigs.sagemaker.aws.amazon.com    | 2019-11-20T17:12:34Z |
| hostingdeployments.sagemaker.aws.amazon.com | 2019-11-20T17:12:34Z |
| hyperparametertuningjobs.sagemaker.aws.amazon.com | 2019-11-20T17:12:34Z |
| models.sagemaker.aws.amazon.com             | 2019-11-20T17:12:34Z |
| trainingjobs.sagemaker.aws.amazon.com       | 2019-11-20T17:12:34Z |

2. Ensure that the operator pod is running successfully. Use the following command to list all pods:

```
kubectl -n my-namespace get pods
```

You should see a pod named sagemaker-k8s-operator-controller-manager-***** in the namespace my-namespace as follows:

<table>
<thead>
<tr>
<th>NAME</th>
<th>READY</th>
<th>STATUS</th>
<th>RESTARTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>sagemaker-k8s-operator-controller-manager-12345678-r8abc</td>
<td>2/2</td>
<td>Running</td>
<td>0</td>
</tr>
</tbody>
</table>

Install the SageMaker logs kubectl plugin

As part of the SageMaker Operators for Kubernetes, you can use the smlogs plugin for kubectl. This enables SageMaker CloudWatch logs to be streamed with kubectl. kubectl must be installed onto
your PATH. The following commands place the binary in the sagemaker-k8s-bin directory in your home directory, and add that directory to your PATH.

```bash
export os="linux"
wget https://amazon-sagemaker-operator-for-k8s-us-east-1.s3.amazonaws.com/kubectl-smlogs-plugin/v1/{os}.amd64.tar.gz
tar xvzf ${os}.amd64.tar.gz

# Move binaries to a directory in your homedir.
mkdir ~/sagemaker-k8s-bin
cp ./kubectl-smlogs.{os}.amd64/kubectl-smlogs ~/sagemaker-k8s-bin/.

# This line adds the binaries to your PATH in your .bashrc.
echo 'export PATH=$PATH:~/sagemaker-k8s-bin' >> ~/.bashrc

# Source your .bashrc to update environment variables:
source ~/.bashrc
```

Use the following command to verify that the kubectl plugin is installed correctly:

```
kubectl smlogs
```

If the kubectl plugin is installed correctly, your output should look like the following:

**View SageMaker logs via Kubernetes**

**Usage:**
```
smlogs [command]
```

**Aliases:**
```
smlogs, SMLogs, Smlogs
```

**Available Commands:**
```
BatchTransformJob       View BatchTransformJob logs via Kubernetes
TrainingJob             View TrainingJob logs via Kubernetes
help                    Help about any command
```

**Flags:**
```
-h, --help   help for smlogs
```

Use "smlogs [command] --help" for more information about a command.

---

**Clean up resources**

To uninstall the operator from your cluster, you must first make sure to delete all SageMaker resources from the cluster. Failure to do so causes the operator delete operation to hang. Run the following commands to stop all jobs:

```bash
# Delete all SageMaker jobs from Kubernetes
kubectl delete --all --all-namespaces hyperparametertuningjob.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces batchtransformjob.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces hostingdeployment.sagemaker.aws.amazon.com
```

You should see output similar to the following:

```
$ kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com
```
After you delete all SageMaker jobs, see Delete operators (p. 3436) to delete the operator from your cluster.

**Delete operators**

**Delete cluster-based operators**

**Operators installed using YAML**

To uninstall the operator from your cluster, make sure that all SageMaker resources have been deleted from the cluster. Failure to do so causes the operator delete operation to hang.

**Note**

Before deleting your cluster, be sure to delete all SageMaker resources from the cluster. See Clean up resources (p. 3435) for more information.

After you delete all SageMaker jobs, use kubectl to delete the operator from the cluster:

```bash
# Delete the operator and its resources
kubectl delete -f /installer.yaml
```

You should see output similar to the following:

```bash
$ kubectl delete -f raw-yaml/installer.yaml
namespace "sagemaker-k8s-operator-system" deleted
customresourcedefinition.apirelations.k8s.io "batchtransformjobs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apirelations.k8s.io "endpointconfigs.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apirelations.k8s.io "hostingdeployments.sagemaker.aws.amazon.com" deleted
customresourcedefinition.apirelations.k8s.io "trainingjobs.sagemaker.aws.amazon.com" deleted
role.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-role" deleted
clusterrole.rbac.authorization.k8s.io "sagemaker-k8s-operator-manager-role" deleted
clusterrole.rbac.authorization.k8s.io "sagemaker-k8s-operator-proxy-role" deleted
rolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-rolebinding" deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-manager-rolebinding" deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-proxy-rolebinding" deleted
service "sagemaker-k8s-operator-controller-manager-metrics-service" deleted
deployment.apps "sagemaker-k8s-operator-controller-manager" deleted
secrets "sagemaker-k8s-operator-abcde" deleted
```
Operators installed using Helm Charts

To delete the operator CRDs, first delete all the running jobs. Then delete the Helm Chart that was used to deploy the operators using the following commands:

```
# get the helm charts
helm ls

# delete the charts
helm delete <chart_name>
```

Delete namespace-based operators

Operators installed with YAML

To uninstall the operator from your cluster, first make sure that all SageMaker resources have been deleted from the cluster. Failure to do so causes the operator delete operation to hang.

**Note**
Before deleting your cluster, be sure to delete all SageMaker resources from the cluster. See Clean up resources (p. 3435) for more information.

After you delete all SageMaker jobs, use kubectl to first delete the operator from the namespace and then the CRDs from the cluster. Run the following commands to delete the operator from the cluster:

```
# Delete the operator using the same yaml file that was used to install the operator
kubectl delete -f operator.yaml

# Now delete the CRDs using the CRD installer yaml

# Now you can delete the namespace if you want
kubectl delete namespace <namespace>
```

Operators installed with Helm Charts

To delete the operator CRDs, first delete all the running jobs. Then delete the Helm Chart that was used to deploy the operators using the following commands:

```
# Delete the operator
helm delete <chart_name>

# delete the crds
helm delete crds

# optionally delete the namespace
kubectl delete namespace <namespace>
```

Troubleshooting

Debugging a Failed Job

- Check the job status by running the following:

```
kubectl get <CRD Type> <job name>
```
• If the job was created in SageMaker, you can use the following command to see the STATUS and the SageMaker Job Name:

```
kubectl get <crd type> <job name>
```

• You can use `smlogs` to find the cause of the issue using the following command:

```
kubectl smlogs <crd type> <job name>
```

• You can also use the `describe` command to get more details about the job using the following command. The output has an additional field that has more information about the status of the job.

```
kubectl describe <crd type> <job name>
```

• If the job was not created in SageMaker, then use the logs of the operator's pod to find the cause of the issue as follows:

```
$ kubectl get pods -A | grep sagemaker
# Output:
sagemaker-k8s-operator-system sagemaker-k8s-operator-controller-manager-5cd7df4d74-wh22z 2/2 Running 0 3h33m
$ kubectl logs -p <pod name> -c manager -n sagemaker-k8s-operator-system
```

Deleting an Operator CRD

If deleting a job is not working, check if the operator is running. If the operator is not running, then you have to delete the finalizer using the following steps:

1. In a new terminal, open the job in an editor using `kubectl edit` as follows:

```
kubectl edit <crd type> <job name>
```

2. Edit the job to delete the finalizer by removing the following two lines from the file. Save the file and the job is be deleted.

```
finalizers:
- sagemaker-operator-finalizer
```

Images and SMlogs in each Region

The following table lists the available operator images and SMLogs in each region.

<table>
<thead>
<tr>
<th>Region</th>
<th>Controller Image</th>
<th>Linux SMLogs</th>
</tr>
</thead>
<tbody>
<tr>
<td>us-east-1</td>
<td>95758390962.dkr.ecr.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s:v1</td>
<td><a href="https://s3.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz">https://s3.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz</a></td>
</tr>
</tbody>
</table>
### Using Amazon SageMaker Jobs

To run an Amazon SageMaker job using the Operators for Kubernetes, you can either apply a YAML file or use the supplied Helm Charts.

**Important**

The new version of SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK). For more information, see [Migrate resources to the new SageMaker Operators for Kubernetes](#) or go directly to the ACK documentation.

All sample operator jobs in the following tutorials use sample data taken from a public MNIST dataset. In order to run these samples, download the dataset into your Amazon S3 bucket. You can find the dataset in [Download the MNIST Dataset](#).

For more ML with the ACK SageMaker controller, see also those SageMaker tutorials.

#### Contents

- TrainingJob operator (p. 3439)
- HyperParameterTuningJob operator (p. 3444)
- BatchTransformJob operator (p. 3449)
- HostingDeployment operator (p. 3452)
- ProcessingJob operator (p. 3457)
- HostingAutoscalingPolicy (HAP) Operator (p. 3461)

### TrainingJob operator

Training job operators reconcile your specified training job spec to SageMaker by launching it for you in SageMaker. You can learn more about SageMaker training jobs in the SageMaker [CreateTrainingJob API documentation](#).

#### Topics

- Create a TrainingJob Using a YAML File (p. 3439)
- Create a TrainingJob Using a Helm Chart (p. 3440)
- List TrainingJobs (p. 3441)
- Describe a TrainingJob (p. 3441)
- View Logs from TrainingJobs (p. 3443)
- Delete TrainingJobs (p. 3443)

#### Create a TrainingJob Using a YAML File

1. Download the sample YAML file for training using the following command:
2. Edit the `xgboost-mnist-trainingjob.yaml` file to replace the `roleArn` parameter with your `<sagemaker-execution-role>`, and `outputPath` with your Amazon S3 bucket that the SageMaker execution role has write access to. The `roleArn` must have permissions so that SageMaker can access Amazon S3, Amazon CloudWatch, and other services on your behalf. For more information on creating an SageMaker ExecutionRole, see SageMaker Roles. Apply the YAML file using the following command:

```bash
kubectl apply -f xgboost-mnist-trainingjob.yaml
```

### Create a TrainingJob Using a Helm Chart

You can use Helm Charts to run TrainingJobs.

1. Clone the GitHub repository to get the source using the following command:

   ```bash
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/training-jobs/` folder and edit the `values.yaml` file to replace values like `rolearn` and `outputpath` with values that correspond to your account. The RoleARN must have permissions so that SageMaker can access Amazon S3, Amazon CloudWatch, and other services on your behalf. For more information on creating an SageMaker ExecutionRole, see SageMaker Roles.

### Create the TrainingJob

With the roles and Amazon S3 buckets replaced with appropriate values in `values.yaml`, you can create a training job using the following command:

```bash
helm install . --generate-name
```

Your output should look like the following:

```
NAME: chart-12345678
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
NAMESPACE: default
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES:
Thanks for installing the sagemaker-k8s-trainingjob.
```

### Verify Your Training Helm Chart

To verify that the Helm Chart was created successfully, run:

```bash
helm ls
```

Your output should look like the following:

```
NAME | STATUS | NAMESPACE | REVISION | UPDATED APP VERSION
--- | --- | --- | --- | ---
```
helm install creates a TrainingJob Kubernetes resource. The operator launches the actual training job in SageMaker and updates the TrainingJob Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note:** SageMaker does not allow you to update a running training job. You cannot edit any parameter and re-apply the file/config. Either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

**List TrainingJobs**

Use the following command to list all jobs created using the Kubernetes operator:

```
kubectl get TrainingJob
```

The output listing all jobs should look like the following:

```
kubectl get trainingjobs

  NAME                        STATUS       SECONDARY-STATUS   CREATION-TIME   
  xgboost-mnist-from-for-s3   InProgress   Starting           2019-11-20T23:42:35Z   
  xgboost-mnist-from-for-s3-examplef11eab94e0ed4671d5a8f
```

A training job continues to be listed after the job has completed or failed. You can remove a TrainingJob job from the list by following the Delete a Training Job steps. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

**TrainingJob Status Values**

The STATUS field can be one of the following values:

- Completed
- InProgress
- Failed
- Stopped
- Stopping

These statuses come directly from the SageMaker official API documentation.

In addition to the official SageMaker status, it is possible for STATUS to be SynchronizingK8sJobWithSageMaker. This means that the operator has not yet processed the job.

**Secondary Status Values**

The secondary statuses come directly from the SageMaker official API documentation. They contain more granular information about the status of the job.

**Describe a TrainingJob**

You can get more details about the training job by using the describe kubectl command. This is typically used for debugging a problem or checking the parameters of a training job. To get information about your training job, use the following command:
kubectl describe trainingjob xgboost-mnist-from-for-s3

The output for your training job should look like the following:

Name:         xgboost-mnist-from-for-s3
Namespace:    default
Labels:       <none>
Annotations:  <none>
API Version:  sagemaker.aws.amazon.com/v1

View Logs from TrainingJobs

Use the following command to see the logs from the kmeans-mnist training job:

```
kubectl smlogs trainingjob xgboost-mnist-from-for-s3
```

Your output should look similar to the following. The logs from instances are ordered chronologically.

```
xgboost-mnist-from-for-s3" has SageMaker TrainingJobName "xgboost-mnist-from-for-s3-123456789" in region "us-east-2", status "InProgress" and secondary status "Starting"
xgboost-mnist-from-for-s3-6d7fa0af0bef11eab94e0ed46example/algo-1-1574293123 2019-11-20 23:45:24.7 +0000 UTC Arguments: train

```

Delete TrainingJobs

Use the following command to stop a training job on Amazon SageMaker:

```
kubectl delete trainingjob xgboost-mnist-from-for-s3
```

This command removes the SageMaker training job from Kubernetes. This command returns the following output:

```
trainingjob.sagemaker.aws.amazon.com "xgboost-mnist-from-for-s3" deleted
```

If the job is still in progress on SageMaker, the job stops. You do not incur any charges for SageMaker resources after your job stops or completes.

**Note:** SageMaker does not delete training jobs. Stopped jobs continue to show on the SageMaker console. The delete command takes about 2 minutes to clean up the resources from SageMaker.
HyperParameterTuningJob operator

Hyperparameter tuning job operators reconcile your specified hyperparameter tuning job spec to SageMaker by launching it in SageMaker. You can learn more about SageMaker hyperparameter tuning jobs in the SageMaker CreateHyperParameterTuningJob API documentation.

Topics

- Create a HyperparameterTuningJob Using a YAML File (p. 3444)
- Create a HyperparameterTuningJob using a Helm Chart (p. 3444)
- List HyperparameterTuningJobs (p. 3445)
- Describe a HyperparameterTuningJob (p. 3446)
- View Logs from HyperparameterTuningJobs (p. 3448)
- Delete a HyperparameterTuningJob (p. 3449)

Create a HyperparameterTuningJob Using a YAML File

1. Download the sample YAML file for the hyperparameter tuning job using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-hpo.yaml
   ```

2. Edit the `xgboost-mnist-hpo.yaml` file to replace the `roleArn` parameter with your `sagemaker-execution-role`. For the hyperparameter tuning job to succeed, you must also change the `s3InputPath` and `s3OutputPath` to values that correspond to your account. Apply the updates YAML file using the following command:

   ```bash
   kubectl apply -f xgboost-mnist-hpo.yaml
   ```

Create a HyperparameterTuningJob using a Helm Chart

You can use Helm Charts to run hyperparameter tuning jobs.

1. Clone the GitHub repository to get the source using the following command:

   ```bash
   git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
   ```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/hyperparameter-tuning-jobs/` folder.

3. Edit the `values.yaml` file to replace the `roleArn` parameter with your `sagemaker-execution-role`. For the hyperparameter tuning job to succeed, you must also change the `s3InputPath` and `s3OutputPath` to values that correspond to your account.

Create the HyperparameterTuningJob

With the roles and Amazon S3 paths replaced with appropriate values in `values.yaml`, you can create a hyperparameter tuning job using the following command:

```bash
helm install . --generate-name
```

Your output should look similar to the following:

```
NAME: chart-1574292948
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
```
Verify Chart Installation

To verify that the Helm Chart was created successfully, run the following command:

```
helm ls
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>NAMESPACE</th>
<th>REVISION</th>
<th>UPDATED</th>
</tr>
</thead>
<tbody>
<tr>
<td>chart-1474292948 UTC</td>
<td>default</td>
<td>1</td>
<td>2019-11-20 23:35:49.9136092 +0000</td>
</tr>
<tr>
<td>deployed STATUS</td>
<td>sagemaker-k8s-hyperparametertuningjob-0.1.0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>chart-1574292948 UTC</td>
<td>default</td>
<td>1</td>
<td>2019-11-20 23:35:49.9136092 +0000</td>
</tr>
<tr>
<td>deployed STATUS</td>
<td>sagemaker-k8s-trainingjob-0.1.0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>rolebased-1574291698 UTC</td>
<td>default</td>
<td>1</td>
<td>2019-11-20 23:14:59.6777082 +0000</td>
</tr>
<tr>
<td>deployed STATUS</td>
<td>sagemaker-k8s-operator-0.1.0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

`helm install` creates a `HyperParameterTuningJob` Kubernetes resource. The operator launches the actual hyperparameter optimization job in SageMaker and updates the `HyperParameterTuningJob` Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note**: SageMaker does not allow you to update a running hyperparameter tuning job. You cannot edit any parameter and re-apply the file/config. You must either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

List HyperparameterTuningJobs

Use the following command to list all jobs created using the Kubernetes operator:

```
kubectl get hyperparametertuningjob
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
<th>COMPLETED</th>
<th>INPROGRESS</th>
<th>ERRORS</th>
<th>STOPPED</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEST-TRAINING-JOB</td>
<td>Completed</td>
<td>2019-10-17T01:15:52Z</td>
<td>10</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>xgboost-mnist-hpo</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>xgboostsha92f5e3cf07b11e9bf6c06d6-009-4c7a123</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>xgboostsha92f5e3cf07b11e9bf6c123</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A hyperparameter tuning job continues to be listed after the job has completed or failed. You can remove a `Hyperparametertuningjob` from the list by following the steps in Delete a Hyperparameter Tuning Job. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

**Hyperparameter Tuning Job Status Values**

The `STATUS` field can be one of the following values:

- Completed
- InProgress
- Failed
- Stopped
- Stopping

These statuses come directly from the SageMaker official API documentation.

In addition to the official SageMaker status, it is possible for STATUS to be `SynchronizingK8sJobWithSageMaker`. This means that the operator has not yet processed the job.

### Status Counters

The output has several counters, like COMPLETED and INPROGRESS. These represent how many training jobs have completed and are in progress, respectively. For more information about how these are determined, see `TrainingJobStatusCounters` in the SageMaker API documentation.

### Best TrainingJob

This column contains the name of the TrainingJob that best optimized the selected metric.

To see a summary of the tuned hyperparameters, run:

```bash
kubectl describe hyperparametertuningjob xgboost-mnist-hpo
```

To see detailed information about the TrainingJob, run:

```bash
kubectl describe trainingjobs <job name>
```

### Spawned TrainingJobs

You can also track all 10 training jobs in Kubernetes launched by `HyperparameterTuningJob` by running the following command:

```bash
kubectl get trainingjobs
```

### Describe a HyperparameterTuningJob

You can obtain debugging details using the `describe` `kubectl` command.

```bash
kubectl describe hyperparametertuningjob xgboost-mnist-hpo
```

In addition to information about the tuning job, the SageMaker Operator for Kubernetes also exposes the best training job found by the hyperparameter tuning job in the `describe` output as follows:

```yaml
Name: xgboost-mnist-hpo
Namespace: default
Labels:

View Logs from HyperparameterTuningJobs

Hyperparameter tuning jobs do not have logs, but all training jobs launched by them do have logs. These logs can be accessed as if they were a normal training job. For more information, see View Logs from Training Jobs.
Delete a HyperparameterTuningJob

Use the following command to stop a hyperparameter job in SageMaker.

```
kubectl delete hyperparametertuningjob xgboost-mnist-hpo
```

This command removes the hyperparameter tuning job and associated training jobs from your Kubernetes cluster and stops them in SageMaker. Jobs that have stopped or completed do not incur any charges for SageMaker resources. SageMaker does not delete hyperparameter tuning jobs. Stopped jobs continue to show on the SageMaker Console.

Your output should look like the following:

```
hyperparametertuningjob.sagemaker.aws.amazon.com "xgboost-mnist-hpo" deleted
```

**Note:** The delete command takes about 2 minutes to clean up the resources from SageMaker.

BatchTransformJob operator

Batch transform job operators reconcile your specified batch transform job spec to SageMaker by launching it in SageMaker. You can learn more about SageMaker batch transform job in the SageMaker CreateTransformJob API documentation.

**Topics**
- Create a BatchTransformJob Using a YAML File (p. 3449)
- Create a BatchTransformJob Using a Helm Chart (p. 3449)
- List BatchTransformJobs (p. 3450)
- Describe a BatchTransformJob (p. 3451)
- View Logs from BatchTransformJobs (p. 3452)
- Delete a BatchTransformJob (p. 3452)

Create a BatchTransformJob Using a YAML File

1. Download the sample YAML file for the batch transform job using the following command:

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-batchtransform.yaml
```

2. Edit the file `xgboost-mnist-batchtransform.yaml` to change necessary parameters to replace the `inputdataconfig` with your input data and `s3OutputPath` with your Amazon S3 buckets that the SageMaker execution role has write access to.

3. Apply the YAML file using the following command:

```
kubectl apply -f xgboost-mnist-batchtransform.yaml
```

Create a BatchTransformJob Using a Helm Chart

You can use Helm Charts to run batch transform jobs.

**Get the Helm installer directory**

Clone the GitHub repository to get the source using the following command:
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git

Configure the Helm Chart

Navigate to the amazon-sagemaker-operator-for-k8s/hack/charts/batch-transform-jobs/ folder.

Edit the values.yaml file to replace the inputdataconfig with your input data and outputPath with your S3 buckets to which the SageMaker execution role has write access.

Create a BatchTransformJob

1. Use the following command to create a batch transform job:

   ```
   helm install . --generate-name
   ```

   Your output should look like the following:

   ```
   NAME: chart-1574292948
   LAST DEPLOYED: Wed Nov 20 23:35:49 2019
   NAMESPACE: default
   STATUS: deployed
   REVISION: 1
   TEST SUITE: None
   NOTES:
   Thanks for installing the sagemaker-k8s-batch-transform-job.
   ```

2. To verify that the Helm Chart was created successfully, run the following command:

   ```
   helm ls
   ```

   This command creates a BatchTransformJob Kubernetes resource. The operator launches the actual transform job in SageMaker and updates the BatchTransformJob Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

   **Note:** SageMaker does not allow you to update a running batch transform job. You cannot edit any parameter and re-apply the file/config. You must either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

List BatchTransformJobs

Use the following command to list all jobs created using the Kubernetes operator:

```
kubectl get batchtransformjob
```
Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
<th>SAGEMAKER-JOB-NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>xgboost-mnist-batch-transform</td>
<td>Completed</td>
<td>2019-11-18T03:44:00Z</td>
<td>xgboost-mnist-</td>
</tr>
<tr>
<td>a88fb19809b511eaac440aa8axgboost</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A batch transform job will continue to be listed after the job has completed or failed. You can remove a hyperparametertuningjob from the list by following the Delete a Batch Transform Job steps. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

**Batch Transform Status Values**

The STATUS field can be one of the following values:

- Completed
- InProgress
- Failed
- Stopped
- Stopping

These statuses come directly from the SageMaker official API documentation.

In addition to the official SageMaker status, it is possible for STATUS to be SynchronizingK8sJobWithSageMaker. This means that the operator has not yet processed the job.

**Describe a BatchTransformJob**

You can obtain debugging details using the describe kubectl command.

```
kubectl describe batchtransformjob xgboost-mnist-batch-transform
```

Your output should look like the following:

```
Name:         xgboost-mnist-batch-transform
Namespace:    default
Labels:       <none>
Annotations:  kubectl.kubernetes.io/last-applied-configuration:
               {
"apiVersion":"sagemaker.aws.amazon.com/v1","kind":"BatchTransformJob","metadata":{
"annotations":{}
,"name":"xgboost-mnist","namespace":
"uid":a88fb198-09b5-11ea-ac44-0aa8a9UIDNUM
Spec:
Model Name:  TrainingJob-20190814SMJOb-IKEB
Region:      us-east-1
Transform Input:
  Content Type:  text/csv
  Data Source:
```
View Logs from BatchTransformJobs

Use the following command to see the logs from the xgboost-mnist batch transform job:

```
kubectl smlogs batchtransformjob xgboost-mnist-batch-transform
```

Delete a BatchTransformJob

Use the following command to stop a batch transform job in SageMaker.

```
kubectl delete batchTransformJob xgboost-mnist-batch-transform
```

Your output should look like the following:

```
batchtransformjob.sagemaker.aws.amazon.com "xgboost-mnist" deleted
```

This command removes the batch transform job from your Kubernetes cluster, as well as stops them in SageMaker. Jobs that have stopped or completed do not incur any charges for SageMaker resources. Delete takes about 2 minutes to clean up the resources from SageMaker.

**Note:** SageMaker does not delete batch transform jobs. Stopped jobs continue to show on the SageMaker console.

HostingDeployment operator

HostingDeployment operators support creating and deleting an endpoint, as well as updating an existing endpoint, for real-time inference. The hosting deployment operator reconciles your specified hosting deployment job spec to SageMaker by creating models, endpoint-configs and endpoints in SageMaker.

You can learn more about SageMaker inference in the SageMaker [CreateEndpoint API documentation](https://docs.aws.amazon.com/sagemaker/latest/dg/API_CreateEndpoint.html).

Topics

- Configure a HostingDeployment Resource (p. 3453)
- Create a HostingDeployment (p. 3453)
- List HostingDeployments (p. 3453)
- Describe a HostingDeployment (p. 3454)
- Invoking the Endpoint (p. 3455)
- Update HostingDeployment (p. 3456)
- Delete the HostingDeployment (p. 3456)
Configure a HostingDeployment Resource

Download the sample YAML file for the hosting deployment job using the following command:

```bash
curl https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-hostingdeployment.yaml
```

The `xgboost-mnist-hostingdeployment.yaml` file has the following components that can be edited as required:

- **ProductionVariants**: A production variant is a set of instances serving a single model. SageMaker load-balances between all production variants according to set weights.
- **Models**: A model is the containers and execution role ARN necessary to serve a model. It requires at least a single container.
- **Containers**: A container specifies the dataset and serving image. If you are using your own custom algorithm instead of an algorithm provided by SageMaker, the inference code must meet SageMaker requirements. For more information, see Using Your Own Algorithms with SageMaker.

Create a HostingDeployment

To create a HostingDeployment, use `kubectl` to apply the file `hosting.yaml` with the following command:

```bash
cubectl apply -f hosting.yaml
```

SageMaker creates an endpoint with the specified configuration. You incur charges for SageMaker resources used during the lifetime of your endpoint. You do not incur any charges once your endpoint is deleted.

The creation process takes approximately 10 minutes.

List HostingDeployments

To verify that the HostingDeployment was created, use the following command:

```bash
cubectl get hostingdeployments
```

Your output should look like the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>SAGEMAKER-ENDPOINT-NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>host-xgboost</td>
<td>Creating</td>
<td>host-xgboost-0e83e0d5f1e45a450aSMLOGS</td>
</tr>
</tbody>
</table>

HostingDeployment Status Values

The status field can be one of several values:

- **SynchronizingK8sJobWithSageMaker**: The operator is preparing to create the endpoint.
- **ReconcilingEndpoint**: The operator is creating, updating, or deleting endpoint resources. If the HostingDeployment remains in this state, use `kubectl describe` to see the reason in the Additional field.
- **OutOfService**: Endpoint is not available to take incoming requests.
- **Creating**: `CreateEndpoint` is executing.
- **Updating**: `UpdateEndpoint` or `UpdateEndpointWeightsAndCapacities` is executing.
- **SystemUpdating**: Endpoint is undergoing maintenance and cannot be updated or deleted or re-scaled until it has completed. This maintenance operation does not change any customer-specified values such as VPC config, KMS encryption, model, instance type, or instance count.
- **RollingBack**: Endpoint fails to scale up or down or change its variant weight and is in the process of rolling back to its previous configuration. Once the rollback completes, endpoint returns to an **InService** status. This transitional status only applies to an endpoint that has autoscaling enabled and is undergoing variant weight or capacity changes as part of an **UpdateEndpointWeightsAndCapacities** call or when the **UpdateEndpointWeightsAndCapacities** operation is called explicitly.
- **InService**: Endpoint is available to process incoming requests.
- **Deleting**: **DeleteEndpoint** is executing.
- **Failed**: Endpoint could not be created, updated, or re-scaled. Use **DescribeEndpoint:FailureReason** for information about the failure. **DeleteEndpoint** is the only operation that can be performed on a failed endpoint.

**Describe a HostingDeployment**

You can obtain debugging details using the describe kubectl command.

```
kubectl describe hostingdeployment
```

Your output should look like the following:

```
Name:         host-xgboost
Namespace:    default
Labels:       <none>
Annotations:  kubectl.kubernetes.io/last-applied-configuration:

         Model Name:               xgboost-model
         Variant Name:            all-traffic
         Region:                   us-east-2
   Status:
```

3454
Amazon SageMaker Developer Guide
SageMaker Operators for Kubernetes

Endpoint Arn:          arn:aws:sagemaker:us-east-2:123456789012:endpoint/host-xgboost-def0e83e0d5f11eaaaexample
Endpoint Config Name:  host-xgboost-1-def0e83e0d5f11eaaaexample
Endpoint Name:         host-xgboost-def0e83e0d5f11eaaaexample
Endpoint Status:       Creating
Endpoint URL:          https://runtime.sagemaker.us-east-2.amazonaws.com/endpoints/host-xgboost-def0e83e0d5f11eaaaexample/invocations
Last Check Time:       2019-11-22T19:43:57Z
Last Modified Time:    2019-11-22T19:40:04Z
Model Names:
  Name:   xgboost-model
  Value:  xgboost-model-1-def0e83e0d5f11-df5cc9fd0d5f11eaaaexample
Events:     <none>

The status field provides more information using the following fields:

- **Additional**: Additional information about the status of the hosting deployment. This field is optional and only gets populated in case of error.
- **Creation Time**: When the endpoint was created in SageMaker.
- **Endpoint ARN**: The SageMaker endpoint ARN.
- **Endpoint Config Name**: The SageMaker name of the endpoint configuration.
- **Endpoint Name**: The SageMaker name of the endpoint.
- **Endpoint Status**: The status of the endpoint.
- **Endpoint URL**: The HTTPS URL that can be used to access the endpoint. For more information, see Deploy a Model on SageMaker Hosting Services.
- **FailureReason**: If a create, update, or delete command fails, the cause is shown here.
- **Last Check Time**: The last time the operator checked the status of the endpoint.
- **Last Modified Time**: The last time the endpoint was modified.
- **Model Names**: A key-value pair of HostingDeployment model names to SageMaker model names.

**Invoking the Endpoint**

Once the endpoint status is InService, you can invoke the endpoint in two ways: using the AWS CLI, which does authentication and URL request signing, or using an HTTP client like cURL. If you use your own client, you need to do AWS v4 URL signing and authentication on your own.

To invoke the endpoint using the AWS CLI, run the following command. Make sure to replace the Region and endpoint-name with your endpoint's Region and SageMaker endpoint name. This information can be obtained from the output of `kubectl describe`.

```bash
# Invoke the endpoint with mock input data.
aws sagemaker-runtime invoke-endpoint \
  --region us-east-2 \
  --endpoint-name <endpoint name> \n  --body "$(seq 784 | xargs echo | sed 's/ /,/g')" \n  >(cat) \n  --content-type text/csv > /dev/null
```

For example, if your Region is `us-east-2` and your endpoint config name is `host-xgboost-f56b6b280d7511ea824b129926example`, then the following command would invoke the endpoint:

```bash
aws sagemaker-runtime invoke-endpoint \
  --region us-east-2 \n  --endpoint-name host-xgboost-f56b6b280d7511ea824b129926example \n  --body "$\{seq 784 | xargs echo | sed 's/ /,/g'\}" \n  >(cat) \n  --content-type text/csv > /dev/null
```

4.95847082138
3455
Here, 4.95847082138 is the prediction from the model for the mock data.

**Update HostingDeployment**

1. Once a HostingDeployment has a status of InService, it can be updated. It might take about 10 minutes for HostingDeployment to be in service. To verify that the status is InService, use the following command:

   ```bash
   kubectl get hostingdeployments
   ```

2. The HostingDeployment can be updated before the status is InService. The operator waits until the SageMaker endpoint is InService before applying the update.

   To apply an update, modify the `hosting.yaml` file. For example, change the `initialInstanceCount` field from 1 to 2 as follows:

   ```yaml
   apiVersion: sagemaker.aws.amazon.com/v1
   kind: HostingDeployment
   metadata:
      name: host-xgboost
   spec:
      region: us-east-2
      productionVariants:
      - variantName: all-traffic
        modelName: xgboost-model
        initialInstanceCount: 2
        instanceType: ml.c5.large
      models:
      - name: xgboost-model
        executionRoleArn: arn:aws:iam::123456789012:role/service-role/AmazonSageMaker-ExecutionRole
        primaryContainer: xgboost
        containers:
          - xgboost
            containerHostname: xgboost
            modelDataUrl: s3://my-bucket/inference/xgboost-mnist/model.tar.gz
            image: 123456789012.dkr.ecr.us-east-2.amazonaws.com/xgboost:latest
   ```

3. Save the file, then use `kubectl` to apply your update as follows. You should see the status change from InService to ReconcilingEndpoint, then Updating.

   ```bash
   $ kubectl apply -f hosting.yaml
   hostingdeployment.sagemaker.aws.amazon.com/host-xgboost configured
   $ kubectl get hostingdeployments
   NAME           STATUS                SAGEMAKER-ENDPOINT-NAME
   host-xgboost   ReconcilingEndpoint   host-xgboost-def0e83e0d5f11eaaa450a350abcdef
   $ kubectl get hostingdeployments
   NAME           STATUS     SAGEMAKER-ENDPOINT-NAME
   host-xgboost   Updating   host-xgboost-def0e83e0d5f11eaaa450a350abcdef
   ```

   SageMaker deploys a new set of instances with your models, switches traffic to use the new instances, and drains the old instances. As soon as this process begins, the status becomes Updating. After the update is complete, your endpoint becomes InService. This process takes approximately 10 minutes.

**Delete the HostingDeployment**

1. Use `kubectl` to delete a HostingDeployment with the following command:
Your output should look like the following:

```
hostingdeployment.sagemaker.aws.amazon.com "host-xgboost" deleted
```

2. To verify that the hosting deployment has been deleted, use the following command:

```
kubectl get hostingdeployments
No resources found.
```

Endpoints that have been deleted do not incur any charges for SageMaker resources.

**ProcessingJob operator**

ProcessingJob operators are used to launch Amazon SageMaker processing jobs. For more information on SageMaker processing jobs, see [CreateProcessingJob](#).

**Topics**

- [Create a ProcessingJob Using a YAML File](#) (p. 3457)
- [List ProcessingJobs](#) (p. 3458)
- [Describe a ProcessingJob](#) (p. 3459)
- [Delete a ProcessingJob](#) (p. 3460)

### Create a ProcessingJob Using a YAML File

Follow these steps to create an Amazon SageMaker processing job by using a YAML file:

1. Download the `kmeans_preprocessing.py` pre-processing script.

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/
samples/kmeans_preprocessing.py
   ```

2. In one of your Amazon Simple Storage Service (Amazon S3) buckets, create a `mnist_kmeans_example/processing_code` folder and upload the script to the folder.

3. Download the `kmeans-mnist-processingjob.yaml` file.

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/
samples/kmeans-mnist-processingjob.yaml
   ```

4. Edit the YAML file to specify your `sagemaker-execution-role` and replace all instances of `my-bucket` with your S3 bucket.

```yaml
...
metadata:
  name: kmeans-mnist-processing
...
roleArn: arn:aws:iam::<acct-id>:role/service-role/<sagemaker-execution-role>
...
processingOutputConfig:
  outputs:
    ...
s3Output:
```

3457
s3Uri: s3://<my-bucket>/mnist_kmeans_example/output/

... processingInputs:
... s3Input:
  s3Uri: s3://<my-bucket>/mnist_kmeans_example/processing_code/
  kmeans_preprocessing.py

The sagemaker-execution-role must have permissions so that SageMaker can access your S3 bucket, Amazon CloudWatch, and other services on your behalf. For more information on creating an execution role, see SageMaker Roles.

5. Apply the YAML file using one of the following commands.

For cluster-scoped installation:

```
kubectl apply -f kmeans-mnist-processingjob.yaml
```

For namespace-scoped installation:

```
kubectl apply -f kmeans-mnist-processingjob.yaml -n <NAMESPACE>
```

**List ProcessingJobs**

Use one of the following commands to list all the jobs created using the ProcessingJob operator. SAGEMAKER-JOB-NAME comes from the metadata section of the YAML file.

For cluster-scoped installation:

```
kubectl get ProcessingJob kmeans-mnist-processing
```

For namespace-scoped installation:

```
kubectl get ProcessingJob -n <NAMESPACE> kmeans-mnist-processing
```

Your output should look similar to the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
<th>SAGEMAKER-JOB-NAME</th>
</tr>
</thead>
</table>

The output lists all jobs regardless of their status. To remove a job from the list, see Delete a Processing Job.

**ProcessingJob Status**

- **SynchronizingK8sJobWithSageMaker** – The job is first submitted to the cluster. The operator has received the request and is preparing to create the processing job.
- **Reconciling** – The operator is initializing or recovering from transient errors, along with others. If the processing job remains in this state, use the kubectl describe command to see the reason in the Additional field.
- **InProgress | Completed | Failed | Stopping | Stopped** – Status of the SageMaker processing job. For more information, see DescribeProcessingJob.
- **Error** – The operator cannot recover by reconciling.
Amazon SageMaker Developer Guide
SageMaker Operators for Kubernetes

Jobs that have completed, stopped, or failed do not incur further charges for SageMaker resources.

Describe a ProcessingJob
Use one of the following commands to get more details about a processing job. These commands are
typically used for debugging a problem or checking the parameters of a processing job.
For cluster-scoped installation:
kubectl describe processingjob kmeans-mnist-processing

For namespace-scoped installation:
kubectl describe processingjob kmeans-mnist-processing -n <NAMESPACE>

The output for your processing job should look similar to the following.
$ kubectl describe ProcessingJob kmeans-mnist-processing
Name:
kmeans-mnist-processing
Namespace:
default
Labels:
<none>
Annotations: kubectl.kubernetes.io/last-applied-configuration:
{"apiVersion":"sagemaker.aws.amazon.com/
v1","kind":"ProcessingJob","metadata":{"annotations":{},"name":"kmeans-mnistprocessing",...
API Version: sagemaker.aws.amazon.com/v1

### Processing Resources:

- **Cluster Config:**
  - Instance Count: 1
  - Instance Type: ml.m5.xlarge
  - Volume Size In GB: 20
  - Region: us-west-2
  - Role Arn: arn:aws:iam::<acct-id>::role/m-sagemaker-role

- **Stopping Condition:**
  - Max Runtime In Seconds: 1800

- **Tags:**
  - Key: tagKey
  - Value: tagValue

- **Status:**
  - Last Check Time: 2020-09-22T21:14:29Z
  - Processing Job Status: InProgress
  - SageMaker Processing Job Name: kmeans-mnist-processing-7410ed52fd1811eab19a165ae9f9e385
  - Events: <none>

---

**Delete a ProcessingJob**

When you delete a processing job, the SageMaker processing job is removed from Kubernetes but the job isn't deleted from SageMaker. If the job status in SageMaker is *InProgress* the job is stopped. Processing jobs that are stopped do not incur any charges for SageMaker resources. Use one of the following commands to delete a processing job.

**For cluster-scoped installation:**

```
kubectl delete processingjob kmeans-mnist-processing
```

**For namespace-scoped installation:**

```
kubectl delete processingjob kmeans-mnist-processing -n <NAMESPACE>
```

The output for your processing job should look similar to the following.

```
processingjob.sagemaker.aws.amazon.com "kmeans-mnist-processing" deleted
```

**Note**

SageMaker does not delete the processing job. Stopped jobs continue to show in the SageMaker console. The delete command takes a few minutes to clean up the resources from SageMaker.
HostingAutoscalingPolicy (HAP) Operator

The HostingAutoscalingPolicy (HAP) operator takes a list of resource IDs as input and applies the same policy to each of them. Each resource ID is a combination of an endpoint name and a variant name. The HAP operator performs two steps: it registers the resource IDs and then applies the scaling policy to each resource ID. Delete undoes both actions. You can apply the HAP to an existing SageMaker endpoint or you can create a new SageMaker endpoint using the HostingDeployment operator. You can read more about SageMaker autoscaling in the Application Autoscaling Policy documentation.

Note
In your kubectl commands, you can use the short form, hap, in place of hostingautoscalingpolicy.

Topics
- Create a HostingAutoscalingPolicy Using a YAML File (p. 3461)
- List HostingAutoscalingPolicies (p. 3463)
- Describe a HostingAutoscalingPolicy (p. 3464)
- Update a HostingAutoscalingPolicy (p. 3464)
- Delete a HostingAutoscalingPolicy (p. 3464)
- Update or Delete an Endpoint with a HostingAutoscalingPolicy (p. 3464)

Create a HostingAutoscalingPolicy Using a YAML File

Use a YAML file to create a HostingAutoscalingPolicy (HAP) that applies a predefined or custom metric to one or multiple SageMaker endpoints.

Amazon SageMaker requires specific values in order to apply autoscaling to your variant. If these values are not specified in the YAML spec, the HAP operator applies the following default values.

```
# Do not change
Namespace                    = "sagemaker"
# Do not change
ScalableDimension            = "sagemaker:variant:DesiredInstanceCount"
# Only one supported
PolicyType                   = "TargetTrackingScaling"
# This is the default policy name but can be changed to apply a custom policy
DefaultAutoscalingPolicyName = "SageMakerEndpointInvocationScalingPolicy"
```

Use the following samples to create a HAP that applies a predefined or custom metric to one or multiple endpoints.

Sample 1: Apply a Predefined Metric to a Single Endpoint Variant

1. Download the sample YAML file for a predefined metric using the following command:

   ```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-predefined-metric.yaml
   ```

2. Edit the YAML file to specify your endpointName, variantName, and region.

3. Use one of the following commands to apply a predefined metric to a single resource ID (endpoint name and variant name combination).

   For cluster-scoped installation:
   ```
kubectl apply -f hap-predefined-metric.yaml
   ```

   For namespace-scoped installation:
Sample 2: Apply a Custom Metric to a Single Endpoint Variant

1. Download the sample YAML file for a custom metric using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-custom-metric.yaml
   ```

2. Edit the YAML file to specify your `endpointName`, `variantName`, and `region`.

3. Use one of the following commands to apply a custom metric to a single resource ID (endpoint name and variant name combination) in place of the recommended `SageMakerVariantInvocationsPerInstance`.

   **Note**
   Amazon SageMaker does not check the validity of your YAML spec.

   For cluster-scoped installation:
   ```bash
   kubectl apply -f hap-custom-metric.yaml
   ```

   For namespace-scoped installation:
   ```bash
   kubectl apply -f hap-custom-metric.yaml -n <NAMESPACE>
   ```

Sample 3: Apply a Scaling Policy to Multiple Endpoints and Variants

You can use the HAP operator to apply the same scaling policy to multiple resource IDs. A separate `scaling_policy` request is created for each resource ID (endpoint name and variant name combination).

1. Download the sample YAML file for a predefined metric using the following command:

   ```bash
   wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/hap-predefined-metric.yaml
   ```

2. Edit the YAML file to specify your `region` and multiple `endpointName` and `variantName` values.

3. Use one of the following commands to apply a predefined metric to multiple resource IDs (endpoint name and variant name combinations).

   For cluster-scoped installation:
   ```bash
   kubectl apply -f hap-predefined-metric.yaml
   ```

   For namespace-scoped installation:
   ```bash
   kubectl apply -f hap-predefined-metric.yaml -n <NAMESPACE>
   ```

Considerations for Hosting Autoscaling Policies for Multiple Endpoints and Variants

The following considerations apply when you use multiple resource IDs:
• If you apply a single policy across multiple resource IDs, one PolicyARN is created per resource ID. Five endpoints have five PolicyARNs. When you run the `describe` command on the policy, the responses show up as one job and include a single job status.

• If you apply a custom metric to multiple resource IDs, the same dimension or value is used for all the resource ID (variant) values. For example, if you apply a customer metric for instances 1-5, and the endpoint variant dimension is mapped to variant 1, when variant 1 exceeds the metrics, all endpoints are scaled up or down.

• The HAP operator supports updating the list of resource IDs. If you modify, add, or delete resource IDs to the spec, the autoscaling policy is removed from the previous list of variants and applied to the newly specified resource ID combinations. Use the `describe` command to list the resource IDs to which the policy is currently applied.

**List HostingAutoscalingPolicies**

Use one of the following commands to list all HostingAutoscalingPolicies (HAPs) created using the HAP operator.

For cluster-scoped installation:

```
kubectl get hap
```

For namespace-scoped installation:

```
kubectl get hap -n <NAMESPACE>
```

Your output should look similar to the following:

<table>
<thead>
<tr>
<th>NAME</th>
<th>STATUS</th>
<th>CREATION-TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>hap-predefined</td>
<td>Created</td>
<td>2021-07-13T21:32:21Z</td>
</tr>
</tbody>
</table>

Use the following command to check the status of your HostingAutoscalingPolicy (HAP).

```
kubectl get hap <job-name>
```

One of the following values is returned:

• Reconciling – Certain types of errors show the status as Reconciling instead of Error. Some examples are server-side errors and endpoints in the Creating or Updating state. Check the Additional field in status or operator logs for more details.

• Created

• Error

**To view the autoscaling endpoint to which you applied the policy**

2. In the left side panel, expand **Inference**.
3. Choose **Endpoints**.
4. Select the name of the endpoint of interest.
5. Scroll to the **Endpoint runtime settings** section.
Describe a HostingAutoscalingPolicy

Use the following command to get more details about a HostingAutoscalingPolicy (HAP). These commands are typically used for debugging a problem or checking the resource IDs (endpoint name and variant name combinations) of a HAP.

```
kubectl describe hap <job-name>
```

Update a HostingAutoscalingPolicy

The HostingAutoscalingPolicy (HAP) operator supports updates. You can edit your YAML spec to change the values and then reapply the policy. The HAP operator deletes the existing policy and applies the new policy.

Delete a HostingAutoscalingPolicy

Use one of the following commands to delete a HostingAutoscalingPolicy (HAP) policy.

For cluster-scoped installation:

```
kubectl delete hap hap-predefined
```

For namespace-scoped installation:

```
kubectl delete hap hap-predefined -n <NAMESPACE>
```

This command deletes the scaling policy and deregisters the scaling target from Kubernetes. This command returns the following output:

```
hostingautoscalingpolicies.sagemaker.aws.amazon.com "hap-predefined" deleted
```

Update or Delete an Endpoint with a HostingAutoscalingPolicy

To update an endpoint that has a HostingAutoscalingPolicy (HAP), use the `kubectl delete` command to remove the HAP, update the endpoint, and then reapply the HAP.

To delete an endpoint that has a HAP, use the `kubectl delete` command to remove the HAP before you delete the endpoint.

Migrate resources to the new SageMaker Operators for Kubernetes

The new Amazon SageMaker Operators for Kubernetes uses AWS Controllers for Kubernetes (ACK) to train, tune, and deploy machine learning models with Amazon SageMaker. ACK is a framework for building Kubernetes custom controllers, where each controller communicates with an AWS service API. These controllers allow Kubernetes users to provision AWS resources like databases or message queues using the Kubernetes API. For a list of all ACK service controllers, see Services in the ACK documentation.

**Note**

The new SageMaker Operators for Kubernetes are not backwards compatible. Use the following steps to migrate your resources.

For more information, see the ACK documentation or the ACK SageMaker controller GitHub repository. For a list of supported SageMaker resources, refer to the ACK API Reference. To get started with hands-on examples, see Tutorials (p. 3467).
Prerequisites

To successfully migrate resources to the new SageMaker Operators for Kubernetes, you must:

2. If you are using HostingAutoscalingPolicy resources (p. 3466), install the new Application Auto Scaling Operator. See Setup in Scale SageMaker Workloads with Application Auto Scaling for step-by-step instructions. This step is optional if you are not using HostingAutoScalingPolicy resources.

If permissions are configured correctly, then the ACK SageMaker service controller can determine the specification and status of the AWS resource and reconcile the resource as if the ACK controller originally created it.

Adopt resources

The new SageMaker Operators for Kubernetes provide the ability to adopt resources that were not originally created by the ACK service controller. For more information, see Adopt Existing AWS Resources in the ACK documentation.

The following steps show how the new SageMaker Operators for Kubernetes can adopt an existing SageMaker endpoint. Save the following sample to a file named adopt-endpoint-sample.yaml.

```yaml
apiVersion: services.k8s.aws/v1alpha1
description: AdoptedResource
metadata:
  name: adopt-endpoint-sample
spec:
  aws:
    # resource to adopt, not created by ACK
    nameOrID: xgboost-endpoint
  kubernetes:
    group: sagemaker.services.k8s.aws
    kind: Endpoint
    metadata:
    # target K8s CR name
    name: xgboost-endpoint
```

Submit the custom resource (CR) using kubectl apply:

```bash
cubectl apply -f adopt-endpoint-sample.yaml
```

Use kubectl describe to check the status conditions of your adopted resource.

```bash
cubectl describe adoptedresource adopt-endpoint-sample
```

Verify that the ACK. Adopted condition is True. The output should look similar to the following example:

```yaml
---
kind: AdoptedResource
metadata:
  annotations:
    kubectl.kubernetes.io/last-applied-configuration: '{"apiVersion":"services.k8s.aws/v1alpha1","kind":"AdoptedResource","metadata":{"annotations":{},"name":"xgboost-endpoint","namespace":"default"},"spec":{"aws":{"nameOrID":"xgboost-endpoint"},"kubernetes":{"group":"sagemaker.services.k8s.aws","kind":"Endpoint","metadata":{"name":"xgboost-endpoint"}}}'}
```
creationTimestamp: '2021-04-27T02:49:14Z'
finalizers:
- finalizers.services.k8s.aws/AdoptedResource
generation: 1
name: adopt-endpoint-sample
namespace: default
resourceVersion: '12669876'
selfLink: "/apis/services.k8s.aws/v1alpha1/namespaces/default/adoptedresources/adopt-endpoint-sample"
uid: 35f8fa92-29dd-4040-9d0d-0b07bbd7ca0b
spec:
  aws:
    nameOrID: xgboost-endpoint
  kubernetes:
    group: sagemaker.services.k8s.aws
    kind: Endpoint
    metadata:
      name: xgboost-endpoint
    status:
      conditions:
      - status: 'True'
        type: ACK.Adopted

Check that your resource exists in your cluster:

```
kubectl describe endpoints.sagemaker xgboost-endpoint
```

HostingAutoscalingPolicy resources

The HostingAutoscalingPolicy (HAP) resource consists of multiple Application Auto Scaling resources: ScalableTarget and ScalingPolicy. When adopting a HAP resource with ACK, you need to first install the Application Auto Scaling controller. To adopt HAP resources, you need to adopt both ScalableTarget and ScalingPolicy resources. You can find the resource identifier for these resources in the status of the HostingAutoscalingPolicy resource (status.ResourceIDList).

HostingDeployment resources

The HostingDeployment resource consists of multiple SageMaker resources: Endpoint, EndpointConfig, and each Model. If you adopt a SageMaker endpoint in ACK, you need to adopt the Endpoint, EndpointConfig, and each Model separately. The Endpoint, EndpointConfig, and Model names can be found in status of the HostingDeployment resource (status.endpointName, status.endpointConfigName, and status.modelNames).

For a list of all supported SageMaker resources, refer to the ACK API Reference.

Clean up old resources

After the new SageMaker Operators for Kubernetes adopt your resources, it is time to uninstall old operators and clean up old resources.

Step 1: Uninstall the old operator

To uninstall the old operator, see Delete operators (p. 3436).

**Warning**

Uninstall the old operator before deleting any old resources.

Step 2: Remove finalizers and delete old resources

**Warning**

Before deleting old resources, be sure that you have uninstalled the old operator.
After uninstalling the old operator, you must explicitly remove the finalizers to delete old operator resources. The following sample script shows how to delete all training jobs managed by the old operator in a given namespace. You can use a similar pattern to delete additional resources once they are adopted by the new operator.

**Note**
You must use full resource names to get resources. For example, use `kubectl get trainingjobs.sagemaker.aws.amazon.com` instead of `kubectl get trainingjob`.

```bash
namespace=sagemaker_namespace
training_jobs=$(kubectl get trainingjobs.sagemaker.aws.amazon.com -n $namespace -ojson | jq -r '.items | .[] | .metadata.name')
for job in $training_jobs
    do
        echo "Deleting $job resource in $namespace namespace"
        kubectl patch trainingjobs.sagemaker.aws.amazon.com $job -n $namespace -p '{"metadata": {"finalizers":null}}' --type=merge
        kubectl delete trainingjobs.sagemaker.aws.amazon.com $job -n $namespace
    done
```

**Tutorials**
For more in-depth guides on installing and using the new SageMaker Operator for Kubernetes, see the following tutorials:

- Machine Learning with the ACK SageMaker Controller
- Scale SageMaker Workloads with Application Auto Scaling

### SageMaker Components for Kubeflow Pipelines

This document outlines how to use SageMaker Components for Kubeflow Pipelines (KFP). With these pipeline components, you can create and monitor native SageMaker training, tuning, endpoint deployment, and batch transform jobs from your Kubeflow Pipelines. By running Kubeflow Pipeline jobs on SageMaker, you move data processing and training jobs from the Kubernetes cluster to SageMaker’s machine learning-optimized managed service. This document assumes prior knowledge of Kubernetes and Kubeflow.

**Contents**

- What is Kubeflow Pipelines? (p. 3467)
- Kubeflow Pipeline components (p. 3468)
- IAM permissions (p. 3469)
- Converting Pipelines to use SageMaker (p. 3470)
- Using SageMaker Components (p. 3470)

**What is Kubeflow Pipelines?**

Kubeflow Pipelines (KFP) is a platform for building and deploying portable, scalable machine learning (ML) workflows based on Docker containers. The Kubeflow Pipelines platform consists of the following:

- A user interface (UI) for managing and tracking experiments, jobs, and runs.
- An engine (Argo) for scheduling multi-step ML workflows.
- An AWS SDK for Python (Boto3) SDK for defining and manipulating pipelines and components.
• Notebooks for interacting with the system using the SDK.

A pipeline is a description of an ML workflow expressed as a directed acyclic graph as shown in the following diagram. Every step in the workflow is expressed as a Kubeflow Pipeline component, which is a AWS SDK for Python (Boto3) module.

If your data has been preprocessed, the standard pipeline can take a subset of the data and run hyperparameter optimization of your model. The pipeline then trains a model with the full dataset using the optimal hyperparameters. This model is used for both batch inference and endpoint creation.

For more information on Kubeflow Pipelines, see the Kubeflow Pipelines documentation.

Kubeflow Pipeline components

A Kubeflow Pipeline component is a set of code used to execute one step of a Kubeflow pipeline. Components are represented by a AWS SDK for Python (Boto3) module built into a Docker image. These components make it fast and easy to write pipelines for experimentation and production environments without having to interact with the underlying Kubernetes infrastructure.

SageMaker Components for Kubeflow Pipelines versions

SageMaker Components for Kubeflow Pipelines come in two versions. Each version leverages a different backend to create and manage resources on SageMaker.

• The SageMaker Components for Kubeflow Pipelines version 1 (v1.x or below) use Boto3 (AWS SDK for AWS SDK for Python (Boto3)) as backend.
• The version 2 (v2.0.0-alpha2 and above) of SageMaker Components for Kubeflow Pipelines use SageMaker Operator for Kubernetes (ACK).

AWS introduced ACK to facilitate a Kubernetes-native way of managing AWS Cloud resources. ACK includes a set of AWS service-specific controllers, one of which is the SageMaker controller. The SageMaker controller makes it easier for machine learning developers and data scientists using Kubernetes as their control plane to train, tune, and deploy machine learning (ML) models in SageMaker. For more information, see SageMaker Operators for Kubernetes

Both versions of the SageMaker Components for Kubeflow Pipelines are supported. However, the version 2 provides some additional advantages. In particular, it offers:

1. A consistent experience to manage your SageMaker resources from any application, whether you are using Kubeflow pipelines, or Kubernetes CLI (kubectl) or other Kubeflow applications such as Notebooks.
2. The flexibility to manage and monitor your SageMaker resources outside of the Kubeflow pipeline workflow.
3. Zero setup time to use the components if you deployed the full Kubeflow on AWS release since the SageMaker Operator is part of its deployment.

What do SageMaker Components for Kubeflow Pipelines provide?

SageMaker Components for Kubeflow Pipelines offer an alternative to launching your compute-intensive jobs from SageMaker. The components integrate SageMaker with the portability and orchestration of Kubeflow Pipelines. Using the SageMaker Components for Kubeflow Pipelines (KFP), you can create and monitor your SageMaker resources as part of a Kubeflow Pipelines workflow. Each of the jobs in your pipelines runs on SageMaker instead of the local Kubernetes cluster. The job parameters, status, logs, and outputs from SageMaker are still accessible from the Kubeflow Pipelines UI.
The following SageMaker components have been created to integrate six key SageMaker features into your ML workflows. You can create a Kubeflow Pipeline built entirely using these components, or integrate individual components into your workflow as needed. Alternatively, you can find all SageMaker Components for Kubeflow Pipelines in GitHub.

There is no additional charge for using SageMaker Components for Kubeflow Pipelines. You incur charges for any SageMaker resources you use through these components.

**Training components**

**Processing**

The Processing component enables you to submit processing jobs to SageMaker directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Processing Kubeflow Pipeline component version 1.

**Training**

The Training component allows you to submit SageMaker Training jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Training Kubeflow Pipelines component version 2. For information about Version 1 of the Training component see SageMaker Training Kubeflow Pipelines component version 1.

**Hyperparameter Optimization**

The Hyperparameter Optimization component enables you to submit hyperparameter tuning jobs to SageMaker directly from a Kubeflow Pipelines workflow. For more information, see SageMaker hyperparameter optimization Kubeflow Pipeline component version 1.

**Inference components**

**Hosting Deploy**

The Deploy component enables you to deploy a model in SageMaker Hosting from a Kubeflow Pipelines workflow. For more information, see SageMaker Hosting Services - Create Endpoint Kubeflow Pipeline component version 1.

**Batch Transform component**

The Batch Transform component enables you to run inference jobs for an entire dataset in SageMaker from a Kubeflow Pipelines workflow. For more information, see SageMaker Batch Transform Kubeflow Pipeline component version 1.

**Ground Truth components**

**Ground Truth** The Ground Truth component enables you to submit SageMaker Ground Truth labeling jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker Ground Truth Kubeflow Pipelines component version 1.

**Workteam**

The Workteam component enables you to create SageMaker private workteam jobs directly from a Kubeflow Pipelines workflow. For more information, see SageMaker create private workteam Kubeflow Pipelines component version 1.

**IAM permissions**

Deploying Kubeflow Pipelines with SageMaker components requires the following three levels of IAM permissions:
• An IAM user/role to access your AWS account (**your_credentials**). Note: You don't need this at all if you already have access to KFP web UI and have your input data in Amazon S3, or if you already have an Amazon Elastic Kubernetes Service (Amazon EKS) cluster with KFP.

You use this user/role from your gateway node, which can be your local machine or a remote instance, to:
• Create an Amazon EKS cluster and install KFP
• Create IAM roles/users
• Create Amazon S3 buckets for your sample input data

The IAM user/role needs the following permissions:
• CloudWatchLogsFullAccess
• AWSCloudFormationFullAccess
• IAMFullAccess
• AmazonS3FullAccess
• AmazonEC2FullAccess
• AmazonEKSAdminPolicy (Create this policy using the schema from Amazon EKS Identity-Based Policy Examples)

• An IAM role used by pipeline pods (**kfp-example-pod-role**) or the SageMaker Operator for Kubernetes controller pod to access SageMaker. This permission is used to create and monitor SageMaker jobs.

Note: You can limit permissions to the KFP and controller pods by creating and attaching your own custom policy.

The role needs the following permission:
• AmazonSageMakerFullAccess

• An IAM role used by SageMaker jobs to access resources such as Amazon S3 and Amazon ECR etc. (**kfp-example-sagemaker-execution-role**).

Your SageMaker jobs use this role to:
• Access SageMaker resources
• Input Data from Amazon S3
• Store your output model to Amazon S3

The role needs the following permissions:
• AmazonSageMakerFullAccess
• AmazonS3FullAccess

These are all the IAM users/roles you need to run KFP components for SageMaker.

When you have run the components and have created the SageMaker endpoint, you also need a role with the sagemaker:InvokeEndpoint permission to query inference endpoints.

**Converting Pipelines to use SageMaker**

You can convert an existing pipeline to use SageMaker by porting your generic AWS SDK for Python (Boto3) processing containers and training containers. If you are using SageMaker for inference, you also need to attach IAM permissions to your cluster and convert an artifact to a model.

**Using SageMaker Components**

In this tutorial, you run a pipeline using SageMaker Components for Kubeflow Pipelines to train a classification model using Kmeans with the MNIST dataset. This workflow uses Kubeflow pipelines as the orchestrator and SageMaker to execute each step of the workflow. For the full code for this and other pipeline examples, see the Sample SageMaker Kubeflow Pipelines. For information on the components used, see the KubeFlow Pipelines GitHub repository.
• Install Kubeflow Pipelines (p. 3471)
• Run Kubeflow Pipelines (p. 3478)

Install Kubeflow Pipelines

To use Kubeflow Pipelines (KFP), you need an Amazon Elastic Kubernetes Service (Amazon EKS) cluster and a gateway node to interact with that cluster. The following sections show the steps needed to set up these resources.

Topics
• Choose an installation option (p. 3471)
• Configure your pipeline permissions to access SageMaker (p. 3473)
• Access the KFP UI (p. 3475)

Choose an installation option

Kubeflow Pipelines offer two installation options. Select the option that applies to your use case:

1. Full Kubeflow on AWS Deployment (p. 3471)
   To use other Kubeflow components in addition to Kubeflow Pipelines, choose the full AWS Distribution of Kubeflow deployment.
2. Standalone Kubeflow Pipelines Deployment (p. 3471)
   To use the Kubeflow Pipelines without the other components of Kubeflow, install Kubeflow pipelines standalone.

Full Kubeflow on AWS Deployment

To install the full release of Kubeflow on AWS, follow one of the deployment guides

Standalone Kubeflow Pipelines Deployment

Set up a gateway node

A gateway node is used to create an Amazon EKS cluster and access the Kubeflow Pipelines UI. Use your local machine or an Amazon EC2 instance as your gateway node. If you want to use a new Amazon EC2 instance, create one with the latest Ubuntu 18.04 DLAMI version from the AWS console using the steps in Launching and Configuring a DLAMI.

Complete the following steps to set up your gateway node. Depending on your environment, you may have certain requirements already configured.

1. If you don't have an existing Amazon EKS cluster, create a user named your_credentials using the steps in Creating an IAM User in Your AWS Account. If you have an existing Amazon EKS cluster, use the credentials of the IAM role or user that has access to it.
2. Add the following permissions to your user using the steps in Changing Permissions for an IAM User:
   • CloudWatchLogsFullAccess
   • AWSCloudFormationFullAccess
   • IAMFullAccess
   • AmazonS3FullAccess
   • AmazonEC2FullAccess
   • AmazonEKSAdminPolicy (Create this policy using the schema from Amazon EKS Identity-Based Policy Examples)
3. Install the following on your gateway node to access the Amazon EKS cluster and KFP UI.
   - **AWS CLI**: If you are using an IAM user, configure your Access Key ID, Secret Access Key and preferred AWS Region by running: `aws configure`
   - **aws-iam-authenticator** version 0.1.31 and above
   - **eksctl** version above 0.15.
   - **kubectl** (The version needs to match your Kubernetes version within one minor version)

4. Install `boto3`.
   ```
pip install boto3
   ```

**Set up an Amazon EKS cluster**

Run the following steps from the command line of your gateway node to set up an Amazon EKS cluster:

1. If you do not have an existing Amazon EKS cluster, complete the following substeps. If you already have an Amazon EKS cluster, skip this step.
   a. Run the following from your command line to create an Amazon EKS cluster with version 1.17 or above. Replace `<your-cluster-name>` with any name for your cluster.
      ```
      eksctl create cluster --name <your-cluster-name> --region us-east-1 --auto-kubeconfig --timeout=50m --managed --nodes=1
      ```
   b. When cluster creation is complete, verify that you have access to the cluster using the following command.
      ```
      kubectl get nodes
      ```

2. Verify that the current `kubectl` context is the cluster you want to use with the following command. The current context is marked with an asterisk (*) in the output.
   ```
   kubectl config get-contexts
   ```
   
   CURRENT NAME     CLUSTER
   * <username>@<clustername>.us-east-1.eksctl.io  <clustername>.us-east-1.eksctl.io

3. If the desired cluster is not configured as your current default, update the default with the following command.
   ```
   aws eks update-kubeconfig --name <clustername> --region us-east-1
   ```

**Install Kubeflow Pipelines**

Run the following steps from the terminal of your gateway node to install Kubeflow Pipelines on your cluster.

1. Install all **cert-manager components**:
   ```
   kubectl apply -f https://github.com/cert-manager/cert-manager/releases/download/v1.9.1/cert-manager.yaml
   ```

2. Install the Kubeflow pipelines:
   ```
   export PIPELINE_VERSION=2.0.0-alpha.5
   ```
kubectl apply -k "github.com/kubeflow/pipelines/manifests/kustomize/env/cert-manager/cluster-scoped-resources?ref=$KFP_VERSION"

kubectl wait --for condition=established --timeout=60s crd/applications.app.k8s.io
kubectl apply -k "github.com/kubeflow/pipelines/manifests/kustomize/env/cert-manager/dev?ref=$KFP_VERSION"

3. Verify that the Kubeflow Pipelines service and other related resources are running.

```
kubectl -n kubeflow get all | grep pipeline
```

Your output should look like the following.

<table>
<thead>
<tr>
<th>pod/ml-pipeline-6b88c67994-kdtjv</th>
<th>1/1</th>
<th>Running</th>
<th>0</th>

</tbody>
</table>

Configure your pipeline permissions to access SageMaker

In this section, you create IAM users/roles and permissions to be used by Kubeflow Pipeline pods to access SageMaker services.

Configuration for SageMaker components version 2

To run SageMaker Components version 2 for Kubeflow Pipelines, you need to install the SageMaker Operator for Kubernetes and configure RBAC permissions for the Kubeflow Pipeline pods to create SageMaker custom resources in your Kubernetes cluster from the pipeline pods.
**Important**
Follow this section if you are using Kubeflow pipelines standalone deployment. These steps are preconfigured if you are using AWS distribution of Kubeflow version 1.6.0-aws-b1.0.0 or above.

   Follow the Setup section of [Machine Learning with ACK SageMaker Controller tutorial](https://aws.amazon.com/amazon-sagemaker/) to install the SageMaker Controller.

2. Configure RBAC permissions for the service account used by Kubeflow pipeline pods. In Kubeflow pipeline standalone deployment, the pipeline runs are executed in the namespace kubeflow using the pipeline-runner service account.
   a. Create a **RoleBinding** that grants service account access to manage sagemaker custom resources.

   ```yaml
cat > manage_sagemaker_cr.yaml <<EOF
   apiVersion: rbac.authorization.k8s.io/v1
   kind: RoleBinding
   metadata:
     name: manage-sagemaker-cr
     namespace: kubeflow
   subjects:
     - kind: ServiceAccount
       name: pipeline-runner
       namespace: kubeflow
   roleRef:
     kind: ClusterRole
     name: ack-sagemaker-controller
     apiGroup: rbac.authorization.k8s.io
   EOF
   kubectl apply -f manage_sagemaker_cr.yaml
   
   b. Make sure that the rolebinding was created by running:

   ```bash
   kubectl get rolebinding manage-sagemaker-cr -n kubeflow -o yaml
   ```

**Configuration for SageMaker components version 1**

To run SageMaker Components version 1 for Kubeflow Pipelines, the Kubeflow Pipeline pods need access to SageMaker.

**Important**
Follow this section if you are using full Kubeflow or standalone deployment.

To grant SageMaker access to the service account used by Kubeflow pipeline pods, follow those steps:
1. Export your cluster name (e.g., my-cluster-name) and cluster region (e.g., us-east-1).

   ```bash
   export CLUSTER_NAME=my-cluster-name
   export CLUSTER_REGION=us-east-1
   ```

2. Export the namespace and service account name according to your installation.
   - For the full Kubeflow on AWS installation, export your profile namespace (e.g., kubeflow-user-example-com) and default-editor as the service account.
     ```bash
     export NAMESPACE=kubeflow-user-example-com
     export KUBEFLOW_PIPELINE_POD_SERVICE_ACCOUNT=default-editor
     ```
   - For the standalone Pipelines deployment, export kubeflow as the namespace and pipeline-runner as the service account.
     ```bash
     export NAMESPACE=kubeflow
     export KUBEFLOW_PIPELINE_POD_SERVICE_ACCOUNT=pipeline-runner
     ```

3. Enable OIDC support on the Amazon EKS cluster with the following command.

   ```bash
   eksctl utils associate-iam-oidc-provider --cluster ${CLUSTER_NAME} \
   --region ${CLUSTER_REGION} --approve
   ```

4. Create a KFP execution role for the pods to access AWS services.

   ```bash
   eksctl create iamserviceaccount \
   --name ${KUBEFLOW_PIPELINE_POD_SERVICE_ACCOUNT} \
   --namespace $NAMESPACE --cluster ${CLUSTER_NAME} \
   --region ${CLUSTER_REGION} \
   --attach-policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess \
   --attach-policy-arn arn:aws:iam::aws:policy/CloudWatchLogsFullAccess \
   --override-existing-serviceaccounts \
   --approve
   ```

Once you are finished configuring your pipeline permissions to access SageMaker Components version 1, follow the SageMaker components for Kubeflow pipelines guide on the Kubeflow on AWS documentation.

Access the KFP UI

The Kubeflow Pipelines UI is used for managing and tracking experiments, jobs, and runs on your cluster. For instructions on how to access the Kubeflow Pipelines UI from your gateway node, follow the steps that apply to your deployment option in this section.

Full Kubeflow on AWS Deployment

Follow the instructions on the Kubeflow on AWS website to connect to the Kubeflow dashboard and navigate to the pipelines tab.
Standalone Kubeflow Pipelines Deployment

Use port forwarding to access the Kubeflow Pipelines UI from your gateway node by following those steps.

Set up port forwarding to the KFP UI service

Run the following from the command line of your gateway node:

1. Verify that the KFP UI service is running using the following command:

   ```bash
   kubectl -n kubeflow get service ml-pipeline-ui
   ```

<table>
<thead>
<tr>
<th>NAME</th>
<th>TYPE</th>
<th>CLUSTER-IP</th>
<th>EXTERNAL-IP</th>
<th>PORT(S)</th>
<th>AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ml-pipeline-ui</td>
<td>ClusterIP</td>
<td>10.100.38.71</td>
<td>&lt;none&gt;</td>
<td>80/TCP</td>
<td>2d22h</td>
</tr>
</tbody>
</table>

2. Run the following command to set up port forwarding to the KFP UI service. This forwards the KFP UI to port 8080 on your gateway node and allows you to access the KFP UI from your browser.

   ```bash
   kubectl port-forward -n kubeflow service/ml-pipeline-ui 8080:80
   ```

   The port forward from your remote machine drops if there is no activity. Run this command again if your dashboard is unable to get logs or updates. If the commands return an error, ensure that there is no process already running on the port you are trying to use.

Access the KFP UI service

Your method of accessing the KFP UI depends on your gateway node type.

- Local machine as the gateway node

  1. Access the dashboard in your browser as follows:

     http://localhost:8080

  2. Choose **Pipelines** to access the pipelines UI.

- Amazon EC2 instance as the gateway node

  1. You need to set up an SSH tunnel on your Amazon EC2 instance to access the Kubeflow dashboard from your local machine's browser.

     From a new terminal session in your local machine, run the following. Replace `<public-DNS-of-gateway-node>` with the IP address of your instance found on the Amazon EC2 console. You can also use the public DNS. Replace `<path_to_key>` with the path to the pem key used to access the gateway node.

     ```bash
     public_DNS_address=<public-DNS-of-gateway-node> 
     key=<path_to_key>
     on Ubuntu:
     ssh -i $<key> -L 9000:localhost:8080 ubuntu@$public_DNS_address
     or on Amazon Linux:
     ssh -i $<key> -L 9000:localhost:8080 ec2-user@$public_DNS_address
     ```

  2. Access the dashboard in your browser.

     http://localhost:9000
3. Choose **Pipelines** to access the KFP UI.

**(Optional) Add access to additional IAM users or roles**

If you use an intuitive IDE like Jupyter or want other people in your organization to use the cluster you set up, you can also give them access. The following steps run through this workflow using SageMaker notebooks. An SageMaker notebook instance is a fully managed Amazon EC2 compute instance that runs the Jupyter Notebook App. You use the notebook instance to create and manage Jupyter notebooks to create ML workflows. You can define, compile, deploy, and run your pipeline using the KFP AWS SDK for Python (Boto3) SDK or CLI. If you're not using an SageMaker notebook to run Jupyter, you need to install the **AWS CLI** and the latest version of **kubect1**.

1. Follow the steps in Create an SageMaker Notebook Instance to create a SageMaker notebook instance if you do not already have one. Give the IAM role for this instance the S3FullAccess permission.

2. Amazon EKS clusters use IAM users and roles to control access to the cluster. The rules are implemented in a config map named aws-auth. Only the user/role that has access to the cluster will be able to edit this config map. Run the following from the command line of your gateway node to get the IAM role of the notebook instance you created. Replace `<instance-name>` with the name of your instance.

   ```
   aws sagemaker describe-notebook-instance --notebook-instance-name <instance-name> --region <region> --output text --query 'RoleArn'
   ```

   This command outputs the IAM role ARN in the `arn:aws:iam::<account-id>:role/<role-name>` format. Take note of this ARN.

3. Run the following to attach the policies the IAM role. Replace `<role-name>` with the `<role-name>` in your ARN.

   ```
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonEKSWorkerNodePolicy
   aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonS3FullAccess
   ```

4. eksctl provides commands to read and edit the aws-auth config map. system:masters is one of the default user groups. You add the user to this group. The system:masters group has super user permissions to the cluster. You can also create a group with more restrictive permissions or you can bind permissions directly to users. Replace `<IAM-Rol-arn>` with the ARN of the IAM role. `<your_username>` can be any unique username.

   ```
   eksctl create iamidentitymapping \
      --cluster <cluster-name> \
      --arn <IAM-Rol-arn> \
      --group system:masters \
      --username <your-username> \
      --region <region>
   ```

5. Open the Jupyter notebook on your SageMaker instance and run the following to verify that it has access to the cluster.

   ```
   aws eks --region <region> update-kubeconfig --name <cluster-name>
   kubectl -n kubeflow get all | grep pipeline
   ```
Run Kubeflow Pipelines

Now that the setup of your gateway node and Amazon EKS cluster is complete, you can create your classification pipeline. To create your pipeline, you need to define and compile it. You then deploy it and use it to run workflows. You can define your pipeline in AWS SDK for Python (Boto3) and use the KFP dashboard, KFP CLI, or AWS SDK for Python (Boto3) SDK to compile, deploy, and run your workflows. The full code for the MNIST classification pipeline example is available in the Kubeflow Github repository. To use it, clone the example AWS SDK for Python (Boto3) files to your gateway node.

To run the classification pipeline example, follow the first section then continue with the steps that apply to your deployment option.

Create a SageMaker execution role

The kfp-example-sagemaker-execution-role IAM role is used by SageMaker jobs to access AWS resources. For more information, see the IAM Permissions section. You provide this role as an input parameter when running the pipeline.

Run the following to create the role. Note the ARN that is returned in your output.

```
SAGEMAKER_EXECUTION_ROLE_NAME=kfp-example-sagemaker-execution-role

aws iam create-role --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --assume-role-policy-document "$TRUST"
aws iam attach-role-policy --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
aws iam attach-role-policy --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --policy-arn arn:aws:iam::aws:policy/AmazonS3FullAccess
aws iam get-role --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --output text --query 'Role.Arn'
```

Full Kubeflow on AWS Deployment

Follow the instructions of the SageMaker Training Pipeline tutorial for MNIST Classification with K-Means.

Standalone Kubeflow Pipelines Deployment

Prepare datasets

To run the pipelines, you need to upload the data extraction pre-processing script to an Amazon S3 bucket. This bucket and all resources for this example must be located in the us-east-1 Amazon Region. If you don't have a bucket, create one using the steps in Creating a bucket.

From the mnist-kmeans-sagemaker folder of the Kubeflow repository you cloned on your gateway node, run the following command to upload the kmeans_preprocessing.py file to your Amazon S3 bucket. Change <bucket-name> to the name of the Amazon S3 bucket you created.

```
aws s3 cp mnist-kmeans-sagemaker/kmeans_preprocessing.py s3://<bucket-name>/mnist_kmeans_example/processing_code/kmeans_preprocessing.py
```

Compile and deploy your pipeline

After defining the pipeline in AWS SDK for Python (Boto3), you must compile the pipeline to an intermediate representation before you can submit it to the Kubeflow Pipelines service. The intermediate representation is a workflow specification in the form of a YAML file compressed into a tar.gz file. You need the KFP SDK to compile your pipeline.
Install KFP SDK

Run the following from the command line of your gateway node:

1. Install the KFP SDK following the instructions in the Kubeflow pipelines documentation.
2. Verify that the KFP SDK is installed with the following command:
   ```
   pip show kfp
   ```
3. Verify that `dsl-compile` has been installed correctly as follows:
   ```
   which dsl-compile
   ```

Compile your pipeline

You have three options to interact with Kubeflow Pipelines: KFP UI, KFP CLI, or the KFP SDK. The following sections illustrate the workflow using the KFP UI and CLI.

Complete the following from your gateway node to compile your pipeline.

1. Modify your AWS SDK for Python (Boto3) file with your Amazon S3 bucket name and IAM role ARN.
2. Use the `dsl-compile` command from the command line to compile your pipeline as follows. Replace `<path-to-python-file>` with the path to your pipeline and `<path-to-output>` with the location where you want your tar.gz file to be.
   ```
   dsl-compile --py <path-to-python-file> --output <path-to-output>
   ```

Upload and run the pipeline using the KFP CLI

Complete the following steps from the command line of your gateway node. KFP organizes runs of your pipeline as experiments. You have the option to specify an experiment name. If you do not specify one, the run will be listed under Default experiment.

1. Upload your pipeline as follows:
   ```
   kfp pipeline upload --pipeline-name <pipeline-name> <path-to-output-tar.gz>
   ```
   Your output should look like the following. Take note of the ID.

   Pipeline 29c3ff21-49f5-4dfe-94f6-618c0e2420fe has been submitted
   Pipeline Details
   ------------------
   ID 29c3ff21-49f5-4dfe-94f6-618c0e2420fe
   Name sm-pipeline
   Description
   Uploaded at 2020-04-30T20:22:39+00:00
   ...
   ...

2. Create a run using the following command. The KFP CLI run command currently does not support specifying input parameters while creating the run. You need to update your parameters in the AWS SDK for Python (Boto3) pipeline file before compiling. Replace `<experiment-name>` and `<job-name>` with any names. Replace `<pipeline-id>` with the ID of your submitted pipeline. Replace `<your-role-arn>` with the ARN of kfp-example-pod-role. Replace `<your-bucket-name>` with the name of the Amazon S3 bucket you created.
kfp run submit --experiment-name <experiment-name> --run-name <job-name> --pipeline-id <pipeline-id> role_arn="<your-role-arn>" bucket_name="<your-bucket-name>"

You can also directly submit a run using the compiled pipeline package created as the output of the dsl-compile command.

kfp run submit --experiment-name <experiment-name> --run-name <job-name> --package-file <path-to-output> role_arn="<your-role-arn>" bucket_name="<your-bucket-name>"

Your output should look like the following:

Creating experiment aws.
Run 95084a2c-f18d-4b77-a9da-eba00bf01e63 is submitted

+--------------------------------------+--------+----------+---------------------------
| run id    | name   | status   | created at               |
+======================================+========+==========+===========================
| 95084a2c-f18d-4b77-a9da-eba00bf01e63 | sm-job |          | 2020-04-30T20:36:41+00:00 |
+--------------------------------------+--------+----------+---------------------------

3. Navigate to the UI to check the progress of the job.

Upload and run the pipeline using the KFP UI

1. On the left panel, choose the Pipelines tab.
2. In the upper-right corner, choose +UploadPipeline.
3. Enter the pipeline name and description.
4. Choose Upload a file and enter the path to the tar.gz file you created using the CLI or with the AWS SDK for Python (Boto3) SDK.
5. On the left panel, choose the Pipelines tab.
6. Find the pipeline you created.
7. Choose +CreateRun.
8. Enter your input parameters.

Run predictions

Once your classification pipeline is deployed, you can run classification predictions against the endpoint that was created by the Deploy component. Use the KFP UI to check the output artifacts for sagemaker-deploy-model-endpoint_name. Download the .tgz file to extract the endpoint name or check the SageMaker console in the region you used.

Configure permissions to run predictions

If you want to run predictions from your gateway node, skip this section.

1. To use any other machine to run predictions, assign the sagemaker:InvokeEndpoint permission to the IAM role or IAM user used by the client machine. This permission is used to run predictions.
2. On your gateway node, run the following to create a policy file:
cat <<EoF > ./sagemaker-invoke.json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "sagemaker:InvokeEndpoint"
         ],
         "Resource": "*"
      }
   ]
}
EoF

3. Attach the policy to the client node's IAM role or IAM user.

4. If your client machine has an IAM role attached, run the following. Replace <your-instance-IAM-role> with the name of the client node's IAM role. Replace <path-to-sagemaker-invoke-json> with the path to the policy file you created.

   aws iam put-role-policy --role-name <your-instance-IAM-role> --policy-name sagemaker-invoke-for-worker --policy-document file://<path-to-sagemaker-invoke-json>

5. If your client machine has IAM user credentials configured, run the following. Replace <your_IAM_user_name> with the name of the client node's IAM user. Replace <path-to-sagemaker-invoke-json> with the path to the policy file you created.

   aws iam put-user-policy --user-name <your-IAM-user-name> --policy-name sagemaker-invoke-for-worker --policy-document file://<path-to-sagemaker-invoke-json>

Run predictions

1. Create a AWS SDK for Python (Boto3) file from your client machine named mnist-predictions.py with the following content. Replace the ENDPOINT_NAME variable. This script loads the MNIST dataset, then creates a CSV from those digits and sends it to the endpoint for prediction. It then outputs the results.

```
import boto3
import gzip
import io
import json
import numpy
import pickle

ENDPOINT_NAME='<endpoint-name>
region = boto3.Session().region_name

# S3 bucket where the original mnist data is downloaded and stored
downloaded_data_bucket = f"jumpstart-cache-prod-{region}"
downloaded_data_prefix = "lp-notebooks-datasets/mnist"

# Download the dataset
s3 = boto3.client("s3")
s3.download_file(downloaded_data_bucket, f"{downloaded_data_prefix}/mnist.pkl.gz", "mnist.pkl.gz")

# Load the dataset
with gzip.open('mnist.pkl.gz', 'rb') as f:
    train_set, valid_set, test_set = pickle.load(f, encoding='latin1')
```
# Simple function to create a csv from our numpy array

def np2csv(arr):
    csv = io.BytesIO()
    numpy.savetxt(csv, arr, delimiter=',', fmt='%g')
    return csv.getvalue().decode().rstrip()

runtime = boto3.Session(region).client('sagemaker-runtime')
payload = np2csv(train_set[0][30:31])
response = runtime.invoke_endpoint(EndpointName=ENDPOINT_NAME,
                                      ContentType='text/csv',
                                      Body=payload)
result = json.loads(response['Body'].read().decode())
print(result)

2. Run the AWS SDK for Python (Boto3) file as follows:

   python mnist-predictions.py

View results and logs

When the pipeline is running, you can choose any component to check execution details, such as inputs and outputs. This lists the names of created resources.

If the KFP request is successfully processed and an SageMaker job is created, the component logs in the KFP UI provide a link to the job created in SageMaker. The CloudWatch logs are also provided if the job is successfully created.

If you run too many pipeline jobs on the same cluster, you may see an error message that indicates you do not have enough pods available. To fix this, log in to your gateway node and delete the pods created by the pipelines you are not using as follows:

   kubectl get pods -n kubeflow
   kubectl delete pods -n kubeflow <name-of-pipeline-pod>

Cleanup

When you’re finished with your pipeline, you need to clean up your resources.

1. From the KFP dashboard, terminate your pipeline runs if they do not exit properly by choosing Terminate.
2. If the Terminate option doesn’t work, log in to your gateway node and manually terminate all the pods created by your pipeline run as follows:

   kubectl get pods -n kubeflow
   kubectl delete pods -n kubeflow <name-of-pipeline-pod>

3. Using your AWS account, log in to the SageMaker service. Manually stop all training, batch transform, and HPO jobs. Delete models, data buckets, and endpoints to avoid incurring any additional costs. Terminating the pipeline runs does not stop the jobs in SageMaker.

Notebook-based Workflows

You can use Amazon SageMaker Studio fully-managed notebooks to interactively build, train, and deploy machine learning models. However, there are various scenarios in which you might want to run your
notebook as a non-interactive, scheduled job. For example, you might want to create regular audit reports that analyze all training jobs run over a certain time frame and analyze the business value of deploying those models into production. Or you might want to scale up a feature engineering job after testing the data transformation logic on a small subset of data. Other common use cases include:

- Scheduling jobs for model drift monitoring
- Exploring the parameter space for better models

Studio provides fast and simple tools built from the existing Amazon EventBridge, SageMaker Training and SageMaker Pipelines services to help you schedule your notebook jobs interactively. You don’t have to craft your own custom solution or enlist features from other services that may require additional overhead in time and costs to deploy.

The Studio notebook scheduling feature initiates a non-interactive job for you based on any schedule you choose. You can launch a job on demand or according to a fixed schedule. You can also run multiple notebooks in parallel, and parameterize cells in your notebooks to customize the input parameters to your notebook.

**Prerequisites**

To schedule a notebook job, make sure you meet the following criteria:

- Ensure your Jupyter notebook and any initialization or startup scripts are self-contained with respect to code and software packages. Otherwise, your non-interactive job may incur errors.
- Review Constraints and considerations (p. 3494) to make sure you properly configured your Jupyter notebook, network settings, and container settings.
- Ensure your notebook can access needed external resources, such as Amazon EMR clusters.
- If you connect to an Amazon EMR cluster in your notebook and want to parameterize your Amazon EMR connection command, you must apply a workaround using environment variables to pass parameters. For details, see Connect to an Amazon EMR cluster (p. 3490).
- If you connect to an Amazon EMR cluster using Kerberos, LDAP, or HTTP Basic Auth authentication, you must use the AWS Secrets Manager to pass your security credentials to your Amazon EMR connection command. For details, see Connect to an Amazon EMR cluster (p. 3490).
- (Optional) If you want the UI to preload a script to run upon notebook startup, your admin must install it with a Lifecycle Configuration (LCC). For information about how to use a LCC script, see Customize a Notebook Instance Using a Lifecycle Configuration Script.

**Install policies and permissions**

Before you schedule your first notebook run, make sure that you install the proper policies and permissions. The following instructions show you how to configure the following permissions:

- Job execution role trust relationships
- Additional IAM permissions attached to the job execution role
- (optional) The AWS KMS permission policy to use a custom KMS key

**To modify the trust relationships**

1. Open the IAM console.
2. Select Roles in the left panel.
3. Find the job execution role for your notebook job and choose the role name.
4. Choose the **Trust relationships** tab.
5. Choose **Edit trust policy**.
6. Copy and paste the following policy:

   ```json
   {
     "Version": "2012-10-17",
     "Statement": [
       {
         "Effect": "Allow",
         "Principal": {
           "Service": "sagemaker.amazonaws.com"
         },
         "Action": "sts:AssumeRole"
       },
       {
         "Effect": "Allow",
         "Principal": {
           "Service": "events.amazonaws.com"
         },
         "Action": "sts:AssumeRole"
       }
     ]
   }
   ```

7. Choose **Update Policy**.

**Add additional IAM permissions**

The following JSON snippet is an example policy that you should add to the Studio execution and notebook job roles if you don't use the Studio execution role as the notebook job role. Review and modify this policy if you need to further restrict privileges.

```json
{
  "Version":"2012-10-17",
  "Statement":[
    {
      "Effect":"Allow",
      "Action":["iam:PassRole",
                 "events:TagResource",
                 "events:DeleteRule",
                 "events:PutTargets",
                 "events:DescribeRule",
                 "events:PutRule",
                 "events:RemoveTargets",
                 "events:DisableRule",
                 "events:EnableRule"
               ],
      "Resource": "*",
      "Condition":{
        "StringLike":{
          "iam:PassedToService":[
            "sagemaker.amazonaws.com",
            "events.amazonaws.com"
          ]
        }
      }
    },
    {
      "Effect":"Allow",
      "Action": ["events:TagResource",
                 "events:DeleteRule",
                 "events:PutTargets",
                 "events:DescribeRule",
                 "events:PutRule",
                 "events:RemoveTargets",
                 "events:DisableRule",
                 "events:EnableRule"
               ],
      "Resource": "*",
      "Condition":{
        "StringLike":{
          "iam:PassedToService":[
            "sagemaker.amazonaws.com",
            "events.amazonaws.com"
          ]
        }
      }
    }
  ]
}
```
"StringEquals": {
   "aws:ResourceTag/sagemaker:is-scheduling-notebook-job": "true"
}
},

"Effect": "Allow",

Create and manage your scheduled notebook jobs

The SageMaker Studio notebook scheduling feature gives you the tools to create and manage your non-interactive notebook jobs. You can create jobs, view the jobs you created, and pause, stop, or resume existing jobs. You can also modify notebook schedules.

When you create your scheduled notebook job, Studio automatically populates the form with default options to help you get started quickly. For example, Studio generates resources such as Amazon S3 buckets needed to schedule your notebook job if you don’t specify your own. Studio also infers details related to your infrastructure, such as your kernel, image, role ARN, and security groups. At a minimum, you can submit an on-demand job without setting any options or a (scheduled) notebook job definition supplying just the time-specific schedule information. However, you can customize other fields if your scheduled job requires specialized settings. For details about how to schedule a notebook job, see Schedule a notebook job (p. 3487).

The scheduled notebook dashboards help organize the job definitions that you schedule, and also keep track of the actual jobs that run from your job definitions. There are two important concepts to understand when scheduling notebook jobs: job definitions and job runs. Job definitions are schedules you set to run specific notebooks. For example, you can create a job definition that runs notebook

AWS KMS permission policy (optional)

By default, Studio encrypts the input and output Amazon S3 buckets using server side encryption, but you can specify a custom KMS key to encrypt your data in the output S3 bucket and the storage volume attached to the notebook job.

If you want to use a custom KMS key, attach the following policy and supply your own KMS key ARN.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:Encrypt",
        "kms:Decrypt",
        "kms:ReEncrypt*",
        "kms:GenerateDataKey*",
        "kms:DescribeKey",
        "kms:CreateGrant"
      ],
      "Resource": "your_KMS_key_AR
```
XYZ.ipynb every Wednesday. This job definition launches the actual job runs which occur this coming Wednesday, next Wednesday, the Wednesday after that, and so on.

The Studio interface provides two main tabs that help you track your existing job definitions and job runs:

- **Notebook Jobs** tab: This tab displays a list of all your job runs from your on-demand jobs and job definitions. From this tab, you can directly access the details for a single job run. For example, you can view a single job run that occurred two Wednesdays ago.

- **Notebook Job Definitions** tab: This tab displays a list of all your job definitions. From this tab, you can directly access the details for a single job definition. For example, you can view the schedule you created to run XYZ.ipynb every Wednesday.

For details about the **Notebook Jobs** tab, see View notebook jobs (p. 3492).

For details about the **Notebook Job Definitions** tab, see View notebook job definitions (p. 3493).

**Schedule a notebook job**

**Note**

The notebook scheduler is built from the Amazon EventBridge, SageMaker Training, and SageMaker Pipelines services. If your notebook jobs fail, you might see errors related to these services.

To schedule a notebook job, complete the following steps.

1. Open the **Create Job** form in one of two ways:
   - **Using the File Browser**
     1. In the **File Browser** in the left panel, right-click on the notebook you want to run as a scheduled job.
     2. Choose **Create Notebook Job**.
   - **Within the Studio notebook**
     - Inside the Studio notebook you want to run as a scheduled job, choose the **Create Notebook Job** icon in the Studio toolbar.

2. Complete the pop-up form. The form displays the following fields:
   - **Job name**: A descriptive name you specify for your job.
   - **Input file**: The name of the notebook which you are scheduling to run in non-interactive mode.
   - **Compute type**: The type of Amazon EC2 instance in which you want to run your notebook.
   - **Parameters**: Custom parameters you can optionally specify as inputs to your notebook. To use this feature, you must tag a specific cell in your Jupyter notebook with the **parameters** tag, or else your parameters may not have correct values in the notebook. For more details, see Parameterize your notebook (p. 3491).
   - **Additional Options**: For details about additional customizations you can apply, see Additional options (p. 3488).

3. Schedule your job. You can run your notebook on demand or on a fixed schedule.
   - To run the notebook on demand, complete the following steps:
     - Select **Run Now**.
     - Choose **Create**.
   - The **Notebook Jobs** tab appears. Choose **Reload** to load your job into the dashboard.
   - To run the notebook on a fixed schedule, complete the following steps:
     - Choose **Run on a schedule**.
- Choose the **Interval** dropdown list and select an interval. The intervals range from every minute to monthly. You can also select **Custom schedule**.

  - Based on the interval you choose, additional fields appear to help you further specify your desired run day and time. For example, if you select **Day** for a daily run, an additional field appears for you to specify the desired time. Note that any time you specify is in UTC format. Note also that if you choose a small interval, such as one minute, your jobs overlap if the previous job is not complete when the next job starts.

  If you select a custom schedule, you use cron syntax in the expression box to specify your exact run date and time. The cron syntax is a space-separated list of digits, each of which represent a unit of time from seconds to years. For help with cron syntax, you can choose **Get help with cron syntax** under the expression box.

- Choose **Create**.

- The **Notebook Job Definitions** tab appears. Choose **Reload** to load your job definition into the dashboard.

### Additional options

Studio tries to infer details about your job's infrastructure settings so you can launch your jobs quickly without worrying about the backend details. However, if your job requires further customization, you can override the Studio provided defaults in the **Create Job** form.

If you choose the **Additional options** dropdown list in the **Create Job** form, you can customize the following options:

<table>
<thead>
<tr>
<th>Custom option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Image</strong></td>
<td>The kernel image used to run the notebook job. Studio attempts to infer this field from your notebook's current image. If Studio cannot infer this value, the form displays a validation error requiring you to specify it. For a list of images supported by the notebook scheduler, see [Available Amazon SageMaker Images](p. 153).</td>
</tr>
<tr>
<td><strong>Kernel</strong></td>
<td>The Jupyter kernel used to run the notebook job. Studio infers this field from your notebook's current kernel. If Studio cannot infer this value, the form displays a validation error requiring you to specify it.</td>
</tr>
<tr>
<td><strong>Role ARN</strong></td>
<td>The role's Amazon Resource Name (ARN). This role is used with the notebook job and defaults to the Studio execution role.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td></td>
<td>If Studio cannot infer this value, the <strong>Role ARN</strong> field will be blank. In this case, insert the ARN you want to use.</td>
</tr>
<tr>
<td><strong>Input folder</strong></td>
<td>The folder containing your inputs. If you don't specify a folder, Studio creates a default Amazon S3 bucket for your inputs. Studio puts the job inputs, including the input notebook and any optional start-up or initialization scripts, in this folder.</td>
</tr>
<tr>
<td><strong>Output folder</strong></td>
<td>The folder containing your outputs. If you don't specify a folder, Studio creates a default Amazon S3 bucket for your outputs.</td>
</tr>
<tr>
<td><strong>Environment variables</strong></td>
<td>Any existing environment variables that you want to override, or new environment variables that you want to introduce and use in your notebook.</td>
</tr>
<tr>
<td>Custom option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Start-up script</strong></td>
<td>A script preloaded in the notebook startup menu that you can choose to run before you run the notebook. Your admin must set this up with a Lifecycle Configuration (LCC) script.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>A start-up script runs in a shell outside of the Studio environment. Therefore, this script cannot depend on the Studio local storage, environment variables, or app metadata (in /opt/ml/metadata). Also, if you use a start-up script and an initialization script, the start-up script runs first.</td>
</tr>
<tr>
<td><strong>Initialization script</strong></td>
<td>An alternative to using an LCC script. This is a path to a local script you can run when your notebook starts up. If you don't provide an absolute path, Studio assumes your path is relative to /home/sagemaker-user.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>An initialization script is sourced from the same shell as the notebook job so the script can access the Studio local storage, environment variables, and app metadata (in /opt/ml/metadata). This is not the case for a start-up script described previously. Also, if you use a start-up script and an initialization script, the start-up script runs first.</td>
</tr>
<tr>
<td><strong>Configure job encryption</strong></td>
<td>Check this box if you want to encrypt your notebook job outputs, job instance volume, or both. This option is not selected by default. If left unchecked, Studio encrypts the job outputs with the account's default KMS key and does not encrypt the job instance volume.</td>
</tr>
<tr>
<td><strong>Output encryption KMS key</strong></td>
<td>If you checked Configure job encryption, insert a KMS key if you want to customize the encryption key used for your notebook job outputs. If you do not specify this field, Studio encrypts the notebook job outputs with SSE-KMS using the default Amazon S3 KMS key. Also, if you create the S3 bucket yourself and use encryption, Studio respects whatever encryption type you use.</td>
</tr>
<tr>
<td><strong>Job instance volume encryption KMS key</strong></td>
<td>If you checked Configure job encryption, insert a KMS key if you want to encrypt your job instance volume.</td>
</tr>
</tbody>
</table>

If Studio detects that you configured a Virtual Private Cloud (VPC), you can also customize the following options:

<table>
<thead>
<tr>
<th>Custom option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use a Virtual Private Cloud to run this job</strong></td>
<td>Check this box if you want to use a VPC. If you choose to use a VPC, you need to specify at least one private subnet and at least one security group in the following options. If you don't use any private subnets, you need to consider other configuration options. For details, see Public VPC subnets not supported in Constraints and considerations (p. 3494).</td>
</tr>
<tr>
<td><strong>Subnet(s)</strong></td>
<td>Your subnets. This defaults to the subnets associated with the Studio domain. This field must contain at least one and at most five, and all the subnets you provide should be private. For</td>
</tr>
</tbody>
</table>
Create and manage your scheduled notebook jobs

<table>
<thead>
<tr>
<th>Custom option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>details, see Public VPC subnets not supported in Constraints and considerations (p. 3494).</td>
</tr>
<tr>
<td>Security group(s)</td>
<td>Your security groups. This field must contain at least one and at most 15. For details, see Public VPC subnets not supported in Constraints and considerations (p. 3494).</td>
</tr>
</tbody>
</table>

Connect to an Amazon EMR cluster

If you connect to an Amazon EMR cluster in your Jupyter notebook, you might need to perform additional setup. In particular, the following discussion addresses two issues:

- **Passing parameters into your Amazon EMR connection command.** In SparkMagic kernels, parameters you pass to your Amazon EMR connection command may not work as expected due to differences in how Papermill passes parameters and how SparkMagic receives parameters. The workaround to address this limitation is to pass parameters as environment variables. For more details about the issue and workaround, see Pass parameters to your EMR connection command (p. 3490).

- **Passing user credentials to Kerberos, LDAP, or HTTP Basic Auth-authenticated Amazon EMR clusters.** In interactive mode, Studio asks for credentials in a popup form where you can enter your username and password. In your non-interactive scheduled notebook, you have to pass them through the AWS Secrets Manager. For more details about how to use the AWS Secrets Manager in your scheduled notebook jobs, see Pass user credentials to your Kerberos, LDAP, or HTTP Basic Auth-authenticated Amazon EMR cluster (p. 3490).

**Pass parameters to your EMR connection command**

If you are using images with the SparkMagic PySpark and Spark kernels and want to parameterize your EMR connection command, provide your parameters in the Environment variables field instead of the Parameters field in the Create Job form (in the Additional Options dropdown menu). You also have to make sure your EMR connection command in the Jupyter notebook passes these parameters as environment variables. For example, suppose you pass `cluster-id` as an environment variable when you create your job. Your EMR connection command should look like the following:

```python
%%local
import os
%sanalytics emr connect --cluster-id {os.getenv('cluster_id')} --auth-type None
```

You need this workaround to meet requirements by SparkMagic and Papermill. For background context, the SparkMagic kernel expects that the `%%local` magic command accompany any local variables you define. However, Papermill does not pass the `%%local` magic command with your overrides. In order to work around this Papermill limitation, you must supply your parameters as environment variables in the Environment variables field.

**Pass user credentials to your Kerberos, LDAP, or HTTP Basic Auth-authenticated Amazon EMR cluster**

To establish a secure connection to an Amazon EMR cluster that uses Kerberos, LDAP, or HTTP Basic Auth authentication, you use the AWS Secrets Manager to pass user credentials to your connection command. For information about how to create a Secrets Manager secret, see Create an AWS Secrets Manager secret. You pass the secret with the `--secrets` argument, as shown in the following example:

```bash
%sanalytics emr connect --cluster-id j_abcde12345
```
Your administrator can set up a flexible access policy using an attribute-based-access-control (ABAC) method, which assigns access based on special tags. You can set up flexible access to create a single secret for all users in the account or a secret for each user. The following code samples demonstrate these scenarios:

### Create a single secret for all users in the account

```json
{
  "Version": "2012-10-17",
  "Statement": [{
    "Effect": "Allow",
    "Principal": {
      "AWS": "arn:aws:iam::AWS_ACCOUNT_ID:role/service-role/AmazonSageMaker-ExecutionRole-20190101T012345"},
    "Action": "secretsmanager:GetSecretValue",
                   "arn:aws:secretsmanager:us-west-2:AWS_ACCOUNT_ID:secret:aes789-7g8h9i" ]
  }]
}
```

### Create a different secret for each user

You can create a different secret for each user using the PrincipleTag tag, as shown in the following example:

```json
{
  "Version": "2012-10-17",
  "Statement": [{
    "Effect": "Allow",
    "Principal": {
      "AWS": "arn:aws:iam::AWS_ACCOUNT_ID:role/service-role/AmazonSageMaker-ExecutionRole-20190101T012345"},
    "Condition": {
      "StringEquals": {
        "aws:ResourceTag/user-identity": "${aws:PrincipalTag/user-identity}"}
    },
    "Action": "secretsmanager:GetSecretValue",
                   "arn:aws:secretsmanager:us-west-2:AWS_ACCOUNT_ID:secret:aes789-7g8h9i" ]
  }]
}
```

### Parameterize your notebook

To pass new parameters or parameter overrides to your scheduled notebook job, you must make some modifications to your notebook. When you pass a parameter, Studio uses the methodology enforced by Papermill. Studio searches for a Jupyter cell tagged with the parameters tag and applies the
new parameters or parameter overrides immediately after this cell. If you don't have any cells tagged with `parameters`, Studio applies the parameters at the beginning of the notebook. If you have more than one cell tagged with `parameters`, Studio applies the parameters after the first cell tagged with `parameters`.

To tag a cell in your notebook with the `parameters` tag, complete the following steps:

1. Select the cell to parameterize.
2. Choose the **Property Inspector** icon (🛠️) in the right sidebar.
3. Type `parameters` in the Add Tag box.
4. Choose the + sign.
5. The `parameters` tag appears under **Cell Tags** with a check mark, which means the tag is applied to the cell.

**View notebook jobs**

The Notebook Jobs tab shows a history of your on-demand jobs and all the jobs that run from the job definitions you created. This tab opens after you create an on-demand job, or you can just view this tab yourself to see a history of past and current jobs. If you select the **Job name** for any job, you can view details for a single job in its Job Detail page. For more information about the Job Detail page, see the following section View a single job (p. 3492).

The Notebook Jobs tab includes the following information for each job:

- **Output files**: Displays the availability of output files. This column can contain one of the following:
  - A download icon (ダウンロード): The output notebook and log are available for download; choose this button to download them. Note that a failed job can still generate output files if the failure occurred after the files were created. In this case, it is helpful to view the output notebook to identify the failure point.
  - Links to the Notebook and Output log: The notebook and output log are downloaded. Choose the links to view their contents.
  - (blank): The job was stopped by the user, or a failure occurred in the job run before it could generate output files. For example, network failures could prevent the job from starting.

  The output notebook is the result of running all cells in the notebook, and also incorporates any new or overriding parameters or environment variables you included. The output log captures the details of the job run to help you troubleshoot failed jobs.

- **Created at**: The time the on-demand job or scheduled job was created.
- **Status**: The current status of the job, which is one of the following values:
  - In progress: The job is running
  - Failed: The job failed from configuration or notebook logic errors
  - Stopped: The job was stopped by the user
  - Completed: The job completed
- **Actions**: This column provides shortcuts to help you stop or remove any job directly in the interface.

**View a single job**

From the Notebook Jobs tab, you can select a job name to view the Job Detail page for a specific job. The Job Detail page includes all the details you provided in the Create Job form. Use this page to confirm the settings you specified when you created the job definition.

In addition, you can access shortcuts to help you perform the following actions in the page itself:
• **Delete Job**: Remove the job from the Notebook Jobs tab.
• **Stop Job**: Stop your running job.

**View notebook job definitions**

When you create a job definition, you create a schedule for a job. The Notebook Job Definitions tab lists these schedules. For example, you might create a job definition that runs a specific notebook every minute. Once this job definition is active, you see a new job every minute in the Notebook Jobs tab.

The Notebook Job Definitions tab displays a dashboard with all your job definitions and includes the input notebook, the creation time, the schedule, and the status for each job definition. The value in the Status column is one of the following values:

- **Paused**: You paused the job definition. Studio does not initiate any jobs until you resume the definition.
- **Active**: The schedule is on and Studio can run the notebook according to the schedule you specified.

In addition, the Actions column provides shortcuts to help you perform the following tasks directly in the interface:

- **Pause**: Pauses the job definition. Studio won’t create any jobs until you resume the definition.
- **Delete**: Removes the job definition from the Notebook Job Definitions tab.
- **Resume**: Continues a paused job definition so that it can start jobs.

If you created a job definition but it doesn’t initiate jobs, see Job definition doesn’t create jobs (p. 3494) in the Troubleshooting guide (p. 3493).

**View a single job definition**

If you select a job definition name in the Notebook Job Definitions tab, you see the Job Definition page where you can view specific details for a job definition. Use this page to confirm the settings you specified when you created the job definition. If you don’t see any jobs created from your job definition, see Job definition doesn’t create jobs (p. 3494) in the Troubleshooting guide (p. 3493).

This page also contains a section listing the jobs that run from this job definition. Viewing your jobs in the Job Definition page may be a more productive way to help you organize your jobs instead of viewing jobs in the Notebook Jobs tab, which combines all jobs from all your job definitions.

In addition, this page provides shortcuts for the following actions:

- **Pause/Resume**: Pause your job definition, or resume a paused definition. Note that if a job is currently running for this definition, Studio does not stop it.
- **Run**: Run a single on-demand job from this job definition. This option also lets you specify different input parameters to your notebook before starting the job.
- **Edit Job Definition**: Change the schedule of your job definition. You can select a different time interval, or you can opt for a custom schedule using cron syntax.
- **Delete Job Definition**: Remove the job definition from the Notebook Job Definitions tab. Note that if a job is currently running for this definition, Studio does not stop it.

**Troubleshooting guide**

Refer to this troubleshooting guide to help you debug failures you might experience when your scheduled notebook job runs.
Job definition doesn’t create jobs

If your job definition doesn’t initiate any jobs, see the following possible causes:

**Missing permissions**

- The role assigned to the job definition does not have a trust relationship with Amazon EventBridge. That is, EventBridge cannot assume the role.
- The role assigned to the job definition does not have permission to call SageMaker:StartPipelineExecution.
- The role assigned to the job definition does not have permission to call SageMaker:CreateTrainingJob.

**EventBridge quota exceeded**

If you see a Put* error such as the following example, you exceeded an EventBridge quota. To resolve this, you can clean up unused EventBridge runs, or ask AWS Support to increase your quota.

```
LimitExceededException) when calling the PutRule operation:
The requested resource exceeds the maximum number allowed
```

For more information about EventBridge quotas, see Amazon EventBridge quotas.

**Pipeline quota limit exceeded**

If you see an error such as the following example, you exceeded the number of pipelines that you can run. To resolve this, you can clean up unused pipelines in your account, or ask AWS Support to increase your quota.

```
ResourceLimitExceeded: The account-level service limit 'Maximum number of pipelines allowed per account' is XXX Pipelines, with current utilization of XXX Pipelines and a request delta of 1 Pipelines.
```

For more information about pipeline quotas, see Amazon SageMaker endpoints and quotas.

**Training job limit exceeded**

If you see an error such as the following example, you exceeded the number of training jobs that you can run. To resolve this, reduce the number of training jobs in your account, or ask AWS Support to increase your quota.

```
ResourceLimitExceeded: The account-level service limit 'ml.m5.2xlarge for training job usage' is 0 Instances, with current utilization of 0 Instances and a request delta of 1 Instances. Please contact AWS support to request an increase for this limit.
```

For more information about training job quotas, see Amazon SageMaker endpoints and quotas.

**Constraints and considerations**

Review the following constraints to ensure your notebook jobs complete successfully. Studio uses Papermill to run notebooks. You might need to update Jupyter notebooks to align to Papermill’s requirements. There are also restrictions on the content of LCC scripts and important details to understand regarding VPC configuration.

**JupyterLab version support**. JupyterLab versions 3.0 and above are supported.
**Using `pip install` with packages that require kernel restart.** Papermill does not support calling `pip install` to install packages that require a kernel restart. In this situation, use `pip install` in an initialization script. For a package installation that does not require kernel restart, you can still include `pip install` in the notebook.

**Papermill assumes specific kernel and language names registered with Jupyter.** Papermill registers a translator for specific kernels and languages. If you bring your own instance (BYOI), use a standard kernel name as shown in the following snippet:

```python
papermill_translators.register("python", PythonTranslator)
papermill_translators.register("R", RTranslator)
papermill_translators.register("scala", ScalaTranslator)
papermill_translators.register("julia", JuliaTranslator)
papermill_translators.register("matlab", MatlabTranslator)
papermill_translators.register(".net-csharp", CSharpTranslator)
papermill_translators.register(".net-fsharp", FSharpTranslator)
papermill_translators.register(".net-powershell", PowershellTranslator)
papermill_translators.register("pysparkkernel", PythonTranslator)
papermill_translators.register("sparkkernel", ScalaTranslator)
papermill_translators.register("sparkrkernel", RTranslator)
papermill_translators.register("bash", BashTranslator)
```

**Parameters and environment variable limits.** When you create your notebook job, it receives the parameters and environment variables you specify. You can pass up to 100 parameters. Each parameter name can be up to 256 characters long, and the associated value can be up to 2500 characters long. If you pass environment variables, you can pass up to 28 variables. The variable name and associated value can be up to 512 characters long. If you need more than 28 environment variables, use additional environment variables in an initialization script which has no limit on the number of environment variables you can use.

**Image and kernel support.** The driver that launches your notebook job assumes the following:

- A base Python runtime environment is installed in the Studio or bring-your-own (BYO) images and is the default in the shell.
- The base Python runtime environment includes the Jupyter client with kernelspecs properly configured.
- The base Python runtime environment includes the `pip` function so the notebook job can install system dependencies.
- For images with multiple environments, your initialization script should switch to the proper kernel-specific environment before installing notebook-specific packages. You should switch back to the default Python runtime environment, if different from the kernel runtime environment, after configuring the kernel Python runtime environment.

The driver that launches your notebook job is a bash script, and Bash v4 must be available at `/bin/bash`.

**Root privileges on bring-your-own-images (BYOI).** You must have root privileges on your own Studio images, either as the root user or through `sudo` access. If you are not a root user but accessing root privileges through `sudo`, use `1000/100` as the UID/GID.

**Only private VPC subnets used during job creation.** If you use a VPC, Studio uses your private subnets to create your job. Specify one to five private subnets (and 1–15 security groups).

If you use a VPC with private subnets, you must choose one of the following options to ensure the notebook job can connect to dependent services or resources:

- If the job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to the service. For a list of services that support interface endpoints, see [AWS services that support VPC interfaces](https://aws.amazon.com/vpc/).
integrate with AWS PrivateLink. For information about creating an interface VPC endpoint, see Access an AWS service using an interface VPC endpoint. At minimum, an Amazon S3 VPC endpoint gateway must be provided.

- If a notebook job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see VPC with public and private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

**Service limits.** Since the notebook job scheduler is built from SageMaker Pipelines, SageMaker Training, and Amazon EventBridge services, your notebook jobs are subject to their service-specific quotas. If you exceed these quotas, you may see error messages related to these services. For example, there are limits for how many pipelines you can run at one time, and how many rules you can set up for a single event bus. For more information about SageMaker quotas, see Amazon SageMaker Endpoints and Quotas. For more information about EventBridge quotas, see Amazon EventBridge Quotas.

### Pricing for scheduled notebook jobs

When you schedule SageMaker Studio notebook jobs, your Jupyter notebooks run on SageMaker training instances. After you select an Image and Kernel in your Create Job form, the form provides a list of available compute types. You are charged for the compute type you choose, based on the combined duration of use for all notebook jobs that run from the job definition. If you don't specify a compute type, then Studio assigns you a default Amazon EC2 instance type of ml.m5.large. For a breakdown of SageMaker Studio pricing by compute type, see Amazon SageMaker Pricing.

## Amazon SageMaker Workflows FAQ

Use the following FAQ items to find answers to commonly asked questions about MLOps workflows.

**Q. Do I need to use the SageMaker Python SDK to create a SageMaker pipeline?**

No, the SageMaker Python SDK is not required to create a SageMaker pipeline. You can also use boto3 or AWS CloudFormation. Creating a pipeline requires a pipeline definition, which is a JSON object that defines each step of the pipeline. The SageMaker SDK offers a simple way to construct the pipeline definition, which you can use with any of the APIs previously mentioned to create the pipeline itself. Without using the SDK, users have to write the raw JSON definition to create the pipeline without any of the error checks provided by the SageMaker Python SDK. To see the schema for the pipeline JSON definition, see SageMaker Pipeline Definition JSON Schema. The following code sample shows an example of a SageMaker pipeline definition JSON object:

```json
{ 'Version': '2020-12-01',
  'Metadata': {},
  'Parameters': [{ 'Name': 'ProcessingInstanceType', 'Type': 'String', 'DefaultValue': 'ml.m5.xlarge' },
      { 'Name': 'ProcessingInstanceCount', 'Type': 'Integer', 'DefaultValue': 1 },
      { 'Name': 'TrainingInstanceType', 'Type': 'String', 'DefaultValue': 'ml.m5.xlarge' },
      { 'Name': 'ModelApprovalStatus', 'Type': 'String', 'DefaultValue': 'PendingManualApproval' },
      { 'Name': 'ProcessedData', 'Type': 'String' }],
  'Timeout': 300,
}
```
Q. Why do I see a repack step in my SageMaker pipeline?

Model repacking happens when the pipeline needs to include a custom script in the compressed model file (model.tar.gz) to be uploaded to Amazon S3 and used to deploy a model to a SageMaker endpoint. When SageMaker pipeline trains a model and registers it to the model registry, it introduces a repack step if the trained model output from the training job needs to include a custom inference script. The repack step uncompresses the model, adds a new script, and recompresses the model. Running the pipeline adds the repack step as a training job.

Q. Can I use SageMaker Experiments with SageMaker Pipelines?

Yes. SageMaker Pipelines is natively integrated with SageMaker Experiments. You can use PipelineExperimentConfig when creating a pipeline and set your own SageMaker Experiment name. Each run of the pipeline creates a trial, and each step in the pipeline corresponds to a TrialComponent within the trial. If no trial name is specified in the experiment config, the pipeline execution ID is used as the trial name.

Q. SageMaker Project templates have a model deploy repository that uses CloudFormation (CFN) to create an endpoint. Are there ways to deploy the model without using CloudFormation?

You can customize the deploy repository in the project template to deploy the model from the model registry any way you like. The template uses CloudFormation to create a real-time endpoint, as an
example. You can update the deployment to use the SageMaker SDK, boto3, or any other API that can create endpoints instead of CFN. If you need to update the CodeBuild steps as part of the deployment pipeline, you can create a custom template.

Q. How do we pass the model file Amazon S3 URL from the train step to the model register step in a SageMaker pipeline at run time?

You can reference the model location as a property of the training step, as shown in the end-to-end example CustomerChurn pipeline in Github.

Q. If I am extending a prebuilt container to train an estimator or for a ProcessingStep on SageMaker Pipelines, is it necessary to copy the script to the container in the Dockerfile?

No, you can either copy the script to the container or pass it via the entry_point argument (of your estimator entity) or code argument (of your processor entity), as demonstrated in the following code sample.

```python
step_process = ProcessingStep(
    name="PreprocessAbaloneData",
    processor=sklearn_processor,
    inputs = [
        ProcessingInput(
            input_name='dataset',
            source=..., 
            destination="/opt/ml/processing/code",
        )
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train",
                        destination = processed_data_path),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation",
                        destination = processed_data_path),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test", destination = processed_data_path),
    ],
    code=os.path.join(BASE_DIR, "process.py"), ## Code is passed through an argument
    cache_config = cache_config,
    job_arguments = ['-input', 'arg1']
)

sklearn_estimator = SKLearn(
    entry_point=os.path.join(BASE_DIR, "train.py"), ## Code is passed through the entry_point
    framework_version="0.23-1",
    instance_type=training_instance_type,
    role=role,
    output_path=model_path, # New
    sagemaker_session=sagemaker_session, # New
    instance_count=1, # New
    base_job_name=f"{base_job_prefix}/pilot-train",
    metric_definitions=
    [  
        {'Name': 'train:accuracy', 'Regex': 'accuracy_train=\((.*?);\)'},
        {'Name': 'validation:accuracy', 'Regex': 'accuracy_validation=\((.*?);\)'}
    ],
)
```
Q. What’s the recommended way to manage dependencies for different SageMaker Pipelines steps?

You can use a SageMaker Projects template to implement image-building CI/CD. With this template, you can automate the CI/CD of images that are built and pushed to Amazon ECR. Changes in the container files in your project’s source control repositories initiate the ML pipeline and deploy the latest version for your container. For more information, see the blog Create Amazon SageMaker projects with image building CI/CD pipelines.

Q. How do I provide SageMaker Project access to specific user profiles in Amazon SageMaker Studio?

Since SageMaker Projects is backed by AWS Service Catalog, you must add each role that requires access to SageMaker Projects to the Amazon SageMaker Solutions and ML Ops products Portfolio in the service catalog. You can do this on the Groups, roles, and users tab, as shown in the following image. If each user profile in Studio has a different role, you should add each of those roles to the service catalog. You can also do this while creating a user profile in Studio.

Q. Where do I see the properties associated with each SageMaker pipeline step so that I can use them in subsequent steps?

Each step in the pipeline uses the underlying SageMaker APIs for the corresponding jobs. For example, TrainingStep invokes the CreateTrainingJob API and the step properties correspond to the response from DescribeTrainingJob. The response output can be found in the API reference link for DescribeTrainingJob. You can follow the same procedure to get the properties for TransformStep, ProcessingStep, TuningStep, and CreateModelStep. For more information about pipeline steps, see Pipeline Steps.

Q. What’s the best way to reproduce my model in SageMaker?

SageMaker’s Lineage Tracking service works in the backend to track all the metadata associated with your model training and deployment workflows. This includes your training jobs, datasets used, pipelines, endpoints, and the actual models. You can query the lineage service at any point to find the exact artifacts used to train a model. Using those artifacts, you can recreate the same ML workflow to reproduce the model as long as you have access to the exact dataset that was used. A trial component tracks the training job. This trial component has all the parameters used as part of the training job. If you don’t need to rerun the entire workflow, you can reproduce the training job to derive the same model.
Using Amazon Augmented AI for Human Review

When you use AI applications such as Amazon Rekognition, Amazon Textract, or your custom machine learning (ML) models, you can use Amazon Augmented AI to get human review of low-confidence predictions or random prediction samples.

What is Amazon Augmented AI?

Amazon Augmented AI (Amazon A2I) is a service that brings human review of ML predictions to all developers by removing the heavy lifting associated with building human review systems or managing large numbers of human reviewers.

Many ML applications require humans to review low-confidence predictions to ensure the results are correct. For example, extracting information from scanned mortgage application forms can require human review due to low-quality scans or poor handwriting. Building human review systems can be time-consuming and expensive because it involves implementing complex processes or workflows, writing custom software to manage review tasks and results, and managing large groups of reviewers.

Amazon A2I streamlines building and managing human reviews for ML applications. Amazon A2I provides built-in human review workflows for common ML use cases, such as content moderation and text extraction from documents. You can also create your own workflows for ML models built on SageMaker or any other tools. Using Amazon A2I, you can allow human reviewers to step in when a model is unable to make a high-confidence prediction or to audit its predictions on an ongoing basis.

Amazon A2I Use Case Examples

The following examples demonstrate how you can use Amazon A2I to integrate a human review loop into your ML application. For each of these examples, you can find a Jupyter Notebook that demonstrates that workflow in Use Cases and Examples Using Amazon A2I (p. 3521).

- **Use Amazon A2I with Amazon Textract** – Have humans review important key-value pairs in single-page documents or have Amazon Textract randomly sample and send documents from your dataset to humans for review.
- **Use Amazon A2I with Amazon Rekognition** – Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low-confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.
- **Use Amazon A2I to review real-time ML inferences** – Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker hosted endpoint and incrementally train your model using Amazon A2I output data.
- **Use Amazon A2I with Amazon Comprehend** – Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.
- **Use Amazon A2I with Amazon Transcribe** – Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcriptions of similar video or audio content.
- **Use Amazon A2I with Amazon Translate** – Have humans review low-confidence translations returned from Amazon Translate.
• **Use Amazon A2I to review tabular data** – Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.

**Get Started with Amazon Augmented AI**

To get started using Amazon Augmented AI, review the Core Components of Amazon A2I (p. 3501) and Prerequisites to Using Augmented AI (p. 3505). Then, use the following documentation to learn how to use the Amazon A2I console and API.

- Tutorial: Get Started in the Amazon A2I Console (p. 3505)
- Tutorial: Get Started Using the Amazon A2I API (p. 3511)

You can also get started using the Amazon A2I API by following a Jupyter Notebook tutorial. See Use Cases and Examples Using Amazon A2I (p. 3521) for a list of notebooks and use cases.

**Core Components of Amazon A2I**

Review the following terms to familiarize yourself with the core components of Amazon A2I.

**Task Types**

The AI/ML workflow into which you integrate Amazon A2I defines an Amazon A2I task type.
Amazon A2I supports:

- **Two built-in task types**: Amazon Textract key-value pair extraction and Amazon Rekognition image moderation.
- **A custom task type**: Use a custom task type to integrate a human review loop into any machine learning workflow. You can use a custom task type to integrate Amazon A2I with other AWS services like Amazon Comprehend, Amazon Transcribe, and Amazon Translate, as well as your own custom machine learning workflows. To learn more, see Use Cases and Examples Using Amazon A2I (p. 3521).

Select a tab in the following table to see diagrams that illustrate how Amazon A2I works with each task type. Select the task type page using the links in the preceding list to learn more about that task type.

**Amazon Textract – Key-value pair extraction**

This image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

**Amazon Rekognition – Image moderation**

This image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.
Custom Task Type

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

Human Review Workflow (Flow Definition)

You use a human review workflow to specify your human work team, to set up your worker UI using a worker task template, and to provide information about how workers should complete the review task.

For built-in task types, you also use the human review workflow to identify the conditions under which a human loop is initiated. For example, Amazon Rekognition can perform image content moderation using machine learning. You can use the human review workflow to specify that an image is sent to a human for content moderation review if Amazon Rekognition's confidence is too low.

You can use a human review workflow to create multiple human loops.
You can create a flow definition in the SageMaker console or with the SageMaker API. To learn more about both of these options, see Create a Human Review Workflow (p. 3529).

**Work Team**

A work team is a group of human workers to whom you send your human review tasks.

When you create a human review workflow, you specify a single work team.

Your work team can come from the Amazon Mechanical Turk workforce, a vendor-managed workforce, or your own private workforce. When you use the private workforce, you can create multiple work teams. Each work team can be used in multiple human review workflows. To learn how to create a workforce and work teams, see Create and Manage Workforces (p. 763).

**Worker Task Template and Human Task UI**

You use a worker task template to create a worker UI (a human task UI) for your human review tasks.

The human task UI displays your input data, such as documents or images, and instructions to workers. It also provides interactive tools that the worker uses to complete your tasks.

For built-in task types, you must use the Amazon A2I worker task template provided for that task type.

**Human Loops**

A human loop is used to create a single human review job. For each human review job, you can choose the number of workers that are sent a task to review a single data object. For example, if you set the number of workers per object to 3 for an image classification labeling job, three workers classify each input image. Increasing the number of workers per object can improve label accuracy.

A human loop is created using a human review workflow as follows:

- For built-in task types, the conditions specified in the human review workflow determine when the human loop is created.
- Human review tasks are sent to the work team specified in the human review workflow.
- The worker task template specified in the human review workflow is used to render the human task UI.

**When do human loops get created?**

When you use one of the built-in task types, the corresponding AWS service creates and starts a human loop on your behalf when the conditions specified in your human review workflow are met. For example:

- When you use Augmented AI with Amazon Textract, you can integrate Amazon A2I into a document review task using the API operation AnalyzeDocument. A human loop is created every time Amazon Textract returns inferences about key-value pairs that meet the conditions you specify in your human review workflow.
- When you use Augmented AI with Amazon Rekognition, you can integrate Amazon A2I into an image moderation task using the API operation DetectModerationLabels. A human loop is created every time Amazon Rekognition returns inferences about image content that meet the conditions you specify in your human review workflow.

When using a custom task type, you start a human loop using the Amazon Augmented AI Runtime API. When you call StartHumanLoop in your custom application, a task is sent to human reviewers.

To learn how to create and start a human loop, see Create and Start a Human Loop (p. 3548).
To generate these resources and create a human review workflow, Amazon A2I integrates multiple APIs, including the Amazon Augmented AI Runtime Model, the SageMaker APIs, and APIs associated with your task type. To learn more, see Use APIs in Amazon Augmented AI (p. 3584).

Note
AWS Region availability may differ when you use Augmented AI with other AWS services, such as Amazon Textract. Create Augmented AI resources in the same AWS Region that you use to interact with those AWS services. For AWS Region availability for all services, see the Region Table.

Prerequisites to Using Augmented AI

Amazon A2I uses resources in IAM, SageMaker, and Amazon S3 to create and run your human review workflows. You can create some of these resources in the Amazon A2I console when you create a human review workflow. To learn how, see Tutorial: Get Started in the Amazon A2I Console (p. 3505).

To use Amazon A2I, you need the following resources:

- One or more Amazon S3 buckets in the same AWS Region as the workflow for your input and output data. To create a bucket, follow the instructions in Create a Bucket in the Amazon Simple Storage Service Console User Guide.
- An IAM role with required permissions to create a human review workflow and an IAM user or role with permission to access Augmented AI. For more information, see Permissions and Security in Amazon Augmented AI (p. 3576).
- A public, private, or vendor workforce for your human review workflows. If you plan to use a private workforce, you need to set one up ahead of time in the same AWS Region as your Amazon A2I workflow. To learn more about these workforce types, see Create and Manage Workforces (p. 763).

Important
To learn about the compliance programs that cover Amazon Augmented AI at this time, see AWS Services in Scope by Compliance Program. If you use Amazon Augmented AI in conjunction with other AWS services (such as Amazon Rekognition and Amazon Textract), note that Amazon Augmented AI may not be in scope for the same compliance programs as those other services. You are responsible for how you use Amazon Augmented AI, including understanding how the service processes or stores customer data and any impact on the compliance of your data environment. You should discuss your workload objectives and goals with your AWS account team; they can help you evaluate whether the service is a good fit for your proposed use case and architecture.

Tutorial: Get Started in the Amazon A2I Console

The following tutorial shows you how to get started using Amazon A2I in the Amazon A2I console.

The tutorial gives you the option to use Augmented AI with Amazon Textract for document review or Amazon Rekognition for image content review.

Prerequisites

To get started using Amazon A2I, complete the following prerequisites.

- Create an Amazon S3 bucket in the same AWS Region as the workflow for your input and output data. For example, if you are using Amazon A2I with Amazon Textract in us-east-1, create your bucket in us-east-1. To create a bucket, follow the instructions in Create a Bucket in the Amazon Simple Storage Service Console User Guide.
- Do one of the following:
• If you want to complete the tutorial using Amazon Textract, download this sample document and place it in your Amazon S3 bucket.
• If you want to complete the tutorial using Amazon Rekognition, download this image and place it in your Amazon S3 bucket.

Note
The Amazon A2I console is embedded in the SageMaker console.

Step 1: Create a Work Team

First, create a work team in the Amazon A2I console and add yourself as a worker so that you can preview the worker review task.

Important
This tutorial uses a private work team. The Amazon A2I private workforce is configured in the Ground Truth area of the SageMaker console and is shared between Amazon A2I and Ground Truth.

To create a private workforce using worker emails
2. In the navigation pane, choose Labeling workforces under Ground Truth.
3. Choose Private, then choose Create private team.
4. Choose Invite new workers by email.
5. For this tutorial, enter your email and any others that you want to be able to preview the human task UI. You can paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an Amazon SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to Amazon SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
8. Choose Create private team.

If you add yourself to a private work team, you receive an email from no-reply@verificationemail.com with login information. Use the link in this email to reset your password and log in to your worker portal. This is where your human review tasks appear when you create a human loop.

Step 2: Create a Human Review Workflow

In this step, you create a human review workflow. Each human review workflow is created for a specific task type. This tutorial allows you to choose between the built-in task types: Amazon Rekognition and Amazon Textract.

To create a human review workflow:
1. Open the Augmented AI console at https://console.aws.amazon.com/a2i to access the Human review workflows page.
2. Select Create human review workflow.
3. In Workflow settings, enter a workflow Name, S3 bucket, and the IAM role that you created for this tutorial, with the AWS managed policy AmazonAugmentedAIIntegratedAPIAccess attached.
4. For Task type, select Textract – Key-value pair extraction or Rekognition – Image moderation.

5. Select the task type that you chose from the following table for instructions for that task type.

Amazon Textract – Key-value pair extraction

1. Select Trigger a human review for specific form keys based on the form key confidence score or when specific form keys are missing.

2. For Key name, enter Mail Address.

3. Set the identification confidence threshold between 0 and 99.

4. Set the qualification confidence threshold between 0 and 99.

5. Select Trigger a human review for all form keys identified by Amazon Textract with confidence scores in a specific range.

6. Set the identification confidence threshold between 0 and 90.

7. Set the qualification confidence threshold between 0 and 90.

This initiates a human review if Amazon Textract returns a confidence score that is less than 99 for Mail Address and its key, or if it returns a confidence score less than 90 for any key value pair detected in the document.

The following image shows the Amazon Textract form extraction - Conditions for invoking human review section of the Amazon A2I console. In the image, the check boxes for the two types of triggers explained in the proceeding paragraph are checked, and Mail Address is used as a Key name for the first trigger. The identification confidence threshold is defined using confidence scores for key-value pairs detect within the form and is set between 0 and 99. The qualification confidence threshold is defined using confidence scores for text contained within keys and values in a form and is set between 0 and 99.
Amazon Rekognition – Image moderation

1. **Select** Trigger human review for labels identified by Amazon Rekognition based on label confidence score.

2. **Set the** Threshold between 0 and 98.

This initiates a human review if Amazon Rekognition returns a confidence score that is less than 98 for an image moderation job.

The following image shows how you can select the Trigger human review for labels identified by Amazon Rekognition based on label confidence score option and enter a Threshold between 0 and 98 in the Amazon A2I console.
6. Under **Worker task template creation**, select **Create from a default template**.

7. Enter a **Template name**.

8. In **Task description** field, enter the following text:

   Read the instructions carefully and complete the task.

9. Under **Workers**, select **Private**.

10. Select the private team that you created.

11. Choose **Create**.

Once your human review workflow is created, it appears in the table on the **Human review workflows** page. When the **Status** is **Active**, copy and save the Workflow ARN. You need it for the next step.

**Step 3: Start a Human Loop**

You must use an API operation to start a human loop. There are a variety of language-specific SDKs that you can use to interact with these API operations. To see documentation for each of these SDKs, refer to the **See Also** section in the API documentation, as shown in the following image.

For this tutorial, you use one of the following APIs:

- If you chose the Amazon Textract task type, you use the **AnalyzeDocument** operation.
- If you chose the Amazon Rekognition task type, you use the **DetectModerationLabels** operation.
You can interact with these APIs using a SageMaker notebook instance (recommended for new users) or the AWS Command Line Interface (AWS CLI). Choose one of the following to learn more about these options:

- To learn more about and set up a notebook instance, see Use Amazon SageMaker Notebook Instances (p. 358).
- To learn more about and get started using the AWS CLI, see What Is the AWS Command Line Interface? in the AWS Command Line Interface User Guide.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `analyze_document` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.analyze_document(
    Document={
        "S3Object": {
            "Bucket": "AWSDOC-EXAMPLE-BUCKET",
            "Name": "document-name.pdf"
        }
    },
    HumanLoopConfig={
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation",
                "FreeOfAdultContent"
            ]
        },
        "FeatureTypes": ["TABLES", "FORMS"]
    }
)
```

Amazon Rekognition – Image moderation

The following example uses the AWS SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `detect_moderation_labels` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.detect_moderation_labels(
    Image={
        "S3Object": {
            "Bucket": "AWSDOC-EXAMPLE-BUCKET",
            "Name": "image-name.png"
        }
    },
    HumanLoopConfig={
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation",
                "FreeOfAdultContent"
            ]
        }
    }
)
```
Step 4: View Human Loop Status in Console

When you start a human loop, you can view its status in the Amazon A2I console.

To view your human loop status

1. Open the Augmented AI console at https://console.aws.amazon.com/a2i to access the Human review workflows page.
2. Select the human review workflow that you used to start your human loop.
3. In the Human loops section, you can see your human loop. View its status in the Status column.

Step 5: Download Output Data

Your output data is stored in the Amazon S3 bucket you specified when you created a human review workflow.

To view your Amazon A2I output data

1. Open the Amazon S3 console.
2. Select the Amazon S3 bucket you specified when you created your human review workflow in step 2 of this example.
3. Starting with the folder that is named after your human review workflow, navigate to your output data by selecting the folder with the following naming convention:

   s3://output-bucket-specified-in-human-review-workflow/human-review-workflow-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json

4. Select output.json and choose Download.

Tutorial: Get Started Using the Amazon A2I API

This tutorial explains the API operations you can use to get started using Amazon A2I.

To use a Jupyter Notebook to run these operations, select a Jupyter Notebook from Use Cases and Examples Using Amazon A2I (p. 3521) and use Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3523) to learn how to use it in a SageMaker notebook instance.

To learn more about the API operations you can use with Amazon A2I, see Use APIs in Amazon Augmented AI (p. 3584).

Create a Private Work Team

You can create a private work team and add yourself as a worker so that you can preview Amazon A2I.

If you are not familiar with Amazon Cognito, we recommend that you use the SageMaker console to create a private workforce and add yourself as a private worker. For instructions, see Step 1: Create a Work Team (p. 3506).

If you are familiar with Amazon Cognito, you can use the following instructions to create a private work team using the SageMaker API. After you create a work team, note the work team ARN (WorkteamArn).

To learn more about the private workforce and other available configurations, see Use a Private Workforce (p. 768).
Create a private workforce

If you have not created a private workforce, you can do so using an Amazon Cognito user pool. Make sure that you have added yourself to this user pool. You can create a private work team using the AWS SDK for Python (Boto3) `create_workforce` function. For other language-specific SDKs, refer to the list in CreateWorkforce.

```python
response = client.create_workforce(
    CognitoConfig={
        "UserPool": "Pool_ID",
        "ClientId": "app-client-id"
    },
    WorkforceName="workforce-name"
)
```

Create a private work team

After you have created a private workforce in the AWS Region to configure and start your human loop, you can create a private work team using the AWS SDK for Python (Boto3) `create_workteam` function. For other language-specific SDKs, refer to the list in CreateWorkteam.

```python
response = client.create_workteam(
    WorkteamName="work-team-name",
    WorkforceName= "workforce-name",
    MemberDefinitions=[
        {
            "CognitoMemberDefinition": {
                "UserPool": "<aws-region>_ID",
                "UserGroup": "user-group",
                "ClientId": "app-client-id"
            },
        }
    ]
)
```

Access your work team ARN as follows:

```python
workteamArn = response["WorkteamArn"]
```

List private work teams in your account

If you have already created a private work team, you can list all work teams in a given AWS Region in your account using the AWS SDK for Python (Boto3) `list_workteams` function. For other language-specific SDKs, refer to the list in ListWorkteams.

```python
response = client.list_workteams()
```

If you have numerous work teams in your account, you may want to use `MaxResults`, `SortBy`, and `NameContains` to filter your results.

Create a Human Review Workflow

You can create a human review workflow using the Amazon A2I `CreateFlowDefinition` operation. Before you create your human review workflow, you need to create a human task UI. You can do this with the `CreateHumanTaskUi` operation.
If you are using Amazon A2I with the Amazon Textract or Amazon Rekognition integrations, you can specify activation conditions using a JSON.

Create a Human Task UI

If you are creating a human review workflow to be used with Amazon Textract or Amazon Rekognition integrations, you need to use and modify pre-made worker task template. For all custom integrations, you can use your own custom worker task template. Use the following table to learn how to create a human task UI using a worker task template for the two built-in integrations. Replace the template with your own to customize this request.

Amazon Textract – Key-value pair extraction

To learn more about this template, see Custom Template Example for Amazon Textract (p. 3559).

```html
<template type="html" language="en">
  <script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
  <template>
    <crowd-form>
      <crowd-textract-analyze-document
        src="{{ task.input.aiServiceRequest.document.s3Object.bucket }}/{{ task.input.aiServiceRequest.document.s3Object.name }}"/>
      <crowd-textract-analyze-document
        initial-value="{{ task.input.aiServiceRequest.document.s3Object.bucket }}/{{ task.input.aiServiceRequest document.s3Object.name }}"/>

      <header>
        Review the key-value pairs listed on the right and correct them if they don't match the following document.
      </header>

      <no-key-edit/>
      <no-geometry-edit/>
      <keys>[
        "{{ task.input.humanLoopContext.importantFormKeys }}"
      ]</keys>
      <block-types>[
        "KEY_VALUE_SET"
      ]</block-types>

      <short-instructions header="Instructions">
        <p>Click on a key-value pair to highlight the corresponding key-value pair in the document.</p>
        <p>Click on a key-value block to highlight the corresponding key-value pair in the document.</p>
        <p>If it is a valid key-value pair, review the content for the value. If the content is incorrect, correct it.</p>
        <p>The text of the value is incorrect, correct it.</p>
        <p>A wrong value is identified, correct it.</p>
        <p>If it is not a valid key-value relationship, choose No.</p>
        <p>Key and value displayed in one line.</p>
        <p>Key and value displayed in two lines.</p>
      </short-instructions>
    </crowd-form>
  </template>
</template>
```
Amazon Rekognition – Image moderation

To learn more about this template, see Custom Template Example for Amazon Rekognition (p. 3561).

```
<template>
<% capture s3_uri %>http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3Object.bucket }}/%
{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<short-instructions header="Instructions">
    <style>
        .instructions {
            white-space: pre-wrap;
        }
    </style>
    <p class="instructions">Review the image and choose all applicable categories. If no categories apply, choose None.</p>
</short-instructions>

<b>Nudity</b>
Visuals depicting nude male or female person or persons

<b>Partial Nudity</b>
Visuals depicting covered up nudity, for example using hands or pose

<b>Revealing Clothes</b>
Visuals depicting revealing clothes and poses

<b>Physical Violence</b>
Visuals depicting violent physical assault, such as kicking or punching

<b>Weapon Violence</b>
Visuals depicting violence using weapons like firearms or blades, such as shooting

<b>Weapons</b>
Visuals depicting weapons like firearms and blades
```

3514
Custom Integration

The following is an example template that can be used in a custom integration. This template is used in this notebook, demonstrating a custom integration with Amazon Comprehend.

```python

template = r'''
<crop-form>
    <crop-classifier
    name="sentiment"
    categories="["Positive", "Negative", "Neutral", "Mixed"]"
    initial-value="{{ task.input.initialValue }}"
    header="What sentiment does this text convey?"
    >
    <classification-target>
        {{ task.input.taskObject }}
    </classification-target>

    <full-instructions header="Sentiment Analysis Instructions">
        <p><strong>Positive</strong> sentiment include: joy, excitement, delight</p>
        <p><strong>Negative</strong> sentiment include: anger, sarcasm, anxiety</p>
        <p><strong>Neutral</strong>: neither positive or negative, such as stating a fact</p>
        <p><strong>Mixed</strong>: when the sentiment is mixed</p>
    </full-instructions>

    <short-instructions>
        Choose the primary sentiment that is expressed by the text.
    </short-instructions>
</crop-classifier>
'''

Using the template specified above, you can create a template using the AWS SDK for Python (Boto3) `create_human_task_ui` function. For other language-specific SDKs, refer to the list in `CreateHumanTaskUi`.

```python

response = client.create_human_task_ui(  
    HumanTaskUiName="human-task-ui-name",
    UiTemplate={  
        "Content": template
    }
)

```

This response element contains the human task UI ARN. Save this as follows:

```python

humanTaskUiArn = response["HumanTaskUiArn"]

```

Create JSON to specify activation conditions

For Amazon Textract and Amazon Rekognition built-in integrations, you can save activation conditions in a JSON object and use this in your `CreateFlowDefinition` request.
Next, select a tab to see example activation conditions you can use for these built-in integrations. For additional information about activation condition options, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3535).

Amazon Textract – Key-value pair extraction

This example specifies conditions for specific keys (such as Mail address) in the document. If Amazon Textract's confidence falls outside of the thresholds set here, the document is sent to a human for review, with the specific keys that initiated the human loop prompted to the worker.

```python
import json

humanLoopActivationConditions = json.dumps(
    {
        "Conditions": [
            {
                "Or": [
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Mail address",
                            "ImportantFormKeyAliases": ["Mail Address:","Mail address:","Mailing Add:","Mailing Addresses"],
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "MissingImportantFormKey",
                        "ConditionParameters": {
                            "ImportantFormKey": "Mail address",
                            "ImportantFormKeyAliases": ["Mail Address:","Mail address:","Mailing Add:","Mailing Addresses"]
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Phone Number",
                            "ImportantFormKeyAliases": ["Phone number:","Phone No.:"],
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "*",
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "*",
                            "KeyValueBlockConfidenceGreaterThan": 0,
                            "WordBlockConfidenceGreaterThan": 0
                        }
                    }
                ]
            }
        ]
    }
)
```
Amazon Rekognition – Image moderation

The human loop activation conditions used here are tailored towards Amazon Rekognition content moderation; they are based on the confidence thresholds for the Suggestive and Female Swimwear Or Underwear moderation labels.

```
import json
humanLoopActivationConditions = json.dumps(
    {
        "Conditions": [
            {
                "Or": [
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Suggestive",
                            "ConfidenceLessThan": 98
                        }
                    },
                    {
                        "ConditionType": "ModerationLabelConfidenceCheck",
                        "ConditionParameters": {
                            "ModerationLabelName": "Female Swimwear Or Underwear",
                            "ConfidenceGreaterThan": 98
                        }
                    }
                ]
            }
        ]
    }
)

Create a human review workflow

This section gives an example of the CreateFlowDefinition AWS SDK for Python (Boto3) request using the resources created in the previous sections. For other language-specific SDKs, refer to the list in CreateFlowDefinition. Use the tabs in the following table to see the requests to create a human review workflow for Amazon Textract and Amazon Rekognition built-in integrations.

Amazon Textract – Key-value pair extraction

If you use the built-in integration with Amazon Textract, you must specify "AWS/Textract/AnalyzeDocument/Forms/V1" for "AwsManagedHumanLoopRequestSource" in HumanLoopRequestSource.

```
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/V1"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "HumanLoopActivationConditions": humanLoopActivationConditions
        }
    }
)
```
Amazon Rekognition – Image moderation

If you use the built-in integration with Amazon Rekognition, you must specify "AWS/Rekognition/DetectModerationLabels/Image/V3" for "AwsManagedHumanLoopRequestSource" in HumanLoopRequestSource.

```python
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Rekognition/DetectModerationLabels/Image/V3"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "humanLoopActivationConditions": humanLoopActivationConditions
        }
    },
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Image content moderation",
        "TaskDescription": "Review the image and instructions. Complete the task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": ["content moderation"],
    },
    OutputConfig={
        "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
    },
    RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
    Tags=[
        {
            "Key": "string",
            "Value": "string"
        },
    ]
)
```
Custom Integration

If you use a custom integration, exclude the following parameters: HumanLoopRequestSource, HumanLoopActivationConfig.

```python
response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Image content moderation",
        "TaskDescription": "Review the image and instructions. Complete the task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": [
            "content moderation",
        ],
    },
    OutputConfig={
        "S3OutputPath": "s3://DOC-EXAMPLE-BUCKET/prefix/",
    },
    RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
    Tags=[
        {"Key": "string",
            "Value": "string"
        },
    ]
)
```

After you create a human review workflow, you can retrieve the flow definition ARN from the response:

```
humanReviewWorkflowArn = response["FlowDefinitionArn"]
```

Create a Human Loop

The API operation you use to start a human loop depends on the Amazon A2I integration you use.

- If you use the Amazon Textract built-in integration, you use the `AnalyzeDocument` operation.
- If you use the Amazon Rekognition built-in integration, you use the `DetectModerationLabels` operation.
- If you use a custom integration, you use the `StartHumanLoop` operation.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the AWS SDK for Python (Boto3).

Amazon Textract – Key-value pair extraction

The following example uses the AWS SDK for Python (Boto3) to call `analyze_document` in `us-west-2`. Replace the italicized red text with your resources. Include the `DataAttributes`
Human loops are only created if Amazon Textract's confidence for document analysis task meets the activation conditions you specified in your human review workflow. You can check the response element to determine if a human loop has been created. To see everything included in this response, see `HumanLoopActivationOutput`.

```python
if "HumanLoopArn" in analyzeDocumentResponse["HumanLoopActivationOutput"]: # A human loop has been started!
    print(f"A human loop has been started with ARN: {analyzeDocumentResponse["HumanLoopActivationOutput"]['HumanLoopArn']}")
```

Human loops are only created if Amazon Rekognition's confidence for an image moderation task meets the activation conditions you specified in your human review workflow. You can check the response element to determine if a human loop has been created. To see everything included in this response, see `HumanLoopActivationOutput`.

```python
if "HumanLoopArn" in response["HumanLoopActivationOutput"]: # A human loop has been started!
    print(f"A human loop has been started with ARN: {response["HumanLoopActivationOutput"]['HumanLoopArn']}")
```
Custom Integration

The following example uses the AWS SDK for Python (Boto3) to call `start_human_loop` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `start_human_loop` documentation in the AWS SDK for Python (Boto) API Reference.

```python
response = client.start_human_loop(
    HumanLoopName= "human-loop-name",
    HumanLoopInput={"InputContent": inputContentJson},
    DataAttributes={"ContentClassifiers":
    ["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]
    }
)
```

This example stores input content in the variable `inputContentJson`. Assume that the input content contains two elements: a text blurb and sentiment (such as Positive, Negative, or Neutral), and it is formatted as follows:

```python
inputContent = {
    "initialValue": sentiment,
    "taskObject": blurb
}
```

The keys `initialValue` and `taskObject` must correspond to the keys used in the liquid elements of the worker task template. Refer to the custom template in Create a Human Task UI (p. 3513) to see an example.

To create `inputContentJson`, do the following:

```python
import json
inputContentJson = json.dumps(inputContent)
```

A human loop starts each time you call `start_human_loop`. To check the status of your human loop, use `describe_human_loop`:

```python
human_loop_info = a2i.describe_human_loop(HumanLoopName="human-loop-name")
print(f"HumanLoop Status: {resp["HumanLoopStatus"]}")
print(f"HumanLoop Output Destination: {resp["HumanLoopOutput"]}")
```

Use Cases and Examples Using Amazon A2I

You can use Amazon Augmented AI to incorporate a human review into your workflow for built-in task types, Amazon Textract and Amazon Rekognition, or your own custom tasks using a custom task type.

When you create a human review workflow using one of the built-in task types, you can specify conditions, such as confidence thresholds, that initiate a human review. The service (Amazon Rekognition or Amazon Textract) creates a human loop on your behalf when these conditions are met and supplies your input data directly to Amazon A2I to send to human reviewers. To learn more about the built-in task types, use the following:
- Use Amazon Augmented AI with Amazon Textract (p. 3523)
- Use Amazon Augmented AI with Amazon Rekognition (p. 3526)

When you use a custom task type, you create and start a human loop using the Amazon A2I Runtime API. Use the custom task type to incorporate a human review workflow with other AWS services or your own custom ML application.

- For more details, see Use Amazon Augmented AI with Custom Task Types (p. 3527)

The following table outlines a variety of Amazon A2I use cases that you can explore using SageMaker Jupyter Notebooks. To get started with a Jupyter Notebook, use the instructions in Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3523). For more examples, see this GitHub repository.

**Use Case Description**

SageMaker hosted endpoint and incrementally train your model using Amazon A2I output data.

**Task Type**

Custom

**Topics**

- Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3523)
- Use Amazon Augmented AI with Amazon Textract (p. 3523)
- Use Amazon Augmented AI with Amazon Rekognition (p. 3526)
- Use Amazon Augmented AI with Custom Task Types (p. 3527)

**Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook**

For an end-to-end example that demonstrates how to integrate an Amazon A2I human review loop into a machine learning workflow, you can use a Jupyter Notebook from this GitHub Repository in a SageMaker notebook instance.

**To use an Amazon A2I custom task type sample notebook in an Amazon SageMaker notebook instance:**

1. If you do not have an active SageMaker notebook instance, create one by following the instructions in Step 1: Create an Amazon SageMaker Notebook Instance (p. 78).
2. When your notebook instance is active, choose Open JupyterLab to the right of the notebook instance's name. It may take a few moments for JupyterLab to load.
3. Choose the icon to clone a GitHub repository into your workspace.
4. Enter the amazon-a2i-sample-jupyter-notebooks repository HTTPS URL.
5. Choose CLONE.
6. Open the notebook that you would like to run.
7. Follow the instructions in the notebook to configure your human review workflow and human loop and run the cells.
8. To avoid incurring unnecessary charges, when you are done with the demo, stop and delete your notebook instance in addition to any Amazon S3 buckets, IAM roles, and CloudWatch Events resources created during the walkthrough.

**Use Amazon Augmented AI with Amazon Textract**

Amazon Textract enables you to add document text detection and analysis to your applications. Amazon Augmented AI (Amazon A2I) directly integrates with Amazon Textract's AnalyzeDocument API operation. You can use AnalyzeDocument to analyze a document for relationships between detected items. When you add an Amazon A2I human review loop to an AnalyzeDocument request, Amazon A2I monitors the Amazon Textract results and sends a document to one or more human workers for
review when the conditions specified in your flow definition are met. For example, if you want a human to review a specific key like `Full name:` and their associated input values, you can create an activation condition that starts a human review any time the `Full name:` key is detected or when the inference confidence for that key falls within a range that you specify.

The following image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can specify when Amazon Textract sends a task to a human worker for review when creating a human review workflow or flow definition by specifying activation conditions.

You can set the following activation conditions when using the Amazon Textract task type:

- Initiate a human review for specific form keys based on the form key confidence score.
- Initiate a human review when specific form keys are missing.
- Initiate human review for all form keys identified by Amazon Textract with confidence scores in a specified range.
- Randomly send a sample of forms to humans for review.

When your activation condition depends on form key confidence scores, you can use two types of prediction confidence to initiate human loops:

- **Identification confidence** – The confidence score for key-value pairs detected within a form.
- **Qualification confidence** – The confidence score for text contained within key and value in a form.

In the image in the following section, `Full Name: Jane Doe` is the key-value pair, `Full Name` is the key, and `Jane Doe` is the value.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the `HumanLoopActivationConditions` parameter of the `CreateFlowDefinition` API operation.
Get Started: Integrate a Human Review into an Amazon Textract Analyze Document Job

To integrate a human review into an Amazon Textract text detection and analysis job, you need to create a flow definition, and then use the Amazon Textract API to integrate that flow definition into your workflow. To learn how to create a flow definition using the SageMaker console or Augmented AI API, see the following topics:

- Create a Human Review Workflow (Console) (p. 3530)
- Create a Human Review Workflow (API) (p. 3532)

After you've created your flow definition, see Using Augmented AI with Amazon Textract to learn how to integrate your flow definition into your Amazon Textract task.

End-to-End Example Using Amazon Textract and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Textract with Amazon A2I using the console, see Tutorial: Get Started in the Amazon A2I Console (p. 3505).

To learn how to use the Amazon A2I API to create and start a human review, you can use Amazon Augmented AI (Amazon A2I) integration with Amazon Textract’s Analyze Document [Example] in a SageMaker Notebook instance. To get started, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3523).

A2I Textract Worker Console Preview

When they're assigned a review task in an Amazon Textract workflow, workers might see a user interface similar to the following:
You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see Create and Manage Worker Task Templates (p. 3556).

Use Amazon Augmented AI with Amazon Rekognition

Amazon Rekognition makes it easy to add image analysis to your applications. The Amazon Rekognition DetectModerationLabels API operation is directly integrated with Amazon A2I so that you can easily create a human loop to review unsafe images, such as explicit adult or violent content. You can use DetectModerationLabels to configure a human loop using a flow definition ARN. This enables Amazon A2I to analyze predictions made by Amazon Rekognition and send results to a human for review to ensure they meet the conditions set in your flow definition.

The following image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: and Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can set the following activation conditions when using the Amazon Rekognition task type:

- Initiate human review for labels identified by Amazon Rekognition based on the label confidence score.
- Randomly send a sample of images to humans for review.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the HumanLoopActivationConditions parameter of the CreateFlowDefinition API operation. To learn how specify activation conditions in JSON format, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3535) and Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition (p. 3543).

Note
When using Augmented AI with Amazon Rekognition, create Augmented AI resources in the same AWS Region you use to call DetectModerationLabels.
Get Started: Integrate a Human Review into an Amazon Rekognition Image Moderation Job

To integrate a human review into an Amazon Rekognition, see the following topics:

- Create a Human Review Workflow (Console) (p. 3530)
- Create a Human Review Workflow (API) (p. 3532)

After you've created your flow definition, see Using Augmented AI with Amazon Rekognition to learn how to integrate your flow definition into your Amazon Rekognition task.

End-to-end Demo Using Amazon Rekognition and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Rekognition with Amazon A2I using the console, see Tutorial: Get Started in the Amazon A2I Console (p. 3505).

To learn how to use the Amazon A2I API to create and start a human review, you can use Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition [Example] in a SageMaker notebook instance. To get started, see Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook (p. 3523).

A2I Rekognition Worker Console Preview

When they're assigned a review task in an Amazon Rekognition workflow, workers might see a user interface similar to the following:

![Image of A2I Rekognition Worker Console Preview]

You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see Create and Manage Worker Task Templates (p. 3556).

Use Amazon Augmented AI with Custom Task Types

You can use Amazon Augmented AI (Amazon A2I) to incorporate a human review (human loop) into any machine learning workflow using the custom task type. This options gives you the most flexibility to customize the conditions under which your data objects are sent to humans for review, as well as the look and feel of your worker user interface.
When you use a custom task type, you create a custom human review workflow and specify the conditions under which a data object is sent for human review directly in your application.

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

Use the procedures on this page to learn how to integrate Amazon A2I into any machine learning workflow using the custom task type.

Create a human loop using a flow definition, integrate it into your application, and monitor the results

1. Complete the Amazon A2I Prerequisites to Using Augmented AI (p. 3505). Note the following:
   - The path to the Amazon Simple Storage Service (Amazon S3) bucket or buckets where you store your input and output data.
   - The Amazon Resource Name (ARN) of an AWS Identity and Access Management (IAM) role with required permissions attached.
   - (Optional) The ARN of your private workforce, if you plan to use one.
2. Using HTML elements, create a custom worker template which Amazon A2I uses to generate your worker task UI. To learn how to create a custom template, see Create Custom Worker Task Templates (p. 3558).
3. Use the custom worker template from step 2 to generate a worker task template in the Amazon SageMaker console. To learn how, see Create a Worker Task Template (p. 3557).

In the next step, you create a flow definition:

- If you want to create a flow definition using the SageMaker API, note the ARN of this worker task template for the next step.
- If you are creating a flow definition using the console, your template automatically appears in Worker task template section when you choose Create human review workflow.
4. When creating your flow definition, provide the path to your S3 buckets, your IAM role ARN, and your worker template.

   - To learn how to create a flow definition using the SageMaker CreateFlowDefinition API, see Create a Human Review Workflow (API) (p. 3532).
Create a Human Review Workflow

Use an Amazon Augmented AI (Amazon A2I) human review workflow, or flow definition, to specify the following:

- For the Amazon Textract and Amazon Rekognition built-in task types, the conditions under which your human loop is called
- The workforce to which your tasks are sent
- The set of instructions that your workforce receives, which is called a worker task template
- The configuration of your worker tasks, including the number of workers that receive a task and time limits to complete tasks
- Where your output data is stored

You can create a human review workflow in the SageMaker console or using the SageMaker CreateFlowDefinition operation. You can build a worker task template using the console for Amazon Textract and Amazon Rekognition task types while creating your flow definition.

**Important**

Human loop activation conditions, which initiate the human loop—for example, confidence thresholds—aren't available for Amazon A2I custom task types. When using the console to create a flow definition for a custom task type, you can't specify activation conditions. When using the Amazon A2I API to create a flow definition for a custom task type, you can't set the HumanLoopActivationConditions attribute of the HumanLoopActivationConditionsConfig parameter. To control when human reviews are initiated, specify conditions under which StartHumanLoop is called in your custom application. In this case, every StartHumanLoop invocation results in a human review. For more information, see Use Amazon Augmented AI with Custom Task Types (p. 3527).

**Prerequisites**

To create a human review workflow definition, you must have completed the prerequisites described in Prerequisites to Using Augmented AI (p. 3505).
If you use the API to create a flow definition for any task type, or if you use a custom task type when creating a flow definition in the console, first create a worker task template. For more information, see Create and Manage Worker Task Templates (p. 3556).

If you want to preview your worker task template while creating a flow definition for a built-in task type in the console, ensure that you grant the role that you use to create the flow definition permission to access the Amazon S3 bucket that contains your template artifacts using a policy like the one described in Enable Worker Task Template Previews (p. 3580).

**Topics**
- Create a Human Review Workflow (Console) (p. 3530)
- Create a Human Review Workflow (API) (p. 3532)
- JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3535)

**Create a Human Review Workflow (Console)**

Use this procedure to create a Amazon Augmented AI (Amazon A2I) human review workflow using the SageMaker console. If you are new to Amazon A2I, we recommend that you create a private work team using people in your organization, and use this work team's ARN when creating your flow definition. To learn how to set up a private workforce and create a work team, see Create a Private Workforce (Amazon SageMaker Console) (p. 769). If you have already set up a private workforce, see Create a Work Team Using the SageMaker Console (p. 773) to learn how to add a work team to that workforce.

If you are using Amazon A2I with one of the built-in task types, you can create worker instructions using a default worker task template provided by Augmented AI while creating a human review workflow in the console. To see samples of the default templates provided by Augmented AI, see the built-in task types in Use Cases and Examples Using Amazon A2I (p. 3521).

**To create flow definition (console)**

2. In the navigation pane, under the Augmented AI section, choose Human review workflows and then choose Create human review workflow.
3. In Overview, do the following:
   a. For Name, enter a unique workflow name. The name must be lowercase, unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
   b. For S3 location for output, enter the S3 bucket where you want to store the human review results. The bucket must be located in the same AWS Region as the workflow.
   c. For IAM role, choose the role that has the required permissions. If you choose a built-in task type and want to preview your worker template in the console, provide a role with the type of policy described in Enable Worker Task Template Previews (p. 3580) attached.
4. For Task type, choose the task type that you want the human worker to perform.
5. If you chose the Amazon Rekognition or Amazon Textract task type, specify the conditions that invoke human review.
   - For Amazon Rekognition image moderation tasks, choose an inference confidence score threshold interval that initiates human review.
   - For Amazon Textract tasks, you can initiate a human review when specific form keys are missing or when form key detection confidence is low. You can also initiate a human review if, after evaluating all of the form keys in the text, confidence is lower than your required threshold for
any form key. Two variables specify your confidence thresholds: **Identification confidence** and **Qualification confidence**. To learn more about these variables, see Use Amazon Augmented AI with Amazon Textract (p. 3523).

- For both task types, you can randomly send a percentage of data objects (images or forms) and their labels to humans for review.

6. Configure and specify your worker task template:

   a. If you are using the Amazon Rekognition or Amazon Textract task type:
      
      • In the **Create template** section:
        
        • To create instructions for your workers using the Amazon A2I default template for Amazon Rekognition and Amazon Textract task types, choose **Build from a default template**.
        
        • If you choose **Build from a default template**, create your instructions under **Worker task design**:
          
          • Provide a **Template name** that is unique in the AWS Region you are in.
          
          • In the **Instructions** section, provide detailed instructions on how to complete your task. To help workers achieve greater accuracy, provide good and bad examples.
          
          • (Optional) In **Additional instructions**, provide your workers with additional information and instructions.

          For information on creating effective instructions, see Creating Good Worker Instructions (p. 3565).

          • To select a custom template that you've created, choose it from the **Template** menu and provide a **Task description** to briefly describe the task for your workers. To learn how to create a custom template, see Create a Worker Task Template (p. 3557).

   b. If you are using the custom task type:
      
      • In the **Worker task template** section, select your template from the list. All of the templates that you have created in the SageMaker console appear in this list. To learn how to create a template for custom task types, see Create and Manage Worker Task Templates (p. 3556).

7. (Optional) Preview your worker template:

   For Amazon Rekognition and Amazon Textract task types, you have the option to choose **See a sample worker task** to preview your worker task UI.

   If you are creating a flow definition for a custom task type, you can preview your worker task UI using the RenderUiTemplate operation. For more information, see Preview a Worker Task Template (p. 3565).

8. For **Workers**, choose a workforce type.

9. Choose **Create**.

**Next Steps**

After you've created a human review workflow, it appears in the console under **Human review workflows**. To see your flow definition's Amazon Resource Name (ARN) and configuration details, choose the workflow by selecting its name.

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (for example, the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both options, see Create and Start a Human Loop (p. 3548).
Create a Human Review Workflow (API)

To create a flow definition using the SageMaker API, you use the `CreateFlowDefinition` operation. After you complete the Prerequisites to Using Augmented AI (p. 3505), use the following procedure to learn how to use this API operation.

For an overview of the `CreateFlowDefinition` operation, and details about each parameter, see `CreateFlowDefinition`.

To create a flow definition (API)

1. For `FlowDefinitionName`, enter a unique name. The name must be unique within the AWS Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
2. For `RoleArn`, enter the ARN of the role that you configured to grant access to your data sources.
3. For `HumanLoopConfig`, enter information about the workers and what they should see. For information about each parameter in `HumanLoopConfig`, see `HumanLoopConfig`.
4. (Optional) If you are using a built-in task type, provide conditions that initiate a human loop in `HumanLoopActivationConfig`. To learn how to create the input required for the `HumanLoopActivationConfig` parameter, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3535). If you do not specify conditions here, when you provide a flow definition to the AWS service associated with a built-in task type (for example, Amazon Textract or Amazon Rekognition), that service sends every task to a human worker for review.

If you are using a custom task type, `HumanLoopActivationConfig` is disabled. To learn how to control when tasks are sent to human workers using a custom task type, see Use Amazon Augmented AI with Custom Task Types (p. 3527).

5. (Optional) If you are using a built-in task type, specify the integration source (for example, Amazon Rekognition or Amazon Textract) in the `HumanLoopRequestSource` parameter.
6. For `OutputConfig`, indicate where in Amazon Simple Storage Service (Amazon S3) to store the output of the human loop.
7. (Optional) Use `Tags` to enter key-value pairs to help you categorize and organize a flow definition. Each tag consists of a key and a value, both of which you define.

Amazon Textract – Key-value pair extraction

The following is an example of a request to create an Amazon Textract human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use `AWS/Textract/AnalyzeDocument/Forms/V1` to create a Amazon Textract human loop. Only include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Textract/AnalyzeDocument/Forms/V1'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
```
Amazon Rekognition – Image moderation

The following is an example of a request to create an Amazon Rekognition human review workflow (flow definition) using the AWS SDK for Python (Boto3). You must use ‘AWS/Rekognition/DetectModerationLabels/Image/V3’ to create an Amazon Rekognition flow definition. Only include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Rekognition/DetectModerationLabels/Image/V3'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {}  # Empty
    },
    HumanLoopConfig={
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': ['Keyword1', 'Keyword2'],
    },
    PublicWorkforceTaskPrice={
        'AmountInUsd': {
            'Dollars': 123,
            'Cents': 123,
            'TenthFractionsOfACent': 123
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags=[
        {'Key': 'KeyName',
         'Value': 'ValueName'}
    ]
)
```
Create a Human Review Workflow (API)

The following is an example of a request to create a human review workflow (flow definition) for a custom integration. To create this type of human review workflow, omit HumanLoopRequestSource from the flow definition request. You only need to include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': ['-Keyword1','Keyword2'],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::account_number:role/role_name',
    Tags=[
        {'Key': 'KeyName'}
    ]
)
```

Custom Workflow

The following is an example of a request to create a human review workflow (flow definition) for a custom integration. To create this type of human review workflow, omit HumanLoopRequestSource from the flow definition request. You only need to include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```python
sagemaker_client = boto3.client('sagemaker', aws_region)
response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': { }
    },
    HumanLoopConfig={
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': ['Keyword1','Keyword2'],
        'PublicWorkforceTaskPrice': { 'AmountInUsd': { 'Dollars': 123, 'Cents': 123, 'TenthFractionsOfACent': 123 } },
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::account_number:role/role_name',
    Tags=[
        {'Key': 'KeyName'}
    ]
)
```
Next Steps

The return value of a successful call of the CreateFlowDefinition API operation is a flow definition Amazon Resource Name (ARN).

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that AWS service's API (i.e. the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both of these options, see Create and Start a Human Loop (p. 3548).

JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI

The HumanLoopActivationConditions is an input parameter of the CreateFlowDefinition API. This parameter is a JSON-formatted string. The JSON models the conditions under which a human loop is created when those conditions are evaluated against the response from an integrating AI service API (such as Rekognition.DetectModerationLabels or Textract.AnalyzeDocument). This response is referred to as an inference. For example, Amazon Rekognition sends an inference of a moderation label with an associated confidence score. In this example, the inference is the model's best estimate of the appropriate label for an image. For Amazon Textract, inference is made on the association between blocks of text (key-value pairs), such as the association between Name: and Sue in a form as well as content within a block of text, or word block, such as 'Name'.

The following is the schema for the JSON. At the top level, the HumanLoopActivationConditions has a JSON array, Conditions. Each member of this array is an independent condition that, if evaluated to true, results in Amazon A2I creating a human loop. Each such independent condition can be a simple condition or a complex condition. A simple condition has the following attributes:

- **ConditionType**: This attribute identifies the type of condition. Each AWS AI service API that integrates with Amazon A2I defines its own set of allowed ConditionTypes.
  - **Rekognition DetectModerationLabels**: This API supports the ModerationLabelConfidenceCheck and Sampling ConditionType values.
  - **Textract AnalyzeDocument**: This API supports the ImportantFormKeyConfidenceCheck, MissingImportantFormKey, and Sampling ConditionType values.
- **ConditionParameters**: This is a JSON object that parameterizes the condition. The set of allowed attributes of this object is dependent on the value of the ConditionType. Each ConditionType defines its own set of ConditionParameters.

A member of the Conditions array can model a complex condition. This is accomplished by logically connecting simple conditions using the And and Or logical operators and nesting the underlying simple conditions. Up to two levels of nesting are supported.

```json
{
"$schema": "http://json-schema.org/draft-07/schema#",
"definitions": {
  "Condition": {
    "type": "object",
    "properties": {
      "ConditionType": {
        "type": "string"
      }
    }
  }
}
```
Note

Human loop activation conditions aren't available for human review workflows that are integrated with custom task types. The HumanLoopActivationConditions parameter is disabled for custom task types.
Use Human Loop Activation Conditions JSON Schema with Amazon Textract

When used with Amazon A2I, the AnalyzeDocument operation supports the following inputs in the ConditionType parameter:

- **ImportantFormKeyConfidenceCheck** – Use this condition to create a human loop when inference confidence is within a specified range for document form keys and word blocks. A form key is any word in a document that is associated with an input. The input is called a value. Together, form keys and values are referred to as *key-value pairs*. A word block refers to the words that Amazon Textract recognizes inside of a detected block of text. To learn more about Amazon Textract document blocks, see *Documents and Block Objects* in the *Amazon Textract Developer Guide*.
- **MissingImportantFormKey** – Use this condition to create a human loop when Amazon Textract did not identify the key or its associated aliases within the document.
- **Sampling** – Use this condition to specify a percentage of forms to send to humans for review, regardless of inference confidence scores. Use this condition to do the following:
  - Audit your ML model by randomly sampling all forms analyzed by your model and sending a specified percentage to humans for review.
  - Using the ImportantFormKeyConfidenceCheck condition, randomly sample a percentage of the inferences that met the conditions specified in ImportantFormKeyConfidenceCheck to start a human loop and send only the specified percentage to humans for review.

**Note**
If you send the same request to AnalyzeDocument multiple times, the result of Sampling does not change for the inference of that input. For example, if you make an AnalyzeDocument request once, and Sampling doesn't initiate a human loop, subsequent requests to AnalyzeDocument with the same configuration do not initiate a human loop.

**ImportantFormKeyConfidenceCheck Inputs and Results**

The ImportantFormKeyConfidenceCheck ConditionType supports the following ConditionParameters:

- **ImportantFormKey** – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers. If the value of this parameter is the special catch-all value (*), then all keys are considered to be matched to the condition. You can use this to model the case where any key-value pair satisfying certain confidence thresholds needs human review.
- **ImportantFormKeyAliases** – An array that represents alternate spellings or logical equivalents for the important form key.
- **KeyValueBlockConfidenceEquals**
- **KeyValueBlockConfidenceLessThan**
- **KeyValueBlockConfidenceLessThanEquals**
- **KeyValueBlockConfidenceGreaterThan**
- **KeyValueBlockConfidenceGreaterThanEquals**
- **WordBlockConfidenceEquals**
- **WordBlockConfidenceLessThan**
- **WordBlockConfidenceLessThanEquals**
• WordBlockConfidenceGreaterThan
• WordBlockConfidenceGreaterThanEquals

When you use the ImportantFormKeyConfidenceCheck ConditionType, Amazon A2I sends the key-value block and word block inferences of the key-value blocks and associated aliases that you specified in ImportantFormKey and ImportantFormKeyAliases for human review.

When creating a flow definition, if you use the default worker task template that is provided in the Human review workflows section of the Amazon SageMaker console, key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the {{ task.input.selectedAiServiceResponse.blocks }} element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see Custom Template Example for Amazon Textract (p. 3559).

MissingImportantFormKey Inputs and Results

The MissingImportantFormKey ConditionType supports the following ConditionParameters:

• ImportantFormKey – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers.
• ImportantFormKeyAliases – An array that represents alternate spellings or logical equivalents for the important form key.

When you use the MissingImportantFormKey ConditionType, if the key in ImportantFormKey or aliases in ImportantFormKeyAliases are not included in the Amazon Textract inference, that form is sent to human for review and no predicted key-value pairs are included. For example, if Amazon Textract only identified Address and Phone in a form, but was missing the ImportantFormKey Name (in the MissingImportantFormKey condition type) that form would be sent to humans for review without any of the form keys detected (Address and Phone).

If you use the default worker task template that is provided in the SageMaker console, a task is created asking workers to identify the key in ImportantFormKey and associated value. If you use a custom worker task template, you need to include the <task.input.humanLoopContext> custom HTML element to configure this task.

Sampling Inputs and Results

The Sampling ConditionType supports the RandomSamplingPercentage ConditionParameters. The input for RandomSamplingPercentage must be real number between 0.01 and 100. This number represents the percentage of data that qualifies for a human review and is sent to humans for review. If you use the Sampling condition without any other conditions, this number represents the percentage of all resulting inferences made by the AnalyzeDocument operation from a single request that is sent to humans for review.

If you specify the Sampling condition without any other condition type, all key-value and block inferences are sent to workers for review.

When creating a flow definition, if you use the default worker task template that is provided in the Human review workflows section of the SageMaker console, all key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the {{ task.input.selectedAiServiceResponse.blocks }} element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see Custom Template Example for Amazon Textract (p. 3559).
Examples

While only one condition needs to evaluate to true to initiate a human loop, Amazon A2I evaluates all conditions for each object analyzed by Amazon Textract. The human reviewers are asked to review the important form keys for all the conditions that evaluated to true.

Example 1: Detect important form keys with confidence scores in a specified range that initiate a human loop

The following example shows a HumanLoopActivationConditions JSON that initiates a human loop if any one of the following three conditions is met:

- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Employee Name, Name, or EmployeeName, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block being less than 65 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract AnalyzeDocument API returns a key-value pair whose key is one of Gross Pay, GrossPay, or GrossAmount, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.

```json
{
  "Conditions": [
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "Employee Name",
        "ImportantFormKeyAliases": [
          "Name",
          "EmployeeName"
        ],
        "KeyValueBlockConfidenceLessThan": 60,
        "WordBlockConfidenceLessThan": 85
      }
    },
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "Pay Date",
        "ImportantFormKeyAliases": [
          "PayDate",
          "DateOfPay",
          "pay-date"
        ],
        "KeyValueBlockConfidenceLessThan": 65,
        "WordBlockConfidenceLessThan": 85
      }
    },
    {
      "ConditionType": "ImportantFormKeyConfidenceCheck",
      "ConditionParameters": {
        "ImportantFormKey": "Gross Pay",
        "ImportantFormKeyAliases": [
          "GrossPay",
          "GrossAmount"
        ],
        "KeyValueBlockConfidenceLessThan": 60,
        "WordBlockConfidenceLessThan": 85
      }
    }
  ]
}
```
Example 2: Use ImportantFormKeyConfidenceCheck

In the following example, if Amazon Textract detects a key-value pair whose confidence for the key-value block is less than 60 and is less than 90 for any underlying word blocks, it creates a human loop. The human reviewers are asked to review all the form key-value pairs that matched the confidence value comparisons.

```json
{
    "Conditions": [
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "*",
                "KeyValueBlockConfidenceLessThan": 60,
                "WordBlockConfidenceLessThan": 90
            }
        }
    ]
}
```

Example 3: Use Sampling

In the following example, 5% of inferences resulting from an Amazon Textract AnalyzeDocument request are sent to human workers for review. All detected key-value pairs returned by Amazon Textract are sent to workers for review.

```json
{
    "Conditions": [
        {
            "ConditionType": "Sampling",
            "ConditionParameters": {
                "RandomSamplingPercentage": 5
            }
        }
    ]
}
```

Example 4: Use MissingImportantFormKey

In the following example, if Mailing Address or its alias, Mailing Address:, is missing from keys detected by Amazon Textract, a human review is initiated. When using the default worker task template, the worker UI asks workers to identify the key Mailing Address or Mailing Address: and its associated value.

```json
{
    "ConditionType": "MissingImportantFormKey",
    "ConditionParameters": {
        "ImportantFormKey": "Mailing Address",
        "ImportantFormKeyAliases": ["Mailing Address:"]
    }
}
```

Example 5: Use Sampling and ImportantFormKeyConfidenceCheck with the And operator

In this example, 5% of key-value pairs detected by Amazon Textract whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85, are sent to workers for review.
Example 6: Use Sampling and ImportantFormKeyConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low confidence inferences of a specified key-value pair for human review and sample high confidence inference of a key-value pair at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences less than 60, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.
- 5% of key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences greater than 90, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.

```json
{
    "Conditions": [
        {
            "And": [
                {
                    "ConditionType": "Sampling",
                    "ConditionParameters": {
                        "RandomSamplingPercentage": 5
                    }
                },
                {
                    "ConditionType": "ImportantFormKeyConfidenceCheck",
                    "ConditionParameters": {
                        "ImportantFormKey": "Pay Date",
                        "ImportantFormKeyAliases": [
                            "PayDate",
                            "DateOfPay",
                            "pay-date"
                        ],
                        "KeyValueBlockConfidenceLessThan": 65,
                        "WordBlockConfidenceLessThan": 85
                    }
                }
            ]
        },
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Pay Date",
                "ImportantFormKeyAliases": [
                    "PayDate",
                    "DateOfPay",
                    "pay-date"
                ],
                "KeyValueBlockConfidenceLessThan": 60,
                "WordBlockConfidenceLessThan": 60
            }
        }
    ]
}
```
Example 7: Use Sampling and ImportantFormKeyConfidenceCheck with the Or operator

In the following example, the Amazon Textract AnalyzeDocument operation returns a key-value pair whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85. Additionally, 5% of all other forms initiate a human loop. For each form randomly chosen, all key-value pairs detected for that form are sent to humans for review.

```json
{
    "Conditions": [
        {
            "Or": [
                {
                    "ConditionType": "Sampling",
                    "ConditionParameters": {
                        "RandomSamplingPercentage": 5
                    }
                },
                {
                    "ConditionType": "ImportantFormKeyConfidenceCheck",
                    "ConditionParameters": {
                        "ImportantFormKey": "Pay Date",
                        "ImportantFormKeyAliases": [
                            "PayDate",
                            "DateOfPay",
                            "pay-date"
                        ],
                        "KeyValueBlockConfidenceLessThan": 65,
                        "WordBlockConfidenceLessThan": 85
                    }
                }
            ]
        }
    ]
}
```
Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition

When used with Amazon A2I, the Amazon Rekognition DetectModerationLabels operation supports the following inputs in the ConditionType parameters:

- ModerationLabelConfidenceCheck – Use this condition type to create a human loop when inference confidence is low for one or more specified labels.
- Sampling – Use this condition to specify a percentage of all inferences to send to humans for review. Use this condition to do the following:
  - Audit your ML model by randomly sampling all of your model's inferences and sending a specified percentage to humans for review.
  - Using the ModerationLabelConfidenceCheck condition, randomly sample a percentage of the inferences that met the conditions specified in ModerationLabelConfidenceCheck to start a human loop and send only the specified percentage to humans for review.

**Note**

If you send the same request to DetectModerationLabels multiple times, the result of Sampling does not change for the inference of that input. For example, if you make a DetectModerationLabels request once, and Sampling does not initiate a human loop, subsequent requests to DetectModerationLabels with the same configuration don't initiate a human loop.

When creating a flow definition, if you use the default worker task template that is provided in the Human review workflows section of the Amazon SageMaker console, inferences sent for human review by these activation conditions are included in the worker UI when a worker opens your task. If you use a custom worker task template, you need to include the <task.input.selectedAiServiceResponse.blocks> custom HTML element to access these inferences. For an example of a custom template that uses this HTML element, see Custom Template Example for Amazon Rekognition (p. 3561).

**ModerationLabelConfidenceCheck Inputs**

For the ModerationLabelConfidenceCheck ConditionType, the following ConditionParameters are supported:

- ModerationLabelName – The exact (case-sensitive) name of a ModerationLabel detected by the Amazon Rekognition DetectModerationLabels operation. You can specify the special catch-all value (*) to denote any moderation label.
- ConfidenceEquals
- ConfidenceLessThan
- ConfidenceLessThanEquals
- ConfidenceGreaterThan
- ConfidenceGreaterThanEquals

When you use the ModerationLabelConfidenceCheck ConditionType, Amazon A2I sends label inferences for the labels that you specified in ModerationLabelName for human review.

**Sampling Inputs**

The Sampling ConditionType supports the RandomSamplingPercentage ConditionParameters. The input for the RandomSamplingPercentage parameter should be real number between 0.01 and
100. This number represents the percentage of inferences that qualifies for a human review that are sent to humans for review. If you use the Sampling condition without any other conditions, this number represents the percentage of all inferences that result from a single DetectModerationLabel request that are sent to humans for review.

Examples

Example 1: Use ModerationLabelConfidenceCheck with the And operator

The following example of a HumanLoopActivationConditions condition initiates a human loop when one or more of the following conditions are met:

- Amazon Rekognition detects the Graphic Male Nudity moderation label with a confidence between 90 and 99.
- Amazon Rekognition detects the Graphic Female Nudity moderation label with a confidence between 80 and 99.

Note the use of the Or and And logical operators to model this logic.

Although only one of the two conditions under the Or operator needs to evaluate to true for a human loop to be created, Amazon Augmented AI evaluates all conditions. Human reviewers are asked to review the moderation labels for all the conditions that evaluated to true.

```json
{
  "Conditions": [
    {
      "Or": [
        {
          "And": [
            {
              "ConditionType": "ModerationLabelConfidenceCheck",
              "ConditionParameters": {
                "ModerationLabelName": "Graphic Male Nudity",
                "ConfidenceLessThanEquals": 99
              }
            },
            {
              "ConditionType": "ModerationLabelConfidenceCheck",
              "ConditionParameters": {
                "ModerationLabelName": "Graphic Male Nudity",
                "ConfidenceGreaterThanEquals": 90
              }
            }
          ]
        },
        {
          "And": [
            {
              "ConditionType": "ModerationLabelConfidenceCheck",
              "ConditionParameters": {
                "ModerationLabelName": "Graphic Female Nudity",
                "ConfidenceLessThanEquals": 99
              }
            },
            {
              "ConditionType": "ModerationLabelConfidenceCheck",
              "ConditionParameters": {
                "ModerationLabelName": "Graphic Female Nudity",
                "ConfidenceGreaterThanEquals": 80
              }
            }
          ]
        }
      ]
    }
  ]
}
```
Example 2: Use ModerationLabelConfidenceCheck with the catch-all value (*)

In the following example, if any moderation label with a confidence greater than or equal to 75 is detected, a human loop is initiated. Human reviewers are asked to review all moderation labels with confidence scores greater than or equal to 75.

```json
{
    "Conditions": [
        {
            "ConditionType": "ModerationLabelConfidenceCheck",
            "ConditionParameters": {
                "ModerationLabelName": "*",
                "ConfidenceGreaterThanEquals": 75
            }
        }
    ]
}
```

Example 3: Use Sampling

In the following example, 5% of Amazon Rekognition inferences from a DetectModerationLabels request are sent to human workers. When using the default worker task template provided in the SageMaker console, all moderation labels returned by Amazon Rekognition are sent to workers for review.

```json
{
    "Conditions": [
        {
            "ConditionType": "Sampling",
            "ConditionParameters": {
                "RandomSamplingPercentage": 5
            }
        }
    ]
}
```

Example 4: Use Sampling and ModerationLabelConfidenceCheck with the And operator

In this example, 5% of Amazon Rekognition inferences of the Graphic Male Nudity moderation label with a confidence greater than 50 are sent workers for review. When using the default worker task template provided in the SageMaker console, only the inferences of the Graphic Male Nudity label are sent to workers for review.

```json
{
    "Conditions": [
        {
            "And": [
                {
                    "ConditionType": "Sampling",
                    "ConditionParameters": {
                        "RandomSamplingPercentage": 5
                    }
                },
                {
                    "ConditionType": "ModerationLabelConfidenceCheck",
                    "ConditionParameters": {
                        "ModerationLabelName": "Graphic Male Nudity",
                        "ConfidenceGreaterThan": 50
                    }
                }
            ]
        }
    ]
}
```
Example 5: Use Sampling and ModerationLabelConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low-confidence inferences of a specified label for human review and sample high-confidence inferences of a label at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Inferences for the Graphic Male Nudity moderation label with confidence scores less than 60 are always sent for human review. Only the Graphic Male Nudity label is sent to workers to review.
- 5% of all inferences for the Graphic Male Nudity moderation label with confidence scores greater than 90 are sent for human review. Only the Graphic Male Nudity label is sent to workers to review.

```json
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceLessThan": 60
          }
        },
        {
          "And": [
            {
              "ConditionType": "Sampling",
              "ConditionParameters": {
                "RandomSamplingPercentage": 5
              }
            },
            {
              "ConditionType": "ModerationLabelConfidenceCheck",
              "ConditionParameters": {
                "ModerationLabelName": "Graphic Male Nudity",
                "ConfidenceGreaterThan": 90
              }
            }
          ]
        }
      ]
    }
  ]
}
```

Example 6: Use Sampling and ModerationLabelConfidenceCheck with the Or operator

In the following example, a human loop is created if the Amazon Rekognition inference response contains the 'Graphic Male Nudity' label with inference confidence greater than 50. Additionally, 5% of all other inferences initiate a human loop.

```json
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceGreaterThan": 50
          }
        },
        {
          "Sampling": {
            "RandomSamplingPercentage": 5
          }
        }
      ]
    }
  ]
}
```
Delete a Human Review Workflow

When you delete a human review workflow or you delete your AWS account while a human loop is in process, your human review workflow status changes to Deleting. Amazon A2I automatically stops and deletes all associated human loops if workers have not started tasks created by those human loops. If human workers are already working on a task, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human review workflow’s status is Deleting. If these tasks are completed, the results are stored in the Amazon S3 bucket specified in your flow definition.

Deleting a flow definition does not remove any worker answers from your S3 bucket. If the tasks are completed, but you deleted your AWS account, the results are stored in the Augmented AI service bucket for 30 days and then permanently deleted.

After all human loops have been deleted, the human review workflow is permanently deleted. When a human review workflow has been deleted, you can reuse its name to create a new human review workflow.

You might want to delete a human review workflow for any of the following reasons:

- You have sent data to a set of human reviewers and you want to delete all non-started human loops because you do not want those workers to work on those tasks any longer.
- The worker task template used to generate your worker UI does not render correctly or is not functioning as expected.

After you delete a human review workflow, the following changes occur:

- The human review workflow no longer appears on the **Human review workflows** page in the Augmented AI area of the Amazon SageMaker console.
- When you use the human review workflow name as input to the API operations `DescribeFlowDefinition` or `DeleteFlowDefinition`, Augmented AI returns a `ResourceNotFound` error.
- When you use `ListFlowDefinitions`, deleted human review workflows aren’t included in the results.
- When you use `ListHumanLoops`, Augmented AI returns a `ResourceNotFoundException`.
Delete a Flow Definition Using the Console or the SageMaker API

You can delete a human review workflow on the Human review workflows page in the Augmented AI area of the SageMaker console or by using the SageMaker API. Flow definitions can only be deleted if their status is Active.

Delete a human review workflow (console)

1. Navigate to the Augmented AI console at https://console.aws.amazon.com/a2i/.
2. In the navigation pane, under the Augmented AI section, choose Human review workflows.
3. Select the hyperlinked name of the human review workflow that you want to delete.
4. On the Summary page of your human review workflow, choose Delete.
5. In the dialog box asking you to confirm that you want to delete your human review workflow, choose Delete.

You're automatically redirected to the Human review workflows page. While your human review workflow is being deleted, the status Deleting appears in the status column for that workflow. After it's deleted, it doesn't appear in the list of workflows on this page.

Delete a human review workflow (API)

You can delete a human review workflow (flow definition) using the SageMaker DeleteFlowDefinition API operation. This API operation is supported through the AWS CLI and a variety of language specific SDKs. The following table shows example requests using SDK for Python (Boto3) and the AWS CLI to delete the human review workflow, example-flow-definition.

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3) to delete the human review workflow. For more information, see delete_flow_definition in the AWS SDK for Python (Boto) API Reference.

```python
import boto3
sagemaker_client = boto3.client('sagemaker')
response = sagemaker_client.delete_flow_definition(FlowDefinitionName='example-flow-definition')
```

AWS CLI

The following request example uses the AWS CLI to delete the human review workflow. For more information, see delete-flow-definition in the AWS CLI Command Reference.

```
$ aws sagemaker delete-flow-definition --flow-definition-name 'example-flow-definition'
```

If the action is successful, Augmented AI sends back an HTTP 200 response with an empty HTTP body.

Create and Start a Human Loop

A human loop starts your human review workflow and sends data review tasks to human workers. When you use one of the Amazon A2I built-in task types, the corresponding AWS service creates and
starts a human loop on your behalf when the conditions specified in your flow definition are met. If no conditions are specified in your flow definition, a human loop is created for each object. When using Amazon A2I for a custom task, a human loop starts when your application calls StartHumanLoop.

Use the following instructions to configure a human loop with Amazon Rekognition or Amazon Textract built-in task types and custom task types.

**Prerequisites**

To create and start a human loop, you must attach the AmazonAugmentedAIFullAccess policy to the AWS Identity and Access Management (IAM) user or role that configures or starts the human loop. This is the identity that you use to configure the human loop using HumanLoopConfig for built-in task types. For custom task types, this is the identity that you use to call StartHumanLoop.

Additionally, when using a built-in task type, your IAM user or role must have permission to invoke API operations of the AWS service associated with your task type. For example, if you are using Amazon Rekognition with Augmented AI, you must attach permissions required to call DetectModerationLabels. For examples of identity-based policies you can use to grant these permissions, see [Amazon Rekognition Identity-Based Policy Examples](https://docs.aws.amazon.com/rekognition/latest/dg/rekognition-iam-policy-examples.html) and [Amazon Textract Identity-Based Policy Examples](https://docs.aws.amazon.com/textract/latest/dg/textract-iam-policy-examples.html). You can also use the more general policy AmazonAugmentedAIIntegratedAPIAccess to grant these permissions. For more information, see [Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations](p. 3579).

To create and start a human loop, you need a flow definition ARN. To learn how to create a flow definition (or human review workflow), see [Create a Human Review Workflow](p. 3529).

**Important**

Amazon A2I requires all S3 buckets that contain human loop input image data to have a CORS policy attached. To learn more about this change, see [CORS Permission Requirement](p. 3577).

### Create and Start a Human Loop for a Built-in Task Type

To start a human loop using a built-in task type, use the corresponding service's API to provide your input data and to configure the human loop. For Amazon Textract, you use the AnalyzeDocument API operation. For Amazon Rekognition, you use the DetectModerationLabels API operation. You can use the AWS CLI or a language-specific SDK to create requests using these API operations.

**Important**

When you create a human loop using a built-in task type, you can use DataAttributes to specify a set of ContentClassifiers related to the input provided to the StartHumanLoop operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA. Include the FreeOfPersonallyIdentifiableInformation content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the 'FreeOfAdultContent' classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

After you start your ML job using your built-in task type's AWS service API, Amazon A2I monitors the inference results of that service. For example, when running a job with Amazon Rekognition, Amazon A2I checks the inference confidence score for each image and compares it to the confidence thresholds specified in your flow definition. If the conditions to start a human review task are satisfied, or if you didn't specify conditions in your flow definition, a human review task is sent to workers.
Create an Amazon Textract Human Loop

Amazon A2I integrates with Amazon Textract so that you can configure and start a human loop using the Amazon Textract API. To send a document file to Amazon Textract for document analysis, you use the Amazon Textract AnalyzeDocument API operation. To add a human loop to this document analysis job, you must configure the parameter HumanLoopConfig.

When you configure your human loop, the flow definition you specify in FlowDefinitionArn of HumanLoopConfig must be located in the same AWS Region as the bucket identified in Bucket of the Document parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

**AWS SDK for Python (Boto3)**

The following request example uses the SDK for Python (Boto3). For more information, see analyze_document in the AWS SDK for Python (Boto) API Reference.

```python
import boto3
textract = boto3.client('textract', aws_region)
response = textract.analyze_document(
    Document={'S3Object': {'Bucket': bucket_name, 'Name': document_name}},
    FeatureTypes=['TABLES', 'FORMS'],
    HumanLoopConfig={
        'HumanLoopName': 'human_loop_name',
        'DataAttributes': {'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']}
    }
)
```

**AWS CLI**

The following request example uses the AWS CLI. For more information, see analyze-document in the AWS CLI Command Reference.

```
$ aws textract analyze-document \
    --document '{"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' \
    --human-loop-config \
    HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name",DataAttributes='{ContentClassifiers=["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}' \
    --feature-types ['"TABLES", "FORMS"]'
```

```
$ aws textract analyze-document \
    --document '{"S3Object":{"Bucket":"bucket_name","Name":"document_name"}}' \
    --human-loop-config \
    '{"HumanLoopName":"human_loop_name","FlowDefinitionArn":"arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name","DataAttributes":{"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}}' \
    --feature-types ['"TABLES", "FORMS"]'
```
After you run `AnalyzeDocument` with a human loop configured, Amazon A2I monitors the results from `AnalyzeDocument` and checks it against the flow definition’s activation conditions. If the Amazon Textract inference confidence score for one or more key-value pairs meets the conditions for review, Amazon A2I starts a human review loop and includes the `HumanLoopActivationOutput` object in the `AnalyzeDocument` response.

Create an Amazon Rekognition Human Loop

Amazon A2I integrates with Amazon Rekognition so that you can configure and start a human loop using the Amazon Rekognition API. To send images to Amazon Rekognition for content moderation, you use the Amazon Rekognition `DetectModerationLabels` API operation. To configure a human loop, set the `HumanLoopConfig` parameter when you configure `DetectModerationLabels`.

When you configure your human loop, the flow definition you specify in `FlowDefinitionArn` of `HumanLoopConfig` must be located in the same AWS Region as the S3 bucket identified in `Bucket` of the `Image` parameter.

The following table shows examples of how to use this operation with the AWS CLI and AWS SDK for Python (Boto3).

### AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see `detect_moderation_labels` in the [AWS SDK for Python (Boto) API Reference](https://boto3.amazonaws.com/v1/documentation/api/latest/reference/services/rekognition.html#Rekognition.Client.detect_moderation_labels).

```python
import boto3
rekognition = boto3.client("rekognition", aws_region)
response = rekognition.detect_moderation_labels( 
    Image={'S3Object': {'Bucket': bucket_name, 'Name': image_name}}, 
    HumanLoopConfig={
        'HumanLoopName': human_loop_name, 
        'FlowDefinitionArn': flow_def_arn, 
    },
    DataAttributes={'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']}
)
```

### AWS CLI

The following request example uses the AWS CLI. For more information, see `detect-moderation-labels` in the [AWS CLI Command Reference](https://awscli.amazonaws.com/v2/documentation/api/latest/reference/rekognition/detect-moderation-labels.html).

```bash
$ aws rekognition detect-moderation-labels --image "S3Object={Bucket='bucket_name',Name='image_name'}" --human-loop-config "HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name" DataAttributes='{"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}'
```

```bash
$ aws rekognition detect-moderation-labels --image "S3Object={Bucket='bucket_name',Name='image_name'}" --human-loop-config "{"HumanLoopName": "human_loop_name", "FlowDefinitionArn": "arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name", "DataAttributes": {"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"]}}"
```
After you run DetectModerationLabels with a human loop configured, Amazon A2I monitors the results from DetectModerationLabels and checks it against the flow definition's activation conditions. If the Amazon Rekognition inference confidence score for an image meets the conditions for review, Amazon A2I starts a human review loop and includes the response element HumanLoopActivationOutput in the DetectModerationLabels response.

Create and Start a Human Loop for a Custom Task Type

To configure a human loop for a custom human review task, use the StartHumanLoop operation within your application. This section provides an example of a human loop request using the AWS SDK for Python (Boto3) and the AWS Command Line Interface (AWS CLI). For documentation on other language-specific SDKs that support StartHumanLoop, use the See Also section of StartHumanLoop in the Amazon Augmented AI Runtime API documentation. Refer to Use Cases and Examples Using Amazon A2I (p. 3521) to see examples that demonstrate how to use Amazon A2I with a custom task type.

Prerequisites

To complete this procedure, you need:

- Input data formatted as a string representation of a JSON-formatted file
- The Amazon Resource Name (ARN) of your flow definition

To configure the human loop

1. For DataAttributes, specify a set of ContentClassifiers related to the input provided to the StartHumanLoop operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

   To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA, and include the FreeOfPersonallyIdentifiableInformation content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the ‘FreeOfAdultContent’ classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

2. For FlowDefinitionArn, enter the Amazon Resource Name (ARN) of your flow definition.

3. For HumanLoopInput, enter your input data as a string representation of a JSON-formatted file. Structure your input data and custom worker task template so that your input data is properly displayed to human workers when you start your human loop. See Preview a Worker Task Template (p. 3565) to learn how to preview your custom worker task template.

4. For HumanLoopName, enter a name for the human loop. The name must be unique within the Region in your account and can have up to 63 characters. Valid characters are a-z, 0-9, and -(hyphen).

To start a human loop

- To start a human loop, submit a request similar to the following examples using your preferred language-specific SDK.

AWS SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see Boto 3 Augmented AI Runtime in the AWS SDK for Python (Boto) API Reference.
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')

response = a2i_runtime_client.start_human_loop(
    HumanLoopName='human_loop_name',
    HumanLoopInput={
        'InputContent': '{"InputContent": {"prompt":"What is the answer?"}}'
    },
    DataAttributes={
        'ContentClassifiers': ['FreeOfPersonallyIdentifiableInformation','FreeOfAdultContent'],
    }
)

AWS CLI

The following request example uses the AWS CLI. For more information, see start-human-loop in the AWS CLI Command Reference.

```bash
$ aws sagemaker-a2i-runtime start-human-loop
--flow-definition-arn 'arn:aws:sagemaker:aws-region:xyz:flow-definition/flow_def_name' \
--human-loop-name 'human_loop_name' \
--human-loop-input '{"InputContent": "{"prompt":"What is the answer?"}"}' \
--data-attributes ContentClassifiers="FreeOfPersonallyIdentifiableInformation","FreeOfAdultContent"
```

When you successfully start a human loop by invoking StartHumanLoop directly, the response includes a HumanLoopARN and a HumanLoopActivationResults object which is set to NULL. You can use this the human loop name to monitor and manage your human loop.

Next Steps:

After starting a human loop, you can manage and monitor it with the Amazon Augmented AI Runtime API and Amazon CloudWatch Events. To learn more, see Monitor and Manage Your Human Loop (p. 3566).

Delete a Human Loop

When you delete a human loop, the status changes to Deleting. When the human loop is deleted, the associated human review task is no longer available to workers. You might want to delete a human loop in one of the following circumstances:

- The worker task template used to generate your worker user interface does not render correctly or is not functioning as expected.
- A single data object was accidentally sent to workers multiple times.
- You no longer need a data object reviewed by a human.

If the status of a human loop is InProgress, you must stop the human loop before deleting it. When you stop a human loop, the status changes to Stopping while it is being stopped. When the status changes to Stopped, you can delete the human loop.
If human workers are already working on a task when you stop the associated human loop, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human loop's status is Stopping. If these tasks are completed, the results are stored in the Amazon S3 bucket URI specified in your human review workflow. If the worker leaves the task without submitting work, it is stopped and the worker can't return to the task. If no worker has started working on the task, it is stopped immediately.

If you delete the AWS account used to create the human loop, it is stopped and deleted automatically.

**Human Loop Data Retention and Deletion**

When a human worker completes a human review task, the results are stored in the Amazon S3 output bucket you specified in the human review workflow used to create the human loop. Deleting or stopping a human loop does not remove any worker answers from your S3 bucket.

Additionally, Amazon A2I temporarily stores human loop input and output data internally for the following reasons:

- If you configure your human loops so that a single data object is sent to multiple workers for review, Amazon A2I does not write output data to your S3 bucket until all workers have completed the review task. Amazon A2I stores partial answers—answers from individual workers—internally so that it can write full results to your S3 bucket.
- If you report a low-quality human review result, Amazon A2I can investigate and respond to your issue.
- If you lose access to or delete the output S3 bucket specified in the human review workflow used to create a human loop, and the task has already been sent to one or more workers, Amazon A2I needs a place to temporarily store human review results.

Amazon A2I deletes this data internally 30 days after a human loop’s status changes to one of the following: Deleted, Stopped, or Completed. In other words, data is deleted 30 days after the human loop has been completed, stopped, or deleted. Additionally, this data is deleted after 30 days if you close the AWS account used to create associated human loops.

**Stop and Delete a Flow Definition Using the Console or the Amazon A2I API**

You can stop and delete a human loop in the Augmented AI console or by using the SageMaker API. When the human loop has been deleted, the status changes to Deleted.

**Delete a human loop (console)**

1. Navigate to the Augmented AI console at https://console.aws.amazon.com/a2i/.
2. In the navigation pane, under the Augmented AI section, choose Human review workflows.
3. Choose the hyperlinked name of the human review workflow you used to create the human loop you want to delete.
4. In the Human loops section at the bottom of the page, select the human loop you want to stop and delete.
5. If the human loop status is Completed, Stopped, or Failed, select Delete.
   
   If the human loop Status is InProgress, select Stop. When the status changes to Stopped, select Delete.
Delete a human loop (API)

1. Check the status of your human loop using the Augmented AI Runtime API operation `DescribeHumanLoop`. See examples using this operation in the following table.

**AWS SDK for Python (Boto3)**

The following example uses the SDK for Python (Boto3) to describe the human loop named `example-human-loop`. For more information, see `describe_human_loop` in the AWS SDK for Python (Boto) API Reference.

```python
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.describe_human_loop(HumanLoopName='example-human-loop')
human_loop_status = response['HumanLoopStatus']
print(f'example-human-loop status is: {human_loop_status}')
```

**AWS CLI**

The following example uses the AWS CLI to describe the human loop named `example-human-loop`. For more information, see `describe-human-loop` in the AWS CLI Command Reference.

```
$ aws sagemaker-a2i-runtime describe-human-loop --human-loop-name 'example-human-loop'
```

2. If the flow definition status is Completed, Stopped, or Failed, delete the flow definition using the Augmented AI Runtime API operation `DeleteHumanLoop`.

**AWS SDK for Python (Boto3)**

The following example uses the SDK for Python (Boto3) to delete the human loop named `example-human-loop`. For more information, see `delete_human_loop` in the AWS SDK for Python (Boto) API Reference.

```python
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.delete_human_loop(HumanLoopName='example-human-loop')
```

**AWS CLI**

The following example uses the AWS CLI to delete the human loop named `example-human-loop`. For more information, see `delete-human-loop` in the AWS CLI Command Reference.

```
$ aws sagemaker-a2i-runtime delete-human-loop --human-loop-name 'example-human-loop'
```

If the human loop status is InProgress, stop the human loop using `StopHumanLoop` and then use `DeleteHumanLoop` to delete it.

**AWS SDK for Python (Boto3)**

The following example uses the SDK for Python (Boto3) to describe the human loop named `example-human-loop`. For more information, see `stop_human_loop` in the AWS SDK for Python (Boto) API Reference.
Create and Manage Worker Task Templates

You can create a task user interface for your workers by creating a worker task template. A worker task template is an HTML file that is used to display your input data and instructions to help workers complete your task.

For Amazon Rekognition or Amazon Textract task types, you can customize a pre-made worker task template using a graphical user interface (GUI) and avoid interacting with HTML code. For this option, use the instructions in Create a Human Review Workflow (Console) (p. 3530) to create a human review workflow and customize your worker task template in the Amazon SageMaker console. Once you create a template using these instructions, it appears on the worker task templates page of the Augmented AI console.

If you are creating a human review workflow for a custom task type, you must create a custom worker task template using HTML code. For more information, see Create Custom Worker Task Templates (p. 3558).

If you create your template using HTML, you must use this template to generate an Amazon A2I human task UI Amazon Resource Name (ARN) in the Amazon A2I console. This ARN has the following format: \textit{arn:aws:sagemaker:<aws-region>:<aws-account-number>:human-task-ui/<template-name>}. This ARN is associated with a worker task template resource that you can use in one or more human review workflows (flow definitions).

Generate a human task UI ARN using a worker task template by following the instructions found in Create a Worker Task Template (p. 3557) or by using the CreateHumanTaskUi API operation.

Topics

- Create and Delete Worker Task Templates (p. 3556)
- Create Custom Worker Task Templates (p. 3558)
- Creating Good Worker Instructions (p. 3565)

Create and Delete Worker Task Templates

You can use a worker template to customize the interface and instructions that your workers see when working on your tasks. Use the instructions on this page to create a worker task template in the Augmented AI area of the Amazon SageMaker console. A starter template is provided for Amazon Textract and Amazon Rekognition tasks. To learn how to customize your template using HTML crowd elements, see Create Custom Worker Task Templates (p. 3558).

When you create a worker template in the worker task templates page of the Augmented AI area of the SageMaker console, a worker task template ARN is generated. Use this ARN as the input to
HumanTaskUiArn when you create a flow definition using the API operation CreateFlowDefinition. You can choose this template when creating a human review workflow on the human review workflows page of the console.

If you are creating a worker task template resource for an Amazon Textract or Amazon Rekognition task type, you can preview the worker UI that is generated from your template on the worker task templates console page. You must attach the policy described in Enable Worker Task Template Previews (p. 3580) to the IAM role that you use to preview the template.

**Create a Worker Task Template**

You can create a worker task template using the SageMaker console and using the SageMaker API operation CreateHumanTaskUi.

**Create a worker task template (console)**

1. Open the Amazon A2I console at https://console.aws.amazon.com/a2i/.
2. Under Amazon Augmented AI in the left navigation pane, choose Worker task templates.
3. Choose Create template.
4. In Template name, enter a unique name.
5. (Optional) Enter an IAM role that grants Amazon A2I the permissions necessary to call services on your behalf.
6. In Template type, choose a template type from the dropdown list. If you are creating a template for a Textract-form extraction or Rekognition-image moderation task, choose the appropriate option.
7. Enter your custom template elements as follows:
   - If you selected the Amazon Textract or Amazon Rekognition task template, the Template editor autopopulates with a default template that you can customize.
   - If you are using a custom template, enter your predefined template in the editor.
8. (Optional) To complete this step, you must provide an IAM role ARN with permission to read Amazon S3 objects that get rendered on your user interface in Step 5.

   You can only preview your template if you are creating templates for Amazon Textract or Amazon Rekognition.

   Choose See preview to preview the interface and instructions that workers see. This is an interactive preview. After you complete the sample task and choose Submit, you see the resulting output from the task that you just performed.

   If you are creating a worker task template for a custom task type, you can preview your worker task UI using RenderUiTemplate. For more information, see Preview a Worker Task Template (p. 3565).

9. When you're satisfied with your template, choose Create.

After you've created your template, you can select that template when you create a human review workflow in the console. Your template also appears in the Amazon Augmented AI section of the SageMaker console under Worker task templates. Choose your template to view its ARN. Use this ARN when using the CreateFlowDefinition API operation.

**Create a worker task template using a worker task template (API)**

To generate a worker task template using the SageMaker API operation CreateHumanTaskUi, specify a name for your UI in HumanTaskUiName and input your HTML template in Content under UiTemplate. Find documentation on language-specific SDKs that support this API operation in the See Also section of the CreateHumanTaskUi.
Delete a Worker Task Template

Once you have created a worker task template, you can delete it using the SageMaker console or the SageMaker API operation `DeleteHumanTaskUi`.

When you delete a worker task template, you are not able to use human review workflows (flow definitions) created using that template to start human loops. Any human loops that have already been created using the worker task template that you delete continue to be processed until completion and are not impacted.

Delete a worker task template (console)

1. Open the Amazon A2I console at `https://console.aws.amazon.com/a2i/`.
2. Under Amazon Augmented AI in the left navigation pane, choose **Worker task templates**.
3. Select the template that you want to delete.
4. Select **Delete**.
5. A modal appears to confirm your choice. Select **Delete**.

Delete a worker task template (API)

To delete a worker task template using the SageMaker API operation `DeleteHumanTaskUi`, specify a name of your UI in `HumanTaskUiName`.

Create Custom Worker Task Templates

*Crowd HTML Elements* are web components that provide a number of task widgets and design elements that you can tailor to the question you want to ask. You can use these crowd elements to create a custom worker template and integrate it with an Amazon Augmented AI (Amazon A2I) human review workflow to customize the worker console and instructions.

For a list of all HTML crowd elements available to Amazon A2I users, see *Crowd HTML Elements Reference* (p. 789). For examples of templates, see the AWS GitHub repository, which contains over 60 sample custom task templates.

Develop Templates Locally

When in the console to test how your template processes incoming data, you can test the look and feel of your template's HTML and custom elements in your browser by adding the following code to the top of your HTML file.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

This loads the necessary code to render the custom HTML elements. Use this code if you want to develop your template's look and feel in your preferred editor instead of in the console.

This code won't parse your variables. You might want to replace them with sample content while developing locally.

Use External Assets

Amazon Augmented AI custom templates enable you to embed external scripts and style sheets. For example, the following header embeds a `text/css` style sheet name `stylesheet` located at `https://www.example.com/my-enhancement-styles.css` into the custom template.
If you encounter errors, ensure that your originating server is sending the correct MIME type and encoding headers with the assets.

For example, the MIME and encoding type for remote scripts is application/javascript;CHARSET=UTF-8.

The MIME and encoding type for remote stylesheets is text/css;CHARSET=UTF-8.

Track Your Variables

When building a custom template, you must add variables to it to represent the pieces of data that might change from task to task, or worker to worker. If you're starting with one of the sample templates, you need to make sure you're aware of the variables it already uses.

For example, for a custom template that integrates an Augmented AI human review loop with a Amazon Textract text review task, `{{ task.input.selectedAiServiceResponse.blocks }}` is used for initial-value input data. For Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition, `{{ task.input.selectedAiServiceResponse.moderationLabels }}` is used. For a custom task type, you need to determine the input parameter for your task type.

Use `{{ task.input.customInputValuesForStartHumanLoop }}` where you specify `customInputValuesForStartHumanLoop`.

Custom Template Example for Amazon Textract

All custom templates begin and end with the `<crowd-form> </crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements.

For an Amazon Textract document analysis task, use the `<crowd-textract-analyze-document>` element. It uses the following attributes:

- `src` – Specifies the URL of the image file to be annotated.
- `initialValue` – Sets initial values for attributes found in the worker UI.
- `blockTypes` (required) – Determines the kind of analysis that the workers can do. Only KEY_VALUE_SET is currently supported.
- `keys` (required) – Specifies new keys and the associated text value that the worker can add.
- `no-key-edit` (required) – Prevents the workers from editing the keys of annotations passed through `initialValue`
- `no-geometry-edit` – Prevents workers from editing the polygons of annotations passed through `initialValue`.

For children of the `<crowd-textract-analyze-document>` element, you must have two Regions. You can use arbitrary HTML and CSS elements in these Regions.

- `<full-instructions>` – Instructions that are available from the View full instructions link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- `<short-instructions>` – A brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.
An Amazon Textract template would look similar to the following.

**Example**

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/{{ task.input.aiServiceRequest.document.s3Object.bucket }}/\t{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-textract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if they don't match the following document."
    no-key-edit
    no-geometry-edit
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types="[ 'KEY_VALUE_SET']"
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
        .instructionsImage {
          display: inline-block;
          max-width: 100%;
        }
      </style>
      <p class='instructions'>Choose a key-value block to highlight the corresponding key-value pair in the document.

      If it is a valid key-value pair, review the content for the value. If the content is incorrect, correct it.
      The text of the value is incorrect, correct it.
      <img class='instructionsImage' src="https://example-site/correct-value-text.png" />

      A wrong value is identified, correct it.
      <img class='instructionsImage' src="https://example-site/correct-value.png" />

      If it is not a valid key-value relationship, choose No.
      <img class='instructionsImage' src="https://example-site/not-a-key-value-pair.png" />

      If you can’t find the key in the document, choose Key not found.
      <img class='instructionsImage' src="https://example-site/key-is-not-found.png" />

      If the content of a field is empty, choose Value is blank.
      <img class='instructionsImage' src="https://example-site/value-is-blank.png" />

      <b>Examples</b>
      Key and value are often displayed next to or below each other.
      Key and value displayed in one line.
      <img class='instructionsImage' src="https://example-site/sample-key-value-pair-1.png" />

      Key and value displayed in two lines.
      <img class='instructionsImage' src="https://example-site/sample-key-value-pair-2.png" />

      If the content of the value has multiple lines, enter all the text without a line break. Include all value text even if it extends beyond the highlight box.
      <img class='instructionsImage' src="https://assets.crowd.aws/images/a2i-console/multiple-lines.png" />
    </short-instructions>
</crowd-form>
```
Custom Template Example for Amazon Rekognition

All custom templates begin and end with the `<crowd-form> </crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements. For an Amazon Rekognition custom task template, use the `<crowd-rekognition-detect-moderation-labels>` element. This element supports the following attributes:

- `categories` – An array of strings or an array of objects where each object has a name field.
  - If the categories come in as objects, the following applies:
    - The displayed categories are the value of the name field.
    - The returned answer contains the full objects of any selected categories.
  - If the categories come in as strings, the following applies:
    - The returned answer is an array of all the strings that were selected.
- `exclusion-category` – By setting this attribute, you create a button underneath the categories in the UI. When a user selects the button, all categories are deselected and disabled. If the worker selects the button again, you re-enable users to choose categories. If the worker submits the task by selecting Submit after you select the button, that task returns an empty array.

For children of the `<crowd-rekognition-detect-moderation-labels>` element, you must have two Regions.

- `<full-instructions>` – Instructions that are available from the View full instructions link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- `<short-instructions>` – Brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

A template using these elements would look similar to the following.
<style>
  <p class='instructions'>Review the image and choose all applicable categories. If no categories apply, choose None.

  <b>Nudity</b><br>
  Visuals depicting nude male or female person or persons

  <b>Graphic Male Nudity</b><br>
  Visuals depicting full frontal male nudity, often close ups

  <b>Graphic Female Nudity</b><br>
  Visuals depicting full frontal female nudity, often close ups

  <b>Sexual Activity</b><br>
  Visuals depicting various types of explicit sexual activities and pornography

  <b>Illustrated Nudity or Sexual Activity</b><br>
  Visuals depicting animated or drawn sexual activity, nudity, or pornography

  <b>Adult Toys</b><br>
  Visuals depicting adult toys, often in a marketing context

  <b>Female Swimwear or Underwear</b><br>
  Visuals depicting female person wearing only swimwear or underwear

  <b>Male Swimwear Or Underwear</b><br>
  Visuals depicting male person wearing only swimwear or underwear

  <b>Partial Nudity</b><br>
  Visuals depicting covered up nudity, for example using hands or pose

  <b>Revealing Clothes</b><br>
  Visuals depicting revealing clothes and poses, such as deep cut dresses

  <b>Graphic Violence or Gore</b><br>
  Visuals depicting prominent blood or bloody injuries

  <b>Physical Violence</b><br>
  Visuals depicting violent physical assault, such as kicking or punching

  <b>Weapon Violence</b><br>
  Visuals depicting violence using weapons like firearms or blades, such as shooting

  <b>Weapons</b><br>
  Visuals depicting weapons like firearms and blades

  <b>Self Injury</b><br>
  Visuals depicting self-inflicted cutting on the body, typically in distinctive patterns using sharp objects

  <b>Emaciated Bodies</b><br>
  Visuals depicting extremely malnourished human bodies

  <b>Corpses</b><br>
  Visuals depicting human dead bodies

  <b>Hanging</b><br>
  Visuals depicting death by hanging
</p>
</style>
Add Automation with Liquid

The custom template system uses Liquid for automation. Liquid is an open-source inline markup language. For more information and documentation, see the Liquid homepage.

In Liquid, the text between single curly braces and percent symbols is an instruction or tag that performs an operation like control flow or iteration. Text between double curly braces is a variable or object that outputs its value. The following list includes two types of liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you are redirected to the Liquid documentation.

- **Control flow**: Includes programming logic operators like if/else, unless, and case/when.
- **Iteration**: Enables you to run blocks of code repeatedly using statements like for loops.

For example, the following code example demonstrates how you can use the Liquid for tag to create a for loop. This example loops through the moderationLabels returned from Amazon Rekognition and displays the moderationLabels attributes name and parentName for workers to review:

```liquid
{% for label in task.input.selectedAiServiceResponse.moderationLabels %}
  {
    name: &quot;{{ label.name }}&quot;,
    parentName: &quot;{{ label.parentName }}&quot;,
  },
{% endfor %}
```

Use Variable Filters

In addition to the standard Liquid filters and actions, Amazon Augmented AI (Amazon A2I) offers additional filters. You apply filters by placing a pipe (|) character after the variable name, and then specifying a filter name. To chain filters, use the following format.

**Example**

```liquid
{{ <content> | <filter> | <filter> }}
```

Autoescape and Explicit Escape

By default, inputs are HTML-escaped to prevent confusion between your variable text and HTML. You can explicitly add the escape filter to make it more obvious to someone reading the source of your template that escaping is being done.

**escape_once**

escape_once ensures that if you’ve already escaped your code, it doesn’t get re-escaped again. For example, it ensures that &amp; doesn’t become &amp;amp;.

**skip_autoescape**

skip_autoescape is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

**Note**

Use skip_autoescape sparingly. As a best practice for templates, avoid passing in functional code or markup with skip_autoescape unless you are absolutely sure that you have strict control over what’s being passed. If you’re passing user input, you could be opening your workers up to a cross-site scripting attack.
to_json

to_json encodes data that you provide to JavaScript Object Notation (JSON). If you provide an object, it serializes it.

grant_read_access

grant_read_access takes an Amazon Simple Storage Service (Amazon S3) URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible to workers.

Example Example of the to_json and grant_read_access filters

Input

```liquid
auto-escape: {{ "Have you read 'James & the Giant Peach'?' }}
explicit escape: {{ "Have you read 'James & the Giant Peach'?' | escape }}
explicit escape_once: {{ "Have you read 'James & the Giant Peach'?' | escape_once }}
skip_autoescape: {{ "Have you read 'James & the Giant Peach'?' | skip_autoescape }}
to_json: {{ jsObject | to_json }}
grant_read_access: {{ "s3://examplebucket/myphoto.png" | grant_read_access }}
```

Example

Output

```liquid
auto-escape: Have you read "James & the Giant Peach"
explicit escape: Have you read "James & the Giant Peach"
explicit escape_once: Have you read "James & the Giant Peach"
skip_autoescape: Have you read 'James & the Giant Peach'?
to_json: { "point_number": 8, "coords": [ 59, 76 ] }
grant_read_access: https://s3.amazonaws.com/examplebucket/myphoto.png?access token and other params
```

Example Example of an automated classification template.

To automate this simple text classification sample, include the Liquid tag `{{ task.input.source }}`. This example uses the `crowd-classifier` (p. 803) element.

```html
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive', 'negative', 'neutral', 'cannot determine']"
    header="Which term best describes this tweet?"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>
  </crowd-classifier>

  <full-instructions header="Analyzing a sentiment">
    Try to determine the feeling the author of the tweet is trying to express.
    If none seems to match, choose "other."
  </full-instructions>

  <short-instructions>
    Pick the term that best describes the sentiment of the tweet.
  </short-instructions>
</crowd-form>
```
Preview a Worker Task Template

To preview a custom worker task template, use the SageMaker RenderUiTemplate operation. You can use the RenderUiTemplate operation with the AWS CLI or your preferred AWS SDK. For documentation on the supported language specific SDKs for this API operation, see the See Also section of the RenderUiTemplate.

Prerequisites

To preview your worker task template, the AWS Identity and Access Management (IAM) role Amazon Resource Name (ARN), or RoleArn, that you use must have permission to access to the S3 objects that are used by the template. To learn how to configure your role or user see Enable Worker Task Template Previews (p. 3580).

To preview your worker task template using the RenderUiTemplate operation:

1. Provide a RoleArn of the role with required policies attached to preview your custom template.
2. In the Input parameter of Task, provide a JSON object that contains values for the variables defined in the template. These are the variables that are substituted for the task.input.source variable. For example, if you define a task.input.text variable in your template, you can supply the variable in the JSON object as text: sample text.
3. In the Content parameter of UiTemplate, insert your template.

Once you've configured RenderUiTemplate, use your preferred SDK or the AWS CLI to submit a request to render your template. If your request was successful, the response includes RenderedContent, a Liquid template that renders the HTML for the worker UI.

Important

To preview your template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. For a sample policy that you can attach to your IAM role to grant these permissions, see Enable Worker Task Template Previews (p. 3580).

Creating Good Worker Instructions

Creating good instructions for your human review jobs improves your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console when creating a human review workflow, or you can use the console to create a custom worker template and include your instructions in this template. The instructions are shown to the worker on the UI page where they complete their labeling task.

Create Good Worker Instructions

There are three kinds of instructions in the Amazon Augmented AI console:

- **Task Description** – The description should provide a succinct explanation of the task.
- **Instructions** – These instructions are shown on the same webpage where workers complete a task. These instructions should provide an easy reference to show the worker the correct way to complete the task.
- **Additional Instructions** – These instructions are shown in a dialog box that appears when a worker chooses View full instructions. We recommend that you provide detailed instructions for completing the task, and include several examples showing edge cases and other difficult situations for labeling objects.
Add Example Images to Your Instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions, do the following:

1. Place the cursor where the image should go in the instructions editor.
2. Choose the image icon in the editor toolbar.
3. Enter the URL of your image.

If your instruction image is in an S3 bucket that isn't publicly accessible, do the following:

- For the image URL, enter: `{{ 'https://s3.amazonaws.com/your-bucket-name/image-file-name' | grant_read_access }}`.

This renders the image URL with a short-lived, one-time access code that’s appended so the worker’s browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview. See `grant_read_access` (p. 3564) for more information about the `grant_read_access` element.

Monitor and Manage Your Human Loop

Once you’ve started a human review loop, you can check the results of tasks sent to the loop and manage it using the Amazon Augmented AI Runtime API. Additionally, Amazon A2I integrates with Amazon EventBridge (also known as Amazon CloudWatch Events) to alert you when a human review loop status changes to Completed, Failed, or Stopped. This event delivery is guaranteed at least once, which means all events created when human loops finish are successfully delivered to EventBridge.

Use the procedures below to learn how to use the Amazon A2I Runtime API to monitor and manage your human loops. See Use Amazon CloudWatch Events in Amazon Augmented AI (p. 3581) to learn how Amazon A2I integrates with Amazon EventBridge.

To check your output data:

1. Check the results of your human loop by calling the DescribeHumanLoop operation. The result of this API operation contains information about the reason for and outcome of the loop activation.
2. Check the output data from your human loop in Amazon Simple Storage Service (Amazon S3). In the path to the data, YYYY/MM/DD/hh/mm/ss represents the human loop creation date with year (YYYY), month (MM), and day (DD), and the creation time with hour (hh), minute (mm), and second (ss). The path can be fetched from `s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json`.

You can integrate this structure with AWS Glue or Amazon Athena to partition and analyze your output data. For more information, see Managing Partitions for ETL Output in AWS Glue.

To learn more about Amazon A2I output data format, see Amazon A2I Output Data (p. 3567).

To stop and delete your human loop:

1. Once a human loop has been started, you can stop your human loop by calling the StopHumanLoop operation using the `HumanLoopName`. If a human loop was successfully stopped, the server sends back an HTTP 200 response.
2. To delete a human loop for which the status equals Failed, Completed, or Stopped, use the `DeleteHumanLoop` operation.

To list human loops:

1. You can list all active human loops by calling the `ListHumanLoops` operation. You can filter human loops by the creation date of the loop using the `CreationTimeAfter` and `CreateTimeBefore` parameters.
2. If successful, `ListHumanLoops` returns `HumanLoopSummaries` and `NextToken` objects in the response element. `HumanLoopSummaries` contains information about a single human loop. For example, it lists a loop's status and, if applicable, its failure reason.

Use the string returned in `NextToken` as an input in a subsequent call to `ListHumanLoops` to see the next page of human loops.

Amazon A2I Output Data

When your machine learning workflow sends Amazon A2I a data object, a human loop is created and human reviewers receive a task to review that data object. The output data from each human review task is stored in the Amazon Simple Storage Service (Amazon S3) output bucket you specify in your human review workflow. In the path to the data, `YYYY/MM/DD/hh/mm/ss` represents the human loop creation date with year (YYYY), month (MM), and day (DD), and the creation time with hour (hh), minute (mm), and second (ss).

```
s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

The content of your output data depends on the type of task type (built-in or custom) and the type of workforce you use. Your output data always includes the response from the human worker. Additionally, output data may include metadata about the human loop, the human reviewer (worker), and the data object.

Use the following sections to learn more about Amazon A2I output data format for different task types and workforces.

Output Data From Built-In Task Types

Amazon A2I built-in task types include Amazon Textract and Amazon Rekognition. In addition to human responses, the output data from one of these tasks includes details about the reason the human loop was created and information about the integrated service used to create the human loop. Use the following table to learn more about the output data schema for all built-in task types. The value for each of these parameters depends on the service you use with Amazon A2I. Refer to the second table in this section for more information about these service-specific values.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value Type</th>
<th>Example Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>awsManagedHumanLoopRequestSource</td>
<td>String</td>
<td>AWS/Rekognition/DetectModerationLabels</td>
<td>The API operation and associated AWS services that requested that Amazon A2I create the human loop. This is the API operation you use to configure your task.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Value Type</td>
<td>Example Values</td>
<td>Description</td>

<td>JSON object</td>
<td>{ &quot;Conditions&quot;: [&quot;...&quot;], }</td>
<td>A JSON object in inputContent that contains the reason a human loop was created. This includes a list of the activation conditions (Conditions) included in your human review workflow (flow definition), and the evaluation result for each condition—this result is either true or false. To learn more about activation conditions, see JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 3535).</td>
</tr>
</tbody>
</table>

Select a tab on the following table to learn about the task type–specific parameters and see an example output-data code block for each of the built-in task types.

### Amazon Textract Task Type Output Data

When you use the Amazon Textract built-in integration, you see 'AWS/Textract/AnalyzeDocument/Forms/V1' as the value for awsManagedHumanLoopRequestSource in your output data.

The answerContent parameter contains a Block object that includes human responses for all blocks sent to Amazon A2I.

The aiServiceResponse parameter also includes a Block object with Amazon Textract's response to the original request sent using to AnalyzeDocument.

To learn more about the parameters you see in the block object, refer to Block in the *Amazon Textract Developer Guide*.

The following is an example of the output data from an Amazon A2I human review of Amazon Textract document analysis inferences.

```json
{
    "awsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/V1",
    "humanAnswers": [
        {
            "answerContent": {
                "AWS/Textract/AnalyzeDocument/Forms/V1": {
                    "blocks": ["..."
                }
            },
            "submissionTime": "2020-09-28T19:17:59.880Z",
```
"workerId": "111122223333",
"workerMetadata": {
    "identityData": {
        "identityProviderType": "Cognito",
        "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
    }
}
],
"humanLoopName": "human-loop-name",

                        "EvaluationResult": true
                    }
                ]
            }
        ]
    }
Amazon Rekognition Task Type Output Data

When you use the Amazon Textract built-in integration, you see the string 'AWS/Rekognition/DetectModerationLabels/Image/V3' as the value for `awsManagedHumanLoopRequestSource` in your output data.

The `answerContent` parameter contains a `moderationLabels` object that contains human responses for all moderation labels sent to Amazon A2I.

The `aiServiceResponse` parameter also includes a `moderationLabels` object with Amazon Rekognition's response to the original request sent to `DetectModerationLabels`.

To learn more about the parameters you see in the block object, refer to `ModerationLabel` in the Amazon Rekognition Developer Guide.

The following is an example of the output data from an Amazon A2I human review of Amazon Rekognition image moderation inferences.

```json
{
    "awsManagedHumanLoopRequestSource": "AWS/Rekognition/DetectModerationLabels/Image/V3",
    "humanAnswers": [
        {
            "answerContent": {
                "AWS/Rekognition/DetectModerationLabels/Image/V3": {
                    "moderationLabels": [...]
                }
            },
            "submissionTime": "2020-09-28T19:22:35.508Z",
            "workerId": "ef7294f850a3d9d1",
            "workerMetadata": {
                "identityData": {
                    "identityProviderType": "Cognito",
                    "sub": "c6a8eb7-9944-42e9-a6b9-1112222333"
                }
            }
        }
    ],
    "humanLoopName": "human-loop-name",
    "inputContent": {
        "aiServiceRequest": {
            "humanLoopConfig": {
            ...
            }
        }
    }
}
```
Output Data From Custom Task Types

When you add Amazon A2I to a custom human review workflow, you see the following parameters in the output data returned from human review tasks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flowDefinitionArn</td>
<td>String</td>
<td>The Amazon Resource Number (ARN) of the human review</td>
</tr>
<tr>
<td>humanLoopName</td>

  ],
  "moderationModelVersion": "3.0"
}
```
The following is an example of output data from a custom integration with Amazon A2I and Amazon Transcribe. In this example, the inputContent consists of:

- A path to an .mp4 file in Amazon S3 and the video title
- The transcription returned from Amazon Transcribe (parsed from Amazon Transcribe output data)
- A start and end time used by the worker task template to clip the .mp4 file and show workers a relevant portion of the video

```json
{
   "humanAnswers": [
      {
         "answerContent": {
            "transcription": "use lambda to turn your notebook"
         },
         "submissionTime": "2020-06-18T17:08:26.246Z",
         "workerId": "ef7294f850a3d9d1",
         "workerMetadata": {
            "identityData": {
               "identityProviderType": "Cognito",
               "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
            }
         }
      }
   ],
   "humanLoopName": "human-loop-name",
   "inputContent": {
      "audioPath": "s3://DOC-EXAMPLE-BUCKET1/a2i_transcribe_demo/Fully-Managed Notebook Instances with Amazon SageMaker - a Deep Dive.mp4",
      "end_time": 950.27,
      "original_words": "but definitely use Lambda to turn your ",
      "start_time": 948.51,
```
Track Worker Activity

Amazon A2I provides information that you can use to track individual workers in task output data. To identify the worker that worked on the human review task, use the following from the output data in Amazon S3:

- The `acceptanceTime` is the time that the worker accepted the task. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (`YYYY`), month (`MM`), day (`DD`), hour (`HH`), minute (`MM`), second (`SS`), and millisecond (`mmm`). The date and time are separated by a `T`.
- The `submissionTime` is the time that the worker submitted their annotations using the Submit button. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (`YYYY`), month (`MM`), day (`DD`), hour (`HH`), minute (`MM`), second (`SS`), and millisecond (`mmm`). The date and time are separated by a `T`.
- `timeSpentInSeconds` reports the total time, in seconds, that a worker actively worked on that task. This metric does not include time when a worker paused or took a break.
- The `workerId` is unique to each worker.
- If you use a private workforce, in `workerMetadata`, you see the following.
  - The `identityProviderType` is the service used to manage the private workforce.
  - The `issuer` is the Amazon Cognito user pool or OpenID Connect (OIDC) Identity Provider (IdP) issuer associated with the work team assigned to this human review task.
  - A unique sub identifier refers to the worker. If you create a workforce using Amazon Cognito, you can retrieve details about this worker (such as the name or user name) associated with this ID using Amazon Cognito. To learn how, see Managing and Searching for User Accounts in Amazon Cognito Developer Guide.

The following is an example of the output you may see if you use Amazon Cognito to create a private workforce. This is identified in the `identityProviderType`.

```
"submissionTime": "2020-12-28T18:59:58.321Z",
"acceptanceTime": "2020-12-28T18:15:19.191Z",
"timeSpentInSeconds": 40.543,
"workerId": "a12b3cde5g4h5i67",
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Cognito",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
  }
}
```

The following is an example of the output you may see if you use your own OIDC IdP to create a private workforce:

```
"workerMetadata": {
  "identityData": {
    "identityProviderType": "Oidc",
    "issuer": "https://example-oidc-ipd.com/adfs",
    "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee"
  }
}
```
Permissions and Security in Amazon Augmented AI

When using Amazon Augmented AI (Amazon A2I) to create a human review workflow for your ML/AI application, you create and configure resources in Amazon SageMaker such as a human workforce and worker task templates. To configure and start a human loop, you either integrate Amazon A2I with other AWS services such as Amazon Textract or Amazon Rekognition, or use the Amazon Augmented AI Runtime API. To create a human review workflow and start a human loop, you must attach certain policies to your AWS Identity and Access Management (IAM) role or user. Specifically:

- When you start a human loop using image input data on or after January 12th, 2020, you must add a CORS header policy to the Amazon S3 bucket that contains your input data. See CORS Permission Requirement (p. 3577) to learn more.
- When you create a flow definition, you need to provide a role that grants Amazon A2I permission to access Amazon S3 both for reading objects that are rendered in a human task UI and for writing the results of the human review.

This role must also have a trust policy attached to give SageMaker permission to assume the role. This allows Amazon A2I to perform actions in accordance with permissions that you attach to the role.

See Add Permissions to the IAM Role Used to Create a Flow Definition (p. 3577) for example policies that you can modify and attach to the role you use to create a flow definition. These are the policies that are attached to the IAM role that is created in the Human review workflows section of the Amazon A2I area of the SageMaker console.

- To create and start human loops, you either use an API operation from a built-in task type (such as DetectModerationLabel or AnalyzeDocument) or the Amazon A2I Runtime API operation StartHumanLoop in a custom ML application. You need to attach the AmazonAugmentedAIFullAccess managed policy to the IAM user that invokes these API operations to grant permission to these services to use Amazon A2I operations. To learn how, see Create an IAM User That Can Invoke Amazon A2I API Operations (p. 3579).

This policy does not grant permission to invoke the API operations of the AWS service associated with built-in task types. For example, AmazonAugmentedAIFullAccess does not grant permission to call the Amazon Rekognition DetectModerationLabel API operation or Amazon Textract AnalyzeDocument API operation. You can use the more general policy, AmazonAugmentedAIIntegratedAPIAccess, to grant these permissions. For more information, see Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations (p. 3579). This is a good option when you want to grant an IAM user broad permissions to use Amazon A2I and integrated AWS services' API operations.

If you want to configure more granular permissions, see Amazon Rekognition Identity-Based Policy Examples and Amazon Textract Identity-Based Policy Examples for identity-based policies you can use to grant permission to use these individual services.

- To preview your custom worker task UI template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. See a policy example in Enable Worker Task Template Previews (p. 3580).

Topics
- CORS Permission Requirement (p. 3577)
- Add Permissions to the IAM Role Used to Create a Flow Definition (p. 3577)
- Create an IAM User That Can Invoke Amazon A2I API Operations (p. 3579)
- Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations (p. 3579)
CORS Permission Requirement

Earlier in 2020, widely used browsers like Chrome and Firefox changed their default behavior for rotating images based on image metadata, referred to as EXIF data. Previously, images would always display in browsers exactly how they are stored on disk, which is typically unrotated. After the change, images now rotate according to a piece of image metadata called orientation value. This has important implications for the entire machine learning (ML) community. For example, if the EXIF orientation is not considered, applications that are used to annotate images may display images in unexpected orientations and result in incorrect labels.

Starting with Chrome 89, AWS can no longer automatically prevent the rotation of images because the web standards group W3C has decided that the ability to control rotation of images violates the web's Same-Origin Policy. Therefore, to ensure human workers annotate your input images in a predictable orientation when you submit requests to create a human loop, you must add a CORS header policy to the S3 buckets that contain your input images.

**Important**
If you do not add a CORS configuration to the S3 buckets that contains your input data, human review tasks for those input data objects fail.

You can add a CORS policy to an S3 bucket that contains input data in the Amazon S3 console. To set the required CORS headers on the S3 bucket that contains your input images in the S3 console, follow the directions detailed in How do I add cross-domain resource sharing with CORS?. Use the following CORS configuration code for the buckets that host your images. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

**JSON**

```
[  
  "AllowedHeaders": [],
  "AllowedMethods": ["GET"],
  "AllowedOrigins": ["*"],
  "ExposeHeaders": []
]
```

**XML**

```
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
  </CORSRule>
</CORSConfiguration>
```

Add Permissions to the IAM Role Used to Create a Flow Definition

To create a flow definition, attach the policies in this section to the role that you use when creating a human review workflow in the SageMaker console, or when using the CreateFlowDefinition API operation.
• If you are using the console to create a human review workflow, enter the role Amazon Resource Name (ARN) in the IAM role field when creating a human review workflow in the console.

• When creating a flow definition using the API, attach these policies to the role that is passed to the RoleArn parameter of the CreateFlowDefinition operation.

When you create a human review workflow (flow definition), Amazon A2I invokes Amazon S3 to complete your task. To grant Amazon A2I permission to retrieve and store your files in your Amazon S3 bucket, create the following policy and attach it to your role. For example, if the images, documents, and other files that you are sending for human review are stored in an S3 bucket named my_input_bucket, and if you want the human reviews to be stored in a bucket named my_output_bucket, create the following policy.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["s3:GetObject"],
            "Resource": ["arn:aws:s3:::my_input_bucket/*"]
        },
        {
            "Effect": "Allow",
            "Action": ["s3:PutObject"],
            "Resource": ["arn:aws:s3:::my_output_bucket/*"]
        }
    ]
}
```

In addition, the IAM role must have the following trust policy to give SageMaker permission to assume the role. To learn more about IAM trust policies, see Resource-Based Policies section of Policies and Permissions in the AWS Identity and Access Management documentation.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowSageMakerToAssumeRole",
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

For more information about creating and managing IAM roles and policies, see the following topics in the AWS Identity and Access Management User Guide:

• To create an IAM role, see Creating a Role to Delegate Permissions to an IAM User.
• To learn how to create IAM policies, see Creating IAM Policies.
Create an IAM User That Can Invoke Amazon A2I API Operations

To use Amazon A2I to create and start human loops for Amazon Rekognition, Amazon Textract, or the Amazon A2I runtime API, you must use an IAM user that has permissions to invoke Amazon A2I operations. To do this, use the IAM console to attach the `AmazonAugmentedAIFullAccess` managed policy to a new or existing IAM user.

This policy grants permission to an IAM user to invoke API operations from the SageMaker API for flow definition creation and management and the Amazon Augmented AI Runtime API for human loop creation and management. To learn more about these API operations, see Use APIs in Amazon Augmented AI.

`AmazonAugmentedAIFullAccess` does not grant permissions to use Amazon Rekognition or Amazon Textract API operations.

**Note**

You can also attach the `AmazonAugmentedAIFullAccess` policy to an IAM role that is used to create and start a human loop.

To create the required IAM user

2. Choose Users and choose an existing user, or create a new user by choosing Add user. To learn how to create a new user, see Creating an IAM User in Your AWS Account in the AWS Identity and Access Management User Guide.
   - If you chose to attach the policy to an existing user, choose Add permissions.
   - While creating a new user, follow the next step on the Set permissions page.
3. Choose Attach existing policies directly.
4. In the Search bar, enter `AmazonAugmentedAIFullAccess` and check the box next to that policy.
   
   To enable this IAM user to create a flow definition with the public work team, also attach the `AmazonSageMakerMechanicalTurkAccess` managed policy.
5. After attaching the policy or policies:
   - If you are using an existing user, choose Next: Review, and then choose Add permissions.
   - If you are creating a new user, choose Next: Tags and complete the process of creating your user.

For more information, see Adding and Removing IAM Identity Permissions in the AWS Identity and Access Management User Guide.

Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations

To create an IAM user that has permission to invoke the API operations used by the built-in task types (that is, DetectModerationLabels for Amazon Rekognition and AnalyzeDocument for Amazon
Enable Worker Task Template Previews

To customize the interface and instructions that your workers see when working on your tasks, you create a worker task template. You can create the template using the CreateHumanTaskUi operation or the SageMaker console.

To preview your template, you need an IAM role with the following permissions to read Amazon S3 objects that get rendered on your user interface.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3:::my_input_bucket/*"
      ]
    }
  ]
}
```
For Amazon Rekognition and Amazon Textract task types, you can preview your template using the Amazon Augmented AI section of the SageMaker console. For custom task types, you preview your template by invoking the `RenderUiTemplate` operation. To preview your template, follow the instructions for your task type:

- Amazon Rekognition and Amazon Textract task types – In the SageMaker console, use the role's Amazon Resource Name (ARN) in the procedure documented in Create a Worker Task Template (p. 3557).
- Custom task types – In the `RenderUiTemplate` operation, use the role's ARN in the `RoleArn` parameter.

**Using Amazon A2I with AWS KMS Encrypted Buckets**

If you specify an AWS Key Management Service (AWS KMS) customer managed key to encrypt output data in `OutputConfig` of `CreateFlowDefinition`, you must add an IAM policy similar to the following to that key. This policy gives the IAM execution role that you use to create your human loops permission to use this key to perform all of the actions listed in "Action". To learn more about these actions, see AWS KMS permissions in the AWS Key Management Service Developer Guide.

To use this policy, replace the IAM service-role ARN in "Principal" with the ARN of the execution role you use to create the human review workflow (flow definition). When you create a labeling job using `CreateFlowDefinition`, this is the ARN you specify for `RoleArn`. Note that you cannot provide a KmsKeyId when you create a flow definition in the console.

```json
{
  "Sid": "AllowUseOfKmsKey",
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::111122223333:role/service-role/example-role"
  },
  "Action": [
    "kms:Encrypt",
    "kms:Decrypt",
    "kms:ReEncrypt*",
    "kms:GenerateDataKey*",
    "kms:DescribeKey"
  ],
  "Resource": "*"
}
```

**Additional Permissions and Security Resources**

- the section called "Control Access to SageMaker Resources by Using Tags" (p. 3637).
- the section called “SageMaker Identity-Based Policies” (p. 3615)
- the section called "Control Creation of SageMaker Resources with Condition Keys" (p. 3628)
- the section called “Amazon SageMaker API Permissions Reference” (p. 3674)
- `Security` (p. 3603)

**Use Amazon CloudWatch Events in Amazon Augmented AI**

Amazon Augmented AI uses Amazon CloudWatch Events to alert you when a human review loop status changes to Completed, Failed, or Stopped. This event delivery is guaranteed at least once, which
means all events created when human loops finish are successfully delivered to CloudWatch Events (Amazon EventBridge). When a review loop changes to one of these states, Augmented AI sends an event to CloudWatch Events similar to the following.

```json
{
  "version": "0",
  "id": "12345678-1111-2222-3333-12345EXAMPLE",
  "detail-type": "SageMaker A2I HumanLoop Status Change",
  "source": "aws.sagemaker",
  "account": "1111111111111",
  "time": "2019-11-14T17:49:25Z",
  "region": "us-east-1",
  "resources": ["arn:aws:sagemaker:us-east-1:111111111111:human-loop/humanloop-nov-14-1"],
  "detail": {
    "creationTime": "2019-11-14T17:37:36.740Z",
    "failureCode": null,
    "failureReason": null,
    "flowDefinitionArn": "arn:aws:sagemaker:us-east-1:111111111111:flow-definition/flowdef-nov-12",
    "humanLoopName": "humanloop-nov-14-1",
    "humanLoopOutput": {
      "outputS3Uri": "s3://customer-output-bucket-specified-in-flow-definition/flowdef-nov-12/2019/11/14/17/37/36/humanloop-nov-14-1/output.json"
    },
    "humanLoopStatus": "Completed"
  }
}
```

The details in the JSON output include the following:

**creationTime**

The timestamp when Augmented AI created the human loop.

**failureCode**

A failure code denoting a specific type of failure.

**failureReason**

The reason why a human loop has failed. The failure reason is only returned when the human review loop status is failed.

**flowDefinitionArn**

The Amazon Resource Name (ARN) of the flow definition, or human review workflow.

**humanLoopArn**

The Amazon Resource Name (ARN) of the human loop.

**humanLoopName**

The name of the human loop.

**humanLoopOutput**

An object containing information about the output of the human loop.

**outputS3Uri**

The location of the Amazon S3 object where Augmented AI stores your human loop output.
humanLoopStatus

The status of the human loop.

## Send Events from Your Human Loop to CloudWatch Events

To configure a CloudWatch Events rule to get status updates, or events, for your Amazon A2I human loops, use the AWS Command Line Interface (AWS CLI) `put-rule` command. When using the `put-rule` command, specify the following to receive human loop statuses:

- "source": ["aws.sagemaker"]
- "detail-type": ["SageMaker A2I HumanLoop Status Change"]

To configure a CloudWatch Events rule to watch for all status changes, use the following command and replace the placeholder text. For example, replace "A2IHUMANLOOPSTATUSCHANGES" with a unique CloudWatch Events rule name and "arn:aws:iam::111122223333:role/MyRoleForThisRule" with the Amazon Resource Number (ARN) of an IAM role with an events.amazonaws.com trust policy attached. Replace `region` with the AWS Region in which you want to create the rule.

```bash
aws events put-rule --name "A2IHUMANLOOPSTATUSCHANGES"
--event-pattern "{"source": ["aws.sagemaker"], "detail-type": ["SageMaker A2I HumanLoop Status Change"]}"
--role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
--region "region"
```

To learn more about the `put-rule` request, see Event Patterns in CloudWatch Events in the Amazon CloudWatch Events User Guide.

## Set Up a Target to Process Events

To process events, you need to set up a target. For example, if you want to receive an email when a human loop status changes, use a procedure in Setting Up Amazon SNS Notifications in the Amazon CloudWatch User Guide to set up an Amazon SNS topic and subscribe your email to it. Once you have created a topic, you can use it to create a target.

### To add a target to your CloudWatch Events rule

1. Open the CloudWatch console: https://console.aws.amazon.com/cloudwatch/home
2. In the navigation pane, choose Rules.
3. Choose the rule to which you want to add a target.
4. Choose Actions, and then choose Edit.
5. Under Targets, choose Add Target and choose the AWS service you want to act when a human loop status change event is detected.
6. Configure your target. For instructions, see the topic for configuring a target in the AWS documentation for that service.
7. Choose Configure details.
8. For Name, enter a name and, optionally, provide details about the purpose of the rule in Description.
9. Make sure that the check box next to State is selected so that your rule is listed as Enabled.
10. Choose Update rule.
Use Human Review Output

After you receive human review results, you can analyze the results and compare them to machine learning predictions. The JSON that is stored in the Amazon S3 bucket contains both the machine learning predictions and the human review results.

More Information

Automating Amazon SageMaker with Amazon EventBridge (p. 3836)

Use APIs in Amazon Augmented AI

You can create a human review workflow or a worker task template programmatically. The APIs you use depend on whether you are creating a Amazon Rekognition, Amazon Textract, or custom task type. This topic provides links to API reference documentation for each task type and programming task.

The following APIs can be used with Augmented AI:

Amazon Augmented AI

Use the Augmented AI API to start, stop, and delete human review loops. You can also list all human review loops and return information about human review loops in your account.

Learn more about human review loop APIs in the Amazon Augmented AI Runtime API Reference.

Amazon Rekognition

Use the HumanLoopConfig parameter of the DetectModerationLabels API to initiate a human review workflow using Amazon Rekognition.

Amazon SageMaker

Use the Amazon SageMaker API to create a FlowDefinition, also known as a human review workflow. You can also create a HumanTaskUi or worker task template.

For more information, see the CreateFlowDefinition or the CreateHumanTaskUi API documentation.

Amazon Textract

Use the HumanLoopConfig parameter of the AnalyzeDocument API to initiate a human review workflow using Amazon Textract.

Programmatic Tutorials

The following tutorials provide example code and step-by-step instructions for creating human review workflows and worker task templates programmatically.

- Tutorial: Get Started Using the Amazon A2I API (p. 3511)
- Create a Human Review Workflow (API) (p. 3532)
- Create and Start a Human Loop (p. 3548)
- Using Amazon Augmented AI with Amazon Rekognition in the Amazon Rekognition Developer Guide
- Using Amazon Augmented AI with Amazon Textract AnalyzeDocument in the Amazon Textract Developer Guide
Buy and Sell Amazon SageMaker Algorithms and Models in AWS Marketplace

Amazon SageMaker integrates with AWS Marketplace, enabling developers to charge other SageMaker users for the use of their algorithms and model packages. AWS Marketplace is a curated digital catalog that makes it easy for customers to find, buy, deploy, and manage third-party software and services that customers need to build solutions and run their businesses. AWS Marketplace includes thousands of software listings in popular categories, such as security, networking, storage, machine learning, business intelligence, database, and DevOps. It simplifies software licensing and procurement with flexible pricing options and multiple deployment methods.

For information, see AWS Marketplace Documentation.

Topics

- SageMaker Algorithms (p. 3585)
- SageMaker Model Packages (p. 3585)
- Sell Amazon SageMaker Algorithms and Model Packages (p. 3599)
- Find and Subscribe to Algorithms and Model Packages on AWS Marketplace (p. 3602)
- Use Algorithm and Model Package Resources (p. 3592)

SageMaker Algorithms

An algorithm enables you to perform end-to-end machine learning. It has two logical components: training and inference. Buyers can use the training component to create training jobs in SageMaker and build a machine learning model. SageMaker saves the model artifacts generated by the algorithm during training to an Amazon S3 bucket. For more information, see Train a Model with Amazon SageMaker (p. 10).

Buyers use the inference component with the model artifacts generated during a training job to create a deployable model in their SageMaker account. They can use the deployable model for real-time inference by using SageMaker hosting services. Or, they can get inferences for an entire dataset by running batch transform jobs. For more information, see Deploy a Model in Amazon SageMaker (p. 12).

SageMaker Model Packages

Buyers use a model package to build a deployable model in SageMaker. They can use the deployable model for real-time inference by using SageMaker hosting services. Or, they can get inferences for an entire dataset by running batch transform jobs. For more information, see Deploy a Model in Amazon SageMaker (p. 12). As a seller, you can build your model artifacts by training in SageMaker, or you can use your own model artifacts from a model that you trained outside of SageMaker. You can charge buyers for inference.
Use your own algorithms and models with the AWS Marketplace

The following sections show how to create algorithm and model package resources that you can use locally and publish to the AWS Marketplace.

Topics
- Create Algorithm and Model Package Resources (p. 3586)
- Use Algorithm and Model Package Resources (p. 3592)

Create Algorithm and Model Package Resources

After your training and/or inference code is packaged in Docker containers, create algorithm and model package resources that you can use in your Amazon SageMaker account and, optionally, publish on AWS Marketplace.

Topics
- Create an Algorithm Resource (p. 3586)
- Create a Model Package Resource (p. 3589)

Create an Algorithm Resource

To create an algorithm resource that you can use to run training jobs in Amazon SageMaker and publish on AWS Marketplace specify the following information:

- The Docker containers that contains the training and, optionally, inference code.
- The configuration of the input data that your algorithm expects for training.
- The hyperparameters that your algorithm supports.
- Metrics that your algorithm sends to Amazon CloudWatch during training jobs.
- The instance types that your algorithm supports for training and inference, and whether it supports distributed training across multiple instances.
- Validation profiles, which are training jobs that SageMaker uses to test your algorithm's training code and batch transform jobs that SageMaker runs to test your algorithm's inference code.

To ensure that buyers and sellers can be confident that products work in SageMaker, we require that you validate your algorithms before listing them on AWS Marketplace. You can list products in the AWS Marketplace only if validation succeeds. To validate your algorithms, SageMaker uses your validation profile and sample data to run the following validations tasks:

1. Create a training job in your account to verify that your training image works with SageMaker.
2. If you included inference code in your algorithm, create a model in your account using the algorithm's inference image and the model artifacts produced by the training job.
3. If you included inference code in your algorithm, create a transform job in your account using the model to verify that your inference image works with SageMaker.

When you list your product on AWS Marketplace, the inputs and outputs of this validation process persist as part of your product and are made available to your buyers. This helps buyers understand and evaluate the product before they buy it. For example, buyers can inspect the input data that you used, the outputs generated, and the logs and metrics emitted by your code. The more comprehensive your validation specification, the easier it is for customers to evaluate your product.
Note
In your validation profile, provide only data that you want to expose publicly.

Validation can take up to a few hours. To see the status of the jobs in your account, in the SageMaker console, see the Training jobs and Transform jobs pages. If validation fails, you can access the scan and validation reports from the SageMaker console. If any issues are found, you will have to create the algorithm again.

Note
To publish your algorithm on AWS Marketplace, at least one validation profile is required.

You can create an algorithm by using either the SageMaker console or the SageMaker API.

Topics
- Create an Algorithm Resource (Console) (p. 3587)
- Create an Algorithm Resource (API) (p. 3589)

Create an Algorithm Resource (Console)

To create an algorithm resource (console)

2. From the left menu, choose Training.
3. From the dropdown menu, choose Algorithms, then choose Create algorithm.
4. On the Training specifications page, provide the following information:
   a. For Algorithm name, type a name for your algorithm. The algorithm name must be unique in your account and in the AWS region. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
   b. Type a description for your algorithm. This description appears in the SageMaker console and in the AWS Marketplace.
   c. For Training image, type the path in Amazon ECR where your training container is stored.
   d. For Support distributed training, Choose Yes if your algorithm supports training on multiple instances. Otherwise, choose No.
   e. For Support instance types for training, choose the instance types that your algorithm supports.
   f. For Channel specification, specify up to 8 channels of input data for your algorithm. For example, you might specify 3 input channels named train, validation, and test. For each channel, specify the following information:
      i. For Channel name, type a name for the channel. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
      ii. To require the channel for your algorithm, choose Channel required.
      iii. Type a description for the channel.
      iv. For Supported input modes, choose Pipe mode if your algorithm supports streaming the input data, and File mode if your algorithm supports downloading the input data as a file. You can choose both.
      v. For Supported content types, type the MIME type that your algorithm expects for input data.
      vi. For Supported compression type, choose Gzip if your algorithm supports Gzip compression. Otherwise, choose None.
vii. Choose Add channel to add another data input channel, or choose Next if you are done adding channels.

5. On the Tuning specifications page, provide the following information:

a. For Hyperparameter specification, specify the hyperparameters that your algorithm supports by editing the JSON object. For each hyperparameter that your algorithm supports, construct a JSON block similar to the following:

```json
{
"DefaultValue": "5",
"Description": "The first hyperparameter",
"IsRequired": true,
"IsTunable": false,
"Name": "intRange",
"Range": {
"IntegerParameterRangeSpecification": {
"MaxValue": "10",
"MinValue": "1"
},
"Type": "Integer"
}
```

In the JSON, supply the following:

i. For DefaultValue, specify a default value for the hyperparameter, if there is one.

ii. For Description, specify a description for the hyperparameter.

iii. For IsRequired, specify whether the hyperparameter is required.

iv. For IsTunable, specify true if this hyperparameter can be tuned when a user runs a hyperparameter tuning job that uses this algorithm. For information, see Perform Automatic Model Tuning with SageMaker (p. 1654).

v. For Name, specify a name for the hyperparameter.

vi. For Range, specify one of the following:

• IntegerParameterRangeSpecification - the values of the hyperparameter are integers. Specify minimum and maximum values for the hyperparameter.

• ContinuousParameterRangeSpecification - the values of the hyperparameter are floating-point values. Specify minimum and maximum values for the hyperparameter.

• CategoricalParameterRangeSpecification - the values of the hyperparameter are categorical values. Specify a list of all of the possible values.

vii. For Type, specify Integer, Continuous, or Categorical. The value must correspond to the type of Range that you specified.

b. For Metric definitions, specify any training metrics that you want your algorithm to emit. SageMaker uses the regular expression that you specify to find the metrics by parsing the logs from your training container during training. Users can view these metrics when they run training jobs with your algorithm, and they can monitor and plot the metrics in Amazon CloudWatch. For information, see Monitor and Analyze Training Jobs Using Amazon CloudWatch Metrics (p. 1936). For each metric, provide the following information:

i. For Metric name, type a name for the metric.

ii. For Regex, type the regular expression that SageMaker uses to parse training logs so that it can find the metric value.

iii. For Objective metric support choose Yes if this metric can be used as the objective metric for a hyperparameter tuning job. For information, see Perform Automatic Model Tuning with SageMaker (p. 1654).
iv. Choose Add metric to add another metric, or choose Next if you are done adding metrics.

6. On the Inference specifications page, provide the following information if your algorithm supports inference:
   a. For Location of inference image, type the path in Amazon ECR where your inference container is stored.
   b. For Container DNS host name, type the name of a DNS host for your image.
   c. For Supported instance types for real-time inference, choose the instance types that your algorithm supports for models deployed as hosted endpoints in SageMaker. For information, see Deploy Models for Inference (p. 1943).
   d. For Supported instance types for batch transform jobs, choose the instance types that your algorithm supports for batch transform jobs. For information, see Use Batch Transform (p. 2191).
   e. For Supported content types, type the type of input data that your algorithm expects for inference requests.
   f. For Supported response MIME types, type the MIME types that your algorithm supports for inference responses.
   g. Choose Next.

7. On the Validation specifications page, provide the following information:
   a. For Publish this algorithm on AWS Marketplace, choose Yes to publish the algorithm on AWS Marketplace.
   b. For Validate this resource, choose Yes if you want SageMaker to run training jobs and/or batch transform jobs that you specify to test the training and/or inference code of your algorithm.
      Note
      To publish your algorithm on AWS Marketplace, your algorithm must be validated.
   c. For IAM role, choose an IAM role that has the required permissions to run training jobs and batch transform jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3646).
   d. For Validation profile, specify the following:
      - A name for the validation profile.
      - A Training job definition. This is a JSON block that describes a training job. This is in the same format as the TrainingJobDefinition input parameter of the CreateAlgorithm API.
      - A Transform job definition. This is a JSON block that describes a batch transform job. This is in the same format as the TransformJobDefinition input parameter of the CreateAlgorithm API.
   e. Choose Create algorithm.

Create an Algorithm Resource (API)

To create an algorithm resource by using the SageMaker API, call the CreateAlgorithm API.

Create a Model Package Resource

To create a model package resource that you can use to create deployable models in Amazon SageMaker and publish on AWS Marketplace specify the following information:

- The Docker container that contains the inference code, or the algorithm resource that was used to train the model.
• The location of the model artifacts. Model artifacts can either be packaged in the same Docker container as the inference code or stored in Amazon S3.
• The instance types that your model package supports for both real-time inference and batch transform jobs.
• Validation profiles, which are batch transform jobs that SageMaker runs to test your model package's inference code.

Before listing model packages on AWS Marketplace, you must validate them. This ensures that buyers and sellers can be confident that products work in Amazon SageMaker. You can list products on AWS Marketplace only if validation succeeds.

The validation procedure uses your validation profile and sample data to run the following validations tasks:
1. Create a model in your account using the model package's inference image and the optional model artifacts that are stored in Amazon S3.

   **Note**
   A model package is specific to the region in which you create it. The S3 bucket where the model artifacts are stored must be in the same region where your created the model package.

2. Create a transform job in your account using the model to verify that your inference image works with SageMaker.
3. Create a validation profile.

   **Note**
   In your validation profile, provide only data that you want to expose publicly.

Validation can take up to a few hours. To see the status of the jobs in your account, in the SageMaker console, see the Transform jobs pages. If validation fails, you can access the scan and validation reports from the SageMaker console. After fixing issues, recreate the algorithm. When the status of the algorithm is COMPLETED, find it in the SageMaker console and start the listing process.

   **Note**
   To publish your model package on AWS Marketplace, at least one validation profile is required.

You can create an model package either by using the SageMaker console or by using the SageMaker API.

**Topics**
- Create a Model Package Resource (Console) (p. 3590)
- Create a Model Package Resource (API) (p. 3592)

**Create a Model Package Resource (Console)**

**To create a model package in the SageMaker console:**
2. From the left menu, choose **Inference**.
3. Choose **Marketplace model packages**, then choose **Create marketplace model package**.
4. On the **Inference specifications** page, provide the following information:
   a. For **Model package name**, type a name for your model package. The model package name must be unique in your account and in the AWS region. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
b. Type a description for your model package. This description appears in the SageMaker console and in the AWS Marketplace.

c. For Inference specification options, choose Provide the location of the inference image and model artifacts to create a model package by using an inference container and model artifacts. Choose Provide the algorithm used for training and its model artifacts to create a model package from an algorithm resource that you created or subscribe to from AWS Marketplace.

d. If you chose Provide the location of the inference image and model artifacts for Inference specification options, provide the following information for Container definition and Supported resources:
   
i. For Location of inference image, type the path to the image that contains your inference code. The image must be stored as a Docker container in Amazon ECR.
   
ii. For Location of model data artifacts, type the location in S3 where your model artifacts are stored.
   
iii. For Container DNS host name, type the name of the DNS host to use for your container.
   
iv. For Supported instance types for real-time inference, choose the instance types that your model package supports for real-time inference from SageMaker hosted endpoints.
   
v. For Supported instance types for batch transform jobs, choose the instance types that your model package supports for batch transform jobs.
   
vi. Supported content types, type the content types that your model package expects for inference requests.
   
vii. For Supported response MIME types, type the MIME types that your model package uses to provide inferences.

The algorithm used for training and its model artifacts for Inference specification options, provide the following information:

   i. For Algorithm ARN, type the Amazon Resource Name (ARN) of the algorithm resource to use to create the model package.

   ii. For Location of model data artifacts, type the location in S3 where your model artifacts are stored.

f. Choose Next.

5. On the Validation and scanning page, provide the following information:

   a. For Publish this model package on AWS Marketplace, choose Yes to publish the model package on AWS Marketplace.

   b. For Validate this resource, choose Yes if you want SageMaker to run batch transform jobs that you specify to test the inference code of your model package.

   Note
   To publish your model package on AWS Marketplace, your model package must be validated.

   c. For IAM role, choose an IAM role that has the required permissions to run batch transform jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3646).

   d. For Validation profile, specify the following:

      • A name for the validation profile.
      
      • A Transform job definition. This is a JSON block that describes a batch transform job. This is in the same format as the TransformJobDefinition input parameter of the CreateAlgorithm API.

Create a Model Package Resource (API)

To create a model package by using the SageMaker API, call the CreateModelPackage API.

Use Algorithm and Model Package Resources

You can create algorithms and model packages as resources in your Amazon SageMaker account, and you can find and subscribe to algorithms and model packages on AWS Marketplace.

Use algorithms to:

- Run training jobs. For information, see Use an Algorithm to Run a Training Job (p. 3593).
- Run hyperparameter tuning jobs. For information, see Use an Algorithm to Run a Hyperparameter Tuning Job (p. 3595).
- Create model packages. After you use an algorithm resource to run a training job or a hyperparameter tuning job, you can use the model artifacts that these jobs output along with the algorithm to create a model package. For information, see Create a Model Package Resource (p. 3589).

**Note**
If you subscribe to an algorithm on AWS Marketplace, you must create a model package before you can use it to get inferences by creating hosted endpoint or running a batch transform job.
• Create models that you can use to get real-time inference or run batch transform jobs. For information, see Use a Model Package to Create a Model (p. 3598).
• Create hosted endpoints to get real-time inference. For information, see Deploy the Model to SageMaker Hosting Services (p. 88).
• Create batch transform jobs. For information, see (Optional) Make Prediction with Batch Transform (p. 89).

Topics
• Use an Algorithm to Run a Training Job (p. 3593)
• Use an Algorithm to Run a Hyperparameter Tuning Job (p. 3595)
• Use a Model Package to Create a Model (p. 3598)

Use an Algorithm to Run a Training Job

You can create an algorithm resource to create a training job by using the Amazon SageMaker console, the low-level Amazon SageMaker API, or the Amazon SageMaker Python SDK.

Topics
• Use an Algorithm to Run a Training Job (Console) (p. 3593)
• Use an Algorithm to Run a Training Job (API) (p. 3594)
• Use an Algorithm to Run a Training Job (Amazon SageMaker Python SDK) (p. 3594)

Use an Algorithm to Run a Training Job (Console)

To use an algorithm to run a training job (console)
2. Choose Algorithms.
3. Choose an algorithm that you created from the list on the My algorithms tab or choose an algorithm that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create training job.
   The algorithm you chose will automatically be selected.
5. On the Create training job page, provide the following information:
   a. For Job name, type a name for the training job.
   b. For IAM role, choose an IAM role that has the required permissions to run training jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3646).
   c. For Resource configuration, provide the following information:
      i. For Instance type, choose the instance type to use for training.
      ii. For Instance count, type the number of ML instances to use for the training job.
      iii. For Additional volume per instance (GB), type the size of the ML storage volume that you want to provision. ML storage volumes store model artifacts and incremental states.
      iv. For Encryption key, if you want Amazon SageMaker to use an AWS Key Management Service key to encrypt data in the ML storage volume attached to the training instance, specify the key.
      v. For Stopping condition, specify the maximum amount of time in seconds, minutes, hours, or days, that you want the training job to run.
d. For VPC, choose a Amazon VPC that you want to allow your training container to access. For more information, see Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3776).

e. For Hyperparameters, specify the values of the hyperparameters to use for the training job.

f. For Input data configuration, specify the following values for each channel of input data to use for the training job. You can see what channels the algorithm you're using for training support, and the content type, supported compression type, and supported input modes for each channel, under Channel specification section of the Algorithm summary page for the algorithm.

i. For Channel name, type the name of the input channel.

ii. For Content type, type the content type of the data that the algorithm expects for the channel.

iii. For Compression type, choose the data compression type to use, if any.

iv. For Record wrapper, choose RecordIO if the algorithm expects data in the RecordIO format.

v. For S3 data type, S3 data distribution type, and S3 location, specify the appropriate values. For information about what these values mean, see S3DataSource.

vi. For Input mode, choose File to download the data from to the provisioned ML storage volume, and mount the directory to a Docker volume. Choose PipeTo stream data directly from Amazon S3 to the container.

vii. To add another input channel, choose Add channel. If you are finished adding input channels, choose Done.

g. For Output location, specify the following values:

i. For S3 output path, choose the S3 location where the training job stores output, such as model artifacts.

   Note
   You use the model artifacts stored at this location to create a model or model package from this training job.

ii. For Encryption key, if you want SageMaker to use a AWS KMS key to encrypt output data at rest in the S3 location.

h. For Tags, specify one or more tags to manage the training job. Each tag consists of a key and an optional value. Tag keys must be unique per resource.

i. Choose Create training job to run the training job.

Use an Algorithm to Run a Training Job (API)

To use an algorithm to run a training job by using the SageMaker API, specify either the name or the Amazon Resource Name (ARN) as the AlgorithmName field of the AlgorithmSpecification object that you pass to CreateTrainingJob. For information about training models in SageMaker, see Train a Model with Amazon SageMaker (p. 10).

Use an Algorithm to Run a Training Job (Amazon SageMaker Python SDK)

Use an algorithm that you created or subscribed to on AWS Marketplace to create a training job, create an AlgorithmEstimator object and specify either the Amazon Resource Name (ARN) or the name of the algorithm as the value of the algorithm_arn argument. Then call the fit method of the estimator. For example:

```python
from sagemaker import AlgorithmEstimator
data_path = os.path.join(DATA_DIR, 'marketplace', 'training')
```
Use an Algorithm to Run a Hyperparameter Tuning Job

A hyperparameter tuning job finds the best version of a model by running many training jobs on your dataset using the algorithm and ranges of hyperparameters that you specify. It then chooses the hyperparameter values that result in a model that performs the best, as measured by a metric that you choose. For more information, see Perform Automatic Model Tuning with SageMaker (p. 1654).

You can create use an algorithm resource to create a hyperparameter tuning job by using the Amazon SageMaker console, the low-level Amazon SageMaker API, or the Amazon SageMaker Python SDK.

Topics

- Use an Algorithm to Run a Hyperparameter Tuning Job (Console) (p. 3595)
- Use an Algorithm to Run a Hyperparameter Tuning Job (API) (p. 3597)
- Use an Algorithm to Run a Hyperparameter Tuning Job (Amazon SageMaker Python SDK) (p. 3597)

Use an Algorithm to Run a Hyperparameter Tuning Job (Console)

To use an algorithm to run a hyperparameter tuning job (console)

2. Choose Algorithms.
3. Choose an algorithm that you created from the list on the My algorithms tab or choose an algorithm that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create hyperparameter tuning job.
   The algorithm you chose will automatically be selected.
5. On the Create hyperparameter tuning job page, provide the following information:
   a. For Warm start, choose Enable warm start to use the information from previous hyperparameter tuning jobs as a starting point for this hyperparameter tuning job. For more information, see Run a Warm Start Hyperparameter Tuning Job (p. 1678).
      i. Choose Identical data and algorithm if your input data is the same as the input data for the parent jobs of this hyperparameter tuning job, or choose Transfer learning to use additional or different input data for this hyperparameter tuning job.
      ii. For Parent hyperparameter tuning job(s), choose up to 5 hyperparameter tuning jobs to use as parents to this hyperparameter tuning job.
   b. For Hyperparameter tuning job name, type a name for the tuning job.
   c. For IAM role, choose an IAM role that has the required permissions to run hyperparameter tuning jobs in SageMaker, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3646).
d. For **VPC**, choose a Amazon VPC that you want to allow the training jobs that the tuning job launches to access. For more information, see *Give SageMaker Training Jobs Access to Resources in Your Amazon VPC* (p. 3776).

e. Choose **Next**.

f. For **Objective metric**, choose the metric that the hyperparameter tuning job uses to determine the best combination of hyperparameters, and choose whether to minimize or maximize this metric. For more information, see *View the Best Training Job* (p. 1676).

g. For **Hyperparameter configuration**, choose ranges for the tunable hyperparameters that you want the tuning job to search, and set static values for hyperparameters that you want to remain constant in all training jobs that the hyperparameter tuning job launches. For more information, see *Define Hyperparameter Ranges* (p. 1658).

h. Choose **Next**.

i. For **Input data configuration**, specify the following values for each channel of input data to use for the hyperparameter tuning job. You can see what channels the algorithm you're using for hyperparameter tuning supports, and the content type, supported compression type, and supported input modes for each channel, under **Channel specification** section of the **Algorithm summary** page for the algorithm.

   i. For **Channel name**, type the name of the input channel.

   ii. For **Content type**, type the content type of the data that the algorithm expects for the channel.

   iii. For **Compression type**, choose the data compression type to use, if any.

   iv. For **Record wrapper**, choose RecordIO if the algorithm expects data in the RecordIO format.

   v. For **S3 data type**, **S3 data distribution type**, and **S3 location**, specify the appropriate values. For information about what these values mean, see **S3DataSource**.

   vi. For **Input mode**, choose **File** to download the data from to the provisioned ML storage volume, and mount the directory to a Docker volume. Choose **Pipe** to stream data directly from Amazon S3 to the container.

   vii. To add another input channel, choose **Add channel**. If you are finished adding input channels, choose **Done**.

j. For **Output location**, specify the following values:

   i. For **S3 output path**, choose the S3 location where the training jobs that this hyperparameter tuning job launches store output, such as model artifacts.

      **Note**
      You use the model artifacts stored at this location to create a model or model package from this hyperparameter tuning job.

   ii. For **Encryption key**, if you want SageMaker to use a AWS KMS key to encrypt output data at rest in the S3 location.

k. For **Resource configuration**, provide the following information:

   i. For **Instance type**, choose the instance type to use for each training job that the hyperparameter tuning job launches.

   ii. For **Instance count**, type the number of ML instances to use for each training job that the hyperparameter tuning job launches.

   iii. For **Additional volume per instance (GB)**, type the size of the ML storage volume that you want to provision each training job that the hyperparameter tuning job launches. ML storage volumes store model artifacts and incremental states.

   iv. For **Encryption key**, if you want Amazon SageMaker to use an AWS Key Management Service key to encrypt data in the ML storage volume attached to the training instances, specify the key.
l. For **Resource limits**, provide the following information:
   i. For **Maximum training jobs**, specify the maximum number of training jobs that you want the hyperparameter tuning job to launch. A hyperparameter tuning job can launch a maximum of 500 training jobs.
   ii. For **Maximum parallel training jobs**, specify the maximum number of concurrent training jobs that the hyperparameter tuning job can launch. A hyperparameter tuning job can launch a maximum of 10 concurrent training jobs.
   iii. For **Stopping condition**, specify the maximum amount of time in seconds, minutes, hours, or days, that you want each training job that the hyperparameter tuning job launches to run.
   m. For **Tags**, specify one or more tags to manage the hyperparameter tuning job. Each tag consists of a key and an optional value. Tag keys must be unique per resource.
   n. Choose **Create jobs** to run the hyperparameter tuning job.

**Use an Algorithm to Run a Hyperparameter Tuning Job (API)**

To use an algorithm to run a hyperparameter tuning job by using the SageMaker API, specify either the name or the Amazon Resource Name (ARN) of the algorithm as the `AlgorithmName` field of the `AlgorithmSpecification` object that you pass to `CreateHyperParameterTuningJob`. For information about hyperparameter tuning in SageMaker, see *Perform Automatic Model Tuning with SageMaker* (p. 1654).

**Use an Algorithm to Run a Hyperparameter Tuning Job (Amazon SageMaker Python SDK)**

Use an algorithm that you created or subscribed to on AWS Marketplace to create a hyperparameter tuning job, create an `AlgorithmEstimator` object and specify either the Amazon Resource Name (ARN) or the name of the algorithm as the value of the `algorithm_arn` argument. Then initialize a `HyperparameterTuner` object with the `AlgorithmEstimator` you created as the value of the `estimator` argument. Finally, call the `fit` method of the `AlgorithmEstimator`. For example:

```python
from sagemaker import AlgorithmEstimator
from sagemaker.tuner import HyperparameterTuner

data_path = os.path.join(DATA_DIR, 'marketplace', 'training')
algo = AlgorithmEstimator(
    role='SageMakerRole',
    instance_count=1,
    instance_type='ml.c4.xlarge',
    sagemaker_session=sagemaker_session,
    base_job_name='test-marketplace')

train_input = algo.sagemaker_session.upload_data(
    path=data_path, key_prefix='integ-test-data/marketplace/train')
algo.set_hyperparameters(max_leaf_nodes=10)
tuner = HyperparameterTuner(estimator=algo, base_tuning_job_name='some-name',
                            objective_metric_name='validation:accuracy',
                            hyperparameter_ranges=hyperparameter_ranges,
                            max_jobs=2, max_parallel_jobs=2)
tuner.fit({'training': train_input}, include_cls_metadata=False)
tuner.wait()
```
Use a Model Package to Create a Model

Use a model package to create a deployable model that you can use to get real-time inferences by creating a hosted endpoint or to run batch transform jobs. You can create a deployable model from a model package by using the Amazon SageMaker console, the low-level SageMaker API, or the Amazon SageMaker Python SDK.

Topics

- Use a Model Package to Create a Model (Console) (p. 3598)
- Use a Model Package to Create a Model (API) (p. 3598)
- Use a Model Package to Create a Model (Amazon SageMaker Python SDK) (p. 3599)

Use a Model Package to Create a Model (Console)

To create a deployable model from a model package (console)

2. Choose Model packages.
3. Choose a model package that you created from the list on the My model packages tab or choose a model package that you subscribed to on the AWS Marketplace subscriptions tab.
4. Choose Create model.
5. For Model name, type a name for the model.
6. For IAM role, choose an IAM role that has the required permissions to call other services on your behalf, or choose Create a new role to allow SageMaker to create a role that has the AmazonSageMakerFullAccess managed policy attached. For information, see SageMaker Roles (p. 3646).
7. For VPC, choose a Amazon VPC that you want to allow the model to access. For more information, see Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC (p. 3779).
8. Leave the default values for Container input options and Choose model package.
9. For environment variables, provide the names and values of environment variables you want to pass to the model container.
10. For Tags, specify one or more tags to manage the model. Each tag consists of a key and an optional value. Tag keys must be unique per resource.
11. Choose Create model.

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosting endpoints in SageMaker, see Deploy Models for Inference.

Use a Model Package to Create a Model (API)

To use a model package to create a deployable model by using the SageMaker API, specify the name or the Amazon Resource Name (ARN) of the model package as the ModelPackageName field of the ContainerDefinition object that you pass to the CreateModel API.

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosted endpoints in SageMaker, see Deploy Models for Inference.
Use a Model Package to Create a Model (Amazon SageMaker Python SDK)

To use a model package to create a deployable model by using the SageMaker Python SDK, initialize a ModelPackage object, and pass the Amazon Resource Name (ARN) of the model package as the model_package_arn argument. For example:

```python
from sagemaker import ModelPackage
model = ModelPackage(role='SageMakerRole',
                     model_package_arn='training-job-scikit-decision-trees-1542660466-6f92',
                     sagemaker_session=sagemaker_session)
```

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosting endpoints in SageMaker, see Deploy Models for Inference.

Sell Amazon SageMaker Algorithms and Model Packages

Selling Amazon SageMaker algorithms and model packages is a three-step process:

1. Develop your algorithm or model, and package it in a Docker container. For information, see Develop Algorithms and Models in Amazon SageMaker (p. 3600).

2. Create an algorithm or model package resource in SageMaker. For information, see Create Algorithm and Model Package Resources (p. 3586).

3. Register as a seller on AWS Marketplace and list your algorithm or model package on AWS Marketplace. For information about registering as a seller, see Getting Started as a Seller in the User Guide for AWS Marketplace Providers. For information about listing and monetizing your algorithms and model packages, see Listing Algorithms and Model Packages in AWS Marketplace for Machine Learning in the User Guide for AWS Marketplace Providers.
Develop Algorithms and Models in Amazon SageMaker

Before you can create algorithm and model package resources to use in Amazon SageMaker or list on AWS Marketplace, you have to develop them and package them in Docker containers.

**Note**
When algorithms and model packages are created for listing on AWS Marketplace, SageMaker scans the containers for security vulnerabilities on supported operating systems. Only the following operating system versions are supported:

- Debian: 6.0, 7, 8, 9, 10
- CentOS: 5, 6, 7
- Oracle Linux: 5, 6, 7
- Alpine: 3.3, 3.4, 3.5
- Amazon Linux

**Develop Algorithms in SageMaker**

An algorithm should be packaged as a docker container and stored in Amazon ECR to use it in SageMaker. The Docker container contains the training code used to run training jobs and, optionally, the inference code used to get inferences from models trained by using the algorithm.

For information about developing algorithms in SageMaker and packaging them as containers, see Using Docker containers with SageMaker (p. 2392). For a complete example of how to create an algorithm container, see the sample notebook at https://sagemaker-examples.readthedocs.io/en/latest/advanced_functionality/scikit Bring your own/scikit bring your own.html. You can also find the sample notebook in a SageMaker notebook instance. The notebook is in the Advanced Functionality section, and is named scikit bring your own.ipynb. For information about using the sample notebooks in a notebook instance, see Example Notebooks (p. 373).

Always thoroughly test your algorithms before you create algorithm resources to publish on AWS Marketplace.

**Note**
When a buyer subscribes to your containerized product, the Docker containers run in an isolated (internet-free) environment. When you create your containers, do not rely on making outgoing calls over the internet. Calls to AWS services are also not allowed.
**Develop Models in SageMaker**

A deployable model in SageMaker consists of inference code, model artifacts, an IAM role that is used to access resources, and other information required to deploy the model in SageMaker. Model artifacts are the results of training a model by using a machine learning algorithm. The inference code must be packaged in a Docker container and stored in Amazon ECR. You can either package the model artifacts in the same container as the inference code, or store them in Amazon S3.

You create a model by running a training job in SageMaker, or by training a machine learning algorithm outside of SageMaker. If you run a training job in SageMaker, the resulting model artifacts are available in the `ModelArtifacts` field in the response to a call to the `DescribeTrainingJob` operation. For information about how to develop a SageMaker model container, see *Use Your Own Inference Code* (p. 3293). For a complete example of how to create a model container from a model trained outside of SageMaker, see the sample notebook at https://sagemaker-examples.readthedocs.io/en/latest/advanced_functionality/xgboost_brинг_your_own_model/xgboost_brинг_your_own_model.html. You can also find the sample notebook in a SageMaker notebook instance. The notebook is in the *Advanced Functionality* section, and is named `xgboost_brинг_your_own_model.ipynb`. For information about using the sample notebooks in a notebook instance, see *Example Notebooks* (p. 373).

Always thoroughly test your models before you create model packages to publish on AWS Marketplace.

**Note**

When a buyer subscribes to your containerized product, the Docker containers run in an isolated (internet-free) environment. When you create your containers, do not rely on making outgoing calls over the internet. Calls to AWS services are also not allowed.

**List Your Algorithm or Model Package on AWS Marketplace**

After creating and validating your algorithm or model in Amazon SageMaker, list your product on AWS Marketplace. The listing process makes your products available in the AWS Marketplace and the SageMaker console.

To list products on AWS Marketplace, you must be a registered seller. To register, use the self-registration process from the AWS Marketplace Management Portal (AMMP). For information, see *Getting Started as a Seller* in the *User Guide for AWS Marketplace Providers*. When you start the product listing process from the Amazon SageMaker console, we check your seller registration status. If you have not registered, we direct you to do so.

To start the listing process, do one of the following:

- From the SageMaker console, choose the product, choose *Actions*, and choose *Publish new ML Marketplace listing*. This carries over your product reference, the Amazon Resource Name (ARN), and directs you to the AMMP to create the listing.

- Go to *ML listing process*, manually enter the Amazon Resource Name (ARN), and start your product listing. This process carries over the product metadata that you entered when creating the product in SageMaker. For an algorithm listing, the information includes the supported instance types and hyperparameters. In addition, you can enter a product description, promotional information, and support information as you would with other AWS Marketplace products.
Find and Subscribe to Algorithms and Model Packages on AWS Marketplace

With AWS Marketplace, you can browse and search for hundreds of machine learning algorithms and models in a broad range of categories, such as computer vision, natural language processing, speech recognition, text, data, voice, image, video analysis, fraud detection, predictive analysis, and more.

To find algorithms on AWS Marketplace

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. Choose Algorithms, then choose Find algorithms.

   This takes you to the AWS Marketplace algorithms page. For information about finding and subscribing to algorithms on AWS Marketplace, see Machine Learning Products in the AWS Marketplace User Guide for AWS Consumers.

To find model packages on AWS Marketplace

2. Choose Model packages, then choose Find model packages.

   This takes you to the AWS Marketplace model packages page. For information about finding and subscribing to model packages on AWS Marketplace, see Machine Learning Products in the AWS Marketplace User Guide for AWS Consumers.

Use Algorithms and Model Packages

For information about using algorithms and model packages that you subscribe to in SageMaker, see Use Algorithm and Model Package Resources (p. 3592).

Note

When you create a training job, inference endpoint, and batch transform job from an algorithm or model package that you subscribe to on AWS Marketplace, the training and inference containers do not have access to the internet. Because the containers do not have access to the internet, the seller of the algorithm or model package does not have access to your data.
Security in Amazon SageMaker

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS compliance programs. To learn about the compliance programs that apply to Amazon SageMaker, see AWS Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using SageMaker. The following topics show you how to configure SageMaker to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your SageMaker resources.

**Topics**

- Access Control (p. 3603)
- Data Protection in Amazon SageMaker (p. 3605)
- Identity and Access Management for Amazon SageMaker (p. 3611)
- Logging and Monitoring (p. 3757)
- Compliance Validation for Amazon SageMaker (p. 3758)
- Resilience in Amazon SageMaker (p. 3758)
- Infrastructure Security in Amazon SageMaker (p. 3758)

Access Control

Amazon SageMaker Studio notebooks and SageMaker notebook instances differ in their runtime environments. The following topics describe how to control root access to these notebooks.

**Topics**

- Access control and SageMaker Studio notebooks (p. 3603)
- Control root access to a SageMaker notebook instance (p. 3605)

Access control and SageMaker Studio notebooks

Amazon SageMaker Studio uses filesystem and container permissions for access control and isolation of Studio users and notebooks. This is one of the major differences between Studio notebooks and SageMaker notebook instances. This topic describes how permissions are set up to avoid security threats, what SageMaker does by default, and how the customer can customize the permissions. For more
information about Studio notebooks and their runtime environment, see Use Amazon SageMaker Studio Notebooks (p. 133).

SageMaker app permissions

A run-as user is a POSIX user/group which is used to run the JupyterServer app and KernelGateway apps inside the container.

The run-as user for the JupyterServer app is sagemaker-user (1000) by default. This user has sudo permissions to enable the installation of dependencies such as yum packages.

The run-as user for the KernelGateway apps is root (0) by default. This user is able to install dependencies using pip/apt-get/conda.

Due to user remapping, neither user is able to access resources or make changes to the host instance.

User remapping

SageMaker performs user-remapping to map a user inside the container to a user on the host instance outside the container. The range of user IDs (0 - 65535) in the container are mapped to non-privileged user IDs above 65535 on the instance. For example, sagemaker-user (1000) inside the container might map to user (200001) on the instance, where the number in parentheses is the user ID. If the customer creates a new user/group inside the container, it won't be privileged on the host instance regardless of the user/group ID. The root user of the container is also mapped to a non-privileged user on the instance. For more information, see Isolate containers with a user namespace.

Custom image permissions

Customers can bring their own custom SageMaker images. These images can specify a different run-as user/group to launch the KernelGateway app. The customer can implement fine grained permission control inside the image, for example, to disable root access or perform other actions. The same user remapping applies here. For more information, see Bring your own SageMaker image (p. 157).

Container isolation

Docker keeps a list of default capabilities that the container can use. SageMaker doesn't add additional capabilities. SageMaker adds specific route rules to block requests to Amazon EFS and the instance metadata service (IMDS) from the container. Customers can't change these route rules from the container. For more information, see Runtime privilege and Linux capabilities.

App metadata access

Metadata used by running apps are mounted to the container with read-only permission. Customers aren't able to modify this metadata from the container. For the available metadata, see Get Studio Notebook and App Metadata (p. 145).

User isolation on EFS

When you onboard to Studio, SageMaker creates an Amazon Elastic File System (EFS) volume for your domain that is shared by all Studio users in the domain. Each user gets their own private home directory on the EFS volume. This home directory is used to store the user's notebooks, Git repositories, and other data. To prevent other users in the domain from accessing the user's data, SageMaker creates a globally unique user ID for the user's profile and applies it as a POSIX user/group ID for the user's home directory.

EBS access

An Amazon Elastic Block Store (Amazon EBS) volume is attached to the host instance and shared across all images. It's used for the root volume of the notebooks and stores temporary data that's generated inside the container. The storage isn't persisted when the instance running the notebooks is deleted. The root user inside the container can't access the EBS volume.
IMDS access

Due to security concerns, access to the Amazon Elastic Compute Cloud (Amazon EC2) Instance Metadata Service (IMDS) is unavailable in SageMaker Studio. For more information on IMDS, see Instance metadata and user data.

Control root access to a SageMaker notebook instance

By default, when you create a notebook instance, users that log into that notebook instance have root access. Data science is an iterative process that might require the data scientist to test and use different software tools and packages, so many notebook instance users need to have root access to be able to install these tools and packages. Because users with root access have administrator privileges, users can access and edit all files on a notebook instance with root access enabled.

If you don’t want users to have root access to a notebook instance, when you call CreateNotebookInstance or UpdateNotebookInstance operations, set the RootAccess field to Disabled. You can also disable root access for users when you create or update a notebook instance in the Amazon SageMaker console. For information, see Step 1: Create an Amazon SageMaker Notebook Instance (p. 78).

Note
Lifecycle configurations need root access to be able to set up a notebook instance. Because of this, lifecycle configurations associated with a notebook instance always run with root access even if you disable root access for users.

Note
For security reasons, Rootless Docker is installed on root-disabled notebook instances instead of regular Docker. For more information, see Run the Docker daemon as a non-root user (Rootless mode)

Data Protection in Amazon SageMaker

The AWS shared responsibility model applies to data protection in Amazon SageMaker. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual user accounts with AWS Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We recommend TLS 1.2 or later.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.
We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form fields such as a Name field. This includes when you work with Amazon SageMaker or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Topics
- Protect Data at Rest Using Encryption (p. 3606)
- Protecting Data in Transit with Encryption (p. 3608)
- Key Management (p. 3610)
- Internetwork Traffic Privacy (p. 3610)

Protect Data at Rest Using Encryption

To protect your Amazon SageMaker Studio notebooks and SageMaker notebook instances, along with your model-building data and model artifacts, SageMaker encrypts the notebooks, as well as output from Training and Batch Transform jobs. SageMaker encrypts these by default using the AWS Managed Key for Amazon S3. This AWS Managed Key for Amazon S3 cannot be shared for cross-account access. For cross-account access, specify your customer managed key while creating SageMaker resources so that it can be shared for cross-account access. For more information on AWS KMS, see What is AWS Key Management Service?.

Topics
- Studio notebooks (p. 3606)
- Notebook instances, SageMaker jobs, and Endpoints (p. 3607)
- SageMaker geospatial capabilities (p. 3607)

Studio notebooks

In Amazon SageMaker Studio, your SageMaker Studio notebooks and data can be stored in the following locations:

- An S3 bucket – When you onboard to Studio and enable shareable notebook resources, SageMaker shares notebook snapshots and metadata in an Amazon Simple Storage Service (Amazon S3) bucket.
- An EFS volume – When you onboard to Studio, SageMaker attaches an Amazon Elastic File System (Amazon EFS) volume to your domain for storing your Studio notebooks and data files. The EFS volume persists after the domain is deleted.
- An EBS volume – When you open a notebook in Studio, an Amazon Elastic Block Store (Amazon EBS) is attached to the instance that the notebook runs on. The EBS volume persists for the duration of the instance.

SageMaker uses the AWS Key Management Service (AWS KMS) to encrypt the S3 bucket and both volumes. By default, it uses an AWS managed key. For more control, you can specify your own customer managed key when you onboard to Studio or through the SageMaker API. For more information, see Onboard to Amazon SageMaker Domain (p. 36) and CreateDomain.

In the CreateDomain API, you use the S3KmsKeyId parameter to specify the customer managed key for shareable notebooks. You use the KmsKeyId parameter to specify the customer managed key for the EFS and EBS volumes. The same customer managed key is used for both volumes. The customer managed key for shareable notebooks can be the same customer managed key as used for the volumes or a different customer managed key.
Notebook instances, SageMaker jobs, and Endpoints

To encrypt the machine learning (ML) storage volume that is attached to notebooks, processing jobs, training jobs, hyperparameter tuning jobs, batch transform jobs, and endpoints, you can pass an AWS KMS key to SageMaker. If you don't specify a KMS key, SageMaker encrypts storage volumes with a transient key and discards it immediately after encrypting the storage volume. For notebook instances, if you don't specify a KMS key, SageMaker encrypts both OS volumes and ML data volumes with a system-managed KMS key.

You can use an AWS managed AWS KMS key to encrypt all instance OS volumes. You can encrypt all ML data volumes for all SageMaker instances with a AWS KMS key that you specify. ML storage volumes are mounted as follows:

- Notebooks - /home/ec2-user/SageMaker
- Processing - /opt/ml/processing and /tmp/
- Training - /opt/ml/ and /tmp/
- Batch - /opt/ml/ and /tmp/
- Endpoints - /opt/ml/ and /tmp/

Processing, batch transform, and training job containers and their storage are ephemeral in nature. When the job completes, output is uploaded to Amazon S3 using AWS KMS encryption with an optional AWS KMS key that you specify and the instance is torn down. If a AWS KMS Key is not provided in the job request, the output is encrypted by default using your AWS Managed Key for Amazon S3.

**Note**
The key policy for an AWS Managed Key for Amazon S3 cannot be edited, so cross-account permissions cannot be granted for these key policies. If the output Amazon S3 bucket for the request is from another account, specify your own AWS KMS Customer Key in the job request and ensure that the job's execution role has permissions to encrypt data with it.

**Important**
Sensitive data that needs to be encrypted with a KMS key for compliance reasons should be stored in the ML storage volume or in Amazon S3, both of which can be encrypted using a KMS key you specify.

When you open a notebook instance, SageMaker saves it and any files associated with it in the SageMaker folder in the ML storage volume by default. When you stop a notebook instance, SageMaker creates a snapshot of the ML storage volume. Any customizations to the operating system of the stopped instance, such as installed custom libraries or operating system level settings, are lost. Consider using a lifecycle configuration to automate customizations of the default notebook instance. When you terminate an instance, the snapshot and the ML storage volume are deleted. Any data that you need to persist beyond the lifespan of the notebook instance should be transferred to an Amazon S3 bucket.

**Note**
Certain Nitro-based SageMaker instances include local storage, depending on the instance type. Local storage volumes are encrypted using a hardware module on the instance. You can't use a KMS key on an instance type with local storage. For a list of instance types that support local instance storage, see [Instance Store Volumes](https://docs.aws.amazon.com/sagemaker/latest/dg/instance-store-volumes.html). For more information about storage volumes on Nitro-based instances, see [Amazon EBS and NVMe on Linux Instances](https://docs.aws.amazon.com/sagemaker/latest/dg/nitro-ssd-instance-storage.html). For more information about local instance storage encryption, see [SSD Instance Store Volumes](https://docs.aws.amazon.com/sagemaker/latest/dg/nitro-ssd-instance-storage.html).

**SageMaker geospatial capabilities**

You can protect your data at rest using encryption for SageMaker geospatial.

**Server-Side Encryption with Amazon SageMaker geospatial managed key (Default)**
Amazon SageMaker geospatial capabilities encrypts all your data, including computational results from your EarthObservationJobs and VectorEnrichmentJobs along with all your service metadata. There is no data that is stored within Amazon SageMaker unencrypted. It uses a default AWS managed key to encrypt all your data.

**Server-Side Encryption with KMS Keys Stored in AWS Key Management Service (SSE-KMS)**

Currently, Amazon SageMaker geospatial capabilities do not support encryption using a customer-owned KMS key.

### Protecting Data in Transit with Encryption

All internetwork data in transit supports TLS 1.2 encryption.

With Amazon SageMaker, machine learning (ML) model artifacts and other system artifacts are encrypted in transit and at rest. Requests to the SageMaker API and console are made over a secure (SSL) connection. You pass AWS Identity and Access Management roles to SageMaker to provide permissions to access resources on your behalf for training and deployment. Use encrypted Amazon S3 buckets for model artifacts and data, and to pass an AWS KMS key to SageMaker instances to encrypt the attached ML storage volumes.

Some intranetwork data in transit (inside the service platform) is unencrypted. This includes:

- Command and control communications between the service control plane and training job instances (not customer data).
- Communications between nodes in distributed processing jobs (intranetwork).
- Communications between nodes in distributed training jobs (intranetwork).

There are no inter-node communications for batch processing.

You can choose to encrypt communication between nodes in a training cluster.

**Note**

For use cases in the healthcare sector, the best practice for security is to encrypt communication between the nodes.

For information about how to encrypt communication, see the next topic at [Protect Communications Between ML Compute Instances in a Distributed Training Job](#).

**Note**

Encrypting inter-container traffic can increase training time, especially if you use distributed deep learning algorithms. For affected algorithms, this additional level of security also increases cost. The training time for most SageMaker built-in algorithms, such as XGBoost, DeepAR, and linear learner, typically aren't affected.

FIPS validated endpoints are available for the SageMaker API and request router for hosted models (runtime). For information about FIPS compliant endpoints, see [Federal Information Processing Standard (FIPS) 140-2](#).

### Protect Communications with RStudio on Amazon SageMaker

RStudio on Amazon SageMaker provides encryption for all communications that involve SageMaker components. However, the previous version did not support encryption between the RStudioServerPro and RSession apps.

RStudio released version 2022.02.2-485.pro2 in April 2022. This version supports encryption between RStudioServerPro and RSession apps to enable end-to-end encryption. The version upgrade, however, is not completely backward compatible. As a result, you must update all of your RStudioServerPro and RSession apps. For information about how to update your apps, see [Upgrade the RStudio Version](#).
Protect Communications Between ML Compute Instances in a Distributed Training Job

By default, Amazon SageMaker runs training jobs in an Amazon Virtual Private Cloud (Amazon VPC) to help keep your data secure. You can add another level of security to protect your training containers and data by configuring a private VPC. Distributed ML frameworks and algorithms usually transmit information that is directly related to the model, such as weights, not the training dataset. When performing distributed training, you can further protect data that is transmitted between instances. This can help you to comply with regulatory requirements. To do this, use inter-container traffic encryption.

**Note**
For use cases in the healthcare sector, the best practice for security is to encrypt communication between the nodes.

Enabling inter-container traffic encryption can increase training time, especially if you are using distributed deep learning algorithms. Enabling inter-container traffic encryption doesn't affect training jobs with a single compute instance. However, for training jobs with several compute instances, the effect on training time depends on the amount of communication between compute instances. For affected algorithms, adding this additional level of security also increases cost. The training time for most SageMaker built-in algorithms, such as XGBoost, DeepAR, and linear learner, typically aren't affected.

You can enable inter-container traffic encryption for training jobs or hyperparameter tuning jobs. You can use SageMaker APIs or console to enable inter-container traffic encryption.

For information about running training jobs in a private VPC, see Give SageMaker Training Jobs Access to Resources in Your Amazon VPC (p. 3776).

**Enable Inter-container Traffic Encryption (API)**

Before enabling inter-container traffic encryption on training or hyperparameter tuning jobs with APIs, add inbound and outbound rules to your private VPC's security group.

**To enable inter-container traffic encryption (API)**

1. Add the following inbound and outbound rules in the security group for your private VPC:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port Range</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>UDP</td>
<td>500</td>
<td>Self Security Group ID</td>
</tr>
<tr>
<td>ESP 50</td>
<td>N/A</td>
<td>Self Security Group ID</td>
</tr>
</tbody>
</table>

2. When you send a request to the CreateTrainingJob or CreateHyperParameterTuningJob API, specify True for the EnableInterContainerTrafficEncryption parameter.

**Note**
For the ESP 50 protocol, the AWS Security Group Console might display the port range as "All". However, Amazon EC2 ignores the specified port range because it is not applicable for the ESP 50 IP protocol.

**Enable Inter-container Traffic Encryption (Console)**

**Enable Inter-container Traffic Encryption in a Training Job**

**To enable inter-container traffic encryption in a training job**

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose **Training**, then choose **Training jobs**.
3. Choose **Create training job**.
4. Under **Network**, choose a **VPC**. You can use the default VPC or one that you have created.
5. Choose **Enable inter-container traffic encryption**.

After you enable inter-container traffic encryption, finish creating the training job. For more information, see Step 4: Train a Model (p. 84).

**Enable Inter-container Traffic Encryption in a Hyperparameter Tuning Job**

**To enable inter-container traffic encryption in a hyperparameter tuning job**

1. Open the Amazon SageMaker console at https://console.aws.amazon.com/sagemaker/.
2. In the navigation pane, choose **Training**, then choose **Hyperparameter tuning jobs**.
3. Choose **Create hyperparameter tuning job**.
4. Under **Network**, choose a **VPC**. You can use the default VPC or one that you created.
5. Choose **Enable inter-container traffic encryption**.

After enabling inter-container traffic encryption, finish creating the hyperparameter tuning job. For more information, see Configure and Launch a Hyperparameter Tuning Job (p. 1669).

**Key Management**

Customers can specify AWS KMS keys, including bring your own keys (BYOK), to use for envelope encryption with Amazon S3 input/output buckets and machine learning (ML) Amazon EBS volumes. ML volumes for notebook instances and for processing, training, and hosted model Docker containers can be optionally encrypted by using AWS KMS customer-owned keys. All instance OS volumes are encrypted with an AWS-managed AWS KMS key.

**Note**

Certain Nitro-based instances include local storage, dependent on the instance type. Local storage volumes are encrypted using a hardware module on the instance. You can't request a **VolumeKmsKeyId** when using an instance type with local storage.

For a list of instance types that support local instance storage, see Instance Store Volumes.

For more information about local instance storage encryption, see SSD Instance Store Volumes.

For more information about storage volumes on nitro-based instances, see Amazon EBS and NVMe on Linux Instances.

For information about AWS KMS keys see What is AWS Key Management Service? in the AWS Key Management Service Developer Guide.

**Internetwork Traffic Privacy**

This topic describes how Amazon SageMaker secures connections from the service to other locations.

Internetwork communications support TLS 1.2 encryption between all components and clients.

Instances can be connected to Customer VPC, providing access to S3 VPC endpoints or customer repositories. Internet egress can be managed through this interface by the customer if service platform internet egress is disabled for notebooks. For training and hosting, egress through the service platform is not available when connected to the customer's VPC.

By default, API calls made to published endpoints traverse the public network to the request router. SageMaker supports Amazon Virtual Private Cloud interface endpoints powered by AWS PrivateLink for private connectivity between the customer's VPC and the request router to access hosted model
Identity and Access Management for Amazon SageMaker

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be authenticated (signed in) and authorized (have permissions) to use SageMaker resources. IAM is an AWS service that you can use with no additional charge.

Topics
- Audience (p. 3611)
- Authenticating with Identities (p. 3611)
- Managing Access Using Policies (p. 3613)
- How Amazon SageMaker Works with IAM (p. 3615)

- Troubleshooting Amazon SageMaker Identity and Access (p. 3755)

Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in SageMaker.

Service user – If you use the SageMaker service to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more SageMaker features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in SageMaker, see Troubleshooting Amazon SageMaker Identity and Access (p. 3755).

Service administrator – If you're in charge of SageMaker resources at your company, you probably have full access to SageMaker. It's your job to determine which SageMaker features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with SageMaker, see How Amazon SageMaker Works with IAM (p. 3615).

IAM administrator – If you’re an IAM administrator, you might want to learn details about how you can write policies to manage access to SageMaker. To view example SageMaker identity-based policies that you can use in IAM, see Amazon SageMaker Identity-Based Policy Examples (p. 3618).

Authenticating with Identities

Authentication is how you sign in to AWS using your identity credentials. You must be authenticated (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.
You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (successor to AWS Single Sign-On) (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see How to sign in to your AWS account in the AWS Sign-In User Guide.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see Signature Version 4 signing process in the AWS General Reference.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Multi-factor authentication in the AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide and Using multi-factor authentication (MFA) in AWS in the IAM User Guide.

AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the AWS Account Management Reference Guide.

IAM Users and Groups

An IAM user is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the IAM User Guide.

An IAM group is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named IAMAdmins and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see When to create an IAM user (instead of a role) in the IAM User Guide.

IAM Roles

An IAM role is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

IAM roles with temporary credentials are useful in the following situations:
• **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see Creating a role for a third-party Identity Provider in the IAM User Guide. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see Permission sets in the AWS IAM Identity Center (successor to AWS Single Sign-On) User Guide.

• **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.

• **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

• **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.

• **Principal permissions** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. Policies grant permissions to a principal. When you use some services, you might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see Actions, Resources, and Condition Keys for Amazon SageMaker in the Service Authorization Reference.

• **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

• **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

• **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the IAM User Guide.

To learn whether to use IAM roles or IAM users, see When to create an IAM role (instead of a user) in the IAM User Guide.

### Managing Access Using Policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the IAM User Guide.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.
Every IAM entity (user or role) starts with no permissions. By default, users can do nothing, not even change their own password. To give a user permission to do something, an administrator must attach a permissions policy to a user. Or the administrator can add the user to a group that has the intended permissions. When an administrator gives permissions to a group, all users in that group are granted those permissions.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

**Identity-Based Policies**

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Creating IAM policies](#) in the [IAM User Guide](#).

Identity-based policies can be further categorized as inline policies or managed policies. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see [Choosing between managed policies and inline policies](#) in the [IAM User Guide](#).

**Resource-Based Policies**

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

**Access Control Lists (ACLs)**

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see [Access control list (ACL) overview](#) in the [Amazon Simple Storage Service Developer Guide](#).

**Other Policy Types**

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the `Principal` field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see [Permissions boundaries for IAM entities](#) in the [IAM User Guide](#).
• **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the AWS Organizations User Guide.

• **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the IAM User Guide.

**Multiple Policy Types**

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the IAM User Guide.

**How Amazon SageMaker Works with IAM**

Before you use IAM to manage access to SageMaker, you should understand what IAM features are available to use with SageMaker. To get a high-level view of how SageMaker and other AWS services work with IAM, see AWS Services That Work with IAM in the IAM User Guide.

**Topics**

- SageMaker Identity-Based Policies (p. 3615)

**SageMaker Identity-Based Policies**

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. SageMaker supports specific actions, resources, and condition keys. To learn about all of the elements that you use in a JSON policy, see IAM JSON Policy Elements Reference in the IAM User Guide.

**Actions**

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Action element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Policy actions usually have the same name as the associated AWS API operation. There are some exceptions, such as permission-only actions that don't have a matching API operation. There are also some operations that require multiple actions in a policy. These additional actions are called dependent actions.

Include actions in a policy to grant permissions to perform the associated operation.

Policy actions in SageMaker use the following prefix before the action: sagemaker:. For example, to grant someone permission to run a SageMaker training job with the SageMaker CreateTrainingJob API operation, you include the sagemaker:CreateTrainingJob action in their policy. Policy statements must include either an Action or NotAction element. SageMaker defines its own set of actions that describe tasks that you can perform with this service.

To specify multiple actions in a single statement, separate them with commas as follows:
You can specify multiple actions using wildcards (*). For example, to specify all actions that begin with the word Describe, include the following action:

"Action": "sagemaker:Describe*"

To see a list of SageMaker actions, see Actions, resources, and condition keys for Amazon SageMaker in the Service Authorization Reference.

**Resources**

SageMaker does not support specifying resource ARNs in a policy.

**Condition Keys**

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Condition element (or Condition block) lets you specify conditions in which a statement is in effect. The Condition element is optional. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request.

If you specify multiple Condition elements in a statement, or multiple keys in a single Condition element, AWS evaluates them using a logical AND operation. If you specify multiple values for a single condition key, AWS evaluates the condition using a logical OR operation. All of the conditions must be met before the statement's permissions are granted.

You can also use placeholder variables when you specify conditions. For example, you can grant an IAM user permission to access a resource only if it is tagged with their IAM user name. For more information, see IAM policy elements: variables and tags in the IAM User Guide.

AWS supports global condition keys and service-specific condition keys. To see all AWS global condition keys, see AWS global condition context keys in the IAM User Guide.

SageMaker defines its own set of condition keys and also supports using some global condition keys. To see all AWS global condition keys, see AWS Global Condition Context Keys in the IAM User Guide.

SageMaker supports a number of service-specific condition keys that you can use for fine-grained access control for the following operations:

- CreateProcessingJob
- CreateTrainingJob
- CreateModel
- CreateEndpointConfig
- CreateTransformJob
- CreateHyperParameterTuningJob
- CreateLabelingJob
- CreateNotebookInstance
• **UpdateNotebookInstance**

To see a list of SageMaker condition keys, see [Condition keys for Amazon SageMaker](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) in the *IAM User Guide*. To learn with which actions and resources you can use a condition key, see [Actions defined by Amazon SageMaker](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html).

For examples of using SageMaker condition keys, see the following: [Control Creation of SageMaker Resources with Condition Keys](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) (p. 3628).

**Examples**

**SageMaker Resource-Based Policies**

SageMaker does not support resource-based policies.

**Authorization Based on SageMaker Tags**

You can attach tags to SageMaker resources or pass tags in a request to SageMaker. To control access based on tags, you provide tag information in the condition element of a policy using the `sagemaker:ResourceTag/key-name`, `aws:RequestTag/key-name`, or `aws:TagKeys` condition keys. For more information about tagging SageMaker resources, see [Control Access to SageMaker Resources by Using Tags](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) (p. 3637).

To view an example identity-based policy for limiting access to a resource based on the tags on that resource, see [Control Access to SageMaker Resources by Using Tags](https://docs.aws.amazon.com/IAM/latest/UserGuide/index.html) (p. 3637).

**SageMaker IAM Roles**

An IAM role is an entity within your AWS account that has specific permissions.

**Using Temporary Credentials with SageMaker**

You can use temporary credentials to sign in with federation, assume an IAM role, or to assume a cross-account role. You obtain temporary security credentials by calling AWS STS API operations such as `AssumeRole` or `GetFederationToken`.

SageMaker supports using temporary credentials.

**Service-Linked Roles**

SageMaker partially supports service-linked roles. Service-linked roles are currently available for SageMaker Studio and SageMaker training jobs.

**Service Roles**

This feature allows a service to assume a service role on your behalf. This role allows the service to access resources in other services to complete an action on your behalf. Service roles appear in your IAM account and are owned by the account. This means that an IAM administrator can change the permissions for this role. However, doing so might break the functionality of the service.

SageMaker supports service roles.

**Choosing an IAM Role in SageMaker**

When you create a notebook instance, processing job, training job, hosted endpoint, or batch transform job resource in SageMaker, you must choose a role to allow SageMaker to access SageMaker on your
behalf. If you have previously created a service role or service-linked role, then SageMaker provides
you with a list of roles to choose from. It's important to choose a role that allows access to the AWS
operations and resources you need. For more information, see SageMaker Roles (p. 3646).

Amazon SageMaker Identity-Based Policy Examples

By default, IAM users and roles don't have permission to create or modify SageMaker resources.
They also can't perform tasks using the AWS Management Console, AWS CLI, or AWS API. An IAM
administrator must create IAM policies that grant users and roles permission to perform specific API
operations on the specified resources they need. The administrator must then attach those policies to
the IAM users or groups that require those permissions. To learn how to attach policies to an IAM user or
group, see Adding and Removing IAM Identity Permissions in the IAM User Guide.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see
Creating Policies on the JSON Tab in the IAM User Guide.

Topics
- Policy Best Practices (p. 3618)
- Using the SageMaker Console (p. 3619)
- Allow Users to View Their Own Permissions (p. 3627)
- Control Creation of SageMaker Resources with Condition Keys (p. 3628)
- Control Access to the SageMaker API by Using Identity-based Policies (p. 3635)
- Limit Access to SageMaker API and Runtime Calls by IP Address (p. 3636)
- Limit Access to a Notebook Instance by IP Address (p. 3637)
- Control Access to SageMaker Resources by Using Tags (p. 3637)
- Require the Presence or Absence of Tags for API Calls (p. 3639)

Policy Best Practices

Identity-based policies determine whether someone can create, access, or delete SageMaker resources in
your account. These actions can incur costs for your AWS account. When you create or edit identity-based
policies, follow these guidelines and recommendations:

- Get started with AWS managed policies and move toward least-privilege permissions – To get
  started granting permissions to your users and workloads, use the AWS managed policies that grant
  permissions for many common use cases. They are available in your AWS account. We recommend that
  you reduce permissions further by defining AWS customer managed policies that are specific to your
  use cases. For more information, see AWS managed policies or AWS managed policies for job functions
  in the IAM User Guide.

- Apply least-privilege permissions – When you set permissions with IAM policies, grant only the
  permissions required to perform a task. You do this by defining the actions that can be taken on
  specific resources under specific conditions, also known as least-privilege permissions. For more
  information about using IAM to apply permissions, see Policies and permissions in IAM in the IAM User
  Guide.

- Use conditions in IAM policies to further restrict access – You can add a condition to your policies to
  limit access to actions and resources. For example, you can write a policy condition to specify that all
  requests must be sent using SSL. You can also use conditions to grant access to service actions if they
  are used through a specific AWS service, such as AWS CloudFormation. For more information, see IAM
  JSON policy elements: Condition in the IAM User Guide.

- Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions
  – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM
  policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy
Identity-Based Policy Examples

Checks and actionable recommendations to help you author secure and functional policies. For more information, see IAM Access Analyzer policy validation in the IAM User Guide.

- **Require multi-factor authentication (MFA)** – If you have a scenario that requires IAM users or root users in your account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see Configuring MFA-protected API access in the IAM User Guide.

For more information about best practices in IAM, see Security best practices in IAM in the IAM User Guide.

Using the SageMaker Console

To access the Amazon SageMaker console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the SageMaker resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won't function as intended for entities (IAM users or roles) with that policy.

To ensure that those entities can still use the SageMaker console, also attach the following AWS managed policy to the entities. For more information, see Adding Permissions to a User in the IAM User Guide:

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that you're trying to perform.

Topics

- Permissions Required to Use the Amazon SageMaker Console (p. 3619)
- Permissions Required to Use the Amazon SageMaker Ground Truth Console (p. 3621)
- Permissions Required to Use the Amazon Augmented AI (Preview) Console (p. 3622)

Permissions Required to Use the Amazon SageMaker Console

The permissions reference table lists the Amazon SageMaker API operations and shows the required permissions for each operation. For more information about Amazon SageMaker API operations, see Amazon SageMaker API Permissions: Actions, Permissions, and Resources Reference (p. 3674).

To use the Amazon SageMaker console, you need to grant permissions for additional actions. Specifically, the console needs permissions that allow the `ec2` actions to display subnets, VPCs, and security groups. Optionally, the console needs permission to create execution roles for tasks such as `CreateNotebook`, `CreateTrainingJob`, and `CreateModel`. Grant these permissions with the following permissions policy:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "SageMakerApis",
         "Effect": "Allow",
         "Action": [
            "sagemaker:*"
         ],
         "Resource": "*"
      },
      {
         "Sid": "VpcConfigurationForCreateForms",
         "Effect": "Allow"
      }
   ]
}
```
"Action": [
  "ec2:DescribeVpcs",
  "ec2:DescribeSubnets",
  "ec2:DescribeSecurityGroups"
],
"Resource": "*"
},
{ "Sid": "KmsKeysForCreateForms",
  "Effect": "Allow",
  "Action": [
    "kms:DescribeKey",
    "kms:ListAliases"
  ],
  "Resource": "*"
},
{ "Sid": "AccessAwsMarketplaceSubscriptions",
  "Effect": "Allow",
  "Action": [
    "aws-marketplace:ViewSubscriptions"
  ],
  "Resource": "*"
},
{ "Effect": "Allow",
  "Action": [
    "codecommit:BatchGetRepositories",
    "codecommit:CreateRepository",
    "codecommit:GetRepository",

    "codecommit:ListBranches",
    "secretsmanager:CreateSecret",
    "secretsmanager:DescribeSecret",
    "secretsmanager:ListSecrets"
  ],
  "Resource": "*"
},
{ "Sid": "ListAndCreateExecutionRoles",
  "Effect": "Allow",
  "Action": [
    "iam:ListRoles",
    "iam:CreateRole",
    "iam:CreatePolicy",
    "iam:AttachRolePolicy"
  ],
  "Resource": "*"
},
{ "Sid": "DescribeECRMetaData",
  "Effect": "Allow",
  "Action": [
    "ecr:Describe*"
  ],
  "Resource": "*"
},
{ "Sid": "PassRoleForExecutionRoles",
  "Effect": "Allow",
  "Action": [
    "iam:PassRole"
  ],
  "Resource": "*",
  "Condition": {
    "StringEquals": {
Permissions Required to Use the Amazon SageMaker Ground Truth Console

To use the Amazon SageMaker Ground Truth console, you need to grant permissions for additional resources. Specifically, the console needs permissions for the AWS Marketplace to view subscriptions, Amazon Cognito operations to manage your private workforce, Amazon S3 actions for access to your input and output files, and AWS Lambda actions to list and invoke functions. Grant these permissions with the following permissions policy:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "GroundTruthConsole",
            "Effect": "Allow",
            "Action": [
                "aws-marketplace:DescribeListings",
                "aws-marketplace:ViewSubscriptions",
                "cognito-idp:AdminAddUserToGroup",
                "cognito-idp:AdminCreateUser",
                "cognito-idp:AdminDeleteUser",
                "cognito-idp:AdminDisableUser",
                "cognito-idp:AdminEnableUser",
                "cognito-idp:AdminRemoveUserFromGroup",
                "cognito-idp:CreateGroup",
                "cognito-idp:CreateUserPool",
                "cognito-idp:CreateUserPoolClient",
                "cognito-idp:CreateUserPoolDomain",
                "cognito-idp:DescribeUserPool",
                "cognito-idp:DescribeUserPoolClient",
                "cognito-idp:ListGroups",
                "cognito-idp:ListIdentityProviders",
                "cognito-idp:ListUsers",
                "cognito-idp:ListUsersInGroup",
                "cognito-idp:ListUserPoolClients",
                "cognito-idp:ListUserPools",
                "cognito-idp:ListUserPool",
                "cognito-idp:UpdateUserPoolClient",
                "groundtruthlabeling:DescribeConsoleJob",
                "groundtruthlabeling:ListDatasetObjects",
                "groundtruthlabeling:RunFilterOrSampleManifestJob",
                "groundtruthlabeling:RunGenerateManifestByCrawlingJob",
                "lambda:InvokeFunction",
                "lambda:ListFunctions",
                "s3:GetObject",
                "s3:PutObject",
                "s3:SelectObjectContent"
            ],
            "Resource": "*"
        }
    ]
}
```
Permissions Required to Use the Amazon Augmented AI (Preview) Console

To use the Augmented AI console, you need to grant permissions for additional resources. Grant these permissions with the following permissions policy:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:*Algorithm",
                "sagemaker:*Algorithms",
                "sagemaker:*App",
                "sagemaker:*Apps",
                "sagemaker:*AutoMLJob",
                "sagemaker:*AutoMLJobs",
                "sagemaker:*CodeRepositories",
                "sagemaker:*CodeRepository",
                "sagemaker:*CompilationJob",
                "sagemaker:*CompilationJobs",
                "sagemaker:*Endpoint",

Allow Users to View Their Own Permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "ViewOwnUserInfo",
         "Effect": "Allow",
         "Action": [
            "iam:GetUserPolicy",
            "iam:ListGroupsForUser",
            "iam:ListAttachedUserPolicies",
            "iam:GetUser"
         ],
         "Resource": "arn:aws:iam::\:*:user/\:*",
         "Condition": {
            "StringEquals": {
               "iam:PrincipalId": ["\:*"]
            }
         }
      }
   ]
}
```
Control Creation of SageMaker Resources with Condition Keys

Control fine-grained access to allow the creation of SageMaker resources by using SageMaker-specific condition keys. For information about using condition keys in IAM policies, see IAM JSON Policy Elements: Condition in the IAM User Guide.

The condition keys, along with related API actions, and links to relevant documentation are listed in Condition Keys for SageMaker in the IAM User Guide.

The following examples show how to use the SageMaker condition keys to control access.

Topics

- Control Access to SageMaker Resources by Using File System Condition Keys (p. 3628)
- Restrict Training to a Specific VPC (p. 3630)
- Restrict Access to Workforce Types for Ground Truth Labeling Jobs and Amazon A2I Human Review Workflows (p. 3631)
- Enforce Encryption of Input Data (p. 3632)
- Enforce Encryption of Notebook Instance Storage Volume (p. 3632)
- Enforce Network Isolation for Training Jobs (p. 3633)
- Enforce a Specific Instance Type for Training Jobs (p. 3633)
- Enforce a Specific E1 Accelerator for Training Jobs (p. 3634)
- Enforce Disabling Internet Access and Root Access for Creating Notebook Instances (p. 3634)

Control Access to SageMaker Resources by Using File System Condition Keys

SageMaker training provides a secure infrastructure for the training algorithm to run in, but for some cases you may want increased defense in depth. For example, you minimize the risk of running untrusted code in your algorithm, or you have specific security mandates in your organization. For these scenarios, you can use the service-specific condition keys in the Condition element of an IAM policy to scope down the user to specific file systems, directories, access modes (read-write, read-only) and security groups.

Topics

- Restrict an IAM User to Specific Directories and Access Modes (p. 3629)
- Restrict an IAM User to a Specific File System (p. 3629)
Restrict an IAM User to Specific Directories and Access Modes

The policy below restricts an IAM user to the /sagemaker/xgboost-dm/train and /sagemaker/xgboost-dm/validation directories of an EFS file system to ro (read-only) AccessMode:

Note
When a directory is allowed, all of its subdirectories are also accessible by the training algorithm. POSIX permissions are ignored.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AccessToElasticFileSystem",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:FileSystemId": "fs-12345678",
                    "sagemaker:FileSystemAccessMode": "ro",
                    "sagemaker:FileSystemType": "EFS",
                    "sagemaker:FileSystemDirectoryPath": "/sagemaker/xgboost-dm/train"
                }
            }
        },
        {
            "Sid": "AccessToElasticFileSystemValidation",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:FileSystemId": "fs-12345678",
                    "sagemaker:FileSystemAccessMode": "ro",
                    "sagemaker:FileSystemType": "EFS",
                    "sagemaker:FileSystemDirectoryPath": "/sagemaker/xgboost-dm/validation"
                }
            }
        }
    ]
}
```

Restrict an IAM User to a Specific File System

To prevent a malicious algorithm using a user space client from accessing any file system directly in your account, you can restrict networking traffic by allowing ingress from a specific security group. In the following example, the IAM user can only use the specified security group to access the file system:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AccessToLustreFileSystem",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:FileSystemId": "fs-12345678",
                    "sagemaker:FileSystemAccessMode": "ro",
                    "sagemaker:FileSystemType": "EFS",
                    "sagemaker:FileSystemDirectoryPath": "/sagemaker/xgboost-dm/train"
                }
            }
        }
    ]
}
```
Although the above example can restrict an algorithm to a specific file system, it does not prevent an algorithm from accessing any directory within that file system using the user space client. To mitigate this, you can:

- Ensure that the file system only contains data that you trust your IAM users to access
- Create an IAM role that restricts your IAM users to launching training jobs with algorithms from approved ECR repositories

For more information on how to use roles with SageMaker, see SageMaker Roles.

**Restrict Training to a Specific VPC**

Restrict an AWS user to creating training jobs from within a Amazon VPC. When a training job is created within a VPC, you can use VPC flow logs to monitor all traffic to and from the training cluster. For information about using VPC flow logs, see VPC Flow Logs in the Amazon Virtual Private Cloud User Guide.

The following policy enforces that a training job is created by an IAM user calling CreateTrainingJob from within a VPC:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowFromVpc",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "ForAllValues:StringEquals": {
                    "sagemaker:VpcSubnets": ["subnet-a1234"],
                    "sagemaker:VpcSecurityGroupIds": ["sg12345", "sg-67890"]
                },
                "Null": {
                    "sagemaker:VpcSubnets": "false",
                    "sagemaker:VpcSecurityGroupIds": "false"
                }
            }
        }
    ]
}
```
Restrict Access to Workforce Types for Ground Truth Labeling Jobs and Amazon A2I Human Review Workflows

Amazon SageMaker Ground Truth and Amazon Augmented AI work teams fall into one of three workforce types: public (with Amazon Mechanical Turk), private, and vendor. To restrict IAM user access to a specific work team using one of these types or the work team ARN, use the `sagemaker:WorkteamType` and/or the `sagemaker:WorkteamArn` condition keys.

For the `sagemaker:WorkteamType` condition key, use string condition operators. For the `sagemaker:WorkteamArn` condition key, use Amazon Resource Name (ARN) condition operators. If the user attempts to create a labeling job with a restricted work team, SageMaker returns an access denied error.

The policies below demonstrate different ways to use the `sagemaker:WorkteamType` and `sagemaker:WorkteamArn` condition keys with appropriate condition operators and valid condition values.

The following example uses the `sagemaker:WorkteamType` condition key with the `StringEquals` condition operator to restrict access to a public work team. It accepts condition values in the following format: `workforcetype-crowd`, where `workforcetype` can equal public, private, or vendor.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamType",
      "Effect": "Deny",
      "Action": "sagemaker:CreateLabelingJob",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "sagemaker:WorkteamType": "public-crowd"
        }
      }
    }
  ]
}
```

The following policies show how to restrict access to a public work team using the `sagemaker:WorkteamArn` condition key. The first shows how to use it with a valid IAM regex-variant of the work team ARN and the `ArnLike` condition operator. The second shows how to use it with the `ArnEquals` condition operator and the work team ARN.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamType",
      "Effect": "Deny",
      "Action": "sagemaker:CreateLabelingJob",
      "Resource": "*",
      "Condition": {
        "ArnLike": {
          "sagemaker:WorkteamArn": "arn:aws:sagemaker:*:*:workteam/public-crowd/*
        }
      }
    }
  ]
}
```
Identity-Based Policy Examples

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamType",
      "Effect": "Deny",
      "Action": "sagemaker:CreateLabelingJob",
      "Resource": "*",
      "Condition": {
        "ArnEquals": {
        }
      }
    }
  ]
}
```

Enforce Encryption of Input Data

The following policy restricts an IAM user to specify an AWS KMS key to encrypt input data when creating training, hyperparameter tuning, and labeling jobs by using the `sagemaker:VolumeKmsKey` condition key:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "EnforceEncryption",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateTrainingJob",
        "sagemaker:CreateHyperParameterTuningJob",
        "sagemaker:CreateLabelingJob",
        "sagemaker:CreateFlowDefinition"
      ],
      "Resource": "*",
      "Condition": {
        "ArnEquals": {
          "sagemaker:VolumeKmsKey": "arn:aws:kms:us-west-2:11112223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
        }
      }
    }
  ]
}
```

Enforce Encryption of Notebook Instance Storage Volume

The following policy restricts an IAM user to specify an AWS KMS key to encrypt the attached storage volume when creating or updating a notebook instance by using the `sagemaker:VolumeKmsKey` condition key:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "RestrictWorkteamVolume",
      "Effect": "Deny",
      "Action": "sagemaker:CreateNotebookInstance",
      "Resource": "*",
      "Condition": {
        "ArnEquals": {
        }
      }
    }
  ]
}
```
"Sid": "EnforceEncryption",
"Effect": "Allow",
"Action": [
  "sagemaker:CreateNotebookInstance"
],
"Resource": "*",
"Condition": {
  "ArnLike": {
    "sagemaker:VolumeKmsKey": "*key/volume-kms-key-12345"
  }
}
]
}

Enforce Network Isolation for Training Jobs

The following policy restricts an IAM user to enable network isolation when creating training jobs by using the `sagemaker:NetworkIsolation` condition key:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "EnforceIsolation",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateTrainingJob",
        "sagemaker:CreateHyperParameterTuningJob"
      ],
      "Resource": "*",
      "Condition": {
        "Bool": {
          "sagemaker:NetworkIsolation": "true"
        }
      }
    }
  ]
}
```

Enforce a Specific Instance Type for Training Jobs

The following policy restricts an IAM user to use a specific instance type when creating training jobs by using the `sagemaker:InstanceTypes` condition key:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "EnforceInstanceType",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateTrainingJob",
        "sagemaker:CreateHyperParameterTuningJob"
      ],
      "Resource": "*",
      "Condition": {
        "ForAllValues:StringLike": {
          "sagemaker:InstanceTypes": ["ml.c5.*"]
        }
      }
    }
  ]
}
```
Enforce a Specific EI Accelerator for Training Jobs

The following policy restricts an IAM user to use a specific elastic inference (EI) accelerator, if an accelerator is provided, when creating or updating notebook instances and when creating endpoint configurations by using the `sagemaker:AcceleratorTypes` condition key:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "EnforceAcceleratorType",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreateNotebookInstance",
            "sagemaker:UpdateNotebookInstance",
            "sagemaker:CreateEndpointConfig"
         ],
         "Resource": "*",
         "Condition": {
            "ForAllValues:StringEquals": {
               "sagemaker:AcceleratorTypes": ["ml.eia1.medium"]
            }
         }
      }
   ]
}
```

Enforce Disabling Internet Access and Root Access for Creating Notebook Instances

You can disable both internet access and root access to notebook instances to help make them more secure. For information about controlling root access to a notebook instance, see Control root access to a SageMaker notebook instance (p. 3605). For information about disabling internet access for a notebook instance, see Connect a Notebook Instance in a VPC to External Resources (p. 3761).

The following policy requires an IAM user to disable network access when creating instance, and disable root access when creating or updating a notebook instance.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "LockDownCreateNotebookInstance",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreateNotebookInstance"
         ],
         "Resource": "*",
         "Condition": {
            "StringEquals": {
               "sagemaker:DirectInternetAccess": "Disabled",
               "sagemaker:RootAccess": "Disabled"
            },
            "Null": {
               "sagemaker:VpcSubnets": "false",
               "sagemaker:VpcSecurityGroupIds": "false"
            }
         }
      }
   ]
}
```
Control Access to the SageMaker API by Using Identity-based Policies

To control access to SageMaker API calls and calls to SageMaker hosted endpoints, use identity-based IAM policies.

Topics

- Restrict Access to SageMaker API and Runtime to Calls from Within Your VPC (p. 3635)

Restrict Access to SageMaker API and Runtime to Calls from Within Your VPC

If you set up an interface endpoint in your VPC, individuals outside the VPC can still connect to the SageMaker API and runtime over the internet unless you attach an IAM policy that restricts access to calls coming from within the VPC to all users and groups that have access to your SageMaker resources. For information about creating a VPC interface endpoint for the SageMaker API and runtime, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3763).

Important

If you apply an IAM policy similar to one of the following, users can't access the specified SageMaker APIs through the console.

To restrict access to only connections made from within your VPC, create an AWS Identity and Access Management policy that restricts access to only calls that come from within your VPC. Then add that policy to every AWS Identity and Access Management user, group, or role used to access the SageMaker API or runtime.

Note

This policy allows connections only to callers within a subnet where you created an interface endpoint.

```json
{
   "Id": "api-example-1",
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "EnableAPIAccess",
         "Effect": "Allow",
         "Action": [ "sagemaker:*" ],
         "Resource": "*",
         "Condition": { }
      }
   ]
}
```
If you want to restrict access to the API to only calls made using the interface endpoint, use the `aws:SourceVpce` condition key instead of `aws:SourceVpc`:

```json
{
    "Id": "api-example-1",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnableAPIAccess",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreatePresignedNotebookInstanceUrl"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:SourceVpce": [
                        "vpce-111bbccc",
                        "vpce-111bbddd"
                    ]
                }
            }
        }
    ]
}
```

**Limit Access to SageMaker API and Runtime Calls by IP Address**

To allow access to SageMaker API calls and runtime invocations only from IP addresses in a list that you specify, attach an IAM policy that denies access to the API unless the call comes from an IP address in the list to every AWS Identity and Access Management user, group, or role used to access the API or runtime. For information about creating IAM policies, see [Creating IAM Policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_policies.html) in the *AWS Identity and Access Management User Guide*. To specify the list of IP addresses that you want to have access to the API call, use the `IpAddress` condition operator and the `aws:SourceIp` condition context key. For information about IAM condition operators, see [IAM JSON Policy Elements: Condition Operators](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_policies-json.html) in the *AWS Identity and Access Management User Guide*. For information about IAM condition context keys, see [AWS Global Condition Context Keys](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_policies-condition-context-keys.html).

For example, the following policy allows access to the `CreateTrainingJob` only from IP addresses in the ranges `192.0.2.0-192.0.2.255` and `203.0.113.0-203.0.113.255`:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:CreateTrainingJob",
            "Resource": "*",
            "Condition": {
                "IpAddress": {
                    "aws:SourceIp": [
                        "192.0.2.0/24",
                        "203.0.113.0/24"
                    ]
                }
            }
        }
    ]
}
```
Limit Access to a Notebook Instance by IP Address

To allow access to a notebook instance only from IP addresses in a list that you specify, attach an IAM policy that denies access to `CreatePresignedNotebookInstanceUrl` unless the call comes from an IP address in the list to every AWS Identity and Access Management user, group, or role used to access the notebook instance. For information about creating IAM policies, see Creating IAM Policies in the AWS Identity and Access Management User Guide. To specify the list of IP addresses that you want to have access to the notebook instance, use the `IpAddress` condition operator and the `aws:SourceIp` condition context key. For information about IAM condition operators, see IAM JSON Policy Elements: Condition Operators in the AWS Identity and Access Management User Guide. For information about IAM condition context keys, see AWS Global Condition Context Keys.

For example, the following policy allows access to a notebook instance only from IP addresses in the ranges 192.0.2.0-192.0.2.255 and 203.0.113.0-203.0.113.255:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:CreatePresignedNotebookInstanceUrl",
            "Resource": "*",
            "Condition": {
                "IpAddress": {
                    "aws:SourceIp": [
                        "192.0.2.0/24",
                        "203.0.113.0/24"
                    ]
                }
            }
        }
    ]
}
```

The policy restricts access to both the call to `CreatePresignedNotebookInstanceUrl` and to the URL that the call returns. The policy also restricts access to opening a notebook instance in the console and is enforced for every HTTP request and WebSocket frame that attempts to connect to the notebook instance.

**Note**
Using this method to filter by IP address is incompatible when connecting to SageMaker through a VPC interface endpoint. For information about restricting access to a notebook instance when connecting through a VPC interface endpoint, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3769).

Control Access to SageMaker Resources by Using Tags

Control access to groups of SageMaker resources by attaching tags to the resources and specifying `ResourceTag` conditions in IAM policies.

**Note**
Tag-based policies don't work to restrict the following API calls:
For example, suppose you've defined two different IAM groups, named DevTeam1 and DevTeam2, in your AWS account. Suppose also that you've created 10 notebook instances, 5 of which are used for one project, and 5 of which are used for a second project. You want to allow members of DevTeam1 to make API calls on notebook instances used for the first project, and members of DevTeam2 to make API calls on notebook instances used for the second project.

**To control access to API calls (example)**

1. Add a tag with the key Project and value A to the notebook instances used for the first project. For information about adding tags to SageMaker resources, see AddTags.

2. Add a tag with the key Project and value B to the notebook instances used for the second project.

3. Create an IAM policy with a ResourceTag condition that denies access to the notebook instances used for the second project, and attach that policy to DevTeam1. The following is an example of a policy that denies all API calls on any notebook instance that has a tag with a key of Project and a value of B:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:*",
            "Resource": "*"
        }
    ]
}
```
Identity-Based Policy Examples

```json
{
  "Effect": "Deny",
  "Action": "sagemaker:*",
  "Resource": "*",
  "Condition": {
    "StringEquals": {
      "sagemaker:ResourceTag/Project": "B"
    }
  }
},
{
  "Effect": "Deny",
  "Action": ["sagemaker:AddTags", "sagemaker:DeleteTags"],
  "Resource": "*"
}
}
```

For information about creating IAM policies and attaching them to identities, see Controlling Access Using Policies in the AWS Identity and Access Management User Guide.

4. Create an IAM policy with a ResourceTag condition that denies access to the notebook instances used for the first project, and attach that policy to DevTeam2. The following is an example of a policy that denies all API calls on any notebook instance that has a tag with a key of Project and a value of A:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "sagemaker:*",
      "Resource": "*"
    },
    {
      "Effect": "Deny",
      "Action": "sagemaker:*",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "sagemaker:ResourceTag/Project": "A"
        }
      }
    },
    {
      "Effect": "Deny",
      "Action": ["sagemaker:AddTags", "sagemaker:DeleteTags"],
      "Resource": "*"
    }
  ]
}
```

**Require the Presence or Absence of Tags for API Calls**

Require the presence or absence of specific tags or specific tag values by using RequestTag condition keys in an IAM policy. For example, if you want to require that every endpoint created by any member

3639
of an IAM group to be created with a tag with the key `environment` and value `dev`, create a policy as follows:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:CreateEndpoint",
            "Resource": "arn:aws:sagemaker:*:*:endpoint/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/environment": "dev"
                }
            }
        }
    ]
}
```

## Cross-Service Confused Deputy Prevention

The confused deputy problem is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. In AWS, cross-service impersonation can result in the confused deputy problem. Cross-service impersonation can occur when one service (the calling service) calls another service (the called service). The calling service can be manipulated to use its permissions to act on another customer's resources in a way it should not otherwise have permission to access. To prevent this, AWS provides tools that help you protect your data for all services with service principals that have been given access to resources in your account.

Read on for general guidance or navigate to an example for a specific SageMaker feature:

### Topics

### Limit Permissions With Global Condition Keys

We recommend using the `aws:SourceArn` and `aws:SourceAccount` global condition keys in resource policies to limit the permissions to the resource that Amazon SageMaker gives another service. If you use both global condition keys and the `aws:SourceArn` value contains the account ID, the `aws:SourceAccount` value and the account in the `aws:SourceArn` value must use the same account ID when used in the same policy statement. Use `aws:SourceArn` if you want only one resource to be associated with the cross-service access. Use `aws:SourceAccount` if you want to allow any resource in that account to be associated with the cross-service use.
The most effective way to protect against the confused deputy problem is to use the `aws:SourceArn` global condition key with the full ARN of the resource. If you don't know the full ARN of the resource or if you are specifying multiple resources, use the `aws:SourceArn` global condition key with wildcards (*) for the unknown portions of the ARN. For example, `arn:aws:sagemaker:*:123456789012:*`.

The following example shows how you can use the `aws:SourceArn` and `aws:SourceAccount` global condition keys in SageMaker to prevent the confused deputy problem.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Sid": "ConfusedDeputyPreventionExamplePolicy",
    "Effect": "Allow",
    "Principal": {
      "Service": "sagemaker.amazonaws.com"
    },
    "Action": "service:ActionName",
    "Resource": [ "arn:aws:service::ResourceName/*" ],
    "Condition": {
      "ArnLike": { "aws:SourceArn": "arn:partition:sagemaker:region:123456789012:*" },
      "StringEquals": { "aws:SourceAccount": "123456789012" }
    }
  }
}
```

**SageMaker Edge Manager**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Edge Manager created by account number `123456789012` in the `us-west-2` Region.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
        "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
      }
    }
  }
}
```

You can replace the `aws:SourceArn` in this template with the full ARN of one specific packaging job to further limit permissions.

**SageMaker Images**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Images. Use this template with either `Image` or `ImageVersion`. This example uses an `ImageVersion` record ARN with the account number.
123456789012. Note that because the account number is part of the `aws:SourceArn` value, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
      }
    }
  }
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific image or image version. The ARN must be in the format provided above and specify either image or image-version. The partition placeholder should designate either an AWS commercial partition (`aws`) or an AWS in China partition (`aws-cn`), depending on where the image or image version is running. Similarly, the region placeholder in the ARN can be any valid Region where SageMaker images are available.

### SageMaker Inference

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker real-time, serverless, and asynchronous inference. Note that because the account number is part of the `aws:SourceArn` value, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sagemaker.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
        "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
      }
    }
  }
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific model or endpoint. The ARN must be in the format provided above. The asterisk in the ARN template does not stand for wildcard and should not be changed.

### SageMaker Batch Transform Jobs

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker batch transform jobs created by account number 123456789012 in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": { "Service": "sagemaker.amazonaws.com" },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
          "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
        }
      }
    }
  ]
}
```
"Principal": {  
  "Service": "sagemaker.amazonaws.com"
},  
"Action": "sts:AssumeRole",
"Condition": {  
  "ArnLike": {  
  }  
}  
]
}
]

You can replace the `aws:SourceArn` in this template with the full ARN of one specific batch transform job to further limit permissions.

**SageMaker Marketplace**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Marketplace resources created by account number `123456789012` in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
        }
      }
    }
  ]
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific algorithm or model package. The ARN must be in the format provided above. The asterisk in the ARN template does stand for wildcard and covers all training jobs, models, and batch transform jobs from validation steps, as well as algorithm and model packages published to SageMaker Marketplace.

**SageMaker Neo**

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Neo compilation jobs created by account number `123456789012` in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
        }
      }
    }
  ]
}
```
You can replace the `aws:SourceArn` in this template with the full ARN of one specific compilation job to further limit permissions.

### SageMaker Pipelines

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Pipelines using pipeline execution records from one or more pipelines. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "sagemaker.amazonaws.com"
         },
         "Action": "sts:AssumeRole",
         "Condition": {
            "ArnLike": {
               "aws:SourceArn": "arn:partition:sagemaker:region:123456789012:pipeline/mypipeline/*"
            }
         }
      }
   ]
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific pipeline execution. The ARN must be in the format provided above. The `partition` placeholder should designate either an AWS commercial partition (`aws`) or an AWS in China partition (`aws-cn`), depending on where the pipeline is running. Similarly, the `region` placeholder in the ARN can be any valid Region where SageMaker Pipelines is available.

The asterisk in the ARN template does stand for wildcard and covers all pipeline executions of a pipeline named `mypipeline`. If you want to allow the AssumeRole permissions for all pipelines in account 123456789012 rather than one specific pipeline, then the `aws:SourceArn` would be `arn:aws:sagemaker:*:123456789012:pipeline/*`.

### SageMaker Processing Jobs

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker processing jobs created by account number 123456789012 in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": {
            "Service": "sagemaker.amazonaws.com"
         },
         "Action": "sts:AssumeRole",
         "Condition": {
            "ArnLike": {
            }
         }
      }
   ]
}
```
You can replace the `aws:SourceArn` in this template with the full ARN of one specific processing job to further limit permissions.

### SageMaker Studio

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker Studio created by account number `123456789012` in the `us-west-2` Region. Note that because the account number is part of the `aws:SourceArn` value, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
          "aws:SourceArn": "arn:aws:sagemaker:us-west-2:123456789012:*"
        }
      }
    }
  ]
}
```

Do not replace the `aws:SourceArn` in this template with the full ARN of a specific Studio application, user profile, or domain. The ARN must be in the format provided in the previous example. The asterisk in the ARN template does not stand for wildcard and should not be changed.

### SageMaker Training Jobs

The following example shows how you can use the `aws:SourceArn` global condition key to prevent the cross-service confused deputy problem for SageMaker training jobs created by account number `123456789012` in the `us-west-2` Region. Note that because the account number is in the ARN, you do not need to specify an `aws:SourceAccount` value.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "ArnLike": {
        }
      }
    }
  ]
}
```
You can replace the `aws:SourceArn` in this template with the full ARN of one specific training job to further limit permissions.

**Next Up**
For more information on managing execution roles, see SageMaker Roles.

**SageMaker Roles**

As a managed service, Amazon SageMaker performs operations on your behalf on the AWS hardware that is managed by SageMaker. SageMaker can perform only operations that the user permits.

A SageMaker user can grant these permissions with an IAM role (referred to as an execution role).

To create and use a locally available execution role, you can use the following procedures.

**Get execution role**

You can find the IAM execution role in the following ways:

**From the notebook**

When you run a notebook within SageMaker (from the SageMaker console or SageMaker Studio) you can access the execution role with the following code:

```python
sagemaker_session = sagemaker.Session()
role = sagemaker.get_execution_role()
```

**Note**
The execution role is available only when running a notebook within SageMaker. If you run `get_execution_role` in a notebook not on SageMaker, expect a "region" error.

**From the SageMaker console**

Under Notebook > Notebook instances, select the notebook. The ARN is given in the Permissions and encryption section.

**Create execution role**

Use the following procedure to create an execution role with the IAM managed policy, AmazonSageMakerFullAccess, attached. If your use case requires more granular permissions, use other sections on this page to create an execution role that meets your business needs.

**Important**
The IAM managed policy, AmazonSageMakerFullAccess, used in the following procedure only grants the execution role permission to perform certain Amazon S3 actions on buckets or objects with SageMaker, Sagemaker, sagemaker, or aws-glue in the name. To learn how to add an additional policy to an execution role to grant it access to other Amazon S3 buckets and objects, see Add Additional Amazon S3 Permissions to a SageMaker Execution Role (p. 3647).
To create a new role

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. Select Roles and then select Create role.
4. Select Next: Permissions.
5. The IAM managed policy, AmazonSageMakerFullAccess is automatically attached to this role. To see the permissions included in this policy, select the sideways arrow next to the policy name. Select Next: Tags.
6. (Optional) Add tags and select Next: Review.
7. Give the role a name in the text field under Role name and select Create role.
8. On the Roles section of the IAM console, select the role you just created. If needed, use the text box to search for the role using the role name you entered in step 7.
9. On the role summary page, make note of the ARN.

With a known ARN for your role, you can programmatically check the role when running the notebook locally or on SageMaker. Replace RoleName with your known ARN:

```python
try:
    role = sagemaker.get_execution_role()
except ValueError:
    iam = boto3.client('iam')
    role = iam.get_role(RoleName='AmazonSageMaker-ExecutionRole-20201200T100000')['Role']['Arn']
```

Add Additional Amazon S3 Permissions to a SageMaker Execution Role

When you use a SageMaker feature with resources in Amazon S3, such as input data, the execution role you specify in your request (for example CreateTrainingJob) is used to access these resources.

If you attach the IAM managed policy, AmazonSageMakerFullAccess, to an execution role, that role has permission to perform certain Amazon S3 actions on buckets or objects with SageMaker, Sagemaker, sagemaker, or aws-glue in the name. It also has permission to perform the following actions on any Amazon S3 resource:

```
"s3:CreateBucket",
"s3:GetBucketLocation",
"s3:ListBucket",
"s3:ListAllMyBuckets",
"s3:GetBucketCors",
"s3:PutBucketCors"
```

To give an execution role permissions to access one or more specific buckets in Amazon S3, you can attach a policy similar to the following to the role. This policy grants an IAM role permission to perform all actions that AmazonSageMakerFullAccess allows but restricts this access to the buckets DOC-EXAMPLE-BUCKET1 and DOC-EXAMPLE-BUCKET2. Refer to the security documentation for the specific SageMaker feature you are using to learn more about the Amazon S3 permissions required for that feature.

```json
{
    "Version": "2012-10-17",
    "Statement": [
    {
        "Effect": "Allow",
        "Action": [
```
"s3:GetObject",
"s3:PutObject",
"s3:DeleteObject",
"s3:AbortMultipartUpload"
],
"Resource": [
  "arn:aws:s3:::DOC-EXAMPLE-BUCKET1/*",
  "arn:aws:s3:::DOC-EXAMPLE-BUCKET2/*"
]
},
{
  "Effect": "Allow",
  "Action": [
    "s3:CreateBucket",
    "s3:GetBucketLocation",
    "s3:ListBucket",
    "s3:ListAllMyBuckets",
    "s3:GetBucketCors",
    "s3:PutBucketCors"
  ],
  "Resource": "*"
},
{
  "Effect": "Allow",
  "Action": [
    "s3:GetBucketAcl",
    "s3:PutObjectAcl"
  ],
  "Resource": [
    "arn:aws:s3:::DOC-EXAMPLE-BUCKET1",
    "arn:aws:s3:::DOC-EXAMPLE-BUCKET2"
  ]
}]
}

Passing Roles

Actions like passing a role between services are a common function within SageMaker. You can find more details on Actions, Resources, and Condition Keys for SageMaker in the IAM User Guide.

You pass the role (iam:PassRole) when making these API calls: CreateAutoMLJob, CreateCompilationJob, CreateDomain, CreateFlowDefinition, CreateHyperParameterTuningJob, CreateImage, CreateLabelingJob, CreateModel, CreateMonitoringSchedule, CreateNotebookInstance, CreateProcessingJob, CreateTrainingJob, CreateUserProfile, RenderUiTemplate, and UpdateImage.

You attach the following trust policy to the IAM role which grants SageMaker principal permissions to assume the role, and is the same for all of the execution roles:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "sagemaker.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```
The permissions that you need to grant to the role vary depending on the API that you call. The following sections explain these permissions.

**Note**
Instead of managing permissions by crafting a permission policy, you can use the AWS-managed AmazonSageMakerFullAccess permission policy. The permissions in this policy are fairly broad, to allow for any actions you might want to perform in SageMaker. For a listing of the policy including information about the reasons for adding many of the permissions, see AWS managed policy: AmazonSageMakerFullAccess (p. 3695). If you prefer to create custom policies and manage permissions to scope the permissions only to the actions you need to perform with the execution role, see the following topics.

**Important**
If you’re running into issues, see Troubleshooting Amazon SageMaker Identity and Access (p. 3755).

For more information about IAM roles, see IAM Roles in the IAM User Guide.

**Topics**
- CreateAutoMLJob API: Execution Role Permissions (p. 3649)
- CreateDomain API: Execution Role Permissions (p. 3651)
- CreateImage and UpdateImage APIs: Execution Role Permissions (p. 3651)
- CreateNotebookInstance API: Execution Role Permissions (p. 3652)
- CreateHyperParameterTuningJob API: Execution Role Permissions (p. 3655)
- CreateProcessingJob API: Execution Role Permissions (p. 3657)
- CreateTrainingJob API: Execution Role Permissions (p. 3660)
- CreateModel API: Execution Role Permissions (p. 3662)
- SageMaker geospatial capability roles (p. 3664)

**CreateAutoMLJob API: Execution Role Permissions**

For an execution role that you can pass in a CreateAutoMLJob API request, you can attach the following minimum permission policy to the role:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "iam:PassRole"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": "sagemaker.amazonaws.com"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:DescribeEndpointConfig",
                "sagemaker:DescribeModel",
                "sagemaker:InvokeEndpoint",
                "sagemaker:ListTags",
                "sagemaker:DescribeEndpoint",
                "sagemaker:CreateModel"
            ],
            "Resource": "*"
        }
    ]
}
```
If you specify a private VPC for your AutoML job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2:DeleteNetworkInterface",
    "ec2:DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeVpcs",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups"
  ],
  "Resource": "*"
}
```

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": ["kms:Decrypt"
}
```

If you specify a KMS key in the output configuration of your AutoML job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": ["kms:Encrypt"
}
```

If you specify a volume KMS key in the resource configuration of your AutoML job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": ["kms:Encrypt"
}
```
CreateDomain API: Execution Role Permissions

The execution role for domains with IAM Identity Center and the user/execution role for IAM domains need the following permissions when you pass an AWS KMS customer managed key as the KmsKeyId in the CreateDomain API request. The permissions are enforced during the CreateApp API call.

For an execution role that you can pass in the CreateDomain API request, you can attach the following permission policy to the role:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "kms:CreateGrant",
            "kms:DescribeKey"
         ],
         "Resource": "arn:aws:kms:region:account-id:key/kms-key-id"
      }
   ]
}
```

Alternatively, if the permissions are specified in a KMS policy, you can attach the following policy to the role:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "Allow use of the key",
         "Effect": "Allow",
         "Principal": { "AWS": [ "arn:aws:iam::account-id:role/ExecutionRole" ] },
         "Action": [ "kms:CreateGrant", "kms:DescribeKey" ],
         "Resource": "*"
      }
   ]
}
```

CreateImage and UpdateImage APIs: Execution Role Permissions

For an execution role that you can pass in a CreateImage or UpdateImage API request, you can attach the following permission policy to the role:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [ "kms:CreateGrant", "kms:DescribeKey" ],
         "Resource": "*"
      }
   ]
}
```
CreateNotebookInstance API: Execution Role Permissions

The permissions that you grant to the execution role for calling the CreateNotebookInstance API depend on what you plan to do with the notebook instance. If you plan to use it to invoke SageMaker APIs and pass the same role when calling the CreateTrainingJob and CreateModel APIs, attach the following permissions policy to the role:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:*",
                "ecr:GetAuthorizationToken",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage",
                "ecr:BatchCheckLayerAvailability",
                "ecr:SetRepositoryPolicy",
                "ecr:CompleteLayerUpload",
                "ecr:BatchDeleteImage",
                "ecr:UploadLayerPart",
                "ecr:DeleteRepositoryPolicy",
                "ecr:InitiateLayerUpload",
                "ecr:DeleteRepository",
                "ecr:PutImage",
                "ecr:CreateRepository",
                "cloudwatch:PutMetricData",
                "cloudwatch:GetMetricData",
                "cloudwatch:GetMetricStatistics",
                "cloudwatch:ListMetrics",
                "logs:CreateLogGroup",
                "logs:CreateLogStream",
                "logs:DescribeLogStreams",
                "logs:PutLogEvents",
                "logs:GetLogEvents",
                "s3:CreateBucket",
                "s3:ListBucket",
                "s3:GetBucketLocation",
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": "sagemaker.amazonaws.com"
                }
            }
        }
    ]
}
```
To tighten the permissions, limit them to specific Amazon S3 and Amazon ECR resources, by restricting "Resource": "*", as follows:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sagemaker:*",
        "ecr:GetAuthorizationToken",
        "cloudwatch:PutMetricData",
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:DescribeLogStreams",
        "logs:PutLogEvents",
        "logs:GetLogEvents"
      ],
      "Resource": "*"
    },
    { "Effect": "Allow",
      "Action": [ "iam:PassRole"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "iam:PassedToService": "sagemaker.amazonaws.com"
        }
      }
    }
  ]
}
```
If you plan to access other resources, such as Amazon DynamoDB or Amazon Relational Database Service, add the relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3:ListBucket` permission to the specific bucket that you specify as `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope `s3:GetObject`, `s3:PutObject`, and `s3:DeleteObject` permissions as follows:
  - Scope to the following values that you specify in a `CreateTrainingJob` request:
    - `InputDataConfig.DataSource.S3DataSource.S3Uri`
    - `OutputDataConfig.S3OutputPath`
  - Scope to the following values that you specify in a `CreateModel` request:
PrimaryContainer.ModelDataUrl
SuplementalContainers.ModelDataUrl
• Scope ecr permissions as follows:
  • Scope to the AlgorithmSpecification.TrainingImage value that you specify in a CreateTrainingJob request.
  • Scope to the PrimaryContainer.Image value that you specify in a CreateModel request.

The cloudwatch and logs actions are applicable for "*" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

CreateHyperParameterTuningJob API: Execution Role Permissions

For an execution role that you can pass in a CreateHyperParameterTuningJob API request, you can attach the following permission policy to the role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:PutLogEvents",
        "logs:CreateLogGroup",
        "logs:DescribeLogStreams",
        "s3:GetObject",
        "s3:PutObject",
        "s3:ListBucket",
        "ecr:GetAuthorizationToken",
        "ecr:BatchCheckLayerAvailability",
        "ecr:GetDownloadUrlForLayer",
        "ecr:BatchGetImage"
      ],
      "Resource": "*"
    }
  ]
}
```

Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:PutLogEvents",
        "logs:CreateLogGroup",
        "logs:DescribeLogStreams",
        "ecr:GetAuthorizationToken"
      ],
      "Resource": "*"
    }
  ]
}
```
If the training container associated with the hyperparameter tuning job needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3:ListBucket` permission to a specific bucket that you specify as the `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope the `s3:GetObject` and `s3:PutObject` permissions to the following objects that you specify in the input and output data configuration in a `CreateHyperParameterTuningJob` request:
  
  `InputDataConfig.DataSource.S3DataSource.S3Uri`  
  `OutputDataConfig.S3OutputPath`

- Scope Amazon ECR permissions to the registry path (`AlgorithmSpecification.TrainingImage`) that you specify in a `CreateHyperParameterTuningJob` request.

The `cloudwatch` and `logs` actions are applicable for "*" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your hyperparameter tuning job, add the following permissions:
If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": ["kms:Decrypt"
}
```

If you specify a KMS key in the output configuration of your hyperparameter tuning job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": ["kms:Encrypt"
}
```

If you specify a volume KMS key in the resource configuration of your hyperparameter tuning job, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": ["kms:CreateGrant"
}
```

### CreateProcessingJob API: Execution Role Permissions

For an execution role that you can pass in a `CreateProcessingJob` API request, you can attach the following permission policy to the role:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["cloudwatch:PutMetricData",
                 "logs:CreateLogStream",
                 "logs:PutLogEvents",
                 "logs:CreateLogGroup",
                 "logs:DescribeLogStreams",
                 "s3:GetObject",
                 "s3:PutObject",
                 "s3:ListBucket",
                 "ecr:GetAuthorizationToken",
```
Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": ["s3:ListBucket"],
      "Resource": ["arn:aws:s3:::inputbucket"]
    },
    {
      "Effect": "Allow",
      "Action": ["s3:GetObject", "s3:PutObject"],
      "Resource": ["arn:aws:s3:::inputbucket/object", "arn:aws:s3:::outputbucket/path"]
    },
    {
      "Effect": "Allow",
      "Action": ["ecr:BatchCheckLayerAvailability", "ecr:GetDownloadUrlForLayer", "ecr:BatchGetImage"],
      "Resource": "arn:aws:ecr:region::repository/my-repo"
    }
  ]
}
```

If CreateProcessingJob.AppSpecification.ImageUri needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:
• Scope the s3:ListBucket permission to a specific bucket that you specify as the ProcessingInputs in a CreateProcessingJob request.

• Scope the s3:GetObject and s3:PutObject permissions to the objects that will be downloaded or uploaded in the ProcessingInputs and ProcessingOutputConfig in a CreateProcessingJob request.

• Scope Amazon ECR permissions to the registry path (AppSpecification.ImageUri) that you specify in a CreateProcessingJob request.

The cloudwatch and logs actions are applicable for "*" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your processing job, add the following permissions. Don't scope in the policy with any conditions or resource filters. Otherwise, the validation checks that occur during the creation of the processing job fail.

```
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateNetworkInterface",
        "ec2:CreateNetworkInterfacePermission",
        "ec2:DeleteNetworkInterface",
        "ec2:DeleteNetworkInterfacePermission",
        "ec2:DescribeNetworkInterfaces",
        "ec2:DescribeVpcs",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups"
    ]
}
```

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms:Decrypt"
    ]
}
```

If you specify a KMS key in the output configuration of your processing job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms:Encrypt"
    ]
}
```

If you specify a volume KMS key in the resource configuration of your processing job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms:CreateGrant"
    ]
}
```
CreateTrainingJob API: Execution Role Permissions

For an execution role that you can pass in a CreateTrainingJob API request, you can attach the following permission policy to the role:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "cloudwatch:PutMetricData",
            "logs:CreateLogStream",
            "logs:PutLogEvents",
            "logs:CreateLogGroup",
            "logs:DescribeLogStreams",
            "s3:GetObject",
            "s3:PutObject",
            "s3:ListBucket",
            "ecr:GetAuthorizationToken",
            "ecr:BatchCheckLayerAvailability",
            "ecr:GetDownloadUrlForLayer",
            "ecr:BatchGetImage"
         ],
         "Resource": "*
      }
   ]
}
```

Instead of specifying "Resource": "*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "cloudwatch:PutMetricData",
            "logs:CreateLogStream",
            "logs:PutLogEvents",
            "logs:CreateLogGroup",
            "logs:DescribeLogStreams",
            "ecr:GetAuthorizationToken"
         ],
         "Resource": "*"
      },
      {
         "Effect": "Allow",
         "Action": [
            "s3:ListBucket"
         ],
         "Resource": [
            "arn:aws:s3:::inputbucket"
         ]
      },
      {
         "Effect": "Allow",
         "Action": [
            "s3:GetObject",
            "s3:PutObject"
         ],
         "Resource": [
            "arn:aws:s3:::inputbucket"...
         ]
      }
   ]
}
```
If `CreateTrainingJob.AlgorithmSpecifications.TrainingImage` needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3:ListBucket` permission to a specific bucket that you specify as the `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope the `s3:GetObject` and `s3:PutObject` permissions to the following objects that you specify in the input and output data configuration in a `CreateTrainingJob` request:
  - `InputDataConfig.DataSource.S3DataSource.S3Uri`
  - `OutputDataConfig.S3OutputPath`
- Scope Amazon ECR permissions to the registry path (`AlgorithmSpecification.TrainingImage`) that you specify in a `CreateTrainingJob` request.

The `cloudwatch` and `logs` actions are applicable for `*` resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your training job, add the following permissions:

```json
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateNetworkInterface",
        "ec2:CreateNetworkInterfacePermission",
        "ec2:DeleteNetworkInterface",
        "ec2:DeleteNetworkInterfacePermission",
        "ec2:DescribeNetworkInterfaces",
        "ec2:DescribeVpcs",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups"
    ]
}
```

If your input is encrypted using server-side encryption with an AWS KMS–managed key (SSE-KMS), add the following permissions:

```json
{
    "Effect": "Allow",
    "Action": [
        "kms:Encrypt",
        "kms:Decrypt",
        "kms:ReEncrypt*",
        "kms:Untag Resource",
        "kms:TagResource",
        "kms:GetKeyPolicy",
        "kms:PutKeyPolicy"
    ],
    "Resource": "arn:aws:kms:region:account-id:key/key-id"
}
```
If you specify a KMS key in the output configuration of your training job, add the following permissions:

```json
{
   "Effect": "Allow",
   "Action": [
      "kms:Decrypt"
   ]
}
```

If you specify a volume KMS key in the resource configuration of your training job, add the following permissions:

```json
{
   "Effect": "Allow",
   "Action": [
      "kms:CreateGrant"
   ]
}
```

### CreateModel API: Execution Role Permissions

For an execution role that you can pass in a `CreateModel` API request, you can attach the following permission policy to the role:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "cloudwatch:PutMetricData",
            "logs:CreateLogStream",
            "logs:PutLogEvents",
            "logs:CreateLogGroup",
            "logs:DescribeLogStreams",
            "s3:GetObject",
            "s3:ListBucket",
            "ecr:GetAuthorizationToken",
            "ecr:BatchCheckLayerAvailability",
            "ecr:GetDownloadUrlForLayer",
            "ecr:BatchGetImage"
         ],
         "Resource": "*"
      }
   ]
}
```

Instead of the specifying "Resource": "*", you can scope these permissions to specific Amazon S3 and Amazon ECR resources:

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "cloudwatch:PutMetricData",
            "logs:CreateLogStream",
            "logs:PutLogEvents",
            "logs:CreateLogGroup",
            "logs:DescribeLogStreams",
            "s3:GetObject",
            "s3:ListBucket",
            "ecr:GetAuthorizationToken",
            "ecr:BatchCheckLayerAvailability",
            "ecr:GetDownloadUrlForLayer",
            "ecr:BatchGetImage"
         ],
         "Resource": "s3://example-bucket/"
      }
   ]
}
```
If `CreateModel.PrimaryContainer.Image` need to access other data sources, such as Amazon DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope S3 permissions to objects that you specify in the `PrimaryContainer.ModelDataUrl` in a `CreateModel` request.
- Scope Amazon ECR permissions to a specific registry path that you specify as the `PrimaryContainer.Image` and `SecondaryContainer.Image` in a `CreateModel` request.

The `cloudwatch` and `logs` actions are applicable for "*" resources. For more information, see CloudWatch Resources and Operations in the Amazon CloudWatch User Guide.

If you specify a private VPC for your model, add the following permissions:

```json
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2:DeleteNetworkInterface",
    "ec2:DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeVpcs",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:DescribeSecurityGroups"
  ]
}
```
SageMaker geospatial capability roles

As a managed service, Amazon SageMaker geospatial capabilities perform operations on your behalf on the AWS hardware that is managed by SageMaker. It can perform only operations that the user permits. A user can grant these permissions with an IAM role (referred to as an execution role).

To create and use a locally available execution role, you can use the following procedures.

Create an execution role

To work with SageMaker geospatial you need to setup a user role and an execution role. A user role is an AWS identity with permission policies that determine what the user can and can not do within AWS. An execution role is an IAM role that grants the service permission to access your AWS resources. An execution role consists of permissions and trust policy. The trust policy specifies which principals have the permission to assume the role.

Use the following procedure to create an execution role with the IAM managed policy, AmazonSageMakerGeospatialFullAccess, attached. If your use case requires more granular permissions, use other sections of this guide to create an execution role that meets your business needs.

Important

The IAM managed policy, AmazonSageMakerGeospatialFullAccess, used in the following procedure only grants the execution role permission to perform certain Amazon S3 actions on buckets or objects with SageMaker, Sagemaker, sagemaker, or aws-glue in the name. To learn how to add an additional policy to an execution role to grant it access to other Amazon S3 buckets and objects, see Add Additional Amazon S3 Permissions to a SageMaker Execution Role (p. 3647).

To create a new role

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. Select Roles and then select Create role.
4. Select Next: Permissions.
5. The IAM managed policy, AmazonSageMakerGeospatialFullAccess is automatically attached to this role. To see the permissions included in this policy, select the sideways arrow next to the policy name. Select Next: Tags.
6. (Optional) Add tags and select Next: Review.
7. Give the role a name in the text field under Role name and select Create role.
8. In the Roles section of the IAM console, select the role you just created. If needed, use the text box to search for the role using the role name you entered in step 7.
9. On the role summary page, make note of the ARN.

Passing Roles

Actions like passing a role between services are a common function within SageMaker. You can find more details on Actions, Resources, and Condition Keys for SageMaker in the IAM User Guide.

You pass the role (iam:PassRole) when making these API calls: StartEarthObservationJob, StartVectorEnrichmentJob, ExportEarthObservationJob, ExportVectorEnrichmentJob.

You attach the following trust policy to the IAM role, which grants SageMaker principal permissions to assume the role, and is the same for all of the execution roles:

```json
{
    "Version": "2012-10-17",
}  ```
SageMaker Roles

The permissions that you need to grant to the role may vary depending on the API that you call. The following sections explain these permissions.

**Note**
Instead of managing permissions by crafting a permission policy, you can use the AWS managed AmazonSageMakerFullAccess permission policy. The permissions in this policy are fairly broad, to allow for any actions you might want to perform in SageMaker. For a listing of the policy including information about the reasons for adding many of the permissions, see AWS managed policy: AmazonSageMakerFullAccess (p. 3695). If you prefer to create custom policies and manage permissions to scope the permissions only to the actions you need to perform with the execution role, see the following topics.

**Important**
If you're running into issues, see Troubleshooting Amazon SageMaker Identity and Access (p. 3755).

For more information about IAM roles, see IAM Roles in the IAM User Guide.

**Topics**
- StartEarthObservationJob API: Execution Role Permissions (p. 3665)
- StartVectorEnrichmentJob API: Execution Role Permissions (p. 3666)
- ExportEarthObservationJob API: Execution Role Permissions (p. 3666)
- ExportVectorEnrichmentJob API: Execution Role Permissions (p. 3667)

**StartEarthObservationJob API: Execution Role Permissions**

For an execution role that you can pass in a StartEarthObservationJob API request, you can attach the following minimum permission policy to the role:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:AbortMultipartUpload",
        "s3:PutObject",
        "s3:GetObject",
        "s3:ListBucketMultipartUploads"
      ],
      "Resource": [
        "arn:aws:s3:::*SageMaker*",
        "arn:aws:s3:::*Sagemaker*",
        "arn:aws:s3:::*sagemaker*"
      ]
    }
  ]
}
```
If your input Amazon S3 bucket is encrypted using server-side encryption with an AWS KMS managed key (SSE-KMS), see Using Amazon S3 Bucket Keys for more information.

**StartVectorEnrichmentJob API: Execution Role Permissions**

For an execution role that you can pass in a `StartVectorEnrichmentJob` API request, you can attach the following minimum permission policy to the role:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:AbortMultipartUpload",
        "s3:PutObject",
        "s3:GetObject",
        "s3:ListBucketMultipartUploads"
      ],
      "Resource": [
        "arn:aws:s3:::*SageMaker*",
        "arn:aws:s3:::*Sagemaker*",
        "arn:aws:s3:::*sagemaker*"
      ]
    },
    {
      "Effect": "Allow",
      "Action": "sagemaker-geospatial:GetVectorEnrichmentJob",
      "Resource": "arn:aws:sagemaker-geospatial:*:*:vector-enrichment-job/*"
    }
  ]
}
```

If your input Amazon S3 bucket is encrypted using server-side encryption with an AWS KMS managed key (SSE-KMS), see Using Amazon S3 Bucket Keys for more information.

**ExportEarthObservationJob API: Execution Role Permissions**

For an execution role that you can pass in a `ExportEarthObservationJob` API request, you can attach the following minimum permission policy to the role:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:AbortMultipartUpload",
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::*SageMaker*",
        "arn:aws:s3:::*Sagemaker*",
        "arn:aws:s3:::*sagemaker*"
      ]
    },
    {
      "Effect": "Allow",
      "Action": "sagemaker-geospatial:GetEarthObservationJob",
      "Resource": "arn:aws:sagemaker-geospatial:*:*:earth-observation-job/*"
    }
  ]
}
```
Amazon SageMaker Developer Guide
Role Manager

"s3:GetObject",
"s3:ListBucketMultipartUploads"
],
"Resource": [
"arn:aws:s3:::*SageMaker*",
"arn:aws:s3:::*Sagemaker*",
"arn:aws:s3:::*sagemaker*"
},
{
  "Effect": "Allow",
  "Action": "sagemaker-geospatial:GetEarthObservationJob",
  "Resource": "arn:aws:sagemaker-geospatial:*:*:earth-observation-job/*"
}
}

If your input Amazon S3 bucket is encrypted using server-side encryption with an AWS KMS managed key (SSE-KMS), see Using Amazon S3 Bucket Keys for more information.

ExportVectorEnrichmentJob API: Execution Role Permissions

For an execution role that you can pass in an ExportVectorEnrichmentJob API request, you can attach the following minimum permission policy to the role:

```json
{
  
  "Version": "2012-10-17",
  
  "Statement": [
    
    { 
      "Effect": "Allow",
      "Action": [
        "s3:AbortMultipartUpload",
        "s3:PutObject",
        "s3:GetObject",
        "s3:ListBucketMultipartUploads"
      ],
      "Resource": [
        "arn:aws:s3:::*SageMaker*",
        "arn:aws:s3:::*Sagemaker*",
        "arn:aws:s3:::*sagemaker*"
      ]
    },
    
    { 
      "Effect": "Allow",
      "Action": "sagemaker-geospatial:GetVectorEnrichmentJob",
      "Resource": "arn:aws:sagemaker-geospatial:*:*:vector-enrichment-job/*"
    } 
  ]
}
```

If your input Amazon S3 bucket is encrypted using server-side encryption with an AWS KMS managed key (SSE-KMS), see Using Amazon S3 Bucket Keys for more information.

Amazon SageMaker Role Manager

Machine learning (ML) administrators striving for least-privilege permissions with Amazon SageMaker must account for a diversity of industry perspectives, including the unique least-privilege access needs
required for personas such as data scientists, machine learning operation (MLOps) engineers, and more. Use Amazon SageMaker Role Manager to build and manage persona-based IAM roles for common machine learning needs directly through the Amazon SageMaker console.

Amazon SageMaker Role Manager provides 3 preconfigured role personas and predefined permissions for 12 common ML activities. Explore the provided personas and their suggested policies, or create and maintain roles for personas unique to your business needs. If you require additional customization, specify networking and encryption permissions for Amazon Virtual Private Cloud resources and AWS Key Management Service encryption keys in Step 1. Enter role information (p. 3668) of the Amazon SageMaker Role Manager.

Topics
• Using the role manager (p. 3668)
• Persona reference (p. 3669)
• ML activity reference (p. 3670)
• Launch Studio (p. 3671)
• Role Manager FAQs (p. 3673)

Using the role manager

To access Amazon SageMaker Role Manager, go to the Amazon SageMaker console and choose Getting Started in the navigation pane. In the Configure role section, choose Create a role.

Alternatively, you can access Amazon SageMaker Role Manager when setting up a domain or user profile through the Control Panel. To access the role manager when setting up a domain or user profile, choose Create a new role and then choose Create role using Amazon SageMaker Role Manager.

Prerequisites

To use Amazon SageMaker Role Manager, you must have permission to create an IAM role. This permission is usually available to ML administrators and roles with least-privilege permissions for ML practitioners.

You can temporarily assume an IAM role in the AWS Management Console by switching roles. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

Step 1. Enter role information

Provide a name to use as the unique suffix of your new SageMaker role. By default, the prefix "sagemaker-" is added to every role name for easier search in the IAM console. For example, if you name your role test-123 during role creation, your role shows up as sagemaker-test-123 in the IAM console. You can optionally add a description of your role to provide additional details.

Then, choose from one of the available personas to get suggested permissions for personas such as data scientists, data engineers, or machine learning operations (MLOps) engineers. For information on available personas and their suggested permissions, see Persona reference (p. 3669). To create a role without any suggested permissions to guide you, choose Custom Role Settings.

Note

We recommend that you first use the role manager to create a SageMaker Compute Role so that SageMaker compute resources have the ability to perform tasks such as training and inference. Use the SageMaker Compute Role persona to create this role with the role manager. After creating a SageMaker Compute Role, take note of its ARN for future use.

Network and encryption conditions

We recommend that you activate VPC customization to use VPC configurations, subnets, and security groups with IAM policies associated with your new role. When VPC customization is activated, IAM
policies for ML activities that interact with VPC resources are scoped down for least-privilege access. VPC customization is not activated by default. For more details on recommended networking architecture, see Networking architecture in the AWS Technical Guide.

You can also use a KMS key to encrypt, decrypt, and re-encrypt data for regulated workloads with highly sensitive data. When AWS KMS customization is activated, IAM policies for ML activities that support custom encryption keys are scoped down for least-privilege access. For more information, see Encryption with AWS KMS in the AWS Technical Guide.

Step 2. Configure ML activities

Each Amazon SageMaker Role Manager ML activity includes suggested IAM permissions to provide access to relevant AWS resources. Some ML activities require that you add service role ARNs to complete setup. For information on predefined ML activities and their permissions, see ML activity reference (p. 3670). For information on adding service roles, see Service roles (p. 3669).

Based on the chosen persona, certain ML activities are already selected. You can deselect any suggested ML activities or select additional activities to create your own role. If you selected the Custom Role Settings persona, then no ML activities are preselected in this step.

You can add any additional AWS or customer-managed IAM policies to your role in Step 3: Add additional policies and tags (p. 3669).

Service roles

Some AWS services require a service role to perform actions on your behalf. If the ML activity that you selected requires you to pass a service role, then you must provide the ARN for that service role.

You can either create a new service role or use an existing one, such as a service role created with the SageMaker Compute Role persona. You can find the ARN of an existing role by selecting the role name in the Roles section of the IAM console. To learn more about service roles, see Creating a role for an AWS service.

Step 3: Add additional policies and tags

You can add any existing AWS or customer-managed IAM policies to your new role. For information on existing SageMaker policies, see AWS Managed Policies for Amazon SageMaker. You can also check your existing policies in the Roles section of the IAM console.

Optionally, use tag-based policy conditions to assign metadata information to categorize and manage AWS resources. Each tag is represented by a key-value pair. For more information, see Controlling access to AWS resources using tags.

Review role

Take the time to review all of the information associated with your new role. Choose Previous to go back and edit any of the information. When you are ready to create your role, choose Create role. This generates a role with permissions for your selected ML activities. You can view your new role in the Roles section of the IAM console.

Persona reference

Amazon SageMaker Role Manager provides suggested permissions for a number of ML personas. These include user execution roles for common ML practitioner responsibilities as well as service execution roles for common AWS service interactions needed to work with SageMaker.

Each persona has suggested permissions in the form of selected ML activities. For information on predefined ML activities and their permissions, see ML activity reference (p. 3670).
Data scientist persona

Use this persona to configure permissions to perform general machine learning development and experimentation in a SageMaker environment. This persona includes the following preselected ML activities:

- Run Studio Applications
- Manage ML Jobs
- Manage Models
- Manage Experiments
- Search and Visualize Experiments
- Amazon S3 Bucket Access

MLOps persona

Choose this persona to configure permissions for operational activities. This persona includes the following preselected ML activities:

- Run Studio Applications
- Manage Models
- Manage Endpoints
- Manage Pipelines
- Search and Visualize Experiments

SageMaker compute persona

Note

We recommend that you first use the role manager to create a SageMaker Compute Role so that SageMaker compute resources can perform tasks such as training and inference. Use the SageMaker Compute Role persona to create this role with the role manager. After creating a SageMaker Compute Role, take note of its ARN for future use.

This persona includes the following preselected ML activity:

- Access Required AWS Services

ML activity reference

ML activities are common AWS tasks related to machine learning with SageMaker that require specific IAM permissions. Each persona suggests related ML activities when creating a role with Amazon SageMaker Role Manager. You can select any additional ML activities or deselect any suggested ML activities to create a role that meets your unique business needs.

Amazon SageMaker Role Manager provides predefined permissions for the following ML activities:

<table>
<thead>
<tr>
<th>ML activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Required AWS Services</td>
<td>Permissions to access Amazon S3, Amazon ECR, Amazon CloudWatch, and Amazon EC2. Required for execution roles for jobs and endpoints.</td>
</tr>
<tr>
<td>Run Studio Applications</td>
<td>Permissions to operate within a Studio environment. Required for domain and user profile execution roles.</td>
</tr>
<tr>
<td>ML activity</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Manage ML Jobs</td>
<td>Permissions to audit, query lineage, and visualize experiments.</td>
</tr>
<tr>
<td>Manage Models</td>
<td>Permissions to manage SageMaker jobs across their lifecycles.</td>
</tr>
<tr>
<td>Manage Endpoints</td>
<td>Permissions to manage SageMaker endpoint deployments and updates.</td>
</tr>
<tr>
<td>Manage Pipelines</td>
<td>Permissions to manage SageMaker pipelines and pipeline executions.</td>
</tr>
<tr>
<td>Manage Experiments</td>
<td>Permissions to manage SageMaker experiments and trials.</td>
</tr>
<tr>
<td>Search and Visualize Experiments</td>
<td>Permissions to audit, query lineage, and visualize experiments.</td>
</tr>
<tr>
<td>Manage Model Monitoring</td>
<td>Permissions to manage monitoring schedules for SageMaker Model Monitor.</td>
</tr>
<tr>
<td>S3 Full Access</td>
<td>Permissions to perform all Amazon S3 operations.</td>
</tr>
<tr>
<td>S3 Bucket Access</td>
<td>Permissions to perform operations on specified S3 buckets.</td>
</tr>
<tr>
<td>Query Athena Workgroups</td>
<td>Permissions to run and manage Amazon Athena queries.</td>
</tr>
</tbody>
</table>

**Launch Studio**

Use your persona-focused roles to launch Studio. If you are an administrator, you can give your users access to Studio and have them assume their persona role either directly through the AWS Management Console or through the AWS IAM Identity Center (successor to AWS Single Sign-On).

**Launch Studio with AWS Management Console**

For data scientists or other users to assume their given persona through the AWS Management Console, they require a console role to get to the Studio environment.

You cannot use Amazon SageMaker Role Manager to create a role that grants permissions to the AWS Management Console. However, after creating a service role in the role manager, you can go to the IAM console to edit the role and add a user access role. The following is an example of a role that provides user access to the AWS Management Console:

```json
{
   "Version": "2012-10-17",
   "Statement": [
   {
      "Sid": "DescribeCurrentDomain",
      "Effect": "Allow",
      "Action": "sagemaker:DescribeDomain",
   },
   {
      "Sid": "RemoveErrorMessageFromConsole",
      "Effect": "Allow",
      "Action": "iam:PassRole",
      "Resource": "arn:aws:iam::<ACCOUNT-ID>:role/<SERVICE-ROLE-NAME>
   }
   ]
}
```
In the Studio control panel, choose **Add User** to create a new user. In the **General Settings** section, give your user a name and set the **Default execution role** for the user to be the role that you created using Amazon SageMaker Role Manager.

On the next screen, choose the appropriate Jupyter Lab version, and whether to turn on SageMaker Jumpstart and SageMaker Project templates. Then choose **Next**. On the SageMaker Canvas settings page, choose whether to turn on SageMaker Canvas support, and additionally whether to allow for timeseries forecasting in SageMaker Canvas. Then choose **Submit**.

Your new user should now be visible in the Studio control panel. To test this user, choose **Studio** from the **Launch app** dropdown list in the same row as the user's name.

**Launch Studio with IAM Identity Center**

To assign IAM Identity Center users to execution roles, the user must first exist in the IAM Identity Center directory. For more information, see **Manage identities in IAM Identity Center** in the **AWS IAM Identity Center (successor to AWS Single Sign-On)**.

**Note**
Your IAM Identity Center Authentication directory and Studio Domain must be in the same AWS Region.

1. To assign IAM Identity Center users to your Studio Domain, choose **Assign users and Groups** in the Studio control panel. On the **Assign users and groups** screen select your data scientist user, and then choose **Assign Users and Groups**.
2. After the user is added to the Studio control panel, choose the user to open the user details screen.
3. On the **User details** screen, choose **Edit**.
4. On the **Edit user profile** screen, under **General settings**, modify the **Default execution role** to match the user execution role you've created for your data scientists.
5. Choose **Next** through the rest of the settings pages, and choose **Submit** to save your changes.
When your data scientist or other user logs into the IAM Identity Center portal, they see a tile for this Studio Domain. Choosing that tile logs them into Studio with their assigned user execution role.

Role Manager FAQs

Refer to the following FAQ items for answers to commonly asked questions about Amazon SageMaker Role Manager.

Q. How can I access Amazon SageMaker Role Manager?
A: You can access Amazon SageMaker Role Manager either through the Getting Started or Control Panel sections in the Amazon SageMaker console. If you choose Getting Started in the navigation pane, scroll down to the Configure role section and choose Create a role. Alternatively, you can access Amazon SageMaker Role Manager when setting up a domain or user profile through the control panel. To access the role manager when setting up a domain or user profile, choose Create a new role and then choose Create role using Amazon SageMaker Role Manager.

Q. What are personas?
A: Personas are preconfigured groups of permissions based on common machine learning (ML) responsibilities. For example, the data science persona suggests permissions for general machine learning development and experimentation in a SageMaker environment, while the MLOps persona suggests permissions for ML activities related to operations.

Q. What are ML activities?
A: ML activities are common AWS tasks related to machine learning with SageMaker that require specific IAM permissions. Each persona suggests related ML activities when creating a role with Amazon SageMaker Role Manager. ML activities include tasks such as Amazon S3 full access or searching and visualizing experiments. For more information, see ML activity reference (p. 3670).

Q. Are the roles that I create with the role manager AWS Identity and Access Management (IAM) roles?
A: Yes. Roles created using the Amazon SageMaker Role Manager are IAM roles with customized access policies. You can view created roles in the Roles section of the IAM console.

Q. How can I view the roles that I created using Amazon SageMaker Role Manager?
A: You can view created roles in the Roles section of the IAM console. By default, the prefix "sagemaker-" is added to every role name for easier search in the IAM console. For example, if you named your role test-123 during role creation, your role shows up as sagemaker-test-123 in the IAM console.

Q. Can I modify a role made with Amazon SageMaker Role Manager once it is created?
A: Yes. You can modify the roles and policies created by Amazon SageMaker Role Manager through the IAM console. For more information, see Modifying a role in the AWS Identity and Access Management User Guide.

Q. Can I attach my own policies to roles created using Amazon SageMaker Role Manager?
A: Yes. You can attach any AWS or customer-managed IAM policies from your account to the role that you create using Amazon SageMaker Role Manager.

Q. How many policies can I add to a role that I create with Amazon SageMaker Role Manager?
A: The maximum limit for attaching managed policies to an IAM role or user is 20. The maximum character size limit for managed policies is 6,144. For more information, see IAM object quotas and IAM and AWS Security Token Service quotas name requirements, and character limits.
Q. Can I add conditions to ML activities?

A: Any conditions that you provide in Step 1. Enter role information (p. 3668) of the Amazon SageMaker Role Manager, such as subnets, security groups, or KMS keys, are automatically passed to any ML activities selected in Step 2. Configure ML activities (p. 3669). You can also add additional conditions to ML activities if necessary. For example, you might also add InstanceTypes or IntercontainerTrafficEncryption conditions to the Manage Training Jobs activity.

Q. Can I use tagging to manage access to any AWS resource?

A: You can add tags to your role in Step 3: Add additional policies and tags (p. 3669) of the Amazon SageMaker Role Manager. To successfully manage AWS resources using tags, you must add the same tag to both the role and any associated policies. For example, you can add a tag to a role and to an Amazon S3 bucket. Then, because the role passes the tag to the SageMaker session, only a user with that role can access that S3 bucket. You can add tags to a policy through the IAM console. For more information, see Tagging IAM roles in the AWS Identity and Access Management User Guide.

Q. Can I use Amazon SageMaker Role Manager to create a role to access the AWS Management Console?

A: No. However, after creating a service role in the role manager, you can go to the IAM console to edit the role and add a human access role in IAM console.

Q. What is difference between a user federation role and a SageMaker execution role?

A: A user federation role is directly assumed by a user to access AWS resources such as access to the AWS Management Console. A SageMaker execution role is assumed by the SageMaker service to perform a function on behalf of a user or an automation tool. For example, when a user opens a Studio instance, Studio assumes the execution role associated with the user profile in order to access AWS resources on the behalf of the user. If the user profile does not specify an execution role, then the execution role is specified at the Amazon SageMaker Domain level.

Q. If I am using a custom web application that accesses Studio through a presigned url, what role is used?

A: If you use a custom web application to access Studio, then you have a hybrid user federation role and SageMaker execution role. Be sure that this role has least privilege permissions for both what the user can do and what Studio can do on the associated user's behalf.

Q: Can I use Amazon SageMaker Role Manager with AWS IAM Identity Center authentication for my Studio domain?

A: AWS IAM Identity Center (successor to AWS Single Sign-On) Studio Cloud Applications use a Studio execution role to grant permissions to federated users. This execution role can be specified at the Studio IAM Identity Center user profile level or the default domain level. User identities and groups must be synchronized into IAM Identity Center and the Studio user profile must be created with IAM Identity Center user assignment using CreateUserProfile. For more information, see Launch Studio with IAM Identity Center (p. 3672).

Amazon SageMaker API Permissions: Actions, Permissions, and Resources Reference

When you are setting up access control and writing a permissions policy that you can attach to an IAM identity (an identity-based policy), use the following as a reference. The each Amazon SageMaker API operation, the corresponding actions for which you can grant permissions to perform the action, and the AWS resource for which you can grant the permissions. You specify the actions in the policy's Action field, and you specify the resource value in the policy's Resource field.
### Note
Except for the ListTags API, resource-level restrictions are not available on List- calls. Any user calling a List- API will see all resources of that type in the account.

To express conditions in your Amazon SageMaker policies, you can use AWS-wide condition keys. For a complete list of AWS-wide keys, see Available Keys in the IAM User Guide.

#### Amazon SageMaker API Operations and Required Permissions for Actions

**API Operation: UpdateWorkteam**

Required Permissions (API Action): sagemaker:UpdateWorkteam
AWS Managed Policies for Amazon SageMaker

To add permissions to users, groups, and roles, it is easier to use AWS managed policies than to write policies yourself. It takes time and expertise to create IAM customer managed policies that provide your team with only the permissions they need. To get started quickly, you can use our AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see AWS managed policies in the IAM User Guide.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) to which the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

Additionally, AWS supports managed policies for job functions that span multiple services. For example, the ReadOnlyAccess AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see AWS managed policies for job functions in the IAM User Guide.

Important
We recommend that you use the most restricted policy that allows you to perform your use case.

The following AWS managed policies, which you can attach to users in your account, are specific to Amazon SageMaker:

- **AmazonSageMakerFullAccess** – Grants full access to Amazon SageMaker and SageMaker geospatial resources and the supported operations. This does not provide unrestricted Amazon S3 access, but supports buckets and objects with specific sagemaker tags. This policy allows all IAM roles to be passed to Amazon SageMaker, but only allows IAM roles with "AmazonSageMaker" in them to be passed to the AWS Glue, AWS Step Functions, and AWS RoboMaker services.

- **AmazonSageMakerReadOnly** – Grants read-only access to Amazon SageMaker resources.

The following AWS managed policies can be attached to users in your account but are not recommended:

- **AdministratorAccess** – Grants all actions for all AWS services and for all resources in the account.
- **DataScientist** – Grants a wide range of permissions to cover most of the use cases (primarily for analytics and business intelligence) encountered by data scientists.

You can review these permissions policies by signing in to the IAM console and searching for them.

You can also create your own custom IAM policies to allow permissions for Amazon SageMaker actions and resources as you need them. You can attach these custom policies to the IAM users or groups that require them.

Topics
- AWS managed policy: AmazonSageMakerFullAccess (p. 3695)
- AWS managed policy: AmazonSageMakerReadOnly (p. 3704)
- AWS managed policies for Amazon SageMaker Canvas (p. 3705)
- AWS managed policies for Amazon SageMaker Feature Store (p. 3710)
AWS managed policy: AmazonSageMakerFullAccess

This policy grants administrative permissions that allow a principal full access to all Amazon SageMaker and SageMaker geospatial resources and operations. The policy also provides select access to related services. This policy allows all IAM roles to be passed to Amazon SageMaker, but only allows IAM roles with "AmazonSageMaker" in them to be passed to the AWS Glue, AWS Step Functions, and AWS RoboMaker services. This policy does not include permissions to create an Amazon SageMaker domain. For information on the policy needed to create a domain, see Create an IAM Administrator User and Group (p. 35).

Permissions details

This policy includes the following permissions.

- application-autoscaling – Allows principals to automatically scale a SageMaker real-time inference endpoint.
- athena – Allows principals to query a list of data catalogs, databases, and table metadata from Amazon Athena.
- aws-marketplace – Allows principals to view AWS AI Marketplace subscriptions. You need this if you want to access SageMaker software subscribed in AWS Marketplace.
- cloudformation – Allows principals to get AWS CloudFormation templates for using SageMaker JumpStart solutions and Pipelines. SageMaker JumpStart creates resources necessary to run end-to-end machine learning solutions that tie SageMaker to other AWS services. SageMaker Pipelines creates new projects that are backed by AWS Service Catalog.
- cloudwatch – Allows principals to post CloudWatch metrics, interact with alarms, and upload logs to CloudWatch Logs in your account.
- codebuild – Allows principals to store AWS CodeBuild artifacts for SageMaker Pipeline and Projects.
- codecommit – Needed for AWS CodeCommit integration with SageMaker notebook instances.
- cognito-idp – Needed for Amazon SageMaker Ground Truth to define private workforce and work teams.
- ec2 – Needed for SageMaker to manage Amazon EC2 resources and network interfaces when you specify an Amazon VPC for your SageMaker jobs, models, endpoints, and notebook instances.
- ecs – Needed to pull and store Docker artifacts for Amazon SageMaker Studio (custom images), training, processing, batch inference, and inference endpoints. This is also required to use your own container in SageMaker. Additional permissions for SageMaker JumpStart solutions are required to create and remove custom images on behalf of users.
- elastic-inference – Allows principals to connect to Amazon Elastic Inference for using SageMaker notebook instances and endpoints.
- elasticfilesystem – Allows principals to access Amazon Elastic File System. This is needed for SageMaker to use data sources in Amazon Elastic File System for training machine learning models.
- fsx – Allows principals to access Amazon FSx. This is needed for SageMaker to use data sources in Amazon FSx for training machine learning models.
- glue – Needed for inference pipeline pre-processing from within SageMaker notebook instances.
• *groundtruthlabeling* – Needed for Ground Truth labeling jobs. The groundtruthlabeling endpoint is accessed by the Ground Truth console.

• *iam* – Needed to give the SageMaker console access to available IAM roles and create service-linked roles.

• *kms* – Needed to give the SageMaker console access to available AWS KMS keys and retrieve them for any specified AWS KMS aliases in jobs and endpoints.

• *lambda* – Allows principals to invoke and get a list of AWS Lambda functions.

• *logs* – Needed to allow SageMaker jobs and endpoints to publish log streams.

• *redshift* – Allows principals to access Amazon Redshift cluster credentials.

• *redshift-data* – Allows principals to use data from Amazon Redshift to run, describe, and cancel statements; get statement results; and list schemas and tables.

• *robomaker* – Allows principals to have full access to create, get descriptions, and delete AWS RoboMaker simulation applications and jobs. This is also needed to run reinforcement learning examples on notebook instances.

• *s3* – Allows principals to have full access to Amazon S3 resources pertaining to SageMaker, but not all of Amazon S3.

• *sagemaker* – Allows principals to list tags on Amazon SageMaker user profiles, and add tags to SageMaker apps. Also allows principals to describe and list spaces.

• *sagemaker* and *sagemaker-geospatial* – Allows principals access to all Amazon SageMaker resources except domains, user profiles, apps, spaces, and flow-definitions.

• *secretsmanager* – Allows principals to have full access to AWS Secrets Manager. The principals can securely encrypt, store, and retrieve credentials for databases and other services. This is also needed for SageMaker notebook instances with SageMaker code repositories that use GitHub.

• *servicecatalog* – Allows principals to use AWS Service Catalog. The principals can create, get a list of, update, or terminate provisioned products, such as servers, databases, websites, or applications deployed using AWS resources. This is needed for SageMaker JumpStart and Projects to find and read service catalog products and launch AWS resources in user accounts.

• *sns* – Allows principals to get a list of Amazon SNS topics. This is needed for endpoints with Async Inference enabled for notifying users that their inference has completed.

• *states* – Needed for SageMaker JumpStart and Pipelines to use a service catalog to create step function resources.

• *tag* – Needed for SageMaker Pipelines to render in Studio. Studio needs resources tagged with particular sagemaker:project-id tag-key. This requires the tag:GetResources permission.

AWS managed policy: AmazonSageMakerReadOnly

This policy grants read-only access to Amazon SageMaker through the AWS Management Console and SDK.

Permissions details

This policy includes the following permissions.

- **application-autoscaling** – Allows users to browse descriptions of scalable SageMaker real-time inference endpoints.
- **aws-marketplace** – Allows users to view AWS AI Marketplace subscriptions.
- **cloudwatch** – Allows users to receive CloudWatch alarms.
- **cognito-idp** – Needed for Amazon SageMaker Ground Truth to browse descriptions and lists of private workforce and work teams.
- **ecr** – Needed to read Docker artifacts for training and inference.
**AWS managed policies for Amazon SageMaker Canvas**

These AWS managed policies add permissions required to use SageMaker Canvas. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

**Topics**
- AWS managed policy: AmazonSageMakerCanvasFullAccess (p. 3705)
- AWS managed policy: AmazonSageMakerCanvasForecastAccess (p. 3709)
- Amazon SageMaker updates to Amazon SageMaker Canvas managed policies (p. 3710)

**AWS managed policy: AmazonSageMakerCanvasFullAccess**

This policy grants permissions that allow full access to Amazon SageMaker Canvas through the AWS Management Console and SDK. The policy also provides select access to related services (for example, Amazon Simple Storage Service (Amazon S3), AWS Identity and Access Management (IAM), Amazon Virtual Private Cloud (Amazon VPC), Amazon Elastic Container Registry (Amazon ECR), Amazon CloudWatch Logs, Amazon Redshift, AWS Secrets Manager, and Amazon Forecast).

**Permissions details**

This AWS managed policy includes the following permissions.
- **sagemaker** – Allows principals to create and host SageMaker models. These resources are limited to those whose name includes "Canvas", "canvas", or "model-compilation-".
- **ec2** – Allows principals to create Amazon VPC endpoints.
- **ecr** – Allows principals to get information about a container image.
- **iam** – Allows principals to pass an IAM role to Amazon SageMaker and Amazon Forecast.
- **logs** – Allows principals to publish logs from training jobs and endpoints.
- **s3** – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose name includes "SageMaker", "Sagemaker", or "sagemaker".
- **secretsmanager** – Allows principals to store customer credentials to connect to a Snowflake database using Secrets Manager.
- **redshift-data** – Allows principals to run queries on Amazon Redshift.
- **forecast** – Allows principals to use Amazon Forecast.

AWS managed policy: AmazonSageMakerCanvasForecastAccess

This policy grants permissions commonly needed to use SageMaker Canvas with Amazon Forecast.

Permissions details

This AWS managed policy includes the following permissions.

- s3 – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose case-insensitive name starts with "sagemaker-".

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "s3:GetObject",
            "s3:PutObject"
         ],
         "Resource": [
            "arn:aws:s3:::sagemaker-*/Canvas",
            "arn:aws:s3:::sagemaker-*/canvas"
         ]
      },
      {
         "Effect": "Allow",
         "Action": [
            "s3:ListBucket"
         ],
         "Resource": [
            "arn:aws:s3:::sagemaker-*"  
         ]
      }
   ]
}
```
Amazon SageMaker updates to Amazon SageMaker Canvas managed policies

View details about updates to AWS managed policies for SageMaker Canvas since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the SageMaker Document history page. (p. 3850)

AWS managed policies for Amazon SageMaker Feature Store

These AWS managed policies add permissions required to use Feature Store. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

Topics
- AWS managed policy: AmazonSageMakerFeatureStoreAccess (p. 3710)
- Amazon SageMaker updates to Amazon SageMaker Feature Store managed policies (p. 3711)

AWS managed policy: AmazonSageMakerFeatureStoreAccess

This policy grants permissions required to enable the offline store for an Amazon SageMaker Feature Store feature group.

Permissions details

This AWS managed policy includes the following permissions.

- `s3` – Allows principals to write data into an offline store Amazon S3 bucket. These buckets are limited to those whose name includes "SageMaker", "Sagemaker", or "sagemaker".
- `s3` – Allows principals to read existing manifest files maintained in the metadata folder of an offline store S3 bucket.
- `glue` – Allows principals to read and update AWS Glue tables. These permissions are limited to tables in the sagemaker_featurestore folder.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:PutObject",
                "s3:GetBucketAcl"
            ]
        }
    ]
}
```
Amazon SageMaker updates to Amazon SageMaker Feature Store managed policies

View details about updates to AWS managed policies for Feature Store since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the SageMaker Document history page. (p. 3850)

AWS managed policies for Amazon SageMaker geospatial

These AWS managed policies add permissions required to use SageMaker geospatial. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.
AWS managed policy: AmazonSageMakerGeospatialFullAccess

This policy grants permissions that allow full access to Amazon SageMaker geospatial through the AWS Management Console and SDK.

Permissions details

This AWS managed policy includes the following permissions.

- sagemaker-geospatial – Allows principals full access to all SageMaker geospatial resources.
- iam – Allows principals to pass an IAM role to SageMaker geospatial.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "sagemaker-geospatial:*",
      "Resource": "*",
    },
    {

AWS managed policy: AmazonSageMakerGeospatialExecutionRole

This policy grants permissions commonly needed to use SageMaker geospatial.

Permissions details

This AWS managed policy includes the following permissions.

- s3 – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose name contains "SageMaker", "Sagemaker", or "sagemaker".
- sagemaker-geospatial – Allows principals to access Earth observation jobs through the GetEarthObservationJob API.

AWS Managed Policies for Amazon SageMaker Ground Truth

These AWS managed policies add permissions required to use SageMaker Ground Truth. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

Topics
- AWS managed policy: AmazonSageMakerGroundTruthExecution (p. 3713)
- AWS managed policy: GroundTruthSyntheticConsoleFullAccess (p. 3716)
- AWS managed policy: GroundTruthSyntheticConsoleReadOnlyAccess (p. 3717)
- Amazon SageMaker updates to SageMaker Ground Truth managed policies (p. 3717)

AWS managed policy: AmazonSageMakerGroundTruthExecution

This AWS managed policy grants permissions commonly needed to use SageMaker Ground Truth.

Permissions details

This policy includes the following permissions.

- lambda – Allows principals to invoke Lambda functions whose name includes "sagemaker" (case-insensitive), "GtRecipe", or "LabelingFunction".
• **s3** – Allows principals to add and retrieve objects from Amazon S3 buckets. These objects are limited to those whose case-insensitive name contains "groundtruth" or "sagemaker", or are tagged with "SageMaker".

• **cloudwatch** – Allows principals to post CloudWatch metrics.

• **logs** – Allows principals to create and access log streams, and post log events.

• **sqs** – Allows principals to create Amazon SQS queues, and send and receive Amazon SQS messages. These permissions are limited to queues whose name includes "GroundTruth".

• **sns** – Allows principals to subscribe to and publish messages to Amazon SNS topics whose case-insensitive name contains "groundtruth" or "sagemaker".

• **ec2** – Allows principals to create, describe, and delete Amazon VPC endpoints whose VPC endpoint service name contains "sagemaker-task-resources" or "labeling".

AWS managed policy: GroundTruthSyntheticConsoleFullAccess

This AWS managed policy grants permissions needed to use most features of the SageMaker Ground Truth synthetic data console. The policy is available in your AWS account. In order to use all features of the console, users must add "s3:GetObject" permissions to allow SageMaker Ground Truth synthetic data console to display data from their S3 buckets. This can be done by attaching the AmazonS3ReadOnlyAccess managed policy to their role or by adding "s3:GetObject" for specific S3 resources to their role.

Permissions details

This policy includes the following permissions.

- **s3** – Allows the retrieval of objects from Amazon S3 buckets to display data in the console.
- **sagemaker-groundtruth-synthetic** – Allows the console to call SageMaker Ground Truth synthetic data APIs.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker-groundtruth-synthetic:*",
                "s3:ListBucket"
            ],
            "Resource": "*"
        }
    ]
}
```
AWS managed policy: GroundTruthSyntheticConsoleReadOnlyAccess

This AWS managed policy grants read-only access to SageMaker Ground Truth synthetic data via the AWS Management Console. In order to use all features of the console, users must add "s3:GetObject" permissions to allow SageMaker Ground Truth synthetic data console to display data from their S3 buckets. This can be done by attaching the AmazonS3ReadOnlyAccess managed policy to their role or by adding "s3:GetObject" for specific S3 resources to their role.

Permissions details

This policy includes the following permissions.

- **s3** – Allows the retrieval of objects from Amazon S3 buckets to display data in the console.
- **sagemaker-groundtruth-synthetic** – Allows the console to call SageMaker Ground Truth synthetic data ReadOnly APIs.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "sagemaker-groundtruth-synthetic:List*",
            "sagemaker-groundtruth-synthetic:Get*",
            "s3:ListBucket"
         ],
         "Resource": "*"
      }
   ]
}
```

AWS Managed Policies for SageMaker Pipelines

These AWS managed policies add permissions required to use SageMaker Pipelines. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

Topics

- AWS managed policy: AmazonSageMakerPipelinesIntegrations (p. 3720)
AWS managed policy: AmazonSageMakerPipelinesIntegrations

This AWS managed policy grants permissions commonly needed to use Callback steps and Lambda steps in SageMaker Pipelines. The policy is added to the AmazonSageMaker-ExecutionRole that is created when you onboard to Amazon SageMaker Studio. The policy can be attached to any role used for authoring or executing a pipeline.

This policy grants appropriate AWS Lambda, Amazon Simple Queue Service (Amazon SQS), Amazon EventBridge, and IAM permissions needed when building pipelines that invoke Lambda functions or include callback steps, which can be used for manual approval steps or running custom workloads.

The Amazon SQS permissions allow you to create the Amazon SQS queue needed for receiving callback messages, and also to send messages to that queue.

The Lambda permissions allow you to create, read, update, and delete the Lambda functions used in the pipeline steps, and also to invoke those Lambda functions.

This policy grants the Amazon EMR permissions needed to run a pipelines Amazon EMR step.

Permissions details

This policy includes the following permissions.

- **elasticmapreduce** – Read, add, and cancel steps in a running Amazon EMR cluster.
- **events** – Read, create, update, and add targets to an EventBridge rule named SageMakerPipelineExecutionEMRStepStatusUpdateRule.
- **iam** – Pass an IAM role to the AWS Lambda service.
- **lambda** – Create, read, update, delete, and invoke Lambda functions. These permissions are limited to functions whose name includes "sagemaker".
- **sqs** – Create an Amazon SQS queue; send an Amazon SQS message. These permissions are limited to queues whose name includes "sagemaker".

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [

AWS Managed Policies for SageMaker projects and JumpStart

These AWS managed policies add permissions to use built-in Amazon SageMaker project templates and JumpStart solutions. The policies are available in your AWS account and are used by execution roles created from the SageMaker console.

SageMaker projects and JumpStart use AWS Service Catalog to provision AWS resources in customers’ accounts. Some created resources need to assume an execution role. For example, if AWS Service Catalog creates a CodePipeline pipeline on behalf of a customer for a SageMaker machine learning CI/CD project, then that pipeline requires an IAM role.

The `AmazonSageMakerServiceCatalogProductsLaunchRole` role has the permissions required to launch the SageMaker portfolio of products from AWS Service Catalog. The `AmazonSageMakerServiceCatalogProductsUseRole` role has the permissions required to use the SageMaker portfolio of products from AWS Service Catalog. The `AmazonSageMakerServiceCatalogProductsLaunchRole` role passes an `AmazonSageMakerServiceCatalogProductsUseRole` role to the provisioned AWS Service Catalog product resources.

**Topics**
- AWS managed policy: `AmazonSageMakerAdmin-ServiceCatalogProductsServiceRolePolicy` (p. 3722)
- AWS managed policy: `AmazonSageMakerServiceCatalogProductsApiGatewayServiceRolePolicy` (p. 3730)
- AWS managed policy: `AmazonSageMakerServiceCatalogProductsCloudformationServiceRolePolicy` (p. 3731)
- AWS managed policy: `AmazonSageMakerServiceCatalogProductsCodeBuildServiceRolePolicy` (p. 3735)
- AWS managed policy: `AmazonSageMakerServiceCatalogProductsCodePipelineServiceRolePolicy` (p. 3742)
- AWS managed policy: `AmazonSageMakerServiceCatalogProductsEventsServiceRolePolicy` (p. 3744)
- AWS managed policy: `AmazonSageMakerServiceCatalogProductsFirehoseServiceRolePolicy` (p. 3744)
- AWS managed policy: `AmazonSageMakerServiceCatalogProductsGlueServiceRolePolicy` (p. 3745)
- AWS managed policy: `AmazonSageMakerServiceCatalogProductsLambdaServiceRolePolicy` (p. 3746)
- Amazon SageMaker updates to AWS Service Catalog AWS managed policies (p. 3753)

**AWS managed policy: `AmazonSageMakerAdmin-ServiceCatalogProductsServiceRolePolicy`**

This service role policy is used by the AWS Service Catalog service to provision products from the Amazon SageMaker portfolio. The policy grants permissions to a set of related AWS services including AWS CodePipeline, AWS CodeBuild, AWS CodeCommit, AWS Glue, AWS CloudFormation, and others.

The `AmazonSageMakerAdmin-ServiceCatalogProductsServiceRolePolicy` policy is intended to be used by the `AmazonSageMakerServiceCatalogProductsLaunchRole` role created from the SageMaker console. The policy adds permissions to provision AWS resources for SageMaker projects and JumpStart using AWS Service Catalog to a customer’s account.
Permissions details

This policy includes the following permissions.

- **apigateway** – Allows the role to call API Gateway endpoints that are tagged with `sagemaker:launch-source`.
- **cloudformation** – Allows AWS Service Catalog to create, update and delete CloudFormation stacks.
- **codebuild** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodeBuild projects.
- **codecommit** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodeCommit repositories.
- **codepipeline** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create, update and delete CodePipelines.
- **codestar-connections** – Allows the role to pass AWS CodeStar connections.
- **cognito-idp** – Allows the role to create, update, and delete groups and user pools. Also allows tagging resources.
- **ecr** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create and delete Amazon ECR repositories. Also allows tagging resources.
- **events** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to create and delete EventBridge rules. Used for tying together the various components of the CICD pipeline.
- **firehose** – Allows the role to interact with Kinesis Data Firehose streams.
- **glue** – Allows the role to interact with AWS Glue.
- **iam** – Allows the role to pass roles prepended with `AmazonSageMakerServiceCatalog`. This is needed when Projects provisions a AWS Service Catalog product, as a role needs to be passed to AWS Service Catalog.
- **lambda** – Allows the role to interact with AWS Lambda. Also allows tagging resources.
- **logs** – Allows the role to create, delete and access log streams.
- **s3** – Allows the role assumed by AWS Service Catalog and passed to CloudFormation to access Amazon S3 buckets where the Project template code is stored.
- **sagemaker** – Allows the role to interact with various SageMaker services. This is done both in CloudFormation during template provisioning, as well as in CodeBuild during CICD pipeline execution. Also allows tagging the following resources: endpoints, endpoint configurations, models, pipelines, projects, and model packages.
- **states** – Allows the role to create, delete, and update Step Functions prepended with `sagemaker`.

AWS managed policy:
AmazonSageMakerServiceCatalogProductsApiGatewayServiceRolePolicy

This policy is used by Amazon API Gateway within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by API Gateway that require a role.

Permissions details
This policy includes the following permissions.

- **Logs** – Create and read CloudWatch Logs groups, streams, and events; update events; describe various resources.

  These permissions are limited to resources whose log group prefix starts with "aws/apigateway/".
AWS managed policy:
AmazonSageMakerServiceCatalogProductsCloudformationServiceRolePolicy

This policy is used by AWS CloudFormation within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by AWS CloudFormation that require a role.

Permissions details

This policy includes the following permissions.

- sagemaker – Allow access to various SageMaker resources excluding domains, user-profiles, apps, and flow definitions.
- iam – Pass the AmazonSageMakerServiceCatalogProductsCodeBuildRole and AmazonSageMakerServiceCatalogProductsExecutionRole roles.

AWS managed policy:
AmazonSageMakerServiceCatalogProductsCodeBuildServiceRolePolicy

This policy is used by AWS CodeBuild within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by CodeBuild that require a role.

Permissions details
This policy includes the following permissions.

- **sagemaker** – Allow access to various SageMaker resources.
- **codecommit** – Upload CodeCommit archives to CodeBuild pipelines, get upload status, and cancel uploads; get branch and commit information. These permissions are limited to resources whose name starts with "sagemaker-".
- **ecr** – Create Amazon ECR repositories and container images; upload image layers. These permissions are limited to repositories whose name starts with "sagemaker-".
- **iam** – Read all resources.
- **iam** – Pass the following roles:
  - AmazonSageMakerServiceCatalogProductsCloudformationRole to AWS CloudFormation.
  - AmazonSageMakerServiceCatalogProductsCodeBuildRole to AWS CodeBuild.
  - AmazonSageMakerServiceCatalogProductsCodePipelineRole to AWS CodePipeline.
  - AmazonSageMakerServiceCatalogProductsExecutionRole to Amazon EventBridge.
- **logs** – Create and read CloudWatch Logs groups, streams, and events; update events; describe various resources. These permissions are limited to resources whose name prefix starts with "aws/codebuild/".
- **s3** – Create, read, and list Amazon S3 buckets. These permissions are limited to buckets whose name starts with "sagemaker-".

AWS managed policy:
AmazonSageMakerServiceCatalogProductsCodePipelineServiceRolePolicy

This policy is used by AWS CodePipeline within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by CodePipeline that require a role.

Permissions details

This policy includes the following permissions.

- **cloudformation** – Create, read, delete, and update CloudFormation stacks; create, read, delete, and execute change sets; set stack policy. These permissions are limited to resources whose name starts with "sagemaker-".
- **s3** – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL); and read the AWS Region the bucket resides in.

These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".
- **iam** – Pass the AmazonSageMakerServiceCatalogProductsCloudformationRole role.
- **codebuild** – Get CodeBuild build information and start builds. These permissions are limited to project and build resources whose name starts with "sagemaker-".
- **codecommit** – Upload CodeCommit archives to CodeBuild pipelines, get upload status, and cancel uploads; get branch and commit information.

AWS managed policy: AmazonSageMakerServiceCatalogProductsEventsServiceRolePolicy

This policy is used by Amazon EventBridge within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by EventBridge that require a role.

Permissions details

This policy includes the following permissions.

- codepipeline – Start a CodeBuild execution. These permissions are limited to pipelines whose name starts with "sagemaker-".

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "codepipeline:StartPipelineExecution",
      "Resource": "arn:aws:codepipeline:*:*:sagemaker-*"
    }
  ]
}
```

AWS managed policy: AmazonSageMakerServiceCatalogProductsFirehoseServiceRolePolicy

This policy is used by Amazon Kinesis Data Firehose within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by Kinesis Data Firehose that require a role.

Permissions details

This policy includes the following permissions.

- firehose – Send Kinesis Data Firehose records. These permissions are limited to resources whose delivery stream name starts with "sagemaker-".

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": 
      [ "firehose:PutRecord",
        "firehose:PutRecordBatch"
      ],
      "Resource": "arn:aws:firehose:*:*:deliverystream/sagemaker-*"
    }
  ]
}
```
AWS managed policy:
AmazonSageMakerServiceCatalogProductsGlueServiceRolePolicy

This policy is used by AWS Glue within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by Glue that require a role.

Permissions details

This policy includes the following permissions.

- **glue** – Create, read, and delete AWS Glue partitions, tables, and table versions. These permissions are limited to those resources whose name starts with "sagemaker-". Create and read AWS Glue databases. These permissions are limited to databases whose name is "default", "global_temp", or starts with "sagemaker-". Get user defined functions.

- **s3** – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL), and read the AWS Region the bucket resides in. These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".

- **logs** – Create, read, and delete CloudWatch Logs log group, streams, and deliveries; and create a resource policy. These permissions are limited to resources whose name prefix starts with "aws/glue/".

```json
{
  "Version": "2012-10-17",
  "Statement": [  
    {  
      "Effect": "Allow",
      "Action": [  
        "glue:BatchCreatePartition",
        "glue:BatchDeletePartition",
        "glue:BatchDeleteTable",
        "glue:BatchDeleteTableVersion",
        "glue:BatchGetPartition",
        "glue:CreateDatabase",
        "glue:CreatePartition",
        "glue:CreateTable",
        "glue:DeletePartition",
        "glue:DeleteTable",
        "glue:DeleteTableVersion",

        "glue:UpdateTable",
        "glue:GetUserDefinedFunctions"
      ],
      "Resource": [  
        "arn:aws:glue:*::catalog",
        "arn:aws:glue:*::database/default",
        "arn:aws:glue:*::database/global_temp",
        "arn:aws:glue:*::database/sagemaker-*",
        "arn:aws:glue:*::table/sagemaker-*"
      ]
    }
  ]
}
```
AWS managed policy:
AmazonSageMakerServiceCatalogProductsLambdaServiceRolePolicy

This policy is used by AWS Lambda within the AWS Service Catalog provisioned products from the Amazon SageMaker portfolio. The policy is intended to be attached to an IAM role that the AmazonSageMakerServiceCatalogProductsLaunchRole passes to the AWS resources created by Lambda that require a role.

Permissions details
This policy includes the following permissions.

- **sagemaker** – Allow access to various SageMaker resources.
- **ecr** – Create and delete Amazon ECR repositories; create, read, and delete container images; upload image layers. These permissions are limited to repositories whose name starts with "sagemaker-".
- **events** – Create, read, and delete Amazon EventBridge rules; and create and remove targets. These permissions are limited to rules whose name starts with "sagemaker-".
- **s3** – Create, read, list, and delete Amazon S3 buckets; add, read, and delete objects from the buckets; read and set the CORS configuration; read the access control list (ACL), and read the AWS Region the bucket resides in.
  
  These permissions are limited to buckets whose name starts with "sagemaker-" or "aws-glue-".
- **iam** – Pass the AmazonSageMakerServiceCatalogProductsExecutionRole role.
- **logs** – Create, read, and delete CloudWatch Logs log group, streams, and deliveries; and create a resource policy.
  
  These permissions are limited to resources whose name prefix starts with "aws/lambda/".

Troubleshooting Amazon SageMaker Identity and Access

Use the following information to help you diagnose and fix common issues that you might encounter when working with SageMaker and IAM.

**Topics**

- I Am Not Authorized to Perform an Action in SageMaker (p. 3756)
- I Am Not Authorized to Perform iam:PassRole (p. 3756)
- I Want to View My Access Keys (p. 3756)
- I'm an Administrator and Want to Allow Others to Access SageMaker (p. 3757)
- I Want to Allow People Outside of My AWS Account to Access My SageMaker Resources (p. 3757)
I Am Not Authorized to Perform an Action in SageMaker

If the AWS Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password.

The following example error occurs when the mateojackson IAM user tries to use the console to view details about a training job but does not have sagemaker:sagemaker:DescribeTrainingJob permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform: sagemaker:DescribeTrainingJob on resource: my-example-widget
```

In this case, Mateo asks his administrator to update his policies to allow him to access the TrainingJob resource using the sagemaker:DescribeTrainingJob action.

I Am Not Authorized to Perform iam:PassRole

If you receive an error that you're not authorized to perform the iam:PassRole action, your policies must be updated to allow you to pass a role to SageMaker.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named marymajor tries to use the console to perform an action in SageMaker. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform: iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the iam:PassRole action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I Want to View My Access Keys

After you create your IAM user access keys, you can view your access key ID at any time. However, you can't view your secret access key again. If you lose your secret key, you must create a new access key pair.

Access keys consist of two parts: an access key ID (for example, AKIAI0SF0DN7EXAMPLE) and a secret access key (for example, wJalrXUtncFEMI/K7MDENG/bPxRf1CYEXAMPLEKEY). Like a user name and password, you must use both the access key ID and secret access key together to authenticate your requests. Manage your access keys as securely as you do your user name and password.

**Important**

Do not provide your access keys to a third party, even to help find your canonical user ID. By doing this, you might give someone permanent access to your account.

When you create an access key pair, you are prompted to save the access key ID and secret access key in a secure location. The secret access key is available only at the time you create it. If you lose your secret access key, you must add new access keys to your IAM user. You can have a maximum of two access keys. If you already have two, you must delete one key pair before creating a new one. To view instructions, see Managing access keys in the IAM User Guide.
I'm an Administrator and Want to Allow Others to Access SageMaker

To allow others to access SageMaker, you must create an IAM entity (user or role) for the person or application that needs access. They will use the credentials for that entity to access AWS. You must then attach a policy to the entity that grants them the correct permissions in SageMaker.

To get started right away, see Creating your first IAM delegated user and group in the IAM User Guide.

I Want to Allow People Outside of My AWS Account to Access My SageMaker Resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether SageMaker supports these features, see How Amazon SageMaker Works with IAM (p. 3615).
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the IAM User Guide.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the IAM User Guide.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the IAM User Guide.
- To learn the difference between using roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

Logging and Monitoring

You can monitor Amazon SageMaker using Amazon CloudWatch, which collects raw data and processes it into readable, near real-time metrics. These statistics are kept for 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing. You can also set alarms that watch for certain thresholds and send notifications or take actions when those thresholds are met. For more information, see Monitor Amazon SageMaker with Amazon CloudWatch (p. 3818).

Amazon CloudWatch Logs enables you to monitor, store, and access your log files from Amazon EC2 instances, AWS CloudTrail, and other sources. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see Log Amazon SageMaker Events with Amazon CloudWatch (p. 3830).

AWS CloudTrail provides a record of actions taken by a user, role, or an AWS service in SageMaker. Using the information collected by CloudTrail, you can determine the request that was made to SageMaker, the IP address from which the request was made, who made the request, when it was made, and additional details. For more information, Log Amazon SageMaker API Calls with AWS CloudTrail (p. 3831).

Note
CloudTrail does not monitor calls to runtime_InvokeEndpoint.
You can create rules in Amazon CloudWatch Events to react to status changes in status in a SageMaker training, hyperparameter tuning, or batch transform job. For more information, see Automating Amazon SageMaker with Amazon EventBridge (p. 3836).

Compliance Validation for Amazon SageMaker

Third-party auditors assess the security and compliance of Amazon SageMaker as part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of AWS services in scope of specific compliance programs, see AWS Services in Scope by Compliance Program. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using Amazon SageMaker is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- **Architecting for HIPAA Security and Compliance Whitepaper** – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.
- **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.
- **AWS Config** – This AWS service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- **AWS Security Hub** – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.

Resilience in Amazon SageMaker

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between Availability Zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

In addition to the AWS global infrastructure, Amazon SageMaker offers several features to help support your data resiliency and backup needs.

Infrastructure Security in Amazon SageMaker

As a managed service, Amazon SageMaker is protected by the AWS global network security procedures that are described in the Amazon Web Services: Overview of Security Processes whitepaper.

You use AWS published API calls to access Amazon SageMaker through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also
support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

Topics

- SageMaker Scans AWS Marketplace Training and Inference Containers for Security Vulnerabilities (p. 3759)
- Connect to Resources From Within a VPC (p. 3759)
- Run Training and Inference Containers in Internet-Free Mode (p. 3762)
- Connect to SageMaker Through a VPC Interface Endpoint (p. 3763)
- Give SageMaker Access to Resources in your Amazon VPC (p. 3773)

SageMaker Scans AWS Marketplace Training and Inference Containers for Security Vulnerabilities

To meet our security requirements, algorithms and model packages listed in AWS Marketplace are scanned for Common Vulnerabilities and Exposures (CVE). CVE is a list of publicly known information about security vulnerability and exposure. The National Vulnerability Database (NVD) provides CVE details such as severity, impact rating, and fix information. Both CVE and NVD are available for public consumption and free for security tools and services to use. For more information, see http://cve.mitre.org/about/faqs.html#what_is_cve.

Connect to Resources From Within a VPC

Amazon SageMaker Studio and SageMaker notebook instances allow direct internet access by default. This allows you to download popular packages and notebooks, customize your development environment, and work efficiently. However, this could provide an additional avenue for unauthorized access to your data. For example, if you install malicious code on your computer in the form of a publicly available notebook or a publicly available source code library, it could access your data. You can choose to restrict which traffic can access the internet by launching your Amazon SageMaker Studio and SageMaker notebook instances in a Amazon Virtual Private Cloud (Amazon VPC) of your choosing.

An Amazon Virtual Private Cloud is a virtual network dedicated to your AWS account. With an Amazon VPC, you can control the network access and internet connectivity of your Amazon SageMaker Studio and notebook instances. You can disable direct internet access to add an additional layer of security.

The following topics describe how to connect your SageMaker Studio instances and notebook instances to resources in a VPC.

Topics

- Connect SageMaker Studio Notebooks in a VPC to External Resources (p. 3759)
- Connect a Notebook Instance in a VPC to External Resources (p. 3761)

Connect SageMaker Studio Notebooks in a VPC to External Resources

The following topic gives information on how to connect Studio Notebooks in a VPC to external resources.
Default communication with the internet

By default, SageMaker Studio provides a network interface that allows communication with the internet through a VPC managed by SageMaker. Traffic to AWS services like Amazon S3 and CloudWatch goes through an internet gateway, as does traffic that accesses the SageMaker API and SageMaker runtime. Traffic between the domain and your Amazon EFS volume goes through the VPC that you specified when you onboarded to Studio or called the `CreateDomain` API. The following diagram shows the default configuration.

VPC only communication with the internet

To prevent SageMaker from providing internet access to your Studio notebooks, you can disable internet access by specifying the VPC only network access type when you onboard to Studio or call the `CreateDomain` API. As a result, you won’t be able to run a Studio notebook unless your VPC has an interface endpoint to the SageMaker API and runtime, or a NAT gateway with internet access, and your security groups allow outbound connections. The following diagram shows a configuration for using VPC-only mode.

Requirements to use VPC only mode

When you choose VpcOnly, follow these steps:
1. Ensure your subnets have the required number of IP addresses needed. The expected number of IP addresses needed per user can vary based on use case. We recommend between 2 and 4 IP addresses per user. The total IP address capacity for a Studio domain is the sum of available IP addresses for each subnet provided when the domain is created. Ensure that your estimated IP address usage does not exceed the capacity supported by the number of subnets you provide. Additionally, using subnets distributed across many availability zones can aid in IP address availability. For more information, see VPC and subnet sizing for IPv4.

   **Note**
   You can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see Dedicated Instances.

2. Set up one or more security groups with inbound and outbound rules that together allow the following traffic:

   - **NFS traffic over TCP on port 2049** between the domain and the Amazon EFS volume.
   - **TCP traffic within the security group.** This is required for connectivity between the JupyterServer app and the KernelGateway apps. You must allow access to at least ports in the range 8192-65535.

3. If you want to allow internet access, you must use a NAT gateway with access to the internet, for example through an internet gateway.

4. If you don't want to allow internet access, create interface VPC endpoints (AWS PrivateLink) to allow Studio to access the following services with the corresponding service names. You must also associate the security groups for your VPC with these endpoints.

   - SageMaker API: com.amazonaws.us-east-1.sagemaker.api
   - SageMaker runtime: com.amazonaws.us-east-1.sagemaker.runtime. This is required to run Studio notebooks and to train and host models.
   - Amazon S3: com.amazonaws.us-east-1.s3.
   - To use SageMaker Projects: com.amazonaws.us-east-1.servicecatalog.
   - Any other AWS services you require.

   **Note**
   For a customer working within VPC mode, company firewalls can cause connection issues with SageMaker Studio or between JupyterServer and the KernelGateway. Make the following checks if you encounter one of these issues when using SageMaker Studio from behind a firewall.

   - Check that the Studio URL is in your networks allowlist.
   - Check that the websocket connections are not blocked. Jupyter uses websocket under the hood. If the KernelGateway application is InService, JupyterServer may not be able to connect to the KernelGateway. You should see this problem when opening System Terminal as well.

**For more information**

- Securing Amazon SageMaker Studio connectivity using a private VPC.
- Security groups for your VPC
- Connect to SageMaker Through a VPC Interface Endpoint (p. 3763)
- VPC with public and private subnets (NAT)

**Connect a Notebook Instance in a VPC to External Resources**

The following topic gives information on how to connect your notebook instance in a VPC to external resources.
Default communication with the internet

When your notebook allows direct internet access, SageMaker provides a network interface that allows the notebook to communicate with the internet through a VPC managed by SageMaker. Traffic within your VPC's CIDR goes through elastic network interface created in your VPC. All the other traffic goes through the network interface created by SageMaker, which is essentially through the public internet. Traffic to gateway VPC endpoints like Amazon S3 and DynamoDB goes through the public internet, while traffic to interface VPC interface endpoints still goes through your VPC. If you want to use gateway VPC endpoints, you might want to disable direct internet access.

VPC communication with the internet

To disable direct internet access, you can specify a VPC for your notebook instance. By doing so, you prevent SageMaker from providing internet access to your notebook instance. As a result, the notebook instance can't train or host models unless your VPC has an interface endpoint (AWS PrivateLink) or a NAT gateway and your security groups allow outbound connections.

For information about creating a VPC interface endpoint to use AWS PrivateLink for your notebook instance, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3769). For information about setting up a NAT gateway for your VPC, see VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide. For more information about networking configurations in each networking mode and configuring network on premise, see Understanding Amazon SageMaker notebook instance networking configurations and advanced routing options.

Security and Shared Notebook Instances

A SageMaker notebook instance is designed to work best for an individual user. It is designed to give data scientists and other users the most power for managing their development environment.

A notebook instance user has root access for installing packages and other pertinent software. We recommend that you exercise judgement when granting individuals access to notebook instances that are attached to a VPC that contains sensitive information. For example, you might grant a user access to a notebook instance with an IAM policy, as shown in the following example:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "sagemaker:CreatePresignedNotebookInstanceUrl",
    }
  ]
}
```

Run Training and Inference Containers in Internet-Free Mode

SageMaker training and deployed inference containers are internet-enabled by default. This allows containers to access external services and resources on the public internet as part of your training and inference workloads. However, this could provide an avenue for unauthorized access to your data. For example, a malicious user or code that you accidentally install on the container (in the form of a publicly available source code library) could access your data and transfer it to a remote host.
If you use an Amazon VPC by specifying a value for the `VpcConfig` parameter when you call `CreateTrainingJob`, `CreateHyperParameterTuningJob`, or `CreateModel`, you can protect your data and resources by managing security groups and restricting internet access from your VPC. However, this comes at the cost of additional network configuration, and has the risk of configuring your network incorrectly. If you do not want SageMaker to provide external network access to your training or inference containers, you can enable network isolation.

**Network Isolation**

You can enable network isolation when you create your training job or model by setting the value of the `EnableNetworkIsolation` parameter to `True` when you call `CreateTrainingJob`, `CreateHyperParameterTuningJob`, or `CreateModel`.

**Note**

Network isolation is required to run training jobs and models using resources from AWS Marketplace.

If you enable network isolation, the containers can't make any outbound network calls, even to other AWS services such as Amazon S3. Additionally, no AWS credentials are made available to the container runtime environment. In the case of a training job with multiple instances, network inbound and outbound traffic is limited to the peers of each training container. SageMaker still performs download and upload operations against Amazon S3 using your SageMaker execution role in isolation from the training or inference container.

The following managed SageMaker containers do not support network isolation because they require access to Amazon S3:

- Chainer
- SageMaker Reinforcement Learning

**Network isolation with a VPC**

Network isolation can be used in conjunction with a VPC. In this scenario, the download and upload of customer data and model artifacts are routed through your VPC subnet. However, the training and inference containers themselves continue to be isolated from the network, and do not have access to any resource within your VPC or on the internet.

**Connect to SageMaker Through a VPC Interface Endpoint**

You can connect directly to the SageMaker API or to the SageMaker Runtime through an interface endpoint in your Virtual Private Cloud (VPC) instead of connecting over the internet. When you use a VPC interface endpoint, communication between your VPC and the SageMaker API or Runtime is conducted entirely and securely within the AWS network.

The SageMaker API and Runtime support Amazon Virtual Private Cloud (Amazon VPC) interface endpoints that are powered by AWS PrivateLink. Each VPC endpoint is represented by one or more Elastic Network Interfaces with private IP addresses in your VPC subnets.

The VPC interface endpoint connects your VPC directly to the SageMaker API or Runtime without an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. The instances in your VPC don't need public IP addresses to communicate with the SageMaker API or Runtime.

You can create an interface endpoint to connect to SageMaker or to SageMaker Runtime with either the AWS console or AWS Command Line Interface (AWS CLI) commands. For instructions, see [Creating an Interface Endpoint](#).
**Amazon SageMaker Developer Guide**

*Connect to SageMaker Through a VPC Interface Endpoint*

After you have created a VPC endpoint, you can use the following example CLI commands that use the endpoint-url parameter to specify interface endpoints to the SageMaker API or Runtime:

```bash
aws sagemaker list-notebook-instances --endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
aws sagemaker list-training-jobs --endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
aws sagemaker-runtime invoke-endpoint --endpoint-url VPC_Endpoint_ID.runtime.sagemaker.Region.vpce.amazonaws.com --endpoint-name Endpoint_Name --body "Endpoint_Body" --content-type "Content_Type" Output_File
```

If you enable private DNS hostnames for your VPC endpoint, you don't need to specify the endpoint URL. The SageMaker API DNS hostname that the CLI and SageMaker SDK use by default (https://api.sagemaker.Region.amazonaws.com) resolves to your VPC endpoint. Similarly, the SageMaker Runtime DNS hostname that the CLI and SageMaker Runtime SDK use by default (https://runtime.sagemaker.Region.amazonaws.com) resolves to your VPC endpoint.

The SageMaker API and Runtime support VPC endpoints in all AWS Regions where both Amazon VPC and SageMaker are available. SageMaker supports making calls to all of its Operations inside your VPC. The result AuthorizedUrl from the CreatePresignedNotebookInstanceUrl is not supported by AWS PrivateLink. For information about how to enable AWS PrivateLink for the authorized URL that users use to connect to a notebook instance, see Connect to a Notebook Instance Through a VPC Interface Endpoint (p. 3769).

To learn more about AWS PrivateLink, see the AWS PrivateLink documentation. Refer to PrivateLink Pricing for the price of VPC endpoints. To learn more about VPC and endpoints, see Amazon VPC. For information about how to use identity-based AWS Identity and Access Management policies to restrict access to the SageMaker API and runtime, see Control Access to the SageMaker API by Using Identity-based Policies (p. 3635).

### Create a VPC Endpoint Policy for SageMaker

You can create a policy for Amazon VPC endpoints for SageMaker to specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see Controlling Access to Services with VPC Endpoints in the Amazon VPC User Guide.

**Note**

VPC endpoint policies aren't supported for Federal Information Processing Standard (FIPS) SageMaker runtime endpoints for `runtime_InvokeEndpoint`.

The following example VPC endpoint policy specifies that all users who have access to the VPC interface endpoint are allowed to invoke the SageMaker hosted endpoint named `myEndpoint`.

```json
{
    "Statement": [
        {
            "Action": "sagemaker:InvokeEndpoint",
```
In this example, the following are denied:

• Other SageMaker API actions, such as sagemaker:CreateEndpoint and sagemaker:CreateTrainingJob.
• Invoking SageMaker hosted endpoints other than myEndpoint.

**Note**

In this example, users can still take other SageMaker API actions from outside the VPC. For information about how to restrict API calls to those from within the VPC, see Control Access to the SageMaker API by Using Identity-based Policies (p. 3635).

Create a VPC Endpoint Policy for Amazon SageMaker Feature Store

To create a VPC Endpoint for Amazon SageMaker Feature Store, use the following endpoint template, substituting your `VPC_Endpoint_ID.api` and `Region`:

```
VPC_Endpoint_ID.api.featurestore-runtime.sagemaker.Region.vpce.amazonaws.com
```

Connect to SageMaker Studio Through an Interface VPC Endpoint

You can connect to Amazon SageMaker Studio from your Amazon Virtual Private Cloud (Amazon VPC) through an interface endpoint in your VPC instead of connecting over the internet. When you use an interface VPC endpoint (interface endpoint), communication between your VPC and Studio is conducted entirely and securely within the AWS network.

SageMaker Studio supports interface endpoints that are powered by AWS PrivateLink. Each interface endpoint is represented by one or more Elastic network interfaces with private IP addresses in your VPC subnets.

Studio supports interface endpoints in all AWS Regions where both Amazon SageMaker and Amazon VPC are available.

**Topics**

- Create a VPC Endpoint (p. 3765)
- Create a VPC Endpoint Policy for SageMaker Studio (p. 3766)
- Allow Access Only from Within Your VPC (p. 3767)

Create a VPC Endpoint

You can create an interface endpoint to connect to Studio with either the AWS console or the AWS Command Line Interface (AWS CLI). For instructions, see Creating an interface endpoint. Make sure that you create interface endpoints for all of the subnets in your VPC from which you want to connect to Studio.
When you create an interface endpoint, ensure that the security groups on your endpoint allow inbound access for HTTPS traffic from the security groups associated with SageMaker Studio. For more information, see Control access to services with VPC endpoints.

**Note**
In addition to creating an interface endpoint to connect to SageMaker Studio, create an interface endpoint to connect to the Amazon SageMaker API. When users call CreatePresignedDomainUrl to get the URL to connect to Studio, that call goes through the interface endpoint used to connect to the SageMaker API.

When you create the interface endpoint, specify `aws.sagemaker.Region.studio` as the service name. After you create the interface endpoint, enable private DNS for your endpoint. When you connect to SageMaker Studio from within the VPC using the SageMaker API, the AWS CLI, or the console, you connect through the interface endpoint instead of the public internet. You also need to set up a custom DNS with private hosted zones for the Amazon VPC endpoint so SageMaker Studio can access the SageMaker API using the `api.sagemaker.$region.amazonaws.com` endpoint rather than using the VPC endpoint URL. For instructions on setting up a private hosted zone, see Working with private hosted zones.

### Create a VPC Endpoint Policy for SageMaker Studio

You can attach an Amazon VPC endpoint policy to the interface VPC endpoints that you use to connect to SageMaker Studio. The endpoint policy controls access to Studio. You can specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

To use a VPC endpoint with SageMaker Studio, your endpoint policy must allow the CreateApp operation on the KernelGateway app type. This allows traffic that is routed to through the VPC endpoint to call the CreateApp API. The following example VPC endpoint policy shows how to allow the CreateApp operation.

```json
{
    "Statement": [
        {
            "Action": "sagemaker:CreateApp",
            "Effect": "Allow",
            "Principal": "*"
        }
    ]
}
```

For more information, see Controlling access to services with VPC endpoints.

The following example of a VPC endpoint policy specifies that all users that have access to the endpoint are allowed to access the user profiles in the SageMaker Studio domain with the specified domain ID. Access to other domains is denied.

```json
{
    "Statement": [
        {
            "Action": "sagemaker:CreatePresignedDomainUrl",
            "Effect": "Allow",
            "Principal": "*"
        }
    ]
}
```
Allow Access Only from Within Your VPC

Users outside your VPC can connect to SageMaker Studio over the internet even if you set up an interface endpoint in your VPC.

To allow access to only connections made from within your VPC, create an AWS Identity and Access Management (IAM) policy to that effect. Add that policy to every IAM user, group, or role used to access Studio. This feature is only supported in IAM mode, and is not supported in IAM Identity Center mode. The following examples demonstrate how to create such policies.

Important
If you apply an IAM policy similar to one of the following examples, users can't access SageMaker Studio or the specified SageMaker APIs through the SageMaker console. To access Studio, users must use a presigned URL or call the SageMaker APIs directly.

Example 1: Allow connections only within the subnet of an interface endpoint
The following policy allows connections only to callers within the subnet where you created the interface endpoint.

```
{
   "Id": "sagemaker-studio-example-1",
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "Enable SageMaker Studio Access",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreatePresignedDomainUrl",
            "sagemaker:DescribeUserProfile"
         ],
         "Resource": "*",
         "Condition": {
            "StringEquals": {
               "aws:SourceVpc": "vpc-111bbaaa"
            }
         }
      }
   ]
}
```

Example 2: Allow connections only through interface endpoints using aws:sourceVpce
The following policy allows connections only to those made through the interface endpoints specified by the aws:sourceVpce condition key. For example, the first interface endpoint could allow access through the SageMaker Studio Control Panel. The second interface endpoint could allow access through the SageMaker API.

```
{
   "Id": "sagemaker-studio-example-2",
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "Enable SageMaker Studio Access",
         "Effect": "Allow",
         "Action": [
            "sagemaker:CreatePresignedDomainUrl",
            "sagemaker:DescribeUserProfile"
         ],
         "Resource": "*",
         "Condition": {
            "StringEquals": {
               "aws:SourceVpce": "vpc-111bbaaa"
            }
         }
      }
   ]
}
```
This policy includes the `DescribeUserProfile` action. Typically you call `DescribeUserProfile` to make sure that the status of the user profile is `InService` before you try to connect to the domain. For example:

```bash
aws sagemaker describe-user-profile
  --domain-id domain-id
  --user-profile-name profile-name
```

Response:

```
{
  "DomainId": "domain-id",
  "UserProfileName": "profile-name",
  "HomeEfsFileSystemUid": "200001",
  "Status": "InService",
  "LastModifiedTime": 1605418785.555,
  "CreationTime": 1605418477.297
}
```

```bash
aws sagemaker create-presigned-domain-url
  --domain-id domain-id
  --user-profile-name profile-name
```

Response:

```
{
  "AuthorizedUrl": "https://domain-id.studio.us-west-2.sagemaker.aws/auth?token=AuthToken"
}
```

For both of these calls, if you are using a version of the AWS SDK that was released before August 13, 2018, you must specify the endpoint URL in the call. For example, the following example shows a call to `create-presigned-domain-url`:

```bash
aws sagemaker create-presigned-domain-url
  --domain-id domain-id
  --user-profile-name profile-name
  --endpoint-url vpc-endpoint-id.api.sagemaker.Region.vpce.amazonaws.com
```

**Example 3: Allow connections from IP addresses using `aws:SourceIp`**

The following policy allows connections only from the specified range of IP addresses using the `aws:SourceIp` condition key.

```json
{
  "Condition": {
    "ForAnyValue:StringEquals": {
      "aws:sourceVpce": [
        "vpce-111bbccc",
        "vpce-111bbddd"
      ]
    }
  }
}
```
Connect to SageMaker Through a VPC Interface Endpoint

Example 4: Allow connections from IP addresses through an interface endpoint using aws:VpcSourceIp

If you are accessing SageMaker Studio through an interface endpoint, you can use the aws:VpcSourceIp condition key to allow connections only from the specified range of IP addresses within the subnet where you created the interface endpoint as shown in the following policy:

```
{
  "Id": "sagemaker-studio-example-4",
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "Enable SageMaker Studio Access",
      "Effect": "Allow",
      "Action": ["sagemaker:CreatePresignedDomainUrl", "sagemaker:DescribeUserProfile"],
      "Resource": "*",
      "Condition": {
        "IpAddress": {
          "aws:SourceIp": [
            "192.0.2.0/24",
            "203.0.113.0/24"
          ]
        },
        "StringEquals": {
          "aws:SourceVpc": "vpc-111bbaaa"
        }
      }
    }
  }
}
```

Connect to a Notebook Instance Through a VPC Interface Endpoint

You can connect to your notebook instance from your VPC through an interface endpoint in your Virtual Private Cloud (VPC) instead of connecting over the public internet. When you use a VPC interface
endpoint, communication between your VPC and the notebook instance is conducted entirely and securely within the AWS network.

SageMaker notebook instances support Amazon Virtual Private Cloud (Amazon VPC) interface endpoints that are powered by AWS PrivateLink. Each VPC endpoint is represented by one or more Elastic Network Interfaces with private IP addresses in your VPC subnets.

**Note**
Before you create an interface VPC endpoint to connect to a notebook instance, create an interface VPC endpoint to connect to the SageMaker API. That way, when users call CreatePresignedNotebookInstanceUrl to get the URL to connect to the notebook instance, that call also goes through the interface VPC endpoint. For information, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3763).

You can create an interface endpoint to connect to your notebook instance with either the AWS console or AWS Command Line Interface (AWS CLI) commands. For instructions, see Creating an Interface Endpoint. Make sure that you create an interface endpoint for all of the subnets in your VPC from which you want to connect to the notebook instance.

When you create the interface endpoint, specify `aws.sagemaker.region.notebook` as the service name. After you create a VPC endpoint, enable private DNS for your VPC endpoint. Anyone using the SageMaker API, the AWS CLI, or the console to connect to the notebook instance from within the VPC connects to the notebook instance through the VPC endpoint instead of the public internet.

SageMaker notebook instances support VPC endpoints in all AWS Regions where both Amazon VPC and SageMaker are available.

**Topics**
- Connect Your Private Network to Your VPC (p. 3770)
- Create a VPC Endpoint Policy for SageMaker Notebook Instances (p. 3770)
- Restrict Access to Connections from Within Your VPC (p. 3771)

**Connect Your Private Network to Your VPC**
To connect to your notebook instance through your VPC, you either have to connect from an instance that is inside the VPC, or connect your private network to your VPC by using an AWS Virtual Private Network (AWS VPN) or AWS Direct Connect. For information about AWS VPN, see VPN Connections in the Amazon Virtual Private Cloud User Guide. For information about AWS Direct Connect, see Creating a Connection in the AWS Direct Connect User Guide.

**Create a VPC Endpoint Policy for SageMaker Notebook Instances**
You can create a policy for Amazon VPC endpoints for SageMaker notebook instances to specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see Controlling Access to Services with VPC Endpoints in the Amazon VPC User Guide.

The following example of a VPC endpoint policy specifies that all users that have access to the endpoint are allowed to access the notebook instance named myNotebookInstance.

```json
{
  "Statement": [
    {
```
Access to other notebook instances is denied.

**Restrict Access to Connections from Within Your VPC**

Even if you set up an interface endpoint in your VPC, individuals outside the VPC can connect to the notebook instance over the internet.

**Important**

If you apply an IAM policy similar to one of the following, users can’t access the specified SageMaker APIs or the notebook instance through the console.

To restrict access to only connections made from within your VPC, create an AWS Identity and Access Management policy that restricts access to only calls that come from within your VPC. Then add that policy to every AWS Identity and Access Management user, group, or role used to access the notebook instance.

**Note**

This policy allows connections only to callers within a subnet where you created an interface endpoint.

```json
{
    "Id": "notebook-example-1",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable Notebook Access",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreatePresignedNotebookInstanceUrl",
                "sagemaker:DescribeNotebookInstance"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:SourceVpc": "vpc-11bbaaa"
                }
            }
        }
    ]
}
```

If you want to restrict access to the notebook instance to only connections made using the interface endpoint, use the `aws:SourceVpce` condition key instead of `aws:SourceVpc`:

```json
{
    "Id": "notebook-example-1",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable Notebook Access",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreatePresignedNotebookInstanceUrl",
                "sagemaker:DescribeNotebookInstance"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:SourceVpce": "vpc-11bbaaa"
                }
            }
        }
    ]
}
```
Both of these policy examples assume that you have also created an interface endpoint for the SageMaker API. For more information, see Connect to SageMaker Through a VPC Interface Endpoint (p. 3763). In the second example, one of the values for aws:SourceVpce is the ID of the interface endpoint for the notebook instance. The other is the ID of the interface endpoint for the SageMaker API.

The policy examples here include DescribeNotebookInstance, because typically you would call DescribeNotebookInstance to make sure that the NotebookInstanceStatus is InService before you try to connect to it. For example:

```bash
aws sagemaker describe-notebook-instance --notebook-instance-name myNotebookInstance
```

```json
{
    "NotebookInstanceName": "myNotebookInstance",
    "NotebookInstanceStatus": "InService",
    "Url": "mynotebookinstance.notebook.us-west-2.sagemaker.aws",
    "InstanceType": "ml.m4.xlarge",
    "RoleArn": "arn:aws:iam::1234567890ab:role/service-role/AmazonSageMaker-ExecutionRole-1234567890ab"
}
```

```bash
aws sagemaker create-presigned-notebook-instance-url --notebook-instance-name myNotebookInstance
```

```json
{
}
```

**Note**

The presigned url generated can be used from anywhere on the internet.

For both of these calls, if you did not enable private DNS hostnames for your VPC endpoint, or if you are using a version of the AWS SDK that was released before August 13, 2018, you must specify the endpoint URL in the call. For example, the call to create-presigned-notebook-instance-url is:

```bash
aws sagemaker create-presigned-notebook-instance-url
--notebook-instance-name myNotebookInstance
--endpoint-url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
```
Connect Your Private Network to Your VPC

To call the SageMaker API and runtime through your VPC, you have to connect from an instance that is inside the VPC or connect your private network to your VPC by using an AWS Virtual Private Network (AWS VPN) or AWS Direct Connect. For information about AWS VPN, see VPN Connections in the Amazon Virtual Private Cloud User Guide. For information about AWS Direct Connect, see Creating a Connection in the AWS Direct Connect User Guide.

Give SageMaker Access to Resources in your Amazon VPC

SageMaker runs the following job types in an Amazon Virtual Private Cloud by default.

- Processing
- Training
- Model hosting
- Batch transform
- Amazon SageMaker Clarify
- SageMaker Compilation

However, containers for these jobs access AWS resources—such as the Amazon Simple Storage Service (Amazon S3) buckets where you store training data and model artifacts—over the internet.

To control access to your data and job containers, we recommend that you create a private VPC and configure it so that they aren't accessible over the internet. For information about creating and configuring a VPC, see Getting Started With Amazon VPC in the Amazon VPC User Guide. Using a VPC helps to protect your job containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your job containers by using VPC flow logs. For more information, see VPC Flow Logs in the Amazon VPC User Guide.

You specify your private VPC configuration when you create jobs by specifying subnets and security groups. When you specify the subnets and security groups, SageMaker creates elastic network interfaces that are associated with your security groups in one of the subnets. Network interfaces allow your job containers to connect to resources in your VPC. For information about network interfaces, see Elastic Network Interfaces in the Amazon VPC User Guide.

Topics

- Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC (p. 3773)

Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC

To control access to your data and processing jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet.
creating and configuring a VPC, see Getting Started With Amazon VPC in the Amazon VPC User Guide. Using a VPC helps to protect your processing containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your processing containers by using VPC flow logs. For more information, see VPC Flow Logs in the Amazon VPC User Guide.

This document explains how to add Amazon VPC configurations for processing jobs.

**Configure a Processing Job for Amazon VPC Access**

To specify subnets and security groups in your private VPC, use the NetworkConfig.VpcConfig request parameter of the CreateProcessingJob API, or provide this information when you create a processing job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your processing containers. The network interfaces provide your processing containers with a network connection within your VPC that is not connected to the internet. They also enable your processing job to connect to resources in your private VPC.

The following is an example of the VpcConfig parameter that you include in your call to CreateProcessingJob:

```json
VpcConfig: {
    "Subnets": [
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2"
    ],
    "SecurityGroupIds": [
        "sg-0123456789abcdef0"
    ]
}
```

**Configure Your Private VPC for SageMaker Processing**

When configuring the private VPC for your SageMaker processing jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

**Topics**

- Ensure That Subnets Have Enough IP Addresses (p. 3774)
- Create an Amazon S3 VPC Endpoint (p. 3774)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3775)
- Configure Route Tables (p. 3776)
- Configure the VPC Security Group (p. 3776)
- Connect to Resources Outside Your VPC (p. 3776)

**Ensure That Subnets Have Enough IP Addresses**

Your VPC subnets should have at least two private IP addresses for each instance in a processing job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

**Create an Amazon S3 VPC Endpoint**

If you configure your VPC so that processing containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your processing containers to access the buckets where you store your data. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.
To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint.
3. For Service Name, choose com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. For VPC, choose the VPC you want to use for this endpoint.
5. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
6. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3775).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Processing Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the processing container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```json
{
    "Statement": [
        {
            "Sid": "AmazonLinuxAMIRepositoryAccess",
            "Principal": "*",
            "Action": ["s3:GetObject"],
            "Effect": "Deny",
            "Resource": [
                "arn:aws:s3:::packages.*.amazonaws.com/*",
                "arn:aws:s3:::repo.*.amazonaws.com/*"
            ]
        }
    ],

    "Statement": [
        {
            "Sid": "AmazonLinux2AMIRepositoryAccess",
            "Principal": "*",
            "Action": ["s3:GetObject"],
            "Effect": "Deny",
            "Resource": [
                "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"
            ]
        }
    ]
}
```
Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your processing jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In distributed processing, you must allow communication between the different containers in the same processing job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For more information, see Security Group Rules.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, processing jobs that use that VPC do not have access to resources outside your VPC. If your processing job needs access to resources outside your VPC, provide access with one of the following options:

- If your processing job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.
- If your processing job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give SageMaker Training Jobs Access to Resources in Your Amazon VPC

Note
For training jobs, you can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see Dedicated Instances.

Configure a Training Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateTrainingJob API, or provide this information when you create a training job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your training containers. The network interfaces provide your training containers with a network connection within your VPC that is not connected to the internet. They also enable your training job to connect to resources in your private VPC.

The following is an example of the VpcConfig parameter that you include in your call to CreateTrainingJob:

```json
VpcConfig: {
  "Subnets": [
    "subnet-0123456789abdef0",
    "subnet-0123456789abdef1",
    "subnet-0123456789abdef2"
  ],
  "SecurityGroupIds": [
    "sg-0123456789abdef0"
  ]
}
```
Configure Your Private VPC for SageMaker Training

When configuring the private VPC for your SageMaker training jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

Topics
- Ensure That Subnets Have Enough IP Addresses (p. 3777)
- Create an Amazon S3 VPC Endpoint (p. 3777)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3777)
- Configure Route Tables (p. 3778)
- Configure the VPC Security Group (p. 3778)
- Connect to Resources Outside Your VPC (p. 3778)

Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a training job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

Create an Amazon S3 VPC Endpoint

If you configure your VPC so that training containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your training data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your training containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint
3. For Service Name, search for com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. Choose the Gateway type.
5. For VPC, choose the VPC you want to use for this endpoint.
6. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
7. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3777).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Training Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the training container. If you don't want users to install packages from that repository,
create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```json
{
    "Statement": [
        {
            "Sid": "AmazonLinuxAMIRepositoryAccess",
            "Principal": "*",
            "Action": [
                "s3:GetObject"
            ],
            "Effect": "Deny",
            "Resource": [
                "arn:aws:s3:::packages.*.amazonaws.com/**",
                "arn:aws:s3:::repo.*.amazonaws.com/**"
            ]
        }
    ]
}
{
    "Statement": [
        {
            "Sid": "AmazonLinux2AMIRepositoryAccess",
            "Principal": "*",
            "Action": [
                "s3:GetObject"
            ],
            "Effect": "Deny",
            "Resource": [
                "arn:aws:s3:::amazonlinux.*.amazonaws.com/**"
            ]
        }
    ]
}
```

**Configure Route Tables**

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your training jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

**Configure the VPC Security Group**

In distributed training, you must allow communication between the different containers in the same training job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For EFA-enabled instances, ensure that both inbound and outbound connections allow all traffic from the same security group. For information, see Security Group Rules in the Amazon Virtual Private Cloud User Guide.

**Connect to Resources Outside Your VPC**

If you configure your VPC so that it doesn't have internet access, training jobs that use that VPC do not have access to resources outside your VPC. If your training job needs access to resources outside your VPC, provide access with one of the following options:

- If your training job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon Virtual Private Cloud User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon Virtual Private Cloud User Guide.
• If your training job needs access to an AWS service that doesn’t support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC

Configure a Model for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateModel API, or provide this information when you create a model in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your model containers. The network interfaces provide your model containers with a network connection within your VPC that is not connected to the internet. They also enable your model to connect to resources in your private VPC.

**Note**

You must create at least two subnets in different availability zones in your private VPC, even if you have only one hosting instance.

The following is an example of the VpcConfig parameter that you include in your call to CreateModel:

```javascript
VpcConfig: {
    "Subnets": [
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2"
    ],
    "SecurityGroupIds": ["sg-0123456789abcdef0"]
}
```

Configure Your Private VPC for SageMaker Hosting

When configuring the private VPC for your SageMaker models, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

**Topics**

- Ensure That Subnets Have Enough IP Addresses (p. 3779)
- Create an Amazon S3 VPC Endpoint (p. 3779)
- Use a Custom Endpoint Policy to Restrict Access to Amazon S3 (p. 3780)
- Add Permissions for Endpoint Access for Containers Running in a VPC to Custom IAM Policies (p. 3781)
- Configure Route Tables (p. 3781)
- Connect to Resources Outside Your VPC (p. 3781)

Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each model instance. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

Create an Amazon S3 VPC Endpoint

If you configure your VPC so that model containers don’t have access to the internet, they can’t connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access.
By creating a VPC endpoint, you allow your model containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

To create an Amazon S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint
3. For Service Name, choose `com.amazonaws.region.s3`, where `region` is the name of the AWS Region where your VPC resides.
4. For VPC, choose the VPC that you want to use for this endpoint.
5. For Configure route tables, choose the route tables for the endpoint to use. The VPC service automatically adds a route to each route table that you choose that points Amazon S3 traffic to the new endpoint.
6. For Policy, choose Full Access to allow full access to the Amazon S3 service by any user or service within the VPC. To restrict access further, choose Custom. For more information, see Use a Custom Endpoint Policy to Restrict Access to Amazon S3 (p. 3780).

Use a Custom Endpoint Policy to Restrict Access to Amazon S3

The default endpoint policy allows full access to Amazon Simple Storage Service (Amazon S3) for any user or service in your VPC. To further restrict access to Amazon S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3.

You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Model Container with a Custom Endpoint Policy

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the model container. If you don't want users to install packages from those repositories, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```json
{
  "Statement": [ 
    {
      "Sid": "AmazonLinuxAMIREpositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/*",
        "arn:aws:s3:::repo.*.amazonaws.com/*"
      ]
    }
  ]
}
{
  "Statement": [ 
    {
      "Sid": "AmazonLinux2AMIREpositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/*",
        "arn:aws:s3:::repo.*.amazonaws.com/*"
      ]
    }
  ]
}
```
Add Permissions for Endpoint Access for Containers Running in a VPC to Custom IAM Policies

The SageMakerFullAccess managed policy includes the permissions that you need to use models configured for Amazon VPC access with an endpoint. These permissions allow SageMaker to create an elastic network interface and attach it to model containers running in a VPC. If you use your own IAM policy, you must add the following permissions to that policy to use models configured for VPC access.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Resource": "*"
        }
    ]
}
```

For more information about the SageMakerFullAccess managed policy, see AWS managed policy: AmazonSageMakerFullAccess (p. 3695).

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your models resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, models that use that VPC do not have access to resources outside your VPC. If your model needs access to resources outside your VPC, provide access with one of the following options:

- If your model needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.
- If your model needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.
Give Batch Transform Jobs Access to Resources in Your Amazon VPC

To control access to your data and batch transform jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet. You specify your private VPC configuration when you create a model by specifying subnets and security groups. You then specify the same model when you create a batch transform job. When you specify the subnets and security groups, SageMaker creates elastic network interfaces that are associated with your security groups in one of the subnets. Network interfaces allow your model containers to connect to resources in your VPC. For information about network interfaces, see Elastic Network Interfaces in the Amazon VPC User Guide.

This document explains how to add Amazon VPC configurations for batch transform jobs.

Configure a Batch Transform Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateModel API, or provide this information when you create a model in the SageMaker console. Then specify the same model in the ModelName request parameter of the CreateTransformJob API, or in the Model name field when you create a transform job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your model containers. The network interfaces provide your model containers with a network connection within your VPC that is not connected to the internet. They also enable your transform job to connect to resources in your private VPC.

The following is an example of the VpcConfig parameter that you include in your call to CreateModel:

```
VpcConfig: {
  "Subnets": [
    "subnet-0123456789abcdef0",
    "subnet-0123456789abcdef1",
    "subnet-0123456789abcdef2"
  ],
  "SecurityGroupIds": [
    "sg-0123456789abcdef0"
  ]
}
```

If you are creating a model using the CreateModel API operation, the IAM execution role that you use to create your model must include the permissions described in CreateModel API: Execution Role Permissions (p. 3662), including the following permissions required for a private VPC.

When creating a model in the console, if you select Create a new role in the Model Settings section, the AmazonSageMakerFullAccess policy used to create the role already contains these permissions. If you select Enter a custom IAM role ARN or Use existing role, the role ARN that you specify must have an execution policy attached with the following permissions.

```
{
  "Effect": "Allow",
  "Action": [
    "ec2:CreateNetworkInterface",
    "ec2:CreateNetworkInterfacePermission",
    "ec2:DeleteNetworkInterface",
    "ec2:DeleteNetworkInterfacePermission",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeSecurityGroups",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeSubnets",
    "ec2:EditVehicle"  
  ]
}
```
Configure Your Private VPC for SageMaker Batch Transform

When configuring the private VPC for your SageMaker batch transform jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

Topics
- Ensure That Subnets Have Enough IP Addresses (p. 3783)
- Create an Amazon S3 VPC Endpoint (p. 3783)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3783)
- Configure Route Tables (p. 3784)
- Configure the VPC Security Group (p. 3784)
- Connect to Resources Outside Your VPC (p. 3784)

Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a transform job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

Create an Amazon S3 VPC Endpoint

If you configure your VPC so that model containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your model containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.

To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose Endpoints, then choose Create Endpoint
3. For Service Name, choose com.amazonaws.region.s3, where region is the name of the region where your VPC resides.
4. For VPC, choose the VPC you want to use for this endpoint.
5. For Configure route tables, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
6. For Policy, choose Full Access to allow full access to the S3 service by any user or service within the VPC. Choose Custom to restrict access further. For information, see Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3783).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies.

Restrict Package Installation on the Model Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the training container. If you don't want users to install packages from that repository,
create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{
  "Statement": [
    {
      "Sid": "AmazonLinuxAMlRepositoryAccess",
      "Principal": "*",
      "Action": [ "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::packages.*.amazonaws.com/**",
        "arn:aws:s3:::repo.*.amazonaws.com/**"  
      ]
    }
  ]
}
```

```
{
  "Statement": [
    {
      "Sid": "AmazonLinux2AMlRepositoryAccess",
      "Principal": "*",
      "Action": [ "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/**"  
      ]
    }
  ]
}
```

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your batch transform jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In distributed batch transform, you must allow communication between the different containers in the same batch transform job. To do that, configure a rule for your security group that allows inbound and outbound connections between members of the same security group. Members of the same security group should be able to communicate with each other across all ports. For more information, see Security Group Rules.

Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, batch transform jobs that use that VPC do not have access to resources outside your VPC. If your batch transform job needs access to resources outside your VPC, provide access with one of the following options:

- If your batch transform job needs access to an AWS service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see VPC Endpoints in the Amazon VPC User Guide. For information about creating an interface VPC endpoint, see Interface VPC Endpoints (AWS PrivateLink) in the Amazon VPC User Guide.
• If your batch transform job needs access to an AWS service that doesn't support interface VPC endpoints or to a resource outside of AWS, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see Scenario 2: VPC with Public and Private Subnets (NAT) in the Amazon Virtual Private Cloud User Guide.

Give Amazon SageMaker Clarify Jobs Access to Resources in Your Amazon VPC

To control access to your data and SageMaker Clarify jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet. For information about creating and configuring an Amazon VPC for processing jobs, see Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC.

This document explains how to add additional Amazon VPC configurations that meet the requirements for SageMaker Clarify jobs.

Topics
• Configure a SageMaker Clarify Job for Amazon VPC Access (p. 3785)
• Configure Your Private Amazon VPC for SageMaker Clarify jobs (p. 3787)

Configure a SageMaker Clarify Job for Amazon VPC Access

You need to specify subnets and security groups when configuring your private Amazon VPC for SageMaker Clarify jobs and to enable the job to get inferences from the SageMaker model when computing post-training bias metrics and feature contributions that help explain model predictions.

Topics
• SageMaker Clarify Job Amazon VPC Subnets and Security Groups (p. 3785)
• Configure a Model Amazon VPC for Inference (p. 3786)

SageMaker Clarify Job Amazon VPC Subnets and Security Groups

Subnets and security groups in your private Amazon VPC can be assigned to a SageMaker Clarify job in various ways, depending on how you create the job.

• **SageMaker console**: Provide this information when you create the job in the SageMaker Dashboard. From the Processing menu, choose Processing jobs, then choose Create processing job. Select the VPC option in the Network panel and provide the subnets and security groups using the drop-down lists. Make sure network isolation option provided in this panel is set to disabled.

• **SageMaker API**: Use the NetworkConfig.VpcConfig request parameter of the CreateProcessingJob API, as shown in the following example:

```json
"NetworkConfig": {
  "VpcConfig": {
    "Subnets": ["subnet-0123456789abcdef0", "subnet-0123456789abcdef1", "subnet-0123456789abcdef2"],
    "SecurityGroupIds": ["sg-0123456789abcdef0"
  ]
}
```

3785
• **SageMaker Python SDK**: Use the NetworkConfig parameter of the `SageMakerClarifyProcessor` API or `Processor` API, as shown in the following example:

```python
from sagemaker.network import NetworkConfig
network_config = NetworkConfig(
    subnets=[
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2",
    ],
    security_group_ids=[
        "sg-0123456789abcdef0",
    ],
)
```

SageMaker uses the information to create network interfaces and attach them to the SageMaker Clarify job. The network interfaces provide a SageMaker Clarify job with a network connection within your Amazon VPC that is not connected to the public internet. They also enable the SageMaker Clarify job to connect to resources in your private Amazon VPC.

**Configure a Model Amazon VPC for Inference**

In order to compute post-training bias metrics and explainability, the SageMaker Clarify job needs to get inferences from the SageMaker model that is specified by the `model_name` parameter of the `analysis configuration` for the SageMaker Clarify processing job. Alternatively, if you use the `SageMakerClarifyProcessor` API in the SageMaker Python SDK, the job needs to get the `model_name` specified by the `ModelConfig` class. To accomplish this, the SageMaker Clarify job creates an ephemeral endpoint with the model, known as a *shadow endpoint*, and then applies the Amazon VPC configuration of the model to the shadow endpoint.

**Note**

The network isolation option of both the SageMaker Clarify job and the model must be disabled (by default the option is disabled) so that the SageMaker Clarify job can communicate with the shadow endpoint.

To specify subnets and security groups in your private Amazon VPC to the SageMaker model, use the `VpcConfig` request parameter of the `CreateModel` API or provide this information when you create the model using the SageMaker dashboard in the console. The following is an example of the `VpcConfig` parameter that you include in your call to `CreateModel`:

```json
"VpcConfig": {
    "Subnets": [
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2"
    ],
    "SecurityGroupIds": [
        "sg-0123456789abcdef0"
    ]
}
```

You can specify the number of instances of the shadow endpoint to launch with the `initial_instance_count` parameter of the `analysis configuration` for the SageMaker Clarify processing job. Alternatively, if you use the `SageMakerClarifyProcessor` API in the SageMaker Python SDK, the job needs to get the `instance_count` specified by the `ModelConfig` class.

**Note**

Even if you only request one instance when creating the shadow endpoint, you need at least two subnets in the model's `ModelConfig` in distinct availability zones. Otherwise, the shadow endpoint creation fails with the following error:
ClientError: Error hosting endpoint sagemaker-clarify-endpoint-XXX: Failed. Reason: Unable to locate at least 2 availability zone(s) with the requested instance type YYY that overlap with SageMaker subnets.

If your model requires model files in Amazon S3, then the model Amazon VPC needs to have an Amazon S3 VPC endpoint. For more information about creating and configuring an Amazon VPC for SageMaker models, see Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC (p. 3779).

Configure Your Private Amazon VPC for SageMaker Clarify jobs

In general, you can follow the steps in Configure Your Private VPC for SageMaker Processing to configure your private Amazon VPC for SageMaker Clarify jobs. Here are some highlights and special requirements for SageMaker Clarify jobs.

Topics
- Connect to Resources Outside Your Amazon VPC (p. 3787)
- Configure the Amazon VPC Security Group (p. 3787)

Connect to Resources Outside Your Amazon VPC

If you configure your Amazon VPC so that it does not have public internet access, then some additional setup is required to grant SageMaker Clarify jobs access to resources and services outside of your Amazon VPC. For example, an Amazon S3 VPC endpoint is required because a SageMaker Clarify job needs to load a dataset from an S3 bucket as well as save the analysis results to an S3 bucket. For more information, see Create an Amazon S3 VPC Endpoint for the creation guide. In addition, if a SageMaker Clarify job needs to get inferences from the shadow endpoint, then it needs to call several more AWS services.

- **Create an Amazon SageMaker API service VPC endpoint**: The SageMaker Clarify job needs to call the Amazon SageMaker API service to manipulate the shadow endpoint, or to describe a SageMaker model for Amazon VPC validation. You can follow the guidance provided in the Securing all Amazon SageMaker API calls with AWS PrivateLink blog to create an Amazon SageMaker API VPC endpoint that allows the SageMaker Clarify job to make the service calls. Note that the service name of Amazon SageMaker API service is `com.amazonaws.region.sagemaker.api`, where `region` is the name of the Region where your Amazon VPC resides.

- **Create an Amazon SageMaker Runtime VPC Endpoint**: The SageMaker Clarify job needs to call the Amazon SageMaker runtime service, which routes the invocations to the shadow endpoint. The setup steps are similar to those for the Amazon SageMaker API service. Note that the service name of Amazon SageMaker Runtime service is `com.amazonaws.region.sagemaker.runtime`, where `region` is the name of the Region where your Amazon VPC resides.

Configure the Amazon VPC Security Group

SageMaker Clarify jobs support distributed processing when two or more processing instances are specified in one of the following ways:

- **SageMaker console**: The Instance count is specified in the Resource configuration part of the Job settings panel on the Create processing job page.
- **SageMaker API**: The InstanceCount is specified when you create the job with the CreateProcessingJob API.
- **SageMaker Python SDK**: The instance_count is specified when using the SageMakerClarifyProcessor API or the Processor API.
In distributed processing, you must allow communication between the different instances in the same processing job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see Security group rules.

**Give SageMaker Compilation Jobs Access to Resources in Your Amazon VPC**

*Note*

For compilation jobs, you can configure only subnets with a default tenancy VPC in which your job runs on shared hardware. For more information on the tenancy attribute for VPCs, see Dedicated Instances.

**Configure a Compilation Job for Amazon VPC Access**

To specify subnets and security groups in your private VPC, use the VpcConfig request parameter of the CreateCompilationJob API, or provide this information when you create a compilation job in the SageMaker console. SageMaker Neo uses this information to create network interfaces and attach them to your compilation jobs. The network interfaces provide compilation jobs with a network connection within your VPC that is not connected to the internet. They also enable your compilation job to connect to resources in your private VPC. The following is an example of the VpcConfig parameter that you include in your call to CreateCompilationJob:

```
VpcConfig: {
    "Subnets": [
        "subnet-0123456789abcdef0",
        "subnet-0123456789abcdef1",
        "subnet-0123456789abcdef2"
    ],
    "SecurityGroupIds": [
        "sg-0123456789abcdef0"
    ]
}
```

**Configure Your Private VPC for SageMaker Compilation**

When configuring the private VPC for your SageMaker compilation jobs, use the following guidelines. For information about setting up a VPC, see Working with VPCs and Subnets in the Amazon VPC User Guide.

**Topics**

- Ensure That Subnets Have Enough IP Addresses (p. 3788)
- Create an Amazon S3 VPC Endpoint (p. 3788)
- Use a Custom Endpoint Policy to Restrict Access to S3 (p. 3789)
- Configure Route Tables (p. 3790)
- Configure the VPC Security Group (p. 3790)

**Ensure That Subnets Have Enough IP Addresses**

Your VPC subnets should have at least two private IP addresses for each instance in a compilation job. For more information, see VPC and Subnet Sizing for IPv4 in the Amazon VPC User Guide.

**Create an Amazon S3 VPC Endpoint**

If you configure your VPC to block access to the internet, SageMaker Neo can't connect to the Amazon S3 buckets that contain your models unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your SageMaker Neo compilation jobs to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see Endpoints for Amazon S3.
To create an S3 VPC endpoint:

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose **Endpoints**, then choose **Create Endpoint**
3. For **Service Name**, search for `com.amazonaws.region.s3`, where `region` is the name of the region where your VPC resides.
4. Choose the **Gateway** type.
5. For **VPC**, choose the VPC you want to use for this endpoint.
6. For **Configure route tables**, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
7. For **Policy**, choose **Full Access** to allow full access to the S3 service by any user or service within the VPC. Choose **Custom** to restrict access further. For information, see **Use a Custom Endpoint Policy to Restrict Access to S3** (p. 3777).

Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see Using Endpoint Policies for Amazon S3. You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see Using Amazon S3 Bucket Policies. The following is a sample customized policy:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Principal": {
                "AWS": "*"
            },
            "Action": "s3:GetObject",
            "Resource": [
                "arn:aws:s3:::your-sample-bucket",
                "arn:aws:s3:::your-sample-bucket/*"
            ],
            "Condition": {
                "StringNotEquals": {
                    "aws:SourceVpce": [
                        "vpce-01234567890123456"
                    ]
                }
            }
        }
    ]
}
```

Add Permissions for Compilation Job Running in a Amazon VPC to Custom IAM Policies

The **SageMakerFullAccess** managed policy includes the permissions that you need to use models configured for Amazon VPC access with an endpoint. These permissions allow SageMaker Neo to create an elastic network interface and attach it to compilation job running in a Amazon VPC. If you use your own IAM policy, you must add the following permissions to that policy to use models configured for Amazon VPC access.

```json
{"Version": "2012-10-17",
    "Statement": [
        {"Effect": "Allow",
```
"Action": [
  "ec2:DescribeVpcEndpoints",
  "ec2:DescribeDhcpOptions",
  "ec2:DescribeVpcs",
  "ec2:DescribeSubnets",
  "ec2:DescribeSecurityGroups",
  "ec2:DescribeNetworkInterfaces",
  "ec2:DeleteNetworkInterfacePermission",
  "ec2:DeleteNetworkInterface",
  "ec2:CreateNetworkInterfacePermission",
  "ec2:CreateNetworkInterface",
  "ec2:ModifyNetworkInterfaceAttribute"
],
"Resource": "*"
]

For more information about the SageMakerFullAccess managed policy, see AWS managed policy: AmazonSageMakerFullAccess (p. 3695).

Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, http://s3-aws-region.amazonaws.com/MyBucket) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your compilation jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see Routing for Gateway Endpoints in the Amazon VPC User Guide.

Configure the VPC Security Group

In your security group for the compilation job, you must allow outbound communication to your Amazon S3 Amazon VPC endpoints and the subnet CIDR ranges used for the compilation job. For information, see Security Group Rules and Control access to services with Amazon VPC endpoints.
Amazon SageMaker Model Governance

Model governance is a framework that gives systematic visibility into machine learning (ML) model development, validation, and usage. Amazon SageMaker provides purpose-built ML governance tools for managing control access, activity tracking, and reporting across the ML lifecycle.

Manage least-privilege permissions for ML practitioners using Amazon SageMaker Role Manager, create detailed model documentation using Amazon SageMaker Model Cards, and gain visibility into your models with centralized dashboards using Amazon SageMaker Model Dashboard.

Amazon SageMaker Role Manager

With Amazon SageMaker Role Manager, administrators can define user permissions with least-privilege permissions for common machine learning activities. Use Amazon SageMaker Role Manager to build and manage persona-based IAM roles specific to your business needs.

For more information, see Amazon SageMaker Role Manager (p. 3667).

Amazon SageMaker Model Cards

Use Amazon SageMaker Model Cards to document, retrieve, and share essential model information from conception to deployment. With model cards, model risk managers, data scientists, and ML engineers can create an immutable record of intended model uses, risk ratings, training details, evaluation results, and more.

For more information, see Amazon SageMaker Model Cards (p. 3791).

Amazon SageMaker Model Dashboard

Amazon SageMaker Model Dashboard is a pre-built, visual overview of all the models in your account. Model Dashboard integrates valuable information from Amazon SageMaker Model Monitor, Transform Jobs, Endpoints, ML Lineage Tracking and Amazon CloudWatch so you can access high-level model information and track model performance in one unified view.

For more information, see Model Dashboard (p. 3808).

Amazon SageMaker Model Cards

Use Amazon SageMaker Model Cards to document critical details about your machine learning (ML) models in a single place for streamlined governance and reporting.

Catalog details such as the intended use and risk rating of a model, training details and metrics, evaluation results and observations, and additional call-outs such as considerations, recommendations, and custom information. By creating model cards, you can do the following:

- Provide guidance on how a model should be used.
• Support audit activities with detailed descriptions of model training and performance.
• Communicate how a model is intended to support business goals.

Model cards provide prescriptive guidance on what information to document and include fields for custom information. After creating a model card, you can export it to a PDF or download it to share with relevant stakeholders. Any edits other than an approval status update made to a model card result in additional model card versions in order to have an immutable record of model changes.

**Topics**
- Prerequisites (p. 3792)
- Intended uses of a model (p. 3792)
- Risk ratings (p. 3792)
- Model card JSON schema (p. 3793)
- Use model cards through the Amazon SageMaker console (p. 3801)
- Use model cards through the SageMaker Python SDK (p. 3803)
- Use model cards through the low-level APIs (p. 3806)
- Model card FAQs (p. 3807)

**Prerequisites**

To get started with Amazon SageMaker Model Cards, you must have permission to create, edit, view, and export model cards.

**Intended uses of a model**

Specifying the intended uses of a model helps ensure that model developers and users have the information they need to train or deploy the model responsibly. The intended uses of a model should describe the scenarios in which the model is appropriate to use as well as the scenarios in which the model is not recommended to use.

We recommend including:
- The general purpose of the model
- Use cases for which the model was intended
- Use cases for which the model was not intended
- Assumptions made when developing the model

The intended uses of a model go beyond technical details and describe how a model should be used in production, the scenarios in which it is appropriate to use a model, and additional considerations such as the type of data to use with the model or any assumptions made during development.

**Risk ratings**

Developers create ML models for use cases with varying levels of risk. For example, a model that approves loan applications might be a higher risk model than one that detects the category of an email. Given the varied risk profiles of a model, model cards provide a field for you to categorize a model's risk rating.

This risk rating can be unknown, low, medium, or high. Use these risk rating fields to label unknown, low, medium, or high-risk models and help your organization comply with any existing rules about putting certain models into production.
Model card JSON schema

Evaluation details for a model card must be provided in JSON format. If you have existing JSON format evaluation reports generated by SageMaker Clarify or SageMaker Model Monitor, upload them to Amazon S3 and provide an S3 URI to automatically parse evaluation metrics. For more information and sample reports, see the example metrics folder in the Amazon SageMaker Model Governance - Model Cards example notebook.

When creating a model card using the SageMaker Python SDK, model content must be in the model card JSON schema and provided as a string. Provide model content similar to the following example.

Model card JSON schema sample file

```json
{
  "$schema": "http://json-schema.org/draft-07/schema#",
  "$id": "http://json-schema.org/draft-07/schema#",
  "title": "SageMakerModelCardSchema",
  "description": "Default model card schema",
  "version": "0.1.0",
  "type": "object",
  "additionalProperties": false,
  "properties": {

  }
}
Use model cards through the Amazon SageMaker console

You can create an Amazon SageMaker Model Card directly through the SageMaker console.

Create a model card

Go to the Amazon SageMaker console. In the navigation pane, under Governance, choose Model cards. On the upper right-hand corner, choose Create model card.

Go through the four steps in the Create model card prompt to document details about your model.

Step 1: Enter model details and intended use

If your model is an AWS resource, specify the exact model name in this field to auto-populate model details. To browse existing model names, see Models in the Amazon SageMaker console. Each unique model name can have only one associated model card.

If your model is not an AWS resource, provide a unique name for your model. To add a model as an AWS resource, see Create a model in the Amazon SageMaker Developer Guide. Alternatively, you can add your model as a model package using SageMaker Marketplace or SageMaker Model Registry.

For more information on intended uses, see ??? (p. 3792). For more information on risk ratings, see Risk ratings (p. 3792).

Step 2: Enter training details

Add any training details, training observations, datasets, hyperparameters, and details about the model's objective function to the model card.
The objective function in a model card can be any function that is optimized during training. This can include, but is not limited to, cost functions, loss functions, or objective metrics. In this section, document the objective function that is most critical to training your model.

We recommend that you catalog the following attributes of your objective function:

- Optimization direction
- Metric
- Description

For example, you might minimize (optimization direction) cross entropy loss (metric) for a binary classification problem (description) or maximize likelihood for logistic regression. Additionally, you can provide notes about why you chose this objective function over others.

**Step 3: Enter evaluation details**

If you have existing evaluation reports generated by SageMaker Clarify or Model Monitor, either provide an S3 URI for those reports or upload them manually to add them to the model card.

For more information on Clarify, see [Run SageMaker Clarify Processing Jobs for Bias Analysis and Explainability](#).

For more information on monitoring drift in model quality metrics using Model Monitor, see [Monitor model quality](#).

To add your own evaluation report, choose **Generic model card evaluation**. All model card evaluation reports must be in the [Model card JSON schema](#).

**Step 4: Enter additional details**

Add custom model card detail fields for any additional information that you want to address on your model card. For example, you might include the custom field *Line of business* with a value of *Personal finance*.

**Save model card**

After reviewing the information in your model card, choose **Save** in the lower right-hand corner to save your model card.

**Edit a model card**

To edit a model card, navigate to the model card of your choice by selecting its name in the Amazon SageMaker Model Card console and choose **Edit**.

After you save a model card, you cannot edit the name of that model card. After you save a model card version, you cannot update that version of the model card. Any edits that you need to make are saved as a subsequent version in order to have an immutable record of model changes.

To view different versions of the model card, choose **Actions, Select version**, and then choose the version that you want to view.

**Export a model card**

Follow these steps to export a model card.

1. Go to the Amazon SageMaker Model Card console.
2. Choose the name of the model card you want to export.
3. In the model card overview, choose **Actions** and then **Export PDF**.
4. Enter an S3 URI or browse available S3 buckets for your model card PDF.
5. If your model card exports successfully, you can either choose **Download PDF** in the resulting banner or download your PDF directly from Amazon S3.

**Delete a model card**

Follow these steps to permanently delete one or more model cards.

1. Go to the Amazon SageMaker Model Cards console.
2. Check the box to the left of the name of the card(s) you want to delete.
3. Choose **Delete** in the upper right-hand corner.
4. Confirm your request to permanently delete one or more cards.

You can also delete a model card when viewing the model card overview in the console by choosing **Actions** and then **Delete model card**.

**Use model cards through the SageMaker Python SDK**

You can create an Amazon SageMaker Model Card programmatically through the SageMaker Python SDK. For more information see Amazon SageMaker Model Cards in the SageMaker Python SDK API reference.

**Create a model card**

Before creating a model card, you must first define the content of your model card. When using the SageMaker Python SDK, model content consists of a model overview, training details, intended uses, evaluation details, and additional information.

**Note**

To use model cards with the SageMaker Python SDK, you first need to establish a SageMaker Session. For more information, see Session in the SageMaker Python SDK API reference.

**Define model overview**

Define an overview of your model.

```python
model_overview = ModelOverview.from_name(
    model_name=model_name,
    sagemaker_session=sagemaker_session,
    model_description="A-description-of-your-model",
    problem_type="Problem-type",  # For example, "Binary Classification"
    algorithm_type="Algorithm-type",  # For example, "Logistic Regression"
    model_creator="Name-of-model-creator",
    model_owner="Name-of-model-owner",
)
```

If your model is an AWS resource, then overview information such as the model ARN, inference container URI, and the S3 location of model artifacts is automatically retrievable. Print the associated AWS metadata with the following commands:

```python
print(model_overview.model_id)
print(model_overview.inference_environment.container_image)
print(model_overview.model_artifact)
```
Define training details

To define your model's training details, you must first define its objective function.

```python
objective_function = ObjectiveFunction(
    function=Function(
        function=ObjectiveFunctionEnum.MINIMIZE,
        facet=FacetEnum.LOSS,
    ),
    notes="An-explanation-about-objective-function",
)
```

Next, you can define your training details using your existing model overview, session, and objective function. Add any training observations here.

```python
training_details = TrainingDetails.from_model_overview(
    model_overview=model_overview,
    sagemaker_session=sagemaker_session,
    objective_function=objective_function,
    training_observations="Model-training-observations",
)
```

Once again, if your model is an AWS resource, certain training details are autopopulated. Print the training job ARN, training container URI, and training metrics with the following commands:

```python
print(training_details.training_job_details.training_arn)
print(training_details.training_job_details.training_environment.container_image)
print(["name": i.name, "value": i.value} for i in
    training_details.training_job_details.training_metrics])
```

Define evaluation details

To define your model's evaluation details, you must first define one or more metric groups to describe metrics used for any evaluation jobs.

```python
my_metric_group = MetricGroup(
    name="binary classification metrics",
    metric_data=[Metric(name="accuracy", type=MetricTypeEnum.NUMBER, value=0.5])
)
```

Next, you can define your evaluation details using evaluation metrics and datasets for each evaluation job. Add any evaluation observations here and give your evaluation job a unique name.

```python
evaluation_details = [
    EvaluationJob(
        name="Example-evaluation-job",
        evaluation_observation="Evaluation-observations",
        datasets=["s3://path/to/evaluation/data"],
        metric_groups=[my_metric_group],
    )
]
```

If you have existing evaluation reports generated by SageMaker Clarify or SageMaker Model Monitor, upload them to Amazon S3 and provide an S3 URI to automatically parse evaluation metrics. To add your own generic model card evaluation report, provide a report in the evaluation results JSON format.

```python
report_type = "clarify_bias.json"
```
Define intended uses

Define the intended uses of the model, including the general purpose of the model and the use cases for which it was intended. It is also recommended to include any factors that potentially affect this model's efficacy in a particular use case and your organization's risk rating of the model. For more information, see Intended uses of a model (p. 3792) and Risk ratings (p. 3792).

```python
intended_uses = IntendedUses(
    purpose_of_model="Purpose-of-the-model",
    intended_uses="The-intended-uses-of-this-model",
    factors_affecting_model_efficiency="Any-factors-effecting-model-efficacy",
    risk_rating=RiskRatingEnum.LOW,
    explanations_for_risk_rating="Explanation-for-low-risk-rating",
)
```

Define additional information

Lastly, you can add additional custom information to your model card. You can document any ethical considerations, caveats, and recommendations about the model. You can also add any custom details that you would like in the form of key-value pairs.

```python
additional_information = AdditionalInformation(
    ethical_considerations="Any-ethical-considerations",
    caveats_and_recommendations="Any-caveats-and-recommendations",
    custom_details={"custom details1": "details-value"},
)
```

Create model card

Name your model card, define a model card, and then use that definition to create a model card using the SageMaker Python SDK.

```python
model_card_name = "my-model-card"
my_card = ModelCard(
    name=model_card_name,
    status=ModelCardStatusEnum.DRAFT,
    model_overview=model_overview,
    training_details=training_details,
    intended_uses=intended_uses,
    evaluation_details=evaluation_details,
    additional_information=additional_information,
    sagemaker_session=sagemaker_session,
)
my_card.create()
```

Edit a model card

You can edit a model card using the `model_card` . update() method. Updating a model card creates a new model card version in order to have an immutable record of model changes. You cannot update the name of a model card.

```python
my_card.model_overview.model_description = "updated-model-description"
my_card.update()
```
Export a model card

Specify an S3 output path and export your model card PDF to it with the following commands:

```python
s3_output_path = f"s3://{bucket}/{prefix}/export"
pdf_s3_url = my_card.export_pdf(s3_output_path=s3_output_path).delete()
```

Delete a model card

Permanently delete a model card with the following command:

```python
my_card.delete()
```

Sample notebooks

For more information on working with model cards through the SageMaker Python SDK, see the *Amazon SageMaker Model Governance - Model Card* example notebook.

Use model cards through the low-level APIs

You can create an Amazon SageMaker Model Card directly through the SageMaker API or the AWS Command Line Interface (AWS CLI).

**Note**

When creating a model card with the low-level APIs, the content must be in the model card JSON schema and provided as a string. For more information, see Model card JSON schema (p. 3793).

SageMaker API

Use the following SageMaker API commands to work with Amazon SageMaker Model Cards:

- CreateModelCard
- DescribeModelCard
- ListModelCards
- ListModelCardVersions
- UpdateModelCard
- CreateModelCardExportJob
- DescribeModelCardExportJob
- ListModelCardExportJobs
- DeleteModelCard

AWS CLI

Use the following AWS CLI commands to work with Amazon SageMaker Model Cards:

- create-model-card
- describe-model-card
- list-model-cards
- list-model-card-versions
- update-model-card
- create-model-card-export-job
Model card FAQs

Refer to the following FAQ items for answers to commonly asked questions about Amazon SageMaker Model Card.

Q. What is model risk?

A: You can use models for a variety of business applications ranging from predicting cyber attacks and approving loan applications to detecting the category of an email. Each of these applications assumes a different level of risk. For example, incorrectly detecting a cyber attack has much greater business impact than incorrectly categorizing an email. Given these varied risk profiles of a model, you can use model cards to provide a risk rating of low, medium, or high for a model. If you don't know the risk of your model, you can set the status to unknown. Customers are responsible for assigning the risk profile for each model. Based on the risk rating, organizations may have different rules in place for deploying those models to production. For more information, see Risk ratings (p. 3792).

Q. What is the intended use of a model?

The intended use of a model describes how you should use the model in your production applications. This goes beyond technical requirements like the type of instance to which you should deploy a model and instead refers to the types of applications to create with the model, the scenarios in which you can expect a reasonable performance from the model, or the type of data to use with the model. We recommend providing this information in the model card for better model governance. You can define a kind of model specification in the intended use field and ensure that model developers and consumers follow this specification while training and deploying their models. For more information, see Intended uses of a model (p. 3792).

Q. Does SageMaker autopopulate information in my model card?

When you use the SageMaker Python SDK or the AWS console to create your model card, SageMaker autopopulates details about your SageMaker trained model in the card. This includes details about how the model was trained along with all the model details returned by the describe-model API call.

Q. Can I customize a model card?

Amazon SageMaker Model Cards have a defined structure to them that cannot be modified. This structure gives you guidance on what information should be captured in a model card. While you cannot change the structure of the model card, there is some flexibility introduced through custom properties in the Additional information section of the model card.

Q. Can I edit a model card once it is created?

Model cards have versions associated with them. A given model version is immutable across all attributes other than the model card status. If you make any other changes to the model card, such as evaluation metrics, description, or intended uses, SageMaker creates a new version of the model card to reflect the updated information. This is to ensure that a model card, once created, cannot be tampered with.

Q. Can I create model cards for models that were not trained using SageMaker?

A: Yes. You can create model cards for models not trained in SageMaker, but no information is automatically populated in the card. You must supply all the information needed in the model card for non-SageMaker models.
Q. Can I export or share model cards?
A: Yes. You can export each version of a model card to a PDF, downloaded, and share it.

Q. Do I need to register my model in the Model Registry to use model cards?
A: No. You can use model cards independently of the Model Registry.

Q. What is the difference between model cards and Model Registry?
A: Model cards are intended to provide organizations with a mechanism to document as much detail about their model as they like by following SageMaker's prescriptive guidance along with providing their own custom information. You can introduce model cards at the very start of the ML process and use them to define the business problem that the model should solve and any considerations to think about while using the model. After a model is trained, you can populate the model card associated with that model with information about the model and how it was trained. Model cards are associated with models and are immutable once associated with a model. This ensures that the model card is the single source of truth for all the information related to a model, including how it was trained and how it should be used.

The Model Registry is a catalog that stores metadata about your models. Each entry in the model registry corresponds to a unique model version. That model version contains information about the model such as where the model artifacts are stored in Amazon S3, what container is needed to deploy the model, and custom metadata that should be attached to the model.

Q. Are model card versions related to model versions in the Model Registry?
A: Model card versions and model versions are different entities in SageMaker. Each update to a model card results in a new version of that card. Model versions correspond to incrementally trained models that are registered in the Model Registry. A model card version may be linked to a specific model version in the Model Registry by way of the model ID field in the model card, but this is not necessary.

Q. Are model cards integrated with SageMaker Model Monitor?
A: No. You can upload the performance metrics computed by SageMaker Model Monitor to the model card by uploading a metrics file to Amazon S3 and linking that to the card, but there is no native integration between Model Monitor and model cards. Model dashboards are integrated with Model Monitor. For more information on model dashboards, see Amazon SageMaker Model Dashboard.

Model Dashboard

Amazon SageMaker Model Dashboard is a centralized portal, accessible from the SageMaker console, where you can view, search, and explore all of the models in your account. You can track which models are deployed for inference and if they are used in batch transform jobs or hosted on endpoints. If you set up monitors with Amazon SageMaker Model Monitor, you can also track the performance of your models as they make real-time predictions on live data. You can use the dashboard to find models that violate thresholds you set for data quality, model quality, bias and explainability. The dashboard's comprehensive presentation of all your monitor results helps you quickly identify models that don't have these metrics configured.

The Model Dashboard aggregates model-related information from several SageMaker features. In addition to the services provided in Model Monitor, you can view model cards, visualize workflow lineage, and track your endpoint performance. You no longer have to sort through logs, query in notebooks, or access other AWS services to collect the data you need. With a cohesive user experience and integration
into existing services, SageMaker's Model Dashboard provides an out-of-the-box model governance solution to help you ensure quality coverage across all your models.

**Prerequisites**

To use the Model Dashboard, you should have one or more models in your account. You can train models using Amazon SageMaker or import models you've trained elsewhere. To create a model in SageMaker, you can use the `CreateModel` API. For more information, see `CreateModel`. You can also use SageMaker-provided ML environments, such as Amazon SageMaker Studio, which provides project templates that set up model training and deployment for you. For information about how to get started with Studio, see `Amazon SageMaker Studio`.

While this is not a mandatory prerequisite, customers gain the most value out of the dashboard if they set up model monitoring jobs using SageMaker Model Monitor for models deployed to endpoints. For prerequisites and instructions on how to use SageMaker Model Monitor, see `Monitor models for data and model quality, bias, and explainability` (p. 2088).

**Model Dashboard elements**

The Model Dashboard view extracts high-level details from each model to provide a comprehensive summary of every model in your account. If your model is deployed for inference, the dashboard helps you track the performance of your model and endpoint in real time.

Important details to highlight in this page include:

- **Risk rating**: A user-specified parameter from the model card with a low, medium, or high value. The model card's risk rating is a categorical measure of the business impact of the model's predictions. Models are used for a variety of business applications, each of which assumes a different level of risk. For example, incorrectly detecting a cyber attack has much greater business impact than incorrectly categorizing an email. If you don't know the model risk, you can set it to unknown. For information about Amazon SageMaker Model Cards see `Model Cards`.

- **Model Monitor alerts**: Model Monitor alerts are a primary focus of the Model Dashboard, and reviewing the existing documentation on the various monitors provided by SageMaker is a helpful way to get started. For an in-depth explanation of the SageMaker Model Monitor feature and sample notebooks, see `Monitor models for data and model quality, bias, and explainability` (p. 2088).

The Model Dashboard displays Model Monitor status values by the following monitor types:

- **Data Quality**: Compares live data to training data. If they diverge, your model's inferences may no longer be accurate. For additional details about the Data Quality monitor, see `Monitor data quality` (p. 2099).

- **Model Quality**: Compares the predictions that the model makes with the actual Ground Truth labels that the model attempts to predict. For additional details about the Model Quality monitor, see `Monitor model quality` (p. 2106).

- **Bias Drift**: Compares the distribution of live data to training data, which can also cause inaccurate predictions. For additional details about the Bias Drift monitor, see `Monitor Bias Drift for Models in Production` (p. 2114).

- **Feature Attribution Drift**: Also known as explainability drift. Compares the relative rankings of your features in training data versus live data, which could also be a result of bias drift. For additional details about the Feature Attribution Drift monitor, see `Monitor Feature Attribution Drift for Models in Production` (p. 2123).

Each Model Monitor status is one of the following values:

- **None**: No monitor is scheduled
- **Inactive**: A monitor was scheduled, but it was deactivated
- **OK**: A monitor is scheduled and is active, and has not encountered the necessary number of violations in recent model monitor executions to raise an alert
• **Time and date:** An active monitor raised an alert at the specified time and date

• **Endpoint:** The endpoints which host your model for real-time inference. Within the Model Dashboard, you can select the endpoint column to view performance metrics such as CPU, GPU, disk, and memory utilization of your endpoints in real time to help you track the performance of your compute instances.

• **Batch transform job:** The most recent batch transform job that ran using this model. This column helps you determine if a model is actively used for batch inference.

• **Model details:** Each entry in the dashboard links to a model details page where you can dive deeper into an individual model. You can access the model's lineage graph, which visualizes the workflow from data preparation to deployment, and metadata for each step. You can also create and view the model card, review alert details and history, assess the performance of your real-time endpoints, and access other infrastructure-related details.

---

**View Model Monitor schedules and alerts**

Using the Python SDK, you can create a model monitor for data quality, model quality, bias drift, or feature attribution drift. For more information about using SageMaker Model Monitor, see Monitor models for data and model quality, bias, and explainability (p. 2088). The Model Dashboard populates information from all the monitors you create on all your models in your account. You can track the status of each monitor, which indicates whether your monitor is running as expected or failed due to an internal error. You can also activate or deactivate any monitor in the model details page itself. For instructions about how to view scheduled monitors for a model, see View scheduled monitors (p. 3810). For instructions about how to activate or deactivate model monitors, see Activate or deactivate a model monitor (p. 3810).

A properly-configured and actively-running model monitor might raise alerts, in which case the monitoring executions produce violation reports. For details about how alerts work and how to view alert results, history, and links to job reports for debug, see View and edit alerts (p. 3811).

---

**View scheduled monitors**

**To view a model's scheduled monitors, complete the following steps:**

1. Open the SageMaker console.

2. Choose Governance in the left panel.

3. Choose Model Dashboard.

4. In the Models section of the Model Dashboard, select the model name of the scheduled monitors you want to view.

5. View the scheduled monitors in the Monitor schedule section. You can review the status for each monitor in the Status schedule column, which is one of the following values:

   • **Failed:** The monitoring schedule failed due to a problem with the configuration or settings (such as incorrect user permissions).
   
   • **Pending:** The monitor is in the process of becoming scheduled.
   
   • **Stopped:** The schedule is stopped by the user.
   
   • **Scheduled:** The schedule is created and runs at the frequency you specified.

---

**Activate or deactivate a model monitor**

**To activate or deactivate a model monitor, complete the following steps:**

1. Open the SageMaker console.
2. Choose **Governance** in the left panel.
3. Choose **Model Dashboard**.
4. In the **Models** section of the Model Dashboard, select the model name of the alert you want to modify.
5. Choose the radio box next to the monitor schedule of the alert you want to modify.
6. (optional) Choose **Deactivate monitor schedule** if you want to deactivate your monitor schedule.
7. (optional) Choose **Activate monitor schedule** if you want to activate your monitor schedule.

**View and edit alerts**

The Model Dashboard displays alerts you configured in Amazon CloudWatch. You can modify the alert criteria within the dashboard itself. The alert criteria depend upon two parameters:

- **Datapoints to alert**: Within the evaluation period, how many execution failures raise an alert.
- **Evaluation period**: The number of most recent monitoring executions to consider when evaluating alert status.

The following image shows an example scenario of a series of Model Monitor executions in which we set a hypothetical **Evaluation period** of 3 and a **Datapoints to alert** value of 2. After every monitoring execution, the number of failures are counted within the **Evaluation period** of 3. If the number of failures meets or exceeds the **Datapoints to alert** value 2, the monitor raises an alert and remains in alert status until the number of failures within the **Evaluation period** becomes less than 2 in subsequent iterations. In the image, the evaluation windows are red when the monitor raises an alert or remains in alert status, and green otherwise.

Note that even if the evaluation window size has not reached the **Evaluation period** of 3, as shown in the first 2 rows of the image, the monitor still raises an alert if the number of failures meets or exceeds the **Datapoints to alert** value of 2.

![Example Scenario Scenario Image](image-url)
Within the monitor details page, you can view your alert history, edit existing alert criteria, and view job reports to help you debug alert failures. For instructions about how to view alert history or job reports for failed monitoring executions, see View alert history or job reports (p. 3812). For instructions about how to edit alert criteria, see Edit alert criteria (p. 3812).

**View alert history or job reports**

**To view alert history or job reports of failed executions, complete the following steps:**

1. Open the SageMaker console.
2. Choose Governance in the left panel.
3. Choose Model Dashboard.
4. In the Models section of the Model Dashboard, select the model name of the alert history you want to view.
5. In the Schedule name column, select the monitor name of the alert history you want to view.
6. To view alert history, select the Alert history tab.
7. (optional) To view job reports of monitoring executions, complete the following steps:
   1. In the Alert history tab, choose View executions for the alert you want to investigate.
   2. In the Execution history table, choose View report of the monitoring execution you want to investigate.

   **The report displays the following information:**
   - **Feature**: The user-defined ML feature monitored
   - **Constraint**: The specific check within the monitor
   - **Violation details**: Information about why the constraint was violated

**Edit alert criteria**

**To edit an alert in the Model Dashboard, complete the following steps:**

1. Open the SageMaker console.
2. Choose Governance in the left panel.
3. Choose Model Dashboard.
4. In the Models section of the Model Dashboard, select the model name of the alert you want to modify.
5. Choose the radio box next to the monitor schedule of the alert you want to modify.
6. Choose Edit Alert in the Monitor schedule section.
7. (optional) Change Datapoints to alert if you want to change the number of failures within the Evaluation period that initiate an alert.
8. (optional) Change Evaluation period if you want to change the number of most recent monitoring executions to consider when evaluating alert status.

**View a model lineage graph**

When you train a model, Amazon SageMaker creates a visualization of your entire ML workflow from data preparation to deployment. This visualization is called a model lineage graph and uses entities to represent individual steps in your workflow. For example, a basic model lineage graph might have an entity representing your training set, which is associated with an entity representing your training job, which is associated with another entity representing your model.
In addition, the graph stores information about each step in your workflow. With this information, you can recreate any step in the workflow or track model and dataset lineage. For example, SageMaker Lineage stores the S3 URI of your input data sources with each job so you can perform further analysis of the data sources for compliance verification.

While the model lineage graph can help you view the steps in individual workflows, there are many other capabilities that you can leverage using the AWS SDK. For example, with the AWS SDK you can create or query your entities. For more information about the full set of features in SageMaker Lineage and example notebooks, see Amazon SageMaker ML Lineage Tracking (p. 3406).

### Introduction to entities

Amazon SageMaker automatically creates tracking entities for SageMaker jobs, models, model packages, and endpoints if the data is available. For a basic workflow, suppose you train a model using a dataset. SageMaker automatically generates a lineage graph with three entities:

- **Dataset**: A type of artifact, which is an entity representing a URI addressable object or data. An artifact is generally either an input or an output to a trial component or action.
- **TrainingJob**: A type of trial component, which is an entity representing processing, training, and transform jobs.
- **Model**: Another type of artifact. Like the Dataset artifact, a Model is a URI addressable object. In this case, it is an output of the TrainingJob trial component.

Your model lineage graph expands quickly if you add additional steps to your workflow, such as data preprocessing or postprocessing, if you deploy your model to an endpoint, or if you include your model in a model package, among many other possibilities. For the complete list of SageMaker entities, see Amazon SageMaker ML Lineage Tracking (p. 3406).

### Entity properties

Each node in the graph displays the entity type, but you can choose the vertical ellipsis to the right of the entity type to see specific details related to your workflow. In our previous barebones lineage graph, you can choose the vertical ellipsis next to **DataSet** to see specific values for the following properties (common to all artifact entities):

- **Name**: The name of your dataset.
- **Source URI**: The Amazon S3 location of your dataset.

For the **TrainingJob** entity, you can see the specific values for the following properties (common to all **TrialComponent** entities):

- **Name**: The name of the training job.
- **Job ARN**: The Amazon Resource Name (ARN) of your training job.

For the **Model** entity, you see the same properties as listed for **DataSet** since they are both artifact entities. For a list of the entities and their associated properties, see Lineage Tracking Entities (p. 3407).

### Entity queries

Amazon SageMaker automatically generates graphs of lineage entities as you use them. However if you are running many iterations of an experiment and don't want to view every lineage graph, the AWS SDK can help you perform queries across all your workflows. For example, you can query your lineage entities for all the processing jobs that use an endpoint. Or, you can see all the downstream trails that use an artifact. For a list of all the queries you can perform, see Querying Lineage Entities (p. 3414).
View a model’s lineage graph

To view the lineage graph for a model, complete the following steps:

1. Open the SageMaker console.
2. Choose Governance in the left panel.
3. Choose Model Dashboard.
4. In the Models section of the Model Dashboard, select the model name of the lineage graph you want to view.
5. Choose View lineage in the Model Overview section.

View Endpoint Status

If you want to use your trained model to perform inference on live data, you deploy your model to a real-time endpoint. To ensure appropriate latency of your predictions, you want to make sure the instances that host your model are running efficiently. Model Dashboard’s endpoint monitoring feature displays real-time information about your endpoint configuration and helps you track endpoint performance with metrics.

Monitor settings

The Model Dashboard links to existing SageMaker endpoint details pages which display real-time graphs of metrics you can select in Amazon CloudWatch. Within your dashboard, you can track these metrics as your endpoint is handling real-time inference requests. Some metrics you can select are the following:

- CpuUtilization: The sum of each individual CPU core's utilization, with each ranging from 0%–100%.
- MemoryUtilization: The percentage of memory used by the containers on an instance, ranging from 0%–100%.
- DiskUtilization: The percentage of disk space used by the containers on an instance, ranging from 0%–100%.

For the complete list of metrics you can view in real time, see Monitor Amazon SageMaker with Amazon CloudWatch (p. 3818).

Runtime settings

Amazon SageMaker supports automatic scaling (auto scaling) for your hosted models. Auto scaling dynamically adjusts the number of instances provisioned for a model in response to changes in your workload. When the workload increases, auto scaling brings more instances online. When the workload decreases, auto scaling removes unnecessary instances so that you don't pay for provisioned instances that you aren't using. You can customize the following runtime settings in the Model Dashboard:

- Update weights: Change the amount of workload assigned to each instance with numerical weighting. For more information about instance weighting during auto scaling, see Configure instance weighting for Amazon EC2 Auto Scaling.
- Update instance count: Change the number of total instances that can service your workload when it increases.

For more information about endpoint runtime settings, see CreateEndpointConfig.

Endpoint configuration settings
Endpoint configuration settings display the settings you specified when you created the endpoint. These settings inform SageMaker which resources to provision for your endpoint. Some settings included are the following:

- **Data capture**: You can choose to capture information about your endpoint's inputs and outputs. For example, you may want to sample incoming traffic to see if the results correlate to training data. You can customize your sampling frequency, the format of the stored data, and Amazon S3 location of stored data. For more information about setting up your data capture configuration, see [Capture data](p. 2091).
- **Production variants**: See the previous discussion in [*Runtime settings*](#).
- **Async invocation configuration**: If your endpoint is asynchronous, this section includes the maximum number of concurrent requests sent by the SageMaker client to the model container, the Amazon S3 location of your success and failure notifications, and the output location of your endpoint outputs. For more information about asynchronous outputs, see [Create, invoke, and update an Asynchronous Endpoint](p. 2176).
- **Encryption key**: You can enter your encryption key if you want to encrypt your outputs.

For more information about endpoint configuration settings, see [CreateEndpointConfig].

**View status and configuration for an endpoint**

To view the status and configuration for a model's endpoint, complete the following steps:

1. Open the SageMaker console.
2. Choose **Governance** in the left panel.
3. Choose **Model Dashboard**.
4. In the **Models** section of the Model Dashboard, select the model name of the endpoint you want to view.
5. Select the endpoint name in the **Endpoints** section.

**Model Dashboard FAQ**

Refer to the following FAQ topics for answers to commonly asked questions about Amazon SageMaker Model Dashboard.

Q. **What is Model Dashboard?**

Amazon SageMaker Model Dashboard is a centralized repository of all models created in your account. The models are generally the outputs of SageMaker training jobs, but you can also import models trained elsewhere and host them on SageMaker. Model Dashboard provides a single interface for IT administrators, model risk managers, and business leaders to track all deployed models and aggregates data from multiple AWS services to provide indicators about how your models are performing. You can view details about model endpoints, batch transform jobs, and monitoring jobs for additional insights into model performance. The dashboard’s visual display helps you quickly identify which models have missing or inactive monitors so you can ensure all models are periodically checked for data drift, model drift, bias drift, and feature attribution drift. Lastly, the dashboard's ready access to model details helps you dive deep so you can access logs, infrastructure-related information, and resources to help you debug monitoring failures.

Q. **What are the prerequisites to use Model Dashboard?**

You should have one or more models created in SageMaker, either trained on SageMaker or externally trained. While this is not a mandatory prerequisite, you gain the most value from the dashboard if you set up model monitoring jobs via Amazon SageMaker Model Monitor for models deployed to endpoints.
Q. Who should use Model Dashboard?

Model risk managers, ML practitioners, data scientists and business leaders can get a comprehensive overview of models using the Model Dashboard. The dashboard aggregates and displays data from Amazon SageMaker Model Cards, Endpoints and Model Monitor services to display valuable information such as model metadata from the model card and model registry, endpoints where the models are deployed, and insights from model monitoring.

Q. How do I use Model Dashboard?

Model Dashboard is available out of the box with Amazon SageMaker and does not require any prior configuration. However, if you have set up model monitoring jobs using SageMaker Model Monitor and Clarify, you use Amazon CloudWatch to configure alerts that raise a flag in the dashboard when model performance deviates from an acceptable range. You can create and add new model cards to the dashboard, and view all the monitoring results associated with endpoints. Model Dashboard currently does not support cross-account models.

Q. What is Amazon SageMaker Model Monitor?

With Amazon SageMaker Model Monitor, you can select the data you want to monitor and analyze without writing any code. SageMaker Model Monitor lets you select data, such as prediction output, from a menu of options and captures metadata such as timestamp, model name, and endpoint so you can analyze model predictions. You can specify the sampling rate of data capture as a percentage of overall traffic in the case of high volume real-time predictions. This data is stored in your own Amazon S3 bucket. You can also encrypt this data, configure fine-grained security, define data retention policies, and implement access control mechanisms for secure access.

Q. What types of model monitors does SageMaker support?

SageMaker Model Monitor provides the following types of model monitors:

- **Data Quality**: Monitor drift in data quality.
- **Model Quality**: Monitor drift in model quality metrics, such as accuracy.
- **Bias Drift for Models in Production**: Monitor bias in your model's predictions by comparing the distribution of training and live data.
- **Feature Attribution Drift for Models in Production**: Monitor drift in feature attribution by comparing the relative rankings of features in training and live data.

Q. What inference methods does SageMaker Model Monitor support?

Model Monitor currently supports endpoints that host a single model for real-time inference or batch transform, and does not support monitoring of multi-model endpoints.

Q. How can I get started with SageMaker Model Monitor?

You can use the following resources to get started with model monitoring:

- Data quality monitor example notebook
- Model quality monitor example notebook
- Bias drift monitor example notebook
- Feature attribution drift monitor example notebook

For more examples of model monitoring, see the GitHub repository amazon-sagemaker-examples.
Q. How does Model Monitor work?

Amazon SageMaker Model Monitor automatically monitors machine learning models in production, using rules to detect drift in your model. Model Monitor notifies you when quality issues arise through alerts. To learn more, see How Model Monitor Works (p. 2089).

Q. When and how do you bring your own container (BYOC) for Model Monitor?

Model Monitor computes model metrics and statistics on tabular data only. For use cases other than tabular datasets, such as images or text, you can bring your own containers (BYOC) to monitor your data and models. For example, you can use BYOC to monitor an image classification model that takes images as input and outputs a label. To learn more about container contracts, see Bring Your Own Containers (p. 2148).

Q. Where can I find examples of BYOC for Model Monitor?

You can find helpful BYOC examples in the following links:

- Monitor models for data and model quality, bias, and explainability (p. 2088)
- GitHub example repository
- Bring Your Own Containers (p. 2148)
- Detecting data drift in NLP using BYOC Model Monitor
- Detecting and analyzing incorrect predictions in CV

Q. How do I integrate Model Monitor with SageMaker Pipelines?

For details about how to integrate Model Monitor and SageMaker Pipelines, see Amazon SageMaker Pipelines now integrates with SageMaker Model Monitor and SageMaker Clarify.

For an example, see the GitHub sample notebook SageMaker Pipelines integration with Model Monitor and Clarify.

Q. Are there any performance concerns using DataCapture?

When turned on, data capture occurs asynchronously on the SageMaker endpoints. To prevent impact to inference requests, DataCapture stops capturing requests at high levels of disk usage. It is recommended you keep your disk utilization below 75% to ensure DataCapture continues capturing requests.
Monitor Amazon SageMaker

Monitoring is an important part of maintaining the reliability, availability, and performance of SageMaker and your other AWS solutions. AWS provides the following monitoring tools to watch SageMaker, report when something is wrong, and take automatic actions when appropriate:

- **Amazon CloudWatch** monitors your AWS resources and the applications that you run on AWS in real time. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. For example, you can have CloudWatch track CPU usage or other metrics of your Amazon EC2 instances and automatically launch new instances when needed. For more information, see the [Amazon CloudWatch User Guide](#).

- **Amazon CloudWatch Logs** enables you to monitor, store, and access your log files from EC2 instances, AWS CloudTrail, and other sources. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see the [Amazon CloudWatch Logs User Guide](#).

- **AWS CloudTrail** captures API calls and related events made by or on behalf of your AWS account and delivers the log files to an Amazon S3 bucket that you specify. You can identify which users and accounts called AWS, the source IP address from which the calls were made, and when the calls occurred. For more information, see the [AWS CloudTrail User Guide](#).

- **CloudWatch Events** delivers a near real-time stream of system events that describe changes in AWS resources. Create CloudWatch Events rules react to a status change in a SageMaker training, hyperparameter tuning, or batch transform job

### Topics

- Monitor Amazon SageMaker with Amazon CloudWatch (p. 3818)
- Log Amazon SageMaker Events with Amazon CloudWatch (p. 3830)
- Log Amazon SageMaker API Calls with AWS CloudTrail (p. 3831)
- Monitoring user resource access from Amazon SageMaker Studio (p. 3834)
- Automating Amazon SageMaker with Amazon EventBridge (p. 3836)

Monitor Amazon SageMaker with Amazon CloudWatch

You can monitor Amazon SageMaker using Amazon CloudWatch, which collects raw data and processes it into readable, near real-time metrics. These statistics are kept for 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing. However, the Amazon CloudWatch console limits the search to metrics that were updated in the last 2 weeks. This limitation ensures that the most current jobs are shown in your namespace. To graph metrics without using a search, specify its exact name in the source view. You can also set alarms that watch for certain thresholds, and send notifications or take actions when those thresholds are met. For more information, see the [Amazon CloudWatch User Guide](#).

**SageMaker Metrics and Dimensions**

- SageMaker Endpoint Invocation Metrics (p. 3819)
- SageMaker Multi-Model Endpoint Metrics (p. 3820)
- SageMaker Jobs and Endpoint Metrics (p. 3822)
- SageMaker Ground Truth Metrics (p. 3825)
SageMaker Endpoint Invocation Metrics

The AWS/SageMaker namespace includes the following request metrics from calls to `InvokeEndpoint`.

Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see `GetMetricStatistics` in the Amazon CloudWatch API Reference.

### Endpoint Invocation Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invocation4XXErrors</td>
<td>The number of <code>InvokeEndpoint</code> requests where the model returned a 4xx HTTP response code. For each 4xx response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>Invocation5XXErrors</td>
<td>The number of <code>InvokeEndpoint</code> requests where the model returned a 5xx HTTP response code. For each 5xx response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>InvocationModelError</td>
<td>The number of model invocation requests which did not result in 2XX HTTP response. This includes 4XX/5XX status codes, low-level socket errors, malformed HTTP responses, and request timeouts. For each error response, 1 is sent; otherwise, 0 is sent.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>Invocations</td>
<td>The number of <code>InvokeEndpoint</code> requests sent to a model endpoint. To get the total number of requests sent to a model endpoint, use the Sum statistic.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum</td>
</tr>
<tr>
<td>InvocationsPerInstance</td>
<td>The number of invocations sent to a model, normalized by InstanceCount in each ProductionVariant. 1/numberOfInstances is sent as the value on each request, where numberOfInstances is the number of active instances for the ProductionVariant behind the endpoint at the time of the request.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Sum</td>
</tr>
<tr>
<td>ModelLatency</td>
<td>The interval of time taken by a model to respond as viewed from SageMaker. This interval includes the local communication times taken to send the...</td>
</tr>
</tbody>
</table>
### Multi-Model Endpoint Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RequestLatency</td>
<td>The interval of time added to the time taken to respond to a client request by SageMaker overheads. This interval is measured from the time SageMaker receives the request until it returns a response to the client, minus the ModelLatency. Overhead latency can vary depending on multiple factors, including request and response payload sizes, request frequency, and authentication/authorization of the request.</td>
</tr>
<tr>
<td>OverheadLatency</td>
<td>The interval of time added to the time taken to respond to a client request by SageMaker overheads. This interval is measured from the time SageMaker receives the request until it returns a response to the client, minus the ModelLatency. Overhead latency can vary depending on multiple factors, including request and response payload sizes, request frequency, and authentication/authorization of the request.</td>
</tr>
<tr>
<td>ModelLatency</td>
<td>The interval of time that an invocation request has waited for the target model to be downloaded, or loaded, or both in order to perform inference.</td>
</tr>
<tr>
<td>ModelSetupTime</td>
<td>The time it takes to launch new compute resources for a serverless endpoint. The time can vary depending on the model size, how long it takes to download the model, and the start-up time of the container.</td>
</tr>
<tr>
<td>ModelLoadingWaitTime</td>
<td>The interval of time that an invocation request has waited for the target model to be downloaded, or loaded, or both in order to perform inference.</td>
</tr>
</tbody>
</table>

### Dimensions for Endpoint Invocation Metrics

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EndpointName, VariantName</td>
<td>Filters endpoint invocation metrics for a ProductionVariant of the specified endpoint and variant.</td>
</tr>
</tbody>
</table>

### SageMaker Multi-Model Endpoint Metrics

The AWS/SageMaker namespace includes the following model loading metrics from calls to `InvokeEndpoint`.

Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see `GetMetricStatistics` in the `Amazon CloudWatch API Reference`.

### Multi-Model Endpoint Model Loading Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ModelLoadingWaitTime</td>
<td>The interval of time that an invocation request has waited for the target model to be downloaded, or loaded, or both in order to perform inference.</td>
</tr>
</tbody>
</table>
### Multi-Model Endpoint Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ModelUnloadingTime</td>
<td>The interval of time that it took to unload the model through the container's <code>UnloadModel</code> API call.</td>
</tr>
<tr>
<td></td>
<td>Units: Microseconds</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
<tr>
<td>ModelDownloadingTime</td>
<td>The interval of time that it took to download the model from Amazon Simple Storage Service (Amazon S3).</td>
</tr>
<tr>
<td></td>
<td>Units: Microseconds</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
<tr>
<td>ModelLoadingTime</td>
<td>The interval of time that it took to load the model through the container's <code>LoadModel</code> API call.</td>
</tr>
<tr>
<td></td>
<td>Units: Microseconds</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
<tr>
<td>ModelCacheHit</td>
<td>The number of <code>InvokeEndpoint</code> requests sent to the multi-model endpoint for which the model was already loaded.</td>
</tr>
<tr>
<td></td>
<td>The Average statistic shows the ratio of requests for which the model was already loaded.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>

**Dimensions for Multi-Model Endpoint Model Loading Metrics**

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EndpointName, VariantName</td>
<td>Filters endpoint invocation metrics for a <code>ProductionVariant</code> of the specified endpoint and variant.</td>
</tr>
</tbody>
</table>

The `/aws/sagemaker/Endpoints` namespaces include the following instance metrics from calls to `InvokeEndpoint`.

Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see `GetMetricStatistics` in the Amazon CloudWatch API Reference.

### Multi-Model Endpoint Model Instance Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LoadedModelCount</td>
<td>The number of models loaded in the containers of the multi-model endpoint. This metric is emitted per instance.</td>
</tr>
<tr>
<td></td>
<td>The Average statistic with a period of 1 minute tells you the average number of models loaded per instance.</td>
</tr>
</tbody>
</table>
### Metric

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Sum statistic</td>
<td>tells you the total number of models loaded across all instances in the endpoint.</td>
</tr>
<tr>
<td></td>
<td>The models that this metric tracks are not necessarily unique because a model might be loaded in multiple containers at the endpoint.</td>
</tr>
<tr>
<td></td>
<td>Units: None</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
</tbody>
</table>

### Dimensions for Multi-Model Endpoint Model Loading Metrics

<tbody>
<tr>
<td>EndpointName, VariantName</td>
<td>Filters endpoint invocation metrics for a ProductionVariant of the specified endpoint and variant.</td>
</tr>
</tbody>
</table>

### SageMaker Jobs and Endpoint Metrics

The /aws/sagemaker/ProcessingJobs, /aws/sagemaker/TrainingJobs, /aws/sagemaker/TransformJobs, and /aws/sagemaker/Endpoints namespaces include the following metrics for the training jobs and endpoint instances.

- **Metrics are available at a 1-minute frequency.**
  
  **Note**
  
  Amazon CloudWatch supports high-resolution custom metrics and its finest resolution is 1 second. However, the finer the resolution, the shorter the lifespan of the CloudWatch metrics. For the 1-second frequency resolution, the CloudWatch metrics are available for 3 hours. For more information about the resolution and the lifespan of the CloudWatch metrics, see GetMetricStatistics in the Amazon CloudWatch API Reference.
  
  **Tip**
  
  If you want to profile your training job with a finer resolution down to 100-millisecond (0.1 second) granularity and store the training metrics indefinitely in Amazon S3 for custom analysis at any time, consider using Amazon SageMaker Debugger. SageMaker Debugger provides built-in rules to automatically detect common training issues; it detects hardware resource utilization issues (such as CPU, GPU, and I/O bottlenecks) and non-converging model issues (such as overfit, vanishing gradients, and exploding tensors). SageMaker Debugger also provides visualizations through Studio and its profiling report. To explore the Debugger visualizations, see SageMaker Debugger Insights Dashboard Walkthrough, Debugger Profiling Report Walkthrough, and Analyze Data Using the SMDebug Client Library.

### Processing Job, Training Job, Batch Transform Job, and Endpoint Instance Metrics

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPUUtilization</td>
<td>The sum of each individual CPU core's utilization. The CPU utilization of each core range is 0–100. For example, if there are four CPUs, the CPUUtilization range is 0%–400%. For processing jobs, the value is the CPU utilization of the processing container on the instance.</td>
</tr>
<tr>
<td></td>
<td>For training jobs, the value is the CPU utilization of the algorithm container on the instance.</td>
</tr>
<tr>
<td>Metric</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Metric</strong></td>
<td><strong>Description</strong></td>
</tr>
</tbody>
</table>
| CPUUtilization | For batch transform jobs, the value is the CPU utilization of the transform container on the instance.  
For endpoint variants, the value is the sum of the CPU utilization of the primary and supplementary containers on the instance.  

**Note**  
For multi-instance jobs, each instance reports CPU utilization metrics. However, the default view in CloudWatch shows the average CPU utilization across all instances.  

Units: Percent |
| MemoryUtilization | The percentage of memory that is used by the containers on an instance.  
This value range is 0%–100%.  
For processing jobs, the value is the memory utilization of the processing container on the instance.  
For training jobs, the value is the memory utilization of the algorithm container on the instance.  
For batch transform jobs, the value is the memory utilization of the transform container on the instance.  
For endpoint variants, the value is the sum of the memory utilization of the primary and supplementary containers on the instance.  

**Note**  
For multi-instance jobs, each instance reports memory utilization metrics. However, the default view in CloudWatch shows the average memory utilization across all instances.  

Units: Percent |
| GPUUtilization | The percentage of GPU units that are used by the containers on an instance.  
The value can range between 0–100 and is multiplied by the number of GPUs. For example, if there are four GPUs, the GPUUtilization range is 0%–400%.  
For processing jobs, the value is the GPU utilization of the processing container on the instance.  
For training jobs, the value is the GPU utilization of the algorithm container on the instance.  
For batch transform jobs, the value is the GPU utilization of the transform container on the instance.  
For endpoint variants, the value is the sum of the GPU utilization of the primary and supplementary containers on the instance.  

**Note**  
For multi-instance jobs, each instance reports GPU utilization metrics. However, the default view in CloudWatch shows the average GPU utilization across all instances.  

Units: Percent |
### Metric and Description

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GPUMemoryUtilization</strong></td>
<td>The percentage of GPU memory used by the containers on an instance. The value range is 0–100 and is multiplied by the number of GPUs. For example, if there are four GPUs, the GPUMemoryUtilization range is 0%–400%. For processing jobs, the value is the GPU memory utilization of the processing container on the instance. For training jobs, the value is the GPU memory utilization of the algorithm container on the instance. For batch transform jobs, the value is the GPU memory utilization of the transform container on the instance. For endpoint variants, the value is the sum of the GPU memory utilization of the primary and supplementary containers on the instance. <strong>Note</strong> For multi-instance jobs, each instance reports GPU memory utilization metrics. However, the default view in CloudWatch shows the average GPU memory utilization across all instances.</td>
</tr>
<tr>
<td><strong>DiskUtilization</strong></td>
<td>The percentage of disk space used by the containers on an instance uses. This value range is 0%–100%. This metric is not supported for batch transform jobs. For processing jobs, the value is the disk space utilization of the processing container on the instance. For training jobs, the value is the disk space utilization of the algorithm container on the instance. For endpoint variants, the value is the sum of the disk space utilization of the primary and supplementary containers on the instance. <strong>Note</strong> For multi-instance jobs, each instance reports disk utilization metrics. However, the default view in CloudWatch shows the average disk utilization across all instances.</td>
</tr>
</tbody>
</table>

### Dimensions for Processing Job, Training Job and Batch Transform Job Instance Metrics

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>For processing jobs, the value for this dimension has the format [processing-job-name]/algo-[instance number in cluster]. Use this dimension to filter instance metrics for the specified processing job and instance. This dimension format is present only in the /aws/sagemaker/ProcessingJobs namespace. For training jobs, the value for this dimension has the format [training-job-name]/algo-[instance number in cluster]. Use this dimension to filter instance metrics for the specified training job and instance. This dimension format is present only in the /aws/sagemaker/TrainingJobs namespace.</td>
</tr>
<tr>
<td>Dimension</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>

### SageMaker Pipelines Metrics

The AWS/Sagemaker/ModelBuildingPipeline namespace includes the following metrics for pipeline executions.

Two categories of Pipelines execution metrics are available:

- **Execution Metrics across All Pipelines** – Account level pipeline execution metrics (for all pipelines in the current account)
• **Execution Metrics by Pipeline** – Pipeline execution metrics per pipeline

Metrics are available at a 1-minute frequency.

**Pipelines Execution Metrics**

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExecutionStarted</td>
<td>The number of pipeline executions that started.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>ExecutionFailed</td>
<td>The number of pipeline executions that failed.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>ExecutionSucceeded</td>
<td>The number of pipeline executions that succeeded.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>ExecutionStopped</td>
<td>The number of pipeline executions that stopped.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum</td>
</tr>
<tr>
<td>ExecutionDuration</td>
<td>The duration in milliseconds that the pipeline execution ran.</td>
</tr>
<tr>
<td></td>
<td>Units: Milliseconds</td>
</tr>
<tr>
<td></td>
<td>Valid statistics: Average, Sum, Min, Max, Sample Count</td>
</tr>
</tbody>
</table>

**Dimensions for Execution Metrics by Pipeline**

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PipelineName</td>
<td>Filters pipeline execution metrics for a specified pipeline.</td>
</tr>
</tbody>
</table>

**Pipelines Step Metrics**

The AWS/Sagemaker/ModelBuildingPipeline namespace includes the following metrics for pipeline steps.

Metrics are available at a 1-minute frequency.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StepStarted</td>
<td>The number of steps that started.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>

</tbody>
</table>
Log Amazon SageMaker Events with Amazon CloudWatch

To help you debug your compilation jobs, processing jobs, training jobs, endpoints, transform jobs, notebook instances, and notebook instance lifecycle configurations, anything an algorithm container, a model container, or a notebook instance lifecycle configuration sends to `stdout` or `stderr` is also sent to Amazon CloudWatch Logs. In addition to debugging, you can use these for progress analysis.

**Logs**

The following table lists all of the logs provided by Amazon SageMaker.

<table>
<thead>
<tr>
<th>Log Group Name</th>
<th>Log Stream Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/aws/sagemaker/CompilationJobs</code></td>
<td><code>[compilation-job-name]</code></td>
</tr>
</tbody>
</table>
Log Amazon SageMaker API Calls with AWS CloudTrail

Amazon SageMaker Developer Guide
Log SageMaker API Calls with CloudTrail

<table>
<thead>
<tr>
<th>Log Group Name</th>
<th>Log Stream Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>/aws/sagemaker/Endpoints/[EndpointName]</td>
<td>[production-variant-name]/[instance-id]</td>
</tr>
<tr>
<td></td>
<td>[production-variant-name]/[instance-id]/[container-name provided in SageMaker model] (For Inference Pipelines)</td>
</tr>
<tr>
<td>/aws/sagemaker/groundtruth/WorkerActivity</td>
<td>aws/sagemaker/groundtruth/worker-activity/[requester-AWS-Id]-[region]/[timestamp]</td>
</tr>
<tr>
<td>/aws/sagemaker/LabelingJobs</td>
<td>[labeling-job-name]</td>
</tr>
<tr>
<td>/aws/sagemaker/NotebookInstances</td>
<td>[notebook-instance-name]/[LifecycleConfigHook]</td>
</tr>
<tr>

<td>[notebook-instance-name]/jupyter.log</td>
</tr>
<tr>
<td>/aws/sagemaker/ProcessingJobs</td>
<td>[processing-job-name]/[hostname]-[epoch_timestamp]</td>
</tr>
<tr>
<td>/aws/sagemaker/studio</td>
<td>[domain-id]/[user-profile-name]/[app-type]/[app-name]</td>
</tr>
<tr>
<td></td>
<td>[domain-id]/domain-shared/rstudioserverpro/default</td>
</tr>
<tr>
<td>/aws/sagemaker/TrainingJobs</td>
<td>[training-job-name]/algo-[instance-number-in-cluster]-[epoch_timestamp]</td>
</tr>
<tr>
<td>/aws/sagemaker/TransformJobs</td>
<td>[transform-job-name]/[instance-id]-[epoch_timestamp]</td>
</tr>
<tr>
<td></td>
<td>[transform-job-name]/[instance-id]-[epoch_timestamp]/data-log</td>
</tr>
<tr>
<td></td>
<td>[transform-job-name]/[instance-id]-[epoch_timestamp]/[container-name provided in SageMaker model] (For Inference Pipelines)</td>
</tr>
</tbody>
</table>

**Note**
1. The /aws/sagemaker/NotebookInstances/[LifecycleConfigHook] log stream is created when you create a notebook instance with a lifecycle configuration. For more information, see [Customize a Notebook Instance Using a Lifecycle Configuration Script](p. 366).
2. For Inference Pipelines, if you don't provide container names, the platform uses **container-1, container-2**, and so on, corresponding to the order provided in the SageMaker model.

For more information about logging events with CloudWatch logging, see [What is Amazon CloudWatch Logs?](in the Amazon CloudWatch User Guide).

Log Amazon SageMaker API Calls with AWS CloudTrail

Amazon SageMaker is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in SageMaker. CloudTrail captures all API calls for SageMaker, with the exception of InvokeEndpoint and InvokeEndpointAsync, as events. The calls captured include calls from the SageMaker console and code calls to the SageMaker API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for
SageMaker Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in Amazon SageMaker, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for Amazon SageMaker, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for Creating a Trail
- CloudTrail Supported Services and Integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

All SageMaker actions, with the exception of InvokeEndpoint and InvokeEndpointAsync, are logged by CloudTrail and are documented in the Operations. For example, calls to the CreateTrainingJob, CreateEndpoint and CreateNotebookInstance actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the CloudTrail userIdentity Element.

Operations Performed by Automatic Model Tuning

SageMaker supports logging non-API service events to your CloudTrail log files for automatic model tuning jobs. These events are related to your tuning jobs but, are not the direct result of a customer request to the public AWS API. For example, when you create a hyperparameter tuning job by calling CreateHyperParameterTuningJob, SageMaker creates training jobs to evaluate various combinations of hyperparameters to find the best result. Similarly, when you call StopHyperParameterTuningJob to stop a hyperparameter tuning job, SageMaker might stop any of the associated running training
jobs. Non-API events for your tuning jobs are logged to CloudTrail to help you improve governance, compliance, and operational and risk auditing of your AWS account.

Log entries that result from non-API service events have an eventType of AwsServiceEvent instead of AwsApiCall.

Understanding SageMaker Log File Entries

A trail is a configuration that enables delivery of events as log files to an S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following examples a log entry for the CreateEndpoint action, which creates an endpoint to deploy a trained model.

```json
{
    "eventVersion": "1.05",
    "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIXDAYQEXAMPLEMLYNGL",
        "arn": "arn:aws:iam::123456789012:user/intern",
        "accountId": "123456789012",
        "accessKeyId": "ASXIAQEXAMPLEQULKNXV",
        "userName": "intern"
    },
    "eventTime": "2018-01-02T13:39:06Z",
    "eventSource": "sagemaker.amazonaws.com",
    "eventName": "CreateEndpoint",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "127.0.0.1",
    "userAgent": "USER_AGENT",
    "requestParameters": {
        "endpointName": "ExampleEndpoint",
        "endpointConfigName": "ExampleEndpointConfig"
    },
    "responseElements": {
        "endpointArn": "arn:aws:sagemaker:us-west-2:123456789012:endpoint/exampleendpoint"
    },
    "requestID": "6b1b42b9-EXAMPLE",
    "eventID": "a6f85b21-EXAMPLE",
    "eventType": "AwsApiCall",
    "recipientAccountId": "444455556666"
}
```

The following example is a log entry for the CreateModel action, which creates one or more containers to host a previously trained model.

```json
{
    "eventVersion": "1.05",
    "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIXDAYQEXAMPLEMLYNGL",
        "arn": "arn:aws:iam::123456789012:user/intern",
        "accountId": "123456789012",
        "accessKeyId": "ASXIAQEXAMPLEQULKNXV",
        "userName": "intern"
    },
    "eventTime": "2018-01-02T13:39:06Z",
    "eventSource": "sagemaker.amazonaws.com",
    "eventName": "CreateModel",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "127.0.0.1",
    "userAgent": "USER_AGENT",
    "requestParameters": {
        "modelName": "ExampleModel"
    },
    "responseElements": {
        "modelArn": "arn:aws:sagemaker:us-west-2:123456789012:model/examplemodel"
    },
    "requestID": "f4f85b21-EXAMPLE",
    "eventID": "a6f85b21-EXAMPLE",
    "eventType": "AwsApiCall",
    "recipientAccountId": "444455556666"
}
```
Monitoring user resource access from Amazon SageMaker Studio

With Amazon SageMaker Studio, you can monitor user resource access. To view resource access activity, you can configure AWS CloudTrail to monitor and record user activities by following the steps in Log Amazon SageMaker API Calls with AWS CloudTrail.

However, the AWS CloudTrail logs for resource access only list the Studio execution IAM role as the identifier. This level of logging is enough to audit user activity when each user profile has a distinct execution role. However, when a single execution IAM role is shared between several user profiles, you can't get information about the specific user that accessed the AWS resources.

You can get information about which specific user performed an action in an AWS CloudTrail log when using a shared execution role, using the sourceIdentity configuration to propagate the Studio user profile name. For more information about source identity, see Monitor and control actions taken with assumed roles.

Prerequisites

- Install and configure the AWS Command Line Interface following the steps in Installing or updating the latest version of the AWS CLI.
- Ensure that Studio users in your domain don't have a policy that allows them to update or modify the Studio domain.
- All execution roles must have the following trust policy permissions:
  - Any role that the Studio domain's execution role assumes must have the sts:SetSourceIdentity permission in the trust policy as follows.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },

```
Enable \texttt{sourceIdentity}

The ability to propagate the user profile name as the \texttt{sourceIdentity} in Studio is turned off by default.

To enable the ability to propagate the user profile name as the \texttt{sourceIdentity}, use the AWS CLI during domain creation and domain update. This feature is enabled at the domain level and not at the user profile level.

After you enable this configuration, administrators can view the user profile in the AWS CloudTrail log for the service accessed. The user profile is given as the \texttt{sourceIdentity} value in the \texttt{userIdentity} section. For more information about using AWS CloudTrail logs with SageMaker, see \texttt{Log Amazon SageMaker API Calls with AWS CloudTrail}.

You can use the following code to enable the propagation of the user profile name as the \texttt{sourceIdentity} during domain creation using the \texttt{create-domain} API.

```
create-domain
--domain-name <value>
--auth-mode <value>
--default-user-settings <value>
--subnet-ids <value>
--vpc-id <value>
[--tags <value>]
[--app-network-access-type <value>]
[--home-efs-file-system-kms-key-id <value>]
[--kms-key-id <value>]
[--app-security-group-management <value>]
[--domain-settings "ExecutionRoleIdentityConfig=USER_PROFILE_NAME"]
[--cli-input-json <value>]
[--generate-cli-skeleton <value>]
```

You can enable the propagation of the user profile name as the \texttt{sourceIdentity} during domain update using the \texttt{update-domain} API.

To update this configuration, all apps in the domain must be in the Stopped or Deleted state. For more information about how to stop and shut down apps, see \texttt{Shut down and Update Studio Apps}.

Use the following code to enable the propagation of the user profile name as the \texttt{sourceIdentity}.

```
update-domain
```
Turn off sourceIdentity

You can also turn off the propagation of the user profile name as the sourceIdentity using the AWS CLI. This occurs during domain update by passing the DISABLED value for the --role-session-context-config parameter as part of the update-domain API call.

Note
To update this configuration, all apps in the domain must be in the Stopped or Deleted state. For more information about how to stop and shut down apps, see Shut down and Update Studio Apps.

In the AWS CLI, use the following code to disable the propagation of the user profile name as the sourceIdentity.

```
update-domain
--domain-id <value>
[--default-user-settings <value>]
[--domain-settings-for-update "ExecutionRoleIdentityConfig=DISABLED"]
[--cli-input-json <value>]
[--generate-cli-skeleton <value>]
```

Automating Amazon SageMaker with Amazon EventBridge

Amazon EventBridge monitors status change events in Amazon SageMaker. EventBridge enables you to automate SageMaker and respond automatically to events such as a training job status change or endpoint status change. Events from SageMaker are delivered to EventBridge in near real time. You can write simple rules to indicate which events are of interest to you, and what automated actions to take when an event matches a rule. For an example of how to create a rule, see Schedule a Pipeline with Amazon EventBridge (p. 3346).

Some examples of the actions that can be automatically triggered include the following:

- Invoking an AWS Lambda function
- Invoking Amazon EC2 Run Command
- Relaying the event to Amazon Kinesis Data Streams
- Activating an AWS Step Functions state machine
- Notifying an Amazon SNS topic or an AWS SMS queue

SageMaker events monitored by EventBridge

- Training job state change (p. 3837)
- Hyperparameter tuning job state change (p. 3838)
- Transform job state change (p. 3839)
- Endpoint state change (p. 3840)
- Feature group state change (p. 3841)
• Model package state change (p. 3842)
• Pipeline execution state change (p. 3843)
• Pipeline step state change (p. 3843)
• SageMaker image state change (p. 3844)
• SageMaker image version state change (p. 3844)
• Endpoint deployment state change (p. 3845)

Training job state change

Indicates a change in the status of a SageMaker training job.

If the value of TrainingJobStatus is Failed, the event contains the FailureReason field, which provides a description of why the training job failed.

```json
{
    "version": "0",
    "id": "844e2571-85d4-695f-b930-0153b71dcb42",

**Endpoint state change**

Indicates a change in the status of a SageMaker hosted real-time inference endpoint.

The following shows an event with an endpoint in the IN_SERVICE state.

```json
{
  "version": "0",
  "id": "d2921b5a-b0ad-cace-a8e3-0f159d018e06",
  "detail-type": "SageMaker Endpoint State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "1583831889050",
  "region": "us-west-2",
  "resources": [
  ],
  "detail": {
    "EndpointName": "MyEndpoint",
    "EndpointConfigName": "MyEndpointConfig",
    "ProductionVariants": [
      {
        "DesiredWeight": 1.0,
        "DesiredInstanceCount": 1.0
      }
    ]
  }
}
```
Feature group state change

Indicates a change either in the FeatureGroupStatus or the OfflineStoreStatus of a SageMaker feature group.

```json
{
	"version": "0",
	"id": "93201503-abdb-36a4-1b9b-4c1c3e3671c0",
	"detail-type": "SageMaker Feature Group State Change",
	"source": "aws.sagemaker",
	"account": "123456789012",
	"time": "2021-01-26T01:22:01Z",
	"region": "us-east-1",
	"resources": [

        }
    }
}
```
Pipeline execution state change

Indicates a change in the status of a SageMaker pipeline execution.

```json
{
"version": "0",
"id": "315c1398-40ff-a850-213b-158f73kd93ir",
"detail-type": "SageMaker Model Building Pipeline Execution Status Change",
"source": "aws.sagemaker",

"executionEndTime": "2021-03-15T16:10:10Z",
"pipelineExecutionDescription": "SomeDescription",
"pipelineArn": "arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123",
"pipelineExecutionArn": "arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123/execution/p4jn9xou8a8s"
}
}```

Pipeline step state change

Indicates a change in the status of a SageMaker pipeline step.

If there is a cache hit, the event contains the cacheHitResult field.

If the value of currentStepStatus is Failed, the event contains the failureReason field, which provides a description of why the step failed.

```json
{
"version": "0",
"id": "ea37ccbb-5e2b-05e9-4073-1daazc940304",
"detail-type": "SageMaker Model Building Pipeline Execution Step Status Change",
"source": "aws.sagemaker",
"account": "123456789012",
"time": "2021-03-15T16:10:10Z",
"region": "us-east-1",
"resources": ["arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123",

"currentStepStatus": "Failed",
"failureReason": "SomeFailureReason"
}
}````
SageMaker image state change

Indicates a change in the status of a SageMaker image.

```
{
    "version": "0",
    "id": "cee033a3-17d8-49f8-865f-b9ebf485d9ee",
    "detail-type": "SageMaker Image State Change",
    "source": "aws.sagemaker",
    "account": "123456789012",
    "time": "2021-04-29T01:29:59Z",
    "region": "us-east-1",
    "resources": ["arn:aws:sagemaker:us-west-2:123456789012:image/cee033a3-17d8-49f8-865f-b9ebf485d9ee"],
    "detail": {
        "ImageName": "cee033a3-17d8-49f8-865f-b9ebf485d9ee",
        "ImageArn": "arn:aws:sagemaker:us-west-2:123456789012:image/cee033a3-17d8-49f8-865f-b9ebf485d9ee",
        "ImageStatus": "Creating",
        "Version": 1.0,
        "Tags": {}
    }
}
```

SageMaker image version state change

Indicates a change in the status of a SageMaker image version.

```
{
    "version": "0",
    "id": "07fc4615-ebd7-15fc-1746-243411f09f04",
    "detail-type": "SageMaker Image Version State Change",
    "source": "aws.sagemaker",
    "account": "123456789012",
    "time": "2021-04-29T01:29:59Z",
    "region": "us-east-1",
    "resources": ["arn:aws:sagemaker:us-west-2:123456789012:image-version/07800032-2d29-48b7-8f82-5129225b2a85"],
    "detail": {
        "ImageArn": "arn:aws:sagemaker:us-west-2:123456789012:image/a70ff896-c832-4fe8-add6-eba25a0f43e6",
        "ImageVersionStatus": "Creating",
        "Version": 1.0,
        "Tags": {}
    }
}
```

For more information about the status values and their meanings for SageMaker jobs, endpoints, and pipelines, see the following links:
Endpoint deployment state change

Important
The following examples may not work for all endpoints. For a list of features that may exclude your endpoint, see the Exclusions (p. 2216) page.

Indicates a state change for an endpoint deployment. The following example shows an endpoint updating with a blue/green canary deployment.

```json
{
  "version": "0",
  "id": "0bd4a141-0a02-9d8a-f977-3924c3fb259c",
  "detail-type": "SageMaker Endpoint Deployment State Change",
  "source": "aws.sagemaker",
  "account": "123456789012",
  "time": "2021-10-25T01:52:12Z",
  "region": "us-west-2",
  "resources": [
  ],
  "detail": {
    "EndpointName": "sample-endpoint",
    "EndpointConfigName": "sample-endpoint-config-1",
    "ProductionVariants": [
      {
        "VariantName": "AllTraffic",
        "CurrentWeight": 1,
        "DesiredWeight": 1,
        "CurrentInstanceCount": 3,
        "DesiredInstanceCount": 3
      }
    ],
    "EndpointStatus": "UPDATING",
    "CreationTime": 1635195148181,
    "LastModifiedTime": 1635195148181,
    "Tags": [],
    "PendingDeploymentSummary": {
      "EndpointConfigName": "sample-endpoint-config-2",
      "StartTime": Timestamp,
      "ProductionVariants": [
      ]
    }
  }
}```
The following example indicates a state change for an endpoint deployment, which is being updated with new capacity on an existing endpoint configuration.

```json
{
    "version": "0",
    "id": "0bd4a10-0a02-9d8a-f97-3924c3f3b259c",
    "detail-type": "SageMaker Endpoint Deployment State Change",
    "source": "aws.sagemaker",
    "account": "123456789012",
    "time": "2021-10-25T01:52:12Z",
    "region": "us-west-2",
    "resources": [
    ],
    "detail": {
        "EndpointName": "sample-endpoint",
        "EndpointConfigName": "sample-endpoint-config-1",
        "ProductionVariants": [
            {
                "VariantName": "AllTraffic",
                "CurrentWeight": 1,
                "DesiredWeight": 1,
                "CurrentInstanceCount": 3,
                "DesiredInstanceCount": 6,
                "VariantStatus": [
                    {
                        "Status": "Updating",
                        "StatusMessage": "Scaling out desired instance count to 6."
                    }
                ],
            }
        ],
        "EndpointStatus": "UPDATING",
        "CreationTime": 1635195148181,
        "LastModifiedTime": 1635195148181,
        "Tags": {}
    }
}
```

The following secondary deployment statuses are also available for endpoints (found in the `VariantStatus` object).

- Creating: creating instances for the production variant.
Example message: "Launching X instance(s)."
- Deleting: terminating instances for the production variant.
  Example message: "Terminating X instance(s)."
- Updating: updating capacity for the production variant.
  Example messages: "Launching X instance(s).", "Scaling out desired instance count to X."
- ActivatingTraffic: turning on traffic for the production variant.
  Example message: "Activating traffic on canary capacity of X instance(s)."
- Baking: waiting period to monitor the CloudWatch alarms in the auto-rollback configuration.
  Example message: "Baking for X seconds (TerminationWaitInSeconds) with traffic enabled on full capacity of Y instance(s)."
API Reference Guide for Amazon SageMaker

Overview

Amazon SageMaker provides APIs, SDKs, and a command line interface that you can use to create and manage notebook instances and train and deploy models.

- Amazon SageMaker Python SDK (Recommended)
- Amazon SageMaker API Reference
- Amazon Augmented AI API Reference
- AWS Command Line Interface
- AWS SDK for .NET
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for JavaScript
- AWS SDK for PHP
- AWS SDK for Python (Boto)
- AWS SDK for Ruby
- Amazon SageMaker Spark

You can also get code examples from the Amazon SageMaker example notebooks GitHub repository.

- Example notebooks

Programming Model for Amazon SageMaker

Making API calls directly from code is cumbersome, and requires you to write code to authenticate your requests. Amazon SageMaker provides the following alternatives:

- Use the SageMaker console—With the console, you don’t write any code. You use the console UI to start model training or deploy a model. The console works well for simple jobs, where you use a built-in training algorithm and you don’t need to preprocess training data.

- Modify the example Jupyter notebooks—SageMaker provides several Jupyter notebooks that train and deploy models using specific algorithms and datasets. Start with a notebook that has a suitable algorithm and modify it to accommodate your data source and specific needs.

- Write model training and inference code from scratch—SageMaker provides multiple AWS SDK languages (listed in the overview) and the Amazon SageMaker Python SDK, a high-level Python library that you can use in your code to start model training jobs and deploy the resulting models.
• **The SageMaker Python SDK**—This Python library simplifies model training and deployment. In addition to authenticating your requests, the library abstracts platform specifics by providing simple methods and default parameters. For example:

  • To deploy your model, you call only the `deploy()` method. The method creates a SageMaker model artifact, an endpoint configuration, then deploys the model on an endpoint.

  • If you use a custom framework script for model training, you call the `fit()` method. The method creates a .gzip file of your script, uploads it to an Amazon S3 location, and then runs it for model training, and other tasks. For more information, see [Use Machine Learning Frameworks, Python, and R with Amazon SageMaker](p. 14).

• **The AWS SDKs**—The SDKs provide methods that correspond to the SageMaker API (see [Operations](p. 3)). Use the SDKs to programmatically start a model training job and host the model in SageMaker. SDK clients authenticate your requests by using your access keys, so you don’t need to write authentication code. They are available in multiple languages and platforms. For more information, see the preceding list in the overview.

In [Get Started with Amazon SageMaker](p. 34), you train and deploy a model using an algorithm provided by SageMaker. That exercise shows how to use both of these libraries. For more information, see [Get Started with Amazon SageMaker](p. 34).

• **Integrate SageMaker into your Apache Spark workflow**—SageMaker provides a library for calling its APIs from Apache Spark. With it, you can use SageMaker-based estimators in an Apache Spark pipeline. For more information, see [Use Apache Spark with Amazon SageMaker](p. 15).

Autopilot time series data (p. 3850)

Amazon SageMaker Autopilot accepts time series as model inputs. For more information, see Amazon SageMaker Autopilot data and problem types.

October 25, 2021

AWS managed policies (p. 3850)

Started tracking changes for SageMaker managed policies.

June 10, 2021

New features re:Invent 2020 (p. 3850)

The following new features were introduced at re:Invent 2020.

- Amazon SageMaker Model Building Pipelines
- Automate MLOps with SageMaker Projects
- SageMaker Edge Manager
- SageMaker Clarify
- SageMaker Data Wrangler
- SageMaker Feature Store
- SageMaker Studio JumpStart
- Register and Deploy Models with Model Registry
- SageMaker Distributed
- Deep Profiling with SageMaker Debugger

December 1, 2020

Studio Notebooks (p. 3850)

SageMaker Studio Notebooks

April 28, 2020

New features re:Invent 2019 (p. 3850)

The following new features were introduced at re:Invent 2019.

- SageMaker Studio
- SageMaker Studio Notebooks (preview)
- SageMaker Experiments
- SageMaker Autopilot
- SageMaker Debugger
- SageMaker Model Monitor
